Another member of the same regiment writes: "Are now quartered in very comfortable barracks, in a large town about 20 miles from the firing line and about 30 miles from Verdun, and can plainly hear the roar of the big guns night and day. Airships are active overhead all the time and have witnessed several air battles. This town is frequently bombed by the German raiders and usually at night. I was in London several Sundays ago when the city was bombed in an air raid, and several people were killed. . . . Tobacco is high here and doubly so in England, where 24 cents is charged for a five-cent sack of Bull Durham and 44 cents for a ten-cent can of Tuxedo. . . . I made an interesting trip this morning to an old battlefield and went through some of the trenches that the Germans have used. I could get wagon-loads of souvenirs if I wished."

Brake Pipe Leakage and Compressor Capacity*

Testing Train Leakage by Charging Through an Orifice Designed to Supply Maximum Allowable Leakage

By C. R. Weaver

Supervisor Air Brakes, New York Central, Cleveland, Ohio.

IT has been customary to determine the brake pipe leakage by making a 10 lb. brake pipe reduction, lapping the brake valve and noting the rate of drop in brake pipe pressure. Then, knowing the volume of the brake pipe, it is possible to calculate the cubic feet of free air lost from the brake pipe, during the first minute. This figure is commonly accepted as a measure of the relative condition of trains on the road with respect to leakage from the brake system.

After an extended investigation of long freight trains, the writer was convinced that the information so obtained was of little value and rather misleading than otherwise. Trains were found on which the brake pipe leakage, as noted above, was not excessive, and the compressor capacity ample to supply the air required for maintaining the pressure in the brake system, but subsequent observations on the road showed the compressor capacity insufficient to supply the air lost.

There are several causes for apparent disagreement of such observations, namely:

(1) Opening up of leaks in hose couplings and pipe connections when the train is in motion that do not exist when the train is standing.

(2) Leakage caused by movement of apparatus when running due to insecure fastening of reservoirs or brake cylinders to the car body.

(3) Leakage from the auxiliary reservoir side of the triple valve piston caused by leaky gaskets, leaky release valves, etc.

How much influence these causes may have is uncertain, but the fact remains that trains having no more brake pipe leakage, measured in the usual way, than could be easily supplied by the compressor capacity, have been found in numerous cases to overtax the compressor, causing its failure.

It is very difficult to ascertain brake pipe leakage, in fact, it can only be done by closing all the triple valve cut-out cocks throughout the train, which is impracticable and of little value, since it is the volume of air that escapes from the system that is now the vital consideration as far as train movements are concerned, i. e., time to charge the brake system and to restore and maintain the required pressure.

There is, however, another side of this: viz., the effect of the brake pipe leakage on the operation of the brakes, such as lessening the ability to release all the brakes in the train, and lengthening the time in which they can be released. The leakage may also become so great that a brake application commenced by the engineer may result in a continuous application of the brakes. However, this is hardly likely to become serious with the long, large volume air brake trains of today, since the capacity of the compressor, the limitations of transmission of the air by the passageways of the brake valve and feed valve, and the ability to transmit air in sufficient quantity through the pipes of the present long trains will be exceeded before the brake pipe leakage, in pounds per minute, has any serious effect upon the operation of the brakes.

The whole question of brake pipe leakage resolves itself into what quantity of air may be permitted to escape from the brake system and still permit charging, maintaining and re-

plenishing the brake system in such time as will not impose limitations upon traffic in the way of delays, getting trains ready in the yard, and operating them over the road.

It is very difficult to ascertain what quantity of air is actually leaking out of the brake system. It is not difficult to find out what drop takes place in the pressure, but this varies owing to variations in methods of making tests, positions assumed by triple valves, etc. It is not difficult, however, to fix on some quantity of air that may be permitted to leak out of the brake pipe and then supply in the yard this quantity of air to a train previously charged and observe whether or not the quantity supplied does, or does not, maintain the required pressure. If it maintains or more than maintains the pressure, it is apparent that the leakage of the train is no more than can be permitted. If it does not maintain the pressure then the leakage must be reduced to the point where it can be maintained. The permissible amount of leakage from the entire brake system is the starting point. Too much leakage must not be allowed or an undesirably large compressor capacity or high degree of compressor maintenance will be necessary. An excessively low amount of leakage must not be insisted upon, or traffic will be interfered with on account of the time required to stop the leaks.

In order to arrive at some basis of what would be the allowable leakage, the Interstate Commerce Commission condemning tests of air compressors is the basis of the available compressor capacity. This, by the way, in the writer's opinion allows too wide a variation in the condemning tests. A New York No. 5 compressor is only required to deliver 59 cu. ft. of air, which is only 65.5 per cent of its capacity when in good condition, whereas the 8½-in. cross-compound compressor is required to deliver 86 cu. ft. of free air, which is 90.5 per cent of its good condition performance.

DETAILS OF TESTS

It was decided to determine the leakage by means of an orifice through which air would be supplied at a definite pressure which would be sufficient to provide for the maximum amount of allowable leakage. If, with this arrangement it was not possible to maintain the pressure in the brake pipe, then the leakage was too great. If the brake pipe pressure remained the same, or was raised, it would then be known that the leakage was not excessive. The tests were made on a 100-car freight train, conforming to the following specifications:

Size of equipment, 10-in. (combined); length of cars, 42 ft.; brake pipe volume per car, 920 cu. in.; auxiliary reservoir volume, 2,440 cu. in.; leakage uniformly distributed at car 4 and every tenth car up to and including car 94, regulated by cocks in branch pipe near triple valve; test gages on branch pipes of cars 1 and 95 and on auxiliary reservoir of car 1.

The locomotive equipment was as follows:

Brake equipment, No. 6 ET; main reservoir volume, 50,000 cu. in.; main reservoir pressure, duplex control 100 lb. and 130 lb.; compressor, two 9½-in. or one 8½-in. CC.; steam pressure, 195 lb. to 210 lb.; test gages on main reservoir and brake pipe.

The orifice was placed between the yard air system and the train with a by-pass in which was placed an air meter

*Abstract of a paper presented before the September meeting of the Central Railway Club.

(Toolometer) by means of which the amount of air passing through the orifice was determined.

Two main classes of tests were made which may be referred to as charging tests and pump up tests. The first charging tests were made with an orifice $17/64$ in. in diameter, which was computed to furnish an amount of air equivalent to 75 per cent of a New York No. 5-A compressor capacity. With this orifice and a constant pressure of 80 lb., the brake pipe leakage was regulated until the air flowing through the orifice was just able to maintain 70 lb. pressure in the brake pipe of the first car. By means of the Toolometer it was found that this rate was 41 cu. ft. of free air per minute.

This rate was used as a basis for making the pump up tests, using the locomotive with two $9\frac{1}{2}$ -in. compressors and 200 lb. steam pressure. Fig. 1 shows a graphic record of the results of the pump up test in which an empty train was charged to a pressure of 70 lb. on car 1. The train was charged with the brake valve in running position. When the first car of the train was charged to 70 lb., an attempt was made to raise the pressure to 85 lb. by placing the brake valve handle in full release position. After more than 20 minutes the pressure became stationary at $82\frac{1}{2}$ lb. By means of the orifice, the yard plant apparatus and the Toolometer, it was found that 50.4 cu. ft. of free air per minute was required to maintain the total train leakage under these conditions.

It was then concluded that the total leakage rate of 41 cu. ft. of free air per minute at 70 lb. pressure on the first car was too great. The orifice was therefore replaced with one of $1/4$ -in. diameter. This showed that 70 lb. could be maintained on the first car with an 80-lb. yard pressure, with a total leakage rate of 35 cu. ft. of free air per minute. The pump up test was then repeated and the brake pipe pressure on the first car was raised from 70 lb. to 85 lb. in about 15

Fig. 1—Time of Charging Train with Leakage of 41 Cu. Ft. per Minute; Brake Valve in Running Position

minutes, thus showing that the $1/4$ -in. orifice was suitable. Fig. 2 shows a graphic record of the second series of pump up tests where the leakage had been reduced to 35 cu. ft. of free air per minute.

Other tests were made to show how time could be saved in charging the train by placing the brake valve in the release position until the train had been nearly fully charged, then moving it to a running position, thus bringing the feed valve into operation so that it would not be overcharged. Tests were also made to determine the best way of handling the yard charging orifice. The Toolometer readings were checked and found to be sufficiently accurate.

CONCLUSIONS

The ordinary method of measuring brake pipe leakage on trains is not an accurate check on the total amount of train leakage which the compressor on the locomotive must be able to supply if the train is to be handled successfully.

The method suggested for measuring the total leakage by charging the train through an orifice supplied with a fixed pressure does not afford an accurate means of measuring the total train leakage.

If the maximum permissible amount of train leakage is

Fig. 2—Time of Charging Train with Leakage of 35 Cu. Ft. per Minute; Brake Valve in Running Position

fixed upon, an orifice size can be determined which when supplied with a constant pressure of 80 lb. from a yard plant will just supply the necessary amount of air to the train to maintain the leakage specified.

Such a charging orifice can conveniently be used while charging a train from the yard plant and it will afford a means for accurately determining whether the total leakage of the train is less than, equal to or greater than the maximum permissible leakage.

The best method of manipulating the charging orifice test apparatus is for the operator to start the test with the by-pass around the orifice open and then as the train charges gradually close this by-pass so as to maintain 70 lb. brake pipe pressure on the first car of the train. This method will accomplish the charging of the train in a minimum of time and avoid any objectionable overcharging.

The foregoing seems to point out the necessity of a better brake maintenance and a better initial installation of the brake apparatus; this has particular reference to securing the reservoirs and cylinders to the car body and proper clamping of the brake pipe. A large majority of the leaks are due to loose reservoirs, cylinders, and brake pipes. Tightening of the unions when these parts are loose only affords temporary relief. More attention should be paid to hose couplings when mounting hose, as many are found that do not gage and when coupled, leak.

A recent investigation of 12 trains, varying from 80 to 114 cars per train, showed a loss of air from 50 per cent to 93 per cent of the compressor capacity. Losses of this kind are not only expensive in compressor maintenance and coal consumption, but cause serious delays to traffic.

The writer wishes to express his appreciation to the Westinghouse Air Brake Company for assistance in conducting the tests and compiling the test data.

DISCUSSION

The discussion indicated a general appreciation of the seriousness of train leakage on roads handling trains approach-

ing and often exceeding 100 cars. Not only has the difficulty of maintaining and supplying adequate train pipe pressure been increased by the handling of long trains, but heavy cars and the severe shocks which result from rough handling have greatly added to the difficulties of maintaining a reasonably tight train line. Under these conditions, reservoirs inadequately secured and pipes not sufficiently clamped, are soon jarred loose and excessive leaks result. The need of co-operation between the maintenance forces and designers, in order that the location of the air brake equipment and the methods of securing it to the car may be such that it will adequately perform its functions, was pointed out.

The opinion was expressed that the time has arrived when a complete system of piping designed especially to meet the requirements of locomotive and car service is needed. The piping now in use is not essentially different from that used for gas and water in our houses under the most favorable conditions so far as external stresses are concerned; it is an adaptation of existing facilities not well suited to meet the entirely different conditions under which they must operate. Attention was called to the frequency with which a poorly designed piping layout is found on hopper bottom cars where the reservoir is often placed directly over the train pipe with a branch pipe not over 12 in. or 14 in. long, and this made up largely of elbows and couplings. With the train pipe located between the center sills it is often impossible to locate, much less attend to repairs to a leak when it is located.

One of the most prolific causes of train leaks is inadequate reservoir fastenings which permit the reservoir to become loose under the stresses imposed in service. It is usually the practice to leave the stopping of leaks until trains have been made up and tested in the yards. Under such conditions time does not permit of doing more than patching up unions and other similar repairs, the result being that leaks caused by loose reservoirs are immediately opened up again as soon as the train is in motion. It was suggested that such repairs might well be made on the house track while cars are being loaded, at which time the leaks could be permanently stopped and delays in despatching trains materially reduced.

APPROPRIATION FOR TRANSPORTATION

A total of \$350,000,000 for the transportation of the army and its supplies is provided for in the deficiency appropriation bill passed by the House on September 18 and sent to the Senate. The provisions governing this expenditure are as follows:

"For transportation of the army and its supplies, including transportation of the troops when moving either by land or water, and of their baggage, including members of the Officers' Reserve Corps, enlisted men of the Enlisted Reserve Corps, and retired enlisted men when ordered to active duty, including the cost of packing and crating; for transportation of recruits and recruiting parties; of applicants for enlistment between recruiting stations and recruiting depots; for travel allowance to officers and enlisted men on discharge; for payment of travel allowance as provided in section 126 of the act approved June 3, 1916, to enlisted men of the National Guard on their discharge from the service of the United States, and to members of the National Guard who have been mustered into the service of the United States and discharged on account of physical disability; for payment of travel pay to officers of the National Guard on their discharge from the service of the United States, as prescribed in the act approved March 2, 1901; for travel allowance to persons on their discharge from the United States disciplinary barracks or from any place in which they have been held under a sentence of dishonorable discharge and confinement for more than six months, or from St. Elizabeth's Hospital after transfer thereto from such barracks or places, to their homes (or elsewhere as they may elect), provided the cost

in each case shall not be greater than to the place of last enlistment; of the necessary agents and other employees, including per diem allowances in lieu of subsistence not exceeding \$4 for those authorized to receive the per diem allowance; of clothing and equipage and other quartermaster stores from army depots or places of purchase or delivery to the several posts and army depots and from those depots to the troops in the field; of horse equipment; of ordnance and ordnance stores, and small arms from the foundries and armories to the arsenals, fortifications, frontier posts, and army depots; for payment of wharfage, tolls, and ferriages; for transportation of funds of the army; for the hire of employees; for the payment of army transportation lawfully due such land-grant railroads as have not received aid in Government bonds (to be adjusted in accordance with the decisions of the Supreme Court in cases decided under such land-grant acts), but in no case shall more than 50 per cent. of full amount of service be paid: *Provided*, That such compensation shall be computed upon the basis of the tariff or lower special rates for like transportation performed for the public at large and shall be accepted as in full for all demands for such service: *Provided further*, That in expending the money appropriated by this act a railroad company which has not received aid in bonds of the United States, and which obtained a grant of public land to aid in the construction of its railroad on condition that such railroad should be a post route and military road, subject to the use of the United States for postal, military, naval, and other Government services, and also subject to such regulations as Congress may impose restricting the charge for such Government transportation, having claims against the United States for transportation of troops and munitions of war and military supplies and property over such aided roads, shall be paid out of the moneys appropriated by the foregoing provision only on the basis of such rate for the transportation of such troops and munitions of war and military supplies and property as the Secretary of War shall deem just and reasonable under the foregoing provision, such rate not to exceed 50 per cent. of the compensation for such Government transportation as shall at that time be charged to and paid by private parties to any such company for like and similar transportation; and the amount so fixed to be paid shall be accepted as in full for all demands for such service: *And provided further*, That nothing in the preceding provisos shall be construed to prevent the accounting officers of the Government from making full payment to land-grant railroads for transportation of property or persons where the courts of the United States have held that such property or persons do not come within the scope of the deductions provided for in the land-grant acts; for the purchase and hire of draft and pack animals in such numbers as are actually required for the service, including reasonable provision for replacing unserviceable animals; for the purchase, hire, operation, maintenance, and repair of such harness, wagons, carts, drays, other vehicles, and motor-propelled and horse-drawn passenger-carrying vehicles, as are required for the transportation of troops and supplies, and for official, military, and garrison purposes; for drayage and cartage at the several depots; for the hire of teamsters and other employees; for the purchase and repair of ships, boats, and other vessels required for the transportation of troops and supplies and for official, military, and garrison purposes; for expense of sailing public transports and other vessels on the various rivers, the Gulf of Mexico, and the Atlantic and Pacific Oceans, \$350,000,000."

CANADIAN RAILWAYMAN HONORED.—Lieut.-Col. C. W. P. Ramsay, chief engineer for construction, Eastern lines, Canadian Pacific Railway, and now with the Canadian Army in France, has been made a Companion of the Order of St. Michael and St. George.

HALF MILLION TROOPS MOVED BY RAIL

With words of the highest praise for the railways, Secretary of War Baker announced on Monday that since early in August, when large troop movements began, the roads had transported 502,000 soldiers to training camps, cantonments and seaports without any serious derangement of their regular passenger schedules and without serious injury to a man.

"This strikingly illustrates," said Secretary Baker, "the patriotic co-operation of the railroads with the government and also the tremendous capacity of American railways. I think the railroads deserve great credit for this achievement."

The figure used by Secretary Baker, which represents the

Good Bye, Broadway—Hello, Camp Upton

total up to Sunday night, and covers approximately half of the initial movement now under way, includes the units of the regular army and the railway engineer regiments that have gone to France, those of the National Guard units that have been moved to training camps, and the first two increments of the 687,000 selected for the National Army that have been moved from 4,531 local concentration points to their 16 cantonments.

The National Guard movement, which began early in August, includes about 300,000 men and their impedimenta. The National Army movement began on September 5-9 when about 5 per cent of the total, or approximately 35,000 men, were transported. These were handled on regular passenger trains, one-fifth starting from their originating points on each of the five days, and required no special schedules. The second increment of 40 per cent, or approximately 275,000 men, were entrained from September 19 to 23; another 40 per cent is to be entrained from October 3 to 7 and the remaining 15 per cent beginning October 19. During the transportation of the second increment of the National Army the movement of the National Guard was temporarily postponed, to be resumed early in October.

From most of the local concentration points only a few men were moved at a time, special trains being required only for the contingents from the larger cities, but as the cantonments were approached the movement became more concentrated and extra coaches were attached. When these reached a certain number they were detached from the regular trains and made up into special trains. Day coaches were used for the shorter trips and tourist sleepers for those located farthest from the cantonments.

Under the arrangements worked out by the American Railway Association schedules were prepared by the passenger associations in conference with representatives of the operating departments and then approved by the Quarter-

master General. Orders were issued that passenger equipment be immediately emptied upon arrival and immediately returned to the road from which received. Orders for the disposition of Pullman equipment released were waiting for the cars at destination.

When requests for such information were made, the railroad officers were authorized by the Quartermaster General to confidentially notify Red Cross officials at points where troop trains were scheduled to stop of the expected time of arrival, in order that the Red Cross organization could give attention to the troops in transit. Where troop trains contain both passenger and freight equipment, the Railroads' War Board has ordered that the freight cars should always be on the rear of the train. This permits proper heating of coaches and Pullman cars when the weather requires it.

The Adjutant General has issued a circular to all department and division commanders directing commanding officers of troop trains when arranging stops en route for feeding, watering and resting animals to co-operate with the operating officials of the railroads in having such stops made, as far as circumstances will permit, at such time and place as will be agreeable to the operating requirements and needs of the railway service.

THE Y. M. C. A.

Secretaries of the Railroad Y. M. C. A. accompanied about 200 of the trains carrying drafted men in the second contingent of 40 per cent to the cantonments. These secretaries told the men about the work of the Y. M. C. A. in the camps and overseas. They distributed magazines and stationery, and by this means and through personal contact in other ways made the trip an easier one for all concerned, the soldiers-to-be themselves, the men in charge and the train crews.

HANDLING TROOPS TO CAMP UPTON

Camp Upton, on Long Island, by last Sunday night had received not quite 11,000 of the camp's quota of 43,000 men for the new National Army. These men had been arriving on special trains from New York City the five preceding

Copyright by Underwood & Underwood, N. Y.

The Last Chance to See the Selected Men in "Mufti"

days and will be adjusted to their new surroundings when a similar number follow them late this week.

The camp will train for the National Army the men from New York City, those from Westchester, Putnam and Dutchess counties, on the east side of the Hudson river just to the north of New York, and those from Nassau and Suffolk counties making up the remainder of Long Island outside of New York City.

The camp itself lies just to the north of the main line of the Long Island Railroad between Yaphank and Manorville stations and is about 63 miles east of New York City. The

railroad is single track from Hicksville, which is about half way to the camp, so that the extensive passenger and freight traffic required for the camp has to be handled accordingly.

The movement of men to the camp practically all comes through New York, Brooklyn or Long Island City and is complicated by the necessity of using electrically operated steel equipment through the tunnels under the river out of the Pennsylvania Station, or the subway out of Flatbush Avenue Station in Brooklyn and of transferring to the steam operated wooden equipment beyond. The road, following its usual practice, has worked out the scheme of carrying the men in multiple unit electric trains out of these two stations and of transferring them car by car at Jamaica, the general transfer point, 11 miles out.

The various draft boards bring their quotas on foot, in automobiles or trolley cars to the stations, and each lot of men is kept together in one or two cars. The second movement, which began Wednesday and ended Sunday, required three or four trains daily, each train consisting of from 10 to 14 cars. The trains came through the 63 miles in about three hours, which is very good, considering the fact that the line is only single tracked and is now carrying far more than its accustomed amount of both freight and passenger business. The men from the different boards remain in charge of a member of the board, but at Medford, two stations before the camp, the train is boarded by army officers, so that when it arrives at the Camp Upton station the men can be taken off the train and marched immediately to their new barracks.

One of the interesting features of handling the trains has been the work of the Y. M. C. A. Thus far the Railroad Y. M. C. A. has been able to have a secretary on all but two trains. This representative has introduced the Y. M. C. A. to the men and gotten them interested in the work it is planning to do at the camp and has also helped the railroad and the army officers to no small degree in getting the men ready to receive the officers at Medford.

The Long Island is one of the few roads of the country

Copyright by Press Illustrating Service, N. Y.

Express—No Sleepers.

that has had to handle a movement to a cantonment almost exclusively. It has also had to move large numbers of visitors to Camp Mills at Mineola where the Rainbow Division, 27,000 strong, is encamped, awaiting orders to embark for France. Fortunately the Long Island is a passenger railroad and this new traffic has come after the summer rush is over. There has thus far been no serious shortage of cars or of locomotives.

The facilities for receiving the men at Camp Upton are fast being put in readiness. There are now two stations at the camp, one on the main line and one on a wye which

extends north into the camp proper. The total trackage laid down was approximately 11 miles in length, three-quarters of a mile for a siding on the main line, $3\frac{1}{4}$ miles for a temporary contractor's siding and a little over seven miles for the permanent layout for the camp itself. This permanent trackage includes a wye to facilitate operation, a freight yard for about 100 cars, an engine yard and also serves a row of 10 government warehouses, an l. c. l. freight station, team tracks, etc., and the passenger station, now in process of construction. The passenger station tracks are four in number, each long enough to hold a good-sized train and with wide gravel platforms between. The Long Island for some time has been handling the camp laborers to its main line

Copyright by Underwood & Underwood, N. Y.

A View from Another Railroad. Leaving North Station, Boston, for Camp Devens

station, and it has been doing an exceedingly large business, because the mosquitoes drove the contractors' men both to distraction and home. Conditions, of course, are much better now. The Long Island at one time had to bring down and carry back its own laborers in a work train each day, because the men refused to board at the camp even at increased wages. The road now has facilities for 98 clerical and other employees at the camp, including comfortable offices, barracks and an attractive eating place at which the men can obtain meals at 25 cents each. Until these buildings were ready these men had to work in converted passenger cars; at one time the freight office with about 28 clerks had its headquarters in a single car.

SPECIAL RATES FOR SOLDIERS

The special trains for drafted men come, of course, to the station on the wye. The Long Island will shortly begin to make a much more extensive use of its camp station, however, because it will establish a schedule of five camp specials each way daily. On four of the westward trains (to New York), all in the evening, and on two of the returning trains, leaving New York at 9:29 and 11:44 in the evening, respectively, for soldiers only,—officers and enlisted men in uniform,—will be allowed a special rate of 60 cents for the round trip, this being at the rate of less than one-half cent a mile. On the other specials, for visitors and soldiers, soldiers will pay \$1.20 for the round trip. Visitors on these specials will be given a special rate of \$2.50 for the round trip, and even this is a considerable reduction, for the regular fare is \$3.54. The specials will make only one stop—at Jamaica—where passengers will change cars for the New York or Brooklyn stations.

RUSSIAN RAILWAY LOAN.—The Petrograd newspapers announce the forthcoming issue of a second so-called railway loan. The money will be used for 17 railway companies which have been taken over by a syndicate of banks. The loan will be for rubles, 750,000,000 (\$386,000,000), the rate of interest $4\frac{1}{2}$ per cent, and the price of issue 81 $\frac{1}{3}$.

The Bridge Showing the Suspended Span in Place

Quebec Bridge Central Span Successfully Hoisted

Roller or Key Bearings Used as Supports During
Raising Instead of Rocker Bearings and Steel Castings

By A. J. Meyers

Chief Draftsman, Board of Engineers, Quebec Bridge

ONE of the greatest feats of bridge engineering the world has ever seen was brought to a successful conclusion on Thursday, September 20, 1917, at 4.01 p. m., when the 10-in. pins connecting the two sections of the eyebars suspending the new suspended span of the Quebec bridge to the ends of the cantilever arms were driven. This span is 640 ft. long center to center of end supporting bars, 88 ft. wide center to center of trusses and 110 ft. deep center to center of chords at the center of the span. When completed and ready for hoisting into its final position, it weighed practically 4,950 tons. The cantilever arms are each 580 ft. long, and with the placing of the suspended span the task of bridging a clear distance of 1800 ft.—the longest span in the world between main piers—had been completed. The two adjacent anchor arms are 515 ft. long and the depth over the main pier is 310 ft. from center of the main shoe to the center of the top chord connecting links.

DETAILS OF DESIGN

The trusses of the span have the top chords curved to a parabola, the depth at the hip being 70 ft. and at the middle of the span 110 ft. The web is a sub-panel Pratt system with main verticals compression posts, except the vertical hangers at the hip, which with the main diagonals are tension members. The main panels vary in length from 65 ft. in the end panels to 80 ft. for the panels at the center of the span. For the bottom chord throughout and for the first main tension diagonals of the web eyebars were used. All the other truss members were of built up construction. The top chords were pin-connected at all the main panel points with shop or field splices at the intermediate sub-panel points. Nickel steel was used throughout for all the main truss members and the top and bottom lateral systems, but the sway bracing and the minor web members, which carried no moving load stresses, were made of carbon steel. The greatest area of the top chord members was 434 sq. in., and in the center panel of the bottom chord eyebars 311.5 sq. in. The top and bottom lateral systems, as well as the sway bracing, were double intersection systems, designed to take both tension and compression in each member.

The manufactured length of the truss members was such

that after the span was erected and carrying its full live and dead load the trusses would have their geometrical shape, that is the main truss members would be straight between main panel points. For this reason the faced ends of the top chords, where these members are spliced in the field, would not come to a square bearing during erection. In order to obtain a square bearing at these points before riveting on the splice material, a special method of erection had to be adopted. Sand-jacks were placed on top of the outside columns of the staging bents at the main panel points, the main vertical posts of the span bearing on these jacks. At the sub-panel points, and between the inside columns of the staging bents and the floorbeams, wood blocking was used in place of the sand-jacks. The elevations of the bottom chord panel points during erection were calculated to suit the manufactured length of the truss members, or in other words the camber of the truss. The span being completely erected, except for the riveting of the top chord splices which had only been bolted up with 50 per cent of the field holes filled with bolts, the timber blocking between the floorbeams and inside columns of the staging and also between the sub-verticals and outside columns of the staging, was removed and the sand-jacks were lowered until the span rested on its bearings at the end staging bents which then carried the full dead load. The nuts on the bolts in the top chord splices were then loosened, and the bearing surfaces allowed to come squarely together; the lengths of the sub struts supporting the chords at the splices having been calculated so that the chords would be straight between main panel points for this condition. The chord splice material was then fully riveted.

BEARINGS RADICALLY CHANGED

The design of the bearings which on this occasion transferred the load of the suspended span to the lower supporting girders was radically different from the bearings of last year. After the intermediate falsework bents were removed and the span rested on the end bents at L0 and L18, the reaction of the span was borne by part bearings under the two outside ribs of the XLO joint, specially designed to take care of the expansion and contraction of 3 to 3½ in. at each

end of the span. This motion was due to a variation in temperature of 90 deg. F. or from a minimum temperature of 30 deg. to a maximum of 120 deg., which might have occurred during the summer months. These part bearings were also designed to accommodate the rotation of the XLO joint about the transverse axis of the joint, as the span deformed under the dead load stresses when the initial erection

The lower portion of the outside bearing was $4\frac{5}{8}$ in. thick and was built up of a loose $\frac{3}{4}$ in. top bronze plate, two loose steel plates, $\frac{7}{8}$ in. and 1 in. thick respectively, and a laminated section of sheet lead, 13/16 in. thick. These several plates and sheet lead filling were contained in a lower bed casting riveted to the supporting girder and were held against motion longitudinally by cast steel blocks, bolted in

Details of the Supporting Bearings. These Took the Place of the Rocker Bearings Used Last Year

camber was eliminated and the span rested entirely on the end supporting bents.

The upper portion of the outside bearing was $3\frac{3}{8}$ in. thick and was riveted to the bottom of the XLO joint. It was planed on the under surface and also on the edges to a width of $7\frac{7}{16}$ in. and to a length of 2 ft. 6 in. and slid when the span was expanding or contracting on the polished and paraffined surface of the top bronze plate of the lower portion of the bearing, at the same time being guided and contained by the planed sides of the lower bed casting.

the ends of the trough of the bed casting by three 1-in. diameter through bolts. Three-inch clearance was allowed between each end of the upper and lower portions of the bearing for longitudinal motion. The sheet lead filling, which was 13/16 in. thick before taking load, flowed under the reaction of the span and took care of the rotation of the XLO joint about its transverse axis as the members of the span changed their lengths under varying stresses and conditions. In order to prevent the sheet lead from squeezing out around the edges of the loose steel plates in the lower bed casting a

75,000 lb. each and passed through sheaves at the lower corners of the mooring trusses and from there up to a nine-part $\frac{3}{4}$ in. wire rope tackle which led back to the drums of the derrick hoists situated on the bridge floor at the ends of the cantilever arms. The span was pulled directly under its final position in the bridge by means of these ropes and the derrick hoists. The hanger lifting chains which raised the span were then lowered two feet and connected through slotted holes at the lower ends to the pins at the top of the short hanger links connecting to the supporting girders.

The mooring frames were made of two steel trusses braced together by one vertical plane of laterals and three horizontal transverse brace frames. This bracing was designed to take a transverse pull from each end of the suspended span of 300,000 lb. The mooring frames were connected to the cantilever arm floorbeams so that they could be raised so as not to obstruct the channel unnecessarily.

THE LIFTING APPARATUS

The lifting links or hanger chains were made of plates 28 in. wide, four plates to each chain and two chains to each corner of the span. These two hanger chains were

in. back to back of angles and 25 ft. long and were built up of two plate girders connected together by bearings, stiffening and pin connection diaphragms, and also cover plates.

The upper supporting girders at the CUO joint of the cantilever arm were designed in a similar manner to the lower supporting girders, the key bearing for the girders and the pin connections for the vertical hangers allowing turning about both the transverse and longitudinal axis of the supporting girders. With bearings of this design the suspended span could move in any direction under the influences of external forces arising from wind, pull of anchorage tackle or inequality in jacking during the hoisting of the span.

The jacking girders were located at the same elevation as the floor of the cantilever arm. They were hung from the upper supporting girders by stiff braced hangers which were pin connected at the upper and lower ends. At the lower ends these stiff hangers were attached to guides built of plates and angles which passed through the upper jacking girders and were riveted into the lower jacking girders. The position of the lower girders was therefore fixed and their distance from the panel point CUO did not change

The Span Arriving at the Bridge Site

attached to the lower supporting girder and were hung from the lower jacking girders, situated just above the bottom chords of the cantilever arms. The lower links of the chain were 31 in. wide instead of 28 in. to take the 15 in. pin connecting the chain to the stub of the lower supporting girder.

The material in all links was carbon steel except the two lower sections, which were silicon steel. These lower sections were made of silicon steel in order to provide a greater factor of safety against repeated bending stress due to swaying of the span under the action of wind and jacking forces. The bending stress in these links was higher and repeated more often than in the upper links of the chain. The links of the chain were connected together by 12 in. pins $12\frac{3}{4}$ in. long at each end and held in place by 14 in. dia. cast steel pin caps, threaded onto a $1\frac{3}{4}$ in. through pin bolt.

The hanger chains connected at the lower end to the supporting girders. These supporting girders were 6 ft. $11\frac{1}{2}$

during the jacking operations. The upper girders were the movable girders and slid up and down on the guides as the 1000-ton jacks were operated. These jacks were placed between the upper and lower jacking girders, two at each corner of the span, and did the work of lifting the span. In order to avoid binding of the jacks, due to the deflection of the jacking girders under load, the jacks were provided with rocker seats at their upper and lower bearings. They were located at the extreme end of the jacking girders where they bore against transverse diaphragms riveted into the jacking girders.

In addition to the hydraulic jacks, four follower-up screw jacks were provided at each corner of the span as a safety device in case anything should go wrong with the pumping system for the hydraulic jacks or the jacks themselves should fail to maintain the pressure necessary to hold the weight of the span while being lifted. These screw jacks also reacted against cross girder diaphragms in the upper and lower jacking girders. The screw itself was counter-

weighted so that practically all the friction due to its weight was eliminated. They were operated by hand from a platform in front of the lower jacking girder by means of a set of gearing so arranged that the two screws at each end of the girder were always at the same level. The counterweighting of the screws enabled the operator to turn them without difficulty and to follow the operation of the hydraulic jacks with equal speed and very little exertion.

The hanger lifting chains were guided between cross pin bearing diaphragms riveted into the jacking girders. The chains were bored every 6 ft. to receive a 12-in. dia. pin, while the cross diaphragms were bored for the same diameter of pin at 2 ft. centers. The clearance provided in the pin hole of the hanger chain was $\frac{1}{2}$ in. transversely and

The Jacking Girders Showing the Hydraulic Jacks and Safety Screws

$\frac{3}{8}$ in. longitudinally, and in the pin holes of the cross diaphragm 1 in. transversely and $1\frac{3}{4}$ in. longitudinally. This clearance was found to be ample to allow the pins to be driven without difficulty during jacking operations. Having the pin holes in the cross diaphragms at 2 ft. centers enabled the pin holes in the hangers to be bored at 6 ft. centers and at the same time accommodate the 2-ft. stroke of the jack.

Each operation of the jacks lifted the span 2 ft. During the lifting or upward stroke a 12-in. pin engaged the hanger chains through the diaphragms in the upper jacking girders. At the finish of the stroke the pins were entered in the diaphragms of the lower jacking girders to engage the hanger chains. The upper pins were then removed, the pistons of the jacks and the upper girders lowered, the upper pins again entered, the lower pins removed, and the jacks again operated. As each 24-ft. length of hanger chain passed up through the upper jacking girders it was disconnected and removed. The jacking pins were counterweighted and balanced to enable them to be handled with facility by the men on the operating platform.

The jacks were supplied with water by a pair of direct acting double plunger pumps operated by compressed air and located on the center line of the bridge floor at the ends of the cantilever arms. By means of the set of controlling valves installed in front of the pumps the supply of water sent to each corner of the span was regulated and, in this manner with the aid of indicators placed in front of the valve operator which showed any difference in level between the lifting girders on each side of the bridge, the two corners of each end of the span were kept at the same elevation.

Another set of valves with similar indicators, situated on the operating platform in front of each set of jacking girders, controlled the water supply to each separate jack at one corner of the span.

RECORD OF FLOATING IN AND HOISTING OPERATIONS

The methods followed in floating were similar to those followed in last year's operations which were fully described in the *Railway Age Gazette* of September 22, 1916. The start was made at 5.45 on the morning of September 17, seven tugs being used in the operation. Ranges had been placed on the north shore at known distances apart so that the speed of the span could be ascertained at any time and increased or diminished as required to have the span arrive at the bridge site at the appointed time, when the current would be nearing zero velocity. The first jacking commenced at 9.10. Practically one complete operation was made before any load was taken by the lifting chains. Three more lifts were then made and the scows floated clear at 10.28. Twelve lifts were made during the first day and the span was hoisted a distance of 24 ft. Twenty-two lifts were made during the second day; twenty-six lifts during the third day, and fifteen lifts on the fourth day. The final connection between the eyebar suspenders at the ends of the span and those hanging down from the CUO joints of the cantilever arms, was made at 4.01 p. m. Sept. 20, 1917. At 4.51 p. m. of the same day, the load was transferred

End Elevation of the Jacking Equipment

from the lifting apparatus to the permanent hangers of the span.

The work was carried out under the supervision of the Board of Engineers, Quebec Bridge, composed of Messrs. C. N. Monsarrat (chairman and chief engineer), Ralph Modjeski and H. P. Borden. The St. Lawrence Bridge Company is the contractor for the superstructure, of which company Phelps Johnson is president, G. H. Duggan, chief engineer, Geo. F. Porter, engineer of construction, S. P. Mitchell, consulting engineer of erection, and W. B. Fortune, erection superintendent. The lifting apparatus which was furnished by the Watson Stillman Company of Aldene, N. J., performed its work with remarkable efficiency, no delays being experienced in the lifting.

General News Department

The Southern Railway has made a general increase, said to be 10 or 12 per cent, in the pay of clerks.

The Delaware & Hudson, beginning October 1, will run its passenger trains to and from the Canadian Pacific station in Montreal.

Large numbers of operators of the Great North Western Telegraph Company, of Canada, struck and left their work on Monday last.

The Delaware & Hudson has made a general increase in the pay of shopmen; said to be, for mechanics, from 45 cents an hour to 50 cents, and for helpers from 30 cents an hour to 33½ cents.

The State College of Pennsylvania announces special correspondence courses in elementary engineering subjects, established to meet the unusual demand for men in shops and manufacturing plants.

As the result of action taken by the Chicago committee of the Commission on Car Service on September 18, box cars unloaded in Chicago may be reloaded for movement over any railway in any direction, regardless of the ownership of the car.

At the Sheepshead Bay track, New York City, September 22, Louis Chevrolet, driving a Frontenac car, traveled 100 miles in 54 minutes; 20.98 seconds. This is said to be about two minutes better than the best previous record for that distance.

The New York, New Haven & Hartford is to employ both younger and older men in the operating department. The age limits, hitherto, 21 years to 35 years, will be, for firemen, 18 to 45 years; for trainmen, 18 to 50 years; and for other employees, 18 to 60 years.

Freighthouse employees in Kansas City returned to work on September 24, after having been out on strike for over two weeks. The railroads granted increased wages to the men, but refused to recognize the union, which was one of the principal demands of the strikers. All of the men were taken back except a few of the most active agitators.

The New York, New Haven & Hartford reports that for the six months ending June, 1917, the average revenue tons per loaded freight car mile was 18.23 tons, as compared with 16.61 tons in the corresponding period last year, and 15.55 tons in 1916. The company is continuing to impress upon the shipping public that it is its patriotic duty to load cars to their full cubic or weight capacity in order that freight may be handled more expeditiously and efficiently.

A passenger train of the Mobile & Ohio was stopped by robbers near Finger, Tenn., on the night of September 20, and the safe in the express car was blown open. The robbers compelled the engineman to move the express car several miles away from the rest of the train; and after completing their robbery, which, it is said, gave them little of value, they drove the engineman and firemen off the engine, and, taking charge of it themselves, escaped by running some miles ahead.

The Tidewater & Western, a three-foot gage railroad, extending from Bermuda, Va., westward to Farmville, 89 miles, being unable to earn a living, proposes to discontinue and dispose of its property. Authority to do this has just been granted by the Supreme Court of Appeals of the state of Virginia, in a decision which annuls an order of the Corporation Commission of that state, which order held that the railroad company could not dissolve. The court sustains the opinion of Commissioner Rhea, who dissented from the order forbidding the railroad to suspend operations. It is understood that the rails are to be sold to go to England.

In a recent letter to officers and employees of the Chicago & North Western, R. H. Aishton, president, announces that all in the service of the road will be given an opportunity to subscribe to a fund to be used for the purchase of Christmas

presents consisting of tobacco, pipes, candy, etc., for shipment to the members of the North Western company of the Thirteenth Engineers (Railways) now in France. Contributions will be received by the division superintendents of the road, and no subscription will be accepted in excess of 50 cents from any one person. With these presents a list of subscribers will be sent to the officers in charge of the company.

Negotiations between the Northern Pacific and its telegraphers were at a standstill at the time of writing because of the delay of one of the vice-presidents of the union in reaching St. Paul to assist in the conferences. The original demand of the men was for an increase of 18.5 per cent in the wage scale, but this request has been modified to provide for a 15 per cent increase, to be distributed on the basis of a minimum advance of \$10 a month. The company offers an increase of 8.32 per cent, and maintains that the granting of that advance will make the average wage scale on the Northern Pacific equivalent to the scale granted by the Union Pacific to its telegraphers on July 1, and in excess of the wages paid on many other roads in Northern Pacific territory.

The Senate Committee on Interstate Commerce on September 21 began a hearing on the Pomerene bill, giving the President power to fix prices on steel, iron and their products, wherever and whenever sold, either by producer or dealer, and to establish rules for the regulation of the method of production, sale, shipment, distribution, apportionment or storage thereof among dealers and consumers, domestic and foreign. Thus the bill provides for the regulation of sales to the public as well as to the government, and to the Allies. Joseph E. Davies, of the Federal Trade Commission, was the principal witness at the first session, and testified that between 75 and 80 per cent of the bituminous coal in the country had been contracted for at prices in excess of the mine prices fixed by the President a few weeks ago. As the contracts made before the President's order are allowed to stand, this leaves only from 20 to 25 per cent of the supply to be affected by the reduced prices.

Charles A. Prouty, director of the division of valuation, of the Interstate Commerce Commission, has filed a memorandum in the Texas Midland case, stating that while the solicitor's brief covers the legal points involved, the law of valuation is in such a plastic state that the decision of the commission will go far toward fixing the law in many instances, and he therefore confines himself to what he calls the practical considerations involved. Director Prouty says that while he fully concurs in the holding of the solicitor that the valuation act does not require the commission to find an ultimate value, it is still his conviction that an ultimate value for rate-making purposes should be stated, and that the full benefit of this valuation cannot be realized unless this be done. However, he says, this does not mean that any sort of the work now being done, or of the money now being expended, is thrown away because the commission is not required to establish at this time such ultimate value; for the facts are being prepared to be reported to Congress under the present act and "a final value can be quickly stated when Congress has determined by whom and possibly by what rule such value shall be determined."

Aerial Mail Routes Proposed

As a result of a conference between the Postmaster General and the Secretary of War, and with the approval of the President, Congress has been asked to authorize the Secretary of War to turn over to the post office department all military airplanes and motor vehicles not serviceable for military purposes, or which after the war may be dispensed with for military service. As soon as authority of Congress is secured and any airplanes are turned over to the Post Office Department, it is proposed to establish airplane mail routes in this country similar to those in Italy and France. An amendment to authorize this plan has been added by the House Post Office Committee to the Senate

bill, authorizing experiments in motor truck delivery by the Post Office Department in the vicinity of large cities in the United States.

Three Miles Up with 12 Passengers

Lieutenant E. Resnati, an Italian army aviator now practicing in America, flying near Newport News, Va., on September 20, rose to an altitude of 17,000 ft., and he carried 12 passengers. The machine used was a Caproni triplane, propelled by three engines of 160 hp. each. It has a wing spread of 70 ft.

Headlight Order Modified

The Interstate Commerce Commission has announced a further modification of its locomotive inspection rules, postponing from July 1 to January 1, 1918, the effective date of the requirement that new locomotives shall be equipped with electric headlights, and providing that for locomotives in service prior to that date the changes shall be made the first time they are shopped for general repairs after that date. All locomotives are required to be equipped by July 1, 1920.

Wage Increases on Canadian Pacific

Increased wages and improved working conditions were recently granted to enginemen, firemen and hostlers on the western lines of the Canadian Pacific. Passenger enginemen and firemen received an increase of 40 cents and 25 cents per 100 miles respectively, or approximately 10 per cent on the minimum rate for passenger service. The minimum day's work in passenger service was fixed at 100 miles or less, or five hours or less, except on the Mountain sub-division, where 6 hours and 40 minutes or less, or 100 miles or less, will constitute a minimum day. Overtime will be allowed pro rata at 20 miles an hour for a five-hour day, and 15 miles an hour for a day of 6 hours and 40 minutes.

Freight enginemen and firemen were granted an increase of 25 cents and 15 cents per 100 miles respectively, and an eight-hour day. The increase will amount to approximately five per cent for a minimum day. Enginemen in yard service were granted a 5 cents a day increase, and firemen 5 to 15 cents a day, according to the class of engine, in addition to the eight-hour day. Enginemen and firemen in transfer service were granted an increase of 5 and 10 cents a day respectively, and an eight-hour day. Hostlers were granted the eight-hour day, with a minimum of \$3.20 and \$3.35 per day, according to the territory, and with overtime at 33 1/4 cents and 35 cents an hour respectively. All arbitrators (except the preparatory time) will be paid at rates per hour to conform with the eight-hour day. About 4,500 men are affected by the increases, which will total about \$450,000 yearly.

Old Times

J. E. Alger, a locomotive engineer, writing to the Springfield Republican, says that the Boston & Albany was the first American railroad to pay bonuses in lieu of pensions. He says:

"I have been much interested in your articles in regard to railroading, especially that entitled 'No More Pensions for Boston & Albany Railroaders.' I thought that an account of the first payment of any money made by a railroad to an employee for services rendered, outside of his regular wages, might be of interest.

"The road was the Boston & Albany, and the man James M. Alger, an engineer, running between Worcester and Boston. He retired May 1, 1895, after 49 years' service. I have before me the letter from E. D. Hayden, vice-president, containing the vote of the directors, giving to him, in recognition of his long and faithful services, the sum of \$1,200. Not long afterward another old engineer received the same amount. A little later, William Bliss, president of the road, made a ruling that any employee who had been in the service of the road for 25 years, with a clean record, and who wished to retire, should receive a check for a year's pay. This continued until the New York Central took control, and the new form of pension took effect.

"It is interesting to note the conditions of a half century ago. James M. Alger took the Brookline (suburban passenger) train in 1852; and December 25, 1856, the season ticket passengers made him a present of \$125. Mr. Alger took the 7 a. m. out of Worcester, March 7, 1864, and April 4, the following month, the

passengers on the Brookline train, that he left the month before, sent him a \$500 treasury note as a testimonial. Those were the days when the engineer knew almost every passenger who rode on his train. Now we know a few, but in the hustle and rush, there is no time for a handshake, and hardly for a word of greeting. . . ."

Turin to London, at 90 Miles an Hour

On Monday last, September 24, Captain Marquis Giulio Laureati, of the Italian air service, carrying one passenger, flew from Italy to England without a stop. He left Turin at 8:28, Italian time, and landed at Hounslow, a suburb of London, at 2:50 p. m., 656 miles in 7 hours 22 minutes, or an average rate of approximately 90 miles an hour. Captain Laureati flew an Aila machine, and carried two machine guns.

From Turin he followed the railroad as far as Susa, on the Italian frontier. Crossing the Alps (Mont Cenis) at an altitude of nearly 12,000 feet, he passed over Lanslebourg and followed the railroad from Modane. He passed to the east of Paris, and crossed the English Channel in 15 minutes. He carried an autograph letter from his King to King George. During the flight he took food from a bottle fastened inside his coat and fitted with a rubber tube like an infant's feeding bottle. On August 26 Laureati flew from Turin to Naples and back, a distance of 920 miles, without a stop.

Progress on Alaska Railroad

The deficiency appropriation bill passed by the House of Representatives on September 19, and then sent to the Senate, contains provision for an additional appropriation of \$4,000,000 for the construction of the Alaskan railroad. In connection with this item the following statement as to the progress of the road, up to September 10, by H. A. Meyer, assistant to the Secretary of the Interior, was placed in the Congressional Record:

"The Alaska Northern Railroad, purchased by the government and running from Seward to mile 71, at Kern Creek, is being rehabilitated. The first 25 miles from Seward are completed and able to handle any traffic. From mile 25 to mile 71 the road is being rehabilitated, but is usable. From mile 71 to Potter Creek, mile 100, a distance of 29 miles, extraordinarily heavy work is encountered requiring blasting through practically solid rock. Here the line runs along Turnagain Arm, and in this district the grading work has made some progress.

"Rail has been laid and the road is in operation southward from Anchorage, at mile 114, to mile 100, and northward to mile 175, with a branch at Matanuska, 38 miles from Anchorage, to Chickaloon, the heart of the Matanuska coal fields, a distance of 37 miles. It will thus be seen, with the exception of 29 miles of work along Turnagain Arm, rail has been laid from Seward to Chickaloon, a distance of 189 miles, and 23 miles additional on the main line. All efforts are now being made toward closing this gap. This it is hoped to do in 1918.

"Northward on the main line from mile 175 to mile 230 grading work is in progress and will be completed this season. Track laying here will proceed as rapidly as the weather will permit. From mile 230, Talkeetna, to mile 250, Dead Horse Hill, the grading is well advanced, but will not be finally completed until 1918. From mile 250 to mile 260 the right of way has been cleared. From mile 260 into and through Broad Pass, engineering and preliminary work has been done to mile 360. At mile 360 the Nenana coal field is reached, and from this point to the town of Nenana, at mile 415, 9 miles of track have been laid, 32 miles of grading have been practically completed, and 14 miles have been cleared and partially graded. From mile 415 to Fairbanks, at mile 470, the clearing has been completed and grading is underway.

"It will thus be seen that to date 192 miles of rail are in operation.

"With the additional funds requested it is the intention to lay rail along Turnagain Arm, and from Nenana southward to the Nenana coal fields. This work should be completed in 1918, and when this is done, there will be two units of operation, viz., from Seward into the Susitna Valley, with a branch to the Matanuska coal fields, which will permit of the shipment of Matanuska coal to tidewater at Anchorage and Seward, and from Fairbanks to the Nenana fields, so that shipments can also be made from the Nenana fields to the country tributary to Fairbanks."

Coal Production

The weekly report of the Geological Survey on the production of bituminous coal for the week ended September 8 shows 74.8 as the ratio of tonnage produced to full time capacity for the mines reporting, as compared with 72 for the preceding week. Coal originated by 17 of the principal bituminous carriers amounted to 111,874 cars, or 2,000 more cars than for any other week since July. The greatest increase was in Pennsylvania and Ohio, which, the report says, corroborates the inference drawn that the priority order on lake shipments is having its effect. Reports of cars loaded on 90 roads in the week ended September 15 show a gain of but .5 per cent over the week ended September 1. The improvement, the report says, is local and largely in the districts affected by the priority order. The percentage of full time output lost on account of car shortage by all mines reporting dropped from 10.3 to 6.5. Practically every district reporting exhibited a better car supply. The percentage lost on account of the labor shortage and strikes was 7.8, as compared with 6.9 in the preceding week.

Foreign Born Subscribers to the Liberty Loan

To ascertain the extent to which railroad employees of foreign birth subscribed to the first Liberty Loan, a special investigation has been completed on the directly operated lines of the Pennsylvania Railroad East of Pittsburgh and Erie. The result of this inquiry shows that out of a total of 160,127 employees, in all departments, 25,827 were born in foreign countries. There were among all the employees—both native and foreign born—52,782 subscriptions, totaling more than \$3,400,000.

Nearly one in three of the foreign-born employees was found to have been a Liberty Bond purchaser. The exact number of subscribers of alien birth was 8,146, or within two per cent of the proportion of employees of American birth who subscribed.

The inquiry also brought out the fact that there are in the service of the Pennsylvania Railroad men of 42 different nationalities, besides native-born Americans; and members of 30 alien races were included among the buyers of Liberty Bonds.

The Italian race furnished the largest number of foreign-born employees on the Pennsylvania Railroad, the number being 8,365, or practically one-third of all the alien born. Thirty-two per cent of the Italians, or a total of 2,725 employees, bought Liberty Bonds.

The inquiry also brought out the important fact that since the fall of 1914 the Pennsylvania Lines East of Pittsburgh have sustained a net loss of 7,977 employees of foreign birth, as a result of men returning to their native countries for military service, or obtaining employment elsewhere in America, attracted by the higher wages offered by industries which have been able to take advantage of economic conditions.

"Sailing" on Dry Land

The New York, New Haven & Hartford, in announcing its plan for sailing days for package freight, to be started on the first of October, explains the proposal as follows:

These sailing or shipping dates will be scheduled and regularly maintained. When a car, for example, is scheduled to leave a freight house on Wednesday afternoon at 3 o'clock for another designated point, that car will leave whether it is fully loaded or not. The shipper will know that his freight will leave that day; and he will know when the car is due at its destination, and he can advise the consignee accordingly.

This plan provides for direct shipments between various points, preventing the delay at transfer points where heretofore I. C. I. freight has been generally sent for reclassification. One of the principal causes of delay at the present time is the shortage of labor at freight houses, and the new plan will largely eliminate this. It is estimated that at least 1,200 less cars a week will be required to move the I. C. I. freight than under the old system.

Earlier closing hours will be established, and some cars will close as early as 12 o'clock noon, while others will close at 1 p. m., 2, 3 and 4. Shippers will be fully informed as to scheduled closing hours and shipping days, and printed schedules will be provided. The plan will be put into operation first in the larger cities on the eastern end of the line, Boston, Providence, Pawtucket, Woonsocket, Worcester, etc. Advance notice will be given shippers as to the time the new method will become effective.

The road has also adopted a suggestion of the Railroads' War Board that waybills accompany freight to prevent loss or delay of small shipments en route.

New York City Rapid Transit

The New York Public Service Commission, First district, reports that it is the hope of the commissioners to place the Lexington Avenue and the Seventh Avenue subways, New York City, in operation before the end of the year, and also to extend the operation of the Broadway subway from Fourteenth street north to Times Square. The completion of these lines will effect the greatest transit relief ever afforded to residents of Manhattan and the Bronx at any one time. It will mean the doubling (from four to eight tracks) of the subway facilities north of Forty-second street and their trebling, for most of the distance in Manhattan, south of Forty-second street. The Lexington Avenue and Seventh Avenue subways are to be operated by the Interborough Rapid Transit Company, and the Broadway subway by the New York Consolidated Railroad Company.

Automatic Stops on the San Francisco-Oakland

L. E. Jones, signal engineer of the San Francisco-Oakland Terminal Railways, in a paper presented before the Pacific Railway Club at San Francisco, August 9, reviewing the history of automatic signaling apparatus on high speed electric railways, says that the use of automatic train stops on that road has been so satisfactory during the six years since the first installation was made that the stops were introduced in connection with the interlocking signals of the company's principal terminal in 1916, when the tracks and signals were reconstructed. The stops were installed on about three miles of the line (double track) in 1910. Most of this line is on trestles in the bay, and heavy fogs are frequent. The terminal where the stops have been introduced is also on trestles, and derails, arranged in the ordinary way, cannot be used. Experience with the stops in this terminal for about one year has proved satisfactory, and at least one serious collision has been avoided by the automatic application of the brakes on a train of which the motorman had a mental lapse. He overlooked a signal when he was moving directly toward a heavily loaded passenger train at a speed of about 25 miles an hour.

These stops are described in the Signal Dictionary, page 113.

Society of Railway Financial Officers

The eleventh annual meeting of the Society of Railway Financial Officers will be held at the Jefferson hotel, St. Louis, Mo., on October 16, 17 and 18. The program includes an address of welcome by Richard S. Hawes, vice-president of the St. Louis Chamber of Commerce; an address by Frank Trumbull, chairman of the Railroad Executives' Advisory Committee, and a report on the Clearing House Committee, by T. H. B. McKnight, all on Tuesday; a paper on "Handling Liberty Loan Subscriptions," by R. W. Morrison, assistant treasurer, Pennsylvania Lines West; an address by John E. Lonsdale, president of the National Bank of Commerce of St. Louis, and vice-president of the National Association of Owners of Railroad Securities; a paper on "Pension Systems for Smaller Transportation Companies," by J. P. Reeves, treasurer, Chicago & Eastern Illinois; a paper on "Wartime Economics," by B. F. James, secretary and treasurer of the Colorado & Southern, and an address on "The Y. M. C. A. at the Front," by Rubens Humphrey, secretary, St. Louis Railroad Y. M. C. A., on Wednesday; and a paper on "Women for Treasury Department Work," by A. B. Jones, local treasurer of the Chicago & North Western, on Thursday.

Roadmasters Elect Officers

At the closing session of the convention of the Roadmasters' and Maintenance of Way Association at Chicago on Thursday morning of last week, the following officers were elected for the ensuing year: President, A. Grills, general roadmaster, Grand Trunk, St. Thomas, Ont.; first vice-president, J. B. Oatman, roadmaster, Buffalo, Rochester & Pittsburgh, Du Bois, Pa.; second vice-president, J. W. Powers, supervisor, New York Central, Oswego, N. Y.; secretary, P. J. McAndrews, roadmaster, Chicago & North Western, Sterling, Ill.; treasurer, Coleman

King, supervisor, Long Island, Jamaica, N. Y.; members of executive committee, four years, George Beckingham, superintendent of track, Grand Trunk, Montreal, Que.; J. P. Corcoran, roadmaster, Chicago & Alton, Bloomington, Ill.; three years, A. M. Clough, supervisor, New York Central, Batavia, N. Y.; W. Wiltsee, principal assistant engineer, Norfolk & Western, Roanoke, Va.; two years, J. S. McGuigan, roadmaster, St. Louis-San Francisco, St. Louis; one year, F. J. Meyer, roadmaster, New York, Ontario & Western, Walton, N. Y.

Chicago was selected as the place for holding the next convention, although the executive committee was given authority to change this location if conditions warranted.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hone, C. R. K. of N. E. 143 Liberty St., New York. Next meeting, October 16-17, St. Louis.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 16-18, 1917, Chicago.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—Tom Lebon, The Lebon Company, Chicago. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, March, May, July and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CINCINNATI RAILWAY CLUB.—H. Boulet, Chief Interchange Inspector, Cin'ti Rys., 101 Carew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Monroe St., Chicago. Annual convention, October 1-3, 1917, Baltimore, Md.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. W. Hager, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 16-18, 1917, Cleveland, Ohio.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York City. Next annual convention, October 16, 1917, Washington, D. C.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 34th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wollner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, office of the president's assistant, Seaboard Air Line, Norfolk, Va. Next meeting, October 24, 1917, Planters Hotel, St. Louis, Mo.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, N. & W., Philadelphia, Pa. Next annual convention, October 16-18, St. Louis, Mo.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—J. O. Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday in month, except June, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TRAFFIC CLUB OF CHICAGO.—C. R. Sierke, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, 2d Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—I. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Acting Secretary, 1735 Monadnock Block, Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evenings except in July and August.

Traffic News

A hearing before the Interstate Commerce Commission on claims for loss or damage of grain was resumed at Chicago, Ill., on September 18, before H. C. Wilson, attorney examiner.

The Montana Railroad and Public Service Commission, in a decision announced on September 14, denied the application of the railroads of that state for an increase of 15 cents a ton in coal rates.

The Baltimore & Ohio has filed with the Interstate Commerce Commission a tariff providing that coupons of mileage books may be used by passengers for the payment of excess baggage charges, and for meals in dining cars, and telegrams.

In passing the deficiency appropriation bill on September 26 the Senate increased the appropriation for the transportation of the army and its supplies from \$350,000,000, as provided in the House bill, to \$413,567,777. The bill was then sent to conference.

The Southern Classification Committee has announced an extensive docket of proposed changes to be made in Southern Classification No. 43, on which shippers will be given an opportunity to be heard at a hearing at the Sinton hotel, Cincinnati, beginning on October 9.

The New York State Public Service Commission, Second district, announces that substantially all intrastate freight rates west of Buffalo and Salamanca have been advanced to the basis provided for in the orders of the Interstate Commerce Commission, increasing interstate rates on the 15 per cent application of the railroads.

The Baltimore & Ohio has accepted no freight for Baltimore, except foodstuffs and the other articles usually excepted, since September 21, whether carload or less than carload; and on Tuesday of this week it was said that 1,500 cars were still waiting. There is a shortage of men to unload the cars, and consignees have been slow in unloading bulk freight.

The Southern Pacific reports deciduous fruit shipments from California, from last November up to August 27, as totaling 9,903 carloads, the largest movement in history. As compared with previous years the records read: For 1914, 8,044 cars; for 1915, 7,242; for 1916, 9,556; for 1917, 9,903. The grape movement is now on and a recent estimate placed the grape movement from California this year at 11,000 cars.

During the period extending from the opening of the Panama Canal for commercial traffic in August, 1914, to the end of June, 1917, 3,751 vessels with cargoes aggregating 15,339,000 tons passed through it. The traffic from the Pacific ocean to the Atlantic was considerably heavier than that in the other direction; 1,905 vessels with a cargo tonnage of 8,702,300, making the trip from the Pacific to the Atlantic, and 1,846 ships with a cargo tonnage of 6,636,800, making the trip through the canal to the Pacific. Nearly one-half of this total traffic was handled in the year ending June 30, 1917.

The Missouri Public Service Commission has issued an appeal to shippers and carriers asking for the utmost conservation of the car supply. It says: Buyers should order by maximum car loads instead of customary trade units; should place their orders in advance as far as possible so that shippers may be able to double load the cars; should promptly unload all freight, and not take advantage of the full free time granted. Shippers should order only the cars actually needed, and should specify the smallest size cars necessary to carry the loads. Shipments to the same destination should be combined in one car as often as possible.

The Kansas Public Utilities Commission on September 17 filed a formal answer in the United States District Court at Topeka, Kan., to the charges of the carriers relative to the two-cent passenger fare law in force in that state. On August 24, the

Atchison, Topeka & Santa Fe and other railroads applied for an injunction to prevent the utilities commission from interfering with the filing of higher rates, setting up that the Kansas two-cent fare law of 1911 was confiscatory and discriminatory against interstate traffic. The testimony of the Santa Fe, which was typical, showed that the road earned only 1.96 per cent on Kansas passenger business in 1916.

In order to facilitate the direction and proper ticketing of passengers to the military and naval posts throughout the country, the passenger traffic department of the Illinois Central has prepared a bulletin containing essential information concerning military posts located on that road and in adjacent territory served by its immediate connections, a map showing the location of the military posts, and a list of all other encampments. With reference to the encampments on or near the Illinois Central, the bulletin contains information relative to the character of each camp, its location, also the fare from large cities in the vicinity, and directions concerning the routing of passengers.

Reports received by R. H. Aishton, president of the Chicago & North Western, and chairman of the Central Department Committee of the Railroads' War Board, show that from the beginning of the war up to September 22, passenger train service in the 15 states in the department has been reduced to the extent of 9,201,327 train-miles per year. Through the reductions so far made in the central department, 1,660 men and 320 locomotives have been made available for other service, and there is an annual saving of 989,359 tons of coal, and 203,097 barrels of fuel oil. In most cases where a train has been annulled additional coaches have been added to other trains. In some cases mixed trains are doing the service which had been given by regular passenger trains. No transcontinental trains have been taken off.

The Japan Travel Association has recently organized for the purpose of promoting and stimulating interest in trade and travel between Japan and America and to disseminate information to that end through the co-operation of railway and steamship agencies in all parts of America and the Orient. The association will publish a monthly periodical, entitled "Japan," which will be distributed free to all important ticket agencies in the United States. The officers of the association are: President, George H. Corse, Jr., foreign passenger agent of the Union Pacific System, Chicago; vice-president, L. H. Nutting, general eastern agent, Southern Pacific, New York; treasurer, L. E. Bemiss, agent, Toyo Kisen Kaisha, San Francisco, Cal.; and secretary, James K. Steele, editor of "Japan," San Francisco, Cal.

The oppressively hot weather of late July incited travel to mountain, lake and ocean resorts. Hotels and transportation companies have made up in part in August for slender earnings in the early summer, but the short summer resort season comes to an abrupt close at Labor Day. There seems to be no good reason for the tradition that Labor Day must mark the close of vacation activities. September and October furnish the most equable and agreeable weather in our latitude. A well organized effort to establish a new tradition by exploiting the advantages of early fall travel and resort enjoyments, would doubtless bring good returns. The National parks and other Western resorts seem to have fared better than the Eastern. Estes park has had capacity business, and while Yosemite and Yellowstone have had smaller patronage than last season, Glacier National park has had a substantial increase. Commercial travel continues very heavy.—*American Express Bulletin*.

Every hog that is killed in transit, due to overcrowding or mishandling, means a loss now of about \$30, and the Department of Agriculture advises the following simple precautions: 1. When hogs are very hot, during or after a drive, never pour cold water over their backs. 2. Before loading, clean the car and bed it with sand, which during dry, hot weather should be wetted down thoroughly in the daytime. In hot weather it is advisable to suspend burlap sacks of ice from the ceiling of the car to reduce the temperature, and, incidentally, to sprinkle the animals with cool water. Ice placed in sacks on the floor is not accessible to all the hogs. 3. Crowding hogs in a car during warm weather is a prolific source of mortality. 4. The feeding of corn before and during shipment in hot weather should be reduced to a minimum. Oats are preferable. The maximum

maintenance requirement of hogs in transit for 24 hours is one pound of grain a hundredweight or approximately three bushels of corn to a car. Thousands of bushels of corn have been wasted in live-stock cars.

The Reconsignment Waste

The Bureau of Markets of the United States Department of Agriculture, reporting on an inspection of the Potomac Yards (Alexandria), Virginia, for 30 days last summer, reports that 236 cars of perishable commodities were held on the average of 44 hours each by shippers or consignees, before issuing orders to move the cars. No car held for less than 24 hours was counted. A car of cabbage was held 78 hours; a car of watermelons, 84 hours; a car of cucumbers, 104 hours; a car of potatoes, 128 hours; and a car of tomatoes, 213 hours.

Shippers to Give Active Assistance to Chicago Committee

At the meeting of the executive committee of the Chicago committee of the Chicago Commission on Car Service on September 10, the names of those who have been selected to represent the National Industrial Traffic League and the Chicago Association of Commerce on various sub-committees were announced. F. T. Bentley, traffic manager of the Illinois Steel Company, will represent the National Industrial Traffic League, and H. C. Barlow, traffic director of the Chicago Association of Commerce, will represent his organization on a committee on accumulation and embargoes. This body will have power to place embargoes when necessary to prevent the loading and delivery of cars to industries or individuals failing to unload cars within a reasonable time. This committee will be assisted by a committee on the delays in loading and unloading cars of which W. J. Womer, traffic manager of the Consumers' Company, Chicago, is a member representing the National Industrial Traffic League. In addition, R. C. Ross, traffic manager of J. T. Ryerson & Son, Chicago, will represent the league, and George W. Dixon, president of the Arthur Dixon Transfer Company, the Chicago Association of Commerce, on a committee on handling l. c. l. matters and trap cars. F. L. Bateman, secretary of the Chicago Furniture Manufacturers' Association, will represent the league on a committee on intensive loading.

The executive committee also discussed the question of the grain movement this year as compared with last, and in this connection it was stated that shipments of wheat and oats were exceedingly light, and it was thought that possibly a large part of the wheat crop would be milled and shipped out as flour. It was also the consensus of opinion that the greater part of the wheat that is exported this year will be shipped from the gulf ports, thus relieving to a large extent the congestion at the terminals on the Atlantic seaboard. A letter was read from J. S. Brown, manager of the transportation department of the Chicago Board of Trade, who advised that the only Chicago roads apparently in need of cars for the grain movement were the Chicago & Alton, the Chicago & Eastern Illinois, the Illinois Central and the Wabash. J. F. Porterfield, general superintendent of transportation of the Illinois Central, stated on September 10 his road was short 665 cars for grain loading at Indiana and Illinois points. He also stated that the I. C. received an average of 130 cars for grain loading per day last year, whereas they were getting only about 30 per day from eastern roads this year, and that help would have to be given by the Commission on Car Service if the movement of grain was to be taken care of on his line. The matter was referred to the Commission on Car Service at Washington, with the request that it consider the advisability of ordering cars to Illinois and Indiana territory.

In response to an inquiry by the Commission on Car Service at Washington as to the attitude of the Chicago roads towards the acceptance or rejection of bad order cars on the commission's orders, it was the consensus of opinion that the following resolution passed by the General Superintendents' Association of Chicago was to the point: "Resolved, that all cars offered on equalization orders of the Commission on Car Service shall be cars which, when delivered, are at least suitable for rough freight of some character. The receiving line should accept and make repairs to all cars requiring running repairs."

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Interstate Commerce Commission has suspended from September 20 until January 18 the proposed increase in rates on petroleum and its products between points in Central Freight Association territory.

The Interstate Commerce Commission has approved for filing tariffs filed by the Toledo & Ohio Central and the New York Central increasing from 5 to 6 cents per net ton the charge for transferring lake cargo coal to vessel at lake ports.

The commission has suspended from September 20 until January 18 proposed increased commodity rates on cigars, cigarettes and tobacco from Durham, Raleigh and other points in North Carolina and certain Virginia points to points in Central Freight Association territory.

The commission has suspended from September 20 until January 18 tariffs providing for increased rates on wooden pails and tubs in straight or mixed carloads between points on the lines of the Great Northern, Minneapolis, St. Paul & Sault Ste. Marie and the Northern Pacific.

The Interstate Commerce Commission has suspended from September 20 until January 18 proposed increased carload commodity rates on cypress lumber from certain stations on the Chicago, Rock Island & Pacific in Arkansas to Kansas City, Omaha and other western destinations.

Briefs have been filed with the Interstate Commerce Commission in the case involving the tentative valuation of the Texas Midland, reported by the Division of Valuation, which was protested by the road. Briefs were filed in behalf of the railroad company, pointing out the objections to the tentative valuation; by P. J. Farrell, solicitor for the Division of Valuation, asking that the tentative report be made final; by the valuation committee of the National Association of Railway Commissioners, approving the tentative valuation with some modifications, but urging an estimate as to the original cost to date, and on behalf of the four brotherhoods of train service employees, contending that the tentative report should be referred back to the Division of Valuation for a finding as to the original cost to date, without which, it was argued, the report would be valueless. Solicitor Farrell in his brief contended that the commission is not required by the law to fix a definite value.

STATE COMMISSIONS

The Denver, Laramie & Northern

The Public Utilities Commission of Colorado, in a decision issued September 1, approves the action of the Denver, Laramie & Northern in abandoning a part of its road; but concerning the central portion, about 29 miles, the proposed abandonment and dismantling is disapproved. It is understood that this part is to be sold to the Great Western Railway, which operates a line from Longmont to Eaton.

The Denver, Laramie & Northern, formerly the Denver, Laramie & Northwestern, operates from Denver, northward, 56 miles, to Greeley, the stations referred to, in order, being: Utah Junction, 3 miles; Boulder Valley Junction, 19 miles; Milliken, 43 miles; Elm, 48 miles; Greeley, 56 miles. From Denver to Utah Junction, the trains are run over the line of the Denver & Salt Lake; and entrance into Greeley is over the tracks of the Greeley Terminal Railway. The commission holds that there is no demand for the service of this road, warranting maintenance of train service, between Elm and Greeley and between Utah Junction and Boulder Valley Junction. From Boulder Valley Junction to Elm the line is to be taken over by the Great Western.

The decision quotes at length the opinions of numerous courts and state railroad commissions concerning the powers of state commissions in cases of this kind, and also concerning the right of a railroad to give up or transfer its franchise authorizing it to

exist as a corporation. The whole of this line, both that part which is sold to the Great Western and the parts which are to be abandoned, is paralleled by the Denver-Cheyenne line of the Union Pacific, and parts of the line are also paralleled by other roads.

Colorado Car Repairers—Sheds Refused

The Public Utilities Commission of Colorado, George T. Bradley, M. H. Aylesworth and A. P. Anderson, reporting on a complaint of the Brotherhood of Railway Carmen against all of the railroads of Colorado, dismisses the request of the carmen that the commission order the railroads to erect sheds for the protection of car repairers from the weather. Quoting President Wilson (in his proclamation of April 16), and the circular of the Railroads' War Board, calling on railroad men and all other citizens to put forth their utmost efforts to win the war, and to avoid unnecessary work and expenditures, the commission holds that it would be unreasonable to issue the order for the erection of the sheds at the present time. It is recognized that there may be a few days in the winter when sheds would promote the convenience of the men, but the urgency is held to be not so great as claimed.

COURT NEWS

Stop, Look, Listen Rule—Idaho

The Idaho Supreme Court holds that it is the duty of one about to cross a railroad track at a crossing to look and listen, but that it is not negligence per se to fail to stop; and that where the facts are disputed, the question of contributory negligence is one of fact, to be determined by the jury, under proper instructions.—*Graves v. Northern Pacific (Idaho)*, 166 Pac. 571. Decided June 29, 1917.

Constant Operation of Crane at Terminal Not a Nuisance

A crane used by a railroad company for loading and unloading freight was situated in a district in Detroit, the character of which was not preponderantly residential. In a suit against the company the Michigan Supreme Court holds that the operation of the crane by day and night, where made necessary by the demands of the public, was not a "public nuisance." The locality was clearly a railroad terminal, and its character as such must have been known to the people now living there when they took up their abode there. It was held that the trial judge should have directed a verdict for the railroad company and judgment of conviction was reversed.—*People v. Wabash (Mich.)*, 163 N. W., 396. Decided July 26, 1917.

Termination of Initial Carriers' Liability—Custom

Bills of lading of a shipment of cattle provided for through transportation from points in Alabama to New Orleans, La. They contained no stipulations as to point or mode of delivery after arrival at New Orleans. The initial carrier, the Atlantic Coast Line, delivered the cattle to the L. & N. at Montgomery, Ala., by which road they were carried to the terminus at New Orleans. The consignee received two cars of cattle at the L. & N. pens, while all the others were delivered over the Louisiana Southern to an adjacent parish, where the consignee had its yards and place of business. By custom or course of dealings between the consignee and the L. & N., the consignee had the option of receiving shipments at the L. & N. stockyards or through an intermediate carrier. In an action for damages by the shipper against the A. C. L., the Alabama Supreme Court holds that the defendant's liability ended when the shipment arrived at the terminal of the L. & N. for delivery, and as the shipper failed to prove that the condition of the cattle was produced by the defendant or the L. & N., the trial court properly directed a verdict for the defendant. The liability of the defendant could not be extended to cover any loss or damage to the cattle while being transported over the line of the Louisiana Southern by any custom or course of dealings between the consignee and the L. & N., especially where the defendant, when he accepted the shipment, knew nothing of such custom or course of dealing.—*Henderson v. A. C. L. (Ala.)*, 76 So., 309. Decided July 2, 1917.

Foreign Shipments—Limitation of Liability

The New York Appellate Division holds that a shipment from Yokohama to New York, in respect to its transportation by rail from San Francisco, the shipper having given no notice that he elected to ship subject to the common law rules of liability, must be deemed to have been made under the filed classifications and rates, and under the terms of the uniform bill of lading, though no such bill was in fact issued or signed. Under the third section of the uniform bill of lading on file with the Interstate Commerce Commission, where a lower than invoice value of the goods was agreed upon by the bill of lading issued by a steamship company covering a shipment from Yokohama to New York, a carrier by rail, for loss of the goods, was liable only for the agreed value, the agreement having been made for the benefit of each successive carrier.—*Burke v. Union Pac.*, 166 N. Y. Supp., 100. Decided July 13, 1917.

Relief Department Contract—Release in Full

A South Carolina statute provides that the acceptance of benefits under a relief department contract shall not bar an action for negligent injury, notwithstanding a subsequent release given on payment of such sum only as may be due the employee under contract. An employee was injured while employed by the Atlantic Coast Line and while he was a member of its relief department. A dispute existed as to the amount due him on the relief contract, and he refused to accept an amount tendered, and brought suit for damages for his injury. A compromise was effected whereby he was paid \$3,500, which he accepted, executing a release, "in full payment by way of settlement and compromise of all claims and damages growing out of or incident to the injury received by me." He subsequently sued on the relief department contract and the railroad pleaded the release as a bar. The South Carolina Supreme Court holds that the release was a bar to a suit on the relief contract and affirmed judgment for the defendant.—*Starr v. A. C. L.* (S. Car.), 93 S. E., 176. Decided July 25, 1917.

Signal Structure Not an "Attractive Nuisance"

A railroad had recently set up a metal signal structure, including a railed platform at the height of 20 feet, reached by a permanent ladder with rungs that began one foot from the ground and were one foot apart. Near the structure was a wooden pole that for some time had been used by another railroad. Cross-arms on that pole supported dangerous high voltage electric wires. The wires were 3 feet or more above the rail of the platform. A boy between 11 and 12 years old climbed up the ladder to the platform, and while waving his arms in gesticulation came in contact with one of the wires and was severely injured. He sued the railroad. There was proof that sometimes children had played near the structure, which was on the defendant's right of way in Connecticut, and that they had on occasions climbed the structure. There was no proof that the defendant affirmatively had countenanced or permitted, or knowingly had suffered such play or such ascents. The plaintiff claimed that by the law of Connecticut the railroad was liable for negligence. The New York Court of Appeals held that the proof did not justify a verdict for the plaintiff. The plaintiff assumed all risk of danger incident to the then condition of the premises. The so-called "attractive nuisance" doctrine has never been sanctioned by the Connecticut Supreme Court, and the leading New York case on the subject, *Walsh v. Fitchburg*, 145 N. Y. 301, is to the same effect. In both Connecticut and New York the rule is that the duty of a railroad company toward a boy who has become a licensee is not greater than its duty would be to him as a trespasser. No distinction is made between mere trespassers and bare licensees. The railroad was entitled to an instruction that the jury could not predicate a verdict on the proposition that the signal structure was an attractive nuisance; and it was error to qualify such instruction with the statement that the jury might "consider the way this was built in deciding whether the defendant should reasonably have anticipated the boy's climbing the pole." The burden was on the plaintiff to establish active negligence by the defendant. Judgment for the plaintiff was reversed and a new trial granted.—*St. Cartier v. New York, N. H. & H.*, 165 N. Y. Supp., 852.

Equipment and Supplies

FREIGHT CARS

THE WESTERN MARYLAND is asking prices on 1,000 freight cars.

THE GREAT LAKES TRAINING STATION, Great Lakes, Ill., is inquiring for 8 gondola cars.

THE MICHIGAN ALKALI COMPANY, Detroit, Mich., is inquiring for 50 50-ton to 70-ton hopper cars.

THE CUBA NORTHERN has ordered 25 30-ton steel underframe flat cars from the American Car & Foundry Company.

THE OHIO CITIES GAS COMPANY, Columbus, Ohio, is inquiring for 50 to 100 8,000-gal. tank cars.

THE UNITED STATES NAVY has ordered 3 flat cars from the Central Locomotive & Car Works for the Portsmouth, N. H., navy yard.

PASSENGER CARS

THE GUANTANAMO & WESTERN (Cuba) is inquiring through Carr Brothers, of New York, for 3 first-class coaches, 6 third-class coaches, and 3 combination baggage and mail cars.

THE CUBA NORTHERN has ordered 6 first class coaches, 10 second class coaches and 4 combination baggage mail and express car from the American Car & Foundry Company.

IRON AND STEEL

THE RAY & GILA VALLEY has ordered 156 tons of steel from the American Bridge Company for a bridge near Ray, Ariz.

THE VALUE OF MECHANICAL ENGINEERING.—Nowadays most of the civil engineer's work is done by machinery, and even the architect is rapidly becoming only an adjunct to the constructional engineer. The mechanical engineer is called in at the inception of every big undertaking, whether civil or military; and those not thoroughly grounded in mechanics have to take a back seat.—*Railway Gazette, London.*

THE UGANDA RAILWAY, AFRICA.—The railway and lake steamer facilities in the Protectorates of British East Africa and Uganda are owned and operated by the government through the management of the Uganda Railway. The lines operated are all of meter gage. The Uganda Railway proper from Mombasa to Kisumu, on Lake Victoria Nyanza, has a total mileage of 618. The rolling stock consists of 97 locomotives, 234 passenger cars, and 1,292 small freight cars, mostly steel. In Uganda the Busoga Railway has 61 miles of track, and the Port Bell-Kampala Railway operates 6 miles.

LINKING RAILWAYS IN SOUTH AMERICA.—An interesting development in the scheme for linking up the South American railways has just been completed. For some years past the Antofagasta (Chile) & Bolivia Railway and the Bolivia Railway have been constructing new railway lines in Bolivia under a concession given by the Bolivian government in 1906 to certain American bankers. More than \$30,000,000 have already been expended on this scheme, \$12,500,000 of which has been provided by Bolivia. Lines have been constructed linking up the Antofagasta system with the Bolivian capital, La Paz, with Potosi, a mining center, and Cochobambo, an important agricultural district. In addition, a line has been built to tap extensive mines in the south of Bolivia, and this line, it is intended, will eventually connect Bolivia with Argentina. The railway program was initiated by General Montes, the ex-president of Bolivia, who opened the Cochobambo line last month. Percival Farquhar, who conceived the Brazil Railway scheme, was interested in this project, and acquired a large holding in the Antofagasta Company, a substantial portion of which, however, had to be sold subsequently, owing to the Brazil company's difficulties.

Supply Trade News

Russell Dale, general sales manager of the Rich Tool Company and manager of the Tungsten Valve Company, Chicago, died in that city on September 22.

J. M. Fitzgerald and Otto S. Flath, of the Alger Supply Company, Peoples Gas building, Chicago, have been appointed general sales agents of the National Electric Specialty Company, Toledo, Ohio.

Harry L. Allen, assistant fourth vice-president of the American Steel Foundries, died at Cleveland, August 31, at the age of 35 years. Mr. Allen had been with the company 15 years, coming to it at the time of its organization from the American Steel Castings Company.

The recent contracts placed with F. H. Lovell & Co. by the Navy Department, amounting to approximately \$1,500,000, have necessitated further additions to the company's plant at Arlington, including another two-story, 90 ft. by 100 ft. machine shop, in addition to the original machine shops, and an addition to the brass foundry.

E. N. Sanctuary, president of the Oxy-Acetylene Appliance Company, of New York, formerly engineer and secretary of the Bowers Southern Dredging Company, of Galveston, Tex., and an experienced construction engineer, has been commissioned a captain in the Engineer Officers' Reserve Corps, and has been assigned to the Washington office of S. M. Felton, director general of railways, in charge of the personnel for new railway troops being organized for service abroad.

H. McB. Parker, sales representative of the Hunt-Spiller Manufacturing Corporation, Boston, Mass., who entered the Officers' Training Camp at Plattsburg in May, and was thereafter detailed to special duty in the Submarine Signal Company, has enlisted in the United States Navy, and has been assigned to one of the United States destroyers, which has sailed for France. C. L. Galloway has been appointed sales representative of the Hunt-Spiller Manufacturing Corporation for the Northeastern district. Mr. Galloway for the last 18 years has been in the employ of the New York, New Haven & Hartford, in and about Boston, and serving in various capacities in the mechanical department.

TRADE PUBLICATIONS

THE BENJAMIN ELECTRIC MANUFACTURING COMPANY, Chicago, Ill., has issued a new Benjamin catalogue, No. S-2, which shows much that is new in the way of panel board construction, including an entirely new line of resident and dead front panel boards, which represent a great advance in construction and design. Particular attention has been made to arrange the pages so as to make the specifications and listing perfectly clear.

STORAGE BATTERIES FOR INDUSTRIAL LOCOMOTIVES.—The Edison Storage Battery Company, Orange, N. J., has recently issued bulletin 610 on the use of Edison storage batteries in lumber tractors, industrial locomotives and surface carriers. The first part of this bulletin is devoted to the improvement and economy in the operation of lumber mills and yards that may be obtained by the use of electric tractors, industrial locomotives and surface carriers, equipped with storage batteries, and to illustrations with descriptive captions of existing installations where such labor, power and time saving devices are in use in the lumber industry. The last few pages of the bulletin describe the construction and manufacture of the Edison storage battery. The Edison electric portable lighting outfit is described in another bulletin, No. 819. This consists of five cells, type B 2, completely assembled, fully charged and ready for service together with two properly guarded 12 candle power lamps with reflectors and with 11-ft. extension cords. One of these lamps can be used for 20 hours on one complete charge of the battery. Both of them will work for ten hours. This outfit is handy for lighting man-holes and other dark places where electric lights are not usually available. The complete weight of the outfit is 40 lb.

Railway Construction

CHESAPEAKE & OHIO.—This company proposes to build an enginehouse and shop building at Raleigh, W. Va., but the work has not yet been authorized.

CHICAGO & NORTH WESTERN.—This road is adding about 6,000 ft. of track to its switching yards at Antigo, Wis. Company forces are doing the work.

CHICAGO, BURLINGTON & QUINCY.—This company is asking for bids for the construction of a one-story, brick passenger station, 34 ft. by 132 ft., with concrete foundation, at Scottsbluff, Neb. The old passenger station at this point will be moved to a new site and remodeled to serve as a freighthouse.

DALLAS SOUTHWESTERN TRACTION.—E. D. Turner, president of this company and the Dallas Northwestern, is quoted as saying that construction work will be started at once on the electric line, between Dallas, Tex., and Irving. A contract for the construction work has been let to the Creek Construction Company, Supulpa, Okla. The line is eventually to be extended to Cleburne, a distance of about 60 miles. J. T. Witt, chief engineer, Dallas.

GRAND TRUNK.—A new station is to be built by this company at Orillia, Ont., 34 ft. by 142 ft., with umbrella sheds at each end, 22 ft. by 34 ft. The station will have concrete foundations to the grade line, with stone base to height of sills, 3 ft. 8½ in., and the super-structure above the base will be of brick.

GREEN BAY & EASTERN.—This road will be built from Green Bay, Wis., through Manitowoc to Sheboygan, 80 miles. The work will involve the handling of about 9,000 cu. yd. of material per mile, the construction of four 65-ft. bridges, two 50-ft. spans, two 30-ft. spans, and a number of small pile trestles. The bridge work will involve the use of 1,500,000 ft. b.m. of fir timber, 500,000 lineal ft. of piling, 300 tons of steel and 2,000 cu. yd. of concrete. The maximum grade will be 1.5 per cent, and the maximum curvature 6 deg. Steam motive power will be used for handling freight and gasoline electric cars for passenger and express service. The principal commodities the road will carry are cheese, milk, stock feed, live stock, building materials, implements, grain, farm produce and general merchandise. W. M. Willinger, president, Manitowoc, Wis.; Joseph A. Mesiroff, chief engineer, 407 Merrill building, Milwaukee, Wis. (April 13, page 808).

PHILADELPHIA & READING.—This company is building a 15-stall, one-story engine house at Reading, Pa., on a site located north of the shops on Sixth street. It will be 110 ft. wide and 418 ft. long. The entire structure is to be of reinforced concrete and brick; Henry E. Baton, Philadelphia, Pa., is the contractor.

SOUTHERN PACIFIC.—This road will double-track its line between Stockham, Ariz., and Polvo, six miles, the section being approximately three miles each way from the division terminal at Tucson. The work will be very light outside of track laying and ballasting.

CENTRAL TRAFFIC COMPTROLLER IN INDIA.—The Indian Railway Board has appointed a central traffic comptroller to deal with the question of the relative importance of different classes of traffic, and to control the distribution of rolling stock between the various systems. The officer appointed is Lieut.-Colonel H. A. Camcron, the traffic manager of the North Western Railway of India.

INCREASED RATES IN FAR EAST.—Increases of both through and local tariffs on the Chinese Eastern was given effect on July 28, according to an announcement in the Manchuria Daily News. With the local tariffs a 50 per cent increase was introduced in the passenger rates and a 100 per cent advance in the freight rates, except for cereals. The increase for the through freight for transportation over the Chinese Eastern, the Amur, and the Ussuri Railways is 200 per cent; that for the eastern (Harbin-Pogranichnaya) section 40 per cent; and that for the eastern (Harbin-Manchouli) section 100 per cent.

Railway Financial News

CHICAGO, ROCK ISLAND & PACIFIC.—James A. Patten, a director of the Rock Island company, has issued the following statement: "I have seen Mr. Amster's remarkable circular letter to the stockholders, in which he shows a positive genius for inaccuracy of statement. The attack upon J. N. Wallace is without any just foundation. Mr. Amster did not save the stockholders. He was only one of many who did this work. He did not reorganize the company, but the work was done by a committee of six, of which Mr. Amster was only one. Mr. Amster did offer to the stockholders a plan of reorganization, and in order to carry it out asked the stockholders to take \$25,000,000 of 8 per cent preferred rights or income bonds. His plan failed. Mr. Amster made a handsome profit out of the underwriting of the new preferred stock, and received \$25,000 for his services as a member of the reorganization. But this amount did not satisfy him, and when, in the interests of economy, it was thought best by the executive committee to pay no unnecessary salaries, and that no salary should be paid to the members and chairman of the executive committee or the chairman of the full board, he was the only person voting against this resolution. This whole matter could be adjusted to the satisfaction of Mr. Amster if they would continue him as chairman of the executive committee on a salary, and have him sit in the Chicago office, and dictate to Mr. Gorman how he should run the road, for which Mr. Amster has not had the necessary training and has not the native ability to fill, and I object seriously, as a stockholder of the Rock Island road, to having Mr. Amster manage its affairs. I just wish to ask Mr. Amster one general question: How much money did he make out of the reorganization of the Rock Island road? Lastly, the charge made by Mr. Amster that the old crowd is still in control is so untrue it is hardly worth replying to. It is evidently put out with a purpose of appealing to prejudice in order to obtain proxies so that he can obtain control of the road and manage it to suit himself. I sincerely trust that such a contingency is not possible, and that the stockholders of the road will prevent it."

Mr. Amster, in reply to the charges made against him by Mr. Patten, admits that he received \$25,000 as a member of the Rock Island reorganization committee, but contends that the minority stockholders secured a standing in the reorganization as the result of the work he did. "Of course I received \$25,000 as a member of the reorganization committee, as did the other members of that committee," his statement read. "Mr. Prosser, the chairman, received \$50,000. But for the three years' constant work that I did as chairman of the stockholders' protective committee I did not receive a penny. I have just mailed 1,400 checks, aggregating over \$32,000, returning in full the contributions of 1,400 stockholders, although in doing this I personally am out \$10,000 plus the expenses which I am now incurring in the effort to elect directors representative of the stockholders. The real reason for taking away my salary as chairman of the executive committee was probably because I opposed loading up the company with another coal company, which a brother-in-law of one of the leading Chicago directors and a friend of Mr. Patten wanted the company to buy about a year ago at \$200 an acre. The company could buy equally good coal land for under \$40 an acre."

DENVER & RIO GRANDE.—United States Marshal Thomas F. McCarty has levied on \$3,000,000 Liberty Loan bonds, the property of this company in possession of the Hanover National bank and the American Exchange bank, New York City. The seizure of these bonds was by order of Judge Learned Hand in a suit brought by Murray, Prentiss & Howland, attorneys for the Equitable Trust Company, trustees, judgment creditors against the Denver & Rio Grande. This action grows out of the suit of the Western Pacific against the Denver & Rio Grande to enforce payment of interest on bonds guaranteed by the latter, which was decided in favor of the Western Pacific by Judge Hand, who fixed damages at \$38,270,343. The bonds will be sold at public auction.

Railway Officers

Executive, Financial, Legal and Accounting

C. Manning has been appointed assistant to vice-president of the Grand Trunk, with office at Montreal, Que.

T. S. Ford, auditor of the Pittsburgh, Lisbon & Western, has been appointed also treasurer, with office at Lisbon, Ohio, vice C. P. Smith, resigned.

John G. Rodgers, whose appointment as assistant to president of the Pennsylvania Railroad has already been announced in these columns, was born on November 14, 1862. He was

J. G. Rodgers

educated at Lehigh University, and entered the service of the Pennsylvania Railroad on July 20, 1882. Mr. Rodgers served through the various grades in the engineering department until he reached the position of assistant engineer of construction, from which he was transferred in January, 1888, to the maintenance of way office at Altoona. He held various positions in that department until January, 1900, when he resigned as supervisor of the Philadelphia division to become superintendent of the New York, Philadelphia & Norfolk. In March, 1909, Mr. Rodgers was appointed assistant to the general manager of the Pennsylvania Railroad. On March 3, 1911, he was appointed general superintendent of the Northern division at Buffalo, N. Y., and now becomes assistant to president, as above noted.

George C. Jones, whose appointment as assistant to president of the Grand Trunk, with headquarters at Toronto, Ont., has already been announced in these columns, was born on September 24, 1860, at

G. C. Jones

Clyde, N. Y. He began railway work in 1874, and served until 1880, on roads now forming part of the Erie consecutively as messenger and yard clerk on the Atlantic & Great Western at Kent, Ohio, and as yard clerk and operator at various points on the New York, Pennsylvania & Ohio. In January, 1880, he was appointed operator and despatcher on the Cleveland, Columbus, Cincinnati & Indianapolis, now a part of the Cleveland, Cincinnati, Chicago & St. Louis, and from March, 1882, to August, 1883, was operator of the Western Union Telegraph Company. From August, 1883, to February, 1885, he was despatcher on the New York, Pennsylvania & Ohio, now a part of the Erie, and later served as despatcher on the Burlington, Cedar Rapids & Northern, now a part of the Chicago, Rock Island & Pacific. He was then despatcher and chief despatcher on the Wabash, and from January, 1896, to January, 1905, served first as assistant superin-

tendent and then as superintendent of the Grand Trunk. From January, 1905, to February, 1913, he was general manager of the Central Vermont; he then became vice-president of the same road, and since May, 1912, served also as vice-president of the Southern New England, until his recent appointment as assistant to president of the Grand Trunk, as above noted.

E. Marvin Underwood, whose appointment as general counsel of the Seaboard Air Line, with office at Norfolk, Va., has already been announced in these columns, was born on December 11, 1877, in Douglas county, Ga. After graduating from Vanderbilt University in 1900, he attended law school, receiving his degree of bachelor of laws in 1902. He then spent the following year in studies at the Faculté de Droit of the University of Paris, and upon his return to this country began the practice of law at Atlanta, Ga. He later became a member of the firm of King, Spalding & Underwood, of that city, and as such engaged in railroad practice, representing, among other companies, the Seaboard Air Line Railway. On February 24, 1914, he was appointed assistant attorney-general of the United States and as such represented the government in a number of important litigations before the Supreme Court of the United States, notably the case in which the constitutionality of the Adamson Law was upheld and the Pacific Terminal Case.

George Reeder has been appointed auditor of the Gulf, Florida & Alabama, with office at Pensacola, Fla., vice J. P. Smith.

E. F. Blomeyer, general manager of the Ann Arbor, with headquarters at Toledo, Ohio, has also been appointed vice-president, effective September 1.

Operating

Alexander M. Parker, who has been appointed superintendent of the Camden Terminal division of the Pennsylvania Railroad, and the West Jersey & Seashore Railroad, with headquarters at Camden, N. J., as has already been announced in these columns, was born on June 25, 1870, at Carlisle, Cumberland county, Pa., and was educated at Dickinson College. He entered the service of the Pennsylvania Railroad in 1888 as rodman, in which capacity and subsequent higher ones he was engaged for several years on survey work. In 1891 he was transferred to the assistant engineer's office on the Philadelphia division, and was later transferred to the office of the principal assistant engineer at Altoona. In 1892 he was appointed assistant supervisor of the Philadelphia division at Lancaster, and four years later was transferred as assistant supervisor to the Philadelphia yards. He was appointed supervisor at Tyrone in 1897, and subsequently served in the same capacity on the Frederick, the Schuylkill and the New York divisions, becoming assistant to the principal assistant engineer at Jersey City, N. J., in 1903. He was appointed principal as-

sistant engineer in 1905, and upon the organization of the Hudson division at New York in 1909, Mr. Parker was appointed superintendent. On January 1, 1912, he was transferred as superintendent to the Allegheny division, with headquarters at Oil City, Pa., which position he held until his recent appointment as superintendent of the Camden Terminal division and the West Jersey & Seashore, as above noted.

Paul L. Grove, who has been appointed superintendent of the Delaware division of the Philadelphia, Baltimore & Washington, with office at Wilmington, Del., was born on October 3, 1878, at Altoona, Pa., and was educated in the public schools of that city. From May 1, 1894, to December 1, 1899, he was employed by the Pennsylvania Railroad as messenger and machinist apprentice in the Altoona shops. On February 1, 1902, he was transferred to the shops at Columbia, Pa., as inspector, and in October, 1904, became shop foreman on the Bedford division. He was promoted to assistant master mechanic of the Altoona machine shops on July 1, 1905, and was made assistant engineer of motive power on the Buffalo division in September, 1910. He was promoted on December 1, 1913, to master mechanic on the Williamsport division; in October, 1914, he was transferred to the Renovo division, and on July 1, 1916, he was again transferred to the Philadelphia Terminal division, in charge of the West Philadelphia shops, and now becomes superintendent of the Delaware division of the Philadelphia, Baltimore & Washington, with headquarters at Wilmington, Del.

Andrew J. Whitney, who has been appointed general superintendent of the Northern division of the Pennsylvania Railroad, with headquarters at Buffalo, N. Y., as has already been announced in these columns, was born on October 11, 1862, at Harrisburg, Pa., and was educated in the public schools and the Harrisburg Academy. He entered the service of the Pennsylvania Railroad in June, 1881, as a rodman, and was engaged on the construction of the Lewisburg & Tyrone Railroad and the Schuylkill Valley Railroad. In May, 1886, he was transferred to the maintenance of way department, at York, Pa., on the Frederick division, as engineer right of way; he subsequently was assigned to the Altoona office, and on February 1, 1889, was appointed assistant supervisor at Washington, D. C. Mr. Whitney was promoted to supervisor on the Tyrone division at Tyrone, Pa., in May, 1893, following which he served consecutively as supervisor at Pittsburgh yard, assistant engineer of the West Penn division, and acting superintendent of the same division. On June 1, 1903, he was appointed assistant engineer of the West Jersey & Seashore; and in May, 1905, was made principal assistant engineer of the Pennsylvania Railroad division. He was appointed superintendent of the Delaware division of the Philadelphia, Baltimore & Washington at Wilmington, Del., in April, 1907, and

E. M. Underwood

P. L. Grove

A. M. Parker

A. J. Whitney

was made superintendent of the Maryland division in January, 1910, which position he held until his recent appointment as general superintendent of the Northern division of the Pennsylvania Railroad, as above noted.

O. R. Belcher has been appointed superintendent of the Nevada-California-Oregon, with headquarters at Alturas, Cal., vice J. W. Ward, resigned.

E. T. Mulquin has been appointed chief dispatcher of the Second district of the St. Louis Southwestern, with office at Pine Bluff, Ark., vice C. Dancy, resigned.

John L. Wilkes, formerly chief dispatcher of the Illinois Central, at Princeton, Ky., and more recently out of railway service, has been appointed assistant superintendent of the Nashville, Chattanooga & St. Louis, at Atlanta, Ga.

P. C. Byrne, superintendent of the Alabama & North Western, has been appointed general superintendent in full charge of operation and maintenance, with headquarters at Mobile, Ala. The office of superintendent has been abolished.

O. W. Campbell has been appointed assistant to chief operating officer of the Missouri, Kansas & Texas, and the Missouri, Kansas & Texas Railway of Texas, with headquarters at Dallas, Tex., vice C. G. Elliott, resigned to engage in other business. Effective October 1.

R. E. Laidlow has been appointed superintendent of terminals of the Michigan Central at Detroit, Mich., succeeding J. L. McKee, resigned to accept service with another company; and W. A. Keavy has been appointed assistant superintendent of terminals at Detroit, succeeding Mr. Laidlow, effective September 15.

Traffic

S. J. Witt has been appointed general agent of the Akron, Canton & Youngstown, with offices at Akron, Ohio.

George S. Harlan has been appointed division freight agent of the Baltimore & Ohio, with headquarters at Baltimore, Md.

L. F. Root has been appointed commercial agent of the Cincinnati, Indianapolis & Western at Indianapolis, Ind., succeeding P. M. Havens, promoted, effective September 8.

J. A. Cox has been appointed commercial agent of the Galveston, Houston & Henderson, with headquarters at Houston, Tex., succeeding J. M. Lamb, resigned to enter military service.

J. S. Taber, freight agent of the Texas & Pacific, with headquarters at Abilene, Tex., has been appointed commercial agent, with the same headquarters. He will also continue his duties as freight agent.

M. A. Patterson, assistant general freight agent of the Chicago, Rock Island & Pacific at Chicago, has been promoted to general freight agent, with office at Chicago, succeeding H. A. Snyder, resigned, and Carl R. Maier has been appointed assistant general freight agent, with office at Chicago.

James P. Anderson, general agent of the Pennsylvania Railroad at Philadelphia, Pa., has been promoted to passenger traffic manager of the Pennsylvania Lines East of Pittsburgh and Erie, succeeding George W. Boyd, deceased; Oliver T. Boyd, division passenger agent at New York, has been promoted to general passenger agent of the Pennsylvania Railroad Lines East of Pittsburgh, with headquarters at Philadelphia; William Pedrick, Jr., division passenger agent at Baltimore, Md., succeeds Mr. Boyd as division passenger agent at New York; A. E. Buchanan, division passenger agent at Harrisburg, Pa., has been promoted division passenger agent at Baltimore, and N. S. Longaker, district passenger solicitor at Philadelphia, has been promoted to division passenger agent at Harrisburg. Effective October 1.

H. A. Snyder, general freight agent of the Chicago, Rock Island & Pacific, with headquarters at Chicago, has retired. Mr. Snyder was born at Pottsville, Pa., on June 23, 1857, and entered railroad service with the Philadelphia & Reading in 1876, as a clerk in the freight office in that city. He was later transferred to the general freight office at Philadelphia, and in 1888, when the Philadelphia & Reading opened an office at Chicago he was appointed general western agent, with headquarters there. He was appointed general agent of the Chicago, Rock Island &

Pacific, at Omaha, Neb., in 1889, and on January 1, 1897, was promoted to assistant general freight agent, with headquarters at Chicago. He was appointed general freight agent on January 1, 1910. He was in railroad service for 41 years, 28 of which were with the Rock Island.

W. E. Duperow, whose appointment as general passenger agent of the Grand Trunk Pacific and the Canadian Government Railways, with headquarters at Winnipeg, Man., has already been announced in these columns, was born in 1872, at Stratford, Ont., and in 1893 entered the service of the Grand Trunk. He held various positions in the passenger traffic department until 1902, and then for five years was general manager of the Huntsville, Lake of Bays and Lake Simcoe Navigation Company, at Huntsville, Ont. He returned to the service of the Grand Trunk as traveling passenger agent at Toronto, and in 1910 was appointed city passenger and ticket agent at Victoria, B. C. Two years later he became general agent at Vancouver, and in 1914 was appointed assistant general passenger agent of the Grand Trunk Pacific. He subsequently was appointed assistant general passenger agent also of the Canadian Government Railways, and now becomes general passenger agent of both roads, as above noted.

W. E. Duperow

Engineering and Rolling Stock

R. J. Williams has been appointed superintendent of motive power of the Pere Marquette, with headquarters at Detroit, Mich., succeeding W. L. Kellogg, resigned; effective October 1.

The signal and telephone departments of the Western Maryland have been combined, and the title of E. E. Bradley, signal engineer at Baltimore, Md., has been changed to signal and telephone engineer.

H. C. Eich, master mechanic at the Burnside, Chicago, shops of the Illinois Central, has been appointed superintendent of motive power of the Chicago Great Western, with headquarters at Oelwein, Iowa, succeeding G. M. Crownover, resigned.

Herbert E. Morgan, pilot signal engineer in the valuation department of the Illinois Central, has been appointed signal engineer, succeeding W. M. Vandersluis, who is now a captain in the Engineering Corps, and is stationed at Ft. Leavenworth, Kan.

H. C. May, superintendent of motive power of the Lehigh Valley at South Bethlehem, Pa., has been appointed to the same position on the Chicago, Indianapolis & Louisville, with office at La Fayette, Ind., succeeding C. P. Burgman, assigned to other duties.

W. J. Bennett, assistant superintendent of motive power on the Denver & Rio Grande, at Denver, Colo., has been appointed superintendent of the motive power and car departments, with the same headquarters, effective September 20, succeeding J. F. Enright, deceased.

J. B. Diven, assistant engineer of motive power of the New Jersey division of the Pennsylvania Railroad at New York, has been appointed master mechanic of the Philadelphia terminal division, with office at West Philadelphia, Pa., succeeding P. L. Grove, promoted to superintendent of the Delaware division, with office at Wilmington, Del. James Young, Jr., assistant master mechanic of the Philadelphia, Baltimore & Washington, at Wilmington, Del., succeeds Mr. Diven; J. H. Fulmor, master mechanic of the Pennsylvania Railroad at Mount Carbon, Pa., has been appointed inspector in the office of the superintendent of motive power, Eastern Pennsylvania division, with headquar-

ters at Altoona; and C. J. Halliwell, inspector in the office of the general superintendent of motive power at Altoona, succeeds Mr. Fulmor. F. E. Marsh, assistant master mechanic at Altoona, has been appointed master mechanic of the New York, Philadelphia & Norfolk, with office at Cape Charles City, Va., succeeding A. W. Byron, granted leave of absence to enter military service at Camp Oglethorpe, Ga., and C. W. Burket has been appointed assistant master mechanic of the Monongahela division of the Pennsylvania, with office at South Pittsburgh, Pa., succeeding E. H. Newbury, transferred to shop inspector in the office of the superintendent of motive power at Pittsburgh.

W. H. Sample, whose appointment as superintendent of motive power of the Grand Trunk, with headquarters at Montreal, Quebec, has already been announced in these columns, was born in 1864, at Altona, N. Y., and was educated at the high school of his native town. He began railway work in 1882, as fireman on the Central Vermont, and in 1886 was promoted to engine-man. From 1887 to 1890, he served on the Santa Fe System as engine-man, and then returned to the Central Vermont. In 1901 he was appointed road foreman of engines, remaining in that position until 1906. He then entered the service of the United Fruit Company as superintendent of motive power and car departments, on the Northern Central Railway of Costa Rica, Central America, resigning from that position in 1911 to go to the Grand Trunk as master mechanic on the Ottawa division. He was transferred as master mechanic in 1914 to the western lines, and in 1916 was again transferred in the same capacity to the eastern lines.

W. H. Sample

Purchasing

G. H. Walters, engineer of tests in the stores department of the Chicago, Milwaukee & St. Paul, at Milwaukee, Wis., has been appointed assistant purchasing agent, with office at Chicago, succeeding A. J. Jennings, resigned.

F. B. MacSwain, storeman on the Canadian Pacific at Ogden, Alta., has been appointed storekeeper, with headquarters at Calgary, succeeding G. F. Rosengren, transferred to Lethbridge. N. C. Stibbs, storekeeper at Lethbridge, has been transferred to Nelson, B. C., succeeding D. S. Schofield, transferred to Revelstoke. T. W. Madden, storekeeper at Revelstoke, has been transferred to Coquitlam.

Special

W. H. Howard, secretary of the Southeastern Passenger Association for several years, with office at Atlanta, Ga., has been elected chairman of the association, succeeding the late Joseph Richardson.

Railway Officers in Military Service

H. W. Young, assistant engineer on the Union Pacific, has been appointed captain in the Eighth Regiment, Engineering Corps, United States Army.

E. R. Reynolds, until recently general baggage agent of the Chicago Great Western at Chicago, is now a captain in the National Army at Camp Grant, Ill.

Byron L. Kelso, until recently assistant engineer in the valuation department of the Chicago, Burlington & Quincy, at Chicago, has received a commission as captain in the Engineer Officers' Reserve Corps.

W. A. Hill, assistant engineer in the valuation department of the Chicago, Burlington & Quincy, at Chicago, has been commissioned major in the Engineer Officers' Reserve Corps, but

has not yet been called to service. T. R. Brunson, also an assistant engineer in the valuation department of the Burlington at Chicago, is now at Fort Sheridan, Ill., in the second officers' training camp.

Paul T. Marwick, secretary to President S. M. Felton, of the Chicago Great Western, has been transferred from Chicago to Washington as secretary to Mr. Felton as director general of railways, Corps of Engineers, War Department.

OBITUARY

George W. Boyd, passenger traffic manager of the Pennsylvania Railroad, Lines East of Pittsburgh, with office at Philadelphia, Pa., died on September 22 at his summer home at Cape May, N. J. He was born on August 1, 1848, at Indianapolis, Ind., and began railway work in 1863, in the freight department at Indianapolis of the Cleveland, Columbus, Cincinnati & Indianapolis, now the Cleveland, Cincinnati, Chicago & St. Louis, and for several years he served as clerk of the freight department. In June, 1872, he was appointed cashier of the passenger department of the Pennsylvania Railroad, remaining in that position until January, 1874, when he was promoted to chief clerk. From January, 1882, to June, 1903, he was assistant general passenger agent of the same road, and then was promoted to general passenger agent, which position he held until March 1, 1913, when he was appointed passenger traffic manager.

G. W. Boyd

Edward Stanton Koller, vice-president and general manager of the Colorado & Southern, whose death was announced in the *Railway Age Gazette* of September 7, was born at New Freedom, Pa., on October 18, 1864. He entered railway service with the Pennsylvania in 1882 as a telegraph operator, and clerk in the office of the division superintendent at Harrisburg, and four years later entered the employ of the Chicago, Burlington & Quincy in a similar capacity. In March, 1892, he was promoted to traveling auditor, and in March, 1903, he became chief clerk in the division superintendent's office at Lincoln, Neb.

On April 1, 1905, he was appointed trainmaster of the Lincoln division, and later served successively until September 1, 1912, as assistant superintendent of the same division, superintendent of the McCook division, and general superintendent of the Illinois district, with headquarters at Galesburg, Ill. On the latter date he was promoted to assistant general manager of the lines east of the Missouri river, and on August 1, 1913, was transferred to the lines west of the Missouri river, with headquarters at Omaha, Neb. On March 1, 1915, he was appointed general manager of the Colorado & Southern at Denver, Colo., and on March 1, 1916, was elected vice-president in addition, in which capacity he served until his death.

GENERAL NEWS SECTION.....

The importance of the work of the railway development departments has been increased greatly in the short time

Commercial Possibilities of the South

that has elapsed since the United States entered the war last April. Most people are aware of the prominence taken by this department in the movement to increase the supply of foodstuffs by arranging for leases of company land for employees' war gardens, the assistance given in various ways to farmers, the material published on the proper culture, harvesting, and storing or preserving of vegetables, etc. We have not heard so much, however, about the search that the railways have been making for new minerals and substitutes for materials that were formerly imported into this country, or of the assistance that has been given to industries working with such materials. The work that has been done along this line was very forcefully brought out at the Third National Exposition of Chemical Industries held in New York last week. Five railways, the Southern, the Norfolk & Western, the Nashville, Chattanooga & St. Louis, the Carolina, Clinchfield & Ohio, and the Central of Georgia, had exhibits, and it was an eye opener to see the variety of materials that are available in the territory these roads traverse; coal, lumber, tanning materials, kaolins and clays, shales, bauxites, limestone, marble, manganese, copper, arsenic, asbestos, silica, graphite, mica, sulphur, etc. In fact, of 57 commercial minerals found in this country no less than 53 are found in the South. The industrial or development departments of the five roads above mentioned are doing much to develop the commercial possibilities of these materials.

Notwithstanding the fact that R. A. White, general auditor of the New York Central and former president of the Association of American Railway Accounting Officers, strongly urged in a letter to the association the appointment of a committee to study methods which are being developed by different accounting organizations and to act as a clearing house for what might be called "kinks" in auditing methods, the association, by a comparatively close vote, turned down the suggestion.

A Needed Committee

Probably if Mr. White had been present at the convention of the association and could have given more fully than he did in his letter the reasons which led to the introduction of the resolution, it would have been carried. The point urged against it was that the executive committee was now empowered to deal with such matters. Mr. White's experience, however, as president was that there were many questions which came up which did not come under the jurisdiction of the executive committee but which ought to be dealt with by some committee of the association. As it is now, there are really a great number of details which are dealt with in various ways in different auditing offices. Some methods of handling these details are far better than others, but unless chance intervenes, members of the association, except close friends of the officers with the improved methods, will never hear about them. There is so much routine to audit office work that accounting officers are peculiarly liable to get into a rut. It is especially necessary that there should be free interchange of ideas, therefore, and it would seem that the association might well have given more serious consideration to the experience and resulting suggestion of one of the most progressive presidents the association has ever had.

Without in any way reflecting on the ability or character of the three men whom President Wilson has nominated for appointment to the Interstate Commerce Commission, it is to be regretted that advantage was not taken of the opportunity presented by the necessity of making three appointments at once to place on this important body at least one man of practical business experience in the affairs over which the commission has jurisdiction. One of the new appointees is a newspaper man who has demonstrated ability in several ways; two are lawyers and former members of state railway commissions, one of them with a considerable experience in that field and one whose term of office was very brief. Undoubtedly they are all very good men and compare very favorably with the majority of the candidates whose appointment is urged upon the President by congressmen and others when vacancies

The New I. C. C.

Appointments

occur in governmental offices of this kind. However, as was stated in an editorial last week, we had hoped that when the commission was to be enlarged to nine members, in recognition of the importance and magnitude of its work, a serious effort would be made to secure men of special knowledge, experience and ability in the field with which the commission has to deal, following the precedent already set in appointments to the Federal Reserve Board, the Federal Trade Commission and the Tariff Commission. The *Railway Age Gazette* has frequently urged the appointment of a practical railroad man to the commission. We appreciate that there are some practical and political difficulties involved in such of course, but the circumstance of three vacancies at one time when the commission was to be enlarged presented an unusual opportunity for the selection of a representative of the shippers and another of the railroads without leaving the slightest room for criticism that either side was being favored or that the commission was being packed with experts. Surely it would not have been impossible to find two men of long experience in facing the problems of the business man who uses the railroad and of the railroad manager who could bring to the commission the practical business viewpoint without an undue amount of partisan prejudice. As the commission will now be constituted it will contain a majority of lawyers, also a majority of five men who have served as state railroad commissioners. It may be argued that as the business of the commission is to interpret and administer the law, it should include a large proportion of men of legal training, and that because its function is to regulate railroads, men who have had experience in such regulation are especially fitted for its work. We could more readily concede the force of such a contention if it were not carried to an extreme.

The nine regiments of railway engineers now in France or on their way there

Living Up to the Regiments Overseas

furnish only one of the many reasons why railwaymen should subscribe for the second issue of the Liberty Loan; but they furnish the one big reason why railwaymen should excel their brothers in all other lines of industry in subscribing. No other industry has so representative a body of men in France as have the railways, and it is only right that railway men at home should take it upon themselves to show that there was reason and justice in giving railwaymen the honor of being among the first to get into action in France. The railwaymen overseas are already setting a pace that their brothers at home will be hard pushed to follow. But surely American railwaymen still at their daily tasks are not going to let the men in uniform overseas get all the glory! The men in the railway regiments are doing their duty, whatever it may be, with an enthusiasm and a will. The men at home are doing their duty likewise; but just as it is the duty of an engineer company to construct a mile of railway directly behind a battery, so is it the duty of railwaymen at home to do their daily tasks efficiently, and, when the opportunity offers, to subscribe for Liberty Loan Bonds. Railwaymen abroad are leading men of other industries in making history. Railwaymen at home are likewise leading men of other industries in the performance of their duty. Let the good work go on; apply the same principles to the Liberty Loan! The government wants subscribers. If a railwayman took no bonds in the first loan, now is his chance to make up for it; if he took some the first time, let him take more; if he is still tied up with bonds on the partial payment plan and is financially unable to take more, then his way is clear; let him get after the man next to him to get on the "Bond Wagon." There are easy payment plans galore, and to be patriotic at four per cent certainly is not hard.

The Association of American Railway Accounting Officers, at its convention held in Chicago last week, voted to take steps to call to the attention of railroad executives and of the Railroads' War Board in Washington the need for through interline waybilling. The discussion of this subject is as old as the association itself and it was the necessity for a common understanding of this and related subjects that led to the formation of the association in 1888. At present, however, it takes on an importance even greater than it has ever had before. Universal interline waybilling would presumably carry with it the establishment of through rates on a very much broader scale than at present and should do away also with the present absurdly complicated inter-road divisions. These divisions have been built up by an intricate game of give and take between traffic officers of different roads and between traffic officers and shippers, with the result that to work out one road's division of a rate is often a mathematical problem of very considerable labor. There are probably a great many reasons, at least in the minds of traffic officers, why it would be very difficult to make a change and why a change would be inexpedient. The fallacy of these arguments is best demonstrated by the fact that the same traffic officer who will argue that the rates applying to his own road should not be simplified will sweep aside as mere timidity the argument that some other complicated set of rates in which his road is not interested could not be simplified. Local waybilling between junction points, with rates based on a percentage of other rates, which themselves are based on some complicated system of percentages, makes a large amount of absolutely unnecessary clerical labor. The difficulty of getting together widely separated traffic officers and of getting any agreement between a multitude of competitors has heretofore been greater than the Accounting Association could overcome. Now, however, when there is a central board with power to deal with such subjects, and when the interest of all classes of railroad officers has been so concentrated on the elimination of waste, the time ought to be propitious for an establishment of interline waybilling with through rates and simplified divisions.

"SMOKES" FOR THE RAILWAY MEN IN FRANCE

THE railway-regiments which have been raised and those which are being raised for service in Europe should be "adopted" by the railway officers and employees and the railway supply concerns of this country. These regiments are composed of former railway officers and employees. Their members are all making great sacrifices for their country. Whatever the railway and railway supply men who stay behind can do to show their appreciation of what the members of the railway regiments are doing, to help to make them realize that the folks at home have not forgotten them and to contribute to their comfort and even their pleasure ought to be done.

When men are deprived in one way or another of the social life and the comforts of home the proportion of them who smoke greatly increases, and in no class of men is the desire for the enjoyment of smoking greater than among soldiers.

"For thy sake, tobacco, I
Would do anything but die"

said Charles Lamb in his "A Farewell to Tobacco." The average soldier, and especially if he has been deprived of a reasonable supply of tobacco for a while, would state his feelings quite as strongly as did Lamb. Furthermore, the average American soldier who has had to use French tobacco for a while would be willing almost to die for some American tobacco. The manufacture and sale of tobacco is a

monopoly of the French government and Americans who have had experience with the French tobacco seldom care to renew acquaintance with it.

In order that the members of the railway regiments may have the solace of "Lady Nicotine" a movement has been started by a number of the leading railway supply concerns to raise a fund among the railway supply companies for this purpose. Details regarding this movement are given elsewhere in this issue. S. M. Felton, director general of the railways of the United States government, has estimated the amount of tobacco which should be sent to the railway regiments and the committee of railway supply men which has been organized will endeavor to raise a fund sufficient for this purpose.

No difficulty ought to be experienced in raising the required amount of money. Contributions ought to flow in in abundant quantity from railway supply companies, and supply men all over the country who are interested in the comfort and welfare of the brave and patriotic men composing the railway regiments. All the members of these regiments are volunteers and they have been inspired solely by patriotism in enlisting. The railway supply men who are among the most patriotic and generous of our citizens, may be relied on for their bit in seeing that they do not want for smokes.

"BREAD CAST UPON THE RAILS"

SOME facts which are of great interest and significance at this time are presented in an entertaining story form by John W. Kean, transportation clerk of the Navy Department, in an article entitled, "Railway Land Grants Now Save Public Millions," which we publish elsewhere in this issue. For many years it has been the custom of men of the LaFollette school of political philosophy to dwell upon the "gifts" of vast amounts of land made by the government to the early railways to secure their construction. Mr. Kean's article shows that these grants of land were not "gifts," but had a string tied to them and that this string will, during the present year, save the government approximately \$50,000,000 in military transportation charges.

The railways are required to transport the government's property and troops over their land grant lines either free or for 50 per cent of the rates charged to the public. The land, when given to the railways, was practically valueless, as Mr. Kean shows. Before the Illinois Central Railroad was constructed, land in the territory where it was built was offered for sale by the government at 12½ cents an acre. Mr. Kean estimates the present value of all the land given to the railways at an average of \$10 an acre, or approximately \$1,000,000,000. If this estimate is correct, it comes to a very large sum. But if Mr. Kean's estimate of \$50,000,000 as the government's saving on military transportation as a result of the land grants also is correct, then the government this year on military transportation alone will make a saving as the result of the land grants which will pay a return of 5 per cent on the present value of all the land that it has given to the railways. Furthermore, the roads which, because of the land grants, have to perform military transportation free or at reduced rates, also have to transport the mails at reduced rates, and always have had to.

It is a well known fact that the construction of railways immediately caused very great increases in the value of the adjacent land which the government kept as well as in the value of that which it gave to the railways. As Mr. Kean shows, land along the Illinois Central which the government had been offering for 12½ cents an acre readily sold after the road was built for \$2.50 an acre. The increase in the value of the land retained by the government was sufficient to far more than compensate for all the grants it had made to the railways. It would be interesting, however, if a record

could be presented showing annually how many millions of dollars the government has saved in the transportation of troops, of the mails and of property belonging to it as a result of the reduction of rates secured by the land grant agreements. We have heard the statement made, although we have never seen detailed statistics advanced to support it, that certain railways, by the reductions in rates on government business alone, have repaid the government several times over for the land which it is alleged to have "donated" to them. All of which shows, as Mr. Kean makes Uncle Sam remark, that bread cast upon the rails, like bread cast upon the waters, may return after many days.

SOME VIEWS ON RAILROAD PROFITS AND RAILROAD MELONS

IN its issue for September 20 the Omaha Daily News published an editorial in which, on the basis of certain statistics compiled by the Interstate Commerce Commission, it estimated that "the net revenue or profit of the railways of the United States in June, 1917, will be found to exceed that for June, 1916, by \$10,000,000." The total figures for June of railways operating about 90 per cent of the mileage of the country and receiving about 97 per cent of the total earnings are now available. They show that for June, 1917, as compared with June, 1916, total operating revenues increased \$49,720,000 and operating expenses and taxes \$42,276,000, leaving an increase of net operating income of \$7,500,000.

But why pick out a single month for comparison when the figures for six full months of the present fiscal year are available? The figures for the six months, January to June, inclusive, show that total operating revenues of the same roads increased \$201,000,000, while operating expenses and taxes increased \$219,500,000, and in consequence net operating income or "profit" was over \$18,000,000 less than in the first six months of 1916.

Furthermore, every person having any knowledge of railway affairs who will study all the underlying figures, will see that the net earnings now being shown are largely artificial because the railways are not spending as much for maintenance of equipment and maintenance of way as they ought in order adequately to maintain the properties. In the first six months of 1917 the increase in total operating revenues was 12.2 per cent and the increase in operating expenses 18.5 per cent. Meantime, the increase in transportation expenses was 26.3 per cent; the increase in expenditures for maintenance of equipment, 12.5 per cent; and the increase in expenditures for maintenance of way only 7.6 per cent. If the railways were spending relatively as much for maintenance as they were four years ago, and as they ought to keep in good shape, their operating expenses would be much larger and the net operating income shown much smaller.

Why are they not spending more for maintenance? Partly because some of them cannot afford to; partly because of high wages and high prices; partly because of scarcity of labor and materials. It is certainly unfortunate for the roads that they should be exploited in the press as enjoying larger net earnings than they really are, when these large nominal net earnings are being derived in great measure from the deterioration of numerous properties.

Continuing in its editorial, the Omaha Daily News refers to the extra 10 per cent dividend declared by the directors of the Burlington on August 3, and quotes some statements from the Daily News Record, which it refers to as "a New York financial and commercial sheet."

"This is only a very small slice," says the Daily News Record in the article quoted, "of the Chicago, Burlington & Quincy melon, which will some day come to the holders of stock. As a matter of fact, extra surplus is estimated in

excess of \$100,000,000, and this 10 per cent extra dividend is only 10 per cent of that estimated surplus."

The implication is that stockholders will ultimately get all of the Burlington surplus. They would have some difficulty in getting it very soon in the form of cash dividends, since practically all of it is invested in physical improvements in the property. "If the improvements, which have been paid for out of earnings, were capitalized," the Daily News Record adds, "the surplus would be very much larger." We suppose this sentence is meant to suggest that the way the Daily News Record expects the stockholders to get the rest of the melon is in the form of stock dividends.

"The same journal, talking frankly, because," as the Omaha Daily News remarks, "it is read only by those who profit from the conditions it describes," continues:

"The significance of it (the Burlington dividend) was that perhaps prosperous railroads would do something more for stockholders than pay dividends of the past few years, now that it was no longer necessary to join the hue and cry of railroad poverty and impending bankruptcy. There is a long list of railroad properties in this country which can declare larger dividends, extra dividends, rights, etc., dividing up accrued surplus, provided that directors are willing to do so. Railroad etiquette demanded that in the campaign for increased rates there should be no such distribution, but now that the ice is broken, other directors may be willing to take the plunge."

As the Omaha Daily News truly remarks, "Quite different from the talk made by the railways when they asked for permission to raise rates!" But the Omaha Daily News should note that all this talk about railroads that are so rich they can afford to increase dividends, cut "melons," etc., does not come from the managers of the railways. It comes from a publication in New York for whose views most of the railway managers would be only too glad to disavow responsibility.

The quotations we have made from the Omaha Daily News and from the Daily News Record of New York illustrate two kinds of utterances which do the railways much harm. There is one class of publications which constantly exaggerates the prosperity of the railways in order to create public sentiment against them. There is another class which constantly exaggerates the probable, and even the possible, dividends of railways, apparently to subserve the purposes of the speculative element among investors and of that other large class of investors who have never become reconciled to the principle that great conservatism in financial management is as indispensable to the future welfare of the railway companies as efficiency in operation.

The managers of the railways know, first, that there are not many roads in this country that could now, or are likely ever to be able in future to cut melons. They also know that it is most inexpedient for the railways as a whole that those which can do so should do so. Unfortunately, the hands of the responsible managers are often forced by men in Wall street whose avarice is only surpassed by their ignorance of the state of public opinion west of the Allegheny mountains.

To any men having influence in the financial affairs of railways who believe with the Daily News Record of New York that there are numerous prosperous railways which could and should go into the melon-cutting business, the *Railway Age Gazette* suggests that they travel for a while over the lines of the railways of the South and West and familiarize themselves with the sentiment which prevails among the people of those territories, especially those in the agricultural communities. If they will do this, they will return to their desks realizing that so far as the future of private ownership and management of railways in the United States is concerned, they had just as well go out and dynamite every mile of road in the country as to attempt to revive the melon-cutting industry.

The *Railway Age Gazette* does not believe in railroad melons, whether in the form of stock dividends or cash dividends or in any other form. We do not believe in them either as a matter of railroad policy or of principle. The

melons which a few railways cut 10 years or more ago, have, by the effect they produced on public sentiment, cost the railways as a whole hundreds of millions of dollars, and, if as a result of such emanations from Wall street as that published by the Daily News Record of New York, the impression goes abroad that melon-cutting is to be revived in the railroad business, those who are now trying to secure reforms in our present system of railway regulation had just as well shut up shop and engage in some other line of endeavor.

There is no good reason founded on public policy, economics, law or morals why a railway which has been conservatively financed, is being efficiently operated and well maintained, is giving the public good service and is earning enough money to do so should not pay dividends of 6, 8 or 10 per cent; but proposals to pay big extra dividends or to capitalize invested surplus by the issuance of large stock dividends are dangerous in the extreme, and if any of the financial powers in Wall street don't know this they need education regarding railway affairs even more than do the radical politicians of the Middle West.

MATERIAL FOR THE MECHANICAL DEPARTMENT

THE mechanical departments on most railroads have for a number of years been giving more and more attention to the conservation of material. This tendency was quickened during the hard times, preceding the world war; as a result a great many roads had a more or less thorough housecleaning of material. Some of it was found to be obsolete or entirely useless and was sold as scrap; other parts were such that they could be repaired or reworked and put back into service; a large amount of material was suitable for immediate use and was turned back into the storehouses for distribution to points where it was most needed. After the entry of this country into the war the price of materials rose to a still higher level and further incentive was given to clamoration. Certain classes of material became exceedingly difficult to get at any price and the railroads were forced to use all their ingenuity in piecing out, reworking and utilizing scrap material of this sort.

In not a few cases radical changes have been made in the design of parts in order to substitute materials which were more easily obtainable. There are limits, however, to which the conservation of material may be carried in these days when the cars and locomotives are making new records each month for service performances, and this is particularly true now that skilled labor, or labor of any kind, is so scarce. A new factor has also entered into the problem in the past few months; the output of a number of industries that supplied raw material to railway supply companies, and even some of those that furnished finished material to railways, has been commandeered by the government. More and more is expected of the railroads in the months to come, and yet it must frankly be admitted that the heavy and prolonged stress on the motive power and equipment is beginning to tell. A considerable part of the equipment is now in no condition to stand a severe winter. Because of the vital importance of transportation to the successful outcome of the war it is to be hoped that those in authority will see to it that a fair proportion of the needed materials is allotted for railway use. Indeed, it will do little good to commandeer it for other purposes if the railroads are unable to transport it. Those in charge of the railways have done everything in their power to help the nation in its time of need and doubtless have hesitated to put too much stress upon the needs of the railroads. It would seem, however, that the time has come for concerted action in order that sufficient provision may be made to see that they are properly equipped to meet the greater demands that will be made upon them.

Railway Land Grants Now Save Public Millions

"Bread Cast Upon Rails" Gives \$50,000,000 a Year to Government in Military Transportation Charges

By John W. Kean

Transportation Clerk, Navy Department, Washington, D. C.

UNCLE SAM was busy with a short pencil when I entered his office and there was such a pleased expression on his face that I did not have the heart to interrupt him.

Evidently working out a satisfactory solution of the problem he put the pencil carefully away in the fancy vest and looking up with a smile asked, "What is it the Scriptures say, Son, about 'bread cast upon the waters'?"

"Bread cast upon the waters shall return after many days," I replied.

"I knew it was something like that," he said. Then, glancing down at the sheets upon which he had been figuring, he continued, "I have just made the strange and agreeable discovery that bread cast upon the rails also returns after many days."

"You will have to explain that remark to me, Uncle," I said, "I'm not very good at riddles."

"With pleasure," Uncle said. "From 1850 to 1870 I was on a regular Santa Claus spree and gave away over one hundred million acres of land to ambitious nephews with an itching to build railroads. There was a string attached to the gifts, however, in the shape of a proviso that my troops and property were to be granted reductions in rates. Not much importance was attached to the string at the time, because who imagined I would be transporting troops and property to the extent I am today? Here are some figures, however, which show that the little drawback inserted in the grants will bring in fully \$50,000,000 this year. Is that plain talk, Son?"

"It certainly is, Uncle," I answered, "and I imagine fifty million makes quite a nice bouquet of yellow beauties."

A \$50,000,000 RETURN

"Yes, and I must say the boys are presenting it with good grace, as they can well afford to do. My transportation bill this year is simply a whopper. Take the war department alone. My original appropriation for the army was \$4,350,000. We thought it was quite some appropriation at the time, but it turned out to be chicken feed, to talk plain for you, Son."

I acknowledged the corn and Uncle continued: "Then I sat in the Big Game and in June Congress, my banker, gave me a \$221,963,745.42 stack of chips for the Transportation of the Army and its Supplies. That went before I had the seat warm and on September 6 the banker began considering a little request for \$350,000,000 more. The way the game is going I will spend \$500,000,000 for railroad transportation for the army alone. The navy and other departments will cost me \$25,000,000 more."

"You evidently figure then, Uncle," I said, "that the drawback in the grants will bring you in about 10 per cent?"

"Yes, that's a very conservative estimate," Uncle replied. "It has always been a mystery to me why the roads did not keep an accurate record of such deductions, but they never have and there has been no reason why I should keep such a record."

"I understand, Uncle," I said, "that the lines contemplate the establishment of a clearing house in Washington for all government business. If they do I presume they will keep better records on this class of travel which will be very heavy for years to come."

"No doubt, and they should do so," Uncle said. "It was a realization of the value of the grants to me this year, however, that started me on a little historical research and I have certainly come across some very interesting and amusing documents."

"Please tell me about them, Uncle," I said, "I am always interested in anything that affects the railroads."

"Gladly," Uncle said. "You understand, of course, the general history of the grants and that they were made in the first place primarily to promote the sale of the public lands. Then, later, from a humanitarian standpoint; railroads were necessary to provide the early pioneers with a means of protection against the savages. Still later, before there was any means of transportation across the continent, except by prairie schooner, gold was discovered in California, and I donated millions of acres of the public lands to aid in the construction of railroads to the Pacific Coast. In the construction of these transcontinental lines, which were also a military necessity, there are volumes of history that is more thrilling than any fiction."

Uncle interrupted his story, apparently recalling those early days and the brave men and women who laid the foundation of his great democratic country. The story of the land grants promised to be more interesting than I expected, so, after a moment, I said, "Go ahead, Uncle, I thought you were going to read me a lot of dry laws filled with statistics, but you are telling a real story."

"No," Uncle said with a smile and shake of the head, "I haven't told you a story, I have just told you where there were stories. However, I will sketch the land grant history for you in the form of a story if you like—a sort of moving picture as it were."

SOME LAND GRANT HISTORY

"Stephen A. Douglas, 'The Little Giant,' of Illinois, induced me to make the first grant in 1850 to the states of Illinois, Mississippi and Alabama for the construction of a railroad from Dubuque and Chicago to the Ohio river and from the Ohio river to Mobile. 'The Little Giant' is, therefore, our hero. As a result of this grant the Illinois Central and the Mobile & Ohio Railroads were constructed."

"Now, of course, you understand, Son, that we cannot have a story without a villain and the papers and it was right in this first grant that the rascal came upon the scene. To work upon his entrance properly, however, I must go back to the year 1802. In that year I authorized the Secretary of the Treasury to 'view, mark and open such roads in the territory northwest of the Ohio river as, in his opinion, might best promote the sale of the public land.' Then, for the next scene, moving westward to Indiana, in the year 1824, I made a grant of land to that state for a canal to connect the Wabash river with Lake Erie. The grant contained this proviso:

AND PROVIDED FURTHER, that the said canal, when completed, shall be and forever remain a public highway for the use of the government of the United States, free from any toll or other charge whatever, for any property of the United States or persons in their service on public business passing through the same.

"This was the first proviso with reference to reductions in fares and it covered my property and all persons in my service."

"And now we are back to 1850, and the villain. I have

made a thorough search of the records but, so far, have been unable to identify him. The grant of 1850 for the railroads followed the wording of the canal grant with this single exception—the words 'persons in their service' were changed to read 'troops of the United States.'

"All the succeeding grants to the roads also read 'troops of the United States.' As I said, I have been unable to learn who made the change or why it was done. Had no change been made I would today be receiving reductions in rates for all my family instead of for my troops only. It may be the framers of the grant figured such a clause might encourage civilian travel and that it was only necessary for me to transport troops. If that was the reason, they left out the civilians they made a bad guess for I will spend \$500,000 this year for the transportation of my farmer boys in the Department of Agriculture alone. When you consider what I will pay for the rest of my civilian family you can imagine what the rascal cost me."

"He was a regular villain, Uncle," I said with great sympathy, "to change the papers on you like that, but let's forget him if you please and introduce me to the heroine, I am anxious to meet the lady."

I think Uncle realized I was trying to corner him in his little plot of telling the land grant history as a story but he just smiled and reached for another paper, "I have here," he said, "a decision of the Supreme Court, part of which I will read to you:

Was the plaintiff, by reason of being a land grant railroad, bound to transport the troops and property of the United States free of charge, or had SHE a right to a reasonable compensation for such services.

"There SHE is, Son—the railroads. Just at present the damsel is very busy bustling around attending to business but ordinarily she requires her full share of attention."

"Well, we must admit she makes a good heroine, Uncle," I said, "and it is proper that she should receive attention. Now you know, of course, Uncle, that a story must have a comedian,"—"Here," I thought, "is where I have him cornered,"—"May I ask who is your funny man?"

Again Uncle smiled and reached for a paper. "Before I introduce my comedian," he said, "I am going to give you some advice. No doubt, you have frequently wondered why government documents—with a few notable exceptions—were such dry reading. I know you have and I am going to tell you the reason and then introduce my comedian.

"Documents in commercial life are comparatively short lived, but some literary ghoul is always poking through my vaults and bringing to light my past history. A prospector who discovers a pocket of virgin gold is no happier than one of those chaps when he comes across a flowery document that has missed history a million miles. He immediately reproduces the masterpiece for the edification of a humor-loving public, while the disgusted author mutters strange words and turns over in his grave. So be careful what you write, Son, when you are a United States Senator, or some day it will be dug up on you as was this report of the Select Committee of the House on Pacific Railroads and Telegraph, August, 1856. Just to carry out our little plot I will pick the author of this report as my humorous character.

WHEN LAND WAS WORTH 12½ CENTS AN ACRE

"After expressing grave doubts as to whether a railroad could ever be built across the continent 'through those vast mountain regions whose aspiring summits present 12 feet of defying snow to the burning rays of the July sun,' the report continues:

So rapid is the fall of snow, and so resistlessly do the winds sweep over those almost boundless plains, it is quite impossible to gain a distant shelter.

So with a train of cars running up the plain from Iowa or Missouri to the foot of the Rocky mountains, a distance of some 800 miles, how, in a storm, is shelter, or wood, or water, or food to be gained? Arrested 800 miles from Iowa in November, how is a train of cars to be relieved before May? By what means could it even be visited? In such a case the sheltering skill would be useless. To talk of doing business in the

winter season on a road through such a region, though every conductor was a Kit Carson and every traveler a Fremont, would seem to be idle and preposterous.

"He certainly didn't think much of the idea, did he, Uncle?"

"No, but we must make allowances, Son. A minority report is a thankless task. I hope, however, you will take the lesson to heart and if you are ever tempted to do any fancy writing be very, very careful."

"I will certainly do so Uncle," I said. "But just what was your part in the land grant story, to get back to our bacon, or rather bread?"

"Well some of the boys thought I was the Goat," Uncle replied smiling, "and no wonder. But they only saw part of the picture.

"In the 20 years following 1850 I gave away or granted 107,722,553 acres of land to aid in the construction of railroads. This was a territory equal in size to the New England states with New York and Pennsylvania added for good measure. This immense territory was divided among the following 35 railroads:

Alabama & Vicksburg.....	199,102
Alabama Great Southern.....	653,809
Atchison, Topeka & Santa Fe.....	3,007,839
Atchison, Topeka & Santa Fe Coast Lines.....	3,157,473
Central of Georgia.....	302,191
Chicago & North Western.....	3,954,934
Chicago, Burlington & Quincy.....	3,363,297
Chicago, Milwaukee & St. Paul.....	1,465,554
Chicago, Rock Island & Pacific.....	839,404
Chicago, St. Paul, Minneapolis & Omaha.....	3,271,091
Duluth, South Shore & Atlantic.....	434,231
Grand Rapids & Indiana.....	852,521
Grand Trunk.....	6,469
Great Northern.....	2,924,263
Gulf & Ship Island.....	139,113
Illinois Central.....	3,611,620
Lake Shore & Michigan Central.....	141,320
Louisville & Nashville.....	1,580,402
Michigan Central.....	602,468
Minneapolis, St. Paul & Sault Ste. Marie.....	838,228
Missouri, Kansas & Texas.....	705,622
Missouri Pacific.....	397,263
Mobile & Ohio.....	1,156,659
Nashville, Chattanooga & St. Louis.....	67,785
Northern Pacific.....	31,658,331
Pere Marquette.....	412,887
St. Joseph & Grand Island.....	562,933
St. Louis & San Francisco.....	1,280,784
St. Louis, Iron Mountain & Southern.....	2,442,398
Seaboard Air Line.....	1,460,984
Southern Pacific.....	16,012,228
Southern Railway.....	458,556
Texas & Pacific.....	1,001,017
Union Pacific.....	18,306,036
Vicksburg, Shreveport & Pacific.....	463,747
Total Number of Acres.....	107,722,564

"The last grant was made in 1871 and in that year the state legislatures of Indiana, Missouri, Ohio and Pennsylvania passed resolutions protesting against any further grants."

"You were really not surprised were you, Uncle?" I asked. "That certainly was a Santa Claus spree."

"No, I was not surprised," Uncle said. "I must say that once I get started I do not believe in half-way measures. But don't forget that the drawback provision in the grants will be at work as long as the railroads are in existence. I think when the day of final accounting comes Uncle Sam will have a credit on the right side in these land grant deals. Let me also read you part of the majority report of the Select Committee of the House on Pacific Railroads and Telegraph, August, 1856:

No better example can be given of the benefits resulting from the construction of railroads to both public and private property, than that of the Illinois Central Railroad. On the line of that railroad the public lands had been offered for sale for many years without finding a purchaser, and were at last reduced to the lowest minimum price, 12½ cents per acre—

"Think of that," Uncle interrupted his reading to remark. "An eighty in the heart of Illinois going begging for ten dollars. Now listen—"

but after the government had given away one-half to assist in building the road, the other half very readily sold for \$2.50 per acre.

"So you see there are two sides to the picture and I did not make such a bad bargain after all. Nor did the State

of Illinois, judging from the following article in the Chicago Evening Post of May 30, 1856:

The official returns of the new census of Illinois (1856) have just been received. The entire population is over 1,300,000, which is a gain of about 50 per cent upon the census of 1850. By comparing the increase through the several decades and semi-decades since the census has been taken it will be seen that the gain has been much larger during the past five years than in any former period. The railroad system has been developed in Illinois within the last five years, and one of the fruits has been to double the population. A correspondent showed the other day that another way to estimate the value of her land. Add to these the improved society, the multiplied educational and moral influences which follow population, and take advantage of all cheap methods of transportation, and then one may begin to appreciate the advantages of the modern railway system as an engine of civilization.

"You see," Uncle said smiling, "there were publicity experts in those days looking after the interests of our leading lady."

"And the experts of today are no better, Uncle." I said, "only now they get a lot of pictures to help along the good work. Did the building of the lines have the same good effect in increasing the value of your land in other cases as in Illinois?" I asked.

"Yes," Uncle answered. "Of course, the benefits were not always so immediate. Nearly all the acts provided for a grant of every alternate section for six miles on each side of the road and nearly all carried a further proviso that the remaining sections should be sold to settlers at not less than double the minimum price per acre."

"Has the value of the lands granted to the lines ever been figured, Uncle?" I asked.

"No," Uncle answered, "but estimates have been made of the amount received by the lines for lands sold that are fairly accurate. This estimate averages \$10 per acre, or about \$1,000,000,000 for the 107,000,000 acres. Most of the grants excepted mineral lands (other than coal and iron) and this exception has been the source of considerable litigation. Oil, as you know, was discovered on the land granted to the Southern Pacific Company in California and many learned judges have had an opportunity to decide whether, in their opinion, oil was a mineral.

"Then you must not forget the military feature of the grants. The great transcontinental lines received millions of acres of land but their builders were brave men and entitled to help in the construction of lines which were an absolute military necessity but which were through a territory where, as our humorous friend wrote, 'the country was so sandy, sterile and desolate a wolf could not make a living.' This is the same country which the government and the lines have made the supply house for the world."

LAND GRANT RATES

"Your story has certainly taught me that it is dangerous to predict, Uncle," I said, "but there is one point that is not quite clear to me. The clause in the grants stated that you were to have the use of the lines free from toll or other charge and you keep speaking of reductions in rates. Will you clear that up for me?"

Uncle hesitated for a moment and then said with a twinkle in his eye, "You have touched on a rather delicate subject, Son, but I will explain. I sometimes think it was a case of the villain still pursuing me.

"There are two classes of land-grant roads now—free lines over which I pay absolutely no charge for the transportation of my troops and property, and lines over which I pay 50 per cent of the public rate.

"The first grants provided that I was to have the use of the lines free from toll or other charge. These are now the 50 per cent lines. Several of the latter grants contained an additional proviso reading, 'All property and troops of the United States shall at all times be transported over the said railroad and branches at the cost, charge and expense of the company.' These are the free lines and, unfortunately for me, they are not very numerous. The Southern Pacific,

from a point near Sacramento, Cal., to Portland, Ore., is the longest and perhaps the most valuable from my standpoint. There are also free stretches of line on the Missouri Pacific and the Rock Island in Arkansas that came in very handy in figuring rates on the movements to the Mexican border, which you will recall if you are good at remembering ancient history. There are a few more strips, but up to the present, at least, they have not been of much importance so far as my movements of troops and property have been concerned.

"It was the first proviso, however, that started all the trouble. The lines said, 'Go ahead. We admit we are a public highway for the use of your troops and property free from toll or other charge, but we deny that we are under any obligation to furnish motive power or equipment free of charge.'"

"It certainly did look like the fine Italian hand of the villain, didn't it, Uncle?" I said.

"I must confess it did," Uncle replied with a slight shake of the head. "The question, however, was finally submitted to the Supreme Court and I have just been reading the opinion which was handed down in October, 1876. It is very interesting. I have always been particularly fortunate in having in my immediate family experts in handling English and presenting facts in a clear and logical manner. Many of my public documents are masterpieces in this respect and it occurred to me while reading the opinion of the Supreme Court in this land-grant case that here was a document entitled to a place on the roll of honor. I will read you the vital parts of the opinion:

Congress in most of the legislative acts by which it has made donations of public lands to the states in which they lie, for the purpose of aiding in the construction of railroads, has stipulated that the railroads so aided shall be public highways for the use of the government, free from all tolls or other charge for the transportation of its troops or property. The question has arisen between the railroad companies owning these roads and the officers of the government whether this reservation includes the free use of the roads alone, or transportation also. The companies claim that if they give to the government the free use of their roads it is all that is required of them. The government claims that it is entitled to have free transportation on the roads, and that it is the duty of the companies to perform it; and Congress has refused compensation for such transportation, giving the companies, however, the right to appeal to the Court of Claims. That court having been appealed to, and having decided adversely before us for consideration, we have now before us the cases and are now

The manner in which the question arises is stated with sufficient accuracy by the counsel of one of the appellant companies as follows:

"I'll bet he was the villain, Uncle," I interrupted, but Uncle only smiled and continued reading:

Was the plaintiff, by reason of being a land-grant railroad, bound to transport the troops and property of the United States free from any toll or other charge, or had she a reasonable right to a compensation for such services?

"I knew it, Uncle," I interrupted, "see how the rascal called the plaintiff a 'she' just to work on their sympathies." Uncle continued reading:

The case turns upon the construction that should be given to the clause in the Act of 1864, which declares that "the said railroad shall be, and remain, a public highway for the use of the government of the United States, free from all toll or other charge for (upon) the transportation of any property or troops of the United States."

And the counsel for the appellants analyzes this provision as follows—

1. That this is a legislative declaration of three things—
2. That the railroad shall be a public highway.
3. That the United States shall have the right to use the same for the transportation of its troops and property.

3. That the United States, in the transportation of its troops and property over such railroad as a public highway, shall not be required to pay any toll or other charge."

"There is nothing like a good counsel, is there, Uncle?" I again interrupted.

"There certainly isn't, Son," Uncle said. "Now listen to the opinion of the Court:

It is somewhat singular that a provision apparently so simple in its terms should give rise to such wide differences of opinion as to its true construction. The difficulty arises from the peculiar character of a railway as a means of public travel and transportation. The case of a turnpike or canal would have furnished no difficulties whatever. Those thoroughfares are usually constructed and owned by companies who have nothing

to do with transportation thereon. They merely furnish the thoroughfare. Had the provision in question related to public works of this kind, it would have been clear that the right reserved to the government would have been merely the right to use the works themselves (the turnpike or canal) free from toll. The words "free from toll or other charge for the transportation of property or troops" would have referred, by necessary implication, to transportation performed by the government itself, either in its own carriages or vessels, or in carriages or vessels procured and employed at its expense. No one would imagine for a moment that the turnpike or canal company would be bound to furnish the means of transportation, much less the propelling power and labor for performing it.

"It does begin to look a little bit different, doesn't it, Uncle?" I said.

"Oh, yes," Uncle replied. "Each time I read that far I am ready to admit they were right, but the next paragraph advances some rather startling ideas and I will read it to you:

It is undoubtedly familiar to most of those whose recollections go back that far that railroads were generally expected to be public highways, on which every man who could procure the proper carriages and apparatus would have the right to travel. This was the understanding in England where they originated. The Railway Clauses Consolidated Act, passed in 1842, provided in detail for the use of railways by all persons who might choose to put carriages thereon, upon payment of the tolls demandable, subject to the provision of the statute and the regulations of the company.

"That is rather startling, Uncle," I said. "The recent car congestion would be a child's puzzle compared to the confusion that would occur if everybody who could afford a car and an engine should start over the tracks."

"It does sound like a joke, Son, but the learned Court explains in the next paragraph, which reads:

But the ascertained impracticability of the general and indiscriminate public use of these great thoroughfares does not preclude their use by transportation companies having no interest in the roads themselves. Such companies, in fact, are actually engaged in conducting a vast carrying business on the principal lines of railroad throughout the country. Nor does it preclude the idea that it may be of great importance to the government, in conducting its various operations in peace and war, to have the free use of railroads as thoroughfares whenever it chooses to assume the conduct and management of its own transportation business thereon.

We are of the opinion that the reservation in question secures to the government only a free use of the railroads concerned, and that it does not entitle the government to have troops or property transported by the companies over their respective roads free of charge for transporting the same.

"It really was a simple case when you come to think about it, Uncle. But I noticed that the Court stated that you had the right to use the roads as thoroughfares whenever you decided to assume the conduct of your own transportation business. Why was it you did not build the roads yourself instead of donating the land, and do you expect ever to take over the complete ownership and operation of the railroads?"

"What are you doing, Son, still trying to corner me?" Uncle asked with a terrible frown but with a twinkle in his eye. "However, I will explain the rate question a little more fully and then try to answer you.

"As a result of the decision of the Supreme Court in all cases where the grants provided that I was to have the use of the road free from toll or other charge, or where the acts provided that Congress was to fix the compensation, as was done in a few cases, I now pay one-half the public rate. The agreement to pay one-half was in the nature of a compromise to cover use of motive power and equipment. Where the act provided that 'All property and troops shall at all times be transported over the said railroad and branches at the cost, charge and expense of the company,' as I previously explained, there is no payment whatever.

UNCLE SAM AND HIS NEPHEWS

"With the rate question cleared up, Son, at least I hope I made it clear, we will take up your nice simple little question—Why didn't I build the railroads myself and am I ever going to take over the ownership and operation of the lines?" and I am going to answer you first in true Yankee fashion by asking you another. Did you ever hear how I got my name Uncle Sam?"

"No," I answered, "I never did. I always thought it came from the initial letters of United States."

"No," Uncle said, "it was not derived from United States. According to the most authentic records the name came about in this manner. Immediately after the declaration of war with England in 1812, Elbert Anderson of New York, a contractor, visited Troy and purchased a large quantity of provisions for sale to the government. He employed Ebenezer and Samuel Wilson as inspectors, Samuel being generally known as Uncle Sam."

"The Wilson family seems to continue to play a prominent part in our history," I interrupted Uncle to gently remark.

"Yes, it does, Son. It was the duty of the two Wilsons at Troy, particularly Sam, to inspect the provisions before packing them for shipment to the army. The boxes were marked E.A.-U.S., standing for Elbert Anderson and United States. One of the workmen was asked one day the meaning of the letters and he jokingly replied, 'Elbert Anderson and Uncle Sam,' by 'Uncle Sam' referring, of course, to Sam Wilson. The joke became popular among the workmen and Uncle Sam Wilson was frequently jollied by the men on the increase in his possessions.

"Many of these men later joined the Army and their joke accompanied them, boxes marked 'E.A.-U.S.' being invariably referred to as 'Uncle Sam's goods.' The joke soon appeared in print, took the popular fancy and I suppose I will always be Uncle Sam."

"That is interesting, Uncle," I said, "how do you like your name?"

"Oh, I like it very well," Uncle replied, "and I often think how appropriate it is. Have you a rich uncle in your family or do you know one among your friends? If you do you will better appreciate why I say it is appropriate. I certainly have a fellow feeling for all rich, old bachelor uncles.

"When my nephews decided that I was somewhat of a necessary nuisance they drew up a document called a Constitution, which informed me in very polite language just where I stood. Among a few of the so-called privileges granted me was the right to establish post offices and post roads. I suppose under this privilege I could have built the railroads, or, if not, they also gave me the privilege of promoting the general welfare of the family, and that was certainly quite a privilege. I am doing a little promoting of the general welfare in Alaska today.

"In the building of our railroads, however, and in the building of many of our other great commercial enterprises, those dear nephews of mine would come to me and say, 'Now, Uncle, you have enough trouble, why bother with this job?' The best way is for you to loan us the money, or help us out with lands or bonds, or high tariffs. Besides, we can do it better than you, anyway.' I'm a good-natured man, but some day that last remark is going to get a rise out of me and then the boys would better take to the tall timbers. I would not mind it so much if they would say they can do it as well, but when they brag about how much better they can do it, Uncle Sam gets a little sore.

"In a general way that was how it happened with the railroads. The boys came to me for help and I am proud today of the work they accomplished.

"The only thing that grieves me at times is the selfishness of some of the family. I must say, however, that this is not generally true of the railroad boys. But I help some of my nephews to get on their feet and then when they get rich and powerful they think they are bigger than I am and they would trim me for my whiskers if I did not watch them.

"And if the boys would not quarrel so much among themselves I would be happier—and this time I will not leave the railroad boys out. Then when I try to settle their disputes they turn on me like a fighting husband and wife and I get blamed for the whole fracas. I feel sometimes like the

little boy who said nobody loved him and he was going out in the garden and eat worms."

"Your name certainly does suit you, Uncle," I said with great sympathy. "I think rich, old bachelor uncles must lead a hard life. And now for my last question, and I promise not to try to corner you again—Do you think you will ever take over the ownership and operation of the roads?"

"You evidently believe, Son," Uncle said with a smile and the old twinkle in the eye, "in leaving the hard one for the last. I am not going to give you an answer to that question now, Son, but I will make a bargain with you.

"The railroad boys have been doing a great work for me so far in this terrible war that has been forced on us. If they keep it up—"

Again Uncle interrupted his story as in the beginning, when he stopped to think of the brave unselfish men who had laid the foundations of the Republic. This time he was evidently thinking of a few brave, unselfish men who were striving to protect the completed structure. In the first instance I had called his thoughts back to the story, but this time I did not have the heart to interrupt his thoughts. He finally rose from his chair and coming around with a smile, though a somewhat serious smile, to where I also stood he

bargain and we will shake on it—come around after the war is over and I will tell you if I think I ought to take over the railroads."

"All right, that's a bargain, Uncle," I said. Then, knowing he wouldn't mind a little joke, I continued, "but judging from the amount of money you say you will owe them, Uncle, maybe you will be lucky if the railroads don't take over the government."

"Oh, I guess not, Son," he said as he threw back his head and gave a good hearty laugh.

But I glanced back as I went out the door and he was back at his desk and feeling around in the fancy vest for the short pencil.

LOCOMOTIVE TERMINAL DETENTION RECORDS

The demand for power is now so great that every effort must be made to keep it working effectively a maximum percentage of the time. One of the largest sources of delay is at the terminal and any means by which this delay can be analyzed and corrected will serve to increase the total locomotive supply. The Pennsylvania Railroad uses a form for gathering this information which shows the movement

Fig. 1—Daily Report for Recording the Movement of Locomotives Through Terminals

said, "There are many indications, Son, that out of this war will come not only a broader and better understanding between governments and the people governed, but between different classes of the people. We have been accused, and perhaps with some truth, of worshipping success and money and of ignoring the rights of others to gain our ends. There are many indications that out of this war will blossom a flower of higher and purer ideals; that success and money, for themselves alone, will not be the ultimate aim, but success and money interwoven with service.

"But I must stop preaching, Son. You will also recall that I taught you it was dangerous to prophesy. Here is my

of a locomotive from the time it arrives at the terminal until it leaves.

The form shown in Fig. 1 is made out daily by the round-house force and includes information of interest to the transportation department, as well as the mechanical department. This form furnishes a complete record of all locomotives arriving and departing from the enginehouse between midnight and midnight. At midnight all computations of time automatically cease and the locomotive numbers of all locomotives remaining within the enginehouse or yard territory are carried forward to the sheet for the following day and the computation of the time starts at 12:01 a. m. The

time shown under the column immediately preceding the column in which the midnight time is recorded should be carried forward to the next daily sheet for information. A second form, Fig. 2, gives a daily summary of the average time the locomotives spend in passing from one point to another in the terminal.

Referring to Fig. 1, the daily detail report of each locomotive: Columns 1, 2, 3, 4, 5 and 6 are self-explanatory. Column 7 shows the time at which the crew shown in columns 5 and 6 will again be available for service. Column 8 shows the time the locomotive and train arrive at the terminal, this time being taken from the engineman's time card or work report. In general the point at which this time is to be taken should be that at which the yard delays begin. Column 9 shows the time elapsing between the time of arrival at the terminal and the arrival of the locomotive at the pit track and is one of the items tabulated in column A (Fig. 2) of the summary. In case midnight intervenes between the time the locomotive arrives at the terminal and the time it arrives at the pit track, the time in column 9 is computed to midnight and the locomotive number and the time shown under column 8 are carried forward to the sheet for the following day. Column 10 shows the time that the locomotive arrives at the pit track or other points at which

between locomotives requiring under 24 hours for repairs and those requiring more than that.

Columns 16 to 23 are self-explanatory, column 23 being the time at which the locomotive and crew leave the engine-house territory. Column 24 shows the time that the locomotive and train clear the terminal yard for freight trains, or the time the train leaves the terminal for passenger trains. Column 25 shows the time between the time the locomotive was ready for service and the time it was ordered, being the difference between columns 14 and 18. This is shown in column D, Fig. 2, of the daily summary. Column 26 shows the time between the time the locomotive is ready for service and the time it leaves the terminal with its train. This time is shown in the summary sheet under E. Column 27 shows the time the engine has spent in the hands of the mechanical department from its arrival at the pit track to the time it is ready for service, or, in other words, the time elapsing between that recorded in columns 10 and 14, or, again, the sum of the computed time shown under columns 11 and 13. This information is shown in column F on the daily summary, Fig. 2. Column 28 shows the time the engine is at the terminal for which the transportation department is responsible, it being the sum of the time shown in columns 9 and 26. This information is shown in the

Notes: Column 9 Letter A—Time from Terminal to Pit Track. Column 11 Letter B—Time from Pit Track to Enginehouse. Column 13 Letter C—Time from Arrival at Enginehouse to Ready for Service. Column 25 Letter D—Time from Ready for Service to Time Ordered. Column 26 Letter E—Time from Ready for Service to Leaving Terminal with Train. Column 27 Letter F—Time from Arrival at Pit Track to Ready for Service. Column 28 Letter G—Total Time from Arrival at Terminal to Arrival at Pit Track, Plus Time from Time Ready for Service to Departure from Terminal. Column 29 Letter H—Total Time from Inbound Terminal to Departure from Outbound Terminal.										

Fig. 2—Summary of Average Movement of Locomotives Through Terminals

the engine crew is relieved, this time to be noted by the engineman on his work report. Column 11 shows the time the locomotive takes in passing from the pit track to the enginehouse or the point at which the repairs are to be made and is the difference of the time shown in columns 10 and 12. Column 11 is shown in Fig. 2, the summary, as column B. The same rules apply regarding midnight as before described. Column 13 shows the time elapsing between the time the locomotive arrives at the enginehouse (column 12) and the time it is ready for service (column 14). This information is shown in column C in the summary. Column 15 is used to make any notations that may seem desirable.

Where a locomotive arrives at an enginehouse and is to be sent to the shop, it is to be dropped from the daily report sheet after the time shown under column 12, and locomotives arriving at a terminal from the shop begin their record on the daily sheet at column 12. Where locomotives remain at enginehouses for heavy repairs, a record of the repairs to be made is noted on each daily report. The time in column 13 may or may not be kept separate for locomotives requiring over 24 hours for repairs and separate averages computed as

daily summary sheet under column G. Column 29 shows the total time the locomotive spends in the terminal which is equivalent to adding the computed time shown under columns 27 and 28 of Fig. 1, or columns F and G in Fig. 2.

By this means the movement of each locomotive and the average movement of all locomotives through a terminal is readily determined. The performance may be analyzed and the work of various terminals checked. Conditions, of course, will vary at different engine terminals, which makes the comparison of one terminal with another difficult; but where a locomotive seems to spend too much time either in the hands of the mechanical or the transportation department, a positive record of just what has transpired is at hand and opens the way for a satisfactory investigation. This information is usually gathered by the clerk at the roundhouse who keeps the enginemen's reports. At large terminals, separate sheets may be used for locomotives in each kind of service, such as passenger, freight and work or shifting. Each daily report is in the hands of the superintendent of motive power early the next morning with the averages determined, so that he is able to get a general idea of each terminal under his jurisdiction.

Three New Interstate Commissioners

**Majority of the Commissioners Are Lawyers as Before;
New England and the Pacific Coast Are Represented**

ROBERT W. WOOLLEY, former director of the mint; Clyde B. Aitchison, solicitor for the valuation committee of the National Association of Railway Commissioners, and George W. Anderson, United States district attorney for Massachusetts, were nominated by President Wilson on September 29 for appointment to the Interstate Commerce Commission; Mr. Woolley for a term ending December 31, 1920, to succeed the late Judson C. Clements; Mr. Aitchison for a term ending in 1921, and Mr. Anderson

was appointed from Colorado. Commissioner Daniels from New Jersey and Commissioner McChord from Kentucky, the commission would seem to be fairly representative geographically. The only large group of states not represented is the Southwest, which circumstance may or may not be accounted for by the attempted secession of the largest one of the neglected states, so far as matters of railway regulation are concerned.

It is expected that announcement will shortly be made, if the President's appointments are duly confirmed by the Senate, of a reorganization of the commission into divisions, as authorized by the new law, to have special jurisdiction over various departments of the commission's work, with the full powers of the commission, subject to its review.

Robert Wickliffe Woolley, of Fairfax, Va., has recently been director of publicity for the first Liberty Loan. He was born at Lexington, Ky., April 29, 1871, attended the State University of Kentucky in 1886 and 1887; left college on account of ill health and engaged in newspaper work on the Lexington Leader in 1893. He was sporting editor of the

Robert W. Woolley

for a term ending in 1922, these for the two additional commissioners authorized by the law of August 9, bringing the membership up to nine. The nominations were sent to the Senate and referred to the Committee on Interstate Commerce with no likelihood of opposition. Mr. Woolley's experience has been principally that of a newspaper man. Mr. Aitchison is a lawyer and was formerly chairman of the Oregon Railroad Commission. Mr. Anderson is also a lawyer and was a member of the Massachusetts Public Service Commission for one year (1913-14).

With a 50 per cent infusion of new blood the commission will, therefore, have a majority of five lawyers, including Commissioners Harlan, Hall and McChord, also a majority of five former state railway commissioners, including Commissioners McChord, Meyer and Daniels. As the law provides that no more than five of the commissioners shall be of the same political party, it is proper to remark that Mr. Woolley and Mr. Anderson are Democrats and Mr. Aitchison a Republican.

It is understood that one of the considerations influencing these appointments was a purpose to give representation on the commission to the Pacific Coast and to New England. Mr. Woolley is a resident of Virginia. As the central west is now represented by Commissioners Clark of Iowa, Harlan of Illinois and Meyer of Wisconsin, while Chairman Hall

George W. Anderson

Chicago Tribune in 1896 and 1897, and on the staff of the New York World in New York and Washington from 1897 to 1905 and from 1907 to 1909. From 1909 to 1911 he was engaged as magazine writer, and in 1911 and 1912 he was chief investigator for the Stanley Commission, investigating the affairs of the United States Steel Corporation. In 1912 he became chief of the bureau of publicity for the Democratic National Committee, and in 1912 and in 1914 he also edited Democratic campaign textbooks. From April 30, 1913, until March 3, 1915, he was auditor of the treasury for the In-

terior Department, and on the latter date he was appointed director of the mint, which position he resigned to take charge of publicity for the Liberty Loan.

Clyde B. Aitchison was born February 22, 1875, at Clinton, Ia. He practiced law at Council Bluffs, Ia., from 1896 to 1903, and at Portland, Ore., from 1903 to 1907. He was clerk of the State Tax Commission of Oregon from June, 1905, to July 1, 1906, and was one of the authors of the Oregon Railroad Commission law adopted on February 18, 1907. He was appointed a member of the Railroad Commission of Oregon on February 18, 1907, for a short term, was again elected a member in June, 1908, made chairman in January, 1911, and re-elected on November 5, 1912. He resigned from the Oregon Commission last year to become solicitor for the valuation committee of the National Association of Railway Commissioners, and in this position has maintained an office in Washington and taken an active part in representing the interests of the state commissions in connection with the valuation of railroads being made by the Interstate Commerce Commission.

George Weston Anderson was born at Acworth, N. H.

THE FIRST U. S. A. CAR FOR SERVICE IN FRANCE

The car builders have completed the first car on the government's orders for about 13,000 cars for the American forces overseas. The car shown in the illustration is a standard gage high side gondola and is one of the original order of 6,000 standard gage cars reported in the *Railway Age Gazette* of August 17. The car is stenciled "New 9-17," apparently meaning that it was completed some time in September.

The car has a capacity of 33 tons, this comparing with the usual four-wheel French car of not over 20 tons capacity. It is 36 ft. in length, its cubical content is 1,386 cu. ft., and its weight is 32,800 lb.

The car body is built largely to French standards with side buffers and screw couplings, the last being necessary as it will operate with French rolling stock. It is, however, carried on American arch bar trucks with standard M. C. B. journal boxes and is fitted with standard American air brake equipment. The rod over the top of the car is to support

Copyright, 1917. Committee on Public Information.

This Is the First of 13,000 Cars Now on Order for the Government

September 1, 1861, was graduated from Cushing Academy, Ashburnham, Mass., in 1882, from Williams College in 1886 and from Boston University Law School in 1890. He has been engaged in the practice of law at Boston since 1890, and was Democratic candidate for the office of attorney general of Massachusetts in 1911. On July 1, 1913, he became a member of the Public Service Commission of Massachusetts, resigning on November 1, 1914, to become United States district attorney for Massachusetts. Last winter he was appointed special assistant to the attorney general of the United States in charge of the conduct of an investigation of matters pertaining to the prices of food supplies. As public service commissioner he had a reputation for independence and public spirit, and both in that position and in the district attorneyship he has had opportunity to familiarize himself thoroughly with the peculiar transportation conditions which now prevail in New England and which, no doubt, were in the President's mind when he chose a Boston man for the new commissionership.

a tarpaulin to protect the car's contents, this rod being adjustable so that it may be swung down along the side when necessary.

EQUIPMENT EXPORTS IN AUGUST.—Exports of cars and parts from the port of New York in August, 1917, amounted to \$1,095,476, as compared with \$768,960 in August, 1916, according to a report of the National City Bank of New York. Locomotive exports for the same month totaled \$898,387, as compared with \$1,299,992 in the previous year. Steel rails exported totaled \$813,746, as compared with \$350,189.

TRANS-AUSTRALIAN RAILROAD NEARLY FINISHED.—Although hindered by the war, construction of the great Trans-Australian Railroad is nearing completion, and advices from Melbourne state that it will be finished this year. The work was begun in 1912. The line will connect eastern and western Australia, and will have cost the builders upward of \$30,500,000. The new line is 1,063 miles long.

The Government Position on Valuation*

The Attitude of the Federal Forces on the More Important Questions Presented by the Texas Midland

By C. A. Prouty

Director, Division of Valuation, Interstate Commerce Commission.

THIS memorandum is in no sense intended as a brief upon the law questions involved. The solicitor of the commission has filed such a brief, which must be accepted as stating the legal claim of the division of valuation upon all points. But many of the questions presented are not legal in any proper sense. Assuming that the courts must finally decide the question, that decision will not be controlled by ordinary legal considerations.

Some of these questions are administrative and refer to the manner in which the valuation shall be made and returned to Congress. The Congress has indicated the thing to be accomplished; manifestly the commission with its practical knowledge must have a considerable discretion in determining the manner of that accomplishment.

The answers to other of these questions depend upon economic considerations. They are not governed by statutes or legal precedents. The law of valuation is still in a plastic state, and while courts and commissions may have discussed these questions and even decided what should be done in particular cases, the law itself can not be said to be established. The decision of this commission will go far toward fixing the law in many instances. It is therefore more important that the commission should clearly understand the practical question presented and the general considerations which should govern its disposal than that it be regaled with long extracts from judges and commissioners who have looked at the question from a single angle and who have had neither the information nor time to think the matter out to a correct conclusion.

It is mainly in this view that the present memorandum is prepared. I have not attempted to cite authorities, but rather to lay before the commission the practical situation and the reasons which have controlled the division of valuation.

As a member of the Interstate Commerce Commission I several times joined with my associates in recommending to Congress that it provide for a valuation of railroad property, and in so doing I for one understood that a valuation in dollars of the property as a whole was called for. There can be little doubt that a majority of the members of the Congress which enacted this measure understood that it provided for a statement of the value of the railroad properties dealt with in money and that the act was so accepted by the country at large.

It is still my own conviction that an ultimate value for rate-making purposes should be stated and that the full benefit of this valuation can not be realized unless this be done. The vice of the railroad situation today is uncertainty. If the present system of providing public service by private capital is to be continued, some way must be found to assure that capital of the treatment which it will receive. It is difficult to see how this can be done until the value of the property now devoted to that service has first been determined.

This does not, however, at all mean that any part of the work now being done or of the money now being expended is thrown away because the commission is not required to establish at this time such ultimate value. Before such a value can be named the facts which the Commission is collecting and reporting to Congress should be before the tri-

bunal which fixes it. The facts are being prepared under the present act and a final value can be quickly stated when Congress has determined by whom and possibly by what rule such value shall be determined.

The carrier claims that in showing cost of reproduction we must look back to original conditions and allow for the clearing and grubbing which was actually done in building the railroad, while the division of valuation insists that only such clearing and grubbing should be allowed for as must have been done at the date of valuation. The question is one of principle and is: In showing cost of reproduction, shall natural conditions be assumed as they exist today, or shall we inquire what those conditions were at the time of the original construction? Both theories have found advocates in the past and both have been applied by commissions and courts. It can not be said that the weight of authority preponderates in favor of either.

There has been a manifest disposition upon the part of many courts and commissions to include in cost of reproduction everything which ought to be included in the fair value of the property. The evaluator seems to have assumed that cost of reproduction when ascertained would measure the value of the property and to have embraced in reproductive cost, for this reason, everything which ought to go into a final fair value.

This has not been the view of the division of valuation. The Supreme Court has said that cost of reproduction does not alone determine the fair value of the property, for rate-making purposes at least, but that other matters must also be considered. Congress by the valuation act has required the commission to state the principal facts which must be known and considered in determining fair value, including among these cost of reproduction. It has seemed of importance to report the exact thing called for by Congress.

The railroads of this country are the result of a process of development. They were not constructed by a single impulse, but have gradually grown into their present form. Steel and masonry have taken the place of wood. Trestles have been filled. Additional tracks have been added. To attempt to reconstruct the road in the manner in which it was constructed would be manifestly impossible. The attempt is to take the railroad as it exists today and to reconstruct that railroad in kind, for the most part, by one impulse in the most economical manner by present methods and under present conditions.

To attempt to reproduce these properties historically would involve much uncertainty and possible error. It is necessary to depend upon the statement and the record of the carrier in some cases, as in the location of hidden quantities which can not be seen and examined; but in so far as it is possible to see and observe it has been felt that the Government party should be required to note what actually exists and not to report as though it were a fact what merely comes to it as hearsay from some other source.

The objection to the adoption of this theory is that many items of expense which were actually incurred by the carrier in the construction of its property are not reflected in reproductive cost. This item of clearing and grubbing is an illustration. So also if a building were located upon the right of way which was moved at the expense of the carrier or if the location of a highway was changed for the benefit of the

* Abstracted from a memorandum filed with the Interstate Commerce Commission with reference to the valuation of the Texas Midland.

carrier and at its expense, these items would not appear in cost of reproduction.

It must be admitted that such items do not appear in reproduction cost upon the present-condition theory. The expense would not be incurred if the property were to be reconstructed today and therefore is not included. The land through which the road runs has been cleared and tilled and has thereby increased in value. The carrier is given the benefit of that change in conditions. If the land is to be valued in its present condition, why should not clearing and grubbing also be assessed under the same conditions?

No attempt is made to show as reproductive cost the actual cost of producing this property as it was produced. In some instances and in some respects the original cost was greater and in others less. The commission is required to show the original as well as the reproductive cost and all these items enter into such original cost.

It has been the belief of the division that reproductive cost should mean exactly what the statute calls for, and that is "cost of reproduction new." The division of valuation has attempted to report just that thing, namely, the cost of reproducing the property actually in existence under present conditions by present methods and at present prices. This cost of reproduction does not necessarily represent the fair value upon which the carrier is entitled to a return, but what it does represent is clearly and exactly known. If the carrier claims an allowance for anything not embraced by reason of what has transpired in the past, that particular thing can be made the subject of investigation and allowed for if it should be. By adhering steadfastly to this rule much uncertainty, confusion, and possible duplication will be avoided, and at the same time there will be no danger of omitting any item to which the carrier is entitled.

This would seem to be one of the matters about which the administrative discretion of the commission should prevail. Within certain limits the commission may certainly determine what it will show as a part of cost of reproduction new.

INDUSTRY TRACKS

There are in this country many spur tracks serving private industries. It is claimed by the carriers that in all cases where the locomotives of the carrier pass over these tracks for the purpose of making deliveries to and receiving traffic from the industry the track is used by the carrier and should be inventoried to it. The division of valuation does not concede this. Such tracks, in its opinion, are not used by the carrier for its purpose as a common carrier within the meaning of the valuation act, but rather are used for the joint benefit of the shipper and the carrier.

In the view of the division it should be assumed that these tracks will be constructed in the hypothetical reproduction of the property exactly as they were constructed and that the carrier should be allowed for its interest in the property and no more. These tracks have been constructed under a variety of contracts. Sometimes the carrier procures the right of way and constructs the track entirely at its own expense. In such case the track is the property of the carrier and should be inventoried to it. In other instances the industry constructs and maintains the track entirely at its own expense. In these cases the carrier is allowed nothing whatever on account of the track. The mere fact that its locomotive runs in and out over this track is no reason why the track should be inventoried as property used by the carrier for its purposes as a carrier. This is in no sense property which the carrier has devoted to the public use.

In the great majority of instances the track is constructed and maintained partly at the expense of the carrier and partly at the expense of the industry, and in such case each party is credited with the amount which belongs to it.

It generally happens that the carrier has under the contract of construction the right to remove, upon the termina-

tion of the use, the rails, ties, and other movable property. It usually enjoys that right even though these articles of property may have been paid for by the industry. If the carrier enjoys the right of removal, whether it furnished the property or not, it is credited with these items of property and also with the tracklaying and surfacing which would be required to put them in place. As a rule the land upon which the track is located belongs to the industry. The industry may at any time terminate the use, and in that event the land reverts to it. Upon this condition nothing is allowed the carrier for the land. It is not believed that it has any such title to it or interest in it as entitles it to make that the basis of a claim for earnings.

If property is jointly owned by two or more railroad companies that property appears in the inventory of each of the owners. Where property is owned by one railroad company but used exclusively by another it is inventoried to the owner but it also appears in the inventory of the using company. The details will be given but once and will ordinarily be found in the inventory of the owner, although in some cases they may appear in that of the user where the relation of the user to the property is really that of an owner. When property is both owned and used by one railroad company which gives to some other railroad company a qualified use in the property in common with itself, that property is inventoried to the owner and is classified as owned and used by the owner. While reference is made to the fact of such use in the engineering report and the tentative valuation, the property itself does not appear in the inventory of the company having the qualified use, and this is the thing of which the carrier in this case complains.

As a practical matter it would require an immense amount of work to separately inventory every piece of track and every facility in which and over which a railroad other than the owner may have some right of use. These track-age rights are so interlaced and so involved as to make it almost impossible to untangle them and to state separately the value of each piece of property involved. While this might be done it certainly ought not to be attempted in view of the enormous expense involved unless some good will result. Under the present system every piece of railroad property which is owned or used for common carrier purposes is valued and the statute in that respect has been literally complied with. It would serve no useful purpose to attempt to state separately and by itself the value of each piece of property in which some company other than the owner may have an incidental use in common with the owner.

APPRECIATION

Most units of property which enter into the construction and operation of a railroad improve at the very first under use. While, however, this is true at the very outset it speedily comes to pass that the different units which enter into the property begin to deteriorate. After a comparatively few days the property ceases to appreciate and begins to depreciate. Rails, ties, cars, engines, are all growing older and all become in a very short time less valuable than when new.

To this rule that the physical property of the railroad depreciates the roadbed forms an important exception. This item of property grows better with time instead of worse. Without inquiring for the moment just how or why this improvement occurs, the testimony in this case clearly shows and it must be admitted as a physical fact, that a seasoned roadbed is of more value than a new one. It costs less to maintain and the same amount of traffic can be handled over it at less expense. Should the commission attempt to ascertain and report the value of this appreciation?

There is nothing in the valuation act which expressly requires this. Clearly it should not be shown as a part of the cost of reproduction new, for it does not exist in the property when new. It is only with lapse of time and as the property

becomes old that the appreciation takes place. The natural connection in which to show this would be along with depreciation. Just as other parts of the property depreciate, so this part appreciates. The Supreme Court of the United States has said that appreciation should be added to and depreciation subtracted from the cost of reproduction new. The act, however, does not require this. Appreciation might perhaps be properly shown as an additional value or element of value, but this provision of the act seems to apply to intangible rather than physical property, and this appreciation is a physical fact which must be reported and valued as such, if at all.

It was the evident intention of the framers of this act to provide for the statement in some form of every fact which might have a bearing upon the final value of these properties. It was also the plain intent to show the condition of the property at the date of valuation so that its then value might be determined. This being so, it seems to me that the commission should, if it can be done, place a value upon this physical change which has taken place in the property since new. Unless that is done it will be impossible to show the physical value of the property which is being devoted at a given time to the public service. There is every reason to suppose that the Supreme Court would hold that no final value could be fixed upon which a fair return should be allowed without considering this element of appreciation.

How is the value of this appreciation to be ascertained? This is the serious question. The witness for the carriers are all positive in their assertion that appreciation does exist, and this is admitted, but no one of them clearly points out a basis for putting this physical fact into dollars. There is some attempt to show that it has cost the carrier a certain amount and that this cost is the fair measure of its value. Were it possible to state what appreciation has in fact cost, that probably would be the most satisfactory way of determining its value, but appreciation under the accounting rules of the commission costs the carrier nothing whatever. The entire expense of doing the things which have been done must under the rules of the commission be charged to cost of operation. No part of those expenditures can properly appear in the investment account.

Unless, therefore, the commission is prepared to change its accounting rules and to hold that a portion of these maintenance expenditures can properly be charged as an addition or betterment to the property, which can not be done and never will be done as a practical matter, there is no such thing as the cost of appreciation. The property has improved. It is of more value at the end of the five years than when operation began, but that improvement is due to natural processes; it has not been produced by any act of the carrier and it has not involved any expenditure of money upon the part of the carrier. On the whole, it must be apparent that if the carrier has earned that to which it is entitled—that is, an amount sufficient to pay its operating expenses, the depreciation in its property, and a fair return upon the investment—there is no reason in equity why it should be allowed anything on account of this appreciation, which is entirely a process of nature and for which no expenditure whatever has been made by the carrier.

But the question is not what effect shall be given to appreciation in determining the final value of the property. Appreciation is a physical fact; the seasoned roadbed is worth more than the new one. What in dollars is the value of this change? I have endeavored to show that this value can not be stated in terms of cost, because under the rules of the commission solidification and adaptation cost nothing.

In my own opinion the commission ought not to fix any definite figure for appreciation until some further study of that matter can be made by the division of valuation. The accounts of carriers have not been kept in such a way that

figures bearing upon this subject can be obtained without an analysis of the details. Just what or how reliable information could be worked up is uncertain but if the commission is of the opinion that some figure should be established in respect to this item the matter might well be re-committed to the division of valuation with instructions to investigate and report to the commission.

DEPRECIATION

The carriers claim that there is no depreciation so long as the property is maintained in a state of 100 per cent efficiency. The duty of the commission is, as they see it, to inquire whether there be deferred maintenance, and, if so, to report that; otherwise it should report no depreciation. This certainly is not true of a single simple unit of railroad property. Take, for example, a rail. This has a life depending upon the conditions of use and maintenance. Let it be assumed that the life of the rail under consideration is 10 years. At the end of the first year this rail carries the same load with the same safety as when new. It is at 100 per cent efficiency. Nevertheless one-tenth of its life has gone. At the end of five years it is still at 100 per cent efficiency but one-half its life has gone. No definition of depreciation has ever been formulated under which it could be said that this rail does not depreciate as its useful life expires.

It is conceded by the Government that a public utility has a right to demand from the public in the way of earnings an amount sufficient to cover depreciation. Will it be conceded by the public utilities of this country that nothing need be allowed for the wear of the rail or the ties? Certainly it will not be and ought not to be.

It is true that in case of a composite property like a railroad, made up of different units of various kinds with a life of varying lengths, there comes a time when renewals will offset depreciation, so that if the property is properly maintained it does not depreciate as a whole below that point.

That this is so appears from the fact that the total depreciation in case of an old railroad may be even less than in case of a much newer one. The per cent of depreciation in the highly maintained Pennsylvania line, which is 50 years old, may be less than that in some newly constructed line which is not 10 years old. This is a fact of great significance which may play an important part when it comes to devising some proper way in which to state depreciation and determine a proper depreciation allowance. It does not support the claim that there is no depreciation until a falling off in efficiency occurs.

The contention of the carriers is that to depreciate their properties and to make the depreciated value the basis for rate making is virtually to confiscate those properties by this amount; but if this be so it is because the carrier has not in the past earned, as it should, an amount sufficient to cover depreciation. A railroad should earn from the day it begins operation an amount sufficient to pay its operating expenses, the depreciation of its property, and a fair return upon that property invested for the public benefit. If it has earned that amount and if its property has depreciated 15 per cent, then it has somewhere in some form the amount of this depreciation, and the depreciation itself ought to be charged against it. It may be that in the majority of cases the railroad did not earn in its early years and could not have earned under reasonable rates a sufficient amount to take care of this depreciation; but this does not show that the depreciation itself does not occur.

The act requires the commission to show in detail, with respect to each piece of property, the cost of reproduction less depreciation. This is exactly what the division of valuation is attempting to do. No attempt has been made to depreciate each tie or each rail, but the ties upon a valua-

tion section are regarded as one piece of property, so of the rails, other track material, etc. Each building of considerable size is depreciated as a unit, and the same thing is true of shop machines, of engines, and of cars. It is inconceivable that the commission will seriously entertain the proposition of the carrier to find no depreciation unless there be deferred maintenance.

The commission uses what is known as the "straight-line" method; that is, it assumes that the total service units are equally distributed over the entire life of an article. Some suggestion has been made by counsel that this method was unjust to the carrier and ought not to be employed. No testimony has been introduced in support of this proposition. The commission is without information as to what other method might be employed or as to how it could be applied.

The straight-line method has been used generally, if not uniformly, in valuation proceedings where depreciation was shown. That was the method employed in the cases which went to the Supreme Court of the United States. It would seem to be fair to all parties, since it expresses the exact condition of the property.

CONTINGENCIES

In most estimates of the cost of reproduction in the past an allowance has been made in the nature of an overhead charge for contingencies. This has generally been computed as a percentage and has varied from 2 to 10 per cent. Some times the same percentage has been computed upon both road and equipment accounts, while in other cases a larger percentage has been used for the road accounts than for equipment. No allowance has been made for contingencies, as such, by the commission in the tentative valuation of the Texas Midland and this is alleged as error.

When the building of a railroad is in contemplation the engineer locates his railroad, ascertains what facts he can as to physical and commercial conditions under which that railroad is to be built, makes his surveys, draws his plans, and from these surveys and plans determines the quantities which will enter into the construction of the road. He then applies to those quantities what he believes to be a proper price, and thereby shows the total expense of building the railroad.

The accuracy of this estimate will depend upon the character of the man who makes it and the care with which it is made; but even though the engineer be competent and the work done with care, it is still found necessary by experience to add to the estimate from 5 to 10 per cent for contingencies to cover matters which have not been foreseen. No question can be made that the prudent engineer and the prudent investor will do this and that experience demonstrates the practical necessity for such an addition. But what are the reasons for this allowance and do those reasons apply in case of a reproductive estimate?

There are perhaps two general classes of items which justify the allowance for contingencies in case of the road to be constructed. It is almost inevitable that some things will be forgotten which are finally necessary to the completion of the property. If a complete detail of the construction expense as actually incurred be compared with the detailed estimate, it will be found that certain items in the former do not appear in the latter. These omitted items make up a considerable part of the allowance for contingencies.

In the building of the railroad unexpected difficulties are encountered. The character of the excavation is not what was anticipated. Rock is found where earth might have been expected. Bridge piers must be given a greater depth of penetration than was indicated by the borings and soundings. These and numerous other unforeseen conditions add to the total cost of the work.

Neither of these two classes of items which make up the greater part of the sum total of contingencies in new construction are present in the reproduction of the property. The road has been constructed. Every item which enters into the property is present and can be seen and inventoried. Those things which were omitted in the estimate of original construction are all here before the eye in case of the completed property. The first class of items which renders an allowance for contingencies imperative in case of new construction disappears in case of reproduction.

It may be said, although that claim has not been very clearly urged in testimony by the carriers, that it is impossible to enumerate all the items of property which enter into the construction of a railroad and that some allowance must be made to take care of inevitable omissions. While this might be so in case of an inventory hastily taken, it is not true of the inventory which is being made in this valuation.

It should be further noted that certain matters which might be termed contingencies are taken care of in the price. This is illustrated by the building accounts. In determining the reproductive cost of a building a bill of materials is prepared and prices are applied. To this an addition is made on account of contingencies or contractor's profit or both. This is to cover that element of uncertainty which exists in every estimate. The result is the outside figure for which the building could be built by the carrier or for which it could be contracted to a responsible contractor if that method were preferred. Certainly nothing further should be added to the cost thus determined on account of contingencies.

In some of the primary accounts there is no contingency. This would be so of rail. It would be true of ties if properly handled and cared for. Wherever there is a liability to loss an allowance is made on this account. In the laying of rail, for instance, a certain number of spikes will be lost. The carrier to produce a mile of track must purchase more spikes than will be found in the completed track. An allowance is made on this account, the quantity of spikes actually found being increased sufficiently to cover the quantity which must as a practical matter be purchased. The same sort of an allowance is made in other cases where necessary. It has been felt that much more accurate results can be reached in this way than by a general allowance based on an analogy which does not exist to cover something the amount of which can only be guessed at.

ENGINEERING

In determining cost of reproduction it has been the general practice to allow a gross sum for engineering in the nature of an overhead expense. It is claimed that this is not correct. The Kansas commission in its protest against the tentative value of the Kansas City Southern insists that engineering ought not to be included in one general item but should be assigned to particular pieces of property, and the first inquiry is, What practice should be followed in this respect?

The conclusion was reached after the most careful consideration with the engineers of the commission that to attempt to allocate the cost of engineering to particular pieces of property would be a refinement not practiced in the past, not called for in the present work, and which for lack of supporting data would introduce an element of greater uncertainty rather than greater certainty. It was therefore determined to adopt the almost universal practice of the past and to treat engineering as an overhead charge which could be properly stated in a single gross amount.

For the determination of this amount two methods are open, the synthetical and the historical. Under the synthetical method an attempt is made to determine the amount of engineering service which will be required and its cost.

A construction program is mapped out; the number of engineers required is determined; their grade and salaries are fixed; the length of their service is stated; and in this way the total amount of the expenditure is arrived at. This method was actually tried by the division of valuation in case of all the properties first valued with the result that we became convinced that it was neither satisfactory nor safe. The objection is that no supporting data can be found. Reliance must be placed entirely upon the judgment of the man who makes the estimate. It is not possible to bring that judgment to the test of actual experience as disclosed by the records of the carriers.

The historical method inquires what this expense has been in the past and seeks to determine in this manner what it would be today. For years engineering has stood as primary account No. 1. It is one of the few accounts which have never been changed. It has been easy to distinguish those items which should go to this account. The actual cost of engineering is therefore known with substantial accuracy as to many railroad properties.

Assuming that engineering is to be computed as a percentage, upon what base should it be reckoned? Should the entire cost of the property be taken or should the percentage be applied to certain items of cost?

The investment accounts of a railroad are divided into three general classes, road, equipment, and general expenditures. It is evident that there is no connection and therefore no necessary relation between engineering and general expenditures. This class of accounts should therefore be omitted in computing engineering.

In some cases engineering accrues as an expense in connection with equipment and in others it does not. With smaller roads and with many of the larger roads equipment engineering is furnished by the builder and becomes a part of the price paid for the completed article. It often happens, however, that equipment is furnished according to specifications prepared by the carrier and this involves an item of engineering expense. Considered as a whole, the proportion of engineering cost assignable to equipment is almost negligible.

Now, the relation between the cost of equipment and the cost of roadway varies greatly with different properties. The New Orleans, Texas & Mexico, for example, shows a reproductive cost of its roadway of approximately \$4,407,868 and of equipment of approximately \$3,997,808, while in case of the Winston-Salem Southbound the reproductive cost of its roadway is \$4,493,137 and of its equipment \$292,165. It will be seen, therefore, that there is no definite relation between the cost of engineering and the cost of equipment and therefore equipment should be disregarded in seeking a satisfactory base for the computing of engineering as a percentage.

This would leave the road accounts only and from these engineering itself should be excluded. The same is also true of land in connection with which there is little or no engineering proper. Whatever might go into that account is more properly chargeable to the cost of the land.

It would seem, therefore, that the road accounts exclusive of land and engineering afford the most reliable base for the computation of engineering as a percentage.

For the purpose of ascertaining whether engineering could properly be stated as a percentage of the above road accounts a study was early begun by the division of valuation, the results of which were exhibited to the commission by its supervisor of accounts. The property of 70 different corporations was covered. One hundred and twenty-one different projects ranging from 2½ to 900 miles in length were involved. The total number of miles of railroad construction was 9,617, the cost of which was \$302,000,000.

These projects were selected by the supervisor of accounts by taking first those properties upon which the accountants

of the commission were then engaged, and next selecting certain other properties which were pointed out by our engineers in the various districts as probably instructive. No one knew when the property was selected what the figures would show. No attempt was made to support any preconceived theory, the sole desire being to ascertain the fact, and it is believed that the result is fairly reliable. Our stock of information is being added to day by day and the sum total may somewhat change the present result, but not much.

An examination of the figures given by Mr. Brown shows that in 6 cases the per cent of engineering exceeds 6 per cent; in 10 cases it is between 5 and 6 per cent; in 4 cases it is below 1 per cent; and in 16 cases between 1 and 2 per cent. An examination of the chart introduced in connection with Mr. Brown's testimony, upon which the percentages are graphically shown, demonstrates that the great bulk falls between 2 and 5 per cent. Mr. Brown testified that a weighted average showed approximately 3.6 per cent.

The deduction from the study of the division of valuation is confirmed by the studies of the carriers, and the information accumulated by them. Mr. Hansel is chairman of a committee appointed by the president's conference committee for the purpose of dealing with the subject of engineering. He had before him while giving his testimony a compilation of data furnished him by the carriers from all parts of the country. Those figures given by the carriers themselves, and therefore not unduly low, showed an average of 4.4 per cent as stated by Mr. Hansel. It is not believed that the returns from which Mr. Hansel testified are as representative as those of the commission, for while they cover a greater mileage they only embrace 38 different corporations as compared with 70 in the compilation of the division of valuation.

Acting upon the strength of what our own studies disclosed the Washington office issued to members of the engineering board an instruction to allow for engineering a percentage of the road and track accounts, exclusive of land and engineering, which should be not less than 2 per cent nor more than 5 per cent under ordinary circumstances. If the member of the engineering board believes that there are peculiar circumstances which justify the applying of a percentage either above or below the limits thus fixed he calls the case to the attention of the Washington office, giving his opinion and his reasons in support of the same. It is then determined upon conference what percentage shall be allowed. It is believed that this is the fairest—indeed the only possible—way in which engineering can be treated in a valuation upon the scale of this one, and where it is required that the valuation shall be distributed between the several States, and it is further believed that the figures fixed are not open to serious question.

Assuming that the above rule is correct, how shall it be applied to a particular property? How shall the engineer determine whether 2 per cent or 5 per cent is the proper figure to allow?

Plainly, he must inquire as to the character of the road and the amount of engineering required. If the road is of extremely simple construction and the expenditure is ordinary in amount, the percentage would be low, while if the difficulties are many it would be high, although it should be noted that some of the most difficult projects show a comparatively low percentage of engineering cost, for the reason that the total cost upon which the percentage is reckoned is large. For example, the Florida East Coast extension from Homestead to Key West involves unusual engineering difficulties, and yet the percentage of engineering is but 2.52 per cent.

GENERAL EXPENDITURES

The best examination we have been able to give the matter indicates that 1½ per cent would be about right for the

average case, but this is computed upon all the road accounts except land. In some States a large charter fee is required, depending usually upon the amount of the capital stock and bonds named in the articles of incorporation. Our engineers are instructed to ascertain the amount of such fee and to add it to the $1\frac{1}{2}$ per cent where it is more than nominal.

It was felt at the outset that it might be necessary to determine in each case the cost of obtaining money; that is, that inquiry must be made into the credit of the company and the circumstances which would surround its financing. Further reflection, however, showed that this would be an almost impossible task and that the result would be misleading rather than informing. On the whole it seemed best to assume that the credit of all companies whose property was being reproduced was good and the same; that they could all obtain money at the same rate and purchase supplies for the same price. Upon no other theory would the cost of reproducing the different properties be fairly comparable.

This being settled the next question was, what rate of interest should be adopted? Six per cent is the legal rate of interest in a large section of this country where no other rate is specified. An examination of the sale of bonds of various kinds for the five years preceding June 30, 1914, led to the belief that this rate would be ample to cover not only the interest on the money but any brokerage which would usually be charged for the obtaining of the money. It has been assumed, therefore, that at 6 per cent whatever money is needed can be obtained and that this rate of interest will cover the entire cost of obtaining the money.

CONSTRUCTION PERIOD

The only importance of the construction period is in its bearing upon interest during construction and to an extent perhaps upon certain other overhead charges like engineering and general expenditures. While there can be no serious question as to this period in case of the Texas Midland, there will be a wide difference of opinion in many, and perhaps in most cases. The length of the construction period will be one of the debatable questions which will run into money more rapidly than almost any other and what is meant by it should be clearly defined.

With respect to the determination of the length of the construction period two observations may be made.

(1) An examination of the construction history of many railroads shows that construction has seldom proceeded as rapidly as it might economically have done. Delays have been due to a great variety of causes but oftenest to financial difficulties. For this reason the period of construction as it has actually existed in case of particular properties is not a fair measure of what the construction period for those properties should be, nor is the average construction period a fair test. The construction period as determined by our engineers is not supposed to represent the shortest period in which the railroad could be constructed but rather that period within which the work might be economically done. The usual delays which occur on the average in normal times due to labor and market conditions are assumed to exist, but unusual delays due to financial troubles and to other causes peculiar to individual properties are eliminated.

(2) All existing means of transportation aside from the property itself which is under reproduction are assumed to exist. The Texas Midland, for example, is crossed by several different roads, which makes possible the bringing in of men and materials at these junction points. This enables the engineer to proceed with his hypothetical reconstruction at several different places at the same time. Assuming that conditions are the same along the entire line a road 300 miles in extent might be reproduced in nearly the same time as a road 100 miles long.

INTEREST DURING CONSTRUCTION

It has already been stated in discussing cost of securing money that 6 per cent had been fixed upon as the rate of interest which should be allowed; it remains to consider the length of time for which this rate should be applied. In the valuation of public utilities like a railroad it has been customary in the past to allow interest for one-half the construction period. This is apparently done upon the theory that expenditures would run over the entire period of construction at about the same rate. Following this practice the division of valuation at first determined that interest should be reckoned upon the entire reproductive cost for one-half the full construction period.

The equipment of a railroad very often makes up a considerable part of its entire cost. This is not usually purchased for the most part until the road is practically completed and but little if any interest is actually paid on expenditures on this account up to the time that operation begins. For this reason it did not seem proper to treat the payments for equipment exactly the same as payments for other items of construction. It was finally decided to allow in most cases interest upon equipment for three months.

Interest was computed upon the above basis in case of the Texas Midland. In reckoning interest the entire construction period was used and interest was computed for nine months upon all accounts except land and interest.

My own opinion is still what it has been from the first. It is hardly conceivable that a railroad would be built without having provision in cash for on the average at least three months' expenditures. In addition, it must be remembered that no interest is allowed on expenditures during the preliminary period until the end of that period or until actual construction has begun. A deposit averaging that amount would undoubtedly carry with it some small allowance on account of interest from the bank, and 6 per cent is perhaps more than the average railroad has paid; but remembering that this covers not only interest on the money but the expense of obtaining the money it seems to me that the rule, while certainly a liberal one, is perhaps none too liberal.

LANDS

Some of the most important and at the same time the most doubtful and difficult questions presented arise under lands. No attempt is here made to discuss the legal phases of these questions, but simply to consider what should be done from an administrative standpoint.

Paragraph *First* of the valuation act requires the commission to report original cost, cost of reproduction new, and the cost of reproduction less depreciation of each piece of property owned or used by a common carrier for its purposes as a common carrier. If this paragraph stood alone, it would clearly impose upon the commission the duty of reporting the cost of reproducing the operative lands of the carrier.

Paragraph *Second* enumerates in detail the things which are to be reported as to the operative lands of the carrier. It is a maxim of statutory construction that a general provision may be modified by a particular provision in the same statute, and when these two paragraphs are considered together it seems evident that all the facts as to which Congress desired a report touching the right of way of the carrier are enumerated in Paragraph *Second*. If this is so, the commission is not required to report in terms the cost to the carrier of acquiring at the present day its common-carrier lands.

This, however, is not of much practical importance since paragraph *second*, as ordinarily interpreted, requires the commission to report, if not the cost of reproduction, at least what amounts to the same thing. Paragraph *second*,

which may for convenience be repeated here, is as follows:

Second. Such investigation and report shall state in detail and separately from improvements the original cost of all lands, rights of way, and terminals owned or used for the purposes of a common carrier, and ascertained as of the time of dedication to public use, and the present value of the same, and separately the original and present cost of condemnation and damages or of purchase in excess of such original cost or present value.

Every effort is being made both by the carrier and by the commission to ascertain and report the original cost of lands. The carrier is required to make return showing such cost in detail and this return when received is carefully examined and verified by the accountants of the commission. The records of the carrier, municipal land records, court records, and any and every source of information which tends to show what the carrier did actually pay for its right of way are consulted.

When it is impossible to ascertain what the carrier did in fact pay no attempt has been made to estimate the value of the lands acquired at the time of their original acquisition. Certain lands of the Texas Midland were donated and an attempt was made to ascertain the value of these lands at the time of the donation. About 20 years had elapsed. It was found exceedingly difficult to obtain reliable information and it was felt that the result did not justify the effort; since then no similar attempt has been made unless it was possible to reach a fairly reliable conclusion.

Our accountants attempt to classify this original cost; that is, to show how much was paid the landowner and whether as a purchase price or as condemnation damages, the cost of taking and recording the title, the fees paid lawyers, land agents, etc. These classified costs are assigned so far as possible to specific parcels. In a word, all the information available upon the subject of original cost is being compiled and reported in as much detail as would be profitable.

The commission has reported in the tentative valuation of the Texas Midland and in all other tentative valuations to date a present value which is arrived at by ascertaining the number of acres of land owned or used by the carrier for its purposes as a common carrier and multiplying this acreage by a market value determined from the present market value of similar adjacent and adjoining lands. Due allowance is made for any peculiar value which may attach by reason of the peculiar adaptability of the land to railroad use. Nothing is included for the expense of acquisition, nor for severance damages, nor for interest during construction.

I have myself doubted whether this was in all cases the *present value* called for by the statute. It is the market value by the acre of the lands taken; what an entire tract of such land would sell for; it is not the present value of the right of way of the carrier if that is to be determined either by what it would ordinarily cost the carrier to acquire a piece of that peculiar shape and for that use, or by the lessening of value to the entire tract of the land owner.

The purpose of the valuation act seems to have been to require from the commission a report of all those facts needed to establish the value upon which a carrier is entitled to earn. In this view it is said to be well enough to report acreage value as present value, since original cost is also reported, and if original cost is to govern, the tribunal which fixes the ultimate value can use the proper figure.

It has seemed to me that under the decision of the *Minnesota Rate case* some further investigation should be made where the original cost exceeds the acreage value and that after such investigation a present value should be determined which might or might not, according to circumstances, be the original cost or some figure differing from that. The original cost would be merely an item of evidence bearing upon present value.

No attempt has been made to show the cost of originally procuring right of way in excess of then acreage value and none should be made for the reason that it can not be shown with sufficient accuracy to be of service. To attempt to go back more than 10 to 15 years and to state the acreage value of the lands of the carrier at the time of their appropriation would be to enter the realm of speculation. Any conclusion reached would be little better than a guess. Congress certainly does not intend to require what is practically impossible. If this is to be attempted at all it could probably best be done by applying a percentage or multiplier as hereinafter indicated.

No attempt has so far been made to show the cost of procuring right of way at present time in excess of acreage value for the following reasons: (a) The meaning of the statute is extremely uncertain. (b) The *Minnesota rate case*, decided after the passage of the valuation act, has upset many theories as to the valuation of railway lands and thereby rendered unimportant facts which were previously considered to be significant. If this provision be construed as requiring the commission to show the cost of acquiring the lands of a carrier at the present time in addition to the acreage value of the land itself, then that decision has apparently rendered this work unnecessary.

Carriers insist that such is the meaning of this provision and have given evidence tending to show that it is possible to ascertain and report the fact. It is claimed that each parcel should be considered by itself, that the acreage value of the land taken should be determined, and that it should be further determined what the damages to such parcels are in addition to such land value. This is the question submitted in every condemnation proceeding and to adopt this course of action would mean that a condemnation proceeding should be instituted as to every individual parcel. I have made myself and have caused to be made by others some estimate of the expense of determining these values in that way, and the general opinion is that a conservative estimate would be from \$2,000,000 to \$4,000,000 in addition to the land work which we are now doing. My own belief is that it would be considerably more than this sum if we were to include the subsequent expenses of litigation after the tentative report of the commission had been published.

The carriers seem to assume that the commission would be satisfied to accept the showing which they might make but this can not be done. If this fact is to be determined it must be determined by the representatives of the commission. Today we have no rules or methods for the handling of this matter nor are many of our land appraisers competent to handle it. If this thing is to be done a new method of procedure must be marked out, new rules must be formulated, and a new corps of employees must be drilled.

When all this has been done and a result has been obtained, what supporting data can be marshaled to sustain it? Absolutely nothing except the opinion of some man. This is not at all so of the present land values which we are obtaining. Back of these values are opinions and assessments and of more importance than all else actual sales. It is becoming evident that the acreage values which the commission fixes either in country or in city can not be successfully attacked. The commission may publish these with some assurance that they will stand the test of the most rigid investigation. Not so with these severance damages which will have nothing but a mere opinion founded on no intelligent experience behind them.

I have never contended myself that it was impossible to report this fact. This is the issue in every condemnation case. Upon that issue witnesses are called and a conclusion is finally reached. It can hardly be said that the commission could not investigate and report its conclusion. My

thought has been that the commission was not justified in throwing away millions of money to establish a fact which the Supreme Court of the United States has held since the passage of the act to be of no account when ascertained.

If the commission is of the opinion that the act does require it to report this fact, and that this requirement of the act should be complied with before calling to the attention of Congress the decision of the Supreme Court, this can probably be done by another method, which will produce a more accurate result and will not involve much effort or expense.

It is generally understood that a railroad must pay for its right of way something more than the acreage value of the land which it takes. It has been the general impression that the value of the right of way of a railroad was determined by the cost of acquiring that right of way at the time in question under the then land values. Therefore in order to determine the value of its right of way it has been necessary to first determine this excess which the railroad must pay over and above the acreage value.

For this purpose studies have been made by State commissions and others. The actual expenditure by a railroad for its right of way in a particular case is known. The acreage value of the land acquired can be determined with substantial accuracy in just the way that our people are determining that fact today. The difference between the amount actually paid by the railroad and this acreage value represents the excess cost.

The result of these studies has usually been stated in the form of a percentage or multiple; that is, the excess cost would be as much as the acreage cost, or it might be one-half as much or twice as much. In any event it was stated in terms of a percentage of the land cost and was ordinarily known as a multiple.

If any attempt is to be made to show cost of procuring right of way, it should be done in this manner. The result would be more reliable, it would cost but little, and when once determined would leave less room for dispute and subsequent litigation.

Below is a statement of my own opinion as to what the commission should report touching the operative lands of a common carrier:

1. It should ascertain and report the acreage value. This is the basic fact upon which all other facts must depend. Whatever else is done this is the first and principal thing. The division of valuation has felt that if this fact could be accurately ascertained anything else which needed to be done or could be done would involve comparatively little effort. Up to the present time this is practically all which the land section has attempted to do.

2. This value is being reported as the present value called for by the statute, but I doubt whether this is correct. In some cases, and perhaps in most cases, the acreage value and the present value are the same, but there are instances in which this is not true. In my own opinion it would be better to report an acreage value and also a present value.

Should this be done the acreage value would be the present value in all cases where original cost, including the expense of acquisition and adding a reasonable amount for interest during construction did not exceed such acreage value. If original cost did exceed the acreage value, then some further investigation should be made. If the value of these lands had not declined since the date of their acquisition, if they were acquired with reasonable prudence, and if no unusual or abnormal condition appeared, then original cost would be stated as present value, not because original cost is present value, but because under the circumstances it would be the best evidence of such reasonable value.

3. If the commission believes that it should report cost

of acquisition at the present time, that should be stated as a percentage of the acreage value. Such percentage should be determined for each carrier and there would be no objection to giving the amount in dollars produced by the percentage.

OTHER VALUES AND ELEMENTS OF VALUE

The commission is required to investigate and report other values and elements of value, if any. Before the making of a tentative valuation upon the Texas Midland a communication was addressed to that carrier stating that it might file with the division of valuation, if it desired, a statement of the particulars in which it claimed an allowance of this character. In reply that company did file such statement, claiming an allowance on account of the following items:

- (a) Going concern value.
- (b) Connection with other lines.
- (c) Good station facilities.
- (d) Gradients.

No testimony was introduced in support of its claim by the carrier and the commission stated in the tentative valuation that upon the record thus presented it was unable to find that the carrier was entitled to any allowance on account of other values and elements of value.

It follows that since the commission is not finding an ultimate value there should be no attempt to state at this time in dollars the other values or elements of value which might be considered in the determination of a final value of this property.

NEW PENNSYLVANIA ELECTRIC LOCOMOTIVE HAULS ITS FIRST TRAIN

An electric locomotive, which was built at the Altoona shops of the Pennsylvania Railroad for use in hauling heavy trains on the Horseshoe Curve and over the Allegheny Mountains, when the main line between Altoona and Conemaugh is electrified, was given its first trial trip on August 24.

The test was conducted on the electrified portion of the main line between Overbrook and Paoli. The freight train.

The New Locomotive Under Test on the Paoli Electrification of the Pennsylvania.

which was drawn by the electric locomotive, consisted of an idle steam locomotive, 68 loaded freight cars and a cabin car. Similar tests were conducted for several days.

The new locomotive, known as class FFI, is provided with four motors and has an hourly rating of 4,800 horsepower. It can be operated in either direction, and was designed to give great power at low speed. The locomotive

measures 76 ft. 6¼ in. over-all, and has a wheel base 63 ft. 11 in. long. The driving wheels are 6 ft. in diameter. The total weight of the engine is 240 tons and the effective weight on drives is 198 tons. It is designed to operate from an 11,000 volt, single-phase overhead contact wire, taking current by means of a pantograph similar to that used on the suburban electric motor car trains in service between Philadelphia and Paoli. A detailed description of this locomotive was given on page 1199 of the *Railway Age Gazette* for June 8, 1917. The cab, frame, trucks and other mechanical parts were built by the railroad at the Altoona shops; the electrical equipment was supplied by the Westinghouse Electric & Manufacturing Company of East Pittsburgh.

The locomotive was built with the idea of developing a standard type for handling tonnage trains electrically over the grade west of Altoona, Pa., known as the Altoona Hill. This hill includes 24 miles of 1 per cent, and 12 miles of 2 per cent grade, and contains the famous Horseshoe Curve. Although the trial electric locomotive has been built and is being tested, the actual work of electrifying the section of main line referred to has not yet been authorized.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., October 3, 1917.

NEWLANDS COMMITTEE CONSIDERING WESTERN TRIP

The Newlands Joint Committee on Interstate Commerce, whose inquiry into questions pertaining to railway regulation and control and government ownership has been subjected to so many vicissitudes, is giving consideration to a plan for resuming its activities during the brief interval between the prospective adjournment of the special war session of Congress and the opening of the regular session in December. While it is understood that nothing definite has yet been decided the leaders in the committee are planning a trip to the Pacific Coast for the purpose of holding hearings in San Francisco, possibly at other western cities, and also in Chicago. Such a trip would hardly place the committee in a position to make even a partial report to Congress that would be worth while, because its investigation has been so interrupted that it has thus far been able to hear but little evidence beyond the preliminary testimony on behalf of the railroads; but many members of the committee are anxious to take advantage of the opportunity to hear from western shippers and others during the brief respite from legislative activity.

Under the resolution passed last winter extending the time for the committee's inquiry a report is required to be presented at the opening of the next session, but by an amendment to the urgent deficiency appropriation bill passed by the Senate last week, the committee is continued for another year and the time for reporting is extended until the first Monday in December, 1918. The bill was sent to conference on September 28.

The joint resolution authorizing a general inquiry into the subject of railroad regulation was passed in July, 1916, and hearings were expected to be held during the summer. At its first meeting the committee outlined a tentative itinerary for an extensive western trip but the Congressional session was so delayed by the threatened railroad strike and other matters that the hearings were not begun until November 20, continuing until December 9; and it became necessary to ask for the extension. Hearings were also held during March and May, but the declaration of war with Germany and the calling of the busy extra session now drawing to a close put further progress out of the question.

The new conditions created by the war and the concentration of the nation's energies on its prosecution are also considered to have made it inadvisable for the committee to attempt to make any final report this year.

WAR REVENUE BILL

The war revenue bill, designed to yield \$2,700,000,000 in revenue during the next year, after having been considerably revised in conference from the form in which it was originally passed in the House and from that in which it was passed by the Senate, was reported back to the House on Saturday and passed on Monday. It was passed by the Senate on Tuesday. The most important change in the provisions affecting the taxation of railroads was made in the war profits tax, for the purpose of allowing an exemption of from 7 to 9 per cent of the invested capital, as defined by the bill. The graduated scale of rates is also changed to range from 20 to 60 per cent of various percentages of the so-called excess profits. The House bill levied an excess profits tax in addition to the excess profits tax now upon the statute books of 8 per cent. of the average net income of corporations and partnerships in excess of 8 per cent of the capital actually invested and an additional exemption of \$5,000. The Senate substituted a war profits tax providing graduated rates ranging from 12 to 60 per cent upon incomes in excess of the average income during the years 1911, 1912 and 1913. The Senate provision, however, limited the exemption to an amount not less than 6 nor more than 10 per cent of the actual capital invested. The conferees on the part of the House receded from the disagreement to this amendment with an amendment levying an excess profits tax upon the excess profits ranging from 20 to 60 per cent. In arriving at the excess profits an exemption from the net income as shown by the income tax returns of not less than 7 nor more than 9 per cent of the actual capital invested is to be allowed. In addition, domestic corporations are allowed a flat exemption of \$3,000.

The bill still provides for an increase of the corporation income tax to a total of 6 per cent and also provides a tax of 10 per cent upon the amount of corporate income remaining undistributed six months after the end of each year, with an exemption of the amount actually invested and employed in the business or retained for the reasonable requirements of the business. One amendment adopted by the conferees provides that the normal tax of individuals on the income derive from interest from bonds containing a tax free covenant provision shall be deducted and withheld at the source of the income, providing that this shall not apply to the new 2 per cent normal tax until on and after January 1, 1918. The effect is to require the withholding of only 2 per cent on the income from the corporate bonds.

The compromise rates of the war tax are as follows:

20 per cent of the amount of the net incomes in excess of the deduction allowed and not in excess of 15 per cent of the invested capital for the taxable year.

25 per cent of the net income in excess of 15 per cent and not in excess of 20 per cent.

35 per cent of the net income in excess of 20 per cent and not in excess of 25 per cent.

45 per cent of the net income in excess of 25 per cent and not in excess of 33 per cent.

60 per cent of the net income in excess of 33 per cent.

The invested capital is defined as: (1) Actual cash paid in; (2) the actual cash value of tangible property paid in other than cash, for stock or shares at the time of such payment (but in case such tangible property was paid in prior to January 1, 1914, the actual cash value of such property as of January 1, 1914, but in no case to exceed the par value of the original stock or shares specifically issued therefor), and, (3) paid in or earned surplus and undivided profits used or employed in the business exclusive of undivided profits earned during the taxable year.

Several changes were also made in the proposed taxes on freight, express and passenger transportation. The tax on freight bills is left at 3 per cent. The House bill provided a tax on express of 6 per cent of the amount paid for the

transportation. The Senate amended this by proposing a tax of 1 cent for each 25 cents or fraction thereof. The compromise provides for a tax of 1 cent for each 20 cents or fraction thereof. The House bill provided a tax equivalent to 10 per cent of the amount paid for the transportation of persons by rail or water. The Senate reduced this to 5 per cent and the compromise amendment provides for 8 per cent. This applies to any form of mechanical motive power on a regularly established line in competition with carriers by rail or water. The House bill provided a tax equivalent to 10 per cent of the amount paid for seats, berths or state-rooms in parlor cars, sleeping cars or on vessels. The Senate reduced this to 5 per cent but the Senate conferees receded. The compromise amendment applying to transportation of railroad company material provides that the tax shall not apply to the transportation of company material transported by one carrier which constitutes a part of a railroad system for another carrier which is also part of the same system.

MOBILIZATION OF THE ARMY

Up to Wednesday of this week, at the time of the start of the third division of the new National Army for the training camp cantonments, the railroads had moved approximately 720,000 soldiers from their homes or quarters to training camps or embarkation points since early in August, including the regular army, the National Guard and the selective draft army. The total up to Saturday night, September 29, was 705,000. The great bulk of this army, according to a statement issued by the Railroads' War Board giving a general description of the part played by the railroads in handling the biggest troop movement ever attempted in this country, has required special train service, involving the use of 13,500 passenger cars, including 1,500 Pullman standard and tourist sleeping cars, 2,000 baggage cars and 4,500 freight cars. The part that did not require special train service was the 32,549 men included in the first 5 per cent of the National Army that moved by regular trains on September 5.

Approximately 40 per cent more, 275,000 men, were entrained from September 19 to 23 and 25 per cent more, or approximately 172,000, are included in the division to be entrained from October 3 to 7. It is expected that the balance of the citizen soldiers will begin to move to the cantonments beginning October 17 and there are some additional units of the National Guard to be taken care of.

The figures as to the percentages of the National Army to be moved on different dates as originally planned are somewhat larger than the number actually moved on those dates because of the fact that some of the cantonments were not quite ready to receive the complete quotas and because of the complications introduced by the plan of moving the colored men in separate trains. As a result the balance to be moved beginning October 17 will be somewhat larger than originally contemplated. This, however, is in no way the fault of the railroads as they have displayed a remarkable example of efficiency throughout the entire performance, which has progressed "with smoothness and success," according to a statement by Secretary of War Baker.

The troop movement problem has been a most difficult one to handle. Some conception of what it has meant may be deduced from the fact that in the National Army movement alone the railroads have had to prepare special schedules covering the 4,531 towns and cities designated by the Provost Marshal General as the points of local concentration from which the recruits proceed to their cantonments, and the special train movements have had to be so directed as to prevent interruption to the regular passenger service.

These schedules were prepared by the various territorial passenger associations and the extent of the work involved may be appreciated from the fact that in the office of the

Transcontinental Passenger Association, under the direction of Chairman E. L. Bevington, which had the longest hauls to arrange for, 75 clerks have been employed for several weeks on their preparation; and in the office of C. L. Hunter, vice-chairman of the Trunk Line Association, a force of 60 was employed. Of the local concentration points, those where the largest number of men were to start were designated as extra coach or special train points, while the men from the smaller towns started on regular trains. The points at which additional men were to be taken on the trains were all provided for in the schedules, as well as those at which extra coaches were to be added. At certain concentration points the extra coaches were made up into special trains to run through to the cantonments. All of these schedules were worked out well in advance, submitted to and approved by the War Department and then distributed to each of the local boards in charge of the entrainment. In many cases they were prepared sufficiently in advance to have them printed. The longest haul made in the new National army movement to date, according to the statement of the Railroads' War Board, was that of the special train which moved the citizen soldiers from Yuma, Arizona, to Fort Riley, Kansas, a distance of 1,514 miles. This trip occupied 48 hours.

The shortest distance traveled by any unit of the new National Army was that of the District of Columbia unit to Camp Meade in Maryland, a trip of less than 25 miles.

Practically all of the National Guard movements to date have been of great length. The longest one was that made by a battalion of San Francisco engineers from San Francisco, California, to a point on the Atlantic Coast. This battalion included 506 men and 18 officers. They occupied a special train comprising one standard sleeper, nine tourist sleepers, one baggage car, two kitchen cars and three box cars. Their train left San Francisco at 4 p. m. on September 1 and arrived at destination at 10:15 a. m. September 8.

The railroads have taken every step possible to safeguard the lives that the government has entrusted to them, and to complete the troop movement without delay and also without interfering with the abnormal amount of commercial traffic that the war has produced.

The railroads have experienced some difficulty in certain cases because of a lack of complete control by the military authorities over the drafted men en route and reports have been made of a number of specific instances of wanton damage to passenger cars by troops. This has been particularly noticeable in the case of some of the men from the Northwest. A report was received stating that a large number of the selected men who boarded a train in Montana were "crazy drunk" and not only seriously injured several of their own number in a scrimmage on the train, but murdered one train porter and threw another off the train while it was running 50 miles an hour. They also broke into a baggage car and took \$300 worth of food supplies. The railroads have taken up with the War Department the question of securing protection from incidents of this kind.

A bulletin issued on June 15 by the acting chief of staff of the army stated that the many complaints received and claims filed for damage to railroad equipment in recent movements of troops would indicate that commanding officers of troop trains are not complying with the field service regulations regarding the keeping of order on trains. One of these rules requires the commanding officers of each troop train to take such action as may be necessary to prevent railroad equipment from being defaced or injured in any way by his command and that he will particularly caution all concerned against throwing articles from cars, a serious accident having occurred from this cause. Where any damage or defacement is noted, a report is to be made through proper military channels to the adjutant general of the army and the railroad representative is to be given an acknowledgment. Railroad officers have been directed to arrange to have a joint inspection made at destination.

The Twenty-ninth Annual Meeting.

American Railway Accounting Officers Meeting

Universal Through Interline Waybilling, Accounting
for Government Business and Other Important Reports

THE twenty-ninth annual meeting of the Association of American Railway Accounting Officers was held at the Congress Hotel, Chicago, on September 26 and 27. Of the approximately 700 members of the association there were over 200 present. The meeting was a strictly business one; there were no entertainment features provided. Every effort was made to carry out the work of the association with all the speed consistent with a thorough consideration of the subjects discussed.

EXECUTIVE COMMITTEE

UNIVERSAL THROUGH INTERLINE WAYBILLING, THROUGH
RATES AND SIMPLIFIED DIVISIONS.

There exists at this time and probably will continue to exist for an indefinite period an urgent necessity for:

(a) The conservation and minimization of clerical man power.

(b) The conservation of revenues by reducing operating costs.

(c) The prompt and expeditious movement of freights.

(d) The continuous movement, without intermediate delays for rebilling of freights, of all freight cars moving under inter-road loads.

Local waybilling to and from intermediate junctions or inter-road freights, both car load and less car loads, act as a means of preventing the accomplishment of those necessities above referred to. Complicated divisions and the absences of inter-road rates act as a deterrent to the establishment of through interline waybilling and to the minimization of clerical costs incident thereto.

The Association of American Railway Accounting Officers, realizing all the benefits to be gained from such through interline waybilling has for years past strongly advocated its universal adoption with, thus far, but little substantial success. The difficulty would seem to be largely in its inability to forcefully interest the several freight traffic officers and traffic associations in its importance.

The association has through its standing Committee on Freight Accounts created a sub-committee, charged with the duty of meeting and conferring with the several freight traffic committees and associations for the purpose of impressing upon the members of such committees and associations the importance of the simplification of inter-road divisions and the establishment of through rates, to the

end that interline waybilling may be universally adopted.

While that sub-committee has been both progressive and aggressive in its work, it has apparently met with but lukewarm success, and but little, if any, substantial progress has thus far been made.

The needs herein stated are so pressing and the benefits to be derived from universal through interline waybilling are so apparent that this association deems it to be its duty not only to continue its present activities, through its freight committee, but to strengthen the hands of that committee and to bring the question to the attention of the chief executives of the railroad, and to those ends, be it:

Resolved: The president of this association be, and he is hereby directed to direct the standing freight committee to continue until otherwise directed, the sub-committee created by it to confer with freight traffic committees and associations urging the simplifications of inter-road divisions and the establishment of through rates to the end that the universal adoption of through interline waybilling may be made at once practicable as well as economical. Be it further

Resolved: The president of this association be, and he is hereby directed to appoint an associate committee, consisting of five chief accounting officers, to be territorially selected, whose duty it will be to act with and to as far as possible aid the sub-committee of the freight committee in accomplishing the ends sought by it to be accomplished; and be it further

Resolved: That the president of this association be, and he is hereby directed to, either direct or through the sub-committee on Military Transportation Accounting, bring these preambles and resolutions to the attention of the Special Committee on National Defense of the American Railway Association.

BILLS FOR CAR REPAIRS

The committee approved the recommendation that there be added to the accounting officers rules printed in the rule of the Master Car Builders' Association the following sentences: "All bills should be rendered promptly. Bills rendered after one year from date of repairs may be declined."

CHARGING HIGHER RATES ON FREIGHT SHIPPED "TO ORDER"

It was resolved that while the committee appreciates the question of additional expense and responsibility involved

in connection with "order notify" shipments the Association of American Railway Accounting Officers, not being a rate-making body, the matter does not come within its province.

MEMBERSHIP CHANGES

During the year the committee has admitted 77 new members to the association and on April 21, 1917, the association had 695 active members, representing 298,852 miles of railroad and certain express companies and water carriers. This is an increase of 52 active members as compared with April 21, 1916. The association has 69 honorary members.

CORPORATE, FISCAL AND GENERAL ACCOUNTS

A MINIMUM FOR ADDITION AND BETTERMENT CHARGES

The chairman of the committee is in receipt of a letter dated June 10, 1916, from Thomas W. Hulme, general secretary Presidents' Conference Committee, Philadelphia, Pa., reading:

As a member of the sub-committee conferring with the government on modification of Valuation Order No. 3 governing the reporting of additions and betterments and deletions, you have full knowledge of the recent suggestion of Director Frouty of the Division of Valuation that there should be a modification of the requirements of the Interstate Commerce Commission through their order of July last requiring the charging, as I understand it, to capital account of all expenditures, no matter how small, which are not properly chargeable to expense accounts. It seems to me that this matter is one that in the first instance should be dealt with by the Association of Accounting Officers and not by this organization on valuation. I understand there is to be a meeting of the standing committee on corporate, fiscal and general accounts on the 26th. I, therefore, recommend that the subject should receive their consideration and will thank you to advise me of developments in connection therewith.

I will mention this subject at the meeting of the presidents on the 16th instant, but will not ask them to take any action thereon.

That letter was presented to the committee by Chairman A. H. Plant with the following comments:

The members will recall that when the present classifications of road and equipment and of operating expenses were promulgated the railways were given the option of charging expenditures for additions and betterments for amounts less than \$200.00 to operating expenses. This privilege was optional.

Subsequently and apparently at the suggestion of the Division of Valuation the Interstate Commerce Commission withdrew this privilege and directed that all items of expenditures for additions and betterments, regardless of the amounts involved, be charged to the property accounts and not to operating expenses.

Confronted with the difficulties of recording additions and betterments under this revised rule and of reporting them to the Division of Valuation under order No. 3 of that division, the general secretary of the presidents' conference committee appointed a subcommittee consisting of two accounting officers and two engineers to confer with the representatives of the division of valuation looking to a modification of the reports to be made under valuation order No. 3. During the conference which was held by that subcommittee and the representatives of the division of valuation, it was suggested by the division of valuation that an order be issued under which the railways would be required to charge to and to report as operating expenses all expenditures for additions and betterments below an amount to be determined. Such a rule to be made mandatory.

The subcommittee for the railways was requested to give the matter consideration, to make a canvass of the railways, and to ascertain whether such an order would be feasible or not and also to advise the division of valuation what figure, in its opinion, should be used as a minimum.

The subcommittee for the railways, at a subsequent meeting with the division of valuation, stated that the matter was of such importance as to justify more careful and deliberate consideration and that it was not prepared at that time to make any recommendations in respect to it.

The matter being one both of policy and of accounting,

it was felt by the subcommittee and also by the general secretary that it should be referred to the members of the Standing Committee on Corporate, Fiscal and General Accounts for, first, the ascertainment of the views of their chief executives as to the policy features, and second, for a full discussion of the subject from an accounting standpoint.

After carefully considering the matter, the committee adopted the following resolution:

WHEREAS, The Division of Valuation, Interstate Commerce Commission, has suggested the issuance of an accounting order changing the present rules and under which any expenditures for improvements and extensions of existing property when the amount is below a minimum, to be established for that purpose, shall be charged to operating expenses and not to investment account; and

WHEREAS, While this committee recognizes that the rules, as they now stand, are probably in accordance with correct accounting, it also recognizes that the additional work required in carrying out those rules is so great as to cause an expense not warranted by the results; therefore be it

Resolved, That a change be made in the present rules so as to permit amounts within such minimum to be charged to investment or to operating expenses, at the option of the carrier.

DEPRECIATION OF EQUIPMENT

The committee is of the opinion that depreciation should be based on the ledger value of equipment as of the last day of the period preceding that for which depreciation is figured.

Fred W. Sweney, chief examiner of accounts of the Interstate Commerce Commission, wrote to the chairman of the committee asking whether or not it would be possible to make an assignment to private accounts of the investment in equipment prior to July 1, 1907, in order that accounting for depreciation on such equipment should be simplified. Mr. Sweney suggested that if an assignment on an actual basis cannot be made, estimates be employed. The committee, however, did not think it advisable to make the separation as suggested where this involved assigning an estimated value to equipment. Where the actual cost of the equipment standing in the property account can be determined the committee was of the opinion that the separation could be made.

OMITTING TREASURER'S NAME ON DRAFTS

By direction of President R. A. White, the following letter of May 16, 1916, from L. G. Scott, comptroller, Wabash Railway, was submitted for consideration by the committee:

I find that it is the practice of a large number of roads in making drafts for interline and per diem balances to show the name of the treasurer on the drafts. In order to do this it is necessary to refer to the Official and Equipment Guides to ascertain the name of the treasurer, and this takes a great deal of time.

In looking through the drafts drawn by foreign roads upon this company that were paid today, I find the following:

Forty drafts show name of the treasurer.

Twenty drafts drawn on the treasurer, without name of the treasurer being given (in some of these cases the word "treasurer" was printed on the draft).

Twenty-three drafts drawn on the Wabash Railway, St. Louis, without any reference to the treasurer.

It occurred to me that it might be well to bring this matter to the attention of the accounting officers members of the association, and the matter is referred to you to take whatever action you may consider desirable. If the practice of dropping the names of the treasurers was adopted by all of the carriers it would certainly eliminate an immense amount of work in making monthly drafts.

The committee is of the opinion that this is a matter for local determination and action by each individual line.

ACCOUNTING FOR REBUILT CARS

The committee recommends the adoption of the following resolutions:

Resolved, That this association approves the effort of the Special Committee for Conference with the M. C. B. Association to establish uniform rules for settlement between roads

for destroyed cars, and believes that where a car has been rebuilt, the settlement should be on the basis of a new car.

Further Resolved, That the determination of whether or not a car has been rebuilt should not depend upon the dollars spent but upon schedules of work done which this association hereby asks the special committee to recommend that the Master Car Builders' Association prepare.

Further Resolved, That this association recommend to the Division of Carriers' Accounts, Interstate Commerce Commission, that the existing rule for the retirement of an old unit and the substitution therefor of a rebuilt unit of equipment be amended so that the factor for determining the retirement shall be based upon physical changes reflected by the schedules recommended in the foregoing resolutions, rather than upon costs.

GENERAL BALANCE SHEET ACCOUNTS

The committee is of the opinion that the item in the general balance sheet "interest matured unpaid" should be omitted so that interest payable July 1 which is now included in that account would be included in "unmatured interest accrued."

CLASSIFIED STATEMENT OF EQUIPMENT

The committee is of the opinion that it is not necessary to make provision for a separate showing for work locomotives in schedule 414.

EQUALIZATION OF OPERATING EXPENSES

The following is a letter, dated March 27, 1917, from Fred W. Sweeney, chief examiner of accounts, Interstate Commerce Commission, addressed to Chairman A. H. Plant:

The returns submitted by carriers in response to accounting series circular No. 50, "Opening Reserve Accounts," indicate that all carriers do not uniformly interpret the provisions of section 19, "Equalization of Expenses," in the special instructions on page 37 of the classification of operating revenues and operating expenses of steam roads. It is provided that:

"For the purpose of equalizing the monthly charges for the repairs of fixed improvements and equipment the carrier may include each month in the appropriate primary repair accounts a uniform proportion of the amount of authorized estimates of such expenses for the fiscal or calendar year."

The question has been raised as to the construction to be placed on the phrase "uniform proportion," it having been pointed out that a uniform proportion is not necessarily an equal proportion.

For the purpose of developing the views of the committee and arriving at consistent treatment by all carriers employing operating reserves for the permissive equalization of operating expenses, the matter is submitted for the consideration of the committee so that if it is regarded as desirable an accounting case may be prepared which will clearly indicate the construction to be placed on the text in question.

The committee appointed the following subcommittee to confer with the commission's representatives on this matter and report to the committee: A. H. Plant, chairman; C. M. Bunting, C. B. Seger and G. R. Martin.

MODIFICATION OF REPORTS AND STATISTICS REQUIRED BY GOVERNMENT BODIES

The executive committee of the Special Committee on National Defense of the American Railway Association, recognizing the substantial decrease in clerical man power and clerical efficiency of the railroads occasioned by enlistments in the several branches of the government, the selective draft and other conditions brought about by the war on the one hand, and the multitude of accounting and statistical requirements imposed by governmental and supervisory bodies upon the railroads, and the abnormal conditions under which government men and materials will be transported during the war, requiring increased clerical efficiency over normal conditions to properly account, between the government and the railroads, for revenues earned under those conditions on the other hand, has under consideration an appeal to the several federal and state bodies to which the large volume of reports are now made by the railroads, for some relief from the burdens thus imposed.

As an initial step in that direction the chairman of the

committee was requested, by the executive committee referred to, to convene the Standing Committee on Corporate, Fiscal and General Accounts, for the purpose of making a careful study of the reports, statistics and accounting requirements of the several governmental bodies, with a view to making its recommendations as to the extent such requirements might be modified, as will be seen from the following minute of that executive committee:

"A. H. Plant appeared before the committee and was requested to convene the Committee on Corporate, Fiscal and General Accounts of the Association of American Railway Accounting Officers to consider a possible reduction in the Accounting system now required by the Interstate Commerce Commission and to make a preliminary report thereon. It was the feeling of the committee that when the preliminary report is received, consideration should be given to holding a conference concerning it with representatives of the Interstate Commerce Commission, and Clyde B. Aitchison, representing the state railroad commissions, before a formal report is made on behalf of the executive committee to the Interstate Commerce Commission."

Thereupon a meeting of the committee was held in Washington on Thursday, August 16. Twenty-two members of the committee, including the president of the association, attended the meeting, either in person, by representatives or by vesting in the committee authority to act for them.

The committee, after hearing fully the objects sought to be accomplished, decided that the best results could be obtained by referring the working out of the details to a subcommittee. This subcommittee, having associated with it, Dr. Lorenz and Mr. Sweeney of the Interstate Commerce Commission, after considering the matter in great detail, reached its final conclusions and made its report, which report was, by the Chairman of the committee, submitted to the executive committee of the Special Committee on National Defense of the American Railway Association on Wednesday, August 22, 1917. The report was, upon its presentation, taken into consideration of the committee, submitted to the executive committee taken by it to bring about the recommendations of the committee with respect to a joint conference between representatives of the Interstate Commerce Commission, the state commissions, and the railroads, looking to reaching final conclusions in the matter.

The corporate committee during its deliberation upon this subject, concluded that the matter could be more effectively handled through its subcommittee on Statistics and Accounts, with the addition of C. B. Seger. After reaching their conclusion, it delegated the handling of the entire question to that subcommittee with full power to act and to carry the matter to a final conclusion.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS
Standing Committee on Corporate, Fiscal and General Accounts
Office of the Chairman, 1300 Pennsylvania Avenue, N. W.

WASHINGTON, D. C., August 22, 1917.
To the Executive Committee of the Special Committee on National Defense of the American Railway Association, Fairfax Harrison, Chairman:
Sir—In the matter of Docket A-127:

Complying with a minute of your committee promulgated August 9, 1917, requesting that the standing committee on corporate, fiscal and general accounts of the Association of American Railway Accounting Officers be convened for the purpose of considering a possible reduction in the accounting systems and reports required of the railroads by governmental bodies, you are advised that the accounting committee convened, gave due and careful consideration to the matter submitted to it by you, and presents herewith its report.

(1) The annual report required of class 1 railroads by the Interstate Commerce Commission includes approximately 100 separate schedules or statements, which may be divided into the following general classes, i. e.,

- (a) Historical,
- (b) Corporate and Fiscal,
- (c) Operations,
- (d) Statistical, including special studies.

Each of the schedules was carefully considered by the committee, due consideration being given to the retention of data relating to the corporate, financial and operating results of railroads. The committee's conclusions with respect to that report are that some of the schedules can be eliminated, others modified and still others consolidated with other schedules without impairing the value of the report.

The modifications suggested, if adopted by both federal and state com-

misions, would result in substantial savings in man power and would materially aid the railroads in meeting abnormal accounting and physical conditions brought about by the war.

The committee's recommendations in detail are contained in Exhibit "A," which is made a part of this report.

(2) Practically all of the states require annual reports similar to those required by the federal commission with, however, more or less applications and elaborations. Many of the states require separations of results of operations as between those within and without the state, and further separations of results as between interstate and intrastate operations. Still others require allocations to show separately operating costs applicable to passenger service and to freight service of both state and interstate business.

You will, of course, appreciate that the several states generally follow the federal commission in their annual report requirements, therefore the full measure of relief sought by the railroads cannot be obtained unless the several states will modify their requirements in line with such concessions as may be made by the federal commission. It is the hope of the committee that the state bodies will accept, without modification, copies of reports required by the federal commission.

The committee has reason to believe that the several states are in a receptive mood with respect to a general review and possible modification of the statistical data now required of railroads by them. This belief is predicated upon a report made by a committee on statistics and accounts of the National Association of Railway Commissioners submitted to and adopted by it at its annual meeting on November 13 and 17 of last year. An excerpt from such report is herewith submitted as Exhibit "B."

(3) Many of the schedules required by the annual reports and not a few of those required monthly and periodically call for statistics apparently for specific studies and for the information of statisticians and others who seek information for compilations to be prepared by them. In this connection attention is directed to schedule No. 320 in the annual report calling for a segregation of expenses between freight and passenger; this is covered by a specific order and classification of the commission, and such separation has been made since July 1, 1915. The statistics required in schedule 330 are experimental and have been kept for a sufficient time to afford the commission a basis for any study which they may desire to make. During the war period such reports will not reflect normal operating conditions. It is recommended that the order and amended classification be suspended during the period of the war, if not permanently.

The value or reliability of statistics made for comparative purposes, or for the purpose of determining unit costs is materially lessened when the factors from which they are produced are disturbed by abnormal conditions.

The conditions under which the railroads will be required to handle traffic during the period of the war will have a marked effect upon such factors, thus, in the opinion of the committee, destroy their usefulness.

(4) Many demands are made upon carriers by the Division of Valuation for statistical data. The reports required by it, in addition to the engineering and field work, are numerous and require large forces for their compilation.

As an illustration, under the terms of Order No. 3, recently issued, carriers are required to report in detail units, quantities and prices of practically all additions and betterments work done by them since the time of valuation. Careful consideration results in the conclusion that the burdens placed upon carriers by the terms of this division could be substantially reduced, and every requirement of the division could be met if the order were modified so that carriers would report only the total cost of each project and be required to record and retain as matters of record in their offices the basic data the details of which, with respect to each project, would be at all times available to the commission.

In addition to the federal requirements many states having completed individual valuations require of railroads monthly and periodical reports of additions and betterments. The recommendations made with respect to the Federal Valuation Order No. 3 applies with equal force to the requirements of the states. A copy of Valuation Order No. 3 is attached and marked tabular "C."

It should be understood that the data required by Order No. 3 is not limited to the period of valuation, but it is continuous for all time; therefore, the burden imposed by a compliance with it will not cease with the completion of the valuation work.

(5) The information called for by schedule No. 561, employees and their compensation, in the annual report, was compiled originally in accordance with suggestions made by the American Railway Association. It is a costly schedule to produce, and it is recommended that it be reviewed by the proper committee with a view to its modification.

(6) The committee understands that a sub-committee of the American Railway Association now has under consideration recommendations looking to the simplification of the form of accident report required from carriers to be filed with the federal commission. Railroads representing something like 204,000 miles made 153,000 accident reports during the year 1915.

(7) As to boiler inspection and other operating reports, your committee recommends that the possible simplification of these reports be studied by other committees having to do with the details of such reports. During the year 1915 the railroads made approximately 2,174,000 boiler and boiler inspection reports.

(8) In addition to the requirements which may be classed as "accounting," many and varied other reports are required by regulating bodies, some monthly, others periodically, such as reports of shop operations required by the Census Bureau; reports of various classes of traffic required by the Agricultural Department, etc. Efforts should be made to reduce the number of such reports.

(9) A compilation made by the Bureau of Railway Economics, Exhibit "D" attached, shows that during the year 1915 (the latest data available), railroads representing approximately 204,000 miles of road were required to compile approximately 1,876,000 original reports to governmental and other supervising bodies, many of which were required in duplicate. These reports vary from a monthly report, by stations, of the number of cars of milk shipped from each station, to the complete annual report required by the federal commission, which report is required in duplicate.

(10) Enlistments, the selective draft, and demands made upon the railroads by governmental and industrial bodies for experienced clerks, have materially handicapped the railroads in producing records and data necessary

to maintain the integrity of their accounts and in properly safeguarding and accounting for revenues earned by them. This condition is increasing, and will continue to increase during the period of the war. On many railroads, offices heretofore adequately and capably equipped clerically, are now confronted with depleted forces, or are, to a large extent, dependent upon new and inexperienced clerks.

(11) The data necessary to the compilation of all the reports required originate largely in line, agency and divisional offices. The data thus originated is passed along through the various channels until it reaches the department charged with the duty of compiling and reporting it; therefore, it may be reasonably assumed that practically every department on the railroad has a clerical as well as supervisory duty to perform in one way or another in preparing or accumulating data necessary in the preparation of these reports.

In order to properly meet demands which will be made upon them because of war conditions, the railroads will be taxed to their maximum capacity in meeting physical conditions incident to and necessary in the movement of men and materials, and in handling their commercial traffic. This condition, coupled with depleted forces by reason of conditions noted in paragraph 10, will make it very difficult, if not quite impossible, for the railroads to prepare in its line and general offices a large volume of the data now required by governmental bodies.

(12) It is the opinion of the corporate committee that to produce any appreciable results in the saving and conservation of man power by the reduction of reports, statistics and other data now required by governmental and supervising bodies, it will be necessary to give careful and thorough consideration to the various reports now required from railroads. This can only be done through concerted action on the part of

- (a) Representatives of the federal commission;
- (b) Representatives of the state commissions; and
- (c) Representatives of the railroads.

It is recommended for your consideration that a joint meeting of the three interests be held at an early date for the purpose of going into the entire matter in detail and reaching a mutual understanding as to what modifications, eliminations, consolidations and simplifications can be made in the entire schedule of reports now required from railroads, and the committee recommends that such action be taken.

The committee awaits your further pleasure.

Respectfully submitted, A. H. PLANT, Chairman.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS

The following is an excerpt from a report of the Committee on Statistics and Accounts of Railroad Companies of the National Association of Railway Commissioners, submitted as a part of the report of the Committee on Corporate, Fiscal and General Accounts:

"There have been brought to the attention of this committee the results of an inquiry made by the Bureau of Railway Economics regarding reports required to be filed with federal and state authorities by carriers by steam railway. From a preliminary study of the returns it appears that during the year ended June 30, 1915, the number of reports filed by the larger carriers, representing slightly less than 205,000 miles of operated road, aggregated 1,876,208. Some of these were required to be filed in duplicate and the number of duplicates was 1,115,570, making a grand total of 2,991,778. Of the number of originals, 1,565,042 were filed with federal authorities and 299,551 were filed with state authorities, while 11,615 were filed with local authorities. Some of these reports consisted of but a single sheet, while others were relatively large. Some were largely composed of matter which the carriers would record for their own purposes, while others contained little or no matter of value to the carriers. In view of the number of reports, it seems advisable to examine critically, at proper intervals, the list of reports required and to eliminate those no longer useful.

"In connection with the matter of reports required to be filed by carriers, your committee respectfully suggests that it would be well for the various commissions represented in the association to secure wherever necessary greater latitude for administrative discretion in the matter of requiring reports to be filed in certain cases. Many of the smaller carriers state that they find the provisions of the laws requiring reports in numerous cases to be burdensome, and while your committee does not wish to underrate the importance of ample and accurate records with respect to the efficiency of operation of even small carriers, it is satisfied that the necessity for certain reports is less in the cases of small carriers. Carriers in the Interstate Commerce Commission's Class III, those earning less than \$100,000 per annum, while amounting to more than 48 per cent of the total number of operating carriers by steam railway, exclusive of switching and

terminal companies, report operations on less than 3½ per cent of the operated *road* mileage, and less than 2½ per cent of the operated *track* mileage, and their revenues were less than one-half of 1 per cent of the total for the country. If the matter of the character and number of reports to be required of this class of carriers were left to the discretion of the respective commissions, unnecessary burdens upon these small companies might be lessened without sacrificing any public interest. It is not suggested that commissions should not have full authority to inspect books and other records of such corporations and to require the institution and maintenance of such records as the administration of the law by such commissions may show to be necessary, but it is the view of your committee that the determination of such records and the details of the reports to be required of such corporations should be left to the respective commissions, rather than be fixed by statute. The statute should, so far as practicable, prescribe only the controlling principles, leaving the details to be worked out by the commissions."

The report was signed by A. H. Plant, comptroller of the Southern Railway, as chairman, and was approved by the association

INTERLINE CARD WAYBILLS

Interline card waybills have been used by carriers to a limited extent in certain restricted territories to facilitate the movement of freight for which regular revenue waybills cannot be prepared in time to accompany the freight from the shipping point. They were adopted originally upon the recommendation of the Association of Transportation and Car Accounting Officers with the understanding that they would eliminate delays and congestion at junctions and terminal stations. Their use was quite general some years ago, but as they were found to be unsatisfactory, and encouraged delay in the preparation of revenue waybills, many carriers refused to accept freight from connecting carriers unless accompanied by revenue waybills, with the result that they are not now used extensively.

The principal argument advanced for the use of the interline card waybill is that it expedites the movement of freight. This argument has force as applied only to the movement of freight out of the point of origin and any slight delay at the point of origin occasioned by having the revenue waybill accompany the freight is more than offset by the expedited movement through the junction points and the prompt delivery at destination. At the point of origin by proper co-operation between the shippers and the railroads, the revenue waybill can and should be made to accompany every carload shipment. It is the sense of this association that the use of interline card waybills for carload shipments should be discontinued entirely and that they shall be used for L.C.I. shipments only upon authority of the accounting officers of the carriers interested.

Interline card waybills for L.C.I. shipments should be checked by the destination carriers against the revenue waybills, and if revenue waybills are not received within twenty-four hours after arrival of the freight, the waybills carrier should be requested to furnish revenue waybills.

A. A. R. A. O. standard form 111, interline card waybill, should be used when specifically authorized upon conditions mentioned in paragraph No. 92.

PROTECTION OF DESTINATION WEIGHTS

It is the fundamental principle underlying the association rules and practices that the destination road is charged with assessing the correct transportation charges. This principle is seldom questioned in connection with weights when we are dealing with interline waybills. When, however, we come to weights on rebilled shipments, some roads want to depart from this principle and dictate to the destination road what weights and what proof of weights shall be used, and

this notwithstanding that if the very same shipment were moving on a through interline waybill, the whole question would probably be left entirely to the destination road. In the opinion of the committee, this exception in regard to rebilled shipments is altogether illogical and places an unjust and irksome burden on the destination road, by requiring it to defend its weights and to produce weight certificates and other proof of weights that would not be required if the very same shipment had moved on an interline waybill. In the opinion of the committee this anomaly should be removed, and to that purpose the committee recommends the adoption of the following, which, in principle, is in accord with the rules of the Freight Claim Association:

Destination Weights on Rebilled Shipments. Initial and intermediate carriers shall accept the weights that are used by the destination carrier in assessing freight charges on rebilled shipments, and shall not require the destination carrier to substantiate the weights so used by weight certificate or otherwise.

QUALITY OF PAPER WAYBILLS

It has been observed by freight accounting officers that some roads are printing waybills on paper so thin and flimsy as to cause trouble to every one who deals with them. These waybills are so limp that they are hard to assort and bind, and crumple to a degree that makes them hard to read. By reason of their lack of toughness, important words and figures are frequently torn off. This is a false economy when all railroads are considered.

It is, therefore, strongly recommended that all waybill blanks be printed on paper of adequate weight and toughness.

ILLEGIBLE FREIGHT BILLS

The synopsis of 1916, in paragraphs 162 to 169, clearly sets forth the proper method of preparing waybills; the Standard Freight Bill Association No. 123, gives all data necessary for the proper preparation of this document.

Agents have been cautioned through circulars and letters to be careful in the preparation of waybills, transfer billing and freight bills, but the committee is of the opinion that the only way to prevent complaints is a systematic check of waybills against shipping orders, and of transfer bills and freight bills against waybills, with a view to eliminating any errors or omissions made in transcribing.

Errors and omissions are not entirely chargeable to agents and their forces. The shippers can render valuable assistance by preparing bills of lading and shipping orders with more care, and should not turn these documents—forming the foundation on which the waybills are built up—over to the agents, unless they are convinced that all the information necessary to render a perfect and satisfactory waybill is shown thereon, and that all the various documents furnished with the shipping order are legible, distinct, and, above all, that no abbreviations of any kind are used.

This action was taken by the committee on a complaint made by the National Industrial Traffic League to the Interstate Commerce Commission.

COMBINATION OF LOCAL RATES

Inasmuch as government freight is moving in large quantities, and, under the present emergency, must be moved promptly, it is very important that all carriers adopt and follow a definite, uniform plan of rendering accounts and making settlements among themselves in connection therewith.

Therefore, the recommendations contained in the 1916 Freight Synopsis, paragraphs 119 to 129, inclusive, are hereby reaffirmed, with the further recommendation:

That separate abstracts, division statements, and summaries be rendered in the settlement of transportation charges on government property; that the destination carrier

report currently tonnage and revenue and divide the revenue among the carriers interested. The abstracts, division statements, and summaries may be stamped "Government accounts—not subject to draft until the charges are collected," it being understood that the collecting carrier will notify the interested carriers promptly when amounts are collected, so that drafts can be drawn.

The Sub-committee on Military Transportation Accounting of the Special Committee on National Defense is now creating a Government Transportation Accounting Bureau in Washington, through which it is proposed, in conjunction with the depot quartermaster at Washington, to prepare and settle the accounts covering freight and passenger transportation for the government. The committee is informed that under the proposed arrangement prompt settlements of transportation accounts may be expected by carriers and that delays similar to those heretofore experienced will be avoided under the proposed plan of the Sub-committee on Military Transportation Accounting.

The report of the committee, which was signed by W. W. Strickland, freight auditor of the Atchison, Topeka & Santa Fe, as chairman, was approved by the association.

PASSENGER ACCOUNTS

OVERCOLLECTION ON TICKET SALES

The committee is of the opinion that overcharges on passenger tickets amounting to \$1 or less on any one ticket should be handled in the same manner as indicated in case 202; that is, carried in the passenger revenue accounts until refunded.

REDEEMED AND EXCHANGED TICKETS

The committee submitted the following questions to the twenty-one carriers represented on the committee:

1. What tickets are reported *with* revenue?
2. What tickets are reported *without* revenue?
3. How are agents' accounts cleared for those tickets reported with revenue and exchanged for other than cash?

The replies received show the practices of such carriers to be as follows:

	Reported by agents	
	With value	Without value
Tickets sold for cash.....	21	None
Tickets issued on Government or State request.....	13	8
Tickets issued on prepaid orders.....	12	9
Tickets issued on exchange orders.....	13	8
Tickets issued on those exchanged for other tickets.....	11	10

Three carriers reply that *all* tickets issued by agents whether receiving cash for same or not are reported by them with revenue, one more carrier replying that they are contemplating adopting same system.

Where tickets are reported by agents with revenue without receiving actual cash for same, their accounts are cleared by a majority of the carriers through a suspense account. Two replies indicate that they consider such an account unnecessary.

PATTERN OF PUNCH FOR LIMITING TICKETS

Resolved. That the association recommends the use of punches provided with L or O (circle) dies for indicating limits and classes on interline tickets, and also for indicating routes and destinations on multi-route tickets, but that the association would recommend that the O (circle) die be used in preference to the L punch.

SETTLEMENTS FOR GOVERNMENT TRANSPORTATION

This association reaffirms its previous action in the matter of reporting out tickets issued on government orders, as shown in the Passenger Synopsis, except that during the existing war it will be permissible for carriers to render a separate report of tickets stamped "Government account—not subject to draft until charges are collected," with the understanding that the collecting carriers will notify the

interested carriers promptly so that drafts can be drawn.

Where tickets issued on government orders are included in the regular reports, separate sheets should be used for such items, marked "Government," in order that these may be readily distinguished from the regular ticket sales.

A. J. GILLINGHAM

It comes to our attention that Mr. A. J. Gillingham, assistant to comptroller, Pennsylvania Railroad, will, on August 31, 1917, retire from railway service, and will resign as an active member of the Association of American Railway Accounting Officers, and the standing committee on Passenger Accounts.

It seems appropriate that the committee should pause and express its regret at parting with such an able, enthusiastic worker, and wish for him a happiness that comes from a life well spent. The committee acknowledges its indebtedness, in ungrudging measure, to Mr. Gillingham for his long, faithful and helpful service on this committee. His enthusiasm has been contagious. He has given his time freely for its welfare, and the work of the committee will bear his impress for all time to come. He has always had the interests of the committee at heart.

Mr. Gillingham is a man of forceful, convincing, pleasing personality—a good companion, a worth-while friend. After all, the friendships we make constitute the best part of life, and we have been fortunate indeed in having Mr. Gillingham for a friend, companion and fellow-worker.

The report of the committee was signed by W. F. Van Bergen, auditor of passenger accounts, Chicago & North Western, as chairman, and was approved by the association.

DISBURSEMENT ACCOUNTS

RECLAMATION OF SECOND-HAND MATERIAL

The terms "Second-hand Material" and "Reclaimed Material" are frequently used in a somewhat confusing manner and in order that there may be no misunderstanding as to the use of the terms the committee would define "Second-hand Material" as such material as has been released from use in such condition as that it may be applied again without repair or other process of manufacture.

"Reclaimed Material" is material picked up or acquired during the usual process of repairs and renewals, or as the result of obsolescence, which by a process of manufacture has been made usable in some form.

Accounts should be kept to which should be charged, at its scrap value, all material when placed in process of reclamation. To these accounts should also be charged the cost of all labor and material used in the process of reclamation, together with a proportion of shop and store expenses.

Reclaimed material should be charged to stock accounts at its cost as determined by the method outlined in the preceding paragraph.

CAR REPAIR BILLS

The subject referred to the committee naturally divides itself into two sections, viz.:

(a) The extent to which the accounting department should be responsible for correct accounting in connection with car repair bills and vouchers, and

(b) Whether it is the best practice to do as much of the accounting work as may be possible in the audit office or have it done by the mechanical department, the audit office merely to verify the calculations.

Taking up the first (a) proposition, the committee reports as follows:

The accounting department should supervise and be responsible for correct accounting in all departments; therefore, should assume responsibility for the correct preparation of car repair bills and for the proper checking and vouchering of such bills received from foreign lines.

With respect to the second (b) proposition, the committee reports that:

Based on the experience of roads which have adopted the plan of handling this work in the accounting department, and as a result of consideration of the subject, the committee is of the opinion that it is the best practice and the best results are obtained by handling this work in the accounting department. The following reasons suggest why the work can be more efficiently handled in the accounting department than in the mechanical department.

(a) The car department is organized, equipped and trained to give its first attention to the making of the repairs in order to get the cars back into service and necessarily is not likely to attach the same importance to recording and accounting for the repairs made as does the accounting department.

(b) The accounting department is composed of men who are trained to do all classes of accounting work. The accountant is not wedded to any particular branch of the service, but is taught to look out for the interests of all. He appreciates the relative value of small things and understands the necessity of looking out for them in an effort to stop all leakage in the matter of accounting for revenues and expenses. So far as matters of accounts and accounting are concerned, his training along analytical lines enables him to make investigations more thorough and complete than would be possible by a man not so trained. By concentrating all accounting work in connection with the preparation of car repair bills and vouchers in the accounting department, the carrier is assured of a uniform interpretation of the M. C. B. rules as they may apply to repair cards turned in from all repair points, by men who are qualified to interpret these rules correctly, and of the prompt preparation of bills and vouchers according to the most practical and scientific methods, resulting in bills and vouchers being taken into proper month's accounts. To these advantages may be added the additional advantage of having bills presented more promptly for collections; less danger of bills becoming lost in transit from mechanical department to accounting department; usually more convenient accessibility to the car accountant's records which have to be consulted frequently, etc.

RAIL REQUIREMENTS

Where rail requirements are made involving the substitution of lighter second-hand rail for heavier rail released, the credit to road and equipment shall be based on the difference between the weight of the rail laid and that released at current prices of the rail laid.

STORING IRON AND STEEL

The committee is of the opinion that the expense of unloading, reloading and storing iron and steel articles for export should be handled through the regular station accounts and the revenue should be divided between storage—freight and miscellaneous. The report was signed by A. Hermany, auditor of disbursements, Chicago, Rock Island & Pacific, as chairman and was approved by the association.

COMMITTEE FOR CONFERENCE WITH THE FREIGHT CLAIM ASSOCIATION

COLLECTION OF DEFICITS

When shipments are refused or unclaimed at destination, and freight and accessorial charges are not collectible from consignee by reason of non-assumption of ownership, such deficit may be charged to the initial carrier. The initial carrier shall be required to make necessary legal effort to collect from shipper. In the event that initial carrier is unable to collect after proper legal effort, the deficit shall be proratable. The above shall not apply when shipments are otherwise provided for by tariff.

HANDLING ASTRAY FREIGHT

After further consideration of this matter, the committee recommends that astray freight should be forwarded to marked destination on a distinctive form of astray freight waybill, but that no freight charges should be shown thereon by billing agent.

The report was signed by C. E. Hildum, auditor of freight accounts of the Erie, as chairman, and was approved by the association.

COMMITTEE FOR CONFERENCE WITH THE MASTER CAR BUILDERS' ASSOCIATION

A subject brought to our attention was that in connection with bills rendered by various companies against each other. It appears that in Rule 91 of the M. C. B. Association there are certain rules which are referred to as being those of the Association of American Railway Accounting Officers, but such rules do not specify any time after which bills would not be considered and the attention of the committee was directed to bills rendered by one company against another covering repairs made over ten years previously and the M. C. B. Association requested that we include in our rules the following:

"All bills should be rendered promptly. Bills rendered after one year from date of repairs may be declined."

Under the circumstances the committee felt that the request was a reasonable one and accordingly wrote Mr. Robinson, the president of our association, requesting that the matter be brought before the executive committee of our association at its meeting February 12 and 13, 1917. This was done and the executive committee approved our action and under date of February 19, 1917, Joseph W. Taylor, secretary of the Master Car Builders' Association, was advised accordingly.

The other matter and the one for which this committee was primarily appointed was the question of a check on car repair bills, which was fully discussed between the three committees named. It developed that at a meeting of the American Railway Association held sometime previously, that association had appropriated not to exceed \$3,000.00 a month to defray expenses of an investigation to be conducted by the Master Car Builders' Association, that association to employ ten men for the purpose of conducting the investigation.

The Master Car Builders' Association were agreeable to have the committee appoint five representatives and their committee appoint five for the purpose of making the investigation. This has been done and at the present time the secretary of the M. C. B. Association is endeavoring to secure from the various railroads of the country such credentials as will enable the ten representatives to make whatever investigation is finally decided upon should be made. We have not as yet agreed upon a method of procedure, but as soon as the secretary of the M. C. B. Association is in possession of all credentials, the matter will be agreed upon promptly and it is hoped that the investigation will be started at an early date.

The report was signed by M. P. Blauvelt, until recently comptroller of the Illinois Central, as chairman and was approved by the association.

PRESIDENT'S ADDRESS

When elected president of the association, I accepted the great honor with many misgivings, one being on account of my inability to deliver an address. It is, therefore, probably fortunate for the members present, as it certainly is for me, that this meeting was called for business purposes only, and that the change in the order of business, which is effective for the first time this year, has so placed the time for delivering the president's address that about all the business of the association he had to talk about has been fully cov-

ered in the reports of the committees and the discussion of the same. So my remarks must necessarily be brief.

War conditions have made necessary some changes in the practices governing the accounting between carriers for government business carried, as have been covered by the reports of the standing freight and passenger committees.

The synopses covering the recommendations of the association, now in effect, the issuance of which was authorized at this meeting, will, in my opinion, be of very great interest and benefit to the members.

I think the railroads are to be congratulated that this association does not intend to discontinue the fight it has so unsuccessfully waged in the past for through tariffs with simplified divisions and through billing arrangements, as is indicated by their action today. I feel certain that if, as suggested by Mr. Plant, the matter is brought to its attention, we can safely figure on assistance from the Special Committee on National Defense.

In his address at the Detroit meeting, President White stated that the "question of the change of the fiscal year had been carried to the court of final resort." That court has given a verdict in favor of the plaintiff and, knowing as I do the important part that Mr. White and those working with him had in the accomplishment of this result, they are entitled to the thanks of the association.

My attention has been called to the fact that changes have been made, from time to time, in some sections of the constitution and by-laws which are not in perfect harmony with the provisions of other sections; and, yesterday, your attention was called to the fact that the rules for both active and honorary membership qualifications have not always been uniformly construed by the executive committee, with the result that in some years applicants have been elected, while in others, those with like qualifications have been rejected.

I think you will agree that the rules governing the conduct of the association should be made so plain that they cannot be misunderstood, and especially, that the rules regarding membership qualifications should be so worded that "honor can be given where honor is due," which I do not think is always possible as they now read; and I therefore would recommend that the president be instructed to appoint a special committee of at least three (of which he will be one and, possibly, the vice-presidents the other two) to carefully revise the constitution and by-laws so as to meet conditions partly outlined above, reporting its recommendations direct to the association.

The conditions mentioned in paragraph 10 of the report of the standing committee on Corporate, Fiscal and General Accounts to the executive committee of the Special Committee on National Defense, in reference to the scarcity of clerical help, as given on page 11 of the Supplemental Agenda, is becoming very serious, as it is getting more and more difficult to retain the services of experienced clerks even at the increased wages railway companies are able to offer. As vacancies occur they have to be filled with inexperienced male clerks and by the employment of a larger proportion of women than has heretofore been thought practicable—all of this in face of increased demands on the accounting departments for information made necessary by the unusual conditions. While in the past the question of economy has not been overlooked, it has been (experienced help being plentiful) considered from a financial angle, but now we are compelled to consider it from, to most of us, an entirely new angle. It would, therefore, seem that this requires a special study not only into the methods of accounting, the reports required and the possibility of the elimination of those features not absolutely necessary for safeguarding the revenues of the company, but, also, as to the practicability of installing additional mechanical ap-

pliances that will accomplish a saving in labor with, or without, a saving in expense.

As many of the practices now being followed and forms now in use were, in the interest of uniformity, recommended by the association, it would seem that the association could be of great assistance to the railroads in this matter, and I would, therefore, recommend that the president be authorized to appoint a special committee for the purpose of making this study. Or, if that is not thought advisable, that he be authorized to delegate the appropriate standing committees on commerce in either case for early consideration, their recommendations to be submitted to the president for printing and distribution to the members of the association.

As will be noticed from the reports, the work of the different committees has broadened in the effort that has been and is being made to make the association of the utmost benefit to its members. The reports submitted include the largest number of subjects that has ever come before the association, and I wish to extend my thanks to the committees for the promptness with which they have handled the matters that have been brought to their attention and the consideration given to any suggestions that I have made.

In conclusion, it is probably unnecessary for me to say that the work of the secretary has been performed in his usual efficient manner, and has been more than satisfactory. It will be noticed from his report that, with twenty-five retirements, the membership of the association has been increased by fifty-two during the year, with an increase of over seven-thousand miles of railroad represented. The finances of the association are in first-class shape.

RESOLUTIONS

The following resolutions were adopted by the association:

Resolved, That the president and the two vice-presidents shall constitute a Special Committee on the Revision of the Constitution and By-Laws, whose report shall be submitted for action at the next annual meeting of the association.

Further resolved, That this resolution, as provided in Article XII of the constitution, is notice of amendment and revision.

Resolved, That the president appoint a special committee of five to prepare recommendations as to how accounting officers may best meet conditions confronting them with respect to clerical labor and the compilation of accounting and statistical data, particularly with respect to the use of mechanical devices as a means of solving the shortage in experienced clerical labor. The recommendation of this special committee shall be submitted to the president and distributed to all members as early as possible.

A paper was read by W. H. Williams, vice-president of the Delaware & Hudson and chairman of the board of directors of the Wabash, on Financing Modern Warfare.

St. Louis was fixed as the place for the next meeting of the association.

ELECTION OF OFFICERS

J. A. Taylor, comptroller of the Central of New Jersey and vice-president of the association, was elected president, succeeding L. A. Robinson, comptroller of the Chicago & North Western. R. E. Berger, assistant auditor of the Wabash and second vice-president of the association, was elected first vice-president, succeeding Mr. Taylor. A. D. McDonald, vice-president and comptroller of the Southern Pacific, was elected second vice-president, succeeding Mr. Berger. The following were elected members of the executive committee to succeed four retiring members of the committee: J. J. Elkin, general auditor of the Baltimore & Ohio; W. D. Beymer, comptroller of the Central of Georgia; H. A. Gray, comptroller of the Northern Pacific, and L. G. Scott, comptroller of the Wabash.

NEW FLOOR PLANS FOR POSTAL CARS

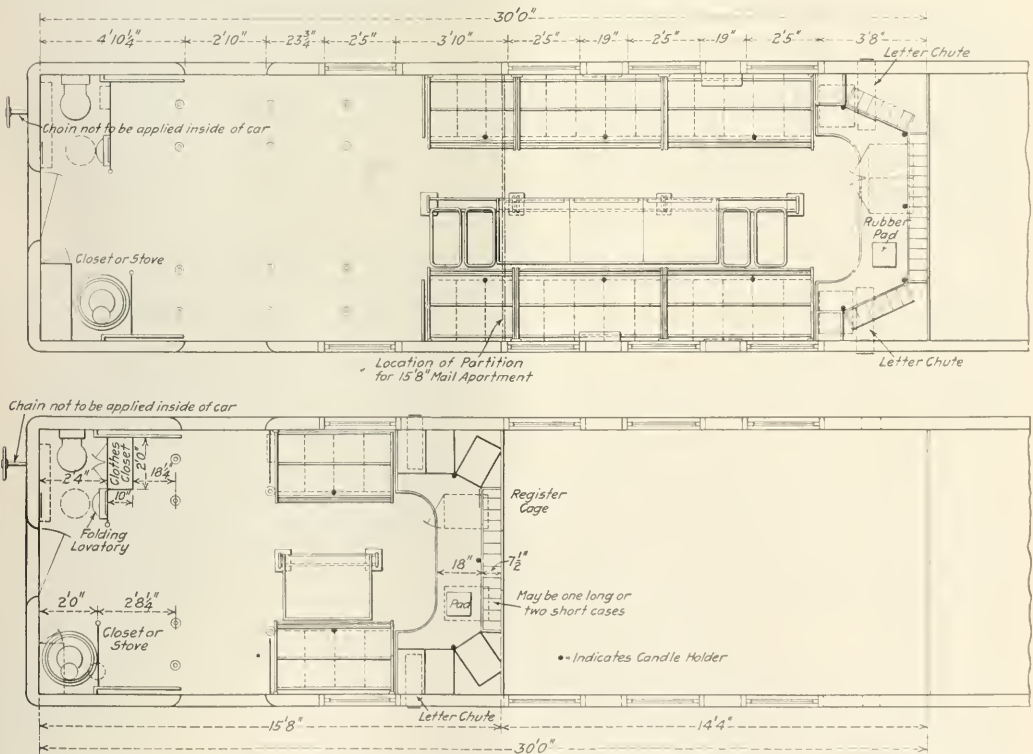

A modification of plans for the construction of postal cars has been approved and issued as an optional standard by the Division of Railway Mail Service of the Post Office

necessary to increase or decrease the space devoted to handling mail. The cost of maintaining postal cars conforming to the requirements of the Post Office Department should be materially lessened by this arrangement.

The new plans consist of minor modifications of existing

Plans for Converting the 60-ft. Mail Car to the 30-ft. Compartment

New Optional Floor Plans for 15-ft. and 30-ft. Floor Plans

Department. The changes have been made with a view to providing designs that can be easily converted from one standard length to another when service conditions make it

standards which will make it possible to convert a 60-ft. postal car into a 30-ft. apartment car, or change a 30-ft. apartment car into one having a 15-ft. apartment. In case

it is desired to return to the original arrangement it can be done at slight expense. These changes have been made possible by making the location of the doors and windows common to either size car.

The Post Office Department points out in connection with these plans that the work of transforming from one length to another may be greatly facilitated by making the interior equipment more nearly portable than is customary at present. Screws and bolts may be used for securing fixtures which are now permanently attached to the car body. It is also suggested that roads building 60-ft. postal cars which may at some future time be changed to 30-ft. apartment cars, may make it easy to change one end of the cars into a baggage compartment by framing the side doorways at one end for the company's standard baggage door-opening and filling in with false work to reduce the door openings to 2 ft. 10 in., the standard for postal cars.

Complete plans for the 15-ft.-30-ft. mail apartment are shown on Railway Mail Service drawing sheet M, while the plans for the 60-ft. mail car convertible to a 30-ft. apartment are shown on sheet N.

THE RESULTS OF CO-OPERATION

Reports just compiled for the Railroads' War Board indicate that the traveling public in general and the shippers in particular are giving the finest kind of co-operation to the railroads in the handling of the increased traffic that the war has produced. What this co-operation means may be gleaned from these facts given in a statement issued by the board:

Since May 1 the railroads, aided by the loyalty and understanding of the public, have been able to reduce their passenger service by approximately 25,000,000 miles. This has released thousands of train crews and locomotives for use in the freight service and cleared thousands of miles of track, thereby facilitating the movement of coal, food products and supplies needed by the government.

In addition to the foregoing saving of equipment and trackage, the shippers, big and small, have rallied so splendidly to the slogan, "Make one car do the work of two," that a saving of close to half a million freight cars has been accomplished. This saving of freight cars has enabled the railroads to move approximately 25 per cent more freight since war was declared than during the same period last year.

Intensive loading and a general increase in the size of the "trade units" used by the various industries has rendered possible the saving of car space. Cotton, for instance, which was formerly moved in units of 50 bales, now moves only in units of 65 and 75. As there are 18,000,000 bales to be moved by rail each season, the increase in the trade unit in this one commodity alone has produced a saving of anywhere from 83,000 to 125,000 cars.

Sugar, on which the carload minimum from the South was formerly only 24,000 lb. per car, now moves only on a 60,000 lb. carload minimum.

The producers of manufactured food products, especially the canners, have also come to a realization of the value of intensive loading, and are now loading virtually all of their cars to capacity.

Coal, which has been loaded beyond the marked capacity on most lines since the beginning of the war, is also moving freely now, although labor trouble in some parts of the country is tending to counteract the efforts of the railroads to meet the abnormal demand for fuel. During the past month, the supply of cars on the "lake coal" lines has been increased 25 per cent and there has been some increase in the movement of bituminous coal to lake ports, but it has not been proportionate to the increased supply of cars, as labor trouble has tended to decrease the mine production.

Although excellent results have been achieved to date through the co-operation of the shippers, the travelling public and the railroads, it will be necessary for all concerned to exert renewed efforts, as the abnormal demands upon the railroads in the movement of both troops and supplies is constantly increasing, while the securing of new equipment is virtually impossible.

From now on, it is stated, 2,500 cars a day will be required by the government to move food and supplies to the men in training at the National Army, National Guard and other encampments, while the demand of the Allies for cars to carry export goods to the seaports will be practically doubled. All of this additional traffic must be moved by the railroads, although they have only 3 per cent more equipment than they had at this time last year.

RAILWAY REGIMENTS' TOBACCO FUND

A movement has been started to have the railway supply companies and railway supply men of the United States raise a "Railway Regiments' Tobacco Fund." As this statement implies the purpose is to raise a fund with which to buy tobacco for the members of the railway regiments which have been organized and which are yet to be organized for service in the war in France.

The movement was initiated by F. A. Poor, president of the P. & M. Company, Chicago. He took the matter up with S. M. Felton, president of the Chicago Great Western, who is director general of railways for the United States government. Mr. Felton in a recent letter to Mr. Poor said, "It is quite difficult to have any tobacco delivered directly to the regiments in bulk so we will have to use the parcel post, and my suggestion would be to send twelve 20-lb. packages to each regiment each week. I think each package should contain 15 lb. of Bull Durham with necessary cigarette papers and 5 lb. of pipe tobacco. I do not know if this is too much of a contract for you or not, but as your letter spoke of 'regiments' I am giving you the addresses of all nine."

In order to raise the necessary funds a committee has been organized composed of the following: F. A. Poor, president, P. & M. Company; chairman: R. P. Lamont, president, American Steel Foundries, George A. Post, president, Standard Coupler Company and of the Railway Business Association, E. H. Bell, president, the Railroad Supply Company, and of the Railway Appliances Association, J. M. Hopkins, president, Camel Company, A. C. Moore, vice-president, Safety Car Heating and Lighting Company, and Samuel O. Dunn, editor, *Railway Age Gazette*, secretary. A meeting of this committee was held at the Chicago Club in Chicago on Tuesday.

It will be noted that the amount of tobacco required fully to supply each regiment, will be 240 lb. a week, or, a total of 2,160 lb. for the nine regiments. It has been ascertained that this amount can be bought for \$1,080, and it is hoped to raise this amount. John Washburn, vice-president of the Continental & Commercial National Bank, of Chicago, has consented to act as treasurer of the fund.

PERUVIAN RAILROAD EXTENSIONS.—The Central Railway of Peru will be extended through Ayacucho southward until it connects with the Southern Railways of Peru at a point near Cuzco. This extension will bring within the reach of the coast the extensive coal deposits of Jatunhuasi where there is said to exist an excellent steaming and coking coal in almost inexhaustible quantity. A bill recently passed also provides for the extension of the Southern Railways of Peru and the State Railways of Bolivia. The extension of the Chimbote Railway will bring the rich silver mines and agricultural lands of the Department of Ancash within reach of the coast.

General News Department

The Pennsylvania Railroad has advanced the pay of large numbers of trackmen from \$2.10 a day to \$2.30.

The Oregon Short Line recently granted increases in pay averaging 7 per cent to its telegraph operators, numbering 286.

The striking telegraphers of the Great North Western Telegraph Company, Canada, returned to work October 1. The reports say that they received an advance in pay.

Arguments were to be heard by the United States Supreme Court this week in the Illinois passenger fare case involving conflict between the Illinois 2-cent fare law and a decision of the Interstate Commerce Commission establishing a rate of 2.4 cents a mile.

S. M. Felton, director general of railways, announces that twelve units of railway officers, consisting of division superintendents and their staffs, under a general manager and two general superintendents, are to be sent to Russia to rehabilitate the Trans-Siberian Railway.

The Supreme Court on Tuesday heard arguments on the appeal from a decision of the District of Columbia court holding that Milton H. Smith, president of the Louisville & Nashville, must answer questions propounded to him by the Interstate Commerce Commission having reference to the expenditure of the funds of the road for political purposes.

The Court of Appeals of Kentucky has affirmed the decision of the lower court imposing a fine of \$500 against the Mammoth Cave Railroad for failing to obey the law requiring separate cars for negroes. The road is nine miles long and runs a train twice a day carrying passengers and freight. Usually this train has one coach, carrying both passengers and baggage.

A conference was to have been held at Washington on Thursday of this week between a committee representing the Association of American Railway Accounting Officers and representatives of the Interstate Commerce Commission and of the National Association of Railway Commissioners, to consider the possibility of reducing to some extent the requirements of the commissions as to accounts and statistics to be furnished by the railroads, in order to reduce the amount of work required of their clerical forces during the war.

At the suggestion of the United States Food Administration R. H. Aishton, chairman of the Central Department Committee of the Railroads' War Board, has sent a circular to the railroads in the wheat belt asking them to take every action deemed expedient to eliminate fire hazards in the vicinity of country and terminal elevators. It is suggested that each individual road take action in the direction indicated and that they secure the cooperation of grain dealers to this end.

Between 350 and 400 switchmen on the Elgin, Joliet & Eastern struck on September 27 for a 50 per cent increase in wages. At the time of writing a settlement with the men had not yet been reached and the movement of traffic to and from the steel plants at South Chicago, Ill., and Gary, Ind., which the road serves, had been seriously interfered with. The steel plants have been unable to work at full capacity on account of the lack of transportation facilities since the strike went into effect.

The Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific, the Michigan Central and the Chicago & Alton, have filed claims for exemption for those of its train service employees coming within the age limit prescribed by the draft law, whose loss would cripple the efficiency of the road. The requests made by the roads are not in the nature of applications for blanket exemptions but are petitions for individual exemptions for those employees whose retention is most important from an operating standpoint.

The United States Civil Service Commission announces examinations, October 23, for freight rate clerk, men only, at salaries from \$1,200 to \$1,500. Positions are open in the War

Department at Philadelphia and at Norfolk. Applicants must have had five years' experience, and knowledge of the procedure on land grant railroads. At Norfolk, the clerk must have had experience in demurrage, billing and freight claims. The commission also announces examinations October 30 for senior signal engineer, grade 2, for the valuation department of the Interstate Commerce Commission, salaries \$1,800 to \$2,700. Applicants must be between 25 and 45 years old.

About 200 telegraphers on the northern (Buffalo & Allegheny) division of the Pennsylvania Railroad struck on September 26. It is said that the men acted independently of any regular union. The railroad company after issuing an ultimatum on September 28 proceeded to man the offices with operators from other divisions and elsewhere and passenger traffic was kept going, though with considerable delays for several days. Coincident with this report comes a despatch from Altoona saying that telegraphers on the middle division of the Pennsylvania (and, evidently, on other divisions) have had their pay advanced \$3.20 a month; and that this is the second advance which has been granted to them since September 1.

In passing the urgent deficiency appropriation bill on September 25, the Senate adopted an amendment to the provision governing the compensation to be paid to land grant railroads so as to provide that land grant railroads organized under the act of July 28, 1866, chapter 300, shall receive the same compensation for transportation of property and troops of the United States as is paid to land grant railroads organized under the land grant act of March 31, 1863, and the act of July 27, 1866, chapter 278. The purpose of this was to give the Missouri Pacific the usual land grant rate, 50 per cent of the regular rate, on that part of its line in Illinois serving a training camp. The line had a land grant dating from 1866, containing a provision under which the War Department has held that the road was entitled to no compensation.

Promotions in the Army

W. W. Atterbury, vice-president of the Pennsylvania Railroad, who, under General Pershing, has been in charge of railroad affairs in France several weeks, and who, on September 14, was appointed director general of transportation in that field, was, on October 2, nominated by President Wilson to be a brigadier-general in the National Army, with that rank from August 5. Colonel Chauncey B. Baker, of the Quartermaster Corps, was at the same time nominated to the same rank.

Railroad Port Agents Appointed

At the request of Colonel Chauncey B. Baker, chief of embarkation service, the Commission on Car Service has directed its various local sub-committees and interested railroads at other points to designate a representative as railroad port agent at each of the principal seaports of the country, to act as adviser to the local United States Army Quartermaster, or other officer sent temporarily to handle United States government freight for oversea shipment.

Women Employed to Replace Men Called to Colors

Railroads in the Middle West are gradually adding more women to their pay rolls to take the places of employees who have left to serve their country. The Northern Pacific recently employed four women for clerical work in the local freight office, eight in the yard office and one in the mechanical department at Duluth, Minn. In addition, the road already had at work six women in the roundhouse in that city, one in a clerical position in the car shops and 14 at manual labor. The women employed for manual labor in the mechanical department are largely engaged in wiping engines and cleaning up around the cinder pits, while of those in the car shops, one works at a bench repairing air apparatus and 13 are in the yard unloading grain-door lumber.

The Chicago, Burlington & Quincy has employed 12 women at its St. Joseph (Mo.) shops to clean up rubbish on repair tracks, sweep shop buildings and wipe locomotives. The Grand Trunk recently employed a woman ticket agent in its Chicago city office, and the Chicago & North Western a station mistress at Ames, Iowa.

Two prominent roads in the East have women at work in track-repair gangs.

Disastrous Collision at Kellyville, Okla.

In a butting collision of passenger trains on the St. Louis-San Francisco a short distance west of Kellyville, Okla., on the 28th of September 25 passengers were killed and 28 were injured. One of the trains was almost completely wrecked, while in the other a coach was telescoped by the mail car. A majority of the killed were negroes and the list included also three Indians. It is said that the men on the engines of both trains escaped serious injury. The eastbound train had the right to the road and the westbound should have waited for it at Kellyville; but the men in charge of the westbound, seeing an empty troop train standing on the side track assumed, without investigation, that this was the train which should be met at that point.

Luncheon to Australian Commissioner

The Railway Business Association was the host at a luncheon given at the Union League Club, Chicago, September 26, in honor of H. C. Hoyle, former Minister of Railways of New South Wales, who is making a tour of Canada and the United States as a special commissioner to deal with railway and other important problems in connection with war. Mr. Connelly, agent-general, in London, of Western Australia, who was in Chicago, was also the association's guest. George A. Post, president of the association, presided, and there were present about 80 members and guests. In Mr. Hoyle's address he said that he was getting in touch with makers of railway goods suitable for use in Australia. He is paying particular attention to cars and locomotives and their parts; problems of fuel and lubrication; machinery and tools; and labor-saving devices for use in railway construction, operation and maintenance. He requests manufacturers to send him catalogues and other information at Sydney, N. S. W.

Tuesday "Beefless Day" on Dining Cars

Commencing this week, Tuesday of every week will hereafter be "beefless day" in the dining cars and restaurants of many lines of the country. This step has been decided upon at the request of the United States Food Administration, for the purpose of aiding in conserving the beef supply of the country. The elimination of beef on Tuesdays will be complete, and will apply not only to steak and roast beef, but also to tongue, corned beef, rib-ends, ox-tails, etc.

For the purpose of further aiding the United States Food Administration in the campaign to eliminate waste in the use of foodstuffs of all kinds the Pennsylvania will place on the tables and counters of all its restaurant cars and restaurants cards containing a reprint of the Food Administration's general plan of saving. The reverse side of the card will contain the statement that the restaurant service of the Pennsylvania System is a member of the United States Food Administration.

Bankers' Railway Bulletin

A new series of the Bankers' Railway Bulletin, which first made its appearance ten years ago, but was discontinued, has been issued by Jean Paul Muller of the Statistical News Service, Washington, formerly a statistician of the Interstate Commerce Commission. The new series begins with the September issue and it is proposed to issue it at the end of the third week of each month hereafter, as long as the subject matter has news value. The purpose of the bulletin as originally published was to familiarize the financial press, the investment banker and the public with the chief items of current information relating to the financial results of railroad operation contained in the monthly reports of railways to the Interstate Commerce Commission. The new series is expected to be of special interest on account of the Interstate Commerce Commission's recent decision, in the 15 per cent rate case, in which it expressed the intention, for the future, of keeping in close touch with the operating results of the rail-

ways in connection with their desire for an advance in freight rates. It is intended to bring to the attention of those interested data now available monthly through a change in the form of the monthly report, which became effective on July 1, and to present results of railway operation deducible therefrom in a manner most easily understood by everybody, which is in terms of the average annual percentage and of return on the investment in railway property. This important feature is shown graphically on the front cover page in the form of a chart entitled "Barometer of Railway Earnings."

The September issue covers the July returns, which are reported by the carriers early in September. These show that the rate of return on investment in railway property (owned and leased) of the 186 Class I roads was slightly lower in July, 1917 (6.81 per cent), than it was in July, 1916 (7.00 per cent). It also shows that the rate of return for the first six months of the calendar year 1917 was lower than that for 1916. On another page the investment, net income and percentage are given by groups for the month of July and the seven months period of the year with comparisons with the previous year. Six pages of the report are devoted to the figures showing railway operating revenue, net railway operating income, investment in road and equipment and rate of return for the systems and individual roads, which will be of service to bankers and investors whose interests are confined to specific roads. On the final page is presented a copy of the new form of monthly reports which went into effect on July 1 and which makes it possible to show the percentage of return. The bulletin is prepared in such a way as to make it especially useful for convenient reference by those interested in an analysis of railway returns.

Three Railroads Subscribe \$15,000,000 to the Liberty Loan

One of the features of the first day's campaign for subscriptions to the second issue of the Liberty Loan were subscriptions of \$5,000,000 each by the Union Pacific and the Southern Pacific.

The directors of the Atchison, Topeka & Santa Fe Railway Company, at a meeting held on Tuesday, also voted to subscribe \$5,000,000 to the second Liberty Loan of 1917. This sum will be distributed through five of the Federal Reserve districts through which the road is operated.

American Electric Railway Association

The conference which is to take the place of the annual convention of the American Electric Railway Association and its affiliated bodies, The American Electric Railway Accountants' Association, the American Electric Engineering Railway Association, the American Electric Railway Claims Association, and the American Electric Railway Transportation and Traffic Association, will be held at the Engineering Societies building, 29 West 39th street, New York, October 9, at 9:30 a. m.

The program includes papers on the following subjects: "General Survey of Present Electric Railway Problems"; "Is the War Bonus Practicable as a Means of Wage Adjustment in the Electric Railway Industry?"; "Female Substitutes for Male Employees"; "The Pending Applications for Fare Increases in New York State." There will also be topical discussions on various methods of increasing fares: (a) "Charge for Transfers," (b) "Increases in Flat Rates for Present Zones," (c) "Shortening Present Single Fare Zones."

Engineers' Society of Western Pennsylvania

At the regular monthly meeting of the Engineers' Society of Western Pennsylvania to be held in the auditorium of the Union Arcade building in Pittsburgh, October 16, an illustrated paper will be presented by George H. Barbour, a mechanical engineer of Pittsburgh on "Wheel Contracts on Rail Heads."

Associated Business Papers Convention

The annual convention of the Associated Business Papers, Inc., will be held at the Congress Hotel, Chicago, October 11, 12 and 13. The program for the morning sessions will cover special problems of the business papers. On the afternoon of October 11 the editors will be in charge and will discuss problems concerned with increased effectiveness of the business papers during the war and following its close. On the afternoon of October 12 the general topic will be "Business and the War" and speakers of

national importance will discuss the transportation problem, foreign trade, control of prices and supply of raw materials, co-ordination of business and government, and merchandizing and the war. "Business and the War" will also be the underlying thought of the program at the annual dinner on Friday evening, October 12. Governor Whitman will be one of the speakers.

New England Railroad Club

The next regular meeting of this club will be held at Copley Square Hotel, Boston, Tuesday evening, October 9. There will be an address on "The Freight Car; a Factor in Winning the War," by E. H. DeGroot, Jr., chief of the division of car service of the Interstate Commerce Commission.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

AIR TRAKE ASSOCIATION.—F. M. Nellis, Room 3014, 165 Broadway, New York City.

AMERICAN ASSOCIATION OF DEMERBAGE OFFICERS.—F. A. Portious, 455 Grand Central Station, Chicago.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. W., Hoboken, N. J. Next convention, to have been held October, 1917, San Francisco, Cal., indefinitely postponed.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, Chicago, Ill.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. K. N. J., 143 Liberty St., New York. Next meeting, October 16-17, St. Louis.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York. Convention for 1917 postponed.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—Fred C. J. Dell, 165 Broadway, New York.

AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Convention for 1917 postponed.

AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, general secretary, 75 Church St., New York.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 16-18, 1917, Chicago.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Illinois Central, Chicago.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Augier, Supt. Timber Preservation, U. S. M. & M. Royal Sta., Baltimore, Md. Next convention, January, 1918, Chicago.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Rooms 1116-8 Woodward Bldg., Washington, D. C.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, Terminal Station, Central, New Jersey, Jersey City, N. J.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Semi-annual and annual convention postponed indefinitely.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Superintendent of Telegraph, Indiana Harbor Belt, Gibson, Ind.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—Tom Lehon, The Lehon Company, Chicago. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 177 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Tuesday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. R. McMurphy, New York Central, Albany, N. Y.

CINCINNATI RAILWAY CLUB.—H. Boutet, Chief Interchange Inspector, Cincinnati, Rys., 101 Carew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Avenue Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Traffic Manager, R. F. & P., Richmond, Va.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, C. B. & Q. R. R., 702 E. 51st St., Chicago. Next convention, May, 1918, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1126 W. Broadway, Winona, Minn.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenot, 11 W. Monroe St., Chicago.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. W. Haret, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 16-18, 1917, Cleveland, Ohio.

MASTER BOILER MAKERS' ASSOCIATION.—HARRY D. Vought, 95 Liberty St., New York.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dine, B. & M. Reading, Mass.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York City. Next annual convention, October 16, 1917, Washington, D. C.

NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, 349 Peoples Gas Bldg., Chicago.

NEW ENGLAND RAILWAY CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Tuesday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILROAD CLUB.—W. S. Wollner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Johnson Hotel, Peoria, Ill.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Tuesday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.

RAILWAY DEVELOPMENT ASSOCIATION.—D. C. Welty, Commissioner of Agriculture, St. Louis, Mo. Regular meetings, 1st and 3d Tuesday, Exchange Bldg., St. Louis. Next annual convention, May, 1918, Houston, Tex.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Office of the President's Assistant, Seaboard Air Line, Norfolk, Va.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, 1912 DuPont, Wash., D. C. Next convention, to have been held October, 1917, DuPont, Wash., D. C., indefinitely postponed.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, N. Y. C. R. R., Box Collinwood, Ohio.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders' and Master Mechanics' Association.

RAILWAY TELEGRAPH AND APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W., Sterling, Ill. Next annual convention, September 17-19, St. Louis.

ST. LOUIS RAILWAY CLUB.—B. W. F. Fennell, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY ELECTRICAL OFFICIALS.—W. C. Hall, C. & N. W., Philadelphia, Pa. Next annual convention, October 16-18, St. Louis, Mo.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. V. R. R., Atlanta, Ga.

SOUTHERN & SOUTHWEST RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—C. B. Signer, La Salle Hotel, Chicago.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Next annual convention, June 18, 1918, Grand Rapids, Mich.

TRAFFIC CLUB OF PITTSBURGH.—D. J. Wells, Gen'l Ag't, Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., Cleveland, Ohio.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN ASSOCIATION OF SHORT LINE RAILROADS.—Clarence M. Oddie, Mills Bldg., San Francisco.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercutt, Acting Secretary, 1735 Monadnock Block, Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evenings except in July and August.

REVENUES AND EXPENSES OF RAILWAYS

SEVEN MONTHS OF CALENDAR YEAR, 1917

Name of road.	Average mileage operated during period.	Operating revenues.				Operating expenses.			Operating ratio.	Net railway operation.	Railway tax accruals.	Operating income (or loss).	Increase (or decrease) over last year.
		Freight.	Passenger.	Total (inc. misc.).	Way and structures.	Equipment.	Traffic.	Transportation.

Traffic News

The Maine Central announces a schedule of "sailing days," at its principal freight stations, for less than carload shipments of freight.

The Lehigh Valley announces the discontinuance of its lake freight line between Buffalo and Chicago, the four steamships which have been used in this service having been taken over by the government for use on the Atlantic Ocean. The company regrets to announce this suspension of freight traffic, but recognizes that the members of the Shipping Board at Washington are best qualified to decide where the boats are needed; and "we are glad that we had ships which the government could use to good advantage in winning the war."

The Alabama Public Service Commission believes that, by October 25, when most of the troops will have been moved to their camps, the railroads of that state ought to resume the operation of certain passenger trains which were taken off two months ago, and the different roads have been called upon to appear before the commission October 16. The commissioners think that the reduced passenger service should be continued only so long as the locomotives are needed for the movement of troops and of supplies for the army and navy.

Shipments of grain over the Canadian Northern from western Canada, during the last crop year, the year ending August 31, amounted to 100 million bushels, which is about 32 per cent of all of the grain inspected in western Canada during the year. The number of cars moved was 88,953, of which 60,551 cars went to Port Arthur. The records of inspection show a crop movement this year of about 35 per cent less than in the crop of the year preceding; but the quantity inspected on the Canadian Northern was slightly larger than in the year before.

In the United States Court at Baltimore, Md., September 26, the Quemahoning Coal Company, of Pennsylvania, filed a complaint against the Baltimore & Ohio for alleged unfair discrimination in the enforcement of its embargo on coal destined to Baltimore, claiming that its cars of coal were held at Cumberland while shipments consigned to the Tidewater Coal Exchange Pool continued to go forward. It is understood that the suit is in the nature of a complaint against the operation of the pool of coal shipment, favored by the government, for economizing space in ocean vessels.

Pacific coast shippers, by co-operating in heavier car loading saved during the month of August enough cars to supply the Southern Pacific's entire Pacific system for one and one-half days. About 3,000 cars are required daily to fill the demands of the shippers on the system. By heavier car-loading 4,537 cars were saved during August, 1917, as compared with the same month last year. It is estimated that this saving was sufficient to provide during August all the cars required to load the following commodities: sugar, paper, peas, beans, salt, dried fruits, canned goods, rice, potatoes, corn, oats and brick.

H. A. Garfield, United States fuel administrator, on October 2 issued an order prohibiting for the time being the shipment of coal into Canada from lake ports. The purpose is to divert this coal to the northwest where there is need for a million tons a week during the remainder of the season of navigation. While the shipments have approximated the required amount a large part of the coal has been diverted into Canada. The order states that the quantity of coal moving by vessel from Lake Erie ports to American lake ports on Lake Superior and Michigan is inadequate as compared with the quantity moving to Canadian lake ports and other American lake ports and that the supply of coal at present available for shipment by rail and of railroad freight cars for the carrying thereof are insufficient to make up the deficiency in the supply of coal moving by lake. Therefore, all producers of coal having contracts for delivery to lake ports for trans-shipment are ordered to continue such shipments to at least the same extent and with the same frequency as at present or heretofore since September 1 and dock companies, shippers and

other agencies receiving such coal at Lake Erie ports are ordered to forward the same by the earliest available carrier by water to American lake ports on Lake Superior or Lake Michigan. They are also prohibited from consigning, reshipping or reconsigning any such coal to any points either in Canada or the United States other than points in the northwest which have heretofore usually been supplied with coal from such American ports on Lake Superior and Michigan.

Barlow Talks to Chicago Committee

H. C. Barlow, traffic director of the Chicago Association of Commerce, and until recently advisory member of the Division of Car Service of the Interstate Commerce Commission, addressed the meeting of the Chicago committee of the Commission on Car Service on September 25. He strongly urged upon the railroads the necessity for reducing the time cars are not in motion. He gave the results of a check he had made of the movement of a number of cars which disclosed some very unsatisfactory conditions and he believed that notwithstanding the great improvement that had been made in the service even more could be done. In regard to the proposed earlier closing of freight houses in Chicago, he said the present hours were fixed by mutual agreement between the Chicago Association of Commerce and the railroads. The best merchandise terminals are the most expensive plant in the railroad service and he left with the railroads the question as to whether they could afford to decrease their ability to receive freight by further curtailing the hours that the freight houses are open. Mr. Barlow strongly disapproved of any attempt to restrict or eliminate the use of trap cars. He believes that their practicability both from a railroad and a commercial standpoint has been thoroughly established.

Full Loading of Cars Urged by Fertilizer Committee

The subcommittee on fertilizers of the committee on chemicals of the advisory commission of the Council of National Defense has issued a statement impressing upon shippers the importance of loading freight cars to capacity, which says:

"The commerce of the United States requires the maximum service of the railroads in the present emergency. The requirements from the railroads on the part of the government in moving vast quantities of construction and building material will tax the railroads to the limit. The supply of cars for government shipments will of necessity take preference, and rightly so. The government departments have used their influence with shippers, encouraging them to make the maximum use of all cars, and trade organizations have undertaken a campaign of education with the object of getting greater use out of present equipment, but the public at large does not as yet realize the seriousness of the situation. The continued assistance of every government department is necessary if the United States is to avoid being embarrassed. It is most unpatriotic of any shipper who loads a car to fail to make the maximum use of it by loading to its full carrying capacity. The failure of one shipper to load cars to the maximum may prevent other shippers from getting any cars at all. If you can give these recommendations consideration and practicable application, it will be entirely in the interest of moving the maximum amount of traffic the facilities of the carriers permit. We feel that the full capacity of the facilities of the carriers and receivers of freight will not satisfy the demand, but it would be more nearly satisfied if every freight car is made to carry the maximum quantity."

ENGLISH RAILWAY OFFICER TO VISIT U. S.—It is stated that Sir Alexander Kaye Butterworth, the general manager of the North-Eastern Railway, is, at the instance of the government, going to America to assist the industrial organization in the United States.—*The Engineer, London.*

COST OF CANADIAN RAILWAY INQUIRY.—The cost of the commission which reported on the railway situation in Canada, recently, was stated in the Senate recently by Sir James Loughheed to have been \$70,088.41. W. M. Acworth received \$15,330 for services and \$1,127.99 for expenses; A. H. Smith received \$137 for expenses, he has not yet been paid for his services; Sir Henry Drayton returned the check for \$15,000 sent him for his services. Twenty-three engineers were employed in connection with the work, receiving \$28,016.33 for their services, and \$3,854.15 for expenses.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has suspended from October 1 to January 29, 1918, a proposed increase in the classification of automobile bodies in official classification territory.

The commission has suspended from September 27 until January 25 increased proportional commodity rates on bituminous coal from mines in Alabama and other states to New Orleans, La.; Memphis, Tenn.; Vicksburg, Miss., and Shreveport, La.

In response to requests, the commission has announced a hearing at Washington on October 22, at which it will hear from representatives of carriers and shippers with reference to rates on petroleum and its products in Central Freight Association territory, as affected by the 15 per cent case decision.

The Interstate Commerce Commission has issued an order indefinitely postponing the effective date of its order in the transcontinental rate case because compliance with the order would require the filing of tariffs increasing rates in some instances which under the amendment to the fifteenth section of the law require approval of the commission before they can be filed.

The commission has suspended from September 27 until January 25 increased class and commodity rates from Pacific Coast territory to Camp Bowie, Tex. Camp Bowie is located on the recently constructed spur of the Texas & Pacific, near Tremble, Tex. Group H rates apply to Texas points generally, including Tremble and Camp Bowie. The suspended items contain an exception to the basis for rates applicable to Texas points and provide that combination rates will apply to Camp Bowie, effective September 27.

The commission has suspended from September 28 until January 26 the withdrawal of joint through carload rates on petroleum and its products from various points in Oklahoma to interstate destinations located on or reached via the Atchison, Topeka & Santa Fe. The proposed cancellation of joint rates would result in substantial increases. For instance, the present rate from Sumpter, Okla., to Cairo, Ill., is 23 cents, and the proposed combination rate is 28 cents per 100 lbs. The present rate from the same point of origin to Austin, Tex., is 39, and the proposed class rate is 70 cents.

Hearing on Increased Rate Procedure

The Interstate Commerce Commission has announced a hearing at Washington on October 15 on a proposed tentative order outlining the form of procedure to be followed to comply with the amendment to section 15 of the commerce law, adopted on August 9, requiring that the approval of a proposed increased rate, fare, charge or classification must be secured before the tariff containing it is filed with the commission by the carrier. Since the law became effective requests of carriers for approval of tariffs have been accumulating in the commission's offices without a definite form of procedure having been adopted. The tentative order states that requests for such approval must be made by application to the commission in a prescribed form, giving detailed information regarding the nature and purpose of the proposed increase, with a complete and accurate statement of the reasons advanced in justification. If the application embraces a number of increases they may be shown in an exhibit for which a proof copy of the proposed tariff may be used with red ink insertions to show both the existing and proposed rates, or these may be shown in memorandum form. All of these requirements are set forth in full in the order. Five copies of each application should be presented, but where more than 20 pages are required, two copies of the exhibit will be accepted as sufficient.

The commission also expressed the view that carriers should consult freely with shippers who may be interested in proposed increases and suggested that the course now pursued by the

classification committees had resulted in a better understanding between shippers and carriers.

The commission has also outlined a publicity plan for apprising interested shippers of the applications for permission to file increased rates. One application containing copies of all exhibits will be open for consultation in the commission's public tariff room and notices will be laid daily upon the table in the press room.

Proposed Increases on Eastbound Grain

The commission has suspended, from October 1 and later dates until January 29, increased carload rates on grain, grain products and by-products of grain between points in Official Classification territory; also from St. Paul, Minn., and St. Paul rate points to eastern destinations. Present and proposed rates from Chicago, on grain, are:

		Rates in cents per 100 lbs.			
		Present.		Proposed.	
		Dom.	Export.	Dom.	Export.
To New York.....	Local	21.8	20.3	24.5	23.0
	Reshipping	16.8	15.3	19.5	18.0
To Philadelphia.....	Local	19.8	19.3	22.5	22.0
	Reshipping	14.8	14.3	17.5	17.0
To Baltimore.....	Local	18.8	18.8	21.5	21.5
	Reshipping	13.8	13.8	16.5	16.5
To Boston.....	Local	23.8	20.3	26.5	23.0
	Reshipping	18.8	15.3	21.5	18.0

On grain products (except flour) the rates are:

		Rates in cents per 100 lbs.			
		Present.		Proposed.	
		Dom.	Export.	Dom.	Export.
To New York.....	Local	22.5	22.5	25.0	25.0

To Boston.....	Local	24.5	22.5	27.0	25.0
	Reshipping	19.5	17.5	22.0	20.0

COURT NEWS

Care for Passenger Temporarily Leaving Train

The California Supreme Court holds that in the case of a passenger temporarily leaving a train during a stop, the railroad is held only to ordinary care and prudence in respect to such passenger. There is a difference in the danger involved and the opportunity and capacity to protect himself between the situation of a passenger while traveling on the train and while temporarily absent from it.—*Sellers v. S. P. (Cal.)*, 166 Pac., 559. Decided July 16, 1917.

Error in Bill of Lading

The Georgia Court of Appeals holds that when the agent of a railroad company receives for shipment a number of bales of cotton, weighs them, and inserts in the bill of lading the number of bales and their total weight; and the number of pounds inserted is in excess of the actual weight, and the shipper attaches to the bill of lading a draft which is paid by an innocent transferee, the railroad is bound by the error of its agent, unless the amount erroneously inserted in the bill of lading is so very large that the error would be apparent on its face.—*A. C. L. v. Luke (Ga.)*, 93 S. E., 286. Decided August 3, 1917.

Crossing Accident—Railroad Recovers from Street Car Company for Conductor's Negligence

Action was brought by a steam railroad company against a street car company for damages to its engine, cars, etc., in a collision between its train and the defendant's car at Binghamton, Tenn., about dusk, September 17, 1914. Previous suits by passengers in the street car had resulted in judgments against the street car company because of its conductor's negligence in signaling to the motorman to cross, although the smoke and steam of a passing train obscured his view in one direction. The steam railroad's trains had always had the right of way, and had been accustomed to proceed without slackening speed, while it had been the uniform custom for the street cars to come to a full stop, and for the conductor to go forward to ascertain whether

a train was approaching and then signal the motorman. The street car company had instructed its conductors to pursue this course. The Circuit Court of Appeals, Sixth Circuit, holds that the car conductor should have delayed signaling the motorman for a reasonable length of time to allow the smoke and dust to clear away. The street car company could not rely as a defense on the rate of speed of the train being contributory negligence. Judgment for the railroad company was affirmed.—*Memphis St. Ry. Co. v. Illinois Central*, 242 Fed., 617. Decided May 18, 1917.

Transportation of Intoxicating Liquors

An Arkansas act of 1917 makes it unlawful for any common carrier or its agent to ship intoxicants into the state, except for strictly medicinal or mechanical purposes. The Supreme Court of the State holds that when alcohol is shipped from a point out of the state and delivered by a common carrier to a person in the state, the common carrier's duty is to use reasonable care to learn for what purpose the liquor is to be used, and it can only deliver the alcohol when in the exercise of such care it is convinced that it is to be used for strictly medicinal or mechanical purposes. If it acts upon reasonable grounds and in good faith and is misled, it is not liable.—*Wells, Fargo & Co. v. State (Ark.)*, 197 S. W., 13. Decided July 2, 1917.

Excessive Damages

The Mississippi Supreme Court holds that where a flagman was killed, leaving his mother, 60 years of age, with a life expectancy of 14 years, to whom the flagman had contributed \$50 a month, a verdict of \$20,000 was excessive, and should be reduced to \$12,500, such amount including damages for pain and suffering.—*Yazoo & M. V. v. Mullins (Miss.)*, 76 So., 147. Decided July 2, 1917.

A verdict for \$15,000 was awarded the widow and minor children of a locomotive engineer for his death from a derailment, when he suffered much pain, before his death, from scalding. The award included \$5,000 for the deceased's physical pain and mental anguish and for awe of impending death. The Louisiana Supreme Court reduced the \$5,000 item to \$2,000.—*Barber v. Louisiana Ry. & Nav. (La.)*, 76 So., 199. Decided June 30, 1917.

Regulation of Interstate and Intrastate Rates

The Arkansas Supreme Court holds that where the Interstate Commerce Commission approved a carrier's interstate rates, but ordered it not to discriminate against interstate traffic by charging it more than one cent above the rate for certain intrastate shipments, the carrier might remove the discrimination by advancing the intrastate rates to within one cent of the interstate rates, although a state statute prescribed lower rates. In so holding the court followed *Houston, East & West Texas v. United States*, 234 U. S., 342 (the Shreveport Case), and *State v. American Express Co.*, 37 U. S. Sup. Ct., 656, reversing a decision of the Supreme Court of South Dakota. It was said in the *American Express Case*: "The Supreme Court of South Dakota declares: 'If the purported order of the [Interstate Commerce] Commission does, in any respect, regulate intrastate commerce, it is to that extent void, owing to the commission's want of jurisdiction over the subject-matter.' That court denies not only the intent of Congress to confer upon the commission authority to remove an existing discrimination against interstate commerce by directing a change of an intrastate rate prescribed by state authority, but denies also the power of Congress under the Constitution to confer such power upon the commission or to exercise it directly. The existence of such power and authority should not have been questioned since the decision of this court in the Shreveport Case.

It is also urged that, even if the commission had power, under the circumstances, to order a change of the intrastate rates, the order in question was invalid because the commission, instead of specifically directing the change, undertook to give the carrier a discretion as to how it should be done and as to the territory to which it should apply. The order properly left to the carrier's discretion to determine how the discrimination should be removed; that is, whether by lowering the interstate rates or by raising the intrastate rates, or by doing both. In its general form the order is identical with that under consideration in the *Shreveport Case*."—*St. Louis, Iron Mountain & Southern v. State*, 197 S. W., 1. Decided July 9, 1917.

Equipment and Supplies

LOCOMOTIVES

ILLINOIS CENTRAL will shortly issue inquiries for 85 locomotives.

RUSSIAN GOVERNMENT.—Reports have it that orders for 750 locomotives to the Baldwin Locomotive Works, and a like number to the American Locomotive Company are about to be placed.

BLISS DALLET & COMPANY have ordered one six-wheel locomotive (060-T-52) from the American Locomotive Company. This locomotive will have 11 by 16 in. cylinders and a total weight in working order of 52,000 lb.

THE SHANTUNG RAILWAY has ordered two Consolidation type locomotives (280-S-160) from the American Locomotive Company. These locomotives will have 20½ by 26 in. cylinders and a total weight in working order of 160,000 lb.

UNITED STATES GOVERNMENT.—The Committee on Public Information, in a story given out Thursday describing the Consolidation locomotives now being built for our forces overseas, makes the statement that "additional orders for both narrow and standard gage equipment are likely."

FREIGHT CARS

THE CENTRAL OF GEORGIA is inquiring for 500 steel underframes.

ILLINOIS CENTRAL will shortly issue inquiries for 3,500 freight cars.

THE ELGIN, JOLIET & EASTERN will build a number of drop bottom gondola cars at their own shops.

THE MARION & EASTERN, Marion, Ill., advises that it is in the market for 1,000 all-steel coal cars.

THOMAS RUDBY, Kansas City, Kan., is inquiring for from 50 to 100 steel underframe, 30-ton refrigerator cars.

WESTERN MARYLAND.—The report in last week's issue to the effect that this company is asking prices on 1,000 freight cars has been denied.

PASSENGER CARS

THE ILLINOIS CENTRAL will shortly issue inquiries for 60 passenger cars.

THE ANTIOQUIA COMMERCIAL CORPORATION of Antioquia, Colombia, has ordered 6 first class and 11 second class coaches from the American Car & Foundry Company for the Ferrocarril del Pacifico.

U. S. COPPER OUTPUT.—A statement issued by the National City Bank, New York, shows the world's copper production, which totaled less than 100,000 tons in 1850 and 130,000 in 1860, was 272,000 in 1890, 496,000 in 1900, 850,000 in 1910, 1,000,000 in 1913, and 1,400,000 in 1916. The United States' share of the world total was 55 per cent in 1913 and 63 per cent in 1916. World production increased approximately 40 per cent in the three-year period 1913-16; that of the United States about 60 per cent.

AUSTRALIAN RAILWAY AFFAIRS.—In Perth a large and representative committee has formulated a scheme for holding a post-war exposition to celebrate the opening of the Trans-Australian Railway. It is suggested that the exposition should remain open for from 12 to 16 weeks, and among the loan exhibits recommended are the presents received by the late King Edward, a model of Queen Alexandra's dairy farm at Sandringham, a collection of famous portraits and memorial scenes in British history, exhibits from the Admiralty, War Office, Trinity House, City of London and British Museum. It is estimated the cost of the exposition would be about £125,000 (\$607,500), and the income £70,000 (\$340,200).

Supply Trade News

Edward F. Carry, president of the Haskell & Barker Car Company, Chicago, has been appointed director of the shipping board of the government, with headquarters at Washington, D. C. Mr. Carry will not sever his connection with the Haskell & Barker Car Company.

John E. Woods, formerly manager of sales of the Carnegie Steel Company, the Illinois Steel Company and the Tennessee Coal, Iron & Railroad Company, at Cincinnati, Ohio, has been appointed assistant general manager of sales, with offices in the Carnegie building, Pittsburgh, effective September 15. Mr. Woods succeeds John W. Dix, deceased.

The United States Switch Company, Eau Claire, Wis., has been incorporated for \$1,750,000 to manufacture the Shepherd automatic railway switch, the Hubbard automatic railway switch, the Shepherd automatic street car switch and other railway appliances. This company has purchased a site and factory buildings at Eau Claire, and plans to construct other buildings at once.

The Union Carbide & Carbon Corporation has been organized in New York with a capital of 3,000,000 shares without stated par value. The new organization proposes to absorb the Union Carbide Company, the National Carbon Company, the Prest-O-Lite Company, and the Linde Air Products Company. Stockowners of the Union Carbide Company are offered two and one-half shares of the corporation for each share of their present holdings, while two shares of new stock will be given for each Prest-O-Lite share, and three and one-quarter shares for each Linde Air Products share. Myron T. Herriek is to be chairman of the corporation's Board of Directors and George O. Knapp, president of the Union Carbide Company, is to be president. The directorate, besides these officers, will consist of C. K. G. Billings, Charles A. Coffin, Jesse J. Kicks, Andrew Squire, Nicholas F. Brady, G. W. Davidson, Conrad Hubert, James Parmelee, Roger C. Sullivan, F. C. Walcott, and James N. Wallace.

Railway Construction

CHICAGO, MILWAUKEE & ST. PAUL.—This company recently awarded a contract to C. Matson & Son, Tacoma, Wash., for the construction of a 5½-mile spur from Greendale, Wash., to American Lake, where the cantonment, Camp Lewis, is located. The work will cost about \$80,000.

ILLINOIS CENTRAL.—This road is preparing plans for a combination freight and passenger station at Litchfield, Ill. The building will be a one-story structure, 120 ft. by 30 ft., with brick walls and tile roof, and will cost about \$35,000.

The company will also build a store and oil house at Jackson, Tenn., which will cost about \$50,000. The building will be of irregular shape, the larger part of which will be 37 ft. by 175 ft., one story high, and the remainder 37 ft. by 72 ft. and two stories high. Offices for the master mechanic will be provided in the second story, and oil tanks for the storage of oil will be provided in the basement. The building will have brick walls and a slate roof.

A contract has been awarded to Joseph E. Nelson & Sons, Chicago, for the construction of mechanical facilities at Mattoon, Ill., which will cost in the neighborhood of \$100,000. Among the new facilities which will be provided will be a 14-stall roundhouse.

A contract has been awarded to George B. Swift & Co., Chicago, for the erection of mechanical facilities at Kankakee, Ill., to cost about \$100,000. The improvements will include a 9-stall roundhouse and an 85-ft. turntable.

Contracts have been awarded to the Gould Construction Company and the Walsh Construction Company, Davenport, Iowa, for the construction of a four-track, 570-ft. concrete bridge at Kankakee, Ill., to cost about \$100,000. (September 7, p. 441.)

Railway Financial News

BOSTON & MAINE.—Stockholders of the Fitchburg Railroad, which is leased to the Boston & Maine, have voted to authorize an issue of \$3,700,000 bonds to provide for the payment of floating debt amounting to \$2,609,000, and to reimburse the Boston & Maine for expenditures for additions and betterments. This bond issue is to take the place of the bond issue of \$3,300,000 which was previously authorized but under which authorization no bonds were sold.

CHICAGO, ROCK ISLAND & PACIFIC.—The directors have sent out the usual call for proxies for the annual meeting of stockholders to take place October 11, but have substituted the name of A. C. Rearick for that of N. L. Amster. N. L. Amster is the chairman of the executive committee and represented certain stockholders in the reorganization who were opposed to a foreclosure sale of the property. A. C. Rearick represents \$11,400,000 stock of the Chicago, Rock Island & Pacific owned in Holland. All eight of the directors other than Mr. Amster who were present at the directors' meeting joined in sending out a statement accompanying the call for proxies which contains the following:

"The unwarranted and misleading communication recently sent to the stockholders by Nathan L. Amster, a director of your company, with design to create in the minds of stockholders the dissatisfaction of the conduct of the affairs of your company which in the opinion of the board of directors the facts do not justify, and we deem it our duty to send this statement to the stockholders in order that you may not be misled to an unwise use of your vote at the forthcoming election of directors.

"The company has passed through many trials and vicissitudes, and it has been hoped by the officers and members of the board of directors of your company that these were all past and that the united effort for the success of the company could now be had. No shareholder can possibly regret more than the members of the board the undignified controversy which Mr. Amster has started and which it has been deemed proper to notice. Each stockholder must determine for himself whether he prefers to favor the proposed board of directors named, for which it is the intention of the proxy committee to vote, or to give their proxies to Mr. Amster to vote for men of his selection as yet unnamed."

The company has asked permission from the Public Utilities Commission of Illinois to issue \$12,482,000 bonds, of which \$1,000,000 is to be general mortgage bonds and the balance first and refunding mortgage bonds.

DENVER & RIO GRANDE.—The stockholders' protective committee, of which John W. Platten is chairman, is asking stockholders for proxies to be voted on October 16 at the annual meeting. The committee proposes to elect Mr. Platten, J. Horace Harding and Harry Bronner as directors, to succeed Kingdon Gould, Benjamin B. McAlpin and H. U. Mudge. The committee was formed after the United States district court had granted a judgment against the Denver & Rio Grande for \$32,000,000 for default of its guarantee of interest on the Western Pacific first mortgage bonds.

HANNIBAL & ST. LOUIS.—The Public Service Commission of Missouri has approved of a reorganization plan for this road which reduces the total capitalization from \$1,835,000 to \$632,000. Under the reorganization there will be \$250,000 preferred and \$370,000 common stock, no bonds, and \$12,000 notes payable.

LEAVENWORTH & TOPEKA.—This road, extending from Leavenworth, Kan., to Topeka, and about 50 miles in length, was recently sold by its joint owners, the Atchison, Topeka & Santa Fe and the Union Pacific, to Chicago interests headed by F. I. Wells, who has been elected president of the road.

NEW YORK CENTRAL.—A syndicate headed by J. P. Morgan & Co. and the National City Company will offer the \$15,000,000 2-year 5 per cent notes, probably on a 6½ per cent basis. The

notes are secured by \$20,000,000 refunding and improvement 4½s.

NEW YORK, NEW HAVEN & HARTFORD.—Official circulars have been sent to stockholders by the directors giving notice that the stockholders will be asked at a special meeting to be held following the regular annual meeting to authorize \$45,000,000 preferred stock.

NEW YORK, ONTARIO & WESTERN.—E. J. Pearson, president of the New York, New Haven & Hartford, has been elected a director of the New York, Ontario & Western, succeeding R. D. Rickard, resigned.

TENNESSEE CENTRAL.—Counsel for the Mississippi Valley Trust Company, the Illinois Central, and the Southern Railway will present a petition to Judge E. T. Sanford, of the United States District Court at Nashville, on the beginning of the term of the court on October 1, seeking an order requiring the receivers of the Tennessee Central to permit the petitioners to have an expert examination made of the books and records of the receivership in order that they may have an opportunity to properly prepare their defense to the petition of the Fourth and First National banks and the First Savings Bank & Trust Company, trustee, against the Tennessee Central. These latter companies recently filed a petition in the federal court seeking to have the receivers' certificates held by the institutions made superior to the first mortgage bonds, held by the Illinois Central and the Southern.

WEBBERS FALLS RAILROAD.—A press despatch says that this road, running from Webbers Falls to Warner, 10 miles, has been sold for \$35,000 to the Muskogee Junk & Supply Company. The tracks, it is said, are to be taken up and sold.

EUROPEAN WATER TRANSPORTATION COSTLY.—Water transportation in Europe is more expensive than rail transportation. For 1905, for instance, the waterways of Prussia showed a deficit of \$3,523 a mile, while the railways yielded a net profit of \$1,814 for every mile. The Prussian government, consequently, uses the railroad profits to offset the waterway deficit.

CONTEMPLATED INCREASE IN ARGENTINE FREIGHT RATES.—The privately owned railways of the Rosario district in conjunction with other lines have given notice to the Federal Railway Commission of a contemplated increase of 22 per cent in all their tariffs to take effect December 15, 1917. An increase of 10 per cent in rates went into effect October 1, 1915. Freight rates in the district average between 1.4 and 1.8 cents per ton-mile.

INCREASED FREIGHT TRAFFIC IN GREAT BRITAIN.—The president of the British Board of Trade was recently asked in the House whether there had been any increase of freight traffic on the railways since the government took over control, notwithstanding the depleted plant; and could he give any comparative figures of 1913 and 1914, and of 1915, 1916 and 1917 of the freight traffic on British railways. To this question G. Roberts replied that there had unquestionably been a very considerable increase of freight traffic on British railways since the government took control, but he was not in a position to furnish figures, inasmuch as large quantities of naval and military traffic had been carried on which no charges were recorded.

CASUALTY LIST OF A BRITISH RAILROAD.—The Earl of Bessborough, K. P., chairman of the London, Brighton & South Coast, addressing the company's staff on August 4, last, said: "I have just got the figures of the men in our service who are away. The total number of men who have left for active service is 4,529. Roughly speaking, the percentage of the whole staff is about 28 per cent. Of these 277 have fallen in action, 330 have been wounded, 28 are prisoners and 23 are missing, and we are glad to think that up to today 30 of our men have received decorations. Now may I ask you, with bowed heads, solemnly to salute those who are gone and have given their lives in the sacred cause, a cause which, as you are well aware, is for the liberty of Europe, if not for the whole world. Also at the same time may I ask you individually and collectively as those associated, as we all are with our railway, solemnly to resolve that you will do everything in your power to bring this war to a successful conclusion? We must ensure that all who have gone shall not be hindered and that their great sacrifice shall not be made in vain."

Railway Officers

Executive, Financial, Legal and Accounting

L. R. Deevers, assistant auditor of the Wheeling & Lake Erie, at Cleveland, Ohio, has been appointed acting auditor, vice C. H. Holmes, temporarily absent on account of illness.

Conrad E. Spens, assistant freight traffic manager of the Chicago, Burlington & Quincy, has been elected vice-president in charge of traffic, succeeding C. G. Burnham, promoted. Mr. Spens was born at Princeton, Ill., on August 14, 1875, and has been connected with the Burlington since 1892, when he became a stenographer in the local freight office at Chicago. In the same year he was transferred to the general freight office as correspondence clerk, and subsequently was chief clerk to the assistant general freight agent, and chief clerk to the traffic manager. On April 1, 1903, Mr. Spens was appointed assistant general freight agent at Chicago, and on August 1, 1905, he was promoted to general freight agent of the lines west of the Missouri river. On December 1, 1912, he was appointed assistant freight traffic manager of the Burlington system, with headquarters at Chicago, and continued in that position until October 1, 1917.

James R. Kearney, general superintendent of transportation of the Baltimore & Ohio, at Baltimore, Md., has been promoted to assistant to vice-president, with headquarters at Baltimore. He was born on March 29, 1859, and was educated in the common schools at Altoona, Pa. In 1876 he began railway work as a clerk in the car record office of the Pennsylvania Railroad, at Altoona. From March, 1880, to May of the following year, he served in the car record office of the Illinois Central, and then to November, 1881, was car accountant of the Illinois Midland, now a part of the Pittsburgh, Cincinnati, Chicago & St. Louis. He then returned to the car record office of the Illinois Central, remaining in that position until May 10, 1882, and subsequently to May 1, 1889, was successively clerk and chief clerk of the car record office of the St. Paul, Minneapolis & Manitoba and its successor, the Great Northern, at St. Paul, Minn. In May, 1889, he entered the service of the Baltimore & Ohio as superintendent of car service. On September 20, 1910, he was promoted to superintendent of transportation, and in July, 1914, was appointed general superintendent of transportation, at Baltimore, Md., which position he held until his recent appointment as assistant to vice-president, as above noted.

C. E. Spens

J. R. Kearney

F. L. Wells has been elected president and J. Isherwood secretary and treasurer of the Leavenworth & Topeka, a recently reorganized line, formerly controlled jointly by the Union Pacific and the Atchison, Topeka & Santa Fe. The company's headquarters are at Leavenworth, Kan.

Benjamin Brinton Greer, whose election as vice-president and general manager of the Colorado & Southern, was announced in the *Railway Age Gazette* of September 21, was born at Chicago on August 6, 1877.

B. B. Greer

He began his business career with the Pullman Company in the summer of 1899, and a few months later entered the service of the Great Northern at St. Paul, Minn., as a clerk in the accounting department, following which he was successively material clerk in the superintendent's office, extra gang foreman, assistant roadmaster, chief clerk to the division superintendent and assistant superintendent, with headquarters at Minneapolis. On December 15, 1908, he left the Great Northern to become transportation inspector on the Chicago, Burlington & Quincy, at Chicago, and on September 10, 1910, was promoted to superintendent of the St. Louis terminals. On May 1, 1911, he became superintendent of the Hannibal division, and on January 1, 1912, was transferred to the St. Joseph division. On July 1, 1913, he was promoted to assistant to the general manager of the lines east of the Missouri river, with headquarters at Chicago, and on January 15, 1914, became assistant general manager of the lines east. On March 1, 1915, he was transferred to the lines west, with headquarters at Omaha, Neb., and on July 1, 1916, became assistant to the vice-president in charge of operation, in which capacity he served until his election, as above noted.

E. P. Bracken, general manager of lines east of the Missouri river, of the Chicago, Burlington & Quincy, with headquarters at Chicago, has been elected vice-president in charge of the operating department, succeeding H. E. Byram, resigned to become president of the Chicago, Milwaukee & St. Paul. Mr. Bracken entered railway service in August, 1887, as a gang foreman on the Lincoln division of the Burlington. From September, 1888, to November, 1905, he was consecutively extra gang foreman on the Wymore division for one year, roadmaster for 13 years and trainmaster for three years. From November, 1905, to April, 1906, he was assistant superintendent of the Lincoln division, and from the latter date until May 15,

E. P. Bracken

1909, he was successively superintendent of the Lincoln, Sterling, Sheridan, Brookfield and Galesburg divisions. In the following year he was general superintendent of the Wyoming district, and from February, 1910, until August, 1912, was assistant general manager of the lines east of the Missouri river, with headquarters at Chicago. Since 1912 he has been general manager of the lines east. As vice-president, in charge of operation, he will continue to have headquarters at Chicago.

Claude G. Burnham, vice-president in charge of traffic of the Chicago, Burlington & Quincy, has been promoted to vice-president of the executive department, a newly created office, the duties of which will be to assist the president in the administration of all departments of the company's service. Mr. Burnham will continue to have headquarters at Chicago, Ill.

Operating

H. B. Voorhees, general superintendent of the Northwestern district at Cincinnati, Ohio, has been appointed general superintendent of transportation of the Baltimore & Ohio, with office at Baltimore, Md.

F. Wear, trainmaster of the Great Northern at Melrose, Minn., has been promoted to superintendent of the Butte division, with headquarters at Great Falls, Mont., succeeding G. E. Votaw, resigned to enter the service of another company, effective October 1.

W. L. Booth, general superintendent of transportation of the Chesapeake & Ohio at Richmond, Va., has been appointed assistant general manager, effective October 1, and his former position has been abolished. A sketch of Mr. Booth's railway career was published in the *Railway Age Gazette* of July 6, 1917, page 46.

John R. Stemm, whose appointment as superintendent of the northern division of the Chicago, Indianapolis & Louisville, with headquarters at Lafayette, Ind., was announced in the *Railway*

J. R. Stemm

Age Gazette on September 14, was born at Wooster, Ohio, on July 27, 1869. His first railroad experience was as an operator at Rochester, Ind., on the Chicago & Atlantic, now the Chicago division of the Erie. From November, 1889, to 1891, he was copy operator in a dispatcher's office on the New York, Pennsylvania & Ohio, now the Erie. From the latter date until May, 1892, he was dispatcher on the same road, following which he was employed in the general offices of the Louisville & Nashville at Louisville, Ky. On November 8, 1892, he was appointed operator of the Louisville, New Albany & Chicago, now the Chicago, Indianapolis & Louisville, at Bloomington, Ind. He was promoted to dispatcher in 1897, to night chief dispatcher in July, 1905, to day chief dispatcher of the southern division in July, 1906, and to trainmaster on the southern division in January, 1913. He was transferred to the northern division in February, 1915, and on September 7, 1917, he was promoted to superintendent of this division, succeeding W. H. Fogg, promoted.

G. Marks freight claim agent of the New York, New Haven & Hartford at Boston, Mass., is to have charge of a new department to be organized to improve the service at freight stations, with headquarters at New Haven, Conn., and G. L. Winlock, auditor of overcharge claims, at Boston, Mass., will have charge also of the freight claim office.

A. G. Smart, division superintendent of the Chicago, Burlington & Quincy at Beardstown, Ill., has been appointed general superintendent of the Nebraska district, with headquarters at Lincoln, Neb., to succeed L. B. Lyman, promoted. W. A. Chittenden, division superintendent at Brookfield, Mo., has been transferred to Beardstown, Ill., to succeed Mr. Smart.

W. F. Giles, assistant superintendent of the Chicago, Burlington & Quincy at Brookfield, Mo., has been promoted to superintendent, succeeding W. A. Chittenden, transferred. H. E. Ruggles, trainmaster at Chicago, has been appointed assistant superintendent of the Chicago division, succeeding H. T. Murray, who has been appointed general yardmaster at Galesburg, Ill.; W. J.

Meyers, assistant trainmaster at Chicago, has been appointed trainmaster, succeeding Mr. Ruggles.

H. C. Oviatt, general superintendent of the Lines West of the New York, New Haven & Hartford at New Haven, Conn., has resigned to go to another company. W. H. Foster, superintendent of the New Haven division at New Haven, has been appointed general superintendent, Lines West, succeeding Mr. Oviatt. F. S. Hobbs, superintendent of the Boston division at Boston, Mass., has been transferred as superintendent to the New Haven division. W. T. Spencer, superintendent of the Old Colony division at Taunton, Mass., has been transferred as superintendent to the Boston division, and F. M. Clark, freight assistant, superintendent of transportation, has been appointed superintendent of the Old Colony division.

E. W. Scheer, general superintendent of the Southwestern district of the Baltimore & Ohio, at Cincinnati, Ohio, has been promoted to general superintendent of the Northwestern district, with headquarters at Cincinnati; F. B. Mitchell, superintendent of the Toledo division at Dayton, Ohio, succeeds Mr. Scheer; Ross B. Mann, superintendent of the Indiana division at Seymour, Ind., succeeds Mr. Mitchell; G. S. Cameron, assistant superintendent of the Ohio division, at Chillicothe, Ohio, has been promoted to superintendent of the Indiana division, succeeding Mr. Mann, and R. W. Brown, trainmaster of the Toledo division, has been promoted to assistant superintendent of the Ohio division, with headquarters at Chillicothe, succeeding Mr. Cameron.

James Buckelew, who has been appointed superintendent of the Maryland division of the Philadelphia, Baltimore & Washington, with headquarters at Wilmington, Del., as has already been announced in these columns, was born on October 7, 1864, at Jamesburg, N. J., and entered the service of the Pennsylvania Railroad on July 23, 1885, as a rodman in the engineering department. He was later transferred to the maintenance of way department, and in May, 1888, was appointed assistant supervisor, and on April 14, 1890, was promoted to supervisor. In January, 1900, he was appointed assistant engineer of the Renovo division, and the following January was transferred in the same capacity to the Tyrone division, and one year later was again transferred in the same capacity to the Pittsburgh division. He was appointed principal assistant engineer of the Philadelphia, Baltimore & Washington on June 1, 1903, and in January, 1906, was appointed superintendent of the Central division. In April, 1907, he was transferred in the same capacity to the Allegheny division of the Pennsylvania Railroad, and on January 1, 1912, was appointed superintendent of the Camden Terminal division and the West Jersey & Seashore, which position he held until his appointment as superintendent of the Maryland division of the Philadelphia, Baltimore & Washington, as above noted.

Arthur H. Slader, chief clerk to the general manager of the Boston & Maine, at Boston, Mass., has been appointed assistant to the general manager; H. C. Robinson, superintendent of the Southern division, at Concord, N. H., has been appointed superintendent of outside operations; W. R. Mooney, superintendent of the Worcester, Nashua and Portland division, at Nashua, N. H., has been appointed superintendent of the Southern division; W. H. Ford, assistant superintendent of the Connecticut & Passumpsic division, at Springfield, Mass., has been appointed superintendent of the Worcester, Nashua & Portland division; C. M. Woodward, trainmaster on the Connecticut & Passumpsic division, has been appointed assistant superintendent of the same division, and H. G. Spaulding, trainmaster on the White Moun-

tains division, has been appointed assistant superintendent of that division.

Louis Baker Allen, assistant general manager, lines east of the Missouri River, of the Chicago, Burlington & Quincy, has been promoted to general manager of the lines east of the Missouri river, with headquarters at Chicago, effective October 1. Mr. Allen was born at Austin, Minn., on August 19, 1868, and entered railroad service in 1880 as a messenger with the Chicago, Milwaukee & St. Paul. He remained in the employ of that company in station, yard and train service until 1889, when he became secretary and chief clerk to the general superintendent of the Minnesota Transfer. From 1893 to 1898, he was with the Great Northern as stenographer and car distributor for the general superintendent. In 1898

L. B. Allen

he was appointed assistant division superintendent on the Great Northern and in the following year was promoted to division superintendent. He entered the service of the Chicago, Rock Island & Pacific on October 10, 1903, as a division superintendent and left that road on February 1, 1906, to become superintendent of the Ottumwa division of the Burlington. He was promoted to general superintendent of the Wyoming district on July 23, 1906, and was transferred as general superintendent to the Iowa district on May 15, 1909. On September 19, 1910, he became general superintendent of the Nebraska district, following which he was promoted to assistant general manager, lines east of the Missouri river, on March 1, 1915. He continued in that position with headquarters at Chicago, until October 1, 1917, when he was appointed general manager lines east of the Missouri river.

Lewis B. Lyman, general superintendent of the Nebraska district of the Chicago, Burlington & Quincy, has been promoted to assistant general manager of the lines east of the Missouri river, with headquarters at Chicago, succeeding L. B. Allen, promoted. Mr. Lyman was born at Dunlap, Iowa, on November 2, 1878, and entered railway service with the Burlington on November 2, 1898, as a brakeman. From October, 1900, to August, 1904, he was a conductor on the same road, and from the latter date to July, 1905, train dispatcher. In the following year he was again a conductor and on August, 1906, was appointed trainmaster. From March, 1908, to July, 1916, he was superintendent on various divisions, following which he was general superintendent of the Nebraska district, with headquarters at Lincoln, Neb. On October 1, 1917, he was appointed assistant general manager of the lines east of the Missouri river.

L. B. Lyman

Traffic

C. E. Dempsey has been appointed chief of the tariff bureau of the Wheeling & Lake Erie, with office at Cleveland, Ohio.

James Finlay, traveling freight agent of the Michigan Central

at Detroit, Mich., has been promoted to commercial agent at Battle Creek.

L. E. Ayer, commercial agent of the Canadian Northern at St. Louis, Mo., has been appointed general agent, with the same headquarters, and will have supervision over passenger and freight matters.

S. A. Williams, general agent of the traffic department of the Chicago & Alton at Peoria, Ill., has been transferred to St. Louis, Mo., where he will have charge of operation and traffic in the St. Louis and East St. Louis districts.

Oliver T. Boyd, whose appointment as general passenger agent of the Pennsylvania Lines East of Pittsburgh and Erie has already been announced in these columns, was born October 29,

1878, in Philadelphia, Pa. He entered the services of the Pennsylvania Railroad in December, 1897, as clerk in the advertising department. On June 1, 1901, he was given charge of the special excursion department, and in July, 1903, he was promoted to chief clerk to the assistant general passenger agent, remaining in that position until May, 1906, when he was appointed city passenger agent at Washington, D. C. In June, 1909, he was granted leave of absence to enter the service of the Hudson & Manhattan, in New York City, as general passenger agent. He remained with that company until September 15, 1912, when he returned to the service of the Pennsylvania Railroad as district passenger agent at Pittsburgh, Pa. In March, 1913, when the passenger department of the Pennsylvania Lines East of Pittsburgh and Erie was reorganized, Mr. Boyd was promoted to division passenger agent at New York, which position he held until his appointment as general passenger agent, with headquarters at Philadelphia, Pa., of the same road, as above noted.

C. W. Galligan, assistant freight traffic manager of the Chicago & Alton at Chicago, has been promoted to freight traffic manager in the headquarters at Chicago and his former title has been abolished.

C. H. Rupert has been appointed general baggage agent of the Chicago Great Western, with headquarters at Chicago, Ill., succeeding E. R. Reynolds, who has been commissioned a captain in the National Army, and is now stationed at Camp Grant, Ill.

Carl R. Maier, whose appointment as assistant general freight agent of the Chicago, Rock Island & Pacific at Chicago was announced in the *Railway Age Gazette* of September 28, was born at Topeka, Kan., on November 18, 1881. He first entered railway service on January 1, 1898, as an office boy in the general freight office of the Rock Island at Topeka. On July 1, 1902, he went to the general freight office at Chicago as a tariff clerk and subsequently held various clerical positions in the tariff department until September, 1915, when he was made chief clerk in charge of divisions. On September 13, 1917, he was promoted to assistant general freight agent in charge of the tariff bureau.

James Webster, whose appointment as freight traffic manager of the New York Central lines west of Buffalo, with headquarters at Chicago, was announced in the *Railway Age Gazette* on September 14, was born near Owen Sound, Ont., on December 14, 1856, and entered railway service in 1874 as a telegraph operator with the Toronto, Grey & Bruce Railway, now a part of the Canadian Pacific. In 1880 he became a stenographer on the Great Western of Canada, now a part of the Grand Trunk, and in 1882 entered the service of the New York, Chicago & St. Louis as a rate clerk, and later served successively until July 1, 1904, as chief clerk, commercial agent and assistant

general freight agent. On the latter date he was promoted to general freight agent, and in January, 1911, became assistant freight traffic manager of the New York Central lines west of Buffalo, with headquarters at Chicago, in which capacity he served until his recent appointment.

F. O. Stafford, whose appointment as manager of the New York Central Fast Freight Lines, with headquarters at Chicago, was announced in the *Railway Age Gazette* on September 14, was born in Canada. He began his railway service with the Merchants' Despatch Transportation Company as a clerk in the offices at Sioux City, Iowa, in April, 1899, and was later promoted to traveling agent. In 1901 he became assistant agent at Kansas City, Mo., and in January, 1904, was promoted to commercial agent, with headquarters at Des Moines, Iowa. In August, 1906, he was appointed assistant agent at St. Louis, Mo., and in March, 1910, became westbound and dairy agent of the New York Central Fast Freight Lines, with the same headquarters. In January, 1911, he was promoted to general westbound agent, with headquarters at Chicago, in which capacity he served until his recent promotion to manager.

Preston Graham Findlay, whose appointment as general freight agent of the Michigan Central, with headquarters at Detroit, Mich., was announced in the *Railway Age Gazette* of September 14, was born at Waterford, Ont., on May 20, 1878. He entered railway service on October 1, 1895, with the Erie, with which road he remained until November 30, 1897, as stenographer, clerk and chief clerk in the motive power department and in the superintendent's office at Buffalo, N. Y. From December, 1897, to May, 1898, he was clerk in the traffic department of the Pennsylvania Railroad at Buffalo, and from the latter date until September 30, 1906, was chief clerk to the division freight agent of the New York Central at Buffalo. He was then transferred to New York City as chief clerk to the general freight agent of the latter road, and was chief clerk to the manager of the New York Central Fast Freight Lines at Buffalo from December 1, 1907, to July 15, 1911, when he was promoted to assistant to the manager at Chicago. He held the latter position until August 15, 1917, at which time he was appointed general freight agent of the Michigan Central.

Carl Howe, whose appointment as traffic manager of the Michigan Central was announced in the *Railway Age Gazette* of September 14, was born at Niles, Mich., on January 11, 1870, and entered railway service as a clerk in the local freight office of the Michigan Central at Michigan City, Ind., on October 18, 1889. From that time until April 10, 1893, he held various clerkships on the same road. On the latter date he was transferred to Chicago Heights, Ill., as local agent. He remained in that position a little over a year, following which he was made traveling freight agent, with headquarters at Chicago. From May 1, 1898, to October 1, 1899, he was assistant chief clerk in the office of the general freight

Carl Howe

traffic manager, and from the latter date until July 1, 1900, chief clerk in the same office. During the ensuing seven years he was assistant general freight agent, and in January, 1907, was appointed traffic manager of the Merchants' Despatch Transportation Company, with headquarters at New York. In November of the same year he was appointed manager of the New York Central Fast Freight Lines, which was a merger of the Merchants' Despatch and various other fast freight lines operating over the New York Central. He continued to hold that position, with headquarters at Chicago, until his recent appointment to traffic manager of the Michigan Central, with headquarters in the same city.

Engineering and Rolling Stock

S. Buffington has been appointed resident engineer of the Kansas City, Mexico & Orient, to take the place of H. B. Holmes, chief engineer, resigned to become associated with Coverdale & Colpitts, New York.

A. N. Reece, office engineer of the Kansas City Southern and the Arkansas Western, has been promoted to division engineer of those roads, with headquarters at Pittsburg, Kan., succeeding G. H. Cook, resigned, effective October 1.

L. S. Kinnaird, master mechanic on the Pennsylvania Lines at Logansport, Ind., has been appointed superintendent of motive power of the Chicago & Eastern Illinois, with headquarters at Danville, Ill., succeeding J. E. Epler, resigned, effective October 1.

Victor U. Powell, master mechanic of the Illinois Central at Freeport, Ill., has been transferred to the Chicago Terminal and Illinois division, with office at Burnside shops, Chicago, succeeding Henry C. Eich, resigned to enter the service of another company, effective October 1.

Herbert G. Morgan, whose appointment as signal engineer of the Illinois Central was announced in the *Railway Age Gazette* on September 28, was born in Huntington, Ind., in 1883. He was educated in the public and high schools of that place and later completed a course in electrical engineering in Purdue University, graduating in 1904. His first technical experience was with the Bell Telephone Company, where he occupied the position of service inspector for three years. In 1907, he entered the drafting room in the signal department of the Illinois Central, where he remained for two years, later going to the Chicago & North Western as chief draftsman in the signal department for one year. He was then appointed assistant engineer for the General Railway Signal Company at Rochester, N. Y., and remained in that place for three years. In 1913, he returned to the Illinois Central as office engineer in the signal department, and in 1914 he was transferred to the valuation department as pilot signal engineer, from which he was promoted to signal engineer, effective September 16, as noted above.

H. G. Morgan

F. N. Hibbits, who resigned as superintendent of motive power of the Lehigh Valley in 1915, to go to the Baldwin Locomotive Works as assistant general superintendent, has returned to the service of the Lehigh Valley, as superintendent of motive power succeeding H. C. May, resigned to go to another company.

Purchasing

W. E. Steen, storekeeper of the Baltimore & Ohio, at Washington, Ind., has been appointed district storekeeper, with jurisdiction over the Southwest district, and H. Shoemaker, district storekeeper at Cincinnati, will in future have jurisdiction over the Northwest district and Chicago terminals.

Railway Officers in Military Service

H. J. Slifer, formerly general manager of the Chicago Great Western, has been commissioned major of the Twenty-first Engineers, a new railway regiment being recruited at Rockford, Ill.

W. K. Adams, formerly bridge engineer of the National Railway of Mexico, has been commissioned captain in the Engineer Officers Reserve Corps U. S. Army, and has been assigned to duty with the 21st Regiment of light railway men at Rockford, Ill.

Thomas Ryan, formerly general freight agent of the Mexican Central at Mexico City, Mex., and afterwards operating manager of the Brazilian railways, has been commissioned a major in the Twenty-first Railway Engineers, now at Rockford, Ill.

Special

W. H. Howard, who has been elected chairman of the Southeastern Passenger Association, with headquarters at Atlanta, Ga., as has already been announced in these columns, entered the service of the Southern Railway in May, 1899, as a stenographer in the office of S. H. Hardwick, assistant general passenger agent at Atlanta. Mr. Howard was transferred to Washington on January 1, 1901, as private secretary to Mr. Hardwick, who, on that date, became general passenger agent of the same road. In April of the following year Mr. Howard returned to Atlanta and was appointed assistant secretary of the Southeastern Passenger Association. He was made secretary of that association in November, 1904, remaining in that position until September 19, 1917, when he was elected chairman, as above noted.

W. H. Howard

OBITUARY

B. F. Farrell, assistant general freight and passenger agent of the Chicago & North Western at Chicago, Ill., died at Evanston, Ill., on September 25. Death was brought on by a paralytic stroke suffered about two months ago.

William J. Wood, a member of the Indiana Public Utilities Commission and formerly attorney-examiner for the Interstate Commerce Commission, died at his home in Indianapolis, on October 3. He was born in Florence, Ala., March 30, 1850. At one time he was third vice-president of the Louisville & Nashville Railroad, in charge of the legal department.

Joshua Vansant McNeal, formerly fourth vice-president and treasurer of the Baltimore & Ohio, at Baltimore, Md., died on September 26. He was born on June 11, 1846, at Baltimore, Md., and was educated in the public schools and at Loyola College, Baltimore, Md. He began railway work in February, 1871, on the Baltimore & Ohio, as a clerk in the general freight office, and in April, 1872, was appointed traveling auditor. From October, 1872, to January, 1880, he was chief clerk of the auditor's office, and was then appointed auditor of the Indianapolis, Decatur & Western, now the Cincinnati, Indianapolis & Western, remaining in this position until May, 1893. He was then appointed assistant treasurer of the Baltimore & Ohio and was promoted to treasurer September 1, 1899. Mr. McNeal was elected fourth vice-president and treasurer on August 1, 1904, and retired from active service on June 30, 1916, at his own request, having reached the age of 70.

The Erie Railroad, to insure that diffident employees shall not be buried under their own modesty, has invited them to write to their superintendent, recounting their experience and telling him what higher positions they feel qualified to fill; and the letters will be treated as confidential. This is the gist of a circular which has been issued by vice-president A. J. Stone, and which is printed in the Erie Railroad Magazine for October. "What is worth having is worth asking for," and this proposal ought to do some good—though the considerate superintendent will find that he has taken a large contract when he sits down to answer those men whose ability is not commensurate with their ambition. Ever since the sons of Zebedee desired to secure places as Assistant to the General Manager of all the Earth, short-sighted aspirants for promotion have been one of the ever-present peace-destroyers in the life of the tender-hearted employer. As a practical matter, the Erie circular lacks one important element; as important for the interest of the company as for the comfort of ambitious employees. It should ask them to say not only what places they can fill, but also what they could do after, say, a month's or three months' training. Many a bright young station agent or conductor, who would not claim to be able to fill a trainmaster's shoes, would be found to be excellently fitted for such a place if he were ordered to take it, and were properly guided at the start. This question would set such men to thinking.

"Patient continuance in well-doing" is the homely but scriptural phrase which indicates the only remedy for the costly delays to freight cars which still persist everywhere, in spite of the vast amount of good work that has been done already in speeding up both railroads and consignees. In other words, there must be *men*, numerous enough and persistent enough to ferret out every delayed car, and get the cause of delay removed. No efficiency expert has discovered any new trick. (If any road has female car tracers, all right; "men" embraces the women.) This is one lesson from the address of E. H. DeGroot, Jr., on the freight car situation, delivered before the New England Railroad Club at Boston last Tues-

day; and it is the gist of the opinions of those who discussed the paper. Cars which pile up fifty or a hundred dollars each in demurrage bills are still heard of too frequently. There is no royal road to happiness in such an extensive business as loading, moving and unloading a hundred million tons of freight every month. Mr. DeGroot covered admirably the whole field of freight car service. G. L. Graham, of the American Woolen Company, who took part in the discussion, told of an interesting movement to start "community loading"—all shippers in a Massachusetts city having customers in (for example) Cleveland combining to fill a car for the Ohio city, thus preventing loss of time at transfer stations and avoiding the delays of too infrequent "sailing days."

Many people seem to think that railways should carry soldiers and sailors on their trains free of charge, just as if

One-half Cent a Mile for Soldiers

the railways could give away transportation as the Y. M. C. A. gives away stationery and magazines, the Navy League, sweaters, or those in charge of a tobacco fund, cigars and cigarettes. The only commodity a railway has to sell is transportation, freight and passenger; and there is no more reason why a railway should carry soldiers or sailors free than that a shoemaker should give them their shoes, or a clothier their uniforms, a publisher, their newspapers, or a landlord, their houses free of charge. In fact, some of these clothiers and landlords are doing just the opposite; they are not reducing prices but raising them, overworking, as it were, the law of supply and demand and charging prices much above the average. It is all the more to the credit, therefore, of a railroad that reduces fares for the men in uniform to one-fourth or one-fifth its regular fares. The railroad in this case is the Long Island. It serves Camp Upton, 63 miles from New York, where the drafted men from that city will train for the National Army. The regular round-trip fare to the camp is \$3.54; visitors to the camp will be carried to the camp on special trains at an excursion fare of \$2.50, but on certain of these trains, those best timed for the use of the soldier, there will be a round trip fare for men in uniform of 60 cents. This figures out on the basis of 126 miles at less than one-half cent a mile. The specials will run over

Car Service Discussion at Boston

a busy single track line and on a better schedule than the regular trains and will make but one stop between Camp Upton and Jamaica, where passengers will change from steam to electric equipment.

as the public is concerned the average traveler, if he understands the situation, is willing to meet the railway more than half way.

THE OBLIGATION TO REPORT DISCOURTESIES

THE writer of a communication on a following page concerning courtesy to the traveling public is right in stating that railway passengers as a general rule will not report the discourtesies of railway employees. This statement may, of course, meet with criticism on the part of some passenger traffic men who may have been led to believe by experience that all some of their patrons ever do is to complain; but it is nevertheless true. The average patron either does not like to or does not want to take the time to compose a reasonable letter of criticism, and seldom does he go beyond wondering to what officer he should address such a letter. The railway officer should not forget that a passenger is under no obligation whatsoever to report discourtesies. It may be an act of kindness to report them, but it is no obligation. The obligation is on the railway—to see that its employees give the traveler efficient and courteous service.

The railways, as far as courtesy is concerned, are like other businesses, with the exception that they have a much harder row to hoe. The retail store has its problem in finding out whether its patrons are satisfied, for when a patron is not satisfied, in most cases, he does not complain, he simply does not trade at that store any more. "If you like our service, tell your friends, if you don't, tell us," many of these stores advertise. The retail store has the advantage of having a clerk's sales as a yard-stick, as it were, of courtesy. The railway, of course, can have no such measure of efficiency and courtesy. A railway passenger's feelings in most cases cannot affect his purchases of tickets; they affect his friendliness and good-will; and it is these elements that count. The railway might say, "If you like the way we treat you, tell your friends and your representative in the legislature, if not, tell Mr. —, our general passenger agent," or something of the kind.

There are roads that are already doing this. The Bay State Street Railway, in its "Your Street Railway Service," the publication it issues to its patrons, says "Don't growl about the service, even when it is bad—kick. Kick straight to us. Write us letters just as frankly as you please. Call a spade a spade. . . . Don't tell your neighbor how bad the service is, tell us all about it. Give us specific data upon which we can work when we try to make improvements." Perhaps some of the steam railways might work out the same idea, and how could they work it out better than by using their time-tables for the purpose? A couple of well-chosen sentences in one of the spare spaces in the time-table would be just the thing. "Mr. Passenger, we are doing our best to give you first class service. If you are not getting what you should expect, we want to know it; but we can't find it out unless you tell us. Write our Mr. —, he will appreciate your kindness and will take immediate steps to find out what is wrong and to remedy the condition."

But, even so, the point still is that most passengers will not complain of discourtesy and ill-treatment even if they are asked. It cannot all be put up to the passengers. What, then, is the answer? Apparently some roads already have it. First and naturally there must be a one hundred per cent effort to render efficient and courteous service. Second, there must be education and as nearly perfect supervision as possible. Educate the employee that the public must be pleased and to tell the public that the railway is doing its best to please. Supervision should serve as the examination to find whether the course of lessons is being understood and followed by the employees with creditable efficiency. So far

DINING CAR MEALS

A CORRESPONDENT, whose letter is published elsewhere in this issue, thinks a dining car ought to be able to serve a 35 cent breakfast, a 50 cent lunch and a 60 cent dinner, and he points out the fact that he knows of city restaurants that do this. Forgetting for a moment that the kind of food and the class of service in a dining car are comparable not to a cheap restaurant, but to a good hotel where room and bath would be in the neighborhood of \$4 to \$5, let us stop for a moment to see what the dining car costs are compared with a cheap city restaurant. Take overhead costs first. There are no average figures available for the whole country as to how far a dining car has to be hauled to serve a lunch or dinner, but 100 miles is conservative, and two meals a day on the average is all that a great many cars can serve. The expenses per mile of carrying a dining car are rather higher than the average expenses of carrying all-passenger cars. Taking a year when costs were not as high as they are now, the Pennsylvania's passenger train expenses per mile were \$1.475, and the average number of cars in a train were 5.52, so that the average cost per car-mile is 27 cents, or for 100 miles \$27. This allows no rental for the car itself, but simply is the cost of hauling it. The rental of a dining car is about \$25 a day.

Again there are no average figures available for the whole country as to the number of people to whom meals are served at each meal time. On some roads it would be as low as 50 and on other roads more than twice that number. Let us take 75 as the average number. This would be 150 meals per day with a rental charge of \$25 and a haulage charge of \$54, or an overhead charge per meal of 53 cents. Compare this with a down-town Childs restaurant in New York, where there are three floors, each 175 ft. x 50 ft., or 26,250 sq. ft. of floor space, with, say, a rental charge of \$40,000 a year, or approximately \$110 a day. This restaurant serves approximately 8,000 meals a day, so that the overhead charge per meal served is less than 1.4 cents, and yet with such a small overhead charge a breakfast such as is suggested by our correspondent would cost apparently about 40 to 45 cents. A 40 cent breakfast as made up in a New York Childs restaurant consists of a sliced orange, bacon, one egg, potatoes, toast and coffee; ham instead of bacon is 5 cents more. It would be possible to pick out a lunch for 50 cents and a dinner for 60 cents, but not including roast beef or roast chicken with potatoes, dessert and coffee or milk.

Yet a Childs restaurant is run at a profit and most dining car service is operated at a loss, the fact being, of course, that not only are strictly overhead costs of a dining car many times as great as the overhead costs per meal served in an inexpensive city restaurant, but the costs of service, of cooking, of fuel, of ice and everything else incidental to the meal are many times greater for a dining car than for the restaurant. But, as was pointed out at first, this is comparing two very different things. Dining car meals are comparable to the meals served in a hotel like the Statler at Buffalo, Cleveland or Detroit. The Statler at Buffalo has recently inaugurated serving what is called a Liberty Lunch, based on "more vegetables—less meat—one way of helping to win the war." As an example, for 65 cents beef saute, cauliflower in butter, French fried potatoes, creamed spinach, stuffed cucumber and coffee or milk are served. This is served all on one plate with a small helping of each one of the articles named. It would presumably be quite impossible to serve a meal such as this if there was not also to help pay the overhead charges a very large number of meals served from the regular menu, where soup varies from 30 to 40 cents, fish from 60 to 75 cents, where roast beef is 70 cents and French fried potatoes

25 cents, etc. These latter prices compare favorably with the prices on dining cars notwithstanding the fact that even with the Statler or like hotels the overhead charges per meal served are presumably much lower than on a dining car.

About the kind of meals, size of portions, etc., that should be served in a dining car there is an infinite difference of opinion. "What is one man's meat is another man's poison" is an old and homely saying, but no one probably appreciates the full force of it more than does a dining car steward. His task is far harder than that of the head waiter of a good hotel because, as our correspondent points out, there are many people who take meals on a dining car that would not go into the restaurant of a Statler hotel for dinner. The class of service, the prices and all are strange to such travelers. To try to please all of them is an utter impossibility. About the best that can be attempted is for a superintendent of dining car service to set himself an ideal and to try to live up to it himself and to see that each steward of each car is trying to live up to this ideal. To get any agreement on what is good service among the varied patrons of dining cars is an impossibility.

STATE LEGISLATION RELATING TO RAILWAYS

THE state legislative mills have been grinding merrily on during 1917 with their customary activity and the usual variety of grist of railway legislation. The facts are shown in a bulletin just issued by the Special Committee on Relations of Railway Operation to Legislation. The 43 legislatures which have been in session within the year have enacted 140 laws relating to railway operation. This is the largest number of new laws passed in any one year except 1913 of the six years during which the committee has kept the record. In 1913 230 such laws were passed, and in the six years from 1912 a total of 605 laws relating to railway operation were added to the statute books.

Not all the legislative attempts to govern railway operation were successful. In the 1917 sessions of these 43 legislatures 808 bills were introduced, and this number also constitutes a record for the seven years during which records of bills have been kept, except in 1913 and 1915 when 1,395 and 1,097, respectively, were introduced. The total of bills affecting railway operation introduced in the seven years is 4,538. The largest number of laws enacted under any one of the 63 heads under which the committee classifies the result is 12, relating to grade crossings. Nine laws were passed relating to track connections at stations, and the same number were passed relating to the equipment of passenger trains.

The never-wearied activity of labor organizations resulted in the enactment of eight laws relating to service letters, time and manner of payment, and six relating to terms and conditions of employment. There are six new laws relating to separation of grades, six relating to destruction or theft of property and six relating to trespassing. Four relate to the furnishing of cars.

When the new enactments are segregated by states it is made to appear plainly that state regulation of railways is a disease that is apt to manifest itself with increasing virulence as the years pass. The states that in 1917 passed the most laws relating to railway operation are, generally, those that have been the most active in formulating regulatory measures in previous years. For example, Kansas leads the list in the present compilation with 12 laws enacted and ties with Missouri on 54 bills introduced. Missouri redeemed her record by passing only four. California is second with nine passed out of 30 introduced, and Ohio and Maine tie for third place with eight laws passed out of 24 and 18 bills introduced in the respective states. Iowa, with 6 laws from 22 bills introduced, Minnesota with 6 from 46 bills, Montana with 6 from 17 bills, and Oregon with 6 laws from 15 bills, maintain their records of previous years.

Letters to the Editor

IMPACT ON RAILROAD BRIDGES

NEW YORK.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

A reading of A. C. Irwin's letter on "The New Impact Formula" printed in your issue of August 3, gives one a wrong impression as to its utility; and by comparing this formula with the so-called 300 formula on the same basis, the reader is led to conclusions which are incorrect.

30,000

The ————— formula is intended to cover only

30,000 + L²

the effects of impact, true impact and nothing else. The 300

———— formula was originally intended to cover not only

300 + L

impact but some allowance for secondary stresses, future increase in loading, deterioration and several other factors of ignorance.

Whether it is more desirable to separate these various factors and design bridges by finding all the stresses, primary, secondary and true impact, and then add something for corrosion to the area of members thus required; or to proceed as at present, throwing all the unknown factors into a general factor which in itself is more or less an unknown, is not a matter of discussion. Individual ability and time will determine the use of one or the other.

The new formula has been adopted by the American Railway Engineering Association without the change of unit stresses from the present specification and with two provisions—(1) that the impact shall not be considered to cover the effect of secondary stresses, and (2) the live load used shall be large enough to cover future increase of loading. No such provision is included in the unit stress or impact.

300

As the ————— formula does include an allowance for

300 + L

secondary stresses, future increase of live load, possible effect of repetition and corrosion, besides impact, it can readily be seen that the formulas are not comparable.

30,000

The ————— formula, if used properly in conjunc-

30,000 + L²

tion with all the other factors, is therefore not easy of application, and moreover does not result in any economy in the weight of steel in bridges, the two reasons given in Mr. Irwin's letter urging its general use.

HERMAN D. HIRSCH,

Assistant Engineer, American Bridge Company.

CHICAGO.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The inability of any one formula to cover all the factors suggested by Mr. Hirsch is apparent and the old formula did not really cover any of them properly, except perhaps the factor of ignorance. Moreover, it has not been used in general as a "cure-all" by designers, nor is there sufficient evidence to show that it was so originally intended.

In 1887 the Pencoyd Iron Works published specifications written by C. C. Schneider, in which the dynamic effect of the live load was allowed for by the formula:

$$I = 0.7 + \frac{5}{L}$$

The addition to the live load given by this formula was

intended to cover not only the dynamic increment, but also an allowance of about 20 per cent of the live load for secondary stresses. This formula was changed about 1894 to:

$$I = 0.1 + \frac{220}{L + 240}$$

because it was thought that too great impact was given by it for long spans, but soon after it was discovered that almost identical values were given by the simpler formula:

$$I = \frac{300}{300 + L}$$

and this was adopted by Mr. Schneider and published in specifications in 1895.

Thus the old "300" formula was obtained from a previous one which was intended to provide about 20 per cent for secondary stresses, by changing it so as to give lower values for long spans. Comparing the first formula with the last one, it is seen that for a span of about 285 ft. the latter provides for 20 per cent less impact than the former and thus the allowance for secondary stress assumed to have been provided in the original formula is wholly wiped out in the last one.

It requires but casual consideration of the fundamental principles governing the determination of secondary stresses to see that neither the old nor the new A. R. E. A. formula can properly provide for these stresses. Secondary stresses are produced by dead load as well as live load and result entirely from the rigidity of the joints. Thus the secondary stresses in a pin-connected truss are limited to the friction on the pins. Secondary stresses are in general proportional to the ratio of the width of a member to its length and theory and experiment show that ordinarily in riveted trusses the end posts and members in the end panels receive the highest secondary stresses. If the old "300" formula provided for secondary stresses, it should give the highest impact for these members, but on the contrary, it provides for a lower impact factor on these members than those near the center of the span. It is thus seen that the factors governing secondary stresses have no relation to the impact formulas under discussion.

Referring to the provisions attributed to the old formula for future increase in loading, it has not been the practice of designers to so credit it,—the increase in future loading being provided for by an excess of design loading over those prevalent at the time. The old and the new A. R. E. A. formulas are comparable because the old one has been used almost exclusively as purely an impact formula just as it is proposed and expected that the new one will be used. The difference, however, is that the old has neither the theoretical nor the experimental foundation which is possessed by the new which is based on the most extensive and trustworthy impact tests ever performed in any country. The new formula should be used because it results in slight economy and because it gives the nearest reflection of the effects of impact that are at present available.

A. C. IRWIN.

DINING CAR MEALS

CHICAGO, ILL.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Breakfast, 35 cents; lunch, 50 cents; dinner, 60 cents; these prices are enough for regular meals in the dining car, but the traveller ought to be able to order from the usual bill of fare if he wishes to. Have the meals announced through the train as follows: 35-cent breakfast now served in diner at the rear (or forward), 50-cent lunch now served, etc., 60-cent dinner now served, etc.

You must admit that a railway journey is an event to a

great many persons, and they like the meals, all but the price. Now, they take their lunches and don't eat in the diner, a great many of them. There is no reason why a diner shouldn't serve good meals for the above prices, and the plan should prove very popular.

For 35 cents they could serve coffee, rolls and fried ham, or coffee, toast and bacon, or sausage, wheat cakes, honey and coffee.

For 50-cent lunch they could serve hungarian goulash or fish, coffee, ice cream or pudding.

For 60-cent dinner they could serve roast beef or roast chicken or fish, coffee, tea or milk, potatoes, pie, ice cream or pudding.

Personally, I know of a good many city restaurants who serve these kind of meals for less money and they are good substantial meals also. A diner buys in large quantities and is always near a market. It should be able to purchase as cheaply as a city restaurant. At these prices a diner should make more money than it now does. Fewer people would carry their lunches.

The United States Navy buys in large quantities, and each battleship stores enough food for three months. It costs the government 45 cents a day, or 15 cents a meal, to feed a sailor. A diner should be able to almost duplicate this cost.

J. A. DEAN.

PASSENGERS WILL NOT REPORT DISCOURTESIES

NEW YORK.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have read with a great deal of interest your editorial entitled "The Courtesy Killer," in the issue of September 14, and fully agree with all said therein as far as it goes, but it strikes me that you should have gone a step further.

Surely, the carriers have made, and are making, most strenuous efforts to educate their employees on the courtesy question. I have seen in many stations and offices neatly framed posters containing masterly written exhortations to be courteous under any and all circumstances. The same thing has been conveyed to employees in circulars time and again, but how is the company to know whether these instructions are being complied with?

Take the case you cited: This would-be passenger evidently went about telling all his friends about the discourteous treatment he had received, probably damning the road and everybody connected with it, whereas it would have been an act of kindness to other would-be passengers and to the railroad if he had reported the case promptly to headquarters so as to enable the officers to apply the necessary discipline.

Unfortunately, as a general rule, people either won't be bothered to report a case of this kind or they don't have the moral courage to do so, with the result that the discourteous agent will continue in his position to the detriment of the road and discomfort of would-be passengers.

I know from experience that the carriers always appreciate this much needed co-operation on the part of the public, and any one with average common sense can judge in which instance it is wise and proper to report a case or when to keep quiet. But to go about complaining to outsiders instead of reporting to headquarters is utterly wrong in principle and does not benefit or help anyone.

TRAVELER.

OIL FUEL IN COSTA RICA.—The Costa Rican railways are finding the use of oil fuel continuously successful. The Costa Rican Railway Company has expended the sum of £40,000 (\$194,400) upon a new installation for the use of oil fuel in the place of coal.

Decapod Type Locomotive for the Russian Government.

Decapod Locomotives for Russian Government

A Notable Order Consisting of 1,231 Heavy Locomotives, Built for a Foreign Country by American Builders

ONE of Russia's most imperative needs is increased transportation facilities. Additional motive power and rolling stock are urgently required, and American manufacturers are furnishing locomotives and cars in large numbers, as rapidly as facilities will permit. Since the summer of 1914 the total number of heavy freight locomotives ordered by the Russian Government railways from the Baldwin Locomotive Works and the American Locomotive Company is 1231, the former company furnishing 725 and the latter 506. These locomotives probably constitute the most notable group of heavy power ever shipped by American locomotive builders to a foreign country. Those last ordered will be completed during the year 1918. In addition, 50 locomotives of similar type have been supplied by the Canadian Locomotive Company.

The design and construction of these locomotives were under the direction of A. I. Lipetz, chief of the locomotive division of the Russian Mission on Ways of Communication in this country. They have been built on a number of different orders; but, although the later engines present various changes in details, as compared with those first constructed, the locomotives are all of the same general design and hauling capacity. The wheel arrangement is 2-10-0, and the tractive force exerted is 51,500 lb. The maximum load per driving axle is limited to 16½ metric tons. The locomotives are designed to operate on curves of 700 ft. radius on the main line and 350 ft. on sidings, and to handle 1,300 metric tons up a grade of 0.8 per cent, at a speed of 8 to 10 m. p. h. They have ample capacity for doing this, while working at a fairly economical cut-off.

The locomotives now being built by both the Baldwin Locomotive Works and the American Locomotive Company are identical in construction. In general design they follow American practice, although many of the details are in accordance with Russian standards. The Russian engine crews can, therefore, handle them without difficulty.

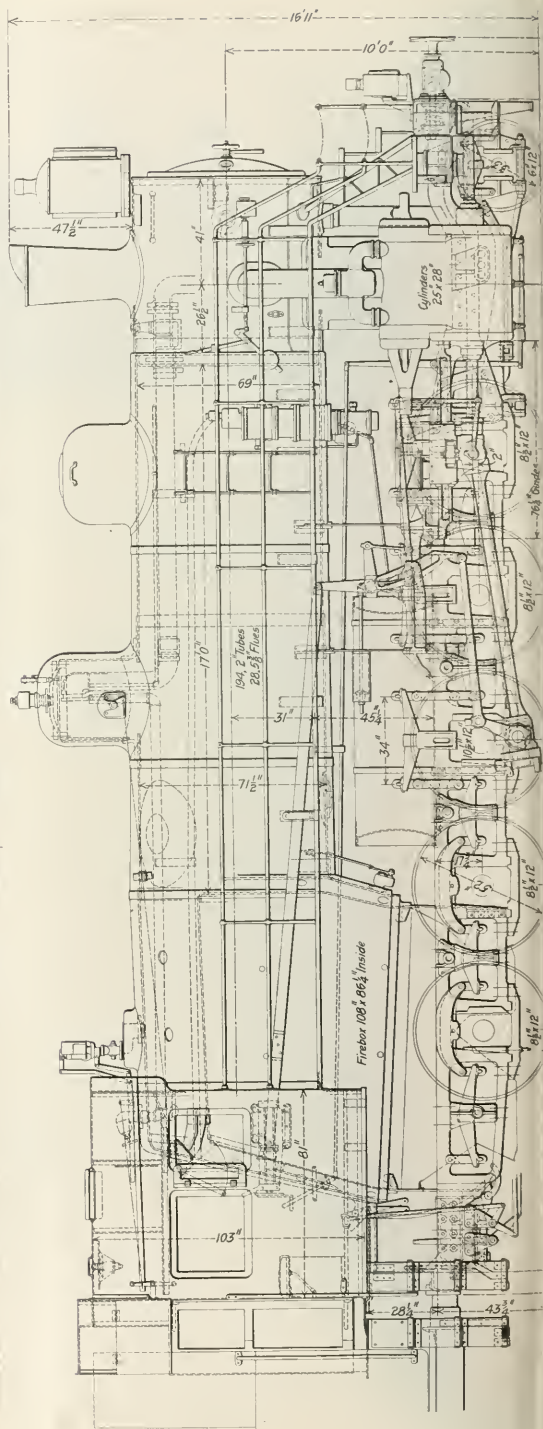

The boiler is of the straight top type, with a wide firebox which is placed above the rear pair of driving wheels. The boiler center is placed 10 ft. above the rail, and this allows ample room for a deep throat, and for the installation of a Security sectional arch supported on water-tubes. The fire-

box is radially stayed, and a total of 462 flexible stays are used in the water legs. Of these, 286 are placed in the sides; 84 in the backhead and 92 in the throat. In addition, four transverse rows of expansion stays support the front end of the crown and one row is used at the back.

The equipment of hand-holes and wash-out plugs is unusually complete; and a man-hole, 15½-in. in diameter, is placed on the round of the boiler on the left hand side, just forward of the firebox. The dome is of the built-up type, with an inside diameter of 30 in. Three safety valves are provided, one of these being mounted on the dome cap, and the other two on a specially designed turret, placed over the firebox and immediately in front of the cab. Two whistles are also mounted on this turret, and the rigging is so arranged that one of them can be blown from the train, by means of an outside cord connection.

The throttle valve is of the sliding type, in accordance with Russian practice, with a small auxiliary valve which opens first, facilitating the opening of the large valve and this same small valve is used when drifting on engines which have no by-pass valves. It has outside connections with the lever in the cab and is arranged to open with a downward movement of the slide. There are two ports in the vertical throttle-pipe, and they are tapered in width, so that a very small opening can be obtained. Springs are provided to assist in holding the slide against its seat.

These locomotives use superheated steam, and are equipped with a 28-element fire-tube type superheater. The superheater damper is arranged with several openings, which are placed in the front wall of the box enclosing the header. This construction replaces the single damper opening in the bottom of the box, which is ordinarily used in American locomotives. The cylinders are of the two-piece type, designed in accordance with American practice. The steam distribution is controlled by 12-in. piston valves. These are fitted, at each end, with light cast steel heads and spiders, between which is placed a cast-iron bull ring. The heads and spiders are mounted on the valve stem, which is extended through the front head. The packing rings and steam chest bushings are of gun-iron. The Walschaert valve gear is applied, in combination with a screw reverse mechanism of Russian

type. The pistons are of rolled steel, with extended piston rods, and the crossheads are light steel castings sliding on single bar guides. The back end of the main rod is fitted with a forked stub of Russian design. A steel filling piece is slipped over the fork between the brass and the key and this filling piece is fitted with a lug through which pass the two key adjusting bolts.

Some of these locomotives are equipped with the Zybloff

tion between the two ends of the cylinder. Another device of special interest is the Shukaloff drifting or vacuum relief valve, which is used in conjunction with the Zybloff by-pass valves. This valve communicates with the superheated steam section in the smoke-box header. When the engine is using steam, the pressure forces the valve down and holds it shut. When, however, the engine is drifting and a vacuum is created in the steam passages, the valve rises from its seat and

Boiler Elevation of the Russian Locomotives

by-pass valve. This device is arranged with a pipe connection 4 in. in diameter, which communicates with the steam ports at each end of the cylinder. In the center of this connection is placed a vertical plunger, formed in one piece with two pistons. When the throttle is open, steam acts on the

air is admitted through a suitable strainer. At the same time, a pipe connection is opened, through which a small quantity of saturated steam is admitted to the superheater header, and thence to the cylinders. This assists in breaking the vacuum and in keeping the valves and pistons properly lubricated.

The exhaust opening is variable and is worked, through suitable connections, by means of a hand-wheel placed in the cab. The exhaust nozzle contains a hollow frustum of a cone, which can be raised or lowered. When in its top position, all the exhaust steam passes out through the interior of the frustum; and when it is lowered, an annular opening around the frustum is provided in addition.

The frames are vanadium steel castings, 4 1/2 in. in width, and placed 43 in. between centers. The equalizing rigging is anchored to the frames between the third and fourth pairs of drivers, but is so arranged that, if desired, it can be changed and anchored between the second and third pairs. The leading truck is equipped with three point suspension links, and is equalized with the drivers in the usual manner.

The driving-wheel centers are turned to metric measurements, and the tire widths and transverse spacing also conform to the metric system. The wheels are designed to balance approximately 45 per cent of the weight of the reciprocating parts. The driving tires are shrunk on the centers, and are held by set screws and retaining rings in addition to the usual shoulder. The tires of the third, or main pair of wheels, are flangeless.

The front bumper is of steel built up, and screw couplings and spring buffers are applied in accordance with Russian railway practice. Two large signal lamps are placed on the front bumper when running forward and at the rear end of the tender when running backward, while the headlight is mounted on top of the smoke box.

Included in the equipment of these locomotives, are Russian-Westinghouse automatic air brakes, LeChatelier cylinder water brakes, electro-pyrometer for indicating superheated steam temperatures, and a six-feed mechanical lubricator. The injectors are of the Russian vertical type, and are mounted on the back head. In connection with them, sprinklers are applied for the ash-pan, smoke-box and cab deck. Power-operated fire-doors have been applied to a

Back Boiler Head of the Russian Locomotives with the Cab Removed

power piston, pushing the plunger up against a spring, and closing communication through the pipe connection. When the throttle is closed, and the steam pressure is relieved, the spring forces the plunger down, and there is free communica-

Railway Fire Protection Association Meets

Reports on Fire Prevention as Related to Explosives, Electrical Hazards and Storage of Pulverized Coal

THE fourth annual convention of the Railway Fire Protection Association was held at St. Louis, Mo., from October 2 to 4, inclusive. B. S. Mace, superintendent of insurance of the Baltimore & Ohio, and vice-president of the association, occupied the chair in the absence of P. Hevener, the president, who is now a first lieutenant in the National Army. The attendance was somewhat below that of last year, but the secretary reported an increase in total membership from 95 to 113. Mr. Mace was elected president for the coming year, Robert Scott, superintendent of insurance of the Atlantic Coast Line, was elected vice-president, and G. L. Ball, superintendent of insurance of the St. Louis-San Francisco, was made secretary-treasurer. The following new members of the executive committee were elected: P. Hevener, superintendent of the insurance department of the Chicago, Rock Island & Pacific, and now in the army on leave of absence; W. F. Hickey, superintendent of insurance of the New York, New Haven & Hartford; C. N. Rambo, of the Norfolk & Western, and E. W. Osborne, insurance inspector of the Northern Pacific.

Resolutions offered by the Committee on Resolutions, C. N. Rambo, chairman, emphasizing the importance of continued and increased attention to fire protective measures were unanimously adopted by the association and will be sent to the presidents of all the railroads in the country.

EXPLOSIVES AND OTHER DANGEROUS ARTICLES

The report of the Committee on Explosives and Other Dangerous Articles, W. S. Topping, Bureau of Explosives, chairman, is abstracted below:

For the period from 1907 to and including June, 1917, the total number of explosions occurring in the transportation of dynamite alone amounted to a total of 27 resulting in the death of 10 persons and the injury of 35 others, and a total property loss of \$611,244. The causes have been segregated and we find that of the total of 27 accidents six were chargeable to failure of railway employees to remove or isolate shipments before they were reached by fire originating through other sources. Five accidents were due to failure of the carrier to enforce prompt removal by the consignee, or to otherwise dispose of shipments of high explosives. Three were due to concealed shipments of high explosives in trunks or in household goods shipped by miners. In two instances explosions were due to fire consuming cars of explosives, the origin of the fires being due to defective car roofs and caused by sparks lodging thereon. In two other instances cars of explosives were involved in derailments.

Our records also show that the following causes are each responsible for an accident:

1. Leaking cases loaded without staying end on end.
2. The placing of a car of high explosives next to a car placarded "Inflammable" and alongside a cinder bank.
3. Failure to place car in center of train, and improperly placing car between tank car and car of rails.
4. Failure to inspect or properly prepare car, draft bolt being replaced and not covered with wood.
5. Failure of brakeman to adjust switch, which derailed the car.
6. Failure to enforce prompt removal by consignee at a non-agency station and storing shipment in shed.
7. Spontaneous decomposition of unsafe explosives not passed upon by the Bureau of Explosives and failure promptly to dispose of a leaking astray shipment.
8. Careless handling, permitting case to fall under car.
9. Intentional explosion by a criminal.

BLACK POWDER

Black powder is usually shipped in metal kegs and under the regulations these kegs are so loaded and stayed as to

prevent movement in ordinary transportation, but the shocks cars receive incident to switching and yard movement sometimes have the effect of breaking down the staying and of permitting the kegs to roll over the car floor, and our records show many instances wherein these kegs have been ruptured and grains of powder spilled on the floor. In not all of these instances, however, has an explosion occurred because of the care exercised by railway employees upon discovery of these bad conditions. It goes without saying that the proper place for explosives is in their containers and not strewn over a car or warehouse floor.

Black powder is much easier of ignition than is dynamite or smokeless powder and when the leaking grains of powder are ignited, even though the ignition of these grains may occur some distance away from the kegs of powder, there is a grave possibility of the ignition communicating to the entire shipment. The ignition of black powder may easily occur through a spark made by contact between metal surfaces, or a flame from a lighted torch. A lighted hand lantern while not the safest sort of light to use around black powder, probably would not cause trouble.

For the period from 1907 to and including June, 1917, the total number of explosions occurring in the transportation of black powder amounted to a total of 18, resulting in the death of 38 persons and the injury of 78 others, and a total property loss of \$125,723. The causes have been segregated and we find that of the total of 18 accidents three were due to derailments, two were chargeable to the concealment in articles of baggage, while the remainder were due to lightning, sparks, leakage, carelessness in loading, failure to keep tramps away, a rear end collision, impact with another car in switching, etc.

OTHER DANGEROUS ARTICLES

In the year 1916 there were 536 accidents connected with the handling of acids, which resulted in the injury of 35 persons and a property loss to the carriers of about \$75,000. Of the various kinds of acids handled, the most dangerous in transportation are nitric acid or mixed nitric acid and sulphuric acid. Either of these acids will cause fires when in contact with combustible material. The use of glass containers for the shipment of nitric acid undoubtedly is the cause of practically all of the fires, taking into consideration the failure of shippers properly to prepare their packages, rough handling on the part of carriers and failure of carriers' employees to exercise proper supervision over the acceptance and loading of such shipments.

Of the other dangerous articles the greatest hazard is in connection with the movement and handling of inflammable liquids. Under the regulations an inflammable liquid is one that has a flash point at or below 80 deg. F., which means that at a temperature of 80 deg. F. or below the liquid gives off inflammable vapors that will ignite on contact with flame. In 1916 70 serious accidents occurred in the handling of gasoline, and cost the carriers \$137,860 and we find that the cause of these accidents was:

1. Deraillments and ignition of vapors or liquid by sparks produced by contact of metal surfaces.
2. Ignition by trainmen's lanterns.
3. Draining of automobiles in cars or on platforms; ignition of the liquid or vapors by lighted matches or lanterns.

1917 TROUBLES

The record so far compiled for this year shows a repetition of careless acts on the part of railway employees and shows

many accidents and fires that could have been avoided by the exercise of proper care and attention to details. Inflammable liquids in tank cars seem to have been involved in fires of considerable frequency. But as stated before, derailments were in many instances the contributing causes. In handling derailed tank cars fires have occurred due to failure of employees to act with extreme care and observe well-known precautions. Other tank car fires were due to failure on the part of railway employees to prevent ignition of leaking gasoline between the tracks. Two serious fires were caused by disobedience of rules with respect to removal of dome covers while contents of tank cars were known to be under pressure.

PUT OUT THE FIRES BEFORE THEY GET BEYOND CONTROL

When fires occur in connection with the transportation or storage of explosives or other dangerous articles, the one important thing to do is to stop the fire in its early stage, and for this purpose qualified and well-trained employees are essential. The best manner of extinguishing these fires depends upon the immediate existing local conditions. Fires caused by nitric acid or mixed nitric and sulphuric acids can be controlled by the careful use of water. In the application of water care must be exercised as in contact with acid it is liable to cause slight explosions, accompanied by the projection of hot acid, which may cause dangerous burns. Therefore, the water should be applied from a safe distance. Sand may also be used to stop a fire started by acid, but if the fire has thus been stopped, the early use of water is desirable to prevent the fire breaking out again. Thoroughly flush away any remaining acid and remove leaking or damaged containers. In all fires caused by nitric or mixed acids, a considerable amount of nitrous fumes will be given off; these fumes are extremely irritating and are poisonous. Employees should not enter a car or other confined space where such fumes are present.

Fire in a case of friction (strike anywhere) matches frequently involves ignition of the match heads in one or more of the inside cartons. If the outside box is not broken open and the smoke dies away after a moment or two, no further action is necessary, as the fire has already been extinguished for want of oxygen, and nothing will be gained by opening the box. If the fire has gained some headway, the burning box or boxes should be removed from the car or warehouse if this is possible; or water should be freely used. Boxes should not be broken open, as the fire will be increased by such action.

Fires in ground charcoal or in charcoal screenings are best handled in removing the burning packages (usually bags). If conditions are such that removal is not possible, water may be used sparingly to extinguish the visible fire; then remove all of the charcoal and separate the wet from the dry charcoal. The dry charcoal should be stored under cover and under observation for several days before permitting such a shipment to move forward, as it is probable that fire may burst out again. The wet charcoal should be destroyed as it is unsafe to transport. Fires in lump charcoal should be extinguished with as little water as possible and the wet charcoal removed from the balance of the lading. The same precautions as to observation for several days should be followed to see that fire does not again occur.

Fires which involve only a small amount of gasoline can often be extinguished by the liberal use of water, but if there is a large amount of gasoline already ignited, water will only spread the fire. Sand or earth should be used to control the flames of the burning gasoline, and could possibly be used in sufficient quantity to smother the fire.

Fires involving tank cars may occur through ignition of the vapors escaping from a safety valve. The burning of these vapors and even of the liquid itself is not a serious matter except as a source of trouble to surrounding prop-

erty. An effort should be made promptly to extinguish such fires by the use of wet bagging thrown over the safety valve, pouring sand in quantity on top, or if the means are available, by the use of a heavy jet of steam. If this cannot be done, isolation is the proper course to pursue, and the fire will eventually burn itself out.

Carbon tetrachloride, the basis of many of the various chemical fire extinguishers, if thrown on an oil fire forms a heavy non-inflammable vapor over the liquid, and mixes readily with oils. The vapor is about five times as heavy as air, and although the fumes from carbon tetrachloride are pungent, brief exposure to them does not cause permanent injury. The efficacy of carbon tetrachloride depends largely on the skill of the user.

Sawdust may be used by means of long-handled shovels, in extinguishing fires involving open tanks. The sawdust is not easily ignited, but floats on the surface forming a blanket which will exclude the oxygen of the air.

Fires in sulphur are best extinguished with water, or if discovered at the start the burning portion may be removed. Sulphur does not burn rapidly nor will the fire spread rapidly. After a fire is apparently extinguished the shipment should be kept under observation, as owing to the low ignition temperature fire may burst out again. The fumes are suffocating and should be avoided by employees.

Nitrate of soda is not easily ignitable, but when intimately mixed with organic matter, such as jute bagging, is liable to cause serious trouble if ignited. The melted nitrate retains a great deal of heat and when water is thrown on it the sudden generation of steam will cause the melted nitrate to scatter and start fresh fire. Whenever practicable, fires in shipments of nitrate of soda should be smothered immediately, as they are difficult to extinguish with water after gaining any headway.

Leaking or damaged cases containing bromine require careful attention in order to avoid fire and, particularly, personal injuries. Fumes of bromine may be neutralized and settled by using ammonia water or household ammonia sprayed through a sprinkler or watering pot. Sufficient ammonia should be sprinkled to counteract the bromine fumes, and the box and packing saturated with the bromine should be saturated with sufficient ammonia so that the odor of ammonia becomes more noticeable than the bromine. After neutralizing the bromine, the broken or leaking bottles can be removed from the cases.

The Bureau of Explosives early took hold of the question of properly constructed cylinders for acetylene and very exhaustive tests were conducted. Finally, with the active co-operation of the acetylene industry, the bureau developed its regulations so that the hazard of transportation has become negligible, and thus the cylinders are now so safeguarded that the widespread use throughout the country, so far as approved cylinders are concerned, is not accompanied by undue hazards. As regards the oxygen cylinder, the bureau has made more and more rigorous regulations, developed systems of inspection and test, including permanent records so that the oxygen cylinder with its 1,800 lb. pressure to the square inch goes through the vicissitudes of transportation and the use of half a billion feet of oxygen per annum and is not accompanied with accidents attributable to cylinder failure.

FIRE PREVENTION AND PROTECTION IN RAILROAD YARDS

The committee on Fire Prevention and Protection in Terminal, Classification and Storage Yards, F. A. Greene, Pennsylvania Railroad, chairman, was approved. The committee, however, was requested to continue its investigation of the subject and to make a final report at the next meeting. An abstract of the report follows:

PREVENTION

Preventive measures may generally be included under the phrase "careful housekeeping." All hay, straw, rubbish, paper, etc., should be removed and the doors of wooden box cars should be kept closed; grass, weeds and undergrowth should be kept out, and rubbish should not be allowed to accumulate in yards or near storage tracks and suitable incinerators should be provided, especially where car cleaning is done. Definite arrangements should be made for the disposition of trash. Cars should not be stored near hazardous risks, such as wooden grain elevators, warehouses, etc., or where exposed by the burning of adjacent property. Dead end tracks should be avoided as far as possible.

The watchman's service is important and should consist of regular tours of the entire yard both day and night, registering on approved portable watchmen's clocks from stations distributed throughout the yard recording at each station at least every two hours and at some station every 30 minutes. There should be a watchman for each 1,000 cars and in the selection for this service preference should be given to young able-bodied men with sight, hearing and sense of smell unimpaired. His duties would be to keep out trespassers, to close or have closed all car doors, to report dirty conditions in yard, engines throwing sparks, and he should be well informed as to the location of all fire appliances, fire alarm boxes, etc.

PROTECTION

Two factors to be considered in determining the outlay warranted are the number of men that are available to handle equipment and the ratio of the cost to the average value at risk.

The most economical and efficient method of protecting classification and storage yards is by equipping all shifting engines with fire extinguishing apparatus. There are several types of such apparatus on the market, all working on the general principle of syphoning the water from the engine tank by means of a steam jet, any one of which is capable of throwing a very satisfactory fire stream.

The great advantage of shifting engines equipped with fire extinguishing apparatus for the protection of yards is that they are readily moved to the fire and are ordinarily well distributed throughout the yard, so that at least one engine can be brought into service at any point promptly. In the hands of a proper organization shifting engines equipped with fire extinguishing apparatus can render almost as efficient service as water lines and fire hydrants. Two non-freezing type "listed" chemical extinguishers of the 2½-gal. size with shoulder strap attachments may be added to the engine equipment to good advantage.

In order to obtain the greatest efficiency from shifting engines equipped with fire extinguishing apparatus, a fire brigade organization should be formed in each yard or district and special instructions should be issued by the division superintendent and posted on the bulletin boards in the district covered and in such other places as may be necessary. These instructions should designate an employee, usually the yardmaster, to assume general charge of the operations of the engines to insure that they are given right of way through the yard in case of fire. The conductor of each crew should be held responsible for his own crew and the members of each crew should be assigned specific duties, such as first brakeman—laying of hose lines and assisting at nozzle; second brakeman—coupling of hose and assisting at nozzle; fireman—coupling hose to locomotive extinguisher and assisting engineman; engineman—care and operation of fire extinguisher. Suitable fire signals should be arranged for calling shifting engines or other assistance. Fire drills should be held every two weeks and reports made to the superintendent; water, however, should not be turned on during freezing weather.

HAND FIRE EQUIPMENT

For the further protection of yards, it is recommended that 2½-gal. chemical extinguishers be distributed in all heated yard buildings, such as scale offices, switch houses, etc., and that employees be designated to handle these extinguishers in the event of fire. In larger yards, it is also recommended that one or more 40-gal. chemical engines of the upset type be provided and a sufficient fire brigade organization formed to bring them into service.

WATER MAINS AND FIRE HYDRANTS

This type of protection is the most expensive to install and before recommending its installation a careful estimate should be prepared of the cost to determine if the values subject to risk from one fire are sufficient to warrant the expenditure. In this connection it should be remembered that while the aggregate values in yards are very large, nevertheless they cannot be considered subject to a single loss, as it is possible with efficient shifting service to remove the cars and prevent a general conflagration.

FIRE BRIGADE

The importance of a well trained fire brigade cannot be over-estimated particularly at points isolated or inaccessible to city fire protection. Frequently in laying out systems of fire protection, the fire brigade fails to receive the consideration which its importance deserves and fire pumps and distribution systems, however perfect, will prove of little value if the means are neglected by which their possibilities are to be realized.

In organizing a private fire brigade the use of the pamphlet on "Private Fire Brigades," issued by the National Fire Protection Association, is recommended.

SIGNALING SYSTEMS

The installation of approved fire alarm systems to cover wide areas, such as classification and storage yards, involves considerable expense and is warranted only where complete systems of water mains and hydrants are installed and a fire brigade organization is maintained. Under ordinary conditions, it is believed that the yard telephone service used in connection with the whistle alarms sounded by shifting engines or from the power plant will fully meet the requirements.

CITY PROTECTION

In most yards on account of inaccessibility, the efficiency of outside fire protection will be more or less reduced. It is important, therefore, that wherever public or volunteer fire departments are located within a reasonable distance of a yard care be exercised to maintain the roadways in good condition at all times. It is also advisable wherever possible to have a city fire alarm box or an auxiliary box located on the premises, otherwise the telephone number of the nearest city fire company should be shown on the fire alarm code.

PROTECTION OF WHARVES AND PIERS

W. F. Hickey, chairman of the Committee on Wharves and Piers, read a report which emphasized the great vulnerability to fire of most of the piers and wharves of the country and urged (1), fireproof construction of piers and wharves, (2), proper care and protection by officials and employees, (3), the provision of all means of extinguishing fires possible. He stated that at the present time extraordinary precautions were vitally necessary on account of the large amount of business being handled on wharves and piers, the danger of congestion and the nature of the traffic handled, which include considerable quantities of munitions. He recommended that the water end of piers and the bulkhead which abuts on the water front be guarded rigidly day and night with frequent watchmen clock records as that is the most likely place of attack for incendiarism by an alien

enemy. The work of this committee was continued with a request that it file a final report at the next meeting.

HAZARDS IN THE STORAGE OF PULVERIZED COAL

C. P. Beistle, chemist of the Bureau of Explosives, read a paper on Hazards in Connection with the Storage of Pulverized Coal, a liberal abstract of which follows:

In the development of the use of pulverized coal, together with many advantages and economies, there has appeared a certain hazard in handling and storage. This hazard under proper conditions is not severe, but should be recognized and provided against in designing and operating equipment. The hazards of pulverized coal are of two kinds. First: the hazard of spontaneous ignition, and second: the explosion hazard.

SPONTANEOUS IGNITION

It has long been known that spontaneous ignition takes place at times in the storage of bituminous coal. Observations of numerous fires in coal in storage and shipment show that the fires originate in coal in large bulk, preferably in the fine or slack coal, and that the spontaneous heating is apparently stimulated by moisture. It is also generally found that fires are more liable to originate spontaneously in coal containing comparatively large amounts of sulphur.

Closer investigation shows that freshly mined bituminous coal when exposed to air starts to absorb oxygen immediately. This oxygen at first combines directly with unsaturated compounds in the coal, and in so doing causes some increase in temperature. As the temperature increases the rate of oxygen absorption also increases, and after the temperature reaches a certain critical point carbon dioxide and water are given. If the conditions are favorable this process may extend to the point of ignition.

As the process initially depends on the action of atmospheric oxygen on the coal, this action will take place only on the surface of the coal. The ratio of the surface to the mass is enormously increased as the size of the individual particles is decreased. Consequently the finer the state of division of the coal, the more rapid the spontaneous oxidation, and the more rapid the consequent development of heat.

The absorption of oxygen by the coal, although taking place at any temperature, increases as the temperature increases; hence spontaneous heating is more likely to occur if the coal is at a high temperature to start with.

In preparing pulverized coal for use the coal is first dried and then ground. This drying is accomplished by direct heating, and is necessary to get the fine and uniform grinding required for the proper use of the fuel. The coal after passing through the dryer is pulverized while still hot or warm. As the drying and fine grinding are essential to the preparation of the fuel, the logical precaution is to carry on the drying process at as low a temperature as practicable. This not only tends to reduce the chances of spontaneous ignition, but also prevents the direct ignition of the coal in the dryer, which sometimes happens. The efficiency of the drying process need not be lowered materially by the use of lower temperatures, as the rapidity of drying depends not only on the temperature, but also on the rapidity with which the air current passes over the material being dried. It should, therefore, be the aim to get the drying done at comparatively low temperatures and with the use of a strong draught through the dryer. The temperature of the coal coming from the dryer should not exceed 150 deg. F.

The pulverized coal should be stored in metal bins or receptacles sufficiently tight to prevent circulation of air or the entrance of moisture. The amount of pulverized coal kept in storage should be as small as is practical, considering the daily consumption: the reserve of fuel should be stored in the lump condition and not as pulverized coal. In case pulverized coal ignites spontaneously, or from any other

cause, it burns slowly with smouldering combustion, and if kept in tight metal bins is not liable to cause much loss. Fires occurring in this way should be extinguished by washing out the contents of the bin with a stream of water.

In common with other combustible dusts, such as flour, elevator dust, etc., under certain conditions coal dust or pulverized coal is capable of producing violent explosions. This explosive action can take place only when the dust is suspended in the air, and then it requires the contact of a spark or flame for ignition.

Coal dust suspended in the air has somewhat the same risks of fire and explosion as the vapors of inflammable liquids, and much the same precautions must be used to prevent escape of dust clouds into the atmosphere as is taken to prevent escape of inflammable vapors.

Storage bins, dryers, pulverizers and conveyors should be tight to prevent the escape of the pulverized coal into the atmosphere. Coal dust should not be allowed to accumulate on exposed surfaces inside of buildings or in other places where by any means it may be thrown into the air to form a dust cloud.

No lights other than incandescent electric lights provided with heavy guards should be permitted in places where pulverized coal is being prepared, handled or stored. Fires, matches, lanterns or torches should not be permitted in or around pulverizing mills or storage bins.

The inflammability of pulverized coal depends on the proportion of volatile matter in the coal and, therefore, bituminous coal is more dangerous in this respect than anthracite coal, and lignites are more dangerous than bituminous coal. While pulverized anthracite coal is not liable to spontaneous ignition and is less liable to produce dust explosions than other coal, the coal commonly pulverized for use as fuel is bituminous coal or lignite, as pulverized anthracite coal has not yet been successfully applied as a fuel, except when mixed with softer coal.

ELECTRICAL HAZARDS

The report of the Committee on Electrical Hazards, T. S. Potts, Cincinnati, Hamilton & Dayton, chairman, was accepted. The report included proposed instruction cards designed to reduce the fire hazards of electric light and motor installations by giving instructions as to their proper maintenance and operation.

STATISTICAL REPORT OF FIRE LOSSES

E. B. Berry, chief insurance inspector of the Southern Railway, read a report on statistics of fire losses during 1916, which follows in part:

Forty-nine railroads, representing 120,805 miles, reported 5,077 fires in 1916, with a loss of \$4,677,374, an increase of 16 2-3 per cent in the number of fires and 74 4-10 per cent in losses over the previous year. The average loss per fire increased from \$55 to \$921, or 66 per cent, and loss per mile of road increased from \$23.62 to \$38.71, or 64 per cent.

As in previous years, 77 per cent of the entire loss was caused by the six prolific fire breeders:

	Per cent.
Defective electric wiring.....	34
Friction, hot boxes, etc.....	19
Locomotive sparks.....	9
Spontaneous combustion.....	8
Wrecks.....	6
Unknown.....	21

The property loss was divided as follows:

	Per cent.
Elevators.....	30
Rolling stock.....	20
Miscellaneous station buildings.....	12
Merchandise in transit.....	8
Shop property.....	6

The heavy loss in elevator buildings is attributed to the unsettled conditions of the country, and demonstrates the absolute need of thorough and competent watch and patrol service.

The rolling stock risk shows an increased loss of \$226,259 over last year; while a large percentage of the loss is due to the destruction of cars by fire at industrial plants, the psychology of the conditions causing heavy loss in elevator property should act inversely with respect to rolling stock.

Merchandise in transit reporting an increase loss of \$111,632 is accounted for by the very great increase in tonnage handled by the carrier with a very much higher value per ton unit. The loss ratio based on destructible value of the risk is in all probability lower than the past year.

HOSE AND HOSE COUPLINGS

The report of the Committee on Hose and Hose Couplings, F. H. Elmore, Southern Railway, chairman, was accepted. Briefly, it recommended the following:

1. Cotton rubber lined hose where exposed to moisture and rough usage.

Use 2½-in. hose where water pressure and volume and force for handling sufficient.

Use 2-in. and 1½-in. hose where volume and pressure reduced. Nozzle outlets reduced commensurately.

Single jacketed hose, except where severity of service demands double jacketed.

3. Purchase hose with underwriters' specifications and with a five year guarantee of service.

4. (a) Factory test of hose.

(b) Regular service in drills.

(c) Optional periodical test at minimum pressure of 125 lb.

5. Confining use of hose to fire protection purposes. Care and maintenance according to detailed recommendations.

6. A clearing house for both new and old hose and authoritative records of all hose, couplings and threads used.

7. Adoption of the national standard, 2½-in. x 3 1/16-in., 7½ threads to the inch, as rapidly as practicable and provision of adapters where necessary.

EQUIPMENT FOR THE AMERICAN MILITARY RAILROAD

The illustrations show one of the narrow gage locomotives built by the Baldwin Locomotive Works for the United States government for service on the narrow gage lines running up to the trenches at the front; one of the standard gage flat cars built by the Haskell & Barker Car Company, and a crawling traction steam shovel also intended for military

Narrow-gage Locomotive for Light Railway Service in France; Built by Baldwin Locomotive Works

A Steam Shovel for the Railway Engineers; Built by the Marion Steam Shovel Co.

Standard-gage Flat Car of 33 Tons Capacity; Built for Service Overseas by the Haskell & Barker Car Company

Portable reels and standard hose houses for yards; substantial stationary reels in buildings.

2. Unlined linen hose where not exposed to dampness or mechanical injury, and not subject to test.

Use 1½-in. and 2-in. hose according to volume and pressure or size of injector pipes.

Use 2½-in. hose on engines equipped with independent pumps.

Metal racks and reels in buildings; metal rack in cab of switch engines.

railroad and construction work abroad. Under the regulations of the War Department and of the Committee on Public Information regarding the publication of military information, publication of the specifications of this equipment and of the number to be used is prohibited.

HOLLAND'S NEW RAILWAY GUIDE.—An Exchange telegram states that the Dutch Government recently published a new railway guide for the winter. Two-thirds of the express trains and many others have been eliminated.

New Central Station at Tokyo

The Progress of the Japanese Railroads*

Part I.—Development of the System and an Account of
the Present Organization, Traffic, Rates and Problems

By Sukehiko Goto

Civil Engineer for the Imperial Government Railways, Tokyo, Japan.

JAPAN began railway construction nearly half a century later than Europe and America, the first railway laid between Tokyo and Yokohama being opened in 1872. History records that a miniature engine was brought to Japan by Commodore Perry, in 1854, for presentation to the Shogun when his fleet made its first visit to Japan's shores. Some time later a railway concession between Tokyo and Yokohama was negotiated for American interests, but this project was frustrated by the downfall of the Tokugawa government.

Immediately after the restoration the new government laid down a program for a national system of railways, and after considerable delay funds were procured in England to the amount of one million sterling. This resulted in the construction of the 18-mile Tokio-Yokohama line, which was opened to traffic in 1872. Two years later the Kobe-Osaka section, a stretch of 20 miles, was completed and in 1877 it was extended to Kyoto. During the first decade of the railway construction program, work did not proceed as speedily as was at first intended, because of lack of funds, so that in 1882-3 only about 115 miles of line had been built, mainly centered about Tokyo, Osaka and Kyoto.

In 1881, after the government had concluded to encourage private enterprise, the Nippon Railway Company was organized to build a line between Tokyo and Aomori, the northeastern extremity of the main island. Under the concession agreement the government undertook to construct part of the new road and assumed control over construction and finance, including rate-making. In return for a land grant and a guarantee of interest payment up to 8 per cent for 10 to 15 years, the company was obliged to finance 50 per cent of the work and to provide certain reduced cost service. The term of the concession was fixed at 99 years, with the privilege of government purchase after 50 years.

The success of this venture gave impetus to private undertakings, and until 1891 no less than 15 railway projects had been started in different parts of the empire and the lines had attained an aggregate length of 1,071 miles, although the government had later greatly restricted construction subsidies and interest guarantees. Railway ventures met with a check in the crisis of 1890, resulting from a crop failure, while the desire for State purchase came to be increasingly evident in that it became exceedingly difficult to operate certain lines with anything like a fair return upon the investment.

Early in 1891 a state purchase bill was placed before the Imperial Diet, but as a result of a compromise this was

withdrawn in favor of a railway construction act, which was passed the next year. This law authorized the government to float bonds for railway construction, and the purchase of private railways. On the other hand, some of the favorable routes were left open to private enterprise. This law served to encourage private building more than state construction and at the end of 1894 the government owned 580 miles of road, as compared with 1,305 miles in the hands of private interests, while ten years later the relative figures stood at 1,461 miles and 3,231 miles. Although the government was far from satisfied with this state of affairs, no concerted move for government ownership was made until after the war with Russia, when, in March, 1906, a bill for the state purchase of railways was introduced in the Diet, which was finally passed in a somewhat modified shape.

THE PURCHASE LAW

Under the provision of this law the government was authorized to take over 17 private lines at any time between 1906 and 1915 at a purchase price determined by the following formulae:

1. Twenty times the amount obtained by multiplying the cost of construction at the date of purchase by the average rate of net profit on the cost of construction during the six semi-annual business terms of the company from the latter half of 1902 to the first half of 1905 inclusive.

2. A sum obtained by converting at the market price the actual cost of stores into the face value of public loan bonds, excepting purchases made with debentures.

By the term "net profit" in the first clause is meant the balance remaining after deducting from the earnings the operating expenses, bonuses, and the interest accruing from accounts other than the revenue account. The purchase price was to be paid in not less than five years after date of purchase in public loans at face value bearing interest at five per cent.

The purchase of the 17 railways was carried out within 18 months, ending in October, 1907, instead of 10 years. The mileage thus acquired was 2,827 miles and the purchase price, including numerous utilities of an allied character, was about \$240,000,000.

SYSTEM GROWS RAPIDLY

The period from the time of nationalization until 1914 was one of phenomenal expansion of traffic. The mileage increased from 4,444.8 miles to 5,472.7 miles, or 23.1 per cent, and at the same time the mileage of double or multiple tracks increased from 459.5 miles to 739.4 miles. The number of locomotives rose from 1,924 in 1908 to 2,500 in 1914, or 29.8 per cent; the number of passenger cars from 4,989 to 6,458, and of freight cars from 32,242 to 42,705. During the seven years the average weight of locomotives rose from 48.0 tons to 52.9 tons, and the average capacity of freight cars from 7.2 tons to 8.6 tons. The locomotive mileage also

*Part 2: An account of the roadway and equipment practice, construction standards, administration of employees, etc., will appear in a later issue.

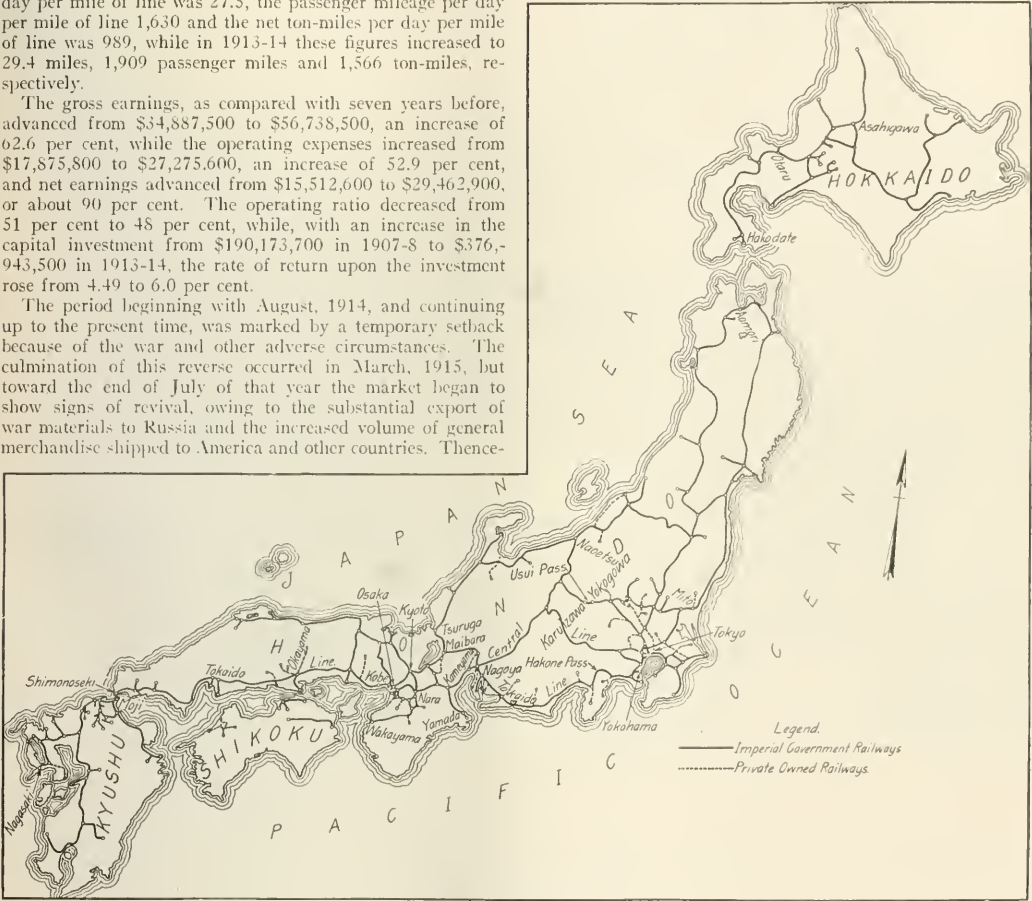

increased from 43,901,036 to 68,744,136 miles and the car mileage from 647,183,493 to 1,212,753,097 miles.

The passenger mileage increased from 2,353,270,765 to 3,690,964,619, a gain of 47.5 per cent, and the ton-mileage from 1,441,125,011 to 3,053,842,638, or more than double the figures of seven years previous. The density of traffic was also marked. In 1907-8 the number of train-miles per day per mile of line was 27.5, the passenger mileage per day per mile of line 1,630 and the net ton-miles per day per mile of line was 989, while in 1913-14 these figures increased to 29.4 miles, 1,909 passenger miles and 1,566 ton-miles, respectively.

The gross earnings, as compared with seven years before, advanced from \$34,887,500 to \$56,738,500, an increase of 62.6 per cent, while the operating expenses increased from \$17,875,800 to \$27,275,600, an increase of 52.9 per cent, and net earnings advanced from \$15,512,600 to \$29,462,900, or about 90 per cent. The operating ratio decreased from 51 per cent to 48 per cent, while, with an increase in the capital investment from \$190,173,700 in 1907-8 to \$376,943,500 in 1913-14, the rate of return upon the investment rose from 4.49 to 6.0 per cent.

The period beginning with August, 1914, and continuing up to the present time, was marked by a temporary setback because of the war and other adverse circumstances. The culmination of this reverse occurred in March, 1915, but toward the end of July of that year the market began to show signs of revival, owing to the substantial export of war materials to Russia and the increased volume of general merchandise shipped to America and other countries. There-

Through trains provided with dining and sleeping car service are regularly run on all the trunk lines, of which the daily train de luxe between Tokyo and Shimonoseki is most notable. This is scheduled to make connections with the Korea-Manchuria through train and the train on the Chinese Eastern railway to facilitate overland communications with Europe via Korea, Manchuria and Siberia. A train is also

Map of Japan

forward the monthly returns have marked a steady increase up to the present.

Traffic returns for the year ending March 31, 1916,

Item.	Year under review.	Increase against preceding year.
Passengers carried	165,780,903	5,384,681
Tons of freight hauled	35,231,896	338,787
Earnings from passenger traffic	\$30,117,600	\$2,676,000
Earnings from freight traffic	\$30,446,000	\$3,442,000
Total	\$60,563,000	\$6,118,000

While endeavoring to promote the growth of traffic and insure the profitable operation of the lines, the railway management has made material efforts to improve the passenger and other service in the direction of safety, speed and comfort. The speeds of passenger trains have been increased materially and the size and weight of the cars have been increased so that they are now practically of the same dimensions as those in use on English railways.

run on the line between Tokyo and Tsuruga, a port on the Japan sea, to effect a connection with Vladivostok and the trans-Siberian route.

Recent years have witnessed the electrification of a substantial mileage of urban and suburban lines. Electric trains are now run between Tokyo and Yokohama, an additional double track line having been built for that purpose. The Yamanote line, which connects Tokyo and Ueno station, north Metropolitan terminus, has also been electrified for the convenience of through passengers.

The ferry service between Japan proper and Korea, the main island and the islands of Shikoku and the Hokkaido is operated by the railways. Thirty-six steamers are in the service and about 2,000,000 passengers and 800,000 tons of freight are handled annually. Car ferry service was also inaugurated a few days ago as a connecting link between the main island and the island of Kyu-shu.

PASSENGER FARES

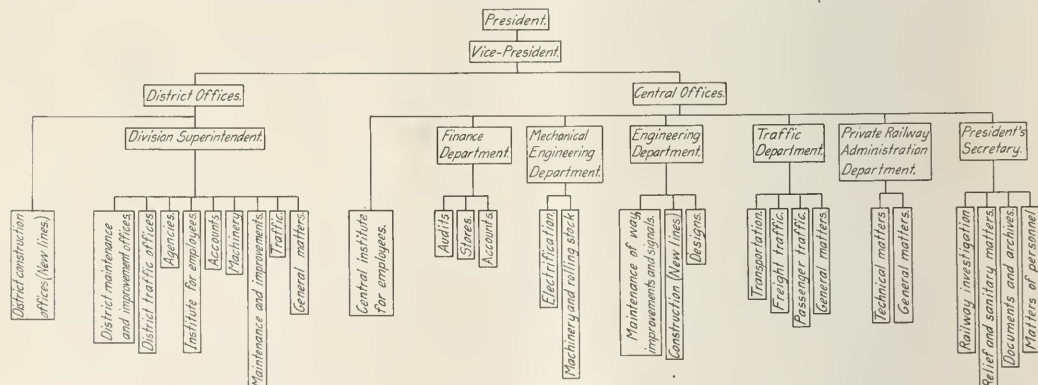

When the private railways were nationalized and brought under uniform control in 1907, the passenger fares on the purchased lines were fundamentally remodeled, a tapering system being adopted. This brought about a substantial reduction in all rates, particularly for long distance travel. The fare per mile for third-class was fixed at 0.87 cents for distances under 50 miles, 0.65 cents for distances between 50 and 100 miles, 0.5 cents between 100 to 200 miles, 0.4 cents between 200 to 300 miles, and 0.35 cents for distances above 300 miles. The rate for second-class was reduced from 175 per cent to 150 per cent of the third-class, and the first-class from 300 per cent to 250 per cent of the third. A transit tax imposed upon all tickets is collected by the railways and paid into the treasury. An extra charge is made for passage on limited trains. For suburban travel, commutation and season tickets are sold at reduced rates, an 80 per cent discount being accorded to school children. The limit of free baggage is fixed at about 40 lb. for the third-class, about 80 lb. for the second-class and about 133 lb. for first-class.

The effects of the reduction of fares, especially on long distance travel under the new tariff, are indicated in a comparison of the traffic revenue during the years 1907-08 to that of 1908-09. In 1907-08, when the new tariff was in operation for six months, the number of passengers per mile of

zone. The terminal charge, which was uniform under the old system, was differentiated according to distance, a substantial reduction being effected in the charge upon short haul traffic. At the same time the distinction between terminal and transportation charges was abolished in accounting the rates. The carload consignment was graded into three classes, different rates being adopted for the different classes in consideration of the relative ability of each class to bear the charge, while specially reduced rates were provided for the first-class goods, which comprise practically 90 per cent of the whole volume of the freight traffic.

The new classification distinguishes four grades: quick service, less-than-carload (kin [3.4 lb.] rates applicable), less-than-carload (ton rates applicable) and carload. The first is for quick service on freight trains and has the advantage of free cartage within the radius of four miles of the destination. The second is for shipments to which kin rates are applicable, the minimum rates being for 67 lb. The third applies to heavy goods measured in terms of tons, and the tariffs thereon are relatively cheap. The carload grade applies to freight of five tons and more received as one shipment.

The classification of goods consists of a first-class, including cereals, coal, cement, timber, stone, salt and manures; a second-class, including sugar, tea, cotton, young shoots and fruits; a third-class, containing pottery, porcelain, furniture,

Organization Chart

line was 25,790 more than in the preceding year, but the average earnings per passenger fell off by 2.6 cents and the average per passenger per mile by 0.01 cent.

FREIGHT RATES

The railroads provide a parcel service handled on passenger trains which corresponds to the express service in the United States, and provides for free delivery within specified limits. The existing rates were adopted in 1905. The minimum rates are fixed at 2.6 cents per pound, applicable uniformly to all distances within 700 miles and 3 cents above 700 miles, the rates being increased on a mileage tapering system with the increase in weight and distance. Double the ordinary rates are levied upon perishable and bulky commodities like paper work, lacquerware, glasses, hats and caps, light utensils and machines.

In October, 1912, a new freight tariff was put into force which was applicable uniformly to all the state lines in the Empire, with the exception of the San-yo line, where a special tariff was adopted in view of competition with the sea route. The Belgian tapering system, based on the zone system, was adopted for the new tariff, which was framed upon the basis of certain fixed rates with an increase for each additional

fabrics, liquor, cakes, etc., and the high-class, including silk, watches, clocks, raw fish, drugs, etc. There is also a special class, having six subdivisions—that including cattle and horses, petroleum and matches, vehicles, corpses, silver and gold currency, bank notes and gunpowder.

Owing to the favorable business conditions, as well as the stimulus accorded by the reduced tariffs, the aggregate freight earnings for 1912-13 showed an improvement of \$1,850,000, or 4.3 per cent, on the figures of the preceding year, though the average rates per ton fell off by 2 cents and the average per ton mile by 0.055 cents. An increase of 27 per cent in the average mileage of freight per ton was also realized, due partly to the growth of long distance traffic encouraged by the reduced rates and the consequent extension of markets.

INTERNATIONAL TRAFFIC ARRANGEMENTS

The government railways have entered into joint traffic conventions with a number of steamship lines touching at the islands. Immediately after the Russo-Japanese war negotiations were opened with Russia with a view to realizing the rail-and-water connection between Europe and Eastern Asia, and in consequence the following through passenger traffics have been put in force: (1) Manchurian-Japanese through traffic, between Japan and North Manchuria (Rus-

sian sphere of influence) and the Maritime Province; (2) Russo-Japanese through traffic, between Japan and Russia; (3) international through traffic between Japan and western Europe (now interrupted by the war).

The through freight service between Japan and Russia is but of recent inauguration, and as such its scope is limited as compared with the passenger traffic. At present two through freight services are in operation, viz., the Manchuria-Japanese through traffic between Japan and Manchuria and the Maritime Province and the through shipment of silk between Japan and European Russia. During 1914-15, 597,370 lb. of cotton yarns, 4,992,573 lb. of cotton tissue and 291,803 lb. of shirtings and knitted goods were carried under this traffic. The through transport of silk can be made in three weeks over the trans-Siberian route, as compared with 65 days spent on the Suez route. The Japan-China through traffic now provides only for the conveyance of passengers and their baggage, the freight traffic service being now under negotiation.

TRAFFIC STATISTICS

March, April and May are months of brisk tourist traffic because of spring pleasure trips, student excursions and religious pilgrimages. After an interval of about two months of stagnation during the rainy season, a general quickening

Fighting Snow

of business again takes place with the advent of the summer season. Another period of prosperous business occurs in October and early November, months of calm, fine weather when all railway lines are crowded from day to day by picknickers. Tourist traffic is regarded as one of the most important sources of revenue, as may be seen from the following table, showing the growth of party passenger traffic during the past five years:

	No. of Tickets Sold	No. of passengers carried one mile under discount party fares.	Earnings from sale of discount party passenger tickets.
1914-15	45,353	3,895,718	\$909,000
1913-14	49,230	3,878,857	1,103,000
1912-13	42,321	3,968,758	1,126,000
1911-12	35,349	2,745,193	839,000
1910-11	38,760	3,560,546	665,000

A comparative statement of traffic in some leading commodities in 1914-15 follow:

Description.	Tons.	Earnings.
Rice	1,392,785	\$1,232,000
Wheat	398,409	265,000
Salt	351,447	210,000
Iron and steel	240,130	227,000
Charcoal	572,516	554,000
Timber	2,468,718	2,043,000
Stone	490,945	266,000
Petroleum	309,266	399,000
Coal	14,453,384	6,118,000
Minerals	555,186	474,000
Fertilizers	436,508	330,000
Bean refuse	363,630	266,000
Raw fish	327,113	912,000
Salted and dried fish	262,039	465,000
Cocoons	122,492	288,000
Cotton cloth	191,456	411,000
Live stock	208,027	298,000

One of the peculiar features of Japanese railways down to recent years was that passenger revenue was greater than that from freight traffic. This disparity has, however, been steadily disappearing since the nationalization of the roads and freight earnings have exceeded those of passengers for the three years past, as follows:

	Passenger Earnings Per Cent.	Freight Earnings Per Cent.
1907-8	56	44
1908-9	54	46
1909-10	53	47
1910-11	53	47
1911-12	53	47
1912-13	49	51
1913-14	49	51
1914-15	49	51

ORGANIZATION

Prior to the railway nationalization, there were two government bureaux in charge of railway affairs, both under the jurisdiction of the department of communications. One had general supervision of both state and private railways and the other was responsible for the operation, maintenance

Interior of First Class Sleeping Car

and construction of state lines. The two departments were consolidated in 1908, and the Imperial Railway Board was created, the jurisdiction of the Imperial government railways being thereby transferred to the direct control of the Minister President of State.

Simultaneously, radical changes were effected in the internal organization of the Imperial government railways, which had so far been managed upon a departmental system. This system worked very well, so long as the operation of State lines was a comparatively small business, but with the sudden increase in mileage realized by the purchase of all trunk lines in the Empire, it was found decidedly inadequate. The centralization system was accordingly abandoned in favor of a divisional one. Under the new system the lines were divided into five different divisions (three for the main island and one each for the islands of Kyushu and Hokkaido). The chart shows the existing organization of the Imperial Government Railways.

RAILWAY PROBLEMS

The railway accounts law provides that the Imperial Government Railways must finance new extensions and improvements from earnings. The annual surplus set apart for this

purpose during the last six years averages a little more than \$8,000,000, while between \$15,000,000 and \$30,000,000 has been expended annually upon construction and improvement work. The result is a deficit of from 10 or 15 million dollars in the capital account. So far, the balance in the capital outlay has been met with temporary appropriations from the postal savings deposits, the accounts being subsequently cleared by the issuance of short term treasury bills and the flotation of foreign loans. The present cabinet has adopted a new policy whereby the annual sinking fund installment has been curtailed from \$25,000,000 to \$15,000,000, the balance of \$10,000,000 being allocated to railway purposes. This departure from the basic principle of the railway independence has elicited serious opposition in the legislature, but it seems to be recognized on all sides that the continuation of the work specified in the government program would otherwise be impossible under the circumstances, unless a radical change should be effected in the general policy of railway nationalization.

According to official estimates for the continuing expenditure, as passed in the recent session of the Diet, until 1927, the government railways will have expended upon construc-

of locomotives of heavy types and greater speed, very little effort has been made, owing to lack of funds, to improve the tracks, the greater part of which are still laid with 60-lb. rail, only 10 per cent of the total mileage having been replaced by 75-lb. rail. The bridges, too, especially those on the lines which were built prior to 1907, suffer much from overstress. Under the circumstances it is found impossible to insure the safety of train service without limiting the operation of heavy engines to certain lines or issuing slow orders. The tunnels, too, are in bad shape and many of them are in urgent need of reconstruction.

The double-tracking of the existing lines is now being prosecuted energetically on certain sections with a view to accommodating a train movement commensurate with the present and prospective requirements of the growing traffic. The elimination of curves and gradients also claims immediate attention, and a number of reconstruction projects are now under way.

Three-quarters of a million dollars will be required to complete the remaining portion of the metropolitan improvements, which consist in building overhead urban lines and connecting the two leading stations in Tokyo. In view of

Electrified Line Under Construction Between Tokio and Yokohama

tion and improvement work a sum of \$408,700,000. Practically three-fourths of the annual installments of the expenditure will be devoted to the betterment of the existing tracks and structures, only one-fourth being expended for new extensions. The reasons for apportioning the expenditure in this ratio may be said to be quite sound, as the growth of traffic points to the pressing need for bringing the lines to a higher standard of efficiency.

The improvement expenditure to be disbursed down to 1927 is made up as follows:

Tracks and structures	\$112,085,000
Electricity	7,529,000
Rolling stock	24,000,000
Shops	4,200,000
Floating equipment	950,000
Total	\$148,764,000

"Tracks and Structures" implies the adding of second or multiple tracks to the existing lines, the building of branch lines and connections, the re-location of parts of the lines, grade separation, terminal improvements, the betterment of tracks and the strengthening of bridges and culverts.

One of the striking features of the railways is the inadequate condition of the tracks in contrast with the high efficiency of motive power. This is chiefly due to the fact that, while the continual growth of train loads and the consequent demand for greater tractive power have led to the adoption

of the increase in the train length and in the frequency of train service, the enlargement of station accommodations has become a matter of urgent necessity at several business centers in the empire. Work is now in progress on the rearrangement and extension of platforms, and of passing and yard tracks, and the enlargement of office buildings and other structures.

The railways require new equipment to the extent of 90 locomotives, 80 passenger cars and 1,500 freight cars each year. Complaints are current yearly because of the congestion of traffic due to the car shortage, especially at the time of the brisk movement of traffic in rice produce and fertilizers, as well as during the year-end season. Two-thirds of the passenger cars are of the small four-wheel type, which the authorities are desirous of superseding with six-wheel cars as soon as money is procured and a plan is devised to dispose of the old equipment taken out of service.

Referring next to the new extensions which represent the construction of 1,200 miles of railway and light railway lines, it is the hope of the railway authorities that the existing policy of starting many different lines at the same time under the pressure of local demands will be abandoned. Under this policy, the funds to be allotted for each line are necessarily scanty, and accordingly the construction work can be but slow, and obviously involves a serious waste. Here-

after it is proposed to pursue a policy of concentration whereby only a few lines will be taken up for construction at a time, and not until they are finished will work on others be started.

STANDARDIZATION OF GAGE

The improvement plans under consideration raise the question of gage which has long been a standing problem. The present narrow gage of 3 ft. 8 in. was adopted during the infancy of Japanese railways when the conditions of the country hardly warranted the building of heavier lines. With the industrial growth of the country the narrow gage was found inadequate and the question of gage conversion appeared in the Diet in as early as 1896. In 1905 the government was approached by E. H. Harriman with the proposal of financing the gage-widening work, but the offer was not entertained on account of the unsatisfactory conditions of the proposed loan, and the scheme remained in abeyance for several years.

In November, 1910, the government appointed the Broad Gage Investigation Commission, which, after several months of thorough and exhaustive study, submitted a report, recommending the completion of the work in the course of 12 years. In August of the same year a ministerial change took place; the next cabinet was against the scheme, and with the dissolution of the committee in December, 1911, the scheme was shelved indefinitely on the ground that there were no resources to finance the undertaking.

On the inauguration of the present government in 1914 the Railway Board was ordered to resume investigations, the results of which were laid before the cabinet in December, 1915. This scheme proposed that the reconstruction of the Tokyo-Shimonoseki line be completed in the course of 12 years with the cost of \$150,000,000, and the other trunk lines in the main island (except the Sobu line) in 25 years with an expenditure of \$299,000,000.

In April, 1916, another gage committee was organized with Count Okuma as chairman, who is quoted as follows:

"There is no longer any doubt as to the necessity of gage-widening work, though the commencement of the undertaking had long been delayed for financial reasons." A suggestion has been made that a portion of the government railways should be transferred to private ownership mainly for financial reasons, the government devoting itself to the improvement of the lines under its control, while the extension of the railways should be left to private enterprises. Under such an arrangement, if adopted, it would probably be found necessary for the government to give some assistance in the construction of new lines."

The deliberations are now in progress and it is expected that the committee will be able to arrive at a decision before long.

INDIAN RAILWAY DEVELOPMENT.—The Railway Board of India has sanctioned a survey by the Eastern Bengal Railway for a 5 ft. 6 in. gage line from Birganj on the Lalgola branch of the railway to Krishnagar via Santipur with an extension to the Bhagirathi River opposite Nabadwip.

RAILROAD CONSTRUCTION IN DONETS BASIN.—A council of mine owners in Donets Basin of Southern Russia has prepared a list of 28 lines, the construction of which is regarded as necessary for the development of the mining industry. Among the most extensive of the proposed roads are the following: Connecting Tschervokva with Matvejev-Kurgan (50 miles); from the station Tasinovataza to the station Nikitovka (20 miles); Nasveteitch to Tama (20 miles); connecting the station Gratchi with the station Eka-terinskaya (14 miles); connecting Grishino with Krematorsky (10 miles). A number of companies in the Donets Basin have completed grading new roadbeds, but can not complete construction work because no rails are obtainable.

RAILWAY MEN OUT TO BEAT THEIR LIBERTY LOAN RECORD

The railways, under the direction of the Liberty Loan Committee on Railroads headed by President Smith of the New York Central, have started a new nation-wide campaign to enlist subscribers for the Second Liberty Loan. With the assistance of a vast series of local organizations of officers and employees, the committee hopes to double the subscriptions made by railway men in the First Liberty Loan, when 241,280 employees subscribed for \$20,027,966 in bonds. This amount was in addition to approximately \$50,000,000 in bonds taken in large blocks by the railroad companies, and wide scattering of the securities to employees was made possible through the arrangements made for payments in installments from the weekly or monthly pay rolls.

The committee has sent telegrams to over 500 railroad presidents throughout the United States urging special organized effort for the sale of the Liberty Bonds. The telegrams said:

"The Liberty Loan Committee, under direction of the Secretary of the Treasury, again requests the undersigned to ask your support in selling Liberty Loan Bonds to railway officers and employees of every grade. It is deemed desirable to make a concerted effort by all roads in the country to put the opportunity equally before all, along the general lines adopted with respect to the First Liberty Loan, offered last spring. Your Committee's experience emphasizes the importance of prompt and thorough *special organizations* in order to obtain effective results. Please wire if you will co-operate."

The telegrams were signed by the members of the committee as follows: A. H. Smith, president of the New York Central, chairman; F. D. Underwood, president of the Erie; W. H. Truesdale, president of the Delaware, Lackawanna & Western; Henry Walters, chairman of the board of the Atlantic Coast Line; Walker D. Hines, acting chairman of the executive committee and general counsel of the Santa Fe; L. F. Loree, president of the Delaware & Hudson; John D. Dennis of the New York banking firm of Blair & Co. and H. W. Burnham of the New York Central, who is secretary of the committee.

Responses from railroad executives pledging hearty co-operation and the formation of special organizations for the bond selling have come in sufficient volume to indicate a practically unanimous effort, and one that with the advantage of previous experience, promises to surpass former results. The Committee on Railroads has set October 27 as the final date on which subscriptions may be received.

The energies of all the vast executive organizations of the American Railroads, numbering nearly 1,000 separate companies, large and small, will be impressed in to the bond selling campaign throughout the next three weeks. Circulars, subscription blanks and advertising matter will be distributed to every individual railroad employee. Under the plan for special organizations, this will be followed up by personal work in charge of local committees of both officers and employees. Employing officers in all of the various departments of transportation service, in the field as well as in offices, will be instructed to bring the matter of contributing to the nation's war sinews to the personal attention of every man and woman who is able to make a subscription.

The campaign will be conducted from the offices of President Smith at the Grand Central Terminal, New York, where constant reports will be received on the progress of the work.

HOW VARIOUS RANKS SUBSCRIBED TO THE FIRST LOAN

Detailed reports from 67 of the leading railroad companies give the percentage of the total number of employees in

various departments of transportation service who subscribed to the first Liberty Loan as follows:

General officers, executives, 33.4 per cent; legal department, 45 per cent; traffic department, 41.7 per cent; accounting department, 29 per cent; transportation department (a) engineers, 17.7 per cent, (b) firemen, 12 per cent, (c) conductors, 18 per cent, (d) agents, operators and station forces, 12.6 per cent, others, 16.5 per cent; locomotive department, 13.8 per cent; car department, 12.8 per cent; maintenance of way department, 1 per cent; all other employees, 16.7 per cent. Average percentage of all employees subscribing, 12.4 per cent.

PENNSYLVANIA SYSTEM WANTS 100,000 SUBSCRIBERS

The second Liberty Loan campaign among the employees of the Pennsylvania Railroad was inaugurated Tuesday morning with an address by President Samuel Rea, delivered at a meeting of about 200 officers of the company, held in the Y. M. C. A. building, Philadelphia.

Mr. Rea pledged the support of the management to aid the government in making the loan a success, and urged full co-operation on the part of all employees.

Other addresses were made by Vice-Presidents Henry Tatnall, W. H. Myers, and A. J. County; by Captain John P. Green, retired vice-president, James F. Fahnestock, treasurer, and R. L. O'Donnel, assistant general manager. J. C. Johnson, superintendent of telegraph, presided.

Mr. Fahnestock referred to the fact that 53,160 employees of the Pennsylvania Railroad subscribed to a total of \$3,440,600 of the bonds of the First Liberty Loan. He urged that every effort should be made to double this record with the Second Loan, and to obtain not less than 100,000 subscriptions for at least \$7,000,000 worth of the new bonds.

B. C. Henion, assistant auditor of disbursements, and chairman of the special Liberty Loan committee of the company, explained in detail the plans for conducting the campaign.

Those in attendance at the meeting were the officers of the company who have been designated to take active charge of the field work of the campaign, on all parts of the Pennsylvania Railroad Lines East of Pittsburgh and Erie. Each division, shop and department was represented, and general instructions were issued for all.

Approximately 65 committees will be organized to cover all portions of the railroad, and, altogether, upward of 1,000 men will be enlisted in the work of personal solicitation. It is part of the plan to make a personal and individual appeal, within a week at the latest, to each of the 160,000 employees on the Lines East, urging every one to become the purchaser of at least one bond of the Second Liberty Loan.

ADVERTISING THE LIBERTY LOAN

Roads the country over are bringing the advantages of subscribing to the Liberty Loan to their patrons at every occasion. They have put placards in their cars, put up posters and enormous banners in their stations; the Pennsylvania has even hung large signs on its ferry boats in New York harbor. In many stations booths have been erected for the use of the bond salesman. In the Grand Central Terminal in New York part of the big information counter in the center of the concourse has been turned over for that purpose. In the North and South stations in Boston, little Liberty Loan cottages have been built where the hurrying commuter may stop and arrange with the representatives of one of the banks for a subscription on the installment plan.

The Railroads' War Board has addressed a bulletin to the railroads stating that the director of publicity of the Treasury Department has requested the co-operation of the railroads operating dining cars to the extent that they have printed on the top of every menu card up to October 27, the date

on which the second Liberty Loan closes, the following: "Help your government win the war. Buy Liberty Bonds now." The War Board suggests this co-operation by the railroads.

COMPANY SUBSCRIPTIONS

A number of roads have already announced subscriptions to the Second Issue of the Liberty Loan on their own account. Among these roads are the following:

Atchison, Topeka & Santa Fe.....	\$5,000,000
Chesapeake & Ohio.....	500,000
Chicago, Burlington & Quincy.....	5,000,000
Delaware, Lackawanna & Western.....	4,000,000
Lehigh Valley.....	1,500,000
Missouri Pacific.....	1,000,000
Nashville, Chattanooga & St. Louis.....	250,000
Norfolk & Western.....	5,000,000
Northern Pacific.....	5,000,000
Southern Pacific.....	5,000,000
Union Pacific.....	5,000,000

KANSAS CITY SOUTHERN OPERATING PERFORMANCE

The Kansas City Southern has been making an excellent record from an operating standpoint during the past few months, showing large increases in gross and net train load in the prevailing direction of movement and an important increase in the average miles made per car per day. It will be noted from the table that the gross train load in the direction of prevailing movement has been increased from 1,277 tons for the fiscal year ending June 30, 1913, to 1,531 tons in the year June 30, 1917. In August, 1917, this figure rose to 1,632 tons. However, the greatest improvement has been in the net train load in the direction of prevailing movement. In 1912-1913 this figure was 654 tons, in 1916-1917 it had been increased to 828 tons, while in August, 1917, it was 915 tons or 40 per cent more than in 1912-1913 and 10 per cent more than the average for 1916-1917.

	Average Tons Per Car of Revenue Freight	Gross Train Load	Net Train Load	Avg. Train Load In Prevailing Direction	Avg. Miles Per Car Per Day
1912-1913.....	24.9	1,200	568	Gross 1,277 Net 654	27.1
1915-1916.....	25.8	1,379	628	1,474	36.4
1916-1917.....	26.3	1,373	650	1,531	40.8
1917					
January.....	27.6	1,403	699	1,470	40.1
February.....	27.1	1,370	660	1,559	41.5
March.....	26.8	1,388	663	1,603	43.7
April.....	25.8	1,412	669	1,578	45.0
May.....	27.0	1,378	639	1,576	45.3
June.....	26.7	1,330	623	1,574	47.1
July.....		1,383	635	1,579	46.8
August.....		1,386	638	1,632	45.3

This increase in the net train load has been made possible largely as a result of the better loading of cars. The average number of tons of revenue freight per car in 1912-1913 was 24.9; in 1916-1917 this had been increased to 26.3 while in January, 1917, it had risen to 27.6. In this connection it is interesting to note that although there was an increase of 1,006,312 lb. of merchandise freight handled in August, 1917, over that of the same month of the previous year, this was handled in 141 less cars. The average loading of merchandise per car in August, 1917, was 13,020 lb., an increase of 1,341 lb. over that of the previous year. This comparison shows an increase of 3.6 per cent in the tonnage handled with an average increase in the loading per car of 10.3 per cent and a decrease of 7.1 per cent in the number of cars required.

Another highly satisfactory performance is shown by the average miles made per car per day. In 1912-1913 this was 27.1. In 1915-1916 it had been increased to 36.4 and the following year to 40.8. This increase has been continued through the present calendar year, the maximum movement of 47.1 miles being made in June, 1917.

NO FARE INCREASE IN IRELAND.—The increase of 50 per cent in English railway fares put into force on January 1st last is not in operation in Ireland.

View of one section of the work.

Dragline Used Successfully in Track Depression

New York, Chicago & St. Louis Is Departing From Usual Methods In Lowering Its Line in Cleveland

THE New York, Chicago & St. Louis is now engaged in the separation of grades with the streets on a section of its line in Cleveland, Ohio, which involves the elimination of 24 street crossings at grade with the tracks and the construction of a four-track roadbed below the level of the streets for a distance of $2\frac{1}{2}$ miles in a cut having a maximum depth of 25 ft. The work is located entirely within the city. Thirteen of the 24 crossings will be carried over the tracks on bridges provided at every second street and marginal roads will be provided for the diversion of the traffic of the alternate streets which will be cut off at the right of way line. Two of the bridges will carry street car tracks. Foot bridges will also be provided at other points designated by the city authorities.

A total of 751,000 cu. yd. of material will be excavated for the track depression in addition to about 61,000 cu. yd. for retaining walls and bridge abutments. The project will also require 74,000 cu. yd. of grading for industrial tracks and 25,000 cu. yd. for street embankments. Over 42,250 cu. yd. of concrete will be placed in bridge abutments and retaining walls, requiring the use of 1,802,690 lb. of reinforcing steel. A total of 38,664 ft. of trackage will be provided and 266,330 sq. ft. of brick paving and 16,342 lineal ft. of curbing will be laid in the streets and marginal roads. The temporary bridges necessary for the carrying on of the work involve an expenditure of more than \$95,000 and the expenditures for the moving of water mains, sewers and drains will total more than \$170,000. It is estimated that the cost of the entire project will exceed \$5,000,000. In addition to its magnitude, the work is of particular interest because of the successful use of a dragline excavator under conditions complicated by street crossings, street car tracks, sewers and overhead cable and wire crossings. In spite of such conditions, the excavator has moved an average of 96,000 cu. yd. of material each month, or about 3,200 cu. yd. each day.

The district affected by the improvement extends $2\frac{1}{2}$ miles from Walworth Run on the east to West Ninety-sixth street and Detroit avenue on the west. It is located in the south-

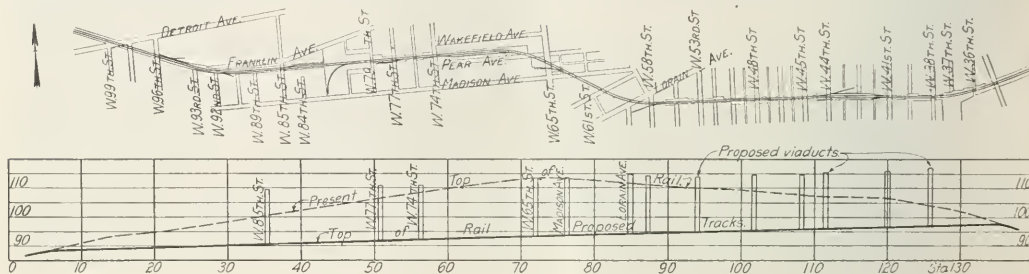

western section of the city in a district already built up solidly with residences, business places and industrial plants so that any plan for improvement presented many difficulties. Because of a summit in the old double-track line located near the center of the work at West Sixty-fifth street, it was impractical to elevate the tracks. It was, therefore, decided to depress them for the entire distance. This decision created the problem of the disposal of the 751,000 cu. yd. of excavated material. It was at first planned to waste the material along the line of the Big Four in a valley called Walworth Run through which the city has built a large sewer, the valley being unoccupied and in an unsightly condition. The first studies which were made for the disposal of the material in this locality were with a view of moving the earth by steam shovels and trains, but as it was found to be impossible to handle the material over the Big Four tracks without serious interference with the regular traffic and as the alinement of the track to the waste bank would have been so irregular as to make it impractical to reach sufficient ground for the disposal of all of the material, this plan was abandoned and it was decided to make the excavation by hydraulic means, utilizing 11,000 ft. of pipe line and pumps designed to discharge 4,000 gal. a minute under a head of 125 ft., as described in the *Railway Age Gazette* of June 16, 1916, page 1335. The equipment for carrying on the work in this manner was secured, but before operations were begun it became desirable to utilize the material from the cut in the double tracking of the Nickel Plate line east of Broadway yard. The decision to utilize excavation in this way made it necessary to load the material on cars. In studying the problem of removing the material and disposing of it all east of the work, it was apparent that if steam shovels were used of sufficient size to load from the bottom of the cut into cars at the elevation of the existing tracks, it would be necessary to dismantle the shovels when passing streets carrying street car tracks. As this situation could be avoided by the use of the dragline and at the same time secure the advantage of utilizing the existing tracks at the old level for the dump cars, thus mak-

ing it possible to handle long trains, such a machine was chosen for the work.

This change in the plans for the disposal of the excavated material after the purchase of the hydraulic equipment left the railroad with a large construction outfit on hand. It is of interest to note that, by taking advantage of the unusual high prices, the railroad has already disposed of the greater part of this equipment for a sum sufficient to nearly cover the investment. With all the material disposed of it is thought

depressed roadbed is being made in two cuts. By shifting the old main tracks to the south where necessary and taking advantage of the additional right-of-way on the north, it was possible to make the first cut while maintaining double track operation for the entire distance east of West Seventy-ninth street, except for a short stretch west of Lorain avenue, where it was necessary to resort to single track because of the diversion of the street car tracks.

The work was begun at the east end with the machine

Layout and Profile of the Grade Separation District

that the change in plans will not result in any appreciable loss from this account.

In making the preliminary studies for the improvement, both two-track and four-track layouts were considered and as the estimates showed a very little difference in the cost of the two schemes and as the cost of changing to a four-track layout after completing a two-track scheme would have been prohibitive, it was decided to construct four tracks at once. In the plans adopted, the bridges are all to be constructed for eight tracks. The four-track prism is being excavated with $1\frac{1}{2}$ to 1 slopes. By installing retaining walls on the right-of-way line and taking out these slopes, the four-

working directly on the surface of the ground as a result of which it experienced no delays in moving over street intersections. The first cut was made on the north and as the work progressed new double tracks were laid behind the dragline and ballasted. Before making the second cut, the traffic will be diverted to this new line.

In addition to the dragline, the equipment consists of three trains of 20 cars each and five locomotives. The cars have a capacity of from 10 to 15 cu. yd. according to the nature of the excavation. The dragline is equipped with a 5-yd. bucket and loads a car in less than three minutes or a train of 20 cars in less than an hour. The dragline averages two and one

One of the Temporary Bridges Built to Carry Street Traffic Across the Cut

track layout may, if necessary at some future time, be expanded to eight tracks.

PLAN OF THE WORK

Before acquiring the additional right-of-way for the project, schemes were considered for the carrying on of the work with as little interference to traffic as possible and with this in view the additional land was acquired on the north of the tracks where practical. East of Sixty-fifth street all the land acquired was so located. The excavation for the

half 50-ft. moves a day and between moves it maintains an average of a bucket load delivered to the cars about every 50 seconds.

The material is loaded into cars standing on a temporary track adjacent to the old main line and, with the exception of 150,000 cu. yd. delivered to the city over the Big Four tracks to make a fill at Walworth avenue, the entire 751,000 cu. yd. is being moved with a maximum haul of three miles east through the Broadway yards and utilized as filling material for double track work. Owing to the plan for providing

space for a temporary loading track, little time has been lost through delays in getting the empty cars to the machine. The efficiency of the operation is best shown in the monthly average of 96,000 cu. yd. of material moved.

As the machine moved through the cut each street crossing is closed as the machine reaches it. Temporary timber bridges have been installed over the first cut at the streets where permanent structures are not to be located. On the return trip, or second cut of the machine, the permanent bridges will be installed at the alternate crossings, which were not provided with temporary bridges after the first passage of the dragline.

In making the first cut, trouble was encountered at West Forty-fifth street where a high-tension transmission line

The Drag Line at Work

crosses over the tracks. The wires at this point would not clear the boom of the machine and, as it was estimated that it would cost \$10,000 to move the line, a short section of the excavation was left in place and was later removed by the company forces with a locomotive crane. At West Fifty-eighth street a temporary bridge was installed with the intention of diverting the street car traffic from Lorain avenue over this bridge so that the excavation through Lorain avenue could be made. Through delay in the delivery of the material it was not possible to make this shift in time and a section containing 12,000 cu. yd. of material was left unexcavated at this point. Later when the shift was made the material was removed by a steam shovel. At West Sixty-fifth street the work was complicated by street car tracks and water mains and at this point the machine moved over the street, leaving the material to be taken out later by a clamshell working from the lower level.

West of West Eightieth street the right-of-way narrows to 66 ft. and when the first cut was completed to this point the dragline was moved to the west end of the work and the north cut was completed with the machine working east. When the dragline arrives at Eightieth street on the return trip it will be moved over and excavate the south cut from that point east. Steam shovels will complete the south cut west of West Eightieth street and will also make the approach grade at the west end of the work.

At nearly all of the intersecting streets water pipes and sewers were encountered. At West Sixty-fifth street a 36-in. low service and a 24-in. high service water line were encountered necessitating carrying the pipes on a trestle. Through the delay of the city in reconstructing the West Fifty-fifth street trunk sewer, which is of brick and 4 ft. by 5 ft. in size, and which will intercept all the sanitary sewers between West Eighty-fifth and West Forty-second streets, considerable trouble was experienced from water and sewage collecting in the open cut. The contractor overcame the trouble at the start by installing pumps behind the machine as he went along. As the work progressed enough pumps

were not available to control the water and the sewage rose above the level of the new grade, interfering with the track laying. To remedy this condition the railroad brought in locomotive cranes and opened drainage ditches at the foot of the slope. In the re-construction of this sewer, which is 45 ft. below the grade of the main track, a start was made by tunneling but the heading south of the track was placed too close to the excavation and as the cut for the track depression reached this point the sewer blew out into it causing a cave-in and making it necessary to drive piling to support the old main line tracks. The sewer work is now being carried on in an open cut.

With the excavation completed a comprehensive scheme for drainage is contemplated. The city will build an intercepting sewer through the length of the cut between the two inside tracks or in the center of the work. While the grade of the cut is all down in a westerly direction, drainage will be effected by a catch basin located at every second street with lateral sewers connecting with the main sewer in the center of the cut. This drainage will be effected by placing the side drains three feet below the surface at streets not provided with catch basins and carrying the drainage each way from such streets with an average drop of about 8 in. to the catch basins.

With the exception of a small amount of concrete which has been placed in the wing walls of a few of the bridges, no masonry work has been started except in the retaining walls for the protection of various industrial plants. This part of

Some Typical Excavation Conditions

the work was described in the *Railway Age Gazette* of June 16, 1916, page 1355.

In designing the bridges a standard plan was followed in all cases where it was physically possible and nine of the 13 structures are to be similar with only minor variations to conform with the differences in the angle of the crossing, curvature of the tracks, etc. The design provides for flat slab spans of I-beams and concrete construction supported on two gravity abutments and three reinforced concrete piers. At square crossings with tangent tracks the clear span between supports is 27 ft., with the tracks spaced at 13 ft. centers, this allows of a 7-ft. clearance from the center of the tracks to the masonry. At skew crossings and when curved tracks are crossed the distance between supports is increased to maintain the standard clearance. Space is provided in the deck for a 34-ft. clear roadway and two sidewalks 10 ft. 11 in. in width. The floor is designed for a uniform load of 100 lb. per sq.

ft. and two 24-ton trucks in any position on the roadway.

The project is being carried on under the general direction of E. E. Hart, chief engineer of the Nickel Plate. W. J. Bergen, first assistant to the chief engineer, is in direct charge of the work and A. C. Harvey, field engineer, is in charge of the field operations. The dragline excavation and the operation of the dirt trains is being handled for the railroad by the Walsh Construction Company of Davenport, Ia.

REPORT ON NORTH BRANFORD COLLISION

The Public Utilities Commission of Connecticut has issued the report of its engineer, John F. Trumbull, on the butting collision of passenger cars on the Shore Line Electric Railway at North Branford, August 13, in which 19 persons were killed and 35 injured. This collision was reported in the *Railway Age Gazette*, August 15, page 299. The west-bound car had run a short distance past a meeting point because the conductor was asleep and the motorman was in a state of mental abstraction. The report says that motorman Negus, according to his own voluntary statement, was in a "dazed" or drowsy condition and oblivious to his surroundings and his duties.

A short distance after passing through a side track (where he should have waited to meet the other car) without realizing the fact, he brought his car nearly to a stop and took on a passenger; and yet neither the motorman nor conductor could recall this incident when giving their testimony. Negus was suddenly restored to animation when he saw the opposing car, coming at 45 miles an hour, and he applied his air brake; but he does not know how he escaped being caught in the wreck. Passengers testify that he ran half the length of the car and jumped off at the center vestibule. The conductor had intentionally gone to sleep, first fixing himself in a comfortable position on a longitudinal seat.

For seven days prior to the collision both the conductor and the motorman had worked long hours, and irregularly. On Sunday, the day before the collision, Negus worked from 7:00 a. m. to 11:10 a. m. and from 3:10 p. m. to 1:40 a. m. the next morning, and in addition was on a car, deadheading, one more hour, or 15 hrs. 40 min. altogether. This combination of day work and night work had been common. There is evidence that Negus did not spend his rest periods in actual rest. The automatic cut-off, the "dead man's handle," designed to stop a car if a motorman should fall asleep, had been tied down so as to be inoperative. Negus said that his arm frequently became tired, holding down the controller handle. On this same trip he had overrun a meeting point at Madison and was called to his senses by the conductor giving him a bell signal. It was then that he tied down the controller. The inspector thinks perhaps he was not so much "dazed" as he was concerned with some personal problem or worry. The conductor, who should have been warned by this mistake at Madison, seems to have let it pass without much thought. He claims to have been subject to dizzy spells, but the testimony of the passengers discredits this claim.

The inspector puts the primary responsibility on Negus and the conductor, Tryon, but adds that "men do not ordinarily become careless, lose their sense of responsibility and wilfully disobey rules that they know are necessary for safety, unless the management of the company also becomes careless and permits violations to go unchecked. . . ."

He recommends the installation of automatic block signals, the adoption of a rule requiring each conductor to exchange signals with his motorman when approaching a meeting point, and other improvements.

The Commission adopts the report of Inspector Trumbull as its own and calls upon the company to exercise more care

in examining the records of the hours of service of men; to never permit men to operate cars who are not fully competent physically, mentally or otherwise and to report by September 18 whether it will accept and adopt these suggestions, and when they will be put in force.

RAILWAY REGIMENTS' TOBACCO FUND

In a short time circular letters will be sent out from the committee in charge of the raising of the Railway Regiments' Tobacco Fund asking railway supply concerns throughout the United States to subscribe to this fund. As announced in the *Railway Age Gazette* for last week, page 618, it is desired to raise for the nine existing railway regiments a total of 2,160 pounds of tobacco weekly, which, it has been ascertained, will cost \$1,080 a week. The appeal to the railway supply concerns will include the following:

Will you not "do your bit" in connection with this work by entering a subscription for your company on the enclosed card and send it to the undersigned at once? Each railway supply concern to which this letter is addressed is respectfully requested to subscribe \$10 a month for 15 months from October 1, 1917, to January 1, 1919, this subscription to be terminated at an earlier date should the war end before the date mentioned. Checks should be made payable to "John R. Washburn, Treasurer," and mailed to "Samuel O. Dunn, Secretary, Railway Regiments' Tobacco Fund," 750 Transportation Building, Chicago.

The committee in charge of raising the fund, of which F. A. Poor, president of the P. & M. Company, is chairman, estimates that if 450 railway supply concerns will subscribe the \$10 a month requested, a sufficient fund can be raised for providing "smokes" for all the members of the existing nine railway regiments. Additional regiments are now being raised but it will be sometime before they are raised and no effort is being made at present to provide for their probable wants. A list of the railway supply concerns of the country, which will be made as complete as practicable, is now being compiled and as rapidly as possible circulars requesting subscriptions from them will be sent out. Meantime, it is hoped that many supply concerns will not wait to be circularized but will send their subscriptions at once to the secretary who, in turn, will promptly turn the money over to the treasurer.

The members of the committee especially desire it should be understood that all the money raised will go into the Tobacco Fund. There will be no expense connected with the collection and administration of the fund since the concerns represented by the members of the committee have agreed to bear all the clerical, postage, stationery and other expenses incurred in collecting and handling the money.

Some subscriptions to the fund already have been made. It is probable that the first list of subscriptions will be published in the *Railway Age Gazette* and other interested publications next week, and the names of all donors will be published hereafter as their subscriptions are received. "Now is the time to subscribe!"

DEMURRAGE REGULATIONS IN IRELAND.—Revised charges and conditions as to freight car demurrage on the Irish railways went into operation on September 1. Two clear days are to be allowed for the unloading of cars containing coal and coke, and one day for unloading merchandise. A demurrage charge of 3s. (\$36) per day for the first two days or portion of a day is to be made if detained beyond the mentioned time, and 6s. (\$72) per day for each day after the first two extra days. Similar charges are to be made against shippers who order cars and then fail to load them within 24 hours after their receipt, or, if loaded, fail to order them away.

Teredo Destroys Improperly Treated Piles

Investigation of Worm-Eaten Douglas
Fir Sticks Discloses Inadequate and
Poorly Distributed Injection of Creosote

By Dr. Hermann von Schrenk
Consulting Timber Engineer, St. Louis, Mo.

Two Piles Destroyed by Teredo.

TWO sections of Douglas fir piling were recently received which were stated to have been treated with creosote and which had been in service about eight or nine years at Tacoma, Wash. Both of these showed that they had been treated with some black preservative. The piles were completely riddled by the teredo, not only in the central untreated portion of the piles, but all through the dark treated portion.

The piles were sectioned at various points, and a careful examination was made of the penetration as indicated by the color (after drying out the sections). This examination showed an average penetration of about 1 in. to 1¼ in. Here and there, however, the penetration was only nominal. At one or two points there was practically no penetration at all. A microscopic examination of the wood fibres at these

per cu. ft. or, for the whole pile, 2.2 lb. per cu. ft. The extracted oils were analyzed, and the average of these analyses gave the following results:

Specific gravity — 1.0151	
Distillation:	
210 deg. C.	1.3
235	6.8
270	33.5
315	11.9
355	24.3
Residue	11.5
Specific gravity 235-315 deg. C. at 38 deg./15.5 deg. C. =	1.020
Specific gravity 315-355 deg. C. at 38 deg./15.5 deg. C. =	1.081
Tar acids	5.2 per cent
Sulphonation 235-315 deg. C.	3.6 per cent
Sulphonation 315-355 deg. C.	2.0 per cent

GENERAL FINDINGS

The chemical characteristics of the preservative indicate that it is in all probability of strictly coal-tar origin; in other words, it has no water-gas tar or other adulterants. Some of the fractions are slightly at variance with the percentage usually found in straight creosote oil, but this is probably accounted for by the fact that in making the extractions certain percentages of the wood fiber and resinous contents normally found in Douglas fir were extracted with it. It was not thought desirable to separate these in view of the general close agreement of the analytical results with those commonly obtained for coal-tar compounds.

The amount of oil used as already shown was given by the two extractions as follows:

	Per cent by weight	Lb. per cu. ft. of treated wood	Lb. per cu. ft. based on whole pile
First extraction	34.0	10.88	3.32
Second extraction	22.3	7.04	2.20

Two Creosoted Douglas Fir Piles Treated After Being Air
Seasoned

points confirmed the visual examination. Small globules of creosote oil appeared in the medullary rays and in an occasional fiber of the summer wood, but practically all of the wood fibers were white and showed no evidence of creosote oil penetration. The distribution of the holes made by the teredo showed the smallest holes in the creosoted portion, the holes increasing in size towards the center of the stick.

Borings were made at various points in the circumference of the piles. A visual examination of these borings indicated that there was apparently more preservative at certain portions of the circumference than at others. Two sets of borings were taken from the creosoted ring, and the oil was extracted from these borings. Using the weight of the dry wood as a basis, the first extraction showed 34 per cent by weight of preservative, or 10.88 lb. of preservative per cu. ft. Calculating the actual volume of the treated wood and taking the whole volume of the pile, the amount of oil per cubic foot, based on the volume of the whole pile, was 3.32 lb. The second extraction showed 22.3 per cent of preservative, based on the dry weight of the wood, or 7.04 lb.

These results indicate clearly that the amount of oil with which these piles were treated was very small. It should be remembered that treating specifications usually require a certain number of pounds per cubic foot, based on the total volume of the material treated. In other words, piles in the Puget Sound district, in order to give anything near proper protection, should have at least 15 to 20 lb. per cu. ft. In view of the fact that Douglas fir can be treated only on the outside, it will readily be seen that, according to the actual amount of oil injected, the portion which is treated would contain far in excess of 15 or 20 lb. per cu. ft.; in other words, the outer portion of the pile which is treated will practically be treated to refusal. This was certainly not the case with the two piles submitted for examination. The amount actually found is probably a little higher than was really the case, because, as stated above, there are probably certain percentages of resin and other extractable materials normally found in Douglas fir.

In view of the fact that these pile sections were immersed in salt water, and from past experience with oils found in piling after eight or nine years of immersion in salt water, we are of the opinion that this light quantity of creosote oil

actually found is fairly indicative of the amount originally injected. By this we mean that evaporative or leaching changes take place so slowly when creosoted wood is submerged that for as short a period as eight or nine years, such loss may be regarded as negligible.

While the penetration was fairly good at most points, there were numerous weak spots at the circumference where the penetration was extremely small. On the photographs there are points where practically no creosote oil is visible. Even the microscope does not disclose any.

Taking the foregoing facts as a basis, it would appear that the reason these piles were so badly decayed and destroyed by the teredo is probably two fold: (1) the amount of oil injected was entirely insufficient to give proper protection; (2) these piles were probably not correctly treated, because they would otherwise have given far better and more uniform penetration.

RECOMMENDATIONS

The lessons to be drawn from an investigation of this sort clearly establish that for successful resistance to the teredo, Douglas fir piles should, wherever possible, be air dried instead of being subjected to the usual boiling treatment. This will very largely obviate the leaving of vulnerable untreated spots in the circumference of the sticks and will at the same time insure a far greater depth of penetration and a larger volume of oil retained than is usually obtained. It has frequently been stated that air seasoning of piling on northern Pacific Coast points is not practicable. I regard this without foundation, however, because piles have been air seasoned in the Puget Sound district and the resultant treatment has been of such superior character that there can be little doubt as to the advantage to be gained by it. One of the photographs shows section of two creosoted Douglas fir sticks, cut 12 ft. from the end, treated after the piles had been thoroughly air seasoned and the very uniform complete penetration of the sap ring should be noted.

It furthermore indicates that our present system of specifying on the basis of so many pounds per cubic foot is a very poor standard for treatment of material like Douglas fir piles. Where a railroad goes to the expense of having material treated, it would be far better if a specification called for a certain depth of penetration irrespective of the quantity of oil injected to obtain it, and make the actual oil used in the treatment the basis of payment, having a possible restriction as to the upper limit of the oil allowable, such limit to be determined on as basis of experience.

It furthermore indicates that the inspection of piling of this character must be carried out by actual borings of a very large number of sticks, and that the method of inspection by which the oil quantity absorbed is judged by gage or other readings is not sufficient.

RAILWAY IN MOROCCO.—In connection with the bill now before the French Parliament for the construction of the railway between Tangiers and Fez, it is pointed out that there already exist 773 km. (480 miles) of railway in Morocco. These are lines actually operating and exclusive of railways under construction. All the lines now operating are narrow-gage (60 centimetres, or 2-ft. gage) military railways, which owing to diplomatic conventions with Germany could not be used for civilian or ordinary traffic up to the outbreak of the war in 1914. France, however, considers herself free from all diplomatic conventions made with Germany, and all lines are now open to ordinary traffic. The traffic receipts per kilometre for the whole of 1916 varied between £740 (\$3,626) and £935 (\$4,582). The proposed Tangiers-Fez line is to be of standard gage. The French Government proposes to give a concession for the whole of the standard gage lines (altogether 670 miles) to a private consortium.

THE FREIGHT CAR AS A FACTOR IN WINNING THE WAR*

By E. H. De Groot, Jr.

Chief of Division of Car Service, Interstate Commerce Commission.

To talk about cars is for me a work of love. My father was a young freight conductor when I was born and all of my life has been spent on or about a railroad. To me the freight car was early a thing of romance and poetry and for me it still holds its charm, notwithstanding a very intimate acquaintance with those perverse characteristics which the operating man finds so much and so often in evidence in his daily experience.

No less an authority than General Joffre has said that the present war is one of transportation, and we all recall the high tribute, as well as the tremendous charge that President Wilson uttered in his appeal of April 15 to the men who run the railways of the country, *** "upon whom rests the immense responsibility of seeing to it that transportation suffers no obstruction, no inefficiency or slackened power."

We must not delude ourselves with the idea that transportation can be furnished as it has been in the past, and that business can be conducted during the war as it has been heretofore. *** The transportation machine has not broken down, as some have asserted, and it is not going to break down. It is assimilating a tremendous aggregate of conglomerated offerings and grinding out more ton-miles than it has ever produced before. As a whole it is being run more efficiently than it has ever been run in all its history, but it must be run with still greater skill—skill progressively greater—as time goes on. * * * But I do not mean that the transportation machine will run without any shocks. On the contrary, I look for pounds and wheezes in many parts before the robins return, and what I want to emphasize is that, more and more, skill and devotion must be forthcoming to offset the increasing difficulties. The crowding of locomotive power, the scarcity of men and materials, the pressure of congested conditions; all these things will make for lower standards in many ways unless resolutely faced and fought; and lowered standards spell inefficiency. We must get the greatest possible output in ton-miles from every individual car. I say individual because I am a little suspicious of averages. They too often cover up disgracefully low accomplishment, and drag down those higher and better. * * * Transportation affects mansion and hovel, rich and poor, alike. It is vital to all. I make this elementary statement because I want to draw from it the conclusion that the business of transportation is one of dignity and necessity and that to serve in the transportation army in this time of national crisis is to enjoy opportunity for a splendid contribution to the cause of our beloved country.

I shall use very few statistics tonight, for my purpose is not to enlighten but to crystalize into adamantine firmness your resolution to play the transportation game through to the end with the same spirit of devotion and sacrifice which we expect from Americans on the firing line in France. 'The Railroads' War Board has told us how the railroads could do more work with existing facilities. * * * In short, the duty of every man in railway service from the humblest to the highest has been made clear over and over again; and for the most part the response has been wholehearted and gratifying. The Commission on Car Service at Washington can give many encouraging examples of heavy loading, double-loading and even triple-loading of cars. Co-operation is an accomplished fact and to an extent which a few months ago would have been unbelievable. Not that the millennium has arrived, for there is yet much room for

*From an address before the New England Railroad Club, Boston, Mass., on October 9, 1917.

improvement on both sides, but very great progress indeed has been made.

I have a pet theory that when the correct answer to the transportation problem is finally worked out it will be found that it is good alike from both the railway standpoint and that of the shipper. Yes, and even beyond that; that the true interests of public and shipper and security-holder and employee are one and the same.

In the meantime, the railroad man and the shipper are each getting a better perspective and as they do so they are throwing fewer stones and doing more planning together. * * * I believe that the time is near when it will be necessary to determine what freight must move and what must be refused. However, the authority to effect this discrimination lies with the President under the priority law, and will undoubtedly be exercised with great care and wisdom.

The freight car has received more attention in the past few months than in all of its previous existence. Its empty mileage and ratio of empty mileage, average miles, repairs, loading, unloading, switching, detentions, billing, reassignment, per diem rate—all and more have been the subject of much study and more discussion.

Great progress has been made. The pooling of box cars under the order of the Commission on Car Service was the greatest advance step taken since 1902 when per diem was adopted. Literally tens of thousands of box cars were actually redistributed to the producing districts by arbitrary order. It is impossible to estimate the increased efficiency which the country has already secured through these measures. Then the Esch law was passed and the Interstate Commerce Commission organized a new division. * * *

As indicated by the commission in its announcement, the Division of Car Service is working very closely with the Commission on Car Service and they are co-operating with us in a most helpful spirit, to the mutual benefit of both shippers and carriers. Your greatest opportunity lies now in speeding up the movement of cars. Watch the yards and terminals, eliminate the delays there, and half of the problem is solved. The price is eternal vigilance. In the last analysis the determining force in making the freight car the tremendous factor which it must be in winning the war is just the plain everyday man—agent and yard clerk and switchman; repairer and trainman and yardmaster—shipper and consignee; and you, and me, and a thousand others. Shall we not do our part? * * *

DISCUSSION

The discussion on Mr. DeGroot's paper was opened by W. C. Kendall, superintendent of transportation of the Boston & Maine, but now serving on the railroads' Car Service Commission at Washington. Mr. Kendall told of the satisfactory progress being made at Washington. The railroads have never worked so closely in co-operation with the Interstate Commerce Commission as now. Complaints of unsatisfactory car service are less numerous than ever before, and the railroad man's life is correspondingly pleasanter. Complaints of all kinds are still sufficiently numerous, however, to keep the transportation men from going to sleep; but, as has been so often observed in the past, a good many of the reported troubles are future and contingent, rather than actual and present. A certain Pittsburgh road, having put on a largely increased corps of inspectors, has succeeded in loading its cars of miscellaneous freight (not including coal and ore) from 53 per cent of their capacity to 88 per cent. A certain large shipper of cement, loading 255 cars of cement in one day recently, put 110 per cent of capacity into 254 of those cars. To the station agent and the ordinary shipper—to all having to deal with the freight car problem—the lesson of today is to follow up every station and every yard, every day, with a fine-tooth comb.

John W. Golden, traffic manager of the Keith Car Manufacturing Company, advocated the establishment of local distributive units. A railroad should be divided into such units, of a size which can be handled as a single proposition in a single day; and the distributor supervising freight car movements in this district should have telegraph or telephone communication, with every point, so as to eliminate completely all delay to messages or in getting answers to questions. This man also should be in constant wire communication with the car-record office of the road, and the car-record office should keep its data close up to the actual car movements at all times.

H. E. Astley, division superintendent of the New York, New Haven & Hartford, at Boston, said that some good work of this kind was already being done on his road. He commended the consignees for their hearty co-operation.

G. L. Graham, traffic manager of the American Woolen Company, Boston, referring to complaints that freight cars are often delayed because the revenue billing did not accompany the car, said that the New Haven road had already started a decided improvement in this matter, and cars coming from connections without revenue billing are not accepted.

In the scarcity of help now felt everywhere we feel the need of some improved apparatus for unloading bulk freight (such, for example, as soft coal) from gondolas which have high sides and no hoppers. Who will produce something of this kind?

The shippers of New England are alive to the situation and are ready to co-operate with the railroads in full loading of cars of miscellaneous freight. New England produces one-seventh of the manufactured goods of the country, and sends out freight in less than carload lots more extensively than any other region. At Lawrence, Mass., there is a plan for co-operation, in expediting shipments, by all the manufacturers in the city. The idea is to combine to send goods to a given city on a given day; all, for example, consolidating their shipments to Cleveland, or to Chicago, so that a full carload may be sent direct to destination. This plan is the outcome of severe losses by delays during the past year. At one time special action had to be taken to release 200 cars of westbound freight which had become blockaded at the Hudson river. In Manchester, England, there is now practically no railroad freight accommodation whatever for the large manufacturers, and to send their products to London they have to use automobiles. New England manufacturers are on the lookout lest their productivity may be diminished by causes which have been felt in Manchester. The co-operative plans of the railroads must be worked to their full extent. If the Boston & Maine, for example, is congested in its direct westbound routes, shippers will demand that goods be sent over the Rutland road, if thereby time can be saved.

L. A. Anthony, superintendent of car service of the Boston & Albany, told of the action taken on his road to expedite freight cars. His force of inspectors has been more than doubled. In spite of the best efforts a hundred cars were discovered, in two months, which had been so delayed that the demurrage bills on them amounted to \$25 or more on each car.

A. G. Thomason, manager of the New England Demurrage Commission, congratulated the railroads on the accomplishment of the long needed and long wished for reforms in car service now manifest on every hand. Mr. Thomason was formerly, for many years, in railroad service, and said he was curious as to the explanation of the recent so-called improvement in the matter of sending revenue waybills with cars. In his experience nobody had ever thought of sending revenue bills in any other way than to get them to destination with, or ahead of, the car.

S. E. Miller, acting superintendent of transportation of the

Boston & Maine, told of the effective co-operation of consignees at stations on his road. There are exceptions to this statement, of course, and to these particular attention is given, personal visits being made where necessary.

W. T. LaMoure, general freight agent of the Boston & Maine, reminded the meeting that the freight traffic men—now supposed by many persons to be doing nothing, because freight comes in faster than it can be dealt with—are helping to keep freight cars moving. The traffic men admit that they are the friends of the public; but the undisputed fact at the present time is that the public is heartily co-operating with the railroads; and the principal difficulty, where there is lack of this co-operation is that there is not a full understanding; the principal lesson for the railroad man who would improve such co-operation is to be always frank and aboveboard in dealing with the shipper or consignee, and in telling him your purposes.

Mr. DeGroot, closing the discussion, expressed his full confidence that the gains in transportation efficiency which are now being accomplished under the stress of war will not be lost. The improvements on which we are now congratulating ourselves are so valuable that backward steps will be impossible.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., October 9, 1917.

INCREASED RATE PROCEDURE

That the operation of putting into effect a new tariff containing an increased rate, fare, charge or classification hereafter is to be surrounded with considerable more formality and publicity than formerly, but that a tariff once filed will probably be less liable to disturbance as a result of protests and complaints, is indicated by the announcement made by the Interstate Commerce Commission of a proposed tentative order prescribing the procedure to be followed in securing its approval for the filing of a new tariff. The order, which will be the subject of a hearing at Washington on October 15, as briefly reported in last week's issue, is made necessary by the amendment to section 15 of the commerce act, which became a law on August 9, having been inserted on short notice while the bill to increase the membership of the commission was in conference.

The amendment provides that until January 1, 1920, no increased rate shall be filed except after having been approved by the commission, although such approval may, in the discretion of the commission, be given without formal hearing and in such case shall not affect any subsequent proceeding.

Since the law became effective, at a time when the members of the commission were away on their vacation, the business of filing tariffs has been pretty much at a standstill. Both tariffs and requests from carriers as to how they should go about obtaining the approval of the commission have accumulated in the commission files along with more or less frantic letters and telegrams from shippers excited by the knowledge that definite proposals to increase rates were in existence to which they had no access. Some idea as to how many tariffs have thus been held up may be gained from the fact that in the 12 months ending October 31, 1916, 106,442 separate tariff publications were filed by carriers and this was less by several thousand than the numbers filed during recent years. Tariffs in transit were taken care of by the commission by a blanket order of approval covering those forwarded prior to August 15 and since then the commission has issued notices of approval in some 22 cases, involving principally tariffs filed for the purpose of making corrections.

Heretofore new tariffs have simply been filed and, unless sufficient protest was made to cause the commission to suspend them, have automatically gone into effect. Under the

proposed order requests for approval of the filing of a tariff containing an increased rate must be made by application in a form set forth, and, according to the order:

"Such application must show the rates, fares, charges, and classifications, which it is proposed to increase, including rules or regulations affecting charges, as well as the nature and extent of the increase, the way in which it is to be effected, and the proposed rates, fares, charges, classifications, rules, and regulations of which approval is sought, and must also contain a complete and accurate statement of the reasons advanced by carriers in justification of the increases sought to be established. If the application embraces a number of increases they may be shown in an exhibit attached to and specifically designated in the application. This may be done by using a copy of the effective tariff and showing thereon in red ink the proposed increases, or by using a proof copy of the proposed issue and inserting thereon in red ink the existing rate, fare, etc., or by showing both the existing and proposed rates, fares, etc., in a memorandum either typewritten or manuscript, attached to the application as an exhibit.

"If the existing rates, fares, etc., are under investigation in suspension proceedings, or under attack in any formal proceeding pending before the commission or if the proposed rates, fares, etc., are predicated upon the commission's findings in any adjudicated proceeding, applications should so indicate by proper reference to the docket numbers of such cases. If the existing rates, fares, etc., are protected by any pending fourth section application reference must be made thereto. "If the commission declines to approve an application and the carrier presents a new application based upon new facts in justification of the proposed increases, such modified application should specifically refer to the previous application and order number declining the same.

"Whenever it is thought that maps would be helpful in presenting the rate situation, they may be employed for purposes of illustration, be designated as exhibits and be attached to the application.

"If the increases sought to be established bear a relationship to the rates, fares, etc., of another carrier or carriers, or to and from other points or localities, or if they bear an established relationship to rates on other commodity or commodities, or if increases are proposed for the purpose of removing discriminations or fourth section violations, applications should state the fact and definitely explain such relationship or fact.

"In instances where the commission has in formal proceedings approved specific rates, fares, charges or classifications it is not necessary to secure further approval, but schedules containing such rates, fares, etc., should specifically refer to the authority therefor in the manner required by Tariff Circulars No. 18-A and No. 19-A or later issues.

"Five copies of each application should be presented to the commission, but where it requires more than 20 pages to set forth the increases sought to be made, it will be sufficient to present two copies of the exhibit referred to and made a part of an application.

"Each application must show the names of the carriers for and on behalf of which it is made, or if made on behalf of all carriers parties to a particular tariff or classification, may refer by I. C. C. number to such tariff or classification, and must be over the signature of an executive officer, a responsible traffic officer or a duly authorized attorney and agent, specifying his title, and must be sworn to before an official qualified to administer oaths."

While these requirements will naturally make it more difficult than at present to get an increased rate on file, and will also add considerably to the work of the commission, it would seem a matter of course that after the commission has had an opportunity to analyze a proposed increase in advance and perhaps to hold a hearing on it, there will be

less likelihood of its being suspended after approval for filing is given, although if additional facts should be brought to the attention of the commission by shippers to warrant such a procedure, there is nothing to prevent such a suspension.

The commission has gained the power, if it deems it wise to exercise it, of absolutely preventing even the filing of an increased rate, but as it already had the power to prevent such a rate becoming effective, the real change in the situation in this respect is apparently rather unsubstantial.

Shippers have been worrying considerably for fear that, the commission once having passed on an application for approval of the filing of a tariff, it would be reluctant to reconsider the same tariff later, and have been advocating some method by which they can be enabled to know the contents of the carriers' applications in time to make protest. In order, therefore, to apprise interested shippers of the applications presented by carriers for permission to file increased rates, the commission calls attention to the fact that the proposed order requires that five copies of each application shall be presented to the commission, and, in all cases, at least a duplicate copy of all exhibits incorporated therewith. According to the plan, one application containing copies of all the exhibits will be open for consultation by the public in the commission's public tariff file rooms and there will be laid daily on the table in the press room and also posted on the secretary's bulletin board, notices indicating applications received to file tariffs carrying increased rates, such notices indicating in brief the tariffs and territory affected.

The commission also has in mind arranging to mail weekly to accredited representatives of organizations of shippers, chambers of commerce or boards of trade similar lists of the applications received, indicating those that may have been acted upon.

The commission also expresses the view in its announcement that carriers should consult freely with shippers who may be interested in proposed increases. It believes that the course now pursued by the classification committees in that regard, by which hearings are held for the benefit of shippers on proposed changes, following the commission's suggestions in its report on the Western Classification Committee case, has resulted in a better understanding between shippers and carriers, and that similar conferences on prospective changes in rates, fares, or charges will serve to reduce or remove much of the friction and difference of opinion hitherto existing between shippers and carriers. It is also thought that conferences between the parties will greatly simplify and expedite the disposition of applications by the commission, and will have a tendency to reduce protests and requests for suspension, and the number of formal complaints filed with the commission.

NEW COMMISSIONERS CONFIRMED

The Senate on October 4 confirmed the President's appointments of Robert W. Woolley, Clyde B. Aitchison and

George W. Anderson as members of the Interstate Commerce Commission and the appointments became effective at once. Early announcement is, therefore, expected of the reorganization of the commission into divisions to handle the various departments of the commission's work, such as rates, valuation, accounting, etc. Senator Hoke Smith of Georgia, who was absent the day the nominations were acted upon, made an unsuccessful effort on the following day to have the Senate reconsider its confirmation of Mr. Woolley, contending that he had had no experience to qualify him for the position. A photograph of Commissioner Aitchison is reproduced herewith. Biographical sketches of the new commissioners were published last week.

* * *

NEWLANDS COMMITTEE TO HOLD HEARINGS IN SAN FRANCISCO

As predicted last week, the Congressional Joint Committee on Interstate Commerce, of which Senator Newlands of Nevada is chairman, has definitely decided to hold a series of hearings in San Francisco during the Congressional recess, in connection with its general inquiry into matters pertaining to railway regulation. Although Congress passed the provisions on the urgent deficiency bill continuing the committee for another year and providing for a report by December 30, the committee desired to take advantage of the opportunity to hear from the far western people who had signified a desire to testify. As one member of the committee expressed it, it is the purpose on this trip to hear from those who do not enjoy the privilege of free transportation to Washington, which the railroad men have, and it is expected that the witnesses will consist principally of shippers and state commissioners, as most of the testimony heard in Washington last fall and spring was on behalf of the railroads. The plan is to hold hearings for

Clyde B. Aitchison

about three weeks at the Palace Hotel in San Francisco, beginning on November 1. If there is sufficient time available before the opening of the regular session of Congress in December, one or two hearings may be held at other places on the way back.

The committee at a meeting in Washington just before the adjournment of Congress accepted the resignation of William C. Adamson as vice-chairman, effective on December 1. Judge Adamson, who is chairman of the House Committee on Interstate and Foreign Commerce, is to leave Congress to become a member of the board of appraisers of the Port of New York. Thetus W. Sims, who will succeed him as chairman of the House Committee, was elected vice-chairman of the Joint Committee.

TRANSPORTING THE COTTON CROP

The Commission on Car Service has recently been giving especial attention to the problem of transporting the cotton crop in such a way as to handle it expeditiously and without

waste of cars, at a time when the southern cotton producing communities are handling an unusual amount of other business, requiring additional cars, because of the location of so many military camps in the southeast. It is estimated that this year's crop will require the railroads to move 18,000,000 bales, including the duplications incident to reshipment, and that if loaded to the ordinary average of 55 bales to the car this would require over 320,000 cars, while if loaded to an average of 75 bales a saving of 100,000 cars may be effected. Cotton, because of its bulk, rarely reaches the weight capacity of the cars in which it is shipped and therefore any changes which will place a larger number of bales in a car will materially assist in solving the transportation problem. On September 28 a circular was sent by the Railroads' War Board to the presidents of all the cotton-carrying roads calling their attention to a more detailed circular sent by the Commission on Car Service to the chief operating officers emphasizing the opportunity presented for intensive loading, prohibiting the shipment of cotton in quantities of less than 65 bales to the car and requiring as many more to be loaded as the size of the car furnished will permit. In complying with this the Southern Railway has issued a circular to put all concerned on notice that it will require the loading of 75 bales of compressed cotton in all standard 36-foot cars. The circular also includes drawings showing the proper method of loading to stow 75 bales in a car.

A conference of cotton growers, merchants, brokers, warehousemen and compressmen with representatives of the transportation companies was held at Washington on October 5 to consider the problem of transporting cotton from the South to New England, in view of the fact that many of the coastwise boats, which usually carry about half of this traffic, have been withdrawn by the government. Howard Elliott, of the Railroads' War Board, addressed the meeting, explaining the difficulties the railroads are facing in attempting to produce enough transportation to go around and outlining the work of the war board. Mr. Elliott laid stress on the necessity for high density compression, in order to secure heavy loading and expressed the opinion that with the full co-operation of the shippers the railroads would be able to take care of all the most essential transportation, although he said that there is a strong chance that some things cannot be taken care of. The conference adopted resolutions recommending that every effort be made to put the cotton in such a condition as to make possible the maximum loading.

THE RAILROAD PROBLEM

Conditions which are handicapping the roads in their effort to produce a maximum of transportation were explained in Mr. Elliott's address and also in a letter written by Fairfax Harrison, chairman of the Railroads' War Board, in reply to an inquiry by Senator Newlands, which was published in the Congressional Record. Mr. Harrison said in part:

"Data collected by direction of this committee indicates that on April 1 there were approximately 102,000 new freight cars under order for American railroads. Recently, in response to inquiries, it was ascertained that there were approximately 3,015 new locomotives under order. Some progress has been made in completing and delivering these cars and engines to the railroads, but progress has been slow, and will doubtless continue so, while few new orders will be placed by the railroads under the existing pressure for raw materials and the delay in securing steel and other manufactured parts. Thus the capacity of all the plate mills in the United States is 3,850,000 tons. We are advised that the government's program for the coming year will require about 1,600,000 tons of such plates. The needs of the railroads in plates merely for repairs to locomotives and cars during the coming year will be 275,000 tons. Orders for new locomotives, rail, and other railroad equipment for use abroad by the United States and the allies, which have been given preference to the needs of our railroads at home, are also delaying our deliveries. This presents one of our most serious problems in the outlook for the next 12 months."

"Through the efforts of this committee and the active co-operation of the railroads of the country, and, in large measure, of regulating authority, national and state, as well as the shipping interests of the country, much has been accomplished to increase the efficiency of the existing equipment."

"It is impossible to make definite reply to your inquiry as to the adequacy of the present equipment, for the reason that we are without definite information as to the volume of additional transportation which the re-

quirements of the government and our allies may still add to the commercial traffic of the country. We have viewed with much concern the reduction in available coastwise tonnage, which formerly handled large amounts of traffic by water from one part of the country to another. As a result the volume of rail transportation has in certain districts of the country been unusually increased, and if more coastwise ocean tonnage is taken by the government an acute condition may result, particularly in the movement of coal and cotton to New England."

"The continued increase of the efficiency of the railroads depends largely upon the delivery of the cars and locomotives now on order to replace those worn out or destroyed from time to time and the regular receipt of rail and steel products for repair purposes."

"These conditions are vital to the continued upkeep and necessary expansion of the carriers, and without adequate attention to them it is inevitable that the railroad machine of the country will in time halt and in some degree fail to meet the requirements imposed upon it. This committee has from time to time since its formation given expression to its concern on this subject, and, in view of your inquiries, I do not hesitate to direct your attention to the necessities of the railroads in these particulars."

"You further inquire whether the increase in volume of transportation has been sufficient to relieve the apprehension of the railroads that the considerable increase in operating expenses would hamper them in the maintenance and development of the necessary facilities for the service of the public. It is difficult within the reasonable limits of a letter adequately to reply to this inquiry, but public reports of results of operation show that the tendency of heavy and continuing increase in operating expenses on many important lines is exceeding the increase in gross revenues through increased traffic."

"Preliminary returns from 175 railroads, covering the United States as a whole, for June, 1917, show net revenue of \$10,321,241, as compared with \$99,901,700 in June, 1916. For the six months ended June, 1917, net revenues from railway operations were \$528,233,173, as compared with \$550,362,415 for the corresponding period in 1916. For the eastern district net revenues from railway operations for the six months ended June, 1917, were \$197,630,024, as compared with \$230,731,415 for the same period in 1916. In the southern and western districts the six months' figures, as well as those for the month of June, 1917, still show increases in net revenues, but reports of later operations in July and August on some important lines in the west indicate a decline in net revenues."

"This constitutes no present bar to the efficient operations of the railroads, but if the prospects are, as railroad managers believe them to be, that this tendency may increase, then, to the extent that it does, it will increasingly limit the ability of the railroads out of income to maintain and develop their facilities for transportation service. This current tendency to establish expenses on a higher level than ever before is what gives railroad managers their gravest concern at the moment. The present large volume of revenues may not always obtain; when it drops the ability to curtail expenses proportionately is limited by conditions over which the railroad manager has no longer any vestige of economic control. Furthermore, these special conditions, taken in connection with the general conditions affecting the money markets of the country, with which you are familiar, have made it doubly difficult, if not impossible, for even the most favored railroad to raise new capital; the sale of long-term bonds is apparently out of the question excepting at heavier discount than prudence will permit, and the issue of new stock upon any reasonable terms is not within the power of any company. Short-term financing is apparently the only recourse for new capital; under present conditions this method requires the payment of high rates of interest and involves early refinancing, which under the present outlook is an unsatisfactory and, in some respects, a dangerous method of supplying the capital needs of the railroads."

Mr. Elliott showed, among other things, that since the organization of the War Board, something like 141,000 empty cars have been distributed, that the increase in bituminous coal handled in May, June, July and August was 25.2 per cent, while the increase in anthracite handled from January to August 31 was 17.18 per cent, that up to the evening of October 2 the railroads had moved 728,010 of the National Guard, the National Army and the Regular Army, and that passenger train service has been reduced by about 25,000,000 train miles, saving about 1,500,000 tons of coal and releasing about 3,000 men for other work. From May 1 to October 1, he said, 128,000,000 bushels of grain have been sent over to the Allies.

"This movement of putting all the railroads in the country under this so-called War Board is of interest in another way than simply in its aspect of giving a higher efficiency for the use of the people of the United States." He said, "I believe that after the war is over we are going to see the greatest business in the United States that we have ever seen. It may not come the first year, but it is coming."

"Some say that the putting together of the railroads the way we have this year is an argument in favor of government ownership, and that that is what it means. I do not agree with that. I think it means that the splendid initiative of the American business man, that has built up this great transportation system that is today doing 20 to 25 per cent more than it ever did before, even under the complicated conditions that confront all of us—it means that the splendid

initiative of the American business man, if not too much fettered by small and nagging restrictions and allowed to go ahead, can do more for the expansion of American business and the expansion of the country than we could possibly obtain by governmental ownership. I say that because that is one of the great problems that very likely will develop out of this war, and you gentlemen who depend upon a successful transportation system are men who will have to help decide that great question by such views as Congress gets from its constituents all over the United States."

ILLINOIS PASSENGER FARE CASE

The Illinois passenger fare cases, involving the conflict between the Illinois 2-cent fare law and an order of the Interstate Commerce Commission requiring the railways of Illinois to remove the discrimination against St. Louis, Mo., and Keokuk, Ia., and finding that 2.4 cents per mile is a reasonable rate, were argued in the United States Supreme Court on Monday, October 8, by representatives of the roads, the Interstate Commerce Commission and the state. Briefs were filed on behalf of the roads by Silas H. Strawn, Robert B. Scott and A. P. Humburg, on behalf of the Interstate Commerce Commission by Joseph W. Folk, its chief counsel, and on behalf of the state authorities by Attorney General Brundage and his assistants, George T. Buckingham and J. H. Wilkerson. Two cases were heard together, an appeal by the railroads from a decision by Judge Landis of the federal court for the northern district of Illinois, dismissing for want of equity their petition for an injunction to restrain the state authorities from preventing their compliance with the commission's order, and also a cross-appeal by the state authorities. Mr. Strawn, in the opening argument for the carriers, contended that the rate of 2.4 cents a mile, found reasonable by the commission, is not subject to review by the court; that if there is any conflict between the state law and the commission's order the federal authority is paramount; that if the state wished to attack the commission's order its forum was in the federal district court at St. Louis, and that the scope of the commission's order to remove the discrimination is broad enough to require advancing the Illinois fares to 2.4 cents.

Mr. Buckingham, for the state, endeavored to keep the case outside of the doctrine of the Shreveport decision by arguing that the commission's order is too vague and indefinite to serve as a justification for disregarding the Illinois statute. He ridiculed the claim of the carriers that it is necessary to advance fares between all points in Illinois to remove the discrimination found, and contended that while the order did not apply to all points its description of the points to which it applies is indefinite. If the order does apply to all Illinois points, he urged, it was beyond the power of the commission to make for lack of evidence, because the commission had not found that the disparity in state and interstate fares worked any injury to St. Louis.

Mr. Folk supported the railroad contention as to the scope of the order and contended that the commission has the power to compel the removal of a state discrimination against interstate commerce.

LIGHT RAILWAYS FOR WARWICKSHIRE.—In connection with the ironstone development in South Warwickshire, England, an application is being made to the Light Railway Commissioners for an order to form a company to be called the Edgehill District Minerals Light Railway Company for the purpose of constructing a series of light railways connecting the Stratford-on-Avon & Midland Junction Railway with sites in the parishes of Burton Dassett, Radway, which lies at the foot of the Edgehills, Rotley, Upton, Horley, Shinington and Wormington. The new line of railway from the Great Western at Banbury to the Hanwell and district iron ore-fields is being rapidly constructed.

POWER PLANT SUPERVISION ON THE BALTIMORE & OHIO

At this time when railroads are confronted with the problem of operating at maximum efficiency and economy, during an acute shortage of labor, they could not do better than thoroughly to study the operation of their power plants. This is an important field full of possibilities hardly touched by the average railroad. For example, how many railroads know to a drop how much of each kind of lubricant machines in power plants should take, and if they are consuming more or less than that amount? Do they know that proper attention is being paid to the cleaning of boilers, to the repair of tubes, and do they know that the boiler settings are watched and cared for? Do they know what amount of fuel is consumed in each plant and do they know that these amounts are what they should be, and what is most important, perhaps, do they know that the methods of operation and maintenance in all plants are uniform and in accordance with properly determined standards?

There are two general methods of providing for supervision of railroad power plant operation and maintenance, viz.: divisional or departmental. Under the purely divisional system each local terminal organization operates and main-

Fig. 1—View of the Switchboard Room in the Curtis Bay Power Plant, Baltimore, Md.

tains its power plant, while under the purely departmental system the operation and maintenance of all power plants over the entire system come under the direct general control of one officer of the company. The inherent fault of the divisional method is that it results in a poor load factor because if the organization is equipped to do the necessary maximum amount of work it is too large when the work is at a minimum. On the other hand, if the supervision is purely departmental, it becomes unwieldy as the organization grows, until finally the supervision of detail becomes impossible. The power plant organization on the Baltimore & Ohio is a combination of the good points of both methods.

Efficient power plant operation requires primarily the co-operation and live interest of every employee, the keeping on hand of a minimum and yet adequate supply of materials and a system of supervision which watches every detail in such a way that the results obtained by each power plant will be comparable with those obtained by all the others. This last requisite is the most difficult to accomplish, but the Baltimore and Ohio has effectively overcome all present existing difficulties by establishing one man control over all power plants on the system. To the man in the field it is usually apparent that a certain piece of work must be done, but it is not always so apparent just how it shall be done to the best advantage of the organization as a whole.

The diagram (Fig. 3.) illustrates part of Baltimore & Ohio

organization which covers power plant supervision. In making a study of this diagram it should be borne in mind that it is the policy of the organization not to make hard and fast rules concerning from whom a man should receive orders or to whom he should give them. It might appear from this that the system is weak, but it will be evident by a careful

Fig. 2—Automatic Stokers and Coal Chutes in Boiler Room, Curtis Bay Power Plant

study of its organization that jurisdiction does not conflict. The railroad is divided into two main parts—Eastern Lines and Western Lines. The Eastern Lines are split into three

black lines in the diagram indicate the order of the pay roll and the order of first hand instructions. The dotted lines indicate the supervision of methods and practices. The electrical engineer also has the power to issue other instructions directly to the five district power plant supervisors and in addition they meet him in council once each month.

REPORTS

With the view of making practice uniform, report blanks and bulletins are issued by the electrical engineer at Baltimore. The standard log sheet made out by the power plant engineer is a report which furnishes information regarding the operation of the boiler and engine room, also a record of fuel and supplies received. The form also gives sufficient information regarding the output of each generator to enable the electrical engineer's office to draw a maximum load curve each month. At the end of the month the report is signed by the power plant engineer, is approved by the master mechanic and sent to the electrical engineer.

From information shown on the power plant time cards and material cards the division accountant prepares a condensed statement, which is sent to the office of the electrical engineer each month with copies to the power plant supervisor and other local supervising officers. In the electrical engineer's office the information is boiled down, reduced to a comparative scale, assembled with the data received from all the power plants in the several districts, and made up in blueprint pamphlet form known as the general power plant statement. This not only contains the cost of operation, fuel consumption, cost of supplies and cost of labor for the month, but also includes the record for the previous month and the average for the year up to date. Copies of the statement are sent to the following: Vice-president in charge of operation and maintenance, general superintendent of motive power, two superintendents of motive power, the electrical engineer, his assistant and his statistician, the five general master mechanics, the five power plant supervisors, all master mechanics, all superintendents of shops and all power plant engineers. By glancing at this statement it is easy to tell if the operation in a certain power plant is improving or

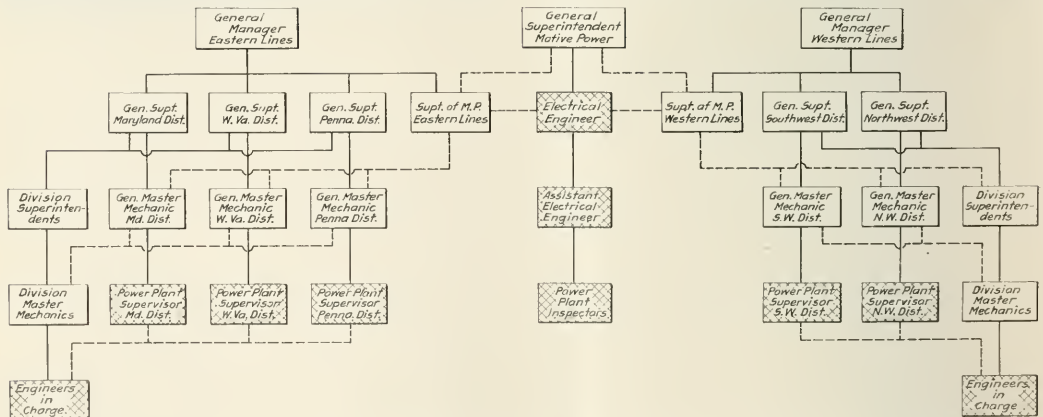

Fig. 3—That Part of the Baltimore & Ohio Organization Having to Do with Supervision and Operation of Power Plants

districts, namely, the Maryland district, the Pennsylvania district and the West Virginia district. The Western Lines are split into two districts, the Southwest district and the Northwest district. A district power plant supervisor attached to the staff of the general master mechanic is placed in each one of the five districts. These men receive instructions regarding the work to be done from the general master mechanic and receive directions regarding how and when it shall be done from the electrical engineer. Thus the full

falling off and to compare it with the operation of any other power plant on the system.

USE OF BULLETINS

With the system developed as outlined above, J. H. Davis, the electrical engineer, was confronted with the problem of obtaining the co-operation of every employee, and of developing a school whereby every employee could and would learn how to bring power house operation up to a maximum effi-

ciency. He conceived the idea of sending out useful information and instructions in the form of short bulletins, couched in language understandable by the average fireman and engineer. It was also considered essential to start at the bottom and have the first bulletins cover information of a fundamental nature. The subject matter of each bulletin is the result of careful study and thorough investigation by specialists.

In a broad way the objects of the series of bulletins are: (a) To bring about a better understanding of the subject of steam generation and its utilization; (b) to point out the causes of losses, preventable and unpreventable; (c) to show how better results may be accomplished and how maximum operating economy may be insured.

Bulletins were also issued to cover repairing, inspecting and testing of stationary boilers, as well as the operation and maintenance of power plants in general. All bulletins are as concise as possible, and the use of technical terms is avoided.

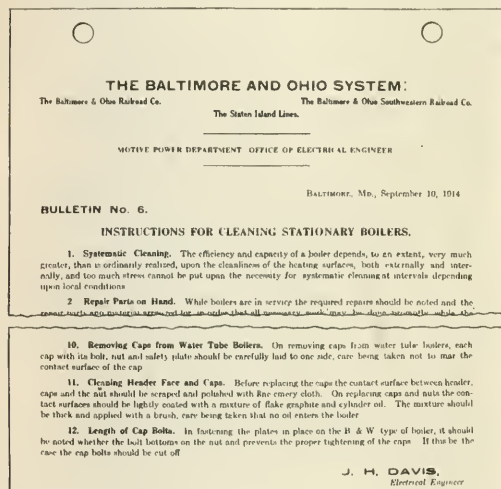

Fig. 4—Sample Copy of Instruction Bulletin Sent Out by the Electrical Engineer

They are of uniform size and are arranged for insertion in loose leaf binders. A copy of one of the bulletins issued is shown in Fig. 4.

Another of the bulletins contains the following information: "As provided in Circular S-2, dated July 13, 1912, the electrical engineer's approval must be obtained before installing steam and air lines or making renewals of existing lines." It is apparent that adding on steam or air lines indiscriminately will eventually overload the power plant and impair all of the previously existing services. Furthermore, the approval of a competent engineer will insure that the work will be done in accordance with the best practices. If it is a case of renewal of an existing line, because of machinery which is to be installed, it may be desirable to change the size of the line or to place it differently. The engineer is the man in the position best to foresee such eventualities.

The following are the titles of the bulletins issued to date:

- No. 1. Generation and Use of Steam from Stationary Boiler Plants.
- No. 2. Rules for the Operation and Care of Stationary Boilers.
- No. 3. Rules for Testing, Inspecting and Cleaning Stationary and Portable Boilers.
- No. 4. Power Plant Losses.
- No. 5. Operating Instructions for Jones Underfeed Stokers.
- No. 6. Instructions for Cleaning Stationary Boilers.
- No. 7. Repairs to Stationary Boilers.
- No. 8. Masonry in Boiler Settings and Furnaces.
- No. 9. Care, Maintenance and Operation of Electric Motors and Controllers.

- No. 10. Hand Firing Soft Coal Under Power Plant Boilers.
- No. 11. Pipe Covering.
- No. S-2. Operation and Maintenance of Lighting and Power Plants.
- No. S-8. Numbering of Stationary and Portable Boilers.
- No. S-9. Rules for Testing, Inspecting and Cleaning Stationary and Portable Boilers.
- No. S-13. Extension and Renewals of Steam and Air Lines.
- No. S-17. Reporting of New Installations, Transfers, Renewals and Scrapping of Power Plant and Electrical Machinery.
- No. 20. Fusible plugs—Stationary Boilers.
- Bulletin No. S-9 annulled and superseded Bulletin No. 3.

A reference book on "Steam—Its Generation and Use" was furnished each power plant. In addition to requiring power plant employees to familiarize themselves with the bulletins they are required to read portions of the reference book from time to time. The bulletins are followed by personal conferences with those engaged in the production and utilization of steam from stationary power plants, the idea being to work out in each plant the best and most economical operating methods. In this way each employee receives, almost in spite of himself, information quite as valuable to him as to his employer. The information is mailed under personal cover to each individual interested and is given out in small doses so that the men pick up and read the bulletins almost as easily as they would a newspaper. Almost without exception they have taken a lively interest in the educational campaign with excellent results. It is of interest to note that, although the photographs in Figs. 1 and 2 were taken without a preparatory cleaning up, the plant presents an exceptionally orderly appearance.

About a year ago, due to conditions caused by the war, some trouble was experienced because of firemen leaving to accept more attractive jobs. This resulted in a temporary shortage of that class of labor. This difficulty has been partially overcome by installing mechanical stokers, but it is apparent that this improvement does not constitute a complete remedy.

WHAT THE SYSTEM HAS ACCOMPLISHED

As an example of the results which can be obtained by proper supervision of power plants, the following incident is cited: The reports from a certain power plant indicated that the consumption of lubricating oil was abnormally large, and in spite of the best efforts of the engineer in charge the consumption continued to be excessive. The district power plant supervisor was sent to the plant and found that the engine was using the minimum amount of oil required to keep the bearings cool. Knowing that something must be wrong, he drilled into the foundation and found the sand in the center saturated with oil. This led to the discovery of a small crack or fissure in the bed plate casting. After the crack was closed by electric welding the oil consumption became normal. It was only through proper supervision, which required accurate reports, that the detection of such a leak was possible.

Although the lubricating oil now being used in all of the 40 power plants is of a better and more expensive grade than that formerly used, estimates indicate that the organization, in one year, has greatly reduced its total expenditures for this item.

It is common knowledge that shop output and engines despatched have increased abnormally during the past year. In addition to this the Baltimore & Ohio has increased the load on a number of its power plants by installing yard taps from the compressed air lines so that trains will already be "pumped up" when the engine takes hold of them. In spite of these increases, the consumption of coal in the power plants was only one per cent more during the fiscal year ending July 1, 1917, than it was the year previous.

Briefly the method of power plant supervision used by the Baltimore & Ohio insures that all operation and maintenance is in accordance with the best practices, that unnecessary work is not done, and, what is of greater importance, it commands the interest and co-operation of each and every employee.

General News Department

The annual convention of the Railway Real Estate Association, which was to have taken place this month at Duluth, Minn., has been postponed for one year on account of the war.

Switchmen on the Elgin, Joliet & Eastern, who struck on September 27, for a 50-per cent increase in wages, returned to work on October 6 and 7 without having their demands granted either in full or in part.

The Supreme Court of the United States has declined to review the decision of the lower court in which the Northern Central was fined for paying rebates to the Mineral Railroad & Mining Company on shipments of coal.

The United States Civil Service Commission announces examinations, November 21, for accounting and statistical clerk, men only, for positions in the Division of Statistics, Interstate Commerce Commission, also the Division of Valuation. Salary, \$1,200 to \$1,620. Applicants must be from 21 to 45 years old.

In the shops of the Grand Trunk at Stratford, Ont., the female employees have been directed to wear uniforms; that is to say, overalls. This is to lessen the danger of accident by catching clothing in machinery. These women for some time have been required to wear caps while at work, some of them having been injured by having their hair caught in drills.

In the urgent deficiency appropriation bill, passed by the Senate on October 3 and by the House on October 4, the appropriation for the transportation of the army and its supplies was fixed at \$375,000,000 by the action of the conferees. In the original House bill the proposed appropriation was \$350,000,000; the Senate increased it to \$413,000,000 and the conferees adopted a compromise.

James Simpson, master mechanic of the Northern Pacific at Livingston, Mont., advises that 39 women are now employed at the roundhouse at Lanrel, Mont., Livingston, Bozeman, Whitehall and Butte, in the capacities of roundhouse foremen's clerks, coach cleaners, wipers, sweepers and turntable operators. The majority of the women so employed are rendering very satisfactory service.

When Joe Willet, a tourist conductor in the employ of the Chicago, Burlington & Quincy, stepped from the train at Boston, Mass., on October 3, he completed his three hundredth round trip between Boston and Los Angeles. He takes a party from Boston across the continent to San Francisco and Los Angeles every 21 days. He estimates he has traveled 4,000,000 miles, a distance equal to 1,600 times around the world.

Up to date 33 employees in the valuation department of the Chicago & North Western have entered army service. Those who had voluntarily entered military service from the North Western engineering department up to August 15 included one assistant engineer, four computers, one construction accountant, one draftsman, 12 instrument men, one assistant pilot, four rodmen, two recorders, three tapemen, and two stenographers.

The Chicago, Rock Island & Pacific, which recently prepared a colored map of the United States showing the location of the various encampments, announces that its first issue of over 100,000 has been exhausted and that it is reprinting the map in order to meet the continued demand for it. The Rock Island also granted permission to the Chicago Tribune to republish the map as a colored supplement in its Sunday issue of September 2, which resulted in a distribution of 650,000 copies.

The proceedings of the conference on social insurance which was held at Washington last December, under the auspices of the International Association of Industrial Accident Boards, have been printed in a thick volume of 935 pages and issued as Bulletin No. 212 of the Bureau of Labor Statistics, Department of Labor. The conference was participated in by a large number of well-informed speakers from the principal departments of industry which are interested in accident and health insurance.

The St. Louis-San Francisco, on October 1, granted increases in wages, ranging from 8 to 10 per cent, to station agents, telegraph operators and other station employees, yard clerks and clerks in the general offices at Springfield, Mo., as well as clerks in the division offices, who had not been granted an increase since January 1. The 10 per cent increase was granted to those employees who received only a 4 per cent increase in August, 1916, while the 8 per cent increase goes to those who received a 6 per cent advance at that time.

The Pennsylvania Railroad (all lines east of Pittsburgh and Erie) reports that the average freight carload in July of this year was 33.51 tons, as compared with 29.57 tons in July, 1916, an improvement of more than 13 per cent. This was equal to a saving of 81,268 cars in the number required to handle the traffic of the road during July. This saving not only enabled the road to handle a much larger amount of commercial business, but also aided materially in rendering efficient military transportation, especially in the carrying of materials for the construction of the various cantonnments. It is believed that the results for August and September will show an even greater improvement in car loading.

A Board of Conciliation, which has inquired into a dispute between the Canadian Pacific and its station agents, telegraphers and linemen, recommends that the pay of these classes be increased not less than 18 per cent, and that the pay of train dispatchers be increased not less than 12 per cent. It is recommended that the road discontinue the payment of higher wages to men in western Canada because of the higher cost of living in that part of the Dominion, living conditions in the east and west being now more nearly equal. The employees had asked for an increase of 25 per cent, citing statistics compiled by the Department of Labor showing that, since 1913, the cost of living had advanced more than 30 per cent.

A strike of clerks of the Nashville, Chattanooga & St. Louis, which had made considerable disturbance for over a week, was settled at Nashville on October 8 by an agreement to have the differences discussed later. The company agreed, in putting the men back at their work, to pay them for the time that they had lost. Both employer and employees declared that they agreed to this settlement because of a feeling of patriotic duty. The Canadian Pacific and its complaining telegraphers have agreed to accept the award of the government Conciliation Board in the matter of the operators' recent request for increase in pay. Agents and operators receive 18 per cent increase and dispatchers 12 per cent.

A plan proposed by a committee of the Association of American Railway Accounting Officers for a modification of some of the accounting and statistical requirements of the Interstate Commerce Commission and state commissions, for the purpose of saving clerical man-power during the war, was discussed at a conference held in Washington on October 4 of members of the committee and of the federal commission and the National Association of Railway Commissioners. The representatives of the Interstate Commerce Commission, M. O. Lorenz, statistician, and F. W. Sweney, chief examiner of accounts, were inclined to assent to most of the proposed changes with some modifications, but the representatives of the state commissions could not commit themselves to an assent to the proposals. An outline of the plan was published in last week's issue in connection with the report of the accounting officers' convention.

Pennsylvania Takes \$5,000,000 in Liberty Bonds

At a meeting of the Board of Directors of the Pennsylvania Railroad Company in Philadelphia, Wednesday, it was decided to subscribe, on behalf of the company, for \$5,000,000 worth of Second Liberty Loan Bonds. Other large subscriptions by various railroads are given on a previous page.

Headlight Complaint Dismissed

Arguments were heard before Judge Anderson of the United States District Court for the district of Indiana at Indianapolis on October 9 on a motion of the United States government to dismiss a complaint filed by the New York Central about three months ago to restrain the government and the Interstate Commerce Commission from enforcing the commission's order requiring the use of high power locomotive headlights. The court granted the motion to dismiss the complaint.

Germany Plotted Destruction of Railroad

Despatches indicating that the German general staff had planned the destruction of the Canadian Pacific Railway line at important points have come into the possession of the State Department. Secretary of State Lansing on Wednesday gave out a copy of a secret message dated January 3, 1916, from Zimmerman, who was then in charge of the German foreign office, to Count von Bernstorff, the German ambassador to this country, including the following instructions: "General staff desires energetic action in regard to proposed destruction of Canadian Pacific Railway at several points with a view to complete a protracted interruption of traffic." Count von Bernstorff was also instructed to provide the necessary funds.

National Railway Appliances Convention to Be Held

The officers of the National Railway Appliances Association have issued an announcement that it is the intention of that association to hold its tenth annual exhibition at the Coliseum and Annex, Chicago, March 18 to March 21, 1918.

The annual exhibition of the National Railway Appliances Association has been held each year in Chicago at the same time as the March meetings of the American Railway Engineering Association, the Railway Signal Association and the Association of Railway Telegraph Superintendents.

With the announcement that the meeting is to be held are sent application blanks for space. Applications for space must be filed in the office of the secretary-treasurer, 122 Michigan avenue, Chicago, not later than November 1.

Railway Returns for August

The Interstate Commerce Commission has made public its partial summary of railway returns for August, giving figures for 153 roads operating 192,397 miles. While operating revenues increased from \$1,357 per mile in August, 1916, to \$1,518 in August, 1917, the operating expenses per mile show an increase from \$855 to \$1,026 so that the net revenue was reduced from \$502 to \$492. While the southern roads show a slight increase in net the eastern and western roads show a reduction. For the eight months total revenues per mile were \$10,839, as compared with \$9,673; expenses, \$7,677, as compared with \$6,493, and net operating revenues were \$3,162, as compared with \$3,180 in 1916. The eastern roads are considerably behind the average for last year in net while the southern and western roads both show increases.

Conductor Sharp

Conductor E. S. Sharp, of the Yazoo & Mississippi Valley, showed tactfulness and high efficiency in the handling of a recent case. A woman and four children boarded his train at Tehula by mistake, both the conductor and the flagman being, just then, engaged in other duties. When Mr. Sharp found the lady and children on his train, he saw that there was nothing to do but carry them on to Greenwood (24 miles), where they could be made comfortable (for six hours), and send them back to Tehula on train No. 313. This he did and the lady seemed perfectly satisfied. She even went so far as to say that she did not blame anybody for the mistake but herself; and while she was in that humor, Mr. Sharp thought it would be a very good time to pay her a small amount and take her full release of the company, which he did. The release was sent in to the claim department and Mr. Sharp was promptly reimbursed. If no settlement had been made by the conductor, the lady might have changed her mind about who was at fault and brought suit against the com-

pany and caused the entire train crew to waste a lot of time hanging around the court house waiting to be called as witnesses. Conductor Sharp is to be commended.—*Illinois Central Magazine.*

Progress of the Mobilization

Up to Tuesday of this week, the railroads had moved 824,000 soldiers to the various training camps and cantonments or embarkation points. This includes the third increment of the National Army, approximately 25 per cent, or 172,000 men, who were entrained at local concentration points from October 3 to 7 and this leaves about 30 per cent still to move. The balance of the National Army are to be moved beginning on October 17 and there are still some National Guard units to be moved.

Approximately 2,500 carloads of food and other necessities are being delivered daily by the railroads at the cantonments where the new National Army and the National Guard are being trained for service abroad, according to reports just received by the Railroads' War Board. The task of the railroads is to supply all the necessities of life for 10 non-productive cities of a population of 40,000 each and 56 smaller cities ranging in population from 300 to 3,000. Altogether, more than a million men must have their daily necessities brought to them by the railroads.

U. S. Employment Exchange for Engineers

The employment service of the United States Department of Labor recently created a branch known as the Teachers and Professional Service Division, the function of which is to aid the employer in obtaining suitable help, and professional persons in securing suitable employment. While intended to embrace all professions, attention has thus far been confined to the teaching and engineering professions. Employers, in reporting positions, are asked to state the nature of the position, its duties, requirements, etc., the possible salary and the probable duration of employment. Applicants for registration should indicate in the first letter the nature of the position desired so that the proper blanks may be furnished.

No service is rendered an applicant until the division has learned from persons familiar with him that he is qualified as to training, experience and personal qualities for the position he seeks. When an applicant is recommended for a reported vacancy, the employer is given an opportunity to examine the data gathered in the course of the investigation, thus effectually preparing for the final step, the personal interview, for which ample facilities are provided in the offices of the division. The services of the division are entirely free, the expense being borne by the government. All communications should be addressed: Teachers and Professional Service Division, U. S. Employment Service, 845 South Wabash avenue, Chicago, Ill.

Navigation on the Ohio With Artificial Floods

Coal to the amount of over 150,000 tons has been taken in boats down the Ohio River, from the mines on the Kanawha River, to Cincinnati and vicinity during the past two months by the aid of artificial rises in the river produced by drawing water from the pools formed by the dams above Huntington, W. Va. To create these artificial rises water was released from pools starting at Dam No. 7 near Midland, Pa., thirty-seven miles below Pittsburgh to Dam No. 29 below Catlettsburg, W. Va., and from the Big Sandy and Kanawha Rivers.

This water transportation, introduced to relieve congestion at mines due to shortage of railroad cars, has been arranged by Colonel Lansing H. Beach, Corps of Engineers, U.S.A., Division Engineer, Central Division, Cincinnati, Ohio. From August to December is a period of low water in the stretches of the Ohio River where it has not been brought to the nine-foot stage by means of dams; twenty-one dams have been completed and are in operation between Pittsburgh and Cincinnati and fourteen remain to be completed on this stretch of the river, leaving nearly 150 miles of river difficult to navigate during the low water period.

Previous to September some relief was afforded by releasing one or two pools to permit navigation of boats over shallow reaches of the river. Some systematic scheme, however, was necessary to obtain the maximum use of the artificial rises without interference with ferry and packet boats; and it was necessary to regulate the drawing of water from the upper pools so as to

prevent them from being drained to the extent that they would be put out of commission. A meeting was held by the Army Engineers with representatives of the various river interests, and plans were devised by which artificial rises would be given from the pools at regular stated intervals. These artificial rises were started in August and several have occurred since. One last week brought down four tows with over 40,000 tons of Kanawha River coal. It has been arranged to give three rises a month about the first, tenth, and twentieth, until the fall rains bring on the natural rises during November or December.

The New Jersey Full-Crew Law

The Public Utility Commissioners of New Jersey have been holding hearings for nearly three weeks on the petition of the Central Railroad of New Jersey to reduce the number of trainmen on certain freight trains in accordance with the Act of March 22, 1917, empowering the board, after hearing, to regulate the number of employees on any train. These hearings have now been completed and briefs are being prepared by the railroad company and the Brotherhood of Railway Trainmen for argument October 24, after which it is expected that the petitions of the other railroads in New Jersey will be taken up. The petition of the Central relates principally to trains of comparatively light tonnage, making but few stops and having little or no switching work to perform. The Brotherhood of Railway Trainmen, acting for the employees, has consumed most of the time allotted to these hearings in the submission of reports and the testimony of witnesses tending to show that the trains referred to in the petitions of the railroad company are affected by many causes which render the services of the extra brakeman necessary, such as hot boxes, broken brake beams, draw heads pulled out, broken knuckles, inspection of trains, testing air brakes, etc. A mass of evidence was submitted by the trainmen relating to the amount of work performed by the train crew which has very little, if any, bearing on the question of safe operation or adequate service for the protection of the public or the employee. It now seems likely that the physical characteristics of each railroad, together with their operating rules and practices, their signals and switches will be taken into consideration by the board.

Prior to the passage of the full crew law, in 1913, it was understood that the New Jersey Public Utility Commissioners had power to pass upon the question of adequate service and, in fact, had, in some instances, issued orders relative to the manning of trains. It had also thoroughly investigated the subject of manning trains and made a report to the Senate, so that upon completion of the present hearings it will be in possession of specific data to enable it to approve or disapprove the manning of trains as suggested by the railroad companies.

Coal Situation

Denial of reports of a coal shortage in Washington, D. C., or of a general shortage in Eastern points, either present or prospective, was made on October 5 by Fuel Administrator Harry A. Garfield. There is not now enough coal in Washington for the winter, he said, but the quantity needed will be supplied after navigation closes on the Great Lakes on November 15. "Shipments to the Great Lakes are being given preference in order to provide sufficient coal for the Northwest before the close of navigation," according to the statement. "This is necessary in order to prevent shipment of coal all rail to the Northwest after the close of navigation, thus sending cars out of service, which would result in an actual car shortage. The Eastern sections of the country are being supplied with sufficient coal for necessary requirements, but increased shipments are not being made for storage purposes because all surplus coal is being shipped to the lakes for Northwest delivery from the docks. As soon as navigation closes on the lakes such shipments will be diverted to Eastern points and distributed according to need; and we anticipate there will be sufficient coal available for necessary requirements.

"The matter of prompt movement of coal cars is now receiving consideration and it will undoubtedly be necessary to give them preference in movement, both loaded and empty, over other slow freight. This will provide additional cars, which should result in increased production sufficient for all necessary purposes."

One of the most important problems now being considered by the Fuel Administration is that of insuring an adequate supply of

fuel coal for the railroads. Many roads have not been able to contract for their full supply and have had to meet their requirements by furnishing cars on certain days only for railroad coal. This subject has been taken up by E. E. Clark of the Interstate Commerce Commission, Fuel Administrator Garfield and R. S. Lovett, priority commissioner, and also has been the subject of conferences between representatives of the Division of Car Service of the Interstate Commerce Commission, the Commission on Car Service and the coal interests. An order from Mr. Garfield prescribing a method of apportioning coal to railroads is expected this week.

The Fuel Administrator on October 7 issued some new regulations, in one of which it is held that coal confiscated by railroads for their own use may be purchased from the owner at the price under which it was consigned when confiscated, if this is not above the figure set by the President. Exception must be made when it has been consigned under a contract that would stand in court, made before the presidential order, in which case the railroad must pay the higher figure if it wants the coal. Another regulation directs that the product of "wagon mines" be shipped in box cars, when it is sent to the general market by rail, thus saving the open cars for the use of mines where the loading can be done most quickly. Where box cars are used by wagon mines a charge of 75 cents per ton, in addition to the President's prices, is permitted to cover the cost of hauling and loading.

Coal miners and operators of western Pennsylvania, Ohio, Indiana and Illinois have appealed to Mr. Garfield to increase coal prices at the mine, fixed in President Wilson's orders, to permit the wage advances agreed upon on October 6 in a conference that began at Washington on September 25.

The weekly report of the Geological Survey on coal production shows that 192,720 carloads of bituminous coal were hauled from the mines by 144 coal-carrying roads during the week ending September 29, the best week since July 28, but the percentage of production to mine capacity was reduced. "Troop movements, congested traffic and disturbances in the labor force at the mines appear to be responsible for the sudden drop in coal production during the week which ended September 22," says the statement. "For all mines reporting the causes of lost time, due to car shortage, increased from 9.8 to 10.5 per cent of the full time capacity, the most acute shortage for many weeks. In the same time losses due to labor shortage increased also."

Meeting of Telegraph Superintendents

A special meeting of the Association of Railway Telegraph Superintendents will be held at the La Salle Hotel, Chicago, on November 22. At this meeting it is proposed to consider the following subjects:

1. Brief progress reports from the different special committees. Committees will meet at the hotel on November 21.
2. Conservation of telegraphing and telephoning in connection with both commercial and railroad wires. A special committee is expected to report on this subject.
3. Shortage of operators and plans for schools to teach operators. A special committee will report.
4. Emergency use of wire facilities in the operation of railroads to meet the present war situation.

Car Foremen's Association of Chicago

At the annual meeting of the Car Foremen's Association of Chicago, which was held at the Hotel Morrison, Chicago, on October 8, the following officers were elected: President, H. H. Estrup, general foreman, Chicago & Eastern Illinois; first vice-president, E. G. Chenoweth, mechanical engineer, Rock Island Lines; second vice-president, M. F. Covert, assistant master car builder, Swift & Co.; treasurer, F. C. Schultz, chief interchange inspector, Chicago Car Interchange Bureau; secretary, Aaron Kline.

Western Railway Club

The next meeting of the Western Railway Club will be held at Hotel Sherman, Chicago, on October 15. Samuel O. Dunn, editor of the *Railway Age Gazette*, will make the opening address, and H. T. Bentley, superintendent of motive power and machinery of the Chicago & North Western, will read a paper on Locomotive Terminal Delays.

Better Business Correspondence Convention

The belief that much business correspondence is not all that it ought to be has led to the calling of a convention to discuss the subject of better business correspondence at Worcester, Mass., October 15 and 16. The meeting will be held in the assembly hall of the Norton company at Worcester, and at the meeting recognized experts in business correspondence for a number of large companies will exchange ideas on the subject through written papers and informal discussion.

The two important subjects to be brought up deal, respectively, with the writing of the letter and its transcribing, it being believed that too many letters are ineffective and that the methods of dictating and transcribing are wasteful.

It is hoped to make this meeting the first of a number of such meetings, so an organization will be perfected and permanent officers elected.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of meet or regular meetings and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, October 16-17, St. Louis.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichy, C. & N. W., Chicago. Next convention, October 16-18, 1917, Chicago.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—Tom Lehon, The Lehon Company, Chicago. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 844 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Morrison Hotel, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November.

ANNUAL MEETING, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CINCINNATI RAILWAY CLUB.—H. Bortet, Chief Interchange Inspector, Cin'tn Rys., 101 Carew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Eloer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

MAINTENANCE OF WAY AND MASTERS PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. J. Hager, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 16-18, 1917, Cleveland, Ohio.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York City. Next annual convention, October 16, 1917, Washington, D. C.

NEW ENGLAND RAILWAY CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Herry D. Vought, 95 Liberty St., New York. Regular meetings, 1st Friday in month, except June, July and August, 26 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Gen. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wellner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PROBIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ST. LOUIS RAILWAY CLUB.—R. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—J. W. Cox, N. & W., Philadelphia, Pa. Next annual convention, October 16-18, St. Louis, Mo.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TRAFFIC CLUB OF B. & O.—B. B. Fisher, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, 1st Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.

WESTERN CANADIAN RAILWAY CLUB.—J. K. Jamieson, Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Acting Secretary, 1735 Mondanock Block, Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evenings except in July and August.

Traffic News

At Winnipeg, October 4, it was announced that both the Canadian Pacific and the Canadian Northern had placed an embargo on all shipments of grain to Fort William and Port Arthur.

Embargoes imposed by the Great Lakes Transit corporation have made it necessary to prohibit the acceptance of freight by boat on the Erie Canal between Albany and Buffalo.

Paul M. Ripley, who resigned as assistant to president of the El Paso & Southwestern in June, has been appointed traffic manager of the American Sugar Refining Company, with headquarters at New York.

To avoid disastrous depletion of herds of cattle and sheep in Western Canada, the government is arranging with railroads of the dominion to carry breeding animals westward at reduced rates, or, in some cases, free, the government bearing a part of the burden.

The Senate on October 5 passed a bill, which had previously passed the House, giving the United States Shipping Board power to suspend present provisions of law for the purpose of permitting vessels of foreign registry and foreign built vessels admitted to American registry to engage in the coastwise trade during the war and for a period of 120 days thereafter, except the coastwise trade with Alaska.

Columbia University, New York City, now maintains an "extension school" at 203 Broadway, in the heart of the business district, where courses are given in railway traffic and rates by Professor T. W. Van Metre and on ports and terminal facilities by R. S. MacElwae. These classes are held between 5 p. m. and 7 p. m. and the fee is \$18 each. There is also a course on theory and practice of ocean transportation, at the same price; also other courses on commercial topics.

The Canadian Pacific has presented at Washington a strong protest against the embargo which was placed by the United States Government on shipments of coal to Canada, declaring that at the present rate the railroad will be in danger of a short supply of coal for its locomotives; locomotives which are engaged in moving American military supplies both to Atlantic and Pacific ports. It is said that these supplies are being sent both to Halifax and to Vancouver, because of the congestion at ports in this country.

A further saving of 96,772 tons of coal per annum, 30 locomotives and 114 men has been effected by reductions in passenger train service on the railroads traversing the 15 central states designated by the Secretary of War as the "Central Department." The total saving of man power, fuel and locomotive power on these railroads in the 15 states from Ohio to Colorado, by passenger train service reductions, is 1,086,171 tons of coal per annum, 203,067 barrels of fuel oil, 350 locomotives and 1,774 men.

The United States Department of Agriculture has issued a circular to farmers, showing what they can do to help in the movement of freight. They are reminded that the transportation situation is still serious, and that cooler weather makes refrigeration less necessary, and makes it possible to run more commodities under ventilation and to load cars more heavily than during the summer. Patriotism demands of farmers and everybody the heaviest loading possible consistent with the safe carriage of the goods.

PASSING OF THE ALLAN LINE.—It is announced that if July 1 the Allan Steamship line loses its separate identity and is merged in the Canadian Pacific Ocean Services. Dating from the heroic days of early steam navigation the Allan line has been a vigorous pioneer in the development of the Trans-Atlantic trade, and especially in the development of Canadian trade with the mother country. —American Express Bulletin.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Interstate Commerce Commission has announced that hearings in the eastern commodity rate case will begin at Washington on November 1 before Examiner Disque.

The Commission has announced hearings at Chicago before Examiner Disque to be held on November 16 in the eastern livestock-fresh meat case, and on November 21 in the eastern grain case.

The Commission has suspended from October 11 to February 8 the operation of certain rates in Agent M. P. Washburn's tariff providing for the cancellation of joint through carload rates on grain and grain products from East St. Louis, Ill., via the Baltimore & Ohio and Louisville, Ky., to Tampa and other points in Florida.

The commission has suspended until February 7, Chicago & North Western, Chicago, Milwaukee & St. Paul, Great Northern, Minneapolis & St. Louis, Minneapolis, St. Paul & Sault Ste. Marie and E. B. Boyd's tariffs, naming increased carload rates on potatoes from Wisconsin, Minnesota, Upper Michigan, North Dakota, South Dakota and Iowa, to interstate destinations. The proposed rates are from 1 to 13 cents per 100 lb. higher than those now in effect.

The Commission has made public the tentative report of Examiner Disque in the livestock classification case, in which it is held that proposed ratings on livestock, less than carload, in Official Classification and Southern territories have not been justified. The roads, however, are authorized to establish new minimum weights and ratings. In view of the amended Cummins amendment carriers in Official Classification territory are required to cancel schedules which provide rates on ordinary livestock dependent upon value.

STATE COMMISSIONS

The Illinois Public Utilities Commission has this week authorized a general increase of 15 cents a ton in freight rates on coal and coke.

The Public Utilities Commission of Colorado, in a decision issued September 23, has authorized the Denver & Salt Lake to increase its local passenger fares from 4½ cents a mile to 5 cents; round trip fares to be at a rate ten per cent less than this. The road is in the hands of receivers and has had very poor traffic for several years; but the commission requires that mileage books at \$30 for one thousand miles, good for the holder and any member of his immediate family, shall be continued in use.

The construction of telegraph and other wire lines across railroad lines, or over or under the facilities of any public service company, is the subject of a pamphlet of 172 pages which has been issued by the Public Service Commission of Pennsylvania. Seven sets of specifications are given, for different classes of work; and in appendices filling about 100 pages—nearly two-thirds of the book—there are a number of chapters containing all sorts of detail information, including drawings, diagrams and tables. The pamphlet is called General Order No. 13, and it says that crossings conforming to the requirements may be constructed without any special permit from the commission, provided notice is seasonably given to the company whose facilities are to be crossed.

PERSONNEL OF COMMISSIONS

Lester Sisler, until recently chief clerk of the Interstate Commerce Commission, has been appointed secretary of the United States Shipping Board. He was recently appointed assistant secretary.

COURT NEWS

Delivery of Goods

The New Mexico Supreme Court holds, in an action for conversion by a consignee, that a railroad company is not estopped to deny delivery by reason of the fact that its agent mailed to the shipper a postal card, on a printed form supplied by the shipper, stating that the goods had been delivered, where subsequent communications between the shipper and the consignee showed there had been no delivery.—*Levers v. Atchison, T. & S. F.* (N. M.) 166 Pac. 1178. Decided July 30, 1917.

State Commission's Power to Refuse Permission to Issue Bonds

The Missouri Supreme Court holds that an order of the Missouri Public Service Commission refusing permission to the Union Pacific, a Utah corporation owning 3,500 miles of road and \$300,000,000 worth of property, only \$3,000,000 of which is in Missouri, and only 1,000 feet of track, to issue bonds for rolling stock and other betterments, would not be "reasonable and lawful," as required by Section III of the Missouri Public Service Act.—*P. S. C. v. U. P.* (Mo.) 197 S. W. 39. Decided June 30, 1917.

Recovery of Freight Charges Overpaid by One Road to Another

Action was brought by the Mobile & Ohio against the Washington & Choctaw to recover money paid by the plaintiff to the defendant on a claim by the latter that it was entitled to a division of the freight on certain lumber shipments. The two railroads had a joint tariff providing a through rate for shipments of lumber originating on the defendant's line, but providing no through rate permitting such shipments to be stopped at the junction point, and there dressed and then forwarded. On lumber so stopped the defendant collected from the original shipper the local rate to the junction point, but demanded and received from the plaintiff a portion of the freight from the junction point to destination, the rate in force on such shipments being the same from the junction point as from the point of origin on the defendant's line. The Federal district court for the Southern District of Alabama holds that the plaintiff was entitled to sue for the payments so made, though they were voluntary, and though in making and receiving them both railroads were guilty of unlawful acts, as the plaintiff was damaged by such payments, and the statute is not limited to the regulation of contracts between shipper and carrier.—*Mobile & Ohio v. Washington & Choctaw*, 242 Fed., 531. Decided May 19, 1917.

Carrier's Liability as Warehouseman

A railroad company, as the last connecting carrier, received a carload of copper ingots, shipped under a bill of lading providing that "property not removed by the party entitled to receive it within 48 hours . . . after notice of its arrival . . . may be kept in car . . . or warehouse subject to a reasonable charge for storage and to carrier's responsibility as warehouseman only." The company's tariff, duly filed and posted, provided that, "when delivery of cars consigned or ordered to private industrial spur tracks cannot be made on account of the act, neglect, or inability of the consignee to receive them, delivery will be considered to have been made when the cars are tendered." On arrival of the car the private track of the consignee was fully occupied, and the railroad left the car on its connecting side track, and notified the consignee that the car was at its disposition, subject to the payment of a demurrage charge. Six days later the consignee paid the demurrage charge and the car was moved to its track, when it was found that one of the seals was broken and that a part of the copper was gone, although, when inspected by the railroad's yard watchman, the evening before, the seals were secure. In an action for the value of the copper lost, the Circuit Court of Appeals, Eighth Circuit, holds that the railroad's liability was that of warehouseman only, and under the rule of the federal courts a warehouseman is liable only for negligence, the burden of proving which rests on the party alleging it, and is not shifted by proof merely of loss or destruction of the property in the charge of the warehouseman. Judgment for the railroad was affirmed.—*United Metals Selling Co. v. Pryor*, 243 Fed. 92. Decided July 9, 1917.

Equipment and Supplies

LOCOMOTIVES

THE RED RIVER & GULF is inquiring for 2 locomotives.

THE CHILEAN GOVERNMENT is inquiring for a number of Mikado locomotives.

THE BRITISH GOVERNMENT is reported as inquiring for 70 ten-wheel locomotives for the Egyptian State Railways.

THE UNION MINIERE DU HAUT KATANGA has ordered 4 six-wheel tank locomotives from the American Locomotive Company. These locomotives will have 10 by 16 in. cylinders and a total weight in working order of 48,000 lb.

CENTRAL OF GEORGIA.—Vice-president L. W. Baldwin on September 27 announced that this company is preparing an order for rolling stock to cost approximately \$2,500,000, viz.: 13 locomotives (10 Mallet type and 3 passenger), \$100,000 each, \$1,300,000; 14 passenger cars (12 day coaches, 2 parlor cars), \$20,000 each, \$280,000; 700 freight cars (200 stock and 500 ventilation), \$1,200 each, \$840,000.

FREIGHT CARS

THE WESTERN PACIFIC is inquiring for prices on 1,500 freight cars.

THE NEW JERSEY LINE COMPANY is reported as inquiring for 50 gondola cars.

THE BANGOR & AROOSTOOK has given the Laconia Car Company an order for 150 box cars.

THE PETROLEUM REFINING COMPANY, Houston, Tex., is inquiring for 50 8,000-gal. capacity tank cars.

THE RUSSIAN GOVERNMENT is receiving quotations on a new inquiry for 10,000 four wheel freight cars.

THE INDIANOMA REFINING COMPANY, St. Louis, Mo., is inquiring for 75 to 100 8,000-gal. capacity tank cars.

THE EGIN, JULIET & EASTERN reported in last week's issue as building a number of freight cars in its own shops, will build 500 gondola cars.

THE UNITED STATES GOVERNMENT is reported as having placed additional orders for 4,800 narrow-gage cars for the use of the forces overseas as follows: American Car & Foundry Company, 1,800; Pressed Steel Car Company, 1,000; Standard Steel Car Company, 1,000, and Ralston Steel Car Company, 1,000.

PASSENGER CARS

THE ILLINOIS CENTRAL has ordered 25 coaches, 15 baggage cars and 5 combination passenger and baggage cars from the Pullman Company.

SIGNALING

THE ATLANTA & WEST POINT has ordered from the A. G. A. Railway Light & Signal Company, Elizabeth, N. J., 91 flashlight equipments for its automatic block signals. These lights will be installed by the railroad. An order has also been given by the Missouri Pacific for four signal lighting equipments of a similar type, to be installed at Osage City, Mo. Orders for A. G. A. crossing signals have been received from the following roads: Atlanta & West Point, one flashlight signal of the double-arm type; Philadelphia & Reading, two of the single-arm type, which have been installed on the Atlantic City division at Richland, N. J.; Union Traction Company of Indiana, one for installation at Indianapolis. The A. G. A. company has also received an order for one coach lighting equipment from the Chesapeake Beach Railway.

Supply Trade News

The International Oxygen Company, 115 Broadway, New York, announces the resignation of P. J. Kroll as the company's representative for Pittsburgh and middle western territory.

The MacLeod Company, Cincinnati, manufacturers of sand blast equipment and metallurgical furnaces, in order to take care of its expanding business, will enlarge its plant and increase its capital to \$100,000.

Fayette H. Reed has been appointed special agent of the New Manufacturing Company, New York, covering the states of California, Nevada, Oregon, Washington, Arizona, New Mexico and Utah, with office at San Francisco, Cal.

William S. Bostwick and Chester A. Lyon, formerly with the Magnus Company, Inc., Chicago, announce the formation of the Bostwick-Lyon Bronze Company, of Waynesboro, Pa., and that they have taken over the entire plant of the Waynesboro Foundry & Machine Company, and have fully equipped it as a modern foundry for the manufacture of brass castings, journal bearings and babbit metal.

The A. G. A. Railway Light & Signal Company, Elizabeth, N. J., has received an order from the Atlanta & West Point for 91 flash light equipments for automatic block signals. The equipment will be installed by the railroad. An order has also been received from the Missouri & Pacific for four signal lighting equipments of a similar type, to be installed at Osage City, Mo. Orders for crossing signals have been received from the following roads: Atlanta & West Point, one grade crossing flash light signal of the double arm type; Philadelphia & Reading, 2 grade crossing signals of the single arm type, which have been installed on the Atlantic City division at Richland, N. J.; Union Traction Company of Indiana, one flashing highway danger signal for installation at Indianapolis. The company has also received from the Chesapeake Beach Railway an order for one coach lighting equipment.

Burwell S. Cutler Made Chief of Foreign Commerce Bureau

The appointment of Burwell S. Cutler, of Buffalo, as Chief of the Bureau of Foreign and Domestic Commerce, Department of Commerce, was confirmed by the Senate October 5. Mr. Cutler, who is well known in manufacturing circles in western New York, came into the Bureau six months ago at a nominal salary to assist in putting the organization on a thoroughly business basis. He was made first assistant chief, but since the resignation of Dr. E. E. Pratt, has been acting chief.

Mr. Cutler was born in Buffalo and finished his scholastic education at Lake Forest University and Harvard. For fifteen years he has been president of an important Buffalo manufacturing concern and has been identified in an official capacity with numerous business houses and civic organizations through the New York State.

Westinghouse Air Brake Company

The recently issued annual report of the Westinghouse Air Brake Company for the fiscal year ending July 31, 1917 shows a net profit for the year, after the usual charges and after setting up adequate reserves to cover estimated tax requirements and other contingent liabilities, of \$6,388,463 as compared with \$9,376,103 in 1916 and \$1,575,839 in 1915. While the volume of brake business this year exceeded that of the previous year by 20 per cent, the net income from this source suffered a slight reduction. On the other hand, income from investments this year exceed \$900,000, as compared with \$500,000 last year, and a substantial contribution to the final result came through the munition business now definitely concluded.

President H. H. Westinghouse in his statement to the stockholders says in part:

"The business of your company for the past year under review closely reflects the general condition of affairs, with which you are familiar. While the volume of business has been large, the difficulty of securing adequate labor and sufficient material

has been and remains acute; prices paid for supplies of all kinds have advanced so far beyond previous quotations that experience in forecasting the future has been of little avail; and taxation is unprecedented.

"Prior to April 1, 1917, it was a matter of some pride that during the preceding twenty-five or thirty years the Westinghouse Air Brake Company, by reason of large purchases of raw material when the markets were favorable, and through the continuous improvement of its manufacturing methods, had never been compelled to advance the price of its product to its contract holders. In the face of the conditions that confronted us early in 1917, however, it was found impossible to continue this policy, and all prices have, therefore, been revised so as to afford adequate protection.

"Before the close of the year 1916 the supplementary munition contracts for time fuses referred to in our last annual report were satisfactorily completed. The temporary loading plant at Runyon, N. J., has been sold, and, after consultation with government officials who advised that its facilities would not be required, the fuse loading plant at Providence, R. I., occupied jointly with the American Locomotive Company, has been partly dismantled. This action does not imply any unwillingness on the part of the Brake Company to put its manufacturing facilities and the experience acquired in the production of munitions of war at the service of our own government on any terms the government may nominate. During the interim between our undertaking the manufacture of 3 in. shrapnel complete and the present time, there has been an enormous increase in facilities for doing this class of work by companies normally engaged in the manufacture of munitions. At the same time, the demand for brake apparatus to equip cars and locomotives urgently needed for the transportation of troops and supplies, both here and abroad, has continued to increase in volume and pressure until all of our facilities and every possible effort on our part are required to meet it, and in this striving to prevent serious delay in the immediate increase of transportation facilities, we believe we are doing more for the successful conduct of the war than we can possibly do otherwise."

Associated companies.—"Of the foreign brake companies in which you are interested, largely through your ownership of a majority of the capital stock of the Westinghouse Brake Company, Ltd., of London, we can report that under the circumstances they are more than meeting expectations. . . . The manufacturing facilities of the French and Russian companies being largely absorbed in the production of munitions of war, our Wilmerding plant has been called upon to supply a large amount of brake apparatus for the cars and locomotives built here for use in France and Russia. While it has been a pleasure to serve our government and our allies in this way, the necessity of conforming to foreign standards has rendered the task more difficult and less profitable than it would have been to produce an equal volume of our standard products."

Locomotive Stoker Company.—"In 1913 your company was instrumental in the incorporation of the Locomotive Stoker Company, formed for the purpose of manufacturing a mechanical locomotive stoker which had been developed by the patentee under the direction of your management. During 1916 the operations of this company were transferred from Schenectady to the old air brake plant in Allegheny, and basing our views on the results so far achieved, we believe that the controlling interest held by your company in the Locomotive Stoker Company will prove to be a profitable investment and that the devices produced by this company will be of great benefit to the railroads of the country. To June 30, 1917, 1,555 stokers were sold and installed, leaving orders on hand sufficient to absorb present facilities during the remainder of the year."

Union Switch & Signal Company. "At the special meeting of stockholders held on March 15, 1917, which was called for the purpose of voting for or against the ratification of the agreement previously made by your board of directors for the exchange of shares of Westinghouse Air Brake Company stock for not less than 60 per cent of the issued and outstanding shares of Union Switch & Signal Company stock, and for other purposes, the agreement in question was ratified and confirmed by a practically unanimous vote. As a result of this action, the Westinghouse Air Brake Company now holds 9,410 shares of the preferred and 118,375 shares of the common capital stock of the Union Switch & Signal Company, representing about 95.9 per cent of its total capitalization. Under substantially the same management and

direction as that of your own company, the Union Switch & Signal Company has made rapid progress in the rehabilitation of its Swissvale plant, which was partially destroyed by fire on February 10, 1917. It is expected that the new shops, of reinforced concrete construction and exceptionally well designed, will be in full operation by the close of the calendar year. In the meantime, the temporary buildings erected in 1915 for the manufacture of munitions have been utilized to the fullest extent and the company has thus been enabled to meet the immediate requirements of its railroad patrons and in so doing maintain both its organization and its position in the trade. Conducted under many difficulties and without the aid of up-to-date facilities that are essential to economical production, these operations have shown little or no profit, but they have served a valuable purpose and the future outlook is promising."

Business Outlook.—"Current demand for brake equipment exceeds our immediate productive capacity, and, including business booked for export, the value and volume of unfilled orders on hand surpasses the normal figure at this season of the year. Until the question of taxation is finally determined, it is impossible to make any prediction as to the probable financial results of the fiscal period on which we have entered."

The general balance sheet follows:

ASSETS	
Cash	\$3,112,404
Accounts and bills receivable	5,190,658
Inventory	9,075,161
Deferred charges to operation	81,626
Investments in associated companies, etc.	15,622,586
Factories, less reserves for depreciation	6,535,921
Real estate, other than for factories	1,972,353
Patents and goodwill	2,485,850
	\$44,076,559
LIABILITIES	
Accounts payable	\$1,613,885
Accrued liabilities	247,275
Federal taxes estimated	643,134
Contingent liability on acct. of sales, subject to future settlements	335,951
Capital stock	28,868,200
Accumulated funds—	
(1) Sundry reserves	3,719,640
(2) Contingent surplus, excess par value capital stock of Am. B. Co.; over value on books of W. A. B. Co.	1,000,000
(3) Surplus, applicable to dividends	7,648,474
	\$44,076,559

TRADE PUBLICATIONS

A FEW DEVICES—IN FOUR LANGUAGES.—The Q & C Company, New York, has recently issued a catalogue for foreign distribution describing the company's line of railway appliances in four languages, English, Spanish, Russian and French.

LOCOMOTIVES.—The Baldwin Locomotive Works, Philadelphia, Pa., has recently issued Record No. 87 on the subject of military supplies. In this pamphlet is included a description of what the Baldwin Locomotive Works has done for the war, mentioning the Consolidation type locomotive built for the United States government, giving a record of the time in which this locomotive was built.

JOURNAL BOX PACKINGS.—The Franklin Manufacturing Company, Franklin, Pa., has recently issued a 26-page pamphlet on the subject of journal box packings. It contains interesting information on the general subject, explaining the properties of good journal box packings and the results that should be obtained from it. The method of manufacturing the packings sold by this company is described, being supplemented by interesting photographs. The materials used in the manufacture of packing are also mentioned and described. A suggested specification for journal box packings is included. The catalogue contains information of particular interest; it brings out the point that journal box packing is not "waste" and that there is not available sufficient high grade wool waste to supply all the railroads. The number of the catalogue is FC 6-17.

FOREST NURSERY AT URUGUAYAN STATION.—At Toledo, a small station on the Central Uruguayan Railway, the Argentine Government maintains a nursery and either gives away or sells at actual cost very young trees for transplanting. In connection with this forest nursery a poultry culture farm is maintained, which is a center of interest to the surrounding country, and all the well-known American breeds of fowl are prominently displayed in fairly large numbers.

Railway Construction

CUYUNA SOUTHERN.—This company will build a steam line from Deerwood, Minn., to St. Paul. C. Adams, Deerwood, Minn., president.

KINDER & NORTHWESTERN.—The proposed construction of 35 miles of line to connect this road with other local lines, mainly in lumber service, will proceed as soon as approval of the consolidation of the companies involved is received from the Interstate Commerce Commission. Alfred Mead, vice-president, Kinder, La.

MINNEAPOLIS & ST. LOUIS.—This company will award a contract some time this month for the erection of a bridge over the Minnesota river near Carver, Minn. The steel, consisting of six deck-girder spans, weighing 220 tons, was fabricated last year, and the foundation work, consisting of reinforced concrete on piling, is being done by the Widell Company, Mankato, Minn., and is about three per cent completed.

SOUTHERN PACIFIC.—This company has instituted a program of extending every station passing track between Blue Canon, Cal., and Truckee to enable the company to handle trains of 55 to 57 cars instead of 45 as at present. During the last few years over \$12,000,000 has been spent on the construction of second track from Rocklin, Cal., to Blue Canon, and Sparks, Nev., to Truckee, Cal.

Railway Financial News

BOSTON & MAINE.—Federal Judge Morton, of Boston, has directed James H. Hustis, temporary receiver, to pay the interest on \$2,000,000 of notes of the Connecticut River Railroad, a leased line, due August 31 last.

CONNECTICUT RIVER.—See Boston & Maine.

DENVER & RIO GRANDE.—E. L. Brown has been elected director and president to succeed H. U. Mudge, resigned. Kingdon Gould, who is now in military service, has resigned as a director and has been succeeded temporarily by S. N. Rice.

The sum of \$3,064,635.03 has been paid by J. P. Morgan & Co. for Liberty Loan bonds of the first issue of a par value of \$3,032,400 at a public auction sale conducted by Thomas D. McCarthy, United States Marshal, on the steps of the New York County Court House. The purchase price was \$100 more than the face value of the securities plus accrued interest. The bonds were seized by the marshal under a judgment recently obtained against the Denver & Rio Grande by the Equitable Trust Company, as trustee, for upward of \$38,000,000. The amount was for alleged liability of the Rio Grande on a guarantee of a mortgage bond issue of the old Western Railways Company which was foreclosed with a resultant deficiency.

MINNEAPOLIS & ST. LOUIS.—At the annual meeting of the stock holders, F. S. Letts, F. A. Chamberlain and F. E. Kenaston were chosen new directors. The retiring directors have been re-elected.

PERE MARQUETTE.—This company has declared the regular quarterly dividend of 1 1/4 per cent upon the prior preference stock, payable November 1 to stock of record October 15. This is the second dividend upon this issue and the first at the regular quarterly rate, the former dividend having been for an irregular period following the reorganization of the company.

SOUTHERN RAILWAY.—Augustus D. Julliard and Jackson E. Reynolds, both of New York, have been elected to fill vacancies on the board of directors. The retiring directors have been re-elected.

Railway Officers

Executive, Financial, Legal and Accounting

John Dickie, chief clerk in the treasurer's office of the Chicago, Milwaukee & St. Paul at Chicago, has been appointed assistant treasurer.

B. L. Bugg, general manager of the Atlanta, Birmingham & Atlantic, with headquarters at Atlanta, Ga., has been elected also a vice-president.

M. C. Kennedy, president of the Cumberland Valley, with headquarters at Chambersburg, Pa., has been granted an indefinite leave of absence.

George H. Campbell has been elected president of the Kentucky & Indiana Terminal Railroad, with office at Baltimore, Md., vice H. W. Miller.

E. L. Brown, former president of the Minneapolis & St. Louis has been elected president of the Denver & Rio Grande to succeed H. U. Mudge, resigned. A photograph and a biographical sketch of Mr. Mudge were published in the *Railway Age Gazette* of November 12, 1915, page 900.

G. L. Winlock, auditor of overcharge claims of the New York, New Haven & Hartford at Boston, Mass., has been appointed freight claim agent, with office at Boston, in charge of loss, damage and overcharge claims, succeeding G. Marks, assigned to other duties, and the office of auditor of overcharge claims has been abolished.

Operating

G. F. Gaunon has been appointed superintendent of the Savannah & Atlanta, with office at Savannah, Ga., vice J. S. Douglas, resigned.

H. E. McGee has been appointed superintendent of the Parsons district of the Missouri, Kansas & Texas, with office at Parsons, Kan., vice J. L. Walsh, transferred.

M. W. Sullivan, superintendent of the Delaware & Hudson at Plattsburg, N. Y., has been appointed superintendent also of the Naperville Junction Railway, with headquarters at Plattsburg, N. Y.

F. W. Lyons has been appointed trainmaster on the Minnesota division of the Northern Pacific, with headquarters at East Grand Forks, Minn., vice F. M. Smith, granted leave of absence to enter military service.

W. J. Sullivan, chief dispatcher of the St. Louis-San Francisco at Birmingham, Ala., has been appointed assistant superintendent of the Willow Springs subdivision, with headquarters at Thayer, Mo., succeeding H. E. Gabriel, who has been relieved to accept service in the United States Army. E. E. Owens succeeds Mr. Sullivan at Birmingham.

A. W. Jones, superintendent of telegraph of the Philadelphia & Reading at Reading, Pa., has been appointed assistant superintendent of the New York division, with office at Reading Terminal, Philadelphia, and L. D. Shearer has been appointed superintendent of the Philadelphia, Reading & Pottsville Telegraph Company, with office at Reading, vice Mr. Jones.

H. C. Oviatt, whose resignation as general superintendent of the Lines West of the New York, New Haven & Hartford was announced in these columns last week, has entered the service of the American International Corporation, division of ship building, and is now in charge of transportation at the corporation's ship building works near Philadelphia, Pa.

J. A. McCrear, general manager of the Long Island, at New York, having been granted an indefinite leave of absence, the position of general manager will be filled by John R. Savage, chief engineer; and J. A. Morris, valuation engineer, will act as chief engineer. W. E. Canning, freight trainmaster at Jamaica, and Ralph Peters, Jr., assistant trainmaster at Jamaica, have been appointed assistant superintendents assigned to special duties.

Traffic

Frank M. Jordan has been appointed commercial freight agent of the Baltimore & Ohio, with headquarters at Wheeling, W. Va., vice W. H. Eaton, promoted.

Walter A. Carlsen has been appointed general agent of the Missouri, Oklahoma & Gulf, with headquarters at Chicago, to succeed C. E. Christopher, resigned to engage in other business.

R. B. Kinkaid, chief of tariff bureau of the Cincinnati, Indianapolis & Western at Indianapolis, Ind., has been appointed assistant general freight agent in charge of tariffs, and the office of chief of tariff bureau is abolished; F. C. Boorman has been appointed commercial agent, with office at Milwaukee, Wis.

C. W. Galligan, whose appointment as freight traffic manager of the Chicago & Alton was announced in the *Railway Age Gazette* of October 5, was born at Cairo, Ill., in October, 1868. He first entered the railroad service at Cairo in 1885, at the local freight office of the Cairo, Vincennes & Chicago, now the Cairo division of the Cleveland, Cincinnati, Chicago & St. Louis. In 1888, he was transferred to the general freight office of the same road as rate clerk, and in 1889 was promoted to chief clerk in the same office. When the Cairo and St. Louis divisions of the Big Four were consolidated in 1890, he was transferred to St. Louis, Mo., as chief clerk to the assistant general freight agent in charge of the newly formed division. In 1892, he was appointed contracting freight agent, with office at St. Louis, and on August 1, 1895, was appointed general freight agent of the St. Louis, Chicago & St. Paul. In January, 1900, when the latter road was absorbed by the Chicago, Peoria & St. Louis, he was appointed assistant general freight agent, with office at St. Louis. On October 1, 1906, he was promoted to general freight agent, with headquarters in the same city, and on September 15, 1912, went to Chicago, Ill., to become general freight agent of the Chicago & Alton. On May 1, 1916, he was promoted to assistant freight traffic manager, with headquarters in the same city, and on October 1, 1917, was promoted to freight traffic manager, the former position being abolished.

F. Montmorency, assistant general freight agent of the Chicago, Burlington & Quincy lines west of the Missouri river, at Omaha, Neb., has been promoted to general freight agent, with the same headquarters, succeeding H. H. Holcomb, who has been promoted as assistant freight traffic manager, with headquarters at Chicago.

George C. Conn, freight traffic manager of the Pere Marquette at Detroit, Mich., has resigned, effective November 1, to become associated with the Buick Motor Company, Flint, Mich. Except for five years, when he was general freight agent of the Minneapolis, St. Paul & Sault Ste. Marie, Mr. Conn has been with the Pere Marquette for 20 years.

J. C. Hext, freight soliciting agent of the Southern Railway at Charleston, S. C., has been promoted to commercial agent at Charleston, succeeding E. M. Ramsey, resigned to enter military service, and A. B. Hammond, traveling freight agent at Charlotte, N. C., has been promoted to commercial agent at Athens, Ga., succeeding H. E. Williams, resigned to enter military service.

F. E. Hollingshead, general agent of the Chicago, Burlington & Quincy at Hannibal, Mo., has been promoted to assistant general freight agent, with headquarters at St. Joseph, Mo., succeeding A. L. West, deceased. T. L. Lawrence, general agent at Atchison, Kan., has been transferred to Hannibal, to succeed Mr. Hollingshead. E. L. Speer, commercial agent at St. Joseph, succeeds Mr. Lawrence as general agent at Atchison.

C. W. Galligan

Engineering and Rolling Stock

H. R. Voelker, foreman in the shops of the Pennsylvania Lines West at Bradford, Ohio, has been promoted to general foreman in the shops at Louisville, Ky.

Henry C. Eich, whose appointment as superintendent of motive power of the Chicago Great Western, with headquarters at Oelwein, Ia., was announced in the *Railway Age Gazette* of September 28, was born in Chicago. On January 2, 1883, he entered railway service as an office boy in the general offices of the Illinois Central at Chicago, and subsequently became machinist apprentice in the Weldon shops, Chicago. He was then successively machinist in the Weldon shops, locomotive fireman, gang foreman at the Burnside shops, general and roundhouse foreman at Freeport, Ill., division general foreman at Louisville, Ky., and master mechanic at East St. Louis, Ill., Memphis, Tenn., and at the Burnside shops at Chicago. He held the latter position until his appointment as superintendent of motive power of the Chicago Great Western on October 1.

H. C. Eich

Special

J. B. Morecock is now secretary of the fire prevention committee of the Seaboard Air Line, with headquarters at Norfolk, Va.

Railway Officers in Military Service

H. E. Gabriel, assistant superintendent of the Willow Springs subdivision of the St. Louis-San Francisco at Thayer, Mo., has resigned to enter military service.

E. M. Smith, trainmaster of the Minnesota division of the Northern Pacific, at East Grand Forks, Minn., has been granted leave of absence to enter military service.

E. M. Ramsey, commercial agent at Charleston, S. C., and H. E. Williams, commercial agent at Athens, Ga., of the Southern Railway, have resigned to enter military service.

B. M. Lockard, assistant engineer in the engineering department of the Chicago & North Western, has received a commission as captain in the Engineer Officers' Reserve Corps.

The President's nomination of W. W. Atterbury, director general of transportation for the U. S. expeditionary forces in France, for appointment to the rank of brigadier general, was confirmed by the Senate on October 4.

C. D. Symes, signal inspector of the Duluth, Winnipeg & Pacific at Virginia, Minn., has received a commission as first lieutenant in the engineer corps of the United States Army and is now stationed at Fort Leavenworth, Kan.

OBITUARY

Robert H. Large, coal traffic manager of the Pennsylvania Railroad at Philadelphia, Pa., died on October 8, at the University Hospital, Philadelphia. He was born on October 31, 1875, at Philadelphia, and entered the service of the Pennsylvania Railroad in 1895 as a rodman in the maintenance of way department. He subsequently served in various clerical positions in the freight department, then as freight solicitor and later as special agent. In June, 1903, he was appointed division freight agent of the Pennsylvania Railroad at Altoona, and in February, 1905, became coal freight agent. He was appointed general coal freight agent in May, 1910, and since May, 1916, was coal traffic manager.

* Illustrated.

Many railroads have long since seen the necessity for cutting down on their time tables, but it is apparent that the economy along this line has not by any means been carried as far as it might be. Railroad time tables and folders are of all sorts and kinds; but they all cost money and much more than they used to cost. There was a time, not so many years ago, that time tables were issued in such quantities that a large proportion of them had to be destroyed at each change of time. That condition has now been remedied on nearly every road, but there is still much waste. Ticket agents, when asked for a time table between two particular points, pass out a complete booklet of almost all the trains on the system, when a very small folder giving only the trains in which the passenger is interested, would suffice. This is, of course, a tremendous waste. The big booklet may cost two cents, five cents, or more, whereas the little folder could be had at the rate of 10 or even 20 for a cent. It is evident, then, that agents should be cautioned not to give away a big booklet when a small folder will do. The president of one large road in the east recently ordered his passenger department to reduce the number of winter time tables by one-half. Another road carrying a very heavy passenger business has carried the step even further. On this road there is now one 96-page folder giving all the passenger trains on the entire system. The various tables are so correlated and arranged that each page or pair of pages is complete in itself. In other words, so made up that the first two tables give all the through trains between X and Y with all information as to car equipment, the second two give all the suburban trains on the Y division in and out of X etc. Thus, pages one and two can be electrolytically typed, and made up as a complete time table of all the through trains between X and Y or pages three and four as a complete time table of the local trains out of X, etc., and put in a small, cheap leaflet that serves the purpose just as well as the big booklet, is much more convenient and costs only one-tenth or one-twentieth as much. The agents are cautioned to give out the small folders whenever possible and when they order, say, 100 of each the large and small, they are given possibly 175 of the small and only 25 of the large. But, one very important thing is emphasized. The notice to the agents

says: "When it is necessary to give a passenger information it should be given out unhesitatingly. If, however, you know the request is merely one based on curiosity, and the passenger is one whom you know can be fully satisfied with one of the smaller leaflets, try to make the small leaflet do the work." There are many other roads on which this idea could be carried out. It will certainly save a lot of money and paper; and both are hard to get these days. As for the passenger, he usually does not specially desire to be handed an expensive time table just to glance at the time of a single train.

It is the patriotic duty of every person to subscribe for the Second Liberty Loan and to encourage others to do so.

The Liberty Loan Among Railway Employees

A number of the railroads have already made large subscriptions to this cause, and many have brought the loan to the attention of their employees in one way or another. Several roads have also offered to finance the purchasing of these bonds for their employees, allowing them to pay for them in instalments. The engineer in charge of track elevation on the Chicago, Rock Island & Pacific, at Chicago, has gone a step further in bringing this loan to the attention of his employees. About 500 men are now employed on this work, including hoboes, Italians, Greeks, Austrians and other nationalities. A few days ago he arranged for four Liberty Loan solicitors and a speaker to accompany him on a trip over this work; each gang was visited on the job, and the general plan was outlined to the men directly and through interpreters where necessary. Following this the men were gathered together in a large meeting at the noon hour and the matter was presented to them again. They were told in simple language what the purpose of the loan was, its security and its other advantages. They were also advised that the company would make arrangements with a bank to carry these bonds on an instalment plan until they were able to complete payments for them. The result was not only an exceedingly enthusiastic meeting, but over 100 men subscribed at that time or over 25 per cent of those present. In one foreign gang over 30 per cent of the men subscribed. Other subscriptions are still being received, so that it is expected that one out of every three men among these laborers will have taken a bond.

Some of the men paid as much as \$50 in cash. An interesting development was the fact that a considerable number of subscriptions were received from Austrians. If results such as these can be secured among employees commonly regarded as least susceptible to appeals of this character, the possibilities of extending such a campaign among all classes of employees can scarcely be estimated. The incident offers a suggestion as to means of bringing the loan to the attention of other employees. A similar procedure was successfully used on many roads for the first Liberty Loan.

It is hard to break confirmed habits. Getting out of a well worn rut is no simple task, and yet the conditions under

Stop Unproductive Work

which the railroads are laboring are so abnormal and the stress is so great that it would seem that there could be no question as to the realities of the war conditions and the fact that all unessential and unproductive work should be pushed to one side and forgotten until after the struggle is over. There is a severe shortage of labor and the railroads have lost many men from supervisory and official positions. The shortage is so great that it is absolutely necessary to decide upon those parts of the work that can be cut down or overlooked for the time being without affecting the more essential work. It seems out of place, for instance, to find a large committee of capable car interchange inspectors touring the country to discover abuses of the M. C. B. rules and spending months in investigating minute details. Such a committee is bound to find many mistakes at this time but it is doubtful if its efforts can remedy the situation to any great extent. The roads are struggling along with the car maintenance problem as best they can with a large amount of green help and many foremen and inspectors who have recently been promoted from the ranks and have had very little coaching or training in their new positions. This is particularly true in industrial centers where the extremely high wages paid have drawn many men away from the railroads. The seriousness of the labor situation is indicated by the fact that men who have served for many years on roads with pension systems and relief funds are leaving the service and surrendering all their rights. It would seem that the members of a committee such as that mentioned above could put in their time to far better advantage by giving intensive service on their own roads in helping to supervise and direct the efforts of those foremen who are not thoroughly acquainted with their new work and also to the education of the green men. Never was there greater need of intensive educational work among railway employees, and this situation is further complicated by the fact that women are daily being employed in larger and larger numbers in all departments.

ENORMOUS INCREASE IN FREIGHT TRAFFIC

IN the month of July the railways of the United States handled 48 per cent more freight traffic than in July, 1915, and 49 per cent more than in July, 1914. The Railroads' War Board has just issued statistics showing that the ton mileage of freight handled in July, 1917, was 20.2 per cent more than it was in the same month of 1916. This increase in the traffic handled reflects a remarkable performance in view of the fact that the traffic of 1916 far surpassed all records up to that time. Because 1916 was a record year it is necessary to compare the results being obtained now with those of years prior to 1916 in order to realize fully the magnitude of the achievements of the railways in handling the present volume of business as well as they are. The increase in freight traffic in July, 1917, over July, 1915, exceeded the annual freight business of the railways of Japan, Spain, Sweden, New South Wales, Switzerland and Brazil combined.

It should be borne in mind that there has been almost no

increase in railway facilities within the last two years. There was an actual decrease in the number of locomotives and freight cars in service on June 30, 1916, as compared with the number in service on June 30, 1915. The number of locomotives and freight cars has increased within the last year, but the number now in service certainly is not more than 1½ per cent more than it was two years ago. In other words, the roads are handling 50 per cent more traffic than they were two years ago with perhaps 1½ per cent more locomotives and cars. Of course, business was comparatively dull at this time two years ago. There were 265,000 surplus freight cars on August 1, 1915; on the other hand, there is a car shortage now; but there would be a vastly larger number of unfilled requisitions for freight cars if there had not been within the last two years an enormous increase in the efficiency with which railway equipment is operated.

We note that the coal mine operators of the country have a friend in official life at Washington. The United States Geological Survey has issued a statement to the press dated October 11, which bears the caption, "Coal Mines Doing Their Bit," "Daily Output of Coal Breaks All Records to Meet This Year's Demands," "1917 Tonnage Promises to Exceed 1915 Records by 25 Per Cent." If the coal mines are "doing their bit" by increasing their output 25 per cent as compared with 1915, what may be said for the railways which are handling 50 per cent more traffic than in 1915? The record being made by the mines is fine, and deserves all the commendation which can be bestowed upon it. We could wish, however, that there was some government department which would show as much pride regarding what the railways are doing as the Geological Survey very properly shows regarding what the mines are doing, for the achievement of the railways is relatively greater than that of the mines.

OFFICIAL MISREPRESENTATION OF THE RAILWAYS

MAN THELEN, who is president of the California Railroad Commission and also president of the National Association of Railway Commissioners, is an able, intelligent and public-spirited man. He is one of the most capable men included in the membership of the state railway commissions. In his recent address as president of the National Association of Railway Commissioners he patriotically urged upon the state commissions the duty of co-operating in every way they can with the railways and other public utilities in order to enable these concerns to operate with the utmost efficiency and thereby contribute their share toward the winning of the war. Since the *Railway Age Gazette* has so high an opinion of Mr. Thelen, and since his address was admirable in many respects, it is with regret that we feel obliged to call attention to a number of indefensible misrepresentations of the railways to which he gave the support of his name and position.

In one place he refers to the action of the railways in deciding, as he says, "to operate as a single consolidated American system and in doing so to eliminate a portion of the waste and inefficiency which were pointed out by the Interstate Commerce Commission in the five per cent rate case and which for years have been recognized and commented upon by state railroad commissioners and other students of railway problems." We should like to have Mr. Thelen tell us where in its opinion in the five per cent advance rate case the Interstate Commerce Commission pointed out the "waste and inefficiency" to which he alludes, and then show us what relationship there is between what the Commission said and what the railways are now doing and attempting to do. The Commission cited many ways in which the railways could increase their revenues by making special charges for special services, but we have sought in vain for a single word in its opinion which pointed out such "waste and inefficiency" as

Mr. Thelen refers to. We boldly assert that there is no such word in it.

In another place Mr. Thelen says, "While the carriers were at first largely in favor of the valuation, they seem now to be generally opposed to the ascertainment of the facts by the Federal Government." The *Railway Age Gazette* has observed the development of the valuation propaganda from its inception, and it does not know of a single railway corporation or railway officer who ever favored "the valuation," by which Mr. Thelen must mean the one provided for by Congress and now being made by the Interstate Commerce Commission. On the contrary, the railways always have opposed valuation on the ground that it does not afford a sound basis for the regulation of rates. They acquiesced in the legislation fathered by that great friend of the Prussians, Senator LaFollette, because they believed that valuation would show that the railways as a whole were not over-capitalized and that therefore, while it would cost a lot of money, it would not do any other harm; but they never "favored" this legislation. Why, then, does Mr. Thelen allege that the railways formerly favored the valuation but are now opposed to its continuance? We challenge his statement as being without foundation and offer our columns to him in which to substantiate it.

In another place Mr. Thelen criticizes the railways upon the ground that duplications of their facilities, their service, and in consequence, of their operating expenses, has resulted in waste. We ask him if it is not a fact that the entire policy of our legislation in the United States has been to cause unrestricted competition between railways and the duplication of facilities of service and of operating expenses which is necessarily incidental to such competition. If, as we contend, these duplications have been not only encouraged, but actually compelled, by law, then does Mr. Thelen think he is justified in referring to them in such a way as to imply that the management of the railways are entirely responsible for them? The *Railway Age Gazette* was engaged in pointing out the duplications of service to which Mr. Thelen refers long before he ever discovered that they existed. Since, however, as Mr. Thelen must have known if the railway managers had got together and agreed to eliminate them they would have been put in jail for violating the Sherman law, we contended that the government as well as the railway managements was responsible for them. Doesn't Mr. Thelen also think that the government had and has some responsibility for them? If so, why doesn't he say so? Doesn't he know that the railways would not have been permitted before the war to have adopted the measures they recently have adopted for the elimination of competition and of the waste to which it leads? If so, why doesn't he say so?

And, speaking of duplications of service and expense, doesn't it occur to Mr. Thelen that there may also be some waste in the duplication resulting from regulation being carried on by Congress, by the Interstate Commerce Commission and by the legislatures and commissions of 48 states? We should like to see the duplications of service and expense in railway operation eliminated. We should also like to see the duplications of service and expense in railway regulation eliminated. Since we agree with Mr. Thelen on the former point, will he agree with us on the latter point?

Mr. Thelen says that "what the railroads are now doing is being patriotically done and deserves and is receiving the unstinted praise and commendation of all American citizens." Then he adds, "The other conditions to which I have referred must be remedied if our transportation system * * * is to measure up to the standard of national efficiency which the people of the United States will imperatively demand after the war." Perhaps Mr. Thelen can think of some other industry in the United States which is managed with greater relative efficiency than the railroads, and will tell us why he thinks it is better managed. Perhaps, also, he has in mind

some other railway system in the world which he thinks is better managed than ours, and will tell us why he thinks it is better managed. We long to be enlightened.

The railway system of the United States has, of course, at times been diseased in some of its members. Taken as a whole, however, it is the most efficient and vigorous business enterprise in the country. Unfortunately, most of our regulating authorities are not interested in the physiology of the railway business, but concern themselves solely with its pathology.

SOUTHERN RAILWAY

THE increased cost of fuel and the increase of trainmen's wages due to the enforcement of the so-called eight-hour law, in the last half of the fiscal year ended June 30, 1917, kept the Southern Railway's showing in the fiscal year from being as good as it otherwise would have been; but despite these increased expenses the year was a very prosperous one for the company. President Harrison, in his annual report, naturally and properly lays great stress on the rapidity and extent of the commercial, industrial and agricultural growth of the southeastern states. At last that ideal for which Mr. Harrison and his predecessor—the late Mr. Finley—worked so hard is being attained. The South is raising sufficient foodstuffs and livestock for its own needs. Add to this the fact that in the current year government estimates place cotton production at 6,357,000 bales, or 19.35 per cent higher than a year ago, and one realizes the foundation on which President Harrison's enthusiasm rests.

The Southern Railway earned \$81,388,000 in the year ended June 30, 1917, an increase of 14.46 per cent over the previous year. This is on an average of \$11,655 per mile, comparing with \$9,967 earned per mile in 1916. It was only 16 years ago that the Southern Railway was earning a little over \$5,000 per mile gross. Of the total operating revenues of \$81,388,000 in 1917, \$54,864,000 was from freight service and \$23,708,000 from passenger train service, the remainder being other transportation revenue, and incidental revenue. The increase in freight revenue, which amounted to \$6,672,000, was due to a greater movement of nearly all classes of commodities. The greatest increase was in the tonnage carried of manufactures and miscellaneous. The revenue from this tonnage amounted to \$16,202,000, or an increase over 1916 of 24.91 per cent. Products of agriculture yielded \$9,662,000 freight revenue, an increase over the previous year of 8.37 per cent, and products of mines yielded \$9,545,000 freight revenue, an increase of 12.91 per cent.

To offset the increased wage scales and fuel costs the principal gain in freight service in operating economies was through better carloading. The average load per loaded car in 1916 was 19.85 tons, and in 1917, 21.05 tons, an increase of 6.05 per cent. There was a small gain in trainloading, the average trainload of revenue freight being 373 tons in 1917, as against 365 tons in 1916, an increase of 2.36 per cent.

Unlike many other roads, the Southern Railway was not helped materially in making a better trainload showing by having a better balanced traffic. The loaded freight car mileage increased 6.34 per cent, and the empty freight car mileage 6.24 per cent. The total number of cars per train was 30.02 in 1917 and 31.54 in 1916. In other words, the heavier trainload was accounted for by better carloading. The total cost of transportation (the out of pocket cost of moving freight and passenger business) was \$3,815,000 in 1917, an increase over 1916 of 16.64 per cent. In the last half of the fiscal year (January to June, 1917) transportation expenses amounted to \$14,415,000 as compared with \$12,334,000 in the previous year. It was estimated that the effect of the eight-hour law and the advanced cost of coal

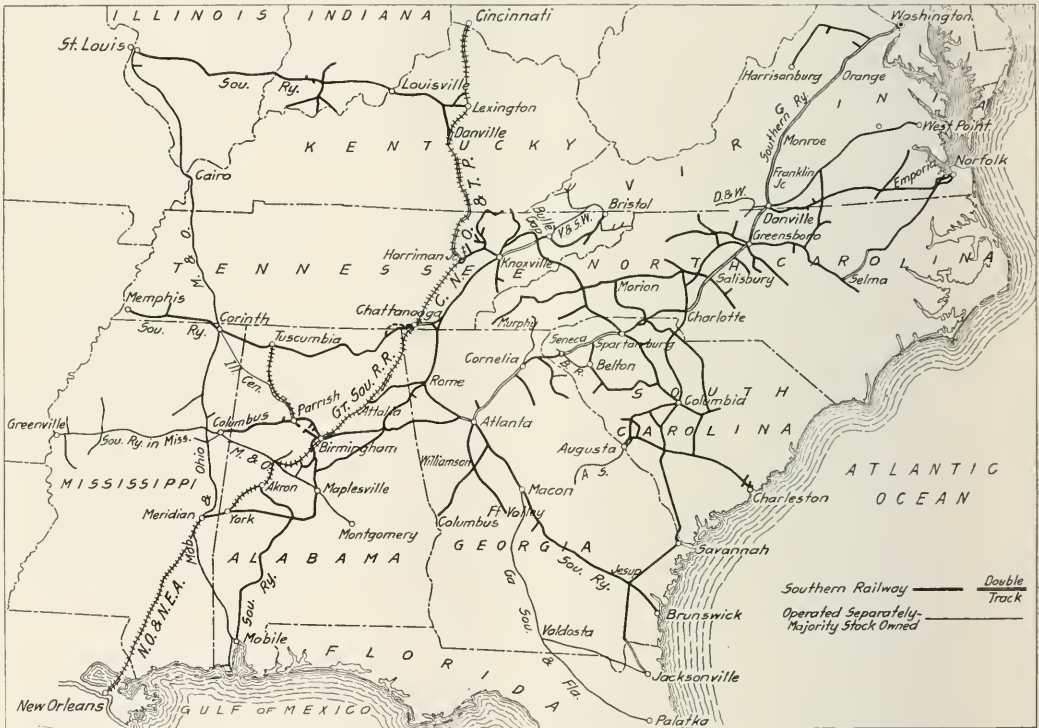

alone increased transportation expenses in these six months by \$1,394,000.

In passenger service the management was able to effect very considerable economies and, moreover, there were more than 17,000,000 passengers carried without the loss of a passenger's life in a train accident. The total number of passengers carried one mile was 888,805,000, an increase of 14 per cent. The average passenger journey was 50 miles in 1917, as against 46 miles in 1916, and the receipts per passenger per mile were 2.145 cents in 1917 and 2.124 cents in 1916. With the increase of over 14 per cent in passenger mileage there was an increase of only 2.96 per cent in passenger-train mileage, and the average number of passengers per train was increased from 47.56 in 1916, to 52.90 in 1917.

The Southern Railway has applied the formula prescribed

betterments expenditures were \$1,053,000 for grading, \$1,-839,000 for bridges, \$731,000 for rails and \$617,000 for other track material. Additions to equipment cost \$5,898,-000 in 1917. Despite the shortage of labor the Southern Railway is keeping its freight cars in very good shape and the percentage of bad order cars to all freight cars on July 1, 1917, was only 2.32 per cent. This is a quite remarkably low percentage of bad order cars. The Southern has placed contracts for new equipment, including 25 Santa Fe, 12 Mallet and 8 Mountain type locomotives, and for 1,400 box cars and 1,313 gondola cars.

President Harrison makes two particularly interesting comments on the results of the year's operation. In speaking of additions and betterments he says: "The success of the company in handling, during the past year, a record traffic easily and without congestion, so building up its in-

The Southern Railway

by the Interstate Commerce Commission for the division of expenses and taxes between freight and passenger service. In passenger service the direct and assigned revenues per passenger-mile averaged 2.764 cents, and the costs assigned to passenger service, to 2.216 cents, leaving an operating income applicable to interest charges, etc., of 5.48 mills per passenger-mile.

In freight service revenues are estimated at 9.44 mills per ton per mile and expenses at 6.20 mills per ton per mile, leaving operating income of 3.24 mills per ton per mile.

Considerably larger amounts were spent for maintenance in 1917 than in 1916. Maintenance of way and structures cost \$10,138,000, an increase over 1916 of \$1,963,000. Maintenance of equipment cost \$12,372,000, an increase over 1916 of \$1,188,000. Besides the amount spent for maintenance, there was \$8,571,000 spent for additions and betterments to roadway. The larger items in the additions and

come balance, may fairly be attributed to the liberal policy of enlarging the plant which has been followed during the past year." And in speaking of the service of employees he says: "Despite disturbed labor conditions throughout the year and acute discussions of wages, the company has again had loyal and efficient service from its army of officers and employees. The management cordially acknowledges that whatever success has been secured is due to that co-operation and to the vigor with which work is done under the stimulus of the now established and recognized pride of the rank and file in their relation to the property." This is not the ordinary somewhat perfunctory acknowledgment of the thanks of the directors to employees and officers but has a ring of heartiness about it that carries conviction. Mr. Harrison, himself chairman of the Railroads' War Board, at Washington, has presumably had to devote a very considerable portion of his time to the work of this board in

its supervision over the operation of all the railroads of the country. It is a tremendous responsibility, and the fact that Mr. Harrison had built up an organization on the Southern Railway which could carry on the management of the Southern Railway in a year of unprecedented pressure of traffic, labor shortage, high prices of materials and increased labor costs as economically as was done in the fiscal year ended June 30, 1917, is a high tribute to his executive ability.

Since the close of the fiscal year the Southern Railway has resumed dividend payments on its preferred stock through the declaration of a semi-annual dividend of $2\frac{1}{2}$ per cent, payable November 20. There are two ways, of course, of looking at this question of the resumption of dividends. With a surplus, after paying interest charges, of \$12,360,000, the declaration of a semi-annual dividend on the preferred stock, calling for \$1,500,000 only, is conservative, and to the holder of Southern Railway preferred stock who is dependent on his or her income from investments for a living the resumption of dividends seems only fair. On the other hand, railroad credit is in such a state as to make long time financing by a road like the Southern Railway extremely difficult, if not impossible.

A comprehensive scheme of financing had been worked out by which a new refunding and improvement mortgage was to be the security for bonds which were to take the place of the development and general mortgage 4's which had hitherto been used for financing the needs of the property, but conditions were such that these bonds could not be sold at a satisfactory price. Instead an issue of \$25,000,000 two-year 5 per cent notes were sold, due March 2, 1919. It might be argued that with money as difficult to obtain for additions and betterments on railroads as it now is, the Southern Railway had better conserve to itself the \$3,000,000 a year which would be called for by 5 per cent dividends on the preferred and invest it in additions and betterments rather than to pay it out to stockholders. Presumably the board of directors felt that the company's credit could be more effectively strengthened by the resumption of dividends on the preferred than by investment in the property of \$3,000,000 additional in the next year. At the end of the year there were \$7,553,000 cash on hand, \$1,964,000 time deposits and \$3,079,000 special deposits. There were only \$455,000 loans and bills payable and \$182,000 of unextinguished discount on funded debt. There was \$845,000 discount on securities charged off during the year through profit and loss account and \$611,000 "net difference between the book value and selling price of securities sold" charged off.

Mention should be made of the acquisition of almost the entire stock of the New Orleans & Northeastern, by the Southern Railway. At the same time the Southern Railway disposed of all interest in the Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific. As will be seen from the map, the acquisition of the New Orleans & Northeastern gives the Southern Railway an entrance into New Orleans and forms a through north and south line in connection with other allied lines of the Southern of great traffic importance.

The following table shows the principal figures for operation in the fiscal year ended June 30, 1917, compared with the fiscal year ended June 30, 1916:

	1917	1916
Average mileage operated.....	6,983	7,023
Freight revenue.....	\$54,863,694	\$47,020,489
Passenger revenue.....	19,061,964	16,615,857
Total operating revenue.....	81,388,325	69,997,675
Maintenance of way and structures.....	10,138,386	8,175,411
Maintenance of equipment.....	12,372,057	11,183,701
Traffic expenses.....	2,039,638	1,904,129
Transportation expenses.....	26,748,978	27,511,698
General expenses.....	2,199,449	2,038,702
Total operating expenses.....	53,630,136	46,041,116
Taxes.....	3,394,424	2,916,427
Operating income.....	24,353,443	21,004,005
Gross income.....	27,457,748	24,436,031
Net income.....	12,360,161	9,333,899
Reserve for preferred dividend.....	1,500,000	
Appropriations for additions and betterments.....	181,402	88,195
Surplus.....	10,678,759	9,245,704

Letters to the Editor

THE VITAL OBJECTION TO UPPER BERTHS

NEW YORK, N. Y.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have read with interest the communication signed by "Traveler" in the August 31 issue of *Railway Age Gazette*, and it seems to me he has diagnosed the upper berth complaint very well indeed. The Pullman Company is to be congratulated upon the splendid progress made in recent years; but much remains to be desired.

Theoretically, the upper berth is the more desirable of the two; the springs are better, the air is purer and the climb up, while inconvenient, is not a vital objection with the average individual.

More provision for care of clothing and a window such as suggested would be desirable and would help to make the upper berths more acceptable; but to me, and to the very large number of men with whom I have discussed this question, the greatest single objection to an upper berth is that of light. There appears to be no adequate regulation covering this matter and in traveling over many different railroad systems I have found many different manners of handling this question. Some porters and conductors have been willing to shut lights off at 10:30, while others insisted upon retaining them at full blast until, and sometimes even after, midnight. There is the same divergence of attitude in the morning, as in some instances lights are turned on as early as half past four or five o'clock at the whim of a porter, while there are also happy occasions where one is allowed to enjoy the semi-darkness of an upper berth until half past six or seven o'clock, although such instances are about as rare as the proverbial hen's teeth, or an oasis in a desert.

In their natural desire to reduce the number of Pullmans necessary to properly care for a contented public, would it not be possible for the Pullman Company, pending the discovery of some method of keeping the car lighted without inconveniencing upper berth patrons, to establish a rule that all lights save berth lights shall be extinguished at not later than ten thirty at night and shall not be lighted before six thirty in the morning? Surely it is no more of a hardship for the occupant of a lower berth to retire by the two berth lights that are his than it is for the unfortunate holder of an upper berth to lie restless in the glare of heavy lights until eleven, eleven thirty or twelve o'clock, when the man downstairs gets tired of reading and is willing to allow the porter to turn off the annoying glare.

Any method of operation that leaves to the discretion of conductors and porters the adjustment of a matter that provokes so much unfavorable comment must be faulty. It seems to me that only a fixed ruling which bears in mind the need of the man in the upper berth for a fair chance to sleep can cover it.

I write from an experience of more than 25 years in Pullman travel and during this quarter of a century I have heard scores of men reluctantly taking upper berths protest against the inconvenience in undressing, but more than all against the inability to get lights turned off at a reasonable hour and the inability to keep them from being turned on at an unreasonable hour in the morning. In other words, is it not fair to the upper berth man to assume that after ten thirty a sleeping car should be what its name suggests, and not a social lounge or a comfortable well-lighted reading room?

A PULLMAN FRI. N.Y.

The Pressing Need of Prompt Co-operation*

Appeal to State Railroad Commissioners to Take Broad Views; States Should Co-operate in Railway Valuation

By Samuel Rea

President of the Pennsylvania Railroad

IN these times of great events, when history is being made daily, it is necessary for Nations, as well as individuals, to become accustomed to changed conditions and adapt themselves to new methods. Now, more than ever before, all political rights and powers existing within this country, must be exercised with the one primary purpose of protecting and defending our national sovereignty.

The Railroads' War Board, on which I have the honor to serve, exists as the creature of our national purpose. Its fundamental object is to unite the railways upon the great work of doing all that is within their power to aid the government in winning the war. It considers and deals with the railroads as a whole, from a national point of view, and is endeavoring to manage them in the best practicable way for the collective welfare of the country. Yet, everything we do is in full recognition of the constitutional and sovereign rights of the states and of their various peoples. These rights are not annulled or suspended by the war, but I wish to speak briefly concerning a few of the ways in which we feel that the regulative bodies of the various states can co-operate with the national regulative power, not only during the continuance of the war, but also to make permanently the railroads the most efficient servants of the public in the times of peace which are to come.

With a degree of co-operation on the part of the general public, which can scarcely be too highly praised, we of the War Board, are making very material progress toward obtaining the maximum service out of the transportation plant of the country. We are expediting traffic; carrying more tons to a car and to a train; moving freight cars and engines more miles per day; eliminating unnecessary train service; consolidating passenger trains; securing prompter unloading, and in many ways releasing men, trackage and equipment to care for the movement of troops, military supplies, food, fuel and other necessities. We are making priority shipments under mandate of the federal law. By our own agreement, we are moving empty cars about the country so as to put them promptly where they are most urgently needed, and are arranging the routing of traffic according to the best physical conditions, and without reference to benefiting individual roads. Other examples of subordination of the competitive activities of individual railroads to the general welfare, are: the efforts made in expediting coal shipments; in furnishing material for the cantonments; in providing additional facilities for new shipyards, industries and mines; in handling the movement of more than 700,000 troops to camp and to seaports for transportation abroad, and in other ways.

All of this means forcing of traffic out of its normal channels, foregoing profitable business and making great financial sacrifices at a time when it is extraordinarily difficult to conserve railroad revenues. We are face to face with an absolutely unprecedented scale of prices for all materials; wages are higher than ever known before; labor is difficult to obtain at any price, and much of it is incredibly inefficient; we are practically unable to obtain new locomotives, as France has the first call on the American supply, and similar conditions exist in the case of steel rails and many

other materials. We are daily made to feel more keenly the competition of industries in the labor market, because they are able to pay wages which the railroads cannot afford. Many of our best men volunteered in the military service months ago, and thousands more have just been taken in the draft. Nevertheless, the railroads have disregarded all of these factors which make operation difficult beyond precedent; they have put profits in the second place and national service in the first place.

My conception of public regulation of railroads is that expressed by that great railroad statesman, Alexander J. Cassatt, who died in office eleven years ago, when president of the Pennsylvania Railroad: that the railroads are, in the nature of things, partial monopolies, and that, therefore, in the public interest, their rates, practices and activities must be placed under governmental regulation; that this regulation must be protective not only of the communities, passengers and shippers which the railroads serve, but also equally of the owners and administrators of these great national properties which are now publicly owned, not by the government, but through a far higher type of public ownership, viz., by hundreds of thousands of individual citizens and the institutions in which they have their funds invested. You, the members of the state railroad commissions, form an important part of this great regulatory power which reaches all over the country. To the extent that you co-operate with the federal government in its supreme power of regulating interstate carriers, you are sharing in promoting the common defence and the general welfare. To the extent that you fail so to co-operate, even though you may appear to be benefiting certain citizens of your own state, you not only weaken the railroads, impair their service and destroy their credit, but also menace the national authority, conflict with its policy, and weaken the effective commercial and military power of the country.

It is to point out this situation and plead that your attitude may always be one of co-operation that I am here tonight. I appreciate what many of you have already done in helping us, on the Railroads' War Board, to do our work properly, and to make successful our efforts to aid the nation. May I suggest some other avenues in which state commissions may co-operate still further?

ABOLISH USELESS REPORTS

Let me first ask that you aid us by consenting to the abolition of all reports, documents and accounting requirements of all kinds which are not absolutely necessary to enable you to do your work. Opportunities for simplification are almost innumerable. Public regulation of the railroads, thus far, has simply added bureau upon bureau and authority upon authority, which have caused to be amassed uncounted and uncountable figures in millions of printed pages of reports, forming an undigested and useless mass.

When you go home, test the necessity of your various reports by cutting some of them out for a time—say for the continuance of the war,—and in that way ascertain whether or not they have real value. The railway accounting officers have asked you for certain relief from the excessive burdens; we need this relief most urgently, because of the many men who have been called to the colors from our accounting departments. It is a source of much gratification

*An address before the members of the National Association of Railroad Commissioners at a banquet at the New Willard Hotel, Washington, D. C., October 17.

that the federal and state commissions have accepted the calendar year, instead of the fiscal year of June 30, for annual reports and that the accounting classifications are now almost identical. But the field is a big one, and much further saving may be achieved.

THREE MILLION REPORTS IN A SINGLE YEAR

For the year ending June 30, 1915, I think the report prepared for the Newlands committee showed that, including duplicates made for the various federal and state authorities, almost 3,000,000 official reports were furnished by the railroads of this country. They consisted of annual and quarterly reports, tax reports, accident reports, equipment and other special reports. The Pennsylvania Railroad system alone furnished over 400,000. Let us cut these to the bone, and build up later if it is found that any which are eliminated are missed. This is the only way to get prompt relief, and promptness in this matter is most urgently essential.

113,965,747 PAGES OF PRINTED TARIFFS FILED AS A FORMALITY

The question whether or not the railroads needed a 5 per cent increase of freight rates, was necessarily a general one; but before the case could even be heard we had to file separate tariffs for every rate affected. The Pennsylvania Railroad system, which was merely one of the carriers involved, was obliged to spend, it is safe to say, \$450,000 for the tariffs which it was required to file, and our Lines West of Pittsburgh alone filed tariffs which made up the enormous and incomprehensible total of 113,965,747 pages, weighing a total of 302,883 pounds. Of course, there was no thought in the mind of anyone as to the possibility of reading or even casually examining all these tariffs, but it was necessary to print and file them because that was the procedure then in force.

Fortunately, since that time we have made some headway in bringing about a recognition of the needlessness of wasting so much time, effort and money in a formality. In the most recent rate case, which was begun last spring, the Interstate Commerce Commission suspended its rules of procedure and allowed the application for a flat advance to be made without the necessity for filing tariffs covering all the many thousands of rates involved.

STATE COMMISSIONERS SHOULD ATTEND I. C. C. HEARINGS

Co-operation by the state commissions with the federal government, in the matter of readjusting railroad rates to a reasonable basis, is a great field for assistance in stabilizing railroad credit, and removing conflicts between interstate and intrastate rates. It ought not to be necessary to spend weeks or months in painfully working out some rate adjustment with the Interstate Commerce Commission and then have to do the same thing with the state commissions in all states affected by the proposed changes. Nor should the spectacle be witnessed of a state virtually setting aside the superior authority of the federal government. I hope to see the time come when state commissions will regularly send their representatives to sit with the Interstate Commerce Commission during its hearings, for the specific and definite purpose of co-ordinating the action of the state commissions to what the federal commission may decide. I think in such cases the state commissions should be willing, without the necessity of a rehearing, to accept the proof heard before the federal commission, and allow the railroads to file rate tariffs in the states simultaneously with those filed with the national government. In view of the thoroughness with which the Interstate Commerce Commission scrutinizes all evidence upon which the railroads base their claims to any rate increases, I am sure that no state would be running the slightest risk of giving any railroad more than was its just due, while, at the same time, procedure would be greatly simplified,

and expense, both to the railroads and to the state governments, would be saved.

A CASE WHERE A STATE SET ASIDE THE FEDERAL AUTHORITY

One of our neighboring states, I regret to say, for a period of three years maintained a scale of intrastate passenger rates which conflicted with the interstate rates specifically authorized by the commission here at Washington. We had, therefore, during that long period the spectacle, which, I am sure, did not reflect credit upon our national capacity for self government, of a state setting aside the action of the superior federal power, while citizens of other states were encouraged to violate the spirit, if not the law, of the interstate commerce act by crossing into the state in question in order to circumvent the rates established by the Interstate Commerce Commission. I am glad to see that this matter has now been disposed of, and that the commission of the state to which I refer has at last consented to have its rates equalized with those established by the federal authority.

Let any of the representatives of the state commissions present here may feel shocked at the example which I have just given, let me direct their attention to the fact that in the Central Freight Association territory, there are still many intrastate rates which have never been readjusted to conform to the decision of the Interstate Commerce Commission in the five per cent rate case decided in 1914. I will not say a word as to the situation West or South.

At the present time, when the railroads are so urgently in need of additional revenues, it would be very helpful if, in view of the small increases conceded by the Interstate Commerce Commission in the rate case of this year, the various state commissions would all promptly act and allow the railroads to apply these rates to intrastate traffic also. I can assure you that what was granted is not half enough, but if the states would permit it to become fully effective the railroad situation would be materially aided. I feel that state commissions should regularly be represented at all federal rate hearings, and that, unless some extraordinary reason exists, should acquiesce in the judgment of the federal commission, and authorize all changes necessary to conform thereto without further proceedings.

NO ROOM FOR PARTISANSHIP

The failure of the states to take a proper place in the regulation of our railroads has given rise to great misgivings, and many states have allowed the railroads and investors—and I suspect the public—to feel that railroad regulation was rather a partisan question than a serious business and economic question. We want your co-operation, and co-operation means prompt action and leadership. In this country, when action and leadership are not forthcoming in the affairs of a corporation or any public body, it must eventually go to the scrap heap, and some other corporation or body must carry out the National will; but meanwhile the country suffers. We are deficient in terminal facilities and equipment because of insufficient earnings and unduly low rates since 1907; and the country and the business man are paying the price of neglect, notwithstanding all our efforts to help them. Bricks without straw cannot be produced. High costs, high taxes, and high wages cannot be paid without sufficient rates. The Pennsylvania Railroad faced the war of 1861 with average freight rates of 2½ cents per ton-mile, and the war of 1917 with average rates of slightly over 6 mills per ton-mile. Yet nearly everything that goes into the expense of railroad operation costs far more now than it did when the Civil War opened.

Testifying before the Joint Commission of the states of New York and New Jersey, yesterday, on port conditions in New York Harbor, I was obliged to point out the results of the unremunerative rates which the railroads have been com-

pelled to accept, stating that over \$20,000,000 should have been spent on the Pennsylvania's New Jersey yard and terminal facilities, to serve that port properly.

The situation is little different elsewhere. In Baltimore, embargoes exist and freight is being unloaded on the streets; the lines of the Philadelphia, Baltimore & Washington should have immediately spent upon them over \$10,000,000 for additional facilities. Our lines serving the lake ports and the Pittsburgh, Youngstown and other great industrial districts are suffering from embargoes; all, in my judgment, because the returns allowed to the Pennsylvania System have been entirely inadequate for very many years.

2385 RAILROAD COMPANIES

Another field for co-operation by the state commissions lies in aiding to bring about uniformity of state laws. The day is here for the consolidation and unification of railroad systems. No less than 2,385 separate railroad corporations report to the Interstate Commerce Commission and I hazard the guess that at least 2,300 of them could be merged into the bigger systems with vast benefit to the public and everyone else concerned.

There are still, in the Pennsylvania Railroad System, about 115 active transportation companies, all necessary, as matters now stand, for the conduct of the service. I think we will all agree that this is just 114 too many; but when we reflect that they represent what were originally more than 600 separate incorporated companies, we can feel that some progress is being made in the right direction. But in any question as to increased rates, the profits or losses of these separate companies play no part in the consideration of the matter by the Interstate Commerce Commission, which looks only to system results. In fact, little attention is given even to large individual railroad systems, because the country is so immense, and the interests of the public in all the states so intertwined, that the results of a whole region are considered, such, as for instance, the Trunk Line territory, or the Central Freight Association territory, or the entire railroad region lying between the Mississippi river and the Atlantic Ocean and between the St. Lawrence and Potomac rivers. Yet many of the state regulative bodies are still working under laws and powers that existed when roads ten miles long were being incorporated, and when a railroad meant little more than rail laid along a public highway. A national conception of transportation is wholly absent from the statutes of many of our States. For instance, prohibitions against the acquisition of so-called parallel or competing lines still exist, oblivious of the fact that a 10- or 20-mile stretch of intrastate line obviously must be competitive with a 12,000 mile interstate system running in the same general direction. Nor would such prohibitions, in any case, be heedful under our present stringent laws against discrimination. I am glad that there is less and less public sympathy with legal conceptions that are anachronisms, but we have still far too many laws and lawyers out of harmony with the actual conditions of today. It is in the highest public interest, for the furtherance of adequate transportation service, that every possible encouragement should be given for the merger, in law as well as in fact, of small lines into large systems, and whatever obstacles still exist against the accomplishment of such ends are stumbling blocks in the way of progress and stand in defiance of economic law. We need a broad, national recognition of this fact, and you men can greatly aid in bringing it about.

TRAFFIC POOLS SHOULD BE LEGALIZED

Even from the federal standpoint there is no longer any necessity for the application of the Sherman law to the railroads. All possible needs for its restrictions have been superseded and made obsolete by our present system of almost complete public regulation. We are having concrete proof of this right now, before our eyes, in the work which the Rail-

roads' War Board is doing in full co-operation with the Interstate Commerce Commission and the other federal authorities. Under the spur of the great necessities arising out of the needs of the common defense, we may be forced to go very far. In order measurably to protect the investment of the public in our railroads, and promptly secure needed transportation, we may be compelled to pool traffic and train service, shift locomotives from one line to another, and do many other things, in the nation's interest which are not now recognized by any law but the necessities of war.

I wish here to say, most unequivocally, that in my judgment, the pooling of traffic by the railroads is essential for the public service and should be affirmatively legalized, not only for the period of the war, but for all time. The restrictions of the Sherman law should not apply to the railroads, and mergers and combinations intended to increase efficiency, simplify accounting, and eliminate the wastes of competition, should not only be countenanced but encouraged, under public supervision and control.

The Pennsylvania Railroad is still a corporation of only one state, although its lines are operated in thirteen different states. We hesitate to become a corporation of other states because of the conflict and confusion of laws and regulation, and we look to the time when either the federal government shall take full and exclusive charge of all interstate transportation questions, including incorporation, security issues and rates, or else when the state and federal authorities shall so co-operate that only one line of decision and action shall apply. Then the owners, managers and the general public will be fairly protected, and railroad credit will be in the hands of responsible regulative authority.

What I say is not spoken with any hostility to state governments or state commissions, for under state charters we have lived and prospered in the past. But the time has now come, in this great nation, when it is no longer possible to administer, in the proper interests of the public, a railroad corporation that depends for guidance upon many different commissions with diversified laws, traditions and procedure, and still have the efficiency necessary for our continued national welfare. This lack of uniformity begins with the manner of incorporating a railroad company, and extends to capitalization, operation, and rates, and even to such matters as the width of the right-of-way and the method of electing directors.

THE STATE COMMISSIONS' FUNCTIONS

Let us not overlook the very important fact that, aside from questions relating to our great railroad systems, the state commissions have on their shoulders the responsibility of regulating and supervising hundreds of public utility enterprises, representing billions of dollars of invested capital and serving, in a truly intrastate sense, our great and growing communities. This is properly a duty of the state authorities and the responsibility of discharging it adequately will inevitably become more weighty and serious with the passing of every year. I am confident that in its intelligent performance you may, with profit to the public and increased prestige to yourselves, expend the full measure of your energy.

In the matter of railroad valuation, also, we need the co-operation of the states. We have a federal valuation law that is most difficult to interpret and, if carried out as tentatively proposed, will involve enormous cost, while the results may be of very doubtful value.

C. A. Prouty, the director of valuation, and an experienced railroad regulator, has recently said that the solicitor of the division of valuation holds "that the valuation act does not require the commission to find an ultimate value." In this Mr. Prouty acquiesces, but follows with the personal observation that it is "his conviction that an ultimate value for rate making purposes should be stated, and that the full benefit of this valuation cannot be realized unless this is done."

Mr. Prouty says that the act was the result of repeated recommendations of the Interstate Commerce Commission, which he understood provided for a valuation in dollars as a whole. Now, if congress has given us a law which does not enact the views of that body, and is not fair to the owners of the railroads and the public, why not forthwith try to correct the law, after full conference with the federal and state commissions and railroad representatives, with the results embodied in revised and explicit recommendations to congress? Failing to secure agreement, then why not recommend the suspension of the work and save an enormous expenditure which may have little value? Why, in this uncertainty, proceed further with this work, now requiring the labor and attention of about 1,500 men on behalf of the government, and about 4,500 men by the railroads, and costing ultimately over \$50,000,000?

I am one of the few railroad men who believe that federal valuation should be pushed to a conclusion, but I wish to voice my deep conviction that it should be a real valuation, based upon a marshalling of facts and data which may be used for any purpose in the future. This is my individual view, based upon a long experience in valuing railroad property for purchase or leasing. Railroad properties are constantly being valued, and are being bought, sold and leased on such valuations, and have been, frequently, for the last 60 years. It has been possible to do this without encountering the tremendous expense, complications, difficulties and grave differences that are being experienced in the federal valuation; and it will be possible to do so again. I believe that today we can have a real governmental valuation of our railroads, and one that will be of real utility, just as soon as we make up our minds that practical considerations, and not theory, shall govern the procedure.

We, therefore, ask you, as part of your public duty, to take an earnest and active interest in this matter. Do not content yourselves with merely combating the railroads' arguments, where you think them vulnerable or in error. This is a place for constructive work, in which you can perform a service of value by aiding in bringing this vexed and difficult problem to a just and satisfactory solution.

PROTECT THE CREDIT AND EFFICIENCY OF THE RAILROADS

To return to my starting point, we ask your aid and co-operation in these matters: Simplification of accounting, elimination of unnecessary reports, prompt according of reasonable rates, legalizing pooling of traffic under proper public supervision, encouragement of mergers to promote efficiency, relief from obsolete restrictions of state statutes and the Sherman law, and obtaining real valuation of the railroads. Your influence in all these matters is potent.

The government cannot move, in this great struggle, without the effective aid of the railroad system. Therefore, let us, through co-operation, make it a real and vital force, and a mighty arm of the Nation in achieving success in our battles, our commerce and our National ideals. Carefully consider the narrow margin of earnings allowed to the railroads, under public regulation, since 1907, upon the huge investment placed at the disposal of the public. I think you will then realize why it has been, and is now, impossible to provide the requisite capital to furnish adequate terminal facilities, and take full advantage of electrification and improved appliances in equipment and operation to keep the railroads well in advance of the growth of traffic. . . . We have given a sign to all the world that this democracy has dedicated its men, its honor and its private and corporate wealth to the nation, so that it may be in the first rank to fight for the world's freedom. . . . In this great work it is an honor for us all to share, realizing that transportation, and especially railroad transportation, is a national service and in the highest degree essential to national prosperity in times of war or peace.

LOCOMOTIVE DESIGN FROM A MAINTENANCE STANDPOINT*

By W. H. Winterrowd

Assistant to Chief Mechanical Engineer, Canadian Pacific

The type and size of a locomotive have an important bearing on certain details of design. A discussion of the factors relating to the selection of the desired type and size is far beyond the scope of this paper as it would involve a thorough consideration of the economics of railway operation.

Occasionally some detail of the resulting design, while undesirable from a maintenance standpoint, is unavoidable. However, the majority of locomotive details are free from other than purely local restrictions and may be designed almost entirely from a maintenance standpoint.

It should not be inferred from what follows that mechanical and operating men, as well as locomotive builders, have not given a great deal of consideration to the points mentioned. Very many locomotives in service today bear witness of such consideration. However, there are at present justifiable reasons for emphasizing and reviewing the importance of locomotive design from a maintenance standpoint.

To-day, under changed conditions, the railroads are being called upon to render greater service than ever before. But little new equipment is available other than that which the railroads may build in their own shops. Repair shops are being worked to capacity. Skilled railway mechanics are scarce. Material of all kinds is difficult to obtain. All of which means that maximum service must be obtained from every bit of existing equipment. It is, therefore, essential to consider every legitimate means whereby the "out of service period" of a locomotive may be decreased and the "in service period" increased.

All new locomotives should be constructed to give maximum service with minimum maintenance. All locomotives being rebuilt, or modernized, should be turned out of the shops prepared to give similar results. Any improvement that can be made to any locomotive, new, modernized, or under repairs, which will result in increased service, increased efficiency, or decreased maintenance, will help to increase the capacity of the railroads.

The following covers briefly a few of the points worthy of consideration:

BOILER

It seems hardly necessary to state that a well designed boiler of ample capacity is easier and cheaper to maintain than one of smaller capacity and which has to be forced continually. The importance of ample capacity can scarcely be over-emphasized, either from a maintenance or operating standpoint. Within its limits of weight and size a boiler should be designed to have a capacity as large as possible consistent with other governing factors. In this connection the values of the superheater, the brick arch, and the feed water heater are unquestionable. These values have been practically demonstrated from the standpoint of economy as well as locomotive capacity.

The maintenance of locomotive boilers is an important factor, the greatest difficulties being leaky flues, leaky mud rings, broken staybolts and cracks in firebox sheets.

Knowing that firebox heating surface does a great deal more work per square foot than the flue heating surface, boiler capacity does not depend upon long flues. Short flues are the easiest to maintain.

The radii of door and back head sheet flanges should be studied in relation to the staybolt stresses. Too small a door opening radius will frequently result in cracking of the sheet at this point because of insufficient provision for expansion.

Mud ring corners of ample radius will be easy to construct

*From a paper before the Canadian Railway Club.

and maintain. Trouble due to small radius has, in many instances, been overcome by electric or acetylene welding the bottom edges of the sheets at this point to the mud ring.

Flexible staybolts reduce staybolt breakage. A careful investigation will indicate the zones of maximum staybolt stress and sheet movement. In these zones the flexible bolts will give good results and reduce staybolt renewals.

In connection with the barrel of the boiler, points which may be mentioned are—throttle and dome arrangement which will permit interior inspection of the boiler without the removal of the standpipe; also the elimination, as far as possible, of all small studs. The latter will apply equally to all parts of the boiler under pressure.

Expansion slides, instead of an expansion sheet, under the front of the mud ring, will eliminate the maintenance of a considerable number of bolts and rivets. Proper consideration of all other expansion sheets will further reduce maintenance of many bolts and rivets and tend to eliminate the many resulting troubles as well.

FRAMES

Frames should be of ample cross section and well braced to hold them rigid. Maximum cross section may be of little avail unless accompanied by sufficient and properly located bracing. In this connection, it hardly seems necessary to mention the advantages of a valve gear located outside the frames. The outside gear has made possible better frame bracing, to say nothing of the advantages of easier inspection and maintenance of the gear itself.

Where cylinder design will permit, a one piece frame with a top tie splice seems desirable. Where large cylinders prevent the above arrangement, a one-piece frame with ample depth under the cylinders, and having no reduction in thickness, will give excellent service.

MOTION WORK

All bearing pressures should be as low as consistent with good practice in order to reduce wear and resultant replacement. Ample pin length is desirable in order to obtain lateral stability. Arrangement of motion and design of back steam chest and back cylinders covers should be such that both valve stem and piston rod packing will be easily accessible.

Valves of light weight will reduce the load on all valve parts and result in reduced maintenance.

Selection of high grade, close grained, cast iron for cylinder and valve bushings, piston heads and rings, and in some cases rod bushes, is more than warranted in view of the increased mileage obtainable and the corresponding decrease in maintenance.

If conditions permit the consideration of heat treated, or alloy steels, the unbalanced forces may be very materially reduced by the use of light reciprocating parts. The reduction of such forces will in turn tend to reduce the maintenance of pins, bushings, etc.

EQUALIZATION

Locomotives should be equalized so as to secure the most efficient guiding power from both leading and trailer trucks, or wheels. This involves the proper distribution of weight and a means of keeping the proper weights on the various axles at all times.

In general, the best results seem to be obtained by dividing the equalizing system so that the division between the front and back systems is as directly under the centre of gravity of the locomotive as the wheel base and other conditions will permit.

The spring gear and equalizing system should receive particular attention when being erected and also when being repaired. The tops of the driving boxes should be milled out squarely and in a plane parallel with the journal bearings. The equalizer and saddles should be fitted to their seats squarely with the pin holes so that the engine will ride

squarely on her springs and track properly. The same will apply to the trailer truck equalizers and spring rigging. Trailer trucks that do not carry the back of the engine level are responsible for much avoidable tire wear.

SPRING AND BRAKE RIGGING

A driver brake main fulcrum shaft in two pieces of equal length, the outer ends supported in bushed bearings integral with the main frames and the central portion supported by a sleeve, will give more even distribution of braking power and maximum accessibility for repairs and adjustments.

Brake cylinders, if at all possible, should be located vertically, in order to reduce packing wear and provide accessibility.

Brake shoe heads and hangers should be so constructed and hung that shoes will swing clear of the wheels when the air pressure is released and permit an easy application of new shoes.

The ratio of brake cylinder to brake shoe pressure should be kept as low as consistent, and should not exceed commonly accepted ratios. This will insure that false travel will be kept to a minimum.

PIPING

The importance of ample clamping and provision for expansion cannot be overemphasized. Piping should be as short as possible consistent with conditions. Accessibility is of prime importance. Piping should be so located that there is no obstruction of washout plugs, arch tube covers, pads, etc. Where pipes pass through the front of the cab, provision should be made for clearance or for sleeve protection to prevent wearing or cutting.

The Canadian Pacific has found it a decided maintenance economy to place lubricator piping from cab to cylinders, etc., in a slightly larger wrought iron pipe where the feeds pass beneath the jacket and lagging. By this means the feed pipes can be removed or applied without the necessity of removing any outside covering.

MISCELLANEOUS

Removable liners on engine and tender truck pedestals make it easy to take up wear and reduce pedestal renewals. To prevent rapid wear between the wheel hub liner face and the driving box sufficient provision for lubrication should be made.

All oiling points should be made as accessible as possible. Handholds or small steps, properly located, to make some oiling points accessible, will soon pay for themselves.

Boiler jacketing should be applied in sections so that panels can be removed with a minimum of labor.

The foregoing are but a few of the multitudinous details which merit most careful thought. But little mention has been made of the possibilities of simplified design by the use of cast steel. It is felt that with the development of the cast steel industry and the production of castings which are practically equivalent to wrought iron that locomotive construction in the future may be greatly simplified. We are today using casting that ten years ago would have been deemed impossible to successfully cast. For example, one piece locomotive frames are now under consideration and will soon be in experimental service. These consist of the two main frames and all cross braces cast in one piece. This in an indication of the degree of simplification that may be obtained. The maintenance of such parts has in turn been made possible by the development of the art of electric and acetylene welding.

In conclusion, simplicity co-related with efficiency should be one of the keynotes of locomotive design. This principle, which in other words is simply good judgment, will make for that degree of efficiency which will be reflected, not only in reduced maintenance costs, but also in the increased capacity of the locomotive plant as a whole.

Farmer and Railroad as Partners in Industry*

They Are Mutually Dependent for Success, Yet the
Farmer Causes Railway Regulation That is Harmful

By W. B. Storey

Vice-President, Atchison, Topeka & Santa Fe Railway

THE railroad, from an agricultural point of view, has in the past been an intangible something to be greatly desired until obtained and then something to be blamed for every manner of ill-luck, to be kicked and cuffed about when there was nothing else to abuse, to be taxed more heavily when revenues were short and, in general, to be made the scapegoat of the community. The farmer has not been able to recognize any community of interest with the railroad. He seems to regard it as an organization having an unlimited command of capital that can do anything by willing it and as generally opposed to everything the farmer wants. Most of the farmers in this state came here after the railroads were here. They accepted them as one of the gifts of nature; soil, water, sunshine and the railroad were at hand and all that was needed was to take advantage of these gifts and by the proper combination begin to make money. The railroad was a very convenient element of this combination because if any of the first three elements failed, the results of the failure could be rectified by taking it out of the fourth, the railroad being the only part of the combination that could be regulated. Today there is hardly anything that happens that is not charged directly or indirectly to the railroad. This feeling is carried so far that every act of the railroad, whether of omission or commission is ascribed to malicious intent on the part of the officers of the road.

If a carload of fruit is delayed by a washout it is a deliberate act on the part of the corporation. If a claim is not promptly paid it is an effort to escape just responsibility. If an employee is impolite it is the act of the management, the fact being overlooked that the employees of the railroad are generally taken from among the people whom they serve. The sole impression, therefore, of the average farmer about the railroad is that it charges very high rates, that it gives very poor service and that it pays its taxes grudgingly.

When the earliest railroads were built no one dreamed of the tremendous stride that was being taken. Those were constructed with the idea of making somewhat easier the limited interchange which then existed but the actual opening up of the land in the manner which has occurred was not foreseen. As illustrating this I would point out that when the first transcontinental railroad was built to California one strong argument that was used to sell the securities was the enormous commerce that would be built up with China and the Orient and very little was said about the business to be developed along the line. There was practically none at that time and few could see the possibilities of the future. Abraham Lincoln, when appearing as attorney for the first railroad to cross the Mississippi, in its application for permission to build the bridge, caused a smile to pass over the room when he suggested that the time might come, in the distant future to be sure, when as much freight might cross the river as then passed up and down the stream. Today that one railroad carries daily across the river more freight than ever passed up and down the stream in a month. In those days it was thought the railroads might bring products to the rivers, but that they could actually supplant the rivers was unbelievable.

HOW RAILROADS DEVELOPED AGRICULTURE

During all this early period there was but little agriculture in its present sense. At once, however, on the construction of railroads, agriculture came into its own; the products of the west could reach the east and even by combining with sea transportation could go to Europe. The land began to produce and immediately came a demand for the land and settlers poured into the newly opened country. The lands adjacent to a railroad were at once settled and then the country beyond the railroads and this, in turn, called for more railroads. The country, as a whole, came to recognize the absolute necessity for transportation and local and government aid was given to induce railroads to build; and capital, not recognizing some of the facts that it has since learned, poured its resources into the construction of new roads. In this manner came development of the country, and to make you realize how rapidly this development came I would point to the fact that the entire railroad mileage of the United States has been built in eighty-seven years and every mile of railroad between Chicago and the Pacific Coast has been built in my lifetime. Coincident with that period has come the entire agricultural development of the west.

But the rapidity of growth brought changes in economic conditions. Railroads were built faster than the country could absorb them; i. e., the country was ready for development, but there were not enough people to develop it, the supply of farmers wanting cheap land having been exhausted. The railroads thus found themselves with miles of rails but with no business. Thus it was discovered that people meant products and products meant business; and immediately followed the effort to induce people to come to the west and finally came the establishment of colonization agents in Europe. Through this means large sections of the country were settled and thousands and thousands of foreigners came to this country. The railroads, therefore, really helped populate the country, and even today this same process is going on, not perhaps by bringing people from Europe, but by bringing people from the more thickly settled portions of the country to that which has been just opened up.

It might be mentioned here incidentally that this rapid development brought in its train many mistakes and not only did financial wreck come to many railroads but to many farmers. The latter were not acquainted with the limitations of the soil and climate and, as in every new country, many were unsuccessful and whole sections of states that were once settled became waste land again. The railroads, however, that had been built to serve such sections could not move out as had the settlers and they were compelled to remain and go through all the vicissitudes of bankruptcy. This, in turn, gave opportunity for people to charge that railroads were improperly managed or purposely wrecked, when, as a matter of fact, they were following only natural laws; one of which is that if there is no business a railroad cannot exist. But this unproductiveness of the country led to efforts on the part of the railroads to make it productive. Consequently there are today all over the country, in the service of the railroads, expert agriculturists, whose function it is to make two blades of grass grow where one grew before. In the east the railroads are trying to rehabilitate that country of deserted farms. In the semi-arid west the railroads

*From an address delivered at Berkeley, Cal., on October 13, on the occasion of the dedication of Hilgard Hall, the new agricultural building of the University of California.

are teaching the farmer the kind of crops to which the soil and climate are adapted and the methods of farming that will produce the best results.

You will thus see that co-incident with the settlement of the country came the raising of crops and produce that demanded and required the railroads and the construction of railroads required the raising of crops; and the two interests, agriculture and transportation, became so closely interwoven that they are now absolutely inseparable.

California early turned its attention to wheat which was raised in the valleys and brought down to the seaboard for shipment abroad. Other than this there was little that California produced agriculturally that could bring capital into the state and even wheat brought such low returns, on account of the distances that it had to be carried to reach a market, that the rewards were meagre. The fruit raised in California for local consumption was of excellent quality but with no market there could not be much growth in the industry. The railroads at the same time traversed the continent and had practically nothing to haul eastward. They could not haul the wheat to the eastern markets because the vast wheat fields of Kansas and the Mississippi Valley were so much nearer the market that they could always undersell the California product. From the double need, therefore, on the part of the farmer for something that would make larger returns and on the part of the railroads for business, came the gradual development of the fruit industry. The original attempt to carry fruit east was made by express train, a car being shipped occasionally, sometimes with bad results but sometimes with profit. After this came refrigeration which permitted a longer period enroute and transportation in freight trains, with the accompanying lower costs which, in turn, meant greater profits; and finally came the business as it is developed today. A great industry on which the prosperity of a state depends has been produced by the farmer and the railroads acting together.

THE RAILROAD AND FARMER AS PARTNERS

The farmer provides the land, selects the best varieties of trees, furnishes water, cultivates the soil, gathers the fruit and through his packing associations cleans, boxes and loads it, while the railroad provides proper kind of cars, has them on hand when wanted, moves the cars immediately they are loaded, ices them at proper points along the road, keeps them moving and delivers to some point two thousand to three thousand miles away at a scheduled time. If there is failure in any one item either on the part of the farmer or the railroad, the entire product of all the labor is lost. All California has thus been developed with this absolute dependence of the farmer on the railroad and yet I doubt if there has ever been any realization of the fact that the two are one; that they are partners that cannot dissolve partnership, that what helps the farmer helps the railroad, what helps the railroad helps the farmer and that one cannot exist without the other.

Let us consider first the organization of a railroad. Is it a reservoir of money that will give forth its contents by edict of law? Is it capable of creating something from nothing? Is it the enemy of all? Is it a combination of Wall Street capitalists who are bent only on extracting from the country everything that can be taken? It is, in fact, none of these things. It is an aggregation of ordinary people, such as you and I, who join their interests to manufacture transportation. These people are shareholders and each one pays into the concern a certain sum of money; the contributions varying from \$100 upward. As illustrating such an organization I might mention the Santa Fe Railroad. On June 30 of this year there were about 44,000 shareholders, and the holdings averaged about 78 shares each, there being many holdings of less than ten shares. These people elect from among their number directors, and

the directors—certain officers to manage the affairs of the business. These officers, who are also just ordinary people, such as you and I, proceed to build certain lines of railroad with the money that has been paid in by the shareholders and to carry over those railroads, for hire, freight and passengers. As the business develops, more miles of railroad are built, possibly with money from the sale of additional stock or perhaps with borrowed money, and the business expands just as in the case of any other business that is furnishing something for which there is a growing demand. If the earnings are enough to give a profit over and above the cost of the article they are manufacturing, the shareholders are the ones entitled to the dividends and if there is a loss they either meet the loss by paying an assessment or they lose their property to the people from whom they have borrowed money. Railroads, therefore, are organized and built to manufacture transportation for profit just as the orchard is planted and developed with the idea of profit. And just as profits in farming induce more investment in farming, so profits in railroading induce more people to invest in railroads. The reverse also holds and unless a railroad pays, people will not invest in it and its credit is destroyed.

RAILROAD MUST PROSPER IF FARMER IS TO SUCCEED

This brings us to a proposition that may sound strange; viz., that it is essential for the success of the farmer that the railroad should prosper. You may ask why, after the railroad is built, is the farmer interested in whether it pays or not? It is compelled by law to run and the farmer is not interested in the shareholder. If the unfortunate man made a mistake in investing in such a concern that is his fault. Let us, however, look into this farther before deciding hastily. In the first place the railroad, like any other business, must grow and keep up with the growth of the country. A line of rails may connect San Francisco and New York, but that is not a real railroad. The latter needs locomotives, cars, sidings, roundhouses, second track, stations, and as the business of a railroad expands, more cars, more locomotives to pull the cars, more side tracks to pass trains, more machine shops to repair engines, larger water and coal stations, and, in fact, more of everything that forms part of a railroad. It is due to lack of these that trains are delayed, that car shortages occur, that freight congestions arise, that embargoes on freight are placed. In order to keep up with the growth of the country, the Santa Fe railroad should spend in additional facilities, such as I have named, at least twenty millions a year, and it should be able to obtain that amount of new money either by stock subscriptions or by borrowing. To do this its credit must be absolutely sound; i. e., investors must be sure of getting returns on their investment. Now, does it come home to you why the farmer is interested in the shareholder? Possibly the whole problem can be better understood by a study of the last five years. For a long period prior to the beginning of the war and for some months afterwards, business in this country was at an extremely low ebb. The railroads suffered with the balance of the country, even more so because, due to commissions and legislatures, their conditions had become more seriously hampered than other lines of business. As a result many roads went into the hands of receivers and others only avoided this by the most careful business methods. The direct consequence was that investors became shy and either refused to invest at all or only when high rates of interest were offered. The railroads, therefore, could not add to their facilities. Then came the business boom and with it the cry that the railroads were not taking care of the business of the country. All the facilities I have named were lacking in sufficient quantity to take care of the business offered and the best efforts of the entire railroad world were unable to meet

the demand. And even today the business of the country is keeping ahead of the railroads. They are struggling to catch up but it is very hard to do so. It is to the vital interest of the farmer that the railroads should keep up with the progress and growth of the country and, therefore, he is interested and deeply interested in the solvency and prosperity of the railroad.

We are now in a position to consider what makes for prosperity in a railroad. The answer is, ample business at proper rates. This brings us at once to the great big point of difference in the past between the farmer and the railroad; viz., rates. This is the rock on which we have split. This is what has led to the misunderstandings, the laws against railroads, the unjust regulation of railroads and to many, if not most of the troubles, that are afflicting railroads today, and, while they have continued to exist under the lower and lower rates, and the more oppressive regulations and the higher taxes, this does not prove that this course of treatment is the best for the railroad or the best for the farmer. I need not cite the fable of the man who was succeeding so well in teaching his horse to eat green colored shavings. On the other hand, the lower and lower rates have made it harder and harder for the railroads to live. They have felt compelled to resist each and every attempt to cut the rates. If rates could follow prices up and down, perhaps at times they could afford to lower rates temporarily, but you may possibly remember the lemon case. When the duty was removed on lemons and the Sicily lemon came to this country at such a price that the California lemon could not compete, a request was made for a lower rate so as to enable the industry to keep alive. This was given. Later the duty was restored and the railroads attempted to go back to the earlier rate, but the effort was resisted and lemons have been hauled ever since at a rate fixed to help out the farmer. The railroads have, therefore, pushed back whenever the suggestion of lower rates is made. This constant struggle has had the effect of making the rate question apparently the irreconcilable conflict; the railroads insisting that they must have higher rates or starve and the farmer just as strongly believing that unless there are lower rates he will starve.

IMPORTANCE OF LARGE TONNAGE TO A RAILROAD

Let us, however, drop the rate question for a moment and look at the other element in prosperity for railroads; viz., ample business. Have you ever heard the yord tonnage? It may be a new one, but in the railroad world it is an important one. Tonnage multiplied by rates gives revenue. Give a railroad all the tonnage it can haul and you may cut the rates instead of raising them and still the railroad will be prosperous. Why are the average rates per ton mile east of Chicago about half of those west? Because the roads in the east have tonnage. Why are the earnings of the western roads showing an increase this past year in spite of the higher cost of everything? Because there has been a heavy increase in tonnage. By increasing the tonnage loaded in cars the item of car and of car repairs per ton hauled is cut down; by increasing the tonnage in trains the element of wages, coal and engine service per ton hauled is decreased and by increasing the number of trains the cost of track maintenance, of administration and of interest charges per ton hauled is decreased. Therefore, tonnage is the great desideratum of the railroad; heavier loaded cars, heavier loaded trains and more trains. As a consequence, to the railroads, tonnage is, in reality, more important than rates.

Now let us look at the farmer's side of the controversy. There are two things that the farmer needs to make his part of the common undertaking a success; viz., low rates and good service. While the farmer, yes, and the entire country, has been keeping watch over rates, the matter of service is the real necessity; quick service and prompt service, sure

service and reliable service. Of what use is a low rate if your products cannot get to market on time or in proper condition? The service given is all important and should be carefully weighed when you are doing your regulating, for you have in your own hands, through your commissions, the final decision in the matter of rates.

Having seen that there are other things besides low rates that the farmer needs and other factors than high rates that the railroad needs, we are in a position to study rates more calmly. The matter is, of course, an important one and if a railroad cannot get tonnage it must have rates. Let us start out by saying that the rate should be a fair one. You smile and ask, but what is a fair rate? The answer is simpler than you think; it is one that will produce the maximum of business. A rate that allows business to develop steadily and constantly is a fair rate. On such a basis as this a rate might be and often is made so low that if applied to all the business of the road it would cause bankruptcy, and, on the other hand, it may be so high as to give a handsome profit to the railroad over and above all expenses and interest charges. It was the misconception of this principle that gave rise to the belief that railroads charged all the traffic would bear. That the rates for the farmer in this state have not been too high in the past is shown by the remarkable development of agriculture in this state. The railroad will carry an orange three thousand miles for you for about half a cent, it will take a lemon for one-fifth of a cent, a pound of potatoes or a pound of beans for three-quarters of a cent or a pound of dried fruit for a cent. Are these rates excessive when you think of the service performed? In no country in the world are freight rates as low as in the United States. The railroad rate today has no real influence on your profits. Different conditions in different years give you a good year or a bad year. If Florida has a large crop of oranges and it comes to market at the same time as yours, your returns will be low; if you yourselves overstock the market the price will be low and your profits small, but these are not reasons for lower rates. The fact that your orchard interests have developed and are continually developing is all the reason that is necessary to show that the rates have been low enough. Let us, therefore, stop contending over the rate question and let us give our attention to the increase in tonnage and to better service. You will be surprised to find how small the rate matter will seem.

HARMFUL REGULATION OF RAILROADS

Having now discussed the great big point of difference let us glance at some of the troubles other than low rate that affect the prosperity of the railroads. In order to control the rates you have formed commissions and the railroads are thus the subject of regulation. This should be a help rather than a trouble if properly handled, but they are, as a matter of fact, over-regulated. There is regulation by the state commission; there is regulation by other state commissions; there is regulation by the Interstate Commerce Commission; there is regulation by the Health Commission; there is regulation by the highway commissions; regulation everywhere, and then when the different commissions have reached the limit of their consciences the legislatures take a hand. Have you ever heard of the full crew law where the legislature has declared in the interest of public safety how many brakemen shall be provided for trains? Can anyone show why a train in Illinois can be operated safely with two brakemen and the same train in California must have three? This simple little California law costs the Santa Fe alone \$50,000 a year. Have you ever heard of the train length law? Possibly not, but in a neighboring state they limit the number of cars that may be handled in a train. Can anyone show why the public safety of Arizona is benefited by limiting the length of trains to seventy-five cars.

whereas in practically every other state it is permitted to haul all of the cars the locomotive will pull? It is not regulation to which there is objection, it is fool regulation, it is conflicting regulation. Do you know that the Santa Fe railroad has to deal with thirteen state commissions and in addition with the Interstate Commerce Commission and the regulations of the various commissions differ from each other and also in some cases with those of the Interstate Commerce Commission?

And now you have afflicted the railroads with valuation. The state of California valued them and not only has the state spent a large amount on the work but so have the railroads. As this work was approaching completion the United States began to value them and they have been doing the entire thing over. The cost to the Santa Fe railroad, of the Interstate Commerce Commission valuation alone, is estimated to be over one million dollars and I assume as much more to the government. This might be justified if anyone could point out the advantage either to the railroad or the state. I claim that the valuation law has been enacted under a misconception. There seems to have grown up in this country the thought that the railroads should only be allowed to earn six per cent or less on their cost and that anything they earn over this is stolen from the public. This is an absolutely wrong idea. It has been necessary in the past to resist, in the courts, rate reductions and the only way this could be done was by showing confiscation; which necessitated showing that the given rates did not allow 6 per cent on the value of the railroad. But nowhere has it been decreed that 6 per cent must be the limit of the earnings. If this should be fixed as a limit there would be no surplus in the good years to help out the bad years and the average would be so low as to stop all investment. As a matter of fact, rates should not be and are not fixed on the basis of the cost of the property but should depend on the principle mentioned above; viz., that which will develop the maximum business.

RAILROADS MORE IMPORTANT THAN WATERWAYS

We felt, at first, that no matter what rates were charged we could stand them if we could only get the railroads. We then reached the conclusion that the rates were too high and that unlimited competition was needed to control this feature, and gave aid and encouragement to every railroad that asked for it. This led to the competition we desired, but other evils at once manifested themselves, such as lower rates to larger shippers. We finally stopped the discrimination by requiring that all rates be published, but we also absolutely stopped competition in rates; for what road would name a lower rate when its rival would at once meet it, leaving as the only effect of the lowered rate less income for both? We then turned to competition by water. We gave government aid to waterways and we are today pouring yearly into our waterways millions and millions of useless expenditures. You, in California, urged the Panama Canal. I know that from a railroad man a statement that money spent in waterways, yes in the Panama Canal, is economically a mistake will not carry much weight, just at present, but I make the assertion boldly and will trust to time to convince you. Have you ever realized that the charges for water service would be higher than those on the railroad if they were based on the actual cost of the improvements or that, on the other hand, the rates on the railroads could be less than they are on the water if the entire interest and maintenance of the railroads should be absorbed by the government? Have you ever realized that the railroads employ more men than can possibly be employed by water routes and that the number of people employed in your midst is a direct element in the prosperity of a country? Have you ever considered that the fostering of waterways turns from the railroad the tonnage which is the

one absolute requirement to enable low rates and that you thus deprive them of the power to give the service that is necessary for the best development of agriculture? All these things should be taken into account, and have been too little considered in the past in the making of our laws and in our feelings toward the railroad problem.

You can thus see how we, in this country, are floundering. In the teachings that will go forth from this temple which we are dedicating today let it be shown that the railroad is the twin brother of agriculture, that in considering what is best for one we must consider the interest of the other, that regulation does not mean strangulation; that unlimited competition may become destructive competition and that a low freight rate is not the panacea for all the troubles of the farmer.

"SAILING DAYS" FOR L.C.L. FREIGHT

Shortly before July 1 the Pennsylvania Railroad announced a plan for the installation of "sailing days" in the handling of l. c. l. freight and the designation of particular stations at which freight will be received exclusively for specified destinations. The purpose of this plan was the elimination of delays incident to the rehandling of freight when consolidating small shipments into full carloads at transfer stations; the conservation of the car supply by securing better average loading; the reduction in the number of car and train movements required to transfer the given quantity of freight, and improvement in the regularity of this service by systematizing and simplifying operations.

This plan was placed in operation in Philadelphia on September 1, and in Baltimore on October 1. It will also be introduced at New York, Buffalo and Pittsburgh in a few weeks and it is expected that it will be adopted ultimately at all of the important freight shipping centers on the Pennsylvania Railroad. Previous to the inauguration of this plan at Philadelphia and Baltimore, "shipping day guides" were printed and distributed among the shippers and freight organizations in these districts. These guides gave complete information concerning the days on which freight will be accepted at the various freight stations for points in all parts of the country and the closing hours at each station for the various destination points.

The cities have been divided into zones and days have been designated on which each station in the city will receive freight for different points. Closing hours have been fixed at different points throughout the afternoon to relieve the congestion of teams and to increase the capacity of the stations.

In the 10 days from September 4 to 13 inclusive the average loading of l. c. l. cars leaving Philadelphia was increased nearly 34 per cent. On this basis it is estimated that when this new system is in full operation all over the road it will save 1,000 cars a day on the lines east of Pittsburgh and Erie in the transportation of less-than-car-load freight. Since the installation of this system many letters expressing commendation have been received from large shippers, indicating that the plan is meeting with the approval of the patrons of the road.

The benefits of this plan are not confined to the individual road but are also reflected on its connections. For instance, the New York, New Haven & Hartford has announced the installation of a similar practice at a number of its stations.

A large amount of l. c. l. freight originates in New England destined for points south and west of New York and over 100 cars of it are handled through the Pennsylvania transfer station at Waverly, N. J., daily. The consolidation of these shipments at the points of origin on the New Haven will do much to facilitate the operation at Waverly transfer which is now badly congested.

EDWARD L. BROWN

Edward L. Brown, who has been elected president of the Denver & Rio Grande, has had an extremely wide experience in railway work. He has a remarkably level head even for a railroad executive and it was this qualification above all others that recommended him to the board of directors. The Denver & Rio Grande is in a rather unsettled condition. Various factors which are contending for the control of the Missouri Pacific, which is now under the domination of Kuhn, Loeb & Co., have a large investment in it, as has also the Gould estate. It was therefore necessary to select a man as president who not only knew how to operate the railroad—and the Denver & Rio Grande, even if its financial affairs were satisfactorily straightened out, is a hard proposition to operate under present conditions—but its president must also be able to shut out from consideration internal and external difficulties and devote himself body and soul to running the railroad along scientific lines.

Mr. Brown is an indefatigable worker and of such a disposition that he can turn from the most annoying problems to some entirely different subject with apparently a perfectly clear outlook. He is entirely fearless and his weakness as well as his pastime consists of work. He is capable of carrying an immense amount of detail in his head and yet this never seems to obscure the broader outlook of his work or the work of his subordinates. He is a man of kindly disposition and on intimate terms with his employees. Mr. Brown, when he was vice-president of the Denver & Rio Grande several years ago, was in general charge of the reconstruction of the Soldier Summit (Utah) section of the line. This is the most important improvement that the Denver & Rio Grande has undertaken in recent years and the replacement of the 4 per cent line with 15 miles of 2 per cent line removed the point of most serious congestion. This work was described in the *Railway Age Gazette* of November 28, 1913, page 1013.

Mr. Brown was born in Iowa in 1864. His first experience in railroad work was with the Chicago, Rock Island & Pacific in 1875 as a messenger boy. From 1887 to 1890 he was consecutively telegraph operator, station agent and train despatcher on this road. In 1883 he was appointed joint agent of the Chicago, Rock Island & Pacific, the Wabash and the Iowa Central, in which capacity he served until 1888. From this time to April, 1891, he was general agent of the St. Paul & Duluth, with office at West Superior, Wis., and from April, 1891, to November, 1891, was commercial agent on that same road, with headquarters at St. Paul, Minn. In November and December of 1891 he was chief despatcher and superintendent of telegraph, and from December, 1891, to March, 1896, he was master of transportation on this road, being promoted to superintendent in March, 1896, and retaining this position until June, 1900. From June 15, 1900,

to February 1, 1902, he was superintendent of the Lake Superior division of the Northern Pacific, with office at Duluth, Minn., and from February, 1902, to April, 1903, was general superintendent of the Montana Central. In April, 1903, he was appointed general superintendent of the Eastern district of the Great Northern, and held this position until March, 1907, when he became general superintendent of the same district with headquarters at St. Paul, Minn. From October, 1907, to February, 1912, he was general superintendent of the Western district of the Great Northern, having his headquarters at Seattle and Tacoma, Wash. From February, 1912, to July, 1913, he was vice-president of the Denver & Rio Grande at Denver, Colo. In July, 1913, he was elected vice-president of the Western Pacific also, and transferred his headquarters to San Francisco, Cal. He was elected to the presidency of the Minneapolis & St. Louis in September, 1916, but was forced to give up this position in March, 1917, because of ill health, which later necessitated an operation at Rochester, Minn.

E. L. Brown

INCREASED RATE PROCEDURE

The Interstate Commerce Commission's proposed tentative order outlining a method of procedure under the amendment to the commerce law that requires railroads to secure the approval of the commission before they may file a tariff containing an increased charge is in the main satisfactory to the railroads. This was stated by representatives of the roads in various territories, at the hearing called by the commission at Washington on Monday to consider the proposed order. Representatives of the shippers, who were present in large numbers, appeared desirous of having some plan which would give them complete notice of the carriers' applications in time to protest, but were not agreed as to how such a plan could be carried

out in practice and expressed no particular opposition to the order. The opinion was expressed on both sides that the plan should result in bringing about a greater degree of co-operation between the carriers and the shippers through conferences before tariffs are prepared and that it will probably result in many rate controversies being threshed out before tariffs are filed instead of afterward.

It was brought out during the hearing that approximately 1,100 applications for permission to file tariffs are now pending before the commission.

G. M. Freer, president of the National Industrial Traffic League, said the shippers were especially interested in securing detailed notice of the applications before they are acted upon and said he had received a suggestion that applications be put on file at places where the roads are now required to keep a complete file of tariffs. Luther M. Walter suggested that either the commission or the carriers pay for publishing lists of applications in a trade paper or papers. R. D. Rynder, speaking for a number of Chicago attorneys practicing before the commission, suggested that applications be

kept on file for 30 days, but that this should not apply to merely perfunctory tariffs intended to correct errors, etc., which should be allowed to become effective at once. He thought the plan of sending notice of applications to shippers' organizations would prove inadequate. S. H. Cowan expressed the opinion that the commission should not attempt to decide as to the reasonableness of rates before approving them for filing. A. E. Helm, of the Kansas Commission, thought that the commission should have a large measure of discretion as to handling applications; that as to many it could dispose of them informally and without publicity and as to the others it should give general notice and hold hearings.

On behalf of the southern carriers, R. Walton Moore said that the tentative plan should be given a trial and that the commission should not attempt to restrict its practice by too many rigid rules. Because a large majority of the applications would be of minor importance, the commission should not attempt to fix a definite period before they could be acted upon and a plan of widespread publicity would be unnecessary.

J. C. Lincoln, of the Merchants' Association of New York, thought a plan could be arranged by which the carriers could notify interested shippers.

F. H. Wood, representing the western lines, said the matter should be left to the broadest discretion of the commission. Otherwise, he said, the law would prove unworkable, but he thought that great good might result from it if it can be made workable, by offering an opportunity for a freer discussion with shippers about proposed advances before they are put in tariff form. He thought one result would be to do away very largely with the suspension docket.

The commission has announced that its board heretofore known as the Investigation and Suspension Board will hereafter be known as the Fifteenth Section Board and in addition to its previous duties will in future receive for the commission all applications of carriers under the amended fifteenth section for permission to file tariffs carrying increased rates, fares or charges.

THE MAINTENANCE PAINTERS' CONVENTION

The fourteenth annual convention of the Maintenance of Way Master Painters' Association of the United States and Canada was held at the Hollenden Hotel, Cleveland, Ohio, on October 16 to 18 inclusive. The officers of this organization for the past year were: President, F. C. Rieboldt, master painter, Chicago, Milwaukee & St. Paul, Milwaukee, Wis.; first vice-president, H. E. Conrad, master painter, Pennsylvania Railroad, Huntington, Pa.; second vice-president, A. E. Wilson, master painter, New York, New Haven & Hartford, Hartford, Conn.; secretary-treasurer, F. W. Hager, master painter, Fort Worth & Denver, Fort Worth, Texas.

The convention was called to order by President Rieboldt with an attendance of about 40 members and guests. After prayer by Rev. John S. Rutledge, an address of welcome was made by Harry L. Davis, mayor of Cleveland, who spoke on the efforts being made by the people of the city to insure the success of the second Liberty Loan. Mr. Rieboldt, in his address, called particular attention to the steps taken by the American Railway Association which are designed to bring about the eventual co-ordination of the work of the various voluntary railway organizations, the plan being to designate the American Railway Engineering Association at the primary body to exercise proper supervision and discipline over the others. He urged a consideration of the matter by the convention. The secretary's report showed a membership of 75, there being no appreciable change during the past year.

A paper by C. F. Loweth, chief engineer, Chicago, Milwaukee & St. Paul, which, owing to his absence, was read

for him, and entitled "Painters and Painters," presented a rather broad aspect of the painter and his relation to life and his work.

C. H. Hall, general superintendent, Patton Paint Company, Milwaukee, read a paper on the "Painting of Interior Walls." In this he discussed the use of white lead, zinc oxide and lithophone composed of approximately 72 per cent barium sulphate and 28 per cent of zinc sulphide, as the pigments for this class of work. The relative values of these materials for interior use were outlined with respect to whiteness, durability, use with dryers and enamels and in the production of various finishes. Emphasis was placed on the need of economizing in the use of materials and the need of resorting to other ingredients for paints at the present time. The need of clean, dry surfaces was urged as absolutely necessary for success, since even the best materials may give poor results if these conditions are not fulfilled.

Edward H. Brown, editor of the *Painters' Magazine*, gave an extemporaneous talk on the present paint material situation. He said that the present estimate for the flax seed crop of the United States was 11,000,000 bu., whereas the normal consumption for the manufacture of linseed oil was 29,000,000 bu. The average annual production of flax seed in this country is above 16,000,000 bu., the deficiency being made up ordinarily by seed produced in Argentina. However, the last South American crop was a virtual failure and the shortage is a most serious one. China wood oil and other oils that may be used as substitutes in some cases are also scarce owing to inadequate shipping and other reasons. Soya beans and sunflower seeds, the cultivation of which has been encouraged in this country for the production of substitute oils are so much in demand for food, that they do not help the paint oil situation to any extent.

Zinc white is practically out of the market, as the government is now requiring it to be conserved for use in automobile tires. Whiting from which putty is made is also scarce, as it has not been imported for over six months owing to the diversion of shipping in favor of products considered more essential at the present time. Attention was also directed to conditions in England which may eventually obtain here to the serious embarrassment of wall paper hangers. As a measure of food conservation the British government has forbidden the use of flours of any kind for pastes.

H. B. Wilson read a paper on the measures to be taken to protect the public from paint or accident when painters are at work around stations, with particular reference to safe scaffolds and ladders and barriers to keep people away from the wet paint. This led to discussion of the use of drop cloths and building paper to protect floors and furniture.

FEW METERS AND HIGH WATER CONSUMPTION.—With only 6.9 of its services and 21 per cent of its consumption metered a per capita water consumption of 249 gal. a day was indicated at Chicago in 1916, according to the last annual report of John Ericson, city engineer. On a very hot August day the pumpage was 320 gal. per capita, and from 8 to 10 a. m. the rate was 340 gal. per capita. The total pumpage at these two rates was 753,000,000 and 850,000,000 gal. Every available pumping unit was in service.

WAGE INCREASES ORDERED IN JAPAN.—The Far East Commercial Supplement states that the Railway Board has decided to raise the wage standard. Officials receiving less than 40 yen (\$19.94) per month are to have a 2-yen (\$1) increase, and those who are paid per diem are to get 6 sen (3 cents) more each working day. "Two yen a month seems to be a small sum, but it means a great deal to this class of workers. All private establishments will probably follow suit," the newspaper states.—*Commerce Report*.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., October 17, 1917.

EASTERN ROADS ASK TO REOPEN RATE CASE

The eastern railroads, at a conference with the Interstate Commerce Commission on Wednesday, will begin negotiations looking to a renewal of their campaign begun early in the spring for a general advance in freight rates which the commission granted only in part in its decision in the 15 per cent case in June. It is understood that the western roads are considering similar action, but have not yet reached a definite decision.

The request of the eastern carriers came in a letter to the commission, dated October 12, from George F. Randolph, commissioner for the lines in Official Classification territory, requesting an informal conference. To this Chairman Hall replied by wire on Saturday that the matters referred to might be presented to the commission at a public session on Wednesday afternoon. Mr. Randolph's letter was as follows:

"The Trunk Line traffic executives, after a discussion today, desired me to try to arrange for a short informal conference with the commission next Wednesday or Thursday (Wednesday preferred) to talk over the rates on traffic not favorably acted upon in the recent decision of the '15 per cent advance in rates case,' some of which are now covered by suspended tariffs and hearings arranged for, others covered by tariffs which carriers cancelled at the suggestion of the commission; and possibly other matters germane to the subject of securing all of the results originally asked for.

"The thought arises from the carriers' keen necessities as shown by the results since the case was presented and was encouraged by the language of the commission on page 23 of its decision as to amplifying its order if the necessity became apparent. If a few of us could have the privilege of such conference on next Wednesday, it is thought it will be of great assistance at the present time in reaching a prompt conclusion as to future action."

The commission's decision allowed advances approximating 15 per cent in the eastern class rates and advances were also allowed to go into effect in the rates on bituminous coal, coke and iron ore. Since then the carriers have filed tariffs on numerous commodity rates, as to which it was claimed that advances were made necessary because of their relation to the class rates and the commission has suspended them.

The hope of the carriers that the commission may change the opinion expressed in its report of June 27 is based on the recent reduction in net income taken in connection with the commission's statement that "we shall, through the medium of the monthly reports of the carriers, keep in close touch with the operating results for the future, and if it shall develop that the fears which have prompted the carriers are realized or that their realization is imminent, we shall be ready to meet that situation by such modification or amplification of the conclusions and orders herein reached and entered as are shown to be justified."

While gross earnings have been increasing rapidly throughout the year expenses have been increasing so much faster that the net operating revenue for eight months of the calendar year, according to the preliminary summary for 177 roads given out by the commission on Saturday, shows a falling off of \$9,000,000 as compared with the corresponding period for 1916. For the eastern roads alone, however, the loss as compared with 1916 was nearly \$40,000,000, the western and southern roads still showing a gain over last year. The eastern roads, however, have shown a decrease in operating income for every month of this year, and the net revenue for eight months, according to the preliminary summary, was \$5,029 per mile as compared with \$5,714 in 1916. Their operating revenues per mile had increased from \$17,955 to \$19,663, but expenses had increased from \$12,209 to \$14,634. For August the western lines also showed a decrease in

net, while the southern lines still showed an increase and for the 220,455 miles of road the net revenue was \$507 as compared with \$528 in August, 1916.

The commission in its decision gave an estimate based on four months' figures that the ratio of operating income to investment for the year would be 5.81 for all roads and 4.89 for the eastern roads, although it said that increasing costs subsequent to April would probably diminish these figures somewhat. For seven months of the year the ratios were 5.55 for all roads as compared with 5.87 for the corresponding months in 1916, and 4.73 for the eastern roads, as compared with 6.51.

There has been considerable talk in Washington recently about a change in the policy of the administration regarding its attitude toward the railways, which it is believed has been brought about in part at least by contact with some of the big men in the railroad and financial world who have been in Washington for war work, and in part by recognition of the important part being played by the railways in carrying on the war. Senator Newlands, chairman of the joint congressional committee on interstate commerce, was recently quoted as follows:

"We have passed that period in the relations of the government and the railways when the activities of the government shall be directed to punitive and correctional action. The things which the government set out to do more than 10 years ago in the way of regulating the railways of the United States have been accomplished. The time is now at hand when the attitude of the government must and will become one of constructive co-operation."

FUEL ADMINISTRATION PROVIDES FOR RAILROAD NEEDS.

The first of a series of orders to distribute coal on a priority basis and regulate the movement of coal cars, issued on October 10 by Fuel Administrator Garfield, provides for taking care of the fuel coal requirements of the Pennsylvania Railroad, which serves about 700 mines, by a plan under which all producers of bituminous along the Pennsylvania will contribute regularly their pro rata share of the fuel needed for its operation, at the prices fixed by the government except where already fixed by contract. It was also announced that other railroads will be served through similar orders soon to follow, which will comprise the first series.

Commercial coal will be distributed by the second series of orders in the apportionment plan, giving preference in order to the government, domestic users, public utilities and all commercial organizations using coal. The present order, which recognizes the fact that unless the railroads are adequately supplied with fuel no one else can be, was adopted after conferences extending over the past two weeks with a committee composed of the following: C. M. Scheaffer, chairman Commission on Car Service; D. E. Spangler, the member of the Commission on Car Service who gives especial attention to coal matters; G. W. Kirtley, assistant to K. S. Lovett, director of priority in transportation; E. H. De Groot, Jr., chief of Division of Car Service, Interstate Commerce Commission; A. G. Gutheim, attorney-examiner Interstate Commerce Commission; L. A. Sneed, representing the Fuel Administration; T. H. Watkins, president Pennsylvania Coal & Coke Corporation; J. Lloyd, Jr., of the Altoona Coal & Coke Company; W. K. Field, president Pittsburgh Coal Company and president National Coal Association; and B. W. Warren, attorney for the Fuel Administration.

The Pennsylvania, like many other railroads, was unable to contract for its full supply before the President's prices went into effect, and not only has the uncontracted coal supply been small but it cannot be obtained at higher prices. The road has therefore been obliged to confiscate coal and to set aside certain days on which it would set cars for loading only with fuel coal. Representations were made some time ago by mine operators to the Fuel Administration that their

coal was being confiscated by the railroad. The statement of the Fuel Administration says that the road's right to do this is unquestioned but that the practice diverted a good deal of commercial coal already contracted for, which displeased dealers to whom it had been consigned and also resulted in an uneconomical use of cars, confiscating cars that otherwise would have been available for commercial loading because often the railroad was obliged to keep coal on the cars longer than is necessary in the regular course of business.

The order provides the method of apportioning the uncontracted coal and also that operators who have already agreed to supply the road with the amount that would be deemed their correct percentage will continue their contracts and remain unaffected by the new order. Other mines must contribute the amount declared to be equitable by the Fuel Administration at the government price. It is stated that the amounts required will, in some instances, interfere with the delivery of full consignments called for by their contracts with customers but the railroads must be kept running and the Fuel Administration suggests that operators withhold coal from persons or corporations needing it least, and that they also attend particularly to the supply of roads other than the Pennsylvania.

"It is deemed particularly essential," the statement continues, "that coal needed by the United States government be not interfered with. The Fuel Administration may make a special priority order in special cases and intends to care fully for domestic users. Munition plants and firms manufacturing necessities of life would come into the priority order class. The plan is expected to show immediate results in an increased supply of coal cars and a steady, equitable flow of fuel to the railroads." Some of those who had to do with drawing up the order also hope that it may have some effect after the present emergency is a thing of the past as a possible foundation for placing the provision of a railroad fuel supply on some regular basis which will recognize the paramount needs of the railroads for coal and do away with the necessity of confiscation and similar methods which often cause much friction. The order is in part as follows:

"It appearing to the United States Fuel Administrator that, under the present method of procuring for the use of the companies hereinafter named railroad coal not now under contract, and which under present conditions can not now be contracted for, by the Pennsylvania Railroad Company for the use of itself and its operated companies . . . there results loss of car efficiency, discrimination in car supply as between mines, disturbance of the mine-labor factor, interference with commercial coal distribution, and interference with priority orders covering the distribution of other coal; and that an adequate and regular supply of bituminous coal for use as railroad fuel by said Pennsylvania Railroad Company and its aforesaid operated companies is necessary for the national security and defense, for the efficient prosecution of the war, and to facilitate the movement of necessities as defined in the act of Congress hereinafter referred to.

"The United States Fuel Administrator acting under authority of an executive order of the President of the United States, dated August 23, 1917, appointing said administrator, and in furtherance of the purpose of said order and of the act of Congress therein referred to and approved August 10, 1917.

"*Hereby orders and directs* that from and after October 15, 1917, and until further order of the Fuel Administrator, but not exceeding the duration of the war in which the United States is now engaged, and subject to modification hereafter by him, producers of bituminous coal operating mines (including mines hereafter opened or beginning or renewing operation) located on the lines of and served by the Pennsylvania Railroad Company and its aforesaid operated companies shall produce, sell, ship, and distribute bituminous coal to said Pennsylvania Railroad Company and its aforesaid operated companies for their use as railroad coal, upon the following plan:

"(1) The percentage proportion which the aggregate requirement of said Pennsylvania Railroad Company and its aforesaid operated companies bears to the capacity of all such mines, as rated by the railroad, shall be ascertained, and each mine which is furnishing such or a greater percentage under contract shall, during the life of the contract, continue so to produce and sell such coal at the contract price, and shall ship and distribute such coal regularly each week when the mine operates and ships, and so far as practicable in equal daily quantities regardless of other obligations.

"(2) The requirement not obtained from mines furnishing such or a greater percentage under the preceding paragraph (1) shall be requisitioned from the remaining mines in the going government price, subject, however, to any revision which may be made retroactively effective in the percentage proportion that such remaining coal requirement of said Pennsylvania Railroad Company and its aforesaid operated companies bears to the capacity of such remaining mines as rated by the railroad, subject, however, to the limitation that each mine under contract shall produce and sell not less than its contract obligation at the contract price, and shall ship and distribute all such coal regularly each week when the mine operates and

ships, and so far as practicable in equal daily quantities, regardless of other obligations.

"*It is further ordered*, That said Pennsylvania Railroad Company and its aforesaid operated companies shall, not later than Saturday of each week, file with the undersigned a statement showing the tonnage of the coal which during the following week shall be requisitioned from each producer and mine upon the authority of this order, and shall post in the office of the car distributor for each district concerned a copy of the statement so filed with the undersigned, and shall give notice to each producer from whom coal shall be requisitioned upon the authority of this order, showing the amount of coal which during the week following shall be requisitioned from each of such producer's mines.

"*It is further ordered* that this order for assuring an adequate and regular supply of bituminous coal for the Pennsylvania Railroad Company and its aforesaid operated companies is hereby given priority, subject, however, to diversion and other regulation by the Fuel Administrator, either generally or in any special case, over all and any contracts of any producer operating mines located on the lines aforesaid."

COAL PRODUCTION

The Fuel Administration issued a statement on October 10 stating that the coal production this year will exceed that of last year by 10 per cent and that of two years ago by 23½ per cent. These figures were compiled by the U. S. Geological Survey in a bulletin showing that last year's bituminous production was in excess of 502,000,000 tons and that this year's production should reach 552,000,000 tons, while anthracite should show substantially the same increase. According to the Geological Survey America is now nearly a month ahead of last year's production at this time. The embargo against sending coal to Canada has been lifted and an arrangement has been made by which it will be supplied on a pro rata basis substantially as though it were a state of the Union. Last year Canada got approximately 19,000,000 tons of coal from this country. "The question of shortage for this year," said Dr. Garfield, "will depend upon whether the American demand has increased by more than the 10 per cent increase in production. If our industrial development, from the war and other causes, has grown beyond that then we must go short. We have no figures at hand to tell what that development has been."

The Fuel Administrator has announced a further classification of bituminous coal mines in several outlying districts allowing considerable increases in the prices as compared with those fixed in the President's original price-fixing order.

Anthracite coal dealers and operators controlling most of the country's supply held a meeting with Federal Fuel Administrator Garfield and his staff on Tuesday, to discuss the anthracite situation and arrange for co-operation in production and distribution.

A working committee of three will be designated among the dealers, to aid in collecting data which are to be put at the disposal of the Fuel Administration. Anthracite is being shipped at present in large quantities to the Northwest, New England and other parts of the country that particularly need it. Shipments to New England during the first eight months of 1917 were 665,704 tons greater than for the corresponding period last year, according to figures furnished the Fuel Administration by the Anthracite Bureau of Information.

Aggregate shipments for the first eight months of this year were 6,455,941. Last year they were 5,790,237. Shipments from the anthracite region have been going forward to New England for the past two months in 50-car trains at the rate of two trains or more a day. Because of the late spring, shipments of anthracite to the upper lake ports to September 1 were slightly less than up to the same time last year. The priority order by which a continuous flow of coal is going westward by water is expected to remedy this soon.

THE RAILWAYS OF HONDURAS.—The railway system of Honduras at the present time consists of 579 km. (359 miles) of line, including those belonging to the National Lines, the line from Puerto Cortes to Potrillos (operated by the state), the Vaccarro Railway (a privately owned line), the Tela Railway, the Cuyamel Fruit Company's line, and the Trujillo Railway.

National Association of Railway Commissioners

President Max Thelen of Association Discusses Railroad Problem and the Duty of Commissioners in War Time

THE 29th annual convention of the National Association of Railway Commissioners was held at Washington beginning October 16 with an attendance of representatives of the Interstate Commerce Commission and of 31 states. Max Thelen, of the California Commission, president of the association, presided.

Henry C. Hall, chairman of the Interstate Commerce Commission, delivered an address of welcome, following the usual custom, in which he referred to the changed conditions in the transportation business brought about by the war and urged the utmost co-operation among the regulating commissions and the carriers and shippers in solving the problems necessary to win the war as speedily as possible. He described the organization of the Railroad's War Board and said that the result of the co-operative action on the part of the railroads was immediately responded to by a similar spirit on the part of shippers. If the railroads had stood on their rights and attempted to act arbitrarily, he said, there never would have been produced such results as have been brought about by the cheerful getting together of both sides. A similar policy had been pursued by the Commission's Division of Car Service in co-operating with the Commission on Car Service, the Fuel Administration and the Director of Priority of Transportation, with the result that it has not been necessary for the Interstate Commerce Commission to issue any orders under the authority conferred by the Esch-Pomerene law.

The various interests have been able to work together in such a way that their action has been the result of a consensus of opinion as to what was best, and as a result the orders of the Commission of Car Service have met with almost unanimous and instant response from the individual railways because there has always been knowledge that if any of its orders were not complied with they might be followed up by mandatory orders of the Interstate Commerce Commission. This illustrates, Chairman Hall said, that the importance of the existence of power is not always shown by the use of that power; often the knowledge that it is there is sufficient. Referring to the activities of regulating bodies, he said that the necessity of winning the war bears upon all in their respectful official capacities and, in so far as is consistent with the laws under which they act, the state of war should be considered as a prime factor in whatever action is taken. He referred to the increased inefficiency of freight operation, brought about by the co-operation of shippers and carriers as an example to all and urged special efforts to compose differences before they reached the stage of formal litigation. He also reiterated the commission's former recommendations toward a greater degree of co-operation between the state and the federal commissions, saying that although there has been no legislation along these lines, the association, through the selection of a committee, might prepare the way for such co-operation during the war in such a way as to avoid any conflict of jurisdictions. Chairman Hall referred to the law passed by Congress last year giving the President power to take over the operation of railroads if necessary, saying that the power to commandeer the railroads has not been exercised, while the power to commandeer carriers by waters has been exercised. This power over the railroads, he said, may yet be exercised, but thus far all who have had to deal with the problems of railway transportation have worked together so harmoniously that the President has not seen the need of exercising his authority.

Max Thelen, president of the association, delivered the

opening address of the convention, in which he said in part:

THE DUTY OF THE STATE COMMISSIONS DURING AND AFTER THE WAR

"At this time, when individual action yields to collective patriotic endeavor, each member of the National Association of Railway Commissioners asks himself—What action can I take and what action can my commission take to serve the nation during the war, and what can I do now in preparation for the vital problems which will come after the war, so that they may be wisely and patriotically solved and so that the nation in the solution thereof may grow stronger, more efficient and more fit?

"It, of course, goes without saying that each commissioner pledges himself unreservedly to every service which his state and his nation may ask of him in the present emergency. We all desire to be of service, but to many of us the path of most effective service is not clear. In the hope of being able to translate our desire to help into terms of specific and definite action, I shall draw attention to certain steps which, in my judgement, the various state commissions can and ought to take to help the nation in the war.

"To assist in the solution of our serious car shortage problem, the state railroad and public service commissions have sent circular letters urging all shippers to co-operate with the railroads by prompt loading, by loading to full capacity and by prompt unloading of freight cars, by distributing empty cars into districts where needed, increasing the daily mileage of locomotives and freight cars, reducing the number of locomotives and freight cars awaiting repairs in shops, and other measures the railroads have patriotically assisted in securing greater efficiency of their limited transportation equipment. While the co-operation of the public authorities, the shippers and the railroads has produced gratifying results, the situation is still serious and threatens to become more acute during the remaining months of the year.

"The state commissions must render further service in the car shortage problem. Wherever we find in our states that extra fare or limited passenger trains are being run in excess of reasonable necessity, wherever we find that unnecessary trains of any character are being operated between competitive points, wherever we find that other unnecessary expenses are still being incurred by the railroads, it is the duty of the state commissions to take affirmative action, to draw the matter to the attention of the railroads and to urge them, not merely to authorize them, to eliminate the unnecessary service and expense so as to conserve their transportation efficiency. While we are at war, the American people do not need luxurious passenger service. In these matters the state commissions should be leaders and not followers.

"The permanent solution of the car shortage and other fundamental railroad problems are matters to which I shall hereinafter refer. Let us, however, at the present time take every emergency measure which can be of assistance, even though temporarily inconveniencing our people, so as to help win the war.

"So important do I regard the giving of direct and immediate assistance by the state commissions to help win the war that I recommend to this convention that it create a Special War Committee which shall be charged with the duty of conferring with the appropriate federal and state authorities and with each state commission and of giving advice

and suggestions as to what each commission can do affirmatively and constructively to help the nation in the present emergency."

Mr. Thelen referred to the applications of the steam railroads to the Interstate Commerce Commission and to the various state commissions to increase their freight rates 15 per cent, which, he said, were based largely on increased operating expenses due to the war, but he said it is a matter of gratification that concurrently with these increased operating expenses there have been such increases not only in gross revenues, but also in net revenues that it will presumably not be necessary for the steam railroads to press their applications where they have not already been dismissed. He then referred to the increases in net earnings in the early months of the year and said that, while there was a decrease for the first six months, the position of the railroads should be measured not by comparison with the record year of 1916, but by the increase of nearly \$155,000,000 in net earnings for the corresponding six months of 1915. While he considered the steam railroads in a condition of prosperity, he declared that many other public utilities have not enjoyed the increase in business which has come to the railroads and that the state commissions should give prompt and sympathetic consideration to their applications for higher rates.

Where applications of railroads for the reduction of elimination of service are reasonably necessary to increase efficiency, they should, he said, be granted, but reductions in necessary service to rural communities and other portions of the country should not be allowed while the carriers at the same time "continue to maintain expensive, not to say, luxurious and largely unnecessary service between competitive points for the purpose of securing business from their rivals.

Expenditures for additional railroad depots or for other new structures or extensions, he said, will, of course, not be ordered by the state commissions while the nation is at war unless absolutely necessary, but he resented the efforts of various public utility representatives to secure from commissions the enactment of formal resolutions that the commission will not order the railroads and other utilities to incur unnecessary expenditures during the war. Before these suggestions were made, he said, most of the state commissions had already decided to refrain from directing any public utility to incur substantial expenditures which can fairly and reasonably be deferred until after the war.

Discussing the railroad problem, Mr. Thelen continued in part as follows:

THE RAILROAD PROBLEM

"The railroad problem in the United States has permanently moved beyond the ownership and operation of the railroads as disconnected entities by private companies. The issue now and hereafter is an issue between consolidated operation of our railroads in private ownership and their unified operation directly by the people through government ownership. National exigency, lofty patriotism, and perhaps a realization that government operation was immediately impending unless private operation met the emergency, prompted the railroads of the United States, immediately after the declaration of war, to operate as a single consolidated American system and in doing so, to eliminate a portion of the waste and inefficiency which were pointed out by the Interstate Commerce Commission in the Five Per Cent Advance Rate Case and which for years have been recognized and commented upon by state railroad commissioners and other students of railroad problems. But what is now being accomplished is only a small part of what must be done if our railroads are to measure up to our new standards of national efficiency.

"Who has not seen passenger and other trains constantly running half empty over two, three or four parallel rail-

road tracks, between the same communities? Who has not seen in our large cities splendidly equipped passenger and freight offices of competing railroad systems, side by side, on the same street, with hosts of competing passenger solicitors, freight solicitors, and other employees, all striving to take business away from the competing railroads? Who has not seen luxurious and unnecessary passenger trains operated by rival railroads at great expense between competitive points for the purpose of attracting freight business from other railroads operating between the same points? Who has not seen in multitudinous forms the results of our laissez faire policy which has permitted our railroads to develop duplications of facilities and of service which have resulted and still result in enormous annual losses to the nation? Who has not observed the increasing difficulty or our railroads in securing at reasonable interest rates or at all the new capital imperatively necessary for extensions and betterments? Who has not observed the unsound financial structures of many of our railroads, leading to bankruptcy proceedings as inevitably as the inexorable laws of time? I am not now speaking of causes but only of the facts which are patent to all.

"These conditions may be summarized as follows:

- "1. Duplication of facilities.
- "2. Duplication of service.
- "3. Duplication of operating expenses.
- "4. Difficulty in securing necessary new funds.
- "5. Unsound financial structures.

"What the railroads are now doing is being patriotically done and deserves and is receiving the unstinted praise and commendation of all American citizens. But what they are now doing in seeking to ameliorate car shortage is merely a scratching of the surface. The other conditions to which I have referred must be remedied if our railroad transportation system is to substitute efficiency and financial stability for inefficiency and weakness and if it is to measure up to the standard of national efficiency which the people of the United States will imperatively demand after the war.

"The question to which thoughtful students of public affairs have been and are now giving attention and to which we as public officials engaged in the supervision and regulation of railroads must give consideration is—Will these necessary changes be brought about under private consolidated management of the railroads or are we to be driven for their solution to government ownership?

"These problems and others are included in the exhaustive program of the Joint Congressional Committee of the Senate and the House of Representatives, commonly known as the Newlands committee.

"With the exception of federal control over the issue of securities, the remedies which have been proposed by the railroads to the Newlands committee are, in my opinion, merely patchwork. They will not cure the matters to which I have referred, which matters are fundamental. Federal incorporation of the railroads is in itself merely a shifting of the machinery of corporate organization and control and as proposed by the railroads will cure none of the fundamental conditions from which the railroads are suffering.

"One of the questions which is included in the program of the Newlands committee is the comparative worth and efficiency of government regulation and control as compared with government ownership and operation.

"The last convention of this association authorized the appointment of a special committee on public ownership and operation, with instructions to consider and report at this convention on the question of public ownership and operation as contrasted with private ownership and operation of public utilities. This committee will present to the convention a report showing its understanding and interpretation of the present-day trend of the changing relations between the public utilities and the people and suggesting to

this association a general outline of the subject, with recommendations indicating along what lines further investigations and studies should be made.

"The subject is one of increasing importance. In my opinion, this association can do no greater constructive work than to ascertain and report the facts in connection with the private and the public ownership and operation of public utilities, so that if this nation should hereafter find it necessary to resort to public ownership and operation of our railroads and other public utilities, it may have at hand a solid foundation of fact on the basis of which it can enter on such task wisely and successfully.

FEDERAL RAILROAD VALUATION

"The Interstate Commerce Commission is at the present time engaged in the most gigantic public utility valuation in the world's history. I refer to its ascertainment of the facts entering into the value of the property of the railroads of the United States, generally known as the federal railroad valuation.

"The Interstate Commerce Commission, through its Division of Valuation, has been hard at work and has made substantial progress. The valuation will be of tremendous importance to the people of the United States when our people finally enter upon the scientific and comprehensive control over the issue of railroad securities and will be of inestimable value if it hereafter becomes necessary to have the government itself take over and operate the railroads.

"The carriers seem to be generally opposed to the ascertainment of the facts by the federal government. The Boston American of August 23, 1917, is authority for the statement that the Advisory Commission of the Council of National Defense, consisting largely of representatives of the railroads and affiliated interests, had advised the Council of National Defense to have the valuation of the railroads suspended during the war. That an effort to suspend or stop the valuation was made is generally known. The effort thus far has been unsuccessful.

"There is nothing in the present emergency which would justify the suspension of the valuation work. For the purpose of taking intelligent action hereafter, the people of the United States are entitled to know, as promptly as possible, the facts with reference to the value of our railroad properties. The valuation work must go on.

"I recommend to this convention that the work of its Valuation Committee be continued and to the various states of the union that they continue, to the extent of their respective abilities, the unselfish and patriotic support which they have heretofore given to this association and to its valuation committee in this work.

"Within the last few months, the railroads have resumed their campaign of publicity against the state and federal commissions. I have purposely said nothing on this subject in my address and I do not propose now to do so. While this nation is at war is not a proper time for the railroads to again enter upon their attacks. Rather should we all unite our efforts and present a common front, so that in harmonious, united action the nation can be most effective in the present contest."

OTHER REPORTS

Reports were presented by 31 standing committees as follows: Executive Committee, Express and Other Contract Carriers by Rail, Safety of Railroad Operation, Railroad Service Accommodations and Claims, Grade Crossings and Trespassing on Railroads, Railroad Rates, Statistics and Accounts of Railroad Companies, Car Service and Demurrage, Public Utility Rates, Service of Public Utility Companies, Safety of Operation of Public Utility Companies, Statistics and Accounts of Public Utility Companies, Valuation, Capitalization and Intercorporate Relations, State and Federal Legislation, Publication of Commissions' Decisions, and Special Committee, Public Ownership and Operation.

The Committee on Safety of Railroad Operation, C. C. McChord, of the Interstate Commerce Commission, chairman, presented a résumé of the authority and activities of the state commissions which have reported to it on this subject and presented the following recommendations, believing that proper action upon each of them will result in material increase in the safety of railroad operation:

(1) That the inspection of railroad tracks and track equipment by all the commissions having jurisdiction with respect thereto be continued and extended.

(2) That the use of the block system should be made compulsory.

(3) That steps be taken to secure uniformity of operating rules on the railroads of the United States.

The Committee on Grade Crossings and Trespassing, J. B. Walker, of the New York Commission, chairman, presented a discussion of grade crossing reforms in the various states in a series of recommendations on the trespassing situation, as follows:

(1) The passage of such federal legislation as may be necessary to eliminate trespassing on railroad rights-of-way. We believe this would be best accomplished by a statute which would be enforceable not alone by the federal authorities but by state and local authorities as well. We believe that to make this statute effective its violation should carry a suitable punishment for the offender either by fine or imprisonment or both.

(2) That the commission of each state give wide publicity to the statistics covering trespass accidents and lose no opportunity to point out that trespass laws are intended to protect human life and limb rather than property rights.

(3) That the railroad companies continue the anti-trespass campaign they have inaugurated and that the state commissions render them all possible assistance in carrying them out.

The Committee on Statistics and Accounts, Arthur A. Lewis, of the Washington Commission, chairman, presented a recommendation that a committee consisting of one member, respectively, of the statistical or accounting department of each commission, the Interstate Commerce Commission and the Association of American Railway Accounting Officers, be appointed by the president of this association for the purpose of preparing and submitting to the next annual convention a uniform annual report schedule.

The Special Committee on Public Ownership and Operation, E. O. Edgerton, of the California Commission, chairman, agreed that no report should be written or can be written at this time with definite conclusions or definite recommendations for or against public ownership. The committee was agreed that any recommendation on so important a question should not be a matter of opinion merely adding argument to the already endless controversy, but should be based on the most exhaustive and thoughtful study of all phases of the problem. It recommended that the National Association appoint a permanent committee to deal with this question to represent the association, if necessary, before governmental or other bodies, if prior to the end of the coming year important action should be taken by the government in this direction, and to make a report to the national association at its next meeting.

Samuel Rea, president of the Pennsylvania Railroad, addressed the members at a banquet on Wednesday evening. An abstract of this address will be found on another page of this issue.

EMBARGO ON CANADIAN RAILS.—An order-in-council has been passed at Ottawa, Can., under the War Measures Act, prohibiting the exportation of steel rails from Canada to countries other than the United Kingdom, British possessions and protectorates.

RAILWAY OPERATING EFFICIENCY

How each freight car and locomotive in the service of the railroads of the United States has been doing its bit in the way of increased service to help win the war is clearly shown in the monthly reports just received by the Railroads' War Board of freight operations during the month of July and in a similar compilation giving the combined results for the three months April, May and June, the second quarter of the year.

With only 1.3 per cent more locomotives in service and

an increase of 18.7 per cent in the efficiency of each locomotive. The revenue ton miles per car increased 17.5 per cent.

This was accomplished, the report shows, by increasing, the number of tons of freight to each train from 617 to 681, or 10.4 per cent, and loading an average of 2.7 tons more, or 11.1 per cent, in each car, while the average mileage run by each locomotive per day was increased 4.4 miles or 6.8 per cent. The average mileage per car per day increased 1.9 or 7.2 per cent. While the percentage of empty car mileage was increased slightly, 3.9 per cent, the average number of cars in shop or awaiting shop was reduced 9.1 per cent and

d Decrease

only 2.3 per cent more freight cars than in July, 1916, railroads operating 220,054 miles of line in July, 1917, handled 20.2 per cent more ton miles of revenue freight. In other words, the 30,277 freight locomotives in service in July handled the equivalent of 33,434,368,526 tons of revenue freight one mile, or an average of 1,104,283 ton miles for each locomotive, as compared with 930,455 in July, 1916,

the average number of locomotives in shop or awaiting shop was reduced 8.7 per cent.

For the three months' period, for 227,156 miles operated, the increase in revenue ton miles was 17.6 per cent, while the increase per locomotive was 16.1 per cent and per car was 15.3 per cent.

The figures for July are shown in the table.

Automatic Straight Air Brake System

Description of the Design and Operation of a New Triple Valve for Passenger and Freight Equipment

A NEW air brake system has recently been perfected by the Automatic Straight Air Brake Company, 14 Wall street, New York, for freight and passenger equipment, which contains many new and interesting features of operation. The purposes of this brake are to give rapid serial action to the brakes throughout a train, to maintain a constant and uniform brake cylinder pressure regardless of piston travel, to permit a variation of brake cylinder pressure at the will of the engineman, to provide a proper and quick release of the brakes for any brake pipe reduction, to

The triple valve is made up of disk valves and diaphragms, no slide valves or pistons being used.

Due to its construction and operation this brake has the characteristics of a straight air brake and at the same time is automatically operated. The straight air features are obtained through the fact that with every application of the brakes air is exhausted from the brake pipe under each car. In case of a service application air from the brake pipe is exhausted into the brake cylinder and in case of an emergency application the air from the brake pipe is exhausted to the atmosphere. In the first case the air is not wasted but is used to build up the pressure in the brake cylinder in conjunction with the supply of air from the service reservoir. In both cases the rapidity of serial action is increased due to the fact that the brake pipe pressure is reduced locally at each car.

The design of the triple valve is such that when fully charged the pressure in the brake pipe acting on the underside of a diaphragm balances the pressure in the auxiliary reservoir acting on the upper side. A reduction in brake pipe pressure causes the auxiliary reservoir pressure to force the diaphragm downward admitting air to the brake cylinder from the brake pipe and service reservoir. The air in the brake cylinder acts on a second diaphragm which is connected to the first and which is of one-half its area. The pressure in the auxiliary reservoir remains unbalanced forcing the diaphragm down until the force exerted by the brake pipe pressure on the underside of this diaphragm plus force exerted by the air in the brake cylinder on its diaphragm exceeds it. The diaphragm will then be raised and the supply of air to the brake cylinder cut off. Thus it will be seen

Service Application of the Brakes with Quick Release

The top curve represents brake cylinder pressure, the full line in the lower set of curves represents the pressure in the auxiliary reservoir, while the dash line shows the pressure in the brake pipe. The pen indicating the brake pipe pressure is set a distance of one minute back of the pens indicating the brake cylinder and auxiliary reservoir pressures. The above curves show that as the brake pipe pressure is reduced, the brake cylinder pressure of 20 lb. is obtained at once, which is increased on further reduction of the brake pipe pressure to about 50 lb., the pressure in the auxiliary reservoir remaining constant. With the building up of the brake pipe pressure, a small amount of air from the auxiliary reservoir is released to the brake pipe to hasten the release, the rapidity of release being indicated by the brake cylinder curve.

provide for a full emergency application of the brakes at any time, to provide a graduated or quick release as desired, and to provide an economical use of air.

This brake system provides a quick action passenger brake, one brake cylinder being used for a service application and two brake cylinders for an emergency application of the brakes. As the triple valve is capable of compensating for varying volumes in brake cylinders, a second brake cylinder can be added to existing freight equipment for empty and load braking, the braking system retaining at the same time all of its functions and principles.

The brake is operated by the engineman in the same manner as is common with present day practice. The equipment can be used interchangeably with other existing equipment. The main features of this new brake are found in an entirely new triple valve with its auxiliary, service and quick action reservoirs. The auxiliary reservoir is of the same volume as that ordinarily used, the service reservoir has a volume of 2,100 cu. in. and the quick action reservoir a volume of 200 cu. in., which with an additional volume due to brake pipe connections, gives an increase in volume of about 2,300 cu. in. per car on 10-in. freight equipment. The service reservoir is used for service and emergency applications of the brake, the auxiliary reservoir is used for an emergency application of the brake and for a quick release of the brake in contrast to a graduated release. The quick action reservoir is used only in making an emergency application of the brakes.

Emergency Application of the Brakes

In this case the brake pipe pressure was reduced to zero, giving an instantaneous brake cylinder pressure of 55 lb. with an accompanying decrease in auxiliary reservoir pressure. At release more air is taken from the auxiliary reservoir to aid the release as described under the quick release operations, the brake being released in about 10 seconds. Due to the construction of the triple valve, the auxiliary reservoir pressure is then raised, through the charging port, with the brake pipe pressure, the difference in the amount being due to the spring used on the auxiliary reservoir diaphragm. This record was obtained from car 61 in the 100-car test rack described in the test.

that the brake cylinder pressure bears a direct relation to the brake pipe reduction and is not affected by the brake piston travel or brake cylinder leakage. By regulating the brake pipe pressure, any brake cylinder pressure may be obtained.

Each triple valve is provided with means for making a graduated or quick release. The graduated release is obtained by building up the brake pipe pressure from the locomotive. The quick release feature is obtained by raising the

brake pipe pressure three pounds, at which time auxiliary reservoir air is released to the brake pipe under each car.

Interesting features of this brake are that service applications can be varied at the will of the engineman by his regulation of the brake pipe pressure without the necessity of releasing the brakes before a re-application when operating with the graduated release, and the fact that the auxiliary reservoir maintains a reserve supply for a full emergency application, regardless of the number of service applications made. The triple valve is of such a design that after a train has once been charged, an emergency application will automatically be made if for any reason the brake pipe pressure should be reduced to zero.

This company has been making a series of exhibition tests on a 100-car test rack composed of 51 A S A brake equipments and 49 brake equipments in common use today, which were attended by between 200 and 300 railroad representatives. The equipments have been distributed in multiples of five throughout the train, that is, five A S A equipments, five other equipments, etc., with the hundredth car being an A S A equipments. These tests have shown that the time between the application of the brakes on the first car and the hundredth car with a service application is about 14 seconds, and with an emergency application about 8 seconds. Records taken on trainographs of a service application with quick release,

by the maintaining valve when open, to pipe 41c and on top of the valve 77. The air passing through valve 55 passes through pipe 10 to chamber 85 of the change-over valve and from there through valve 95 and hollow stem 94 to the service reservoir. From chamber 85 the air also passes up through ports 14 into chamber 90 above the diaphragm 88. The air passing through valve 55 also passes to chamber 47 above the diaphragm 43. As the pressure in chamber 47 plus the pressure caused by spring 50 equalizes with the pressure in chamber 40a, the diaphragm 43 will be depressed, allowing valves 71 and 55 to be closed by their springs.

Emergency Section.—The air in pipe 1a passes to chamber 39a past the clearance 44 into chamber 40 above the diaphragm 39, keeping the valves 60 and 60a closed. This pressure also acts on valve 46, keeping it closed. From chamber 39a the air also passes through the port 68 to the chamber 81 directly through port 74 and to the quick action reservoir.

SERVICE BRAKE APPLICATION

The service application of the brake is made in the usual way by reducing the brakepipe pressure. This reduces the pressure in chamber 2 of the service section and pipe 1a lead to the emergency section.

Service Section.—The reduction in pressure in chamber 2

Performance of the Brake Under Conditions of a Gradually Depleted Brake Pipe, Showing the Performance Under Graduated Release

With the reduction in brake pipe pressure, the brake cylinder pressure increases until both are about 45 lb. From that point a further reduction in brake pipe pressure will cause a reduction in brake cylinder pressure, and in no case below this point will the brake cylinder pressure be less than the brake pipe pressure. A prolonged reduction of the brake pipe pressure was made purposely to disclose this fact. As the brake pipe pressure increases, the brake cylinder pressure increases until a pressure of 45 lb. is obtained in both the brake cylinder and brake pipe. From that point on, the graduated release goes into operation and with a further increase in brake pipe pressure, the brake cylinder pressure will be reduced. It will be noted that the auxiliary reservoir pressure has not changed.

a service application with graduated release and an emergency application are shown in the illustrations.

The following, to be used in connection with a diagrammatic illustration of the triple valve, gives an outline of the operation of the A S A triple valve:

CHARGING THE TRIPLE VALVE

The air from train line 1 passes into chamber 2 of the service section and into pipe 1a leading to the emergency section.

Service Section.—The air pressure in chamber 2 acts on the diaphragm 3, raising it until the valve 9 is uncovered. This permits the air to pass through a small port 18 into chamber 4 and the auxiliary reservoir. The spring 7c exerts a force equivalent to three pounds of air and as soon as the pressure in chamber 4 is within three pounds of the pressure in chamber 2, the valve 9 will close.

The air from chamber 2 also passes through port 12 into the hollow stem 6 past the non-return valve 32a into chamber 30 and on top of valve 32.

From chamber 2 the air also passes through the passage 42 to chamber 40a where it raises the diaphragm 43 which lifts the left hand end of lever 65, opening valves 71 and 55. The air passing through valve 71 passes through pipe 68

permits the pressure in the auxiliary reservoir and chamber 4 to depress the diaphragm 3. This lowers the valve stem 6 and with it diaphragm 29, valve cage 28 and valve 32 and with it valve 35 which is rigidly connected to 32. As valve 35 seats on the cage 135, the opening between the brake cylinder and chamber 25 with the atmosphere is closed. The cage 28 drops away from the valve 32, permitting the air in chamber 30 to pass into chamber 25 which is connected directly to the brake cylinder, thus charging the cylinder. Air also flows from chamber 40a and from the service reservoir through the valve 95, pipe 10 and valve 55 to chamber 2, thus augmenting the air supply in chamber 2 which passes to the brake cylinder.

As the force exerted by the air pressure in chamber 25 on the diaphragm 29 plus the force exerted by the air pressure in chamber 2 on diaphragm 3 exceed the force exerted by the air pressure in chamber 4 plus the pressure of spring 7c, the spindle 6 will be raised with the valve cage 28, seating valve 32, cutting off the supply of air to the brake cylinder. Since the area of diaphragm 29 is about one-half that of diaphragm 3, the pressure in chamber 25 to provide equilibrium will be about twice the reduction made in chamber 2. If for any reason the pressure should leak off from the brake cylinder, the forces will again become unbalanced and

valve 32 will again be open until equilibrium is once more established. In this way the brake cylinder pressure will always remain a certain definite function of the brake pipe for each brake pipe reduction. The air pressure in chamber 47 will be reduced with the pressure above the valve 55, but as it with the spring 50 is greater than the pressure in chamber 40a, the diaphragm 43 will always remain down during the service application of the brake.

Emergency Section.—The reduction of the brake pipe pressure causes a reduction in chambers 39a and 40 without operating any of the parts. The reduction is so gradual

sure in chamber 2, diaphragm 3 and with it valve stem 6, diaphragm 29 and valve cage 28 will be raised, this will lift valve 35 from its seat, permitting the pressure from the brake cylinder to release to the atmosphere, until the pressure in chamber 25 has been reduced sufficiently to re-establish the balance destroyed by the increase in brake pipe pressure. At this time the service section will again move to lap position. In this way the release may be graduated in as many steps as desired, the full release being obtained when the brake pipe pressure has been restored sufficiently to balance the auxiliary reservoir pressure. In

Triple Valve for the Automatic Straight Air Brake System

that the pressure from 81 will be relieved through passage 69 without operating diaphragm 63.

RELEASING THE BRAKES

Graduated Release.—To obtain the graduated release the maintained valve 80 is closed, thus cutting out the use of the valve 77 and the auxiliary reservoir pressure. With the service section in lap position, that is, with the pressures in chambers 25 and 2 balancing the auxiliary pressure in chamber 4, by raising the brake pipe pressure and the pres-

sure in chamber 2, diaphragm 3 and with it valve stem 6, diaphragm 29 and valve cage 28 will be raised, this will lift valve 35 from its seat, permitting the pressure from the brake cylinder to release to the atmosphere, until the pressure in chamber 25 has been reduced sufficiently to re-establish the balance destroyed by the increase in brake pipe pressure. At this time the service section will again move to lap position. In this way the release may be graduated in as many steps as desired, the full release being obtained when the brake pipe pressure has been restored sufficiently to balance the auxiliary reservoir pressure. In

Quick Release.—To obtain the quick release, the maintaining valve 80 is opened, as shown by the full lines in the illustration. With the increase in pressure in chamber 2, the performance of the service section will be as described above. The pressure in chamber 40a will be built up, raising diaphragm 43 and with it the left hand end of lever 65, which will open valve 71 a short time ahead of valve

55 on account of the clearance between the right hand end of the lever and the bottom of the slot in the valve body 55a. Opening valve 71 permits air from the auxiliary reservoir which is at a higher pressure than the air in chamber 40a to pass forward through valve 77, pipe 68, through valve 71 into chamber 40a, thus rapidly increasing the pressure in chamber 2 and insuring a quick release of the air pressure from the brake cylinder. With the brakes released the system will be recharged as described above.

EMERGENCY APPLICATION

There are no movements of the parts in the emergency section during charging, service, lap, and release operations. The moderate service brake pipe reductions permit the air to flow from the quick action reservoir 82 to the train pipe through the restriction screw 69 at the same rate as the brake pipe reduction is taking place, thereby maintaining equal pressures on both sides of diaphragm 63.

To obtain an emergency application, a rapid and prolonged brake pipe reduction is made. This causes the service section to assume service position quickly and reduces the pressure in chamber 39a of the emergency section faster than the pressure in the quick action reservoir 82 can be reduced through the restriction screw 69.

The pressure in chamber 81 above diaphragm 63 will then be higher than the pressure in chamber 39a, with the result that diaphragm 63 will be forced down. Stem 64, moving with the diaphragm, will depress the inner end of the fulcrum lever 65a and the left end will be raised, thereby raising the brake pipe exhaust valve 46, and venting the brake pipe pressure direct to the atmosphere.

The sudden reduction of brake pipe pressure quickly reduces the pressure in chamber 40a of the service section, thereby opening the valve 55 and causing a corresponding reduction in chamber 85 of the change-over valve through pipe 10. The pressure in chamber 85 of the change-over valve will then be reduced faster than the service reservoir pressure can flow through the restricted opening of valve 95, and as the upper chamber 90 is in direct communication with the service reservoir through ports 14, the high service reservoir pressure above diaphragm 88 forces the diaphragm down. This movement closes valve 95 and opens valve 103. The closing of valve 95 seals the service reservoir from the brake pipe, and the opening of valve 103 releases the service reservoir to chamber 41 of the emergency section valve 103a and through pipe 106.

This action occurs instantly and diaphragm 39 is raised by the decreasing brake pipe pressure, in chamber 40, and the increasing service reservoir pressure in chamber 41, thereby raising the yoke 55b. The upward movement of the yoke closes vent valve 51 and opens valves 60 and 60a. The opening of valve 60 releases the auxiliary reservoir to chamber 41 through pipe 41c. From chamber 41 the air from both the service and auxiliary reservoirs flows past valve 60a through pipe 41d to chamber 25 and the brake cylinder.

The operation of the parts just described quickly reduces the brake pipe pressure, and assures a quick and positive emergency application of the brakes throughout the train.

Valve 46 will remain open until the entire brake pipe pressure has been reduced sufficiently to assure an emergency application. The length of time depends upon the time required to vent the pressure in chambers 81 and 82, above diaphragm 63, to chamber 39a. This is determined by the size of the opening through the restriction screw 69. When the pressure in chamber 81 has been reduced to an equality with that in chamber 39a, spring 76 raises diaphragm 63 and spring 77 closes valve 46.

A release of the brakes after an emergency application is affected by raising the brake pipe pressure above the

pressure in chamber 4 which, in emergency, is equal to brake cylinder pressure. When the pressure in the brake pipe and in chambers 2 of the service section and 40 of the emergency section is raised above the equalized pressure in chambers 4 and 41, diaphragm 39 will be depressed, closing valves 60 and 60a, and opening vent valve 51. This releases the pressure in chamber 41 to passage 61 and the atmosphere, and the upward movement of diaphragm 3 opens exhaust valve 35, releasing the brake cylinder pressure to the atmosphere.

When the brake pipe pressure has been raised in chamber 85 of the change-over valve above the service reservoir pressure in chamber 90, diaphragm 88 will be raised to its normal position in which it is held by spring 18, and the service reservoir will again be charged.

Should an emergency application be desired following a service application, and service reservoir and brake pipe pressures are below the emergency brake cylinder pressure, valve 103a will prevent the emergency brake cylinder pressure from returning to the service reservoir.

TRAIN ACCIDENTS IN JULY¹

The following is a list of the most notable train accidents that occurred on the railways of the United States on the month of July, 1917:

Collisions			Kind of accident	Kind of train	Killed	Inj'd
Date	Road	Place				
7.	Louisville & N.	Cave City.	bc	F. & F.	1	6

30.	Central N. J.	Galilee.	fire	F.	1	1

The trains in collision near Cave City, Ky., on the 7th were northbound freight No. 74, second section, and southbound freight No. 15. Both engines and 10 cars were wrecked. One fireman was killed and six trainmen were injured. The cause of the collision was the overlooking of the schedule of train No. 15 by the men in charge of the northbound train.

The trains in collision near North Wilbraham, Mass., on the 11th were eastbound freights. The leading train was in charge of Conductor Carpenter, with engine 1203; it was moving slowly from a siding to the main track and was run into at the side by the following train. One locomotive and 15 cars were wrecked. One engineman, one fireman and one brakeman were slightly injured. The collision occurred about 4:25 p. m. Carpenter's train had been standing on a siding. After a passenger train went by, Carpenter, who was out ahead of his train, said he looked back along the track, which is straight for two miles, saw

¹Abbreviations and marks used in Accident List: xc, Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc, obst., Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—F. or Pass., Passenger train—F. or P., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

nothing coming, and signalled to come ahead. He said he heard a sudden shrill whistle and suddenly a fast freight (engine 1020) loomed up. All hands then tried to stop, but the front end of 1203 projected eight or nine inches over the main track. It appears that Carpenter had opened the switch after the other freight train had passed the last preceding block signal and then did not wait a sufficient time to see if there were a train in the block, approaching. In the collision engine 1020 hooked the 1203 just back of the cylinder and dragged it out on the main line. The 1020 glanced from the heavier 1203 and turned over on its side; and the leading cars of its train piled up, leaving the 1203 still on the rails. Seven cars of hogs were crushed, about 300 animals getting out alive. Four cars of coal made the usual immovable pile, and the wreck blocked both main tracks until 11 p. m.

The trains in collision near St. George, N. Y., on the 14th were a northbound passenger train consisting of a locomotive and three cars, and a heavy freight engine without train, the freight engine running into the rear of the passenger. The freight engine had no persons on it, having been started, in some way not explained, by a repair man in the yard at Clifton; and, running at about 40 miles an hour, it struck the passenger train moving at about 20 miles an hour. The engineman of the passenger train shut off steam and applied the brakes; but the engine at the rear pushed the train about a mile and finally off the track at the St. George tunnel. One employee riding in the baggage compartment, at the rear of the train, was injured and was sent to a hospital; but the other passengers, 35 of them, who in a few cases were slightly injured, were all sent to their homes.

The trains in collision at Nashville, Tenn., on the evening of the 16th were southbound freight No. 73, first and second sections. The first section had been stopped by a block signal and was run into at the rear by the following section. The conductor, in the caboose, was killed. Responsibility for the collision is charged against the flagman of the first section, who did not properly protect his train.

The train involved in the collision at Rosamond, Cal., on the 16th was an eastbound passenger. A string of six loaded freight cars, which escaped control at a point 14 miles west ran down the grade and into the rear of the passenger train and wrecked one car, a sleeping car. Two other cars were overturned. One passenger and one trainman were slightly injured. The runaway cars passed over a derail, which failed to stop them because it broke (by reason of defective metal) at the point of contact with the wheel flange.

The train involved in the collision at Peoria, Ill., on the 17th was westbound passenger No. 201. The train ran through a misplaced switch and collided with a yard engine standing on a side track. Two employees were killed and one seriously and three slightly injured.

The trains in collision at Passaic Junction, N. J., on the morning of the 28th were eastbound freights. The leading train had just begun to move, after a stop, when the following train ran into the caboose, wrecking the caboose and overturning the engine. Eight cars were damaged. A drover in the caboose of the leading train was fatally injured and 4 trainmen were less severely hurt.

The trains in collision at Eureka, W. Va., on the morning of the 29th about 3 o'clock were westbound passenger No. 77 and eastbound freight No. 98, second section. One fireman was killed and three other trainmen were slightly injured. The freight, drawn by two engines, had run past a meeting point and encroached on the time of the passenger train. It had been stopped and the flagman had gone forward a short distance but there was a dense fog, and the flagman had not had time to go far enough to protect his train.

The train derailed near Toccoa, Ga., on the 1st of July

was northbound passenger No. 38. The engine and first three cars were ditched.

The train derailed near Shippenville, Pa., on the 5th was a northbound passenger. The engine fell down a bank and the engineman and fireman were scalded, the former fatally. No passengers were injured. The cause of the derailment was distortion of rails by solar heat.

The train derailed near Granogue, Del., on the 8th was southbound passenger No. 12. The engine fell down a bank and was overturned. Two trainmen and 12 passengers were injured. The cause of the derailment was not determined.

The train derailed near Dalton, Ga., on the 8th was southbound passenger No. 93. Fifteen passengers and five trainmen were injured. The cause of the derailment was not determined.

The train derailed on the Boston, Revere Beach & Lynn at Winthrop, Mass., on the 10th was a southbound passenger. One passenger was killed and eight were injured. The derailment was caused by the moving of a movable point frog, beneath the moving train, by a student signalman, though it appears that the regular signalman was in the cabin. Electric track-circuit locking, which would have prevented the movement of the frog under the train, is being installed, but is not finished.

The train derailed near Caldwell's, N. C., on the 17th about 5 a. m. was northbound passenger No. 26. The whole train was overturned and the engine and cars fell down a bank. The fireman and one passenger were killed and the engineman, one mail clerk and three passengers were injured. The derailment was due to a loose rail from which the angle bars and 11 spikes had been maliciously withdrawn.

The train derailed near Victoria, La., on the 18th was a special passenger carrying soldiers. One soldier was killed and five were injured. Four coaches were overturned.

The train derailed on the Louisiana & North West near Homer, La., on the 18th was a northbound passenger; two coaches were overturned and 14 passengers were slightly injured. The cause of the derailment was spreading of rails.

The train derailed near Hope Mills, N. C., on the 20th was southbound passenger No. 89. Running at about 20 miles an hour, the first car behind the engine was derailed by the weakening of the roadbed by a washout and six cars altogether were ditched. Several passengers and three trainmen slightly injured.

The train derailed near Bryan, Tex., on the 28th was a northbound passenger. The engine and first two cars were overturned and the fireman was killed. Two other trainmen were injured.

The train involved in the accident at Edgewater Park, N. J., on the 28th was a westbound freight. The cars in the train were set on fire by burning gasoline spilled from tanks in a motor truck which was driven into the locomotive of the train at a highway crossing. The gasoline, being lighted presumably by contact with the locomotive firebox, ran along the ditch at the side of the track and set several cars on fire. Sometime after the wrecking of the truck a second tank exploded and did serious damage within a radius of 300 ft. Two cars and the railroad freight house were burned up. The driver of the motor truck was injured, and the explosion caused the death of one and the injury of 14 other men, most of them firemen, fighting the flames. This crossing has an automatic warning bell which is said to have been ringing; the train was moving at about 20 miles an hour.

The train involved in the accident near Galilee, N. J., on the 30th was a southbound passenger. The train struck an automobile truck on a highway crossing causing an explosion of gasoline, the engine and the two cars of the train were at once in flames. One coach was burned up, as was

also the passenger station. The engineman and fireman were severely burned; the engineman fatally. The driver of the wagon was killed.

Electric Car Accidents.—Seven accidents to electric cars occurred in the first five days of July, and were reported in the *Railway Age Gazette* of July 13, page 77; in these accidents the number of persons reported killed was 18 and of injured 185. At Montclair, N. J., on the 17th an electric car filled with a picnic party ran away down a steep grade and 60 persons were reported injured. This car was started by accident, or by the action of some mischief maker, while the conductor and motorman had got off for the purpose of assisting another car which was in trouble.

Canada. In a butting collision of passenger trains on the Canadian Northern near Villeneuve, Alberta, 21 miles west of Edmonton, July 30, five passengers were killed and a large number injured. The reports indicate that the collision was due to a mistake in a train order or to the non-delivery of an order.

RAILROADS HAVE SUBSCRIBED FOR \$48,750,000 OF LIBERTY LOAN

The railroads which are now stretching every muscle to secure Liberty Bond subscriptions among their employees and to advertise the loan to their patrons, are leading the way themselves by having subscribed up to Wednesday evening for almost \$50,000,000 in bonds for their own treasuries.

In last week's issue of the *Railway Age Gazette* a list was given of 11 roads that had subscribed \$37,250,000 in the Second Loan, and note was made on another page that the Pennsylvania had taken \$5,000,000, a total for 12 roads of \$42,250,000. During the past week additional subscriptions have been recorded of \$3,500,000 by the Chicago & North Western \$2,500,000 by the Chicago, Milwaukee & St. Paul and \$500,000 by the Virginian, making the total up to Wednesday night of \$48,750,000.

The Liberty Loan Committee on Railroads headed by A. H. Smith, president of the New York Central, has received assurances that nearly every important road in the country is offering to assist its employees to take bonds on the partial payment plan. Railway employing officers the country over are going after it strong with personal talks, shop meetings and local conferences. A special drive is being made for those who did not subscribe to the first loan and extra efforts are being made to assist those who took bonds in the first Liberty Loan and who are to that extent still tied up on payments.

On some railroads an arrangement has been made whereby banks will take the bonds in the first issue not yet paid for, the employee's partial payments on the bond being applied instead on bonds in the second loan.

"Do you believe in insurance?" says the appeal sent out by the General Liberty Loan Committee of the Central of Georgia, headed by W. B. McKinstry, auditor. "This question," the appeal continues, "will be affirmatively answered by a large majority of Americans today, when practically every known risk may be protected by insurance of some character, but the danger which confronts our country can be averted by only one form of protection—men and more men. Thanks to the patriotism of Americans, as a whole, the men are or will be available to protect our homes and shores from the invasion of the Prussian hordes, but those men require transportation, clothing, equipment and food, and those necessities may be secured only through one medium—*money*! To cover this risk, Uncle Sam is now offering a form of insurance in policies of variable amounts, which he calls *Liberty Bonds*. These policies are of the single premium variety, fully paid up, non-assessable and fully participating. Non-assessable, in that they are not

subject to taxation and fully participating in that they pay interest until their maturity. These policies are backed by a reserve represented by the strength of the government of the United States and are strictly mutual in that each purchaser is a part of the government, and by his patriotism and loyalty can guarantee the validity of his policy.

"How much insurance will you buy?"

THE DAYTON BOOK UMBRELLA

A "book umbrella" is a small rectangular glass box, open at the underside to permit the user to insert his hand, designed to hold a car record book so that the number taker, working outdoors, can carry on his work conveniently in spite of rain or snow. The umbrella needs little description other than that afforded by the illustration, showing a man entering on his book Big Four car No. 6,385. It is 6 in. square, light, strong and durable, and is fitted with a strap by which the clerk can suspend it from his shoulder. Clips are provided at top and bottom by which a book, where a book is used, can be held open at the desired page.

An "umbrella" of different shape is made to hold loose flat sheets, these being held by clips, at the upper end,

The Dayton Book Umbrella

working the same as the ordinary clip used in offices. This design is 11 in. wide 13½ in. long and 5¾ in. high.

When required the umbrella is equipped with a light for night use. This is fixed at the upper end of the box so as to illuminate both the writing surface within the box and the number on the side of the car. The light, electric, is, of course, safe for use around cars containing inflammable freight.

The umbrella is made by the Dayton Manufacturing Company, Dayton, Ohio. It has been used in the yards of the American Rolling Mills for several years and is in experimental use on the Baltimore & Ohio, the Big Four, the Southern and other railways.

Bridge and Building Association Convention

Abstracts of Committee Reports and Papers Presented
at the Meeting Which Was Held This Week in Chicago

THE twenty-seventh annual convention of the American Railway Bridge and Building Association was held at the Sherman Hotel, Chicago, on Tuesday, Wednesday and Thursday of this week. The attendance was very encouraging, considering the unusual conditions obtaining in the country at the present time. The discussions indicated an active interest in the reports and papers presented, many of which were of particular application to the problems now confronting the members of the bridge and building staffs on American railways.

The officers for the past year were: President, C. E. Smith, consulting engineer, St. Louis, Mo.; first vice-president, E. B. Ashby, consulting engineer, Lehigh Valley, New York City; second vice-president, S. C. Tanner, master carpenter, Baltimore & Ohio, Baltimore, Md.; third vice-president, Lee Jutton, division engineer, Chicago & North Western, Madison, Wis.; fourth vice-president, F. E. Weise, chief clerk, engineering department, Chicago, Milwaukee & St. Paul, Chicago, and secretary-treasurer, C. A. Lichty, purchasing department, Chicago & North Western, Chicago.

The convention was called to order by President Smith at ten o'clock, Tuesday morning; addresses of welcome or other opening exercises were dispensed with.

President Smith called attention to the trying conditions under which the bridge and building men are now laboring and to the decision of the executive committee to hold the convention to assist the men in their work. The report of the secretary-treasurer showed a balance on hand of \$958.

DELIVERY OF WATER TO LOCOMOTIVES

Water is delivered to the tender of a locomotive either directly from a storage tank or through a pipe line and a discharging device, commonly called a water column, stand-pipe or penstock. Penstocks or water columns have taken the place of tank spouts to a large extent in modern installations of railway water stations, largely because they permit a more convenient location of the tank and also the taking of water at several points. The desirable qualifications in a penstock are a rapid delivery of water with low frictional resistance to the flow, and a valve movement that may be handled and controlled easily without water hammer. The construction of the penstock should be such as to permit it to be operated easily and to be economical in maintenance. The importance of the time element in train service requires that the delivery of water to the tender be made as quickly as possible. For this reason the waterways should be of ample size and the flow of water through the column as direct as possible.

The following paragraph on the discharging capacity of penstocks is taken from the University of Illinois bulletin No. 21:

"It would seem that with a short line of pipe from the supply tank a velocity through the water column of 12 or 15 ft. per sec. may be considered as the maximum desirable for ordinary conditions, and for longer lines the limiting velocity should be smaller. For a long line of supply main the limit of allowable velocity would be perhaps as low as 8 ft. per sec. It would seem, then, that 3,000 gal. per min. for an 8-in. water column, 4,000 gal. per min. for a 10-in. water column and 6,000 gal. per min. for a 12-in. water column may perhaps be considered to be the limit of desirable flow through water columns. It would also appear that a loss of much more than 20 ft. of head for the discharges just men-

tioned may be considered to be excessive, under conditions of ordinary tank supply."

The principal advantages in the use of pen-stocks or standpipes are that they permit the selection of a permanent location for a tank remote from the tracks and out of the way of future construction, and that they make it possible to deliver the water to locomotives from a single storage tank at as many different points as may be desired.

It is important that supply lines leading to penstocks be designed properly. A penstock operating under a low head should have a larger pipe than one working under a relatively high head. The same thing is true of a long pipe line. If the maximum delivery is desired the supply line should be at least two inches larger than the penstock. Where several penstocks are installed in a busy yard or where more than one engine will take water at the same time, the supply line should be large enough to supply water to more than one penstock without any material decrease in the delivery. A 12-in. penstock with a 14-in. main 1,000 ft. long, will deliver 4,000 gal. per min. with approximately the same loss of head as a 10-in. penstock with 1,000 ft. of 12-in. main delivering 2,750 gal. per min. or an 8-in. penstock with 1,000 ft. of 10-in. main delivering 1,750 gal. per min. A distance of 20 ft. from the top of the rail to the bottom of the tank is generally accepted as the economical height of tower for tanks.

The proper location of penstocks is an important factor in the economical delivery of water. At engine terminals they should be located conveniently so that an engine may take water along with other supplies, such as coal, sand, etc., without any switching or back-up movement. Penstocks serving yard engines should be so located that they will not interfere with the movements of road engines handling trains or with the movements of engines to and from the round-house. In a large yard it is important that the engines do not block the switching lead when taking water, the proper location of penstocks being at each end of the yard, where engines may take water after receiving their trains. In a large yard this may mean a heavy expense for pipe lines, but where there is a frequent train movement the expenditure will be justified by cutting down the terminal delay and facilitating the movement of trains. Where the distance from the main supply tank is very great as for example at an isolated penstock at the far end of a station or yard layout, it will frequently prove more economical to locate an auxiliary tank opposite the penstock, as the supply would be taken by gravity from the main tank through a much smaller pipe than if the engines were supplied direct from the main tank through a penstock main.

An important feature in the economical delivery of water to locomotives is the prevention of waste while taking water. This is sometimes due to carelessness on the part of the fireman, but more often is the result of faulty fixtures and improper design of the manhole on the engine tank. The great range in the height of manholes above the rail makes it a very difficult matter to provide fixtures that may be adjusted to the varying heights unless the manhole is of liberal size. This is especially true of tank spouts. The manhole should be rectangular in shape and not less than 16 in. wide and 30 in. long. It will be found that when taking water with a spout without lateral adjustment, the spout will be at the outside edge of the manhole on high tenders and near the inside edge on low tenders. Thus it will be seen that it is impossible to avoid a waste of water

with round manholes unless they are of uniform height above the rail.

(C. R. Knowles, superintendent of water service, Illinois Central, Chicago, is chairman of the committee presenting this report.)

DISCUSSION

The relative merits of the telescopic and rigid types of spouts created active discussion. B. F. Pickering (B. & M.) stated that he has found the telescopic spout more expensive to maintain than the rigid type and that, as a result, he has replaced several of the telescopic spouts with rigid ones. Several members reported that their experience has been the reverse and that the telescopic spout was more economical in maintenance and in water. Mr. Bowers (Pa. Lines) stated that there are 60 rigid spouts in service on the Pittsburgh division and that, although road engines are not required to cut off their trains, no trouble is experienced.

ERECTION OF GIRDER SPANS WITH LITTLE INTERRUPTION TO TRAFFIC

Bridge work must be planned to interrupt traffic as little as possible, remembering that, when trains are stopped on account of a bridge not being ready, a portion of the plant is shut down and the output is stopped until trains are allowed to proceed.

In the erection of railroad bridges under traffic, one of two general methods must be selected for each particular case. The old bridge must be taken out in small portions and the new bridge erected in the same manner, or the old bridge must be taken out and the new one put in by handling one entire span in one operation. The first method is almost always selected when the traffic over the bridge is quite heavy, making it impracticable to suspend traffic long enough to permit the taking out of an entire span. There are times, however, when this method cannot be followed even in the case of large structures and on heavy traffic lines. In such cases falsework cannot be put in for the erection of bridges in sections and some method must be found to put in one entire span at one operation. When bridges are erected by putting in a portion of a span at a time it is necessary to provide a rather large amount of falsework and to arrange this falsework so that the work of changing from the old bridge to the new can be stopped at any point in order to let trains over when they reach the bridge.

The method of putting in bridges by changing out one entire span at a time is usually selected when traffic conditions are not severe. It has the great advantage of requiring little or no falsework. As has been mentioned above, however, this method must be used, no matter what the traffic conditions are, when it is impossible to put in falsework, such as over busy navigable streams or railroads. Almost always the new span is assembled and riveted alongside the span it is to replace. This necessitates the erection of one falsework bent at the end of each pier and abutment to receive the new span in its temporary position. This is usually put on the down-stream side; although if local conditions require it may be put on the up-stream side. Almost always the ties and rails are put on the new span in its temporary position so as to avoid doing that work after the span is moved into its permanent position. Before the new span is moved it is, of course, necessary to dispose of the old span. If time will permit, the best method is to cut the old span apart and lift it out with a derrick car. If, however, time will not permit, falsework bents must be erected on the opposite side of the piers and abutments from the new span so that the old span can be moved out to one side preliminarily to the moving in of the new span. If the weight of the new span and the capacity of the derrick will permit, the new span should be assembled on the ground at the end of the bridge and then carried bodily into place. The old span, of course, can be removed in the same way. When conditions

will permit this method of erection no falsework of any kind is needed.

When through truss spans are replaced with deck-plate girder spans, it is almost always possible to set the girder spans inside of the truss spans by cutting down the masonry and removing the lower laterals and the floor system of the truss spans. Under proper conditions the girders can be lowered with rigging suspended from the top chords of the old trusses. This is a very economical method of erection, but it can be used only on lines where the traffic is comparatively light.

(Lee Jutton, division engineer, C. & N. W., Madison, Wis., is chairman of the committee.)

DISCUSSION

The discussion brought out a number of interesting methods developed by members to renew bridges without interfering with train movements. These consisted mainly in modifications of methods described by the committee.

W. F. Strouse (B. & O.) made a progress report on repairing and strengthening old masonry, giving replies of several roads to inquiries concerning the advisability of grouting old masonry and other expedients. In the discussion C. E. Smith described the conditions existing on the Missouri Pacific ten years ago when the piers or abutments were moving under 150 bridges on line. These substructures were all strengthened by concrete without a single failure. Other members told of different ways in which they had strengthened structures.

PAINT AND ITS APPLICATION TO RAILWAY STRUCTURES

Wooden and frame structures require the greatest amount of attention and expense, for the only practical method to protect them from decay or to improve their appearance is to apply a preservative coating of high-grade paint. Unpainted wood will darken, warp, become fuzzy and damp and finally decay, but it may be protected permanently from these effects through the occasional use of high-grade paints. Paint acts as a preservative on wood because it closes the openings and pores and so prevents the entrance of decay-producing organisms.

The different species and types of woods vary greatly in their makeup, porosity and compactness, all serious points when the initial or priming coat of paint is applied. White pine and poplar, being soft, close and straight-grained woods, comparatively free from shrinkage, possess good absorbing qualities and a ready affinity for paint, while yellow pine and hemlock are hard, coarse-grained, of very resinous and uneven structure, varying from a soft, porous and quick-absorbing, to a very hard and fast surface into which paint cannot penetrate.

The first class requires that the priming coat be reduced to a medium thin consistency, carrying very little turpentine. The second demands a thinner mixture, carrying from 25 to 40 per cent of turpentine.

Nearly every railroad has adopted a certain standard of painting, both as to method and colors, including the formulas composing the different mixtures. These mixtures, called "standard colors," are usually bought in the open market, although some roads have paint-mixing departments of their own. In a great many cases this material is brought ready for application, thus leaving no room for adjustment to fit the different surfaces, and, of course, is applied as received.

The act of priming or first-coating is the most important operation in painting, although in many cases it is not so considered, which is a vital mistake. The priming coat must fill and satisfy the surface, and so create a foundation upon which all future coats can be successfully applied. It must carry sufficient linseed oil not only to satisfy the surface, but must also bind and hold the pigments to this surface. Priming mixtures must also carry the proper amount of turpentine to cause penetration and assist in forcing the

oil and pigment into the surface by absorption. The formation of the pigment must be such as to allow of penetration into the surface, and, above all, must be well and evenly spread and brushed into the surface.

The prime coat should not stand longer than is necessary to harden the film thoroughly and allow for full absorption and penetration. If allowed to weather, it will become porous and absorb the life of the second coat and there will not be sufficient binder left to adhere to the surface properly.

Usually, railway standards and specifications provide whether two or three coat work is desired, but it should be borne in mind that in trying to finish in two coats over dark, hard and pitchy lumber, especially with light shades, success at some future time may be sacrificed. In the second and finishing coating of structures, care must be exercised in spreading the paint evenly and clean and avoid sags and curtains.

Shingle roofs, at least on the better class of buildings, ought to be painted with some high-grade material, not only to preserve the roof, but to improve the appearance of the structure as well. Moreover, a valuable characteristic of high-grade paint is its resistance to fire. On brick and stone structures, with the exception of window and door frames, sash, doors, gutters and down spouts, no painting is really necessary. The method and color for these items is generally the standard in vogue on each system.

On steel and steel-covered structures, the primer or first coat must be selected judiciously. If the standard finishing color for these structures is of a carbon or lampblack base, it would be wrong to use such a paint for the ground coat applied directly upon the steel. This primer should be a properly prepared rust inhibitive coating, from basic pigments, such as red lead, sublimed blue lead, oxide, chromates or the like inhibitive materials. Over such a ground after proper drying time has elapsed, carbon or other standard paints may be successfully applied. Practical tests have proven that ultimate economy is effected by using only the highest grade of the proper kinds of paint for metal protection.

(Chas. Ettinger, master painter, Illinois Central, is chairman of the committee.)

DISCUSSION

In reply to a question the chairman of the committee stated that the smoke and soot created more severe conditions along railways than elsewhere. G. M. Hoffman, Philadelphia & Reading, stated that the practice of that road is to wash buildings thoroughly and then apply one coat of paint every two, three or four years, according to conditions.

FIREPROOFING ROOFS OF WOODEN BUILDINGS

Wooden shingles were almost universally used in the earlier days of railroads for the covering of all ordinary buildings having roofs with a pitch greater than one-fourth, and while they are rapidly losing favor there are certain localities where they will be used for some time to come owing to their moderate cost, light weight, low heat conductivity, wide application and durability. When shingles get old they become a considerable fire risk and are set on fire readily by sparks from passing locomotives. While there are a number of preparations on the market to make them fire-resisting to a considerable degree, they are likely to be neglected beyond the length of time the preparation remains effective and in this way the roof again becomes a fire risk.

Coverings prepared by saturating felt with asphalt, sometimes termed "composition roofings," or "prepared roofings," are sufficiently fire-resisting for all practical purposes, and on buildings which have a pitch of one-fourth or greater, and where appearance need not be taken into consideration, such material laid from rolls in large sheets with 2-in. lap joints may answer the purpose as well as anything. Most wooden buildings with flat roofs or roofs with slight pitch

are best covered with tar and gravel or metal roofs, the former being generally used on main buildings, and tin in sheets on porch roofs and other places where tar and gravel would be objectionable.

Shingles made from a composition of cement, asbestos, etc., having various trade names are used to a considerable extent and they present a good appearance.

Slate shingles have been in use many years, and for roofs having more than a moderate pitch they are perhaps as durable as anything on the market, or much more so. In cold climates where the pitch of a slate roof is less than one-third or one-fourth, it often proves troublesome.

Tin shingles are used to a considerable extent on some roads and give good satisfaction. When secured with the "bar lock" it is impossible for a tin roof to leak during its lifetime. These shingles are manufactured in various ornamental styles and make a neater appearance than any other kind of ordinary metal covering. Their life on railroad buildings depends entirely on the kind of metal and its protective coatings—tin, galvanizing, paint, etc.

The ordinary tar-and-gravel roof is probably more extensively used on roofs having a slight pitch than any other kind of covering, and its wearing qualities are so well known as to require little comment. Its life depends solely upon the quality of the materials used and their application. Roof coverings which require protective coatings are at a decided disadvantage, for the reason that they are liable to be neglected beyond the time when the coating remains effective when the covering suffers and may result in premature loss.

(C. A. Lichty, inspector, purchasing department, C. & N. W., Chicago, is chairman of the committee.)

DISCUSSION

Doctor Herman Von Schrenk described the results of ten years' investigation of methods of fireproofing wooden roofs and of the development of fire retarding paints. He also showed an exhibit of sample roof sections.

UNIFORM VERSUS DIFFERENTIAL RATES OF PAY

By E. T. Howson

Engineering Editor, *Railway Age Gazette*, Chicago, Ill.

The bridge and building department, in common with other branches of the maintenance of way department, is experiencing serious difficulty at present in retaining adequate forces. The competition for men has become unusually keen, particularly since July 1 of this year, when the construction of the cantonnements and other concentration camps for military forces called for large numbers of carpenters and other skilled mechanics at wages far above those which the railroads were paying.

The principle upon which wages in the maintenance of way department are based is that of a flat or uniform rate for every man. This in turn presupposes that all men are worth equal amounts or that they are of equal ability and efficiency. It is primarily because of this foundation that difficulty has arisen in retaining forces. Furthermore, the railways have not kept pace in the last few years with the rapid increase in the wages of skilled workmen in other industries. In many cases it has been considered impracticable to raise the wages of the large numbers of men employed because of the expense involved, while in others the disinclination to disturb relations with the wages of other employees has tended to hold all of them stationary. The result has been that the outside industries have been able to attract the best men, leaving the less efficient to the roads.

One suggestion which has been made to meet this condition in the bridge and building department is that of establishing different rates for the men in the gangs, which rates could be so arranged that while the total payroll for the gang would not be increased, the men would be paid in proportion to their experience. A graduated rate can also be

held out to the newer men in the gang as a reward for experience and as an incentive for them to put forth their best efforts.

One objection to this system which has very largely retarded its adoption is the fact that the establishment of a higher rate for one group of men disturbs relations with other groups. An even more serious objection to the differential rate is the tendency of some foremen, and not a few supervisors, to use such a differential as a means of securing higher wages for as many of their men as possible without regard to their merit or the purpose of the differential.

In spite of these handicaps, a differential wage rate adjusted to the merits of the different classes of employees has much to commend it, particularly at the present time when labor is so scarce and so nomadic. If fairly and intelligently administered, it will benefit a road by enabling it to meet the competition of industries to a greater extent than is now possible, while it holds out the promise of reward to the younger and less experienced but ambitious workmen.

This is not an untried theory, for at least one road; the St. Louis-San Francisco adopted the plan of paying differential rates for its bridge, building, painting and concrete forces over a year ago, with excellent results. The officers in charge of this branch of maintenance work stated that if this plan had not been in effect much of this work, now completed, would have had to have been left undone because of lack of forces. The statement is further made that this plan has been shown to be economical to the road.

DISCUSSION

G. W. Andrews (Baltimore & Ohio), Fred Burrell (Chicago & North Western) and others, reported excellent results from a sliding scale of wages.

PRESENT SITUATION AS TO WATER SERVICE MATERIALS

By C. R. Knowles

Superintendent Water Service, Illinois Central.

Although a very conservative estimate of the increased cost of all materials used in maintenance of way work has been given as 30 per cent, I think we can safely say that with few exceptions, this figure will come nearer representing the minimum increase in the cost of waterworks materials, many items having increased several hundred per cent. The unprecedented prices and the uncertainty of delivery have created conditions which make it very necessary to employ methods that will help to conserve materials used in waterworks construction and maintenance, especially with such materials as are particularly difficult to secure.

From the present outlook some relief appears in sight as regards prices of certain materials, the price of cast-iron pipe having dropped \$15 per ton on October 1; although with the government and foreign requirements, in addition to the greatly increased domestic demands for materials of all kinds, we cannot hope for much relief in the near future, as far as deliveries are concerned.

While all materials have advanced in cost, the increase has been more marked in iron and steel products, and articles manufactured from brass, copper and other semi-precious metals. Boilers have doubled in cost with indefinite dates of delivery on those built to specifications. Steel tanks of all kinds have advanced from 100 to 150 per cent, tank hoops from 75 to 100 per cent, steam pumps from 40 to 50 per cent and oil engines 30 to 40 per cent, with deliveries from 3 to 9 months in the future, depending on the size of the units.

All stocks of steel and wrought-iron pipe have been depleted and it is difficult to even get a quotation on a definite date of delivery on large pipe. Delivery on cast-iron pipe has been fairly good, although the price has more than trebled in two years. We are laying cast-iron pipe today that

ranges in cost from \$18.50 to \$60 per ton, while the lead used in making the joints has advanced from \$3.75 to \$11 in two years.

The following table shows the range in cost of cast-iron pipe from 1912 to date.

Year	1912.....	Approximately	\$20.65 per net ton
Year	1913.....	Approximately	20.35 per net ton
Year	1914.....	Approximately	18.50 per net ton
Year	1915.....	Approximately	18.60 per net ton
Year	1916.....	Approximately	25.00 per net ton
January, 1917.....	Approximately	32.75 per net ton	
July, 1917.....	Approximately	49.30 per net ton	
October 1, 1917.....	Approximately	60.00 per net ton	

It is along the line of salvaging old pipe lines that the greatest good may be accomplished in conserving waterworks materials. The salvage of cast-iron pipe is almost 100 per cent. Except for the cost of removal, a cast-iron line is of as much value when taken out of the ground after years of service as when it was laid. It is true that a year ago, with cast-iron pipe at \$18 per ton, the cost of removal would in many cases have almost equaled the cost of new pipe, but with pipe at \$60 per ton the removal of old lines is a paying proposition. In many instances wrought-iron pipe may also be salvaged to good advantage.

The saving effected by the conservation and salvage of second-hand material is not confined to pipe alone, but includes all classes of materials. Tank hoops may be repaired and used on other tanks. Sound staves and bottom plank may be utilized in the construction of smaller tubs; valves and fittings may be repaired at a small cost and made to answer for new; rubber pump valves may be faced off and used again; pump packing, worn too small for one pump, may be used in a pump requiring smaller packing.

In many cases standards may be revised, substituting material expensive and difficult to secure with that less expensive and more easily obtained. For example, we have changed the design of our water-column pit, eliminating about 3,000 lb. of castings and several hundred pounds of reinforcing bars, and I believe we now have a better designed pit than we had before. The difficulty in securing steel plates and the great increase in the cost of steel tanks have forced many railroads which had practically adopted the steel tank as standard to return to wood. The high price of steel has also stimulated the interest in concrete tanks and there is great activity along this line. The high cost of cast and wrought iron pipe has caused many railroads to give serious consideration to substituting wood stave for iron pipe.

A great deal may be accomplished in conserving materials by overhauling scrap piles and reclaiming second-hand material, also by cleaning out shelves and the pump houses of the ever-present accumulation of globe valves, fittings, etc., held for a fancied emergency that never occurs. Scrap has advanced in price to such an extent that in some instances the scrap value of an article is in excess of its cost new a few years ago, consequently scrap should be kept cleaned up and forwarded promptly to the storehouse in order that the scrap may be disposed of to the best advantage.

It has been truly said that "The ways in which material and supplies are wasted on a railroad are as many as the number of persons in its employ," and if we may learn the lesson of economy in the use of materials from the present situation it will not have been without its good effect.

DISCUSSION

The discussion of steel, timber and water service materials brought out many descriptions of bridges strengthened to avoid use of new material. I. L. Simmons (Chicago, Rock Island & Pacific) urged that more attention be given to the question of how present structures can be carried over rather than be renewed. Old spans can frequently be strengthened at small expense.

ORGANIZATION AND OPERATION OF BRIDGE AND BUILDING MATERIAL YARDS

By H. C. Pearce

General Purchasing Agent, Seaboard Air Line.

The location of bridge and building material yards must be governed very largely by the geographical location of the property. In the southeast it has been an open question in the past whether it was either economical or necessary to have large general distributing bridge and building yards. Most of the larger systems in the southeast have a large number of mill operations on their own lines, particularly in Georgia and Florida, and lumber has been cheap. Under these conditions arrangements can be made with certain mills to take care of certain territories. This plan, however, leaves many loose ends, and incurs many concealed losses. It is not, and never will be, entirely satisfactory, but the direct saving is so considerable that it must be considered under certain conditions.

On the Pacific Coast a large portion of the lumber comes by water. This makes it desirable that the material yards be located sufficiently close to the docks and wharves to use switching service. In the middle west, the location of lumber yards depends largely on the location of the timber treating plants and distributing territory, so that, broadly speaking, the location of the lumber yard must be left entirely to the geographical location of the property.

LAYING OUT OF YARDS

In laying out bridge and building material yards, the first consideration must be sufficient space and trackage. I have found double tracks to be the most economical. They require less space and ensure a more concentrated organization, switching facilities, and the use of cranes.

Piling, stringers and other trestle timbers should be unloaded on tracks adjacent to each other so that a train of cars can be set in and as many feet of trestle timbers as required, loaded in the quickest possible time. Cranes should, of course, be used wherever obtainable in handling heavy timbers and piling.

The ideal bridge and building yard would include a timber treating plant, planing and wood-working mill, assembling yard, rail yard, frog and switch shop and a general store, for the reason that it is desirable wherever possible to load everything out complete in one shipment or shipments from a central distributing point. The yard should be so arranged that all the material, from the piling to the bolts and washers, will be loaded and shipped in the same train. Frequently a certain number of feet of track, as well as a certain number of trestle timbers, is required. The organization should be such that the necessary rail, fastenings, frogs, switches, etc., can be loaded and shipped along in the same manner.

ORGANIZATION

Maintenance officers have criticized our supply departments for failure to provide material in an intelligent and prompt manner, and very properly so. The reasons are many, but the principal one is that all supply officers do not understand the importance of assembling their materials so they can be shipped in the order they are needed. Having prepared his plans and received authority to do certain work, the maintenance officer then concentrates his efforts toward getting it done. Under a proper organization, he should immediately prepare his requisitions for the necessary material to do the work, describing and classifying them properly. The storekeeper should have sufficient storehouse and platform facilities for assembling such portions of the material required as must be assembled and held together.

Unless the requisition states specifically that certain portions of the material for the structure are to go forward,

nothing should be shipped until everything is ready. All of the material should be charged direct to the job when shipped. When the work is completed, whatever is left over should be picked up, shipped back and proper credit allowed to the work order.

PERSONNEL

The personnel necessary to handle an efficiently organized bridge and building material yard may be said to consist of a foreman in direct charge, with as many working foremen as may be necessary, and the forces divided into gangs of about five men each. It may be said that the foreman should be a practical bridge and building man, and this would appear to be a reasonable conclusion; but the best material yard foremen that I have ever developed were from clerks.

This leads me up to the question as to what department should maintain and operate bridge and building material yards. I have stated that I know of no sound reason why this work should not be handled by the supply department. My reasons are that the providing, distributing and accounting for materials has become a highly specialized service. It is now generally recognized that the work of buying, providing and distributing materials should not be divided, and that the supply department should have charge of and be responsible for all unapplied materials. Such a department must be properly organized and have a sufficient, well trained force to do the work in the most expeditious and economical manner.

The supply department is the providing department. It is the duty of supply officers to so systematize their organizations that they will know absolutely before a purchase is made that it is necessary; that the proper materials have been specified; that the requisitions are prepared in such a manner as to procure the broadest competition; to so arrange their materials when received and to so organize their forces that they can be accurately inventoried, loaded, shipped and delivered where they are required in the shortest possible time, and to see that the salvage is returned, sorted, classified, reclaimed and disposed of to the best advantage. Unless the supply department is organized first on the basis of giving proper and immediate service, it can never be economical or efficient, and can never hope to accomplish the real purpose for which it was organized, which is the providing of suitable materials when and where they are wanted, at the time they are wanted, and at the lowest net cost. For these reasons I reiterate that there is no sound reason why our supply departments should not organize and operate our bridge and building material yards in co-operation with our maintenance officers.

DISCUSSION

A number of members took issue with the paper and advocated a departmental supply under the direction of the bridge department.

HOUSING AND FEEDING BRIDGE AND BUILDING MEN

By F. E. Weise

Chief Clerk, Engineering Department; Chicago, Milwaukee & St. Paul, Chicago, Ill.

We are told that labor is scarce, that it is hard to secure and that it is still harder to hold. This is reiterated so frequently that we cannot lose sight of it. Under such conditions workmen are inclined to be uneasy and there is a tendency on their part to make frequent changes. Anything that will serve to make men more contented with their jobs will do much to help eliminate the waste that is the sure result of constant changing, because the breaking in of new men is expensive. One of the hardest places in which to hold men is in railroad maintenance or construction work,

and of the many things that have an influence on the conduct of the men none is more potent than the way in which they are housed and fed.

In order to do effective work, and render efficient service, a man must be in good health, and the primary object of the camp should be to keep him physically and mentally fit for his work. Good, wholesome, properly cooked and well served food; comfortable, clean and well-ventilated sleeping quarters; provisions for bathing and recreation will accomplish this and secure the good will of the men. Good will brings about co-operation, and will reflect in the amount and quality of the work accomplished.

It has been quite a common practice in the past to house crews in old cars unfit for commercial service. This has been done especially for extra gangs in which a complete camp on wheels was established. This practice is gradually becoming obsolete because equipment is too valuable to be tied up in this manner and cars are only being used for crews that must be moved frequently. Where possible, it will be found to pay to fit up cars for the purpose of housing men. There are many arrangements of kitchen, dining room and bunks. Like building a house; every man has his own ideas and one plan may be as convenient as another.

When men can be located at one point and cover their territory by trains or motor cars, it is possible to provide them with permanent and comfortable buildings. Such buildings are mostly of frame construction and may be as varied in size and arrangement as the requirements demand. Again old car bodies are used either singly or in pairs with a roofed space between. The Chicago & North Western has a plan for a portable building which can be taken apart readily and shipped to another location if desired, thus making it applicable to either temporary or permanent locations.

When it has been decided that a camp is to be established, the site of the work should be examined carefully, and the location of the camp determined upon by considering the conditions that will make it habitable. Location, water supply, drainage and sanitation should be given careful study.

For the average camp, the dining room and kitchen should be in one building and separated by a partition. In the dining room end sufficient tables should be provided so that the entire force may be served at one time. It should be wide enough to provide for two long tables at the sides with an ample aisle between, which will permit waiters to pass back and forth freely. This form of building can be loaded on a flat car and transported from one location to another. For larger camps it may be better to construct the building in the shape of a "T," in which the dining room is one large room and the kitchen an annex at the center of one side. Another good plan consists of three adjoining buildings placed in the form of a letter "U," and provides for two separate dining rooms with a common kitchen. This plan is desirable where the force is apt to fluctuate.

It is quite customary in determining the price to be charged for board and lodging to charge the employee what he would have to pay ordinarily in nearby towns and then furnish as good board as possible with a view to having the camp pay for itself. The cost of meals furnished to those employees needed to operate the camp are considered a part of the camp expense. It will be found more satisfactory to use a rate per week than a rate per meal. In the former case, the matter of lost meals need not be watched, and there are apt to be fewer misunderstandings. As a general experience, a camp of 25 men or less will not pay expenses; a camp of from 50 to 75 men can be made to come out about even, and a larger camp will show a slight profit. This bears out the previous statement.

DISCUSSION

A. Montzheimer (Elgin, Joliet & Eastern) stated that steel underframes should be placed under all cars used for

housing men in order to increase the safety of transportation in trains.

THE NATIONAL SITUATION

Albert Reichmann, district manager of the American Bridge Company, at Chicago, presented a paper telling of the outlook in the steel market and the working of the priority law. He expressed the belief that sufficient steel will be available for actual railway necessities if ordered sufficiently early.

Dr. Herman von Schrenk, consulting engineer, Southern Pine Association, St. Louis, and O. P. M. Goss, consulting engineer, West Coast Lumber Manufacturers' Association, Seattle, described conditions in the lumber market. Dr. von Schrenk told of the heavy demands for cantonment work calling for dimension timber followed by the action of the government last week in commandeering all 12 in. by 12 in. southern pine timber and larger for wooden ships. Mr. Goss described the western trouble with strikes which cut down the output to 35 per cent of the capacity at one time but this has now increased to 75 per cent. Both timber speakers expressed the belief that the supply was sufficient for necessities.

C. A. Lichty made a verbal report on the conservation of materials which brought active discussion.

THE LABOR PROBLEM

Much consideration was given to the labor problem. Four letters were read from members discussing methods of securing and holding labor. They brought out a most active discussion on the floor. B. F. Pickering (Boston & Maine) described successful results obtained by employing one married man in a gang whose wife served as cook.

OTHER BUSINESS

E. E. R. Tratman, Engineering News Record, presented a paper on methods of encasing steel structures with concrete, citing instances of this form of construction.

J. R. Pickering, superintendent car service, Rock Island Lines, prepared a paper on the conservation of cars carrying company material. Several members told how they had organized to prevent delays to cars.

Tuesday evening was devoted to the memory of the late Samuel F. Patterson, secretary-emeritus and for 18 years secretary of the association.

The annual banquet given by the Bridge and Building Supplymen was held in Hotel Sherman on Wednesday evening. The convention adjourned Thursday forenoon. Members made an inspection of the Gary plant of the American Bridge Company on Thursday afternoon.

The total registration of members was 150, approximately equal to the record established last year.

The following officers were elected at the closing session Thursday morning: President, S. C. Tanner, master carpenter, Baltimore & Ohio, Baltimore; first vice-president, Lee Jutton, division engineer, Chicago & North Western, Madison, Wis.; second vice-president, F. E. Weise, chief clerk, engineering department, Chicago, Milwaukee & St. Paul, Chicago; third vice-president, W. F. Strouse, assistant engineer, Baltimore & Ohio, Baltimore; fourth vice-president, C. R. Knowles, superintendent water service, Illinois Central, Chicago; secretary-treasurer, C. A. Lichty, purchasing department, Chicago & North Western, Chicago. Members of executive committee: A. B. McVay, supervisor bridges and buildings, Louisville & Nashville, Evansville, Ind., and J. H. Johnston, superintendent bridges and buildings, Grand Trunk, Montreal.

THE SUPPLY EXHIBIT

The Bridge and Building Supply Men's Association held an exhibit in rooms adjoining the convention hall. Forty

firms were represented, the largest number in the history of the association. The names of the companies and their representatives and the nature of their exhibits are given below:

American Abrasive Metals Co., New York. H. Weaver Mowery.
 American Tar Products Co., Chicago. P. L. Griffiths, S. H. Fields.
 American Valve & Meter Co., Cincinnati, Ohio. D. J. Higgins, J. T. McGarry.
 Baker, John Jr., Co., Chicago. R. M. Elder, Wm. Howe.
 Barrett Company, The, New York. Holt roof connection, Tarvia platforms, ready roofings, built-up roofing and bridge waterproofing, shingles, paints, wood preservative, shingle stains and plastic cement. C. F. Ames, H. E. Barney, E. J. Caldwell, J. A. Clarity, H. W. Flemming, F. W. Freeman, E. P. Hobson, W. T. Kelley, G. R. McVay, J. J. Ross, T. A. Wharton.
 Bird & Son, Chicago. Samples of Neponset roofing. M. L. Caton, H. A. Inwood.
 Carbide Manufacturing Co., Duluth, Minn. Carbide flood lights. Harry Rolinder, Gordon Paterson.
 Carey, Philip, Company, Cincinnati, Ohio. C. L. Cockrell, F. R. Schueler.
 Chicago Bridge & Iron Works, Chicago. Photographs of tanks. H. C. Brown, M. J. Treas.
 Detroit Graphite Co., Detroit, Mich. J. J. Hogan, L. D. Mitchell, W. D. Waugh, T. R. Wyles.
 Dickinson, Paul, Co., Chicago. Adjustable cast iron chimneys, models of Aeolus building ventilators and smoke jacks.
 Dixon, Joseph, Crucible Co., Boston, Mass. Silica-Graphite paint for bridges, building and water tanks, crucibles, lubricants, boiler graphite and Dixon's Eldorado pencils. F. R. Brandon, H. A. Nealley.
 Huff Manufacturing Company, Pittsburgh, Pa. Lifting jacks. E. A. Johnson, C. N. Thulin.
 Fairbanks, Morse & Co., Chicago. F. M. Condit, E. J. Coverdale, F. P. Drinker, E. C. Golegay, G. Howard, J. L. Jones, D. K. Lee, L. H. Matthews, A. A. Taylor.
 Flintkote Manufacturing Co., New York. Rex strip shingles, wide space shingles, Flintkote roofing, construction roofs, Paradox roofing. G. Ellingwood.
 Johns-Manville Co., H. W., Chicago. Asbestos roofing and asbestos smoke jacks. P. C. Jacobs, D. L. Jennings, W. H. Lawrence, C. E. Murphy, W. D. Otter, J. H. Trent, E. H. Willard, J. C. Younglove.
 Lehon Company, The, Chicago. Roofing, building paper and waterproofing fabrics. Tom Lehon, D. B. Wright.
 Massey, C. F., Company, Chicago. Photographs and literature on reinforced concrete products. C. F. Massey, J. E. Moody.
 Mineral Products Company, Chicago. Chas. V. Eades.
 Mudge & Co., Chicago. Solvit compound paint remover, photographs and literature. Geo. W. Bender, Burton W. Mudge, F. Possen.
 Nichols, Geo. P. & Bro., Chicago. Model of transfer table, photographs. Henry Rees, Geo. P. Nichols.
 Patent Vulcanite Roofing Co., Chicago. Roofing materials. H. A. Van Page, J. P. Woolsey.
 Pyrene Manufacturing Co., Chicago, Ill. Fire extinguishers. W. B. Causon, R. B. Henderson.
 Railway Review, Chicago. Current issues of paper. W. M. Camp, J. E. Gougeon, Harold A. Smith.
 Simmons-Boardman Publishing Company, New York and Chicago. Current issues of *Railway Age Gazette* and *Railway Maintenance Engineer*. John H. Cross, E. T. Howson, L. B. Sherman, J. M. Rutherford.
 Standard Asphalt & Refining Co., Chicago. E. K. Carter, R. F. Trumbull.
 U. S. Wind Engine & Pump Co., Batavia, Ill. Literature on pumps and tanks. C. E. Ward, I. E. Wolcott.
 Volkhardt Co., Inc., New York. Non-freezing water hydrants. Chas. P. Cogswell, Wm. Volkhardt.
 Whiting-Evans Mfg. Co., Chicago. Kerosene carburetors. F. R. Callans.

The officers of the Bridge and Building Supplymen's Association last year were: President, H. A. Nealley, Jos. Dixon Crucible Company, Boston vice-president, L. D. Mitchell, Detroit Graphite Company, Detroit; treasurer, P. C. Jacobs, H. W. Johns-Manville Company, Chicago; secretary, Tom Lehon, The Lehon Company, Chicago.

SIAMESE APPROPRIATIONS FOR 1918.—In the budget estimates of Siam for the fiscal year ending March 31, 1918, appropriations have been made to the amount of \$1,369,000 for the extension of the northern railway line, \$212,010 for the construction of branch lines of the southern railway, \$1,717,355 for the irrigation project now under construction, \$48,877 for Bangkok waterworks, and \$321,252 for the completion of the new royal yacht.

BRITISH STATIONMASTERS IN CONFERENCE.—A conference of stationmasters and freight agents, held recently at the Great Eastern Hotel, Liverpool street, elected a committee representative of all stations in the United Kingdom to meet the Railway Executive Committee to present their case for a general all-round improvement in conditions of employment. The conference was attended by 120 delegates, and was the first of its kind to be held.

CAST STEEL PILOT AND ASH PAN

The cast steel pilot and ash pan which are illustrated are products of the Commonwealth Steel Company, St. Louis, Mo. The pilot can be quickly applied, removed, raised or lowered, one means provided for raising or lowering it being a rack. This construction permits the alteration in height to be attained in a few minutes. The racks on the backs of the pilots are made to fit corresponding racks on the pilot beams, or on separate brackets fastened to the pilot beams.

These adjustable pilots are cast in one piece and can readily be made to meet the requirements of new or old loco-

Commonwealth Cast Steel Pilot

motives. They are strong, simple and durable, requiring practically no repairs, and in time make quite a saving in maintenance cost, as compared with other types. They are easily repaired when bent in case of wreck. One of the designs embraces the requirements for both road and switch engines, a long step being placed at either side to meet switch engine requirements when a road engine is used in yard switching. They meet all Government requirements.

The cast steel ash pan is made for both single and double hoppers. These ash pans do away with the frequent expensive renewals and repairs characteristic of other types, as

Commonwealth Cast Steel Ash Pan

they are so designed that they do not burn out. They also prevent live coals from scattering on the roadway and causing fires. As these pans do not warp, a tight door is maintained that retains the coals. They are made up of but a few parts and have that advantage over the built-up types. This type of pan will last a long time and greatly reduces the maintenance costs for this particular part of the locomotive.

WOMAN BRANCH SECRETARY OF THE N. U. R.—The first woman branch secretary of the National Union of Railwaymen of England has been appointed at Ashton-under-Lyne.

General News Department

The Santa Fe lines paid 21.62 per cent of all the taxes collected in New Mexico during 1916.

The Pennsylvania has made a general increase in the pay of clerks in general offices, said to range from \$5 to \$10 a month per capita and to benefit 5,000 clerks.

The Delaware & Hudson is about to reopen its car shops at Green Island, New York, near Troy, which have been idle for seven years. The company is now trying to get the 100 men needed to organize a force to repair freight cars at these shops.

The Grand Trunk Railway of Canada has agreed to grant the engineers and firemen on all its lines the benefit of the "eight-hour law" pay now in force in the United States. The employees on the company's lines in the United States already enjoy the rates provided by this law.

The New Jersey Court of Errors and Appeals on October 8 affirmed the decision of the lower court sustaining the order of the State Public Utilities Commission requiring the abolition of sixteen grade crossings on the lines of the Erie Railroad in Paterson. The order issued by the commission allowed eight years for doing the work. If this decision stands it will mean the expenditure of \$3,000,000 or more.

The United States Civil Service Commission announces examinations, November 20, for the positions of passenger rate clerk and express rate clerk; and there are a large number of places to be filled, at salaries of \$100 a month. Applicants, men only, must be at least 20 years old and must have had experience in passenger or express rate work. There will be 100 passenger rate vacancies in the office of the Quartermaster of the army, at Washington, and 20 in the office of the Auditor for the War Department; and 20 vacancies in the position of express rate clerk in the Quartermaster's office. After six months' satisfactory service there will be an increase of pay. The duties of the positions are the revision, preparation and payment of passenger or express transportation accounts. Generally speaking, an experience of two years will be required, but applicants who have had experience in the government service will be required to show only one year of other experience.

Five Hundred Car Builders Wanted

The recruiting sergeant at Altoona, Pa., recently received a message from the War Department, reading as follows:

"Five hundred car builders or car repairmen for work in French railway shops, must be recruited in your district at once. They will be rated from \$33 to \$106 a month." With the message came the information that the men would be assigned to the 35th Engineers of the National Army.

Headlight Suit Dismissed

As briefly reported in last week's issue, Judge Anderson of the United States district court for the district of Indiana, at Indianapolis on October 9 dismissed a complaint of the New York Central against the enforcement of the Interstate Commerce Commission's order requiring the use of high power locomotive headlights. The complaint was dismissed, at the cost of the complainant, on motion of Blackburn Esterline, special assistant to the attorney general, not on the merits of the headlight order but on technicalities regarding the form of the complaint. The bill in equity named the Interstate Commerce Commission and the United States as defendants. The court held that although the United States was named in the title of the bill it was not named in the bill itself and therefore was not a party to the suit; and that all suits to enjoin the enforcement of an order of the Interstate Commerce Commission must be brought against the United States. The court also held that no relief was prayed for against the United States. The government had also argued that the suit could not be maintained against the commission, in

the form in which it was brought, in the jurisdiction of the district of Indiana. The railroad was represented by C. C. Paulding, J. B. Cockrum and F. H. Schmidt. An argument was also made on behalf of the Pennsylvania by S. O. Pickens.

A Canadian Railroads' War Board

The creation of a railway supervisory board composed of representatives of the Canadian Pacific, the Grand Trunk and the Government Railways (shortly to embrace the Canadian Northern) is under consideration by the Canadian Government. The board would work toward co-ordination of effort to prevent freight congestion and to facilitate the expeditious handling of traffic during the war. Co-ordination with United States lines is also proposed. The standardization of the size of rails on various railroads is likewise being considered.

Aishton Praises Press

"It is a great satisfaction to me to be able to say that the press of the country has been within recent months helping the railroads most generously and effectively." This statement was made at Chicago on October 12 at the convention of Associated Business Papers by R. H. Aishton, president of the Chicago & North Western and chairman of the central department of the Railroads' War Board.

"The only possible solution of our problem was to increase the amount of service of every mile of track, every engine and every car. We had to secure the co-operation of shippers in loading and unloading. To save men and fuel for freight service we had to make reductions in passenger service which, up to the present time, amount to 25,000,000 passenger train miles a year. To secure the good will and co-operation of the public the railroads had to get the reasons before the public, and both the railways and the nation owe a debt of gratitude to the press for the generous way in which it has told and commended what the railways have accomplished.

"There remains a great deal more which the press can do. Shortage of labor and material makes it extremely difficult to maintain our cars and engines and it is impossible to get new equipment. It is almost impossible to get rails. You will see that if the war goes on it is going to become more and more difficult to meet satisfactorily the demands of the public. If this is the case, the railways will need the help of the press more and more. . . . Use your powerful influence to get the business interests to co-operate with the managements of the railways in every way. . . ."

Pacific Railway Club Entertains Japanese Railway Men

The Japanese government, in anticipation of the widening of the gage of the government owned lines from 3 ft. 6 in. to 4 ft. 8½ in., has sent to this country a commission of prominent railway officers to investigate American operating methods. It is proposed to spend many millions of dollars upon this work and the commission is looking into all phases of railway construction, maintenance and operation.

During the first days of its stay in this country the commission visited the terminals of the Southern Pacific on San Francisco Bay and its shops at Sacramento, Cal., various industrial plants in the vicinity of San Francisco and the three-rail line of the Northwestern Pacific.

On October 11 the commissioners were the guests of the board of governors of the Pacific Railway Club at a banquet, where over 200 members of the club were present. G. H. Binkley, president, and William S. Wollner, executive secretary, welcomed the visitors. Dr. Y. Shima, the chairman of the Japanese commission and chief mechanical engineer of the Japanese Government Railways, responded.

Two papers on railway maintenance were presented by

members of the club: H. B. Titcomb, maintenance of way assistant of the Southern Pacific, speaking on "Maintenance of Way, Its Organization and Problems," and G. W. Rear, general bridge inspector of the same company, on "Maintenance of Structures." There was a general discussion of the topic, followed by informal talks on car loading efficiency, in which both the members and the visitors took an active part.

The commission left San Francisco for Los Angeles the following day and will go from there to various points throughout the United States. They are being accompanied by Ellwood G. Babbitt of the United States Bureau of Foreign and Domestic Commerce.

Steel Prices Reduced

An agreement between the War Industries Board and representatives of the steel interests fixing maximum prices on a number of steel articles, supplementing the basic prices covered by the agreement of September 24, was announced on October 11 with the approval of the President. The prices, which become effective immediately and are subject to revision on January 1, are as follows:

Commodity	Price agreed upon	Base
Blooms and billets 4 in. by 4 in. and larger.....	\$47.50 g.t.	Pittsburgh and Youngstown
Billets under 4 in. by 4 in.....	51.00 g.t.	Pittsburgh and Youngstown
Slabs.....	50.00 g.t.	Pittsburgh and Youngstown
Sheet bars.....	51.00 g.t.	Pittsburgh and Youngstown
Wire rods.....	57.00 g.t.	Pittsburgh
Shell bars.....	3 in. to 5 in..... 3.25 per 100 lb.	"
	Over 5 in. to 8 in..... 3.50 "	"
	Over 8 in. to 10 in..... 3.75 "	"
	Over 10 in..... 4.00 "	"
	Grooved..... 2.90 "	"
Skelp.....	Universal..... 3.15 "	"
	Sheared..... 3.25 "	"

It is stated that the prices enumerated have been fixed by the President on the assurance of those representing the steel industry that these prices equitably adjust the relations of the steel interests to each other, and will assist them in fulfilling their obligations to give the country 100 per cent of production at not to exceed the prices heretofore announced.

Measures will be taken by the War Industries Board for placing orders and supervising the output of the steel mills in such manner as to expedite the requirements for war purposes of the government and those nations associated with us, and to supply the needs of the public according to their public importance and in the best interest of all, as far as practicable.

Interstate Commerce Commission Reorganization

The Interstate Commerce Commission on Wednesday issued an order announcing its reorganization into three divisions, under the authority of the law increasing its membership to nine.

Except as otherwise provided by the commission Commissioners McChord, Meyer and Aitchison will constitute Division 1; Commissioners Clark, Daniels and Woolley will constitute Division 2; and Commissioners Harlan, Hall and Anderson will constitute Division 3. Each will have power and authority by a majority thereof to hear, determine, order, certify, report, or otherwise act as to any of the work, business or functions assigned or referred to it. Any division, with regard to any case or matter assigned to it, or any question brought to it under this delegation of duty and authority, may call upon the whole commission for advice and counsel, or for consideration of the case or question by an additional commissioner or commissioners assigned thereto by the whole commission; and the commission may bring before it as such any case or question so allotted or assigned.

To Division 1 will be assigned all cases set for argument beginning October 24, to and including October 31, 1917, and in addition Division 1 will be charged with the conduct of the work of the Bureau of Valuation other than considering and deciding the proceedings relating to the valuation of carriers' property. To Division 2 will be assigned all cases set for argument beginning November 1 to and including November 30, 1917, and in addition Division 2 will be charged with the disposition of applications and requests for suspension under the fifteenth section; of applications under the fourth and sixth sections; of cases on the special docket; of the transportation of explosives and dan-

gerous articles; and of tariffs carrying released rates. To Division 3 will be assigned all cases set for argument beginning December 1 to and including December 31, 1917, and in addition Division 3 will be charged with the disposition of all Board of Review cases which have been submitted and those not heretofore orally argued before the commission or any division thereof.

All cases set for argument and all cases submitted, other than Board of Review cases, in any one month after January 1, 1918, will be assigned in monthly rotation to the respective divisions in the order given above. Matters arising in connection with assigned cases will be disposed of by the division to which such cases have been assigned. All procedural questions requiring commission action arising in connection with unassigned cases may be disposed of by any of the divisions. Miscellaneous administrative matters requiring commission action, not otherwise provided for, may be disposed of by any division. The foregoing assignment does not include the consideration and disposition of valuation cases because the law provides that at least seven members shall participate in such cases. Each division may determine the time and place for its hearings and conferences and determine its order of business.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Superintendent of Telegraph, Indiana Harbor Belt, Gibson, Ind. Next meeting, November 22, La Salle Hotel, Chicago.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Morrison Hotel, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- CINCINNATI RAILWAY CLUB.—H. Boyter, Chief Interchange Inspector, Cincinnati, 101 Catew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- Niagara Frontier Car Men's Association.—Geo. A. J. Hochrehe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PACIFIC RAILWAY CLUB.—W. S. Wallner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.
- RICHMOND RAILWAY CLUB.—F. O. Robinson, C. & O. Richmond, Va. Club has been suspended until after the war.
- St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.
- TRAFFIC CLUB OF CHICAGO.—C. B. Signer, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- WESTERN CANADA RAILWAY CLUB.—L. Kon. Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Traffic News

C. M. Woodward, assistant superintendent of the Boston & Maine at Springfield, Mass., overrun with hundreds of cars of freight awaiting transfer, has sent out an appeal to the schools and colleges for young men and boys who are willing to work in the freight houses on Friday, Saturday and Sunday.

The express companies' embargo against live stock threatened the success of the National Dairy Show at Columbus, Ohio, this week; but in view of the importance of the show as a factor in the campaign to stimulate production, and at the request of the Transportation Department of the Government Food Administration, the express companies so modified their embargoes that the cattle to be used for exhibition purposes were accepted as in former years.

The transportation division of the United States Food Administration is acting to facilitate the marketing of the coming sugar crop in Cuba, which will commence moving about December 15, and at the suggestion of the Food Administration, the Cuban government has lent to the Cuban Railway \$5,000,000 with which to put its road in better condition to properly handle the coming crop. Both the Cuban government and the railway had placed orders in the United States for many needed supplies which they were unable to get filled. These orders were scattered among some 50 business firms in this country. The Food Administration wrote and explained the necessities of the situation, and most of the supplies are now going forward.

The Buffalo, Rochester & Pittsburgh calls on everybody to remember the injunction, "Do your Christmas shopping early." In order to facilitate freight movement, it has been necessary to curtail passenger service. If people, who go to Rochester from the surrounding towns to buy, will begin now to get their Christmas buying out of the way, it will help prevent congestion and crowding of trains during the few days just previous to Christmas. For those who expect to send presents to friends and relatives at a distance, early shopping is imperative. The express service is now working at capacity, business having increased during the past few months 50 per cent. The country has a million men at training camps receiving and sending a large volume of mail, and to get Christmas presents through on time will call for prompt action everywhere.

The United States Geological Survey has issued a statement on coal production in 1917 compared with 1916, pointing out that the shortage of bituminous coal is not due to the failure of the mines to produce more coal than in the past, for the country on September 1 was about a month ahead of last year in output and is expected to finish the year with an increase of 10 per cent over 1916, the banner year, and of 25 per cent over 1915. "The tremendous increase in manufacturing and transportation activity has created a demand certainly greater than the 10 per cent by which production has increased. In the second week of July the average daily production was more than 1,900,000 tons, the highest point ever attained. In the lowest week for the summer, 1,638,000 tons was recorded, and in the first eight months of 1917 the output was 363,500,000 tons, or 37,000,000 tons more than in the first eight months of 1916. In the same period shipments of anthracite increased 16 per cent over those of 1916. Bituminous production in 1916, including coal made into coke, was 502,518,545 tons.

Shipments of anthracite coal for the eight months ending August 31 amounted to 52,291,445 tons, as compared with 44,623,063 in the first eight months of 1916. The increase for the eight months was 7,668,382 tons, or 17.18 per cent; and for the month of August alone it was 28.35 per cent. Shipments to New England, New York City, Philadelphia, Buffalo and Erie have been heavier than during the corresponding period last year. New York received 12,666,650 tons last year, and 13,912,384 this year, a gain of 1,245,734 tons. New England last year got 3,438,242 tons by rail and 2,351,995 by barge, a total of 5,790,237 tons. This year the figures are 4,195,575 by rail and 2,260,366 by barge, a total of 6,455,941 tons, showing a gain of 665,704 tons.

Buffalo and Erie, taken together, got 4,346,917 tons last year and 4,288,002 this year, showing a loss of 58,915 tons. This is attributed to the cold, late spring, which permitted little or no coal to be carried over, and to the Fuel Administration's policy to ship coal past the lake ports to the needy Northwest before the close of navigation. The deficiency will be made up later, and special emergency calls for coal, if authentic, will receive prompt consideration at Washington.

Heavy Fruit Traffic From California

The Southern Pacific announces that in the last 90 days the Pacific Fruit Express has carried 27,000 cars of fruit and other perishables out of California for the East. This sets an average for the three months of 300 cars a day, a volume of traffic of this character never equaled before. The extraordinary fruit movement is still going on. The Pacific Fruit Express has not only exhausted its own supply of cars (12,500 cars), but has hired at high premium between 8,000 and 9,000 foreign cars. New cars, delayed by government requisitions on foundries and car shops, are arriving now at the rate of 20 or 30 a day.

The grape crop is larger than last year, and is later. Two hundred cars a day are now ready to move, with 3,000 cars yet to be hauled. Moreover there are still carloads of onions and potatoes to move and 3,500 cars of oranges.

So great has been the traffic in military trains and government freight that the running time of fruit trains to Chicago has had to be lengthened from six days to eight days, a serious loss in the effective use of the cars.

Eastern Roads Want Increased Commodity Rates

At an informal conference with the Interstate Commerce Commission at Washington on Wednesday, the traffic executives of the lines in Official Classification territory submitted a proposed plan for asking the commission's permission to advance by approximately 15 per cent the commodity rates on which advances were not allowed by the commission in the 15 per cent case decision in June. The delegation of traffic executives was headed by George F. Randolph, commissioner for the lines in Official Classification territory, and George Stuart Patterson, counsel. Mr. Patterson said that the commission in its decision had objected to a horizontal percentage advance in commodity rates and had ordered the tariffs to be cancelled. New tariffs, including increases of approximately 15 per cent, but compiled to preserve existing relationships, had later been filed (prior to the time when the amendment requiring the approval of the commission before increased tariffs could be filed went into effect). The tariffs on grain and grain products, live stock and dressed meats, petroleum and products, and certain miscellaneous commodities have been suspended by the commission, and hearings have been set in some instances.

The carriers desired to ask the commission if it would not be practicable and desirable to withdraw the tariffs now under suspension and postpone the hearings and then file a blanket application for permission to file new tariffs covering all the commodities on which advances were not allowed in the original decision. Mr. Patterson added that it is the opinion of the eastern carriers that any relief which will be secured by permitting these commodity rates to go into effect will be temporary only, and that it is only a question of a short time when the needs of the carriers will be brought to the attention of the commission in a "much more general and specific way."

It was stated that the tariffs, together with a statement of the reasons such as would be required under the tentative fifteenth section order, could be prepared for submission in about 60 days.

A number of representatives of shippers and of state commissioners were present, but most of them took no part. Representatives of the live stock shippers wanted the proposed live stock increases considered in a separate hearing while the roads preferred that all the rates be considered in one proceeding.

Newman Erb, president of the Ann Arbor, and Commissioner McChord, asked whether the case could not be handled by a reopening of the original case, but this was considered impracticable because of the suspension proceedings already started.

It was arranged that Mr. Randolph should put the carriers' proposals in concrete form in a letter to the commission in a few days.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has issued an order relieving the carriers from the requirements of its orders of October 2, 1916, requiring carriers of Class 1 to file semi-monthly reports of freight car requirements and supply and quarterly reports of the condition of freight cars. This information is covered in the reports made by the railways to the commission on car service.

Applications from the railroads for permission to file certain tariffs naming increased rates under the amended fifteenth section of the commerce law will be considered by the commission at the informal hearing set for October 22 in their bearing on the questions to be then presented in respect of rates on petroleum and its products in Central Freight Association territory, as affected by the decision of the commission in the fifteen per cent case. The applications to be considered include the following commodities: Manufactured iron and steel, acid, aqua ammonia, coal tar, creosote, pine, rosin, turpentine, etc., chemicals, asphaltum, lye, and similar articles. The hearing is not for the purpose of receiving evidence, which will be heard at a subsequent hearing.

PERSONNEL OF COMMISSIONS

E. D. Chassell, member of the Board of Railroad Commissioners of Iowa, has resigned to become secretary-treasurer of the Farm Mortgage Bankers' Association of America, with headquarters in Chicago.

COURT NEWS

Additional Receiver for Missouri, Kansas & Texas Denied

Judge William C Hook, presiding in the United States District Court for the Eastern Division of the Eastern District of Missouri, on Tuesday denied the petition of Speyer & Co., New York, for the appointment of an additional receiver for the Missouri, Kansas & Texas Railway, on the ground that the motion was based on criticisms of the management of the road which were not sustained.

"The grounds of the motion," said Judge Hook, "may be grouped under two heads.

"First—Criticisms of the management of the property by the present receiver. These, the court finds, have not been sustained by the proof and arguments presented. Second—That the attitude of the receiver towards the future of the property is too conservative; that he is not in accord with expert estimates of future earnings and costs and economies of operation, etc.; that he has wrongfully assumed the function of an expert adviser of those who have undertaken to formulate a plan of reorganization, and has impressed upon them his insufficient views of the earnings capacity of the railroad, with the result that a proposed plan, based on estimated lower earnings, makes the interest on the new securities to be issued for the junior securities mentioned, contingent instead of fixed or absolute. But it does not appear that in expressing his views the receiver has exceeded the limitations or proprieties of his position, or that he intended to impress them upon those engaged on the plan of reorganization. He appears to have done little more than to give his opinion when it was sought. Furthermore, counsel for those at work upon the plan of reorganization says its terms so far as formulated are not based on anything the receiver has said or on any estimate he has given. But aside from all this, most of the objections made relate to future conditions about which skilled and competent men may widely differ. They are generally too conjectural to afford a fair basis for personal condemnation. The motion should be denied.

"But lest the position of the Court upon the general subject discussed at the hearing be misconstrued, it should be said that so far as it can legally do so, it will favor a plan of reorganization based on a conservative estimate of the future and so soundly framed as to withstand the dangers of financial and commercial stress. It will not encourage a plan of reorganization having no

adequate provision for future capital requirements or one in which the refinancing is so close to probabilities that earnings are likely to be absorbed in a lean year or a succession of them by fixed charges. The last reorganization of this company is an example of insufficient provision for necessary new capital and it is one of the efficient causes of the present receivership. While a particular class of bond or note holders should not be denied the intrinsic value of their pledged security in its proper relation to the property as a whole, whether they should continue to have interest as a fixed and absolute charge or whether it should be contingent upon the proved prosperity of the railroad is a question of broad business policy in which they are not alone concerned. The very worth of the reorganization may be affected by it. Moreover, the public, though not a party to the record, has an interest in every railroad reorganization, accomplished by foreclosure, of which the court should take notice. The ability of a railroad fully and promptly to discharge its duties to the public, and that is of primary concern, depends in great measure upon the free margin between net income and fixed charges. In practice, when the margin becomes small, or disappears under adverse conditions that are rarely discounted sufficiently, the insistent demands of contract obligations are always met at the expense of those of a more general, less definite character."

Hours of Service Act—Telegraph Operators

A telegraph operator, whose regular period of service was from 3:30 p. m. to 12:30 a. m. each night, was directed to remain on duty to care for the United States mails, which were to be delivered to and received from a passenger train scheduled to pass the station at 10:15 p. m. The train on this particular evening was known to the railroad company's officers to be 2½ hours late at a somewhat distant station, and it had been losing instead of gaining time. There was another employee at the station, who was under no restriction as to hours of service, but he was not bonded, and the railroad company made no effort to have him care for the mails. The Circuit Court of Appeals, Eighth Circuit, on appeal from the district court for the Western District of Oklahoma, holds that notwithstanding the company's expectation that some of the lost time would be made up, and despite the fact that there was a considerable margin between the operator's hours and the scheduled time for the trains, the railroad company was guilty of violation of the Hours of Service Act in requiring its operator to remain on duty more than 9 hours, for, if it desired a bonded employee to handle the mail, it should have a sufficient supply of such help subject to call. *Atchison, T. & S. F. v. United States*, 243 Fed. 114. Decided April 9, 1917.

Exchange of Services Between Railroad and Telegraph Companies

In 1887 a railroad company and a telegraph company entered into an agreement for the exchange of "on line" business and "off line" business. At stated periods the amount of "off line" business done by each for the other was ascertained and balances discharged at rates fixed at one-half of the ordinary rates. This contract is still unattacked except as to "off line" business. This feature may be summarized as follows: The railroad company transports men and material for the telegraph company, without limit, so far as the maintenance of the telegraph system on the railroad company's property is concerned. The telegraph company in turn transmits messages along the railroad company's line, also without limit, so far as the maintenance and management of the railroad is concerned; and each company further serves the other with regard to that other's business in respect of business not directly connected with the line of railroad along which the telegraph lines extend. These two kinds of work are commonly known, the former as "on line" business, the latter as "off line" business. In an action by the railroad against the telegraph company, in which the real contest was between these two companies on the one side and the Interstate Commerce Commission on the other, the sole question was whether under the Interstate Commerce Act it was lawful for the two companies to observe such a contract [as regards off line business]. The law says that nothing shall be construed to prevent telephone, telegraph and cable companies from entering into contracts with common carriers for the exchange of services. The Circuit Court of Appeals, Second Circuit, holds that, in the absence of fraud, the right to exchange implies the right to fix the rate, method, or amount of exchange. The agreement being

to exchange the carriage of goods against transmission of intelligence, each party has the further right to fix the value of the services of each to the other; it makes no difference whether for convenience they ascertain that value by the usual money measurement or adopt some other course. If it were shown that this contract or any other agreement were being used as a cover for injuring one party or the public other rules would apply.—*B. & O. v. Western Union*, 242 Fed. 914. Decided May 8, 1917.

Transportation of Intoxicating Liquors

In 1915 a brewing company obtained a temporary injunction restraining the Rock Island from refusing to accept shipments of malt liquor to go into Iowa, intended for private consumption (215 Fed. 672. District Court, D. Minnesota). It was there held that the Webb-Kenyon law does not prevent the transportation of such liquor from one state to another where it is intended for the personal use of the consignee, though in violation of the law of his state which requires the consignee to have a permit. This decree has now been reversed by the Circuit Court of Appeals, Seventh Circuit, with directions to dismiss the bill. It is held that, though the Iowa statute prohibits merely the transportation or conveyance of intoxicating liquor, the receipt of the liquor from the carrier is a violation of the law, so as to bring the transportation of the liquor by an interstate carrier within the condemnation of the Webb-Kenyon Act, since, while the recipient of the liquor may not, as such, be a violator of the law, his receipt of the liquor from the carrier necessarily involves the violation of the law by the carrier.

The court in its opinion called attention to the Postal Department Appropriation Act of March 3, 1917, and to Resolution No. 57 of March 4, 1917. This act forbids the interstate transportation of intoxicating liquors into any State the laws of which prohibit the manufacture or sale therein of intoxicating liquors for beverage purposes.—*Hamm Brewing Co. v. Rock Island*, 243 Fed. 143. Decided April 10, 1917. Rehearing Denied, May 31, 1917.

The State of Washington sought to confiscate a carload of whisky found on a side track at Meadowdale station, on the Great Northern, as being there in violation of the state liquor law. The whisky had been delivered to the railroad at Butte, Mont., with instructions to ship it to a named consignee at Ketchikan, Alaska, via the Great Northern to Meadowdale, in care of a named motor truck company. A bill of lading was issued conforming to these instructions. There was no auto truck line running from Meadowdale to Ketchikan, nor any boat line. Practically all freight for Alaska carried by the Great Northern is unloaded in Seattle and forwarded thence by boat. There was no permit on the whisky as required for liquor brought into Washington. The road informed the consignor that it could not deliver such shipments to a motor truck company, but only to a water carrier, and directed the agent to hold the shipment. At this juncture the liquor was seized by the state sheriff. The railroad filed its claim for freight to Meadowdale and also averred that the shipment was interstate and not subject to the state laws. The lower court found the shipment was not in bona fide interstate commerce, but was intended for unlawful disposition in the state. The Supreme Court of the state holds that the shipment was interstate. It was the railroad's duty to receive the whisky at Butte, unless it knew that it was intended to be diverted for delivery within the state of Washington, where it would be contraband if not protected by permit. Regardless of the state statute casting the burden upon the person claiming the article seized, the burden was held to be on the state to prove that the shipment was in fact not interstate, in view of section 24 of the act, providing that the prohibitory provisions "shall not apply to shipments transported by any common carrier of unbroken packages of intoxicating liquor in continuous transit through this state from a point outside of the state to another point outside of the state." The railroad was held not bound to deliver the liquor to an irresponsible auto delivery company within the state, but had the right to cause a deviation from the designated route. There must be something more than mere suspicion to justify the seizure and confiscation of liquors while in possession of a common carrier as an interstate shipment. The evidence was held insufficient to support a finding that the railroad was violating the state law, and judgment for the state was reversed.—*State v. Great Northern* (Wash.), 167 Pac. 103. Decided August 29, 1917.

Equipment and Supplies

LOCOMOTIVES

THE FRENCH GOVERNMENT is reported as having placed orders through the United States Government for 640 locomotives.

THE ILLINOIS CENTRAL, noted in last week's issue as about to issue inquiries for 85 locomotives, will ask prices on 50 Mikado, 21 switching and 4 hump-yard locomotives.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, wants a second-hand six-wheel switching or Mogul type locomotive with 18 x 24 in. cylinders, a weight of 112,000 lb., with a tractive effort of 24,000 lb., and steam pressure of 165 lb.

FREIGHT CARS

SPENCER KELLOGG & SONS, Buffalo, N. Y., are enquiring for 10 8,000-gal. tank cars.

THE UNION PACIFIC is reported as contemplating the purchase of 5,000 freight cars.

THE BALTIMORE & OHIO will purchase material for 100 caboose cars which it will build in its own shops.

THE AMERICAN STEEL & WIRE COMPANY has ordered a scale test car from the American Car & Foundry Company.

THE FRENCH GOVERNMENT is reported as having placed orders through the United States Government for 9,000 cars with a number of car builders.

THE CENTRAL OF GEORGIA will build about 200 freight cars in its own shops, these being a part of the order mentioned as contemplated in last week's issue.

THE ILLINOIS CENTRAL, reported in last week's issue as about to issue inquiries for 3,500 freight cars, now expects to build from 700 to 1,000 of these cars in its own shops.

THE RUSSIAN GOVERNMENT which was expected to have placed an order last week for 10,000 four-wheel cars has now issued another inquiry for 1,000 eight-wheel cars and may buy as many as 30,000 cars in all.

THE NEW JERSEY LINE COMPANY.—Through a typographical error a company by this name was reported in last week's issue as inquiring for 50 gondola cars. This name should have been given as the New Jersey Zinc Company.

THE NATIONAL TUBE COMPANY has issued inquiries for 10 100-ton skelp cars, 50 70-ton hopper, 50 70-ton coke, 245 70-ton gondola, 15 70-ton flat and 30 50-ton steel dump-car bodies for the Lake Terminal Railroad; 30 70-ton hopper, 4 70-ton gondola and 12 70-ton flat cars for the McKeesport connecting, and 40 70-ton hopper and 14 70-ton gondola cars for the Benwood & Wheeling. This inquiry is similar to the one issued last April, on which, however, no orders were placed at that time.

PASSENGER CARS

THE CENTRAL OF GEORGIA, reported in last week's issue as about to issue an inquiry for passenger cars, has ordered 16 such cars from the Pullman Company.

IRON AND STEEL

THE PENNSYLVANIA RAILROAD has ordered 1,000 tons of bridge steel from the American Bridge Company.

COMMERCE OF ALASKA WITH THE UNITED STATES.—The movement of merchandise between Alaska and the United States reached its highest record in the fiscal year ended June 30, 1917, aggregating practically \$100,000,000 in round numbers. The exact figures are \$99,765,908 in 1917, exceeding the trade in 1916, the previous high year, by 23¼ million dollars, and more than double the trade in 1915, which amounted to \$48,702,387.

Supply Trade News

C. W. Cross has been appointed district manager of the Oxweld Railroad Service Company with office at 233 Railway Exchange, Chicago.

H. F. Bardwell has been appointed New York district manager for the Vanadium-Alloys Steel Company of Pittsburgh and Latrobe, Pa., with offices at 30 Church street, New York.

A. G. Shaver has been retained as consulting engineer by the A. G. A. Railway Light & Signal Company, Elizabeth, N. J. Mr. Shaver's headquarters will be room 857, Peoples Gas Building, Chicago.

Edmund Barany, machine designer of the Singer Manufacturing Company, Elizabeth, N. J., has assumed the duties of mechanical engineer and assistant to general superintendent of the Cleveland Twist Drill Company.

Signal Companies' Publicity Bureau

The four principal signal manufacturing companies—the Union Switch & Signal Company, the General Railway Signal Company, the Federal Signal Company and the Hall Switch & Signal Company—have joined in establishing a single publicity bureau, with headquarters at 120 Broadway, New York; and Henry M. Sperry, for the last three years with the General Railway Signal Company as manager of its department of publicity has been appointed publicity representative of the four companies.

Henry Muhlenberg-Sperry was born in Baltimore, Md., and educated in Philadelphia. He entered railway service in August, 1881 on the Pennsylvania Railroad in the engineer corps of the New York division. In 1887 he was appointed supervisor of signals of this division and had charge of the construction of a large number of interlocking plants required by changing the line from Philadelphia to New York from a two-track to a four-track road. In December, 1891, he left the road and went to the Johnson Railroad Signal Company as general agent, in which position he had general charge of block signal construction on the Hudson division of the New York Central. In June, 1894, he was appointed signal engineer and agent for the National Switch & Signal Company in charge of the western district. Here he designed and installed the large interlocking plant at State Line, Ind., and the signaling of the Chicago Elevated railroads, including the Union Loop. In January, 1899, he was appointed signal engineer and agent for The Union Switch & Signal Company, at New York. While in this position he prepared plans and made a report on the reconstruction of the St. Paul Union Depot, St. Paul, Minn., to provide track facilities for ten roads; he also prepared the preliminary plans and method of signaling for the first New York subway (the Interborough Rapid Transit Company). In February, 1905, he was appointed consulting signal engineer for the Hudson Companies, New York, and prepared plans and reports covering the four tunnels under the Hudson River and the large terminal station at Church street, New York, designed to handle 60,000 passengers an hour. In February, 1906, he was appointed resident manager for the General Railway Signal Company, at New York, and on January 1, 1910, was appointed sales manager at Rochester. From November 1, 1914, he has been manager of the department of publicity

H. M. Sperry

and education of that company, but for the past nine months has been engaged in the preliminaries connected with his present position as publicity representative of the four companies.

Mr. Sperry has also been a director of the National Railway Appliances Association since 1911, and in March, 1916, was elected its president. He is a member of the American Society of Civil Engineers, the American Railway Engineer Association, and the Railway Signal Association.

Emil Tyden, inventor of the Tyden car seal and vice-president of the International Seal & Lock Company, Chicago, has been commissioned a major in the army and assigned to the ordnance section, located at Washington, D. C.

L. F. Wilson, vice-president of the Bird-Archer Company, Chicago, has been called into active service with the Second division of the regular army at Chicamauga Park, Ga., with the rank of major in the quartermaster corps.

Berry Brothers, varnish manufacturers, Detroit, Mich., have prepared an illustrated folder containing instructions on how to recognize military insignia, together with a full page half-tone display of the various marks of rank and distinction in the army and navy.

The Ward Leonard Electric Company, Mount Vernon, N. Y., manufacturers of electric-controlling devices and vitreous enamel insulation resistance units, announces that it is now represented in Cleveland, Ohio, by the Walter P. Ambos Company, with offices in the Arcade.

At a meeting of the directors of the Lima Locomotive Works, Inc., October 17, a semi-annual dividend of 3½ per cent was declared on the preferred stock, payable October 31 to stockholders of record October 24. The number of directors was increased from seven to eleven.

The Taylor Wharton Iron & Steel Company, Easton, Pa., celebrated the 175th anniversary of its organization at High Bridge, N. J., on Saturday, October 13. The program of the day included an inspection of the plant, a historical pageant, a clam bake and a concert during the day and evening.

H. E. Gifford, Jr., has been appointed northwestern representative of the A. G. A. Railway Light & Signal Company, Elizabeth, N. J. Mr. Gifford has been connected with the signal business for about 12 years, in which time he has gained a varied experience both in railway and supply work. His headquarters will be room 857, Peoples Gas Building, Chicago.

John J. Harty, vice-president and general manager of the Canadian Locomotive Company, Kingston, Ont., has been elected president of the company. He is also a director of the Dominion Foundries & Steel Company and is a son of William Harty, who was, some years ago, president of the Canadian Locomotive Company and is still one of its largest stockholders.

Frank B. Archibald, for the past five years eastern manager of the National Lock Washer Company, has been elected vice-president; J. Howard Horn, eastern representative for the past seven years, has been appointed sales manager. On or about December 1, offices will be opened in Philadelphia, Pa., and St. Louis, Mo., these in addition to present offices in Chicago and Detroit, Mich.

Westinghouse Electric & Mfg. Company Announces Wage Increase

Another increase in wages for shop employees aggregating nearly \$2,000,000 a year has just been announced by the Westinghouse Electric & Manufacturing Company. Effective October 16, all employees observing shop hours, except munition workers, will receive an additional bonus of 10 per cent if they are on a salary or time-rate basis, and of 7 per cent if they are on a piece, premium or task basis.

TRADE PUBLICATIONS

TRADING WITH THE ENEMY ACT.—The American Steel Export Company has issued a new 24-page pamphlet giving the groups of countries and lists of materials affected by the President's proclamation and subsequent orders, together with facsimiles of forms prescribed and an explanation of their use.

Railway Construction

CHICAGO SHORT LINE.—This company has begun the construction of a one-story engine and car repair shop with basement at South Chicago, Ill. The building will be a brick structure, 120 ft. by 150 ft., and will cost about \$30,000. Freyn & Co., Chicago, have the contract.

EASTERN TRACTION.—This company is being organized to build an interurban electric line from Houston, Texas, east via Beaumont to Orange, thence south towards Lake Charles, La. The project is being promoted by Ed. Kennedy of Houston and associates. Financial support in the way of bonuses, also donations of right of way and sites for terminals are being given by the towns along the route.

GREAT NORTHERN.—This company has let a contract for grading and double-tracking between Cut Bank, Mont., and Blackfoot, 26 miles, to Porter Brothers, Spokane, Wash. The work will cost approximately \$100,000 and involves no bridge work.

The Great Northern recently commenced the construction of a freight warehouse, 60 ft. by 800 ft., on Pine street, between Eighth street and Van Slyke court, St. Paul, Minn. The building will be of brick and concrete construction, two stories high with a basement for half the length, and one story with no basement for the remainder of the length. The completed structure will cost approximately \$100,000. W. L. Johnson, St. Paul, has the contract.

GULF, COLORADO & SANTA FE.—This company will construct a reservoir at Valera, Tex., with a capacity of about 360,000,000 gal., which will require a pipe line $10\frac{1}{2}$ miles long. The dam will be of earth with a core wall through the center and a concrete spillway.

HOCKING VALLEY.—This company has authorized the construction of second track between Delaware, Ohio, and Marion, 21 miles; Crawford and Cary, 2 miles, and Le Moyne and Cummings, 4 miles, at an estimated cost of about \$1,300,000. The work will include some realignment and grade reduction, including the elimination of 3 highway grade crossings and some concrete arches. The grading will amount to about 20,000 cu. yd. per mile. A considerable portion of the work will be done by force account. No contracts have been let to date.

ILLINOIS CENTRAL.—This company has purchased land on the east side of its right of way between One Hundred and Fifty-seventh and One Hundred and Seventy-fifth streets, Chicago, and will use it for a freight yard. The total estimated expenditure for improvements, including grading, buildings and equipment, is \$1,250,000.

NEW YORK, NEW HAVEN & HARTFORD.—This company has given a contract to the Thompson-Starrett Company, New York, for building a new station at New Haven. The work is to be carried out on a cost plus percentage basis.

NORTHERN PACIFIC.—This company has started laying track on its Lake Basin branch, extending 38 miles northwest from Hesper, Mont., a station on the Great Northern about five miles north of the junction of the Great Northern and the Northern Pacific near Laurel, Mont. About 90 per cent of the grading on the line has been completed, bridges are all completed and the road expects to complete track-laying late in the fall.

PHILADELPHIA & READING.—Work has just been started on the construction of a one story addition to freight house No. 4 at the corner of Noble and New Market streets, Philadelphia, Pa. The extension will be 83 ft. wide by 129 ft. long and 20 ft. high. The structure is to have steel columns, and girders, with brick walls and timber roof, covered with slag roofing. The contractor is A. L. Carhart, Philadelphia.

SOUTHERN PACIFIC, TEXAS LINES.—The Galveston, Harrisburg & San Antonio is building a branch from Rosenberg, Tex., through Needville to Damon Mound, 21 miles. M. M. Cravens, Rosenberg, Tex., has the contract for the grading, 25 per cent of which has been completed. The work involves the handling of about 15,000 cu. yd. per mile. The line will have a maximum curvature of two degrees.

Railway Financial News

BOSTON & MAINE.—At the annual meeting of the stockholders it was voted to hold the annual meeting in future on the second Wednesday in April and to change the annual report to cover the calendar year ended December 31. The fourteen directors were re-elected.

See also New York, New Haven & Hartford.

CANADIAN NORTHERN. The agreement based on the legislation of last session whereby the government acquires the capital stock of this company will be executed shortly. The final conference between representatives of the government and of the railway will take place this week. By the terms of the legislation, when the stock is taken over it will be at a price to be fixed by arbitration. When the stock of the company passes into the hands of the government a board of directors headed by Hon. Frank Cochrane, late Minister of Railways, will be appointed to manage the Canadian Northern system. There are already three government directors on the board and they are expected to remain for the present. The arbitration board which is to determine the value of the common stock will be presided over by Sir William Meredith, while it is understood that the stockholders' arbitrator will be the Hon. F. H. Phippen, counsel of the Canadian Northern. If they fail to agree on a third arbitrator, the senior judge of the Exchequer Court will name him.

CHICAGO, ROCK ISLAND & PACIFIC.—At the annual meeting of stockholders, held at Chicago on October 11, the Amster faction succeeded in electing four directors and the opposition nine directors. The Amster directors are as follows: Nathan L. Amster, Henry Bruere, P. G. Ten Eyck, Prof. William Z. Ripley. The remaining directors are: James E. Gorman, John G. Shedd, James A. Patten, B. G. Dawes, James N. Wallace, James Speyer, Charles H. Hayden and Frederick W. Scott; and A. C. Rearick has been chosen in place of Nathaniel French, who resigned after the meeting. The articles of consolidation were amended, taking from the directors the power to amend the by-laws in any way. Hereafter the by-laws can be changed only by the stockholders.

DENVER & RIO GRANDE.—At the annual meeting directors were elected as outlined in the program announced by the Platten stockholders' committee. The election gives the Missouri Pacific faction, so called, the majority representation on the board. The Gould directors who retired were Kingdon Gould and B. B. McAlpin. The directors elected were B. F. Bush, Edward L. Brown, Harry Bronner, Arthur Coppell, George J. Gould, J. Horace Harding, George C. Haven, E. T. Jeffery, John W. Platten, Finley J. Shepard and Harrison Williams.

NEW YORK, NEW HAVEN & HARTFORD.—Judge Julius M. Mayer, in the United States District Court, has issued an order extending until February 1, 1919, the time for the sale of this company's holdings of the preferred and common stock of the Boston & Maine. Under the dissolution decree of October 17, 1914, the securities were to be disposed of by January 1, 1918.

WESTERN MARYLAND.—Stockholders at the annual meeting of the company in Baltimore authorized the issue of \$5,000,000 7 per cent three-year notes, to be dated November 1, 1917, secured by the pledge of \$6,500,000 of the road's first and refunding mortgage bonds. The creation of an authorized general refunding mortgage of \$150,000,000 was voted to provide for refunding the company's obligations and for improvement purposes.

George J. Gould retired from the board of directors and was succeeded by John N. Willys. The other directors elected were: Edward D. Adams, Maxwell C. Byers, Henry E. Cooper, Bertram Cutler, Frederick T. Gates, Carl R. Gray, Lawrence Greer, Alvin W. Kreech, Edgar L. Marston, Emery H. Smith and W. A. Wilbur.

ANNUAL REPORT

SOUTHERN RAILWAY COMPANY—TWENTY-THIRD ANNUAL REPORT

RICHMOND, VA., October 9, 1917.

To the Stockholders of Southern Railway Company:

The Board of Directors submits the following report of the affairs of the Company for the year ended June 30, 1917.

It has been a record year. The volume of revenue, of expenses and of income, as well as the extent of improvements and betterments carried through, all reached new high levels, reflecting the good and the evil of the prosperity which has come to the South. Expanding business has brought in large returns, but it has set higher than ever before, and perhaps higher than is economically warranted, the standards of expenses. Nevertheless, until business shall again contract it would seem that the South may be expected still to prosper.

The story in detail of the Southern Railway's busy year will be found in the statements of account and statistical analyses exhibited with this report. It may suffice here to submit a rapid summary.

Total revenues were \$91,368,324.97, an increase of 14.46 per cent. over the previous year. Of this there remained, after paying out 70.10 per cent. for the expenses of operation and taxes, a net operating income of \$24,331,453.30. This is equivalent to 5.97 per cent. earned upon the property investment of the Company, which is now \$407,688,151.71.

The final balance of corporate income over charges was \$12,360,161.11, a sum which exceeded by \$3,026,262.50 the like balance of last year and the previous record.

This income balance has enabled the Company to spend during the year \$10,418,687.60 for additions and betterments to and upon the property over and above the proceeds of the Atlanta & Charlotte Air Line bonds which are being applied on double-track construction.

OPERATING CONDITIONS.

The study and practice of efficiency of operation were continued, and are reflected in the fact that the average trainload and the average carload were increased; that there was a substantial decrease in the charges for loss and damage of freight; that the balance of hire of equipment is for the first time in four years on the right side of the account, and most of all, that more than seventeen million passengers were carried without loss of a passenger's life in a train accident. Operating unit costs were, however, distorted, as compared with last year, by the large increases in wages which took effect during the year, and by an unprecedented increase in the cost of fuel.

The property has been well maintained; its physical condition was never better than at the close of the year. The roadway destroyed by storms and floods in July, 1916, was restored and the entire cost of reconstruction was charged to maintenance expense for the year.

At the close of the year the percentages of equipment in bad order and awaiting repair were: freight cars 2.32 per cent., locomotives 8.40 per cent.—figures which tell their own story of preparedness.

General expenses increased with other expenses largely by reason of increases in pay to clerks and attendants and of the continuing increase in the contribution to Federal valuation. On the other hand the charges for salaries and expenses of general officers show a decrease.

Taxes again show a large increase, equivalent to 16.39 per cent. above last year. Last year, for the year include, as nearly as it has been practicable to determine, provision for the additional tax anticipated under the war revenue tax law. It is interesting, however, to note that the requirement of taxes upon the dollar of revenue has now remained constant for three years under great variations of traffic returns, being 4.17 cents in 1915, 1916 and 1917.

TRAFFIC CONDITIONS.

Freight traffic increased 3,291,636 tons, or 10.47 per cent., tons one mile increasing 14.57 per cent.; number of passengers increased 901,187, or 5.37 per cent., passengers one mile increasing 14.05 per cent.

Revenue increases were:

From Freight \$6,672,407.39 or 13.85 per cent.
Passengers 2,511,048.39 or 15.17 per cent.

The results from passenger operations are remarkable, because, when compared with the number of miles of passenger earnings, there was a substantial reduction in passenger-train miles, due in part to the elimination of excursions and of circus trains in anticipation of the war transportation demands of the government, viz:

	Earnings from Passengers.	Passenger-Train Miles.
1913-1914.....	\$19,004,782.70	18,362,757
1916-1917.....	19,061,963.83	16,174,480

Except as affected by varying crop, local and temporary conditions, which caused this year a loss of certain traffic, principally perishables, there was a substantial, steady and uniform increase of every class of traffic handled by the Company, as may be seen from the table of classified tonnage. The tonnage of merchandise continues to be substantially that of bituminous coal, each in round figures ten million tons, or 30 per cent. of the whole tonnage carried. This equivalence has been characteristic for many years and is one of the most interesting of the phenomena of Southern Railway traffic. The tonnage of merchandise produced within the States directly served by the Company the tonnage of cotton seed and its products decreased 101,184 tons, or 13.5 per cent. Increased Southern mill consumption occasioned movement from other territory of cotton more than sufficient to offset the loss in tonnage of that commodity in the South of its own territory, and to give, in fact, an increase of 72,097 tons, or 11.08 per cent.

Through the location of numerous military camps within the South, we have engaged, and in some years may expect to continue to engage, increasingly, in the transportation of supplies for account of the government. Independent of this, the business conditions in the South warrant the expectation of a healthy growth of traffic for the ensuing year.

INDUSTRIAL AND AGRICULTURAL DEVELOPMENT OF THE TERRITORY SERVED.

MANUFACTURING:

The year has been one of steady growth of Southern manufacturing. New plants completed during the year in the territory served by the Southern Railway System and associated lines were as follows:

Character.	Number.
Brick, Tile, etc.....	32
Canneries.....	23
Cheese Factory.....	23
Chemical.....	12

Character.	Number.
Cotton Seed Products, Ginneries, etc.....	30
Creameries.....	8
Fertilizer.....	7
Food and Feed.....	14
Furniture.....	45
Iron Products.....	21
Lumber.....	145
Power Development.....	12
Stones, Coal, Mineral, etc.....	97
Tannery.....	1
Textile, Clothing, etc.....	90
Woodworking.....	33
Miscellaneous.....	226
Total.....	787

The total capital invested in these new industries amounted to \$44,585,280. During the year there were additions made to 348 previously existing manufacturing establishments at a reported cost of \$17,111,370. Plants reported under construction on June 30, 1917, were 89 in number with a capital of \$8,896,500. General improvements consisting of new buildings of all kinds except those used in manufacturing, public utilities, etc., cost \$70,262,335.

The importance of the cotton manufacturing industry of the South on the lines of the Southern Railway System continues to grow. The report of the United States Census Bureau for the cotton statistical year ended July 31, 1917, shows that, during the year, the consumption of cotton in the mills in cotton producing States increased nearly eleven per cent., as compared with an increase of barely one per cent. in the mills of all other States. The consumption in the mills of cotton producing States was 1,883,748 bales, exceeding the 2,899,775 bales consumed in other States by 1,001,638 bales. The growth of cotton manufacturing in the territory served by the Southern Railway System may be said to date from 1880, in which year the consumption of cotton in the mills of cotton producing States was only 188,748 bales, and in all other States 1,381,596 bales. Since that year the increase in consumption in Southern mills has amounted to 1,967 per cent., as compared with 110 per cent. in all other States.

AGRICULTURE:

The current year is one of great prosperity for Southern farmers. With the exception of oats, which were damaged by the unusually severe frosts in the spring, yields of all crops compare most favorably with those of 1916. The September first estimates of the United States Department of Agriculture show the following comparisons for the Southern States served by the Southern Railway System:

	1917.	Increase over 1916.	Per Cent.
Cotton, bales.....	6,357,000	1,030,635	19.35
Corn, bushels.....	676,342,000	181,106,000	36.57
Wheat, bushels.....	48,686,000	676,000*	1.37
Oats, bushels.....	49,507,000	19,595,000*	28.36
Tobacco, pounds.....	915,576,000	68,117,000	8.04
Irish Potatoes, bushels.....	35,811,000	6,947,000	25.01
Sweet Potatoes, bushels.....	6,274,000	1,491,000	31.63
Apples, bushels.....	35,025,000	804,000*	2.24
Peaches, bushels.....	13,387,000	3,611,000	36.94

* Decreases.

In addition to the above crops, there have been large increases in the yields of certain crops for which statistics are not gathered by the Agricultural Department. Velvet beans are rapidly coming into prominence as a most valuable stock feed and are becoming an important agricultural asset of the South. According to a conservative estimate, 5,000,000 acres of velvet beans have been grown in the States served by the Southern Railway System this year, being an increase of at least 300 per cent. over last year. There have also been large increases in the production of soy beans and peanuts.

In the stock husbandry the South has made a new declaration of economic independence. The increased production of grain and forage crops in the South is putting the live stock industry of the territory served on a sound basis and it is rapidly developing. The importance of this fact will be apparent to any one who has studied the statistics of the imports of food, and especially of meats, into the South in the past. Our reports show the location of 8,050 pure-bred breeding cattle and 5,929 pure-bred breeding hogs on farms along our lines during the year. These figures do not represent the total pure bred, but only those that have come to the knowledge of our agricultural agents. The number of hogs would be greatly increased if figures were available covering the work of the boys' pig clubs in all of the territory. That it is not necessary for Southern farmers to go to other sections of the country to purchase pure bred stock is shown as formerly is shown by the frequency with which the names of Southern breeders are found in the lists of prize winners at the leading live stock exhibitions of the North and West as well as of the South. In co-operation with the Division of Animal Industry of the United States Department of Agriculture we are now encouraging a movement of cattle from localities in Texas, where a shortage of food is reported, to farms on our lines. While this movement includes some feeders, most of the animals are high-grade Hereford and Shorthorn cows and heifers which will be used for breeding.

Our reports show that there were planted during the year about 3,500,000 apple, peach, Satsuma orange and other fruit trees in the territory served by the Southern Railway System and associated lines.

We have encouraged our cooperative work in aid of the agricultural development of the territory during the year. Special attention again has been given to aiding farmers to find profitable markets for their products. Letters received from many of those who avail themselves of our service show that it is most helpful and is highly appreciated. One of its results is to encourage farmers to produce in larger quantities products which they have been able to market successfully, thus increasing the volume of our traffic.

IMMIGRATION:

The relatively low prices of farm lands, in proportion to their productive value, in many parts of the South, and the climatic advantages of the territory, after strong inducements for the migration of farmers from more densely populated and less favored parts of the country. The movement of Northern and Western farmers to the South is constantly going on and we hope to make more help and solicitation in the future. One of its results is to encourage farmers to produce in larger quantities products which they have been able to market successfully, thus increasing the volume of our traffic.

being trained and erroneous ideas about the South that they may have will be corrected. As a means of aiding in their education and creating a desire to establish in the South after the war, we are distributing literature in the camps giving facts about the South and its agricultural and industrial opportunities.

THE ADDITIONS TO CAPITAL ACCOUNT AND TO PROPERTY INVESTMENT.

PROPERTY INVESTMENT:

The investment in road and equipment increased \$12,781,279.71, representing additions made during the year, exclusive of expenditures, amounting to \$8,410,921.70, for double-track on the Atlanta & Charlotte Air Line Railway. This investment represents additions provided to take care of an expanding traffic and Letterman for greater efficiency and economy of operation. The success of the Company in handling during the past year a record traffic easily and without congestion, so building its income balance, may fairly be attributed to the liberal policy of enlarging the plant which has been followed during the past few years.

DOUBLE TRACK:

Of the 649 miles of main line between Washington, D. C., and Atlanta, Ga., 521 miles are now double-track on improved alignment and grades, and the work is progressing on the remaining 128 miles. The incomplete work is south of Charlotte, N. C., and additional funds for carrying it on were made available through the sale during the past year of the remaining \$4,000,000 thirty-year five per cent. bonds of The Atlanta & Charlotte Air Line Railway Company provided for issue under the First Mortgage of that Company.

Southern Railway Company now operates a total of 820 miles of double-track railroad.

NEW ORLEANS AND NORTHEASTERN RAILROAD:

Southern Railway Company has acquired substantially all of the capital stock of New Orleans and Northeastern Railroad Company, which owns the railroad extending from New Orleans, La., to Meridian, Miss., there connecting with other lines of Southern Railway System. This stock was held for many years by an English investment company known as the Alabama, New Orleans, Texas and Pacific Junction Railways Company, Limited, and its purchase was made possible through the wish of the Directors and other security holders of the English company to assist the British Government in securing American exchange. The English company owned also the controlling stocks of the Alabama and Vicksburg Railway Company and the Vicksburg, Shreveport and Pacific Railway Company, representing the railroad extending from Meridian westerly to Shreveport, La., and as Southern Railway Company, as a part of the transaction, disposed of its minority holding of the stock of the English company acquired in 1905, it has parted with all interest in the Alabama and Vicksburg and the Vicksburg, Shreveport and Pacific. The acquisition of the New Orleans and Northeastern Railroad stock secures to Southern Railway Company a direct entrance into New Orleans as well as physical connection with its extensive terminals at that port.

BONDS AND NOTES:

There was no increase in mortgage bonds outstanding. Equipment trust obligations increased \$2,059,000.

There were drawn, and taken into the treasury, \$10,675,000 Development and General Mortgage four per cent. bonds. Of these bonds \$10,000,000 were drawn, under the terms of the mortgage, for additions and betterments, and the remaining \$675,000 were drawn for the proportion charged to capital of certain equipment trust obligations paid during the year. The total amount of Development and General Mortgage four per cent. bonds available for disposition on June 30, 1917, was \$49,149,000, of which \$44,250,000 are pledged as collateral for notes.

A comprehensive plan for financing existing and future requirements of capital, including the funding of short term notes, through the creation of a new mortgage to be called the Refunding and Improvement Mortgage, was recommended by the Board of Directors and authorized by the stockholders at the meeting held on January 5, 1917, but has not been consummated because extraordinary conditions existing in the investment market prevented the sale of long term bonds on terms sufficiently advantageous to the Company to justify selling them. This made it necessary again to resort to short term notes, and there were issued and sold \$25,000,000 two-year five per cent. notes dated March 2, 1917, payable March 2, 1919, to provide for retiring notes to discharge the obligation incurred in the purchase of the New Orleans and Northeastern Railroad stock and to furnish a small amount of additional capital for improvements.

DIVIDEND.

A dividend of 2½ per cent. on the Preferred Stock has been declared payable on November 30, 1917, to stockholders of record at the close of business on October 31, 1917. In view of the income account the Board concluded that this dividend might conservatively be paid, in justice to the expectations of the preferred stockholders, notwithstanding the fact that there still remains unsolved the problem of permanent financing of existing and future capital requirements.

SERVICE OF EMPLOYEES.

Despite disturbed labor conditions throughout the year and acute discussions of wages, the Company has again had loyal and efficient service from its army of employees. The management has been daily reminded that whatever success has been secured is due to that co-operation and to the vigor with which work is done under the stimulus of the now established and recognized pride of the rank and file in their relation to the property.

ACCOUNTS.

The accounts have been examined, as usual, by independent auditors and accountants, Messrs. Patterson, Teale & Dennis, and their certificate is made a part of this report.

Respectfully submitted, by order of the board,

FAIRFAX HARRISON,
President.

[Adv.]

Railway Officers

Executive, Financial, Legal and Accounting

W. C. Mitchell has been appointed vice-president of the Susquehanna & New York, with office at New York.

W. E. Welch, superintendent of the Ft. Smith & Western, has been appointed assistant to the receiver, with office at Ft. Smith Ark.

J. D. Watson, assistant to the first vice-president of the St. Louis Southwestern, has been appointed assistant to the president, with office at St. Louis, Mo.

J. T. Freeman has been appointed auditor and general freight and passenger agent of the Brownwood North & South, with office at Brownwood, Tex., succeeding H. M. Grizzard.

M. K. Stephens, in addition to his duties as auditor of the Anthony & Northern, has assumed the position of traffic manager, in place of R. H. Singleton, with office at Hutchinson, Kan.

J. M. C. Usher has been appointed auditor and treasurer of the Sapulpa & Oil Field, with office at Tulsa, Okla., succeeding T. D. Trickey, auditor, and R. S. Homsher, treasurer and traffic manager.

F. W. Charske, anditor of freight accounts of the Union Pacific at Omaha, Neb., has been appointed auditor of the Oregon Short Line to succeed L. R. Wood, who is assigned to other duties with the system.

L. R. Smith has been appointed auditor of station accounts of the Great Northern, and H. F. Bayer, anditor of miscellaneous accounts, with headquarters at St. Paul, Minn., succeeding A. B. Fisher, promoted.

E. B. Barber, treasurer of the Algona Central & Hudson Bay at Sault Ste. Marie, Ont., has been appointed controller, and J. M. Alton has been appointed treasurer. Both with offices at Sault Ste. Marie, Ont.

F. B. Longfield, chief clerk of freight receipts of the Chicago Great Western, has been appointed auditor of freight receipts, with headquarters at Chicago, Ill., to succeed W. J. Cunningham, resigned to become general accountant on the Illinois Central at Chicago.

William E. Lamers has been appointed assistant auditor of the New York, Chicago & St. Louis, with headquarters at Cleveland, Ohio, succeeding James E. Baldwin, resigned. H. S. Lewis, commercial agent at Toledo, Ohio, has been appointed district freight agent at the same place. J. B. Fletcher succeeds Mr. Lewis.

Operating

G. S. Whybark, chief despatcher, has been appointed superintendent of the Arkansas Central, with office at Ft. Smith, Ark.

R. B. Croll, superintendent of car service of the Ft. Smith & Western, has been appointed superintendent in charge of car service, train and station service, with headquarters at Ft. Smith, Ark.

R. McIntyre has been appointed assistant to the vice-president and general manager of the Southern Pacific, Pacific System, in charge of wage schedules, with headquarters at San Francisco, Cal.

H. S. Baumgardner has been appointed superintendent of transportation of the Missouri & North Arkansas, with jurisdiction over train operation and station service, with headquarters at Harrison, Ark.

J. W. Daniels has been appointed superintendent of the Arkansas division of the Missouri Pacific, with headquarters at Little Rock, Ark., succeeding C. L. Mayne, assigned to other duties; effective October 10.

C. E. Hair, assistant secretary of the Chicago, Terre Haute & Southeastern, has been appointed assistant general superintendent, with headquarters at Terre Haute, Ind., and C. V. Link has been appointed assistant superintendent at Bedford, Ind.

L. S. Brown, assistant general superintendent of the eastern lines of the Canadian Government Railways, has been appointed general superintendent of the eastern lines with office at Moncton, N. B., vice J. K. McNeillie, resigned to go to another company.

H. B. Voorhees, who has been appointed general superintendent of transportation of the Baltimore & Ohio, with headquarters at Baltimore, Md., as has already been announced in these columns,

H. B. Voorhees

was born on January 22, 1876, and graduated as a civil engineer from Rensselaer Polytechnic Institute at Troy, N. Y., in 1896. He began railway work in the same year as assistant supervisor of the Philadelphia & Reading at Tamaqua, Pa., and on March 1, 1898, became supervisor. On August 1, 1898, he was promoted to assistant trainmaster, and in October, 1900, became trainmaster. He entered the service of the Baltimore & Ohio on December 1, 1901, as assistant engineer at Pittsburgh, and in August, 1902, was promoted to division engineer, with headquarters at Baltimore. He was appointed assistant to general superintendent in September, 1903, and subsequently served as superintendent and general agent of the Philadelphia division at Philadelphia, Pa., until May, 1910, when he was appointed assistant to president. On May 1, 1912, he was appointed general superintendent of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton lines, at Cincinnati, Ohio; he later served as general superintendent of the Northwestern district of the Baltimore & Ohio, and now becomes general superintendent of transportation of the Baltimore & Ohio, with office at Baltimore, Md., as noted above.

F. M. Clark, whose appointment as superintendent of the Old Colony division of the New York, New Haven & Hartford, with headquarters at Taunton, Mass., has already been announced in

F. M. Clark

these columns, was born in Taunton, and was educated in the public and high schools. He later studied mechanical drafting in the night schools. He entered the service of the Old Colony Railroad in 1891, as agent and operator and remained in the service of that road until it was absorbed by the New York, New Haven & Hartford in June, 1893, since which time he has been continuously in the service of the New Haven. He served consecutively as agent and operator, car distributor and train despatcher until April, 1906, when he was appointed transportation clerk in the office of the assistant general superintendent at Boston, Mass., and later was appointed inspector of transportation in the office of the general superintendent at New Haven. On June 1, 1909, he was appointed acting trainmaster of the Shore Line division; the following November he was appointed trainmaster of the Providence division, remaining in that position until June, 1916, when he was appointed assistant superintendent of transportation with supervision of freight rates, and now becomes superintendent of the Old Colony division as above noted.

C. N. Clark, assistant superintendent of the Denver & Salt Lake at Denver, Colo., having been assigned to other duties, the position is abolished. F. B. Miller has been appointed trainmaster at Denver and will handle all matters heretofore under the jurisdiction of the assistant superintendent.

R. S. Marshall, superintendent of the Georgia division of the Seaboard Air Line at Atlanta, Ga., has been appointed superintendent of the Virginia division, with office at Raleigh, N. C., vice G. R. Carlton, who succeeds Mr. Marshall as superintendent of the Georgia division, with office at Atlanta.

H. B. Titcomb, maintenance of way assistant for the northern district to the assistant chief engineer of the Southern Pacific at San Francisco, Cal., has been appointed superintendent of the Stockton division, with headquarters at Stockton, Cal., succeeding C. H. Ketcham, resigned, effective October 15.

Claude B. Carpenter was appointed superintendent of the Rio Grande Southern division of the Denver & Rio Grande on October 1, succeeding F. White, acting superintendent, assigned to other duties. Mr.

Carpenter was born at Columbia, S. C., on January 11, 1874, and entered the service of the Denver & New Orleans on May 1, 1885, as an office boy in the superintendent's office at Denver, Colo. In September, 1887, he went to the Denver & Rio Grande as office boy in the general passenger agent's office at Denver, and in June, 1890, was transferred to the office of president and general manager as record clerk. On January 1, 1892, he was made record clerk in the general superintendent's office, and was subsequently stenographer, telegraph operator, transportation clerk and private secretary in the same office until 1901, when he became chief clerk. He was appointed chief clerk to the general superintendent of the Colorado & Southern at Denver, on January 19, 1903, and on August 1 of that year became chief clerk to the general manager of the Ft. Worth & Denver City, at Ft. Worth, Tex., also acting as purchasing agent. In May, 1904, he was appointed chief clerk to the superintendent of the northern division of the Colorado & Southern at Denver, and returned to the Denver & Rio Grande in May, 1906, as chief clerk to the general superintendent at Denver. From June 1, 1907, to August 1, 1913, he was chief clerk to the general manager, acting also as superintendent of car service for three years. He was appointed inspector of transportation on the latter date, and on May 1, 1914, became assistant superintendent of the fourth division, from which position he has been promoted to that of superintendent of the Rio Grande Southern division, with headquarters at Ridgway, Colo.

R. C. Andrews, superintendent of the Ft. Worth division of the Texas & Pacific at Ft. Worth, Tex., has been transferred to Marshall, Tex., as superintendent of the eastern division, succeeding W. M. Lynch. Mr. Lynch has been transferred to the Louisiana division as superintendent, with headquarters at Alexandria, La., succeeding W. H. DeFrance, who succeeds Mr. Andrews at Ft. Worth.

A. J. Witchell, engineer of tests of the Spokane, Portland & Seattle, has been appointed to the newly created position of assistant to the general superintendent, with office at Portland, Ore. G. E. Votaw, superintendent of the Great Northern, at Great Falls, Mont., has been appointed superintendent of the Portland division of the Spokane, Portland & Seattle, succeeding C. A. Vermillion, granted a leave of absence on account of ill health.

R. E. Ryan, assistant superintendent of the Minneapolis & St. Louis at Watertown, S. D., has been appointed superintendent of the central and western divisions, with office at Minneapolis, Minn., succeeding C. P. Stembel, resigned to become general

superintendent of the Virginian at Norfolk, Va. The position of assistant superintendent at Watertown has been abolished. H. McCarthy, trainmaster at Minneapolis, has been appointed assistant superintendent of the central and western divisions. F. O. Coleman has been appointed trainmaster of the western division at Watertown. The office of trainmaster of the central division at Minneapolis has been abolished.

J. W. Mulhern, formerly superintendent of the Northern division of the Chicago Great Western, has been appointed general superintendent of the Kettle Valley, a subsidiary of the

Canadian Pacific, with headquarters at Penticton, B. C. Mr. Mulhern was born at Naples, Ill., in 1863, and entered railway service with the Chicago, Burlington & Quincy at Beardstown, Ill., in 1881, serving successively as water carrier, track hand, freight trucker, freight clerk, brakeman and freight and passenger conductor until October, 1887, when he was made yardmaster of the Kansas City terminal. From January, 1890, to December, 1902, he was trainmaster at Brookfield, Mo., and on the latter date was promoted to superintendent of terminal at Kansas City, Mo. In August, 1904, he was appointed superintendent of the Hannibal-St. Louis division at Hannibal, Mo., and in December of the following year was transferred to the superintendency of the Galesburg division at Galesburg, Ill., resigning in July, 1908, to become superintendent of the Illinois lines of the Chicago & Alton at Bloomington, Ill. From May, 1910, to May, 1911, he was assistant to the second vice-president of the Western Pacific at San Francisco, Cal., and from the latter date to August, 1912, was general superintendent of the Utah lines of the Denver & Rio Grande at Salt Lake City. In November, 1912, Mr. Mulhern was appointed superintendent of the Chicago-Petoskey division of the Pere Marquette at Grand Rapids, Mich., and in July, 1914, he went to the Chicago Great Western as superintendent of the Northern division at St. Paul, Minn., which position he held until March, 1917. His appointment as general superintendent of the Kettle Valley was made on July 1.

J. W. Mulhern

C. B. Carpenter

Traffic

Robert J. Sefton has been appointed district passenger agent of the Chicago Great Western at St. Louis, Mo., in place of H. B. Bryning.

G. H. Dougherty, traveling freight agent of the Kansas City Southern at Dallas, Tex., has been appointed general agent, with office at Tulsa, Okla.

W. A. Kellond, general baggage agent of the Missouri, Kansas & Texas, has also assumed the duties of manager of mail traffic, with office at Parsons, Kan.

John D. Deets, superintendent of farming and development of the Minneapolis & St. Louis, has been appointed immigration agent at Minneapolis, Minn.

A. C. Huggins has been appointed commercial agent of the Cleveland, Cincinnati, Chicago & St. Louis at Jacksonville, Fla., succeeding R. G. Parks, resigned.

W. G. Holly has been appointed commercial agent of the Macon, Dublin & Savannah, with headquarters at Atlanta, Ga., vice E. G. Tucker, assigned to other duties.

W. R. Daniels, traveling freight agent of the Texas & Pacific at Dallas, Tex., has been appointed division freight agent at El Paso, Tex., in place of D. L. Ray. R. S. Norton has been appointed commercial agent at San Francisco, Cal., succeeding W. J. Moylan, resigned.

J. M. Gross, assistant general freight agent of the Pennsylvania Railroad, lines east of Pittsburgh, with headquarters at Philadelphia, Pa., has resigned to become general traffic manager of the Bethlehem Steel Company; F. X. Quinn, district freight solicitor of the Pennsylvania Railroad at New York City, has been appointed acting division freight agent at Buffalo, effective October 15.

J. B. Large, division freight agent of the Pennsylvania Railroad, at Buffalo, N. Y., has been appointed assistant general freight agent of the lines East of Pittsburgh, with headquarters at Philadelphia, Pa. He was born on August 18, 1882, at Philadelphia, and was educated at the Protestant Episcopal Academy, of Philadelphia, and at the Wharton School of Finance of the University of Pennsylvania. He entered the service of the Pennsylvania Railroad on October 7, 1902, as a clerk at Germantown Junction, Pa., and the following summer was transferred to the general office at Philadelphia. In May, 1906, he was promoted to traveling freight solicitor, of the Boston district and in October, 1907, was made district

freight solicitor at Providence, R. I. He was promoted in February, 1910, to freight solicitor at Reading, Pa., and on May 8, 1912, upon a change in organization of the Pennsylvania Railroad, he was appointed division freight agent of the Erie and Northern divisions with headquarters at Erie, and later served in the same capacity at Buffalo, N. Y., until his appointment as assistant general freight agent, as above noted.

Horace Hale Holcomb, general freight agent of the Chicago, Burlington & Quincy, lines west of the Missouri river, with headquarters at Omaha, Neb., has been promoted to assistant

freight traffic manager at Chicago, succeeding C. E. Spens, recently elected vice-president in charge of traffic. Mr. Holcomb was born on October 12, 1865, and entered the service of the Burlington on August 1, 1889, as a clerk in the local freight office at Chicago. In March of the following year he was transferred to the Hawthorne (Ill.) yards as rate clerk, and in May, 1891, was made chief clerk at that point. In November, 1900, he was transferred to the general freight office as tariff clerk, and on January 1, 1902, became

chief clerk to the assistant general freight agent at St. Paul, Minn. On March 1 of that year he was made chief clerk to the assistant general freight agent at Chicago, and on August 24, 1905, he was promoted to assistant to the freight traffic manager, which position he held until December, 1912, when he was appointed general freight agent, lines west of the Missouri river, with headquarters at Omaha. He remained in the latter position until his promotion to assistant freight traffic manager on October 1.

C. C. McMillin, assistant general passenger agent of the Georgia Railroad at Atlanta, Ga., has been appointed special pas-

senger agent, with office at Augusta, and J. M. Wooddall has been appointed assistant general passenger agent with office at Atlanta, succeeding Mr. McMillin. Mr. Wooddall has been appointed assistant general passenger agent also of the Atlanta & West Point and the Western Railway of Alabama.

F. B. Rowley, commercial agent of the New York Central Railroad and the New York Central Fast Freight Lines at Minneapolis, Minn., has been promoted to assistant general freight agent of the New York Central Railroad at Chicago. A. L. Evans succeeds Mr. Rowley at Minneapolis and A. C. Lawson has been appointed commercial agent at Salt Lake City, Utah, vice W. L. Greiner, promoted to westbound agent of the Merchants Despatch at Chicago.

James Paul Anderson, who has been appointed passenger traffic manager of the Pennsylvania Lines East of Pittsburgh and Erie, with office at Philadelphia, Pa., as has already been announced

in these columns, was born August 29, 1862, at Beaver, Pa. He was educated in the public schools of Beaver and Allegheny and entered the service of the Allegheny Valley Railway on July 15, 1880, as a clerk in the passenger department. After serving as chief clerk and traveling passenger agent he was appointed general passenger agent of the same road in June, 1889, and when the Pennsylvania Railroad absorbed the Allegheny Valley in August, 1900, he was appointed division ticket agent of the Buffalo and Allegheny

Valley division. On April 1, 1910, he was appointed district passenger agent of the Pittsburgh district, and on August 1, 1912, was promoted to assistant general passenger agent. In March, 1913, the passenger department of the Pennsylvania Lines East of Pittsburgh and Erie was reorganized and Mr. Anderson was promoted to general passenger agent in charge of through traffic, with headquarters at Philadelphia, Pa., which position he held until his appointment as passenger traffic manager, as above noted.

C. E. Veatch, assistant general freight and passenger agent of the Missouri & North Arkansas, has been appointed acting general freight and passenger agent, with office at Harrison, Ark., to succeed J. C. Murray, granted a leave of absence to enter an officers' training camp. W. L. Monson, commercial agent at Atlanta, Ga., has been transferred to Chattanooga, Tenn., succeeding A. A. Boyle, resigned. G. C. Murray has been appointed commercial agent at Atlanta, succeeding Mr. Monson. C. A. Morgan has been appointed commercial agent at Wichita, Kan., succeeding L. C. Williams, resigned, and E. J. Graham becomes commercial agent at New Orleans, taking the place of W. J. McMahon, resigned.

Engineering and Rolling Stock

F. W. Schultz has been appointed master mechanic of the Kansas City, Mexico & Orient of Texas at San Angelo, Tex., vice T. C. Kyle.

C. Whitfield, roadmaster of the Portland division of the Spokane, Portland & Seattle, has been appointed superintendent maintenance of way, with headquarters at Portland, Ore., the title of roadmaster having been abolished.

M. B. McPartland has been appointed master mechanic of the Denver & Salt Lake, with jurisdiction over the motive power and car departments, with headquarters at Utah Junction, Denver, Colo. D. G. Cunningham having resigned, the position of superintendent of machinery is abolished.

E. W. Smith, assistant engineer of motive power of the Pennsylvania Railroad at Altoona, Pa., has been appointed

J. B. Large

J. P. Anderson

H. H. Holcomb

master mechanic, with office at Harrisburg, succeeding C. L. McIlvaine, promoted, and C. O. Keagy, general foreman of the West Philadelphia shops, has been appointed master mechanic of the Middle division of the main line, with office at Altoona.

Charles Lee McIlvaine, master mechanic of the Philadelphia division of the Pennsylvania Railroad at Harrisburg, Pa., has been appointed superintendent of motive power of the Northern division, with headquarters at Buffalo, N. Y.

Claude M. Starke, master mechanic of the Illinois Central at McComb, Miss., has been appointed assistant superintendent of motive power of the Missouri, Kansas & Texas, with headquarters at Parsons, Kan., effective October 1. Mr. Starke was born at Water Valley, Miss., on January 15, 1878, and entered the service of the Illinois Central on April 9, 1891, as a clerk at Water Valley. He was subsequently machinist apprentice, machinist and roundhouse foreman, and was promoted to general foreman at Indianapolis, Ind., on April 1, 1909, being transferred to Champaign, Ill., in a similar capacity on September 1, 1911. He was appointed master mechanic at Water Valley on June 1, 1912, and one year later was transferred to McComb. He held the latter position until his recent appointment as assistant superintendent of motive power of the Missouri, Kansas & Texas.

Francis M. Waring, acting engineer of tests of the Pennsylvania Railroad at Altoona, Pa., has been appointed engineer of tests. He was born on September 28, 1879, at Charleston, S. C., and is a graduate of the Charleston High School and Virginia Polytechnic Institute. He began railway work with the Northern Central at Baltimore, Md., on November 14, 1898. On March 5, 1900, he entered the service of the Pennsylvania Railroad, on special duty at Williamsport, Pa., and in November of the following year he was transferred to Baltimore on special duty and subsequently served there as a machinist until July, 1902, when he again returned to be assigned to special work. In November, 1902, he became a draftsman there, and on October 19, 1903, was made an inspector at Altoona. He entered the test department in September, 1912, as foreman of the physical laboratory, and from June 1, 1917, until he received his recent appointment, he has been acting engineer of tests.

Chas. Manley has been appointed superintendent of machinery of the Missouri & North Arkansas, with jurisdiction over all mechanical and car departments with office at Harrison, Ark., and the position of superintendent, formerly held by him, has been abolished. H. J. Armstrong, resident engineer, has been appointed engineer maintenance of way, with jurisdiction over maintenance of way, structures and water service, with office at Harrison.

C. M. Starke

F. M. Waring

O. C. Wright, assistant engineer of motive power of the Pennsylvania Lines West, at Pittsburgh, Pa., has been appointed master mechanic on the Southwest system at Logansport, Ind. E. B. De Vilbiss, assistant engineer of motive power at Toledo, Ohio, has been transferred to the general office at Pittsburgh, Pa., taking Mr. Wright's place.

Edward Lawless, general foreman locomotive department of the Illinois Central at Freeport, Ill., has been promoted to master mechanic with the same headquarters, succeeding V. U. Powell, transferred to the Burnside shops, Chicago. E. C. Roddie, district foreman at New Orleans, La., has been promoted to master mechanic at McComb, Miss., to succeed C. M. Starke, resigned to become assistant superintendent of motive power of the Missouri, Kansas & Texas at Parsons, Kan.

John M. Henry, assistant superintendent of the New York division of the Pennsylvania Railroad at Jersey City, N. J., has been appointed assistant general superintendent of motive power of the lines east of Pittsburgh with headquarters at Altoona, Pa. He was born on October 10, 1873, and was educated in the public schools of Altoona and graduated from Purdue University in June, 1900. He entered the service of the Pennsylvania Railroad as a special apprentice in the Altoona machine shops on May 5, 1889. He served as an apprentice until September 1, 1896, when he entered Purdue University, being furloughed from the shops during the school term each year. In June, 1900, he became a special apprentice in the office

J. M. Henry

of the assistant engineer of motive power at Altoona; on July 1, 1901, he was promoted to motive power inspector at Altoona, and in February, 1902, was made assistant engineer of motive power of the Erie division and Northern Central Railway at Williamsport, Pa. He was promoted to master mechanic of the Elmira, N. Y., shops on July 1, 1903, and later served in the same capacity first at the Sunbury shops and then at the Olean shops, and at the West Philadelphia shops. On December 1, 1913, he was promoted to superintendent of motive power of the Western Pennsylvania division, at Pittsburgh, Pa., and on May 1, 1916, was appointed assistant superintendent of the Pittsburgh division. He was transferred as assistant superintendent to the New York division on April 15, 1917, and now becomes assistant general superintendent of motive power at Altoona, as above noted.

Purchasing

Robert E. Scott, assistant roadmaster of the Oregon Electric, has been appointed purchasing agent of the Spokane, Portland & Seattle, with headquarters at Portland, Ore.

Railway Officers in Military Service

J. C. Murray, general freight and passenger agent of the Missouri & North Arkansas, with headquarters at Harrison, Ark., has been granted a leave of absence to enter an officers' training camp.

OBITUARY

John H. Hale, for several years past a member of the Connecticut Public Utilities Commission, died at his home in Glastonbury, Conn., on October 12, at the age of 64. Mr. Hale was a noted horticulturist and grower of peaches.

Charles Harrison Tweed, formerly general counsel for the Central Pacific and the Chesapeake & Ohio, also general counsel of the Southern Pacific when that company was organized, died at his home in New York, on October 11, at the age of 83.

The road foreman of engines has been designated as "the eyes of the mechanical department," inasmuch as he is called upon to keep the mechanical department informed regarding the performance of power and to report defective locomotives so that they may be repaired promptly. This is one of the important

duties of this officer, but in too many cases the mechanical department fails to use its "eyes" and disregards the recommendations of the road foremen. The importance of well maintained power at the present time is so obvious that no argument is necessary. It means that more tonnage can be hauled, that less fuel will be used and that the railways will be serving the country with greater efficiency. There is nothing more discouraging to any one than to see his best efforts wasted or disregarded. The road foremen should be made to feel that their efforts are appreciated and that they are performing an important function in our transportation system, not by kind words and pretty compliments, but by action—by putting into effect their suggestions.

Railroads have always hesitated to store coal on account of the supposed deterioration in the calorific value. The

actual extent of this has been definitely settled by a report on the deterioration in the heating value of coal during storage, published as bulletin No. 136 of the Bureau of Mines. Except for the sub-bituminous Wyoming coal, no loss in the heating value of the fuel tested was greater than 1.2 per cent in the first year or 2.1 per cent in two years. Under-water storage tests made with New River and Pittsburgh coals showed practically no loss in calorific value. The New River coal when stored in the air under severe conditions showed a heat loss of about one per cent in one year, two per cent in two years, reaching two and a half to three per cent in five years. The open air storage of Pittsburgh coal developed practically no deterioration during the first year. This increased slowly until at the end of five years the deterioration was 1.1 per cent. The Wyoming sub-bituminous coal, which is known as black lignite, deteriorates rapidly in storage, particularly by slacking. However, by the use of bins with air tight

bottoms and sides and a protecting layer of fine slag on top of the coal, the heat loss of this coal in storage can probably be kept below three per cent in one year and the physical deterioration can also be largely prevented. The results of these investigations, which were made by experts, Horace C. Porter and F. K. Ovit, show that the loss in calorific value of fuel in storage has been overestimated. The loss in most coals, such as New River and Pittsburgh, is so slight that the expense of underwater storage equipment would not be justified except to prevent fires from spontaneous combustion.

The establishment of "sailing days" for the despatch of merchandise cars from large freight stations, reducing by 50 per cent or more the number of cars needed for some services, bids fair to be an effective means of permanent economy; and, as a rule, shippers seem to be disposed to co-operate with the railroads to make the scheme a quick success; but, as with almost everything connected with freight transportation, there are innumerable details to be attended to. At Philadelphia some revisions of schedules have been found necessary already; and at New York the date for starting the plan has been further postponed because of the necessity of additional conferences to adjust it to the needs of the many thousands of shippers. In Massachusetts and Rhode Island it was to have gone into effect on the 10th of October but there the notice is suspended because of the shippers' fear that rival cities will be favored. And it may very well be that these fears are reasonable; although founded on a claim that is based on no real grievance. For example, a retail merchant midway between Boston and Providence or Worcester, will be told that he can have his freight shipped from the smaller city only on Tuesdays or Fridays, whereas at Boston there is no such restriction. The shipper at Boston can get a receipt on Wednesday as well as on Friday. But in the congestion which has prevailed during the past six months the actual date of arrival of two such shipments was, very likely, the same from both cities. The bill of lading issued at Boston seemed to be a promise to get the goods to destination two days earlier than the shipment from Providence

Sailing Days for Freight Cars

(or Worcester) but in reality it did not always carry out such promise. However, the retailer's confidence in a promise like this, whether well-founded or ill-founded, is sufficient to lead him to complain of neglect at the rival city; and the wholesaler who ships from there must, in self-defense, demand that cars shall be sent out no oftener from Boston than from his town. An agreement acceptable to all can without doubt be arranged if everybody has the requisite patience. In the case of many routes, where freight has to be transferred en route from one car to another, shippers will find a very direct self interest, not only in accepting, but in urging a scheme in which the sailing days shall be full car loads always. Meantime, the vitally important fact for all to bear in mind is that the wasteful use of cars must be stopped; for unless the greatest practicable use is made of each car, there would not be enough cars to fill the demand on "sailing days" regardless of how the "sailing days" are arranged.

THE IRRESPONSIBLE AGITATION ABOUT RAILWAYS

IT is remarkable how much attention can be attracted sometimes by utterances on important questions made by men who don't know a thing about the questions discussed. Recently a statement was issued in Washington and published in newspapers throughout the country, in which the prediction was made that the exigencies of war may force government ownership of railways in the "surprisingly near future." This prediction was attributed to an anonymous "Conference Committee on National Preparedness." The pretentious name used was adapted to convey the impression, and evidently did convey it to many people, that the "committee" spoke with knowledge, if not, indeed, with some kind of official authority. It added that "the whole transportation system of America is bending and may break under the strain of our first year in war"; and it advanced a lot of half baked suggestions concerning methods which it thought the railroads ought to adopt in order to increase their efficiency.

The *Railway Age Gazette* has tried to find out the personnel of the "Conference Committee on National Preparedness." We learn that its chairman is Henry A. Wise Wood, a manufacturer of printing machinery in New York. Of course, a manufacturer of printing machinery is just the man to know all about the railway situation and to go down to Washington and enlighten the public about it. The secretary is J. E. Clark. We never heard of him before, and therefore, cannot say whether or not he is as well qualified as Mr. Henry A. Wise Wood to discuss the railway situation. The treasurer is R. B. Price, who, apparently is, or formerly was connected with a large rubber company. Experience in the rubber business, it is needless to say, is the one thing which a man needs to give him intimate and thorough knowledge of railway matters.

One of the best answers which can be made to the apprehensions expressed by this self-ordained and self-constituted committee of amateur saviours of the country was contained in the remarks of Chairman Hall of the Interstate Commerce Commission before the National Association of Railway and Public Utility Commissioners in Washington last week. Mr. Hall said: The power to commandeer the carriers by rail has not been exercised. So harmoniously have all who have to do with the problem of transportation by rail put their labors together that the President has not seen the need of exercising that great power that was placed in him." He also said that the Interstate Commerce Commission has not found it necessary to exercise the power over car service given it by the Esch bill because "the railroads were prompt to recognize the demands upon them. They did the unprecedented. . . . If the

carriers had been standing upon their rights, if they had been calling upon this commission under its powers conferred by the Esch bill to put out orders with regard to the movement of cars; if there had been a reluctant compliance with the orders of authority, there never would have been produced such a result as has been produced by the cheerful, hearty and willing acting together of the shippers and carriers of the country." In other words, Chairman Hall expressed the belief that the voluntary efforts of the railway managers and the shippers to increase the efficiency of railway operation are producing better results than could be produced by the exercise of governmental authority. Chairman Hall and the "Committee on National Preparedness" differ so much because Chairman Hall knows what he is talking about and the committee does not.

IMPORTANCE OF THE MARCH CONVENTION AND EXHIBIT

THE successful convention of the American Railway Bridge and Building Association in Chicago last week, following that of the Roadmasters' Association a month ago, gives further emphasis to the advisability of proceeding with the American Railway Engineering Association convention next March, as pointed out editorially in these columns four weeks ago. Not only did the registration of members at the Bridge and Building convention equal the highest record in the history of the Association, but the attendance at the various sessions was the largest ever recorded, while the discussions were spirited and intensely practical in character.

A large part of the success of these meetings resulted from the revision of the program to meet present problems, many of which have arisen during the last six months. Without this revision there is no question but that the interest would have been less and the attendance smaller. Although some of the committees had done a considerable amount of work on subjects which were superseded by more timely topics, there has been no criticism of this action on the part of the committees or others.

It is important that the American Railway Engineering Association take similar steps. The success of the next convention will depend in large measure on the extent to which the Board of Direction meets the present situation by arranging a program which will provide for a full discussion of the engineering and maintenance problems which are presented by conditions due to the war. Although no definite statement has yet been issued regarding the convention, it is assumed that it will be held as usual. Past conventions have been held on the theory that they contribute to railway efficiency. But never was efficiency in all branches of railway service so vitally needed as it is now. Therefore, either the reason assigned for holding the convention before was a mere subterfuge, or there is the strongest reason that ever existed for holding it next March.

The same reasoning applies to the exhibits of the National Railway Appliances' Association. The manufacturers participating in these exhibits have spent large amounts of time and of money in their preparation in previous years and railway men have visited the Coliseum in large numbers. Was there ever a time when railway men so much needed information regarding devices that would increase efficiency in every direction, and especially that would save labor, as is the case now? Manifestly, to refrain from holding the exhibit this year would be to say, in effect, that such exhibits are of no value, and that the time and money which have been spent on them in the past have been wasted.

While from the standpoint of the individual members of the Appliances Association, the exhibit is a business proposition, and is a step in the selling of their materials to the railways, it is, as a whole, of great educational value to railway men. If the National Railway Appliances Association

was ever justified in emphasizing the educational value of its exhibit and urging the railways to send their men to visit it, this is the time of all times when it is justified in doing so.

All classes of manufacturers of railway supplies used in the maintenance of way department should unite in making this exhibit the most successful ever held. The exhibit should be made such as will give railway men the most practical information—information which will be of direct service to them in meeting the problems which are now immediately confronting them. Some companies which are now crowded with business, believe that it would be unwise to devote even a small part of the facilities of their plants to the preparation of devices especially for exhibit, and they feel, therefore, that they should not be represented. We agree with them that they should not transfer any of their forces from the manufacture of equipment urgently needed by the railways, but we also believe that a particularly interesting and practical exhibit can be made by the judicious selection of equipment on its way from the factory to the roads. Furthermore, the members of the National Railway Appliances Association owe it to the railway men who have supported the exhibit by their attendance in previous years, to give special prominence to all devices which will tend to save labor, as this is the liveliest problem now confronting railroad men.

Although some members of each association believe that the meeting should not be held this year, we believe that it is highly important that both associations proceed with their meetings as usual, revising their programs and their exhibits to meet present day conditions. The National Railway Appliances Association has already issued a statement to the effect that the exhibit will be held and its members should stand back of the organization unitedly to make it of the greatest possible value to the railways and thereby to themselves.

NOW COMES THE REAL TUG OF WAR

THE railways have now entered the period when they will have the greatest difficulty they have ever experienced in handling the available traffic. Within the last eighteen months, and more especially within the last six months, they have increased the efficiency with which they operate their facilities to an extent which two years ago would have been declared impossible. In July, the latest month for which complete statistics are available, they hauled 17½ per cent more ton-miles with each freight car and almost 10 per cent more ton-miles with each freight locomotive than they did in July, 1916. They handled not far from 50 per cent more traffic with each car and each locomotive than they did in the same month two years ago. This remarkable increase in efficiency has been maintained and even augmented up to the present time. But the unprecedented increase of traffic which began about two years ago continues unabated. The roads are handling at the present time not only a heavier passenger and freight traffic than they ever did in any previous year, but also a much heavier total traffic than they have at any previous time in 1917. Furthermore, the indications are that this growth of business will continue unabated for some months. The movement of traffic in the fall and winter months is normally heavier than at any other time of the year, and in spite of the enormous business which has been handled thus far in 1917, the present year promises to be no exception to the usual rule.

The effect of this steady and enormous growth of traffic at a time when, owing to numerous conditions, the railways are prevented from increasing their facilities, is shown by the fact that on October 1 the net car shortage suddenly increased to over 70,000 cars. This is less than half as large as it was last May. But within the next few weeks the

traffic undoubtedly will greatly further increase; and as general transportation conditions probably will grow more and more unfavorable, it is evident that the time has come when the Railroads' War Board, the managements of the individual railways, railway employees, the shipping and receiving public, and those having charge of shipments for the government must put forth an effort approaching the superhuman if the railways are to be enabled to handle all the traffic available. As a result of the severe and unrelenting service to which cars and locomotives have been put for over two years, they are not in satisfactory condition. The same thing may be said of track and other facilities. The railways have lost many employees who have voluntarily enlisted in the army, who have been taken for the citizen army, or who have found more profitable employment in other lines of work. In consequence, they have not now, and cannot get, as many competent employees as they had two years ago, or even a year ago. The weather up to the present time has been highly favorable to efficient operation, but in a short time the annual battle with snow, ice and cold will have to be fought; and then the difficulty of getting the greatest efficiency from equipment will reach the maximum.

One thing which is going to add greatly to the difficulties of the roads for some weeks is the fact that this year's crops, which are now moving, are unusually large. The effect of this is indicated by loud and general complaints of lack of sufficient box cars, which are coming in from all over the central and middle western states. The traffic situation is also going to be aggravated by the labor troubles in the coal mines which have been chronic in central territory for some weeks and which became acute recently in the Illinois field, where most of the mines were closed by a strike. There has never been a time since the middle of August when the railways in a large part of this territory have not been able to furnish more coal cars than there was a demand for. The recent strike in the mines in Illinois has greatly delayed the shipment of coal from the mines of that state. The result is going to be that during the next month or two the railways, and especially those of Illinois, will be called upon to handle a large amount of coal which they ought to have been given opportunity to move weeks ago. It is probable that when this delayed coal movement begins there will speedily develop a serious shortage of coal cars in place of the surplus which recently has existed. Let us hope that the public will take all such facts into consideration while the transportation situation is growing worse, as it probably will be for some weeks to come, and that it will be patient with the railways and give them the utmost co-operation while they are working out their great problem.

If we may judge by past experience, the developments of the next few weeks will pretty definitely determine how successful the railways are going to be in handling the country's traffic during the war. There seems good reason for believing that we are approaching the very peak of the war time freight movement, and that, while there may be no considerable decline of traffic for some months, there will not be a continuance beyond the present winter of such enormous increases in it as have occurred without a pause for many months. If the railways can handle the business until say, March 1, 1918, in a reasonably satisfactory way, the country may safely consider that its transportation problem during the war is solved, unless the struggle shall last so long as to cause the railways to go to pieces physically from the accumulation of deferred maintenance. In our opinion, the real tug of war in the transportation field is going to take place during the next three or four months; and we are confident that if the railways continue to receive the co-operation of the regulating authorities and the shipping public they will stand this crucial test of their efficiency in a way that will merit and will receive the commendation of the nation.

SOCIETY OF RAILWAY FINANCIAL OFFICERS

IN a way the Society of Railway Financial Officers has come to a mile post in its progress. Like most other associations of railroad officers, its primary object has been the adoption of standardized methods of work which will lead to more economical practices. One principal subject to which it has devoted its attention is the universal adoption of the short form voucher. It is hard for anyone not actually engaged in the work of the treasurer's office of a railroad to realize how great in the aggregate is the waste of labor involved in handling irregularly shaped, needlessly long and complicated vouchers which formerly required not only the payee's signature to the voucher, but also a receipt. Through the efforts of the Society of Railway Financial Officers, the requirements for receipt have been almost entirely done away with and a great majority of the more important roads have adopted a short form voucher of standard size which requires a minimum of labor in preparation and in payment.

For some years the society, principally through the efforts of T. H. B. McKnight, treasurer of the Pennsylvania Lines West of Pittsburgh, has been preaching the gospel of the adoption of a clearing house for inter-railroad accounts. The general scope of this clearing house has already been described in the *Railway Age Gazette* and a concise, clear statement of the outlines of the plan and the aims to be accomplished were contained in an address made by Mr. McKnight before the American Association of Railway Accounting Officers published in the *Railway Age Gazette* of June 29, 1917. The plan has been blocked largely through the opposition of the accounting officers. It offers obvious economies and at this particular time ought to be and apparently is going to be given consideration by the railroad executives. In a short discussion which took place at the annual convention of the Society of Railway Financial Officers (a report of the meeting is contained elsewhere in this issue) certain points were made clear and certain points still left obscure.

As concisely as possible, the proposed clearing house would accomplish the following: At present a separate draft is drawn against each road with which any individual road has dealings for the amount due for per diem, car repairs, etc., and a separate check is sent by each road to every other road with which it has dealings in settlement of drafts drawn against it. In other words, not only does each road settle with each other road separately for each account, but it both draws a draft against each other road for amounts due it and makes out a check covering amounts which it owes. The clearing house would receive from each road a memorandum of the agreed on debits and credits against each other road, put these all together and draw a draft against or send a check to each road for its net debit or credit balance. Each treasurer's office, therefore, would each month pay a single draft drawn by the clearing house or receive a single check made by the clearing house, whereas now thousands of drafts are drawn and thousands of checks issued.

Some discussion was had as to the amount of saving that would be effected in the accounting department. If the clearing house plan is properly understood this is a question which is not open to difference of opinion. In so far as the preparation of bills due by other roads is concerned, the accounting and determination of the amount of these bills and the checking up and verification of other roads' bills against the home road, there would be no saving by the adoption of the clearing house plan. As it is now, however, the settlement of each debit and each credit against each road for each account is the subject of a separate ledger entry. Under the clearing house plan there would be a single entry only in the ledger, that dealing with the settlement to or by the clearing house. In other words, up to the point where an agreed on debit or credit for each item was reached,

no saving would be made. Beyond that point there would be a reduction in the number of ledger entries necessary, —varying from thousands to hundreds,—to a single ledger entry.

Committees of the Society of Railway Financial Officers are now bringing this clearing house plan to the attention of railroad executives and to the attention of the Railroads' War Board at Washington. It is so obviously a real economy that it deserves the consideration of railroad executives, and unless some argument against it can be adduced with sounder backing than anything that has heretofore been brought forth, the plan should and, we may hope, will be adopted by the larger roads, and if it is adopted another mile post will have been passed by the Society of Railway Financial Officers.

ECONOMY OF GOOD SHOP LIGHTING

AN effective way to speed up the production in any shop is to provide proper and adequate artificial illumination—a truth not generally recognized. The advantages of good illumination include reduction of accidents, greater accuracy, less eye strain, greater contentment of the workmen, more order and neatness in the shop and easier supervision of the men, all of which have a direct bearing on shop production.

Take the item of accidents alone. A study of industrial accident records obtained from The Workmen's Compensation and Accident Insurance Company's report indicates that for one year, out of 91,000 accidents 23.8 per cent were due directly or indirectly to improper illumination. Of this 23.8 per cent 10 per cent were due primarily to inadequate illumination, while in the remaining 13.8 per cent the lack of proper lighting facilities was a contributory cause. When it is remembered that an accident not only deprives the shop of the services of the workman but also increases the actual operating expense due to the damage claims, the advantage of reducing the liability of accidents is evident.

Studies made of the effect of good lighting on shop production show that good light will add an average of approximately one-half an hour a day per man to the output which represents a production increase of five per cent, brought about by an expenditure of only one-half of one per cent of the wages—a saving equal to ten times the expense. The subject is of such importance that the Department of the Interior recently issued a technical paper on the relation between illumination and efficiency. This paper points out that the most enthusiastic supporters of proper lighting in shops are those who have taken the step to insure it. The paper also points out that actual instances have been reported where production has been increased from 2 to 10 per cent as a result of improved lighting. It is considered good practice to have the cost of light equal one-half to one per cent of the total wage, which is not high when we consider that an average workman will earn his share of this amount in six minutes. On the other hand, it is evident that it would easily be possible for such a workman to lose six minutes of his time each day because of inadequate illumination.

Simply to install a good lighting installation, however, is only half of the job; it must be well maintained so that it will continue to give good service. The standard of cleanliness for lamp reflectors should depend on a balance between the cost of cleaning and the loss by not cleaning. It has been shown that the loss on a 1,000-watt gas-filled lamp with porcelain enameled reflector will be approximately \$34 if allowed to go without cleaning for a year. Figures available for an average shop show that it is possible to clean such reflectors for an average cost of \$1 a month or \$12 a year, which indicates a saving of approximately \$22 per year per fixture.

Letters to the Editor

A REPLY TO DIRECTOR PROUTY'S VALUATION MEMORANDUM

St. Louis, Mo.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

A careful study of the memorandum* of Director C. A. Prouty, of the Division of Valuation, Interstate Commerce Commission, indicates that the policy of the Division of Valuation, as set forth by Mr. Prouty, will result in returning to Congress valuations of not more than two thirds to three fourths of the fair value of the railroads of the United States. It is a fact that the law of valuation is still in a plastic state, but this is primarily due to the so-called different "points of view" taken by those interested in valuation matters up to date. The owners of railroads and other public utility properties on the one hand, have, in the light of their experience in the use that has actually been made of their money, attempted to secure fair recognition of all of the elements that have resulted in capital expenditures in bringing those properties to the condition in which they have been valued; while the representatives of the public having regulatory or investigational powers over such railroads and public utility properties, and without extended experience in the expenditures of money for their development, have contended for the lowest possible figures that the owners could be forced to accept, either through negotiation, through the result of precarious franchise conditions, or through court decisions. It is unfortunate that the representatives of our federal government appear disposed to take advantage of this so-called plastic condition of affairs, which is nothing more nor less than the expropriation of the confiscatory attitude, in attempting to crystallize the unfair demands of the regulatory bodies into definitely expressed principles, having behind them the weight and dignity of the federal representatives. The fact that "the decision of this commission will go far toward fixing the law in many instances" should imbue the Interstate Commerce Commission with the extent of the responsibility placed upon them in this matter.

The vice in the railroad and the entire public utility situation today is not the uncertainty as to what is fair, but the uncertainty as to the extent to which the owners of the railroads and other public utility properties can make the courts see the fairness of their contentions in the light of the destructive representations by regulatory bodies. "If the present system of providing service by private capital is to be continued, some way must be found" not only to assure the capital of the treatment which it will receive, but also to assure that capital that it will receive fair treatment, and that neither the capital nor a fair return thereon will be jeopardized by the confiscatory attitude of the regulatory bodies.

Director Prouty announces in his memorandum that in spite of the claims of the carriers, the Division of Valuation insists at the outset on confiscating that part of a railroad which was actually spent for clearing and grubbing. If it be shown, or be fair to assume, that clearing and grubbing were actually performed and money actually expended for such purposes, the omission of that item of expense appears to amount to clear confiscation.

The valuation of all of the railroads as they exist today on the assumption that any railroad could be reconstructed by one impulse, in the most economical manner, by present methods and under present conditions, would fall far short

of showing fairly the amounts of money that were necessarily expended. The railroads were actually constructed under all conditions, and in many instances it was not possible to proceed by one impulse. In many cases on account of financial conditions, several such impulses were necessary to bring such projects to completion, and the actual amount of money spent under such conditions would far exceed the amount necessary for the construction in the most economical manner, under present methods and under present conditions.

It is certain that the government parties should not be required to report, as though it were a fact, what merely comes to them as hearsay from some other sources, but the Division of Valuation should give fair recognition to the fact that many items of expense were incurred which cannot today be established as facts, as it is certain that a full inventory of hidden quantities, especially on the older lines, which constitute the bulk of the mileage of the country, is not possible; it is certain that expenses were incurred in performing construction of which no physical evidence appears today, and it would be only fair to make some allowance for such expenses, which does not seem to be proposed.

In referring to depreciation Mr. Prouty's memorandum states, "it is conceded by the government that a public utility has a right to demand from the public in the way of earnings an amount sufficient to cover depreciation. Will it be conceded by the public utilities of this country that nothing need be allowed for the wear of the rails or the ties? Certainly it will not be and ought not be."

"It is true that in the case of a composite property, like a railroad, made up of different units of various kinds with a life of varying lengths, there comes a time when renewals will offset depreciation, so that if the property is properly maintained it does not depreciate as a whole below that point."

Of course, it goes without saying that there is depreciation in a railroad, and it is also true that the property finally reaches a point where, if properly maintained, the depreciated value does not further decrease. What, then, if the difference between the first new value and the so-called depreciated value? The owner does not invest his money to the amount of the depreciated value, but he does actually invest to the amount of the total cost. If it be contended by the Division of Valuation that carriers should be permitted to earn only on the depreciated value, then they should also be permitted to earn enough money to retire securities to the amount of the depreciation.

A study of railroad investments and railroad net earnings during the history of railroads in the United States will convince any fair minded qualified individual that the railroads have not in the past earned a fair return, and by no stretch of the imagination can it be assumed that the railroads as a whole have earned enough money to retire capital in an amount equal to the difference between the new cost and the depreciated value. If the commission desires to set up a new basis today for the control of future rates and earnings, then the reproduction cost now should be the basis of present rates, and the rates should be sufficient to earn above that return enough money for a capital retirement fund to retire the amount which the commission might claim as depreciation of the property as a whole, within such a period of years as the commission might determine.

No such basis has ever been followed in the past for amortizing that portion of the capital value representing original investment which is claimed as depreciation. The depreciation funds, so-called, have been deferred maintenance funds, and the accruals of those funds have been used not for the purpose of retiring capital value, but merely for the purpose of making renewals in such a way as to average the maintenance and renewal charges over a period of years. If such depreciation funds are set up and continue to be used, and if there is no additional fund for the retirement of capital

* Abstracted in the *Railway Age Gazette* of October 5, page 599.

value, then certainly the owners are entitled to a fair return on the original investment, because, notwithstanding the fact that there may be actual depreciation in the physical property, the actual investment in the service is equal to the entire original investment. If the depreciation funds be properly kept up, there will always be invested for the public and in their interest the depreciated value of the property plus an aggregate amount in the depreciation funds, the sum of which on any correct basis must always equal the original investment. As the depreciated property and the depreciation funds, which together equal the original investment, are in the service of the public, the public should pay a return on that amount and not on a depreciated value. Depreciation funds have not in the past been built up on any such basis, and if the sum of the depreciated value of a property and its depreciation funds are less than the original investment, it is due to the fact that on the one hand there has been no proper method of making the users of the property pay for the depreciation in its value, while in their service; and on the other hand the net earnings of the company have never been sufficient to afford a fair return on the investment, and the users are in default to the owners in the amount of the difference. A fair recognition of the inadequacy of the rates in the past and the inadequate returns that have been earned, will entitle to recognition at this time, the cost of reproduction new and a fair return upon that cost.

If the Commission desires for future regulation of railroads that the depreciated value be used as a basis on which the fair return should be figured, then the general relation of depreciated value to original cost should be determined, and the rates should be so adjusted as to make the net earnings sufficient to retire the difference within such period of years as might be indicated, either by the retirement of an average amount each year on a straight line basis, or by the retirement of a fixed amount at the end of a fixed period of years on the sinking fund basis. It is unfair at this time to seriously contend that there is in the service of the public the depreciated value of the properties, as the original investment, is really in the service of the public and if in fact the properties have depreciated, the users of that property have been the gainers in the amount of the depreciation for which they have not yet reimbursed the owners. The value in the service of the public is the original investment, or when that can not be ascertained, the reproduction cost new.

If the depreciated value be made the basis of rate making at this time without passing through a transition period during which the carriers will receive the amount claimed as depreciation, in addition to a reasonable return, then certainly the difference between the original investment or reproduction cost new, and the so-called depreciated value, is the amount that will be clearly confiscated from the owners.

Mr. Prouty states that no allowance has been made for contingencies as such by the commission in the tentative value of the Texas Midland, and endeavors to justify that error of the commission by the claim that no expenditures have been made except such as were discovered by the all-seeing eyes of the government parties. In another part of his memorandum he states that no allowances were made for hidden quantities except such as could be noted as actually existent. It is a fact, however, that no matter how clear or complete the histories of railroads may be, many expenditures were made in the construction of the roads of which record can not be found, and of which there is no physical indication today.

An inventory of a railroad based on the most economical method under present conditions and under present practices makes no allowance whatever for conditions that increased the cost of every item of physical property. The construction of many lines has been seriously delayed by unusual weather conditions and unprecedented floods. Bridges have been washed away during construction, embankments have

disappeared into sink-holes and swamps. Organizations have been maintained through long periods, protecting the incomplete property during floods and other conditions preventing progress. Large sums have been spent on bridge foundations in excess of the requirements of the plans on record, and the plans have frequently not been corrected to show the increased cost of such construction.

Certainly it is not fair to say that because a railroad could not possibly establish by complete detail records or by physical conditions on the ground, many years after construction, the exact fact of such increased expenditures, no allowance should be made for them. It is to cover such expenses as those outlined above that an allowance for contingencies has always been made in valuations, and it is unthinkable that the commission will adopt the policy of the division, as set forth by Mr. Prouty, that no contingencies whatever should be allowed for, as it is just as necessary to allow them in arriving at a fair valuation, as it is to allow for them in a preliminary estimate. Omission of any item for contingencies amounts to a clear confiscation of a very considerable portion of the investment.

The statement that no engineering should be allowed on land, and that whatever there may be is more properly chargeable to the land, would be fair enough if the cost of the engineering had really been added to the cost of the land, but only the fair market value of the land was allowed. Certainly the engineering in connection with the acquirement of railroad property amounts to a very material sum, and some allowance should properly be made for that item.

The contention that the value of railroad land is equal to its area multiplied by the unit value of similar or adjacent lands is so far wrong that it is difficult to see how the Commission could have been misled into making any such unfair assumption. Mr. Prouty states, "Nothing is included for acquisition, nor for severance damages, nor for interest during construction." Certainly land can not be acquired without attendant expenses. Right-of-way agents and their staffs, abstractors, land surveyors, local attorneys, condemnation proceedings, all cost money, and are represented in the physical property. It is absurd to omit allowances for them and to assume that the expenses were never incurred.

While it may be the opinion of the commission that severance damages are not real damages, yet it is a fact that the railroads have paid out millions of dollars for such damages, and the omission of such a large item of expense, which is so clearly represented in the capital invested in the railroads, is so unfair as to require no comment.

Nothing whatever is said about the necessity of railroads paying higher prices for lands even where no severance is made, in order to secure particular locations for passenger stations, freight stations, or terminal yards, nor for the higher prices than market value of surrounding lands that must be paid to get continuous strips for right-of-way use. The railroad value of the lands far exceeds the market value of the surrounding properties, and this fact would seem to be so apparent that the attitude of the commission appears to be deliberately unfair. There may be some doubt as to the factor by which the market value of the adjoining land should be multiplied in any particular instance to get the railroad value, but that difficulty is not sufficient justification for ignoring that large item of expense, and it would be a comparatively easy matter for the commission to determine in any particular case just what that factor should be.

Unless the Commission, by adopting a broad policy of public welfare, follows radically different lines than those laid down by Mr. Prouty, the future of transportation facilities in the United States is not encouraging, as the policy laid down in Mr. Prouty's memorandum would be so restrictive of development as to very largely stop railroad construction and extension.

Consulting Engineer.

An early stage in the grading.

Pennsylvania Builds Hump Yard at Indianapolis

**Modern Classification and Engine Terminal Facilities
Are Being Provided. Extensive Drainage System Installed**

TO keep abreast with the rapid industrial development of Indianapolis and its increasing importance as a railway center, the railroads entering that city are spending large sums of money in expanding their facilities for the handling of the freight and passenger traffic which passes through or originates at that point. The Pennsylvania Lines alone now have extensive improvements under way in this city for yards, freight houses and track elevation work.

Excavating a Subway with a Drag Line

One of the most important of the several projects is the so-called Hawthorne yards, a new freight terminal yard, which is now in the course of construction on the eastern edge of the city.

INDIANAPOLIS AS AN INTERCHANGE POINT

The lines of six railways enter the city of Indianapolis, the Big Four with six divisions, the Pennsylvania Lines with five divisions, the Cincinnati, Indianapolis & Western with two divisions and the Monon, the Illinois Central and the Lake Erie & Western with one division each. A seventh road, the Indianapolis Union Railway, which operates the Union station, the Union tracks and the Indianapolis Belt Railway, provides the means for the interchange of traffic between the several roads.

The freight interchange is handled over the Belt railway

tracks. This line is 14 miles long and is located almost entirely within the city. It extends around the city from a connection with the tracks of the Monon and the Lake Erie & Western, near Twenty-first street and Martindale avenue, connecting with the several other railways and their various divisions and has its second terminal at the connection with the Canal branch of the Big Four in North Indianapolis.

The convergence of these six roads with their 16 divisions in Indianapolis creates a great amount of interchange business requiring extensive yards. In the early days the yards were built largely inside the Belt railway and now, with the enormous increase in the traffic handled and because of the growth of the city, it is difficult to find room for expansion at the old sites even if such an arrangement were considered desirable.

The facilities of the Indianapolis division of the Pennsyl-

Some of the Excavation for the Yard

vania lines for handling freight prior to this improvement consisted of a yard east of State avenue inside the belt line and any plans for its expansion involved a large expenditure and would not have provided adequate facilities for any reasonable length of time. It was, therefore, decided to build the new facilities on land acquired for the purpose east of the Belt railway and north of Prospect street, which

carries the traffic of the Indianapolis & Cincinnati traction line. The property is approximately two miles long and one-quarter of a mile wide and extends from Sherman Drive on the west to Arlington Road on the east. The yard is connected with the Belt railway on the west by means of double wye tracks and with the main line of the Indianapolis division on the east by a double track railroad $2\frac{1}{4}$ miles long, built from a point two miles east of Irvington on the main line to the east end of the new yard. All Indianapolis division freight trains will be handled over this connecting line, putting an end to the operation of freight trains through Irvington and the territory between Irvington and the yard at State street. This connecting line is built on a right-of-way 150 ft. wide, acquired for the purpose.

In developing the plans for the improvement consideration was given to the probable future needs of Indianapolis with the intention of building now only for the present and the immediate future, and adding to the layout when it was found necessary. In carrying out this idea sufficient property was acquired and the yard was designed for an ultimate capacity of 10,000 cars. The present improvements include the construction of 50 miles of yard tracks, a reinforced concrete engine house, a reinforced concrete coaling station, inspection pits, ash pits, car repair facilities and an icing station for icing refrigerator cars in transit.

The first yard unit to be constructed will have a capacity of 3,500 cars and will include eastbound and westbound receiving yards and east and westbound classification yards with repair and caboose tracks in each yard. Ten stalls of the engine house will be built as a part of the first unit, and the plans provide for its extension to a 30-stall house when necessary.

ARRANGEMENT OF THE YARD

The yard was designed and built as a gravity yard, two double track humps being provided with a scale on each.

West Half of the Yard

The running tracks divide the east and westbound yards into units. These tracks are laid 20 ft. between centers. In the yards the standard spacing is 13 ft. except for the ladder tracks which are laid 18 ft. between centers. The westbound receiving yard will ultimately have 33 tracks, with a total capacity of 2,470 cars. The first unit will have three tracks with capacities ranging from 90 to 100 cars, three tracks holding from 80 to 90 cars, one track with a capacity for 75 cars and another for 80 cars, or a total capacity for the first unit of 695 cars. The arrangement of

the tracks for the first unit in this and the other divisions of the yard in reference to the ultimate development may be seen in the layout map. The westbound classification yard will eventually be supplied with 33 tracks with a total capacity of 2,130 cars. Of these, the first unit will consist of a total of 20 tracks having a capacity of 1,195 cars.

The eastbound receiving yard will ultimately have 17 tracks with a total capacity of 1,250 cars, and the eastbound

One of the Subways Under Construction

classification yard 41 tracks with a capacity of 2,895 cars. The first unit in the receiving yard will consist of 5 tracks with a capacity of 325 cars and in the classification yard of 17 tracks having a capacity of 1,135 cars. The engine parking yard will have a capacity for 20 engines. Repair tracks will be provided in both the east and westbound classification yards and a repair yard with an ultimate capacity of 300 cars will be located west of the roundhouse between the running tracks and the eastbound receiving yard. The first unit of the repair yard will furnish capacity for 135 cars.

Beginning at the east, the westbound receiving yard tracks

were built on a 0.22 per cent grade, descending in the direction of traffic for 2,000 ft., then on a level grade for 2,678 ft. to the approach to the hump. The hump approach is 654 ft. in length and is on a 0.9 per cent ascending grade. The descent from the hump to the eastbound classification yard is over a 3 per cent grade for 150 ft., then on a 1 per cent grade for 1,168 ft., the remainder of the yard being on a 0.3 per cent descending grade in the direction of traffic.

In the eastbound yards, commencing at the west end, the receiving yard is on a 0.4 per cent ascending grade for its

entire length. The approach to the hump, which is about 800 ft. in length, is on a 1.6 per cent grade to the summit. The descent from the hump is on a 2.5 per cent grade for 175 ft., then on a 0.9 per cent grade for 750 ft. From the end of the 0.9 per cent grade the yard tracks are placed on a 0.3 per cent descending grade in the direction of traffic for 1,100 ft., then becoming level for 1,400 ft., before rising to the level of the running track over a grade of 0.5 per cent, 2,000 ft. in length.

AUXILIARY FACILITIES

The terminal facilities for the yard will include a 30-stall engine house of brick and concrete construction. A con-

One Line of the Drainage System

tract for the erection of 10 stalls in this house has been let to the Alliance Construction Company of Indianapolis. The turntable will be 100 ft. in diameter, and the house 112 ft. deep with a distance of 262 ft. from the center of the turntable to the outer circle wall of the house. A 60-ft. by 144-ft. annex to the roundhouse will be used as a shop room as well as an office building for the road and roundhouse em-

ployees. A power house 35 ft. by 81 ft. will also be built in connection with the roundhouse.

A contract has been let to the Roberts & Schaefer Company, Chicago, for the construction of a 500-ton reinforced concrete coaling station of the mechanical type. Three cinder pits, three concrete inspection pits and a water softening plant will also be provided. The cinder pit will be of concrete and steel construction. The cinders from the engines will be caught in a hopper under the track and conveyed to carts which in turn will be emptied into cars by an air-

driven hoist. The water station will consist of two 50,000-gal. tanks which will be connected with a water softening plant consisting of a water softener and sludge pond. The water will be secured from the city.

A contract will be let in the near future for the construction of a 30-ft. by 58-ft. yard office, the basement of which will be occupied by lockers and rest rooms for yard and road crews. Space will be provided here for an oil room and a boiler room. The first floor will provide quarters for the yard clerks, medical examiner, trainmen, crew despatcher and caller, and a supply room. The second floor will be used by the store clerk, assistant trainmaster, yardmaster and telegraph operators. A storeroom will also be provided on this floor.

PRESENT STATUS OF THE WORK

The grading for the yard tracks and for the Indianapolis division connection line has been completed as has the extensive drainage system for the yard and the bridge masonry constructed in connection with the drainage system and the elimination of crossings at grade with the tracks. In the grade separation work Sherman Drive, South Eastern avenue and Emerson avenue were carried under the yard in subways and Arlington avenue over the yard by means of a reinforced concrete viaduct. A bridge with a trough floor and concrete abutments is provided over the Indianapolis division connection to carry the tracks of the Cincinnati, Indianapolis & Western. A 50-ft. semi-circular arch carrying the tracks of the west wye connection to the Belt railway over Pleasant Run, a 6-ft. by 12-ft. concrete box which carries Bean creek under the yards and two bridges carrying Brookville road over Lick creek and the connection track complete the bridge work.

CONSTRUCTION

Work was begun on this project in May, 1916, when the railroad built a trestle along the line of the north wye connection to the Belt railway to provide an entrance track to the yard site. The trestle was necessary in crossing the low and marshy ground encountered in this locality. The contract for the grading, masonry, and drainage was let to the Dunn-McCarthy Company and the Clifford Construction Company, Chicago, who began operation in June, 1916.

The grading consisted of 750,000 cu. yd. of excavation,

East Half of the Yard

200,000 cu. yd. of which was wasted in filling the low ground just east of the Belt railway. Three methods were followed in making the excavation, the heaviest work being done with steam shovels, while in the lighter work both a dragline machine and Western excavators were used.

The heaviest work was just west of Arlington avenue in the westbound classification yard. The equipment for this work consisted of two shovels and six trains of standard gage dump cars, three trains to each shovel. The earth moved by the shovels was transported west to the low ground

in connection with the roundhouse.

near the Belt railway, and the first fills were made along the line of the double track wye tracks, utilizing the trestle mentioned above for dumping. The 200,000 cu. yd. of excess excavation which was wasted here was placed from construction tracks laid on the fills. The material moved by the dragline was also loaded into standard gage cars, one train being provided for the machine.

A large proportion of the earth was moved by Western excavators which were operated by horses and tractors, the material being loaded into dump wagons for transportation to the fills. An average of 25 teams were used with each of these machines operated by horse power.

THE BRIDGES

The most interesting of the bridges is the reinforced concrete viaduct 296 ft. long which carries Arlington avenue over the yard tracks. The construction of this viaduct involves 530 cu. yd. of foundation excavation, 800 cu. yd. of concrete and 79 tons of reinforcing steel. The viaduct consists of eight spans of 37 ft. and provides a clear roadway of 24 ft. 7 in. The substructure consists of bents built of two reinforced concrete columns resting on 6-ft. by 8-ft. footings. The columns support a reinforced concrete cross girder 4 ft. 4 in. in depth by 18 in. wide and 26 ft. in length. The bents are all single column except at the center where a double column bent was built to provide for contraction. The expansion joint which is placed at the center of the bridge was filled with felt and asphalt.

The main girders spanning between bents are 6 ft. 4 in. deep by 18 in. wide and have spans of 37 ft. They are connected with cross girders 15 in. wide by 2 ft. 4 in. deep, spaced 4 ft. 7 in. on centers. The main girders extend 4 ft. above the floor level, providing the bridge railings which are relieved by paneling. The floor was designed for a uniform live load of 125 lb. per sq. ft., or a 20-ton road roller. The wearing surface of the bridge is of concrete and beneath the

tion with this bridge it was necessary to raise the Cincinnati, Indianapolis & Western tracks and two bridges in the vicinity. The bridges were raised under traffic by jacks and were placed on blocking. When complete, the old stone abutments will be encased in concrete and will be provided with new bridge seats.

THE DRAINING SYSTEM

The drainage for the yard and subways is provided by a system of sewers consisting of one main sewer 6,300 ft. long running through the center of the yard and emptying into Pleasant Run and lateral sewers extending across the yard at intervals of 600 ft. The surface water is collected into 110 inlets placed along these lateral sewers. The main sewer was excavated with a dragline machine and was built

An Early Construction Trestle

of segmental blocks. The lateral sewers were built with trenching machines.

In the drainage system it was necessary to take care of Bean creek which meandered across the site of the yard. The old channel was filled, and the stream diverted to a new channel along the north side of the yard, and a square crossing of the yard was provided by means of a 6-ft. by 12-ft. box culvert. In order to drain the eastbound classification yard it was necessary to lower the creek to a point $1\frac{1}{2}$ miles below the yard. The excavation for the new creek channel was made by a dragline.

Plans for this terminal were developed by the engineering department of the Pennsylvania Lines West, Southwest System, under the directions of W. C. Cushing, chief engineer maintenance of way, and D. P. Beach, division engineer. J. H. Schilling is the engineer in direct charge of all construction.

One of the Concrete Arches Under Construction

pavement the floor is thoroughly waterproofed with Minwax, laid in 5 plys.

The bridge is founded on hard pan, no piling being necessary. The construction materials were unloaded from the cars at the ground level, and the concrete was placed in the forms by means of a tower and chute.

A 50-ft. concrete arch was provided over Pleasant Run and double reinforced concrete boxes for the subways. At Sherman Drive the subway consists of two 25-ft. boxes and at Emerson avenue of two 30-ft. boxes. Bean creek was carried under the yard in a 6-ft. by 12-ft. concrete box 600 ft. long and a bridge consisting of a trough floor superstructure carried on concrete abutments was provided at the Cincinnati, Indianapolis & Western crossing. In connec-

MILITARY CAMP RAILWAYS.—The recent accident on a military camp railway in Yorkshire is a reminder that such lines are among the most interesting railway developments of the war. A typical railway of the kind is on the standard gage, but unfenced and with the minimum of signals, while stations, platforms and sidings are also reduced to a minimum. They serve the dual purpose of improving communication within the limits of a large camp itself, besides enabling through passenger and freight trains to be run to and from the camp by means of a junction with the most conveniently-situated trunk line. Such railways, which must not be confused with the narrow gage camp lines, are also valuable for instructional purposes. They are entirely operated by soldiers, who do not, however, always wear khaki, but the familiar blue-suits and uniform caps, which are distinguished by regimental badges and military brass buttons. Some of these railways own a certain amount of merchandise stock, including high-capacity cars, but most of the stock has been supplied by railway companies. For instance, on a military railway "somewhere in the south of England" the regular service is maintained by Brighton Railway locomotives and coaches, locomotives constructed at Swindon, and Southwestern passenger cars.—*Railway Gazette, London.*

Society of Railway Financial Officers

Interesting Papers Were Read on Thrift Encouragement and on Handling the Liberty Loan Subscriptions

THE eleventh annual meeting of the Society of Railway Financial Officers was held on Tuesday, Wednesday and Thursday of last week. Part of the sessions were held at the Missouri Athletic Association club house and the others at the Jefferson Hotel at St. Louis. After the roll call there was a brief address of welcome made by A. O. Wilson, followed by a short address by President E. H. Alden.

At the afternoon session Frank Trumbull, chairman of the Railroad Executives Advisory Committee, gave an address which the society voted to immediately print and distribute among its members and among banking institutions. The membership committee's report was then made and accepted, and the membership committee was requested to learn the names of the members who had joined the service of the United States and to print these names as a roll of honor in the minutes of the meeting.

CLEARING HOUSE REPORT

T. H. B. McKnight, treasurer of the Pennsylvania Lines West and chairman of the Committee on Clearing House Reports, reported that his committee had turned over to the executive committee the work of interesting railroad executives in the clearing house plan. Some discussion followed, and Mr. McKnight outlined briefly what the clearing house plan was and what progress had been made toward its adoption. The work had been largely educational; the treasurers of nearly all of the larger roads had been convinced of the desirability and feasibility of establishing a clearing house, but the difficulty lay with convincing the accounting officers and up to the present the accounting officers had refused to approve of the plan.

THRIFT ENCOURAGEMENT

At the Wednesday morning session L. E. Katzenbach, treasurer of the Great Northern and chairman of the Committee on Thrift Encouragement, presented the following paper:

Only by the exercise of thrift can the United States successfully accomplish its part in the present struggle. The officers of transportation companies need no report nor recommendation from this committee to support and co-operate with our government officials in all branches of thrift, (a word having the same meaning, but, perhaps, a healthier sound than the word efficiency).

As long as the necessity exists, the transportation companies will help their employees to purchase government issues of bonds, and will offer facilities for easy payment. The issues of Liberty Loan bonds and War Savings certificates have done and will do much to start habits of thrift, and, no doubt, today there is a Liberty Bond in many a home that never before had a dollar laid by.

It has been stated that railroad employees represent about 10 per cent of the wage earning population of this country, and a class of such large relative size has its influence upon the life of the country in times of peace as well as war. The committee hopes that the thrift habits formed now in times of war may be continued indefinitely by co-operation between transportation companies and their employees, and offers its report as a recommendation for preparedness to meet the problems, not only of today but of the future.

Since our last meeting the subject of thrift has been studied in many different ways, and the time for this society to agitate the subject among its employees seems to be most opportune.

In order to ascertain what our transportation companies are doing to encourage their employees to save, your committee on December 28, 1916, sent out a circular letter of inquiry to all members of this society and to financial officers of companies not represented in the society. Replies were received from practically every company addressed.

Many companies maintain pension systems, and a few have hospital and relief organizations, but your committee has thought best to confine its report to plans that involve personal saving and setting aside of funds by employees.

Attached to, and forming a part of this report, summarized in order of their establishment, will be found rules and regulations of the savings and investment plans which have been reported to your committee, and where the information could be obtained, figures are given showing partial results of these plans in effect. The small number of plans in effect has been surprising to your committee, and readily suggests the question as to why there are not more. Do the savings banks and institutions offer all the facilities and benefits that a corporation can offer to its employees through a savings plan of its own? Is there anything to be gained by offering employees an opportunity for thrift and investment? Why do such a small percentage of employees avail themselves of the plans now in effect? These and similar questions present themselves after the study that your committee has given to this subject, and the answers may be approached from different angles, according to the purposes of the employer.

Recent economic development, resulting in increased division of labor and changing social conditions, has brought out the study of welfare work among employees, and all efforts in that direction, based on the proper relation of employee to employer, are designed to produce co-operation. Only by co-operation can all the units of organization reach combined efficiency.

Before attempting to answer the questions above presented it is necessary to determine the relation between thrift and co-operation. Figures are available to show the economic advantages of pleasant working surroundings, proper sanitary arrangements, etc., and the advantages have been the result of the improved physical and mental condition of employees. A proper mental condition implies freedom from anxiety and worry; a condition of mind hard to realize, in the best of surroundings and working conditions, if one's bank account be constantly threatened with an overdraft. Fair wages are necessary, it is true, but with the ability to save must also be the inclination. The function of the thrift plan is to develop the savings inclination and encourage it to become a habit. It does not require much imagination to picture the mental satisfaction of an employee who has a reserve fund, however small, that is increasing to provide for the "rainy day."

If you are willing to concede that a savings account laid by and invested helps to produce the mental attitude essential for co-operation, and that co-operation should be developed in every possible way, the savings plan or systematic encouragement of thrift among employees deserves consideration in railroad organizations.

Properly managed a department of savings or investment should be able to reach many employees that the savings institutions do not attract, and with great benefit to the employees by reason of the saving in administration expense. The railway companies may expect to profit by better loyalty and co-operation from their employees.

One reason for the small percentage of employees enjoying

the savings facilities offered may be the decreasing margin between wages and living expenses, and another may be the employee's unwillingness to have his employers know the extent of his savings, but your committee suggests, if the savings plans now in effect were advertised as carefully as the railway companies advertise their traffic, that the increase in the number of savings accounts would be quite noticeable.

We recommend to those transportation companies having at present no savings or investment plans for their employees that they each institute some such plan. We further recommend that savings plans include provisions along substantially the following lines:

1. That the plan or fund be under company management or control.
2. Company guarantee of principal of deposits, and interest at a rate fixed from time to time by the governing board.
3. Systematic deposits with a low minimum.
4. Privilege of making deposits through payroll deduction orders.
5. Loans in excess of deposits to needy employees (each case to be handled by application to the governing board).

Included in the report were outlines of the thrift plans of a number of railroads including the Pennsylvania Railroad Employees Saving Fund, the Baltimore & Ohio Relief Department, the Employees Saving Fund of the Pennsylvania Lines West of Pittsburgh, the Great Northern General Office Employees Association, the Soo Line Co-operative Association, the Chicago & Alton Employees Savings and Loan Association, and the Arizona & Eastern Savings Plan. Under the head of Investment and Profit Sharing Plans were considered the Great Northern Employees Investment Company, Ltd., and the Illinois Central method of selling stock to employees. The description of these plans is omitted because of space limitations, but will be published in later issues of the *Railway Age Gazette*.

The committee consisted of: L. E. Katzenbach, chairman; Byron Cassell, A. B. Jones, R. R. Reed, Frank Scott and E. H. Alden, ex-officio.

After a rising vote of thanks, the following resolution was adopted:

"Resolved, that a special committee of three, of whom the president shall be one, be appointed by the chair to confer with the Honorable Frank A. Vanderlip as to the possible service by this society and its members in assisting to place new war savings certificates, and that such committee be and hereby is empowered to co-operate with Mr. Vanderlip and the committee of railway executives as may seem to be for the best interests of the United States government, and report back to the executive committee its recommendations."

ARE THE RAILROADS GETTING THEIR DUES?

John G. Lonsdale, president of the National Bank of Commerce in St. Louis, then gave the following address:

To all those who give attention to the underlying causes of a nation's welfare, the trend of the railroad situation in this country for the past several years has been alarming; in fact, so *very alarming* that, were it my purpose merely to offer a categorical answer to the question, "Are the railroads getting their dues," I should voice an emphatic "no," and sit down with the knowledge that my opinion could not be successfully challenged. But, while I do not intend to delve very deeply into railroad history and statistics, still I wish to elaborate my "no" just a little.

Fifty million people in this country are owners of railroad securities, either directly or through investments in banks and insurance policies; but, strange as it may seem, these people are just being waked up to the fact of their ownership through the educational work of the National Association of Owners of Railroad Securities—an organization, by the way, that is deserving of the active support and co-operation of the management of all railroads. However,

there are other—and, to the careful student, more important—considerations that call for a broad public interest in railroad prosperity. Our nation, as it exists today, has been welded and held together no less by our railroads than by our Federal Constitution and form of government. So important to our business and industrial life is the existence and operation of this great railroad system that if all the property of which it is composed were to be suddenly destroyed, the real estate owners of the nation, in order to uphold the values of their lands, could well afford to donate the twenty billion dollars necessary for replacing every railroad. It seems unaccountable, therefore, that the Interstate Commerce Commission should actually place the life of this great industry in jeopardy by its refusal to grant an increase of rates commensurate with the increased costs of operation. It is hard to say what considerations dictated this refusal.

When the federal government in 1887 eliminated competition as the governing factor in the fixing of railroad rates, it devolved upon that government to allow rates that would give the industry a fair return upon the capital invested and reasonable compensation for the risks involved. The Interstate Commerce Commission is the particular branch of the government to which this duty has been delegated. While other industries are creating great contingency funds for the expected after-the-war period of depression and adjustment, our railroads are falling behind on current dividends and expenses. Gross profits have vastly increased, but expenses have increased faster.

As a result of these conditions, the flotation of railroad securities on a satisfactory basis is a virtual impossibility. Not only must bonds be issued at high rates of interest, but even then they must often be sold at a ruinous discount. And, at the present moment, on account of heavy governmental requirements for capital, the railroads are still further hampered, until it seems that the government may be forced to render assistance. This may be done by directly furnishing capital in the form of loans; or, the situation might be somewhat relieved by encouraging the rediscounting of railroad obligations by the federal reserve banks. On June 11, 1917, in reply to an inquiry as to the eligibility for rediscount of 90-day paper of a certain waterworks company, the Federal Reserve Board wrote as follows: "If the proceeds of the paper under consideration have been or are to be used to provide funds for pay rolls, purchases of coal, etc., and if the paper is otherwise in conformity with the law and the provisions of the board's regulations, it is eligible for rediscount by the federal reserve bank." This ruling would, no doubt, apply to railroad paper as well. The government prescribes the system by which all railroads shall keep their books, and these records should therefore be satisfactory as a means of determining whether any railroad's financial condition is such as to make its paper eligible.

Of course, I realize that providing for the free rediscounting of railroad paper would not offer a permanent and sound solution for your problems, because any large amount of outstanding short-time obligations is a menace to railroad success. Nevertheless the present moment calls for emergency measures, and something must be done quickly. A public statement from the reserve board signifying its willingness to accept such paper for rediscount would have the effect of strengthening railroad stocks and bonds in the estimation of the investing public, in addition to providing a considerable amount of otherwise unavailable capital.

This matter of declining railroad security markets and diminishing returns upon such securities has a very serious bearing upon the successful placing of United States government bonds. It is a well-known fact that bonds can be more easily and quickly sold to those accustomed to buying securities—that is, to the investing public. But this part of the public is not prospering now—ground is being lost every day. If the people at large were made to pay increased railroad

rates, the money would be taken in great measure from those who will not buy Liberty Bonds, or any other kind of bonds, and would be distributed in the form of dividends and interest among those who *will* buy. Furthermore, the return to public favor of railroad securities would have a buoyant effect upon the money market and business interests in general. The importance of propitious money market conditions in floating government securities is well recognized. Pessimists are not natural buyers—optimists are. And it is going to take an enormous amount of security-buying to satisfy the needs of our government during this war.

Regardless of how you approach the railroad problem of today, or what possible solution you revolve in your mind, you are always forced to this one conclusion: Relief must come from the federal government. There is no opposition to increased rates among our big shippers. The Interstate Commerce Commission is free to act. If the commission will grant a general increase, the railroads will finance themselves; if not, and if the present trend of affairs continues, the government must sooner or later furnish financial aid to prevent the collapse of this, our nation's greatest and most indispensable industry. If patriotic appeals must eventually be resorted to in order to provide railroad capital, I, for one, will feel as fully bound to respond as I do to Liberty Bond appeals.

HANDLING LIBERTY LOAN SUBSCRIPTIONS

R. W. Morrison, assistant treasurer of the Pennsylvania Lines West, read the following report on handling Liberty Loan subscriptions:

The American people are not, as a rule, purchasers of bonds as are the people of other countries. Less than one-fifth of one per cent of the people of the United States owned bonds, and only a fraction of these were holders of government securities, prior to the Liberty Loan of 1917. It will no doubt be of interest to consider some facts about the first loan and the part taken by the railroad companies to make it a success. In response to the government's call for subscriptions to an issue of \$2,000,000,000 of 3½ per cent bonds, more than 3,000,000 people subscribed and the issue was 50 per cent oversubscribed.

A report of the Liberty Loan Committee of Railroads shows that through the efforts of railroad companies 241,280 employees loaned the government \$20,027,966. From reports made by sixty-seven railroad companies, whose total number of employees in May, 1917, was 910,917, there were 113,506 subscribers; a percentage of 12.4. The total payrolls for May, 1917, of these railroads was \$71,212,224; the amount subscribed by the employees was \$9,646,041, or 13.5 per cent.

The method employed by various railroad companies was very much the same, that was by having the employee subscribe for the amount of bonds desired, the company paying for them, and permitting the employee to repay on the installment plan, by making deductions from their pay on the payrolls, or in cash or check, as they might elect.

Of 25 companies checking their plans for repayment it is found that 15 had the subscriptions sent to the treasurer, 8 to the accounting department, one to the president, and one to a committee composed of the treasurer, comptroller and general counsel. Fourteen would refund to employees leaving the service the amount paid with interest. Five will refund only the amount paid and six make no mention of a refund. Three companies required repayment in 5 installments on the same basis as required by the government, 8 in 10 monthly installments, one in 11 installments, four in 12 installments, five in 20 installments, two in 22 installments, one required 10 per cent of salary to be paid each half month, and one does not state the number of installments in which the payments are to be made.

Briefly some of the main points of the plans are:

ATCHISON, TOPEKA & SANTA FE

Subscription blank to be sent to treasurer. Subscriber states amount of bonds desired but not the number. The treasurer prepares a separate blank for each employee in notifying heads of departments of amount of subscription and deductions to be made on payrolls. Application is made to the treasurer by head of department for refund to an employee leaving the service. Refund is made by voucher. Record of payments by employees is made on loose leaf kept by division and departments.

BALTIMORE & OHIO

Subscriptions sent to treasurer and by him acknowledged. Blank states amount of bonds desired, but not the number and denominations, also that the subscription is not revocable during period of employment. Treasurer notifies the auditor of disbursements of amount to be deducted on payroll. Record of payments by each employee is made on loose leaf. There is no statement of how refunds are made.

BOSTON & MAINE

Subscription blanks state the amount of subscription, but do not state number and denomination desired. Subscriptions are an order to the paymaster to deduct from the employees' pay 2 per cent of amount subscribed for from wages due for week ending June 1, 1917, 18 per cent for week ending June 15, 20 per cent for week ending July 13, 30 per cent for week ending July 27, and 30 per cent for week ending August 10. Employees desiring to pay by cash or check could do so by remitting to treasurer. Receipts given by treasurer and paymaster for all amounts received. Subscriptions were recorded in books in the order in which they were received, and after subscription closed were arranged in alphabetical order. No mention is made of how refunds, if any, were made.

BUFFALO, ROCHESTER & PITTSBURGH

Subscription blank states number, denomination, and total amount of bonds desired. The subscription blanks sent to the treasurer authorize deduction of 10 per cent of wages each pay day, but no deduction less than \$5. An employee leaving the service is refunded the amount he has paid with interest at 3½ per cent, but an employee who desires to discontinue payments and remains in the service is refunded only the amount paid. Employees are permitted to deposit bonds with the company for safe-keeping and it will collect the interest for them. Receipt is given to the employee by the treasurer for amount deducted from his pay. Record of payments by each employee is kept on loose leaf with full record of number and denomination and amount of bonds.

CHICAGO, INDIANAPOLIS & LOUISVILLE

Subscription blank states amount of bonds desired but does not give number and denominations. Record of payment is kept on subscription blank. An employee leaving the service is refunded the amount paid with interest.

CHICAGO, MILWAUKEE & ST. PAUL

Subscription blanks are in triplicate, one copy for payroll maker, one for paymaster, and one for the general auditor. The subscriber states the amount of bonds desired and amount to be deducted for 12 months. A record of payments is made on the reverse side of copy sent to the general auditor. The general auditor keeps all records of subscriptions and payments, but the treasurer acknowledges receipt of same. Payments made in 12 installments, but no mention is made of refund.

CENTRAL OF NEW JERSEY

Subscription blanks signed in duplicate, one part going to comptroller, the other to the Coal & Iron National Bank. Company makes deduction on payroll and pays money to bank. Bonds are held by bank until paid for. Refund of

amount paid without interest is made when employee leaves the service.

CHICAGO, BURLINGTON & QUINCY

Subscriptions sent to the treasurer. Payments to be made in 20 installments, when employees are paid semi-monthly, and in ten installments of those paid monthly. Record of payment kept in auditor's office on large sheet filed by divisions. Refund of amount paid with interest is made to employees leaving the service.

FLORIDA EAST COAST

Subscriptions sent to comptroller accompanied by 2 per cent of amount desired. Payments made in five installments on government percentages. Company makes deduction on payrolls and pays amount to First National Bank of St. Augustine. Employee discharged from railway service or entering military service is refunded amount paid.

GREAT NORTHERN

Subscriptions sent to the chairman, Great Northern Employees Liberty Loan Association provides for payment in ten installments. Refund of amount paid without interest is made to employees leaving the service. Record of payments kept on loose leaf.

ILLINOIS CENTRAL

Subscription blanks signed in triplicate, one copy sent to comptroller, one to office making the payroll and one retained by subscriber. An employee could subscribe for an amount not exceeding 25 per cent of his yearly salary. Payments to be made in number of installments as designated by applicant. Refund of amount paid without interest to an employee leaving the service.

LOUISVILLE & NASHVILLE

Subscriptions sent to the president provide for payment in 12 installments. Record of payments is made on a large sheet, but no mention is made of where the record is kept. Refund of amount paid with interest to an employee leaving the service.

LEHIGH VALLEY

Subscriptions sent to treasurer provide for payment in 12 installments. Record of payments is kept on back of blank. Company will take care of bonds for employee paying interest to owners. Refund of amount paid without interest made to an employee leaving the service. No special forms for accounting employed.

NORFOLK & WESTERN

Subscriptions sent to treasurer provides that payments can be made in ten or twenty installments. Certificate is given by treasurer to each subscriber for amount of his subscription. Record of payments kept on large loose leaf and filed by divisions. Refund of amount paid with interest if employee leaves the service.

NEW YORK, NEW HAVEN & HARTFORD

Employees subscribed by giving order on the paymaster. Payments made in five installments on government plan. Employees at Readsville shop given privilege to make weekly payments of \$1 each. Paymaster gives receipts for all payments. No mention is made of provision for refund if employee leaves the service. No other forms used.

NEW YORK, ONTARIO & WESTERN

Subscriptions sent to the treasurer provides for payments in semi-monthly installments of five per cent of subscription. No mention is made of provision for refund or other blanks used.

NORTHERN PACIFIC

Subscriptions sent to auditor of disbursements provides for payments in ten monthly instalments. Receipt of subscription is acknowledged by the auditor of disbursements.

The auditor furnishes each department with an alphabetical list of employees from whose pay deductions are to be made. Refund is made without interest by adding the amount to the payroll.

PENNSYLVANIA RAILROAD

Subscriptions sent to comptroller provides four ways of making payments.

(1) Subscriber may make full payment at time application is made.

(2) Make an initial payment at time of application and make monthly payments to any agent thereafter.

(3) Make an initial payment at time of application and authorize monthly deduction from wages.

(4) May authorize monthly deduction from wages.

Payments on monthly plan to be made in 10 installments. Company will take care of bonds for employees and pay them the interest by adding amount to payroll on last half of June and December. Refund of amount paid with interest if employee leaves the service or wishes to cancel his subscription.

SOUTHERN PACIFIC

An employee was given the privilege of subscribing for bonds to the amount of 25 per cent of his annual salary. Subscriptions were made in duplicate, original was sent to the auditor, the duplicate retained by the heads of departments making payrolls. Payments were made in 25 installments. The auditor kept a record on a large sheet of subscribers, and the amount paid each month, at the bottom of which is shown the total of deductions made each month. Employees leaving the service, or desiring to cancel their subscriptions, will be refunded the amount paid, with interest, by voucher prepared by the auditor. To all employees paying their subscriptions in full, interim certificates were delivered and receipt therefor taken in duplicate, one copy sent to the auditor and the other copy being retained by the treasurer.

ST. LOUIS-SAN FRANCISCO

Subscriptions sent to treasurer. Payments to be made in ten semi-monthly installments by deduction on payrolls. Deductions made for par value of the bonds and adjustment made by having the first interest coupon detached by the company and draft for \$0.48 per \$50 bond mailed by the treasurer. No mention is made of refund if an employee leaves the service.

SOUTHERN RAILWAY

Subscriptions made in duplicate, one sent to a committee of three, composed of the comptroller, treasurer and general counsel, the other copy retained by the head of the department preparing the payrolls. The comptroller acknowledges receipt of subscription, advising the employee of amount to be deducted from his pay in 12 installments. Deduction sheets prepared and sent to the comptroller monthly, who keeps all records on large loose leaf. An employee leaving the service is paid the amount deducted on the payroll, with interest at 3½ per cent.

UNION PACIFIC

Subscriptions sent to the auditor by employing officer. Payments made on installment plan in 20, or less, installments. Employee was permitted to subscribe for an amount up to 25 per cent of his yearly salary. Deductions sheet is prepared by head of department, showing all deductions made on the payrolls and transmitted to the auditor, who keeps record on large loose leaf, and acknowledges receipt of deductions made. If an employee is drafted in the army, the amount paid will be refunded unless the amount paid is sufficient to cover the price of one or more bonds, then the bond or bonds will be delivered to the employee, together with the amount in excess thereof that may have been paid.

WESTERN MARYLAND

Subscriptions were sent to cashier, and payments made in 25 semi-monthly installments. Account kept with employee on card on which record of all payments were made. An employee leaving the service was refunded the amount paid, with interest. Those remaining in the service could not cancel their subscriptions.

WABASH RAILWAY

Employees were permitted to subscribe on the installment plan for \$50 and \$100 bonds only. Those desiring the larger denominations were required to subscribe through their bank. Subscriptions sent to the comptroller and were payable in 20 semi-monthly installments. Employees leaving the service were refunded the amount paid with interest. No special blanks furnished.

PENNSYLVANIA LINES WEST

The treasury department issued a circular notifying the employees that they could subscribe for Liberty Loan bonds to any amount desired. Attached to the circular was a subscription blank to be filled out by the employee, stating the number, denomination, and par value of the bonds wanted, and authorizing deduction to be made on the pay rolls in ten equal installments stating the name of the company and the division on which employed, his occupation and location. In addition the subscriber was permitted to pay for his bond at once or in a less number of installments than ten, if he so desired. The employee was also notified that if he so desired the company would take care of his bond, the treasurer giving receipt therefor, keeping it in the company's vault subject to the owner's order.

These circulars were sent to the employees by the superintendents, and the subscription blanks detached and mailed to the treasurer in a special envelope. As the subscriptions were received at the treasurer's office, they were numbered consecutively as to division on which the employee worked, each division being designated by a letter. Upon receipt of the subscription blanks, a card was prepared giving the name of the subscriber, the number of his subscription blank, his occupation and address, the number, denomination, and par value of the bonds subscribed for. On the reverse side of the card, provision is made for a record whether the bonds are to be registered or coupon and if registered, the name and address, date of delivery of the bond, and how delivered, and if left in the custody of the treasurer, the number of the envelope in which the bond was filed. After the subscriptions had closed, the cards were separated as to departments and as nearly as possible the way the employees appear on the payroll.

From these cards was prepared in duplicate a list of subscribers, stating occupation, amount subscribed, and deductions to be made in each month from June, 1917, to March, 1918. The total amount subscribed and the monthly deductions shown on this list were balanced with the subscription blanks. The original of this sheet was forwarded to the superintendent for the purpose of having deductions made on the payrolls. Duplicate of the sheet was retained in the treasurer's office, and at the end of each pay period this sheet was turned over to the paymaster, who checked off the amounts deducted from the employees and from this sheet the record of payment was made on the employee's individual card. Receipts were not given to employees from whom deductions were made on the payrolls, but those paying by cash or check were given a receipt for the amount paid.

An employee leaving the service or desiring to cancel his subscription is refunded the amount due him with interest by draft on the Treasurer.

OTHER BUSINESS

At the Wednesday afternoon session a paper was read by J. P. Reeves, treasurer of the Chicago & Eastern Illinois,

on Pension Systems for Smaller Transportation Companies, which it was voted to print in the minutes of the meeting.

It was voted to give the executive committee power to cancel the next annual meeting if war conditions made it necessary.

The following were elected members of the executive committee: L. E. Katzenbach, treasurer of the Great Northern; E. H. Alden, treasurer of the Norfolk & Western; R. W. Morrison, assistant treasurer, Pennsylvania Lines West; F. M. Hickman, local treasurer, Missouri Pacific; and D. K. Kellogg, treasurer, Richmond, Fredericksburg & Potomac.

L. E. Katzenbach was elected president; Byron Cassell, treasurer and assistant secretary, Chicago, Indianapolis & Louisville, was elected first vice-president; and H. E. Suckling, treasurer, Canadian Pacific, second vice-president.

WHY SHOULD A RAILWAY EQUIP ITS LINE WITH BLOCK SIGNALS AND INTERLOCKING?

By Henry M. Sperry

Why should a railway equip its line with block signals and interlocking? There are two answers to this question. First, to provide for safety of train operation through signal protection. This is vital. Second, to provide for facility in train operation through signal direction. This is necessary.

Safety of train operation by block signals and interlocking is so well understood that it need not now be discussed. Facility in train operation is now of prime importance and for this reason a discussion of the important part that railway signaling is taking in facilitating the movement of traffic should prove of value.

Our railways are now handling the largest traffic in their history. It promises to increase under the increasing strain of war conditions. To meet this situation 693 railroad companies, under the direction of the Railroads' War Board, are working together to get the maximum service out of every car, locomotive and mile of track.

Maximum service means working every transportation unit to its capacity. The capacity of the car is the number of tons or passengers it will carry; of the locomotive its maximum tractive force, and of the track the number of trains that can be moved over it in a given time. The size and strength of the car determine the load it will carry; the power of the locomotive the load it will pull. The capacity of the track is determined by the speed of the train and the means employed to direct its movement. It is evident that in order to operate at maximum traffic capacity every factor must be considered so that the cars and locomotives will be loaded to their capacity and moved without loss of time. Splendid progress has been made, as shown by the Railroads' War Board report on freight operations for June.

	June, 1916	June, 1917	Increase, per cent
Average train load—tons.....	64.2	71.5	11.4
Average car load—tons.....	35.3	37.9	10.7
Average daily mileage per locomotive.....	68.1	70.7	8.6
Average daily mileage per freight car.....	27.3	29.1	6.6

The increased cost of locomotives and cars is a most urgent reason for working them to their capacity by cutting out lost time while on the road and in the shop. For example, locomotives now range in price from \$41,666 to \$63,000 for the Mikado and \$40,450 to \$73,850 for the Santa Fe type. This is an increase in prices ranging from 61 per cent to 92 per cent in from one to two years' time. Any means that seems at all promising should be considered. As will be shown, one of the most effective means of eliminating locomotive lost time, while on the road is by the use of automatic block signals and interlocking, as both have been found highly efficient in the direction of traffic.

The progress that has been made in the use of block signals within a five year period (1910-1915) is shown in the fol-

lowing table, together with other figures that should be considered in relation to this progress:

Main track:	1910	1915
Miles operated	266,185	291,232
Locomotives:		
Total number	58,947	65,099
Number per 100 miles	27.245	25.3
Average tractive force pounds.....	27,282	31,546
Freight cars:		
Total number	2,135,121	2,356,338
Number per 100 miles	887	915
Average capacity—tons	36	40
Block signals:	Miles of track	
Automatic	29,202*	51,120*
Non-automatic	63,506	73,327
Without block signals	103,214	96,354
Total passenger lines operated.....	195,922	220,801

* See Interstate Commerce Commission bulletin, January 1, 1911.

° See bulletin, January 1, 1916.

One significant fact in these figures should not be overlooked: the passenger mileage operated by the roads which appear in the annual bulletin issued by the Interstate Commerce Commission, in the five-year period (1910-1915) increased 24,879 miles, while the track mileage operated under automatic block signals in the same period increased only 21,918 miles. The proportions of automatic and non-automatic signals are shown below:

Passenger Mileage, Signaled and Not Signaled

The significant point in the figures shown is that the progress in the installation of automatic block signals is not keeping step with the annual increase in the miles of track operated. The report of the Interstate Commerce Commission for 1916 shows only 156 railroads using block signals and of this number 83 are less than 50 per cent equipped. There still remains a large mileage of passenger lines operated without block signals of any kind.

There are a number of reasons for this slow progress in the installation of automatic block signals. One of the important reasons is believed to be lack of information as to the economic value of automatic block signals.

Railway statistics cover almost every phase of railroad operation except that the data relating to railway signaling is confined to a yearly statement issued by the Interstate Commerce Commission showing the extent to which block signals are used on the railroads of the United States. No statistics are published by which it is possible to measure the value of railroad signaling, as the operating results obtained on the railroads on which they are in use are not published. In fact no general effort has been made to compile the information for publication. The reason, no doubt, is due to the fact that the railroads which have installed block systems and interlocking have found the results so satisfactory and so self-evident that no effort was made permanently to record them.

The urgent demand for increase in traffic facilities now makes it imperative to seek this information; and as evidence of its value the following striking examples of results obtained by the use of automatic block signals are presented to show what we may expect from a careful study of railway signaling as a means for facilitating traffic:

Information from a large railroad system with a net operating revenue of over \$3,000 per mile: extracts from letters sent to the operating vice-president:

1. By the superintendent of a division equipped with automatic block signals:

We have hunched traffic both morning and evening in and out of X, particularly in the evening when we handle nine regular trains in addition to

the fruit and stock trains, which are evening movements. It would be practically impossible to move freight trains between 5 and 11 without the block signals.

Working under the present eight-hour law I believe the system will pay for itself every six or seven years.

2. By another superintendent in charge of a busy division equipped with automatic block signals:

The chief dispatcher and myself know that we can move trains much faster with automatic block signals and get better service out of our men as a whole.

3. By another superintendent in the matter of saving over-time:

Now that we shall be required to make 12½ miles an hour with all freight trains or pay overtime, the signals will be of great benefit.

4. By the man who actually directs the trains' movements—the chief dispatcher:

They are a great success and delay reducer—they cut down delays from one to two hours on freight trains between A and B [the distance between A and B is 94 miles].

5. By the signal supervisor, pointing out their value in protecting traffic:

The following is a record which I have kept since January, 1916. It includes the number of trains which were stopped on account of danger ahead other than a train in the block. These are dangerous conditions which the train dispatcher could not prevent.

12 train stops on account of broken rails.

13 train stops on account of switch partly open due to snow and ice.

6 train stops, cars and engines not clear of the main track.

4 train stops on account of telegraph poles torn down by ice jam causing dangerous condition.

6. Information compiled by a large railroad of which the greater part is single track. This road has had nine years' experience with automatic block signals and now has over 700 miles of its single track equipped.

The following was taken from information furnished by the signal engineer:

The northern division is 98.6 miles long of which 78 miles are single track. Prior to 1908 the division was operated under manual block system with block operators at every passing track, averaging four miles apart. Automatic block signals installed in 1908. After the automatic signals were installed the average time per freight train was reduced two to three hours.

This officer further states that the saving in wages of block operators, not required under the automatic block system, is an offset to the charges under the automatic block system for interest, maintenance and operation.

There are good reasons for the belief that the results obtained on these two large railroads do not differ greatly from the experience of other roads equipped with automatic block signals. If the satisfactory results obtained from the use of automatic block signals are to be extended over the railroads of America, it is evident that a substantial annual increase must be made to equip at least 50 per cent (a modest estimate) of the track used by passenger trains with automatic block signals; and there can be no question as to the importance of decreasing the mileage now operated without any kind of block signals, either automatic or non-automatic.

PULVERIZED COAL FOR CENTRAL OF BRAZIL.—The Central Railroad of Brazil has inaugurated a series of experiments with its new coal-pulverizing plant at Barra do Pirahy, which has caused considerable interest and comment in engineering circles here generally. The plant was furnished by an American firm, was installed here by one of its engineers, and is said to have cost between 2,000 and 3,000 centos of milreis (about \$500,000 to \$750,000 United States currency). The pulverizer is described as being similar in construction to a cement plant. The coal, freed of its moisture, goes into a hopper and is pulverized so that 80 per cent of it can pass through a 200-mesh screen. It is then passed to the locomotive by means of a conveyor screw and blast, thus bringing the ignitable powder to the mouth of the locomotive furnace, at which point combustion takes place. The recent experiments were conducted under the direction of Dr. Assis Ribeiro, a well-known Brazilian engineer, who is assistant director in charge of locomotion for the Central Railroad. The experiments were carried out entirely with American coal and were an unqualified success.—Commerce Report.

A Proposed Code of Car Service Rules*

Carefully Prepared Set of Regulations for Interchange
of Freight Equipment to Correct Present Deficiencies

By Transportation Officer

A RAILROAD is built and maintained for the specific purpose of furnishing transportation. The principal revenue is derived from freight transportation. The cost of building and maintaining a railroad and the cost of maintaining engines and cars, all overhead expense, interest and everything that enters into the cost of getting ready to do business has increased possibly 100 per cent during the past 15 years, and the operating costs are still going up. Of course, they are abnormal now, but even under normal conditions, the tendency has been constantly upward. Therefore, granting that we have a plant ready to do business, the cost of which has increased enormously in recent years, and knowing absolutely that an empty car is a constant expense, it is only ordinary common sense to say that any set of car service rules should accomplish the following results: (1) The return of the car to the owner with reasonable promptness. (2) Its loading in both directions as far as practicable. (3) In the event an empty movement is absolutely necessary, it should be in a homeward direction and should be as short as possible.

In moving cars home empty, we have heretofore had an idiotic method of hauling them over the identical route they happened to have traversed loaded; thus, it has been customary constantly to haul cars away from instead of towards home. This results in absolute waste in transportation expense and much wear and tear on the cars.

The railroads of this country should band themselves together to accomplish three or four things. (1) A system that will get cars back to their owners at some time, with due regard to car efficiency. Then enough cars of each class must be built to enable all of the railroads of the country to handle cars loaded in both directions. It is an economic crime to haul foreign cars home empty and system cars in the reverse direction, when one car would take the load back. (2) A car with standard repair parts should be devised, and in the meantime the Master Car Builders' Association should make some arrangement, particularly during these war times, to authorize the repairing of foreign cars with wrong parts without penalizing the repairing line. Cars are now held up for months at a time awaiting the receipt of a small repair part. (3) Foreign cars received on a line should actually be repaired the same as the owners' cars. (4) When it is positively necessary to haul a foreign car empty over any portion of the way to get it back to its owner, the car should be sent the shortest instead of the longest way.

Cars should be constructed for interchange traffic that can be loaded in both directions. For instance, coal from the West Virginia, Ohio and Pennsylvania fields going into the west and northwest should not be loaded in hopper cars, as this entails a return haul empty from a territory where there is a loading, either for an open top car or a closed car of some description. The use of hopper cars should be confined to the local territories of the owning roads, and is only justified where there is no return loading for the cars.

The rules which are suggested below provide for the minimum empty miles. In order to accomplish this, where empty mileage is necessary, all of the roads must band themselves together in a common unit and operate such

cars as may be hauled empty the fewest miles. If injustice is meted out to any line, the adjustment should be through some accounting method which is inexpensive, rather than in the physical movement of the car. It is generally acknowledged that the rules in effect prior to February 21 (and these were changed from time to time) which provided no penalty but depended upon mutual affection and brotherly love for their observance, were entirely obsolete so far as controlling the equipment is concerned, and further, that the rules effective February 21, which provided a small penalty, were little better. The penalty was so small that employees of railroad companies took a chance that the rules would never be enforced, or that they would never be found out, and that if they were, they could well afford to pay \$5 in order to secure a load that might net their company anywhere from \$50 to \$400. Therefore, it would seem that it is absolutely useless to issue another set of car service rules based upon any mutual paper agreements which are never maintained, because while one set of roads may carry out the agreement, others cannot or will not, and the thing breaks down of its own weight.

It is obvious that if it is really desired to get up a set of car service rules that will result in the return of the car to the owner, there must be an adequate penalty which will make the use of the car unprofitable. I believe the penalty of \$50 provided in the rules below will accomplish this result, but if it will not, it should be increased to such an extent as to bring about the desired result. It is certainly much better for the railroads to establish a penalty that is within reason than to have the government issue a set of rules that will establish a diversion penalty that will be burdensome.

These rules are based upon the following principles: (1) Common box cars are pooled on the basis of cars contributed, or an equivalent thereof. (2) All other equipment is classed as "Special" to the owning line. The originating line is expected to provide sufficient equipment of this class to take care of the business which it originates with the understanding that when this equipment is empty at destination every movement of the car should be in the interest of its prompt return to the owner, under as liberal rules as possible to prevent unnecessary empty mileage.

It must be conceded that no railroad will provide the capital to build equipment for someone else, and that any pool that is constructed must be based upon the basis of ownership or an equivalent, and the rest of the equipment must be handled under a separate set of car service rules which will absolutely secure the return of the car to the owner within a reasonable time. It seems to have been determined that it is practically impossible to handle box cars on an ownership basis; therefore, the only thing left to do is to handle them in a pool. This eliminates all waste in empty mileage, and it rests with the head of the pool to see that the box cars are properly distributed, that adequate penalties are meted out for a failure to carry out the instructions of the commissioner, and that each line having an excess of equipment over and above what it is entitled to, in accordance with what it contributes, shall contribute to the owner an adequate amount over and above the per diem rate for the use of its excess equipment. This amount should be based on the earning capacity of the cars. In the opinion of the writer there is no reason why every line that secures a proportion

*Received in the contest on car interchange which closed June 10, 1917.

of the rate should not contribute its quota of cars. The pool should be so regulated that there will be an equalization during a time of surplus as well as during a time of shortage. This equalization can be so arranged that there will be no actual unnecessary movement of cars in order to accomplish a just equalization in money.

Every manipulation of the pool, and the handling of the other equipment under an ownership basis, should be with a view of eliminating every unnecessary mile of switching or terminal expense, thus securing the highest efficiency possible. To do this, all roads must constitute themselves as a unit in the handling of empty cars, where an empty haul is necessary, and instead of spending hundreds of thousands of dollars to home-route cars, and the manipulation of equipment on the basis of each individual car, these empty cars must be so handled that the car actually moves the least number of miles to get home. If there shall be an injustice done to any subscriber line, it should be adjusted between the roads as a whole on the basis of the empty mileage handled, rather than to make any attempt to handle each car on its record rights, which has resulted in the unnecessary wastage of millions of dollars in this country.

Under the old rules cars have been handled directly away from home in innumerable cases, in order to get the car back to some specific junction point that it may then retrace its steps over another road through identically the same territory, thus wearing out the cars, creating unnecessary mileage and decreasing efficiency. There is also a heavy empty mileage created on account of the condition of equipment and the fact that while the M. C. B. rules provide that foreign cars must be repaired the same as those belonging to the owner, this in effect is not done. There are thousands of cars interchanged today which could be made available for loading for a small expenditure of money, but they are returned to the owner in order that the line that has them may get rid of doing the work, because it has all it can do to take care of its own cars. However, the other fellow is taking the same action, and in the end what we have is a large transportation expense.

As these rules provide that the box car equipment, which is used as the medium of interchange, is pooled, the rules for the handling of the balance of the equipment classed as special equipment, should be tightened up to some extent, but still leave sufficient flexibility to prevent unnecessary handling of empty cars. This I have tried to cover. It will be observed, for instance, that it is provided that once a foreign car reaches the tracks of a railroad having direct connection with the owner, there is no other outlet than the delivery of the car to the owner, loaded or empty. The writer believes this is absolutely right and just, and that it is necessary to encourage car owners to provide themselves with equipment. A road which serves coal interests provides itself with equipment to take its coal to market, and it is therefore justly entitled to the return of these cars. Unless they are returned the shippers on its line will not be provided with transportation facilities. It should be expected by the owners of this special equipment that the cars will be loaded in return movement wherever that is possible under the restrictions named. Under no circumstances should we assume that any class of equipment should be returned empty that can be loaded, as it would in many instances double the cost of furnishing transportation to return a connecting line's cars empty and then haul cars empty in the opposite direction. This not only creates unnecessary expense, but would compel us to increase our equipment to handle a given traffic.

The car service rules effective February 21, provided that cars may be back-hauled once. This rule was impracticable in that it is almost impossible to keep information with the car at all times showing what service it had performed. Our rules provide that a car received from a connecting line may

be handled as desired, but it must be disposed of in accordance with the rules within 30 days in order to escape penalty. The penalty rate for the first 30 days is fixed at \$0.50 per day; for the second 30 days, \$2 per day, and for any additional period, \$5 per day.

Under the old penalty rule the delivery of a car to a belt line, or a road for return loading, broke the penalty and thus nullified the intent of the rule, which was to get the car home. This has been covered here by a provision that such delivery will not break the penalty, provided the car is returned to the delivering line within 30 days.

When it comes to handling cars belonging to indirect connections the writer has endeavored to be as liberal as possible, with due regard to keeping the car moving toward the owner at all times. These rules provide that a car may be moved locally loaded or empty but when delivered off the line it must always move in the direction of the nearest junction point.

In the absence of any loading in accordance with the various options given, the car must be short-routed empty to the owner at the nearest junction point, and every line must receive and haul cars in home route regardless of whether they handled them under load or not. This is the rule now in effect on gondola cars, as promulgated by the Commission on Car Service, and it is increasing the efficiency of coal movements wonderfully, by cutting out unnecessary empty haul and saving a vast amount of money in getting the cars back to the owner. If an injustice is done to any road it may appeal to the Arbitration committee.

We have also provided that cars may be returned empty to the delivering line by certain railroads to be enumerated by the American Railway Association, and published in the Equipment Register, having in mind that roads, such as traction lines and short line railroads will not be able to find loading in accordance with Rule 3, and that, therefore, cars must be returned empty or loaded to the delivering line. However, as between trunk lines, or roads of their length, there is, in our judgment, no reason why the cars should not be handled strictly in accordance with Rule 3. Where it is necessary to haul a car home empty, these rules provide for getting it home the nearest and the cheapest way. Once a car is billed home to the owner empty it may, of course, be loaded by any line over which it passes, so long as it is loaded in accordance with the rules. The elimination of the charge for hauling an empty car will cut out an enormous amount of unnecessary accounting.

For the delivery of a car contrary to these rules we have provided a penalty of \$50. It has been our experience that rules that bear no penalty are inoperative and a small penalty will not cure the evil. The penalty must be sufficiently high to make it absolutely unprofitable to misuse a car. I am firmly convinced that unless it is done, any separate set of rules originated and put into effect by anybody, will be absolutely ineffective. I am likewise convinced that unless we put into effect both a diversion penalty and a time penalty, the Interstate Commerce Commission, which now has the authority, will issue a set of rules and the penalty for the infraction of these rules will be much more severe than is here contemplated. Indeed, I am not so sure but that this diversion penalty should be \$100 instead of \$50.

The home-route car is unnecessary in the handling of cars under these rules. This will save an enormous amount of money in stationary and unnecessary empty hauls. Under the rules proposed below the cars are handled in accordance with the initials stenciled on the cars, and they are kept moving loaded or empty in the direction of the owning line.

In the event these rules should be applicable to common box cars at any time, an additional clause should be added to Rule 2d which could provide that in the event the

balance as between any two trunk line carriers shall be in excess, say of 10 per cent of either line the deficient line shall have the right to take cars belonging to a direct connection out of an interchange point to some point on its own line for return loading in accordance with Rule 2.

A PROPOSED CODE OF CAR SERVICE RULES.—To govern all equipment other than common box cars, which are pooled.

RULE 1. (A) Foreign cars must be utilized as far as practicable for loading to other lines, in accordance with Rules 2 and 3 in preference to system cars.

(B) Any road shall have the right to agree with any other road to deviate from Car Service Rules 1, 2, 3 and 4, inclusive, in the handling of cars.

(C) The movement of a *foreign car* except as provided

(D) A subscriber* road receiving a loaded car from a in these rules will constitute a diversion.

(E) A non-subscriber** road, an industrial road or a shipper, must require that such car be routed in accordance with Rule 2 or 3.

(F) Thirty days will be allowed each line at the current per diem rate. A penalty will be added for all time held in excess of 30 days as indicated in Per Diem Rule No. 3. The delivery of a car empty to a connecting line for return loading, or to a belt or switching line for loading or unloading, will not break the penalty rate, provided the car is returned to the delivering line within 30 days.

RULE 2. A car belonging to a *direct connection* may be: (A) Moved locally loaded or empty. When delivered off the line it must be:

(a) Returned to the owner direct, or

(b) So loaded that the owner will participate in the freight rate.

(B) If empty at a point of interchange with the home road the car must be confined to the switching territory of the holding road. If there is no loading at that point to or via the home road, it must be returned to the owner empty.

All lines interchanging cars at a common point or within switching limits, either over their own rails, through an intermediate line or lines, or via a car ferry or float, within such switching limits, shall be considered a direct connection under these rules. This information shall be published in the Official Railway Equipment Register, and when the interchange is other than via their own rails, the channel through which interchange is effected must be shown.

Note: Where a movement of traffic, in the opinion of the carriers interested, requires the return of empties belonging to such lines at the junction point where delivered loaded and such carriers fail to agree, an appeal may be made to the Per Diem Rules Arbitration committee, whose decision in the matter shall be final.

RULE 3. A car belonging to an *indirect connection* may be: (A) Moved locally loaded or empty. When delivered off the line it must be:

(a) Loaded to any point in the direction of, but not beyond, the nearest junction point with the owner, or

(b) Loaded via any route so that the owner will participate in the freight rate, or

(c) Loaded to any interchange point with the home line, provided, however, that the car must be routed over the home line where common rates apply, or

(d) It may be returned to the delivering line, if in a homeward direction, but not otherwise. Traction lines and such other lines as may be designated by the American Railway Association may return foreign cars to the delivering line, a list of such roads to be published in the Official Railway Equipment Register.

(B) Short routed to the owner at the nearest junction

point, without charge. Such a car may be loaded in accordance with these rules, by any line over which it passes en route home.

RULE 4. (A) A loaded foreign car may be delivered to a switching road to be unloaded within the switching district. Such delivery shall be indicated on the junction report by the letters "F. U."

(B) If the car belongs to a direct connection of the switching line at that point, it must be handled in accordance with Rule 2.

(C) If the car belongs to a direct connection of the switching line, outside of the junction point at which it was received it must be loaded in accordance with Rule 2, or it may be returned to the delivery line, provided its movement is confined to the switching territory.

(D) If the car belongs to an indirect connection of the switching line, it must be loaded in accordance with Rule 3, or returned empty to the delivering line, provided its movement is confined to the switching territory.

(E) An empty foreign car belonging to an indirect connection of the delivering line, and the line to which it is delivered, may be delivered to a connecting road for return loading. Such delivery shall be indicated on the junction report by the letters "F. L." The loading road must route the car in accordance with these rules. If a car is loaded within a switching district the carrier line shall be responsible for its correct loading.

(F) A car belonging to a direct connection of the switching line, outside of the switching district, may be delivered to it to be loaded within the switching district and returned to the delivering line. The carrier line shall be responsible for its correct loading and the car will be treated as belonging to a direct or indirect connection of the carrier road.

(G) A car belonging to a direct connection must not be delivered to a connecting line for return loading, unless it is to be loaded within a switching district, it being the intention that once a foreign car gets on to any road that has a connection with the owner *it must go home*.

A BOX CAR POOL

Box cars are to be pooled on the basis of ownership, each line to be entitled to its ownership in box cars or the equivalent. The pool shall be based upon the following principles:

1. No box cars of less than 60,000-lb. capacity are to be put into the pool.

2. In order that cars may be loaded in both directions, so far as practicable, a definite standard of excellence shall be established, and no cars shall be offered in interchange that do not measure up to this standard.

3. All railroads, including switching and belt lines, shall, within five years, be required to provide themselves with sufficient equipment to take care of their proportion of the through haul, as well as their local requirements; provided, however, that such roads may be excepted from this order by the American Railway Association as it may deem necessary.

4. Until such time as purely switching lines, belt lines, and so-called tap lines, which originate traffic and own no cars, provide themselves with their quota of equipment, such cars as are delivered to such lines will be charged to the delivering line until they clear to another carrier line.

5. Each member of the pool shall be entitled to the number of box cars on its line, including those charged to belt, switching or tap lines, as provided in Rule 4, as contributed by it to the pool.

6. During a car shortage, when any member line is short of its ownership, it shall be entitled to such compensation per car per day, in addition to the regular per diem, for the cars it is short, in accordance with the cars contributed to the pool, as may be determined upon by the members of the pool.

* Subscriber—A road which is a subscriber to the Per Diem Rules agreement.

** Non-Subscriber—A road which is not a subscriber to the Per Diem Rules agreement.

7. Equipment shall be equalized during times of surplus in an equitable manner, either by the actual movement of cars, or by a proper credit to a line having a surplus, in order to avoid unnecessary movement of cars when they are not needed by the deficient lines.

8. The pool commissioner shall have supreme authority in the matter of handling cars, and his instructions shall be obeyed implicitly. There shall be an adequate penalty established for failure to move cars as ordered by the commissioner, and also a penalty rate paid over and above the regular established per diem rate on all cars held in excess of ownership during a car shortage.

9. Per diem settlements shall be made at the current per diem rate with all car owners. Any excess paid by lines having more than their allotment shall be paid to the pool, to be distributed by them to the deficient lines.

CODE OF PER DIEM RULES

RULE 3. Foreign freight cars must be handled as prescribed in Rules 1, 2, 3 and 4 of the Code of Car Service Rules of the American Railway Association, subject to the following penalties:

Diversion Penalty: A road diverting a foreign freight car shall pay to the owner thereof the sum of \$50 in addition to the per diem.

Time Penalty: If a foreign freight car is in the possession of a road for any period over 30 days, computed as per Rule 1, Paragraph E, such road shall pay to the owner

PLANS MATURED FOR N. R. A. A. EXHIBIT

The National Railway Appliances Association has made full announcement to its membership of the plans for the exhibition of railway appliances to be held in the Coliseum and Annex, Chicago, March 18 to 21, 1918, inclusive. This annual exhibit has grown from a small beginning until it is now one of the largest and most successful of its kind, the principal difficulty confronting the management in recent years being to provide the space desired by those applying for this privilege. The association expresses the confident hope that the tenth exhibit, to be held next March, will be one of the best in the history of the organization.

A floor plan of the exhibition space, shown in the illustration, has been sent to interested companies. Special attention is called to the fact that the main entrance to the Coliseum is through the Annex, as in the 1917 exhibition. The principal change in the floor plan is the elimination of the wide center aisle running across the building opposite the main exit and a slight rearrangement of the spaces to provide 31 additional booths. The association received 68 applications for exhibit space last year which could not be filled and of these 31 companies availed themselves of the privilege of membership in spite of the fact that they could not secure space in the Coliseum.

The prospects for a successful exhibit this year are highly encouraging. Within a week of the mailing of the notices to members, 45 applications for space were received and on

Floor Plan of Coliseum and Annex for the N. R. A. A. Exhibit Next March

thereof a penalty rate of \$0.50 per day for the first 30 days' excess time, \$2 per day for the second 30 days and \$5 per day for any additional period in addition to the per diem rate for the further use of the car; except where such penalty is not reported to car owner within 6 months after the last day of the month in which it accrued, the time penalty rate shall be increased \$0.10 per car per day.

In case either of the above penalties is not reported to the car owner within 12 months after the last day of the month in which it accrued, the car owner shall have the right to show a deduction of the amount in its first open per diem report.

Where a car is delivered to a switching road to be loaded or unloaded and is returned to the delivering line, or where a car is delivered empty to a carrier road for return loading, such delivery will not break the time penalty, providing the car is returned within 30 days after delivery.

October 22, two weeks before the spaces will be allotted, over 80 per cent of the area available had been applied for.

The general arrangements for the exhibit are the same as in previous years, although a number of minor changes are announced. A new plan for handling power and lighting service will be used and no nickel telephones will be placed in the booths, as in past years. The association will provide ample telephone service at the southwest corner of the main building which may be used at 5 cents per call. The association will also provide uniformed attendants and messengers to take care of incoming calls. Another important provision for the 1918 exhibit is that no one will be allowed in the building during the erecting and dismantling period without a workman's pass. The detailed arrangements for this exhibit are in charge of the secretary-treasurer, C. W. Kelly, 349 Peoples Gas Building, Chicago.

Western Railway Club Meeting at Chicago

Locomotive Terminal Delays the Main Topic of Discussion. Addresses By H. T. Bentley and Samuel O. Dunn

THE Western Railway Club met at the Hotel Sherman, Chicago, on October 15. H. T. Bentley, superintendent of motive power and machinery of the Chicago & North Western, read a paper on Locomotive Terminal Delays, which was followed by considerable discussion in which A. R. Kipp, president of the club, and mechanical department officials, particularly roundhouse foremen, participated. Samuel O. Dunn, editor of the *Railway Age Gazette*, delivered an informal address, which, together with Mr. Bentley's paper, is abstracted below.

LOCOMOTIVE TERMINAL DELAYS

By H. T. Bentley

Superintendent of Motive Power and Machinery, Chicago & North Western

While the subject of this paper is Locomotive Terminal Delays, it might just as well be called "Keeping Engines Moving, or How the Round House and Shop Men Are Helping to Win the War." One of the vital needs of the country at this time is a prompt movement of engines from their arrival at the coal shed until they are ready for service again so as to handle properly not only the troops, but also the ammunition, grain, and other commodities that are just as necessary to bring the war to a successful ending as are the boys in the trenches.

I am not going into technical details, but will simply enumerate a few things that help to expedite engine move-

ment of engines are waiting to be coaled, the last engine in can get water without having to switch all of the others or wait until they are moved up past the penstock. In the case of a busy terminal, a separate penstock for switch engines is a great time saver. All spouts should be large enough so that no unnecessary delay occurs when taking water.

An engine washing device located outside with proper drainage so that water will be carried off to the sewer.

The turntable should be power operated and the tractor house so located that the operator can see the rails at both ends. A recent installation of a large table came to my notice where the operator could not properly see the rails at either end, making it necessary for two men to be employed where only one would have been needed if the house had been properly located.

It is hardly possible under present conditions to get along without having the use of oxy-acetylene and electric welding outfits in a round house. Numerous terminal delays can be saved with these outfits almost every day, especially in bad water territory where firebox and flue troubles are serious. The welding of flues does overcome delays and the extension of this practice should be considered, although we are told, that unless equipped with welding apparatus in the round houses to follow the work up, there may be some difficulty experienced in case of leakage.

Labor saving devices of all sorts never were in such great demand as at present, and the men who were far sighted enough to equip their shops, engine houses, and engines with them are now reaping the benefit.

A portable electric light cluster with a reflector is a great help to a difficult night job; there ought to be one or more in every busy round house. For reducing terminal delays they are a good investment and easily made.

The dropping of wheels to replace driving box brasses and take up lateral motion is a big job, but with proper devices applied to your engines, much terminal delay can be overcome; we have recently had two engines come to the shops for the first time in five years for driving wheels to be removed. During that time, side play was taken up, new brasses applied and tires changed without dropping the wheels.

The hot water washout plant has been in service long enough to fully prove its usefulness in conserving coal, water and time.

The emptying of sand boxes to make repairs to sanders or to get rid of wet sand is the cause of lots of delays and profanity, both of which can be overcome by proper attention in shops by knowing that joints are water tight and using a sander that can be repaired from the outside without the necessity of emptying the box and spilling sand over the machinery.

The retaining of heat in a boiler, where such action can be taken, not only helps overcome delays, but conserves wood and coal, both of which are in great demand. In some tests made a few months ago, it was shown that it took about twice the amount of steam from the blower line to raise steam on an engine when cold, as compared with one with hot water in the boiler. We periodically talk about covering stacks and sometimes do it, but after a while the practice is dropped. We all know that heat, or its equivalent, dollars and cents, can be saved by covering the stack of a hot engine, then why don't we do it?

What delays can be charged up to an inadequate blower

Report of Delays to Engines in Terminal Service

Date _____ From _____ To _____

ENGINE	Arrived	Time Ordered	Departed	Total Delay	CAUSE OF DELAY

Foreman _____

Report for Recording Delays to Locomotives at Terminals

ments at terminals. First of all the round house foreman must be a hustler and a good all around man, one who has the good will of the men. I believe the round house foreman is entitled to more of our consideration than is sometimes given him.

The following are some of the many good investments for a busy round house.

Coaling facilities that will coal engines quickly without spilling coal on the ground to be shoveled into cinder cars or otherwise wasted.

Clinker pits where cinders can be handled with the greatest dispatch and the least amount of labor.

Sanding apparatus that will quickly deliver the sand in the box instead of on the boiler and the running board, and so located that the tender can be filled at same time.

Penstocks or water tanks properly situated so that if a

system, and why doesn't someone get up a device that will be effective and more economical. The condensation that takes place in a blower line from the boiler room, around the house and then to the locomotive is simply a waste of coal that some inventive genius should be able to overcome. A blower line is a good condenser, but not a very economical medium for steam raising.

The firing up of locomotives is a job that is done hundreds of times every day, and if any member has a method of doing this more economically and quickly than by the practice of using wood and coal and will tell us about it, we may be able to save a few minutes or a few shovels of coal on each fire.

Men speeding up their work in the shops and round houses, and doing it well are just as much entitled to credit as people in other occupations who are doing their bit for this glorious country of ours.

The drawing office is sometimes responsible for delays in round houses, and if the round house foremen were consulted more often by the mechanical engineer, many annoying delays due to poor design or inaccessible parts would be overcome.

It is possible that some of us are still doing some things that are not absolutely necessary, you might call them "frills." A short time ago we held a staff meeting at which this subject was discussed, and decided to postpone doing some things not detrimental to the service, until a more opportune time.

Engineers can save delays at the terminal by correctly reporting the work that actually needs doing; the work slip that shows a bad pound on the right side, or packing blowing without saying where, or the air pump not working, or something wrong with the injector, causes lots of unnecessary work looking for a defect that should have been located in service and which in some cases is difficult to find on a dead engine. Coal can also be saved by the engine crew not coming to the clinker pit with a lot of green coal in the fire box, as it is only knocked out and wasted; we cannot afford to waste coal at any time, but now to do so is almost a crime.

The open sided clinker pit with a depressed track for cinder cars is a question whether there is not something that requires less labor and can handle cinders more economically.

A copy of our "Delays to Engines in Terminal Service" report is shown herewith, from which it will be seen that very little work is required to give information as to the total delay and the cause.

A more elaborate report used by the Pennsylvania Railroad was described and illustrated in the *Railway Age Gazette*, pages 595 and 596 of the October 5, 1917, issue, and a full explanation is given as to the method of handling it. While these reports, of course, require some one to keep track of all movements and delays, yet the information given enables the master mechanic to put his finger on irregularities and correct them.

Most of us are able to say what we could do if we had all the improvements we might think necessary, but as it is impossible to get some of those things now, it is up to us to utilize the facilities we have to the best advantage to keep the wheels moving; by getting good results under those conditions we really are bigger and better men than if surrounded with every convenience for turning engines promptly. Difficulties bring out a man's resourcefulness, and the more difficulties successfully overcome, the more valuable is that man to his employers.

DISCUSSION

Some roads reported that at the present time the average service obtained from locomotives has been increased to 6,000 miles per month in freight service and 9,000 miles per month in passenger service. The practice of filling tenders not quite to the top has been adopted by one road to con-

serve coal and save labor at the terminal. The necessity for power operated devices for handling cinders was emphasized by one of the speakers, who told of a terminal employing eight laborers on this work, where it was necessary to hire 42 new men in a single month. Several roads were reported to be using stack covers; some are attached to the stack, while others are suspended by chains inside the smoke jack. It has been found necessary to have an opening from 2 in. to 4 in. in diameter in the cover to prevent the engine sweating. As an instance of the special methods used to keep power in service, a foreman at one locomotive terminal told how one-eighth inch was removed from the flanges of an entire set of drivers without dropping the wheels by means of a cutting tool attached to the frame of the locomotive.

ADDRESS BY SAMUEL O. DUNN

The presentation of Mr. Bentley's paper was succeeded by an informal talk by Samuel O. Dunn, editor of the *Railway Age Gazette*, on the railway situation. Mr. Dunn called attention to the fact that the railways in the year 1916 handled about 25 per cent more freight traffic than in 1915, and that on top of that they are handling in 1917 a vastly larger traffic than they did in 1916. The freight traffic handled in July, 1917, was 20 per cent greater than that handled in the same month of 1916 and 48 per cent greater than that handled in the same month of 1915. The increase in July, 1917, over July, 1915, was equal to the total freight traffic handled in a year before the war by the combined railways of Japan, Spain, Sweden, New South Wales, Switzerland and Brazil. This great increase in traffic has been handled with practically no addition to the available equipment, which showed that there had been a great augmentation of the efficiency with which equipment was being handled. In spite of the fact that the total business being handled, passenger as well as freight, is now the greatest in history, the tendency of net operating income is to decline.

In the first six months of 1917 gross earnings were 12.2 per cent greater than in the same months of 1916, while operating expenses were 18½ per cent greater, taxes were 17½ per cent greater and net operating income was 3.7 per cent less for the railways as a whole.

Furthermore, during this period transportation expenses increased over 26 per cent, while expenditures for maintenance and equipment increased only 12½ per cent and expenditures for maintenance of way only 7.6 per cent. These increases were relatively so small that they would not cover the increased cost due directly to advances in wages and in the prices of materials and the only rational conclusion that can be drawn is that railway properties are not being maintained to as high standard as they were a year ago. When we entered the war it seemed that the most difficult problem of the railways would be that of moving the tremendous traffic which would be offered to them. Thus far, however, they have been able to do this and it begins to appear that the problem of adequately maintaining the properties will prove to be an even more difficult one. The obstacles encountered in getting a sufficient amount of labor and sufficient materials and the high wages of labor and the high prices of materials are likely to make the problem of maintenance increasingly difficult, but the speaker believed that the loyalty, the ability and the energy of the railway officers and employees of the country would find means for solving the problem. The fact that net earnings are declining while the roads are handling the largest traffic in their history shows the need for advances in rates, and Mr. Dunn predicted that if the railways continued to render the splendid service to the public that they have been rendering since the country entered the war public opinion would compel the regulating authorities to grant the needed advances in rates.

State Railroad Legislation Passed in 1917

Laws Affecting Strikes, Grade Crossing Protection, Wage Payments and Trespassing on Railway Premises

SOME of the more important of the 140 laws relating to railway operation passed by state legislatures in 1917 are abstracted below. Similar laws passed in different states have been grouped together as far as possible.

LABOR LEGISLATION

New Jersey House Bill 223 repeals the excess train crew law of 1913 and empowers the Public Utilities Commission, after notice and hearing, to direct any railroad to employ such a number of employees on its trains as the commission deems necessary to enforce safe, adequate and proper service for the protection of the public and the employees of the road. The act prohibits the reduction of the number of men in train crews without the authority of the commission.

Utah House Bill 10 and Minnesota House Bill 18 authorize the organization of labor unions and prohibit state courts from granting injunctions in any case growing out of a labor dispute unless necessary to prevent irreparable injury to property or property rights, for which there is no adequate remedy at law. New Hampshire House Bill 322 prohibits any employer from soliciting or advertising for employees during a strike without stating plainly that a strike exists.

Ohio House Bill 107 and Michigan House Bill 116 prohibit a railway from discharging or disciplining an employee on information involving his honesty, integrity or a breach of rules furnished by a special agent, detective or spotter, without advising the accused of the specific charges against him and giving him an opportunity to be heard.

Wisconsin Joint Resolution 72 declares against the setting aside or abatement, even temporarily, during the war, of laws designed to safeguard the rights of laborers.

West Virginia Senate Bill 62, North Dakota Senate Bill 78, New Mexico House Bill 24, Nebraska House Bill 33, and Tennessee House Bill 264 require railroads to pay wages semi-monthly.

LAWS AFFECTING TRESPASSERS

South Dakota House Bill 355, New York House Bill 937, New Hampshire House Bill 453, Wyoming Senate Bill 53, and Connecticut State Bill 61, although differing somewhat in their provisions, all aim to prevent trespassers from stealing rides on railroad cars or locomotives. The Wyoming bill makes conductors in charge of cars or trains special constables with authority to arrest offenders and deliver them to the first available sheriff or deputy sheriff. House Bill 116 passed by the same legislature vests similar powers in enginemen. The New Hampshire and South Dakota bills have provisions similar to those in the Wyoming laws.

Iowa House Bill 381 prohibits the occupation of a car or locomotive by force and without the consent of the persons in charge of it. It likewise makes it unlawful for any one to enter a car or engine with a dangerous weapon for the purpose of committing a public offense. Michigan Senate Bill 261, Connecticut Senate Bill 61 and New York House Bill 937 make it unlawful for unauthorized persons to walk upon or along the railway tracks or right of way except at a public or private crossing. The New York law provides specific penalties, a feature heretofore lacking; and this change will greatly facilitate enforcement.

New Hampshire House Bill 584 provides a maximum penalty of \$5,000 or ten years imprisonment, or both, for any one who injures, destroys or damages railroad property or tampers with a railway switch.

GRADE CROSSING LEGISLATION

Vermont Senate Bill 106 requires steam railways to expend not less than \$75 per mile each year in the removal of grade crossings, specifying that the most dangerous crossings be removed first.

Illinois Senate Bill 409 authorizes the Public Utilities Commission to direct the highway commission to abolish, alter or relocate railway crossings at highways or public roads where such a change is necessary to preserve or promote safety. Wisconsin Senate Bill 572 empowers the Railroad Commission to establish the grade of the tracks of any railroads throughout a county containing a city of the first class in anticipation of a future separation of grades at streets and highway crossings.

Maine House Bill 650 authorizes the Public Utilities Commission to fix the maximum speed at which trains may be run over grade crossings and prohibits the unreasonable or negligent obstruction of such crossings by engines, tenders or cars.

Illinois Senate Bill 409 requires that drivers of self-propelled vehicles reduce speed to a maximum of 10 miles an hour on approaching grade crossings and come to a full stop at crossings where stop signs are posted.

Connecticut Senate Bill 580 directs the Public Utilities Commission to determine what crossings are such that public safety requires self-propelled vehicles to stop and requires that prescribed stop signs be set up at these places. New Hampshire House Bill 68 requires drivers of self-propelled vehicles to reduce their speeds to 10 miles an hour when approaching within 100 feet of highway grade crossing.

Maine Senate Bill 349 authorizes the Public Utilities Commission to require steam railways to install, maintain and operate automatic signals at their own expense at highway crossings where, after notice and hearing, it is determined that signals are necessary to protect public safety. The act defines automatic signals as devices which are audible and visible by day and night and which give warning of the approach of trains.

SMOKE PREVENTION

Minnesota House Bill 395 authorizes cities of not less than 20,000 or over 50,000 inhabitants to enact ordinances with penalties to regulate, prohibit or abate the emission of dense smoke within their limits.

Wisconsin House Bill 359 empowers the Railroad Commission to authorize railways to use electricity in lieu of steam as a motive power or to use both whenever in the opinion of the commission, upon petition and after hearing, a total or partial substitution of electricity for steam will be beneficial to the railroad and to the community or territory served by it.

MARKING VEHICLES CARRYING EXPLOSIVES

Montana Senate Bill 51 and New Jersey House Bill 434 provide that vehicles carrying explosives shall display a red flag bearing the word "danger" on a pole at the front end, or in lieu of the flag the words, "Explosives, Danger," in white letters at least six inches high, printed on or attached to the ends and each side of such vehicles. The bills also prohibit the placing of metal tools or pieces of metal or matches in the body of vehicles containing explosives. The bills do not apply to explosives transported in conformity with regulations of the Interstate Commerce Commission, or

to military or naval forces, nor to explosives carried in small quantities.

CAR SERVICE REGULATION

Kansas Senate Bill 107 requires railways to furnish cars to shippers within a period not exceeding three days for an order of ten cars, not more than six days for between 10 and 30 cars, and not more than ten days for 30 cars or more, after written application has been made to the superintendent, agent or other person in charge of transportation. Cars must be placed at the points indicated in the application and in the order in which the applications are made without preference to any person. In emergencies respecting the transportation of any particular product, the Public Utilities Commission may require that the class of cars needed to handle the commodity be furnished within such a reasonable time as it may prescribe.

North Dakota House Bill 195 requires railways to furnish and distribute cars to elevators in proportion to their daily grain receipts.

Nebraska House Bill 40 authorizes the Railroad Commission, if it finds after a hearing that the supply of cars on a railroad is inadequate, to issue an order prescribing rules for the distribution of cars to divisions and stations of the railroad and to shippers at such stations based upon the relative volume of shipments from each division, station or shipper.

Nebraska House Bill 419 requires railways to transport live stock from the point of receipt to destination at a minimum average speed of 18 miles an hour on main lines and 12 miles an hour on branch lines when trains contain six or more carloads, and at a minimum average speed of 12 miles an hour on main lines and 10 miles an hour on branch lines when trains contain less than six carloads. The computation of speed does not include the necessary time consumed in picking up, setting out, loading or unloading carloads of stock at stations, the time consumed awaiting consolidation with main line trains at junction points—not exceeding two hours at each junction point—not the time consumed in watering and feeding the stock. The law does not apply to the movement of livestock from Omaha for feeding or breeding purposes and permits the carriers, with the consent of the Railway Commission, to designate three days weekly as stock shipping days on branch lines not over 125 miles long.

Minnesota House Bill 40 requires the delivery of livestock to chutes at stockyards to which they are billed within five hours after the arrival at a terminal, provided the stockyards are within a radius of 20 miles. Of this time, switching roads whose principal business is transferring livestock from terminal interchange points to stockyards for unloading, shall be allowed not more than three hours after receipt from the carrier road to deliver the stock to chutes.

Texas House Bill 173 prohibits railways from confiscating or otherwise converting to their own use any carload shipments or substantial portions thereof without the express consent of the owner or consignee. The law does not apply to freight damaged or intermingled with other freight in wrecks, or refused or unclaimed freight.

Florida House Bill 4 makes it unlawful for a carrier which receives a line haul to make any charges for switching a car to or from a loading or unloading point located on its line, sidetracks or spurs. This law applies to intrastate shipments only.

North Dakota Senate Bill 86 requires railways to attach to every stock freight train containing 25 or more cars of livestock a sleeping car sufficient for the accommodation and protection of persons accompanying stock.

Missouri Senate Bill 181 requires railroads to stop all regular passenger trains, whether wholly or partially engaged in intrastate passenger service, at county seat stations

and at junctions where stations are maintained for the reception and discharge of passengers.

Nebraska House Bill 67 relieves railroads from the necessity of operating exclusive passenger trains on lines constructed subsequent to January 1, 1917, until such lines earn to exceed seven per cent per annum according to the formula of the Interstate Commerce Commission.

LAWS AFFECTING LOCOMOTIVES

Arkansas House Bill 191 makes it unlawful for a railway to operate an engine unless so constructed that the engineman and fireman are located under the same roof at all times while firing or operating the engine.

Ohio Senate Bill 5 and New York Senate Bill 199 require railroads to equip locomotives with automatic or foot power control firebox doors.

California House Bill 942 requires that steam locomotives be equipped with automatic bell ringers so constructed that they may be set in motion from either or both sides of the locomotive cab.

GRAIN LEAKAGE

Kansas Senate Bill 249 requires railroads to give written notice to consignors of all leaks or defective cars and also written notice within ten days thereafter, of the time, place and extent of the repairs made while the car was in transit. The act applies only to intrastate shipments of bulk grain.

Montana Senate Bill 33 requires railways to furnish box cars for the transportation of grain or other commodities in bulk, of such construction and in such order that they will not leak. The act also requires railways properly to clean and cooper box cars which have been placed for loading and which are not in such condition as to afford safe transportation to such commodities. If cars are not repaired within 24 hours after written complaint by a shipper to the railroad agent, or if cars are placed at a siding where no railroad representative is located, shippers may have repairs made and recover the cost from the railroad.

SLAUGHTER OF LIVESTOCK ON RIGHT OF WAY

Nevada House Bill 150 and New Mexico House Bill 18 require railways to pay owners the fair market value of livestock killed or injured by trains in case the accident is due to the failure of the railway to construct fences on each side of its right of way.

Nevada House Bill 251 requires railways to provide cattle guards at public highway crossings and to pay the owner of livestock the full market value of animals killed and injured because of the lack of such protection.

MOVEMENT OF BUILDINGS ACROSS RAILROAD TRACKS

Oklahoma House Bill 325 and Missouri Senate Bill 387 require railroads to furnish competent workmen when the movement of a building over a railroad track outside the limits of a city of the first, second or third class makes it necessary to cut, remove, raise or interfere with telephone, telegraph or electric wires or poles. The Oklahoma bill provides that the railway shall be reimbursed for such expense but the Missouri bill stipulates that the expense shall be borne by the carrier.

MISCELLANEOUS

Vermont House Bill 148 prescribes a fine of \$5 for any passenger on a common carrier who publicly drinks intoxicating liquors as a beverage. Connecticut Senate Bill 522 provides a maximum fine of \$1,000 or a maximum imprisonment of 10 years, or both, for any railroad employee who, in consequence of intoxication or any gross or wilful conduct or negligence, causes loss of lives or the breaking of a limb.

West Virginia House Bill 82 requires railways to provide suitable space for the transportation of sick and injured passengers traveling on cots or stretchers and provides that

no charge shall be made for such services other than the regular first-class fare.

Oregon House Bill 549 permits the collection or deduction by employers of reasonable amounts from wages of employees for medical, surgical or hospital care.

Oklahoma House Bill 490 prohibits the removal of railway shops or division points which have been located at a point in the state for a period of five years or more, without the permission of the corporation commission. If the commission finds that the sanitary or habitable conditions at the proposed new location would endanger or injuriously affect the health of employees or their families, it shall refuse permission to make such removal.

Kansas House Bill 770 prescribes specifications to which new caboose or way cars must conform.

RAILWAY REGIMENTS' TOBACCO FUND

The committee having in charge the work of raising among the railway supply companies of the United States a Railway Regiments' Tobacco Fund for the railway regiments that have been organized in this country has begun sending out circulars on this subject to railway supply companies and already a considerable number of subscriptions to the fund has been received. The subscribers up to noon on October 23 and the amounts of their subscription were as follows:

Ajax Forge Company, Chicago, Ill.....(to cover 15 months)	\$150
American Manganese Steel Co., Chicago Heights, Ill.....	10 a month
American Steel Foundries, Chicago.....	"
Buda Company, The, Chicago.....(to cover 3 months)	30
Brace Metal Co., New York, N. Y.....	10 a month
Bucyrus Co., South Milwaukee, Wis.....	"
Economy Devices Co., New York, N. Y.....	"
Camel Co., Chicago, Ill.....	"
Haskell & Barker Car Co., Chicago, Ill.....	"
MacRae's Blue Book, Chicago.....	"
Madden Co., Chicago, Ill.....	"
More-Jones Brass & Metal Co., St. Louis, Mo.....	"
P. & M. Co., Chicago, Ill.....	"
Poole Brothers, Chicago.....	"
Prendergast Co., Marion, Ohio.....	"
Pyle-National Co., Chicago, Ill.....	"
Railroad Supply Co., Chicago, Ill.....	"
Railway Age Gazette, New York, N. Y.....	"
Railway Review, Chicago, Ill.....	"
Ryan Car Co., Chicago, Ill.....	"
Safety Car Lighting & Lighting Co., New York, N. Y.....	"
Sargent Co., Chicago, Ill.....	"
Sherburne & Co., Boston, Mass.....	"
Standard Compler Co., New York, N. Y.....	"
Standard Foreigners Co., Chicago, Ill.....	"
Standard Steel Car Co., Chicago, Ill.....	"

The circulars asking for subscriptions and explaining their purpose only recently have been sent out and it is confidently expected that subscriptions will from now on flow in rapidly from railway supply concerns throughout the country. The amount being asked from each concern is only \$10 a month, which is a small matter in itself but if as many subscriptions are received as ought to be the aggregate amount raised will be sufficiently large to provide a large part, if not all, of the "smokes" required to make the members of the railway regiments happy. As previously explained in these columns, the fund is being raised solely to purchase tobacco for members of the railway regiments which, as is well known, are composed almost entirely of former railway officers and employees.

It is a significant fact that the railways of the United States were the first industry to organize themselves to help the government win the war. It is perhaps no less significant that the members of the railway regiments are the first American soldiers to be actually under fire in the zone of hostilities in France. The work of these men is to operate military railways directly "behind the front," and while they do not themselves fight they are exposed to all the dangers of soldiers and are rendering a service which is as indispensable to the carrying on of the war as the men who will actually go into the trenches. Therefore, from every point of view they are the object of peculiar interest to the railway supply concerns of the country and it is hoped that a generous

fund can be raised for them. "Now is the time to subscribe!"

ELECTRIC ARC WELDING *

By E. Wanamaker,

Electrical Engineer, Rock Island Lines.

The ability of the railroads to meet the demands upon their transportation facilities will be an important factor in the time required for the nation to become effective on the battle fronts. This discussion deals with one way of getting more transportation service out of the railway equipment in existence at the present time. Efforts spent in this direction are as patriotic and necessary as can be imagined. The patriotism of the civilians, particularly of the mechanical engineers in railway service, must not stop with the more or less superficial demonstration of loyalty to the Stars and Stripes. Those of us who cannot go to the fighting front must use the best of our abilities to get service, "and still more service," to paraphrase Lloyd George's quotation, from the motive power and rolling stock of the nation's railway systems.

The growing possibilities of the welding processes in motive power and rolling stock maintenance have been a source of amazement to every railway man who has come in contact with the practice. In cutting operations the application of the oxygen cutting processes saved from 50 per cent to 90 per cent of the time required to perform the operation. Yet in many locomotive shops and car yards the old practices are still followed and man power for this cause has not produced the maximum result.

There was a time when worn surfaces of the steel parts in a machine made it necessary to scrap those parts. It was only with the introduction of the autogenous welding processes that it became possible to stop this economic waste.

The repair of broken members of a machine has been another important work of the autogenous welding processes. Prior to their introduction certain steel parts could be welded in the forge fire, but the range of the work was limited and in many cases its cost was equal to the cost of a new part. Now, however, with the exception of cast iron parts, the failure of which would bring death and destruction, practically all parts of a machine which break may safely be repaired.

It is my purpose to point out so far as is possible how far these new practices may be utilized on steam railways to enable the railway systems of the country to meet the present emergency in the matter of service demanded from motive power and rolling stock equipment. The first of the new welding processes, which may properly be called autogenous processes, since the welding takes place more or less automatically, was the thermit welding process. This process found a wide application in the repair of broken steel parts on the railroads and the saving which resulted from its use without doubt aggregated millions of dollars.

Welding with the oxygen and fuel gas flame was the first widely used autogenous welding process. Since everyone is more or less familiar with the gas welding process, this paper will deal primarily with the electric welding process and an extended discussion of the gas process will be omitted. It is sufficient to state that at present the essential difference is in the method of producing the heat for welding, rather than in the fundamental principles involved.

TWO KINDS OF ARC WELDING

There are two kinds of electric arc welding, known respectively as carbon electrode welding and metal electrode welding. In the former an arc is drawn between a carbon electrode and the piece to be welded and the metal to be added is fed into the arc in the form of a "melt bar." This process is not used extensively in railway work, due to the fact that

* Abstract of a paper read before the Western Railway Club.

welding may only be done in the horizontal plane in this manner and that the work is in general inferior to that which is possible with the metal electrode process.

The metal electrode process uses, as the name implies, a metal electrode,—the arc being drawn between the electrode and the piece being welded. The heat of the arc melts the metal of the piece and the metal of the electrode simultaneously. As the metal of the electrode melts it is drawn across the arc to the molten metal of the piece where a complete and homogeneous union is formed, which we call an autogenous weld. I say the metal of the electrode is *drawn* across the arc rather than that it falls through the arc advisedly, since it will flow straight overhead as well as straight downward. The temperature of the arc is extremely high at its center, actually vaporizing the metal to form the visible arc. With the exception of work with certain electrodes (manganese steel and slag-covered electrodes), the electrode is always made the cathode or negative—that is, the current of electricity flows from the piece being welded to the metal electrode. The reason for this practice is that the greatest amount of heat in an electric arc is liberated at the point at which the current passes from the solid medium to the heated vapor of the arc. Since the metal of the piece has more mass and conducts the heat away from the point at which the welding is being done more rapidly than the electrode, it is desirable to have the greatest amount of heat on the piece. Due to the composition of the manganese and slag-coated electrodes, it is necessary to make these electrodes the positive.

The voltage across the arc required for metal electrode welding is approximately 20 volts and direct current power is necessary. The various types of welding equipment are merely different plans for rendering available a rather heavy current at this voltage, and the power economy of the several systems for obtaining this result varies over a wide range.

WELDING ORGANIZATION

The successful application of the process requires the combination of three factors—engineering knowledge, craftsman's skill and enthusiasm. The direction of the practice on our road rests with the engineering staff of the mechanical department; the actual operation is done by skilled members of the boilermakers', pipefitters', machinists' and blacksmiths' crafts. We do not employ novices or apprentices in this work. Only the best men of the respective crafts are picked for operators. It has been plain from the start that only the highest type of craftsmen could secure the results we want and we have witnessed the growth of a considerable amount of pride and enthusiasm in the work among our operators. Even with the best of equipment and facilities for welding, we recognize the fact that it is absolutely necessary that only skilled operators be employed.

Under competent direction, the skilled and enthusiastic operator will seldom make serious blunders in the application of the process. I am quite certain some roads have had great difficulties in this line among operators made of green apprentices and "handy men." Further, we have found that the skilled craftsman, who is enthusiastic about the process, is continually finding new and profitable fields for its application.

The connecting link between the engineering staff and the operators is the supervisor of welding, who is fully informed on the range of approved applications and is also the most expert operator on the road. He is continually traveling between the shops keeping the practice of each up to date and seeing that everything runs smoothly. The operators at local points are under the supervision of the foremen in exactly the same manner as lathe operators or other craftsmen.

STANDARD INSTRUCTIONS

It was found essential that we compile a complete set of welding instructions, which comprise some thirty typewritten pages. It is the purpose of this set of instructions to

standardize the major operations as far as possible. The extreme range of the application of the process has made it quite impossible, up to the present time, to standardize every single operation, but these instructions cover the field in such a general way that the operator is prevented from making serious welding blunders.

RESULTS ON ROCK ISLAND

The actual results of the operation of the welding equipment and the welding system on the Rock Island Lines have proven interesting. We have recently undertaken a rather extensive investigation of what the results are, and I am giving below some of the figures we have obtained as a result of about six months' operation of the complete system. The real answer to the question of whether or not the expenditure of some \$40,000 for the installation of the system was justified lies in the actual facts—reduction of maintenance cost and actual gain in engine days with our present equipment. Tables I, II and III show some actual figures on the cost of repairing a small number of representative locomotive and other parts (for which we were able to obtain costs at a reasonable expenditure) by the gas and electric method, as compared with the old method which in many cases involved a complete replacement of the part. As compared with the old method, the saving of the electric process arises principally in the saving in labor. As compared with the gas process, the electric welding offers a saving in cost of producing heat and an appreciable saving in labor.

TABLE I.—COMPARISON OF ELECTRIC WELDING VS. OLD METHODS AND GAS

Description of parts	WELDING		Saving over old method	Saving over gas	No. engs.
	Cost old method	Cost gas welding			
Valve stems	\$16.28	\$15.26	\$4.76	\$11.52	10.50
Eccentric straps	17.95	7.63	2.38	15.57	5.25
Cylinder cocks	1.36	1.04	.34	1.02	.70
Cross heads	356.40	120.23	37.73	318.67	82.50
Piston heads	47.93	32.74	10.24	37.69	22.50
Motion saddles	8.32	10.94	3.44	4.88	7.50
Frame braces	99.50	48.60	15.00	84.50	33.00
Crank arms	18.81	26.14	8.14	10.67	18.00
Rocker box castings	4.59	7.29	2.04	2.55	5.35
Transmission bar	2.80	4.38	1.38	1.42	3.00
Reach rod	1.25	1.09	.34	.91	.75
Rocker arms	20.75	13.24	4.24	16.51	9.00
Eng. truck equalizers	7.70	17.24	5.24	2.46	12.00
Truck frame	15.70	13.04	4.04	11.66	9.00
Trailer jaws	2.76	4.38	1.36	1.40	3.02
Extension piston cross head	6.30	4.36	1.36	4.94	3.00
Brake beams	1.69	2.18	.68	1.01	1.50
Brake bangers	5.10	7.45	3.40	1.70	4.05
Smoke arch hance	3.50	6.36	2.46	4.11	1.50
Air pump valves	2.50	1.33	.53	1.97	.80
Lugs on valve yoke	32.45	21.80	6.80	25.65	15.00
Push car wheels	6.00	10.56	3.05	2.94	7.50
Silicon wrench	1.60	1.09	.34	1.26	.75
Drill chuck	15.90	2.18	.68	14.32	1.50
Driver brake fulcrum	5.52	8.72	2.72	2.80	6.00
Wheel spokes	1,276.80	113.08	35.08	1,241.72	78.00
Main rod blocks	15.88	28.34	6.84	7.04	19.50
Triple valve gauge	20.00	3.27	1.02	18.98	2.25
Link blocks	72.24	51.49	15.49	56.73	36.00
Lift shafts	23.98	4.02	1.02	22.96	3.00
Quadrant	7.43	11.09	3.59	3.84	7.50
Wedges	55.04	69.69	21.69	58.53	48.00
Chafing castings	8.30	10.70	3.20	5.10	7.50
Plugging and building up holes	349.69	280.94	140.47	209.22	140.47
Tire rim keys	3.22	5.38	2.38	1.84	3.00
Throttle stem	1.50	1.09	.34	1.16	.75
Reverse lever support	3.38	4.36	1.36	2.02	3.00
Smoke box	61.38	32.43	9.93	51.45	23.50
12th line	12.51	11.40	4.00	9.06	12.50
Strip on cross heads	25.37	31.00	12.66	12.66	18.34
Fire door handle	1.75	1.09	.34	1.41	.75
Boiler casings	63.21	30.30	9.32	53.89	20.92
Frame buckle	4.90	2.41	.91	3.99	1.50
Trailer yokes	5.25	6.45	1.95	3.30	4.50
Motion frame	9.10	10.17	4.17	4.93	6.00
Combination lever	1.03	1.75	.55	.48	1.20
Lugs on trailer hub	4.52	8.52	2.98	2.60	9.00
Center castings	76.81	28.56	9.06	67.75	19.50
Spring blocks	1.15	1.09	.34	.81	.75
Guide blocks	5.52	4.29	1.29	4.23	3.00
Binder	5.19	13.10	4.00	1.40	9.00
Steam pipe	1.12	1.12	1.12	1.67	3.00
Flat spots on tires	99.86	95.77	20.77	70.09	66.00
Building bushings	35.65	9.40	3.40	32.25	6.00
Drilling on side rods	93.48	81.16	31.16	62.32	50.00
Grease cups	11.79	3.43	3.86	7.86	2.50
Stationary fire door	8.90	8.72	2.22	5.28	6.00
Cracks in tanks	372.69	113.62	35.16	337.53	78.46
Petticoat spars	140.52	52.37	16.37	124.15	36.00
Filling worn spars	2,672.80	1,000.60	339.60	2,338.20	735.00
Bins	70.66	87.73	27.23	43.43	60.00
Reverse lever parts	103.02	74.04	23.04	79.98	51.00
Totals	\$6,434.10	\$2,755.74	\$921.61	\$5,512.49	\$1,834.13

TABLE II.—COMPARISON OF ELECTRIC WELDING VS. OTHER METHODS

Description of parts	Cost of other methods	Cost of elec. weld	Saving	No. engs.
Pedestals	\$645.00	\$45.24	\$599.76	5
Tank frames	0.03	1.36	7.67	1

TABLE III.—SUMMARY—COSTS AND SAVINGS PER MONTH

Cost of other methods	Cost of gas welds	Cost of electric welds	Saving over other methods	Saving over gas weld
\$6,434.10	\$2,755.74	\$921.61	\$5,512.49	\$1,834.13
7,839.15	3,697.42*	1,154.42	6,684.73	2,543.00*
\$14,373.25	\$6,453.16	\$2,075.03	\$12,197.22	\$4,377.13
COSTS AND SAVINGS—PER YEAR				
\$77,209.20	\$33,068.84	\$11,059.32	\$66,149.88	\$22,009.56
94,069.80	44,369.04*	13,853.04	80,216.76	30,516.00*
\$171,279.00	\$77,437.88	\$24,912.36	\$146,366.64	\$52,525.56

* Figures show cost of gas weld if work could have been welded with gas.

Our figures show that the saving effected by the electric arc welding system is being made at the rate of approximately \$200,000 a year with our present equipment. This figure includes a direct saving as compared with other methods of about \$136,000. The saving arising from the fact that we keep the engines in service a greater proportion of the time makes up the balance of the figure. Our figures show that this saving is being made at the rate of about 1,400 engine days per year.

Another way of looking at the same matter is that by the operation of the electric welding system we have obtained the service of four additional engines, without the additional investment, beyond that required to install the welding system. Four additional engines are worth approximately \$200,000. The welding system installed complete cost about \$40,000. The cost of operation of the system for a year is approximately \$34,000. Figuring the value of the engines at \$40 per day, we will pay for the operation of the whole electric welding system and will clear \$22,000 from this feature alone of the operation of the electric welding system. However, we made important savings, as are shown in the preceding table, in the repair of parts on engines, where we could not show an actual gain in engine days of service, and this saving amounts to more than twice the saving arising in the increase of the number of engine days of service we get from our equipment. The net return secured on the electric welder investment amounts to approximately 500 per cent per annum. The net cost of the installation and equipment per unit under present conditions is approximately \$1,300. The foregoing figures show rather conclusively that the installation of the electric welding system has been a profitable investment on the Rock Island Lines.

AMOUNT OF EQUIPMENT REQUIRED

In spite of the fact that we have probably a larger number of operators than any of the Western roads, we believe that we are far from fully equipped. The field of application of the process is continually widening. We are not able at present to handle all the operations which we have demonstrated to be practical and profitable. There is a totally unexplored field in maintenance of freight and passenger cars, which promises to eclipse in importance maintenance of motive power. There is a field in the repair of special track work, which we have not gone into up to the present.

POSSIBLE NEW APPLICATIONS

Within the last three years the arc welding process has been greatly improved and developed, both in the equipment for making the weld and in the welding material. It has, in fact, been developed to such a state that it will no doubt cause

changes in many forms of construction, and the welding of fireboxes, tanks, etc., will become an economical practice. In the field of car construction and maintenance we may look for a wonderful development. For instance, today the cast steel truck side frame will last almost indefinitely where the electric welder is used in maintenance. By the intelligent application of spot welding with the electric arc, it will, no doubt, be possible to tie down bolts and nuts in the various parts of the rolling stock and motive power in such manner as to prevent their working loose, with the attendant very large saving in maintenance and operating expense. Quite recently we have been able, by using what is called a slag-coated electrode, to deposit steel having a carbon content of 50 per cent, which will enable us to do some work which we have been unable to do heretofore. We can successfully take care of the worn or damaged flanges of driving wheels, and should be able to reclaim much of the special work and rail steel by successfully building up the worn parts or broken sections.

ARC VS. GAS WELDING

It has been our purpose in establishing the practice in the welding field to look the facts squarely in the face and apply either the gas or electric process, depending on which shows the best results at the lowest price. At the present time we are of the opinion that the electric process will supersede the gas process on all steel welding and some of the rough steel cutting. In the cutting of boiler steel and all close cutting, however, and the welding of cast iron and the non-ferrous metals, the gas process has unequaled advantage. We are operating 75 gas torches and one acetylene generating plant on the same general principle as obtains in the case of the electric arc welding equipment. It is also best to use gas welders at all points where only occasional welding is done and which would not justify the investment necessary for the installation of an electric welder.

It is our belief that with approximately five times the amount of electric welding capacity we have at present, we can show at least five times the annual net saving, which would amount to a million dollars a year, and that we can with this equipment in operation show a saving of around 7,000 engine days per year, which means that we would be able to secure from our present engines a mileage that will equal that which could otherwise only be secured by the purchase of 23 additional locomotives.

DISCUSSION

While many roads reported large savings by the use of oxy-acetylene welding, only a few had installed the arc welding process. The field for electric welding is even wider than for gas welding. Contrary to the opinion generally held, cast iron can be welded by the electric process with success. In judging the efficiency of welding, consideration should be given to the elasticity of the metal in the weld as well as the tensile strength. Welding can be done with thermit where other processes prove unsuccessful; for instance, the welding of main and side rods with thermit was practiced with entire success up to the time when the locomotive inspection law, forbidding autogenous welding of such parts, went into effect.

AUSTRALIAN LINES ADOPT SUPERHEATERS.—In giving evidence before T. R. Johnson, who recently investigated the operation of the Victorian Government Railways, W. M. Shannon, the chief mechanical engineer, said that the adoption of superheaters should save 12½ per cent of the fuel consumption, and had 200 of the locomotives on the Victorian railways been equipped with superheaters there would have been a saving last year, when coal was 15s. 10d. (\$18.80) per ton, of £11,378 (\$55,300). At present coal was 21s. 1d. (\$5.06) per ton, and, therefore, there would have been a saving of £17,000 (\$82,620).

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., October 23, 1917.

RATE CASE TO BE REOPENED

The Interstate Commerce Commission, which has sometimes been accused of too great deliberation in acting on railroads' requests for increased rates, sprung a complete surprise on the railroads on Monday by showing a burst of war-time speed and announcing the reopening of the 15 per cent advance rate case, so far as the carriers in the eastern district are concerned, at a hearing on November 5 in Washington. The commission said that if the carriers' suggestion is well grounded that further financial relief is needed, it is obvious that such relief should be had promptly in order that transportation demands in time of war may be fully met. Coming within a week after the traffic executives of the eastern roads had appeared before the commission on October 17 to discuss a new proceeding for increased rates, in which the roads announced that it would take them 60 days to prepare their application, the announcement of the commission was a complete surprise. In fact, it is believed to represent the first case on record, at least of such importance, in which the commission has expressed a willingness to proceed more speedily than even the carriers had suggested, although it had set a new precedent by the expeditious way in which it handled the original 15 per cent case.

Although a suggestion that the matter be handled as a reopening of the 15 per cent case was made at the conference on October 17, George Stuart Patterson and the other representatives of the eastern carriers seemed to think that method out of the question and said that they would prefer to wind up the proceedings in the 15 per cent case and begin an entirely new proceeding with a view of securing the advances which were not allowed in that case. The reasons given were that the original case had become involved in a technical snarl as many of the proposed advances had not been cancelled as expected and were due to be resuspended on October 28, and as to many of the more important commodities involved, the carriers had filed new tariffs which had been suspended and set down for hearings in separate cases. These included the proposed increases on grain and grain products, live stock and fresh meats and petroleum and its products. Last week's conference was concluded with the understanding that George F. Randolph, commissioner for the lines in Official Classification territory would send the commission a formal letter stating the carriers' proposals concretely and that the commission would then give its answer. Without waiting for such a letter, the commission addressed to Mr. Patterson on October 22 and gave out to the press during the evening a letter by Secretary McGinty, saying that he was instructed by the commission to advise that after conference the commission is of the opinion that the carriers in the eastern district represented at the informal conference held on October 17 "are in error in suggesting what is virtually and for most practical purposes a continuance for at least 60 days of the 15 per cent case."

"The 15 per cent case is still open," the letter declared, "and before the commission. If your suggestion is well grounded that further financial relief is needed by the carriers. It is obvious that such relief should be had promptly in order that transportation demands in time of war may be fully met."

The letter continued:

"In its report of June 27 the commission referred at some length to war conditions. The commission reached the conclusion that only part of the requested increase should be then awarded, stating that the things which the carriers believed would happen have not happened. But the commission added, p. 325:

None of us know what the future may develop, . . . if it shall develop that the fears which have prompted the carriers are realized, or that their realization is imminent, we shall be ready to meet that situation by such modification or amplification of the conclusions and orders herein reached and entered, as are shown to be justified.

"The gist of your suggestion of October 17 is that the situation above referred to has now arisen; it is suggested that operating revenues do not now adequately overcome mounting costs. If this be so, the commission's stated purpose of meeting that situation will not have been attained by adopting your suggestion of a hearing 60 or 90 days hence. The commission is emphatically of the opinion that the evidence necessary to establish the full truth should be presented, without delay, in order that the carriers may be maintained in a position to do their full war duty.

"The record submitted in June indicated that the condition of the carriers in New England was less favorable than in any other section of the country. The commission is impressed with the desirability of being promptly advised as to their present situation, particularly as regards their ability to meet the increased cost of railway fuel.

"Since the outbreak of the war carriers and shippers alike have with praiseworthy alacrity co-operated to improve the efficiency of our transportation system. The results have been marked; but there is room for still further elimination of waste and increase of efficiency. On the other hand, there have been many misleading statements and publications with respect to the financial condition of the carriers, particularly in the eastern district. The exact situation should, in our opinion, be at once disclosed before the commission and to the public.

"The commission will therefore set down for further hearing the *Fifteen Per Cent Case*, so far as carriers in the eastern district are concerned, on November 5 at 10 o'clock in Washington, D. C.

"Other parties to this proceeding are being advised accordingly."

The commission on Tuesday issued an order further suspending until April 28, 1918, such rate schedules filed in connection with the 15 per cent case, as the roads were expected to cancel as a result of the decision in that case but which they had failed to cancel. The order applies only to those which shall not have been canceled on or before October 27.

TRANSPORTATION CO-OPERATION

The co-operative method of settling various transportation problems, which is prevailing to such an unusual extent in Washington nowadays, is well illustrated by the plan which was followed in the case of the order issued by the Fuel Administration prescribing a plan for apportioning a certain proportion of the coal mined on the Pennsylvania for its use for railroad fuel, and the similar order which has been issued for the Baltimore & Ohio. Although the order was that of the Fuel Administration it was actually drawn up by and represented the composite experience and knowledge of representatives also of the Interstate Commerce Commission, the Car Service Commission of the Railroads' War Board, the director of priority of transportation and the coal operators; and it also had behind it the authority of the various governmental agencies who participated.

There has been much discussion about the great centralization of arbitrary authority at Washington since the war began and some fears have been expressed that some of the agencies upon whom great power has been conferred would exercise it without taking all necessary conditions into consideration. Judge Lovett was given very broad authority under the priority of shipments act, which some people thought ought to have been conferred upon the Interstate Commerce Commission. The commission was given very broad powers over the distribution of freight cars under the Esch-Pomerene bill, which many thought would restrict the

operations of the Commission on Car Service, which itself was having rather a free hand; and the food and fuel administrations under the Lever law were given almost unlimited authority in certain directions. But, as the working plans of these various bodies have been worked out a plan has been developed, at least so far as transportation matters are concerned, by which none of these bodies has sought to act entirely by itself but an informal co-ordinating committee has been formed by which each makes use of the machinery, experience or knowledge of the other organizations; and experienced transportation men are attached to all of them.

The Interstate Commerce Commission has not issued any orders under the car service law, but it has placed at the head of its Division of Car Service a practical railroad man, E. H. De Groot, Jr., and one of its own ablest examiners, A. G. Guthrie, who has had a considerable experience in car service matters, and these men sit in the meetings of the Commission on Car Service and co-operate with it in various ways. Instead of developing a duplicate organization of its own the commission makes use of the machinery of the railroad organization, and as a result most of the directions of the railroad committee carry the support of the commission's authority. Where transportation of food is concerned Edward Chambers, head of the transportation division of the Food Administration, takes part in the work, and in connection with coal transportation, F. C. Baird, who is connected with the Fuel Administration, is called in. G. W. Kirtley, assistant to Judge Lovett, represents the authority conferred by the priority of shipments law.

There has been some confusion caused by the number of agencies which are engaged in trying to find cars for the hauling of important shipments of various kinds, but in fact most of the requests, no matter to whom addressed, shortly find their way by one channel or another to the Commission on Car Service, which knows where the cars are and how to get them moved.

As a result of this plan of co-operation action may be guided by more information than if each organization acted independently. Numerous appeals for priority orders are made based on fears for the future rather than on actual need. For example, the mayor of a large city recently wired a United States Senator stating that the street railway company in his city had only a three days' supply of coal on hand and urging that the senator arrange for a priority order. The company also appealed to the Commission on Car Service, which had its sub-committee in the city referred to investigate the situation. An actual check showed an 8-day supply of coal at each of two plants and 10 days' supply at each of three others and 60 cars of coal in transit, equal to six days' additional supply.

COAL PRODUCTION AND DISTRIBUTION

The United States Geological Survey in its weekly report on coal production shows a slight increase in bituminous production during the week ending October 13, amounting to .7 per cent over the week of October 6. The total output, including lignite and coal coked, is estimated at 10,702,701 net tons. The average production per working day was 1,783,783 net tons, an amount but little in excess of the daily production at this season last year. Anthracite shipments increased from 42,362 cars to 42,824 cars. The principal factor limiting production, according to the statement, continues to be the shortage of cars. In the week ending October 6 losses from this cause, while smaller by about 2 per cent than during the preceding week, were 10.4 per cent of the full time capacity. The car situation improved noticeably in Indiana and to a lesser degree in Ohio, in both of which states losses from this cause have been severe. Little change was reported in Pennsylvania and West Virginia. The ratio of tonnage produced to full time

capacity with the labor forces at present available was 71.9 per cent for all mines reporting. A decline in the index for Illinois attributed to labor troubles offset the improvement registered by Indiana and Ohio.

The Fuel Administration is giving immediate consideration to the problem of distribution of coal. The program as announced is briefly as follows:

"1. To provide an adequate and regular supply of fuel to the railroads, which is indicated by the order issued in connection with fuel supply of the Pennsylvania Railroad, which has been extended to include the Baltimore & Ohio, and will shortly be applied to other roads, as obviously the railroads cannot be expected to move the enormous amount of freights which they must handle, unless they are provided with sufficient fuel with which to do so, and it is in the interest of the conservation of equipment that this supply be obtained regularly from mines in close proximity to where the coal must be used. This will avoid the necessity as is now the practice, of holding several thousand cars of coal under load, for fuel purposes. It will also eliminate the necessity of transporting coal from one district to another, which will result in a saving of both cars and motive power, of which the railroads are short. It will further avoid confiscation of coal, which has been necessary in some instances in order to provide the railroads with sufficient fuel.

"2. When the adequate and regular supply of fuel had been accomplished, we expect to issue a rule confining coal cars to the coal trade, with such exceptions as are proven necessary, and to compel the return of empty coal cars to the originating line.

"3. The matter of preference in movement of coal cars, both loaded and empty, over other slow freight is receiving consideration, and it will undoubtedly be necessary to issue a rule at an early date, that preference be given to food and fuel. The situation today is the railroads are congested, and are unable to move to the market the coal which is offered them for transportation. This is due to the enormous amount of freight which they are called on to handle. We believe the program thus briefly outlined, when put into effect, will result in an increased car supply to the mine, and will accomplish an increased production sufficient for necessary requirement."

The Fuel Administration will announce within a few days its regulations limiting coal exports to Canada. Control of shipments will be exercised through the issuance by the Fuel Administration of special permits to shippers, who will be allowed to forward cargoes up to the amounts prescribed by the Fuel Administration without obtaining special export licenses. The plan is to hold Canada, during the rest of the year, to supplies not exceeding 10 per cent more coal than was received last year. This arrangement is based on a 10 per cent increase in production in the United States this year and permits the Dominion to share equally with the states of the union. Permits for shipment will be granted only to shippers who sent coal to Canada last year.

INCREASED RATE PROCEDURE

The Interstate Commerce Commission up to October 22 had issued 44 fifteenth section orders, giving approval, without formal hearing, of the filing of tariffs containing increased rates. Over 1,100 such applications have been made by the railroads, but pending the determination of the procedure to be followed the commission has issued approval orders in cases of minor importance, a majority of which are for the purpose of correcting errors in tariffs on file. Order No. 41 approves the filing on five days' notice of tariffs of the Pennsylvania and the Buffalo & Susquehanna increasing rates on iron and steel articles between certain points in Trunk Line territory to make them the same as

rates in effect via other routes. The commission is expected soon to issue its general order establishing the procedure under the fifteenth section as amended, there having been practically no opposition to its tentative order at the hearing last week.

ECONOMIC VALUE TO GOVERN SELECTIVE DRAFT

Provost Marshal General Crowder has announced a change in the machinery of the selective draft by which railroad employees and other men required for important industries need not be called for military service until after others whose economic value in their present occupations is considered of less importance.

For this purpose a series of questions will be addressed to those registered from which information will be obtained to enable the local boards to divide the men into five classes, based on the status as to dependents and the occupation. These classifications will determine the order in which men will be drawn for service and the physical examination will not be made except for the men who are called.

Skilled industrial and agricultural laborers are placed in class 2.

MASTER PAINTERS' CONVENTION

The proceedings of the first day of the Maintenance of Way Master Painters' Convention, which was held at the Hollenden Hotel, Cleveland, October 16 to 18 inclusive, were reported in last week's issue. On Wednesday, Bert E. Darrow, master painter, Atchison, Topeka & Santa Fe, Kansas City, Mo., presented the report of the committee on "Painting of Water Tanks." This was devoted largely to an outline of safe practices in the use of scaffolds, ladders, lines, etc., employed to gain access to the sides of the tub. The discussion of this report brought out interesting information concerning the practices on various roads.

W. S. Lacher, associate engineering editor, *Railway Age Gazette*, Chicago, spoke on the lack of reliable information concerning the amount of painting done by the railroads, particularly in the maintenance of way department, and that in consequence little information was at hand concerning the importance of the work done under the direction of the maintenance of way master painters. He presented some figures indicating the approximate amount of paint used by the railroads in maintenance work, and urged the gathering of more accurate data from which more reliable conclusions could be drawn. Following a discussion of this matter, the president was authorized to appoint a committee to investigate the subject.

An interesting discussion was held on the practice of painting lines along station platforms to indicate the safe limit for passengers to stand when trains are entering the station. The question arose as to the most suitable color, and after some discussion the convention adopted a resolution recommending the painting of a white line on all station platforms as a measure of safety to the public.

On Thursday morning, H. S. Bird, master painter, Philadelphia & Reading, Philadelphia, Pa., presented a committee report on the painting of bridges, which covered the materials and workmanship, and special measures to secure economy and insure the safety of the men employed. H. B. Wilson, master painter of the Bessemer & Lake Erie, Greenville, Pa., read a paper on the finishing of floors, and H. F. Jones read a paper on recommended practices for the master painter designed to secure the greatest efficiency and economy in his work, while insuring the safety of the painters and the public as well as other employees of the railroad.

Metal protection was the subject of a paper read by Philip L. Maury, Sherwin-Williams Co., Cleveland, Ohio. This comprised an outline of the requirements of an efficient metal

covering with a discussion of the behavior of various materials in serving this purpose. Special reference was made to the present paint situation, illustrated by the manner in which the paint experts on the Council of National Defense, have recommended modification of government paint specifications with the effect of conserving valuable materials and greatly reducing the cost of the painting.

This was followed by the discussion of questions submitted during the course of the convention by various members, answers being given by members of a committee. W. S. Lacher gave an outline of the principles of the bonus system with special reference to its application to railroad work, particularly track maintenance. H. E. Conrad, master painter, Pennsylvania Railroad, Huntingdon, Pa., stated that the bonus system had recently been applied to track work on the Pennsylvania and that he was now at work on time studies, designed to apply it to painting. Another subject discussed was the protection of steel decks on track scales, in the course of which H. F. Jones stated that he had secured the best results by three coats of red lead, covered with a coat of graphite, the last two coats being sanded. This proved expensive, but gave very good results. The painting of concrete mile posts and other roadway signs was discussed, and the conclusion was reached that there was no difficulty if the concrete was thoroughly cured before the paint was applied. The scarcity of flax seed for the manufacture of linseed oil led to considerable discussion, some members being of the opinion that the industry would adjust itself to the new conditions, while others believed that the situation was serious. Attention was directed to the need of employing great care in the use of any substitute or adulterated oils.

Election of officers resulted in the following selections: President, H. E. Conrad, master painter, Pennsylvania Railroad, Huntingdon, Pa.; first vice-president, H. F. Jones, Cleveland, Cincinnati, Chicago & St. Louis, Wabash, Ind.; second vice-president Ole Stubstad, master painter, Chicago & North Western, Winona, Minn.; secretary-treasurer, F. W. Hager, Ft. Worth & Denver, Ft. Worth, Tex. Chicago was selected as the place for the next meeting, which will be held October 15 to 17, 1918.

The convention was characterized by active interest in all of the discussions and a good attendance at all the sessions. Practically no time was given to social features. Wednesday and Thursday afternoons were occupied largely by visits to the plants of various paint and varnish manufacturers in Cleveland.

BARB BIG PARCELS TO FRANCE.—Christmas and other gifts for American soldiers in France must be restricted to parcels of not more than seven pounds each. The Post Office Department has announced that it had been informed by the American postal authorities in France that, under the arrangements with the French railways, the French postal service is unable to carry in the parcel post packages in excess of seven pounds.

THE CANAL DU NORD.—The Canal du Nord, the greater part of which is now behind our lines, has a double interest for British readers. With our neglected waterways, says a writer in the *Manchester Guardian*, we can hardly imagine a canal so overburdened with traffic that it can carry no more, and yet this was the case before the war with the water route from Paris to the Lille district. It represents the "very latest" in French canal engineering, and is 70 ft. wide and 8 ft. deep, and has 19 locks with an average lift of 20 ft.—more than 5 ft. greater than any ordinary canal lock in England, and 3 ft. 6 in. more than Latchford, the deepest on the Manchester Ship Canal. The canal, when completed, would have cost nearly £3,000,000 (\$14,580,000) and electric towage was to have been adopted.

Carrying the Selected Men to Camp Devens

The Boston & Maine Has Made the Most of Having
All Necessary Railroad Facilities Already at Hand

ABOUT two weeks have now passed since the completion of the movement of the second contingent of 40 per cent to Camp Devens at Ayer, Mass. On October 8 there were at that cantonment about 36,700 men in training for the new National Army, this representing 85 per cent of the total quota that was intended for the camp. The remaining 15 per cent will be called later this month, although there is some possibility that these men, the last contingent, may be sent, instead, directly to join a depot brigade of the National Guard now forming and in training at Westfield and Framingham, Mass.

The army officers who chose the site for Camp Devens apparently succeeded in picking almost the ideal spot in all New England from the standpoint of healthfulness and sanitation for the cantonment that will hold the 76th divi-

always been an important junction point for both passengers and freight so that when the army officers chose that town for the site of the cantonment they found a comparatively large passenger station, a 2,500-car freight yard, a strategically located wye at the station and the junction of the two divisions, engine houses and attendant railroad facilities. The railroad has had to enlarge its freight yard to a capacity of 3,500 cars, to construct a certain amount of additional trackage to serve the ten government store-houses and to meet the contractors' requirements, and also to make some additions to its passenger station and construct two new interlocking plants, but that has been about all. There has had to be no substantial increase in either the forces at the passenger station or in the freight yard, although this does not necessarily mean that the present

The Crowd that Gave Boston's First 40 Per Cent Its Send Off from North Station

sion of our new National Army. Railway men are agreed that although the camp may not be in the geographical center of the district from which the men at the camp have been drawn, it is at the center of population of New England and at the most strategic point of its network of railway lines.

The movement of troops to Camp Devens and the work of transporting material and supplies to that camp have been peculiar in that the Boston & Maine, on the line of which the camp is situated, has had to construct practically no new facilities or to get together any considerable force of men to handle the camp's freight and passenger traffic. Camp Devens is at Ayer, Mass., on the main line of the Fitchburg division of the Boston & Maine, 35 miles out of Boston and at the junction of the Worcester, Nashua & Portland division at a point 28 miles north of Worcester and not quite 20 miles south of Nashua, N. H. Ayer has

force has not had to do much hustling to keep up with the demands made upon it.

The site for Camp Devens covers an area of about 10,000 acres. It lies immediately south of the main line of the Fitchburg division and west of the W. N. & P. division. These two lines cross at right angles directly at Ayer station about one-half mile east of the camp and the freight yard is adjacent to the W. N. & P. division directly south of the station and east of the camp. Railroad operation at some of the other cantonments has been hindered rather than helped by the necessity for using a wye to turn engines and trains. At Ayer, as will be shown below, the wye is the facility that has helped railroad operation almost more than any other one thing.

The men from Camp Devens have been assembled from the New England states and from northern New York state about as follows: Maine, 1,550; New Hampshire,

1,020; Massachusetts, 17,500; Connecticut, 9,330; Rhode Island, 1,530; New York, 5,100. The rapid progress made by the contractors at Camp Devens enabled that cantonment to be one of the few in the whole 16 to receive its quotas of 5, 40 and 40 per cent respectively on schedule time. The railroads in figuring out their schedules for handling these contingents arranged it so that the two movements of 40 per cent would each be spread over five days and this schedule was lived up to exactly. In the first movement of 40 per cent, the various states contributed their men on the following basis: On the first day, September 19, there were received at the cantonment the men from Maine, New Hampshire, Vermont and Rhode Island; on the second day, those from Connecticut; the third day, those from eastern Massachusetts, excluding Boston; on the fourth day, those from northern New York, and on the last day those from western Massachusetts and from Boston.

The illustration shows the crowd which gave the selected men from Boston their send-off from North Station. As it happened, the fifth day when the men from the Boston district left their homes was a Sunday, a great number of people from the Metropolitan district of Boston came to the railroad terminal to give the men a last good-bye with the result that a congestion resulted in the station and in the streets outside such as had not been seen in either the city or the station for many a day. In fact, so great was the congestion that men from a number of the local boards could not get to their trains at all. The trains went out without them, and they followed on a special made up for their special benefit later in the day. This condition was entirely corrected in the movement of the second 40 per cent, the Boston men moving on a Friday instead of on a Sunday. Boston called out one of the largest details of police it had called out for a long time and admittance to the station platform without a ticket would almost have required a permit from the mayor.

When the second movement began on October 3, the railroads carried as before the men from Maine, New Hampshire, Vermont and Rhode Island on the first day, those from Connecticut on the second day and those from Boston and eastern Massachusetts on the third day. On the fourth day, the second contingent of men from New York arrived, and on the last day, Sunday, October 7, the entire troop movement was completed with the arrival of the men from western Massachusetts.

It has been noted that the Boston & Maine was exceedingly fortunate in having all the necessary facilities already on hand. This preparedness, unintentional as it was, has had a more than compensating effect on the ease of operation which has characterized the railroads' work in connection with the movement of troops to Camp Devens.

As was the case at other cantonments, the policy was followed of running cars on regular trains when there were not sufficient cars from a particular region to make up a fair-sized train. In a case where such cars were handled, they were very often brought through over the Fitchburg division in regular trains, and the men left the cars at Ayer station and marched over to their new barracks. New England is so thickly populated, however, that most of the men came through on special trains. As showing how prepared the Boston & Maine was to handle these trains, it is worth while observing how they were received on a typical day. October 4 was the day on which the camp received its second quota of 40 per cent from Connecticut. These trains came through with from 10 to 13 cars and from 350 to 850 men over the New Haven to Worcester. At Worcester they were taken by a Boston & Maine engine and crew and then covered the ground between Worcester and the camp in about 50 minutes. They unloaded their men on one of the tracks on the main line directly at the crossing of one of the roads leading into the camp itself. The train was then run to Ayer station one mile beyond, around the wye, headed out again and the

movement back to Worcester completed without uncoupling a car or turning an engine. In all cases so quickly was this movement handled that the cars were on the Boston & Maine's line from the time they left Worcester until they returned, not more than 2 or 2½ hours. The entire movement of about 4,400 men required seven trains, all of which arrived at Camp Devens between 1:45 and 6:30 p. m. Not a single train was late, and in most cases the trains arrived from one minute to one-half hour ahead of their schedules.

On another day, the Sunday the troops were carried from Boston and western Massachusetts, 11 trains brought in 7,000 men. On the same day, the yard at Ayer handled 1,800 cars in interchange between divisions, and yet with all this traffic only two extra men were required at the freight and passenger stations, one a flagman and one a switchman. Practically every train came through on time, although the schedule for the specials out of Boston was as good as that of the regular trains which run through without a stop. And what was most important, there was not a minute's delay caused to a freight or passenger train.

Trains from points on the New Haven and Boston & Albany were delivered at Worcester, or Concord Junction. Those from Boston were handled similarly to those from Worcester as mentioned above, that is, they unloaded their men at a siding on the Fitchburg division directly beside the camp, about one mile west of Ayer station, then they were backed around the wye, and, if desired, could be headed out towards Boston, where the cars were cleaned and otherwise disposed of.

One of the most interesting features of the entire job of carrying the selected men was the car supply. Many of the men traveling from points on the Boston & Maine came through in solid vestibule trains, while of those from points on the New Haven were furnished with electrically lighted passenger cars considerably better than is supplied on many of the road's suburban runs. The drafted men in most cases respected this kind of treatment. The condition of the cars was checked up by army and railroad officers directly on its arrival, but there were very few cases where they were at all damaged. This does not mean, of course, that the cars were as clean as they might have been at the end of a normal run. But the car cleaners did not find it hard to sweep out even an enormous pile of magazines, newspapers and empty or partly filled lunch boxes.

In few cases did the run to Camp Devens require much over three or four hours. On longer runs lunch boxes were put on the cars for the men at so-called "dining stations." Of course, as at the other camps, a few of the men took advantage of their opportunity before leaving home to get their last drink and a number of them had to be lifted or helped off the train at the camp, but in no case was there serious disorder. In fact, the train crews that were assigned to these trains were enthusiastic and very much interested in the work they were called upon to do.

The passenger movement to Camp Devens will not, of course, end with the movements of the National Army men to the cantonment. Announcement was made about a couple of weeks ago of the change in the army's plans whereby the drafted negroes will be sent to cantonments throughout the country instead of the cantonments in the southern states, and whereby three National Guard and only one National Army divisions will be formed of white men in the south instead of three divisions each as originally planned. This means among other things that the white men now in the National Army at Camps Gordon (Atlanta, Ga.), Camp Jackson (Columbia, S. C.) and Camp Pike (Little Rock, Ark.) will be taken as far as necessary to fill up the 30th (Camp Sevier, S. C.), 31st (Camp Wheeler, Ga.) and 39th (Camp Beauregard, La.) National Guard divisions, and that the surplus will be sent to the Southern's single National Army division to be formed at Camp Jackson, Columbia, S. C.

Camp Pike will then be filled with surplus men from cantonments in the west and the men at Camp Gordon will be replaced with surplus men from Camps Devens, Upton, Dix, Meade and Lee, all in the east. Camp Devens will be called upon to supply about 8,000 men from its present number, and before long steps will have to be taken by the railroads to provide for their transportation.

But what is more important from the railroads' point of view at the present moment is the fact that Camp Devens has apparently become a Mecca for all New England. One would believe that half the soldiers at the camp had visitors on Sundays, and that those having no visitors took the trip into Boston or to other adjacent towns to see their relatives instead. The road is establishing a special service to Lawrence, Lowell and Worcester and has added a number of express trains between Ayer and Boston. There has been some difficulty in handling this special service because on one or two occasions the army officers have not cooperated sufficiently with the railroad officers as to advising them as to how many men would be on leave. But even that is remedied now.

FREIGHT SERVICE

The advantage of having a classification yard at Camp Devens has in one respect been a disadvantage. At other camps the trains of government or contractors' supplies reach the camp in solid train loads, but at Ayer they come through mixed in with other cars and have to be classified. For a period of two months the road was handling in this way from 35 to 80 cars a day. These cars were classified and handed over to the contractor, or the government, and it is on record that the detention of cars at the camp has seldom been over two days; and the greater part of the cars have been unloaded in a matter of about three hours. Up to September 1, the contractor at the camp had finished 622 barracks and 124 other buildings. For this purpose the railroad had handled 30,000,000 feet of lumber, 20 miles of water pipe, 2 miles of sewer pipe, 60 miles of heating pipe from 12 in. diameter down, a tremendous amount of contractor's equipment, and food and incidental supplies for the workmen. The maximum number of men employed by the contractor on any one day was 9,176, on August 22; and the average number was over 5,000. To feed these employees, the contractor's commissary had to receive supplies enough for an average of 17,100 meals daily. From June 26 to September 1 the contractor alone unloaded 3,000 carloads of freight, an average of 50 cars a day. On one day he unloaded 125 cars. The movement of freight to the camp, of course, still continues, but not quite to the same extent as when the cantonment buildings were under construction.

ENGLAND'S SMALLEST PASSENGER RAILWAY.—According to the Nottingham Guardian, the smallest passenger-carrying railway in England is to be found on the estate of S. P. Derbyshire, at Ilkeston. The gage of the roadbed is only 7 in. The engine, a perfect model of the Midland Railway 1,000 class, is $3\frac{3}{4}$ h. p. and will haul four adult passengers on its miniature bogie truck.

NIGERIA'S RAILWAY REVENUE.—A publication called "West Africa" states that despite the war Nigeria provided for ordinary needs and spent nearly £1,750,000 (\$8,575,000) on railways during 1916, besides £250,000 (\$1,225,000) on war, thereby incurring a deficit of £124,000 (\$607,600) up to December 31. This, however, was all cleared off by the end of February this year.

CONSTANTINOPLE TERMINAL DESTROYED BY FIRE.—The Swiss Insurance Company "Helvetia" has received a telegram from Constantinople saying that the new railway station and two immense warehouses have been totally destroyed by fire, the damage done being estimated at over four million francs (£160,000 or \$784,000). The station was built by the Germans as the terminus of the Bagdad Railway.

INSTRUCTIONS FOR APPLYING WAR TAX

The Association of American Railway Accounting Officers, through a sub-committee headed by A. H. Plant, comptroller of the Southern, has issued a circular giving tentative instructions as to the application of the new war tax to the transportation of property and persons.

An informal conference was held by the subcommittee and others with representatives of the internal revenue commissioner. tentative instructions, as drawn by an accounting officer of one of the lines, being used as a base for the conference. The representatives of the internal revenue department stated that the conclusions reached by them with respect to doubtful questions were tentative and that such tentative conclusions would be subject to formal approval by the Secretary of the Treasury but that, while the conclusions reached might not be final in all respects, they could be used, in the absence of further rulings or decisions, as a working basis.

Should individual or specific transactions arise, not covered in the conclusions, accounting or other officers interested should apply to the internal revenue commissioner, Washington, D. C., for rulings.

If the corporate committee of the association so elects, the chairman will arrange, through the secretary of the association, to reissue and distribute to the members of the association all treasury decisions which may be issued in response to queries made.

The tentative instructions, referred to, are in part as follows:

(1) Section 500 of the law provides that transportation companies shall levy, assess, collect and pay to the United States government, certain taxes for the use of facilities rendered by public utilities.

(2) The taxes imposed under section 500 become effective on November 1, 1917.

(3) Section 501 provides that:—"The taxes imposed by section five hundred shall be paid by the person, corporation, partnership, or association paying for the services or facilities rendered."

(4) The taxes imposed under section 500 of the law in which officers, agents, and conductors of these companies are directly and immediately interested, and which these instructions are intended to cover are:

(a) A tax of 3 per cent of amounts paid for the transportation of property by freight. (See paragraph 5.)

(b) A tax of 1 cent for each 20 cents or fraction thereof, paid for transportation of parcels by express.

(c) A tax of 8 per cent of the amount paid for the transportation of persons (see paragraph 7); and a tax of 10 per cent of the amount paid for seats, berths and staterooms in parlor cars, sleeping cars or on vessels.

(d) A tax of 5 cents upon each telegraph, telephone or radio, despatch, message or conversation for which a charge of 15 cents or more is made.

(e) A stamp tax on each passage ticket sold on or after December 1, 1917, by any vessel to a port or place not in the United States, Canada or Mexico.

(5) The tax of 3 per cent imposed under section 500 applies on amounts paid for the transportation of property by freight either rail or water or both, or by any form of mechanical motor power when in competition with carriers by rail or water, consigned from one point in the United States to another. It also applies on amounts paid for the transportation of milk and cream. (See Schedule A.)

(6) The tax of 1 cent for each 20 cents or fraction thereof paid for the transportation of parcels by express from one point in the United States to another, applies to excess baggage, bicycles, baby-carriages, dogs, etc., transported on passenger trains as well as to express.

(7) The tax of 8 per cent imposed by section 500 applies on amounts paid (in excess of prescribed minima) for the transportation of persons by rail or water, or both, or by any form of mechanical motor power on a regular established line when in competition with carriers by rail or water, from one point in the United States to another

point in the United States, or to any point in Canada or Mexico.

(8) Taxes imposed under section 500 must be paid in cash, or by check if the collecting officer, agent or conductor be authorized by the treasurer to accept checks in payment for transportation. Those imposed under paragraph 10 of Schedule A—Stamp Taxes, must be paid for in adhesive internal revenue stamps.

(9) The responsibility for levying, assessing, and collecting the taxes imposed under the act rests upon the officers, agents, conductors, or other employees of these companies whose duties are to collect revenues for the transportation of property or persons. It will also be the duty of such officers, agents, conductors, and other persons who collect such taxes to record and to make reports and returns of and for such collections to the appropriate accounting officer of their respective companies in the manner herein-after described or which may hereafter be required.

All such taxes so collected must be remitted with other company funds as required by the rules and regulations of the respective treasury officials of those companies having jurisdiction. Separate remittance or deposit reports or tickets for taxes deposited or remitted by officers or agents of these companies will not be required.

(10) The law specifically provides, in respect to transportation, that the tax shall be imposed upon amounts paid for the transportation of property by freight and for the transportation of persons.

The base of the taxes imposed under section 500 of the act are specified per cents (except in the case of telegraph and telephone tolls, and amounts paid for "parcels by express" as defined in Schedule B), of the amounts paid, above certain minima, for services rendered by public utilities; therefore intermediate or terminal costs for services rendered by public utilities, or others, such as costs for bedding, feeding or watering stock, reicing, etc., unless such costs are made a part of and are included in the rate charged for transportation, will not be subject to the tax.

(11) The law is specific as to what payments are taxable. It requires that all taxable collections shall be so recorded as to show whether the tax has or has not been collected when and as such amounts are paid.

It may be assumed the accounts, records and transactions of officers, agents and conductors of these companies will be examined and checked from time to time by representatives of the internal revenue department; you are therefore advised that such records and accounts must be so kept as to enable such examinations to be made; examinations shall be permitted when requested by properly accredited representatives of the internal revenue department.

Section 1004 of the law provides a penalty of not more than \$1,000 for failure to collect, or to truly account for and pay over such taxes.

(12) Section 502 of the act stipulates that the tax shall not be imposed upon any payment received for service rendered the United States, or any state, territory or the District of Columbia.

(13) Transportation costs for private property of officers and agents of the federal and of state governments, when such costs are not borne by such governments, will not be exempt from the tax.

(14) Transportation costs for transportation furnished officers and men for or on account of the British, Canadian or other recruiting missions of foreign governments will not be exempt from the tax, although such transportation be furnished on transportation request forms of the United States government.

The tax applying on amounts paid for such transportation will be billed against and collected from such governments when and as transportation charges are collected; therefore agents shall not demand payment of the tax when transportation is furnished on such orders.

SCHEDULE A—TRANSPORTATION OF PROPERTY BY FREIGHT

(15) The measure of this tax is three (3) per cent of the amount paid for the transportation of property by freight, by rail or water, or by any form of mechanical motor power when in competition with carriers by rail or water, consigned from one point in the United States to another.

(16) The tax of 3 per cent on amounts paid for the transportation of property by freight will accrue and must be levied, assessed and collected when and as freight revenues are collected, except that the tax may and should be computed at the time freight (expense) bills and prepaid shipping tickets or bills of lading are made; the amount of the tax must be shown on the face of each such bill, prepaid ticket, or lading.

(17) The tax must be assessed and collected on "collect" shipments by agents at destinations and on "prepaid" shipments by agents at points of origin; in other words, it must be levied, assessed and collected when and as collections are made from consignees, shippers, their agents or representatives. It must not be assessed or collected by junction agents on freight revenues on freights interchanged with connecting carriers.

(18) This tax of 3 per cent of amounts paid for the transportation of property by freight will apply on all such services wholly rendered after midnight of October 31, 1917, and on all "collect" consignments which start on the journey before November 1, 1917, but which do not reach destinations until after midnight October 31, 1917.

(19) There will be many parcels of property in transit as of midnight October 31, 1917, and agents of these companies must give careful consideration to such, to the end that errors and confusions may be avoided in complying with the law.

(20) The tax will not apply on:—

(a) Freight for which the entire transit service was performed prior to November 1, 1917, regardless of when the transportation costs be paid.

(b) Prepaid consignments received for which bill of lading is issued prior to midnight October 31, 1917.

(21) The tax will apply on all "collect" shipments which reach destinations on or after November 1, 1917.

(22) As to switching and other taxable freight services rendered:

(a) If switching service be performed before midnight October 31, 1917, and the service be paid for on or after November 1, 1917, the tax will not apply.

(b) If the service be paid for prior to November 1, 1917, and the service be not rendered until on or after November 1, 1917, the tax will apply and must be collected.

(c) If unused switching tickets on which collections have been made but for which no service has been performed as of midnight October 31, 1917, be in hands of purchasers, agents shall promptly notify holders thereof that the amounts paid for them will be subject to the tax, and the tax due thereon must be collected and reported.

(23) Agents must promptly on the morning of November 1, or sooner if practicable, carefully examine all freight bills and prepaid shipping tickets on hand and make such notations on them as will enable a quick and correct application of the tax thereto.

(24) If under credit arrangements two or more bills be due by one person, firm, or corporation such bills must be listed, on collection statements and the tax must be applied to each individual consignment shown on such statement. Such statements may include both "collect" and "prepaid" items; but freight and passenger items shall not be included in the same statement.

(25) Statements referred to in the preceding paragraph (24) must be carefully recorded on the station records in such manner as may be prescribed and they shall be preserved.

(26) If credit accounts, either freight or passenger, be relief remitted to, and collections be made through the audit office, agents making such relief remittances need not, except in specific cases which may be otherwise provided for,

assess the tax thereon; such assessments must be made in the audit office and collections shall be made through that channel.

(27) **Company Material:** The tax will not apply on these companies' proportion of transportation charges on company materials and supplies or on any commodity which is necessary for the use of these companies in the conduct of their business as such and is intended to be so used or has been so used.

Junction agents of these companies in paying foreign lines for transportation charges on company material, shall not pay the tax thereon to such foreign lines, as such tax will be assessed and paid by the company in relieving destination agents of such charges.

(28) **Western Union Telegraph Company Material:** Property transported as "free" under the Western Union Telegraph contract will not be subject to the tax.

(29) **Property transported by the Southern Express Company free under contract:** Packages transported as "free" under the contracts between Southern Express Company and these companies, will not be subject to the tax.

(30) The tax of 3 per cent applies on amounts paid for the transportation of property by freight "when consigned from one point in the United States to another."

It does not apply on shipments consigned to points in Canada or Mexico, neither does it apply to shipments consigned to foreign ports or places. If, however, a shipment intended for export be consigned to a port agent and it move to the port on a port lading, the transportation costs on it will be subject to the tax.

(31) **Miscellaneous Services—Property:**

The tax will not apply on miscellaneous services rendered when the charge therefor forms a part of and is included in the through rate charged for the road haul; such as

Switching and drayage, refrigeration, not on car service, demurrage, etc.

If, however, a charge be made for switching or drayage, wharfage, towage and lighterage, in addition to the through rate, the tax will apply on amounts paid therefor.

(32) **Switching:** Amounts paid for switching cars locally, that is, from one yard to another or from one industry to another, will be subject to the tax of 3 per cent, provided such amounts be not included in the through rate of a transportation charge made for a road haul.

(33) **Switching Absorber:** Amounts paid by one carrier to another for switching service rendered in effecting competitive deliveries will not be subject to the tax provided the amount charged for such switching be included in the rate charged for the road haul.

(34) **Reconsign Freight:** If a shipment consigned for delivery at one destination be ordered shipped to another destination with "charges to follow" tax must not be assessed or collected by the agent at the first or original destination. The agent at final destination must levy, assess and collect tax upon the total revenue, original starting point to final destination.

Transit Privileges—(35) It has been tentatively held, subject to the approval of the Secretary of the Treasury, that the measure of tax on amounts paid for transporting property stopped en route for in transit privileges shall be 3 per cent of the amount paid for the transportation of the finished product, starting point of the raw material to final destination of the milled or finished product, and that such tax shall be paid as and when such transportation charges are paid, provided, however, that amounts paid for transportation costs on such raw products points of origin to milling, dressing, cleaning, or refining points which may not be shipped from such intermediate points, shall be subject to the tax.

The application of the tax to in transit transactions presents intricate and complicated problems which will require

close and careful consideration by agents at points where the in transit privileges are granted, and also by the freight claim officers whose duty it is to adjust transportation costs on such shipments.

Milk and Cream—(47) It has been held that amounts paid for milk and cream transported on passenger trains will be subject to the tax, and that the tax rate on amounts paid therefor, shall be 3 per cent of the amount paid.

Milk tickets sold prior to November 1, 1917, and not used before that date, will be subject to the tax, and the tax must be collected thereon from the persons to whom the tickets were sold, before such tickets can be used for transportation.

SCHEDULE B—EXPRESS

(48) **Tax on Amounts Paid on Express Matter:** The act provides that the tax rate on express revenues shall be 1 cent for each 20 cents, or fraction thereof, paid for the transportation of any package, parcel or shipment by express from one point in the United States to another.

Agents and employees of these companies who also act for express companies must obtain instructions from the appropriate officer of such companies as to the collection of the tax on shipments by express.

Excess Baggage—(49) It has been held that amounts paid for excess baggage will be subject to the tax. The rate to be charged therefor will be the rate applied to amounts paid for shipments made by express,—that is 1 cent for each 20 cents or fraction thereof, paid for the transportation of excess baggage. That is to say if 20 cents or less be collected for excess baggage, the tax will be 1 cent, which must be collected; if the amount paid for excess baggage be more than 20 cents but less than 41 cents, the tax will be 2 cents, which must be collected, and so on.

Agents in selling excess baggage books must collect the full amount of tax on the amount paid therefor.

SCHEDULE C—TRANSPORTATION OF PERSONS AND SEATS, BERTHS, AND STATEROOMS

(50) The measure of this tax is 8 per cent of the amount paid for transportation furnished persons.

(51) It applies on amounts paid for all forms of transportation of persons sold and on all cash fares collected on and after November 1, 1917, for journeys originating in the United States destined to points in the United States, Canada or Mexico; except that: amounts paid for tickets or cash fares for continuous journeys costing 35 cents or less, and amounts paid for commutation or season tickets for trips less than 30 miles will not be subject to the tax.

(52) The tax must be levied, assessed, and collected by the officer, agent, conductor or other representative of these companies, who sells the ticket or collects the fare; it must be collected at the time collection is made for a ticket sold and at the time a cash fare is paid.

(53) In selling mileage, commutation and season books or tickets, assess and collect the tax on the total cost of the book or ticket sold.

(54) If a lump sum be paid for a train or a car for the purpose of transporting persons, the tax of 8 per cent shall be levied and collected on the gross amount paid for such train or car.

(55) If the charge for a chartered or special train for the purpose of transporting persons be a per capita rate and if the rate be 30 cents or more, the tax must be assessed and collected on each ticket sold or cash fare collected. If the charge be on a per capita basis with a guaranteed minimum, and the per capita collections be less than the minimum, the tax shall be assessed and collected on the minimum.

(56) Section 500 of the act takes effect November 1, 1917; there will be many persons in transit on tickets sold

prior to that date. The law makes the following provision for such cases:

"If a ticket (other than a mileage book) is bought and partially used before this section goes into effect [November 1, 1917], it shall not be taxed, but if it be bought but not used before this Section takes effect, it shall not be valid for passage until the tax has been paid and such payment evidenced on the ticket in such manner as the commissioner of internal revenue may, by regulation, prescribe."

(57) Under the provision recited in paragraph 56 preceding, conductors will demand the payment of taxes on any ticket (mileage books excepted), dated prior to November 1, 1917, which may be presented for passage after that date, unless such ticket and the conditions under which it is presented show conclusively that the ticket has been previously used for any part of the journey.

(62) Amounts paid for staterooms on vessels: If in selling a ticket for a journey, a part of which is by water, and the amount collected includes the cost of a stateroom, a tax of ten (10) per cent of the cost of the stateroom must be collected in addition to the tax of 8 per cent on the total transportation cost collected. Illustration:—If the transportation cost be \$40 and the cost of the stateroom be \$5 the tax will be 8 per cent on \$40 and 10 per cent on \$5, a total of \$3.70.

(63) Amounts paid for sleeper and parlor car or berths: If the ticket rate for a journey includes the cost of sleeping or parlor accommodation a tax of ten (10) per cent on the cost of such accommodation must be collected in addition to the 8 per cent tax on the transportation cost.

Agents and conductors of these companies must apply and collect the tax on all parlor car seats sold or collected by them in parlor or other cars belonging to or operated by these companies for which a charge is made; the tax upon the receipts from the sale of such accommodations must be accounted for to the appropriate accounting officer of the company to which the parlor car tickets are reported in such manner as he may prescribe.

Agents of these companies who sell Pullman accommodations must be guided by instructions issued by the Pullman Company in the collection and reporting of taxes on such accommodations sold by them.

(64) If a mileage book or any other form of ticket be issued in payment for advertising in lieu for cash, the selling value of such book or ticket will be subject to the tax.

Passage Tickets. (68) Paragraph 10 of Schedule A—Stamp Taxes imposes a tax upon the steamer's proportion of each one way and round trip passage ticket, for each passenger sold or issued in the United States for passage by any vessel to a port or place not in the United States, Canada, or Mexico, provided the cost of such ticket be more than \$10. The taxes on this class of ticket must be paid in adhesive internal revenue stamps to be furnished or paid for by purchasers. Such stamps must be affixed to contract portion of ticket; after being so affixed they must be cancelled by the person using or affixing them, writing or stamping thereon the initials of his or her name, and the date of application.

SCHEDULE D—TELEGRAPH AND TELEPHONE

(69) The tax payable on this class of service is: 5 cents upon each telegraph, telephone, or radio, dispatch, message, or conversation, which originates within the United States; for the transmission of which a charge of 15 cents or more is made for the entire service performed.

SOUTH WALES RAILWAY MEN AND THE EIGHT HOUR DAY.—South Wales railwaymen have decided that the time is not opportune to proceed with a demand for an eight hour day. They are convinced that, ultimately, they will gain more by honorably observing agreements.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS

The twenty-ninth annual convention of the National Association of Railway Commissioners held at Washington last week completed its four-day session on Friday, October 19, after deciding to hold its next year's convention at Washington on November 12. Officers were elected as follows: President, Edward C. Niles, of New Hampshire; first vice-president, Charles E. Elmquist, of Minnesota; second vice-president, C. M. Candler, of Georgia; secretary, James B. Walker, of the New York first district commission, New York City; assistant secretary, L. S. Boyd, librarian of the Interstate Commerce Commission.

SPECIAL WAR COMMITTEE

Responding to a suggestion made by President Thelen in his opening address, a resolution was adopted providing for the appointment by the president of a special war committee of five members, which "shall be charged with the duty of conferring with the appropriate federal and state authorities and with each state commission and of giving advice and suggestions as to what each commission can do affirmatively and constructively to help the Nation in the present emergency; and to select agents to carry out its objects and to make effective the offers of co-operation made by the president and the executive committee." One of the reasons given for the appointment of such a committee was that the state commissions might be enabled to learn of the desires and needs of the government direct instead of from the railroads. The following were appointed members of the committee: Max Thelen, of California, chairman; F. H. Funk, of Illinois; T. H. Whitney, of New York; J. B. Eastman, of Massachusetts; R. W. E. Donges, of New Jersey, and President Niles, *ex officio*.

The association held a dinner at the New Willard Hotel on October 17 at which the speakers were Herbert C. Hoover, United States food administrator; Samuel Rea, president of the Pennsylvania; Max Thelen, president of the association; Clyde B. Aitchison, of the Interstate Commerce Commission, and Senator Francis G. Newlands of Nevada, chairman of the Joint Committee on Interstate Commerce. Mr. Rea's address was published last week. Mr. Hoover complimented the roads on their service to the Nation. Senator Newlands declared that the successful prosecution of the war depends upon transportation more than upon anything else and that the government would either have to give the railroads permission to increase rates or lend them money.

A proposal was adopted that the name of the association be changed to National Association of Railway and Utilities Commissioners, because only a minority of the commissions represented in the membership are purely railroad commissions.

REPORTS OF COMMITTEES

In addition to the reports of committees referred to in last week's issue, the Committee on State and Federal Legislation, J. L. Bristow of Kansas, chairman, outlined the part taken by the committee in connection with the inquiry by the Newlands congressional committee. The committee stated that Mr. Thelen's testimony before the Newlands committee "showed that the main effort of the railroad executives was a concerted drive against the authority of the states for the purpose of depriving them not only of such powers as they now have over roads engaged in interstate commerce, by reason of the failure of the federal government to enter certain fields of regulatory activity, but also to deprive them of the right to regulate and supervise the purely state rates, service, facilities, equipment and safety of operation of all railroads which in any way engage in interstate commerce." It was stated also that Mr. Thelen had demonstrated that "the cause of the impaired credit of the railroads was not public regu-

lation, either state or federal, but could be found in unsound financial structures, unwise railroad construction and inefficient and at times criminal mismanagement of railroad finances."

The committee has an understanding that at the appropriate time all representatives of the state commissions who desired to be heard by the Newlands committee will be given full opportunity to present their views. In anticipation of this hearing, the committee prepared and submitted to a number of the older commissioners a questionnaire, the return of which affords much valuable information as to the jurisdiction exercised by the states and state commissions in regulation of interstate carriers. This information is now in the hands of the committee ready for use at such time as it may be needed. It was the view of the committee that it should be vested with the same general authority which was conferred upon it at the last convention for the purpose of taking any appropriate action which may assist the congressional sub-committee in obtaining all of the information which it may need for the discharge of its duties. This recommendation was adopted by the association.

The Committee on Car Service and Demurrage, F. H. Funk, of the Illinois Commission, chairman, expressed the opinion that one of the first great problems the new Division of Car Service of the Interstate Commerce Commission will be called upon to solve is the formulation of some practical and reasonable rules covering the matter of car distribution in times of car shortage, but in view of the present abnormal conditions the committee felt that any extended discussion of car service problems under present conditions would prove of little permanent value. E. H. De Groot, Jr., addressed the meeting briefly on the work of the Division of Car Service in co-operation with the Commission on Car Service and other bodies.

The Committee on Express and Other Contract Carriers by Rail, J. P. Webster, of the Georgia Commission, chairman, discussed the question as to whether express traffic should be taken over and handled by the express companies direct, expressing the opinion that such a step would not result in as good service to the shipper and receiver of express traffic as is given under present conditions.

The Committee on Capitalization and Intercorporate Relations, A. R. Weed, of Massachusetts Board of Gas and Electric Light Commissioners, chairman, presented a general discussion of the question and recommended that the association urge the immediate adoption of legislation substantially in accordance with the provisions of the Rayburn bill, independently of the question of federal incorporation and that such legislation shall embody the right of the state commissions to sit with the Interstate Commerce Commission and to participate in its deliberations on applications relative to the issue of securities by carriers organized or operating in the respective states, but shall exclude from its scope the securities of street railways.

VALUATION

The Committee on Valuation, C. E. Elmquist, of the Minnesota Commission, chairman, presented a general discussion of the progress made by the Interstate Commerce Commission in the valuation of railroad property. The committee stated that during the last year the carriers have made strenuous covert efforts, including a personal appeal to the President, to secure the discontinuance of proceedings under the valuation act, but that the committee is of the opinion that every reason which was ever urged as warranting the enactment of the law in the first place applies today with the same or greater force and that "there are additional reasons for the valuation that did not exist when Congress passed the law, such as the apparent imminence of government ownership as a live issue, the actual taking over of certain roads for war purposes, and the questions of com-

ensation and return which will grow out of the priority of shipments act and out of the new revenue system." A suggestion was made that the valuation will proceed more rapidly, more cheaply for the government and for the carriers and with less disturbance of the ordinary affairs of the railroads and the balance of the country if the carriers "cease their attitude of regarding the government as being a hostile party in a lawsuit."

The convention voted that a new valuation solicitor should be appointed by the committee to represent the state commissions at Washington in connection with the valuation proceedings, succeeding Mr. Aitchison, who has recently been appointed a member of the Interstate Commerce Commission.

C. A. Prouty, director of the Division of Valuation of the Interstate Commerce Commission, presented a general discussion of the valuation work. He said that the causes which had required the expenditure of so much time on the first preliminary reports would not occur again because the decision of the commission on the points raised in connection with those cases would serve as a guide for future work. He explained that unit prices as of June 30, 1914, are being used so that all of the valuations will be made on a common basis. If it is necessary to change them on account of increasing prices in the future they can all be changed at one time.

Referring to the cost of the work, Mr. Prouty said that up to October 1 the government had expended about \$9,500,000 and that the appropriation for this fiscal year is \$3,500,000. The commission expects to ask for a similar appropriation for the next fiscal year, and he still hopes that the cost to the government will not exceed his original maximum estimate of \$20,000,000. Mr. Prouty said that the cost to the government does not represent the entire cost because the public in the end also pays for the cost to the railroads. He said that the railroads have been passing around some very fantastic figures as to their costs, and he had no way of knowing what they were actually expending, but that the cost to the railroads ought not to exceed the cost to the government. He remarked, however, that the valuation expenses of the railroads include the cost of conferences at White Sulphur Springs, "where the golf course is one of the finest in the country and the cuisine cannot be surpassed." He also declared that a large part of the cost to the railroads is incurred, not for the purpose of contributing to the work, but for the purpose of attacking the work of the government, and is partly due to the fact that many of the railroads had not kept their records in the shape that a well-managed railroad should have kept them, so that the cost of compiling them now ought not fairly to be charged to the expense of the valuation. He added, however, that he had no fault to find with the co-operation being rendered by the carriers, which had been very helpful in many instances.

Director Prouty vigorously opposed the idea of discontinuing the valuation work on account of the war, saying that if the work had not been begun he would not now recommend that it be started, but that if it were discontinued in its present condition it would amount virtually to throwing away every dollar that has been expended. It took more than a year to organize the work originally and it would take that much time to begin it over again. He said the suggestion to suspend the valuation does not originate with the men who are operating the railroads, but with bankers and financiers who control the railroads and who do not want the valuation completed because it would render impossible the manipulations and speculations out of which they have made enormous fortunes. The time might come, Mr. Prouty said, when it would be necessary to discontinue the work, but so long as the ordinary activities of society are continued it would be a mistake to do so. Instead of saving money it would involve additional cost in the future and there are comparatively few men still engaged

in the work who would be likely to become engaged in the work of the war. The engineering force has already been seriously depleted, and the engineers have been encouraged to enlist and have been given leave of absence to go to training camps. Exemptions were asked for only 28 men, who were regarded as indispensable. When the war is over, there is likely to be a very great demand for transportation facilities, and the valuation will serve an important function as a basis for future financing.

While the division of valuation has taken the position that the law does not provide for the finding of an ultimate value, Mr. Prouty said that when all of the information has been collected it must all be put together in some way to determine the ultimate dollars and cents value. For example, he said, the Kansas City Southern is capitalized for about \$99,000,000, and the market value of its securities was found to be about \$62,000,000, the cost of reproduction new was placed at \$50,000,000, and the cost of reproduction less depreciation at \$40,000,000, while the original investment was found to be about \$47,000,000. These are the facts ascertained by the division, and the government must eventually determine what figure represents the value. By this, he said, he meant the value for rate-making purposes.

Glen E. Plumb, counsel for the railroad brotherhoods, read a paper on the subject of "Charter Limitations as Affecting the Value of Railway Property," maintaining that the property right of the railways is limited by their charters to their use for the public service, and that any value beyond this belongs to the public.

The convention decided to provide for a standing committee on public ownership and operation.

RATES

The Committee on Rates, A. E. Helm, of the Kansas Commission, chairman, expressed the opinion that as one step toward the establishment of a scientific method of establishing railroad rates, it is highly desirable that an effort should be made to bring about a uniform percentage relation of class rates for application upon both state and interstate business. The committee also expressed the opinion that the making of increases of rates upon a percentage basis is unlawful for the reason that it necessarily creates a discrimination between localities. It recommended that this method of making increases of rates should be disapproved by all commissions and that, if necessary, the law as relating to the subject should be amended to clearly prohibit the making of such increased rates. The report was discussed by B. H. Meyer of the Interstate Commerce Commission with special reference to the question of minimum carload rates. Commissioner Meyer said that the capacity of freight cars has increased to such a great extent that some railroads probably have too many large cars to suit the requirements of the shippers and not enough cars to meet the reasonable needs of the small shippers, who are sometimes required to pay an amount for a minimum carload which represents a high rate for the quantity actually shipped. Mr. Meyer thought the percentage of utilization of space in the small cars is greater in many cases than in the larger cars.

The report brought out an interesting discussion of various rate situations involving conflicts between the jurisdiction of the federal and state commissions, particularly as to passenger fares, which led to the adoption of a resolution authorizing the Committee on State and Federal Legislation to confer and co-operate with the Interstate Commerce Commission with a view to bringing before Congress a suggestion for legislation to specifically legalize co-operation between the state and federal commissions in such cases. Rate situations involving a conflict as to passenger fares were described by R. W. E. Donges of the New Jersey Commission, and P. J. Lucey of the Illinois Commission, both of whom declared that

they did not see how co-operation with the Interstate Commerce Commission would result in any agreement in their cases.

PROPOSED REDUCTION IN ACCOUNTING REQUIREMENTS

The Committee on Statistics and Accounts, Arthur A. Lewis, of the Washington Commission, chairman, presented a supplemental report of its conference with the statistical and accounting representatives of the Interstate Commerce Commission and of the Association of American Railway Accounting Officers on October 4, held at the request of the railroad committee to consider what elimination of and modification in reports now required from the railroads by the Interstate Commerce Commission and the commissions of the several states could properly be made in order to conserve accounting forces during the war. The committee stated that the representatives of the railroads urged the necessity for relief because there have already been put upon the railroads additional burdens, requiring large increases in their clerical forces; this additional help has been hard to obtain and the carriers have been obliged to take on inexperienced clerks. Having no occasion to doubt these allegations, the committee said, its members, together with the representatives of the Interstate Commerce Commission, have carefully considered and checked over the suggested changes in schedules embodied in the report prepared by a special committee of the railway accounting officers, with the result that they had reached the conclusion that some of the schedules proposed to be eliminated or changed should, in the opinion of the committee and the representatives of the Interstate Commerce Commission, be modified in certain particulars.

Before the consideration of the proposed curtailment of the reports was taken up, it had been made clear by the committee that it had no power to bind any of the state commissions and it was further understood that the changes recommended by the committee to be made are wholly an emergency war measure, to continue only during the war, including a short period of subsequent adjustment. It was also the committee's understanding that the proposed changes and eliminations as modified will not affect the present classification of accounts and that any data heretofore furnished which is now proposed to be eliminated, if found to be necessary and essential to any commission, will be furnished by the carrier in a special report. With this understanding the committee believes that the request for change in the schedules as modified can be accepted by the state commissions without any serious embarrassment, during the war period. This report was referred to a special committee for consideration during the convention, which presented another report making some further modifications in the proposed changes and in this form the action of the committee was approved.

THE CEYLON RAILWAY.—The Ceylon Government Railway comprises a system of 706 miles, of which only 22 miles are double track, and over a large portion of which the traffic is very heavy.

WAR LOSSES OF BRITISH UNION.—Up to August, 1917, there had been 2,998 members of the National Union of Railwaymen killed in action or had died from wounds.—*The Engineer, London.*

PRIVATE OWNERS' CAR ORDER IN ENGLAND.—By an order recently passed in England, when it appears necessary to increase the supply of cars to a colliery, the Board of Trade may take possession of any private owner's cars and use them for that purpose. In such cases the owner is to be paid for the use of the car such amount as may be agreed. Failing agreement, an arbitrator appointed by the Railway and Canal Commission will fix the sum to be paid.

What Pulverized Coal Means to Brazil

By Burning Brazilian Coal This Way, "The Fuel Problems of Our Country Are Solved," Says President Braz

AS much as the railroads and industries in this country are suffering from the present fuel situation, the problem is insignificant when compared with that of Brazil. With about 500,000 square miles of territory containing deposits of coal which can be easily mined and transported to the industrial centers, Brazil has been forced to import this material from Europe and America because of

ordinary grates is impossible. The analysis of the coal is as follows:

Moisture	from 2 to 8 per cent
Sulphur	from 3 to 9 per cent
Volatile	from 14 to 28 per cent
Fixed carbon	from 34 to 58 per cent
Ash	from 26 to 30 per cent

The relatively high volatile and carbon content make it very desirable for fuel if it can be burned successfully.

The Brazilian fuel situation is of national importance and has a direct bearing on the political situation. Several extensive and expensive investigations have been made to find a means for successfully using this fuel, but until 1915 the problem remained unsolved. At that time an article appearing in the *Railway Age Gazette* describing tests made by the Locomotive Pulverized Fuel Company of New York, with pulverized coal on locomotives, was called to the attention of the government by the director of the Central Railway of Brazil, Dr. Miguel Arrojado Lisboa. This method of burning fuel not having previously been considered in connection with the Brazilian coal, Dr. Joaquim de Assis Ribeiro, chief of traction of the Central Railroad of Brazil, was sent to this country to make an investigation. The possibilities of this method were so apparent that 50 tons of Brazilian coal was shipped to this country for tests on the pulverized fuel burning locomotives. These tests proved so satisfactory that in May, 1916, Dr. J. J. da Silva Freire, sub-director and locomotive superintendent of the Central Railway of Brazil came to this country for further investigation, paying particular attention to the use of pulverized fuel in both locomotives and stationary boilers.

As a result of the second investigation the Central Railway of Brazil decided to install a pulverized fuel preparing plant, having a capacity of 15 tons per hour, to be used for steam locomotives and stationary boiler equipment at shops located at Barra do Pirahy, which is about 65 miles north

View of the Front End of the Tender Showing the Distributing Machinery

the fact that up to the present time it has been found impossible to burn the domestic coal successfully. In 1915 there was imported 1,346,147 metric tons, 561,150 of which came from America. The price of this coal has more than doubled on account of the war, the average price now paid

Pulverized Coal Burning Locomotive for the Central Railway of Brazil

being about \$40 per ton. Even at this high rate Brazil has been unable to obtain more than 75 per cent of its requirements.

The difficulties encountered with the use of Brazilian coal are due to the large amount of sulphur and iron pyrites contained in it, which combined with the ash forms such a large amount of clinker that efficient combustion on or-

of Rio de Janeiro. The plans and specifications for this equipment were prepared by the International Pulverized Fuel Corporation, the foreign agents of the Locomotive Pulverized Fuel Company under whose direction the Brazilian pulverized coal tests were made. At the same time an order was placed for twelve 10-wheel passenger locomotives to be equipped with that company's pulverized fuel burning

apparatus. These locomotives were built by the American Locomotive Company.

The ground was broken for the pulverizing plant May 17, 1917, and the plant was placed in operation August 22. The first locomotive fired with pulverized fuel was put into service August 27 and the rest of the locomotives were put into commission at the rate of one a day thereafter. On September 9 the first run was made with the pulverized National coal. This run was made with considerable ceremony, the president of the republic riding the locomotive throughout the trip. A report of the trip from an observer is given below:

"The first official experience with our national coal pulverized was realized yesterday, September 9, on the Central Railway of Brazil, with the special train that transported Dr. Wencenslao Braz, president of the Republic of Brazil, and his staff. Locomotive 282 was attached to the president's special train at Barra do Pirahy and pulled it to Cruzeiro, a distance of 147 kilometers, or about 90 miles, the time being three hours. The trip was made with excellent results, particularly in the long stretch between Barra do Pirahy and Cruzeiro.

"During a great part of the trip the president remained

exactly; the return 3 hours and 25 minutes. President Braz sent a telegram to the minister of public works, as follows: 'The fuel problems of our country have been solved.' He also sent a telegram of congratulations to Dr. Assis Ribeiro. The President and the director expressed themselves as being entirely satisfied and highly pleased at the demonstration, and also as to the simplicity of the machinery and control over the fire, which was thoroughly demonstrated while they were on the locomotive.

"On leaving the locomotive cab for his car, the President embraced effusively the engineer and fireman, and congratu-

Back Head of the Pulverized Fuel Burning Locomotive with the Cab Removed

in the locomotive cab, assisting with the feeding of the firebox with the national coal pulverized in the plant recently constructed at Barra do Pirahy, the coal having come from the Sao Jeronymo mine. The president of the republic showed himself very much impressed with the calorific value of the coal and the ease and regularity with which steam pressure was maintained by the locomotive throughout the trip, and without any smoke.

"The tonnage of the train was 210, which was hauled back, the total coal used being, as well as I can estimate, about 4 tons. The running time going was three hours

Interior of the Pulverizing Mill

lated Dr. Aguiar Mareira, director of the Central Railway of Brazil, on the results obtained."

At the conclusion of the trip the president sent the following telegram to Dr. Travers de Lyra, minister of railways:

"From Barra do Pirahy to Vargem Alegre I traveled on 10-wheel locomotive No. 282 fitted for the use of pulverized fuel, with excellent results. The trip was made with a velocity of 65 kilometers per hour, having a train of 210 units behind it. I take great pleasure to give you this communication, which I am certain will be received by all Brazilians interested as a solution of one of our most important national problems. Salutation. Wencenslao Braz."

With the successful use of native coal, Brazil has solved one of its most perplexing economic problems. The Brazilian government has contracted to equip 250 of the locomotives on the Central of Brazil with the pulverized fuel burning equipment during the next five years. This contract also includes the equipping of stationary boilers and industrial furnaces.

The 12 locomotives which were built in this country and sent to Brazil equipped to burn powdered fuel weigh 172,000 lb. and have a maximum tractive effort of 28,300 lb. They have a gage of 5 ft. 3 in., cylinders 21½ in. by 28 in., driving wheels 68 in. and weigh 122,000 lb. on drivers. They are equipped with firebrick arches and superheaters, have a total heating surface of 2,149.7 sq. ft. and a superheater heating surface of 428.2 sq. ft.

The illustrations show a view of the locomotive, a view of the back head of the locomotive with the cab removed, the front end of the tender containing the pulverized fuel distributing machinery and interesting views of the pulverizing plant.

AN ENGLISH SERVICE RECORD.—George Hall, of Coventry, who is 70 years of age, has completed 60 years in the service of the London & North Western, and drives an engine daily.

General News Department

The Union Pacific is training a class of women at Omaha in ticket selling, as well as in telegraphy and other station agents' duties.

Two armed men bound and gagged the express messenger on a Chicago, Memphis & Gulf passenger train, near Ridgley, Tenn., on October 18, and escaped with about \$12,000 in currency.

In the Federal Court at Louisville, Ky., the Louisville & Nashville has been fined \$200 for violation of the law prohibiting the shipment of cattle from quarantined territory, and the same sum for violation of the safety appliance act.

The Ironton Railroad, operating a line from Hockendauqua, Pa., westward, eight miles, to Siegersville, has notified the Pennsylvania Public Service Commission that at the end of this month it proposes to suspend passenger train service, because of high wages and a scarcity of coal.

The Mexican Government has ordered 3,000,000 bushels of corn in the United States, to relieve distress in Mexico. The corn is to be sent by way of Laredo, at the rate of 200,000 bushels every 20 days. On the railroads in Mexico the freight rate is to be one half the usual tariff.

The Brooklyn Rapid Transit Company, Brooklyn, N. Y., is training ten women to act as guards on subway trains. This company employs women as ticket sellers, and those now being instructed for the train service were picked from the waiting list of applicants for indoor places.

Recent tabulation of employees of the Nashville, Chattanooga & St. Louis now in the service of Uncle Sam, and those subject to draft, shows a total of 1,642 out of approximately 10,000 on the company's payrolls. So far 193 employees have enlisted in the army or navy, while 1,449 men in the several departments of the road are subject to draft.

The New York Central reports that forged drafts of the freight claims accounting department of the road have been found at a number of places in Rochester and Buffalo. The drafts are all drawn on the treasurer of the New York Central Railroad Company through the Lincoln National Bank, New York, for \$35 each, and all bear No. 79,870, dated Buffalo, October 4, 1917, to the order of James A. Oliver, 365 Glenwood avenue. No city is given.

Members of the Order of Railway Telegraphers, involved in a wage dispute with the Chicago, Rock Island & Pacific, presented testimony before an arbitration board in Chicago, last week. Among the demands of the men are: 20 per cent increase in pay, an eight-hour day, various adjustments in rules and certain vacation privileges. It is expected that the board will conclude its deliberations some time this week. The dispute is being arbitrated under the Erdman act by William C. Brown, vice-president of the Order of Railway Telegraphers, Chicago, and Owen D. Gorman, of Mauk, Ga., representing the telegraphers; C. W. Jones, general manager of the Rock Island, Des Moines, Ia., and E. S. Jouett, general attorney of the Louisville & Nashville, Louisville, Ky., representing the railroad; and Judge Stanton J. Pells and Prof. James H. Gore, Washington, D. C., representing the Federal Government.

Record-Breaking Aeroplane Flights

Lieutenant Resnati, an aviator of the Italian army who has been making experimental flights in this country during the past month, arrived at Mineola, L. I., 20 miles east of New York City, on Monday afternoon of this week in 4 hrs. 11 min. from Hampton, Va., carrying eight men besides himself. The distance is about 320 miles, making the average rate of speed about 76 miles an hour. The machine, a triplane, with 85 ft. spread of planes, has three motors of 160 hp. each. Most of the journey was made at a height of about 9,000 ft., at which height the temperature most of the time was about 32° F. On the same day Lieut. Baldrolì, also an Italian, made the same trip in a

210 hp. machine, carrying one passenger, in 2 hrs. 55 min., or at the rate of about 110 miles an hour. Passing over New York City, Lieut. Resnati rose to a height of about 12,000 ft. for the purpose of avoiding disagreeable "air pockets."

Morkrum Printing Telegraph on the Southern Pacific

The Southern Pacific has just put in operation a set of Morkrum printers between Ogden, Utah, and San Francisco, Cal. The wire is duplexed, releasing one wire. By the new apparatus 2,000 messages are sent daily, within a period of about 13 hours. This system is in use between San Francisco and Los Angeles.

More Liberty Loan Subscriptions

In addition to the fifteen roads noticed in the last two issues of the *Railway Age Gazette* as having subscribed a total of \$48,750,000 for the Second Loan Liberty Bonds, the following subscriptions have been recorded in the last week:

Atlanta & West Point.....	\$300,000
Delaware & Hudson.....	1,000,000
Illinois Central.....	1,000,000
Mobile & Ohio.....	420,000
Pittsburgh & West Virginia.....	250,000
St. Louis Southwestern.....	750,000
Union Pacific (additional).....	5,000,000

The total to date, including these items, is \$57,470,000.

Railroad Assistance for Russia

Three members of the American Railroad Commission which went to Russia early in the year to study the railway conditions of that country, with a view to extending assistance from this country, have returned to the United States with detailed recommendations in addition to the reports which have been sent by letter and by cable. Those who have returned are W. L. Darling, formerly chief engineer of the Northern Pacific; George Gibbs, consulting electrical engineer; and J. E. Greiner, formerly chief consulting engineer of the Baltimore & Ohio. They have reported a considerable improvement in the congestion at Vladivostok which has hampered the transportation of supplies over the Trans-Siberian Railway. Extensive plans for improving the condition of the road are now under way at Washington and elsewhere, under the direction of S. M. Felton, director-general of railways for the War Department. Twelve units of railway officers, consisting of division superintendents and their staffs, and including a considerable number of shop men, are being recruited to be sent to Russia. They will be under the direction of G. H. Emerson, general manager of the Great Northern.

Canadian Railways' War Board

"Canadian Railway Association for National Defence" is the name of the war board that has been formed in Canada. It will formulate a policy of railway operation to render the most efficient service to the nation. Plans include elimination of unnecessary service and co-operative use of all facilities. Lord Shaughnessy, Canadian Pacific; Howard G. Kelley, Grand Trunk; Sir William Mackenzie, Canadian Northern, and Alfred H. Smith, New York Central, constitute an executive committee. The administrative board is headed by U. E. Gillen, Grand Trunk, and the car service committee by W. A. Kingsland, Canadian Northern. The headquarters of the board will be at Montreal.

"Car Shortage" Increased

On October 1 the excess of unfilled orders from shippers for freight cars over and above the idle cars at different points numbered 70,380. This compares with a "shortage" of 77,682 on July 1; 33,776 on August 1, and 34,005 on September 1. The gross "shortage" this year was 94,572 cars, almost identical with the number (94,854) one year ago. The difference in the excess of unfilled orders over idle cars for the two years is accounted

for by the fact that in 1916 as many as 34,157 cars were idle, whereas this year only 24,192 were reported as idle, thus indicating a more efficient use of the available equipment on the part of the railroads.

The War Board on October 10 had been in existence exactly six months and the returns just at hand show that during that period the railroads of the country have rendered upwards of 15 per cent more service than they did during the same period last year with practically the same plant.

Send Christmas Packages Early

The campaign for early shipment of Christmas packages, already started in a number of places, is being pushed jointly by the American Railway Association's car service committees of Chicago, Milwaukee, Wis., and South Bend, Ind. Co-operation is promised by representatives of the National Industrial Traffic League and the Chicago Association of Commerce. Each railroad is to do everything possible to promote early shipments, whether by mail or express. Among prospective recipients are approximately a million soldiers in the various cantonments and training camps. The postoffice department has fixed November 15 as the last day for mailing Christmas packages to our soldiers and sailors abroad. There is already a shortage of baggage car equipment that affects the handling of mails. Unless the public takes into consideration the shortage of equipment and of labor that the railway mail service will be confronted with during the holiday period, serious congestion and consequent delays to Christmas mails will result.

Avoid Killing Live Stock!

The Commission on Car Service of the American Railway Association, adopting the appeal for saving animals which has been issued by certain western roads, has issued a circular of appropriate suggestions, designed to conserve the live stock of the nation. The circular is addressed to owners of live stock, town officers, newspaper editors and railroad employees. It says, in part:

"Do you know that thousands of horses, mules, cattle, hogs and sheep are killed annually by railway trains in this country, and that this economic waste, many millions of dollars, can be reduced? The thousands of horses and mules that are killed every year would fill the artillery requirements of many regiments, and the thousands of cattle, hogs and sheep that are killed every year would provide meat for thousands of soldiers. Owners of stock should keep their animals in fenced enclosures. Town officers should pass ordinances prohibiting the practice of permitting stock to roam at large. Superintendents, roadmasters and section men should make a personal appeal to owners to keep their animals in fenced enclosures. Section men should drive stock off right-of-way, and keep farm gates closed, and fences and cattle guards in good repair. . . ."

Food Administration Gives Relief for Cattle

The State Railroad Commission of Texas has thanked the United States Food Administration for its assistance in moving some 1,500 cars of live stock from drought stricken sections of that state to other locations where pasture and water could be obtained. An appeal was issued stating that a portion of Texas was undergoing the most severe drought in the history of the state for many years, and that cattle were dying by the hundreds for lack of food and water. Within 48 hours from the time the appeal reached the Food Administration at Washington stock cars were moving westward to the stricken districts. The worst conditions prevailed along the lines of the Texas & Pacific, and the Kansas City, Mexico & Orient, and these lines were unable to obtain anywhere in the West a sufficient number of cars to get the cattle out of the country. Edward Chambers, head, and F. S. Brooks, assistant head of the transportation division of the Food Administration immediately took charge of the situation and obtained cars in the Eastern section of the country and sent them to Texas. The Pennsylvania, the Wabash, the Burlington, and the Missouri Pacific furnished the first quota of 875 cars, the major portion from the Pennsylvania. A second consignment was required, of which the Chicago & North Western furnished 300 cars, the Chicago, Milwaukee & St. Paul 100, and the El Paso & Southwestern 150. The work of the Food Administration received hearty co-operation from the Commission on Car Service.

New Haven Employees in the Army and Navy

The New York, New Haven & Hartford reports that 893 of its employees have volunteered since war was declared; besides these the records now show that in the operating department alone 537 men have been certified for service in the National Army and 429 drafted. The company's records show that there are 9,073 men in the operating department subject to the selective army. Of this number 4,134 are married and 1,321 are single with dependents. There are 3,435 men in this department between the ages of 21 and 31 who are single and who claim no dependents. Of this latter number there are about 900 in the train service for whom the road would feel justified in claiming exemption for industrial reasons.

There have already been 3 conductors, 4 engineers, 62 firemen and 99 trainmen selected for the National Army. The total number of men in the operating department already called before their local boards is 1,583; the number drafted is equal to 4.9 per cent of those available for service.

Employees entering the military or naval service are considered as on authorized leave of absence and they will retain their seniority rights if exercised within 60 days after date of discharge from government service and if their physical condition is such as to permit them to resume their former duties.

The road proposes to claim exemption only for such men as are indispensable to operation or those specially trained.

Association of Manufacturers of Chilled Car Wheels

The annual meeting of the Association of Manufacturers of Chilled Car Wheels was held at the Waldorf-Astoria Hotel, New York, October 9. George W. Lyndon, president of the association, in his address called attention to the carrying capacity of the chilled iron wheel, saying in part as follows:

"It is now a well established fact that the load that can be carried on a chilled iron wheel is only measured by the ability of the rail to support it. Many 33-in., 950-lb. chilled iron wheels are running under heavy locomotive tenders of 12,000 gal. capacity and are giving such a good account of themselves that no other type of wheel is considered by the users.

"We must pay the closest attention to the quality of our product. We must see that the interior of the 625-lb. and 725-lb. wheel receives recognition in the matter of increased plate thicknesses which can only be obtained by additional weight. We must have a reasonable factor of safety when measured by excessive stresses encountered in service and these heat stresses are now recognized everywhere due to our educational campaign. We are not influenced by commercial considerations in asking for heavier wheels. We know the increased weights are necessary. Perhaps the analyses of the stresses within the wheel may suggest a redistribution of the metal and we may be able to decrease weights, which we will be ready to do with as great an interest as we are now anxious to increase them."

The following officers were elected for the ensuing year: George W. Lyndon, president and treasurer; E. F. Carry and J. A. Kilpatrick, vice-presidents; George F. Griffin, secretary, and F. K. Vial, consulting engineer. The following composed the board of directors: J. M. Buick, vice-president, American Car and Foundry Company; J. A. Kilpatrick, president, Albany Car Wheel Company; W. S. Atwood, chief engineer, Canadian Car & Foundry Company; Charles A. Lindstrom, assistant to president, Central Car Wheel Company; F. K. Vial, chief engineer, Griffin Wheel Company; E. F. Carry, president, Haskell & Barker Car Company; A. G. Wellington, president, Maryland Car Wheel Works; W. C. Arthurs, president, Mt. Vernon Car Manufacturing Company; J. D. Rhodes, president, National Car Wheel Company; F. B. Cooley, president, New York Car Wheel Company; A. J. Miller, general manager, Ramapo Foundry & Wheel Works and Win. F. Cutler, vice-president, Southern Wheel Company.

Association of Railroad Chief Surgeons

The Association of Railroad Chief Surgeons held its semi-annual meeting at Chicago on October 22. The following papers were read at the meeting: A Review of the Results of the Treatment of Burns with Ambrin, by Dr. L. W. Hopkins, chief surgeon of the Chicago & North Western, Chicago; The Carrel Method of Wound Treatment, by Dr. G. W. Cale, chief surgeon of the Frisco Lines, St. Louis, Mo., and The Hospital Associations and

Their Advantages to Railroad Companies, by Dr. M. P. Parrish, chief surgeon of the Wabash, St. Louis, Mo. Among the open topics of discussion were The Recruiting of Surgeons for War Service, Carious Teeth in Men Entering Railway Service, The Employers Liability and Compensation Law of Illinois, Iodine in the Hands of Railroad Employees, and The Advantages of Establishing Reasonable and Average Periods of Convalescence for Various Injuries.

Next Bridge and Building Meeting at New York

At the closing session of the American Railway Bridge and Building Association, held in Chicago on Thursday of last week, New York was selected as the location for the next annual meeting, subject to change by the executive committee, should conditions arise which would make some other location more desirable.

The annual meeting of the Bridge and Building Supply Men's Association was held the same morning, at which time the following officers were elected: President, L. D. Mitchell, Detroit Graphite Co., Detroit, Mich.; vice-president, P. C. Jacobs, H. W. Johns-Manville Co., Chicago; treasurer, Thomas Lehon, the Lehon Company, Chicago; secretary, C. E. Ward, U. S. Wind Engine & Pump Company, Batavia, Ill. Members of executive committee: E. J. Caldwell, the Barrett Company, New York; E. T. Howson, *Railway Age Gazette*, Chicago.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Watten Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Superintendent of Telegraph, Indiana Harbor Belt, Gibson, Ind. Next meeting, November 22, La Salle Hotel, Chicago.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Morrison Hotel, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CINCINNATI RAILWAY CLUB.—H. Boutet, Chief Interchange Inspector, C. & N. Ry., 101 Carew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November. Hotel Sinton, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month. Room 1856, Transportation Bldg., Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 34th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Broadway, N. Y. Regular meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wollner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 307, P. R. R. Sts., Pittsburgh, Pa. Regular meetings, 2d Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Club has been suspended until after the war.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TRAFFIC CLUB OF CHICAGO.—C. B. Sigart, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, 1st Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

WESTERN SOUTHERN RAILWAY CLUB.—E. S. Nethercut, Acting Secretary, 1735 Monadnock Bldg., Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evenings except in July and August.

Traffic News

The Public Utilities Commission of Ohio has authorized an increase of 15 per cent in all freight rates, except on coal, coke and iron, for one year, effective November 20.

George W. Hibbard, for several years past general passenger agent of the Chicago, Milwaukee & St. Paul, at Seattle, Wash., and who recently resigned that office, has established a tourist and travel bureau, with headquarters in the Henry building, Seattle.

The government will suspend its priority order of shipment plans on Monday, October 29, in order to devote the entire production of the Ohio, Western Pennsylvania and Michigan bituminous coal mines for that one day to the emergency needs of the domestic consumers of Ohio and Michigan, the fuel administration announced today. This plan of devoting one day's production to the needs of a particular section will be followed in other cases.

The New York, New Haven & Hartford and the Pennsylvania have appointed a joint embargo committee, with headquarters in New Haven, to consider all applications for permits to make shipments through embargoes; this to facilitate communications between the New Haven and the Pennsylvania, and insure prompt action in all necessary cases. The committee will be known as the "New Haven Committee." The chairman is Richard Hackett, assistant to the senior vice-president of the New Haven road.

The United States Department of Agriculture is endeavoring to get merchants to stop shipping poultry in ice. It has been found that chilled dry-packed poultry reaches destination in much better order than the wet ice-packed product. Specialists of the department have studied shipments of chilled dry-packed poultry and wet ice-packed poultry which had been shipped in the same car, and found the dry-packed in excellent condition, while the wet-packed was unfit for use. A number of packers, at the instance of the department, have changed from wet to dry packing.

The Pennsylvania Railroad reports a saving of 56 cars a day in the transportation of less-than-carload freight, from Baltimore, Md., as the result of the "shipping day" or "sailing date" plan for handling this traffic, which was begun on October 1. In the first ten working days of October, 1916, an average of 182 cars was required daily to accommodate the l. c. l. freight originating in Baltimore, while in the corresponding period of the present year a daily average of 126 cars was used. The difference is affected to some extent by differences in embargo conditions, but by far the greater portion of the saving is directly due to the new plan. The increase in the average number of tons per car is 24 per cent. Officers of the road expect, eventually, on the lines East of Pittsburgh and Erie, to save upward of 1,000 cars a day in the transportation of l. c. l. freight.

Transportation Division, Food Administration

The transportation division of the Food Administration, of which E. Chambers, vice-president of the Santa Fe, is the head, has adjusted some troublesome differences between the express companies and the oyster and fish shippers of the country. The express companies, a short time ago, on account of delays to trains because of the abnormal demands made upon them, decided to stamp on each shipping ticket "Subject to delay on account of congestion." What they were seeking to do was to get away from liability for failure to reach the distant market at a certain hour in the day. Protests at once began to come in, most pronounced from the oyster shippers, who claimed that the uncertainty was extremely damaging to their business. Complaint was filed with the Interstate Commerce Commission and suits against the express companies were threatened.

Shippers from different sections of the country appealed to the Food Administration; and its transportation division, after considering the situation carefully, called a conference of the shipping interests and the express companies, with the result that

an understanding has been reached and the express companies are sending out a circular, saying:

"We have no desire to seek relief from responsibility for loss growing out of the negligence of the companies, or of employees; the endorsement on receipts for perishable shipments 'subject to delay, account of congestion,' can only apply to delay beyond control of the express companies; primarily it only puts shippers on notice that to or from the territory described, the expeditious express service which we formerly have been able to afford, cannot now be accorded. Instructions will be issued that preference be given in every way to government shipments and perishable matter, and that extraordinary care be used in reicing products requiring such attention."

Quick relief from threatened traffic congestion, liable to result in the rotting of great quantities of vegetables, has also been effected by the Food Administration, upon notification by the Farmers' and Fruit Growers' Association. The possibility of congestion was brought about by the announcement that the Montank Steamship Company would cease running its boats after October 11. The producing field, eastern Long Island, is dependent upon the steamship line for most of its shipping, its only other avenue of transportation being over the Long Island Railroad, which also owns the steamship line. The congestion of freight on the railroad without this additional burden, it was stated, precluded any possibility of getting these vegetables to the New York market over the railroad. The transportation division took the matter up with the president of the Long Island road, and the steamship line will continue in operation during the balance of October, and longer if necessary.

The transportation division has requested the California railroads to discontinue the loading of barley for the present; cars are needed for important foodstuffs. The movement of the Washington apple crop, the largest in the history of the state, is to begin at once. The Yakima, Wenatchee and Hood River districts will contribute approximately 18,500 carloads. A serious shortage of shipping facilities in the Payette valley of Idaho has developed in connection with the movement of apples and potatoes. The New York grape crop is now moving rapidly in refrigerator cars. Arrangements for equitable distribution were made by the Food Administration in advance of the movement.

Secretary Baker Praises Troop Movement

Secretary of War Baker, in his weekly statement on the progress of military operations issued on October 22, said:

"An interesting summary of troop movements in the United States shows that since the present mobilization began 914,195 persons have been transported by the railroads for the War Department, of whom 256,815 were transported in standard or tourist sleepers, the remainder in day coaches. This vast movement has been conducted by the railroads of the country without a single serious accident, and the co-operation between the railroads and the department has been most cordial and effective."

Aeroplane Invades Express Company's Field

The Triangle Distributing Corporation, on Thursday, October 11, sent a package of films from Buffalo, N. Y., to Rochester, by aeroplane, the shipment having missed the last train by which it could have reached the consignee in season for the afternoon exhibition. The flight, 70 miles in 45 minutes, was made by Roland Rohlf, an instructor at the Curtiss Aviation Training School. The showman, at Rochester, having complained to the shipper over the telephone and having received assurances that the pictures would be rushed through, announced the fact to his audience, and the people are said to have waited patiently. The aviator landed in a wheat field some distance outside the city.

In connection with the announcement of this flight the Triangle Distributing Corporation says that fourteen of its distributing branches make shipments numbering 6,617, of about 40 pounds each, every week, presumably all by express. This makes an aggregate of 264,680 pounds a week.

Heavy Shipments of New York State Peaches

The New York State Peach Belt—a 90-mile tract west of Rochester and mostly north of the New York Central main line—shipped this year 6,625 carloads, averaging nine tons each, as compared with 4,459 cars last year, the best season on record. The New York Central's Agricultural Department reports a

sweeping shift of the buying markets to more remote points. Sixty-four per cent of this season's fruit was shipped to Pittsburgh or points farther west, as against only 39 per cent last year. The nearby markets took correspondingly lesser proportions. The effect of the longer haul of the bulk of the crop was to tie up the available refrigerator cars for much longer periods and add to the car problem; the record shows that 38 per cent more cars were furnished, to handle an estimated 25 per cent increase in the crop.

Extraordinary weather pranks—particularly a sudden shift from cool to warm—ripened the big crop all at once and severely taxed the facilities of orchards, storage houses and railroads alike for several critical days. The fast-ripening fruit threatened to overflow all bounds; and, in fact, some fruit rotted before it could be gathered, the yield being much greater than the growers had estimated. Also, there were brief shortages of cars at some points. The total shipments by the New York Central, 6,625 cars at 18,000 lb. each, aggregated 119,250,000 lb. Only ten years ago the peach shipments were but 434 carloads; in 1908 they were 1,173 cars; 1912, 2,690 cars.

The Agricultural Department of the New York Central, headed by F. S. Welsh, kept a dozen trained inspectors traveling in automobiles, actively covering the peach districts. These men kept in close touch with growers, suggested better loading methods, reported local car shortages, watched against impaired fruit that would involve claims, noted the icing and other conditions, and in co-operation with local agents assisted toward most efficient freight service. This special service showed such benefits that the railroad company will at once extend it to the crop shipments of apples, celery, potatoes and other perishables.

Illustrated booklets were circulated giving detailed directions to growers regarding the safest methods of loading cars, and the shippers responded with hearty co-operation. Fully 60 per cent of the growers adopted the railroad's suggestion for end-to-end loading of the bushel baskets in four tiers, to prevent shifting in transit. The mobilization of refrigerator cars began early, and on August 16 there were 4,000 cars held in readiness. Throughout the succeeding month an average of 3,000 cars were kept in waiting for the ripening. At 75 cents per car per day, this item of preparedness cost \$2,250 a day, or \$67,500 for the month.

Cool weather delayed ripening until, late in September and heroic efforts could scarcely meet demands for a few days. The "peak" of the harvest was far the heaviest known. During this rush week the daily movement was 362 carloads, as compared with 240 cars daily in the busiest week last year, an increase of 50 per cent. The figures for the entire season show that an average of 187 cars were moved daily in 1917, as against 135 cars daily for the heavy 1916 crop.

The shift of peach shipments this year to more distant markets is shown by percentages of the distribution of the crops of 1917 and 1916, by the railroad records, as follows:

	1916		1917	
	Cars	Per Cent	Cars	Per Cent
To New York State points.....	1,115	25	861	13
To New England.....	401	9	265	4
To Pennsylvania and points South.....	1,204	27	1,259	19
To Pittsburgh and points West.....	1,739	39	4,240	64
Total.....	4,459	100	6,625	100

The shipments to the west, it will be seen, were almost 2½ times as large this year as last.

Japanese Railroad Construction

The Imperial Japanese Diet has passed a bill authorizing the expenditure of \$4,980,000 for the extension of the Boryo and Giran railway lines in Taiwan. Of this sum \$996,000 is to be expended annually for a period of five years, the railways to be completed by the end of the fiscal year 1921. Operations are to be begun before the end of this month (September, 1917). The construction contemplated is the extension of the Boryo Line from Ako to Boryo, with a view to serving the agricultural interests along the plain which the line will traverse, and the extension of the Giran Line from Ilatto to Suwo. The Giran extension, which is chiefly through mountainous country, is expected to aid the development of coal mining in Zuiho and Chosokei districts, where, hitherto, operation has been unsuccessful because of the difficulty of getting the coal out. It is expected also that new veins of ore will be discovered.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Rates on Idaho Lumber Not Too High

Western Pine Manufacturers' Association et al v. Cincinnati, Indianapolis & Western et al. Opinion by Commissioner Clark:

The fact that through rates are composed of the aggregates of intermediate rates does not in itself establish their unreasonableness. Rates on lumber and lumber products from the inland empire to central freight association territory not shown to be unreasonable, unjustly discriminatory, or unduly prejudicial. Minimum weights not shown to be unreasonable. (46 I. C. C., 650.)

Rice Rates Reasonable

Lake Charles Rice Milling Company v. Southern Pacific Company et al. Opinion by Commissioner Clark:

Rates on rough rice from California points to Lake Charles, La., and on clean rice from Lake Charles to trunk line and Atlantic seaboard points not shown to be unreasonable or unduly preferential or prejudicial. Charges on certain shipments which exceeded those that would have accrued on the basis of the aggregates of the intermediate rates found unreasonable and repatriation awarded. Fourth section relief denied. (46 I. C. C., 661.)

Order as to Increased Rate Procedure

The Interstate Commerce Commission on Wednesday issued its fifteenth section order No. 1, prescribing the practice to be followed by railroads in presenting applications for permission to file tariffs containing increased rates, as required by the recent amendment to the fifteenth section of the law. The order is practically the same as the tentative draft, described in the *Railway Age Gazette* of October 12, page 661, which was the subject of a hearing on October 15. The form of application prescribed contains space for a statement as to what steps have been taken to bring the application to the attention of shippers and receivers.

Illinois-to-Iowa Rates Reduced

State of Iowa v. Wabash Railway et al. Opinion by Commissioner Daniels:

Upon complaint that commodity rates between Peoria or Springfield, Ill., and Des Moines and other designated interior Iowa cities, are not in compliance with the fourth section order of the commission in *Des Moines Commodity Rates*, 34 I. C. C., 281; and that they are unreasonable and unduly prejudicial; *Held*, That while the fourth section order in the case referred to has in terms been complied with, the finding of the commission in that case has not been followed; that the maintenance of higher rates between Peoria or Springfield and the designated interior Iowa cities than between Peoria or Springfield and St. Paul is unduly prejudicial; and that the rates in other respects are not found unreasonable. Fourth section relief denied. (46 I. C. C., 703.)

New York Storage and Reconsignment Charges Justified

New York Produce Exchange (on behalf of flour dealers) v. Baltimore & Ohio et al. Opinion by Commissioner Clark:

Reconsignment charge of \$2 per car established as an incentive to the direct billing of carload freight to places of final delivery within New York lighterage limits, and having for its object the relief of the congestion and car shortage situation at New York, found justified. Rule that a shipper from an interior point in the United States must, as a condition precedent to the issuance of a through export bill of lading, guarantee the payment of such storage charges as may accrue at New York after the expiration of free time, found justified. Rule that carload freight moved to New York as domestic traffic and subsequently exported cannot be accorded the benefit of the more liberal storage charges and regulations applicable to export traffic, which rule was designed to prevent the circumvention of embargoes against the movement of freight to New York before ship space is secured, found justified. (46 I. C. C., 666.)

COURT NEWS

The steam railroads entering Washington, D. C., on October 19 filed injunction suits in the District of Columbia Supreme Court against four ticket brokers to restrain them from selling tickets at reduced rates. The court issued rulings on each of the brokers named requiring them to show cause on November 9 why they should not be enjoined from selling any railroad ticket issued by the plaintiff companies or their connecting lines.

Interstate Commerce Commission Sustained

The Circuit Court of Appeals, Sixth Circuit, refused to disturb a finding of the Interstate Commerce Commission that a through rate from Houston to Chicago was unreasonable, so far as it exceeded the sum of the local rates, the finding being supported by evidence, though the local rate from Houston to New Orleans, used as a basis of comparison, applied only to shipments destined to points beyond New Orleans to which no through rates were published; no other rate from Houston to New Orleans being shown, and there being no attempt to show any reason for any distinction between Chicago and other points beyond New Orleans.—*Morgan's Louisiana & Texas R. & S. Co. v. Isaac-Joseph Iron Co.*, 243 Fed. 149. Decided June 5, 1917.

Hours of Service Act—Excusable and Inexcusable Derailments

In an action for the penalty for keeping trainmen on duty more than 16 hours, the railroad company filed pleas admitting the overtime, but alleging that it was due to the derailment of cars and the necessity of clearing the track, and that the accident occurred when it was impracticable to substitute another crew. The Federal District Court, S. D. Florida, sustained demurrers to the company's pleas because they were silent as to the cause of the derailment, holding that if the derailment could have been avoided by ordinary foresight the accident could not be said to be unavoidable, and unless it was unavoidable it was no defense to the action brought.—*United States v. Charlotte Harbor & Northern*, 243 Fed., 772. Decided August 1, 1917.

Safety Appliance Act—"Nearest Available Repair Point"

In a suit for penalties under the Safety Appliance Act it was alleged that the Boston & Maine Railroad hauled over its road, from Gardner, Mass., westward to East Deerfield, a box car which was out of repair by reason of a coupler being missing from the A end of the car. The car, billed from South Mills, Me., to Lake Junction, N. Y., was in a train which left Boston during the night of August 23, 1916; it became defective and was left behind at Gardner, between 1 and 2 o'clock the next morning, with one drawbar pulled out. It was turned around and was attached by its good coupler, behind the caboose, on a freight train going west from Gardner at 7:40 a. m. on August 24. On this train it was taken to East Deerfield, where it was repaired. This was the movement on which the complaint was based. The car contained about 45 pieces of freight, including one cask of gasoline. Gardner is not a repair point for such defects as the car developed. The nearest such point was Fitchburg, 17 miles east from Gardner; East Deerfield is 38 miles west. The freight in the car was destined to points west. The government contended that the car ought to have been taken to Fitchburg, because the distance was shorter. The Federal District Court held that the word "available" in the phrase "to the nearest available point" in the statute cannot be ignored. Availability obviously depends, under the statute, on other conditions besides that of mere distance. Whether Fitchburg was, under all the circumstances, the "nearest available" point for the repair of this car was a matter of business judgment. Upon such a question, involving as it does many elements, the decision of the men in charge of the business, if made in good faith, is entitled to serious consideration. It was not shown to have been wrong in this instance. On some of the freight speedy delivery may have been important, and it did not appear that there was any car at Gardner into which it could have been transferred. Although the distance of the haul was 20 miles longer than that to Fitchburg, the car "gained on the voyage," and its presence did not appear to have substantially increased the risk of injury to employees. Judgment was entered for the defendant.—*United States v. B. & M.*, 243 Fed., 795. Decided September 22, 1917.

Equipment and Supplies

LOCOMOTIVES

THE CHILIAN STATE RAILWAYS is inquiring for prices on 20 locomotives.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., is in the market for one second-hand American type locomotive with 16 in. to 18 in. by 24 in. cylinders, and a weight of from 60 to 75 tons; also for 5 second-hand 6-wheel switching locomotives, 3 with a tractive effort of 30,000 lb., and 2 with a tractive effort of 20,000 lb.

FREIGHT CARS

THE UNITED STATES GOVERNMENT is asking for prices on 10,000 freight cars.

WILSON & COMPANY, Chicago, are in the market for 200 refrigerator cars.

THE BARRET COMPANY, New York, is reported as inquiring for 100 8,000-gal. tank cars.

THE PENNSYLVANIA EQUIPMENT COMPANY, Philadelphia, is in the market for 2 second-hand box cars of from 30 to 50 tons' capacity.

THE ILLINOIS CENTRAL is asking prices on 1,000, 70-ton hopper cars and it is expected will ask for bids on 1,500 50-ton general service cars.

THE WESTERN PACIFIC, reported in the *Railway Age Gazette* of October 12, as asking prices on 1,500 freight cars, has withdrawn its inquiries for these cars.

THE CHILIAN STATE RAILWAY, reported in the *Railway Age Gazette* of August 3, as inquiring for prices on 400 stock and 600 box cars is now asking for prices on 330 box, 230 stock, 200 gondola and 240 flat cars.

THE UNION PACIFIC, reported last week as contemplating the purchase of 5,000 freight cars is now reported as contemplating the purchase of 500 flat cars, 1,000 hopper cars, 1,000 drop bottom gondolas, 1,000 single deck stock cars, 200 tank cars, 50 caboose cars and 1,000 logging trucks.

THE RUSSIAN GOVERNMENT, reported in the issue of October 19 as having issued inquiries for cars, has placed tentative orders for good cars as follows: American Car & Foundry, 10,000; Standard Steel Car Company, 10,000; Pressed Steel Car Company, 6,000; Seattle Car & Foundry Company, 3,000; Keith Car Company, 1,000. These orders may be changed to include a number of eight-wheel freight cars.

PASSENGER CARS

THE CENTRAL OF GEORGIA has ordered 7 passenger coaches, 2 parlor cars, 3 express, 3 combination coach and baggage cars and 2 combination baggage and mail cars from the Pullman Company. This order was reported in last week's issue as 16 cars.

IRISH RAILWAY DISPUTE SETTLED.—A conference held recently in Dublin resulted in a settlement of the Irish railway dispute. The agreement arrived at provides that the workers on Irish railways shall be placed in exactly the same position as workers on English railways. An extra bonus of 3s. (\$0.72) per week has been granted to the Irish railwaymen, and the whole bonus is to be converted into a war wage, with consequent increases for overtime and Sunday work.

TRADE OF THE PORT OF LONDON.—The annual report of the Port of London Authority states that the total net tonnage of vessels which arrived and departed with cargoes and in ballast from and to foreign countries and British possessions, and coastwise, during the year ended December 31 last was 24,976,437 tons as compared with 30,890,531 tons during the year 1915. Both totals are exclusive of the tonnage of vessels employed by the government in connection with the war.

Supply Trade News

Clyde F. Burns, managing editor of the *Railway Review*, Chicago, has resigned to become general manager of the Richey Construction Corporation, New Port Richey, Fla., which is engaging in the construction and management of public utilities.

L. F. Wilson, vice-president of the Bird-Archer Company, Chicago, who was reported in last week's issue of the *Railway Age Gazette* as having been called into active service as major in the second division of the regular army, informs us that this order has been rescinded.

Oscar F. Ostby has opened offices at 2736 Grand Central Terminal, New York, to handle general railway supplies. He has been appointed eastern representative of the Grip Nut Company, Chicago, and manager of sales of the Glazier Manufacturing Company of Rochester, N. Y., the latter company making a complete line of oil headlights, and reflectors and cases for all kinds of headlights.

Mr. Ostby has been one of the energetic members of the Railway Supply Manufacturers' Association, having been its president in 1915-16. He has been much interested in the locomotive headlight field in the interest of the International Acetylene Association, strenuously combating the passage of headlight laws in several states the requirements of which demanded the electric equipment only. He was born March 5, 1883, and received his education in the public schools of Providence, R. I. From 1901 to November, 1904, he was engaged in publicity work. Since then he has been connected with the Commercial Acetylene Railway Light & Signal Company and the Refrigerator, Heater & Ventilator Car Company, serving the latter company as general manager.

Major Robert H. Murray, formerly general manager of the Chicago Bridge & Iron Works, Chicago, is now in command of the first battalion, 311th Engineers, Camp Grant, Rockford, Ill. He first received a commission as captain, but following a period of training at Fort Leavenworth, Kans., was promoted to major.

The Walter A. Zelnicker Supply Company, St. Louis, Mo., has recently secured the services of W. H. Bramman, who is acting in the capacity of assistant to the president. Mr. Bramman before becoming associated with the Zelnicker Supply Company was connected with the American Carbon & Battery Company.

Warren R. Roberts, president of the Roberts & Schaefer Company, engineers and contractors, Chicago, has received a commission as major under the Quartermaster General as executive officer in charge of new emergency construction work during the war. Mr. Roberts left Chicago on October 22 to take up his active work and residence in Washington.

John C. Sullivan, engineer and contractor, and formerly assistant superintendent of the O'Rourke Engineering Construction Company, died at his home, in New York city, on October 23. As assistant superintendent of the O'Rourke Engineering Construction Company he had charge of the construction of one of the North River tunnels of the Pennsylvania railroad.

In connection with the 3½ per cent semi-annual preferred dividend recently declared by the Lima Locomotive Works, Inc., it is understood that the earnings of the company for the period covered by the dividend were about five times the dividend re-

O. F. Ostby

quirement, leaving a balance for the common stock at the annual rate of about 17 per cent. Business now on the books of the company aggregates nearly \$21,000,000.

Major P. G. Jenks, Quartermaster Officers' Reserve Corps and in civil life assistant to the president of the Standard Steel Car Company, Chicago, presented regimental and national colors to the Thirty-fifth Engineers at Rockford, Ill., on October 19, on behalf of car construction companies which have orders from the government. Very appropriately the presentation speech was made by Louis Pitcher, a civil war veteran, who exactly 53 years before (October 19, 1864) was color bearer in the Union army in the battle of Cedar Creek. The Thirty-fifth Engineers is a railway regiment which is being recruited for the purpose of doing car construction work on the American-operated lines in France.

H. P. Meredith, master mechanic of the Maryland and Delaware divisions of the Philadelphia, Baltimore & Washington, has resigned to go to E. I. du Pont de Nemours & Co. as engineer in charge of mechanical maintenance and shop methods, with headquarters at Wilmington, Del. He was born January 12, 1879, in Gloucester county, Virginia, and was educated in private schools in Virginia and public schools of Altoona, Pa. He entered the service of the Pennsylvania Railroad as a special apprentice in 1897. In 1901 he became motive power inspector of the Buffalo & Allegheny Valley division at Buffalo; in 1903 he was promoted to assistant master mechanic of Altoona machine shops, and on July 1, 1905, was promoted to the position of assistant to the general superintendent of motive power at Altoona. He was made master mechanic of the Baltimore division at Baltimore, Md., on May 1, 1910, and on October 15, 1914, was promoted to master mechanic of the Williamsport and Sunbury divisions, with headquarters at Sunbury, Pa. On July 1, 1916, he was promoted to the position which he has just resigned. He is a member of the American Society of Mechanical Engineers, the Master Car Builders' Association, and the American Railway Master Mechanics' Association.

Page Steel & Wire Company

This is the new name of the Page Woven Wire Fence Company, the change having been made because of the growth and diversification of the company's business. Beginning with wire fencing, the Page company has extended its activities so as to include many other products of high-carbon steel, including wire rods, rope wire and spring wire. The company also has exclusive licenses for the sale of "Armco" iron wire, made by the American Rolling Mill Company of Middletown, Ohio, and other specialties. E. C. Sattley, general manager of the Page Steel & Wire Company will have an office at 644 Union Arcade, Pittsburgh, Pa.; but correspondence for the different departments should be addressed, as before, to Monessen, Pa., Adrian, Mich., New York City or Chicago.

Anniversary of Joseph T. Ryerson & Son

Joseph T. Ryerson & Son, Chicago, will celebrate the seventy-fifth anniversary of its organization on November 1. The founder, Joseph T. Ryerson, came to Chicago in 1842 and located in a two-story brick building near Clark and Water streets. He secured a stock of \$30,000 worth of iron and began business as the accredited agent of Wood, Edwards & McKnight, of Pittsburgh. In 1879 he took his son, Edward L. Ryerson, into partnership, and upon his death on March 9, 1885, the business passed to his son. Edward L. Ryerson continued as president of the company until 1911, when he was made chairman of the board of directors. His sons, Joseph T. Ryerson, Donald M. Ryerson and Edward L. Ryerson, Jr., have entered the firm during the past 15 years and are now vice-presidents.

The Chicago plant of the firm has grown continuously in size with frequent changes in location to permit further expansion, and at the present time is located at Sixteenth and Rockwell streets. The plant is divided into two main sections, one division including a warehouse 500 ft. by 500 ft., housing heavy materials, such as large billets, plates and structurals, and the other a five-story office building and a warehouse 500 ft. by 500 ft., in which are stored bars, shafting sheets, tubes, rivets, bolts, nuts, boiler specialties, machinery, etc.

The eastern plant of the company occupies a 10-acre site on West Side avenue, Jersey City, at the junction of the Hackensack

river and Newark bay. The building is 245 ft. by 470 ft., with a floor space of approximately 137,000 sq. ft. The company acquired a St. Louis plant by purchasing the W. G. Hagar Iron Company, thereby adding to its own products a line of mill, mine and boiler-makers' supplies manufactured by the Hagar company. A new plant will be opened at Detroit, Mich., on November 1, to take care of the increased demand for quick shipments of iron and steel in the territory served by that city.

Anniversary of Taylor-Wharton Iron & Steel Company

The one hundred and seventy-fifth anniversary of the founding of the iron industry at High Bridge, N. J., which finally developed into the Taylor-Wharton Iron & Steel Company, was celebrated in that town on October 13. The date was also the 25th anniversary of the first making of manganese steel in America, the first heat of manganese steel having been run off by the Taylor Iron & Steel Company in 1892. The introduction of manganese steel into track work by William Wharton, Jr., & Co., occurred in August, 1894, a little over 23 years ago. The celebration was largely attended by officers and employees of the Taylor-Wharton Iron & Steel Company and its subsidiaries, and the entertainment features included a parade, speeches by prominent men, a band concert, a moving picture program, a clam-bake and dancing. An important part of the festivities was the presentation of gold medals to employees who had been in the service of the company or allied companies for 50 years or more, and silver medals to those with records of service of from 25 to 50 years.

The local deposits of iron ore, abundant timber for charcoal, and water power were the chief factors leading to the location of the iron industry at High Bridge. In colonial times Robert Taylor took over the management of the business, and from him it passed through five generations in a direct line of descent. In 1912 the Taylor Iron & Steel Company purchased William Wharton, Jr., & Co., Inc., Philadelphia, for the purpose of extending the use of manganese steel in track work. The present Taylor-Wharton Iron & Steel Company has five plants: the High Bridge plant, operated directly under the firm name and devoted entirely to the manufacture of manganese steel and other special steel castings; the Easton (Pa.) plant operated under the name of William Wharton, Jr., & Co., Inc., specializing in track work, such as frogs, switches, curves and track layouts for steam and electric roads, as well as all kinds of light and heavy iron and steel forgings for castings; the Philadelphia Roll & Machine Company, making rolls and rolling mill machinery, iron and steel castings, and machinery of a miscellaneous nature; the Manganese Steel Safe Company, Plainfield, N. J., and the Tioga Steel & Iron Company, Philadelphia, which produces light and heavy miscellaneous hammered and hydraulically pressed forgings, and is now turning out a heavy tonnage or rough machined and heat-treated forgings for 4-in. Navy guns.

TRADE PUBLICATIONS

INSULATING BRICK.—The Armstrong Cork & Insulation Company, Pittsburgh, Pa., has issued a folder describing tests made to determine the economy in fuel obtained by the use of Nonpareil insulating brick for boiler settings. One illustration is included showing the method of applying the insulating brick in the boiler setting. The tests showed that 63 per cent of the heat lost was saved by the use of this brick.

POWER REVERSE GEAR.—The Economy Devices Corporation, 30 Church street, New York, has issued bulletin No. 115 describing the type "B" Ragonnet power reverse gear, which is a new design recently placed on the market. The catalogue enumerates the advantages of the power reverse gear and explains the cushioning principle of the type "B" gear. A sectional drawing of the gear is included showing the names of the various parts of the gear.

LOCOMOTIVE FEEDWATER HEATING.—The Locomotive Feedwater Heater Company, 30 Church street, New York, has issued its first bulletin describing the advantages to be obtained by heating the feedwater for locomotive boilers. The bulletin points out the saving to be made in waste heat feedwater heating. Charts showing what economy may be expected by heating the feedwater with exhaust steam from the cylinders are given, and illustrations showing the application of the feedwater heating apparatus to locomotives.

Railway Construction

BUFFALO, ROCHESTER & PITTSBURGH.—Work is now under way near Punxsutawney, Pa., on the construction of a new engine terminal, a 16-stall roundhouse and auxiliary facilities. The work includes changing the course of a highway from the east to the west side of the tracks for a distance of over one mile and ten miles of additional yard track will be constructed. It is expected that the work will be finished by January next. The freight transfer platform at Punxsutawney and the Ganson street freight house at Buffalo are being enlarged.

CAMBRIA & INDIANA.—Work has been completed on a new extension from Revloc Junction, Pa., via Euclah, to Revloc, about 6½ miles.

CANTON & OHIO RIVER (ELECTRIC).—This company has been authorized to build, lease and operate an electric line from Canton, Ohio, to Wheeling, W. Va. The projected route from Canton is southeast via Osnaburg, Minerva, Malvern and Carrollton to Toronto, then south via Steubenville, and Martin's Ferry to Bridgeport, thence east across the Ohio river to Wheeling, about 100 miles. The promoters expect to develop a traffic in coal, manufactured goods and farm products. Milton Bejach, president; James D. White, secretary and treasurer, Pittsburgh, Pa.

CHICAGO, ROCK ISLAND & PACIFIC.—This road has awarded a contract to the Railroad Water & Coal Handling Company, Chicago, for a high pressure water system for the fire protection of its elevators at South Chicago.

ILLINOIS CENTRAL.—This company has awarded a contract to the Railroad Water & Coal Handling Company, Chicago, for a 600-ton coaling station at Kankakee, Ill. The structure will be of timber construction with a concrete substructure. Automatic machinery will be used throughout. A contract was also awarded to the same firm for a fire protection system for yards and shops at Nonconca (Memphis), Tenn.

OREGON SHORT LINE.—This company has awarded a contract to the Utah Construction Company, Ogden, Utah, for the construction of a line from Garland, Utah, south along the west bank of Bear river to Bear River City, Utah, 9.7 miles. It will connect the line from Corinne, Utah, to Malad, Idaho, with the line from Ogden, Utah, to McCannon, Idaho. The maximum grade will be 1½ per cent and the maximum curvature 3 deg. The grading will be light. The only structures to be built are 20 spans of trestle. About 60 per cent of the grading is completed.

The company has completed grading on a spur from Bakers, Utah, north 3.8 miles.

PELLA-LEFFLER SHORT LINE.—This company has been incorporated with \$300,000 capital stock to build a line from Pella, Iowa, to a junction with the Wabash, about 4½ miles. P. H. VanGorp, secretary and treasurer, Pella, Iowa.

PHILADELPHIA, BALTIMORE & WASHINGTON.—A contract has been given to the James McGraw Company for the grading and masonry work on the Chester & Philadelphia branch now under construction to Hog Island, 11.2 miles. Contracts for three small span bridges on the line near Chester, Pa., have been let as follows: For the superstructures of bridges over Darby and Crum rivers to the Bethlehem Steel Company and for the superstructure for Ridley river bridge to the McClintic-Marshall Company.

SHELBYVILLE & FRANKFORT (ELECTRIC).—The plans of this company call for building an electric line from Shelbyville, Ky., east, to connect with Clay Village, Peytona, Grafenberg and Bridgeport, about 20 miles. The work will include building four steel bridges and two power houses. Contracts are expected to be let in the near future, and construction work completed in 1918. The company expects to develop a traffic in farm products. E. H. Taylor, Jr., president, Frankfort, Ky.

SOUTHERN RAILWAY COMPANY IN MISSISSIPPI.—This company has authorized improvements to its passenger station at Columbus, Miss., consisting of the reconstruction of an umbrella shed with concrete pavement under it. The improvements will also include the erection of a new baggage room and ice house.

Railway Financial News

CENTRAL OF NEW JERSEY.—The New Jersey State Board of Public Utility Commissioners has approved an agreement of merger and consolidation between the Central of New Jersey and the following connecting railroads, which are all a part of the Central's system, but which have been operating under separate corporate names: Buena Vista, Carteret & Sewaren, Carteret Extension, Cumberland & Maurice River, Cumberland & Maurice River Extension, Freehold & Atlantic Highlands, Lafayette Railroad, Manufacturers' Extension, Middle Brook, New Jersey Southern, Navensink Railroad, Passaic River Extension, Raritan North Shore, Sound Shore, Toms River, Toms River & Barnegat, Vineland Railroad, Vineland Branch, West Side Connecting, and the West End Railroad Company.

ILLINOIS CENTRAL.—The directors have declared the regular quarterly dividend of 1½ per cent and an extra dividend of 1 per cent, the latter for the year 1917. Both dividends are payable December 1 to stock of record November 5.

MISSOURI, KANSAS & TEXAS.—See item under Court News, *Railway Age Gazette*, October 19, 1917, page 718.

MOUNT AIRY & EASTERN.—This 19-mile line operating between Mount Airy, N. C., and Kibler, Va., has been sold to Washington parties.

NEW MEXICO CENTRAL.—This road has been bought by the Federal Export Corporation of 115 Broadway, New York. It lies in a section of New Mexico that has recently been opened to oil developments. The line is 120 miles long, from Santa Fe, N. M., on the main line of the Atchison, Topeka & Santa Fe, south and southeast to Willard, 80 miles, where it crosses a branch of the Santa Fe, and thence to Torrance, where it connects with the El Paso & Southwestern. The Federal Export Corporation contemplates the electrification of the road or its re-equipment with internal combustion locomotives.

NEW YORK, NEW HAVEN & HARTFORD.—Authority to issue \$45,000,000 of new 7 per cent preferred stock was given the directors at a special meeting of the stockholders October 24. The proposed issue would take up floating indebtedness now represented by a like amount of one-year 6 per cent notes, collateral for which to the amount of \$96,512,516 (book value) has been pledged.

TENNESSEE CENTRAL.—At the fifth attempt to sell this road at auction, no bids were received, and the sale was adjourned to November 30.

WESTERN MARYLAND.—It is said John D. Rockefeller and closely allied interests have agreed to purchase the \$5,000,000 three year 7 per cent notes authorized by the stockholders at their annual meeting. It is understood that these notes will be issued in payment of loans made to the company by Mr. Rockefeller and his associates.

STRIKE IN ARGENTINA.—According to a press despatch, a railway strike of 23 days' duration which paralyzed the transportation system of Argentina was brought to an end on October 18. The strikers notified the president that they were not satisfied with a 10 per cent increase in pay granted by the railroad companies, but that they were resuming work as a mark of personal respect to the nation's executive.

CHEMICAL HEATER FOR SOLDIERS.—The Tech of Boston tells of an individual heating apparatus for soldiers which Colonel Robert L. Howze is now testing to determine its practicability. The heater is not larger than a canteen and it is claimed that it will keep hot for 36 hours and can then be recharged for another period. The heater is filled with a chemical fluid which is first heated by immersion in boiling water. The chemical action increases the heat to a high degree and maintains it for 36 hours. A new charge is a chemical substance no larger than a pea. The "stove" and fuel may thus be carried by a soldier in his haversack.

Railway Officers

Operating

J. C. Bailey has been appointed car service agent of the Desmoer & Lake Erie, with headquarters at Pittsburgh, Pa., succeeding F. A. Huber, resigned to go with another company, effective November 1.

W. C. Hamilton, trainmaster of the Copper Range, also has been appointed car accountant, with office at Houghton, Mich., succeeding G. H. Wescott, who continues in his position of general freight and passenger agent.

Frank Walker has been appointed trainmaster of the Springfield district of the Illinois Central, with headquarters at Clinton, Ill., succeeding Harry L. Moffett, granted leave of absence on account of ill health, effective October 8.

E. B. Kessler, assistant freight trainmaster of the Long Island Railroad at Jamaica, N. Y., has been appointed freight trainmaster vice W. E. Canning, promoted, and John Roe, assistant trainmaster at Jamaica, has been appointed assistant freight trainmaster, succeeding Mr. Kressler.

W. E. Fuller, special representative of the vice-president in charge of operation of the Chicago, Burlington & Quincy, with headquarters at Chicago, has been appointed superintendent of the Galesburg division, with office at Galesburg, Ill. E. J. Worden, superintendent at Galesburg, has been transferred to the La Crosse division at La Crosse, Wis., succeeding M. F. MacLaren, who has joined the Russian Railway Service Corps. Effective October 23.

J. W. Jones, superintendent of the Western division of the Wabash at Moberly, Mo., has been appointed superintendent of the St. Louis Terminal division, vice C. E. Ocheltree assigned to other duties. W. H. Eckard, superintendent of the Moberly division at Moberly, Mo., succeeds Mr. Jones, and L. W. Karnes, trainmaster at Decatur, Ill., has been promoted to superintendent of the Moberly division, with office at Moberly, Mo., vice Mr. Eckard.

O. R. Belcher, whose appointment as superintendent of the Nevada-California-Oregon, with headquarters at Alturas, Cal., was announced in the *Railway Age Gazette* of September 28, was born at Bryan, Tex., on October 7, 1881. He began railway work in July, 1897, with the Texas Central, afterwards the Missouri, Kansas & Texas of Texas, and was employed successively as section laborer, foreman, agent, train despatcher and conductor, until his recent appointment announced above.

F. H. Hammill, assistant general superintendent of the Chicago & North Western at Bonne, Ia., has been appointed general superintendent of the newly created northern district of the Union Pacific, consisting of the Nebraska, Wyoming and western divisions, with headquarters at Omaha, Neb.; and E. Stenger, general superintendent at Omaha, has been transferred to Kansas City, Mo., to become general superintendent of the newly created southern district, consisting of the Kansas and Colorado divisions, effective October 20.

T. F. Lowry, superintendent of the Rocky Mountain division of the Northern Pacific, at Missoula, Mont., has been transferred to the Montana division with headquarters at Livingston, Mont., to succeed B. O. Johnson, who has been granted a leave of absence to join the Russian Railway Service Corps. F. R. Bartles, superintendent of the Minnesota division with headquarters at Staples, Minn., has been transferred to the Rocky Mountain division to succeed Mr. Lowry. E. J. Hackenberg, trainmaster at Staples, Minn., has been promoted to superintendent at Staples to succeed Mr. Bartles. A. W. McClelland has been appointed trainmaster in place of Mr. Hackenberg. Effective October 20.

E. E. Nash, assistant general superintendent of the Chicago & North Western at Chicago, has been transferred to Boone, Iowa, succeeding F. H. Hammill, appointed general superintendent of the Union Pacific. H. M. Eicholtz, superintendent of the Chicago & North Western at Chicago, has been promoted to assistant

general superintendent vice Mr. Nash; B. E. Terpnung, superintendent at Belle Plaine, Iowa, has been transferred to Chicago vice Mr. Eicholtz; F. O'Brien, superintendent at South Pekin, Ill., has been transferred to Belle Plaine vice Mr. Terpnung; C. E. Helmer, assistant superintendent at Winona, Minn., has been promoted to superintendent at South Pekin vice Mr. O'Brien, and S. S. Long, division engineer of the Wisconsin division, has been appointed assistant superintendent at Winona, Iowa, vice Mr. Helmer.

W. B. McCaleb, superintendent of the Philadelphia division of the Pennsylvania Railroad, has been promoted to general superintendent of water companies to succeed the late George S. Cheyney; J. K. Johnston, superintendent of the Tyrone division, Tyrone, Pa., has been appointed superintendent of the Philadelphia division to succeed Mr. McCaleb; J. B. Hutchinson, Jr., assistant superintendent of the Pittsburgh division, at Youngwood, Pa., has been promoted to superintendent of the Tyrone division; H. H. Russell, division engineer of the Pittsburgh division, at Pittsburgh, has been promoted to assistant superintendent of the Pittsburgh division, and George C. Koons, assistant engineer of maintenance of way in charge of bridges and structures at Philadelphia, has been promoted to assistant superintendent of the New York division. Effective October 25.

J. M. Gruber, vice-president of the Great Northern, with headquarters at St. Paul, Minn., has assumed also the duties of general manager heretofore discharged by George H. Emerson, whom the Government has called to take charge of the Russian Railway Service Corps, and who has been granted an indefinite leave of absence by the Great Northern for that purpose. C. O. Jenks, assistant general manager at St. Paul, has been appointed assistant general manager of the lines west of Williston, N. D., with headquarters at Seattle, Wash. F. Bell, general superintendent at St. Paul, has been appointed assistant general manager of the lines from Williston, N. D., east, with the same headquarters. F. S. Elliott, general superintendent at Great Falls, Mont., has been appointed general superintendent of the lake district, with office at Superior, Wis., succeeding G. S. Stewart, given an indefinite leave of absence to enter the Russian Railway Service Corps. L. W. Bowen, assistant general superintendent at St. Paul has been appointed general superintendent of the eastern district, with headquarters at St. Paul, succeeding F. Bell, promoted. W. R. Smith, assistant general superintendent at Spokane, Wash., has been appointed general superintendent of the Central district, with office at Great Falls, Mont., in place of F. S. Elliott, transferred. P. F. Keating, superintendent at Whitefish, Mont., has been appointed assistant general superintendent of the eastern district, with headquarters at St. Paul, succeeding L. W. Bowen, promoted. John Sesser, superintendent at Superior, Wis., has been appointed assistant general superintendent of the central district, with headquarters at Great Falls, Mont., to succeed F. D. Kelsey, who has been transferred as superintendent of the Superior and Mesabi divisions at Superior in place of Mr. Sesser. F. J. Gavin, superintendent at Spokane, Wash., has been appointed assistant general superintendent of the western district, with the same headquarters, vice W. R. Smith, promoted. J. L. Close has been appointed superintendent of the Spokane division at Spokane, succeeding F. J. Gavin, promoted. M. C. LaBertey has been appointed superintendent of the Havre division, with headquarters at Havre, Mont., vice E. D. Woodcock, assigned to other duties. M. J. Flanagan, general master mechanic at Great Falls, has been appointed superintendent of the Kalispell division, with headquarters at Whitefish, Mont., succeeding P. F. Keating, promoted. Effective October 20.

Traffic

Frank I. Smith has been appointed commercial agent of the St. Louis Southwestern at Denver, Colo.

R. M. Dozier, assistant general freight agent of the Missouri Pacific at Omaha, Neb., has been transferred to Memphis, Tenn., effective October 15.

John B. Patterson, passenger agent of the Atlanta & West Point and the Western Railway of Alabama, at Montgomery, Ala., has been appointed district passenger agent, with office at Montgomery.

Lewis C. Mahoney, chief clerk in charge of Interstate Commerce Commission matters in the general freight office of the

Chicago, Burlington & Quincy at Chicago, has been promoted to assistant general freight agent in charge of the same class of work, with headquarters at Chicago, effective October 12. Mr. Mahoney was born on April 10, 1876, and entered the service of the Burlington on November 1, 1906, as a clerk in the general freight office at Chicago. He was later promoted to tariff clerk and then to chief clerk in charge of J. C. C. matters.

Engineering and Rolling Stock

H. P. Meredith, master mechanic of the Maryland and Delaware divisions of the Philadelphia, Baltimore & Washington, at Wilmington, Del., has resigned to go into other business.

O. B. Schoenky, superintendent of shops of the Southern Pacific at Los Angeles, Cal., has been appointed master mechanic of the Tucson division, with office at Tucson, Ariz., vice W. C. Petersen, transferred.

L. Jutton, division engineer of the Chicago & North Western at Madison, Wis., has been transferred to the Wisconsin division, with headquarters at Chicago, vice S. S. Long, and F. W. Hillman succeeds Mr. Jutton as division engineer at Madison.

H. W. Wagner, district engineer of the Atchison, Topeka & Santa Fe at La Junta, Colo., has been promoted to chief engineer of the eastern lines, with headquarters at Topeka, Kan., succeeding R. A. Rutledge. Mr. Rutledge has been transferred to La Junta as district engineer on account of ill health.

H. A. Macbeth, division master mechanic of the New York, Chicago & St. Louis, at Conneaut, Ohio, has been appointed assistant superintendent of motive power, with headquarters at Cleveland, and T. W. Coe, master mechanic of the Indiana Harbor Belt at Gibson, Ind., has been appointed master mechanic of the Nickel Plate at Conneaut, succeeding Mr. Macbeth.

F. Hodapp, road foreman of engines of the Baltimore & Ohio, at Flora, Ill., has been appointed supervisor of locomotive operation, Southwest district, with headquarters at Cincinnati, Ohio; B. F. Crolley, supervisor of locomotive operation at Cincinnati, has been relieved of jurisdiction over Southwest district, to assume position as supervisor of locomotive operation on Northwest district, with headquarters at Cincinnati; T. B. Burgess has been appointed supervisor of locomotive operation of the West Virginia district, with headquarters at Wheeling, W. Va., vice T. K. Faherty, transferred; C. H. Creager, road foreman of engines at Cincinnati, succeeds Mr. Hodapp; J. M. Mendall has been appointed road foreman of engines, with office at Benwood Junction, W. Va., vice W. F. Ross, deceased; and J. G. Kircher has been appointed road foreman of engines, with office at Parkersburg, W. Va., vice E. J. Langhurst, transferred.

A. C. Deyerell, superintendent of motive power of the Great Northern, with headquarters at St. Paul, Minn., has been given entire jurisdiction over the mechanical department. R. D. Hawkins, superintendent of motive power at St. Paul with jurisdiction over part of the mechanical department, having been given an indefinite leave of absence to enter the Russian Railway Service Corps, William Kelly, assistant superintendent of motive power at Spokane, Wash., has been transferred to St. Paul. Henry Yoerg, mechanical engineer, has been appointed assistant superintendent of motive power, with headquarters at St. Paul. W. R. Wood, mechanical valuation engineer, has been appointed mechanical engineer, with office at St. Paul, in place of Mr. Yoerg. J. J. Dowling, master mechanic at Delta, Wash., has been appointed general master mechanic of the central district, with office at Great Falls, Mont., vice M. J. Flanigan, promoted, to superintendent at Whitefish, Mont. T. J. Clark, master mechanic at Spokane, has been appointed general master mechanic of the western district, with the same headquarters, succeeding William Kelly, promoted. All changes were effective October 20.

R. H. Pinkham, division engineer of the Renovo division of the Pennsylvania Railroad at Erie, Pa., has been appointed division engineer of the Pittsburgh division; John Atlee, supervisor of the Pittsburgh division at East Liberty, has been promoted to division engineer of the Renovo division; G. W. Snyder, principal assistant engineer of the Western Pennsylvania division at Pittsburgh, has been appointed assistant engineer of maintenance of way to succeed G. C. Koons; W. T. Covert, division engineer

of the Philadelphia Terminal division, has been promoted to principal assistant engineer of the Western Pennsylvania division, with office at Pittsburgh; C. E. Brinser, division engineer of the Middle division at Altoona, has been promoted to division engineer of the Philadelphia Terminal division; A. W. McClellan, division engineer of the Williamsport division at Williamsport, has been promoted to division engineer of the Middle division; Robert C. Faries, division engineer of the Elmira division at Elmira, N. Y., has been promoted to division engineer of the Williamsport division; C. M. Wisman, supervisor of the New York division at Trenton, N. Y., has been promoted to division engineer of the Elmira division; J. C. Hackenberg, division engineer of the Allegheny division at Oil City, Pa., has been promoted to division engineer of the Maryland division, with office at Wilmington, Del., to succeed Division Engineer J. R. McGraw, who was granted a leave of absence, and E. G. Nyars, supervisor of the Baltimore division at Bowie, Md., has been promoted to division engineer of the Allegheny division. Effective October 25.

Purchasing

A. L. Cochrane, general storekeeper of the Denver & Salt Lake at Denver, Colo., has been appointed purchasing agent and storekeeper, vice C. N. Davids, resigned.

H. A. Anderson, special agent in the purchasing department of the Pennsylvania Railroad at Philadelphia, Pa., has been promoted to assistant purchasing agent; B. P. Phillippe, coal agent in the purchasing department, has been promoted to assistant purchasing agent, and D. T. Jones, stationer, has been promoted to assistant to purchasing agent.

Railway Officers in Military Service

M. F. MacLaren, superintendent of the La Crosse division of the Chicago, Burlington & Quincy, at La Crosse, Wis., has joined the Russian Railway Service Corps.

George H. Emerson, general manager of the Great Northern at St. Paul, Minn., has been called by the Government to take charge of the Russian Railway Service corps.

R. D. Hawkins, superintendent of motive power of the Great Northern, at St. Paul, Minn., has been granted an indefinite leave of absence to enter the Russian Railway Service corps.

M. C. Kennedy, president of the Cumberland Valley at Chambersburg, Pa.; J. A. McCrea, general manager of the Long Island at New York, and the following officers of the Pennsylvania Railroad at Philadelphia, Pa., have been granted leave of absence in order to join the American expeditionary forces in Europe: H. C. Booz, assistant chief engineer; C. M. Bunting, controller; W. H. Farraday, assistant purchasing agent, and I. A. Miller, chief accountant in the general manager's office.

OBITUARY

L. D. Heusner, assistant general passenger agent of the Michigan Central at Detroit, Mich., died at his home in that city on October 17.

J. A. Williamson, district passenger agent of the Baltimore & Ohio at Toledo, Ohio, died at that city on October 15, as the result of an automobile accident.

E. E. Mote, manager of the Pacific Car Demurrage Bureau, died at his home in San Francisco, Cal., on October 19. Mr. Mote was one of the most prominent men in the demurrage field, in which field he began his work several years ago at Kansas City, Mo. He was president of the American Association of Demurrage Officers in 1912 and 1913. As the chief agent in the administration of demurrage affairs in California he has been influential in one of the most important recent reforms in freight car service, namely, the introduction and promotion of the high rate (\$6 per car per day for two years, 1909-1911, and \$3 since 1911), by which delays and misuse of cars have been greatly reduced. Only a few weeks ago he issued a circular appealing for efficiency under war conditions, and containing a strong argument against the use of the "average agreement" in charging for delays to freight cars. He cited statistics to support his contentions. He had the satisfaction of seeing the three-dollar rate put in effect in New Mexico last year, and later in Colorado.

GENERAL NEWS SECTION

* Illustrated.

The attitude—affable or the opposite—in which a ticket seller or a conductor deals with a passenger may have an important effect in making friends—or enemies—for the road. This has been the substance of innumerable admonitions, by circular and otherwise, to trainmen and station men. The same principle applies also in the case of men “higher up.” The Springfield (Mass.) Republican of recent date says:

Pleasing the Public in Non-Essentials

“The Edison Company has been attacked at a hearing in Boston before the gas and electric commission on the charge that that company maintained an extensive lobby at the state house and the city hall. Whatever the facts in the Edison case, it can hardly be denied that railroad and other public service corporations employ a large amount of legal talent in getting their claims presented to public bodies. When certain citizens appeared recently before the Massachusetts Public Service Commission to ask for the restoration of certain train service on the Boston & Maine, the railroad's case was presented, not by a representative of the operating or the traffic department, but by a lawyer. Yet a simple and businesslike explanation of conditions from a railroad officer would probably have left a better impression on the petitioners than a lawyer's explanation of a matter in which no point of law was involved.”

The impressions made on people's minds constitute the whole text of the Republican's little editorial. Not a very large matter, surely; but is not the suggestion just as significant as that relating to the ticket seller? Not that the lawyer was not affable; very likely he was excessively so; but the mere fact that a man is a lawyer, whose meat and drink is polemics, may often be sufficient to produce the unfavorable impression to which our contemporary alludes. The lesson of this little incident is for the superintendent and the general passenger agent: make yourself so fully and thoroughly competent to represent your department before commissions and other public authorities or assemblies that the general manager will never think of calling in the legal department to speak for you. Or, to put it another way, consort so constantly with the gentlemen of the legal department that you can appropriate for yourself all their finest arts! It is no answer to this to say that superintendents are men of action, while lawyers are men of words; there is no law forbidding the superintendent to be skillful both in actions and in words.

Because of a typographical error the *Railway Age Gazette* said in its editorial, entitled “Now Comes the Real Tug of War,” which was published in last

The Increase in Locomotive Efficiency

week's issue, that in July the railways handled “almost 10 per cent more ton-miles with each freight locomotive than they did in July, 1916.” The statement should have been that they handled almost 19 per cent more ton-miles with each locomotive. This figure calls attention to the increases which have occurred recently in locomotive efficiency. The number of ton-miles handled with each freight locomotive in 1916 was over 26 per cent greater than in 1915; but the performance of 1916 has been far surpassed by that of 1917. The Railroads' War Board was organized in the early part of last April. In that month the ton mileage per locomotive was 13.3 per cent greater than in April, 1916. In May the increase in ton mileage per locomotive over the same month of the preceding year was 15½ per cent; in June, 21 per cent, and, as already indicated, in July, 19 per cent. These increases in ton mileage per locomotive have been partly due to increases in the number of tons handled per train and partly to increases in the number of miles made per locomotive per day. The increases in the trainload over that for the corresponding months of last year have ranged from 6½ to 11½ per cent. The increases in the average number of miles made per locomotive per day have not been relatively so large, but they have been of much importance. In the months of April, May, June and July, 1916, the average miles made per locomotive per day never exceeded 66 miles. In the same months of 1917 the average mileage per locomotive per day never was less than 68.8 miles, and in June it was 70.7 miles, and in May, 71.3 miles. The shipping public deserves much of the credit for the increases in the average loading per car, and of course these have contributed to the increases in the average trainload, but the railways deserve all of the credit for the greater efficiency represented by the increases in the average number of miles run by each locomotive daily.

RIDER ON COMMERCE ACT AMENDMENT PRODUCES RATE TANGLE

THE war has led to such a general application of the principle of governmental price-fixing that the popular assumption is that it is something new. As a matter of fact, the railroads have been subject to price-fixing by federal and state governments for the past ten years. During that time the rate scales and adjustments of years upon which the commercial prosperity of the country was founded have been attacked and dissected to such an extent that hardly a trace remains of the railroad rates which were in effect in 1907. With a few exceptions, such as the "five per cent" rate case, the trend of rates has been downward in the past decade. The difficulties of the railroads have been intensified by the conflicting activities of the federal and state regulatory bodies. The same testimony and the same expenses incurred by a hearing before one commission must be duplicated before another. Frequently, the decisions of different commissions are far apart with resultant inconsistencies in rates. In this regard, the "five per cent" case is typical. In 1914 the Interstate Commerce Commission granted advances in rates after an investigation extending over a period of several months. The Public Service Commission of Indiana has not yet permitted the rates to become effective on intrastate business.

The acme of repressive regulation was reached recently when a rider was attached to the bill increasing the size of the Interstate Commerce Commission, which prohibits any advance in freight rates until the reasonableness of such an advance has been first passed on by the commission. The result of this amendment has been to prevent the completion of certain readjustments of rates which actually had been begun, with the result of throwing many tariffs into a snarl that has caused some glaring examples of unfair discrimination between communities and shippers. The rate tangle which has been created will add months of work to the already crowded docket of the overburdened commission.

Illustrative of the complications resulting from the new amendment are the iron and steel rates between Youngstown, Ohio, and Chicago, and between Pittsburgh, Pa., and Chicago. There are at present two sets of rates in effect from Youngstown to Chicago, one of which is higher than the rates from Pittsburgh. This is due to the fact that certain railroads carry special tariffs on iron and steel from Pittsburgh and Youngstown, while other carriers publish class rates covering those articles. On September 20 all class rates were advanced in Official Classification territory and the roads issuing commodity tariffs covering iron and steel from Pittsburgh and Youngstown have been unable to raise these rates to conform with the class rate advance because of the present necessity of securing the approval of the Interstate Commerce Commission. Application for such permission was filed with the commission prior to September 20, but, up to the time of writing, it has not yet been acted upon, with the result that iron rates from the iron producing districts in central Ohio and western Pennsylvania are in a very chaotic condition.

There are many other examples of rate inconsistencies resulting from the legislation referred to. Petroleum rates from St. Louis and Peoria to Detroit, Cleveland and Pittsburgh have been advanced while Chicago rates to the same cities have remained unchanged. Rates on lumber from Chicago to Detroit, Cleveland and Pittsburgh have been advanced, but St. Louis rates to the same points have not changed. Under the law as it stood before it was amended, these inconsistencies would not have developed, since, unless the commission formally interfered, the railways could have gone ahead and finished the readjustments of rates on which they had begun.

The passage of the provision in question is an example

of the sort of ill-considered, half-baked regulation to which the railways have been subjected ever since the era of regulation was entered. The representatives of other classes of industrial concerns have stood by without interfering apparently on the theory that it was "not their funeral." Now, however, that other classes of industries are being subjected to regulation, men in other lines of business may become able to appreciate better what slap-dash regulation means and be more disposed to co-operate with the railways in trying to put a stop to it.

DISCIPLINE IN ITS MORE DIFFICULT ASPECTS

A RHODE ISLAND correspondent, in another column, discusses the three disasters to passengers recently prominent in the news. The main issue is simple, without regard to the details of the antecedents; all railroads, however high the quality of their forces, as a whole, must be alert to detect men who lack the health or the moral self-discipline to keep awake in the cab; and all must expect always to have a percentage of men who never had and never will have the courage to tell the whole truth about a collision, if their own vital interest seems to be at stake. (In fact it takes unusual grit to tell unpleasant facts in many situations where the issues are far less important than the loss of one's job or reputation.)

With these two most familiar faults—falling asleep on duty and telling lies, in extreme circumstances—we may consider also the reckless habit of neglecting regular sleep (going to a ball game or joining one's wife on a shopping excursion, when the rest period happens at a time favorable to those diversions) and the combination of poor judgment and a too-high estimate of the value of money which results in going on duty too soon after a serious sickness. All these faults are alike in that they cannot be dealt with directly. Firemen cannot be depended on to report a sleepy engineer. No inspector can follow men when they are off duty. Equivocators cannot be cured of their vice except as their moral natures are educated. We are here dealing with the most elusive of the human weaknesses which the trainmaster encounters in the performance of his educational functions; imperfections which no printed rules will touch. The problem is to do whatever is possible to get men into that frame of mind where they will not desire to do the wrong thing; or more accurately, where they will, with definite and intelligent purpose, desire to do the right thing.

If we review what we have learned in the past concerning the solution of this problem we shall find it pretty well summed up under two heads: (a) Keep up the training of all employees, even the experienced, so that none shall get rusty on the rules, and (b) see that, always, between the officer and the employees there is a *good understanding*. The first indicates *what* is aimed at and the second indicates *how*; or, rather, the *how* as it relates to the finishing touches. The first may seem to be so obvious and elementary as not to need mention; but is it not often true that unfamiliarity (not ignorance) as regards a simple rule is the first weakness found in an employee who has failed at some point? The second point, a good understanding, is the first and the most important practical element in esprit de corps (which we talk about in theory) actually carried out in a tangible way. Until the officer and the employee understand each other well enough to have some degree of actual sympathy, there can be but faint assurance that the employee has acquired a usable knowledge of the rules, much less an intelligent determination to carry them out. Incidentally, a good understanding is the only eradicator of the strike microbe.

And what we have learned in the past comes pretty near to being all that there is to be learned now. We have learned the lesson but we have not learned it well enough. This article is not designed to bring out any new lessons, but to

call attention to old ones. If we were to go into details we might make the same mistake that is so often made in actual life in the railroad office; keep the attention too closely riveted on the elementary branches of the subject. The most direct injunction that the superintendent or trainmaster can take to himself in this matter is to put a hundred per cent more energy into the same kind of work that he is already doing. In that way he may carry himself and his pupils above the primary class, and broaden both the pupils and himself.

There is, however, one new suggestion; it is found in the brief address of C. H. Baltzell, a superintendent of the St. Louis-San Francisco, before the National Safety Council in New York City last month (*Railway Age Gazette*, September 21, page 521). Speaking of the safety-first propaganda as applied to men in train, yard and switching service, he said that it was a good thing to encourage athletics among these men, as a recreation; for the reason that the man who practices athletics is much more alert to take care of himself and avoid bodily injury in his everyday work. Why not adapt this advice to mental as well as physical work and recreation? Men who exercise their minds when off duty, in recreation or otherwise, will exercise them with better skill and effect when on duty.

RAILWAY MAIL PAY

IN a formal statement filed with the Interstate Commerce Commission early in March the Postmaster General stated that under the space basis of compensating the railways for carrying the mails, put in effect on November 1, 1916, and the tentative rates put in effect at the same time, the total compensation of the railways was \$3,225,405 a year greater than it would have been under the weight basis and rates previously applied. Similar information was imparted to the public in a press statement given out by the Post Office Department about the same time. Since then, however, something has happened to the \$3,000,000. It does not show up in the latest reports of railway earnings and expenses. Incidentally, the reasons why it does not may serve to explain why mail is sometimes received less promptly than formerly.

The Interstate Commerce Commission gave out the other day its usual monthly statement of railway earnings and expenses for the month of July and seven months of the calendar year. This showed very large increases in the revenues received by the railways for the transportation of freight, passengers, express and "all other transportation"—together with corresponding increases in all items of expense—but the revenues from mail traffic for the month showed a decrease from \$5,052,461 in July, 1916, to \$4,836,825 in July, 1917, or from \$22 to \$21 per mile. For the seven months the mail revenue was \$35,476,220 as compared with \$35,197,712 in 1916. This is an increase of \$278,000 or only from \$153 to \$154 per mile. Freight revenue per mile had increased from \$6,172 to \$6,900; passenger revenue from \$1,675 to \$1,877; express revenue from \$215 to \$259, and revenue from all other transportation from \$259 to \$278. Has all this increased volume of business been carried on without an increase in the amount of mail correspondence? Has the boasted parcel post failed to keep pace with the increases in other kinds of transportation? Perish the thought! For the calendar year 1916 the railways' revenues from mail pay were \$265 per mile as compared with only \$255 in 1915. Up to March of this year they still showed an increase. Something has happened since that time with the result that for seven months of the year the railways had actually received only \$278,000 out of the promised \$3,200,000 increase.

As a matter of fact, it has been promised ever since 1914, when the joint congressional committee, which recommended

the space basis of payment and the rates which went into effect tentatively last November, estimated that they would increase the railways' compensation by about \$3,000,000 a year. The railways have always been suspicious of the estimate, and have protested that the rates were too low, while the Postmaster General has asked the Interstate Commerce Commission to reduce them on the ground that they allow the roads to earn too much money.

What has happened to the \$3,000,000 has been exactly what the roads foresaw. In fact, some of the advocates of the law themselves had felt called upon to explain the joker to their colleagues in defending themselves against charges of too great liberality to the railroads. Formerly the railroads were paid for carrying the mail on the basis of weight, just as the post office department itself receives its pay on the weight basis. Under the space basis, so long advocated by the department, it pays the roads so much per car for each mile the car is hauled and has the privilege of putting as much mail in a car as it can get in. The railroads cannot object to this; it is exactly in accordance with their campaign to induce shippers to load freight cars to capacity. The difficulty is in the question of rates. The rates now applied were based on the former average loading of about 3 tons to a car, while the maximum capacity of a car ranges up to 20 tons. In other words, the post office department proposed, and got Congress to approve tentatively, a plan whereby it pays the railroads per car mile about what it used to pay for a 3-ton car, and then proceeds to take the mail out of two or three cars or trains and load it into one. This was explained by Representative Moon in the debate in the House on February 8, 1916, in the following language:

"But, you may ask me, if it is costing more by three or four million dollars, in the first place, to go to the space basis than to remain on the weight basis, why should we make the change? My answer is . . . your department can handle the cars in which they pay for the space and can so adjust the loading and unloading and the transportation as to recoup within a year or two every dollar that is lost by the change in the basis of compensation from weight to space."

The department has apparently arranged matters so that it can recoup even before the first year is up. The new plan had been in effect but a short time when the department issued its statement to the press that it was paying the railways at a higher rate per year than before, and for a time the railway mail revenues showed a slight increase. But this was not for long. A general readjustment of mail service was undertaken. Mail formerly handled in two cars on two trains was "consolidated" into one car on one train. On some trains the space formerly used by mail clerks to sort the mail en route became too valuable to be used for that purpose. The clerks were taken off, the space was filled with mail formerly carried on an earlier train and the sorting was done after arrival at the terminals. This reduced the expenses of the department and the revenues of the railways but it also delayed the mails. People who now receive letters on the second delivery that formerly arrived the first thing in the morning should not jump to hasty conclusions that the delay is caused entirely by the fact that the railways are hauling so many troops and so much government freight.

Undoubtedly, the heavier loading of mail cars possesses some compensating advantages to the railways. It is cheaper to haul one car loaded with 10 tons of mail than two cars holding 5 tons each. Moreover the entire question of mail pay rates is now before the Interstate Commerce Commission for determination, elaborate statistics are being gathered by both the roads and the department to aid it in its decision, and whatever rates the commission finds just and reasonable will be made retroactive.

The point is that the post office department has tried to

make the public think it has increased the railway mail pay when in fact it has reduced it, for no one believes that the volume of mail carried is not greater than it was last year.

Possibly the statement that the roads were being paid more was intended to soothe the considerable element that believes that railway mail rates have always been too low, while the effort to reduce the rates is for the benefit of the class, which probably includes more voters, that believes otherwise or that does not care whether the railroads are treated fairly.

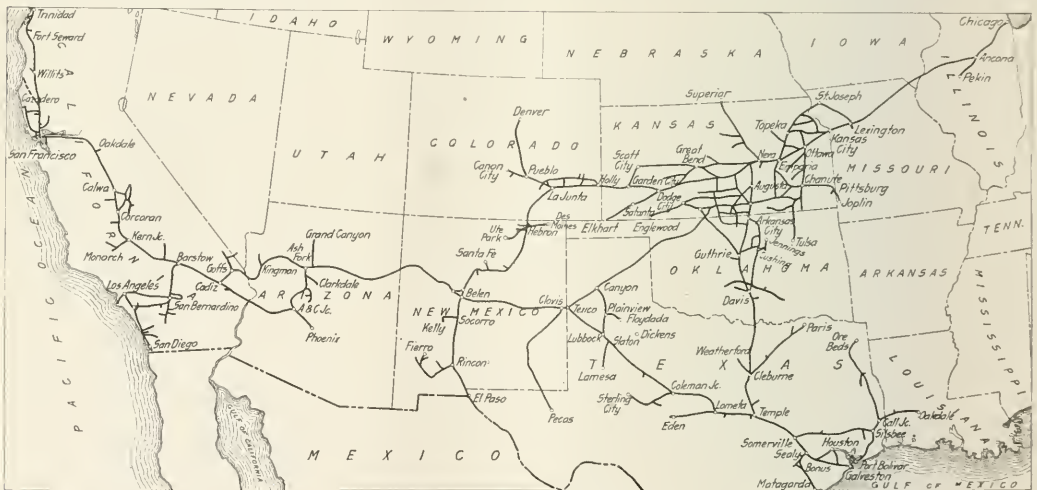

ATCHISON, TOPEKA & SANTA FE

THE amount required to pay interest on all of the outstanding bonds of the Atchison, Topeka & Santa Fe was less in the fiscal year ended June 30, 1917, by approximately half a million dollars than the amount required to pay the interest on the bonds outstanding 10 years before. In 1908 the interest requirements were \$12,579,000; in 1917, \$12,113,000. Since 1908 the Atchison has invested \$169,407,000 in additions, betterments and extensions, this being on top of an investment in railroad property of \$577,433,000 made prior to June 30, 1908. As an example of conservative financing, this is almost unique in American

The causes and conditions which have permitted increased investment to be followed by more than a proportionate increase in net available for profit on investment, and the manner in which new capital was raised for investment, although related both in their results and in their causes, should be studied separately.

The fiscal year ended June 30, 1917, was a record year both in gross and net earnings for the Atchison, Topeka & Santa Fe. Gross totaled \$159,627,000, comparing with \$137,070,000 earned in 1916, which year itself was far and away better than any previous year. Net available for interest and dividends was \$51,789,000, comparing with \$45,132,000 in 1916, which year again was better, as far as net was concerned, than any previous year in the company's history. In other words, up to June 30, 1917, the Atchison had not ceased to enjoy the full effects of the law of increasing returns on railroad investment which the majority of American railroads felt up to 1907 and which up to that time was generally considered as characteristic of well managed roads in this growing country.

In 1917 freight revenue amounted to \$111,809,000, an increase of \$20,377,000. Passenger revenue amounted to \$32,770,000, an increase of \$1,201,000. The Atchison in 1917 operated 11,270 miles of road, so that the average gross

The Atchison, Topeka & Santa Fe

railroad history. But even more remarkable is the fact that whereas so many roads have felt the law of decreasing returns during these 10 years and that the average return on all railroad investment during this time has been on the downward trend, the net on the Santa Fe has shown an increasing ratio of percentage earned on investment. Notwithstanding the enormous increase in investment, the great increase in rate of wages and cost of materials, and in fact of all costs of doing business, the Atchison earned net available for interest and dividends totaling \$51,789,000 in 1917, or at the rate of 6.93 per cent interest on its total property investment. Each of these two facts—the conservatism of its financing and its increase in earning power more than commensurate with the increase in investment—has a most important bearing on the value of Atchison stock as an investment; but in studying the economic aspects of the development of the property in their relation to the economics of railroad operation and development in general in this country, the two must be kept entirely separate and distinct.

revenue per mile of road was \$13,858. With an increase of \$22,417,000 in total revenue over 1916 there was an increase of \$12,603,000 in expenses, the total expenses in 1917 being \$96,334,000. Maintenance of way expenses were slightly less in 1917 than in 1916, due in part to the extraordinarily heavy maintenance expenses of 1916 necessitated by the Galveston flood, and in part by the scarcity of labor which necessarily limited maintenance expenditures. Maintenance of equipment cost \$25,273,000 in 1917, an increase of \$4,758,000 over the previous year. Apparently every effort was made to keep the same standard of maintenance of equipment as that adhered to in previous years and the increase in expenses represents the increased cost of material and of labor.

Transportation expenses amounted to \$45,911,000, an increase of \$7,629,000. Notwithstanding the fact that the second half of 1917 reflects the increased wages necessitated by the so-called eight-hour law and the great increase in fuel prices—both coal and oil—which have taken place, the

ratio of transportation expenses (the out of pocket cost of doing the business) to gross operating revenues has increased only slightly—from over 28 per cent to approximately 29 per cent. A ratio of transportation expenses to gross revenues of less than 30 per cent in these times of high labor costs and high material prices is truly remarkable. Adequate facilities, an adequate organization and a very efficient use of facilities are in general the explanation of this striking showing. The Atchison serves a country which has grown in population and in prosperity very rapidly. The railroad has expanded both extensively and intensively at a rate which has continuously kept facilities well ahead of the requirements placed upon them.

The policy pursued by the Atchison management and that pursued by the Pennsylvania Railroad are founded on the same principle. Both managements have attempted to develop their property with an eye to many years in the future. Pennsylvania was met with obstacles in the way of procuring additional terminal facilities, etc., that made its problem quite different from that of the Atchison. The phenomenal success of the Atchison must be attributed in great part to the accuracy with which President Ripley and his directors forecast the trend of the development of the country and the skill, foresight and effectiveness with which the railroad property was developed to conform with these forecasts. When compared with the mistakes that have been made in extensions and developments of some of the other southwestern roads the precision with which the Atchison built or bought new lines, added to its facilities here, built double track there, etc., seems almost uncanny.

The conservative and sound policy of financing which was pursued would have been impossible without the success of the management in developing new business and handling it at a cost which showed steadily increasing profits. On the other hand, it would have been easy to have pursued a different financial policy, and a full realization should be had of how important it is that the Atchison financed its constantly and rapidly growing needs through the sale of stock or convertible bonds, which in large part have been converted into stock, and through the expenditure of surplus belonging to the stockholders. In 1908 there was \$217,130,000 stock outstanding and \$315,454,000 funded debt outstanding. At the end of 1917 there was \$343,822,000 stock and \$288,809,000 bonds outstanding.

The Atchison is today, in credit and in cash resources, in a most enviable position. There are no loans and bills payable. Cash on hand amounted on June 30, 1917, to \$37,788,000, and time deposits to \$1,260,000. Materials and supplies, which are inventoried not at their present value but at their original cost, which was much lower than the present value, totaled \$18,981,000.

Is there a sign of a turn in the tide of affairs of the Atchison, Topeka & Santa Fe in its annual report for 1917? That is a question of vital importance and yet one which is quite impossible of authoritative answer. In 1908, with which year certain comparisons in these remarks have already been made, there was a quite startling drop in net available for interest and dividends, and 1907, the year previous, had been a year of great prosperity. Could anyone in 1907 have predicted the 1908 results? Could anyone in 1908 have predicted the results of the next ten years? The answer to the first question is comparatively easy. There were many people as far back as 1906 who foresaw the trend of general conditions and the management of the Atchison itself in 1907 was preparing quite effectively for the great depression which took place in business during that and the following year.

The answer to the second question cannot be definite, but the fact is that the Atchison went on with its program of improvements. There is no evidence now, in going back over the annual reports of the company, that President

Ripley lost faith in the future of his company or faltered in his program of keeping facilities ahead of the requirements thereof. On the other hand, it is almost impossible to calmly study present railroad conditions and not feel that even the Atchison cannot go on long showing increasing margin of safety to investors or even a continued margin of safety unless there is a change in general conditions. It may well be that 1917 is not the culmination of the history of the road. It may be that it is a high peak which will be succeeded by depressions and other high peaks, but it is difficult to see how certain general and fundamental conditions which are affecting other railroads can be for an indefinite length of time fended off by the Atchison, Topeka & Santa Fe.

Take the question of taxes alone. President Ripley estimates that it is probable that they will be \$12,000,000 for the calendar year 1917. In the fiscal year ended June 30, 1917, taxes amounted to \$9,871,000. In the previous fiscal year they amounted to \$6,210,000. In recent years they have averaged less than \$6,000,000. Here is an increase of 100 per cent. The increases in wage costs vary, and are not, of course, anywhere near 100 per cent, but on the other hand they are great enough so that it is almost inconceivable that a large enough gain in business can be handled with a small enough increase in number of employees to offset this higher cost, nor is it easily conceivable that heavier train loading, better car loading, greater number of miles per car per day and more effective use of facilities can at the present rate of increased costs offset the higher prices for materials. It is said of the late E. H. Harriman that he could see the downward trend of events, and of railroad prosperity in particular, after 1906 as clearly as anyone, but that he remained an optimist because of his entire confidence in his own ability to meet any conditions which might arise. It may be that Mr. Ripley and the Atchison are such strong swimmers that a tide which may bring disaster to the majority of railroads can be successfully breasted, but such a belief, notwithstanding the truly wonderful showing of the Atchison in 1917, must be founded on faith rather than on substantial evidence.

The following table shows the principal figures for operation in the fiscal year 1917 compared with 1916:

	1917	1916
Average mileage operated.....	11,270	11,247
Freight revenue.....	\$111,809,085	\$91,432,429
Passenger revenue.....	32,770,085	31,568,601
Total operating revenues.....	156,179,121	133,762,392
Insurance of way and structures.....	19,119,336	19,518,635
Maintenance of equipment.....	25,273,169	20,514,960
Traffic expenses.....	2,780,823	2,755,736
Transportation expenses.....	45,910,505	38,281,054
General expenses.....	3,494,122	2,904,040
Total operating expenses.....	96,333,569	83,730,960
Taxes.....	9,870,634	6,210,366
Operating income.....	49,951,675	43,779,993
Gross income.....	53,399,966	47,087,123
Net income.....	39,209,073	32,579,735
Dividends.....	19,250,325	18,690,965
Appropriated for additions and betterments.....	19,875,211	7,000,000

NEW BOOKS

Railway Connections and Junction Points. By R. H. Gray. 341 pages, 4 in. x 6 3/4 in. Bound in paper. Published by H. K. Cammann, 24 Market Place, Baltimore, Md. Price \$1.50.

This little handbook shows, in compact form, the passenger and freight connections of about 150 of the principal railroads of the country, symbols being used to aid the reader in quickly distinguishing between freight and passenger connections; between places where there is a track connection and those where there is none, and to show other data. The book is printed in rather small type, but even at that the New York Central's connections fill more than seven pages. The Central connects with the Lehigh Valley, for example, at 22 places; with the Wabash at 18, and the Pere Marquette at 11, etc. The Seaboard Air Line connects with the Atlantic Coast Line at 63 places. The Southern, the Southern Pacific and other large roads show equally ponderous lists.

The Chicago & North Western and the Chicago, Milwaukee & St. Paul probably take the medal; the stations of these roads are in neighborly (or unneighborly) juxtaposition at no less than 123 places. These are all shown, in alphabetical arrangement, under each of the two roads.

Locomotive Handbook. Compiled by the American Locomotive Company. Bound in leather, 195 pages, 3½ in. by 6 in. Published by the American Locomotive Company, 30 Church street, New York. Price 75 cents.

The locomotive designer has always felt the need of a compact and concise source of information on the fundamentals of locomotive design for ready reference. The American Locomotive Company has done much to supply this need in this Locomotive Handbook which has just been published. Heretofore the locomotive designer has been compelled to refer to material published in various places to get the information he desired on locomotive design, or else possibly to refer to rather cumbersome notes compiled by himself. The Locomotive Handbook will, therefore, fill a real need.

The book opens with a brief description of the American Locomotive Company. This corporation has a full working capacity of 3,000 locomotives per year and employs 20,000 men. This is followed by formulas and tables giving the tractive effort of both simple and compound locomotives. The next subject considered is Train Resistance, the material being contributed by F. J. Cole, chief consulting engineer of the American Locomotive Company. It includes data on the resistance of freight and passenger cars of different weights and at different speeds, together with information showing how the results of tests check with the values given in the handbook. A comparison of the resistance of four and six wheel trucks is made and interesting information is included regarding the effect of a stop in increasing resistance. All phases of the subject are considered, such as velocity grades, acceleration, weather conditions, track resistance, etc.

About eighteen pages are devoted to the subject of locomotive ratios; this was also written by Mr. Cole and is based substantially on bulletin 1017 issued in January, 1914, by the American Locomotive Company. Illustrative examples are given to show how the information given under this head is to be used. Both saturated and superheated steam locomotives are considered. Following this is a section of about eight pages which gives the efficiency of longitudinal seams, stresses in staybolts and crown stays, method of bracing the back head and front tube sheet, the shearing stresses on rivets, etc.

Valuable information is also given on counterbalancing and fuel oil, the counterbalancing information being taken from the 1915 proceedings of the American Railway Master Mechanics' Association. Ten pages are devoted to the federal rules on locomotive inspection and testing.

The balance of the handbook contains methods used by the American Locomotive Company in the design of axles, crank pins, frames, piston rods, helical springs, elliptical springs, location of gage cocks for various grades over which the locomotive operates, piston thrust, etc. Information in tabular form is also given regarding the proper pressures for mounting wheels and piston rods. Several tables are included showing the effective area of staybolts, the proper location of tires on driving wheels, standard U. S. screw threads, properties of saturated and superheated steam pipe threads, wire and sheet metal gages, moduli of rectangular and circular sections, decimal equivalents, speed-second table, tangent deflections, metric unit and U. S. equivalent tables, etc. Information is also given regarding valve setting, including instructions for setting the Walschaert valve gear.

Much time and a great deal of time have been exerted in the compilation of the information published in this book and it will be of considerable assistance to railroad men interested in locomotive design.

Letters to the Editor

THE WEARY AND THE UNTRUTHFUL

PROVIDENCE, R. I.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The North Branford (Conn.) collision of trolley cars has a lesson for us, has it not?

The report of the Connecticut Utilities Commission on this collision, which has recently been issued,* discloses a good deal of loose practice; irregular working hours, weak or worthless supervision, and absence of necessary rules. The natural comment of the steam-railroad man will be that this collision has no lessons for him; but is this so certain? The steam roads do, indeed, have the 16-hour law to restrain them, and the stern logic of costly collisions in the past has taught them the need of constant and vigilant supervision of all train operations; but the spirit of the 16-hour law is often violated by them now, the same as in former years; and many superintendents, probably the great majority, have to confess (to themselves) that the actual supervision of the personnel on their division is far below their ideals.

The steam-road officer who allows men habitually to work as close to the 16-hour limit as is practicable may not be very different, judged by final results, from the trolley-road officer who works men up to a limit fixed by himself; for, from the standpoint of the supervising officer, 16 hours is a very long day. (This is not saying that it is always dangerous for men to be on duty for that length of time. For the individual, in a particular instance, it may or it may not be excessively long. In countless thousands of cases, trainmen in good health and with the proper spirit, working under favorable conditions, have remained on duty, running trains at moderate speeds, for 16 hours, with no bad results.) And, disregarding, for the moment, all rules and technicalities, we have in this North Branford case two conditions which must be dealt with everywhere: (a) men who go on duty when tired in body, or absorbed, mentally, in something outside their work; and (b) men whose explanations of their dereliction, after the event, are of such character that everybody doubts or denies their truth. In the cold but convincing phrase of the old-time superintendent, saddened as he is by experience, men of all kinds will try to lie out of a bad scrape. Or, in more refined language, many men in all classes are found to lack the courage to tell the truth about their own delinquencies.

Very bad collisions have not been so frequent of late; and, if constant agitation of railroad dangers is the only way of keeping railroad superintendents and trainmen fully alert, it may be that we are not now as alert as we should be; but I need not remind your readers that the lessons are still needed. Even while we read of this trolley collision we have the report of a rear collision at Earlville, Illinois, September 16, where the engineman was asleep. Seven passengers were killed. Does not this require the application in steam road service of the most searching lesson of the North Branford case? Again, Kellyville, Oklahoma, with 25 killed (September 28), would seem to illustrate deficient discipline and education as poignantly as the sleeping trolley conductor at North Branford.

WHATCHEER.

FAST TRAIN RUN IN IRELAND.—On the conclusion of the visit to Cork of the Irish Convention a special train was run from that city to Dublin, which covered the 170 miles in 174 minutes, including a stop of ten minutes at Mallow.

A Study of the Car Interchange Situation

Empty Mileage and Proper Maintenance Important Factors in Distribution Plan. Standard Designs Necessary

By Samuel G. Thomson*

THE various codes for car service and interchange rules which appeared in the issue of the *Railway Age Gazette* of August 17, page 279, and which were part of a contest for the best suggestions for a new code, are valuable contributions to this subject and contain much material for further thought. This subject involves the most important transportation problems before the railroads today, and should be kept alive by the active discussion of just such men as have contributed to this contest, in order that all may have the benefit of the other fellow's view. Every railroad in the country should have men in their organizations who are studying the broader use of our railroad car equipment, in addition to their own local transportation problems and the interchange of cars with their immediate neighbors.

Without attempting to review the various details of the above mentioned codes, let us consider whether they embody the correct principles, for it is along this line that present discussion should be encouraged; since the formulation of details will be of no avail until the principles are first clearly established and mutually agreed upon.

HOW MANY CARS SHOULD A RAILROAD OWN?

Each railroad should find it profitable to own, with a reasonable margin of safety, sufficient cars of each kind to take care of the normal business which originates and is distributed on its lines, and also to contribute its fair share of cars to its usual joint business over through or distant routes. With this number of cars, each railroad could do its share in the transportation service of the country and would take care of the normal demands throughout the year during periods of normal business activity. But we must provide for the periods of unusual stress and extra seasonable rushes of traffic. To meet this, we may ask whether efficiency and economy would not best be served by combining the service of like kinds of equipment of several roads some of which might otherwise be idle, rather than require each railroad to own sufficient cars to meet their extra service. The answer would seem to be in the affirmative, which means that railroads should own sufficient cars for average rather than for excess needs. This refers to a class of cars for certain uses or to the railroad's total car equipment.

Car Quota Plan.—The quota is used as a basis for car distribution by all of the codes referred to above except the joint-ownership plan of Mr. Smith. The following question then suggests itself: Is the need for transportation on a given railroad equal at all times to the supply afforded by the cars a railroad should own? The car quota advocates infer by their arguments an affirmative answer to this question, since they make it easy for the railroads to maintain their quota of cars and make it hard for them to do anything else, thus assuming that the quota corresponds to transportation needs at all times. The conclusion of the previous paragraph answers: "No," to this question—i.e. that the needs for transportation are not constant, and that the railroad's quota is a supply of home and foreign cars suitable to meet the general average of their needs, rather than their variable needs.

Will actual conditions shed any light on this subject?

Some railroads own many more cars than their share, while others fall far short. However, let us consider the average railroad where the number of cars owned, or its quota, closely approximates the average number of cars to be found on its lines during the year or over a period of years. Will we not find on this railroad that the quota is not so directly related to the number of cars which it actually has on its lines during the various seasons of the year? This relation of quota to needs is also complicated by the nature of the road—whether it is a terminal or a distributing railroad, a through trunk line or an originating feeder line. Does it not seem, then, that our car distribution system should encourage flexible variation to meet the seasonable requirements rather than lay down certain regulations which will have a tendency at least to maintain artificially at all times a given number of cars? We also find that during the longer periods when cars are in great demand the quota supply does not meet the needs, and that under normal conditions and during slack times the railroad manager is not so much interested in having the use of his quota or even his own cars, particularly if another road could use some of his allotment to better advantage and if the adjustment would produce unnecessary empty mileage. If, then, the average need for transportation over a year or a number of years, being approximately constant, does not meet the varying seasonable demands or even periodic changes, it would seem that the quota should not be the basis for a code of car-service rules, particularly with railroads which have a large portion of their cars going off their lines.

The quota basis for car distribution assumes that car ownership be disregarded. The intent of this plan might be to include as much recognition of ownership as possible in making adjustments, but in practice the result would mean a wide dissipation of cars from their owners, and the return of owner's cars would become almost negligible, since adjustments are intended to be made with any cars which may be most easily obtained. The automatic tendency to maintain the quota of cars would also cause considerable unnecessary empty mileage which the plan is intended to prevent.

It is, of course, generally recognized that each railroad is entitled to the possession of cars equal to its ownership; but may we not add a proviso and have it read: A railroad is entitled to the use of the number of cars equal to its ownership, if it is not to be equitably compensated for its own cars when used by others. Is not then the quota argument a question of justice rather than a plan for furnishing a proper car supply, and is not the answer: To eliminate the question of rights by arranging for proper compensation—rather than to add complication by trying to adjust the operation and distribution of the cars to meet these rights? Does not this question of quota disappear altogether, if some plan were devised to compensate each railroad manager equitably for that part of his own cars which he must loan to the other fellow, i.e., so that he would profit just as much from them as if he were permitted to use them himself? It is true that, in times of stress, a railroad's quota and perhaps more would be needed in order to take care of the business demands, which is the desire of every executive. But this satisfying of the transportation needs is hardly a matter of the rights of ownership; so that perhaps the quota is not a good measure of the necessities of the situa-

* Mr. Thomson was formerly superintendent of motive power and rolling equipment of the Philadelphia & Reading. This article is a continuation of his discussion on this subject which appeared in the *Railway Age Gazette* of July 20, page 109.

tion, since the stress might better be relieved by the combined quotas of several railroads through the agency of a central distributing bureau, which will be required in any event and with any system. Such a bureau or central committee probably would meet emergencies by entirely disregarding the quota plan, and in making seasonable adjustments might find itself acting more often in opposition to the quota regulations than with them.

We see, then, that the quota plan is rather a question of rights of ownership than a basis for car service; also, that it is not a good measure of the variable seasonable needs, that it would have a strong tendency toward the separation of the car and its owner, and would cause some unnecessary empty mileage, all of which features would be objectionable in any new system that may be evolved.

EMPTY CAR MILEAGE

Empty car mileage is a tremendously costly factor in railroad operation, and the illisiveness of this problem is ably brought out by J. L. Payne, comptroller of statistics of the Canadian railways, in the August 31 issue of the *Railway Age Gazette* on page 383. In this article he shows how difficult it is to locate any important factor which directly affects the periodic variations in the percentage of empty-car mileage to total mileage. His figures indicate that these variations are not due to changes in the volume of traffic, to the size of the train-load or car-load, to the varying conditions on different railroads, or to long and short hauls. However, regardless of the difficulties, we all agree that this empty-mileage incubus, which, like the poor, we must always have with us, is one of the fundamental operating problems to be improved in the development of our car-service and interchange rules. A thorough study of it may help us to evolve a code which will reduce empty-car mileage to a minimum.

Effect of Car-Supply on Empty Mileage.—This phase of the problem was not included in Mr. Payne's analysis; but perhaps a study of the resultant effect of owning an extra amount of equipment above normal demands, and its opposite—the effect of operating with a very close margin or with a shortage of equipment—might reveal a close relation between car-supply and empty-car mileage.

It is evident that the smaller the margin of cars with which a railroad can efficiently meet its traffic conditions, the greater will be the return on the capital invested in equipment; but this is not all of the story. We must also consider whether or not a certain increase in equipment would help the service, and what the net financial result would be in owning a larger number of cars, which in turn might be found to reduce operating expenses by reducing empty-mileage. This phase of the subject must be approached from a country-wide viewpoint, since it is obvious that scattered local increases in car equipment might not perceptibly affect the empty mileage in the respective districts, whereas the result of all railroads operating with an increased quota of cars might be appreciable. We know that a general increase in equipment beyond normal requirements, with properly controlled distribution, would not at least increase empty-car mileage, and usually would result in always having more cars "to move toward home under load." As a general proposition then, except in so far as congestion and limited track facilities affect car distribution, an increase of available cars might be found to be effective in diminishing empty mileage.

We may assume that there is an exact number of cars for each road which would give the best operating and economic results, including in this calculation the car's earning power and the cost of handling it empty, as well as the cost for interest, repairs, and depreciation. If the above inference holds true—that more cars might result in less

empty car mileage—then it would be interesting in this connection to consider or attempt to estimate just where an increase in equipment above normal requirements would reach a point where the total of the interest on the investment of the extra cars, the cost of maintenance, depreciation, etc., would over-balance the savings realized by not having so many empty cars to handle. This might be a good subject for a committee of the American Railway Association, and they might take as their first investigation: The present cost of handling empty-cars, without any reference to the effect of increases.

Some might say that these figures would be estimates only, and that the problem is too involved to be worth the effort. In view, however, of the fundamental importance of the empty-car as a transportation problem, this hardly will be accepted as an answer, and the railroads should take upon themselves the responsibility of determining their present empty-car mileage costs as accurately as possible, even if they do not wish to go further and include the effect of equipment increases on empty mileage. In such a study it would be possible to approximate from the transportation and maintenance accounts, with possibly the addition of some supplementary statistics, a very close estimate of the actual expense involved in the handling of empty cars. These figures would be most interesting if brought down to the point where the railroad manager could accept them as very closely representing actual conditions. It may be desirable to postpone the investigation of the effect of increases in equipment until our car-service and interchange system becomes more settled, since the requirements for each railroad and the resultant effect of their co-operation is dependent upon whether we have a system of interchange with railroad ownership as a basis, a general pooling system, an independent corporation ownership or some intermediate compromise.

Convertible Cars.—Convertible types of car, and the adaptation of the usual kinds to other than their regular uses are kindred subjects which enter here as important factors in decreasing empty mileage and consequently in making car service more efficient. The desirability for progress along these lines needs no argument, and it only requires to be kept constantly in the minds of railroad managers, in order that they may have harmonious and continuous co-operation between their mechanical and transportation departments so as to develop equipment which will most economically meet service requirements.

Operating Maxims, Antidotes for Empty-Car Mileage.—"Move cars toward home under load" is, of course, an ideal maxim to keep before us at all times and under all conditions. This will accomplish wonders in eliminating empty mileage; and it infers that the car has a home. Unfortunately, however, the origin and the distribution of traffic on each railroad and throughout the country only permits of partial application of this rule. However, it always should be a guiding principle. We might add to this rule the following as a corollary: "Move cars away from home under load rather than toward home empty." This should apply when the handling road is not in the same community as, or does not have a direct connection with, the owner of the car; but it would first require that the various railroads have in service a good proportion of cars of the same design and with interchangeable repair parts. This latter requirement is worthy of careful thought.

STANDARDIZATION

The distribution of cars regardless of ownership is a most desirable method of operation—if it does not involve over-balancing serious difficulties. It could be accomplished more satisfactorily, and the various shops throughout the country would soon be better able to repair any car which comes along, if the railroads among themselves

were more favorably disposed toward a general standardization of equipment and were making more actual progress toward that end. This is the direction in which we must look for practicable development such as will permit a disregard of ownership without greatly increasing repair costs, and also attain the advantages of reducing empty-car mileage by a more flexible use of cars.

This may sound revolutionary to our old way of thinking. Yes, but these are radically changing times. It is quite possible and entirely practical for a few of the larger railroads to make a start in this direction. The movement only needs leadership. The fundamentals of railroad mechanics and operation are quite similar the country over, and there is not the necessity that many are wont to believe for the existing wide diversity of practices and designs to meet varying conditions. Improvements can be developed, competition encouraged and individuality fostered by the "one-design" plan. It means co-operative use of well-proved practice, the result of which will be less diversity and less frequent changes.

The following is pertinent from the New York Sun: "An airplane man in the financial district was asked why, with all their resources, England, France and Italy together had so far been unable to do more than hold even with Germany in the air, and were waiting for the United States to clinch supremacy. His answer, in view of the Liberty motor, may be interesting. His opinion was that Germany is second only to the United States in learning how to standardize, and this, with remarkable resourcefulness and skill in repairing every machine, no matter how badly smashed, that falls within her lines, had enabled her so far to hold her end up."

How about the freight car that "falls" on our railroad lines? Are the railroads living up to the reputation we have gained in other fields of activity? The pooling of ideas has built up the motor industry, and the war has given the "standardization plan" a wonderful impetus in the construction of the craft that are to travel under and on the seas and through the air. Why not standardized freight cars on land? If our railroad men will accept the thought that in interchange, "common cars" means "common design," this soon would be accomplished, and the government will have no incentive to buy standard cars or to order adherence to uniform plans and specifications.

The M. C. B. Association has accomplished much in developing some generally used standards, and the American Railway Association actually has built a few sample cars, but there must be more of a general movement among the railroads toward the putting into actual operation of several types of standardized cars of the same design with completely interchangeable repair-parts, before we are able to consider as an economical method of operation any of the schemes involving the disregard of railroad ownership and "country-wide repairs" of cars. Government ownership or joint-ownership by an independent corporation would have an excellent feature in bringing about a very rapid adoption of the standardization of cars throughout the country. But the railroads can own the cars themselves and accomplish the same thing—if they will.

CAR REPAIRS

The plan for common ownership of cars by an independent corporation, as suggested by Mr. Smith, in the above mentioned article, has one great objection, in that it removes the incentive for proper maintenance which is always present under a system where the one who uses and repairs the car also owns it. It would seem therefore that an independent corporation ownership, and even a general pooling arrangement of any kind which disregards railroad ownership, is a step in the wrong direction as far as proper maintenance is concerned; also that any code

of rules which is formulated to embrace the proper handling, use and distribution of the cars without giving due consideration to the conditions which will result in the best maintenance will fall far short of the mark.

All of the suggested codes, except the one by Mr. Fisher, disregard the ownership of cars, or make it secondary in their plans for distribution. The above argument, then would also seem to be pertinent to them. Any plan for interchange which has a tendency to render the cars "homeless for repairs" will be a step in the wrong direction until the railroads actually accomplish a much higher degree of standardization among themselves than is now the case.

Proper repairs and economical maintenance of cars is a much larger factor in this car service problem than most people seem to appreciate; so that those who plan for an ideal use and distribution of cars by increasing the distance between the proprietor and his property, first of all had better provide in their plan some *economical* method whereby the car they wish to use will always be ready for service when needed and will be safe to handle. It would seem therefore, from a practical standpoint, that we will be almost compelled to fall back on the railroad ownership plan; also, that we should introduce some incentive to keep a sufficient proportion of the car supply in the hands of the owner for proper maintenance, and to find some way of doing it with a minimum empty-car mileage. Our mechanical railroad officers can appreciate what a hopeless confusion would result from the general application of a system which disregarded these principles of ownership and maintenance and which caused a promiscuous distribution of "homeless" cars throughout the country.

In considering any system which involves the pooling and distribution of equipment without regard to ownership, we may become deceived from the present excellent transportation results which are being effected to meet war conditions. To guard against this, we must look a few years ahead to see where we will land under pool-operation with reference to the mechanical, carrying and service efficiency of the cars themselves, appreciating at the same time that the present pooling methods of disregarding ownership in the distribution of cars are only effective with a relatively small proportion of the total railroad equipment. Unless some plan is introduced into our new code which will give the owner a chance to maintain his standards, the hopelessness of the situation is apparent to all mechanical railroad men, and even to the manager or superintendent who is familiar with foreign-car troubles on his line and with the annoyance of having his yards filled with foreign cars waiting for repair material to be shipped across the country.

Some may argue that foreign cars should be fitted up with any kind of material which will make them safe to run, which is often done to meet emergency. Under such method as a general practice, the mechanical superintendent again will appreciate what the hopelessness of the situation would be a few years hence. Another road's standards might not be safe for his cars, and the judgment of the car inspector and outlying repair-gang would be substituted for the calculations of the drawing room. An inspector's free choice of repairs to an arch bar or truck frame would lead to disaster; and the haphazard substitution of door fastenings, for example, would bring on a resultant confusion which, although not necessarily dangerous, would be like mixing cats and dogs of the undomesticated varieties.

The standard construction of each car, whether good or bad, must be maintained by the workmen as the only practicable shop rule to insure safe repairs. The drawing room must authorize all departures and re-designing. We must maintain the car's own standards or use standardized cars. There is no middle ground of safety. Another point against the repairing of foreign cars with any kind of material in

order to keep them moving—even if the repairs were safely made and the design improved—is, that in creating an atmosphere of utter disregard for standards it would greatly increase repair costs. These increased costs would be excessive if the railroads were not able to carry spare parts for repairs which exactly fit the greater majority of cars going through their shops. Each job would soon become a “cut and fit” operation, and the economy of interchangeability would be lost. In fact, at this very time, when we are most enthusiastic about the great things that are being accomplished in transportation by only a limited pooling of cars from all railroads, there are not many who are talking loudly about the reduced freight car maintenance costs; and many of those who have considered this phase of the matter are dismissing the fact that repair costs have tremendously increased, by the well-worn-out answer: “high cost of material and labor.” Exactly so; but as soon as they begin to look a little further, they need not be surprised to find, that the material is costing much more because it is requiring larger quantities of it for cutting up and forging by hand into odd shapes to fit foreign cars, and that the labor is costing more because the “cut and fit” job by hand for foreign cars is requiring many more hours of pay. Miscellaneous foreign car repairs must be made largely on a day-work basis in order to be entirely fair both to the company and to the workmen. This loss in the use of standard parts for repairs, as well as a partial loss in the use of the piece-work system, is a very ominous thought to the well-informed, when they consider the adoption of a scheme for operating “common cars” in a country-wide pool.

Some may say that the present pooling system is showing so much greater earning power and capacity per car that the railroads can afford to pay greater repair bills. Yes; but let us give the new pooling system “a run for its money” for a couple of years, before we say much about the *net* saving per car; and then let us work for a couple more years under the old plan, with a more favorable Public and Shipper and more lenient Government inspection to deal with, before we publicly advertise our preference for the new pooling system in affording increased capacity per car, or in supplying cars in good order and ready for service when needed.

It would be most interesting for the railroads to analyze their present freight car repair costs at some of their shops or on certain divisions in order to determine the cost of repairing foreign cars relative to the cost of repairing their own. These figures would be startling, and the gradual mounting of the expense curve from month to month would be most interesting to watch as we continue to broaden out our present practice into a country-wide pooling system. The effect of any general decrease or increase in the average cost of materials could be accounted for, thus leaving a resultant curve which would give us some indication of the effect of adopting generally throughout the country a system in which the disregard of individual ownership of cars was a large factor. The great rise in actual cost of material and the percentage increases in the rates of wages are, of course, great factors in our present increased repair costs. This is not so serious, since it will have to come down again, at least part of the way; but the other factor in our present increased repair cost—the foreign car—is inherently connected with the operation of the pooling system, and on this account its effect on costs will keep on increasing, as a larger proportion of cars gets further and further away from the care of their owners.

CONCLUSIONS

In summing up we find a large number of fundamental principles involved, as well as kindred subjects to be developed, before we can arrive very far in outlining a practical code for car service and interchange. In this article, some criticism has been ventured concerning the several

codes which have been very ably worked out and which contain much good material. Certain principles in opposition to these codes have been defended with the view of trying to arrive at some unanimity of opinion, such as will form the basis for a start.

On the constructive and practical side, it may be interesting to consider the writer's previous suggestions which appeared in the *Railway Age Gazette* of July 20 under the head of “Some Constructive Thoughts on Car Interchange,” the substance of which is as follows: Railroad ownership of cars; proper compensation for ownership regardless of the user of the car; greater progress toward standardization, and minimum empty mileage. These suggestions were made with the thought of first seeking the correct principles to follow, and then evolving gradually from our present system, a workable set of general regulations amply supported by accurate statistics obtained from a thorough study of present conditions. Some practical suggestions were also included in this article looking toward the developing of such statistics as would afford proper information for the regulation of an equitable per diem rate for loaned cars, and such as would compensate the owner wherever the car might be used.

The information we now have at hand makes it seem that the old method of compensation for car hire is the simplest and the best, that is: to settle on a basis of car ownership, rather than on a quota basis or through the agency of an independent owning corporation. Our immediate investigations should develop a proper system for adjusting the per diem rate so that each railroad would be compensated equitably for its investment in the cars which are loaned to other roads. We should study every means for reducing empty-car mileage, including the development of convertible types of cars and the best ways of adapting the usual types to other than their regular uses. Our new statistics should show whether or not the increasing of the car supply has any effect in diminishing empty mileage, and if it has, should show in net figures, whether it is better for the railroad to own an increased number of idle cars and make less empty-car miles, or to operate with less equipment and make increased empty-car miles. In regard to the maintenance of equipment, it seems desirable to keep as large a proportion of cars as possible in the hands of the owner. As for operation, the railroads should take immediate steps to get a reasonable proportion of standardized cars into service as soon as possible, and then arrange to “move cars toward home under load,” or, when the car is far from home, in the opposite direction under load rather than home empty. A central bureau or board of railroad men should have general supervision of car distribution. They could direct the movement of cars to and from their owners when the natural movement was not promoting economic use and proper maintenance of the cars, and they could act in times of stress when unusual shifts of equipment become necessary in order to meet the local demand in various localities.

Our summary may be condensed into three questions which should assist in focusing the various problems towards a satisfactory conclusion, as follows: Shall we reduce empty mileage by disregarding ownership and thus improve the service of the present supply of cars at the expense of increased repair costs, or shall we keep down the repair costs by returning owner's cars and then improve the service by increased investment in cars at the expense of greater capital charges and increased idle cars and empty-car miles, or should the railroads get together of their own accord in rapidly putting into service standardized equipment having interchangeable repair parts so that the benefit of the two former alternatives gradually could be realized—in that the car supply thus could be improved by a flexible-distribution plan of generally serviceable standardized cars, which

would at the same time keep down the cost of repairs and not require much empty return mileage to the owner?

The Duty of the Railroads.—The above treatise may suggest to those in everyday touch with these problems some lines of thought for further development, and perhaps bring out better ideas which may differ in substance. Suggestions will be most valuable which are developed in sufficient detail to apply in a practical way to our present codes, and thus put the railroads in the position of having something actually started which will meet the new demands. This development must be the product of railroad experience; and our railroad minds must reveal the most desirable practice rather than wait for Governmental agencies to point out an arbitrary way. It is not a subject to be disposed of in the rush legislation of a closing Congress, or to be determined by law-makers who cannot appreciate or who are in no way familiar with the technicalities of the problem. Expert discussion by our railroad men should precede the enactment of law, rather than remaining dormant to invite the passing of legislation embodying general theories in accordance with popular demand and which may force a further burden upon the railroads. The recent Esch-Pomerehne amendment of the act to regulate commerce may yet, as a by-product of the war, prove to be a great hardship, and its enforcement may be unconstitutional in taking cars from one road and turning them over for the use of another, unless a proper system is evolved to compensate the owner equitably for his cars when they are arbitrarily loaned to another.

This general subject should be argued by our railroad men among themselves and through the columns of the railroad journals as a matter of self preservation, so that when the war is over they will not find themselves blindly following the dictates of some left-over war measure, or adapting themselves to the theories of the platitudinarian. No brand new or revolutionary practice will spring up suddenly, unless, perchance, it is forced by governmental agency on account of a lack of preparedness on the part of the railroads themselves in not being ready when the time comes to put into actual practice such principles and methods as will meet the new demands.

A plea is here entered for our railroad managers to begin an active standardization movement, and then with their car service and interchange experts vigorously to continue their study in the development of the broad principles involved, so that they can start right in at the next meetings of the M. C. B. Association and of the American Railway Association to work out a gradual transformation in the details of the present codes for interchange and car service. These codes today embrace the best that our railroad experts have been able to produce. They are the result of years of conscientious study and service, and contain much in detail which must be used as the basis for a code to meet the change which is taking place in the transportation world. Principles can be revised to meet the new demands, but which need not cause the discard of all the working detail which is the resultant of our best experience. Adherence to railroad ownership in our car distribution would save much of our present practice which can be broadly expanded and supplemented so as to meet the most fastidious demands of our new national transportation.

EXEMPTION FOR BRITISH RAILWAY SLOPMEN.—The Railway Executive Committee has informed the British National Union of Railwaymen that the director of recruiting has agreed that, until further notice, skilled men from railway shops, notified to the war-office for release, who are not required for mechanical or craftsmen's work in the army, will be returned to the railway companies, and will not be posted for combatant duties in line regiments.

ELECTRIC SECTION ADDED TO A MECHANICAL INTERLOCKING PLANT

The Delaware, Lackawanna & Western crosses the Pennsylvania at Bailey avenue tower, about three miles east of Buffalo, N. Y. This crossing is spanned by an overhead bridge carrying the main line of the Lehigh Valley and just north of the tower a highway bridge on Bailey avenue crosses over the Pennsylvania tracks. On account of the large amount of interchange freight handled between the Lackawanna and the Pennsylvania at this crossing, it was decided to add a double track wye connection south of the Lackawanna and east of the Pennsylvania tracks. A large part of the freight is hauled by the Pennsylvania over the Lackawanna main tracks from Bailey avenue to East Buffalo, a distance of about 1½ miles. From this point the trains run about 9½ miles over the Black Rock branch of the Lackawanna to a connection with the Grand Trunk. Previous to the installation of this wye, it was necessary for northbound Pennsylvania freights to back into the Lackawanna interchange tracks over a single-track connection. This arrangement not only blocked the crossing, but also congested the traffic on the interchange track.

Before the wye connection was installed, the old mechanical interlocking plant simply protected the grade crossing. This plant was operated by a 40-lever Saxby & Farmer interlocking machine with 18 levers operating signals, 11 levers operating switches, nine levers operating facing point locks, and two spare levers. The signals were of the lower-quadrant mechanical type. The high signals were slotted and pipe-connected, while the dwarf signals were wire-connected.

On account of the size of the new wye connection, it was not advisable to enlarge the old interlocking machine. Nevertheless, from a construction and maintenance viewpoint, it was desirable to utilize as much of the old apparatus as possible. To do this a 40-lever, style S-8, electric section was added to the old 40-lever mechanical machine, 38 of the mechanical and 33 of the electric levers in the new electro-mechanical machine being used for the operation of the 71 switches and signals.

This type of plant, while it is the first one of its kind on the Lackawanna, is giving good service on the Pennsylvania, and is entirely satisfactory for a busy layout. A recent count shows a total of 5,600 lever and 223 train movements per day at this plant. Of the 223 train movements, 43 were passenger and 180 freight.

The tower is of two-story frame construction, steam heated, and equipped with electric lights. In addition to housing the interlocking apparatus, the tower is used as a block station by the Pennsylvania for protecting traffic beyond the interlocking limits.

The electro-mechanical machine is located on the second floor of the tower. The electric levers of the S-8 machine are fastened in an iron frame above the mechanical locking bed. Each of the electric levers is connected to the locking bed by vertical iron rods, which actuate the mechanical locking. An indication lock is provided, preventing a signal being cleared under improper conditions. An electric lever locks each mechanical lever operating a switch or derail. Where a crossover requires two mechanical levers, on account of the distance from the tower, one electric lever locks both. The locking of levers 035L and 036L is so arranged that lever 036L must be operated in advance of 035L. This is done so that it will not be necessary to stop Lackawanna trains on the railroad or trolley crossing and to assist the trains over the grades on either side of the tower. Slow-speed signal 040L is given a separate number in order to permit switching movements to be made when Pennsylvania trains are on the crossing.

Above the machine, and supported from the ceiling by

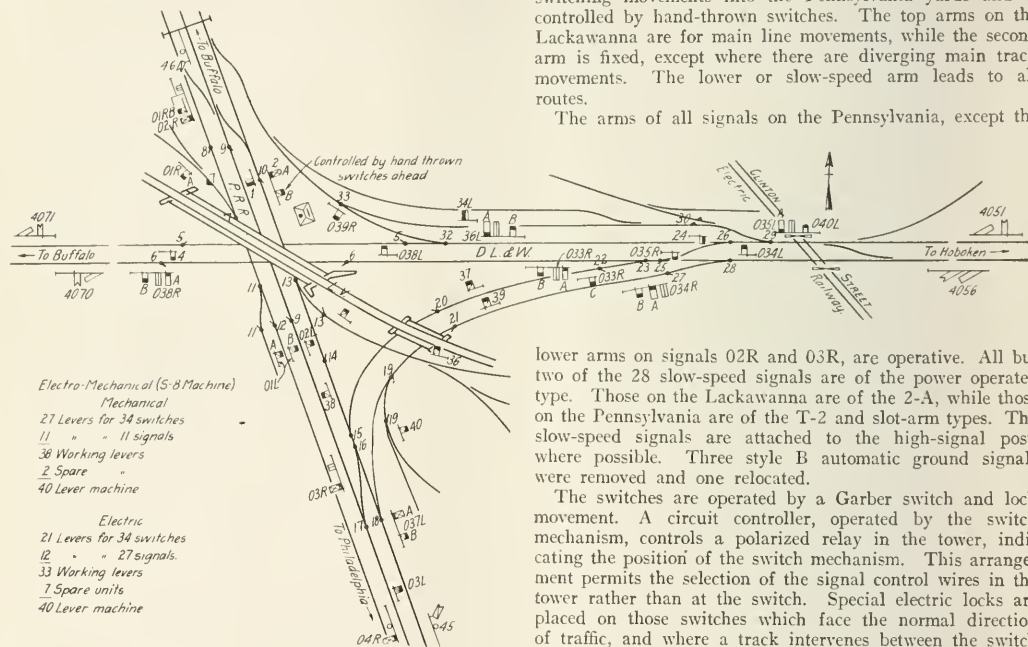

angle irons, is the illuminated track model. The model board, made in the signal repair shop at Hoboken, is of $\frac{1}{2}$ -in. ebony asbestos board, and shows the various tracks, track circuits and signals. The clear position of each signal and the condition of each track circuit is repeated on the model board by a $1\frac{1}{4}$ -watt, 12-volt, candelabrum type electric lamp that is operated on a 6-volt circuit. About 80 lights repeat the various signal and track indications. Two manipulation charts, mounted on the side of the model board, assist the towerman in picking out the proper levers for the indicated movements.

The line relays and the signals, in the limits of the interlocking, are operated from a 14-cell, 18-volt, type A-6, 225-a. h. storage battery. Outside the interlocking limits 16 cells of BSCO battery operate the distant signals, while 12 cells operate the line circuits. Three cells of BSCO battery, connected in multiple, operate each of the 40 track circuits. A fixed resistance unit, varying from 0.1 to 0.3 ohms,

Standard approach, detector and route locking circuits are used. Several clockwork time releases are provided in connection with the approach locking circuits on the high signals. A trap circuit is installed on the dead section of track at the Clinton street trolley crossing, just ahead of signal 035 on the Lackawanna. Several telephones, attached to the signal cases and located at convenient points, permit communication with the tower.

The signals on the Lackawanna are of style B, two-position, lower-quadrant type, while those on the Pennsylvania are of the style B and T-2, three-position upper-quadrant types; except that the distant signals are two-position, upper-quadrant, operating from 45 to 90 degrees. The normal position of the distant signals is at 45 degrees. The style B signals on the Pennsylvania are equipped with the proper attachments for giving the necessary upper-quadrant indications. Pennsylvania signals 04R and 2 are used as block signals. The lower arm on signal 2 is used for switching movements into the Pennsylvania yards and is controlled by hand-thrown switches. The top arms on the Lackawanna are for main line movements, while the second arm is fixed, except where there are diverging main track movements. The lower or slow-speed arm leads to all routes.

The arms of all signals on the Pennsylvania, except the

Tenryugawa Bridge (19 200-ft. spans), Tokaido Line.

The Progress of the Japanese Railroads*

Part 2—A Discussion of Track, Roadway, Signal Standards, Locomotive and Car Practice and Administration

By Sukehiko Goto

Civil Engineer for the Imperial Government Railways, Tokyo, Japan.

THE standard gage of the Japanese railways is 3 ft. 6 in. and the spacing of tracks is normally 12 ft. center to center, although 13 ft. is used on some of the main lines and 14 ft. on electrified lines. The side and vertical clearance, as shown in the diagram, are very small. The standard roadbed on tangent tracks is 16 ft. wide with ballast sections as shown on the typical cross section. The ruling grade is usually 2½ per cent. The rails are mostly 60 lb. or lighter, but renewals on main lines are being made with 75-lb. rails of A. S. C. E. section. Originally the English bull head rails were used, but these are no longer in track.

Timber cross ties are used, usually of chestnut wood. The standard dimensions are 5½ in. by 8 in. by 7 ft. On tangent level tracks 14 or 15 ties are laid to the 33 ft. rail or 13 or 14 to the 30 ft. rail. On some of the less important lines only 12 ties are used. An exception to the above standard is found on the Abt rack railway, where steel ties have been installed. The bridges consist principally of steel truss and plate girder spans, having a maximum span length of 300 ft. These are designed for a live loading corresponding to Cooper's E-33, E-40 and E-45.

In contrast with conditions in America the local stations in Japan usually serve a dense population, calling for a considerable amount of railway business. In consequence practically all stations must be supplied with rather extensive track and station facilities. Station platforms follow the English standard and are as a rule two feet above the top of the rail. Station buildings are usually of wood construction. Engine houses formerly followed the English rectangular design of brick construction, but the American roundhouse type has been adopted in recent years. The diameter of turntables is usually 60 ft.

Single track lines predominate, but the Tokaido and other heavy trunk lines are double track with a few sections of

four track lines. On not a few sections of the system daily train movements amount to 30 or more on single track and 60 or more on double track. This heavy traffic density is made possible by the short distance between stations which generally averages between three and four miles.

	Mileage of tracks in operation on December 31, 1915
Single track	5,000 miles
Double track	734 miles
Through tracks	1 mile
Four tracks	16 miles
Six tracks	4 miles
Total main line.....	5,755 miles
Yard and side tracks.....	2,277 miles
Total all tracks.....	8,840 miles

The number of stations including all block stations is 1,537.

Switching in Japan is generally done by the usual drilling method, and it is only within recent years that gravity classification yards have been taken into consideration. The first hump yard to be placed in operation is at the Tabata station in the northern suburb of Tokyo, which forms the largest classification yard in the country. It is one and one-half miles in length and contains 24 miles of tracks. Twenty-four hundred cars can be handled through this yard in a day. Work is now in progress on a similar yard for the Shinagawa station which will be much larger.

GRADE REDUCTION

Owing to the mountainous character of a large part of the Japanese islands, railway location has been difficult in many portions and has entailed the use of heavy grades and sharp curvature. Grades of 3½ per cent and curves of 9 deg. are common, and in the case of the Abt rack line over the Usui pass a 6½ per cent grade was used. On the Kagoshima line, a large number of switch backs were required.

As traffic increased, it has been necessary to resort to reconstruction with a view to reducing gradients and improving the alignment. The most important reconstruction work has been done on the Tokyo-Kobe line, particularly the

*Part 1—A general account of the history, growth, organization and traffic of the Japanese railways appeared in the *Railway Age Gazette* of October 12, 1917, page 646.

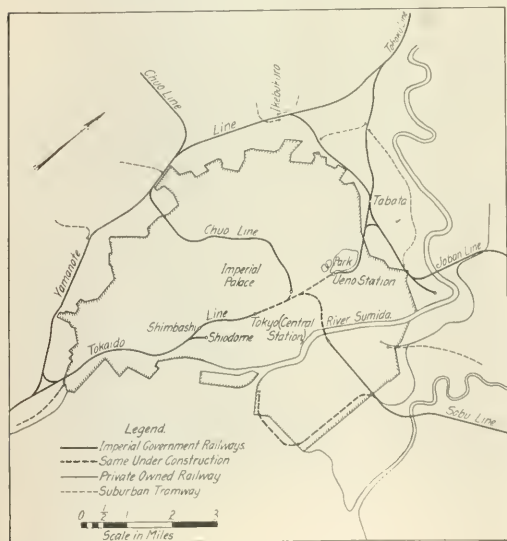

between the two railway systems was by means of the Yamanote belt line, a line of low capacity which has become greatly overtaxed with increased traffic.

The construction of the connecting line through the center of the city with a single station to serve both railroads was

Roadbed Sections

under consideration as early as 1896, but little was accomplished other than the purchase of some of the property until after the Russo-Japanese war of 1904-05. The central station was completed in 1914 as well as a portion of the connecting line, while the rest of it is still under construction. The completion of the new station has made it pos-

Map of Tokyo and Vicinity

sible to transform the old Shimbashi station into a freight terminal, and in this connection it is planned to make extensive terminal developments in the vicinity of the southwestern entrance to the city, where a considerable area of land has been made available by reclamation from Tokyo bay.

The connecting line referred to above is an elevated structure carrying four tracks, two of which are used for suburban service and two for through train service, operated by electric traction and steam respectively. Except for a small portion of the line, the tracks are carried on masonry and steel viaducts, concrete or brick arches spanning between masonry piers being the standard construction with steel plate girder structures supported on steel columns for the

Standard Clearance Diagram

street subways. The floor thickness was reduced to a minimum by the use of half-through girders with solid floors.

SIGNALING

The safety system on Japanese railways has very much in common with that in use on English roads. Traffic on main lines is handled exclusively under the block system, the manual block instrument being used on double-track lines and the tablet controlling block apparatus on single-track lines. The electric lines are protected by automatic

Map and Profile of the Hakone Pass Project

signals of the Hall type. Semaphores are in general use on main lines, while disc signals are used on sidings. The important stations are provided with mechanical interlocking, while at smaller intermediate stations, where traffic is not heavy, a very simple interlocking method is in use.

Siemens & Halske's interlocking apparatus, designed for use with the block system, has recently been installed between Kyoto and Kobe, one of the heaviest traffic sections of the steam lines in Japan, where the number of daily train movements is 60 and more, and where the interlocking and block systems in use on the other steam lines were found inadequate to insure safety.

LOCOMOTIVE PRACTICE

In the initial stage of the Japanese railways all the construction work was undertaken by English engineers, and

throughout the system. A further advance in this direction was represented by 4-4-2 and 2-6-0 types, which were installed in 1911 on certain of the main trunk lines on which these locomotives are now generally in use for through passenger service.

The freight locomotives of the tank type consist mainly of 0-6-0, 0-6-2 and 2-6-2 wheel arrangements, the number of 2-6-4 and 4-6-2 types being very small. In the closing years of the era of Meiji a number of 0-10-0 type engines were designed for use on heavy grades. Among the freight engines, with tenders, 2-6-0 types claim the bulk of the stock,

Mallet Type Locomotive of German Make

the locomotives in use were imported exclusively from England. That country long maintained a place as the guide of railroading in Japan, monopolizing the supplying of equipment for many years. From 1887, however, motive power of American and German manufacture began to come in and toward the close of the period under review the locomotives made in America claimed a far greater proportion of the whole stock than those of England. A few engines were also imported from Switzerland, while others were built

the remainder being of the 2-8-0 and 2-8-2 types. Toward the closing years of the Meiji era, the demand for 2-8-0 types increased and a number of 0-6-6-0 Mallet compounds were ordered from the United States.

Only a few locomotives were designed specially for service in yards. The greater part of those now employed in this work are engines which have been transferred from freight service when increases in traffic rendered them no longer capable of handling the road work. With the in-

Track Elevation in Tokyo

in workshops in Japan. However, these were insignificant in number as compared with those introduced from England, Germany and America. It may be noted that, while Japan has never failed to keep up with the latest standards of locomotive practice in the Occident, she has done practically nothing for which she could claim originality.

The wheel arrangement for tank locomotives in passenger service has gradually advanced from 2-4-0 to 2-4-2, while that for the tender type passenger engines has developed from 0-4-2 to 4-4-0, the latter type being the most common

crease of train load, not only 0-4-0, but 0-6-0 locomotives of the smaller type were found inadequate for switching purposes, and in consequence a number of 0-6-0 of larger type and 0-6-2 engines were withdrawn from the main line service for use in large yards.

Like the Americans, the Japanese have failed to realize satisfactory progress with compound engines which are looked upon as the natural and most efficient form of locomotive in Europe. The first compound locomotive installed upon Japanese railways was put to work in May, 1893. A

small number of additional compound engines were added year after year, but the stock of this type was by no means great, totaling only 54 out of a total of 2377 in 1912. The reason why the compound principle as applied to the locomotives has failed to commend itself to Japanese practice lies in the fact that its structure is extremely complicated. Japanese railways are diversified by the presence of a great number of grades, and this fact makes it impossible to work the compound engines to advantage, while in addition various difficulties attend the design of four-cylinder compounds adaptable to the narrow gage railways.

Japan has adopted superheated locomotives extensively. Occidental practice has been applied here, although it is interesting to note that about 1902-3, when the Schmidt superheater was coming into general use a smokebox superheater was manufactured for trial purposes in Japan, but the test did not develop the desired results. The adoption of the Schmidt superheater in Japanese railways dates from 1911, when some engines ordered from Germany were put in service on the State Railways. These were followed by other locomotives ordered from America.

Because of English influence the continuous vacuum brakes were adopted and are now in general use. Locomotives on the Hokkaido Colliery Railway were equipped with Westinghouse compressed air brakes, but these were sub-

Largest Tank Locomotive in Japan

sequently taken out of service for the purpose of standardizing the operating equipment on the State Railway system. The rack rail locomotives over the Usui Railway are provided with band and counter-pressure brakes.

From the first, couplers of the English pattern were employed on the Japanese railways not only for locomotives imported from England but also for those imported from other countries. The English types were also used in Kyushu which is separated from the main island by the Shimono-seki strait, while, in the Hokkaido, automatic couplers of American type were adopted by the government lines. Apart from the fact that the English type compels men to go between cars, the maximum tractive capacity of the coupler of this description is anything but adequate, and it is not unlikely that the limitation upon its strength may finally hamper the necessary development of the motive power itself. Viewed in this light, the American coupler is judged as a decided improvement upon the English. The only disadvantage inherent in its structure is that the coupler does not admit of being partially remodeled, and the trouble of wholesale reconstruction involved in the remodeling of the coupler has so far deterred the railway management from bringing about the important reform, save for a slight improvement effected in the matter of strength.

FUEL

Fuel for use in locomotives was at first furnished mainly by coal of high quality produced in the islands of Kyushu

and Hokkaido. After years of careful inquiries into the relative merits of products of various localities, the railway management has succeeded in effecting an important saving in this item of cost by the wise selection of coal of the kind which is at once economical and efficient.

About 1898 a trial use was made of oil, and it gave good satisfaction, while emitting very little smoke. These advantages coupled with the low price which generally obtained at that time, induced the railway management to adopt oil in part of the engines employed on the Usui, the Shin-Etsu, and the O-U lines. However, as a result of the gradual rise in the price of oil, the use of liquid fuel was found uneconomical and was discontinued.

In the initial stages of Japanese railways all locomotives were imported from England through the medium of English merchants and were operated by English engineers. It is true that during 40 years of railway development marked progress was made in the matter of speed, tractive power, design and material, but for all that, Japan failed to reach a state of independence as regards a supply of equipment. The greater part of the stock in use on the State and private railways was represented by engines ordered from abroad. They were built in accordance with the specifications of the Railway Board with respect to the general arrangement and the dimensions of the principal parts, but Japan was dependent solely upon the design and workmanship of foreign mechanics for the details.

From about 1893 spasmodic attempts were made to manufacture locomotives at more than one railway shop in Japan, but these shops, originally designed for the repair of engines, were inadequately equipped for manufacture. It was not until 1896, with the establishment of the Kisha Seizo Kaisha in Osaka, that the corner stone was laid for the locomotive industry in Japan. The nationalization of the railways gave no small impetus to the work of car-building in Japan, and in 1908 the Kawasaki Dockyard Company commenced building locomotives at the branch plant at Hyogo. By 1910-11 the two foregoing plants attained a state of great efficiency in the matter of workmanship as well as capacity. The result was the gradual shrinkage of foreign imports and in 1912 the entire order of new engines for the next fiscal year was given to these two plants.

The steady progress made in the building of locomotives at home encouraged the manufacture of parts and appurtenances, and at present this has also reached a stage of independence, although the country is still dependent upon foreign manufactures for the supply of materials. Because of the efforts of the railway authorities in helping forward Japan's locomotive industry more than \$2,000,000 was kept at home through the stoppage of foreign importations of engines.

RAILWAY RESEARCH WORK

Technical test work on Japanese railways began in 1907 when a laboratory was created to conduct tests and experiments on cement, volcanic ashes, fuel, paints, oils and fats and all other kinds of railway materials with a view to furnishing proper guidance to purchasing officers. In 1912, the scope of work in the laboratory was extended to cover technical research on all matters relative to railway materials. Special attention is paid to articles of Japanese production with the idea of fostering domestic industry. Still more appreciable are the results of investigation with a view to the improvement of railway materials.

A second laboratory was established in 1912 with the object of investigating the physical properties of railway materials. The functions of this laboratory are to make tests upon the principal items to be purchased to investigate specifications for purchase; to test the efficiency of finished materials; and to examine the rejected materials and trace the cause.

A locomotive testing plant was constructed in 1911 to de-

termine the proportions of locomotives and parts best suited for the narrow gage lines of the railways, and to ascertain the relative values of the different kinds of coal. The plant is of practically the same pattern as that of the Pennsylvania Railroad at the Louisiana Purchase Exhibition. During 1914-15, 19 tests were conducted on the efficiency of locomotives in addition to the making of chemical analyses of 137 kinds of fuel and the trial burning of 46 kinds of coal.

In view of the prospective shortage in the supply of the Japanese chestnut timber which represents the bulk of cross tie material for the railways, technical research was started regarding possible substitutes. Some 40,000 ties of Japanese chestnut, obtuse ground cypress and 10 other kinds of timber were procured, and after crosscutting, were laid in the different tracks in order to ascertain their actual service.

EDUCATION

In order to meet a growing need for technically-trained help it was decided in May, 1909, to provide an institution to give vocational education to railway employees. A number of district institutes were established in the different divisions for the purpose of instructing young employees in practical knowledge directly bearing on outdoor work, while a central institute was created at Tokyo to cover railway technology of a higher character. Students were selected by examination from among the employees in the general offices and among graduates of the district institutes, special care being taken in filling up the classes with students possessed of reliable character and practical ability as demonstrated in their actual service.

Although the institutes showed very satisfactory results, the arrangements of their courses developed a tendency toward purely academic exercises rather than the practical study of railroading. Accordingly, the regulations of both the central and district institutes were revised in 1913 to establish a more emphatic distinction between the two, the first being devoted to the scientific study of railway business in general, and the latter to teach and train apprentices for a term of six months in practical station and engine house service. The central institute was divided into four courses, business, mechanical, electrical and English language, while the school term was extended to 18 months.

Accompanying the classroom work, the students are taken on excursions at frequent intervals, making a round of visits to various tourist points and manufacturing centers where they observed the relation of business to freight traffic. Special attention was paid to acquainting the students with general features of railways as the minds of railway employees are too liable to run in the narrow grooves defined by the scope of their immediate duties.

Dormitories were provided to train the students in regular habits under the charge of a special inspector, so that they may learn to qualify themselves for the life of co-operation essential to railway service in which the maintenance of discipline among the rank and file is of no less importance than in the army.

The roll of students at the central institute for 1914-15 included a total of 134, while 80 were graduated. During the same year the district institutes graduated 2,002 students, of which 357 took the regular business or technical course and the rest took special instruction—328 for conductors or stationmen, 667 for firemen, 45 for motormen, 439 for telegraph operators, 64 for car inspectors and 182 for enginemen.

SAFETY FIRST IN JAPAN

"Safety First" work on Japanese railways is still in a primitive stage. In September, 1913, an accident prevention committee was organized in the Railway Board under the supervision of the vice-president to investigate accidents and make suggestions for preventing their recurrence. About that time the existing local safety associations were reorganized and unified so that the co-operation among

the units might be fully insured. Separate meetings of the working forces are held monthly at various points on the line to discuss safety matters and various divisional meetings are also conducted.

Each employee is subjected to a physical examination at the time of his employment, and in case of enginemen and firemen the examination is made regularly once a year. A number of experts are sent around to deliver lectures on sanitation to employees, and circulars and bulletins on sanitary and medical matters are distributed from time to time. Special attention is paid to the provision of sanitary arrangements for workshops.

RELIEF ASSOCIATIONS

Relief provision was maintained under the old regime, but the sums allowed were inadequate. After the nationalization of the leading private railways a relief association was organized based on a labor insurance system. Under the new arrangements a material increase was effected in the grants made in case of injuries sustained in the discharge of duties, while death and old age benefits were fixed at graded rates determined in consideration of age, wages and tenure of service. Lastly the allowance of refunds of the subscription was provided for in case of withdrawal from service. The stock fund of the association consists of subscriptions from the members and an annual government subsidy to the amount of 2 per cent of the aggregate earnings of the members.

Membership is compulsory or optional, according to the nature of the service. The roll of the association on March 31, 1915, shows 105,854 members, of which 94,402 were compulsory members, 534 optional members and 10,918 of a special class. There are several grades of grants, depending upon the seriousness of the injury, varying from an amount equal to wages for a period of one year and seven months to two years and six months, to an amount equal to six months' wages. The government furnishes medical attention and hospital services free to railway employees injured on duty.

TRAIN ACCIDENTS IN AUGUST

The following is a list of the most notable train accidents that occurred on the railways of the United States in the month of August, 1917:

Collisions						
Date	Road	Place	Kind of accident	Kind of train	Kil'd	Inj'd

1 Abbreviations and marks used in Accident List:
 bc, Rear collision; bc, Butting collision; xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc. obst., Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—P, or Pass., Passenger train—F, or Ft., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

The trains in collision at Rippon, W. Va., on the 1st were through freights, and 4 engines and 10 cars were wrecked. Two firemen were killed and 5 other trainmen were injured. The wreck took fire but the fire did but little damage. The collision was due to the concurrent failure of trainmen and an operator. The men in charge of the northbound train overlooked a meeting order and an operator failed to display his stop signal.

The trains in collision at Willimantic, Conn., on the 1st were an eastbound passenger train and a locomotive without a train, running west. The collision occurred within yard limits and both trains were moving at moderate speeds. Fifteen passengers were slightly injured. The light engine was not running under control as required by rule.

The trains in collision at Milwaukee, Wis., on the night of the 5th were through passenger trains. Both engines were damaged. Five persons were killed: the engineman of Train No. 3 and four trespassers riding on the end of the mail car of Train No. 58.

The collision at Geneva, N. Y., on the 8th occurred within yard limits. Two light engines moving south collided with another light engine moving north. Two employees were killed. The cause of the collision was a mistake in hand signaling; the men in charge of the southbound engines (173 and 1785) acted on a motion from a switch tender which was intended for engine No. 3783.

The train involved in the collision at Mead's, Ky., on the 15th was westbound passenger No. 23. The train collided with a car standing on the main track which had escaped control on a mine track, where it was being moved down grade by mine employees. The engineman was injured and about 25 persons in the coaches were slightly hurt by broken glass. The car had escaped from the mine track because of the failure of a derail to stop it. The derail was spiked to an unsound tie and the car pushed it to one side.

The trains in collision on the Southern Pacific at Hafed, Nev., on the 15th were eastbound extra freight No. 2516 and a westbound local freight. Both engines and ten cars were wrecked. One engineman, one brakeman, one other employee, and one trespasser were killed. The eastbound train had passed a distant signal at caution but had not been promptly brought under control; and the westbound had encroached on the right of the eastbound, trying to reach Hafed when there was not time to do so.

The trains in collision at Watauga, Tex., on the evening of the 15th were a northbound passenger and a southbound freight. The freight had been brought to a stop and was being backed into a side track. The engineman and fireman of the passenger train were killed and four passengers were injured.

The trains in collision at East Pittsburgh, Pa., on the 19th were an eastbound through freight and another freight which was switching on the main track. Ten cars were wrecked and the conductor, engineman and one brakeman of the through freight were killed and two trainmen were injured. The cause of the collision was disregard of a stop signal by the through freight.

The trains in collision at Albany, N. Y., on the 21st were an eastbound "hill pull," a light engine and a "yard pull." Three locomotives and several cars were damaged. The "hill pull" became uncontrollable on a steep descending grade and collided with a light engine, which was not in motion, and this in turn struck the "yard pull," near North Pearl street. As the "hill pull" departed from West Albany yard, a knuckle opened on the west end of fourth car, and, following this the angle cock was closed to enable trainmen to release the air brakes. When the train was recoupled it appears that the brakeman neglected to open the angle cock and the men in charge of the train neglected to test the brakes, thus leaving the train with insufficient brake power.

The trains in collision at Mansfield, Ill., at 1 a. m. on

the 24th were eastbound passenger No. 44 and a following freight train. The passenger train was standing at the station, and the rear car, a sleeping car, was wrecked. Two passengers were killed and 11 were injured.

The trains in collision near Wilton, Mo., on the 24th were westbound freight No. 93 and eastbound freight No. 72. Both engines and two cars were damaged. One trespasser was killed and one injured. The cause of the collision was that train No. 72 had become more than 12 hours late (thus losing its right to the road) and had not been protected by flag. The westbound train had stopped.

The trains in collision on the Kentucky & Indiana Terminal at Louisville, Ky., on the 30th were a passenger train of the Baltimore & Ohio, drawn by a locomotive of the Kentucky & Indiana Terminal, and a freight train being pushed by a locomotive of the Illinois Central. The engine of the passenger train and three cars of the freight were wrecked. The fireman of the passenger train was injured.

The train derailed near Frederick, Md., on the 2nd was an eastbound freight. Two trainmen were killed and four were injured. A car in the middle of the train was derailed, and fell in front of a westbound freight which was passing at the time and 18 cars were derailed. The car in the eastbound train was buckled and knocked off the track when the slack was closed up by two pushing engines.

The train derailed near Hatcher's Station, Ga., on the evening of the 5th was passenger No. 20. The first three cars were thrown off the track at a washout and a passenger coach was ditched. The injuries are all reported slight.

The train derailed on the Natchez, Urania & Ruston, near Urania, La., on the 10th was a freight train loaded with logs, descending a grade. The locomotive was overturned and five persons were killed. These were a woman and three children riding on the locomotive and the engineman, the engineman having been scalded fatally while trying to release the woman and children from beneath the overturned locomotive. The cause of the derailment is reported as not ascertained.

The train derailed near Gouverneur, N. Y., on the 17th, was a northbound freight. The engine was thrown off the track at a derailing switch and fell down a bank; and the engineman and fireman were killed.

The train derailed on the New York, New Haven & Hartford, Valley division, at Hartford, Conn., on the 20th was a northbound passenger. The engine was overturned and the engineman and fireman were injured. The derailment was caused by a plank which had been placed as a barrier by street repairers, and had been knocked down onto one rail of the track.

The train derailed near Saybrook Junction, Conn., on the 20th was an eastbound locomotive with no cars. It was thrown off the track and overturned at a crossing by striking an automobile. The engineman and fireman escaped with slight injuries. Out of 9 persons in the automobile, 8 were killed.

The train derailed at Lime City, Ohio, on the 22nd was an excursion carrying the Columbus Retail Grocers' Association. The engine was overturned, and a traveling fireman, riding in the cab, was killed. Twenty-five passengers and two trainmen were injured. The derailment was caused by spread track. An officer of the road writes that "just what spread the track is as yet undetermined, a peculiar feature being that the track was spread not only at the point of derailment, but for a distance of some 300 feet beyond the point where the train finally stopped. This spreading, of course, could not have been caused by the derailed train, as it did not pass over this 300 feet of track. Whether this spread was caused by a loose wheel, or something dragging on some train which passed ahead of the derailed train, is as yet undetermined. Another peculiar feature is that eight trains had passed over this track in the

preceding 12 hours, and the engineers in charge of these trains all testify that there was nothing noticed to indicate that there was anything wrong with the track. Of these eight trains, three were passenger trains."

The train derailed on the Gulf Coast Lines, near Cholge, La., on the 30th was castbound passenger No. 2. The derailment was due to the breaking of a switch as the train passed over it. The first two cars were overturned. One passenger was killed and the conductor, engineman and four passengers were injured, the conductor fatally.

The train derailed near Constitution, Ga., on the 31st was local passenger No. 4. The engine and the baggage car were overturned, and the engineman and fireman were seriously scalded. The engineman subsequently died of his injuries.

The train involved in the accident near Connellsville, Pa., on the 11th was a westbound freight. The boiler of the locomotive exploded and the engineman and fireman were injured.

Electric Car Accidents.—Of the 12 serious accidents on trolley roads in August, two had fatal results; the butting collision at North Branford, Conn., August 13, in which 19 persons were killed, and a derailment at Wellsley Hills, Mass., on the 26th, when one man was killed.

SPEED "LAWS" HAMPER RAILROAD EFFICIENCY

It is well known how both railroads and shippers have co-operated to meet the emergencies created by our entrance into the war. Typical of the carriers' response to the needs of the nation was the united action of the railroads within five days after the declaration of war to merge the transportation lines of the country into one great operating organization. No less important in contributing to the increased carrying power of the railways have been the effective efforts of shippers throughout the nation to diminish delay in handling cars and to load them to maximum capacity. It has remained for T. J. Foley, vice-president in charge of operation of the Illinois Central, to point out the great loss in transportation efficiency caused by unreasonable speed restrictions imposed upon the carriers by many cities and towns throughout the country. In a letter addressed to trainmen and enginemen Mr. Foley estimates that if the speed restrictions were abolished the railroads of the country could haul 4,373,952 additional freight cars a distance of 100 miles, or 75,023,520 additional tons of freight a distance of 100 miles in the course of a year. In this letter Mr. Foley said in part:

"It would seem that the only slack left in the railroads is the slack which the people themselves, who are asking for maximum efficiency, have placed in them. Little impediments to operation, in the aggregate, constitute great obstructions. For instance, on the Illinois Central system there are 480 speed restrictions. Practically every hamlet, town and city has its speed restriction, the great majority of which are six miles an hour for freight trains. These restrictions, in many instances unreasonable in the extreme, constitute an enormous burden on interstate commerce. On the main line of the Illinois Central between New Orleans and Chicago there are 91 places where the speed of freight trains is restricted, either by ordinance or state law, the total distance embraced in these restrictions being 57 miles. There are 48 places where passenger trains are required to reduce speed to six miles per hour. Between Omaha and Chicago there are 36 speed restrictions for freight trains and the same number for passenger trains. Many of the places where trains are required to slow down to six miles an hour are mere villages.

"The loss of time resulting from complying with unreasonable speed restrictions on the Illinois Central system is equivalent to a day's work of 49,883 men in each year. This waste is particularly burdensome at this time when the

shortage of labor is a tremendous handicap to efficient operation. Ten thousand more men could now be used on the Illinois Central system if they were available. Complying with these restrictions means the waste of 361,533 tons of coal per year, of the value of \$758,030 at present prices. It means the waste of 10,021 locomotive days in each year, and there is an unprecedented shortage in locomotive power. It means the waste of 248,522 freight cars for one day in each year. Figuring this waste, due to unreasonable speed restrictions, another way, I find that if these speed restrictions were abolished, the Illinois Central could haul 99,408 additional freight cars 100 miles per year with the same number of locomotives and men, or it could haul 1,705,080 additional tons of freight a distance of 100 miles with the same number of locomotives and men. Assuming that speed restrictions throughout the United States average the same per 1,000 miles of track as they do on the Illinois Central system, there are 21,200 speed restrictions in the United States. Complying with these speed restriction laws means the loss to the country of 2,203,210 men for one day in each year. It means the loss of 15,967,840 tons of coal of the value of \$33,479,570. It means the loss of 442,550 locomotive days in each year, and the loss of 10,934,968 freight cars for one day in each year. It means that if these unreasonable speed restrictions were abolished the railroads of the country could haul 4,373,952 additional freight cars a distance of 100 miles, or that they could haul an additional 75,023,520 tons of freight a distance of 100 miles in the course of a year. In these calculations, no allowance is made for the loss of time and money occasioned by pulling out draw-bars and damages to equipment on account of slowing down and starting up heavy freight trains, and railroad men will understand that this loss is considerable.

"I have not heard that there is disposition anywhere to co-operate with the railroads by removing unreasonable speed restrictions. Shippers have taken a lively interest in co-operating with the railroads in increasing their efficiency, but the authorities in the villages, towns, cities and states have not done anything. Perhaps this is because they have not been asked to do so. I think it would be meet and proper for you gentlemen to discuss this matter with the people whenever you have an opportunity.

"Speed restrictions are intended to make it safer for pedestrians and occupants of vehicles, both horse-drawn and motor-propelled, regardless of the inconvenience to transportation. It is thought by many that if trains are required to go through towns slowly and softly, with enginemen and trainmen on the lookout, that there will not be so much danger of accidents. The effect of this is to educate the public to become careless about railroad tracks. There ought never to be anything done towards teaching the public that railroad tracks are safe. The public ought to be taught that they are dangerous in the extreme, and the more dangerous they are the more care will be taken by the people themselves to avoid accidents. The idea of placing responsibility on the railroads for safety at railroad crossings is wrong. Crossings considered the most dangerous, we know from experience, are the scenes of fewer accidents than crossings considered comparatively safe. If speed restrictions were removed, in my opinion, accidents would not increase, because the people would become educated to look out for themselves at railroad tracks, instead of depending upon others to look out for them."

JAPAN GETS BIG STEEL SUPPLY FROM U. S.—Japan's imports of iron and steel from the United States in September, 1917, touched a new high record. In that month \$13,000,000 worth of iron and steel bars, plates and sheets was imported, compared with less than \$10,000,000 the previous month. This is the first time that iron and steel imports exceeded cotton imports into Japan from the United States.

Conversion of Freight to Switch Locomotives

Engines Which Were Considered as Practically Obsolete Are Rebuilt and Adapted to Modern Service

By W. H. Hauser

Mechanical Engineer, Chicago & Eastern Illinois.

THE Chicago & Eastern Illinois has an engine class containing sixteen 12-wheel freight engines which were built in 1897 and 1899. When these were first placed in service they were considered among the largest in the country. The size of freight equipment has increased so

be made simply by removing the engine truck and the rear pair of drivers. In the case of our 12-wheelers, however, this conversion had never been considered as the engines were not designed to permit proper weight distribution if this simple plan of conversion were followed. It was found

Fig. 1—The Twelve-Wheel Locomotive Before Conversion

greatly, however, that for some time past these 12-wheelers have been relegated more and more to odds and ends of service, with their obsolescent day fast approaching. More recently they frequently have been used in a sort of semi-switching and road service but not with entire success due to their long rigid wheel base. They are well built engines,

necessary to change the wheel spacing in order that the proper wheel loads might be obtained.

One of these engines both before and after conversion is shown in Figs. 1 and 2. It will be noticed that the converted 6-wheel switcher is in general a better looking engine than the original 12-wheeler. Many characteristics of the

Fig. 2—The Converted Six-Wheel Switcher

however, except for the type of firebox, which is of the O-G type, very narrow and 10 ft. 6 in. long.

On account of growing need of switching power it was proposed to change some of these 12-wheelers to 6-wheel switchers. The idea of converting freight engines with four pair of drivers and an engine truck to 6-wheel switchers is not a new one as it has been practised by other roads where the engines were so designed that the change could

engines are similar, as is to be expected, but some of the more important are quite dissimilar as will be noted below:

	Before conversion, 12 wheeler	After conversion, 6 wheel switch
Service	Freight	Switch
Traction effort	35,400 lb.	35,400 lb.
Weight in working order	175,500 lb.	160,660 lb.
Weight on drivers	144,050 lb.	160,660 lb.
Weight on leading truck	35,050 lb.
Weight of engine and tender in working order	292,390 lb.	263,160 lb.

	Before conversion,	After conversion,
	12 wheeler	6 wheel switch
Wheel base, driving	15 ft. 6 in.	12 ft.
Wheel base, total	25 ft. 4 in.	12 ft.
Wheel base, engine and tender	54 ft. 7 in.	45 ft. 2 in.
Weight on drivers ÷ tractive effort	3.36	4.53
Simple cylinders, diameter and stroke	21 in. by 26 in.	21 in. by 26 in.
Driver wheel diameter	55 in.	55 in.
Boiler, style firebox	O-G	O-G
Boiler, working pressure	200 lb.	200 lb.
Firebox, length and width	126 in. by 41 in.	126 in. by 41 in.
Flues, number and outside diameter	288—2 in.	288—2 in.
Heating surface, flues	2,045 sq. ft.	2,045 sq. ft.
Heating surface, firebox	197 sq. ft.	197 sq. ft.
Heating surface, total	2,242 sq. ft.	2,242 sq. ft.
Grate, length and width	126 in. by 41 in.	94 in. by 41 in.
Grate area	5,250 sq. ft.	26.8 sq. ft.
Tender, weight light	42,500 lb.	41,000 lb.
Tender capacity, water and coal	6,000 gal.—13 tons	5,000 gal.—10 tons

In converting, the locomotives data covering actual or computed weights were collected for the entire locomotive and its various parts. It was found that by lengthening the distance between the second and third drivers by 17 in. and by shortening the distance between the first driver and the center line of the cylinder by the same amount that the weight on all three pair of drivers would be very evenly divided—in fact, more evenly than is frequently the case

this frame as compared with taking down the entire frame and welding it by the blacksmith fire method follows:

Cut and weld with Oxweld	Taken down, cut, welded and replaced by the blacksmith fire method
\$112	\$387

There are other minor items in connection with the change in the design of the locomotives such as a new and heavier guide yoke brace and a new cast steel guide yoke. The main rods were shortened 17 in., while the side rods between the second and third drivers were lengthened 17 in. The spring rigging had to be altered but to offset this was the salvaged old springs and the fact that repairs and renewals have had been necessary with the old spring rigging anyway. When the first engine was placed in service it was found that owing to the size of the firebox the firing had to be watched with the greatest care, in fact too closely to permit of economical operation. The engines had always been free steamers in freight service when properly fired, but when placed in switch service they became too erratic. After a few trials this trouble was overcome by disconnecting and laying firebrick over three of the front

Fig. 3—The Frames Ready for Welding in the Additional Material Between the Second and Third Drivers

with newly built six-wheel switchers. Below is shown a table of these weight distributions:

	Twelve wheeler, before conversion	Six wheeler, after conversion
Engine truck	35,050 lb.	50,900 lb.
First pair drivers	35,050 lb.	57,800 lb.
Second pair drivers	35,250 lb.	52,000 lb.
Fourth pair drivers	35,100 lb.	

The method followed in changing the frame was quite novel and interesting. The upper and lower front frames were removed and delivered to the blacksmith shop. Six holes were plugged and welded in the blacksmith shop in the rear end of both top frames in order to match with the holes in the top front tongue of the main frame, while the rear end of the lower front frame was straightened and cut off to fit. The main frames were cut with the Oxweld torch between the second and third drivers and separated and 17 in. of each of the front upper main frame tongues were cut off by the same means.

Fig. 3 shows how the frames looked after the blacksmith and machine work had been completed and they were ready for welding in the 17 in. pieces between the second and third drivers. These pieces were welded in with the Oxweld torch. The finished job had a neat appearance. Cost figures covering the Oxweld method of cutting and welding

grates and building a wall 27 in. high at the rear end of these brick. Since doing this five of the converted engines have operated with great success and the others are to be converted as conditions permit.

The total cost of the extra work attendant on converting a single engine and over and above the general repairs and credits obtained for material removed was approximately \$450. The converted engines have been very successful in service both from a mechanical and operating standpoint.

BRITISH LABOR LEADER OPPOSES EIGHT-HOUR DAY DEMAND.—Speaking recently, J. H. Thomas, the general secretary of the National Union of Railwaymen of England, said that it was painful for him to have to oppose a demand for an eight-hour day, but he could not allow 370,000 men to be involved by 30,000 engineers. He had been put in a false position. The moral of the recent agitation was to show the absolute futility of sectional unionism. Approximately 143,000 railwaymen had enlisted, 5,000 of whom had made the great sacrifice. Thousands were already back, and many more would return, shattered in mind, body and spirit—mental derelicts. His conception of leadership was not to lead from behind, not to consider whether a thing was popular or not, but having made up his mind a thing was right or wrong, to act regardless of personal consequences.

A Study of Wood Preservatives and Marine Borers

A Description of Experiments to Determine Effectiveness of Creosote Oils in Preventing Attacks on Piling

By C. H. Teesdale

In Charge of Wood Preservation, United States Forest Products Laboratory, Madison, Wis., and

L. F. Shackell

Professor of Physiology, University of Utah, Salt Lake City

IT is impossible for one unfamiliar with marine shipping to appreciate the immense annual losses occasioned by the attacks of marine borers against wooden structures—boats' bottoms, harbor piling, and so forth. In the worst infested regions of the Atlantic, Pacific and Gulf coasts unprotected piling will not, as a rule, stand up for more than a single season. The economic losses do not stop with the destruction of wooden structures; for in certain situations their replacement often involves tedious work and much more expense than does their original installation. For instance, it is not infrequently necessary to remove a section from the roof of a warehouse in order to replace destroyed foundation piling.

For hundreds of years search has been made for an efficient protective against the attacks of marine borers. Dur-

ing a considerable portion of the wharf from which it was taken. In this last case the piles were exposed to the weather on the bank for one year before being driven, which may have been responsible for the short life in service.

There is an element of uncertainty in all except, perhaps, the heaviest treatments. Coal-tar creosote is a highly complex mixture of organic compounds (no two creosote oils being identical in composition), and methods of analysis are limited mainly to fractional distillations carried out under arbitrary conditions, together with determination of a few physical constants. Furthermore, it has not been known whether the effectiveness of a creosote oil against marine borers is due to its toxic constituents, to its viscosity, to high-boiling, practically non-volatile compounds, or to some combination of the foregoing. The development within recent

(1) Section of a Creosoted Longleaf Pine Pile Destroyed by Teredo at Gulfport, Miss. Left-hand Section Taken at Surface of Water and Right-hand Section Taken at Mud Line. (2) Creosoted Longleaf Pine Piles Badly Damaged by Teredo After Four Years' Service at Gulfport, Miss. (3) Creosoted Longleaf Pine Pile Badly Attacked by Sphaeroma After 12 Years' Service at Mayport, Florida. (4) Section of Creosoted Longleaf Pine Pile After 4 Years' Service at Brunswick, Ga.

ing the past 50 years the use of creosote oils, particularly those obtained from coal tar, has made great headway; until at present impregnation under pressure with coal-tar creosote may be considered a standard method of preserving piling. This method is, however, expensive, and its effectiveness by no means invariable. For example, 12 years is about the average life obtained from piling given an 18-lb. treatment and installed at Pensacola, Fla., and it is the practice of one of the railroads to use a tile protection around creosoted piles where renewals are very expensive. The sections in Fig. 1 were taken from a creosoted longleaf pine pile destroyed by *xylotrya* at Gulfport, Miss., and removed in 1913 after 11 years' service, the cause of failure probably being uneven penetration; Fig. 2 shows the condition of wharf piling at the same place after four years of service, and is typical of about 50 per cent of the piling in the structure driven at the same time. Fig. 3 shows a pile badly damaged by *sphaeroma* at the mouth of the St. Johns river at Mayport, Fla., after 12 years' service. It was in somewhat worse condition than the average piles in the structure of which it is a part. Fig. 4 shows the condition of creosoted longleaf pine piling after four years' service at Brunswick, Ga. This pile shows heavy attack by *limnoria* in the creosoted portion, and is typical of

years of a ready market for individual constituents of creosote—the phenols, naphthaline, tar bases, and so forth—has led to the widespread use against marine borers of oils from which these constituents have been removed in part so that the composition of the oils must be widely different from that of the straight distillate oils used 20 to 50 years ago, and it is uncertain how the effectiveness of the oils is impaired. It is these oils, however, that have furnished the service data on which the reputed effectiveness of creosote oils in general has been based.

For a number of years the United States Forest Service has been investigating methods of treatment and the efficiency of various preservatives, taking records on actual service tests, in an effort to overcome this destruction of timber by marine borers. At the same time the United States Bureau of Fisheries has been studying the life histories of the various borers. Since 1914, these bureaus have been working jointly on the problem, and have published annual reports of progress made, this being the third such report.

The first series of tests was started in 1911 and 1912 with treated specimens of southern yellow pine, each about six inches in diameter and two feet long. Specimens treated with coal-tar creosote fractions were installed at Pensacola, Fla., Gulfport, Miss., and San Francisco, Cal., and speci-

mens treated with various other preservatives were installed at Gulfport and San Diego. A second series of tests was started by installing additional specimens in 1914 and 1915. The pieces treated with coal-tar creosote fractions in 1911 were given an absorption of 18 lbs. per cu. ft. and the later ones an absorption of 8 lbs. per cu. ft.

SUMMARY OF TESTS IN ALL LOCATIONS AFTER 5 TO 6 YEARS' SERVICE.

Preservative.	No. of specimens.	Condition.					
		No attack.	Very slight attack.	Slight attack.	Medium attack.	Severe attack.	Very severe attack.
Fraction I.....	16
Fraction II.....	16
Fraction III.....	16
Fraction IV.....	16
Fraction V.....	16
Coal-tar creosote.....	20
Copperized oil.....	8
Water-gas-tar creosote.....	8
Hardwood tar.....	8
Timber asphalt.....	8
Untreated.....	24

Comparing the results obtained on the five fractions of creosote, it was noted that there was a progressive increase in resistance to attack as the boiling point of the preservative was raised. Thus, all of the specimens treated with Fraction I were either severely attacked or destroyed, while only one treated with Fraction V was destroyed. Those treated with coal-tar creosote were about comparable to those treated with Fraction IV. The high boiling water gas-tar creosote was almost as effective as coal-tar creosote. Of the other preservatives used, copperized oil, hardwood tar, timber asphalt, and Spiritine were not at all effective. Hence, it is concluded that products of petroleum and of the distillation of hard and soft woods are not effective in preventing attack by marine borers.

The later experiments indicate that low boiling water gas-tar distillates are ineffective. Zinc chloride or copper salts added to crude oil were of little value, while ferric chloride or copper salts added to creosote considerably increased the resistance, especially to limnoria attack. Naphthalene added to creosote decreased its resistance to the borers, especially limnoria. While the results indicate that additions of tar to creosote reduced the resistance to attack, this was due to the fact that the tar increased the difficulty of penetration, and, with the low 8-lb. absorptions, resulted in narrow poorly penetrated strips near the surface, in which the borers obtained a start. Where the specimens were well treated, the general surface conditions indicated that tar increased the resistance to attack to a considerable extent. Ferric acetate solutions were of no value.

The shipworm, xylotrya (often confused with a less common relative, teredo), is perhaps the most destructive borer in American waters, and though a microscopic organism at the time of its entrance into a piece of wood, it may attain a length of several feet and a diameter of an inch. Widely different from this mollusc is the tiny crustacean borer, limnoria, which rarely attains a length above one-eighth inch, and yet because of vast numbers is fairly destructive. In spite of the great structural differences between these two forms, their reactions toward creosote poisons were strikingly similar. This was determined from the following summary, which applies equally to both xylotrya and limnoria. Over 1,000 specimens of xylotrya and more than 12,000 limnoria were used.

The preparations investigated consisted of the creosote and creosote fractions used in the above described service tests; a series of creosote light oils; a series of tar acids; a series of tar bases, and a series of crystalline coal-tar hydrocarbons. The light oils tested were benzol, toluol and a mixture of the isomeric xylols. The tar acids consisted of

phenol, orthometa—and para-cresols and alpha—and beta-naphthols. The samples of mixed tar bases consisted of four fractions obtained by the Hempel distillation of crude bases. The temperature limits of these distillates were, respectively, 94 to 167 deg. C., 170 to 210 deg., 210 to 250 deg., and 250 to 315 deg. Experiments were also made with a sample each of pure pyridine and of synthetic quinoline. The crystalline hydrocarbons studied were naphthalene, acenaphthene, phenanthrene and anthracene.

1. The toxicity of creosote fractions *decreases* as the boiling point rises; that is, the creosote and its distillates, arranged in the order of decreasing toxicities, are: Fraction 1, fraction 2, creosote, fraction 3, fraction 4, fraction 5. The high toxicity of fraction 2, which was solid with naphthalene, was probably due mainly to tar acids.

2. The creosote light oils are definitely poisonous to the borers. Benzol is the most, and xylol the least toxic. The toxicity of toluol lies between these two.

3. The tar acids are all highly poisonous to the borers. Their toxicity steadily *increases* with a rise in molecular weight; that is, arranged in order of increasing toxicity, they are: Phenol, the cresols and the naphthols. The three isomeric cresols, which exert practically the same degree of toxic action, are about twice as poisonous as carboic acid; while the two naphthols, also equally toxic, are ten or more times as poisonous as phenol.

4. Tar-base fractions all show a high toxicity for the borers; and this toxicity *increases* with a rise in the boiling point of the fractions. Pure quinoline, boiling at 239 deg. C., is several times as poisonous as pyridine with a boiling point of 115 deg. The toxicities of the tar bases are fairly comparable with those of tar acids of approximately the same boiling points.

5. In comparison with the tar acids or bases or even the lighter hydrocarbon oils the solid hydrocarbons of creosote are only very slightly toxic. Arranged in the order of decreasing effectiveness, they are: naphthalene, phenanthrene, acenaphthene and anthracene. Naphthalene is perhaps five times as toxic as anthracene.

It has apparently been assumed that the more poisonous a creosote oil is the more effectively will it prevent attacks of marine borers. It will be noted, however, that the conclusions drawn from these direct toxicity tests, especially with reference to creosote and its fractionates, are diametrically opposed to the conclusions drawn from the service tests above; that is, the highest boiling fraction, which was the least poisonous, stood up the best in actual service. But it does not follow that some of these observations must be inaccurate, nor that toxicity is not a factor in the preservative action of creosote oils. It seems worth while to consider this point in some detail, if only to show how involved is this problem of marine borers.

The data for the first six preservatives indicate that the practical efficiency of these preservatives is a function of the high-boiling constituents that each contains. For example, Fraction I, which was the least effective, had a residue above 225 deg. C. of 8.1 per cent; whereas Fraction V, the most effective, had a residue above 320 deg. C. of 89.8 per cent. Coal-tar creosote, with an efficiency between that of its lowest and its highest-boiling fractions, had a residue above 320 deg. C. of 25.8 per cent. Now, it is not improbable that the high-boiling, relatively non-volatile constituents tend to prevent the loss of lower boiling, poisonous substances. With such an assumption, it is easy to reconcile the apparently conflicting results of the service tests and the toxicity experiments.

Although the writers are convinced that the proportion of high-boiling constituents in a creosote oil is a large factor in determining its value for marine work, they are also inclined to believe that other though more obscure factors may

play an important part. It seems possible, for instance, that the tar acids and bases, which were found to be the most poisonous constituents of creosote, may be combined chemically in a creosote to form relatively non-poisonous compounds. Another and perhaps more reasonable assumption is that the high-boiling acids (e. g. naphthols) and bases (e. g. quinolines), which are readily miscible with high-boiling neutral creosote oils, but only slightly soluble in sea-water, will be found to have a very low coefficient of distribution between the neutral oils and the sea-water in comparison with lower boiling acids (e. g. phenol) and bases (e. g. pyridine), which are much more soluble in sea-water. The writers expect to test these assumptions experimentally in the near future.

Users of creosoted piling have been greatly puzzled occasionally on observing shipworms boring through heavily creosoted wood. The writers have themselves seen this; but on following the burrows back, have very frequently found that the point of beginning the attack was at a spot which had received, if any, only very superficial treatment. These observations furnished the basis for a series of service tests to determine whether shipworms would pass from untreated into treated wood; and, if so, whether the type of treatment would determine the extent of their attack.

Rectangular sticks of sap loblolly pine, about 3 in. by 3 in. by 36 in., finished on all sides, were treated at the

5 to 7. The last shows that naphthalene, alphanaphthol, phenol and benzol, in the proportions in which they were present, were ineffective in these service tests. Perhaps the most striking point, however, about these tests was the fact that in each of the sheathed specimens treated with creosote or its fractionates the borers passed from the untreated sheathing into the cores; whereas the unsheathed controls in this group were unattacked.

The interpretation of these unexpected results lies in the peculiar life history of the shipworm. The latter invariably begins its attack on wood as a free-swimming larva, microscopic in size. At this time it is readily killed by traces of poisons which may leach slowly from the surface of unsheathed creosoted specimens. But when such a larva has once obtained a foothold in the wood, it undergoes a radical metamorphosis and grows with great rapidity, so that it may attain a size thousands of times that of its larval state in two or three weeks. This great increase in size is accompanied by a corresponding increase in resistance to creosote poisons; so that shipworms, which by some chance have obtained a foothold, may ultimately be enabled to burrow with apparent impunity through heavily treated wood.

The value of high-boiling coal-tar creosote oils for this purpose may be considered as established, but further investigation is necessary to establish the value of specifying high-boiling acids and bases in oils for marine work. A

(5) Sheathing Experiments. Heavy Treatments With Most Toxic Creosote Distillate—Fraction 1. No. 5 Unsheathed Control. Sheathing Practically Destroyed. Attack on Treated Cores, Though Definite, Is Rather Superficial. No Sign of Attack in No. 5. (6) Light Treatments, With Straight Creosote of Medium Toxicity. Depth of Borings Average $\frac{1}{4}$ inch. No. 4 Not Attacked. (7) Light Treatments with Least Toxic Creosote Distillate—Fraction 5. Attack on Treated Cores Fairly General, But For Most Part Extremely Superficial. No Sign of Attack in Unsheathed Control.

Forest Products Laboratory with creosote I and the several fractions. A series of treatments was also made with special preparations as follows: (a) Benzol, 90 per cent; (b) re-sublimed naphthalene, 25 per cent, in gas oil; (c) pure phenol, 5 per cent, in gas oil; (d) alphanaphthol, 1 per cent, in gas oil; (e) gas oil. After treatment the majority of the sticks were sheathed completely with untreated half-inch sap pine boards secured from the same source as the treated wood. The sheathing was surfaced on the side in contact with the treated core, and was secured to the latter with brass screws. One specimen in each treatment was left unsheathed as a control. The purpose of the sheathing was merely to serve as bait for the microscopic free-swimming shipworms, and later as shelter for the borers until they should attain a size sufficient to render them easily observable. The main object of these experiments, however, was to study the reactions of the borers on reaching the treated cores.

The specimens were shipped to the U. S. Fisheries Station, Beaufort, North Carolina, and were installed in Beaufort Harbor in the middle of June, 1915—about five weeks after treatment. They were allowed to remain in the sea-water for six months, and were then taken up and examined.

The results of these tests are illustrated in part in Figs.

liberal content of acids and bases would do no harm, and if these results have practical significance, they strongly indicate that they would increase the effectiveness of an oil.

The following specifications were adopted at the 1917 convention of the American Wood Preservers' Association and provide a distillate oil containing more high-boiling constituents than any previously adopted for use in pressure treating plants. While it was intended for treating paving blocks it is also the best specification thus far adopted that could be used for piling. Such an oil need be used only in the most heavily infested waters. At least 22 lb. per cu. ft. should be injected.

The oil shall be a distillate of coal-gas tar or coke-oven tar. It shall comply with the following requirements:

1. It shall not contain more than 3 per cent of water.
2. It shall not contain more than 0.5 per cent of matter insoluble in benzol.
3. The specific gravity of the oil at 38 deg. C. shall be not less than 1.06.
4. The distillate, based on water-free oil, shall be within the following limits:
 - Up to 210 deg. C. not more than 5 per cent.
 - Up to 235 deg. C. not more than 15 per cent.
5. The specific gravity of the fraction between 235 deg.

and 315 deg. C shall be not less than 1.02 at 38 deg./15.5 deg. C.

The specific gravity of the fraction between 315 deg. and 355 deg. C. shall be not less than 1.10 at 38 deg./15.5 deg. C.

6. The residue above 355 deg. C., if it exceeds 10 per cent, shall have a float-test of not more than 50 seconds at 70 deg. C.

7. The oil shall yield not more than 2 per cent coke residue.

8. The foregoing tests shall be made in accordance with the standard methods of the American Wood Preservers' Association.

SUMMARY

1. The economic losses due to the activities of adult shipworms can never occur as long as treatments of wood for marine structures are able to prevent attack by the microscopical and apparently insignificant shipworm larvae.

2. Heavy treatments with a proper type of creosote will still prove inadequate as long as areas of superficially treated sapwood, heartwood, knots, and so forth, are left exposed for the lodgment of shipworm larvae.

3. It appears that a proper creosote oil for marine work should contain a large proportion of constituents boiling above 320 deg. C., as well as considerable amounts of high-boiling tar acids and bases.

SAFETY AT HIGHWAY GRADE CROSSINGS

The general use of cautionary highway crossing signs (corresponding to distant signals on railroads), the most notable improvement that has been made in crossing safety for many years, is now provided for by law in eight states, namely: California, Connecticut, Illinois, Maine, Massachusetts, New Hampshire, Oklahoma and Vermont.

This and other interesting information concerning grade crossings and trespassing may be found in the report of the committee on these subjects, which was presented at the meeting of the National Association of Railway Commissioners at Washington, October 16. Bills providing for the signs have been presented to the legislatures in a number of other states. Most or all of the laws which have been passed contemplate the fixing of these signs at 300 feet from the tracks. New Hampshire, which was the pioneer state in this matter, reports that the cautionary signs are already in use, but that they are not of the same design as that later adopted or approved by the association. In Vermont the situation is similar to that in New Hampshire. In Connecticut the sign must be furnished by the railroad, but will be set by the city or town. In California, the law requires vehicles approaching grade crossings of railroads to run not faster than 15 miles an hour. Tennessee has a law requiring drivers of automobiles to come to a full stop before crossing tracks. Texas requires them to slacken to six miles an hour at all crossings except those protected by gates or flagmen. The State of Washington has passed a law requiring automobiles carrying passengers to stop before crossing tracks.

The painting of black and white diagonal stripes on crossing gates, and the use of disks instead of flags by crossing watchmen are now regular practice on many railroads in many states.

This report is the most comprehensive review of the grade crossing question which has come to our notice. As to protection of crossings it refers to the action of the association last year, which resulted in joint action (through committees) with the American Railway Association, and the adoption of important standards. On the subject of elimination of grade crossings the report summarizes some figures which show the enormous magnitude of this problem. There are, in 22 states which have replied to a circular, over 110,000

grade crossings. Basing the calculation on the data received, the committee estimates that in the whole United States there are 200,000 grade crossings; and that at these crossings about 2,000 persons are killed each year. In the 22 states reporting, it appears that only ten per cent of the crossings are protected by gates, flagmen or bells. In a number of states a good deal of progress has been made in the elimination of grade crossings. The leaders in this movement are Connecticut, Illinois, Massachusetts, New Jersey, New York, Oklahoma, Oregon, South Carolina and Wisconsin. Massachusetts, with only about 2,000 miles of railroad, has spent, since 1890, about \$42,000,000 on this work. In Illinois, the work, not begun so early, has involved the expenditure of \$55,000,000, a large share of which was spent within the city of Chicago. New York, with four times as many crossings as Massachusetts, has spent only a little more money, namely, \$44,000,000.

Estimates of what it would cost to eliminate all of the crossings in a state are made in a few cases, running up into the hundreds of millions, of course. In California, the estimate averages \$30,000 to each crossing; in Colorado, \$40,000; in New York, \$48,000, and in Wisconsin, \$25,000.

The committee thinks that every state ought to have a law requiring railroad companies to make some progress in the elimination of crossings every year; and, generally speaking, it is believed that the cost should be divided about equally between the railroads and the public, as is the case in New York. The laws, action and policy of the several states in regard to the elimination and protection of highway grade crossings are set forth in a full abstract, filling 26 pages of the committee's report.

Trespassing, which subject was added to the committee's field of work last year, is treated briefly, attention being called to the fact that the only point of contact between grade crossings and trespassing lies in the fact that the crossing makes the rights of way of the railroads easily accessible to trespassers. The lack of respect for railroad property, which developed in many communities in the early days, still remains; and the American record in the matter of trespassing on tracks is disgraceful. Many states have no adequate laws forbidding trespassing on railroads, and in the thirteen states which have such laws it is common knowledge that trespassing has not been stopped.

The committee sent out a circular of inquiry and found that only in four states do the laws forbid trespassing on rights of way, as distinguished from trespassing on trains; and only one state, Pennsylvania, claims that the laws are strictly enforced. The replies to this circular are summarized in tabular form in an appendix. The almost universal neglect of the statutes on this subject leads the committee to say that the outlook is discouraging. The railroads are fully alive to the situation, and in many cases have been exceedingly active, endeavoring to prevent trespassing; but the public authorities are indifferent. There is a widespread belief that anti-trespass laws are passed at the behest of the railroads, not to protect human lives and limb, but to protect railroad property, and to permit corporations to infringe or seek to infringe upon the liberty of the individual. An educational campaign is necessary to dissipate this erroneous notion.

The committee recommended the passage of federal legislation to eliminate trespassing, but the convention did not adopt the recommendation. The committee thinks that a statute could be framed which would be enforceable either by the federal authorities or by state and local authorities. Aside from this, about all that can be done is to continue the present efforts at publicity and general education of the people. The chairman of this committee is James Blaine Walker, New York Public Service Commission, New York City; and the other members are R. C. Bacon, C. C. Elwell, Alex. Gordon, F. J. Miller, John G. Richards, and B. W. Waltermire.

Priority Regulations for Railway Materials

The Methods of Procedure in Securing Supplies and the Extent to Which They Will Affect the Railroads

BECAUSE of the unprecedented demand of the various government departments for iron and steel and their products, for ships, docks, munitions and other supplies for the army and navy, and for construction and other purposes in connection with the war, and because of the unusual needs of the railways and other industries for work urgently necessary in carrying on the war, together with the certainty that non-essential demands on the available capacity must in part, at least, be subordinated to the most urgent requirements, it has been necessary to devise a system of priority to determine the relative precedence in which orders shall be filled.

The determination of relative priority has been placed in the hands of the Priorities Committee of the War Industries Board of the Council of National Defense, located at Washington. Judge Robert S. Lovett, chairman of the executive committee of the Union Pacific, is chairman of this committee and has also been appointed by the President as director of priority of transportation, to administer the powers conferred upon the President by the priority of shipments law. The other members of the committee are: Major General J. B. Aleshire, George Armsby, Rear Admiral N. E. Mason, Edwin B. Parker, J. Leonard Replogle, Rear Admiral A. V. Zane, and R. T. Demsey, executive secretary.

The operation of the priority system must inevitably have an important bearing on the work of railway supply companies and upon even the operation and maintenance of the railways as well as upon their plans for improvements, because the scarcity of materials and supplies necessary to railway work is such that it will be necessary to secure priority orders in order to obtain what is required and precedence must be given to the orders and to the work deemed most essential to the successful prosecution of the present war.

The Priorities Committee has recognized the indispensable character of the service being performed by the railways and has generally followed the practice of classifying requests for priority for railway materials as next in importance to actual war orders.

Directions prescribing the principles to be followed in determining priority were made public in Circular No. 1 issued by the Priorities Committee on September 21, giving instructions as to priority in orders and work for all individuals, firms, associations and corporations engaged in the production of iron and steel and in the manufacture of products thereof. About 25,000 copies of this circular were sent to manufacturers in all parts of the United States, requesting them thereafter to observe the regulations and to give priority in accordance with certificates to be issued by the committee. The circular was signed by Judge Lovett and was approved by the Secretary of War and of the Navy.

Heretofore applications for priority orders have been made direct to the Priorities Committee, but the subcommittee on materials and supplies of the Railroads' War Board, H. B. Spencer, vice-president of the Southern Railway, chairman, which has been keeping in close touch with the work of the Priorities Committee with reference to railway materials and has also conducted investigations as to the needs of the railways for materials and supplies, has now developed a plan by which applications by railroads for priority certificates for work in which they are interested will be sent direct to the office of the subcommittee in Washington and will be handled by it with the Priorities Committee.

The general plan of the priority system is described in Circular No. 1 as follows:

DIRECTIONS AS TO PRIORITY

During the war in which the United States is now engaged, all individuals, firms, associations, and corporations engaged in the production of iron and steel and in the manufacture of products thereof are requested to observe the following regulations respecting priority, viz.:

1. All orders and work shall be divided into three general classes, Class A, Class B, and Class C, with various subdivisions of Classes A and B, indicated by a suffix number, thus: Class A1, A2, A3, A4, etc., and Class B1, B2, B3, B4, etc.

2. Orders and work in Class A shall take precedence of orders and work in both Class B and Class C, and orders and work in Class B shall take precedence of orders and work in Class C, irrespective of the date the orders were received; and orders and work in Class A1 shall take precedence of orders and work in Class A2, etc., and Class B1 shall take precedence of Class B2, etc.

3. Class A comprises war work: that is to say, orders and work urgently necessary in carrying on the war, such as arms, ammunition, ships, etc., and the materials required in the manufacture of same.

4. Class B comprises orders and work which, while not primarily designed for the prosecution of the war, yet are of public interest and essential to the national welfare, or otherwise of exceptional importance.

5. Class C comprises all orders and work not embraced in Class A or Class B, and no certificate of the Priorities Committee will be required therefor. Any order for work or material not accompanied by a certificate in substantially the form set forth on page three of this circular, to the effect that the work or material falls within Class A or Class B, should be treated as an order for work in Class C.

6. All materials required in the manufacture of an article or in the prosecution of any work will be entitled to take the class of such article or work unless otherwise specified in the certificate covering the same.

7. Certificates in the form set forth on page three of this circular will be issued by the Priorities Committee upon application therefor, specifying the classification of the order or work, and priority should be given accordingly in producing and furnishing the material or supplies, or in manufacturing and delivering the article. Certificates of a subsidiary nature will be issued upon request for the furnishing of material and articles required in manufacturing the article or prosecuting the work ordered.

8. All orders placed prior to the date hereof by or on behalf of the War Department or Navy Department of the United States or the United States Shipping Board Emergency Fleet Corporation should be classed as subdivision A1 of Class A, unless otherwise ordered by the officer placing the order or by the Priorities Committee; and all orders for arms, ammunition, and other military supplies and equipment placed prior to the date hereof by or on behalf of the nations associated with the United States in the war in which it is now engaged should be classed as subdivision A2 of Class A unless otherwise ordered by the Priorities Committee.

9. All orders placed after the date hereof should be classed as Class C unless covered by certificates of the Priorities Committee or other written directions of the said committee.

The form of application for a principal Class B priority certificate (Form P C 7) is as follows:

[illegible]

(e) Applications (Form P C 9) for subsidiary certificates covering materials, articles, or work required in the manufacture of articles or in the prosecution of work in connection with which a principal Class B certificate shall

The first concern of the committee has naturally been to secure expedited delivery of the vast supplies of materials urgently required to fill government orders or to make it possible for some subsidiary contractor to proceed with work needed to complete government orders. To a considerable extent the paramount needs of the government have resulted in delaying or setting aside orders placed by the railways or have made it impossible for companies holding contracts from railways to secure materials required to fulfill their contracts. In some cases railways have voluntarily postponed their own requirements to give way to

work considered more urgent. In the case of locomotives precedence was given by direction of the Secretary of War, before the priority system was put into effect, in the following order: For the United States government, for the French government, for the Russian government, and for American railways. Of 968 locomotives turned out by the builders between June 1 and the first part of October, 353 were for the United States or foreign governments, and of the 4,120 locomotives on order, 2,490 were for the United States or foreign governments.

However, since the priority plan has been put into effect recognition has been given to the necessity of keeping the railways in a condition to meet the demands upon them for transportation and railway materials in general have been considered as entitled to Class B 1 rating, providing the reasons for requesting priority justify such a rating in each particular case.

This is the highest rating that can be given to anything which is not included under the head of actual war work.

All applications are passed on individually, however, and

sub-contractor or concern that furnishes some of the contractor's supplies necessary for the completion of the principal contract.

For example, a road that has ordered cars, delivery of which is delayed by inability of the car builder to obtain steel, might ask for a principal certificate for the car builder. The latter in turn, if given a principal certificate, might then request a subsidiary certificate to enable the company from which it must obtain some of the car equipment to secure raw materials. Possibly the completion of an order for cars might be delayed by the difficulty of securing some comparatively unimportant item of equipment. If a priority order covering a comparatively small amount of work would enable the cars to be put into service promptly a Class B1 order would undoubtedly be issued, and the fact that actual war orders were given precedence would not necessarily delay the work until the war orders were completed if the B1 order could be worked in with them. On the other hand, if a steel mill had delayed delivery of plates to a car builder in order to complete an urgently needed order for the War Department or the Shipping Board the cars might be delayed. If a railroad needed materials to complete a signal installation and could show that it was handling a large volume of war traffic which would be facilitated by the signal installation, it would have no difficulty in securing a Class B1 order, but if the road were not able to show that the signal installation would directly expedite war traffic or if the equipment was desired for a road which would not be completed for some time a lower rating would undoubtedly be given.

The sub-committee on Materials and Supplies has recently reported that railways generally have been obtaining sufficient metal for their needs, except that there have been some delays, particularly as to rail.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., October 31.

An unmistakable war order pertaining to transportation, one that will curtail if not eliminate industries and operations not considered essential to the winning of the war, was issued by Judge Lovett, the priority agent on October 27.

It requires all railroads, beginning November 1, to deny the use of open top cars, except platform cars and cars in work service, for the transportation of materials and supplies, other than coal, for the construction, maintenance, or repair of public or private highways, roadways, streets or sidewalks; for the construction, repair or maintenance of theatres, or other buildings to be used for amusement purposes; materials and supplies, other than coal, for the manufacture of pleasure vehicles, furniture or musical instruments; or for the transportation of passenger vehicles, furniture or musical instruments.

This limitation upon the use of gondolas, President Wilson has been convinced, is necessary for an augmentation of the coal supply. For the lack of coal to keep her ammunition factories going, Italy is now being forced to relinquish the Austrian territory which she conquered in May and August.

It is estimated that by forbidding the uses named, the coal movement can be increased 600,000 tons a week. The testimony which caused the President to authorize the issuance of the order tended to show that coal production is being kept down by the inability of the railroads to provide more cars, and that that inability resulted from the carelessness of some railroad officers, and from the obstinacy of consignees who, notwithstanding protests, loaded out coal cars which they had emptied instead of allowing them to be returned without delay to the mines.

The order, by its terms, suggests that the open-car com-

Principal Certificate No. B to be held by who requests that Subsidiary Certificate

Issue to

APPLICATION FOR SUBSIDIARY CLASS B PRIORITY CERTIFICATE

..... 191

Priorities Committee, War Industries Board,
Council of National Defense, Washington, D. C.

GENTLEMEN:

You are hereby requested to issue a Class B Priority Certificate subsidiary to your Principal Priority Certificate, No. B, the requested Subsidiary Priority Certificate to cover an order or contract dated for

placed with for delivery

The execution of this order is necessary for the completion of the contract undertaken by this applicant for which the above-mentioned Principal Priority Certificate was issued for the reasons following:

.....

Yours truly,

(Contractor holding Principal Priority Certificate No. B)

Form PC 1 (7)

rated according to their merits, so that a request from a road that could show that the materials were needed for a purpose that would have a direct effect in enabling it to handle war traffic would be classed as of greater importance than a similar request from a road that could not show so direct a connection with a war emergency.

A railroad which has placed contracts for materials, supplies or equipment, delivery of which has been delayed by inability of the contractor to obtain needed materials or parts, applies for a principal certificate covering its contract, giving the reasons why it is needed and stating that it is able to secure the needed materials, supplies or articles only by being accorded priority. After a principal certificate has been issued the contractor may in turn request a subsidiary certificate covering materials that may be needed by some

modities at present deemed most important are coal, coke, ore, limestone needed in blast furnaces, sugar beets, sugar cane, sorghum and other raw materials for use in the metal, sugar and fertilizer industries, and other commodities necessary for the national defense and security.

While it is called priority order No. 2, it does not follow the form of No. 1. The first order directs that preference be given to lake cargo coal. This one does not say that the railroads shall give preference and priority to coal, coke, etc. On the contrary, it says they "shall deny the use of" gondolas for the purposes indicated. That language was determined upon only after considerable discussion among the transportation men (who really suggested the limitation). Under an order to give preference, it was suggested by those who advocated the "shall deny" form, too much discretion is left with a commercial agent or a yardmaster, who may be anxious to acquire the good will of a big shipper. For illustrative purposes, consider this situation: A manufacturer receives a car of coal. Then he says to the railroad man, "I have a load of paving brick going to Hilltown, ten miles from the mines, and on the direct route to them. I will unload, and load this car before you can get the yard crew to take it away, and I know the bricks will be taken out instantly when it arrives at Hilltown. If you don't let me load them, I'll hold this car 48 hours, and it will not get back to the mines as soon as it will if you allow me to use it for the brick."

The receiver of the coal has a right to hold the car for 48 hours without incurring penalties. Under the terms of the first priority order, the railroad man would have a discretion, perhaps not a legal one, but nevertheless a discretion. Under No. 2, there is no discretion. The railroad "shall deny the use" of open top cars, with the exceptions mentioned, for anything other than the metal, sugar and fertilizer industries and for commodities necessary for the national defense and security.

While the order says "the President has come to the conclusion," etc., the fact is that the transportation men in the Government service are the ones who reached the conclusion and persuaded the President and Dr. Garfield, the Fuel Administrator, to adopt it. Judge Lovett, acting through George W. Kirtley, his executive officer, the members of the Sheaffer committee, and E. H. DeGroot, Jr., and A. G. Gutheim, the commission's division on car service, are the men who devised this plan for so materially increasing the country's coal supply. It is almost a certainty that the order will put a stop to the road-building programs in all the states. Ohio, according to the information reaching Washington, has been using 6,000 cars of road-building materials every week. Another bit of information upon which the car service men worked is that a big automobile manufacturer shipped 60 per cent of his output in coal cars.

The order will be enforced to the letter. If the interdicted industries and operations can survive by using other kinds of cars, they may continue during the war, but not otherwise. Inasmuch as the President's power to grant preferences and priorities is undisputed, it is believed that the method by which he accomplishes the result will not be scrutinized with fault-finding eyes by the courts.

Issuance of the second priority order, as distinguished from the lake cargo coal order; the order for the fueling of various railroads and the diversion of lake cargo coal to any preferred destination during the 24 hours beginning at midnight of October 28; and the appointment of two railroad men, G. N. Snider of the New York Central and Arthur S. Learoyd of the Delaware, Lackawanna & Western, made known in Washington on October 25, indicate, it is suggested, a growing recognition by the powers that be, that fundamentally the winning of the war depends on the full utilization of American railroads. Mr. Snider is to be the

head of the Fuel Administration's transportation department, and Mr. Learoyd is to have charge of the distribution of anthracite coal.

ADVANCED RATE PROCEDURE

The Interstate Commerce Commission, on October 27, consolidated the various investigation and suspension cases created by the tariffs filed immediately after the decision in the Fifteen Per Cent case, canceled the hearings therein, and set them down for hearing in connection with the re-opened Fifteen Per Cent case, technically known as Ex Parte No. 57. What, if any, particular meaning is to be attached to this consolidation is not very clear. There have been intimations that the Commission, in re-opening the Fifteen Per Cent case, intended to take the initiative in that matter out of the hands of the Eastern carriers and keep the proceeding under its own control. How accurate an appraisal of what is in the recesses of the minds of commissioners that may be has not been disclosed. George Stuart Patterson suggested the consolidation and postponement of hearings until such time as the carriers might complete more satisfactory tariffs, about sixty days from the time when he was speaking, October 17. There can be no detailed hearing on any of the suspension cases, six in number, on November 5, the day set for the hearing in the re-opened case. Details can be given in only one, a hearing for which was set on November 1. No time for detailed justification has been allowed in the others. The most that can be said is what has already been told the old suspension board, now known as the Fifteenth Section Board, namely, that some of the tariffs in question overcome the objections set forth in the report on Ex Parte No. 57 as to the destruction of market relationships, and that a fair reading of the reports in the big case and the Central Freight Association decision, authorize the others. About the only other showing that can be made is that expenses are rising much faster than revenues; that net earnings are decreasing and the return on property investment is smaller than ever because large additions have been made to capital.

Erie Barge and Car-Float Service at Chicago

The Completion of a New Freight House Marks the
Close of Four Years of Successful River Transportation

THE recent opening of a new freight station on the Chicago river at Webster avenue, constitutes a valuable addition to the Erie's facilities for handling eastern business by barge and car float between their rails and the northern section of Chicago. It is also an indication that the river service inaugurated by the Erie four years ago is increasing in scope and importance. The main freight terminal at Fourteenth and Clark streets was then disadvantageously situated for the solicitation and handling of

Under conditions existing prior to the summer of 1913, it was necessary for the shipper and receiver of l. c. l. freight over the Erie to team to the road's freight house at Fourteenth and Clark streets, on the south side of the city, to the universal freight stations of the Illinois Tunnel Company in the loop district or to stations of terminal roads on the southwest and west sides. An additional disadvantage lay in the fact that six of the universal freight stations handled outbound l. c. l. freight only. All of these stations were at

traffic consigned to and originating in the north and north-west sections of the city. In order to compete more effectively with other roads, it decided to extend its terminal facilities into that field by utilizing the river. The construction of river freight stations and the launching of a barge and car float service was a new venture for a railroad in Chicago, but a steady increase in business ever since the inception of the service has justified the judgment of those who advocated that means of entering this territory.

such a distance from the northern and northwestern sections of the city as to discourage l. c. l. traffic over the Erie. The road was also handicapped in the solicitation of carload traffic, for although freight routed over the Erie could be shipped to or from the north side by way of connections, it had to undergo the delay incident to switching across the city and passing through interchange yards.

The first river freight station, known as Erie street station, was opened at Erie and Kingsbury streets in August,

1913; in the following month a station was opened on a site at Market and Washington streets, known as Market Square station, which had previously been used by the Erie Railroad Lake Line. It was not until May 1, 1915, that the first Webster avenue station was opened. For a time the Erie rented a float bridge at Robey and Twenty-seventh streets, where cars were transferred to and from its rails, but later a float bridge was constructed by the Erie at Eighteenth street, close to its Fourteenth street freight house, shortening the river haul.

The river service has not only proved attractive to shippers and receivers in the north and northwest sections of Chicago, but has been taken advantage of by industries with dock facilities located on the river. All kinds of all-rail freight, except coal and coke, both in c. l. and l. c. l. lots, are handled at the freight stations, while river industries may ship or receive freight in quantities of 10,000 lb. or more. At present the Erie's river equipment consists of two tugs, four car floats and five barges. Two of the floats have a capacity of four cars each and the two others have a capacity of eight cars. The barges carry from five to six carloads of break bulk freight each, according to the commodities loaded. The tugs operate both day and night.

The Market Square station was abandoned on April 30, 1916, when the lake service was discontinued, so that the Erie has now but two river freight houses. The improvements at Webster avenue, more than compensate for the loss of the station at Market and Washington streets. The new facilities include a brick freight house with a track capacity

livered some time this year, was requisitioned by the government.

The river service has built up a large business for the Erie on the north side of the city, because it has greatly expedited the handling of traffic to and from that territory. There is no longer any incentive for shippers and receivers to favor other roads because of long team hauls through the city to Erie stations, or because of delay to c. l. shipments in switching across the city. In the handling of c. l. freight routed over the Erie fully 48 hours have been saved. In-bound cars are delivered at the river stations on the day of arrival in the city and outbound cars are handled just as quickly. The freight houses have proved especially convenient to certain adjacent industries which formerly had to haul their products considerable distances by team to stations of other roads. Shippers of heavy and bulky products have found the Erie stations especially advantageous. The territory served by the river stations is by no means confined to shippers and consignees in their immediate vicinity, but extends north and northwest to the limits of the city. It is difficult to trace accurately the dividing line between the zones served by the two freight houses, but, speaking roughly, the division may be placed at North avenue, an east-and-west thoroughfare, about a mile and one-half south of the Webster avenue station, and two and a quarter miles north of Erie street station.

The traffic handled on the river includes almost every kind of freight. Among the commodities carried by the barges and car floats for industries with dock facilities are merchandise, cheese, coffee, hides, cocoanuts, beer, canned goods, egg case fillers, sugar, cement, soap, tanners' extract, rubber, bicarbonate of soda and charcoal. Among those handled in carlots at the stations are merchandise, tin plate, caustic soda, hides, matches, paper, leather, wool, barrels, soap, oil, brass, glass, pianos and iron and steel articles.

RAILWAY REGIMENTS' TOBACCO FUND BEGINS TO GROW

The railway supply concerns of the country have begun to respond generously to the request for subscriptions to the Railway Regiments' Tobacco Fund. Up to October 31 fifty-two concerns had subscribed \$10 a month each, making a total which had been subscribed of \$520 a month. In addition a contribution of \$25 has been received from the Barco Manufacturing Company, Chicago. In only a few cases have companies made replies declining to subscribe.

While the start made in raising the fund is gratifying, the amount which has thus far been subscribed is, of course, far short of the total which it is desired to raise. In fact, it is only about one-eighth of the fund which is needed, as the estimated cost of an adequate supply of tobacco for all the railway regiments exceeds \$4,000 a month. The committee in charge of the fund, of which F. A. Poor, president of the P. & M. Company, is chairman, therefore hopes that responses to the request for subscriptions will come in more rapidly and in larger number from now on. As previously announced, checks should be made payable to "John R. Washburn, treasurer," and forwarded to "Samuel O. Dunn, secretary, Railway Regiments' Tobacco Fund, Transportation Building, Chicago."

The first list of subscribers to the fund was published in the *Railway Age Gazette* for October 26, page 753. That list included 26 subscribers. The following list gives the subscriptions received between the time of the preparation of the original list and October 30:

Ajax Rail Anchor Co., Chicago.....	\$10 a month
American Flexible Bolt Co., Pittsburgh, Pa.....	" "
Boss Nut Company, Chicago.....	" "
Buckeye Steel Castings Co., Columbus, Ohio.....	" "
Dilworth, Porter & Co., Pittsburgh, Pa.....	" "
Imperial Appliance Co., Chicago.....	" "

Map Showing Location of Erie Freight Houses and Route of Tugs

for 17 cars, carload team tracks for 43 cars, paved driveways leading to the freight house and team tracks from both Webster and Elston avenues, and a float bridge by means of which cars can be transferred to and from car floats. A 15-ton pillar crane will be erected later for the handling of heavy freight. The freight house was formerly used by a manufacturing establishment and has been provided with an initial storage space of about 9,000 sq. ft., with room within the walls for 13,000 sq. ft. more on the ground floor and for the construction of a second floor if increased traffic warrants. The new station replaces a small temporary house.

The facilities at Erie and Kingsbury streets, where the larger of the present stations is located, include a freight house with 37,700 sq. ft. of floor space, a float bridge, a team track yard with a capacity of 19 cars, equipped with a 15-ton pillar crane, house tracks with room for 10 cars, and storage tracks for 8 cars. The freight house fronts on the river, permitting the direct transfer of freight to and from the barges and car floats. Two gasoline locomotives capable of handling 500 tons perform the switching service both at Erie street and Webster avenue stations. A third locomotive of this type for reserve power, which was to have been de-

RAIL FAILURE STATISTICS FOR 1916*

By M. H. Wickhorst

Engineer of Tests, Rail Committee, American Railway Engineering Association, Chicago.

This report deals with the statistics of rail failures collected for the year ending October 31, 1916, furnished by the railroads of the United States and Canada in response to a circular sent out by the American Railway Association. The information furnished by each railroad showed the number of tons laid of each year's rolling from each mill, the equivalent number of track miles, and the total number of failures that occurred in each year's rolling from the date laid until October 31, 1916.

The failures were divided into four classes, namely, head, web, base and "broken." The reports cover rollings for 1911 and succeeding years and the ages of the rollings would average in the track about the years shown below:

1911.....	5 years	1914.....	2 years
1912.....	4 years	1915.....	1 year
1913.....	3 years	1916.....	Several months

The tonnages represented by the statistics in this report are shown below:

Year rolled	Bessemer	Open-hearth	Total
1911.....	305,910	810,396	1,116,306
1912.....	303,702	1,254,960	1,458,662
1913.....	135,870	1,503,366	1,639,236
1914.....	63,599	1,936,915	1,999,514
1915.....	12,212	1,080,361	1,092,573
1916.....	33,658	749,765	783,423

The equivalent track miles are as follows:

Year rolled	Bessemer	Open-hearth	Total
1911.....	2,198.87	5,770.54	7,969.41
1912.....	1,448.22	8,812.71	10,260.93
1913.....	969.97	10,365.44	11,335.41
1914.....	452.49	7,052.75	7,505.24
1915.....	90.29	7,291.00	7,381.29
1916.....	259.67	5,093.04	5,352.71

It will be noted that in recent years the Bessemer steel has formed only a small part of the rail rolled as covered by the returns in this report. The failures were tabulated with reference particularly to the performance of the rails made by the different mills. Lots of less than 1,000 tons (that is, less than 1,000 tons in any one year's rolling for a railroad) were excluded from the tabulation, as they would unnecessarily extend the tables and not materially change the group totals and averages.

It is interesting to note the comparative performance of Bessemer and open-hearth rails. Figuring the failures per 100 track miles of open-hearth rails as 100 for each of the years 1911, 1912, 1913 and 1914, the relative failures of Bessemer rails, together with the failures per 100 track miles, are shown below:

FAILURES OF OPEN-HEARTH AND BESSEMER COMPARED

Year rolled	Years service	Failures per 100 track miles		Comparative failures	
		Open-hearth	Bessemer	Open-hearth	Bessemer
1911.....	5	161.9	214.1	100	132
1912.....	4	74.2	107.7	100	145
1913.....	3	43.3	60.1	100	135
1914.....	2	18.9	32.3	100	171

*Abstracted from Bulletin No. 199 of the American Railway Engineering Association.

It will be noted that the failures of Bessemer rails per 100 track miles were considerably greater than those of the open-hearth rails. It is probably also true that the open-hearth rails were, in general, in more severe service, so that the actual difference under the same conditions may have been greater.

The figures indicate that the failures of Bessemer rails occur at a considerably higher rate than the failures of open-hearth rails in their early period of service, but as they remain longer in track, the rates of failure become nearer alike.

In order to show more conveniently the relative number of failures from each of the mills and to show the ranking of the mills as regards the failure performance of the rails rolled by them, a table was prepared. Taking the average number of failures per 100 track miles of all the mills in each group (Bessemer and open-hearth) in any year's rolling as 100, the relative number of failures of each of the mills was shown for the years 1911, 1912, 1913 and 1914. It was interesting to note from the tables and diagram that the mills which had the greatest number of failures some years ago and ranked the lowest are showing a tendency to a considerable reduction in the number of failures and ranking well in more recent years.

COURT TAKES CONTROL OF RATE-MAKING

On March 1, 1916, the Evansville & Indianapolis, running from Terre Haute to Evansville, Ind., 134 miles in length, was placed in the hands of a receiver by Judge A. B. Anderson, of the United States District Court for the District of Indiana. The receiver appointed was William P. Kappes, an attorney of Indianapolis, Ind. The receiver took possession and began to operate the railroad on March 1, 1916. At that date the railroad had no equipment whatever, either engines or cars. Its roadbed was in lamentable condition, being ballasted mainly with dirt, which entailed frequent washouts and large expense for maintenance. Its rails were light; averaging 56½ lbs. to the yard. Its principal bridge, a steel structure across White river, had been carried away by a flood, and the track was temporarily supported on a trestle. There were no funds whatever received by the receiver. Operations were carried on for ten months by renting engines and cars. No net revenue was realized and the receivership ran into debt.

In January, 1917, \$600,000 was borrowed on receiver's certificates and was invested in a partial rehabilitation of the railroad and the acquisition of a small amount of rolling stock. By reason of the great increase in the cost of material and in the wages of employees the savings effected by the rehabilitation were neutralized. The figures of operation demonstrated that in the carriage of coal, which was two-thirds of the traffic of the railroad, there was a continual loss of money, averaging as much as \$13,000 a month and that in the carriage of passengers there was a continual loss averaging \$3,000 a month.

Efforts were made by the receiver to obtain better rates on the carriage of coal by application to the Public Service Commission. These applications were denied by the commission. Thereupon the receiver filed petition in the District Court of the United States setting out the efforts that had been made and the losses that were being incurred and alleging that the two-cent passenger fare law of Indiana was confiscatory of the property of the Evansville & Indianapolis and that the rates enforced by the Public Service Commission were likewise confiscatory. The receiver gave notice not only to all the parties in the case, but to the Public Service Commission of Indiana, the attorney general of the state and the prosecuting attorneys of the counties through which the railroad operated.

The petitions were set down for hearing on October 23 and

on that date were heard by Judge Anderson. An order was entered by the court sustaining the receiver's petition declaring the two-cent fare law of Indiana to be confiscatory, so far as it related to the passenger fares upon the Evansville & Indianapolis, and declaring that the freight rates established by the Public Service Commission of Indiana were confiscatory and invalid so far as they failed to cover the cost of operation, on the E. & I., with a reasonable profit. The order directed the receiver to establish compensatory rates for passenger, freight and switching service, any statute or any order of the commission to the contrary notwithstanding; and in the event that any person should attempt or threaten to bring any action to enforce any penalty on account of said statute or orders of the Public Service Commission of Indiana the receiver was given leave to sue for an injunction.

THE RAPID LOADER

The "rapid loader," shown in the photographic illustration, is a device for saving the time of teams, or trucks, when hauling coal, gravel and similar material from cars. Two "loaders," holding 30 cu. ft. each, filled by hand shoveling while the wagon or truck is away on its preceding trip, can

Details of Loader

be tipped in a half minute each, so as to fill the wagon and to impose practically no delay on the driver and horses.

The loader is made of steel, and is said to be "foolproof." The picture shows it in its normal position, the position in which it stands when it is being filled. It is held in posi-

The Rapid Loader

tion by the pin, *P*, shown in the drawing. This drawing represents the loader attached to a coal car with sides 42 in. high. The perspective view shows it on a car considerably higher. Having been emptied, the pan, turned on the pivot,

A (and held in position, while being filled, by the locks, *L*, one on each side), returns by gravity to the position shown.

This device is made in two sizes: the one most commonly used, No. 2, weighs 340 lb., and holds 30 cu. ft. when level full. To move the loader from one car to another the pan is lifted out from the frame, and the whole is moved in two pieces, no further knocking down being necessary.

This loader is made by the Bonney Supply Company, Livingston Building, Rochester, N. Y. Contractors say that, using this as a time-saver, they release cars a half day sooner than would otherwise be possible, and it is declared that in some cases not over 300 cu. yd. of crushed stone or gravel had to be hauled before the loader was paid for by the saving in time, over the common practice of shoveling gravel directly into wagons. Shovelers can always see where each shovelful of material is landing, and do not waste time by looking over the side of the car to see whether they are throwing it with the right force and direction to have it land in the wagon. There is no waste of material falling on the ground.

These loaders are used in many places in the United States and have been sent also to France and Haiti. A recent shipment went to Atlanta, Ga., for use at one of the new military camps.

HUNTOON TRUCK BOLSTER

The Joliet Railway Supply Company, Chicago, has placed on the market a new type of truck bolster known as the Huntoon bolster. It is of the built-up type and embodies the same principles of reinforcing the tension member that is used in the tension member of the Huntoon brake beam.

Both the compression and the tension members are of open hearth steel, the compression member being a channel and the tension member a flat bar upset at the ends to retain the full cross sectional area at the rivet holes. The ends of the tension member are provided with shoulders which interlock

Huntoon Built-up Type Bolster

with the web and flanges of the compression member, thus relieving the shearing strain on the rivets. The king post is of malleable iron of heavy cross section. The center plates can be furnished of malleable iron, cast steel or drop forged, as desired. The bolster is adapted to the application of either plain or anti-friction type side bearings.

Tests have demonstrated that this type of construction produces a bolster of great rigidity and strength. Sizes for 30, 40, 50 and 70 ton cars are now being manufactured and the company is prepared to furnish them in any quantities desired.

INDIAN WAR TRAFFIC REGULATIONS.—Under the "Defense of India Act," the Governor General-in-Council has been authorized to give orders for the following purposes: (1) For requiring railways to give special facilities as to the transport of any article or thing which, in his opinion, is capable of utilization in the prosecution of the present war. (2) For enforcing the prompt loading or unloading of cars; and (3) for controlling other trucks and cars, and for controlling other traffic to expedite the transport of such article or thing.

TRADING WITH THE ENEMY ACT AND ITS APPLICATION*

By Hon. William C. Redfield
Secretary of Commerce.

We are not engaged in a contest for material things, for money, or for territory, or for power, or influence, or for a place in the sun; in the last analysis, we are engaged in a conflict against hideous evil in the world, evil enthroned in high places, evil which for its own purposes would willingly take you and yours, which has not hesitated upon our own soil to promote sabotage and slaughter, fire and explosion, and which does not reckon at all human values, if by so doing it may be enthroned in power.

* * *

This is not merely our war, nor the war of Great Britain, nor the war of France, nor of Italy—it is the war of four-fifths of the human race against a wrong which threatens it all.

* * *

Now, commerce is used as a war weapon in two ways. First, it is used to provide the nations associated with us in the war with the means of warfare; and, second, it is used to see that our enemies do not by direction or indirection obtain anything that comes from our shores which we can prevent. There is a third element in it, the element of conservation, which has to do not with economy of money, as I think is too often thought, but with the saving of that of which we have but little, to the use that must be made of it in the war and the using, on the other hand, of that of which we have abundance in its place.

* * *

The principle which lies behind the restriction of exports is the principle of conservation: that our industry shall be so controlled as regards exports that after our own needs are satisfied, what we sell shall be used to support our associates, and what we have left over shall go freely to places where it is safe to have it go and to persons who use it wisely.

That is the simple principle that lies behind the whole question of the restriction of exports.

Now, the restriction of imports is not our own; it is imposed upon us, but we are the beneficiaries. At the bottom of it lies the same reasoning precisely.

* * *

It had to be general in order to be specific. It is not meant to be, it is not at all likely to be exercised in a general way; it means simply that a body—in this case the War Trades Board—shall be authorized to issue licenses to import prohibited products, and shall import them under such restrictions as that they shall be free for our use, but not free for misuse in the sense of being sold to the enemies of the common cause.

* * *

Now, those are the principles which underlie—I think they are very simple, very clear—the restrictions of exports on our part and the restriction of imports of the prohibited articles from foreign countries. They both mean the concentration of the world's power against the evil we are fighting.

* * *

The restriction of the act will exist whether there is any act or not. It is and has long been the law of nations that in time of war all communication with the enemy of all kinds is prohibited. It didn't need this act to make it impropriety, an act of wrong, to sell goods to the German in Germany, or to ship goods to South America, knowing that by that means they would reach Germany, or reach anybody so as to aid

Germany—that is just as strongly forbidden if this act were repealed to-morrow. The prohibitions of the act are not new; they are simply clearly stated and made plain by the language of the law—but they existed before.

The law, then, provides a clarification of these facts making it perfectly plain what trading is, defining it, defining very clearly with whom trading is forbidden; that is to say, defining enemy and defining ally of enemy; but it does not make new law when it does that; it merely states what was the law before.

Then it proceeds to provide a system of licenses whereby anything which is unlawful in the act or without it, of that character can be legalized by a license.

That is the whole and center and substance of the "Trading with the Enemy Act," the restating plainly and definitely of existing law and the providing of licenses to do, under proper circumstances, anything thereby declared to be lawful.

A NOVEL FORM OF CAR EFFICIENCY CIRCULAR

To concentrate attention on the importance of the prompt release and movement of cars, T. D. Simmons, car distributor on the North Carolina division of the Seaboard Air Line at Hamlet, N. C., has been getting out car efficiency circulars weekly for the past eight months. In addition, car detention statements showing the delays to all cars at all stations have been sent to each agent on the division during the last five months. To make these circulars more readable and attractive and thereby secure greater attention for them, recent copies have been issued in newspaper form.

This paper, which is called The Weekly Car News and which has for its aim, "make one car do the work heretofore requiring two," is issued in mimeographed form and contains editorials, the car detention statement, a summarized statement of the average detention, comments regarding delayed car conditions and car service "advertisements."

The following is typical of the editorials: "During the past week we have received a considerable number of penalty orders from the small shippers on the division. This practice must be discouraged. Agents should point out to these shippers the serious situation we are in, . . . and endeavor to show them the unreasonableness of the action in placing penalty orders. State to them we will be compelled to take steps to protect the company in such cases, especially where such shippers as those at ——— order four box cars for government lumber and one for commercial shipment, filing a penalty order for the commercial car, which will have to be furnished first. Any firm with this disposition deserves no consideration and we expect to handle this case with the Norfolk office for further handling with the National Defense Committee."

News items pertinent to the car distribution problem, such as the following, are also published:

A NEW AGENT

Mr. C. C. Birmingham is acting agent at Osborne. The former agent was one who would not order cars for shippers or read our circulars.

Equally to the point are want-ad advertisements such as the following:

WANTED: StL&SF 121548, SAL 45370 and CC&O 2661 loaded with cross ties for the roadmaster, delayed at Hamlet 21 days. These cars wanted for revenue service.

TO EXCHANGE: Slow handling of cars at Wilmington for better car handling.

These news letters have served to emphasize to the agents the importance of the problem of unloading cars promptly and have aided greatly in improving the mileage performances, the average miles made per car per day on this division now being about 49 as compared with 27.1 a year ago.

*Extracts from an address delivered before the New York Editorial Conference, Tuesday, October 13, 1917, at the Automobile Club of America.

General News Department

The annual meeting of the General Managers' Association of Texas will be held at the Adolphus hotel, Dallas, Tex., on December 6.

The Post Office Department announces that the profits of the department for the fiscal year ending on June 30 last amounted to more than \$9,000,000; and that sum has been paid in to the Treasury Department as a contribution to the general fund.

The machine shop and roundhouse of the Chicago & Eastern Illinois at Salem, Ill., were destroyed by fire on the morning of October 25. The explosion of a five gallon can of gasoline is believed to have started the fire and the loss is estimated at \$200,000.

The Interborough Rapid Transit Company, operating subway and elevated railroads in New York City, announces that to all employees who receive less than \$150 a month, bonuses of \$6 a month will be paid. This is an advance of the bonus from \$3 to \$6, the smaller sum having been paid since August 1 last.

In the United States District Court at New York City last week indictments charging fifty-six unlawful acts in connection with concessions in demurrage on boats were found against the Lehigh Valley Railroad, F. E. Signer, general eastern freight agent of that road, and Charles Schaefer, of New York, a shipper.

The Baldwin Locomotive Works, in the week ending October 20 turned out 72 locomotives. This is at the rate of more than 3,600 a year, compared with 1,989 for the year 1916 and 2,666 in 1906, which was the previous record year. The company is employing an army of 20,000 men and work on government orders engages every department.

The station men, freight clerks, and other classes of employees on the Boston & Maine, who have been threatening a strike for several weeks, finally agreed, on October 25, to refer their claims to arbitration; and Henry B. Endicott, of the Massachusetts State Council on Public Safety, was agreed to both by the railroad company and the committee of employees as the first arbitrator. Each side will select one other arbitrator.

The Lehigh Valley has created the position of fire marshal. Announcement of the appointment of John M. Julian to the position has been made by H. C. Kurtz, chief of the insurance bureau. Mr. Julian has managed the fire-fighting forces of the New York division. His new duties will give him authority over the fire-fighting facilities and conditions affecting fire hazards for the whole system. His office will be in New York.

The New York & Pennsylvania Railroad, 60 miles long, from Canisteo, N. Y., near Hornell, southwestward to Genesee, Pa., and thence westward to Ceres, N. Y., a length of about 57 miles, announces that business will be suspended December 1. The line serves a number of villages which will be wholly deprived of railroad communication. The road has been operating at a loss for the last two years and in recent months has been especially handicapped by lack of men and shortage of coal.

A. H. Plant, Washington, D. C., chairman of the Accounting Officers' Association Committee, announces that the Internal Revenue Department has reconsidered the tax on excess baggage, and holds that the rate of tax to be applied on amounts paid for excess baggage shall be on basis of the tax on persons, namely, eight per cent of the amount paid, instead of on basis of the tax on packages by express. The tax on single trip one way and round trip tickets applies on all rates of thirty-six cents or more.

The Canadian Government has issued an order describing in detail the authority and powers granted to the Fuel Controller, to go into effect November 1. All importers of and dealers in coal must be licensed; commissions and profits are strictly limited and hoarding of coal is forbidden. Prices will be adjusted to stocks on hand, every two weeks; and, except in the summer, no consumer shall have on hand more than enough coal to last him for two months. In case of emergency the fuel controller may

make requisition for coal on any consumer who has more than he needs.

The Philadelphia & Reading, the Central of New Jersey, the Wabash, the Copper Range and other railroads have issued notices to the effect that annual and other season passes which, according to their terms, will expire on December 31, 1917, have been extended to December 31, 1918. Under the regulations of the Interstate Commerce Commission, this extension of time may be made without making endorsement on the passes, a general notice, issued by the road and filed with the commission, being considered sufficient.

The Chicago, Rock Island & Pacific, following an arbitration, has advanced the pay of telegraphers and has made reductions in the workday. The agreement provides for overtime payments for Sunday work, for two weeks' vacation for employees of two years' standing, and other privileges. The advances will add about 12 per cent to the company's payrolls for telegraphers. The Wabash has made an increase of ten per cent in the wages of about 600 telegraphers. Members of the Order of Railroad Telegraphers on the Missouri Pacific have presented a complaint concerning the smallness of the commissions which they receive from Wells-Fargo Express, asking that the present percentages, of six to ten, be increased to a uniform commission of 15 per cent.

The Chamber of Commerce of the United States, reporting on its referendum concerning proposed new railroad legislation, announces an overwhelming vote in favor of laws for Federal regulation of the issuance of railroad securities, and for the other recommendations of the Wheeler committee. For Federal regulation of the issuance of railroad securities the vote was 1,112 in favor and only 27 opposed. For a general railroad incorporation law, under which all railroad carriers subject to the jurisdiction of the Interstate Commerce Commission may organize, the vote was 1,111 to 25. To make such a law compulsory the vote was 1,080 to 49. On the recommendation that the Interstate Commerce Commission be given authority by statute to regulate intrastate rates when those rates affect interstate commerce the vote was 1,054 to 66.

The Illinois State Civil Service Commission announces that it will hold an examination to provide an eligible list for the position of railroad engineer for the Illinois Public Utilities Commission. There is one position of this kind to be filled at the present time at Springfield, salary \$250 to \$333.33 a month. The duties of the position will be to take charge of the investigation of railroad accidents, the examination of dangerous crossings, the inspection for approval of interlocking plants and signal circuits, the investigation of railroad service complaints, and the preparation of orders in connection with railroads. The position is open only to male citizens of the United States over 25 years of age, with an education equivalent to high school graduation, with preferably higher engineering training and experience in location, construction and maintenance of railroads and other engineering work. Applications must be on file in Springfield, Ill., before November 22, and questions covering training and experience will be mailed to all applicants, together with instructions for sending the replies to the commission on November 24.

Southern Pacific in New San Francisco Office Building

The Southern Pacific is now occupying its new \$2,000,000 office building at 65 Market street, San Francisco. The 2,500 employees moved from the Flood building with all equipment, records and paraphernalia without the loss of any time in any department. The new building is of steel, brick and concrete, equipped throughout with automatic sprinklers and pneumatic mailing tubes. Store room is being rented on the first floor and 66 offices on the second. Otherwise, the Southern Pacific's general offices occupy the entire structure.

Better Loading Saves 6,402 Cars in One Month

W. R. Scott, vice-president and general manager of the Southern Pacific, Pacific system, advises that as a result of the car-loading competition in which the agents of the company are participating, 6,402 cars were saved during the month of July, 1917, as compared with the loading in July of last year. Commodities in which the greatest saving of cars is shown follow: Barley, 424 cars; lumber, 509 cars; salt, 40 cars; merchandise, 1,626 cars; rice, 94 cars; brick, 21 cars; canned goods, 96 cars; mill stuffs, 109 cars; perishables, 929 cars; corn and oats, 28 cars; sugar, 88 cars; paper, 78 cars; cement and plaster, 159 cars; miscellaneous, 2,191 cars.

St. Paul Rushes New Electrification

The Chicago, Milwaukee & St. Paul has announced that the contract for locomotives and substation equipment for its Cascade Mountain electrification from Othello, Wash., to Tacoma and Seattle has been divided between the General Electric Company and the Westinghouse Electric & Manufacturing Co. It has been decided to rush this electrification because of the saving in fuel which it will effect. The electric power will be generated by waterfalls in the Cascade mountains, so that thousands of barrels of fuel oil will be saved annually after electric operation starts. The section to be electrified is 211 miles long; this, with the 440 miles already electrically operated over the Bitter Root, Rocky and Belt mountains, between Avery, Idaho, and Harlowton, Mont., will make a total of 651 miles.

Economy of the Lucin Cut-Off

An officer of the Southern Pacific, discussing the savings effected by the line across Great Salt Lake, Utah, built in 1902-1904, reducing the length of the railroad and cutting out steep grades and sharp curves, says that 110 million tons have passed over the cut-off since its completion and that in terms of average car loading this would take about four million cars, making a continuous train 37,000 miles long, or enough to reach one and one-half times around the earth. Had this freight been hauled over the old line it would have necessitated the running of 172 million additional car miles and additional work equivalent to lifting a million car loads a mile in the air. The number of train movements a day is 30 less than it would be if the old trains-load limits were now in force, making an enormous saving in fuel.

Car Distribution Orders

To get empty freight cars into the districts where they are most needed, the Railroads' War Board, acting through the Commission on Car Service, has moved 156,850 empty cars from one railroad to another, irrespective of ownership, since May 1. The orders for these cars since September 1 number 8,905.

The lines to which empties were sent, between October 1 and October 24, were: New York Central, 1,000 cars; Louisville & Nashville, 1,100; Canadian Pacific, 1,000; San Antonio & Aransas Pass, 150; Gulf Coast Lines, 310; Louisiana & Arkansas, 68; Louisiana Railway & Navigation Company, 17; Grand Trunk, 500; Norfolk Southern, 550; Atlantic Coast Line, 1,500; Southern Railway, 260; St. Louis Southwestern, 400; Chicago, Terre Haute & S. E., 200; Mobile & Ohio, 300; Texas & Pacific, 100; Seaboard Air Line, 300; El Paso & S. W., 200; Pittsburgh & Lake Erie, 500; Meridian & Memphis, 150; Tennessee Central, 100; Red River & Gulf, 100; and Sunset Central, 100.

Howard Elliott on Government Ownership

"The putting all the railroads in the country under this so-called War Board is of interest in another way than simply in its aspect of giving a higher efficiency for the use of the people of the United States," said Howard Elliott, of the Railroad's War Board, in a recent interview. "Some say that the putting together of the railroads the way we have this year is an argument in favor of government ownership. I do not agree with that. I think it means that the splendid initiative of the American business man, that has built up this great transportation system that today is doing 20 to 25 per cent more than it ever did before, even under the complicated conditions that confront us—it means that the initiative of the American business man, if not too much fettered by small and nagging restrictions, can do more for the expansion of American business and the expansion

of the country than we could possibly obtain under government ownership.

"I say this because that is one of the great problems that very likely will develop out of this war, and those who depend on a successful transportation system are the men who will have to help decide that great question by such views as Congress gets from its constituents all over the United States."

Railroads Take \$77,810,000 of Liberty Bonds

During the past week additional subscriptions to the Second Liberty Loan have been recorded, bringing the total of \$57,470,000 noted in last week's issue of the *Railway Age Gazette* up to \$77,810,000. The new subscriptions reported are as follows:

Atchison, Topeka & Santa Fe (additional).....	\$2,000,000
Delaware, Lackawanna & Western (additional)....	1,000,000
Kansas City Southern	500,000
Long Island	500,000
Louisville & Nashville.....	6,000,000
Northern Pacific (additional).....	5,000,000
Panama Railroad	30,000
Pennsylvania (additional)	5,000,000
St. Louis-San Francisco.....	300,000
Texas & New Orleans.....	10,000

Besides the subscriptions of the companies, the Railroads' War Board estimates that the railroad employees of this country have taken more than \$50,000,000 worth of the Second Liberty bond issue. For the first bond issue 241,280 railroad employees subscribed an aggregate of \$20,027,966.

Disastrous Fire at Baltimore

In a conflagration, believed to have been of incendiary origin, which started on the evening of October 29, Piers 8 and 9 of the extensive terminal plant of the Baltimore & Ohio Railroad at Locust Point, on the south side of Baltimore Harbor, were destroyed together with freight and other property valued at \$4,000,000 or more.

Piers 8 and 9 were stored with great quantities of munitions and supplies. Fifteen of the crew of a British steamer lying at the pier leaped overboard, and it is feared that some of them were drowned. The British steamer *Kerry Range* was destroyed. The fire started in several places simultaneously, and there were six distinct explosions. A. W. Thompson, vice-president of the Baltimore & Ohio, said:

"The destruction of Piers 8 and 9 will not stop our business at Locust Point. We practically have lost only one-half of Pier No. 8 and the new Pier No. 6, which is completed, will more than offset the loss of Pier No. 9. We have arranged to put up temporary buildings at various places in the terminal to handle the business. The city has kindly offered to help us out with the loan of a pier, as has also the Merchants & Miners Transportation Company. Pier No. 8 will be rebuilt immediately. The material was ordered by telegraph before daylight. There are about 1,500 carloads of freight in transit to Baltimore now for export which we have been handling on those two piers. The Furness-Withy Company has been doing a very large business here also. Reports from our police department indicate beyond question of doubt that the fire was of incendiary origin, as there were five explosions at one time."

Preparedness on the New York Central

Alfred H. Smith, president of the New York Central Lines, has issued a statement showing the immense expenditures of those roads for cars and locomotives during the three years and two months since the war began. The total for locomotives, freight cars and passenger coaches is \$84,324,736; and this equipment at the prices prevailing today would cost \$193,028,610, or an increase of 128.91 per cent!

Thus, by prompt, heavy buying when war broke out, and in early preparation against the present existing dire combination of extraordinary demands for freight service, high prices, and shortage of materials and labor the Central system "has gained an equity of a cool \$100,000,000." Moreover, the gain to the public service in supplying the nation's necessities under war stress, inasmuch as delivery of railroad equipment in America now is impossible at any price, cannot be reckoned in dollars. These humble freight cars and locomotives literally have become almost priceless. About 1,000 locomotives are being sent across the sea to provide for American armies at the front. In freight cars, our government's orders for the month of August alone were 10,866.

Russia is seeking 30,000 to 40,000 freight cars in the United States, in addition to 10,000 in Canada. Railroads and other private buyers must wait indefinitely.

Of freight cars the New York Central bought in the three years 38,052 for the sum of \$53,762,036, or an average of \$1,412.85 per car. The same cars today would cost \$133,839,810, an average of \$3,519.92 per car. The companies bought 734 engines for \$23,768,500, or an average of \$32,383.15 per locomotive. The same locomotives would cost today \$46,927,000, an average of \$63,933.51 each.

Passenger coaches bought numbered 445, costing \$6,794,200, an average of \$15,267.87 per coach. The same cars would now cost \$12,261,600, an average of \$27,544.16. The last of the 38,000 freight cars are just now being delivered. Only about one-half of the 734 locomotives have been delivered, and the remainder will be delayed several months longer through the pre-empting of the manufacturing space for Government necessities.

Railway Revenues and Expenses

The net operating income of the railways of the United States for July, 1917, was less than that for July, 1916, by \$3 per mile, or 0.7 per cent, according to the monthly bulletin of the Bureau of Railway Economics.

Total operating revenues, \$348,437,306, exceeded those for July, 1916, by \$45,205,299. Operating expenses, \$237,821,305, were greater by \$42,216,035. Net operating revenue, \$110,616,001, increased \$2,989,204. Taxes, \$16,286,382 increased by \$3,386,523. Net operating income was \$94,291,180, which is a decrease of \$392,818.

If spread over the mileage represented, operating revenues

increased 19.1 per cent; taxes increased 47.6 per cent. Operating income per mile increased 14.0 per cent.

For the Western railways, operating revenues per mile exceeded those for July, 1916, by 12.5 per cent; operating expenses rose 17.3 per cent; net operating revenue increased 4.7 per cent; taxes increased 24.5 per cent. Operating income per mile increased 1.9 per cent.

The seven months of the current calendar year, compared with the corresponding period of the preceding year, show changes per mile of line as follows: Operating revenues increased 12.0 per cent, operating expenses increased 18.2 per cent, net operating revenue decreased 0.8 per cent, taxes increased 17.7 per cent, while operating income decreased 3.6 per cent.

Operating income per mile decreased 17.6 per cent in the East, increased 3.9 per cent in the South, and increased 9.5 per cent in the West.

July net operating income per mile was 0.7 per cent less in 1917 than in 1916, 23.8 per cent greater than in 1915, 40.2 per cent greater than in 1914, and 36.7 per cent greater than in 1913.

The Interstate Commerce Commission has also given out the table below covering returns for August and for eight months.

Fire Prevention a Patriotic Duty

Resolutions adopted at the annual meeting of the Railway Fire Protection Association at St. Louis, Mo., on October 2, point out that the responsibility of keeping the Allies stocked with supplies and food rests upon the United States, and that while a maximum output of American productive forces is important,

* August returns wanting for one company with July operating revenues of \$159,631.

† August returns wanting for one company with July operating revenues of \$96,039.

averaged \$1,507 per mile, an increase over July, 1916, of 14.6 per cent; operating expenses per mile, \$1,029, were greater by 21.3 per cent; net operating revenue per mile, \$478, shows an increase of 2.5 per cent; while net operating income per mile, \$408, decreased 0.7 per cent. Taxes per mile rose 25.9 per cent.

This summary covers 231,174 miles of operated line, or about 90 per cent of the steam railway mileage of the United States.

For the Eastern railways, operating revenues per mile were greater than those for July, 1916, by 14.0 per cent; operating expenses rose 23.4 per cent; net operating revenue decreased 3.5 per cent; taxes increased 20.2 per cent. Operating income per mile decreased 6.3 per cent.

For the railways of the Southern district, operating revenues per mile exceeded those for July, 1916, by 24.0 per cent; operating expenses rose 26.2 per cent; net operating revenue

the rigid conservation of existing materials and foodstuffs deserves like attention. The resolutions contain the following practical suggestions as to the ways and means of further safeguarding freight and other property:

1. Such additional time, thought and money should be spent in the protection of property as may bring about a more positive conservation of property and resources.

2. An ever-increasing patrolling and watchmen's service should be maintained by active, intelligent and carefully instructed men, such forces to be on duty at all important properties and terminals at all times.

3. Superintendents, foremen and agents should give close personal attention and supervision to the condition of all fire apparatus, water supplies and general housekeeping conditions. Responsibility should be placed for such matters and instructions carefully carried out. Personal tours of the property to look into these matters are desirable on the part of those in charge.

4. All fire equipment should be kept ready for instant use, well maintained in all particulars and plentifully supplied, its condition watched and

to be replaced or supplemented promptly when necessary. Defects should be immediately detected and remedied.

5. Fire brigades and organizations should be carefully instructed and regularly drilled and there should be no relaxation in any way in reducing hazards or the ordinary liability for fires.

Copies of these resolutions have been sent to the chief executive officers of all the railroads in the United States and Canada.

Congressman Adamson Condemns Government Ownership

"What do we want of government ownership of railroads when we have something far better in this country right now?" This was the reply of William C. Adamson, author of the Adamson "eight-hour" law, when questioned in a recent interview at Denver, Col. "Government ownership of railways is not only a fallacy, but is entirely without excuse for having a champion in the United States at this time," the congressman said. He has been on the house committee on interstate and foreign commerce for 21 years, for the past seven having being its chairman, and has had a leading hand in some of the nation's most important legislation during this time.

"When we faced this war there was at once talk of the government taking over the railroads. I thought the government was too busy preparing for the greatest war the world ever dreamed of to stop to wrestle with the herculean task of taking over the most enormous and complicated network of railroads on any continent on the globe. And, besides, it would have cost billions of dollars. This government knows nothing of operating railroads, so I suggested that we make the President of the United States the traffic agent of all the railroads in this country, and the President agreed with me.

"Then we passed a clause in the war bill which provided for preferential shipments—that is, government business was to move first. The result was that millions of tons of military equipment, hundreds of thousands of soldiers and all sorts of supplies have moved on schedule time during the last seven months and without a hitch. No country, even where they have government-owned railroads, ever duplicated this feat. England had an enormous task to move men and munitions, but we saw not the slightest delay or confusion. We told the railroads what to do and they co-operated, not only with splendid spirit but with an efficiency that demanded the admiration of the world. The government got just what it wanted and the railroad chiefs—men whose life work has been railroad—were there to carry out our wishes."

Chicago Switchmen Threaten Another Strike

Representatives of switchmen belonging to the Brotherhood of Railroad Trainmen employed by nineteen railroads entering Chicago recently gave out the following statement: "We hereby earnestly express the belief that the lowest minimum living wage with which a yardman can under existing conditions properly and decently support his family is \$5 per day, and that the present differentials between day and night rates for helpers and foremen should be maintained."

Railroad officers are expecting demands from the brotherhood at any time. The wage scale, which, it is said, the B. R. T. will ask is as follows: Day helpers, \$5 a day; night helpers, \$5.20; day foremen, \$5.30; night foremen, \$5.50. About 2,500 switchmen employed on the nineteen roads belong to the B. R. T., and about 1,300 are non-union. Should the increases be granted by the nineteen roads in question the raise would also probably have to be given to switchmen on all roads in the Chicago switching district, numbering about 7,000. The last time the switchmen presented demands to the Chicago carriers a strike resulted which lasted from July 28 until July 30, when the intervention of officers of the other three railway brotherhoods brought about a settlement.

On Wednesday, October 31, the Switchmen's Union, S. E. Heberlin, president, which represents a large percentage of the yardmen in and around Chicago, formulated a request for large increases in the pay of switchmen, switchtenders and towermen, and asked the railroads for a conference on December 3. They ask for time-and-one-half for all work beyond eight hours a day.

National Waterways Congress

S. A. Thompson, Washington, D. C., secretary of the National Rivers & Harbors Congress, announces that the fourteenth annual convention of the congress is to be held in Washington, December 5, 6 and 7.

The Freight Claim Association

W. P. Paylor, Richmond, Va., secretary of the Freight Claim Association, announces that a conference is to be held at the Vanderbilt Hotel, New York City, November 27, to consider proposed changes in the forms, adopted last year, which have been prescribed for use in making claims on transportation companies for concealed loss and damage. Committees representing the freight claim association, and prominent commercial interests, will confer in the forenoon and take up criticisms of the present forms growing out of the experiences of the last year; and in the afternoon there will be a more general conference, to which shippers' representatives from all over the country have been invited.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

- AIR BRAKE ASSOCIATION.—F. M. Nellis, Room 3014, 165 Broadway, New York City.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J.
- AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, Chicago, Ill.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. & N. W., 143 Liberty St., New York.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Hartman, Room 101, Union Station, St. Louis, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—Fred C. J. Dell, 165 Broadway, New York.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago.
- CONVENTION FOR 1917 postponed.
- AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, general secretary, 75 Church St., New York.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichy, C. & N. W., Chicago. Next annual meeting, October, 1918, New York.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next annual meeting, March 20-22, 1918, Chicago, Ill.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Illinois Central, Chicago.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Anziet, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January, 1918, Chicago.
- ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Redwood Bldg., Washington, D. C. Next annual meeting, St. Louis, May, 1918.
- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, Terminal Station, Central of New Jersey, Jersey City, N. J.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreuccetti, C. & N. W., Room 411, C. & N. W., Chicago.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Superintendent of Telegraph, Indiana Harbor Belt, Gibson, Ind.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—Tom Lehn, The Lehn Company, Chicago. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aron Kline, 841 Laylor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in January, May, September and November. Annual dinner, 2d Thursday in March. Hotel Statler, Buffalo, N. Y.
- CRUISE INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. R. McMunn, New York Central, Albany, N. Y.
- CINCINNATI RAILWAY CLUB.—H. Boubit, Chief Interchange Inspector, Cincinnati, 101 Carew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November. Hotel Sinton, Cincinnati.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Fluer K. Miles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Traffic Manager, R. F. & P., Richmond, Va.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, C. R. & O. R. R. 702 E. 51st St., Chicago. Next convention, May, 1918, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1126 W. Broadway, Winona, Minn.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Monroe St., Chicago. Next annual convention, November 12-14, Hotel Belvedere, Baltimore, Md.

MAINTENANCE OF WAY AND MASTER ENGINEERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. W. Hager, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 15-17, 1918, Chicago.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1122 Karpen Bldg., Chicago. Next annual convention, June, 1918, Atlantic City, N. J.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York City.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—C. W. Kelly, 149 Peoples Gas Bldg., Chicago. Annual exhibition, March 18-21, 1918, Coliseum and Annex, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wollner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. R. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial-Annex Hotel, Pittsburgh.

RAILWAY DEVELOPMENT ASSOCIATION.—D. C. Welty, Commissioner of Agriculture, St. L. Iron Mt. So., 1047 Railway Exchange Bldg., St. Louis. Next annual convention, May, 1918, Houston, Tex.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electricians, Chicago.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Office of the President's Assistant, Seaboard Air Line, Norfolk, Va.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, C. & O., Richmond, Va.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, N. Y. C. R. R., Box C, Collinwood, Ohio.

RAILWAY SUPPLIES AND MATERIALS ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders' and Master Mechanics' Association.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Club has been suspended until after the war.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W., Sterling, Ill. Next annual convention, September 17-19, 1918, Auditorium Hotel, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Faensthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association. SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, N. & W., Philadelphia, Pa.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Tuesday in month, except May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—C. R. Signer, La Salle Hotel, Chicago.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Next annual convention, June 18, 1918, Grand Rapids, Mich.

TRAFFIC CLUB OF PITTSBURGH.—D. I. Wells, Gen'l Ag't, Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., Cleveland, Ohio.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN ASSOCIATION OF SHORT LINE RAILROADS.—Clarence M. Oddie, Mills Bldg., San Francisco, Cal.

WESTERN CANADIAN RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1122 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Secretary, 1735 Monadnock Bldg., Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evenings except in July and August.

Traffic News

Morgan's Steamship Line has again been obliged to place an embargo on northbound freight shipments from Galveston.

The National Industrial Traffic League will hold its annual meeting at the Waldorf Astoria hotel, New York, on November 15 and 16.

The Minnesota Railroad and Warehouse Commission held a hearing at St. Paul, Minn., on October 31, on the application of the railroads for changes in the carload minimum weights in intrastate tariffs to make them conform to the interstate minimums.

The experimental use of large motor trucks in the parcel post service, designed to facilitate the transportation of food supplies direct from farmers to city consumers, which was provided for in the last post office appropriation bill, will first be put in operation between Washington, D. C., and Richmond, Va.

At the meeting of the Traffic Club of New York on October 30, T. C. Powell, vice-president of the Southern Railway, delivered an address on "Scientific Marketing." The report of a special committee appointed to investigate pier congestion and delays to vehicles receiving and delivering freight was also discussed.

The Pennsylvania, like most other roads, has posted notices announcing that the internal revenue tax is to be collected on tickets and freight bills after November 1; and passengers are called upon to apply at the ticket offices earlier than has been customary, because of the extra work which the ticket agents will have to do in collecting the tax and validating the tickets.

The location of the National Army cantonnements on the Pacific Coast is the subject of a pamphlet, with a small map, which has been issued by E. G. McMicken, general passenger agent of the Pacific Steamship Company, San Francisco. Six pages of the pamphlet are occupied with pictures of the chevrons worn by various grades of officers and men in the army and in the navy.

R. H. Ashton, chairman of the central department committee of the Railroads' War Board, has sent to the railroads a circular calling attention to the very large prospective increase both in the number and weight of Christmas packages, and recalling the fact that to take care of this traffic is going to require every available baggage and express car, as well as some refrigerator and other special cars. He urges that all of this class of cars be made suitable for service and gotten off of repair tracks by the first part of December; and, further, that every means be used to induce the public to ship Christmas packages a week or ten days earlier than usual.

The Department of Agriculture issues warning that more care should be exercised in loading grapes, to prevent serious losses in transit. Twelve-quart baskets should never be loaded in cars more than eight high. When loaded nine high the bottom baskets are crushed and broken. All packages must be very firmly stowed in cars to prevent shifting of the load and consequent crushing of bottom layers. Large losses have been found to result from loading weak and broken packages at or near the bottom of the car. Where there has been a scarcity of suitable packages, losses have resulted from chucking, resulting from mixing packages. Trays, twelve-quart baskets, full bushel and half-bushel baskets have been loaded in the same car.

New Boston & St. Louis Trains

The New York, New Haven & Hartford and the Pennsylvania announce that, beginning November 25, a new through passenger train will be run, by the Hell Gate Bridge Route, between Boston and St. Louis. By the tentative schedule the westbound train leaves Boston daily at 1:25 p. m.; Harrisburg, Pa., 11:40 p. m.; Pittsburgh, 6 a. m.; Columbus, 10:15 a. m.; Indianapolis, 3:25 p. m.; arriving at St. Louis 9:35 p. m. Eastbound, the train will leave St. Louis at 11:50 p. m.; Indianapolis, 7:45 a. m.; Columbus, 12:40 p. m.; Pittsburgh (eastern time), 7:10; Harrisburg, 1:15 a. m.; arriving in Boston at 11:30 a. m. Presumably the trains will stop at New York, N. Y., though that place is not mentioned in the list of way stations.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

A hearing on some details connected with the protest of the Winston-Salem Southbound Railway to the tentative valuation of its property made by the Division of Valuation of the Interstate Commerce Commission was held before Examiner Staples at Washington on October 25.

Chairman Hall has addressed a letter to George Stuart Patterson, counsel for the eastern railroads, saying that the fifteenth section order of October 20 is not to be understood as precluding application for or the adoption of a speedier procedure in respect of the increased rates on commodities sought by the eastern carriers and set for hearing on November 5 in the fifteen per cent case.

The fifteenth section amendment of August 10, as applied to carriers ordered to remove a discrimination, apparently deprives them of the option which they have possessed hitherto, as to whether they will remove the discrimination by reducing the higher or raising the lower rate. This point came out in connection with tariffs filed by the Carolina, Clinchfield & Ohio, the Southern, the Norfolk & Western, and the Chesapeake & Ohio and their connections in the Bristol-Johnson City case. In compliance with the Commission's order in the complaint of the Johnson City (Tenn.) Chamber of Commerce v. Southern et al., the roads filed tariffs putting the Johnson City rates in effect at Bristol. The commission held that the Johnson City rates had not been shown to be unreasonable, but that they were unduly discriminatory against Johnson City and in favor of Bristol. Under the new law the carriers made what they thought would be a pro forma application for leave to file tariffs extending the Johnson City rates to Bristol. The commission has never ruled, formally that the new law applies to tariffs filed in obedience to the unamended law, but informally it has declined to place tariffs filed under such conditions in an exempted class, not subject to the so-called Smith amendment. At a so-called informal hearing on the tariffs on October 26, Frank Lyon, attorney for Bristol shippers demanded a formal hearing on the tariffs which have been filed. The commission undoubtedly will agree to this suggestion and have a formal proceeding; but the holding of the hearing will deprive the carriers of the increased revenue that would have resulted if the higher rates for Bristol had been allowed to take the course that has been the usual one in the past.

Rates on Rails to Seaboard

West Virginia Rail Company v. Chesapeake & Ohio et al. Opinion by Commissioner Daniels:

Rates on light steel rails in carloads from Huntington, W. Va., to New York, Philadelphia, Baltimore and eastern basing points, for domestic consumption, found unreasonable to the extent specified in the report. Reparation awarded. Rates on same for export, not found to have been unreasonable, or unduly prejudicial in respect of transportation initiated by the Chesapeake & Ohio, but held to have been unduly prejudicial on traffic originated by the Baltimore & Ohio. Export and domestic rates to the ports, for the future, permitted to be established on the basis voluntarily proposed by defendants. (46 I. C. C., 677.)

Hearings on Transcontinental Rates

Applications filed by the transcontinental roads under the amended 15th section of the act to regulate commerce involve a request for the approval by the commission of tariffs proposed to be filed by the transcontinental lines in purported compliance with the order of the commission dated June 30, 1917. Upon protest filed by Pacific Coast interests and others the commission has arranged to set these applications for informal hearing to be held before Attorney-Examiner Thurtell at Room 1809, 165 Broadway, New York City, on November 5; at the Federal building, Chicago, on November 12, and at the United States court rooms, Portland, Ore., on November 21, in order that the com-

mission may determine (1) whether or not the rates proposed are in compliance with the order of the commission aforesaid, and (2) to receive evidence upon the reasonableness and propriety of the increased rates proposed. The tariffs which the carriers ask permission to file are voluminous. They may be inspected at the office of the commission at Washington, but in order to apprise interested parties as to their character, Attorney-Examiner Thurtell will read, at the hearing on November 5, an abstract designed to elucidate their structure.

STATE COMMISSIONS

The Public Service Commission of Alabama, to which application has been made to order the restoration of numerous passenger trains taken off several months ago, has deferred consideration of the question until its next monthly meeting. This action was taken in the expectation that the railroads and the public can come to an agreement.

The Railroad Commission of Louisiana has issued an order amending its rule No. 49 so as to require all railroads to provide equal but separate accommodations for white and colored passengers and to provide in both the white and the colored cars (or compartments) separate toilets for the sexes. The order must be complied with on or before May 1, 1918. There was some demand for separate smoking compartments both for the whites and the blacks making four classes of accommodations on every train—but the order says nothing about smoking compartments.

COURT NEWS

Train Sheet Records as Evidence

In an action for damages for the destruction of growing timber by fire the Virginia Supreme Court of Appeals holds that records of entries made in the established course of business on train sheets by train despatchers, from reports telegraphed or telephoned them by station agents as to the time of arrival and departure of trains, are admissible in evidence to indicate the location of a train at a certain time.—*French v. Virginian* (Va.), 93 S. E., 585. Decided September 20, 1917.

Scope of State Headlight Law

The Alabama Supreme Court holds that the Alabama Locomotive Headlight Law of 1915 has no application to engines engaged in interstate commerce, the federal act of 1911 as amended in March, 1915, having excluded the states from the right to legislate, though the final federal rules on the subject of headlights were not promulgated until after a railroad charged with violating the Alabama law committed the offense.—*L. & N. v. State* (Ala.), 76 So., 505. Decided June 30, 1917.

Abolition of Grade Crossings—Necessity of Taking Property

A city and several railroads, acting under a state statute giving the necessary authority, entered into a contract for the appropriation of land for yards to relocate the railroads, to elevate their tracks and to provide sites for municipal piers and other extensive improvements. In a suit for injunction by taxpayers, the Pennsylvania Supreme Court holds that a court will not interfere with the judgment of the contracting parties as to the necessity and extent of taking property, without strong and conclusive evidence that the taking was arbitrary, and not for legitimate railroad purposes.—*Chew v. City of Philadelphia* (Pa.), 101 Atl., 915. Decided April 30, 1917.

Recovery for Undercharge—Establishment of Rates

A railroad suing to recover an undercharge on an interstate shipment of live stock is entitled to recover on showing the shipment, its legal duty to recover for the undercharge, and that its tariffs have been filed and published as provided by law. The Supreme Court of the State of Washington holds that, while establishment of a tariff rate depends on the tariffs being filed and posted . . . in "two conspicuous places," etc., such posting is not a condition precedent to a recovery for an undercharge if the establishment of the rate is shown by the filing and by providing its freight offices with copies.—*Northern Pacific v. Longmire* (Wash.), 167 Pac., 79. Decided August 24, 1917.

Crossing Accident—Contributory Negligence

In an action for personal injury to the plaintiff's foot, which was run over by a locomotive at a crossing, the Pennsylvania Supreme Court holds that, as it appeared the plaintiff stopped, looked and listened when he was on a track next to the one on which the locomotive approached, and did not see it, though its headlight was burning and he had an unobstructed view for 160 feet, and immediately started across the track and was struck, he was contributorily negligent, and judgment for the plaintiff was reversed and rendered for the defendant.—*Lapino v. Philadelphia & Reading (Pa.)*, 101 Atl., 767. Decided April 9, 1917.

Car Door Accident—Assumption of Risk by Passenger

In an action by a passenger for injuries to his fingers caused by being slammed in the jamb of a car door it appeared that the plaintiff was on a day coach approaching Scranton when the station was called and the car door into the vestibule was opened by the trainman. The plaintiff left his seat and went forward into the vestibule, preparatory to alighting. There he took a position facing the unopened vestibule door, through which he expected to go. To steady himself he placed his right hand against the jamb of the car door, with his fingers in the space between the door and the jamb. Before the station was reached the trainman reached from the vestibule into the car and pulled shut the door on the plaintiff's fingers. There was no evidence as to the reason for thus shutting the door. There was no proof that the trainman actually saw the position of the plaintiff's fingers, but it was contended he ought to have seen and given warning. The Pennsylvania Supreme Court held that the trainman was under no obligation to see where the plaintiff's fingers happened to be, nor to foresee any reasonable probability that they would be in such a position. The plaintiff, by leaving his seat and standing in the vestibule before the train stopped assumed the risk of what happened, even if he were not guilty of contributory negligence.—*L'Hommedieu v. D., L. & W. (Pa.)*, 101 Atl., 933. Decided May 7, 1917.

Crossing Accident—Stop, Look and Listen

The Circuit Court of Appeals, Fourth Circuit, has affirmed the judgment of the federal district court, N. D. West Virginia, in favor of the defendant railroad in the crossing accident case of *Dernberger v. Baltimore & Ohio* (234 Fed. 405). An abstract of the district court's opinion, containing full details of the facts of the case, appeared in our issue of November 24, 1916, Vol. 61, p. 962. Stated briefly the action was for the death of a farmer, well acquainted with the crossing, who drove his team upon the track in front of a fast express train. The Circuit Court of Appeals in its opinion reviews the evidence at great length and cites many cases regarding the care required from persons approaching railroad crossings. It holds that where, notwithstanding obstructions to the view of approaching trains caused by a heavy growth of weeds, underbrush, etc., a driver on a highway could have seen or heard an approaching train in ample time to avoid being struck if he had looked and listened, but, from a point 150 feet from the crossing he drove towards and on it without looking and listening, apparently oblivious to the danger, he did not exercise the care that a reasonable man would take for his own safety, and there could be no recovery for his death. Under such circumstances the failure of the railroad to give the signal required by statute on approaching the crossing did not make it liable. The court said: "The danger incident to a crossing is increased or diminished according to the nature of the land on either side of the highway. . . . Where the banks are level and the intervening space between the road and the railroad consists of cleared land, the risk is less; but where as in this instance, it appears that there is a heavy growth of weeds, underbrush, etc., so as to obscure the view of the track beyond the crossing in the direction from whence the train comes, the risk is correspondingly increased. Such condition is a warning to the traveler of the imminence of danger, and in the nature of an admonition to exercise reasonable caution in approaching a railroad track; also, the means of transportation employed by the traveler becomes an important factor in determining the degree of diligence to be exercised. . . . No hard and fast rule as to the duty of a traveler on the highway to stop, look and listen before crossing a railroad can be laid down. Under some circumstances the railroad company may so act as to allay the sense

of danger and relieve the traveler from the obligation to stop, look and listen. A plain view of the track may make it no breach of duty for him not to stop or listen. He may be traveling on foot or so silently that he can listen as well going as stopping. The obstruction of the view may be such that he is obliged to depend upon his hearing without the aid of his sight. We, therefore, do not lay down the inflexible rule that a traveler must stop, look and listen under all circumstances." All that the court decided, therefore, was that the evidence excluded any other reasonable conclusion than that the negligent conduct of the deceased was the proximate cause of his death.—*Dernberger v. B. & O.*, 243 Fed. 21. Decided May 17, 1917.

One-day Time Limit on Ticket Valid

The holder of a ticket with the time limit, "Good for continuous passage beginning date of sale only" printed on its face was ejected when he attempted to ride with it on the day following its date. In an action for damages for wrongful ejection the question was raised whether the time limit so imposed was lawful. The plaintiff contended that his rights were contractual, fixed by the contract of carriage between carrier and passenger, and that, therefore, the time limit, although printed on the face of the ticket, could not form a part of such contract or bind the plaintiff, unless he had actual notice of it and acquiesced therein at the time the contract of carriage was made; and this he denied. The railroad contended that the time limit was not a matter of contract, but merely a regulation for the conduct of its business, the validity of which was to be determined upon the sole inquiry of its reasonableness as such regulation, and not on any inquiry as to its invalidity as a contract between carrier and passenger. The Virginia Supreme Court of Appeals holds that a provision in a ticket, considered in its primary sense as evidence of the passenger's right to transportation, that it should be good only on the day of sale, is a reasonable regulation of the carrier and valid, in the absence of governmental regulation or statute to the contrary.—*L. & N. v. Rieley (Va.)*, 93 S. E. 574. Decided September 20, 1917.

Fires Set by Locomotives—No Liability for Injury to Firemen or Fire Engines

The New Hampshire Supreme Court holds that the statute of that state making a railroad liable for damages to person or property from fires set by its locomotives has no application to the case of a fireman employed by a municipality to extinguish fires who was injured in attempting to extinguish a fire set by a railroad's locomotive. The statute applies to persons and property exposed to damage along the line of the road. It does not apply to firemen or fire engines whose exposure results from an attempt to extinguish the fire. Nor was the railroad liable at common law. The question was not one of proximate or remote cause, but whether the railroad owed any duty at all to the plaintiff—whether, apart from his contract of employment, it stood in any legal relation to him, however remote. The court held that it did not. Neither the plaintiff nor his property was in a position to be injured by a fire set by the railroad. His connection with the fire arose solely from his own act in coming into contact with it after it was set. Nor was the railroad liable because of his employment. Knowing that fires will occur from various causes, some culpable and some not, the plaintiff undertook the work of extinguishing all fires without reference to how they were caused. The danger of injury in doing such work was necessarily assumed by him.—*Clark v. Boston & Maine (N. H.)*, 101 Atl. 795. Decided June 5, 1917.

Hours of Service Act—"Emergency" Different from "Casualty"

At a station where the only employee was both agent and telegrapher, the pipe leading up from a pump through the bottom of a water tank used for engines sprang a leak, so that it could not be drained. The weather was extremely cold, and the agent, recognizing that if water were allowed to stand motionless in the pipe it would freeze, communicated the fact to his superiors and was directed to remain on duty during the night, keeping up steam and running the pump at frequent intervals. It did not appear that it would have been impossible to have relieved the operator within the 17-hour period prescribed by section 2 of the law. The Circuit Court of Appeals, Sixth Circuit, affirming a

judgment of the district court for the Northern District of Ohio, holds that, as a casualty or unavoidable accident, to take the case out of the provision in section 3 of the act must be more than some occurrence of a more or less trifling nature, which might possibly be foreseen, it was a violation of the act to retain the operator on duty for more than 17 hours; it not appearing that the opening of the leak was unavoidable.

To make clear the reasoning of the court it is necessary to refer briefly to the sections of the act applicable to the case. Section 2 forbids the employment of day-time telegraph operators or train dispatchers longer than 13 hours, except in case of emergency, when they may be permitted to remain on duty for 4 additional hours in a 24-hour period not exceeding 3 days in any week. Section 3 provides that the act shall not apply in any case of casualty or unavoidable accident, or the act of God. The court said: "If the 'emergency' which will permit 17 hours' service under section 2, and the 'casualty or unavoidable accident' required to invoke the proviso of section 3, were the same thing there would be reason to say that the latter proviso did not cover the cases reached by the former; but there is not only a presumption of a difference in meaning from the fact that the words are selected and put into contrast, but they inherently imply distinction. Congress would naturally have foreseen that in the course of railroad service there would be a great number of unexpected conditions which would require the service of a telegrapher for a few extra hours, and which well might be termed emergencies, but which would not at all rise to the scope of an act of God, an unavoidable accident, or a casualty. While 'casualty' and 'unavoidable accident' are terms broad enough to cover many rather trifling things, yet their association in this section indicates that they were not used in any such broad sense, but only with reference to those extreme cases which justify coupling them with 'act of God.' This construction has been approved by those Circuit Courts which have passed on the question. *United States v. Mo. Pac.*, 213 Fed. 169; *San Pedro v. United States*, 230 Fed. 737; *Denver Ry. v. United States*, 233 Fed. 62;—*Baltimore & Ohio v. United States*, 243 Fed. 153. Decided May 8, 1917.

CHILE INVITES TENDERS FOR LOCOMOTIVE BOILERS.—The American ambassador at Santiago, Chile, cables that tenders have been requested by the Chilean Government for fifteen locomotive boilers which are urgently required for the state railroads. With their bids American manufacturers are required by the Chilean Government to present the requisite export licenses.—*Commerce Report*.

SIBERIAN RAILROAD ONE-THIRD EFFICIENT.—Inefficient transportation service by the Trans-Siberian Railroad is responsible for an immense congestion of traffic at Vladivostok, was the statement of S. R. Bertron, a member of the American Commission to Russia, at the second conference of the Russian-American Chamber of Commerce held recently in New York. "The Trans-Siberian Railroad is only giving about thirty per cent efficiency," Mr. Bertron said. "On the books of the line are double the number of locomotives the Pennsylvania Railroad has per mile. There are three times as many men employed on the Trans-Siberian Railroad as the Pennsylvania has, and yet the efficiency is only thirty per cent. Their failure to utilize to the fullest extent the facilities at their disposal has created a congestion at the port of Vladivostok, where 700,000 tons of material have accumulated. The road is moving only such stuff as is now entering the port, and no inroads are being made on the accumulated freight. The only remedy for this condition is by the introduction of more cars and locomotives. It is expected that our government will be able to introduce a total of 75 locomotives and 1,000 cars in Russia during the present year, but this is only a small fraction of what Russia requires in the way of railroad equipment. In addition to the Trans-Siberian line there will be available during the winter months only one additional line, the Kola Railroad, from the port of Murman. Plans are being made, with the assistance of the American Railway Commission in Russia, to place this line in working order, that its facilities may be of use during the winter months. If this line is placed in commission at the time of the closing of Archangel it will mean that about two thousand tons of material a day can reach Russia by way of the Atlantic Ocean." [Press despatches October 16 said that the Stevens Commission had improved the situation at Vladivostok, increasing the efficiency of the railroad 25 per cent.]

Equipment and Supplies

FREIGHT CARS

THE UNITED STATES NAVY DEPARTMENT is asking for prices on 4 40-ton single sheet box cars.

C. U. SNYDER & Co., Commercial Car Line, Chicago, Ill., has ordered 50 8,000-gal. capacity tank cars from the Pennsylvania Tank Car Company.

THE PETROLEUM REFINING COMPANY, Houston, Texas, reported in the *Railway Age Gazette* of October 12 as inquiring for 50 8,000-gal. capacity tank cars, has ordered these cars from the Pennsylvania Tank Car Company.

THE WESTERN PACIFIC, reported in last week's issue as having withdrawn its inquiries for freight cars, is inquiring for 1,500 steel underframe, 40-foot, 40-ton box cars, and for 300 steel frame, 36-foot and 50-ton general service cars.

THE ILLINOIS CENTRAL, reported in last week's issue as inquiring for prices on cars, has ordered 500 gondola cars from the Haskell & Barker Car Company and a like number from The Pullman Company. This company is asking for prices on 300 flat cars.

SIGNALING

THE LONG ISLAND has ordered from the General Railway Signal Company a mechanical interlocking machine, 32 levers, for Far Rockaway, N. Y.

THE MISSOURI, KANSAS & TEXAS is to install an interlocking plant at North Jefferson, Mo.; Saxby & Farmer machine, 12 levers; installation by the railroad company's forces.

THE ATCHISON, TOPEKA & SANTA FE has ordered from the General Railway Signal Company the materials for an electric interlocking plant at Kelker, Col.; 28-lever machine model 2, with 21 working levers and 7 spare spaces.

THE GREAT NORTHERN has ordered from the General Railway Signal Company, Rochester, N. Y., 200 type 2A automatic block signals with the necessary batteries, relays, wires and other apparatus. These signals are to be installed by the railroad company's forces.

THE GENERAL RAILWAY SIGNAL COMPANY, Rochester, N. Y., has shipped to the South Eastern & Chatham Railway, of England, an electric interlocking machine of 200 levers. It is a "model 2" machine, unit lever type. This machine is for installation at Victoria station, London.

THE GRAND TRUNK is to install the "A P B" automatic block signal system on its line between Shelburne, N. H., and Bethel, Me., 15 miles, single track. The material has been ordered from the General Railway Signal Company and the railroad's forces will do the construction work.

THE NEW YORK CENTRAL is to enlarge its electric interlocking at Wesleyville, Pa., by adding 32 levers to the present 48-lever machine. At Dunkirk the same company will add 16 electric levers to the 60-lever mechanical interlocking lately installed there. Material for these two installations has been ordered from the General Railway Signal Company.

THE NORTHERN PACIFIC's plans for new automatic block signaling aggregate 228 miles of road, as follows: Rice, Minn., to Little Falls, 17 miles, double track; Easton, Wash., to Lester, Wash., 19 miles, double track; Toston, Mont., to Garrison, Mont., 92 miles, single track; Missoula, Mont., to De Smet, Mont., 7 miles, double track; De Smet to Paradise, 93 miles, single track. A total of 379 semaphores will be required; 1,100 relays, 188 switch circuit controllers and 400 cast iron battery chutes; all of which articles, with other material, have been ordered from the General Railway Signal Company. This company also has contracted to install the signals, which work, it is expected, will be completed by the Fall of 1918.

Supply Trade News

The Falls Hollow Staybolt Company has removed its Chicago office from the Fisher Building to 654 Railway Exchange Building.

A. L. Whipple, who for two years has been sales manager of the Railway Improvement Company, 61 Broadway, New York City, has been made vice-president and assistant general manager of that company.

The Continental Construction Corporation has been chartered in Delaware with a capital of \$100,000 to manufacture railway supplies. The incorporators are: C. L. Rimlinger, M. M. Clancy, Wilmington, Del.; Clement M. Egner, Elkton, Md.

The United States Steel Corporation has declared the usual extra dividend of 3 per cent in cash and the regular quarterly dividend of $\frac{1}{4}$ per cent on the common stock, also the regular quarterly dividend of $\frac{1}{4}$ per cent on the preferred stock.

Charles E. Lee, formerly general superintendent of the Boston & Maine and more recently in the railroad supply business, has been appointed transportation manager of the Atherton Construction Company, headquarters at the Four River Ship Building Plant, Quincy, Mass.

Morrill Dunn, vice-president of McCord & Co., and Fred A. Preston, manager of sales of the P. & M. Company, Chicago, have been commissioned captains in the Signal Corps of the U. S. Army and have been assigned to duty with the Air Craft Production Board in France.

R. J. Morgan, who resigned his position with the Midvale Steel & Ordnance Company, has been appointed supervisor of sales of the American Steel Export Company, New York. Mr. Morgan prior to his connections with the Midvale Steel & Ordnance Company was thirteen years in the employ of the Carnegie Steel Company.

The Keith Railway Equipment Company, 122 South Michigan avenue, Chicago, recently bought 33 acres near Hammond, Ind., and has begun the construction of a shop, 200 ft. by 85 ft., for the construction and repair of tank cars. Later two other buildings will be added, one of which will be 350 ft. by 300 ft. and the other 200 ft. by 70 ft.

On October 1, 1917, the New York sales offices of the Edison Storage Battery Company, long located at 206 West Seventy-sixth street, moved into larger quarters, at 209 West Seventy-sixth street, right across the street from the old headquarters. At the new location many additional facilities have been installed to enable the manager, John Kelly, to take care of the increased business.

The Pacific Car & Foundry Company, Seattle, Wash., was recently incorporated to build standard railway equipment, logging cars, trucks, contractors' equipment, forgings, castings, iron and steel and railway supplies in general. The new company has taken over the business of the Seattle Car & Foundry Company and now operates fully equipped car plants both at Seattle, Wash., and Portland, Ore. The officers are: William Pigott, president; O. D. Colvin, vice-president and general manager; James F. Twohy, vice-president and treasurer; James E. McNery, secretary; T. G. Hlaywood, director of purchases.

J. J. Byrne has been appointed eastern representative of the Locomotive Stoker Company of Pittsburgh, Pa., with office at 50 Church street, New York City. Mr. Byrne entered railroad service in 1903, on the Cleveland, Cincinnati, Chicago & St. Louis as machinist's apprentice. He served four years in this capacity at the Delaware shops. He entered the service of the Lake Shore & Michigan Southern as machinist in 1907, and remained with that company until 1909, at which time he entered the employ of the Locomotive Stoker Company as mechanical expert. Mr. Byrne will still devote much of his time to the Southern roads.

Clement F. Street has opened an office as consulting mechanical engineer at 50 Church street, New York. He will give

special attention to questions of design and tests of railway equipment and specialties. Mr. Street at the age of 18 became a machinist's apprentice at the works of the Buckeye Engine Company, and after three years entered the drawing room of that company. Later he became chief draftsman of the Johnstown Company, Johnstown, Pa., leaving after two years to become chief draftsman in the motive power department of the Chicago & St. Paul Railway, where he remained for four years. In 1892 he became mechanical editor of the Railway and Engineering Review of Chicago. Seven years later he went with the Dayton Malleable Iron Company and for nine years was engaged in designing and selling railway supplies for this company, for the Wellman-Seaver-Morgan Company, Cleveland, Ohio, and for the Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa. In 1907 he started to develop a locomotive stoker with the financial assistance of the Westinghouse Air Brake Company, this work finally developing into the formation of the present Locomotive Stoker Company, of which Mr. Street was a vice-president. In 1916 the John Scott Legacy Medal and Premium was awarded to Mr. Street on the recommendation of the Franklin Institute of Philadelphia for his work in developing the Street stoker.

Extension of Automatic Stop System on C. & E. I.

The Miller Train Control Corporation, Staunton, Va., and Danville, Ill., is extending the installation of its automatic train stop apparatus on the lines of the Chicago & Eastern Illinois. The new work is on the 62-mile single-track cutoff between Woodland Junction, Ill., and Villa Grove, over which is moved a heavy through traffic between Chicago and St. Louis. This installation when completed will make a total of 169 miles of line and 276 miles of track on this road operated under the Miller system. On the mileage where the system is at present in service there is a full equipment of automatic (visual) block signals, but the new installation is on an unsigned line.

Supply Companies to Discontinue Sending Holiday Cards

Recognizing that the sending of holiday greeting cards constitutes a burden on the country's mail service and serves no productive purpose during the war, a number of railway supply companies in Chicago have announced their intention to omit the distribution of such cards this year and instead to contribute money to war relief organizations. The announcement reads as follows:

"At this time of world war when money is so sorely needed to alleviate suffering, reduce hunger and care for the sick and wounded, it seems sheer waste to spend money for such unnecessary and unproductive things as holiday greeting cards.

"A number of companies and individuals, among them the undersigned, whose custom it has been to distribute such cards, have decided not to do so this year, but instead to contribute the money to war relief organizations, where it will perform some real service.

"As lack of time prevents a personal canvass of other steel producers and consumers, as well as business houses and banks in general, this form of letter is substituted, and it is hoped the suggestions offered may meet with wide approval and be productive of generous results.

"Contributions should be sent direct (together with a copy of this circular, if desired) to The American Red Cross, the American Fund for French Wounded, or any other relief organizations that may appeal to the giver."

This is signed by Illinois Steel Company; Morden Frog & Crossing Company; American Steel & Wire Company; Universal Portland Cement Company; Lackawanna Steel Company; Carnegie Steel Company; Inland Steel Company; Chicago Railway Equipment Company; A. M. Castle & Company; The P. & M. Company; A. J. O'Leary & Son Company.

TRADE PUBLICATIONS

STAYBOLT IRON.—The Rome Iron Mills, Inc., 30 Church street, New York, has issued Bulletin No. 1 on Rome hollow staybolt iron. These staybolts are made with the tell-tale holes in them and the advantages obtained by using this material are explained. Illustrations showing the texture of the material from the nick and bend test and places in the firebox where these staybolts are particularly advantageous are shown.

Railway Construction

GULF COAST LINES.—These lines have awarded a contract for the construction of a one-story depot, 34 ft. by 230 ft., at Beaumont, Tex., to cost about \$20,000. The building will be of brick construction on reinforced concrete footings and will have a composition roof. The contract was let to Herman Weber, Beaumont. The construction of tracks and other incidental improvements will cost \$30,000 additional. C. S. Kirkpatrick, chief engineer, Houston, Tex.

ILLINOIS CENTRAL.—This company has awarded a contract to G. A. Johnson & Son, Chicago, for the following improvements at Memphis, Tenn.: the construction of new racks and bins in the storehouse, remodeling the mill building, erection of platforms and incline at the mill building, plumbing and sewage work, construction of transfer table pit and engine hoist pit, and erection of coach yard building. The estimated cost of the work is \$50,000.

A contract for additional work at Clinton, Ill., has been awarded to T. S. Leake & Co., Chicago. Eleven stalls in the roundhouse will be lengthened at a cost of about \$60,000.

MONONGAHELA & SOUTHERN.—This company is building a 5-mile branch, to be known as the Clairton branch, from the main line of the Monongahela Southern at Bull Run, Pa., about two miles west of Duquesne to the new By-Product Coke Plant at Wilson. The contract for the grading has been awarded to the T. A. Gillespie Company, New York and Pittsburgh, and work has been commenced. The contract for the steel superstructures has been awarded to the American Bridge Company and track laying will be handled by the railroad forces. The grading work is heavy, calling for the excavation of about 1,200,000 cu. yd. unclassified. There will be a tunnel 1,700 ft. long, two steel railroad bridges 115 ft. and 430 ft. long respectively and four concrete arches, the largest being 50 ft. diameter inside and 425 ft. long. The amount of concrete will be about 75,000 cu. yd. including tunnel lining. The limiting grade southbound is about 1.6 per cent, northbound 1.25 per cent compensated. The maximum curvature is 7 deg. The new line will carry coke from the new By-Product Coke Plant at Clairton to the plants of the Carnegie Steel Company in the Pittsburgh district, also coal, finished steel products and by products from the coke plant. The company expects to complete the work within twelve months.

MONTANA SOUTHERN.—This company has awarded a contract to W. R. Allen, Butte, Mont., for the construction of a steam railway line from Divide, Mont., on the Oregon Short Line, up the Big Hole river through Dewey and Wise River to the Elkhorn mines in Beaver Head county, about 40 miles. The work involves a maximum grade of 2½ per cent, light bridge work and the construction of one tunnel 210 ft. long. The principal commodities the road will handle will be ore and timber. The line is now about 60 per cent completed.

TEXAS & PACIFIC.—This company is building a combination office building and warehouse, 36 ft. by 255 ft., the office portion of which will be two stories high and the warehouse one story. The structure will have a brick exterior and will cost about \$30,000. The Watson Company, Dallas, Tex., has the contract.

MONEY CHANGERS RUSHED.—The busiest money changing office in the world is at Victoria Station, London, where soldiers on leave receive English money for French. Nearly every day it is more than \$80,000. Since the opening of the office two and a half years ago more than \$15,000,000 has been changed.

INCREASED COAL PRODUCTION IN FRANCE.—The monthly production of coal in France has increased from 1,576,062 tons in June, 1916, to 2,345,251 tons in June, 1917, the output of the French coal mines having increased almost steadily during the intervening period. The increase in the output has continued since June, 1917, at which time the total French production, added to the imports of British coal, reached a total of over 3,560,000 tons. French production and British imports in August, 1917, amounted to 4,346,000 tons, the French mines having produced 2,666,000 tons, as compared with 1,616,000 tons in August, 1916.

Railway Financial News

ATCHISON, TOPEKA & SANTA FE.—See editorial comments elsewhere in this issue.

CHESAPEAKE & OHIO.—At the annual meeting of this company the date for holding annual meetings was changed from October to the first Tuesday in April.

CINCINNATI, HAMILTON & DAYTON.—The Delphos branch of this line extending from Dayton, Ohio, to Delphos, has been sold to John Ringling, circus owner, for the price of \$275,000. The sale was confirmed by Judge Hollister in the U. S. District Court at Cincinnati. With the entry of this decree the second receivership of the Cincinnati, Hamilton & Dayton will be at an end. The total bonded indebtedness of the railway company was approximately \$33,200,000. The amount received from the sales of the main line and the Delphos and Ironton divisions was between \$5,000,000 and \$6,000,000.

EVANSVILLE & INDIANAPOLIS.—See article on Court Takes Control of Rate-Making elsewhere in this issue.

WASHINGTON, BALTIMORE & ANNAPOLIS.—This company has declared an initial dividend of 3 per cent on the \$3,000,000 common stock, payable October 31 to stock of record October 25.

RAILWAY PROGRESS IN SOUTH AFRICA.—According to the report for 1916 of the general manager of railways and harbors in South Africa there were 9,419 miles of South African railways open to traffic on December 31 last as compared with 9,033 miles at the end of 1915. The total mileage of railways operated by the administration at the end of 1916 was 11,355. Of the 386 miles opened during the year about 110 miles were in the Cape Province, 158 miles in the Transvaal, 77 miles in the Orange Free State, and 39 miles in Natal.

GRADE OF DOMINICAN CENTRAL REDUCED.—A new cut-off 3 miles long, between Barrabas and La Sabana, was recently completed by the Dominican Central, which is owned and operated by the Dominican Government. The new line reduces the grade from 9½ to 3 per cent and the maximum curvature to 32 degrees. This corresponds to the remainder of the road between Bajabonico and Moca, the terminus. The same tonnage that is hauled over the new line may be carried through to the end of the railroad. It is not feasible to reduce this maximum grade of 3 per cent or the degree of curvature, as the cost would be prohibitive. The new line is laid with 60-lb. American rails, all stone ballasted. Bridges and culverts are of reinforced concrete. The change will greatly reduce the cost of operation and maintenance. The train tonnage will be increased five-fold.—*Commerce Report.*

TRAVELING IN MODERN RUSSIA.—A most entertaining picture of present-day railway travel in Russia was recently contributed to the Daily Mail (London), by Alexander M. Thompson, a well-known writer on labor matters. Mr. Thompson desired to travel from Petrograd to Moscow, and was "evidently congratulated" by his Russian friends when he succeeded, through a friendly commissioner, in booking a sleeping berth at less than four times the official price. The explanation is that in Russia it is the practice of speculators to buy up railway tickets and sell them at huge profits, and unless the intending passenger is prepared to stand in a queue at a ticket office for a couple of days, he is compelled to patronize one of these speculators. Mr. Thompson's train, the last of the day, was due to start at 10 o'clock on a Tuesday. When he arrived at the station, in very good time, he was informed that the train had started three hours earlier. Two very helpful suggestions were then made, that he might stand all night in the corridor or guard's van of another train or return to his hotel and wait until the next day, when he might perhaps have better luck. "When I told my Russian friends who had congratulated me on my extraordinary good fortune in securing the ticket," continued Mr. Thompson, "they merely shrugged their shoulders comfortably and murmured the magic word Nitchewo (never mind), and assured me 'That's Russia.' Meanwhile I wonder when I shall reach Moscow. Nitchewo."

ANNUAL REPORT

ATCHISON, TOPEKA & SANTA FE RAILWAY—TWENTY-SECOND ANNUAL REPORT

SEPTEMBER 11, 1917.

To the Stockholders:

Your Directors submit the following report for the fiscal Year July 1, 1916, to June 30, 1917, inclusive.

The Lines comprising the Atchison System, the operations of which are embraced in the following statements, and the mileage in operation at the end of the year as compared with the previous year, are as follows:

	June 30, 1917.	June 30, 1916.
Atchison, Topeka & Santa Fe Railway.....	8,639.53 miles.	8,647.87 miles.
Rio Grande, El Paso & Santa Fe Railroad.....	20.22 "	20.22 "
Golden Colorado & Santa Fe Railway.....	1,937.21 "	1,937.59 "
Panhandle & Santa Fe Railway.....	665.02 "	665.02 "
	11,261.98 "	11,270.70 "

The average mileage operated during the fiscal year ending June 30, 1917, was 11,270.17 miles, being an increase of 23.37 miles as compared with the average mileage operated during the preceding fiscal year.

In addition to lines covered by this report there were completed on June 30, 1917, 50.70 miles of additional line, all of which will be ready for operation in the near future.

The Company also controls, through ownership of stocks and bonds, other lines aggregating 161.33 miles, and is interested jointly with other companies in 601.87 miles.

INCOME STATEMENT.

The following is a summary of the transactions of the System for the years ending June 30, 1916 and 1917:

	1916.	1917.
Operating Revenues.....	\$133,762,392.24	\$156,179,120.54
Operating Expenses.....	83,730,960.35	96,333,568.67
Net Operating Revenue.....	\$50,031,431.89	\$59,845,551.87
Taxes.....	6,210,366.13	9,870,634.29
Uncollectible Railway Revenues.....	41,072.53	23,242.60
Operating Income.....	\$43,779,993.23	\$49,951,674.98
Rentals and Other Charges.....	\$3,597,122.79	\$3,398,048.92
Gross Corporate Income.....	\$47,087,122.79	\$53,399,966.24
Interest on Bonds, including accrued interest on Adjustment Bonds.....	\$45,109,468.00	\$51,321,917.32
Net Corporate Income (representing amount available for dividends and surplus and for necessary but unproductive or only partially productive expenditures).....	\$2,127,654.79	\$2,078,048.92
	\$45,109,468.00	\$51,321,917.32
Interest on Bonds, including accrued interest on Adjustment Bonds.....	12,529,733.40	12,112,843.95
Net Corporate Income (representing amount available for dividends and surplus and for necessary but unproductive or only partially productive expenditures).....	\$32,579,734.60	\$39,209,073.37

From the net corporate-income for the year the following sums have been deducted:

DIVIDENDS ON PREFERRED STOCK—	
No. 37 (2½%) paid Feb. 1, 1917.....	\$3,104,342.50
No. 38 (2½%) paid Aug. 1, 1917.....	3,104,342.50
	\$6,208,685.00

DIVIDENDS ON COMMON STOCK—	
No. 45 (1½%) paid Sept. 1, 1916.....	\$3,223,177.50
No. 46 (1½%) paid Dec. 1, 1916.....	3,245,947.50
No. 47 (1½%) paid Mar. 1, 1917.....	3,281,737.50
No. 48 (1½%) paid June 1, 1917.....	3,290,767.50
	\$13,041,630.00

Appropriation for Fuel Reserve Fund.....	\$6,210.37
California-Arizona Lines Bonds Sinking Fund.....	14,266.58
S. F. & S. J. V. Rv. Bonds Sinking Fund.....	12,710.00
Income Appropriation for Investment in Physical Property.....	11,000,000.00
(a) For Equipment.....	8,875,211.42
(b) For other additions and betterments.....	39,209,073.37

Surplus to credit of Profit and Loss June 30, 1916.....	\$26,686,308.01
Additions to Profit and Loss Account (Sundry Adjustments).....	466,805.89
Surplus appropriated for Investment in Physical Property.....	\$27,153,113.90
Surplus to credit of Profit and Loss June 30, 1917.....	\$26,988,543.65

Income from sources other than earnings from operation consisted of interest on cash in banks and sums collected as interest and dividends upon bonds and stocks of other companies, the operations of which are not included in the System accounts.

During the fiscal year the sum of \$400,000 in cash was received as the net proceeds of sale of land embraced in the Santa Fe Pacific Land Grant, which was not actually written off the book value of Railroads, Franchises and Other Property and the transaction does not appear in the Income Account.

The appropriation of \$11,000,000 for investment in equipment is somewhat less than the anticipated cost of equipment which has already been bonded but the delay of which has been delayed by the extraordinary conditions growing out of the war. These extraordinary conditions also result in this equipment costing nearly twice what would be its normal cost.

CAPITAL EXPENDITURES AND REDUCTION OF BOOK VALUES.

The total charges to Capital Account, as shown by the General Balance Sheet, page 47, at June 30, 1917, aggregated \$742,631,861.89 as compared with \$715,477,622.71 at June 30, 1916, an increase during the year of \$27,154,239.18, which analyzes as follows:

Construction and acquisition of new mileage, including the acquisition of bonds and stocks of other railway and terminal companies:	
Barion County & Santa Fe Ry.....	\$183,913.67
California, Arizona & Santa Fe Ry.....	3,202.15
Eastern Ry. of New Mexico.....	369.86
Grand Canyon Ry.....	4,621.78
Minkler Southern Ry.....	651,324.48

North Texas & Santa Fe Ry.....	765,634.62
Oil Fields & Santa Fe Ry.....	23,071.34
Oklahoma Central R. Ry.....	26,387.44
Osage County & Santa Fe Ry.....	43,683.83
South Plains & Santa Fe Ry.....	923,088.88
Verde Valley Ry.....	258,000.00
	\$2,882,904.05

Additions and Betterments—System Lines:

Fixed Property.....	\$8,350,070.21
Equipment.....	225,554.84
Betterments to Equipment.....	215,825.53
	\$8,340,490.90

Fuel Lands and Other Properties:

Fuel Lands.....	\$113,246.85
Real Estate held for future use.....	263,850.83
Tie and Timber Lands.....	25,089.23
Miscellaneous Items.....	209,205.38
	192,981.53

Other Investments..... 16,288,852.06

Total Charges..... \$27,705,078.54

Reduction of Book Values:

Baumont Wharf & Terminal Co.....	\$36,000.00
Sunset Ry.....	19,000.00
Santa Fe Land Sales.....	400,000.00
Western Oklahoma Ry.—Land Sales.....	1,624.00
Ice Plant, Belen.....	11,319.61
Ice Plant, San Bernardino.....	63,503.85
Santa Barbara Tie & Pole Co.....	19,391.90
	\$50,839.36

Net Increase in Capital Account during the year..... \$27,154,239.18*

Credits in italics.

*Of this amount the sum of \$14,773,600 represents temporary investments in short term notes and other quickly convertible securities, which sum is to be deducted to make satisfactory comparison with preceding years. The "Net Increase in Capital Account during the year" after deducting the sum of these temporary investments was \$12,380,639.18. The credit item of \$225,554.84 for "Equipment" analyzes as follows:

Equipment retired during the year:	
26 Locomotives.....	\$395,926.81
1,256 Freight-Train Cars.....	652,678.20
36 Passenger-Train Cars.....	188,996.62
257 Miscellaneous Work Cars.....	59,214.77
Miscellaneous Adjustments.....	25,026.37
	\$1,321,842.47

Less—Equipment added as follows:	
11 Locomotives.....	\$287,622.66
427 Freight-Train Cars.....	436,834.50
3 Passenger-Train Cars.....	6,220.29
Motor Equipment of Cars.....	1,272.32
1 Car Float.....	47,725.57
583 Miscellaneous Work Cars.....	315,938.29
1 Automobile.....	690.00
	\$1,096,287.63

\$225,554.84

The 1,256 freight-train cars reported as retired and the 583 miscellaneous work cars added, include 549 cars, which, being permanently assigned to work service, were relettered in work service equipment series with preceding year and transferred from freight equipment to work service equipment at their depreciated value at time of relettering.

In addition to the equipment reported retired as above, 7 freight-train cars and 3 miscellaneous work cars leased from the Oklahoma Central Railroad Company, were also retired during the year and liability therefor included in Other Unadjusted Credits in the General Balance Sheet, page 31.

MAINTENANCE OF EQUIPMENT.

The following statement shows the sums charged to Operating Expenses for Maintenance of Equipment during each year since July 1, 1896:

Year ending June 30.	Average Operated Mileage.	Total Expenditure.	Expenditure Per Mile.
1897.....	6,443.81	\$3,443,884.82	\$534.45
1898.....	6,236.02	3,859,277.99	618.72
1899.....	7,032.62	4,810,795.64	684.07
1900.....	7,341.34	5,267,832.40	717.56
1901.....	7,807.31	6,257,456.57	801.49
1902.....	8,855.38	7,864,251.25	891.22
1903.....	9,765.13	8,510,543.09	1,068.48
1904.....	8,179.59	10,006,135.41	1,223.31
1905.....	8,305.40	10,914,864.47	1,314.19
1906.....	8,433.99	10,730,040.43	1,271.05
1907.....	9,273.15	11,779,846.64	1,270.32
1908.....	9,415.01	14,246,621.41	1,513.18
1909.....	9,794.86	13,903,897.37	1,419.51
1910.....	9,959.33	15,667,974.44	1,569.13
1911.....	10,350.13	16,686,145.45	1,612.17
1912.....	10,627.92	16,321,231.41	1,554.51
1913.....	10,750.31	19,415,254.63	1,806.02
1914.....	10,908.52	19,624,821.51	1,799.05
1915.....	11,114.52	19,764,535.40	1,778.26
1916.....	11,246.80	20,514,960.18	1,824.07
1917.....	11,270.17	25,273,168.92	2,242.48

The heavy increase of 1917 over 1916 is due largely to increases in wages and in cost of materials.

For the year ending June 30, 1917, maintenance charges, including renewals and depreciation, averaged as follows:

Per locomotive.....	\$6,542.04
Per locomotive mile.....	.2035
Per freight car.....	145.28
Per freight car mile.....	.0104
Per passenger car, including mail and express.....	1,621.48
Per passenger car mile.....	.0167

The foregoing average maintenance charges include a proportion of unlocated expenditures for Maintenance of Equipment charged to Superintendence, Shop Machinery, Injuries to Persons, Insurance, Stationery and Printing, Other Expenses, and Maintenance of Equipment at Terminals. Refrigerator cars are not taken into consideration in arriving at freight car averages, such cars being operated by The Santa Fe Refrigerator Dispatch Company, which bears the expense of their maintenance.

MAINTENANCE OF WAY AND STRUCTURES.

The following statement shows the sums charged to Operating Expenses for Maintenance of Way and Structures during each year since July 1, 1896:

Year ending June 30.	Average Operated Mileage.	Total Expenditure.	Expenditure Per Mile.
1897.....	6,443.81	\$6,282,923.15	\$975.03
1898.....	6,936.02	8,281,397.88	1,193.97
1899.....	7,032.62	7,671,107.62	1,090.93
1900.....	7,341.34	6,354,372.10	865.56
1901.....	7,807.31	6,433,840.36	824.08
1902.....	7,855.38	6,141,466.39	781.82
1903.....	7,965.13	9,304,892.04	1,168.20
1904.....	8,179.59	9,170,234.07	1,121.11
1905.....	8,305.40	11,385,418.33	1,370.85
1906.....	8,433.99	12,475,407.97	1,479.18
1907.....	9,273.15	15,286,062.66	1,648.42
1908.....	9,415.01	14,120,828.02	1,499.82
1909.....	9,794.86	12,884,406.81	1,315.43
1910.....	9,916.33	17,807,136.20	1,795.74
1911.....	10,350.13	16,059,786.90	1,551.65
1912.....	10,457.92	16,076,833.75	1,512.70
1913.....	10,750.31	18,054,413.03	1,679.43
1914.....	10,908.52	15,308,780.25	1,403.38
1915.....	11,114.52	16,514,467.89	1,485.85
1916.....	11,246.80	19,518,635.03	1,735.48
1917.....	11,270.17	19,119,336.16	1,696.45

In 1916 Maintenance of Way and Structures included over \$1,500,000 on account of the storm at Galveston and of the floods in California and Arizona. If this abnormal expenditure were excluded from 1916, the year 1917 would show an increase over 1916 of more than \$1,100,000, due principally to increases in wages and in cost of materials.

COMPARISON OF OPERATING RESULTS.

The following is a statement of revenues and expenses of the System for the fiscal year ending June 30, 1917, in comparison with the previous year:

Operating Revenues:	Year Ending June 30, 1917.	Year Ending June 30, 1916.	Increase or Decrease.
Freight.....	\$111,809,085.10	\$91,432,428.97	\$20,376,656.13
Passenger.....	32,770,088.51	31,568,600.55	1,201,487.96
M. Express, and Miscellaneous.....	11,599,946.93	10,761,362.72	838,584.21
Total Operating Revenues.....	\$156,179,120.54	\$133,762,392.24	\$22,416,728.30

OPERATING EXPENSES:

Maintenance of Way and Structures.....	\$19,119,336.16	\$19,518,635.03	—\$399,298.87
Maintenance of Equipment.....	25,274,168.92	20,514,960.18	4,759,208.74
Traffic.....	780,823.48	7,557,235.84	25,067.64
Transportation—Rail Line.....	45,910,504.94	38,281,953.78	7,628,551.16
Miscellaneous Operations.....	184,248.47	—	184,248.47
General.....	3,494,122.42	2,904,040.13	590,082.29
Transportation for Investment—Cr.....	478,635.72	243,464.61	185,171.11
Total Operating Expenses.....	\$96,333,568.67	\$83,730,960.35	\$12,602,608.32

Net Operating Revenue.....	\$59,845,551.87	\$50,031,431.89	\$9,814,119.98
Ratio of Operating Expenses to Operating Revenues.....	61.68	62.60	—92

Credits in italics.

The average tons of freight (revenue and company) per loaded car mile increased from 19.96 to 20.56, or 3.01 per cent.

The average tons of freight (revenue and company) carried per freight-train mile (freight and mixed) increased from 468.10 to 497.75, or 6.33 per cent.

The average freight revenue per freight-train mile increased from \$3.74 to \$4.05, or 8.29 per cent.

The average passenger revenue per passenger-train mile increased from \$1.18 to \$1.23, or 4.24 per cent.

The average passenger-train revenue per passenger-train mile increased from \$1.49 to \$1.56, or 4.70 per cent.

The tons of freight carried one mile (revenue and company, but excluding water ton miles) increased 2,285,850,242, or 19.95 per cent, while miles run by freight cars (loaded and empty) in freight and mixed trains increased 132,403,672, or 16.86 per cent, and the mileage of such trains increased 3,134,586, or 12.81 per cent.

The number of passengers carried one mile decreased 144,934,949, or 9.15 per cent, while miles run by passenger-train cars (excluding work) in passenger and mixed trains decreased 2,513,288, or 1.52 per cent, and the mileage of such trains decreased 77,901, or .29 per cent.

The following is a consolidated statement of the business of the System for each fiscal year during the period since January 1, 1896:

Fiscal Year Ending June 30.	Average Operated Miles.	Gross Revenues, Including Income from Other Sources.	Expenses, Including Taxes and Other Charges.	Interest on Bonds.	Net Corporate Income.
1897.....	6,443.81	\$4,532,628.99	\$36,038,455.30	\$8,440,387.91	\$53,785.78
1898.....	6,936.02	39,396,126.41	30,513,553.17	7,045,988.30	1,836,584.94
1899.....	7,032.62	46,762,933.47	29,332,564.11	7,241,972.00	4,187,997.36
1900.....	7,341.34	46,498,809.04	29,414,427.35	7,345,166.50	9,739,304.98
1901.....	7,807.31	54,807,479.78	34,509,783.34	8,202,810.93	12,497,829.08
1902.....	7,855.38	60,275,944.33	36,272,432.45	8,438,985.00	15,564,526.88
1903.....	7,965.13	63,668,390.99	40,635,576.48	9,134,485.24	13,898,329.27
1904.....	8,179.59	69,419,975.41	44,641,134.10	9,418,770.00	15,559,771.31
1905.....	8,305.40	89,182,329.65	61,458,019.12	9,611,510.00	17,742,606.06
1906.....	8,433.99	99,300,749.05	51,035,355.71	10,622,184.22	17,733,209.12
1907.....	9,273.15	74,436,574.65	61,779,916.16	11,847,934.20	21,168,723.82
1908.....	9,415.01	91,289,770.61	65,031,582.67	12,579,301.77	13,678,886.17
1909.....	9,794.86	85,424,091.89	61,458,019.12	12,548,081.93	20,417,990.93
1910.....	9,916.33	107,543,250.16	75,133,314.54	11,984,151.36	20,425,784.26
1911.....	10,350.13	109,772,481.69	75,689,094.83	12,712,319.31	21,371,067.55
1912.....	10,457.92	110,323,328.13	77,001,224.38	13,660,859.50	21,660,241.25
1913.....	10,750.31	119,412,939.94	83,432,816.21	12,631,335.40	24,153,734.33

1916.....	11,246.80	137,069,521.80	91,960,053.80	12,529,733.40	32,579,734.60
1917.....	11,270.17	159,627,411.80	108,205,444.48	12,112,843.95	39,209,073.37

* 18 months.

The following chart brings out still more clearly the significance of the statement and strikingly depicts the progressive increase in investment which has been necessary to enable the Company to render its public service.

Line "A" is Investment in Property including Material and Supplies.
Line "B" is the Net Income Applicable to Bond Interest, Dividends, Improvement of Property and Strengthening of Credit.
Line "C" is the Amount of Income which would be equivalent to Four Per Cent. on the Investment shown.

PROPERTY INVESTMENT AND RATE OF RETURN.

The following statement shows, for each year, the amount of investment, the amount of net income applicable to bond interest, dividends, improvement of property and strengthening of credit, and the rate of return which such net income represents on the amount of the investment.

Year Ending June 30.	Property Investment.*	Income Applicable to Bond Interest, Dividends, Improvement of Property and Strengthening of Credit.	Per Cent. of Return.
1896 (6 months).....	\$23,260,004.67	\$2,432,870.06	1.65
1897.....	389,118,442.87	6,070,364.45	1.56
1898.....	394,170,563.40	8,871,947.26	2.25
1899.....	402,388,222.21	11,409,315.30	2.84
1900.....	409,670,087.91	17,068,850.91	4.17
1901.....	423,734,716.52	21,196,714.38	5.00
1902.....	445,314,062.19	23,021,018.14	5.37
1903.....	463,230,180.22	23,032,814.51	4.97
1904.....	479,324,339.26	24,778,541.31	5.17
1905.....	485,497,374.42	21,353,856.15	4.40
1906.....	515,557,913.70	28,355,393.34	5.50
1907.....	550,693,087.37	32,724,274.07	5.94
1908.....	572,433,073.23	25,633,510.34	4.44
1909.....	580,297,115.78	33,523,437.28	5.78
1910.....	625,401,211.54	32,387,712.39	5.18
1911.....	688,156,763.91	34,102,511.86	5.18
1912.....	673,465,876.49	33,321,100.75	4.95
1913.....	695,730,983.22	36,078,744.55	5.19
1914.....	709,304,446.55	38,355,393.34	5.40
1915.....	720,792,460.35	36,928,030.11	5.12
1916.....	732,403,747.21	45,312,106.50	6.19
1917.....	746,839,604.72	51,788,723.21	6.93
Annual Average.....	\$347,808,376.51	\$27,132,940.18	4.95

* The amount shown above as "Property Investment" includes sums invested in material and supplies. The amount for year 1917 excludes temporary investments in short term notes and other quickly convertible securities referred to in note on page 11.
* The "Income" shown above is determined after allowing for adjustments made through profit and loss.

The development of the Company's business and of its efficiency have been due principally to the very large expenditures (over \$331,000,000) which have been made in the extension and improvement of the property since January 1, 1896. In order to make such expenditures, your Company has raised since 1896 over \$225,000,000 of "new money" by the sale of capital stock and of bonds which are now outstanding or which (in the case of many of the Convertible Bonds sold) are represented by common stock now outstanding.

CAPITAL STOCK AND FUNDED DEBT.

The outstanding Capital Stock (deducting stock in treasury) on June 30, 1916, consisted of:

Common	\$214,312,500.00	
Preferred	124,173,700.00	
		\$338,486,200.00

Issued during the year:

Common Stock issued in exchange for Convertible Bonds retired	5,336,000.00	
---	--------------	--

Capital Stock outstanding June 30, 1917:

Common	\$219,648,500.00	
Preferred	124,173,700.00	
		\$343,822,200.00

The number of holders of the Company's capital stock on June 30, 1917, and the changes in number for the year were as follows:

	Number of Stockholders.	Increase or decrease for the Year.
Preferred	17,098	Decrease 28
Common	26,750	Increase 257

The outstanding Funded Debt of the System (deducting bonds in the treasury) amounted on June 30, 1916, to...

	\$301,552,353.50
--	------------------

The following changes in the Funded Debt occurred during the year:

Obligations Issued:		
California-Arizona Lines First and Refunding Mortgage 4% Bonds		\$52,545.60
Obligations Purchased or Retired:		
S. F. & S. J. V. Ry. Co. First Mortgage 5% Bonds	\$11,000.00	
Convertible 4% Bonds	5,336,000.00	
Convertible 5% Bonds:		
Retired	6,883,000.00	
Matured Unpaid transferred to Current Liability	566,000.00	
		12,796,000.00
Decrease of Funded Debt	\$12,743,454.40	
Total System Funded Debt outstanding June 30, 1917.....	\$288,808,899.10	

Interest charges for year ending June 30, 1918, will be approximately \$11,742,000 or an average monthly charge of about \$978,500. In making this approximation, exchanges of Convertible Bonds for Common Stock made since June 30, 1917, aggregating \$481,000 are considered.

TREASURY.

Neither this Company nor any of its auxiliaries has any notes or bills outstanding. The Company held in its treasury on June 30, 1917, \$39,047,787.80 cash, and also had available \$5,281,000 General Mortgage Bonds, including bonds not yet certified by the Trustee. The Company also had in the treasury unpledged a large amount of stocks and bonds of other companies, of which part are carried on the balance sheet. Investments and part are included under Railroads, Franchises and Other Property. In addition, the Company and its affiliated companies have invested \$14,773,600 in short term notes and other quickly convertible securities.

FUEL RESERVE FUND.

The fund has been increased during the year by appropriations of income, as follows:

Amount to credit of Fund June 30, 1916.....	\$1,888,316.42
Added during the year.....	56,210.37
In Fund June 30, 1917.....	\$1,944,526.79

BARTON COUNTY AND SANTA FE RAILWAY.

A company has been organized to construct this line, extending northwest from Holton, Ellsworth County, Kansas, a distance of about 32 miles. Construction is in progress and it is expected the line will be completed by the close of the present calendar year. The new line will serve a good agricultural section and should be a valuable feeder to the System.

MINKLER SOUTHERN RAILWAY.

The completion of the extension of this line, from Lindsay to Porterville, California, referred to in the last annual report, has been somewhat delayed. However, 10.8 miles had been completed at June 30, 1917, and the remainder of the extension to Porterville will be ready for operation in the near future. A further extension of this line from Porterville to Ducor, a distance of approximately 13 miles is under construction and will, it is expected, be completed and ready for operation not later than January 1 next. Arrangements have been made by a long term agreement with the Southern Pacific Company for the joint use of that company's line from Ducor to Oil Junction, a distance of 39.5 miles, from which latter point a connection, 3.5 miles in length, will be built to the company's main line near Bakersfield, of the company's main line to the eastward, and to the traffic originating in the Minkler Southern territory.

NORTH TEXAS AND SANTA FE RAILWAY.

This line is being constructed from the main line at or near Shattuck, Ellis County, Oklahoma, westward into Hansford County, Texas, a distance of about 82 miles. Track laying is under way and, if labor conditions permit, the line should be completed and in operation before the end of the current year. The district served by this line is good agricultural land, already fairly well settled and under cultivation, and badly needs transportation facilities.

OIL CITY BRANCH.

Negotiations with the Southern Pacific Company looking to the purchase of an undivided one-half interest in this line, extending from Oil Junction to Alnoff, Kern County, California, a distance of 6.35 miles, with a branch of 2.47 miles in length, extending from said line at Treadwell Junction to the station of Porterville, Kern County, have been completed during the year, and transfer of such half interest to your Company only awaits the formal

approval of the Railroad Commission of the State of California. After such approval is given, this line will be operated for the joint account of the two companies and will give your company direct access over its own rails to the Kern River oil field. The proposed connection between Oil Junction and Bakersfield, referred to under the heading of the Santa Fe Kern Railway, will also give the Company a direct connection with the Oil City Branch.

OSAGE COUNTY AND SANTA FE RAILWAY.

This company has been organized to construct a line from Owen, Washington County, Oklahoma, to a connection with the Eastern Oklahoma Division of your main line near Fairfax, a distance of about 62 miles. The line will traverse an important section of the mid-continent oil fields, and moreover will form an important cut-off for business between Kansas City and Oklahoma-Texas points. Right of way has been arranged for and construction is about to commence, but the line will not be ready for operation until the latter part of next year.

SOUTH PLAINS AND SANTA FE RAILWAY.

This line, formerly known as Crosbyton-South Plains Railroad (name changed during the year) extends from Lubbock, Texas, to Crosbyton, Texas, a distance of 38 miles, with an extension under construction running southwest from Lubbock for a distance of about 65 miles, of which 39.9 miles were completed at June 30, 1917. It is expected the remainder of the line will be completed and ready for operation by January 1 next.

MATERIAL AND SUPPLIES.

The balance sheet shows an increase of \$2,055,222.83, in the value of material and supplies on hand at June 30, 1917, as compared with the balance at the close of the previous year. This increase is due to a somewhat larger stock of material and supplies, rather than the use in its valuation of the high prices now prevailing, the material and supplies having been inventoried at normal prices.

TAXES.

Federal, state and local tax accruals for the year ending June 30, 1917, aggregate the large total of \$9,870,634.29, and show an increase over the preceding year of \$3,660,268.16. The first of these Federal taxes have become a matter of serious concern. Indeed, the Company's tax situation is revolutionized by the new system of Federal taxation recently adopted and which applies to all of the calendar year 1917. The change wrought is not adequately indicated by the increase in taxes for the fiscal year ending June 30, 1917, because that year contains only six months of the calendar year 1917 to which the new Federal taxes apply.

It is impossible to forecast with accuracy the taxes for the calendar year 1917, but it is by no means improbable that they will be, say \$12,000,000, or about twice the annual average of taxes for recent years, and possibly more.

The natural effect of the war with its heavy expenditures is to stimulate expenditure on the part of the states and local governing bodies much of which it is greatly feared will prove to be misdirected and unproductive. In some quarters it is already apparent that there is grave danger that the conduct of state and local affairs will become decidedly more wasteful and inefficient at the very time the need is greatest for making the best possible use of our resources of labor and materials.

Your officials are actively co-operating in efforts that are being made to promote economy and efficiency.

GENERAL.

Your Directors fully recognize that the time is inopportune for the construction of new lines, but the foregoing had been in all cases planned, in some cases definitely promised and in other cases placed under construction before either the great advance in prices or the conditions of the war and it seemed advisable to proceed in spite of adverse conditions. Completion will naturally be somewhat retarded, but it is hoped that all will be completed before the close of the calendar year 1918.

Contrary to our expectations all of the abnormal reasons cited a year ago as accounting for the Company's large increase in cost of operation have been accentuated in the last twelve months. Not only is the European war still in active progress, but our own country is now participating in it and is spending enormous sums for supplies and for transportation. The Pacific Coast is still under the grip of the Panama Canal. The metal market has been unprecedentedly active in all its branches, and this has largely increased our traffic, especially in copper, zinc and lead and the raw materials entering into their production. The oil tonnage on our lines still increases. Even our passenger traffic, which we believed had reached its maximum with the two great expositions on the Pacific Coast, has again shown an increase of over a million dollars.

Owing to high prices and lack of labor, it has not been possible to add materially to equipment, and the result has been that in the effort to handle this enormous business every nerve has been strained to the utmost, and, even with all that could be done, the results have not always been what our patrons have been taught to expect. Very much against the will of your Directors and officers it has been absolutely necessary to place orders for nearly four thousand cars of various types and for thirty engines, all of which were to have been delivered during the calendar year and some of them during the fiscal year, but the needs and demands of the Government have when prices advanced so rapidly, made it impossible to make any more. The price we have contracted to pay for this equipment, when received, are almost double those of two years ago.

On all sides the Company has been confronted with the necessity for increasing wages. The cost of the payroll for the last six months of the year was nearly 33 per cent in excess of the payroll for the corresponding period two years before. This was partly due to the employment of increased forces, but after making allowance for the increase in forces it is believed that the current wages and salaries are at an average about 20 per cent over the wages and salaries of two years ago.

In common with all other carriers in the country, your company sought for relief in increasing its rates, but was denied, the denial being based on our large earnings. It was unfortunate that when the case was decided the large earnings were plainly visible, the greatly enhanced expense had not yet come clearly into view; and this same condition prevailed up to the end of the fiscal year for which this report is made. But the expenses are now beginning to tell on all the carriers, and somewhat later conditions may cause us to revise our rates.

Relations with the public, our patrons, continue good. In common with all other carriers, we have given assurances to the Government that its business of all kinds is to be given preferential movement, but we hope to be able to carry out the promise without serious inconvenience to those who desire to travel or to ship their customary freight. It may be, however, that we shall have to ask for a little patience on the part of these latter.

The faithful and efficient services of the officers and employees of the Company are again acknowledged with pleasure by your Directors.

EDWARD P. RIPLEY,
President.
WALKER D. HINES,
Chairman.

Railway Officers

Executive, Financial, Legal and Accounting

George F. Hawks, general manager of the El Paso & Southwestern at El Paso, Tex., has been elected vice-president and general manager in charge of operation, effective October 24.

C. E. Denney, special engineer to the president of the New York, Chicago & St. Louis, at Cleveland, Ohio, has been appointed assistant to president with headquarters at Cleveland, effective November 1.

W. L. Park, vice-president of the Illinois Central at Chicago, has been granted leave of absence for the duration of the war and has been appointed first vice-president of the Chicago Great Western, with headquarters at Chicago.

C. L. Mayne has been elected president of the Arkansas Central, with headquarters at Fort Smith, Ark., succeeding J. W. Daniels, resigned to become superintendent of the Missouri Pacific at Little Rock, Ark. F. H. Fennessy has been appointed claim agent.

M. J. Caples, vice-president of the Hocking Valley at Columbus, Ohio, has been appointed resident vice-president, representing the Chesapeake & Ohio, the Chesapeake & Ohio of Indiana, and the Chesapeake & Ohio Northern, in an executive capacity, with office at Columbus.

A. Mackrille, general auditor of the New York, New Haven & Hartford and the Central New England at New Haven, Conn., has been appointed auditor of revenue, and T. M. Prentice, auditor, has been appointed general accountant, with headquarters at New Haven. The offices of general auditor, auditor of miscellaneous receipts and auditor have been discontinued.

Benjamin Lamar Bugg, whose election as vice-president and general manager of the Atlanta, Birmingham & Atlantic, with headquarters at Atlanta, Ga., has already been announced in these columns, was born on August 8, 1869, at Palo Alto, Miss., and was educated in the high schools. He began railway work in 1887 with the Florida, Central & Peninsular, now a part of the Seaboard Air Line. In 1891 he went to the Georgia Southern & Florida and in 1895 left that road to become terminal agent of the Central of Georgia at Savannah, Ga. He was appointed general agent of the Old Dominion Steamship Company at Norfolk, Va., in 1907; in 1910 he was appointed traffic manager of the Norfolk Southern at Norfolk, and in 1912 he was appointed traffic manager of the Atlanta, Birmingham & Atlantic, later becoming assistant general manager. In March, 1916, he was promoted general manager, and now becomes vice-president and general manager of the same road, as above noted.

Operating

E. E. Hanna, trainmaster of the Missouri, Kansas & Texas, at Oklahoma City, Okla., has been promoted to superintendent with the same headquarters, succeeding S. H. Charles, resigned to enter other business.

George F. Warner, assistant trainmaster of the Delaware & Hudson at Oneonta, N. Y., has been appointed trainmaster of the Pennsylvania division, with office at Carbondale, Pa., vice H. F. Booth, resigned; and John H. Kilker has been appointed chief train dispatcher of the Pennsylvania division, vice R. A. Siegel assigned to other duties.

George W. Neilson, chief clerk in the office of the general superintendent of the Spokane, Portland & Seattle, at Portland, Ore., has been appointed superintendent of the Pacific & Eastern, with headquarters at Medford, Ore., succeeding G. E. Johnson, who has been appointed superintendent of the Gales Creek & Wilson River at Wilkesboro, Ore.

F. F. Riefel, superintendent of the Detroit division of the New York Central lines at Detroit, Mich., has been appointed superintendent of the Michigan division, with office at Toledo, vice E. Thwaites, transferred as superintendent to the Toledo division,

with office at Cleveland, vice E. R. Bissell, who has been appointed superintendent of the Detroit division, vice Mr. Riefel.

John A. Carson has been appointed superintendent of steamers of the Southern Pacific Company, Pacific system, with headquarters at San Francisco, Cal., with jurisdiction over all floating equipment, vice William Chisholm, resigned, and J. J. Jordan, trainmaster at Roseville, Cal., has been appointed assistant superintendent of the Coast division, in charge of San Francisco terminal.

C. E. Hair, whose appointment as assistant general superintendent of the Chicago, Terre Haute & Southeastern, with headquarters at Terre Haute, Ind., was announced in the *Railway Age Gazette* of October 19, began railway work on January 2, 1906, as a clerk in the freight department of the Chicago, Burlington & Quincy at Chicago. He held various positions until August, 1909, when he was made secretary to the freight traffic manager, leaving the Burlington in May, 1913, to enter the service of the Chicago, Terre Haute & Southeastern as secretary to the president. Mr. Hair retained the latter position until his appointment on August 20, as assistant general superintendent, with headquarters at Terre Haute.

C. E. Hair

A. E. Knights, trainmaster of the Great Northern at Havre, Mont., has been promoted to superintendent of the Montana division, with the same headquarters, succeeding C. E. Leverich, resigned, effective October 25.

William F. Giles, whose appointment as superintendent of the Chicago, Burlington & Quincy, at Brookfield, Mo., was announced in the *Railway Age Gazette* of October 5, was born at Aurora, Ill., on August 17, 1869.

He was educated at Valparaiso University, Valparaiso, Ind., and entered railway service with the Burlington on August 17, 1888, as a telegraph operator, remaining in that position until 1893. From December, 1903, to January, 1905, he was an electrician on the Burlington, and from the latter date until 1907 was supervisor of signals. He was then trainmaster until 1911, when he was promoted to assistant superintendent, remaining in that position on the Brookfield and Beardstown divisions, until October 1, 1917, when he was appointed superintendent of the Brookfield division, succeeding W. A. Chittenden, transferred to Beardstown, Ill.

W. F. Giles

Fred Wear, whose appointment as superintendent of the Butte division of the Great Northern, with headquarters at Great Falls, Mont., was announced in the *Railway Age Gazette* of October 5, was born at London, Ont., on July 22, 1868. He began railway work in 1885 as clerk for the Grand Trunk at Windsor, Ont., and from 1886 to October, 1888, was a brakeman on that road. He was subsequently conductor and yardmaster for the Toledo, St. Louis & Kansas City until June, 1906, and from the latter date to April, 1908, was with the St. Louis

& San Francisco as conductor and yardmaster. He then became general yardmaster for the Ann Arbor at Cadillac, Mich. In December, 1909, he went to the Great Northern as general yardmaster at Great Falls. He was promoted to trainmaster in 1911 and served in that capacity on the Butte, Kalispell, Mesabi and Fergus Falls divisions until his recent appointment as division superintendent, as above noted.

F. H. Hammill, whose appointment as general superintendent of the northern district of the Union Pacific, with headquarters at Omaha, Neb., was announced in the *Railway Age Gazette* of October 26, was born at Rockford, Ill., on January 23, 1872. He entered railway service with the Chicago & North Western in September, 1887, and from 1888 to 1902, was employed by the Chicago, Milwaukee & St. Paul successively as telegraph operator and train dispatcher. He then returned to the Chicago & North Western as train-dispatcher, and was consecutively trainmaster, assistant superintendent, superintendent, and assistant general superintendent in charge of Iowa lines, with headquarters at Boone, Iowa, until October 20, when he was appointed general superintendent of the northern district of the Union Pacific.

F. H. Hammill

R. W. Mitchener, superintendent of transportation of the New York, Chicago & St. Louis, at Cleveland, Ohio, has been appointed general superintendent with headquarters at Cleveland, and the office of superintendent of transportation has been abolished. A. A. Pearce has been appointed superintendent of freight transportation with headquarters at Cleveland, a newly created position.

J. W. Daniels, whose appointment as superintendent of the Arkansas division of the Missouri Pacific, with headquarters at Little Rock, Ark., was announced in the *Railway Age Gazette* of October 19, began railway work at the age of 13 with the St. Louis & San Francisco. When 14 years of age he was night operator and at 18 years was train dispatcher. He became connected with the Missouri Pacific in 1894 as train dispatcher and served successively as chief dispatcher, trainmaster and superintendent of various divisions. In October, 1916, he was elected president of the Arkansas Central, with headquarters at Ft. Smith, Ark., which position he held until his recent appointment as division superintendent of the Missouri Pacific, with office at Little Rock, as noted above.

J. W. Daniels

J. T. Gillick, assistant general manager of the Chicago, Milwaukee & St. Paul, at Chicago, has been promoted to general manager of the lines east of Moberg, S. D., succeeding P. C. Hart assigned to other duties. Macy Nicholson, assistant to vice-president in charge of operation of the Great Northern, at St. Paul, Minn., has been appointed assistant general manager of the Chicago, Milwaukee & St. Paul, succeeding Mr. Gillick.

Effective November 1. A portrait of Mr. Gillick and a sketch of his railway career were published in the *Railway Age Gazette* of July 13, 1917, page 89.

W. H. Foster, whose appointment as general superintendent lines west of the New York, New Haven & Hartford, with headquarters at New Haven, Conn., has already been announced in these columns was born on June 8, 1866. He began railway work in 1882, as an operator on the Pennsylvania Railroad and in 1888, entered the service of the New York, New Haven & Hartford as an operator and dispatcher. In 1903 he was appointed chief dispatcher and five years later became trainmaster. He was appointed division superintendent in 1912, and since May, 1917, was superintendent of the New Haven division at New Haven, Conn., until his recent appointment as general superintendent of the lines west of the same road, as above noted.

W. R. Hudson, general superintendent of the Chesapeake & Ohio at Covington, Ky., has been assigned to other duties, and the Cincinnati & Ashland divisions and the Chesapeake & Ohio Northern have been placed under the jurisdiction of L. B. Allen, general superintendent at Huntington, W. Va. The lines west of Hinton, W. Va. (Chesapeake & Ohio of Indiana excepted), will hereafter be known as the Western general division. The Chesapeake & Ohio of Indiana will be operated separately and the superintendent will report direct to the general manager. The Big Sandy division has been assigned to J. B. Harris, superintendent of the Ashland division and he has been relieved of the Cincinnati division and the Chesapeake & Ohio Northern. The jurisdiction of W. S. Taylor, superintendent Cincinnati Terminal division, has been extended over the Cincinnati division and the C. & O. N., with office at Covington, Ky. J. H. Carlisle, assistant superintendent of freight transportation at Richmond, Va., has been appointed fuel agent with headquarters at Huntington, W. Va. A. T. Lowmaster, superintendent of terminals at Chicago, has been appointed assistant superintendent freight transportation at Richmond, Va. W. D. Cummins has been appointed trainmaster, Cincinnati Terminal division at Covington, Ky. H. R. Davis has been appointed assistant trainmaster of the Cincinnati division and C. & O. N. at Russell, Ky. J. A. Barker, trainmaster at Peru, Ind., has been appointed superintendent of terminals of the Chesapeake & Ohio of Indiana at Chicago. W. M. Lynch, assistant trainmaster at Boston, Ind., has been appointed trainmaster with headquarters at Peru, and F. L. Poindexter has been appointed assistant trainmaster with headquarters at Boston. Effective October 28.

Traffic

F. J. Parker, division freight agent of the Michigan Central at Detroit, Mich., has been appointed assistant general freight agent, with office at Detroit.

W. H. Andrews, westbound contracting freight agent of the Toledo, St. Louis & Western at St. Louis, Mo., has been promoted to general agent at Los Angeles, Cal., to succeed F. M. Miller, resigned to enter military service.

G. N. Snider, coal traffic manager of the New York Central, at New York, has been appointed fuel transportation manager with the United States Fuel Administration, Washington, D. C.

A. S. Learoyd, general freight agent of the Delaware, Lackawanna & Western, at New York, has been granted leave of absence, and has been appointed on the staff of the Fuel Administration at Washington, D. C., to take charge of the distribution of anthracite coal.

A. E. Yardley, commercial agent of the Tennessee Central at Chicago, has been appointed commercial agent, with office at St. Louis, Mo., vice L. L. Beck, resigned, to engage in other business. Mr. Yardley will also continue as commercial agent at Chicago.

J. F. Reily, commercial agent of the Missouri, Kansas & Texas, at Sedalia, Mo., has been appointed general freight and ticket agent in Kansas, with headquarters at Parsons, Kan., succeeding L. B. Chipley, appointed industrial and colonization agent at Boston, Mass. O. C. Thomas has been appointed commercial agent at Tulsa, Okla., to succeed F. W. Dunn, transferred to Oklahoma City, Okla., in place of Mr. Thomas. C. R. Gordon has been appointed commercial agent at Sedalia, Mo., succeeding Mr. Reily.

S. L. Jones, assistant New England agent of the Central of Georgia at Boston, Mass., has been appointed New England agent at Boston, vice A. DeW. Sampson, retired under the company's pension system. Effective November 1.

The following have been appointed industrial and colonization agents of the Missouri, Kansas & Texas, effective October 1: L. B. Chiple, at Boston, Mass., formerly general freight and ticket agent at Parsons, Kan.; Chas. E. Osborne, at Pittsburgh, Pa., formerly chief rate clerk in the general freight office at Dallas, Tex.; L. E. O'Leary, at Cleveland, Ohio, and A. Bryant, at Chicago, both previously connected with the industrial department at St. Louis, Mo.; Chas. L. Knox, at Omaha, Neb., formerly traveling freight claim agent in Texas.

Albert P. Chapman, Jr., whose appointment as assistant general passenger agent of the Chicago, Milwaukee & St. Paul was announced in our issue of August 3, was born at Hartford, Wis., on January 7, 1865. He first entered railway service as a ticket clerk and operator on the St. Paul at Watertown, Wis. He remained at Watertown until 1887, when he was made assistant ticket agent at Milwaukee, Wis. In 1900, he was appointed city ticket agent at Chicago and in 1911, went to Seattle, Wash., to become general agent of the passenger department, which position he continued to hold until his promotion to assistant general passenger agent with the same headquarters on August 1, 1917.

M. A. Patterson, whose appointment as general freight agent of the Chicago, Rock Island & Pacific was announced in the *Railway Age Gazette* of September 28, first entered railroad

service in January, 1879, as a clerk in the local freight office of the Illinois Midland at Peoria, Ill. In October, 1881, he went to the Chicago, Rock Island & Peoria as a clerk in the local freight office at Peoria and subsequently was made chief clerk. From November, 1884, to June, 1898, he was chief clerk to the general freight and passenger agent of the Rock Island & Peoria, an independently operated part of the Rock Island system, at Rock Island, Ill., and the following four years was general freight and passenger agent. On July

1, 1902, when the R. I. & P. was consolidated with the other Rock Island lines, he was appointed assistant general freight agent at Rock Island, later being transferred to Davenport, Ia., with jurisdiction extended over the Peoria, Iowa and Missouri divisions. On July 1, 1903, he was made assistant general freight agent at Kansas City, Mo., with jurisdiction over lines west of the Missouri river, and in November of the following year was transferred to Chicago with the same title and with jurisdiction over the lines east of the Missouri river, in special charge of coal, lumber and livestock traffic, the duties of the position being subsequently enlarged to cover freight traffic in general in the same territory. On September 13 last Mr. Patterson was promoted to general freight agent of the lines east, as noted above.

Frederick E. Hollingshead, whose appointment as assistant general freight agent of the Chicago, Burlington & Quincy, with headquarters at St. Joseph, Mo., was announced in the *Railway Age Gazette* of October 12, was born at Trumansburg, N. Y. He began railway work on October 5, 1887, in the local freight office of the Burlington at Kansas City, Mo., where he was employed as clerk in various capacities until August, 1894, when he was made chief clerk. In November, 1896, he was appointed chief clerk in the general southwestern agent's office, and in August, 1899, was appointed soliciting freight agent, with headquarters in the same office. In December, 1902, he became chief clerk to the general freight agent at St. Louis, Mo., and in September, 1905, was transferred to Hannibal, Mo., as general

agent, which position he held until October 12, of this year, when he was promoted to assistant general freight agent.

Frederick Montmorency, whose appointment as general freight agent of the Chicago, Burlington & Quincy, with headquarters at Omaha, Neb., was announced in the *Railway Age Gazette* of

F. Montmorency

October 12, was born on September 26, 1870. He entered the service of the Burlington on July 1, 1888, as a clerk in the freight claim department at Omaha, and on December 1, 1898, he was made chief clerk to the superintendent of the McCook division, at McCook, Neb. He was appointed assistant general freight agent of the lines west of the Missouri river on September 1, 1900, which position he held until October 5, 1917, when he was promoted to general freight agent of the lines west of the Missouri river, as above noted.

E. B. Wilkerson has been appointed general agent in the freight department of the Missouri Pacific, with headquarters at Wichita, Kan., succeeding S. H. Kilgore, transferred, effective November 1.

Thomas Denton Geoghegan, whose appointment as traffic manager of the Gulf, Mobile & Northern, with headquarters at Mobile, Ala., has already been announced in these columns, was

born on April 8, 1888, at Louisville, Ky., and was educated in the Louisville Normal Training High School. In December, 1903, he began railway work with the Southern Railway as a file clerk in the office of the assistant freight traffic manager at Louisville, Ky., and was in the continuous service of that road until his recent appointment as traffic manager of the G., M. & N. He served as tariff clerk at Louisville, then as correspondence clerk until November, 1906, when he became assistant tariff clerk in the general freight office at Atlanta,

Ga. He was then consecutively assistant quotation clerk at Atlanta; quotation clerk, and later assistant chief clerk at Washington, D. C. In May, 1909, he was appointed chief clerk at Columbia, S. C., then was rate clerk at Atlanta, and later assistant chief clerk at the same place. In June, 1911, he was appointed chief rate clerk and subsequently became chief clerk in the office of the freight traffic manager at Washington, D. C. In February, 1917, he was appointed chief clerk in the office of the vice-president at the same place, which position he held at the time of his appointment as traffic manager of the Gulf, Mobile & Northern, as above noted.

Engineering and Rolling Stock

A. A. Cross, has been appointed assistant engineer of the New York, New Haven & Hartford, with office at New Haven, Conn., to succeed E. O. Carlson, who has entered military service.

H. J. Graeser, office engineer of the St. Louis Southwestern of Texas, at Tyler, Tex., has been promoted to division engineer, with headquarters at Mount Pleasant, Tex., succeeding T. J. Williams, Jr., resigned, effective October 3.

M. A. Patterson

T. D. Geoghegan

G. W. Corrigan, division engineer of the Stockton division of the Southern Pacific at Stockton, Cal., has been appointed division engineer of the San Joaquin division, vice J. P. Edwards, resigned, and J. B. Dawson has been appointed division engineer of the Stockton division, vice Mr. Corrigan.

L. S. Kinnaird, whose appointment as superintendent of motive power of the Chicago & Eastern Illinois, with headquarters at Danville, Ill., was announced in the *Railway Age Gazette* of October 5, was born on July 23, 1869, at Ft. Wayne, Ind., and graduated in mechanical engineering from Purdue University in 1896. He began railway work in 1890 as a draftsman for the Pennsylvania Company, serving in that capacity until September, 1892, when he entered Purdue. He worked as a special apprentice in the shops of the Pennsylvania Company during the summers of 1893, 1894 and 1895, and on July 5, 1896, took permanent employment with that company as a special apprentice. On January 1, 1900, he was appointed assistant master mechanic at Allegheny, Pa., and on November 20, 1902, he was appointed master mechanic of the Cleveland, Akron & Columbus at Mt. Vernon, Ohio. Mr. Kinnaird was appointed master mechanic of the Pittsburgh, Cincinnati, Chicago & St. Louis, at Logansport, Ind., on June 1, 1915, which position he resigned on September 30 to become superintendent of motive power of the Chicago & Eastern Illinois.

Charles Lee McIlvaine, who has been appointed superintendent of motive power of the Northern division of the Pennsylvania Railroad, with headquarters at Buffalo, N. Y., as has already

been announced in these columns was born on September 25, 1872, at Wilmington, Del., and graduated from the mechanical engineering department of the University of Pennsylvania. On October 1, 1899, Mr. McIlvaine entered the service of the Philadelphia, Baltimore & Washington, as a machinist apprentice in the Wilmington shops, and was promoted to the Altoona (Pa.) shops of the Pennsylvania Railroad in January, 1901. He was appointed draftsman in the office of the superintendent of motive power at Jersey City, N. J., in January, 1903, and two years later, was promoted to motive power inspector. In May, 1905, he became assistant master mechanic at the Pavonia shops, Camden, N. J., and two years later, he was appointed assistant engineer of motive power of the Buffalo & Allegheny Valley division, at Buffalo, N. Y. On September 1, 1910, he was transferred to the Erie division and Northern Central Railway at Williamsport, Pa., in the same capacity, and in May, 1911, assumed these duties under the general superintendent of motive power, at Altoona, Pa. He was promoted to master mechanic of the New York, Philadelphia & Norfolk on July 1, 1913, returning to the Pennsylvania Railroad in May, 1917, as master mechanic of the Philadelphia division and on October 10, was appointed superintendent of motive power of the Northern division, as above noted.

L. S. Kinnaird

C. L. McIlvaine

Purchasing

J. F. Esch has been appointed purchasing agent of the Colorado Midland, with headquarters at Colorado Springs, Colo., in place of C. N. Davids, resigned.

John E. Byron, whose appointment as general storekeeper of the Boston & Maine with headquarters at Boston, Mass., has already been announced in these columns, was born on December 4, 1874, at Concord, N. H., and received his education in grammar, high school and business college. He began railway work on April 25, 1892, as clerk and stenographer to the general manager of the Concord & Montreal, and on July 22, 1895, became superintendent's clerk on the Southern division of its successor the Boston & Maine. In November, 1911, he was appointed chief clerk in the maintenance of way department and in August, 1917, was appointed general storekeeper of the same road, as above noted.

H. A. Anderson who has been appointed assistant purchasing agent of the Pennsylvania Railroad, with headquarters at Philadelphia, Pa., as has already been announced in these columns entered the service of the Pennsylvania Railroad in July, 1883 as a messenger in the transportation department at Altoona, Pa. Three years later he was transferred to the motive power department where he served as clerk in the Juniata shops, and later as chief clerk to the general superintendent of motive power. In February, 1904, he was promoted to stock clerk in the purchasing department, and in December of the following year was made special agent of the purchasing department which position he held at the time of his recent appointment as assistant purchasing agent of the same road as above noted.

Railway Officers in Military Service

F. M. Miller, general agent, freight department, of the Toledo, St. Louis & Western at Los Angeles, Cal., has resigned to enter military service at American Lake, Wash.

S. A. Tubman, commercial agent of the Central of Georgia at Baltimore, Md., has been commissioned captain in the Quartermaster's Department of the United States Army.

E. O. Carlson, assistant engineer of the New York, New Haven & Hartford, at New Haven, Conn., has entered military service and is now with the Eleventh Regiment of Railway Engineers.

F. M. Smith, trainmaster of the Northern Pacific at East Grand Forks, Minn., who was granted a leave of absence on September 28, to enter military service, has been commissioned captain, Engineers' Corps, Second Company, Fort Leavenworth, Kan.

Woolsey Finnel, valuation engineer of the Mobile & Ohio, has been commissioned major, and H. Austill, bridge engineer, has been commissioned captain, in the Five Hundred and First Battalion, Twentieth Engineers; L. M. Pill, valuation engineer, has been commissioned captain in the Engineers' Reserve Corps.

OBITUARY

H. P. Elliott, freight claim agent of the Chicago, Milwaukee & St. Paul, at Chicago, died in that city on October 28.

Harry L. Moffett, trainmaster of the Illinois Central at Clinton, Ill., who was recently granted a leave of absence on account of ill health, died in that city on October 21.

Stephen Little, formerly and for many years secretary and controller of the Denver & Rio Grande, died on October 29 at his home in New York City at the age of 87. Mr. Little was born in Ireland and came to this country when a boy. In 1850 he began railroad work on the Pennsylvania Railroad. In 1859 he was appointed auditor of the Northern Central and remained with that company until 1874, when he went to New York City as controller of the Erie, then in reorganization. In 1886 he became controller of the Pullman Company. In 1891 he became controller and later also secretary of the Denver & Rio Grande. He resigned two years ago and retired. Mr. Little was a man of unusual attainments. As an expert in railroad accounting he was broad minded and thoroughly informed. Aside from his routine duties he undertook a number of important special commissions, including investigations of bankrupt roads, and his reports in such cases were noted for their lucidity and fairness and for the independent and impartial spirit manifested. His business standards were always the highest.

* Illustrated.

The two points that were most clearly brought out in the papers discussing the reconsignment privilege which were submitted to the *Railway Age Gazette* were, first, that the privilege is, under present regulations, outrageously abused; and second, that even where it is used for a legitimate purpose it costs

Reconsignment Privilege Contest

the railroad a substantial sum, and that in fairness to shippers who do not use the privilege, the railroads ought to charge for this privilege a sum commensurate with its cost. There were 22 papers submitted in this contest and the paper which was awarded the first prize of \$50 by the three judges—W. C. Loree, formerly general manager of the Baltimore & Ohio; R. S. French, manager and secretary, National League of Commission Merchants of the United States; and Nat Duke, assistant freight traffic manager, Delaware, Lackawanna & Western—is published elsewhere in this issue. There was a great deal of time and thought spent in the preparation of the papers submitted, as will be seen from even a casual reading of the one published this week. There was also a great deal of time and thought spent on the grading of the papers and it will be well worth while for anyone who has to do with the various phases of reconsignment, and especially for those having authority to regulate railroads, to read all the papers that the *Railway Age Gazette* will publish on this subject. The second prize paper will be published next week and others will follow from time to time. It is interesting to note that while the writers of these papers recognize the extent to which the reconsignment privilege is being abused, it was the consensus of opinion that for certain commodities and under certain conditions the reconsignment privilege, if properly charged for, performs a valuable economic function.

The decision of the Federal District Court in the case of the United States versus the Boston & Maine regarding a violation of the Safety Appliance Act concerning the "nearest available repair point," which was published in the *Railway Age Gazette* of November 2, page 773, shows that one Federal court appreciates the difficulties under which our railroads are working at the present time and is co-operating with them

to move the great amount of tonnage thrust upon them. The case in question involved a freight car moving West from Boston which had a drawbar pulled out from one end of the car and which was taken from the train at Gardner, Mass., 17 miles west of one repair point and 38 miles east of the next one. The railroad not having a car at Gardner into which the load of the damaged car could be transferred, did the logical thing any business concern would do, by coupling the damaged car with its one good coupler to the rear of a caboose of a freight train, without affecting the safety of train operation in any way, and moved the car on its westward journey to the repair point 38 miles west of Gardner. The government brought suit on a mere technicality, claiming that the car should have been moved back the 17 miles as that was the nearest available repair point. The Federal District Court by its action showed its desire to co-operate with the railroad which is highly commendable. Its decision was based on a practical and logical interpretation of the law, as the railroad showed that in no case was the purpose of the Safety Appliance Act violated.

The court decisions reported in this issue are mostly those of the United States Circuit Courts of Appeals, and the subjects dealt with are varied and interesting. Any one who thinks that the court news column is dull reading should take a look at these cases. In the Eighth Circuit the hours-of-service inspectors sent out by the Government are held—almost in so many words—to have been frivolous in their criticisms of railroad practice. Other decisions are so narrow, seemingly, that one is tempted to think the judges are frivolous, or at least exceedingly narrow, in their interpretation of the hours-of-service statute. In the Third Circuit the findings of the Interstate Commerce Commission as to the amount of an overcharge are accepted by the court only as prima facie evidence of the correctness of the amount. In the Fourth Circuit, in a suit where a woman in a passenger car, standing in the aisle, was thrown off her feet when the train rounded a curve, the court holds that the swaying and lurching which caused such a disturbance must be considered as a normal and necessary accompaniment of reasonable speeds where a railroad line is as crooked and steep as is the case

Common Sense Applied to Safety Appliance Act

in the mountains of West Virginia. In a New Jersey automobile case some joy riders sued a railroad, not because they were run into by a train, but because of the trouble that they got into when a train was struck by their car; they ran into the side of the train. They could have seen the approaching locomotive when they got to a point within fifteen feet of the tracks. This is a rather short distance; but the judge holds them responsible for not having been on the lookout in ample season; and this duty, says the decision, rested not alone on the driver of the car but also on the other five persons in it. This seems a rather severe doctrine for a female joy-rider, sitting on a young man's knee in the front seat; but courts cannot be expected to have much consideration for sentiment!

A NEW MOVEMENT BY THE RAILROAD BROTHERHOODS

NO doubt when Congress, in order to avert a general railway strike, passed the Adamson law, it thought it had laid the strike ghost indefinitely. But the ghost reappeared last spring. When the Supreme Court upheld the constitutionality of the Adamson act, Congress probably felt sure that the labor problem on the railways was solved for a while. But although it has been only a little more than a year since the law was passed, and will not be a year until January 1, 1918, since it went into effect, the very organizations for whose benefit it was enacted already are starting another movement for changes in their conditions of employment and advances in their wages.

Various reports are being published regarding this new movement. One is that an advance in wages of 25 to 50 per cent will be demanded. Whether an advance is to be asked merely for the conductors and trainmen in passenger service, or for all passenger train employees, or for all employees in both passenger and freight service, is not clear. The members of the United Switchmen of America also are preparing to present claims for advances in wages.

Another report is that the four large brotherhoods will press upon Congress at its next session a demand for legislation arbitrarily limiting and reducing the length of freight trains. Still another report is that the demands made directly upon the railways will include one for a differential wage scale based upon the length of freight trains. For example, employees operating a train of 50 cars would be paid on one basis, those operating trains of 75 cars on a higher basis, and so on.

In any event, it is evident that a new and important movement for a readjustment of the wages and conditions of employment of train service employees is being started. Present conditions make this fact one of great seriousness, not only for the railways, but also for the nation.

The railways are now handling very much the heaviest traffic, and making the largest gross earnings that they ever did. Never in their history were they managed as efficiently as now. The average loads per car and per train, the average mileages made per car and per locomotive daily, far surpass all previous records. Nevertheless, net earnings and net operating income are declining. Until recently this was true only of the eastern lines, although the *ratio* of expenses and taxes to total earnings has been increasing on roads throughout the country. Now the southern and western lines, like those in eastern territory, have begun to show absolute losses of net operating income. The net earnings and net operating income would show still heavier declines if expenditures for maintenance were being increased in proportion to the physical needs of the properties. Another big increase of wages, without a big advance of rates, would be disastrous to a large part of the railways of the country.

Whether such an increase in wages should be granted is one question. Whether it should be granted without the

need and justification for it having been previously passed upon by some body both impartial and competent is an entirely different question. The events which forced and those which followed the passage of the Adamson law, should have made startlingly clear to the public both the non-existence and the need for a law which would provide adequately for the peaceful and just settlement of labor controversies on railroads. The country narrowly escaped a general tie-up of the railways in September, 1916; it again narrowly escaped a general tie-up last spring, when we were just entering the war with Germany, and since we entered the war it actually has experienced a strike of members of the Brotherhood of Railroad Trainmen in the Chicago terminals.

If there was need for legislation providing means for peacefully settling railway labor controversies in peace, how much greater is the need for such legislation now that we are at war! It is futile to say that the brotherhoods would not call a strike when the country was in the midst of a great war. They did call one when we were just entering the war; and the Brotherhood of Railroad Trainmen ordered one in the Chicago terminals after we were at war. We believe the Chicago strike has been pronounced "illegal" but we observe that the men officially responsible for it still have the same positions and influence in the organization that they had before. The only sure means of preventing a general railway strike in the midst of the war is to prohibit it by law. At the same time there should be provided a fair means of arbitration. It need hardly be said that important as it is that labor disputes on the railways should be fairly and peaceably settled at any time, it would be suicidal for the country to permit a strike while it is involved in the present conflict.

Important as is the movement which is being started for advances in the wages of train service employees, hardly less important is the movement which apparently is being begun to in one way or another reduce freight train loads. At any time increases in freight train loads are desirable as means of promoting the economy and efficiency of railway operation. Without large carloads and large trainloads the low freight rates which have prevailed in the United States would have been impossible. Under existing conditions, however, the handling of traffic in large trainloads is not merely important. It is vital. It was difficult before we entered the war for the railways to increase their equipment and other facilities. The war has made increases in them practically impossible. This means that if the gigantic and rapidly increasing traffic of war time is to be handled at all, it must be done by every track, every car and every engine being worked to its utmost capacity. Now, a reduction or a limitation of the length of freight trains would operate as a limitation or a reduction of the amount of freight that could be handled with every track, every car and every locomotive.

Of course, we know the argument of the leaders of the labor brotherhoods is that the railways could increase the traffic handled with existing facilities by speeding up the trains, but to everybody who knows any mathematics and can apply them to the conditions of railroad operation this contention is grotesquely absurd. It is manifest that the faster a locomotive is run, the fewer cars it can haul; that the fewer cars it hauls in a train, the more trains must be run to handle a given traffic, and that the more trains are run, the more meeting and passing points there must be on the railroad. But the more meeting and passing points there are, the more delays there will be to trains from being held on sidings, unless there is a large increase in the amount of trackage of the railways. Furthermore, the freight locomotives now in service have been built for power, not for speed, and every increase made in their speed would in a greater proportion deprive them of the opportunity to use the power which they were built to exert.

The proposal to reduce the length of trains is necessarily a proposal to require the railways to run more trains. But for this purpose they would have to provide more locomotives and trackage, not to mention the fact that they would have to employ more men. But where, under present conditions, would they or could they get the additional locomotives? Where, under present conditions, would they or could they get the capital, the materials and the men necessary to build the additional trackage?

Any measure or wage scale which should be adopted to limit and reduce the length of freight trains under present conditions would be a measure to prevent, and effectively prevent, the railways of the United States from handling the country's business during the war. This is not the intent of it, but it would be the effect of it.

All questions arising regarding the conditions of employment and wages of railway employees should be submitted to arbitration. All questions arising affecting such matters as the number of men to be employed in train crews and the length of the trains to be operated should be submitted to the determination of the Interstate Commerce Commission. The country should not go on allowing such matters to be settled by the menace of strikes or the coercion of legislation passed without any investigation whatever.

PROTECTING SECURITY OWNERS' INTERESTS

ONLY a few roads go through even the form of attempting to hold a stockholders' meeting at which any considerable number of stockholders are present. The New York, New Haven & Hartford and the Southern Railway are two exceptions, but although the good intentions are there on the part of the management, actually the influence which these meetings have on the actions of the board of directors is infinitesimally small. The management which holds the great majority of the proxies of all the stock outstanding consults with one or a few dominating interests and pursues a policy agreed upon at these private conferences. A specific criticism founded on sound argument made at the stockholders' annual meeting would receive consideration, but on most roads if this criticism did not meet the approval of the controlling interests, consideration would amount to little more than notice and acknowledgment. It would not bring about a change in policy.

At this time, when the whole credit structure of American railroads is really in danger, when serious students of railway economics are suggesting that the Government lend money to the railroads, and others are suggesting that the railways sell short term paper to their banks to be rediscounted by the Federal Reserve Banks, it is well to face the facts squarely. There are very few railroads in this country in connection with which it is not easy to name almost off-hand one to half a dozen individuals who actually control the broad policies and select the operating management. In some cases this controlling interest is a banking house, more often it is one or more individual wealthy men working in conjunction with a banking house. A typical example of this latter is the New York Central, with its Vanderbilt control and its banking arrangement with J. P. Morgan & Co.

When there is trouble and a road goes into bankruptcy, protective committees, so-called, are formed by the different classes of security holders, and these committees represent the interests of the security holders in negotiations looking toward a reorganization. The theory, of course, is that the board of directors is the protective committee for all the stockholders as long as the road is solvent and that the investment bankers who sell an issue of bonds or notes act as a protective committee as long as the road is solvent for this class of securities. As a matter of fact, American railroad practice has not in a great number of cases worked out in this way, and the great majority of stockholders of

an American railroad and the great majority of investors in its bonds and notes are at the mercy of the few who are in control. There are plenty of examples in American railroad history where the man or men in control have not only exercised the power which they have, but have conscientiously and disinterestedly lived up to the full responsibility which rests on them under the American system. The Pennsylvania Railroad and the Atchison, Topeka & Santa Fe are the first two companies that come to mind; they are not, of course, alone, but there are altogether too many of the other kind of companies.

In the first place, ought not a banking house which sells an issue of bonds or notes to its customers, take the responsibility of protecting these customers' interests more seriously than most banking houses do now? It is not enough that a member of a banking house which is financing a road, hold the title of director and be present to render the dignity of his presence and his vote to the plans of the controlling interest. There should be some one continuously watching the detailed operations of the road in the interests of stockholders, other than the controlling interests, and in the interests of bond and note holders. There are, of course, a great number of difficulties in the way of devising any practical plan by which this could be put into effect. In government, the two party system is supposed to provide the necessary check. There have been temporary two-party systems in railroad directorates. There are two parties now struggling for supremacy in the Rock Island directorate, but in railroad directorates this does not last long. One or other party gets the upper hand, gets control of the machinery necessary to completely eliminate the other faction, and we have again irresponsible—in the sense of being responsible only to themselves—controlling interests.

The great difficulty lies in the fact that were the interests of investors to be aroused temporarily to a realization of their lack of protection, and were the holders of each class of securities to elect a competent representative to watch the detailed operations of the management and of the controlling interests, to the end that the great majority of security holders would be protected, the men so elected would in a very short time be held responsible, at least until disaster occurred, only by their own sense of duty. Sustained interest on the part of investors is almost more than can be hoped for.

At first glance this seems a problem primarily of concern to the bankers, but as a matter of fact it is of vital concern to railroad men who believe that railroads should continue to be privately managed and privately financed. If the bankers, or some of them, should refuse to assume the responsibility of refinancing maturing obligations and of raising new capital necessary for development to meet the growing needs of the country, it will be railroad executives who will suffer along with the security holders, whose representative they ought to be. It is a subject which deserves the consideration of such bodies as the Executives' Advisory Committee and the Railroads' War Board.

SPENDING MONEY IN LEAN YEARS

ON another page of this issue an account is given of one of the most extensive grade revision and double track projects undertaken in recent years. It is worthy of notice that this work of the Southern between Washington and Atlanta had its inception and saw considerable progress during the early months of the great war, a time when this country was suffering a serious financial depression. The undertaking has been continued during the period of war prosperity and into the time of our own participation in the world conflict. Consequently the officers of the Southern have had an excellent opportunity to observe the marked difference between the cost of construction as carried on in slack times and the cost of work done during periods of

high prices, and have thus been afforded ample proof of the wisdom of the policy they pursued in undertaking the improvement during a time of tight money.

This policy is in marked contrast to that followed by not a few American railways, many of which have enjoyed much better financial credit than the Southern. Some roads undertake work when traffic is heavy, and when as a rule both material and labor are scarce and the construction will suffer the maximum interruption from the traffic. These same roads are also usually the first to order a severe retrenchment at the first sign of a decrease in earnings with the result that the completion of improvements which already represent investments on a large scale is delayed for many months with a consequent loss of interest. The Southern, on the other hand, had the courage to start an important project when its earnings were at low ebb, but it has profited handsomely from this course since the capitalization of large parts of the improvements is materially less than it would have been had its officers required the moral support of the heavy earnings of 1916 before proceeding with the work.

RAILROAD RATES AND NATIONAL DEFENSE

THE outstanding point in the testimony given by the presidents of the large eastern railways in the rate advance case at Washington last Monday is the need for larger earnings with which to maintain the physical properties of the roads. Thus far they have been able to move the commercial and military traffic in spite of its enormous increase, but with present rates they have not enough revenues to get the labor and materials necessary to keep the properties up physically. If they are allowed to deteriorate much more they will become incapable, not merely of handling a still larger traffic, but even of handling a traffic as large as the present. This general thought permeated what was said by all the witnesses for the railways. By none was it more frankly and emphatically expressed than by President Willard of the Baltimore & Ohio, who is also chairman of the government's Advisory Commission on National Defense.

The *Railway Age Gazette* was, we believe, among the first to point out that, difficult as was the problem of handling all the commercial and military traffic, the problem of adequately maintaining the railways was becoming even more difficult and serious. Of course, in the long run, the two problems merge into each other. If the railways are not adequately maintained, they will go to pieces physically and if that occurs they will soon get so they cannot handle an abnormal traffic or even a normal traffic.

The question of the regulation of rates has ceased to be merely an economic question. It has become a problem of national defense. The government is now regulating the prices of many commodities—of steel, of coal, of wheat, and so on. In regulating them it recognizes the fact that prices must not be made so low as to hamper production. Every price that has been fixed is much higher than the average price of the same commodity in the years before the war. In all industries the cost of labor and materials has advanced; and the government has recognized the fact that if its prices are not fixed high enough to cover these increased costs, and at the same time afford a reasonable profit, the maintenance and increase of production, which are vitally necessary for the successful prosecution of the war, will not be secured.

There is one fundamental difference between the situation of other industries and that of the railways. While in other industries great increases in prices have occurred, in the railway industry the average rates received are little, if any, higher than they were before the war in Europe commenced. The railways, however, have been subjected to increases in the cost of labor and materials as great as those which other industries have had to meet. Important as it is that the prices of steel and coal and wheat should be so

fixed as not to discourage the production of these commodities, it is even more important that railway rates should be so fixed as not to restrict the production of transportation. The manufacture of steel in increased quantities is absolutely dependent upon the ability of the railways to transport from the mines to the factories the coal and the ore which must be used in making steel. The farmer may temporarily enlarge his production of wheat without adequate transportation facilities; but when the time comes that the railways are unable to move his crops he will be effectually debarred from maintaining his production, and the consumer will be cut off from the increased crops which he has produced.

The statistics show that there has been a large advance in the expenditures of the railways during the present year for the maintenance of equipment and maintenance of way, but this advance does not represent an increase in the use of labor and materials. It is due entirely to the fact that labor and materials cost more. The amount of labor and materials actually used has declined. Furthermore, for about two years, and especially during the present year, the railways have been moving a vastly increased business with almost no additional facilities. The old rails, the old cars and locomotives are wearing out. A certain part of them must be replaced every year if the total available equipment is not to decline. The money for maintenance and for replacements must come from earnings.

The situation of the eastern carriers as described by their presidents is anything but encouraging. During the nine months ending on October 1, as compared with the same months of 1916, the earnings of 38 of these lines increased \$124,000,000, while their operating expenses advanced \$169,500,000, and in consequence net operating income declined \$57,300,000. This decline in net is continuing and becoming larger. Months ago it was foreseen that it was only a matter of time until the western and southern lines also would begin to show losses in net return; and recently what was then foreseen has begun to occur. The effect of the course of events on railroad credit and upon the value of railroad securities has been very serious. It is estimated that the total depreciation in the market value of railroad stocks and bonds since America was drawn into the war has been \$3,000,000,000.

In almost every other leading country conditions created by the war have rendered it necessary to make substantial advances in railway rates. The railways of the United States have been granted some advances, but they are wholly insufficient. Since the railway question has become a question of national defense it should be dealt with accordingly. The fact that it is in the hands of the Interstate Commerce Commission does not alter its character.

NEW BOOKS

Poor's (Intermediate) Manual of Railroads, 1917. Published by Poor's Manual Company, 80 Lafayette Street, New York. Price, \$7.50.

This intermediate manual supplements the regular fiftieth annual number, which was published about six months ago, by giving reports for all of the principal railroads for the year or for the six months ended December 31, 1916. This, of course, is to conform with the change in practice prescribed by the Interstate Commerce Commission, making the period for reporting to the commission the calendar year instead of the fiscal year ending June 30. The majority of railroads have changed their period of making reports to stockholders to correspond with the Interstate Commerce Commission's requirements. Some, however, have not. Poor's gives income account, balance sheet, operating statistics, etc., for those that did not change their period for reporting to stockholders as well as for those that did. As a link between the fiftieth annual number and the next annual the intermediate manual is a necessity.

Letters to the Editor

WOODING'S AUTOMATIC STOP

NEW YORK CITY.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Your article on "Wooding's Automatic Train Stop" in the issue of September 17, composed largely of selections taken from the Interstate Commerce Commission's report, with the brief comment that three pages of the report are devoted to a discussion of failures, cannot help creating an erroneous opinion. * * * Contrary to the impression caused by the statement that three pages are devoted to discussion of failures, there was not demonstrated a single instance in which the train was not fully protected by the automatic train stop, during the test. Hence, in the true sense, there was not a single failure to be discussed.

There were eleven irregular operations, principally of the permissive control mechanism, called failures, that were easily overcome, but not one of which prevented the automatic train-stop appliance from protecting the train in case of danger.

Six were caused by a partial separation of a break in a faulty construction and installation, that permitted the observer by an act to pass the train at a higher speed than intended; but even under this extreme adverse condition it would require the engineer in actual operation to recognize the danger signal, and act, or the brakes would be applied and the train stopped in safety. One was caused by a loose connection or ground on the engine. One by the U-blade opening the line wire circuit breaker at ramp S-56; two by the signal maintainer cutting off the battery. These four caused a brake application not intended. The eleventh and last was a break-down-test, in which the appliance clearly demonstrated that it was active and ready to fully protect both the appliance and the train as designed; but it was purposely held from doing so.

The causes for all the irregularities that occurred were easily overcome as soon as demonstrated, and they would not have appeared in the Commission's report had time permitted an opportunity to test out the new parts in advance.

The contacts operated perfectly throughout one of the severest sleet storms of this climate; and also when water was poured on them in zero-weather, producing conditions considered the most difficult to be overcome.

The permissive control (not speed control) did all that was required or is of advantage in such an appliance (see paragraph 2, page 18, of the Commission's report). It demonstrated that an engineer, to be sure of getting by with his train, must reduce its speed two miles an hour below that for which the appliance is set. The meagerness of the data on which a positive opinion was withheld was due entirely to the fact that the installation was on a fast passenger train and longer time could not be had; and not to any fault of the device.

This appliance has demonstrated that it provides the protection now required; the protection not now afforded by the highest training of the employees and the latest approved signaling system and equipment. The Interstate Commerce Commission says that it can, no doubt, be developed to meet the needs of any railroad. The mechanical parts are so few and uncomplicated that the most critical expert will approve of them. In addition, this appliance will enable the railroads to safely increase traffic from 10 to 25 per cent on heavily congested roads.

B. F. WOODING.

[The reader will note that the issue is simply a question as to the meaning of the word "failure." The Interstate

Commerce Commission's inspector, following the practice of signal engineers generally, uses this word to designate any operation, or any absence of operation, wherein the apparatus does not accomplish exactly what it is intended to accomplish; whereas Mr. Wooding uses the word only in cases where the movement, or the failure to move, immediately involves a dangerous condition. If a train-stop apparatus allows a train to pass, when it ought to cause an application of the brakes, that is a failure to which everybody applies the same name; but if the apparatus stops a train when the road ahead is clear, and no stop is necessary, the term "non-dangerous failure" is commonly used. In that case, the only direct disturbance is a delay to the train. But a delay may cause much inconvenience. With long and heavy trains unnecessary stops are the *bête noire* of railroad men, because of the frequency with which drawbars are broken or damaged, in making the start, after the stop. These breakages may be due, in large measure to the bad tempers of the enginemen, who, when they are irritated by a delay which they deem unnecessary, handle the throttle with less caution than at other times; but the thing that is supposed to have caused the stop is saddled with the blame, nevertheless. Again, the signal engineer must reduce the number of unnecessary stops to the lowest possible degree for the reason that all enginemen are entitled to feel, constantly, the most complete confidence in the reliability of every apparatus or appliance which may affect the safety of their trains. If there are many unnecessary stops, the men's confidence in the perfection of the apparatus is weakened; and the ambitious signal engineer very naturally, therefore, classes as a failure anything which causes those stops, and which, in so doing, impairs his reputation.—EDITOR.]

ADVANTAGES OF TABLE D'HOTE SYSTEM FOR DINING CARS

CHICAGO.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

While our railroads have accomplished what was thought impossible in successfully transporting troops, government freight, etc., without disorganizing the passenger service, very little or nothing has been done toward remedying the waste in railway dining car service.

Your editorial of May 25 discussing this subject, advocating radical changes and suggesting that we do away with "the almost criminal *a la carte* system so generally in vogue in this country," was splendid, and it is a pity that it was not followed by more articles on the same lines. Worse still, the only follow-up was the publication of a letter from "the passenger traffic manager of a large railway system," in your issue of July 13, who condemned the editorial in question.

I have been watching every issue of the *Railway Age Gazette* since, hoping to find that some real, experienced railway officer (a practical dining car superintendent, for example) would take up the matter and show how well you had hit the nail on the head with your first editorial.

Believing that the present cry for conservation of food should be seriously considered, and believing that it is imperative that we should realize the importance of such saving, I, a small cog in the dining car service, take the liberty of calling your attention to this, hoping that you will take up and continue the fight along the lines suggested in your editorial of May 25.

With all due respect to "the passenger traffic manager," who wrote the letter above mentioned, I beg to differ with his views. Why should a passenger traffic manager be considered an authority on such a question? Unfortunately this has been done for years, and it is the very reason why "there is no part of our railway service which needs drastic reformation more than our dining car service."

The idea that the table d'hôte plan is more wasteful than

our present a la carte is wrong. It is based on results from the table d'hôte system used years ago, and not on the modern way of serving table d'hôte. The passenger traffic manager in question, makes the following charges against this system: 1st. It requires the preparation in advance of a lot of food, much of which is not used. 2d. It permits the passenger to order many things not wanted. 3d. It allows the waiter to bring food not ordered.

None of those charges can be proved correct, nowadays, because: 1st. With competent dining car conductors and chefs, there is no reason why there should be any food prepared in advance and not used; there is always use for every bit of food, if you know how. 2d. By giving the passenger the right to order soup, for example, with choice of one meat or fish, two vegetables, one dessert and drink; and by requesting the passenger to write the order on a check, as it is done to-day with the a la carte system, the passenger will only order what is wanted. 3d. When every order is written on a check, checks are required to get orders out of the kitchen, and the taking of verbal orders is absolutely forbidden; waiters will not be able to bring food not ordered.

The reason why the old table d'hôte system has been condemned, was not because of the system itself, but of the abuses practiced in those days. Menus were too elaborate, with from two to four or five relishes, two or three soups, two kinds of fish, half a dozen entrees, a roast or two, punch, a game, salad, all kinds of pastry, ice cream, hot or frozen pudding, cheese, fruits, etc. On top of all this passengers had the right to order any or all the items on the menu. Orders in those days were taken verbally, and I well remember how they were given. A passenger would mention the one or two articles which most appealed to his taste, at the same time telling the waiter to bring him anything else that looked good. No wonder the waiters would bring everything, from soup to nuts. First of all by so doing the waiter thought that he would get a larger tip, and again it was the *easiest* way to do his work, for it made it unnecessary for him to try to remember the different orders for different passengers.

A private office and not the press would be the proper place to give other *very important facts and figures* which prove that a properly conducted table d'hôte system *will save enormous quantities of food, man power and money* to both the railroad companies and the traveling public. H. F.

LOCOMOTIVES NOT DOING THEIR SHARE

NEW YORK.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

"How long can the railways continue to augment their efficiency enough to meet the demands upon them?" The *Railway Age Gazette* asks this question in the September 21 issue in an editorial headed "Railway Operating Efficiency in June" and giving the operating statistics for June of this year compared with June, 1916.

The question of how much our railways are going to be able to expand their transportation producing power has ceased to become of interest to railway men only. It has become national—even international in scope.

The first of the three tables quoted give a comparison of the revenue tons per mile of line. The average miles moved per day by a car is 29.1, having increased from 27.3. These figures, while they show a creditable improvement, also show that line mileage has not reached the point of saturation. Some roads go far beyond this figure. The Illinois Central, for instance, has been able to boost its average car miles per day to 43.36. Vice-President Kettle in a recently published interview commenting on the Illinois Central June figures said, "If business keeps up, and it is keeping up, we hope to do still better. We keep everything rolling. That is the trick."

Having established the fact that line mileage will be able to handle all the traffic our present locomotive and car equipment can be made to produce we must look to the cars and locomotives for an answer to the question of "How long can the railroads augment their efficiency to meet the demands made upon them?"

Under the remaining two headings the percentages given are as follows:

REVENUE TON MILES PER FREIGHT LOCOMOTIVE					
	U. S.	East.	South.	West.	
Per cent increase June, 1917, over June, 1916	21.0	17.4	15.6	29.9	
REVENUE TON MILES PER FREIGHT CAR					
	U. S.	East.	South.	West.	
Per cent increase June, 1917, over June, 1916	19.6	15.9	17.5	26.6	

The striking and significant thing about these percentages is the similarity of the increases of revenue freight locomotive ton miles and revenue freight car ton miles. Assume an average freight locomotive hauling 2,000 tons. It is fair to assume that 1,000 tons is revenue freight, the other 1,000 tons being the weight of the train. By increasing car loading 20 per cent our average train becomes 1,200 tons of revenue freight and 800 tons of train. We have more freight and in fewer cars and therefore an easier hauling train. A shorter heavier train is always easier to handle as is evidenced by the adjustment factor which has become standard practise.

With this in mind and again examining the percentages of increases it is apparent that pretty much all of the increase in revenue freight hauled has been obtained by heavier car loading and very little, if any, by heavier engine loading. The 27.9 tons does not measure the heaviest average car load that can be obtained, but it is three-quarters of the average capacity and further increases will be gained with increasing difficulty. Over and above this remains the, as yet untouched, increase from heavier engine loading.

To quote an operating man in a recent issue of the *Railway Age Gazette*. "Most engine ratings are made by the mechanical department, and the result is that our engines are under rated. While we make a good showing in engine efficiency we are losing in train load as against what our engines can actually handle."

During the last ten years average tractive effort of freight locomotives has increased 27 per cent because of the addition of modern heavy power. Revenue tons hauled per pound of tractive power have not kept pace with this increase. One authority has said that "during the last five years the economy and capacity of our locomotives have been more than doubled." This means that there is available hauling capacity beyond the figures expressed in the theoretical term "tractive power."

There is ground, therefore, to answer the *Gazette's* question in the most optimistic frame of mind. Who will be the leader in securing heavier engine rating?

OPERATOR.

A SOLUTION FOR THE UPPER BERTH QUESTION

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I wish to make the following suggestion in regard to "The Vital Objection to Upper Berths." It appears that your contributors (and I agree with them) consider the greatest objection to upper berths the lighting system. It would not be practical to extinguish all lights, save berth lights, during the night, on account of the dangers in walking through sleeping cars in complete darkness, but I believe that the Pullman company could rewire their cars to provide also for floor lights, say one in front of every other berth (or section). I have noticed that the floor lighting system works very well in some good moving picture theatres, and it may solve the problem on sleeping cars. H. F.

First Prize in Reconsignment Privilege Contest

Present Abuse of the Privilege and Reason Therefor. Suggestions for a New System Based on Sound Principles

THE three judges in the contest which the *Railway Age Gazette* conducted for the best papers discussing the reconsignment privilege, were W. C. Loree, formerly general manager of Baltimore & Ohio, R. S. French, general manager and secretary of the National League of Commission Merchants of the United States and Nat Duke, assistant freight traffic manager of the Delaware, Lackawanna & Western. In awarding the first prize of \$50 to H. G. Munholland and the second prize of \$25 to S. Wherry, the judges said in part:

We have read carefully, with a great deal of interest, the papers on the reconsignment privilege submitted to us, feeling as we do that the subject is one of importance both to the public and to the railroads, and after mature consideration place them in the following order of merit:

1. Paper by H. C. Munholland, assistant manager, Pacific Car Demurrage Bureau.

This paper is well written and in a convincing manner. The writer is fair to both the railroads and the shippers and his conclusions are reinforced by reliable statistical information. The following points are brought out in this paper:

(a) The privilege is of value to shippers, and when not abused or used for speculative purposes does not unduly delay the movement of cars.

(b) Promotes business of brokers with little or no capital to peddle cars from place to place in the hope of effecting a profitable sale, thereby tying up cars that would be of service in legitimate business.

(c) Promotes use of cars for storage purposes, thereby increasing the car shortage, detrimental to the interests of both the railroads and the public.

(d) Undue number of diversions permitted.

(e) Failure of the carriers to present a good case backed up by sufficient statistical information.

(f) Suggestions to remedy abuses of the privilege.

2. Paper by S. W. Wherry, assistant yardmaster, Pennsylvania Railroad.

This paper is also well written from the standpoint of the operating department of a railroad and explains very fully the delays to cars, due to diversion, and to the flow of traffic, on account of occasional adverse movements because of a car requiring diversion having passed the receiving yard.

The costs given would appear somewhat high, but these costs apply only to the yard referred to, which evidently handles largely dead freight, such as coal, lumber, etc., and the percentage of perishable is small. Probably the percentage of diversion of perishable freight is also small in this yard, as compared with other yards where the average delay is much less.

The other papers submitted we have arranged in accordance with the standing, which, in our judgment, is proper, after taking into consideration the elements of doubt contained in several of them, and the absence of data supporting the conclusions. These papers, however, all have merit and give evidence of careful consideration of the subject.

RECONSIGNMENT OR DIVERSION PRIVILEGES

By R. C. Munholland

Assistant Manager, Pacific Car Demurrage Bureau

The term "reconsignments" is often misunderstood. And, therefore, I will not confine my remarks to "reconsignments" alone. When cars are reconsigned, diverted, reshipped,

held for orders to switch to connection, stopped in transit, or set on hold tracks at destination and there held for disposition, the general purpose of one or all, is the same; that is, regular and through movement of car is retarded.

This leads to the question—are such privileges necessary? My answer is, generally, no, for if a shipper conducts his business properly, when a car is shipped all arrangements for final disposition and delivery should be arranged for, prior to loading and billing, but to be broad and liberal, if absolutely necessary to invoke any privilege, why should such shippers not pay a proper compensation to the railroads for such service?

The plan of allowing diversion or reconsignment on a through rate was no doubt started, originally, to build up certain classes of trade, and for wider distribution to take care of fluctuating conditions. Of late years the practice has grown to such an alarming extent that many brokers of more than the famous 57 varieties have sprung up, whose investment consists mainly of desk room or an office, and who use the carriers' cars for warehouses and display rooms, as they have none of their own, peddle cars from one place to another, or sell and resell to others. It is this class of patrons who have put the kibosh, so to speak, on the whole works.

It can be readily understood, upon reflection, that these brokers cut into the carriers' profits, as the service is generally free. The regrettable feature, however, is the undeniable fact that patrons who do not avail themselves of, or abuse the privilege, must stand a certain portion of the expenses incurred by the other fellow, and far worse is the fact that other shippers are denied cars to load, caused by the cars being tied up under load, and train service and yard work is handicapped, which causes a large loss to every one concerned; to repeat, the good patron is the sufferer.

From the standpoint of the consumer, he is the ultimate loser, as eventually the man or company who eats or uses the commodity peddled from one place to another—each one taking a part in the transaction making a profit—foots the bill, therefore, as usual, the public pays for a service which actually could, to a very large extent, be done away with or at least curtailed. It is not an uncommon practice for shipments to change hands from four to eight times before being actually sold and distributed.

In report of the Interstate Commerce Commission No. 3289, Detroit Traffic Association vs. Lake Shore & Michigan Southern, the remarks of commissioner on diversion privileges are in part as follows:

"There is an ever-present temptation before the shipper, however, to convert the reconsignment privilege into a means of indefinite storage. So long as the demurrage fees are paid, the consignee regards it as his right to delay reconsignment as long as he pleases. The privileges of reconsignment properly carry no such right. Not a little consideration has been given to the question of unnecessary detention and its relation to the shortage of cars that work such a hardship upon the shipping community generally."

The above goes to show the commission is alive to the fact that many parties simply use reconsignment privileges to the disadvantage of the general shipping public.

The railroads, so far, have failed to convince the Interstate Commerce Commission, because of their failure to agree on any definite plan, or to show whether diversions are a good or a bad thing. Before action can be taken to bring this matter to a successful conclusion, the railroads must

get together, decide on one thing and back it up with actual figures.

Under present diversion and reconsignment rules in California an unlimited number of diversions are permitted and no diversion charge is made on fresh fruits, fresh vegetables (including potatoes and onions) live stock and whole grain or seed. These are the very commodities, particularly potatoes, onions and grain, on which the diversion privileges are so very greatly abused. It is our understanding that tariffs of eastern lines are about the same, some commodities exempt from diversion charge and generally no limit on the number of diversions.

To enlighten others and awaken those who are champions of reconsignment and diversion privileges to delay and cost of same, I have compiled exhibits which were used in a recent case decided in favor of the carrier. In compiling figures in these exhibits, we used agents' regular reports, and drew off detained movement of each car involved; therefore, the figures are authentic. Costs are all taken from actual statistics compiled, and while estimation may be a trifle far-fetched, they can be relied upon as being correct at the time they were compiled. Exhibits are for a period of one month, October, 1915, with recapitulation for the same month, October, 1916, for comparison. Detention all accrued in the state of California on trans-continental lines.

Exhibit A shows cars of potatoes and onions, reconsigned or diverted by shippers, and cars and days held, also net demurrage. Note particularly abuse to equipment by shipper No. 1 in comparison with others. No. 1 handled 27.20 per cent of all cars; diverted 45.08 per cent; delayed 50.49 per cent, and demurrage paid was on 50 per cent of the total. The statement reflects how much more some shippers avail themselves of free service than others. The detention on potatoes and onions is far greater than any other commodity in California. Note that 1,636 cars were shipped; 721 were reconsigned or diverted and were delayed a total of 1,214 days, for which the carrier's only revenue was \$345 demurrage; also \$654 demurrage for delay in unloading, total \$999, for which the consumer eventually paid, in order to eat his daily rations of "spuds."

Exhibit B shows detention by various commodities, such as potatoes, onions, hay, straw, wheat, grain, vegetables, fruit, lumber, automobiles, oils and gasoline; total 4,011 cars delayed 4948 days, with only \$1,123 demurrage, or 28 cents per car, 23 cents per day, or hardly enough to pay for grease on the journals.

Exhibit C shows detention by various commodities, exclusive of potatoes and onions, on cars held on "hold tracks" at destination for further orders. Total cars held 3103, for 3954 days, with only \$606 demurrage, or 19 cents per car, 15 cents per day, or about pay for telephone service.

Exhibit D shows same as above, except that totals for delay at terminals of San Francisco and Los Angeles are shown, which indicates that only about 50 per cent of the delay occurred at large cities.

Exhibit E shows grand recapitulation of delay to all cars held for reconsignment, diversions, and others to move from hold track; the total reaching the amazing figure—for one month—of 7114 cars delayed 8902 days, with \$1,729 demurrage, or 24 cents per car, 19 cents per day.

Exhibit F is the same as Exhibit E, except that it is for October, 1916. Total 6387 cars delayed 8741 days, with \$2,388 demurrage, or 36 cents per car, 27 cents per day; note increase caused by introduction of new system of records.

Exhibit G shows routing necessary in handling "a case of slowed up movement": Letters 3, wires 7, telephone 1; total, 11 communications. This exhibit can be taken as an average example of work performed by carriers in carrying out wishes of patrons to avoid demurrage at final destination.

Exhibit H—Shows how cars are slowed up in transit to

accommodate patrons, and service and delay caused thereby; To-wit, for two months, 80 cars, 236 telegrams sent; average, 8 per car; total communications, over 10 per car; average delay per car, 12 days. For period of two months, 96 cars potatoes, diverted 225 times; average 2 1-3 times per car; total messages, 376; average 4 per cent; average delay per car, 14 days. Shippers admitted they held up cars to avoid "breaking the market."

Exhibit I covers four trans-continental lines and one private car line, in the comparatively short period of three weeks; number of cars diverted, 193; number of times diverted, 451; number of diversion messages, 962; cost at Western Union rates, \$957.97; average, \$4.96 per car; average number of messages per car, 5; average diversion per car, 2.34.

Exhibit J shows total of 64,678 cars diverted in one year; 61,956, or 95.79 per cent free of cost, and only 2,722, or 04.21 per cent were charged for; 2,059 cars were diverted two to five times, and 26,714 messages were necessary to complete transaction. Had a charge of \$2 been made on "free cars" the carriers would have collected \$123,912.

In the foregoing exhibits no segregation was made between state and interstate traffic, but the latter composed about 85 per cent of the whole. To illustrate the cost to the railroads of these privileges, I would cite the following:

If commercial wires were used, for example, in October, 1915, on 4,011 cars held for diversion at an average cost of \$4.96 per car, it would amount to \$19,894.56.

There are only a comparatively few paid diversions, but assuming all of these 4,011 cars would have been subject to a diversion charge of \$2, the sum of \$8,022 would have been collected.

A charge is made of \$2.50 for ordinary switching of a car, and as a diversion entails two switchings and considerable extra switching in picking up cars after forwarding instructions are received, we think it only fair to show extra switching of these 4,011 cars on a basis of \$2.50 for setting out and \$2.50 for picking up each car again, or a total of \$5 per car, which amounts to \$20,055.

Since the average earnings of a car per day on our last analysis in this territory was \$5.68 for all cars in commercial service, loss of 4,968 car days is equivalent to \$28,104.64.

The grand total of figures shown above is \$76,076.20 for the month of October, 1915—only one month. If the same ratio would hold good for the entire year, the figures would reach the amazing total of \$912,914.

We have not included in these figures the operating expenses caused by shipments being back-hauled. To illustrate, we had a short time ago 15 cars for one firm in a period of 20 days, that were backhauled 11,250 miles, for which the carrier received no additional revenue.

In view of the foregoing and of the fact that the number of reconsignments and diversions are only a fraction of the total in the United States, the cost of this extra and, nearly always, free service is so alarming, that if figures were available drastic action would be taken immediately to stop up these leaks and loopholes, which now permit a Chinaman with a load of wash to pass through without even touching the sides.

Assuming that it is necessary to clean house and make this service (which is no longer an infant and has become of age) to stand its own cost and cut out this large contributor to car shortages, congestion of terminals, delay to cars, burden in use of wires, clerical labor, etc., the question is—how is it to be done?

First: Statistics must be obtained showing conditions over a period of time to substantiate the fact that curtailment is vital and necessary, otherwise the commissions will not sit up and take notice. Data should be compiled along lines shown in the exhibits appended hereto, or in better fashion, also a record should be kept of messages, tracers, time and cost in handling, cost of extra switching, delay to trains,

cars, damage and claims paid through errors, and in brief all expenses of any sort incurred by any department, substantiated by detailed records, as far as possible, together with an estimate of delay and damage caused to other patrons.

Second: The railroads must decide and agree among themselves, using the data obtained as basis, that diversion

ten years' experience, eleven years of which covered watching of operations on many railroads daily, and while they may not be precisely what the railroads want, and I have not taken space or time to substantiate them, I believe they will at least be food for thought and later action. It should be borne in mind that while figures for charges may seem

and reconsignment and reshipment, stop in transit and hold track detention, shall be restricted or done away with.

Third: It would be my suggestion to cut out all free reconsignments, stop in transits, reshipments, when bulk is not broken, and make a charge of no less than \$2 for each.

Fourth: If orders were not received in ample time to allow continuous movement of car to assess charge of at least \$2.50 for setting car out and \$2.50 to pick it up again. If a backhaul is involved, the shipper should pay the local rate.

Fifth: On cars ordered to hold tracks at destination for further orders, \$1 should be charged for overhead cost and \$2.50 for switching to and from hold track, or total of \$3.50 per car.

Sixth: Tariff provisions should be so worded to prohibit an out of line haul without proper freight revenue for the service.

Seventh: Tariff should be so constructed that the notice of arrival at point of stoppage or destination will constitute the notification, and free time under demurrage rules should be computed from the first 7 a. m. after the notice has been sent, in the manner previously agreed to by the shipper, and not from the time received through some distant railroad representative.

Eighth: Tariffs should provide that cars will not be considered released until forwarding instructions are actually received by the local agent holding the car for disposition and not from time filed with distant railroad representative.

Ninth: A committee of three or five well informed and efficient railroad men, who have full knowledge of the subject, should be found so that if the matter is presented to the Interstate Commerce Commission, this committee could act for all railroads.

Tenth: The aid of American Railroad Association and Commission of Car Service, should be obtained to assist in the movement.

These provisions, I believe, are necessary, from my nine-

excessive, it is not the purpose to obtain additional revenue, but to curb the practice and to make those enjoying the privilege pay its proper cost, taking everything into consideration, I venture to say the figures are not far astray.

EXHIBIT "G"

The following is a sample of many cases discovered in investigations, showing routine necessary to accomplish diversion:

September 15—Letter from consignee at Los Angeles to diversion clerk, Los Angeles, on car consigned to Los Angeles. "Confirming 'phone advice—Stop U. P.-73,732 at Pomond."

September 15—Wire, diversion clerk to agent San Bernardino (division point). "Stop U. P.-73,732, forward to Pomona and advise."

September 15—Wire, diversion clerk to Agent Pomona. "Advise arrival of U. P.-73,732."

September 17—Wire, agent San Bernardino to diversion clerk. "U. P.-73,732 stopped and forwarded to Pomona."

September 17—Wire, agent Pomona to diversion clerk. "U. P.-73,732 has arrived."

September 18—Wire, agent Pomona to diversion clerk. "Give disposition of U. P.-73,732."

September 20—Letter of diversion clerk to consignee, confirming 'phone request. "U. P.-73,732 at Pomona, please give disposition."

September 20—Letter from consignee to diversion clerk confirming 'phone advice. "Divert U. P.-73,732 Pomona to Los Angeles."

September 19—Wire diversion clerk to agent, Pomona. "Forward U. P.-73,732 to Los Angeles."

September 19—Wire, agent Pomona to diversion clerk. "U. P.-73,732 will go forward to Los Angeles."

'Phone advice was usually acted upon, the letters being in confirmation.

EXHIBIT "H"

TWO EXAMPLES OF FLAGRANT ABUSE OF RECONSIGNMENT AND DIVERSION PRIVILEGES

During two months there were stopped at San Bernardino by the East & West Railroad 30 cars consigned to Los Angeles, diverted to intermediate points, and finally to Los Angeles, which required the use of 236 telegrams, or an average of 8 per car. Including telegrams, there were 321 communications, or over 10 per car. Twenty-six of these cars were delayed between San Bernardino and Los Angeles (a distance of 60 miles, with a train schedule of less than 6 hours) on an average of 6 days; the average delay between arrival at San Bernardino and release at Los Angeles was 12 days per car.

North & South Railroad diversion files from January 15 to February 28, show 96 cars of potatoes originating at California, diverted 225 times, an average of 2 1-3 times per car, total number of messages 376, or an average of 4 per car. All but four of these cars were finally unloaded at points in Southern California and were in transit on an average of 14 days.

The consignee frankly admitted that his object in stopping cars was to avoid "breaking the market" and to evade demurrage which would have probably accrued at the final destination had they been allowed to go through on schedule time.

EXHIBIT "I"

STATEMENT SHOWING ABUSE OF FREE DIVERSION PRIVILEGES AND WHAT THE COST WOULD BE HAD MESSAGES BEEN SENT BY WESTERN UNION INSTEAD OF RAILROAD WIRES

Road	No. cars diverted	No. diversion messages times diverted	Cost at Western Union rates	Average cost per car at W. U. rates	Average No. of messages per car	Average No. of diversion per car
Ex. Co.	17	43	\$213.71	\$12.57	9.47	2.53
A. L. W. R. R.	24	68	230	199.58	8.32	9.58
N. & S. R. R.	100	245	170	152.36	1.32	1.70
E. & W. R. R.	31	65	220	174.18	5.62	7.10
S. & E. Ry.	21	30	181	218.16	10.39	8.62
	193	451	962	\$957.97	\$4.96	5.00

*The average is low, because the same message was used to divert more than one car.

The above is a recapitulation of diversions by the four roads and one car line mentioned, and includes some of the most aggravated cases of abuse of the free diversion and free wire privileges, although it covers a comparatively short period. These cover diversion orders filed with offices in California alone, as we are unable at this time to secure information of the same character filed with offices in other states.

Assuming that the North & South Railroad is a fair example of the number of messages per car in accomplishing diversion and that the minimum Western Union rate of 25 cents per message had been imposed, this would represent the respectable sum of \$24,254.

EXHIBIT "J"

FREE AND PAID DIVERSIONS AND RECONSIGNMENTS—FOR ONE YEAR

Road	No. of cars diverted	Free diversions	Paid diversions	Remarks
N. W. R. R.	20,640	19,488	1,152	
Ex. Co.	20,475	20,475	None	2,059 cars diverted 2 to 5 times.
N. & S. R. R.	18,140	17,624	516	26,714 wires sent.
E. & W. R. R.	3,457	3,003	454	
S. E. Ry.	1,966	1,366	600	
Total	64,678	61,956	2,722	

Note.—Of the total number of cars diverted—64,678—there were 61,956, or 95.79 per cent, diverted free of cost, and but 2,722, or 4.21 per cent, on which a charge of \$2 per car was imposed.

Had a charge of \$2 been imposed on each car the total would have been \$129,356 instead of \$5,444, or an increase of \$123,912 for the year.

GERMANY ENCOURAGES WATERWAY TRAFFIC.—From August 1 a new railway charge has been introduced in Germany, apparently as a means of raking in more money—a charge of an additional 7 per cent on the cost of transporting all freight sent by rail, whether for long or short distances. This 7 per cent must be paid by the shipper. More interesting is the fact that from July 1 last it was made compulsory to send certain categories of freight in Germany by water, whenever possible. (Germany has 9,375 miles of navigable inland waterways.) Everything is being done besides to encourage the sending of freight by water, the newly introduced taxes on freight traffic having been removed, within certain limits, in the case of freight which is sent by water, but which it is not compulsory to send by this means. Certain classes of freight may in any case no longer be sent by rail from particular places on the Elbe, Oder and other rivers, but only by water, by a regular service of cargo steamers, running between Altona and a number of other places, including Berlin, and between Berlin and other places. Moreover, surtaxes have been introduced on passenger tickets, amounting on a first-class ticket to 16 per cent, on a second-class ticket to 14 per cent, on a third-class ticket to 12 per cent and on a fourth-class ticket to 10 per cent, with an extra charge for baggage of 12 per cent on the ordinary cost of its conveyance. From this it may be inferred that the financial condition of German railways cannot be altogether brilliant.—A correspondent in the *Railway Gazette*, London.

Second Track Construction on Southern Railway

Additional Facilities Provided to Meet the Requirements of Increased Traffic. Improvement in Grades and Curves

Trestle for 98 Ft. Fill Over 30 Ft. Arch at Walton Creek

DURING the last three years the Southern has undertaken the reconstruction of its main line and the construction of second track on 363 miles out of a total distance of 649 miles between Washington, D. C., and Atlanta, involving an expenditure of over \$20,000,000. It is the most extensive program of this character undertaken in this country during the last few years and when the work now under contract is completed the Southern will have a double track road built to modern standards between these two points. Located as the Southern main line is, high up along the water sheds in the broken and in some places almost moun-

work and it has progressed rapidly since that date. Of the 649 miles, a second track has been built parallel to the original track on about 479 miles and a new double track line has been built in place of the old line on 170 miles. In the revised line the maximum curvature is 6 deg. and this has been used in only a few instances, the sharpest curve generally being less than 4 deg. The grades have been reduced from a maximum of 2 per cent to 1 per cent in both directions except at those points where momentum or pusher grades have been installed. This revision of the grade line has enabled the rating for Mikado engines to be increased from 1,400 tons to 2,000 tons. The improvements have also included the rebuilding and enlargement of division terminals and the elimination of grade crossings where this has been physically practicable. On the new lines already completed nearly 100 crossings have been eliminated, involving a very heavy total expenditure. The removal of these crossings will be described in detail in a second article.

The construction of the second track has been carried on in sections, the most congested portions of the line being improved first and leaving single track districts between. The work has now progressed to the point where the double track line is in operation for the entire distance of 382 miles between Washington, D. C., and Charlotte, N. C., the 53 miles between Spartanburg, S. C., and Central, S. C., and the 78 miles between Cornelia, Ga., and Atlanta. Work was begun on the 61-mile section between Central, S. C., and Cornelia, Ga., in April, 1916, and on the 75 miles between Charlotte, N. C., and Spartanburg in April, 1917. With the completion of these two sections the entire main line between Atlanta and Washington will be double track.

THE DEVELOPMENT OF TRAFFIC

These improvements were made necessary by the rapid development of the territory served by the Southern and the consequent great increase in the volume of traffic handled. In the period between 1900 and 1916 the population of the states served by the railroad increased 23 per cent. In the same period the passenger revenue per mile of road increased over 83 per cent. In 1900, with 6,425 miles of road operated, the number of passengers carried one mile was 370,424,293, while in 1916, with 7,023 miles of road operated, the number had increased to 783,139,707.

The industrial development of the states traversed by the Southern lines is evinced by the figures compiled by

The Washington-Atlanta Line in Relation to the Southern System

tainous areas parallel with the Atlantic seaboard, the original line was one of heavy curvature and grades, 2 per cent grades being common. While the rapidly increasing traffic made the improvement of this line imperative, these physical characteristics made the work unusually expensive.

The construction of second track on this line was first undertaken over 15 years ago, but from 1901 to 1914 only small sections were rebuilt each year. In June, 1914, funds were made available for the more rapid prosecution of the

the United States census of 1914 which show that in the five years covered by the census the value of the manufactured products had increased 18.44 per cent as compared with 17.20 per cent for all other states. The census figures also show that in the 12 months ending July 31, 1916, the mills of the South consumed 3,526,787 bales of cotton, an increase of 16.51 per cent compared with an increase of 11.62 per cent for all other states. Approximately 75 per cent of the cotton spindles of the South are in mills along the lines of the Southern and its associated companies. In the territory served by this road during the year ending June 30, 1916, general improvements, public utilities, etc., were completed at a cost of more than \$67,500,000. Industrial plants numbering 684 and representing a capital investment of more than \$35,000,000 were completed during the same period and additions were made to 320 plants previously established at a cost of nearly \$17,000,000, while construction was begun on 80 other plants representing a capitalization of \$16,327,700.

The principal feature of the agricultural development aside from the production of cotton and tobacco is the rapidity with which the southern farmers are adopting diversified farming and crop rotation with the raising of live stock, which results in increased average yields per acre of the staple crops. The fruit industry is also developing rapidly and in the year ending June 30, 1916, nearly 3,000,000 apple, peach, orange and other fruit trees were planted along the lines of this railway. The result of this general, industrial and agricultural development is reflected in the gain in revenue freight handled which increased from 14,121,181 tons in 1900 to 30,272,130 in 1916.

During the year ending January 30, 1916, 30,272,132

By referring to the map of the system it will be seen that lines radiate from the main line between Washington, D. C., and Atlanta, Ga., and that this main line is the outlet for the traffic from these branch line feeders. At Atlanta lines from Florida and from Arkansas, Mississippi and Alabama converge. At Charlotte the line diverges for Florida. The line from Chattanooga and Tennessee points

Steam Shovels Working in New Glasgow Cut

joins the main line at Salisbury, N. C.; while one line from Norfolk, Va., connects at Greensboro, N. C., and others at Danville, Va. In addition to these main feeders others tap the main stem both north and south of Charlotte. This frequent junction with branch lines places a heavy burden on certain sections of the main line and results in congested

Alinement and Profile of Old and New Lines from Harbin, S. C., to Cornelia, Ga.

tons of commercial freight was moved, of which 29.43 per cent was the product of manufacturers and miscellaneous, 28.6 per cent bituminous coal, 12.1 per cent other products of mines, 16.19 per cent products of forests, 11.86 per cent products of agriculture and 1.11 per cent products of animals. A large amount of this traffic is in high grade commodities which demand fast movement. During the fruit season this demand is particularly imperative. The fruit trains are often run as sections of passenger trains, 15 sections of a train not being uncommon. With single track the expeditious movement of this high grade freight, most of which is northbound, was difficult and at times it interfered seriously with the movement of other freight and of passenger trains. During the period of greatest traffic density it has been necessary to discontinue the operation of all work trains.

districts. With single track these districts limited the capacity of the entire system as all traffic between the east and west and from the north or the south, had to pass over one or more of them. As a result, not only was the operation slowed up and the cost increased in the congested districts, but the development of the entire system was retarded. The justification of the improvement work is shown by the fact that during the year ending June 30, 1916, the entire 649 miles of line earned well over \$25,000 a mile revenue.

FINANCES

At the inception of the project in 1901 the road was handicapped by the lack of funds, and for this and other reasons the double tracking done between 1901 and 1914 was in comparatively short sections, the extent of the yearly work depending on the funds available. During this period

of 13 years, 240 miles of the 382 miles between Washington, D. C., and Charlotte, N. C., and 78 miles north of Atlanta, Ga., were improved. In October, 1914, funds were made available for the remaining work which has since progressed rapidly. At that time an agreement between the Southern

boro. In subsequent years the other sections were built in the order of their importance. South of Charlotte the earliest improvements were made north of the Atlanta terminal district, through which the main line handles a large amount of traffic for the Birmingham district, Mobile, New Orleans and other more distant points.

PLAN OF CONSTRUCTION

Where practical the second track has been built parallel to the old. However, in many cases the surveys disclosed the fact that a better line could be secured and in such sections a new double track line was built, the old location being then abandoned except at a few points. At places sections of the old main line were left in service as spurs for industrial development and at Lynchburg, Va., the old line is still used for local trains. In building replacement lines the engineers were confronted with the problem of locating an improved line and still reaching all the stations served by the old line. This object was accomplished in all cases except at Madison, Ga., where the citizens relieved the railroad from its obligation to maintain service for the sum of \$25,000.

In parallel work the second track was built first on one side of the old main line and then on the other to secure the minimum grading. In some instances it was located far enough from the old track to allow a new double track roadbed to be constructed independent of the old, and in other instances to allow the construction of only one track. In order to understand the construction methods followed in this parallel work it should be remembered that the grades were reduced through such sections the same as on independent lines, all summits being lowered and sags raised so

Coldazel Fill 40 Per Cent Complete

Railway Company and the Atlanta & Charlotte Air Line Railway Company, now a part of the Southern, was ratified authorizing the Atlanta & Charlotte to issue \$20,000,000 of bonds, secured by a first mortgage on all of its railroad property, \$5,500,000 of these bonds being issued to retire the bonded debt of the Atlanta & Charlotte and \$14,500,000 to provide funds for the double tracking of the railroad. These funds made it possible to undertake the double track construction work south of Charlotte in yearly sections much

Alinement and Profile of Old and New Lines from Central, S. C., to Harbin

more extensive than in the earlier work between Charlotte and Washington.

CONSTRUCTION PROGRAM

In carrying on the earlier construction work the first efforts were directed to the relief of those congested districts where the traffic was most dense. The main line north of Charlotte carried a particularly heavy burden, with the congestion becoming greater toward the Washington end. North of Orange, Va., the Southern handles the trains of the Chesapeake & Ohio in addition to its own traffic, and because of this fact the first section to be improved was the 78 miles of line between Orange, Va., and Alexandria. This part of the work was done between 1901 and 1903. During the three following years the work was continued in the congested district between Salisbury, N. C., and Greens-

boro. The old choppy grade line was replaced with longer continuous grades.

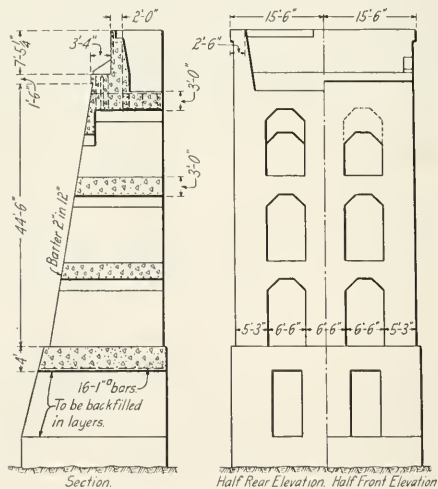

The work was done in two ways where the grade was changed. In one the double track line was built without disturbing the old. In the second, one new track was built at the new grade and traffic was diverted to it, the old track then being taken up and rebuilt in its proper location. Both methods possessed advantages, the first being more expensive in grading and the second in track work. The two methods are illustrated in the diagrams. Where feasible the first method was followed as this led to no delay to construction, both tracks being completed and opened to traffic without disturbing the old track which was taken up when convenient. Also by this method the old roadbed was not endangered by the almost vertical cut that it was necessary to make at the ends of the cross-ties of the old

main track if the second method is followed, at points where the new grade was lower than the old. When following the second method if the change in grade was not more than five feet the old main track was lowered or raised in its original location, while if the change in grade exceeded five feet the new track was built first. With this method, construction must be shut down after the grading for the first track is completed until the new track is laid and traffic diverted to it. The remainder of the roadbed is then built and the second track laid.

In such work the railroad does not allow the contractor to waste, or borrow earth at will, defacing the right of way. Where long light fills or cuts are encountered, where the work is not heavy enough for the employment of steam shovels and trains and the haul is too long for wheeler outfits, revolving shovels have been used in connection with dump wagons and teams. If it happens that it is necessary to waste the material, it is placed below sub-grade and the banks are trimmed to make a slightly appearance.

STANDARDS OF CONSTRUCTION

In both parallel and replacement line work the track is laid with 85-lb. rail by company forces. Tieplates are placed on all curves. The ties used are untreated and in most cases are produced along the right of way. Both

High Abutment of the Buried Type

gravel and broken stone are used for ballast. The standard slope in earth cuts is 1 to 1 and in fills $1\frac{1}{2}$ to 1. In making fills, instead of increasing the height the excess material is placed outside of the standard section which is 31 ft. for a double track roadbed. Ten per cent of the height of the fill, measured on the slope, is placed on each side. For instance, in a fill 100 ft. high the roadbed is made 61 ft. wide instead of the standard 31 ft. This extra width provides for a large amount of wash before the net section is affected. In all cuts a surface ditch is dug 10 ft. back of the top of the slope to prevent the water from washing down over the face of the cuts. This precaution is necessary because of the clayey material encountered. These ditches are turned back away from the track as the fill is approached to prevent the water from washing the toe of the slope. In cuts the standard roadbed width is 39 ft.

The settlement in the fills occurs almost invariably outside of the top of the slope and manifests itself as a vertical crack. The settlement is often as much as 10 to 12 ft., and

after it has subsided the fills are widened, it being necessary sometimes to repeat the operation. American ditchers are used in these operations.

As delivery of steel is so uncertain at present the standard overhead highway bridge on the later work is constructed entirely of creosoted timber except for the floor which is laid with 3-in. by 6-in. untreated heart pine planks. These bridges are built at an average cost of \$500 for labor and \$1,200 for material. The center span over the tracks is built as a truss 33 ft. in length, providing 10-ft. side clearances from the center of track instead of the old standard of 7 ft. 6 in. The roadway provided on the bridges is 20 ft. in the clear. In the earlier work the standard overhead bridge consisted of six $31\frac{1}{2}$ lb., 12-in. I-beams on the approaches and also on the middle spans, supported on 4-post creosoted wooden bents standing on concrete pedestals.

The steel railroad bridges are all designed in accordance

View of the Construction Plant, North Broad River Viaduct

with Cooper's E-55 loading and creosoted ties are provided in the deck. The bridge ties are fitted with 4-hole tie plates and the rails and plates are held in place by screw spikes.

As soon as possible after a section of double track is completed automatic signals are installed and passing tracks provided. The passing sidings are all 4,000 ft. long in the clear and in the replacement lines are located on the down grade slopes of summits in the direction of traffic. Approaching passing tracks on ruling grades, the grade is flattened to a maximum grade of 0.75 per cent for a distance of about one-half mile before reaching the switch. This arrangement permits the trains to stop on the main line, while the switch is being thrown and then to get in motion readily to

enter the siding. As the sidings are located on the down grade slope no trouble is experienced in leaving.

In parallel work the sidings are located in this way wherever feasible. At times, however, they are located on level grades but in no case are they located so that a ruling grade is encountered when entering or leaving a siding.

THE WORK SOUTH OF CHARLOTTE

On the old line between Atlanta and Charlotte, grades as heavy as 2 per cent in spots were encountered with the average about 1.25 per cent. On the improved lines in the replacement work these grades have been reduced to 1 per cent against southbound and to 0.9 per cent against north-bound traffic. In the parallel work the same ruling grades have been maintained but momentum grades with as great a rise as 14 ft. vertically have been permitted at places.

Prior to the sale of the Atlanta & Charlotte bonds in 1914 second track had been provided on the 53 miles between Atlanta and Gainesville except for $4\frac{1}{2}$ miles between Suwanee and Duluth which has since been completed. The construction on this $4\frac{1}{2}$ miles was parallel except for a revision between Strickland Springs and Duluth, where 1,320

new line closely parallels the old, saving 70 ft. in distance, while the rise and fall and the curvature are unchanged. From Easley to Greenville, 12 miles, with the exception of a $4\frac{1}{2}$ -mile revision south of Greenville, this division was also built by the parallel method. The distance saved here by the new line is 795 ft., while 257 deg. 26 min. of curvature and 29 ft. of rise and fall were eliminated. From Greenville to Greer the new line parallels the old except for a revision north of Enoree river, and from Greer to Hayne the only revision is a grade change at Wellford, eliminating 10 ft. of rise and fall.

The line revisions between Central and Hayne were comparatively minor and the work of main interest was the construction of the larger bridges. In the division between Easley and Greenville the bridge over George's Creek consists of three 100-ft. deck girder spans supported on buried abutments and reinforced concrete piers and that over the Saluda river of four 25-ft. concrete arch spans on the north end and a steel viaduct 900 ft. 8 in. long. Both of these bridges are located on the $4\frac{1}{2}$ -mile revision south of Greenville and were consequently built without interference with or from the traffic of the old line.

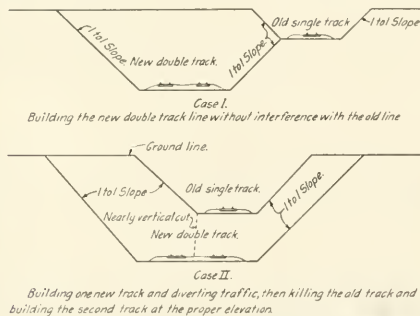

At Saluda river arch spans were provided to avoid a fill at a graveyard, and to permit an underpass for a country road. The viaduct, with its rails 110 ft. above the river, consists of a series of 60-ft. girders and 30-ft. towers which

Piers and Construction Plant at Chauga Creek

ft. of distance, 141 deg. 14 min. in curvature and 19 ft. of rise and fall were eliminated. Between Gainesville and Cornelia, 25 miles, the old line ran up and down hill with short tangents between curves. The new track was built first on one side and then on the other side of the old one to lengthen the tangents and to reduce the curvature. Between Baldwins and Gainesville the line was revised to do away with 6-deg. curves, to maintain the ruling grades and to eliminate a series of short humps in the grade line. In the earlier work, second track had also been provided for a distance of a little over one mile between Spartanburg, S. C., and Hayne, principally included in the Spartanburg yard. In this short section, however, no change was made in either line or grade.

Since the sale of bonds in 1914, the work in this territory has been prosecuted rapidly. The first section to be improved was the 57 miles between Central and Hayne on which work was begun in July, 1915. Construction of the second track in this section is now practically completed and the line is in operation as double track for nearly the entire distance. From Central to Easley, 14 miles, the

Methods of Providing Double Track

are supported on concrete pedestals. The south abutment is of the buried type. The supporting pedestals vary in design and, beginning at the north, the first is built as a reinforced concrete pier on which the girders rest directly. At the first tower the four supports originally were designed as square pedestals, but to save room at the highway which crosses under the viaduct at this point, the design of two of the pedestals was changed and circular reinforced concrete pedestals were provided. The plans provided for square pedestals in the stream but after the experience with the high water of July, 1916, the design of these was changed and buttress pedestals substituted.

The entire structure is founded on rock and the construction was carried on without trouble from water. This rock used in the concrete was quarried in a cut south of the bridge, crushed locally and hauled in wagons to the mixer plant. The sand was mined by hand from the creek and shoveled into wagons while cement was brought from the old line to the plant by wagons. The concrete was all placed from one mixing plant, distributed by an overhead cable way and placed in the forms at the north end from the tower and chute and at the pedestals by means of a derrick. At Enoree river, between Greenville and Greer, a single track deck truss, consisting of two 150-ft. spans with trestle approaches was replaced by four 90-ft. deck girder spans. At this point the second track was built parallel with the

old, a two-mile tangent preventing the building of the new bridge free of the old one without the addition of reverse curves to the line. The masonry for the new southbound track was built complete, with the new steel set 18 in. off center and traffic was diverted from the old structure to the new. The old structure was then removed and the masonry completed.

At the South Tiger river existing curves at either end of the old structure enabled the new one to be constructed free of the old. By reducing the length of the structure from 750 ft. to 540 ft., it was possible to place the new bridge entirely on tangent and to lessen the curvature slightly. The concrete for this structure was all placed from one tower. The stone for the work was brought in by train and the sand mined from the river by hand and hauled in wagons to the mixing plant.

At the Middle Tiger river the original structure was a steel viaduct with 30-ft. towers and 60-ft. girders. It was replaced by a deck girder bridge and the intermediate piers were constructed by boxing around the steel of the old structure. At North Tiger river and Fair Forest creek, similar construction methods were followed.

At Freyes creek a timber trestle was replaced by four 50-ft. deck girder spans. The new piers were arranged to come between the bents of the old structure and no temporary work was necessary to maintain traffic. All the masonry was brought up to the final height and the traffic then diverted over the new southbound main track where the first girders had been placed. The old structure was then torn down, the northbound girders set and the double track put in operation. The girders at this point were placed by derricks.

CORNELIA TO CENTRAL

The most interesting of all the work south of Charlotte is in the mountainous territory between Cornelia, Ga., and Central, S. C. Through this section, which is 61 miles in extent, the country traversed is badly broken and the line leads across a succession of ridges and valleys. The old

The Fill at Walton Creek

location followed around the hills instead of cutting through, necessitating excessive curvature and a very broken grade line. The old line did not lend itself to improvement by parallel construction without excessive cost, and except through villages and cities and other short stretches it was abandoned and a double track line was constructed in a new location that departs three to four miles from the old in places.

Owing to the nature of the country traversed and the fact that a practically new line was built the saving in dis-

tance, rise and fall and curvature were considerable; the new line being five miles shorter than the old, having 3,183 deg. 5 min. less curvature and saving 368 ft. in rise and fall. The maximum curvature is reduced from 6 deg. 14 min. to 4 deg. 30 min., and the maximum grade is cut from 2 per cent in both directions to 1 per cent southbound and 0.9 per cent northbound.

The grading in this section involved the moving of 10,351,200 cu. yd. of earth and rock for which 35 steam shovels were employed and the placing of 127,600 cu. yd. of concrete masonry. Near Ayersville, Ga., a cut 70 ft. deep and over one-half mile in length was excavated, from which

Dan River Bridge

290,000 cu. yd. of material was moved, 70 per cent of which was rock. South of Toccoa the largest fill on the entire line is encountered, 140 ft. high, 1,600 ft. long and containing 1,640,000 cu. yd. of material. At Waltons creek north of Toccoa another fill was made containing 750,000 cu. yd. of material.

The viaduct over the North Broad river which contains 35,000 cu. yd. of concrete is the most important bridge on this section of the line. Other important structures were provided at Tugallo river, Chauga creek, Seneca river, Richland creek, Walton creek and Toxaway creek.

In making the cuts containing rock the general practice was to drill the entire top width of the cut with a well drill, placing the holes from 8 to 10 ft. apart each way and shooting three or four rows of these holes across the entire width of the cut at one time. The shovels were then set at work, the loose materials loaded and removed and the operation repeated. To move the material at the bottom of the cuts steam drills were used and the holes were prepared and shot as above. Where boulders were encountered Jap drills were used ahead of the shovels to break up those that were too large for the shovels to load.

At Lane cut near Ayersville, Ga., where most of the 290,000 cu. yd. of material excavated was wasted, 200,000 cu. yd. within 200 ft. of the cut, the material in the three first cuts of the shovel was moved north and placed in a fill to avoid borrowing. At this point the new line crosses eight ft. above the old, and to move the material north it was necessary to provide a temporary bridge over the old track and an incline embankment down from the crossing to a connection with the old main track. A construction track was placed on this temporary embankment, and the material was moved to the fill in standard gage 6-yd. dump cars. After serving its purpose the temporary embankment was removed by the steam shovels.

South of Toccoa extensive side hill work was encountered and the new line was moved up the hill from its original

location to avoid a 2-ft. fill on the center line which ran to 150-ft. at the bank of the creek below. With the changed location the quantities balanced and in construction a path was cut along the grade line to permit the shovels to work.

The larger fills are built of borrowed materials and the lifts were made on temporary trestles built of poles cut along the line. The average lift is from 30 to 35 ft. At Coldazell fill the borrow pit was located on the north end. The material was moved from the pit by two Osgood No. 73 shovels and transported to the fills in standard gage 12-yd. Western air-dump cars. Two trains of 14 or 15 cars were provided for each shovel. The longest haul was 6,000 ft. and the average 3,000 ft.

At this point the fill crossed the old line 75 ft. above grade, and in order to maintain operation during construction the old main track was re-located up the hill about 100 ft. from its original location. This temporary location involved making a cut containing 50,000 cu. yd. of excavation. The new line was carried over the temporary location of the old main track on 100-ft. girders supported on pile abutments with trestle bents at each end. The embankment at this point was made in four lifts of 35 ft. each. The first trestle was placed diagonally across the site of the fill with the borrow pit on grade with the trestle. The diagonal location of the first trestle permitted the embankment to be made to the full bottom width to the limits of operation. The second and third trestles were also placed diagonally

North End of Saluda River Viaduct Showing Arches, the Solid Concrete Pier, and Square Circular and Buttressed Pedestals

with the center line but at a sharper skew to permit filling out to the toe of slope. As each trestle was built up to the proper height the borrow pit was moved up the hill to a corresponding elevation.

At North Broad river the approaches to the viaduct are on a 110-ft. fill and the embankment was placed from a trestle built to the full height. As the trestles were founded on rock, trouble was experienced in their moving with the creeping of the fill. This was overcome by first placing the fill at the ends and then building the trestle in the form of towers, providing just enough bracing between the towers to secure stability. The material was then dumped between the towers which effectually stopped the sliding.

The North Broad river viaduct which contains 35,000 cu. yd. of concrete, consists of eleven 100-ft. plate girder spans and eight spans of 26 ft., the total length being 1,313 ft. between back walls. It was planned originally to construct this viaduct with steel towers, but because of the high cost of bridge steel, hollow reinforced concrete piers 190 ft. high were built instead. These piers are rectangular in shape on the exterior and oval on the inside. The minimum thickness of the pier shell is 4 ft. and the walls in height are tied together with reinforced concrete slab struts at intervals of 30 ft. The footings are 51 ft. 8 in. by 47 ft. 8 in. in area and the piers at the bottom are 48 ft. 8 in. by 44 ft. 8 in., the dimensions diminishing to 34 ft. by 30 ft. at the coping line. In all cases the greater dimensions

are longitudinal with the bridge. Bridge seats for the 26-ft. girders are provided on the top of the piers.

The construction plant for the structure included a stone crusher located at the south abutment. The stone for the crusher was secured at a quarry 1,000 ft. south and it was transported to the crusher over a narrow gage track. A narrow gage double track was also provided between the crusher and the storage bin for stone, which was located above the mixer, the latter being placed on the low ground adjacent to the river. The cars loaded with stone passed down the incline from the mixer to the storage bin on one track and drew the empties up the incline on the other. The narrow gage track continued down the hill to a connection with a siding from the old main line, one mile distant. Sand and cement for the structure were brought in to this siding by trains and unloaded into the narrow gage equipment for transportation to the mixer plant. The construction plant also included an overhead cable way which supported the chutes from the distributing towers, which were built up in the center of the hollow piers, three piers being built from one tower. The concrete materials dropped by gravity from the storage bins into the mixer; from the mixer the concrete was emptied into 1-yd. buckets which were elevated in a tower provided for that purpose. The concrete was dumped from the buckets to a receiving hopper located in the top of this second tower and passed down chutes through an opening left in the shell of the pier in which the distributing tower was located. Here the concrete was again elevated and distributed to the forms through chutes.

The forms were built in the shape of a rectangle outside and oval inside from timber cut and sawed on the site. They were built in 6-ft. sections 12 ft. long except those at the center of the four sides of the pier which were built in lengths to conform to the batter of the pier faces. Enough forms were built for two sections entirely around the pier which were placed at the same time before beginning construction. The bottom section was filled and allowed to set. While the second section was being poured the bottom forms were removed and elevated into position for the third run. A stiff-leg derrick was utilized in this operation to the limits of its reach after which the cableway was employed. The forms needed no bracing except for tie rods between the inside and outside sections. The rods were placed inside paper tubes and were removed after the concrete had set.

The bridge over the Tugaloo river on the state line between Georgia and South Carolina consists of five 100-ft. girders supported on four solid concrete piers and reinforced concrete abutments, all founded on solid rock which was found 20 ft. below the water. The foundation excavation was made by a derrick and orange peel bucket and wooden cofferdams were provided. The concrete plant was located on the south bank of the river and a trestle carrying a narrow-gage track was provided for the entire length of the work. Stone for the concrete was secured from a quarry two miles down the river and was transported to the site by gasoline-driven barges. Sand was mined from the river by hand and a clamshell derrick and a derrick at the elevated mixer plant placed the concrete materials in gravity bins above the mixer. The concrete from the mixer was poured into buckets mounted on cars running on the dinky track and an endless cable run from a hoisting engine pulled the cars to position for the dumping, when the buckets were picked up by a derrick and emptied into the forms.

At Chauga river the masonry consisted of two buried abutments, one solid concrete pier at each end and two hollow piers. A tower at each end of the work, carrying a cableway, was provided here and the mixing plant was located south of the north pier. An elevator and spout at the plant distributed the concrete to this pier and the adjacent one. The abutments and other piers were poured from buckets mounted on trucks which were run under the mixer and filled

and then picked up by the cableway for transportation to the forms.

At Waltons creek fill a single barrel reinforced concrete arch of 30 ft. span was placed and a 40-ft. arch at Richland creek. Other important bridges were built at Seneca river and at Coneross creek.

NORTH OF CHARLOTTE

On the unimproved line between Charlotte, N. C., and Washington, D. C., the maximum curvature originally was 11 deg. 30 min. and the ruling grade in both directions was 1.5 per cent. In addition to the curvature and rise and fall eliminated on the new line the maximum curvature has been reduced to 6 deg. The ruling grade in both directions is 1 per cent except where an allowance has been made for momentum where in some cases 1.4 per cent grades have been installed and for five pusher grades against southbound traffic which are all located north of Pelham, N. C., in a district of comparatively light southbound traffic, and two pusher grades against northbound traffic. With helper engines at these points the improved line permits a tonnage rating of 2,000 tons for Mikado engines as compared with 1,400 tons on the old line.

The later work in this territory, which is now all completed, included the 60 miles between Orange, Va., and New Glasgow, the 5 miles between Sycamore and Gretna and the 22 miles between Whittle and Danville. These sections were single track gauntlets between double track districts. On their completion all of the 382 miles of line between Charlotte and Washington was placed in operation as double track. In these sections the line lies east of the Blue Ridge mountains, with much of it between the mountains and the James river with tributaries of the latter crossing the railroad in deep valleys at frequent intervals. In consequence, the country involves heavy construction, the heaviest work being on those parts of the line which are closest to the mountains. From Arrowhead to Elma, 20 miles, the line is nearest to the Blue Ridge and the country is so broken that it was considered economy to construct and operate pusher grades in both directions rather than to undertake the expensive construction of a 1 per cent grade line. From Elma to New Glasgow the 1 per cent grade line was installed, involving very heavy construction in the New Glasgow cut which required excavation 100 ft. deep through rock, over 600,000 cu. yd. of material being moved from this cut. Embankments 80 ft. high were also built across the valleys on each side of the ridge through which the cut was made.

The material from the cut was almost equally divided between the two embankments. In moving the rock, which is granite, 60 per cent dynamite was used in 11-ft. holes placed 6 ft. center to center, 30 to 50 holes being shot at one time. The rock broke in large fragments which were shattered by means of charges placed in holes prepared with Jap drills. The rock was handled by a steam shovel at each end of the cut and was hauled to the embankments in standard gage equipment.

The most interesting of the recently completed structures in the line north of Charlotte is the Dan river bridge which is a reinforced concrete trestle 940 ft. long, consisting of thirty-six 26-ft. reinforced concrete slabs, 35 piers and two reinforced concrete counterfort abutments. The substructure is founded on rock 46 ft. below the base of rail and the piers are seated two feet in the rock. The abutments are also founded on rock but to avoid unnecessary excavation the footing slabs between the counterforts were built approximately at the level of the ground surface, the counterforts extending below the slabs into rock. The superstructure is bordered on each side by a 5-ft. walk supported on concrete brackets and protected by concrete parapets. The latter are ornamented with pilasters carried on the ends of the floor

brackets. The bridge involved 5,000 cu. yd. of excavation 14,900 cu. yd. of concrete and 1,600,000 lb. of reinforcing steel.

The grade line over the new bridge is 13.2 ft. higher than over the old, eliminating a 1.5 per cent approach to the Danville passenger station, located a short distance south of the bridge. This change of grade made necessary the relocation of the station. The old building was moved back about 200 ft. and a 7-track station provided. Stairways lead from the three platforms to a waiting room placed under the tracks adjacent to Craighead street which also passes under the tracks through a subway.

For a considerable portion of the distance between Danville and White Oak mountain the line follows Fall creek which it crosses six times, requiring a variety of structures. The first and second crossings each consist of two 80-ft. girder spans and the third one of one 80-ft. girder span with a 20-ft. concrete slab span at each end. The fourth is a concrete trestle of four 26-ft. slab spans while the fifth consists of two 80-ft. arches.

There are 34 culverts and three highway crossings on this section and, exclusive of the Dan river bridge, the structures on this section required 8,000 cu. yd. of wet excavation, 13,000 cu. yd. of dry excavation, 15,000 ft. of pine lumber and 26,450 cu. yd. of concrete. The old bridge over the Buffalo river consisted of a 106-ft. riveted deck truss with the rail level 70 ft. above the street. The second track is located west of and alongside the old line and is carried on two 50-ft. three-centered flat concrete arches. The old stone pier abutments were extended into the concrete abutments for the second track, requiring high counterfort wing walls on the west side. Most of the concrete was placed by means of a tower and chutes.

At the Tye river the old structure consisted of three 166-ft. skew pin-connected deck trusses supported on stone piers and skew T-abutments. The rail level is about 65 ft. above the bed of the stream. The new double track line is west of and parallel to the old one, on a grade 15 ft. higher and is carried on a steel viaduct having 30-ft. tower spans and 60-ft. intermediate spans. The abutments are of the buried type. The one on the north end is unusually high as it rests on foundations, but little higher than the bed of the stream. In the south end the abutment is set in a pocket in the natural rock high up on the hillside. The viaduct towers rest on concrete, tapered pedestals of circular cross section. The columns of the viaduct towers have horizontal bases and are tied together by horizontal bottom struts. This arrangement eliminates lateral stress to a large extent and permits the use of pedestals of relatively slender outline.

Besides the structures mentioned there is a long 30-ft. barrel arch at Oak Ridge requiring 5,000 cu. yd. of concrete. Two forks of the Ravanna river cross the line north and south of Profit, the north fork requiring a bridge consisting of four 75-ft. deck girder spans, while the south requires four 90-ft. deck girder spans. Blue Run is crossed by a concrete bridge consisting of two 30-ft. arches.

All of the construction work both north and south of Charlotte is in charge of W. H. Wells, chief engineer of construction, at Washington, D. C. R. O. Parsons, assistant engineer at Toccoa, Ga., is in charge of the work between Cornelia, Ga., and Central, S. C., and Felder Furlow, assistant engineer at Gastonia, N. C., under whose direction the work between Central, S. C., and Spartanburg, S. C., has been completed, is in charge of the work which was begun in April, 1917, between Spartanburg and Charlotte.

ARMED GUARDS ON RUSSIAN TRAINS.—The Russian Ministry of War has been authorized to provide armed guards for passenger and freight trains, anarchical conditions having been reported on the railways.

WASHINGTON CORRESPONDENCE¹

WASHINGTON, November 6, 1917.

Milton H. Smith, president; Addison R. Smith, vice president and George W. Jones, attorney for the Louisville & Nashville must answer the questions propounded to them by the Interstate Commerce Commission, in the course of its investigation under the Luke Lea resolution, adopted by the Senate in 1913. The resolution was offered, the officials of the railroad and other persons well informed as to politics in Tennessee and Alabama believe, to help Luke Lea retain the senatorship from Tennessee and to punish the railroad and railroad officials for refusing to help him. The commission, however, was not concerned with the motives that promoted the senator from Tennessee to offer his resolution or the senators voting for its adoption.

After some inquiries were made soon after the adoption of the resolution, the subject slumbered until the winter and spring of 1916 when the officials mentioned were summoned to Washington and asked about political contributions they are supposed to have made in Tennessee and Alabama. They declined to answer, on advice of counsel.

The supreme court of the District of Columbia cited the officials to show cause why they should not be required to answer and decided that they were not acting under a constitutional exemption from answering the question. Appeal was taken to the supreme court of the United States. Speaking through Justice McKenna, the court held, on November 5, that they must answer.

The court differentiated this case from the celebrated Harriman case pointing out that in that instance the Commission was endeavoring to make E. H. Harriman tell of Union Pacific stock transactions carried on for him by his brokers. The court held that that was a private matter into which the act to regulate commerce could not give the commission a right to make inquiry. It said that the commission's power was confined to inquiry concerning matters and things on which a formal complaint could be based or a proceeding could be had on the commission's own initiative. Stock transactions by Mr. Harriman, it suggested, did not come within the four corners of the act.

In the Louisville & Nashville case the question was as to what the officials of the railroad company and its affiliated company, the Nashville, Chattanooga & St. Louis, had done with the funds of the corporations in the way of political work. Justice McKenna discussed the case at length. Among other points made by him are:

"The Interstate Commerce Act confers upon the commission powers of investigation in very broad language, and this Court has refused by construction to limit it so far as the business of the carriers is concerned in their relations to the public, and it would seem a necessary deduction from the cases that the investigatory and supervisory powers of the commission extend to all the activities of carriers and to all sums expended by them which would affect in any way their benefit or burden as agents of the public. It is grasped thoroughly and kept in attention that they are public agents, we have at least the principle which should determine judgment in particular instances of regulation or investigation, and it is not far from true, and it may be entirely true, as said by the commission, that 'there can be nothing private or confidential in the activities and expenditures of a carrier engaged in interstate commerce. . . . It is said to be confined to cases where an inquiry is instituted as to any matter or thing concerning which a complaint is authorized to be made, or concerning which any question may arise under any provision' of the act 'or relating to the enforcement of any of the provision' of the act. In other words, that the inquiry is determined by the manner of procedure. The objection overlooks the practical and vigilant functions of the commission. To sustain it, appellant seems to urge

that there must be put into words by some complainant or by the commission, if it move of itself, some definite charge of evil or abuse and put into expression some definite remedy; and that an inquiry must not transcend either charge or remedy. To so transcend, appellant urges, would be an exercise of autocratic power and is condemned in *Harriman v. Interstate Commerce Commission*, 211 U. S. 407. Appellant presses that case beyond its principle and we may observe that section 13 has been amended and broadened since the decision in that case. The inquiry in the present case is more immediate to the functions of the commission than the inquiry in that"

TRAIN ACCIDENTS IN SEPTEMBER¹

The following is a list of the most notable train accidents that occurred on the railways of the United States in the month of September, 1917:

COLLISIONS						
Date	Road	Place	Kind of Accident	Kind of Train	Kil'd	Inj'd
8.	Chicago, B. & O.	Burlington.	xc	P. & F.	0	10

OTHER ACCIDENTS						
Date	Road	Place	Cause of Accident	Kind of Train	Kil'd	Inj'd
*1.	Chicago, B. & Q.	Somonauk.	Fire	F.

The trains in collision at Burlington, Iowa, on the 8th of September were a local passenger of the Chicago, Burlington & Quincy and an empty standing train of the Chicago, Rock Island & Pacific, the first named running over a misplaced switch and striking the other at moderate speed. Both enginemen, both firemen, one conductor and five passengers were injured.

The trains in collision at Jacksonville, Fla., on the evening of the 13th of September were southbound passenger No. 23 of the Seaboard Air Line and northbound passenger No. 80 of the Atlantic Coast Line. The southbound train was entering the station and the northbound was leaving, No. 23 having been admitted to the same track by reason of a misunderstanding between towerman and switchman. Both trains were moving at low speed. An express messenger and three passengers on the southbound train were injured.

The trains in collision at Maxwell, Utah, on the 15th, were a westbound special carrying soldiers and an eastbound regular train. Fifty-three soldiers, 21 other passengers and four employees, were injured. The men in charge of the eastbound train misread a dispatcher's order.

The trains in collision, near Earlville, Ill., on the night

¹ Abbreviations and marks used in Accident List:

rc, Rear collision—bc, Butting collision—xc, Other collisions—b, Brecken—d, Delictive—smf, Inforeseen obstruction—unx, Unexpected—l, derail, Open derailing switch—ms, Misplaced switch—acc, obst., Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—P, or Pass, Passenger train—F, or Ft., Freight train (including empty engines, work trains, etc.)—asterisk, Very wholly or partly destroyed by fire—Dagger, One or more passengers killed.

of the 16th, were eastbound freights. The leading train, carrying live stock, had been unexpectedly stopped and its rear end was struck by the following train, which had run past both distant and home automatic block signals set against it, and also had disregarded the signal of a flagman. Five drivers riding in a passenger car ahead of the caboose were killed outright and two more died later, and six others were injured. The engineer at fault was asleep. The fireman was engaged in putting coal into the firebox.

The trains in collision at Taunton, Mass., on the evening of the 17th, were a southbound passenger and a freight train which was switching on the main track. Twelve passengers were slightly injured. The passenger train had disregarded a stop signal.

The trains in collision on the Pere Marquette, at Bay City, Mich., on the morning of the 17th, were a westbound passenger and an eastbound freight. The engineer, fireman and one passenger were injured.

The trains in collision at Riverside, Mich., on the night of the 20th, were southbound passenger No. 16 and a northbound freight. One trainman was killed. The collision was due to the failure of the freight to wait, as ordered, at Riverside, to meet the passenger.

The trains in collision near Seco, Ky., on the night of the 20th, were a southbound passenger and a locomotive with no person on board. The fireman of the passenger train and three passengers were killed; 40 passengers and 5 employees were injured. Several of the injured subsequently died. The runaway engine had been started from Neon by a laborer in the mechanical department, who attempted to move the engine without authority to do so, and being incompetent to do such work, lost control of the engine.

The collision at Houston, Tex., on the evening of the 22d occurred at the crossing of the Gulf Coast Lines and the International & Great Northern, at Commerce avenue; a switching engine of the last named road backing into passenger train No. 2 of the Gulf Coast Line. The switching engine was moving at moderate speed. One passenger car was overturned and two passengers were injured.

The trains in collision at Atlanta, Ga., on the evening of the 26th, were a southbound local freight consisting of an engine, three cars and a caboose and a preceding train consisting of a locomotive and 20 cars, the engine pushing the car. Both engines and one car were damaged, and the car ahead of the yard engine took fire, apparently from burning oil in the headlight of the locomotive, and the car was destroyed. Six trainmen were injured. The collision was due to excessive speed of the local freight within yard limits.

In the butting collision of passenger trains on the St. Louis-San Francisco, a short distance west of Kellyville, Okla., on the 28th of September, 23 passengers and 2 employees (not trainmen) were killed and 29 passengers and 8 employees were injured. The westbound train was regular passenger No. 407, and the eastbound was an extra. This train had the right to the road, by a regular dispatcher's order, and the westbound should have waited for it at Kellyville. The eastbound train, engine 1322, consisted of empty passenger equipment, being taken east for troops. No. 407 met, at Kellyville, regular eastbound passenger No. 408, and also an extra train, engine 1343, consisting of empty passenger equipment, which had reached Kellyville on its timetable rights; and the men in charge of No. 407, seeing the two trains on the side track, assumed, without making the proper identification by engine numbers, that the extra was the one named in their order. The conductor admitted that he, and also the engineer and a brakeman, had neglected to verify the engine number. The colliding trains were running at about 30 miles an hour. The fatalities were in the leading passenger car of the westbound train, which was crushed by the mail car. The eastbound train, all empties, was badly wrecked.

The train derailed near Bremo, Va., on the 4th, was

Mixed Train No. 307 of the Buckingham branch. The train was moving slowly backward and had partly crossed a bridge when the engine and a loaded coal car, on the north span of the bridge, broke through and fell to the river below. The engineer and one brakeman were injured.

The train derailed near Noonan, Tex., on the 4th, was the westbound Sunset Limited. Two passengers and three trainmen were injured. The derailment was due to the dropping of a brake rod, which caught in an anglebar of the track; this was followed by a brakeshoe catching between the wheel and the rail. Four cars were overturned.

The train derailed near Paris, Ky., on the 7th, was northbound fast freight No. 42; 14 cars were wrecked. Sulphuric acid bursting from tank cars flooded the ground and injured a trespasser. The flow of the acid was so copious that streams were polluted and prompt measures had to be taken to prevent cattle from being injured in drinking. The derailment is believed to have been due to a defective truck.

The train derailed near Cedar Lake, Mich., on the 10th, was a westbound freight. Two cars were wrecked and were destroyed by fire. Five trespassers were killed, being buried under the burning cars.

The train derailed near Basin, Mont., on the 14th was eastbound passenger No. 238. The engine broke through a bridge, and with the first two cars, fell to the ravine, 20 ft. below. The engineer and fireman were killed, and 36 persons were injured, one, the dining car cook, fatally. An officer of the road reports the cause of the accident as "unknown."

The train derailed at McRae, Ga., on the morning of the 15th, about three o'clock was a northbound freight. The engine was derailed at a derailing switch and overturned and the engineer and fireman were killed.

The train derailed near Rose Hill, N. C., on the morning of the 15th, about 2 o'clock was a northbound freight. The engine was overturned and one brakeman was killed. The cause of the derailment was a washout due to sudden torrential rain.

The train derailed on the Baltimore & Ohio near F O Tower, Pa., on the 18th, was a through freight. One brakeman was slightly injured. The derailment was caused by a broken wheel and the road was blocked 14 hours.

The train derailed at Kirkland, Ala., on the morning of the 19th, was northbound passenger No. 38. The engine and seven cars were ditched. Five passengers were injured. The cause of the derailment was a broken rail.

The train derailed near Dawson, Md., on the 20th, was an eastbound freight. Two trainmen were fatally injured. The cause of the derailment was the breaking of the flange of one of the wheels of the tender.

The train derailed on the Central of New Jersey near Dunellen, N. J., on the 22d, was a westbound passenger. The engine (No. 304 of the Philadelphia & Reading, manned by P. & R. crew) fell against a freight train on an adjacent track, and the engineer was fatally injured. The cause of the derailment was the breaking of the tire of the right leading wheel of the front truck of the engine.

The train derailed at Wilmore, Pa., on the 23rd, was a westbound freight. Eight loaded and 12 empty cars were wrecked and scattered over all four tracks, and the track tanks of track No. 4 were damaged for a length of 456 ft. The cause of the derailment was a broken rail.

The train derailed near Arkadelphia, Ark., on the 25th, was northbound passenger No. 4. The engine and two cars were ditched; the engineer, fireman and two mail clerks were injured. The cause of the derailment was the breaking of the axle of the main driving wheels of the locomotive.

The train involved in the accident near Somonauk, Ill., on the first, was an eastbound freight. A car containing provisions caught fire from burning waste on a heated journal, and 11 cars were burned up.

Electric Car Accidents.—Of the six accidents to electric

cars, reported in September, in each of which a score or more of persons were injured—all but one of which accidents were collisions—two were attended by fatal results; near Frackville, Pa., on the third, motorman killed, and near Derby, Conn., on the fourth, three passengers killed.

WITH THE RAILWAY ENGINEERS IN FRANCE

"Somewhere in an active sector," said a recent despatch from the American Field Headquarters in France, "the American railroad engineers are running trains right up to the front.

"An entire railroad system," the despatch continues, "from the general manager's office to the beat of the lonely track-walker, has been handed over to the Yankees by the French War Office. Trains manned by American boys are moving on a strict schedule, carrying shells for the guns, food for the French troops and the daily movement of *poilus* going forward or coming back on leave to rest.

"Temporarily the regiment is lent to the French for the operation of that railroad. The Americans may stay on the job there for the duration of the war or they may be shifted to some other line. They get French rations and their road is a part of the French system. But they wear their own uniform, draw American pay and run the road by their own method, which means economy of man power.

"Fifteen American women worked like biscuit-pushers in a beanyery, and when they began to lose ground against the crush of hungry Americans the colonel himself jumped behind the counter and poured coffee out of a big pail.

"There wasn't much time. The troop train slid into the station, the Yankees piled in, forty to a car, and the officers clambered into their coach.

"Up forward the whistle tooted cautiously; a lantern flashed and the train moved out, carrying the first Americans to the front."

IN THE PARIS-ORLEANS SHOPS

Lieutenant C. G. Brown, of Company E, of the 19th Engineers, the railway shop regiment, in a letter to his professors at the Pennsylvania State College, writes that his company has taken over parts of the Paris-Orleans shops. Lieutenant Brown graduated from the railroad mechanical engineering course at that college 1916 and prior to receiving his commission in the 19th Engineers was a special apprentice in the Pennsylvania Railroad's Altoona shops.

"We have been ready to go to work," he wrote, "and with long hard days I was glad to get to bed by 11. Today we started. Owing to delays in shipment of overalls, tools and all manner of equipment, we had a busy two weeks' work getting set, but with a hundred and one typically French delays, we got off.

Standard Gauge Box Car Built by the Pullman Company for the American Forces in France

"At some points their line is within the range of the Boche guns and shells crump at random along the right of way. At night there is danger of Boche aeroplanes slipping through the tight French aerial patrol and bombing the Yankees at work. This has happened, but so far our troops have had no casualties.

"The correspondent was with engineers when they marched to the troop train to move forward. The move was made without any unnecessary sound to guide Boche air raiders. Along pitch dark streets they swung through the town to the music of their own hobnails beating on flint pavements. The bandmen were there with their horns smothered in green kimonos to prevent the moonlight from glinting on the brass.

"The American commander kept the time of departure secret so that half the town would not stay awake till 1 a. m., to see his boys off.

"Breaking into single file the Americans stepped out of the darkness into the American Red Cross buffet at the railroad station, stowed away their rifles and steel helmets and lined up for free chow.

"We have taken over parts of the Paris-Orleans shops. They do not compare with those in Altoona, but they are bigger than the average P. R. R. shops, except those at Philadelphia and Trenton, and have many American tools. The engines range from ones much smaller and older than any we have to ones as big as our regular freight engines or even a bit larger. Our men started in on a bit of an engine, built in 1885 in Alsace Lorraine, and now in yard service. Starting at 6:30 a. m., with one and one-half hours out for dinner, they had the engine completely dismantled by 5 p. m., ready to start repairs. The French have been in the custom of taking three or four days to get this far, from what I understand. When our men get accustomed to the work and the new measurements, they will do still better.

"I get up at 5 a. m., to walk to the shop. I could write for an hour on shop conditions, many strange peoples working in them, including French women—who do all kinds of work.

"After having been away from shop work for over four months, the clang of the boiler shop was like music. For

the most part, things are much like the equipment in the American shops. The French go at the work in much the same general way, but much slower and more painstakingly than we do at home. We find quite a few machines built in the United States and a number of German make.

"I am general foreman of the erecting and machine shops. This work covers that part of my special apprenticeship. I have 120 men under me.

"We have had fine weather here since our arrival; only two rain storms and it is in the middle of September.

"When this reaches you I shall have finished my fifth month in uniform, and have not had a single regret over going into the service."

FOURTEENTH ENGINEERS TRIM CANADIANS AT BASEBALL

One of the interesting bits of news concerning the doings of the railway engineers in France is the story of the baseball game which Company F, of the 14th Engineers, won by a score of 9 to 4 from a crack team of Canadians.

Captain F. P. Paten, of Company F, was formerly a general yardmaster on the New York, New Haven & Hart-

ford to either right or left field, on account of the wall on one side and the embankment on the other, so that ground rules prevailed. Between first base and third base was the only chance of placing a long drive. Now in your imagination bring yourself to imagine a sloping bank, pitched at a degree of 45, 1000 convalescent soldiers sitting in the sunlight on the side of this hill, the top fringed with officers, nurses and men on stretchers, 45 feet above the players. The ancient brick walls back of first base, over-hung with moss and fringed in places with vegetable life, and in some places age had begun its work and bricks were missing from the wall, and on top of this parapet, another fringe of soldiers, civilians and nurses, some of whom had never seen a baseball game before, but were being coached by the very large number who had.

"The final score was 9 to 4, the game being decided in the fifth inning when the Americans with four runs overcame a score against them of 3 to 1. They added 4 more in the seventh and the Canadians also got one in that inning. The Americans made 16 hits, the Canadians 9.

"At 6:30 in the evening, after the game, the men piled into their automobiles and started on a 30-mile trip back to camp."

FORDS FOR DIVISION SUPERINTENDENTS

The Chicago, Burlington & Quincy has converted a number of Ford automobiles into motor cars for the use of division superintendents. These cars are used for inspection purposes and also to enable the officers to travel over their divisions whenever it is necessary. They have been found particularly convenient on branch lines where the train service is infrequent.

To adapt the automobiles to operate on rails the standard wheels are replaced with pressed steel wheels, which are attached to a rigid axle. The steering wheel is inoperative, the steering post serving merely to support the throttle and

End View of the Box Car Showing the Guerie. One Car in Ten Has This Arrangement for the Brakeman

ford and his company is made up principally of New Haven Railroad men. Captain Paten in the story which he wrote about this ball game to one of the Boston papers said that most of the men on his team were former Boston high school baseball stars. The Canadian team was composed of five members of different Canadian baseball teams and four Canadian officers, who have played ball with their different colleges.

"This Canadian team," he wrote, "has been together for the past two seasons, playing their first game, after leaving Canada, in Egypt. They have been through the Dardanelles campaign, and are now located within 30 miles of our camp. They have been defeated but once, meeting teams in different parts of the hemisphere, composed of Canadians, Americans and some Englishmen.

"The diamond was constructed by German prisoners under the direction of the Canadians. It was of regulation size, and very nicely laid out, but with no chance of a long

A Ford Extra on the Burlington

spark levers. Since the steel wheels are somewhat smaller than those with which the car is regularly equipped, it is necessary to apply racing gears instead of the standard gears furnished with the car. With this modification a speed of 40 miles an hour is readily attained.

A frame is placed under the center of the car on which it is raised when it is necessary to turn it or to remove it from the track. The cars are run under train orders, the driver acting as engineer and the superintendent as conductor. The ease with which repair parts can be obtained in case of a break-down has proved to be a great advantage in the operation of these cars. The Burlington is planning to fit up a large number if the results secured from those already in use are found to warrant it.

Conservation and Reclamation of Material*

Review of Numerous Means By Which the Service of
Railway Material May Be Extended and Increased

By M. K. Barnum,

Assistant to Vice President, Baltimore & Ohio, Baltimore, Md.

“CONSERVATION OF MATERIAL” is a broader term than reclamation, the one frequently used, and, therefore, I think preferable. The reclamation of material has commonly been limited to the sorting of old material, particularly scrap, and picking out such parts as could be repaired and restored to service. Conservation goes much further than that because it is defined as “the preservation of natural resources for economical use.” The saving and economical use of material, in any manner, may be considered as the conservation of material. Most of the suggestions I will offer pertain to the collecting and sorting of material which is either serviceable or can be repaired for service, and some other items that may properly be considered in this connection.

The present prices of most material that the railroads use are from twice to four times what they were two or three years ago, and the value of scrap has increased somewhat in proportion, so that it is more profitable now to work over old material than it was then.

The first and most important thing is to collect the old material, and it is surprising to see how the small bits of iron and steel, such as rivet heads, nuts, washers, etc., that are a by-product of repairing cars, count up when gathered together in a pile. The best way to show the value of this small scrap that, ordinarily, is thought to be worthless, is to pick it up and keep an account of the labor and weight of material collected, and the result will be very convincing. As an example—not long ago at one of our steel car repair tracks boys were employed to gather rivets and rivet heads and in four or five weeks collected about 40 tons, worth over \$1,300 at a cost of about \$100 for labor. At another yard men were unloading yard cleanings into a swamp to release the cars and to fill the swamp. It was noticed that in this stuff there were some small bits of iron, which the men were instructed to throw into a box, and in a month they had saved about 30 tons of scrap worth, approximately, \$1,000.

The scrapping of old cars leaves many truss rods, arch bars and other kinds of iron and soft steel, which can be worked over into new forgings, and our road has a rolling mill in which such pieces are worked down into bar iron for grab irons, safety appliances, etc. This mill, which cost approximately \$10,000 installed, produced a net profit, in the first six months of this year, of over \$40,000. Some roads have questioned the advisability of installing such a plant, but I see no reason why any railroad which has a considerable amount of rolling stock cannot profitably use a re-rolling mill.

In gathering up and sorting scrap iron from cars and locomotives and track work it is always found that a considerable amount of good material is brought in, which should be carefully culled out, as much of it can be returned to service with slight repairs. Brake shoes which are good for more mileage are often found in the scrap, having been taken off because they would not make the long runs, and these brake shoes are sorted out and applied to cabooses, cars and locomotive tenders that are on short runs.

It is hardly necessary to quote in detail the increases in prices of locomotives and cars, but I have some figures here which show that in the two years between May, 1915, and

May, 1917, there was an average increase of 50 per cent in the cost of steel passenger cars, 75 per cent in locomotives and 75 to 100 per cent in freight cars.

It was formerly the practice of many roads, when their freight cars had reached the limit of their profitable life, to burn them so as to get the scrap iron out in the easiest way, but it has been found that burning iron reduces its value approximately 10 per cent as scrap, and the wood is destroyed. Tests which we have made show that the cost of dismantling a freight car is from \$5 to \$10 and saving the wood in condition for further use, results in a net profit of from \$10 to \$20 per car, according to the design. Our road has built many platforms, fences, storage bins, etc., and by using such second hand material we make a perfectly good job at small cost.

Many roads have reclamation plants, and I think they are all working profitably. The more common practices of cutting bolts to shorter lengths, rethreading them, repairing brake beams and sorting out the usable material, such as nuts, washers, etc., are followed on nearly all roads. The road with which I am associated has three such plants, the largest being at Zanesville, O., where we handle anything that is worth working over and fit it for service. There is a tin shop where we repair oil cans, lamps and tinware of all kinds. We have a shop where signals which have been replaced with new or larger sets are thoroughly overhauled, tested and prepared for installation at less important points. There is a saw-mill at which second-hand bridge timbers and various kinds of pile butts, etc., mostly coming from the maintenance of way department, are worked over into usable sizes, and they are prepared to fill orders for a large variety of finished material for buildings, car braces, car siding, roofing, etc. Some of the pieces are large enough to make good track ties, while the small pieces can be used for repairing hand cars, push cars, etc. Most of that material is practically worthless until it is resawed, after which it is worth from \$20 to \$60 per thousand feet. At the same shop we save the scrap pieces of wood and reduce them into charcoal for dining cars and shops, effecting a saving of about \$90 a month.
