IN HIS FORWORD to the Investment Economist section of the *Railway Age*, Frank A. Vanderlip says: "There is need for all the agencies we can have to spread the correct knowledge of the part which capital plays in community progress. * * * There are not few but many very successful businesses founded upon the bedrock principle of secrecy. Nearly every banker in the larger financial centers of the country would probably hazard the opinion that the Standard Oil Company is a highly efficient commercial organization, that it is well managed to an extraordinary degree; but do any of us know anything about it? Hardly anything at all, except the amount of dividends that are paid. An investment in Standard Oil is an investment made on faith. It is in the ordinary acceptance of the term a pure gamble. Judgment based upon facts is entirely lacking."

For years the American railroads, which have formed the backbone of private investment in American corporations, have been compelled to make available to the investor and to the general public the intimate details of their financial affairs. We believe that no part of the present difficulties and low estate of the railroads is due to this enforced publicity. In fact, railroads continued to be favorably considered by investors, despite adverse regulation, amounting sometimes to confiscation, long after their dividend declarations would have warranted almost complete withdrawal on the part of investors. This was due in part probably to tradition, but in even greater part to the fact that the investor felt that at least he knew what he was getting into.

Public utilities have, on the whole, had less salutary frankness forced on them. Holding company devices are the almost universal rule. State public utility commissions have to some extent compelled accounting that is intelligible and illuminating, but the primary object of most of these commissions has been the lowering or at least the holding down of rates. Unless this also is changed, it would appear that many public utilities may have to go through some of the experiences of the railroads. Possibly it is not the proper function of the government to compel frankness in the interests of the investor. It is, however, our conception that it is the duty of the banker who recommends an investment to his customers, and that it is the duty of a paper which discusses financial subjects to demand a plain statement of conditions where possible, to give confidence to corporation offerings of securities in the measure of the frankness with which their business condition is stated.

The man who is in business only for himself, using only his own capital, has a right, except in his income tax state-

ment, to conceal from others all the facts. But just as soon as a business has been incorporated, leaving the manager and directors without personal liability beyond the amount they have paid for stock, the concern asks the investing public to take a share in its business through the purchase of stock or to lend it money through the purchase of bonds, it should give to the public all the facts connected with the conduct of the business that can consistently be made public, without an actual—not theoretical—disclosure of valuable trade secrets. It is an incontrovertible fact that, if investors were repulsed by secrecy, not allured by it, they could very soon compel industrial corporations as well as public utilities and railroads to come out into the open. Secrecy and speculation, however, go hand in hand. It is in the interest of the investors who are not allured by secrecy, but are desirous of forming an opinion of their own on the merits of their investments, that the Investment Economist section of the *Railway Age* will be edited.

Wages Increased

THE STANDARD OIL COMPANY has announced an increase of 10 per cent in wages, making a total increase since August 1, 1915, of 62.8 per cent in general wages, and 80.57 per cent in wages of common labor, in addition to a reduction made in 1915 in hours of labor from 9 to 8, or the equivalent of a further increase in wages of 19.57 per cent. Furthermore, the Standard Oil Company has given to all employees without contribution on their part individual life insurance policies with benefits ranging from a sum equal to three months wages to \$2,000. The company has also made very liberal provision for accident disability, allowing half pay for sickness of more than seven days and continuing this pay for, in some cases, six months and in other cases one year.

There are three points of view from which this subject may most profitably be discussed. Will it benefit the community as a whole? In other words, is it economically sound? Second, is it a good thing for the employees themselves individually? Third, is it a good thing for the company?

If, in the aggregate, the employees who receive these wage increases consume no more than they did in 1915 and the surplus which they are now receiving, as compared with 1915, is devoted to some productive use such as better education for their children, investment directly or indirectly in such a way as to have this surplus used productively, it will certainly do the community as a whole no harm and presumably be a benefit. There are only two ways in which the higher wages can be paid. One is by a higher price being paid for Standard Oil products by the consuming public or a less profit taken by the stockholders of the Standard Oil Company. It is getting a little into the realm of speculation to try to determine whether the surplus wealth which is now being assigned to the employees would have been consumed or saved if it represents wealth taken away from the consumers of Standard Oil products. On the other hand, it may be said with a fair degree of certainty that of this wealth assigned employees represents profits which would have been assigned to stockholders of the Standard Oil Company, it very largely is wealth that would have been used productively and not consumed had it been continued to be assigned to stockholders instead of to labor. The point that should be understood is that if this surplus of wealth assigned to employees, is consumed by them, instead of being used productively, a loss to the community as a whole will result. If wages are sufficient for the worker to gratify his normal wants for food, drink, clothing, and pleasure, an increase of wages, which is consumed entirely by larger purchases of some of these things, is an economic loss to the world.

From the point of view of the individual employee, it

would seem, at first sight, that an increase in wages was pure gain; but even here it will depend entirely on how this increase is used as to the extent of the gain to the individual. If it were to be used entirely to pay for an increased consumption of beer, for instance, it might result in an actual loss, not a gain, to the individual. Furthermore, if it is out of proportion to the worth of the individual as a worker, it, at least potentially, works harm to the individual. If the laborer gets something for nothing, by just so much is his moral fibre and his incentive to better his condition depleted.

The provision of free life insurance, without any contribution on the part of the insured, appears to be in the nature of something for nothing, which is potentially harmful. The desire to save, in order to protect one's family against want in case of the worker's death, is one of the incentives to better labor and to greater production. To do anything to lessen this incentive would seem to be economically wrong. If the employee is not asked to contribute anything toward his life insurance, something of the incentive to greater production is removed. On the other hand, had the insurance been conditioned by some contribution on the part of the employee, the incentive to greater production would have been very much strengthened. If you tell a man that if he will save one dollar, you will add five to it, you have very greatly added to his incentive to save. If the Standard Oil Company had told its employees that for every dollar each of them saved toward life insurance the company would add five dollars of life insurance, saving would have been encouraged and there would have been less of the element of danger of corruption of moral fibre lurking in the "getting of something for nothing."

From the point of view of the company, and as a business proposition purely and simply, this wage increase, reduction of hours of service, and free life and accident insurance and sick benefits, is probably an attempt to bind the employees closer to the Standard Oil Company, to offset the influence of the labor union, and to compete more strongly in the general labor market against other employers. If the object which the company has in view can be accomplished in this way, it is surely thoroughly good business.

Don't Wait Until It Is Too Late

INDIFFERENCE ON THE PART of individual investors in railroad securities has, in the past, been a source of financial loss of a magnitude hard to calculate. If railroad security holders and those indirectly, but none the less vitally, interested in railroad security values are indifferent to their own interests in the present crisis, there may be a bitterly sad awakening awaiting them when it is time to return the roads to their owners. Savings banks in nearly all the eastern states and many of the middle and western states are large holders of railroad securities. The larger life insurance companies have a very large part of their assets invested in railroad securities. Few savings bank depositors or holders of life insurance realize how utterly they are at the mercy of the government in its treatment of the railroads in the present crisis. The stockholder or bondholder or the insurance bank depositor who thinks that now that the government is to guarantee a certain fixed sum to be made available for the payment of interest and dividends on railroad bonds and stock there is no longer a need to scrutinize the earnings of his road, is laying himself open to a rude shock and a serious loss.

If rates are not so adjusted as to yield enough from the earnings of any particular road to meet the government's guarantee, the security holder of this road, if he stays ignorant of conditions till his company resumes uncontrolled and unguaranteed operation, may find himself let in for a

very heavy loss. Whether the security holder is aware of the facts or not, the financial markets will have adjusted themselves to the basis of the earning power, regardless of the fact that up till the moment of returning the roads to their owners, the government has been making up a deficit from operation.

The truth is that the railroad security holder owes it to himself to watch with greater care than ever the earnings of the property in which he has his money. It is for this reason that the suggestion which was made to discontinue accounting as between different companies for the allocation of the divisions of freight and passenger rates is so full of danger. At first sight it would seem that a large amount of work in the accounting offices might be eliminated and, since the only interest of the government is to get a lump sum large enough to cover the lump sum of its guarantees, it would not be of any particular value to know which road was earning more and which less than its proper proportion. Even in the case of the government, this would be a short-sighted way to make a comparatively small saving. No system of cost accounting can properly be worked out without the allocation of revenues as well as of expenses. A knowledge of earnings is necessary to railroad executive officers for proper control of their expenses and it is just as necessary now that these officers report to the government as it ever was.

If the comparatively few people who are close to the stock market and financial news sources are the only ones to follow carefully and intelligently the earnings of individual properties under government operation, it is probable that the great majority of investors, together with savings bank depositors and holders of life insurance, will be left to get caught in the trap of their own indifference. Protest of the few wise observers of the course of events to the government would have little effect even if they were to make the protest, and generally they are not the ones who do the protesting. The security holder himself has got to watch the course of events and if the earnings of his particular road are not adequate to cover the government's guarantee, he should protest most vigorously to the government.

A detailed list of the holdings of bonds and mortgages by each individual life insurance company doing business in New York is published by the State each year; yet how many holders of life insurance ever try to check up for themselves to see what the value of the assets of their company is? Savings banks have to make an individual report in detail of their holdings of corporation securities and mortgages in Massachusetts; yet how many savings bank depositors ever look at this report which may be had for the cost of postage from the commonwealth of Massachusetts? These people, the individual investor, the savings bank depositor, and the holder of life insurance are in a position to protest now against rates or practices which are not remunerative to the particular company or companies in which they have a direct or indirect interest with an effectiveness that they little realize the power of. We believe and most students of the subject believe that it will be to the interest of the government to so adjust rates as to amply cover its guarantees to railroad security holders; but the duty and responsibility rests upon the individual investor to see that the guarantees to his particular company are being earned not in part by the surplus from some other company but by his own company.

There is another angle to this subject: If, by misfortune, government ownership should become a fact, the securities of those roads which, under government control, did not earn sufficient to cover the government's guarantee are going to fare pretty badly. It will be through no fault but that of their own if this turns out to be the case because security holders have not followed monthly and yearly earnings and have not protested against inadequate earnings.

Annual Reports

American Car & Foundry Company

A CONTINUANCE of large earnings to the American Car & Foundry Company would appear to be probable either in the event of war continuing for an indefinite period, or in the event of peace within six months. Before the war almost the entire business of the company was the manufacture of freight and passenger cars, car parts, and small industrial cars. At present a very considerable part of its business is the manufacture of munitions, trench helmets and the like for the Government. This business is proving very profitable to the American Car & Foundry Company, and in the year ended April 30, 1917, during which time the company was turning out similar work for the allies, earnings were very much greater than for any other year since the company's organization.

Earnings from all sources, after the payment for materials consumed and operating expenses, exclusive of repairs and renewals, amounted to \$17,522,909. From this there was charged off \$7,212,037 for renewals, replacements and repairs, and the cost (entire cost) of special equipment for the production of munitions. This left \$10,313,872 available for dividends, since the American Car & Foundry Company has no outstanding bonds. The regular 7 per cent dividends on the \$30,000,000 preferred stock called for \$2,100,000, and in addition the company paid $6\frac{1}{2}$ per cent, calling for \$1,950,000 on its \$30,000,000 common stock. There is appropriated as a reserve for dividends on the common \$2,250,000, which, together with the \$150,000 heretofore appropriated for this reserve, makes a total reserve equivalent to 8 per cent on the common. Appropriation of \$2,500,000 was made for general overhauling and improvements, and of \$500,000 for improving working conditions of employees, and there was \$1,010,872 to be carried to surplus account.

On April 30, 1917, the company had \$6,017,220 cash, \$17,713,438 accounts and notes receivable, and \$19,211,221 materials on hand inventoried at cost or less. Accounts payable amounted to \$16,225,942.

The American Car & Foundry Company was organized in 1899. Its plant consists of 16 freight car shops, 4 passenger car shops, 11 wheel foundries, 12 gray iron foundries, 3 rolling mills and forges, 3 saw mills, 1 malleable foundry and 1 brass foundry and auxiliary shops.

In the first year or two after the organization of the company, the principal efforts of the management were directed toward the development of a flexible and compact organization. The business was concentrated in those plants where the most effective work could be done, and some of the comparatively obsolete plants were dismantled and sold. By 1909, ten years after its organization, the combined plants had a capacity of 125,000 freight cars, 1,500 passenger cars, 350,000 tons of wheels, 300,000 tons of forgings, and 300,000 tons of bar iron. During the calendar year 1917, United States and Canadian companies' orders for freight cars from the American Car & Foundry Company totaled 11,658. The United States Government orders for France totaled 4,018, and the French Government 1,850. Russia had ordered 16,500 freight cars, but the order for 10,000 of these cars was still the subject of negotiation when the Russian Government collapsed, so that there was no loss here to the American Car & Foundry Company. The order for the other 6,500 was only placed in June, and comparatively little work had been done on these cars, which were all to have been four-wheel, so that there is possibly some small loss on that order.

The total number of passenger cars ordered from the

American Car & Foundry Company in the calendar year 1917 was 186.

If it is true then that the company is making large profit from war business, as its income account for the year ended April 30, 1917, would indicate, a continuation of the war would mean a piling up of large sums available for common dividends. On the other hand, there has accumulated in the past few years a very great need for both freight and passenger cars on American railroads, and this need will continue to grow at an even greater rate than heretofore. The American Car & Foundry ought also to be in a particularly good position to get a large volume of foreign orders. When peace comes, therefore, there will be an enormous latent demand for cars, car wheels and car parts. When the railroads are restored to their owners, their credit will have to be very greatly strengthened—this is a necessity—and new equipment and repairs to equipment will be one of the first uses to which new money raised by the railroads will have to be put. Peace, therefore, ought to as surely continue large profits for the American Car & Foundry as would a continuance of war.

The Western Union Telegraph

IS WESTERN UNION a peace stock as well as a war stock? That is a question about which opinion may well differ. The war has benefited the Western Union very greatly, but it is only fair to say that a large part of the profit which has come in the last two years could not have been made had not the management of the Western Union pursued a far-sighted, progressive and courageous policy for some years before the war. The volume of land line and cable service in the calendar year 1917 was 66 per cent greater than in 1914. Gross operating revenues in 1917 amounted to \$76,995,511. This compares with \$61,919,141 in 1916, \$51,171,795 in 1915, and \$46,264,777 in 1914. The unprecedented industrial activity in 1916, and the entry of the United States into the war in 1917, account for the increase in the number and length of telegrams handled by the Western Union. There have been literally thousands of messages sent each day during the past two years by telegram that under ordinary circumstances would in all likelihood have gone by mail.

When peace comes, will the people who have been telegraphing return to the use of the mails? Probably a great many of them will. Some falling off in business of the Western Union would appear probable, but there is another angle from which to look at this. There are a great many people now telephoning messages which would, under ordinary circumstances, be telegraphed. This class of message, coming back to the Western Union with the return to normal conditions, ought in part to offset the loss of the messages now being telegraphed which in peace times would be sent by mail. Furthermore, the Western Union is now doing a huge business for the Government. The rate on Government messages is only 40 per cent of the commercial tolls, and, whereas the Government paid \$3,000,000 for its telegrams in 1917, if the commercial rate had been charged for these messages they would have cost \$7,500,000. The Western Union claims—apparently with a great deal of justice, that its Government business is done at an actual loss. If that is so, when peace is declared the loss from the cessation of Government business in gross earnings will be more than offset by a decrease in expenses.

In 1917 operating expenses, including repairs, rentals and taxes, amounted to \$62,783,006 and, after the payment of interest on bonds and the deduction of \$2,650,000 for reserves, there was \$11,715,366 available for dividends. This is equal to 11.7 per cent on the outstanding stock. The regular 6 per cent dividends were paid and an extra dividend of 1 per cent was paid, calling for \$6,982,298. The amount available for dividends at the end of 1916 was \$12,395,405;

at the end of 1915 \$10,167,592; and at the end of 1914 \$5,371,395. In no one of the years prior to 1917, however, was there a deduction on account of reserves.

The Western Union is, of course, affected by labor scarcity and the high cost of materials. Over 1,200 employees have already gone into military and naval service. In 1917 there was an increase in salaries and wages of \$3,380,000 and, in addition, the company made a special payment to employees receiving \$2,000 a year or less, on the same basis as the special payment made in 1916. This special payment consisted of the flat sum of \$25 to all messengers at independent offices, 7 per cent of the regular annual wages to employees receiving less than \$1,200, and 6 per cent of regular wages to employees receiving from \$1,200 to \$2,000. This special payment, meant to offset the high cost of living for the small salaried employees, called for \$2,170,000 in 1917, and is, of course, included in expenses.

Even before the increased business due to the European war added so much to its revenues, the Western Union was making a considerable progress in net earnings. The adoption of the night letter, the day letter and the delayed cable message, at reduced rates, all made for a fuller utilization of the plant during what would have otherwise been a slack time. It is easy to look back now and say that it was an obvious thing to do to put in the cheap night letter and the comparatively cheap day letter and delayed cable, but actually it took a good deal of courage. It was not so obvious when it was done that this service might not make serious inroads into the more expensive expedited service. Such has not, however, proved to be the case.

In 1914 the Western Union had 25,784 offices and operated 1,581,571 miles of iron wire, 676,196 miles of copper wire and 2,875 miles of land line cables. The miles of pole line totaled 199,473. There was 22,915 nautical miles of ocean cables. During 1917 the company spent net \$5,218,054 on additions and betterments to plant and equipment, and included in this was \$250,000 for property in Chicago on which the company is this year putting up a building which will cost approximately \$1,500,000.

Current liabilities at the end of 1917 totaled \$14,169,906, and this included \$7,683,490 audited vouchers and accounts payable. There was \$5,635,124 cash on hand, \$13,561,005 accounts receivable, and \$15,869,654 marketable securities.

Republic Iron & Steel Company

WHEREAS THE BETHLEHEM STEEL CORPORATION'S total income was about six times as great, after allowing for federal taxes, in 1917 as in 1914, the Republic Iron & Steel Company's total income, after making provision for "excess profits, taxes, and other contingencies," was more than seven times as great in 1917 as in 1914. The increase in gross business was very much greater for Bethlehem than for Republic and, while the comparison of total profits is not an exact and, in detail, accurate comparison, it does show in a striking way how great has been the prosperity of Republic Iron & Steel under war conditions. It is an interesting and a somewhat curious fact, however, that the market price of neither the 7 per cent cumulative preferred stock of the Republic Iron & Steel or of its common stock reflects fully the change that has taken place in the income account from the beginning of 1914 to the end of 1917.

The gross volume of business in 1914 was \$21,366,249. In 1917 it was \$78,325,461. Total profits in 1914 amounted to \$2,407,552 and in 1917, before the deduction for excess profits, to \$28,769,021. The company subtracted \$9,878,657 for excess profits taxes, etc., leaving total profits, after the payment of taxes, of approximately \$18,460,000, or more than 7½ times the profits in 1914. Bethlehem's gross sales in 1914 were \$47,500,000 and its net profits \$9,649,668. In 1917 gross sales amounted to \$298,929,531

and profits, after the deduction of taxes, to \$53,979,360. Of course, any comparison between the value of Bethlehem stock and Republic Iron & Steel would have to take into consideration a great many other factors than those mentioned—the huge additions which Bethlehem has made to its assets, for instance; but the figures quoted are meant only to call attention to what the Republic Iron & Steel Company is doing.

After allowing approximately \$2,000,000 for depreciation and renewals and \$274,072 for exhaustion of minerals and allowing the previously mentioned \$9,878,657 for excess profits taxes, there was \$16,616,532 net profits in 1917. From this was deducted \$759,335 interest on bonds, and the 7 per cent dividends on the \$25,000,000 preferred stock, calling for \$1,750,000, and 6 per cent dividends on the \$27,191,000 common stock, calling for \$1,631,460. There was left a balance of \$12,475,737 to be carried to profit and loss. In 1916, a total of 18 per cent was paid on the preferred stock, so wiping out the cumulated back dividends, and 1½ per cent was paid on the common and \$9,881,298 was carried to profit and loss.

The following table shows a comparison of the production in gross or net tons of the Republic Iron & Steel in 1917 and 1914:

| Tons | 1917 | 1914 |
|--|-----------|-----------|
| Iron ore (gross)..... | 1,706,555 | 1,233,103 |
| Coke (net)..... | 1,329,809 | 850,911 |
| Limestone (gross)..... | 406,306 | 28,755 |
| Pig iron (gross)..... | 1,062,657 | 777,811 |
| Bessemer steel ingots (gross)..... | 675,182 | 391,826 |
| Open-hearth steel ingots (gross)..... | 486,601 | 371,409 |
| Total steel ingots (gross)..... | 1,161,783 | 763,235 |
| Finished and semi-finished products (net)..... | 1,109,829 | 760,054 |

As a matter of fact, production in 1917 was restricted in the second quarter of the year by an explosion which destroyed one of the principal power stations of the company, and in the fourth quarter of the year by a shortage in fuel and in transportation facilities.

During the year \$7,277,461 was spent for new constructions and additions to the property. To insure an adequate supply of fuel, new mines were bought, against which there is outstanding \$1,000,000, 6 per cent first mortgage bonds. A new blast furnace was completed during the year and was blown in in September, 1917. The company now has a capacity for the production of pig iron, totaling 1,425,000 tons. The actual production in 1917 was 1,062,657 tons.

The striking thing about the growth in prosperity of the Republic Iron & Steel is the great increase in the percentage of net earnings to gross volume of business. In 1914 it was less than 10 per cent; in 1917, even after subtracting excess profits, taxes, it was over 23 per cent.

The Republic Iron & Steel, however, has had its troubles with labor as have other steel companies and industry in general. Payrolls in 1917 amounted to \$17,574,481, or an average of \$1,211 per man. In 1915 payrolls totaled \$8,558,574, or an average of \$771 per man. These figures do not include the men working in the coal mine which was purchased during 1917. Notwithstanding the much higher rate of wages paid per man, actually a less efficient class of labor is employed. If, for no other reason, lack of experience is a large factor.

The balance sheet of the Republic Iron & Steel shows the company in a very strong position as regards working capital and liquid assets. Total current liabilities amount to \$13,145,000, but of this only \$3,475,000 are accounts payable and the greater part of it is made up of the \$8,597,086 accrued excess profits taxes and \$845,365 provision for the dividends payable January 1 and February 1. Total current assets amount to \$39,090,580, which includes \$4,367,794 cash and \$14,358,265 United States certificates of indebtedness and Liberty Bonds, and \$13,475,652 inventories of manufactured products and materials and supplies at cost or less, and \$908,863 ore at docks and only \$5,980,005 accounts and notes receivable.

The Baldwin Locomotive Works

THROUGHOUT the profits which have accrued to it during the last two years, the Baldwin Locomotive Works has been able to write down the book value at which patents and good-will have been carried from \$16,699,299 to the comparatively nominal amount of \$899,299. In other words, with the exception of this amount the assets, as shown on the balance sheet, are a considerable value of tangible property. Real estate, machinery, and tools is carried at \$27,467,201, and during the calendar year there was spent on additions to this plant \$1,187,207.

The Baldwin Locomotive Works has been building locomotives since 1831. It has a manufacturing plant in the fifteenth ward of Philadelphia covering 16 acres. The company has bought or secured option on 370 acres of land at East Chicago and, furthermore, the board of directors has authorized the purchase of land adjoining the Eddystone, Pennsylvania, plant at a cost of approximately \$2,500,000. The Eddystone property consists of 225 acres of land, with a plant now being used to manufacture munitions, but which can eventually be adapted to the manufacture of locomotives. The Eddystone property is leased to a subsidiary corporation, the Eddystone Munitions Company, all of the capital stock of which (\$100,000) is owned by the Baldwin Locomotive Works.

In 1913 the output of locomotives was 2,025. This dropped off very sharply in 1914 to 1,804. In 1915 it was 1,869, and in 1916, 1,989. In 1917 the entire plant was being worked nearly to capacity. There were 2,748 locomotives built, and, in addition, \$13,835,707 of other regular work was completed. In addition, contracts for shells and other special work amounting to \$20,972,584 were completed. Thus the gross sales in the calendar year 1917 amounted to \$98,263,865. This compares with \$59,219,058 in 1916, \$22,083,011 in 1915, \$13,616,163 in 1914, and \$37,630,969 in 1913.

The manufacturing profit in 1917 was \$11,779,020, in 1916 \$6,361,811, in 1915 \$2,725,573, in 1914 \$320,609, and in 1913 \$3,886,475.

The percentage of manufacturing profit to gross sales compares as follows:

| | |
|------|------|
| 1917 | 12.0 |
| 1916 | 10.7 |
| 1915 | 12.3 |
| 1914 | 2.4 |
| 1913 | 10.3 |

The Baldwin Locomotive Works has outstanding \$9,-

400,000 first mortgage bonds and \$20,000,000 preferred stock and \$20,000,000 common stock. Regular dividends of seven per cent on the preferred stock (on which dividends are cumulative) have been paid since the incorporation of the present company in 1911. From 1912 to 1914, inclusive, two per cent dividends annually were paid on the common stock; but since 1914 no common stock dividends have been declared.

The common stock is now selling at 77 and the preferred in the neighborhood of 100. The first mortgage bonds are selling at about 100. In February and March of 1914, before the declaration of war and after the prosperous year of 1913, Baldwin common was selling at 50, Baldwin preferred at 108, and the five per cent first mortgage bonds at 104.

The balance sheet of December 31, 1913, showed plant and equipment, which we now know included \$16,699,299 patents and good-will, carried at \$37,081,026, current assets at \$15,735,635, which included \$4,563,848 cash and \$3,155,175 inventories. There were only \$449,442 accounts payable. At the end of 1917, plant and machinery, excluding any good-will and patents, was carried at \$28,254,408 and current assets at \$38,811,325. This included \$6,757,339 cash and \$20,434,766 inventories. Accounts payable amounted to \$5,768,698, and bills payable to \$8,250,000.

The market now puts a value of \$15,400,000 on the \$20,000,000 Baldwin Locomotive common, on which in 1914 it put a value of \$10,000,000. If we should subtract from the assets the \$30,000,000 par value of preferred stock and first mortgage bonds and subtract also the patents and good-will, the amount of current liabilities, debt to the Government and interest accrued on bonds, we get \$22,361,048, the net assets allocatable to the common stock in 1917, and \$8,188,492 in 1913.

Cities Service Company

THE CITIES SERVICE COMPANY is a holding company for companies doing a considerable variety of public utility and other businesses and the plants of these public utilities are scattered broadly over the country. For instance, one of the subsidiary companies is the Denver Gas & Electric Light Company of Denver, Colo., one the Empire District Electric Company of Joplin, Mo., the Danbury & Bethel Gas & Electric Light Company and the Empire Gas & Fuel Company,

Central News Photo Service

The King of the Belgians Inspects a Belgian Heavy Battery

with a large number of subsidiary oil companies. While, of course, the public utilities part of the business has had to face the great increase in cost of labor and materials, without in most cases, any opportunity to raise rates, the astonishing increase in oil production has, together with a great increase in fuel consumption, because of industrial activities, added very greatly to the gross income of the Cities Service Company.

Gross earnings in the calendar year 1917 totaled \$19,252,492, comparing with gross earnings of \$10,110,343 in 1916. This is an increase of over 90 per cent. Earnings available for dividends on the common stock amounted to \$60.73 a share. Only \$6 in cash and \$6 in stock was paid out in dividends. It is a rather remarkable fact that although the company has expanded its operations on a very large scale and at a very rapid rate, the bonds outstanding against the subsidiary companies are equal to only \$1.42 for each one dollar of annual subsidiary gross earnings.

The combined capital assets of the subsidiary companies are carried at \$345,247,763. The Cities Service Company itself has outstanding in the hands of the public \$25,666,300 common stock and \$66,494,800 preferred stock, and of the subsidiary companies there is \$3,685,869 common stock outstanding in the hands of the public and \$5,975,144 preferred stock outstanding in the hands of the public. The Cities Service Company itself on January 10, 1918, had on hand \$2,191,552 cash, with only a nominal amount of current liabilities. The balance sheet for the combined subsidiary companies is for December 31, 1917, and on that date the subsidiaries had \$1,621,964 cash in local banks and \$1,501,314 cash in out-of-town depositories. There were \$4,524,867 current accounts payable, \$19,544,818 bills payable and \$4,580,171 taxes accrued. The total current liabilities of the subsidiary companies including the items just mentioned, amounted to \$32,916,097. The total current assets of the subsidiaries, including the cash previously mentioned, was \$36,602,334, of which the two largest items were crude and refined oil stock \$11,013,489, and stores and supplies \$8,228,545.

The combined statement of earnings of the Cities Service Company and its subsidiaries is especially interesting. In 1914, gross earnings amounted to \$19,093,653, expenses to \$11,577,582, and interest charges to \$3,069,327, leaving \$4,446,744 available for dividends. By 1916 gross earnings had increased to \$48,052,573, operating expenses to \$28,908,646, interest charges to \$5,076,074, and the amount available for dividends to \$14,067,853. In 1917 the combined gross earnings were \$69,634,872, operating expenses \$44,180,841, interest charges \$5,976,506, leaving \$19,477,526 available for dividends.

The United States Steel Corporation

NO ATTEMPT will be made here to comment on the showing made by the United States Steel Corporation in the calendar year 1917.

The following table gives the income account for the years ended December 31, 1917 and 1916:

| | 1917 | 1916 | + Increase — Decrease |
|---|------------------|------------------|--------------------------|
| EARNINGS Before charging interest on bonds and mortgages of subsidiary companies: | | | |
| First quarter | \$78,994,371.04 | \$63,110,720.27 | + \$15,883,650.77 |
| Second quarter | 90,592,701.88 | 83,561,065.24 | + 7,091,636.64 |
| Third quarter | 73,007,297.57 | 88,159,733.30 | — 15,152,435.73 |
| Fourth quarter | 91,567,161.04 | 108,225,573.63 | — 46,658,472.59 |
| Total for year | \$304,161,471.53 | \$342,997,092.44 | — \$38,835,620.91 |
| Less, interest on outstanding bonds and mortgages of the subsidiary companies | 8,869,291.50 | 9,422,914.94 | — 553,623.44 |
| Balance of earnings | \$295,292,180.03 | \$333,574,177.50 | — \$38,281,997.47 |
| Less, charges and allowances for depreciation applied as follows, viz.: | | | |
| To depreciation and extraordinary replacement funds and sinking funds on bonds of subsidiary companies | 43,296,038.26 | 32,762,072.38 | + 10,533,965.88 |
| To sinking funds on U. S. Steel Corporation bonds | 7,257,233.41 | 6,785,540.27 | + 471,693.14 |
| Net income in the year | \$244,738,908.36 | \$294,026,564.85 | — \$49,287,656.49 |
| Deduct: | | | |
| Interest on U. S. Steel Corporation bonds outstanding | 21,256,303.17 | 21,602,852.90 | — 346,549.73 |
| Premium paid on bonds redeemed: | | | |
| On subsidiary companies' bonds | 117,914.50 | 146,277.11 | — 28,362.61 |
| On U. S. Steel Corporation bonds | 745,933.69 | 870,637.57 | — 124,739.88 |
| Balance | \$222,618,757.00 | \$271,406,761.27 | — \$48,788,004.27 |
| Add: Net balance of sundry charges and credits, including adjustments of various accounts | 1,600,807.54 | 124,969.11 | + 1,475,838.43 |
| Balance | \$224,219,564.54 | \$271,531,730.38 | — \$47,312,165.84 |
| Dividends on U. S. Steel Corporation stocks: | | | |
| Preferred, 7 per cent. | 25,219,677.00 | 25,219,677.00 | |
| Common: 1917, regular 5 per cent, extra 13 per cent; 1916, regular 5 per cent, extra 33 1/3 per cent | 91,494,450.00 | 44,476,468.75 | + 47,017,981.25 |
| Net income | \$107,505,437.54 | \$201,835,584.63 | — \$94,330,147.09 |
| Less, Appropriated from net income on account of expenditures made and to be made on authorized appropriations for additional property, new plants and construction | 55,000,000.00 | | + 55,000,000.00 |
| Balance carried to undivided surplus | \$52,505,437.54 | \$201,835,584.63 | — \$149,330,147.09 |

*Balance of earnings after making allowances for estimated amount of Federal income and war excess profits taxes.

Chairman E. H. Gary in his annual report says in part:

The large demand for iron and steel products which existed during 1916 continued during the year 1917. This was increased after the entrance of the United States into the European war, especially for certain lines of products required for the war program. These demands largely exceeded the producing capacity of the manufacturers and, because of the largely increased cost of labor, raw material and supplies, the prices for steel products advanced materially.

Two general advances in wage rates of employees of 10 per cent were made on May 1 and October 1, respectively. These followed three increases in 1916, each of substantially the same percentages and resulted in making the wage rates in effect at close of the year 65 per cent above the rates prevailing at the close of 1915 in the case of unskilled labor and an average of 58 per cent higher in respect of all employees. In December, 1917, the average earnings per em-

pay per day of all the employees, exclusive of the administrative and selling force, was \$4.00; and of the total, including the administrative and selling staff, \$4.65.

The smallest number of employees in the service of the corporation and its subsidiary companies during the year in any month was 250,836, and the highest number 277,526. The average number employed during the entire year and the total payroll in comparison with results for 1916 are as follows:

| | 1917 | 1916 | Increase | Per cent |
|--|--------------|--------------|--------------|----------|
| Average number of employees during the entire year | 268,078 | 231,668 | 15,390 | 6.1 |
| Total amount of payroll, \$ | \$47,370,400 | \$34,388,200 | \$12,982,200 | 31.9 |

During the year 11,486 employees of the United States Steel Corporation and its subsidiary companies entered the regular war service of the United States.

At December 31, 1917, the tonnage of unfilled orders of the subsidiary companies was 9,381,718 tons of rolled steel products, a decrease in comparison with December 31, 1916, of 2,165,568 tons. The conditions prevailing in respect of governmental regulation of prices, priority orders on production and the demands for war purposes directly and indirectly of a large percentage of the output of the mills, naturally interferes with forward buying by customers.

The output of the properties and plants of the subsidiary companies in 1917 did not quite reach the record figures of the previous year, notwithstanding additions and extensions completed and placed in operation increased somewhat the capacity. The decrease in production and output in 1917, compared with 1916, is attributable principally to inability to secure sufficient employees to fully man the plants and to the lack of ample transportation service to furnish the plants with necessary raw materials and supplies. The production during the year, in comparison with results in 1916, of basic raw materials and of semi-finished and of rolled and other finished products for sale to customers was as follows:

| | 1917 Tons | 1916 Tons | Increase or decrease Tons | Per cent |
|---|--------------|--------------|------------------------------|----------|
| Iron ore mined | 31,781,769 | 33,355,169 | 1,573,400 | -4.7 |
| Coal mined | 24,554,525 | 26,606,041 | 2,051,516 | -7.7 |
| For use in making coke | 6,942,298 | 6,162,340 | 779,958 | +12.7 |
| For steam, gas and other purposes | 31,496,823 | 37,768,381 | 1,271,558 | -3.9 |
| Coke manufactured | 17,461,675 | 18,901,962 | 1,440,287 | -7.6 |
| Limestone quarried | 6,494,917 | 7,023,474 | 528,557 | -7.5 |
| Pig iron, ferro and spiegel | 15,652,928 | 17,607,637 | 1,954,709 | -11.1 |
| Steel ingots (bessemer and open hearth) | 20,285,061 | 20,910,589 | 625,528 | -3.0 |
| Rolled and other finished steel products for sale | 14,947,911 | 15,460,792 | 512,881 | -3.3 |
| Universal Portland cement | 10,917,000 | 10,425,600 | 491,400 | -4.7 |

The shipments of all classes of products to customers dur-

ing 1917, in comparison with the shipments during the preceding year, were as follows:

| | 1917 Tons | 1916 Tons | Increase Tons | Per cent |
|---|-----------------|---------------|------------------|----------|
| Domestic Shipments | | | | |
| Rolled steel and other finished products | 14,947,911 | 15,460,792 | 512,881 | -3.3 |
| Pig iron, ingots, spiegel, ferro and open hearth | 15,652,928 | 17,607,637 | 1,954,709 | -11.1 |
| Iron ore, coal and coke | 31,781,769 | 33,355,169 | 1,573,400 | -4.7 |
| Sundry materials and by products | 10,917,000 | 10,425,600 | 491,400 | -4.7 |
| Total tons all kinds of materials, except cement | 14,947,911 | 15,460,792 | 512,881 | -3.3 |
| Universal Portland cement (bbls.) | 10,917,000 | 10,425,600 | 491,400 | -4.7 |
| Export Shipments | | | | |
| Rolled steel and other finished products | 14,947,911 | 15,460,792 | 512,881 | -3.3 |
| Pig iron, ingots and open hearth | 15,652,928 | 17,607,637 | 1,954,709 | -11.1 |
| Sundry materials and by products | 10,917,000 | 10,425,600 | 491,400 | -4.7 |
| Total tons all kinds of materials | 14,947,911 | 15,460,792 | 512,881 | -3.3 |
| Aggregate tonnage of rolled steel and other finished products shipped to both domestic and export trade | 15,377,822 | 15,921,584 | 543,762 | -3.4 |
| Total value of business (covering all of above tonnage): | | | | |
| Domestic | \$1,021,393,678 | \$702,801,167 | \$323,592,511 | 46.0 |
| Export | 179,488,730 | 159,463,290 | 20,025,440 | 12.6 |
| Total | \$1,205,882,408 | \$862,264,457 | \$343,617,951 | 40.0 |

The expenditures made during the year for repairs, maintenance and general up-keep of the properties in comparison with outlays for similar purposes during the preceding year were as follows:

| | 1917 | 1916 | Increase | Per cent |
|---|--------------|--------------|--------------|----------|
| Ordinary repairs and maintenance | \$84,666,857 | \$63,313,553 | \$21,353,304 | 33.7 |
| Extraordinary replacements and general rehabilitation | 7,957,472 | 6,079,074 | 1,878,398 | 30.9 |
| Total | \$92,624,329 | \$69,392,627 | \$23,231,702 | 33.5 |

The large increase over previous year in the expenditures for current and ordinary maintenance is accounted for to a considerable extent by greater cost of labor and material.

The total of all charges to and allowances from gross earnings for the year to cover exhaustion of minerals and deterioration arising from wear and tear of improvements amounted to \$136,057,605, an increase of \$31,481,226, or 30.1 per cent, in comparison with similar charges and allowances in 1916.

The total charges to income account for the year for taxes levied against the Corporation and its subsidiary compa-

Copyright by the International Press Syndicate in

Turkish Prisoners Loading Barges in Egypt

nies, *exclusive* of Federal income and excess profits taxes, amounted to \$18,800,260, in comparison with \$16,907,712 for 1916. Charges were made against 1917 earnings for an estimated allowance of \$233,465,435 for account of Federal income, war income and excess profits taxes for the year. The exact amount of these taxes which may be due and payable cannot be fully determined at the date of writing this report, and it is possible that upon final compilation of tax returns, based on the latest Treasury interpretations of the law, subsequent adjustments may be necessary. It is believed the charges stated will be sufficient to cover the final figures.

During the year there were purchased or constructed by the subsidiary manufacturing, coal and railroad companies additional railroad equipment for general transportation service, as follows: 31 locomotives, 4,280 steel freight cars, 324 box and dump cars, and 28 road cars of various kinds, costing in all \$10,002,070. Three 12,700-ton capacity ore carrying vessels were purchased and placed in commission during the year. One additional steamer of same type was ordered for delivery in 1918.

At the date of writing this report the total amount expended on authorized appropriations for new plants, extensions and additions and betterments, including iron ore mine stripping operations for 1918, equaled approximately \$187,000,000. It is estimated that about \$110,000,000 of this total will be expended in 1918.

In January, 1918, there was offered to the employees of the United States Steel Corporation and of the subsidiary companies the privilege of subscribing for shares of Common Stock of the Corporation, at the price of \$92 per share. Subscriptions were received from 43,258 employees for an aggregate of 95,437 shares. These subscriptions represent an increase of 10.7 per cent in respect of number of subscribers, and 41.5 per cent in the number of shares subscribed over the previous year. The conditions attached to the offer and subscription, aside from the feature of price, were generally similar to those under which stock has been heretofore offered to employees. The usual distribution of special compensation to employees on the basis of the plan adopted in 1903 was also made.

The Trustees of the United States Steel and Carnegie Pension Fund disbursed during the year 1917, in pensions to retired employees, the sum of \$712,506.65. Pensions were granted during 1917 to 241 retiring employees.

The total amount expended by the Corporation and the subsidiary companies during the year for safety work was \$998,806, in comparison with \$848,080 in the previous year. Compared with results in 1916, the fatal and serious accidents per 100 employees showed a decrease of 14.67 per cent, and, compared with 1906, a decrease of 41.63 per cent. The reduction in the relative number of accidents in 1917, compared with previous year, is notable in view of the increased force employed during 1917, which included many new employees not familiar with safety rules and regulations.

The total amount disbursed by all the companies during 1917 in connection with work accidents was \$3,171,994. Of this sum 87 per cent was paid directly to the injured employees or their families or in taking care of them. These payments were made either in accordance with the provisions of the Workmen's Compensation Laws enacted by the several states in which the subsidiary companies are operating, or under the Corporation's Voluntary Accident Relief Plan where there is no statutory law applicable.

In furtherance of the established policy of providing modern sanitary facilities for the health and comfort of the employees, much additional equipment was installed throughout the plants and mines during the year. This added equipment included drinking water systems and sanitary drinking fountains, closets, wash and locker rooms, including 496 shower baths and 15,763 lockers.

The efforts of the Corporation and its subsidiary companies toward the improvement of the material welfare of the employees and their families referred to in previous annual reports have been systematically continued. Due to the increased labor forces and the scarcity of dwellings, it has been necessary for the subsidiary companies to build a large number of houses to accommodate the workmen. Much thought and study has been given to the design and plans of these houses, with a view to furnishing the workmen homes with modern conveniences and at a moderate rental. Through the aid of the subsidiary companies, employees were enabled to increase largely the number of vegetable gardens planted by them during the past year. Considerable unoccupied land adjoining the plants was laid out in plots, which employees were permitted to use for raising vegetables. Altogether, the area utilized by employees for this purpose equaled 2,082 acres and comprised 15,705 gardens.

British Troops Build Light Railways As They Advance

The Small Investor

IT will be the object of the Investment Economist section of the Railway Age to avoid columns of statistics. The quotation, therefore, of stock and bond prices will not be included; but every subscriber to the Railway Age has the privilege of writing in to the Small Investor and asking for price quotations on either listed or unlisted securities. The Railway Age will undertake to furnish an approximate quotation of all securities listed on the New York Stock Exchange as of the day of the receipt of the inquiry and will do its best to furnish a bid and asked price for unlisted securities with such information as is available from reliable sources.

We will be glad to answer inquiries, which we will treat as confidential, about investment securities and while, of course, such quotations of prices and answers to inquiries cannot be guaranteed, they will be obtained in all cases from sources which we believe to be reliable and impartial.

What is an Investment?

PUTTING a penny into a little iron bank from which it cannot be extracted is not an investment, but it contains one of the elements necessary to making an investment and the psychology of it is worth examining. Why is it that the iron bank should play so important a part in making it easier to save? It is just as much a saving if the penny is kept in the small boy's trousers pocket as it is if it is put into the iron bank. For one thing, however, the boy has to save the same penny over and over again if he carries it in his pocket. Every time he passes a candy store he has to perform an act of self-denial. On the other hand, when he puts the penny into the bank, he makes one act only of self-denial.

The Century Dictionary defines invest as "to employ for some profitable use; convert into some other form of wealth" The distinction between saving and investment is the difference between unemployment and employment of money but still the psychology of the boy's penny bank enters into investment. When you save and make an investment, your saving or act of self-denial is completed. You do not have to save the same money every time that you wish to go to the theatre or to indulge in any pleasure that costs money.

It is, of course, this perfectly well recognized trait of human nature that makes it easier to sell almost anything on the instalment plan; but in investment the saving is made with the expectation of profit either through wages which someone else is willing to pay you for the use of your money or enhancement of the value of the other form of wealth, in which you have invested your money, measured in terms of money.

There is a great variety of ways in which the man or woman who will save can make an investment. Money put in the savings bank is in the final analysis money which is entrusted to someone else to invest. It is only in degree that it differs from direct investment in mortgages or bonds on the advice of someone in whom you have confidence. When you put \$50 in a savings bank, however, you are indirectly making a diversified investment. The deposits of the savings bank are used to buy many different kinds of corporation securities and to loan on real estate in different communities, so that, if the savings bank management has used bad judgment in a single instance or a few scattered instances,

the impairment of the value back of your \$50 is so slight as to be negligible. To put money in a savings bank, therefore, is one of the safest ways of making an investment. Since, however, the risk of loss is one of the elements which enters into the price which you can get in the form of interest for the use of your money, the interest paid by the savings bank is comparatively low.

Let us assume that you can make a regular investment of \$50 every two months. Is it possible to invest this money directly in securities of corporations and in time get a diversified investment based on your own judgment? If you are willing to put a certain amount of thought and study into it, it is possible. In this department of the Financial Quarterly of the *Railway Age*, there will be discussed in the simplest terms and in considerable detail the general principles which can be applied to forming a judgment of the worth of an investment in corporation securities. In this first article, the barest outline only of these principles will be given.

The first question is as to what constitutes security for an investment. The distinction between stock and bond is the distinction between a partnership in a business and being a creditor of the business. If you buy stock of any corporation, you are buying a right to share in the profits of that business and are intrusting your money to the management of the business with the knowledge that this money will be used to meet losses if there are losses. If you buy bonds, you lend your money to the business and as long as the business can pay its debts, you will receive a certain fixed amount every three months or every six months as wages for the use of your money.

Broadly and roughly, the large corporations in which you might consider making an investment, that is, buying their stock or their bonds, may be divided between (1) railroads, (2) public utilities and (3) industrials.

Whether you invest in the stock or in the bonds of a railroad company, the only real security for your investment lies in the net earning power of the railroad. Even if the investment is in first mortgage bonds where, if the railroad should default in interest, the bondholders could step in and take the road, wiping out the interest of stockholders to the full extent necessary to get the par value of their bonds, it still remains true that net earning power is about all the security that the bondholder has. If operating the railroad as a railroad will not earn net enough to pay the interest on the first mortgage bonds, the right to sell the road is of almost negligible value where the amount of bonds per mile of road is nothing more than the merest fraction of the cost of building such a road.

Under the heading public utility, come street railway companies, gas and electric companies and the like. Security in this case rests on the type of franchise which the company has, the potential and actual consumer demand for its services and the freedom which it enjoys from competition. There is also, of course, the question of the fairness with which the company is likely to be treated by the authorities which have the power of regulating it. If a gas company has a perpetual franchise, exclusive right to lay gas mains in a growing and prosperous town, and is subject to jurisdiction of a public utility commission which has a record for fair dealing, the security of its bonds or stock is, other things being equal, comparatively high. With the public utility as with the railroad it is primarily net earning power which forms the security for the bondholders as well as the stockholders.

Industrials, so called, are the companies which do a manufacturing or selling business as, for instance, the Republic Iron & Steel Company, the American Woolen Company, or Sears Roebuck & Co. With these companies the first question of security of investment must be answered from a study of the assets and liabilities of the company. Has the company sufficient cash to give it ample working capital? What is the value of its liquid assets? By liquid assets is meant

things which can be sold comparatively readily and the sale of which would not mean the discontinuance of the business; for instance, stocks of raw material and all manufactured articles on hand would be liquid assets of a manufacturing company in contra-distinction to its manufacturing plant, which latter, while it might be saleable and usable for other manufacturing purposes, is indispensable for carrying on the business. The next question is as to the conservation of the valuation of assets. Is a fictitious value placed on good will and patents, and by fictitious in this case is meant too high a

value? If good will and patent are carried at a nominal sum, \$1 or \$100, it is true that this may be a fiction but it is a fiction in the interests of conservatism.

The industrial, unlike the public utility with an exclusive franchise, is always subject to competition. The protection against competition must lie in an organization and plant which permit of a low manufacturing cost.

This outline is not intended to be anything more than indicative of the method of approach of an investigation as to the value of an investment.

Relation Between the Stock Market and Investment

The Difference Between Speculation and Investment Is Fundamentally a Difference in the Mental Attitude

IT IS SOMETIMES SAID that all Americans who buy corporation securities are at heart speculators, not investors. This is not strictly true, but it is true that very often the American investor confuses speculation and investment in a way in which the French investor does not. The French investor, and to a great extent also the English investor, thoroughly understands that what he wants to do is to purchase a fixed income and that his primary concern is to make certain that this income will be surely and regularly paid him. The American investor, and this is equally true of women who are in circumstances which should lead them to adopt the French view without reservation, confuses the market price at which from time to time their investment securities are quoted with the value and security to them of the income which they have purchased.

An open security market is of value to investors as well as speculators but, whereas the speculator makes his profit from the fluctuations in the price at which securities are bought and sold in this market, the investor uses the market as a place in which to buy the securities which yield the income which he desires, or to sell these securities if necessity arises.

In the ordinary use of the term investment, is meant, either a purchase of securities with the sole object of receiving an income from the interest thereon or the dividends thereon, or a purchase with the expectation of enhancement in market value. For the purposes of this discussion, however, when investment is spoken of, only the simple pure variety—purchase of income—is meant. The investor, therefore, in this sense, is interested in the fluctuations in market price only as they offer a more or less propitious time to make a purchase of securities. After deciding that a particular time appears to be propitious to buy a certain security, the investor may well forget entirely the daily quoted price of his security. What he should continue to watch is the earnings of the corporation whose security he has bought.

The speculator is concerned with a number of elements of varying importance, and by speculator is meant the purchaser of corporation securities who is not concerned solely with the income which they yield him but is also desirous of making a profit through the sale of his securities at a higher price than he paid for them. The two principal factors which he must study are the general trend of all security prices—the general trend of the market as it is called. The other factor is the relative trend of the price of the particular security which he is considering buying as compared with the general trend of prices.

The trend of the general market for so-called standard

railroad stocks has been slightly upward since the beginning of 1918 and of the industrial stocks, most dealt in on the New York Stock Exchange, upward. On the other hand, the trend of prices of railroad bonds has been slightly downward, of industrial bonds, slightly upward, and of public utility bonds downward during January and nearly stationary in February and March. Both bonds and stocks have been lower in price in the first three months of 1918 than they were in either 1917 or 1916, and bond prices have been lower than they were in 1915. It would appear, therefore, that the present is a propitious time for the investor who desires to buy income to make an investment, regardless of the fact, which he must recognize, that if the war continues for a considerable period, the market price at which the securities he may buy will be quoted may and probably will be lower than the price which he pays for them now.

To the speculator who is looking for an enhancement in value reflected in a higher quoted price, this possibility cannot be disregarded. Prices are low now but it is quite conceivable that they may go lower still. For speculative purposes, the industrial stocks would appear to be in a much more favorable position in general than railroad stocks. There are many industrial companies which are making large profits out of the manufacture of articles required for the conduct of the war and some of these companies will be in a position to continue to make large profits out of the deferred need for their products in times of peace. With the railroad stocks, however, the outlook is not at present encouraging.

While Director General McAdoo denies any desire to have the Government retain the railroads after the elapse of twenty months after the declaration of peace, it is not at all unthinkable that the Democratic party would go to the country in 1920 with one of the planks in its platform advocating a retention of the railroads, either by a continuation of control and operation or the further step of outright government ownership of the railroads. If government ownership were to be the issue and the country should have the misfortune to adopt it, owners of railroad securities would be, it appears now, in an unenviable position.

While the courts follow public opinion more slowly and conservatively than Congress, after all public opinion is the ground work on which court decisions are founded, even though the legal justification of these decisions is based on previous legal decisions. If the country should vote for government ownership, there is an imminent danger of a huge confiscation of equities of the holders of railroad securities, the courts notwithstanding.

EDITORIAL

Railway Age

EDITORIAL

Francis S. Peabody, chairman of the Peabody Coal Company, has written for the *Railway Age* a brief but important article, which we publish elsewhere in this issue, on the transportation of coal for railway use during the period of government control. Mr. Peabody was formerly chairman of the Committee on Coal Production of the Council of National Defense, and is one of the largest coal operators in the United States. He worked out for the Railroads' War Board a zone system for the distribution of coal for commercial and domestic use which was the basis for the zone system which has been adopted by the Fuel Administration. The railways are very much the largest consumers of coal. Mr. Peabody estimates that they use one-third of all that is produced in the country. Railway men need hardly be told that under the competitive system of railway operation there was a large waste of transportation in the handling of coal for the use of the roads themselves. This was mainly due to the fact that each road sought to get for itself as large a part as possible of each haul of coal intended for its use because this tended to swell its own earnings and at the same time kept down the amount of freight charges it had to pay, directly or indirectly, to other roads. This system, natural but expensive under competitive operation, is needlessly expensive and wasteful of transportation under unified operation. The remedy, Mr. Peabody contends, is a zone system of production and distribution similar to that adopted for commercial coal. His suggestions are earnestly recommended to the consideration of the Railroad Administration and the managers of the individual railways.

Transportation of Railway Coal

The waste in iron and steel that will be occasioned by the use of standard locomotives amounts to such a large sum that it must be given serious consideration, particularly when this material is in such demand for purely war purposes. In the last week's issue of the *Railway Age* attention was called to this fact on page 843. The study has been carried further if the requirements for Mikado, Santa Fe, Mallet, Pacific, Mountain and switching types of locomotives last year were to be fulfilled with the proposed standards, of the weights given by Alba B. Johnson in a paper on the Railroad Administration's Motive Power Problems, published elsewhere in this issue, there would be over 25,000,000 lb. more of locomotive material used than was used last year. The requirements this year will undoubtedly be twice those of last, and it can be safely said that if standard locomotives are adopted, 50,000,000 lb. more of iron and steel will be used than would be necessary if the roads were permitted to order locomotives best suited for their requirements. Based on a cost price of 15 cents per pound, this means that the increase in the cost for locomotives this year would amount to some \$7,500,000. Can the Railroad Administration afford such extravagance? Is there any excuse for such extravagance, particularly when the adoption of standard locomotives will give many roads power which is unsuitable for their conditions and power which they are not prepared to maintain? Will any slight increase in the output of the locomotive builders warrant any such increase in the cost for locomotives?

The representatives of the *Railway Age* have invariably found when talking with men conversant with locomotive design and operation that there is a distinct feeling against the adoption of standard locomotives for all the railroads in this country, particularly at this time. So general is this feeling that it is beginning to appear that the director general has not been getting the consensus of opinion on this very important subject. The railroad men particularly seem to hesitate to speak their minds. Every interview on the subject is closed with an admonition from them—"Now don't quote me. I am working for the government and I intend to be a good soldier." They cannot better perform their duty to their country than by doing what they can to prevent the Railroad Administration from making a mistake which is so full of disastrous possibilities. It is the duty of every railroad man who knows, to speak through the most direct channel he has—either through the regional directors or the standardization committee,—and give his honest and just opinion on the practicability of standard locomotives. Alba B. Johnson, president of the Baldwin Locomotive Works, in a paper before the U. S. Chamber of Commerce, which is published elsewhere in this issue, has availed himself of an opportunity of saying what he thinks on standardization. He says: "It may be said that the workman who is responsible for the best workmanship should be entitled to the selection of his own tools, and similarly, that the railroad manager who is responsible for his record of efficiency and economy, should be permitted the widest discretion in selecting the locomotives which he regards as best fitted for the conditions of service upon his line." And further: "Thus, instead of simplifying the problem of locomotive maintenance, the introduction of government standards would complicate it." He closes his discussion with the admonition that: "Especially should this (standard locomotives) be considered most carefully when the world-wide danger of this war is upon us." There are other men as well able to speak on this subject as is Mr. Johnson—men in the railroad field, who know just what standard locomotives will mean to them. Let them speak before it is too late!

Express Your Views on Standardization

An interpretation of the Hours-of-Service law by the "rule of reason" instead of on the basis of the strictest possible construction, is one of the unusual things recorded in our Court News column this week. It is in a decision by Judge Buffington in the United States Circuit Court of Appeals at Philadelphia. The engineman and fireman of a helping engine had a good deal of time off between runs and the judge suggested that now, when everybody is in duty bound to work to his utmost to win the war, there ought to be some reasonable way in which this rest-time should be allowed for. Whether or not this view will be sustained, under the cold scrutiny of the full bench of the higher court, we do not know. Indeed, the declaration is perhaps to be classed only as an *obiter dictum* and so of only temporary interest; but it is at least a refreshing variation in the dreary and unending succession of strict constructions by which, dur-

Ameliorative Words from the Bench

ing the past dozen years, the courts have converted the rules of freight-train running into a petrified strait-jacket, in which no one has a chance to breathe. In essence, the controversies over hours of service are only a part of the campaign of the brotherhoods for higher pay; but, nevertheless, every airing of the subject helps to impress the fact that every railroadman's duty at the present time is to put forth his best efforts for efficiency, whether his day's work is done in 8 hours, or is scattered over 18 hours. His own health, physical and mental, as related to his personal efficiency, is the only justifiable limitation. Another significant *obiter dictum* of this decision is that wherein the judge says that the Interstate Commerce Commission, instead of prosecuting the railroads in the courts for their infractions of laws which in some respects are almost unworkable, ought to formulate and prescribe reasonable rules under which the laws could be complied with according to the normal dictates of common sense. What could be more rational?

The Transverse Fissure Problem

THE DETERMINATION of the conditions leading to the development of interior transverse fissures in steel rails has proved one of the most baffling problems with which railway men and metallurgists have been confronted for many years. Although brought prominently to light in the investigation of the Lehigh Valley wreck at Manchester, N. Y., in 1911, little really definite information has been developed regarding the causes of this type of rail failure, in spite of the fact that it has been given close study by many rail experts since that time. However, the attention which is being given to this problem, and the data which are being collected have demonstrated the fallacy of certain theories that have been advanced and are narrowing down the range of possible causes and thereby bringing nearer the final solution.

The most recent contribution to this subject is the paper by James E. Howard, presented before the American Institute of Mining Engineers in New York on February 20 (abstracted in the *Railway Age Gazette* of November 30, 1917) and the discussions of this paper, several of which are published in part on another page in this issue. In his paper Mr. Howard repeats the conclusion advanced frequently in his reports to the Interstate Commerce Commission that transverse fissures are fatigue fractures which may develop in rails which are structurally free from any known defects. In other words, he believes that they are the result solely of service conditions. In this position he is supported by the manufacturers, but opposed by railway men, and this line of cleavage was particularly evident in the discussion at New York.

Representatives of the manufacturers have advocated decreasing the loads to which the rails are subjected, or increasing the section of the rail. To the first suggestion railway men reply that it is impracticable, while maintaining that the necessity for the second has not yet been demonstrated. That some of the manufacturers are alive to the importance of the problem is indicated by the statement of a representative of one of the large steel companies that his firm is planning to build a machine in the near future which will test full sized rails to determine the effect of section, chemical composition and methods of manufacture on the ability of the rails to withstand the stresses to which they are subjected in track.

In support of their contention that transverse fissures are not fatigue fractures arising primarily from the oversteering of the rail in service, but arise from defects originating in the mills, a number of the railway men presented data to show that transverse fissures have occurred in rails which have been subjected to very limited service, while they have not been found in other rails which have carried a very

heavy traffic; also this form of failure is more prevalent in rails secured from some mills than from others and certain heats show many more failures than other heats from the same mill.

While transverse fissures are relatively few, measured in terms of the total number of rails in track, as pointed out by several railway men, the inherent possibility of a serious accident resulting from a failure is so great and the probability of detection is so limited that a study of this subject warrants the closest attention in order that the causes may be determined and the conditions leading to the development of this form of rail failure in the mill and in the track may be removed.

George A. Post and the Railway Business Association

THE TWO MOST IMPORTANT EVENTS which took place at the meeting of the Railway Business Association in Chicago on Monday were the announcement of the fact that George A. Post intends to retire as president of the association and the reference to the present executive committee of the duty of reorganizing the association and appointing its future officers.

Mr. Post was the father of the association. He has been president of it ever since its organization. Its principal purpose in the past has been to promote good relations between the railways and the railway supply companies and to educate public opinion and public officials regarding the railway question. For the leadership of the association, while seeking to accomplish these purposes, Mr. Post has shown that he possesses an excellent equipment. He is a public speaker of rare ability. He is a diplomatist of consummate tact. While always willing to lead, he has always been equally willing and even anxious to take counsel with and be guided by the judgment of his associates. The association under his presidency has done well the things it set out to do. Recently new conditions have developed in both the railway and railway supply business. The railway supply business has been confronted by entirely new problems. Mr. Post has never rendered such able and valuable service to it as he has within recent weeks in presenting the point of view, the rights and the problems of its members to Director General McAdoo and other officers of the Railroad Administration at Washington.

The new problems which government control of the railroads have presented to the railroad supply business, together with Mr. Post's impending retirement from the presidency of the Railway Business Association, have made clear the necessity for greatly broadening the scope of this organization and reorganizing it. The association at its meeting in Chicago adopted a change in its constitution, delegating to its executive committee the determination of the scope of its work and the way it should be done in the future and the task of working out the reorganization.

This sweeping delegation of power gives to the executive committee a very important duty and imposes on it a very heavy responsibility. The way in which the executive committee performs its duty and discharges its responsibility may largely shape the entire future of the railway materials business in this country.

In every body of men there always are some who believe in the use of conservative methods and some who believe in the use of aggressive measures. The thing which makes an efficient and useful organization is the combination in judicious proportions of conservatism and caution on the one hand with aggressiveness and courage on the other. The Railway Business Association desires and will need the generous, whole-hearted support of all the manufacturers of and dealers in railway materials who have rights to be protected

and legitimate interests to be promoted. To form an organization which will secure the support of all these interests and which will protect and further their interests while at all times recognizing and promoting the rights and interests of the public also, is the problem and the opportunity of the executive committee.

Government control has raised the new problems with which the railway materials concerns are now confronted. Government ownership would be a menace to the rights and welfare of the entire railway materials business. A broad view of the situation should be taken and it should be handled cautiously but vigorously, diplomatically but courageously.

Two Great Industries—An Analogy

THE GOVERNMENT, having assumed control of railway operation, and guaranteed the net return of the companies, has become responsible for railway operating expenses. The prices paid for equipment and supplies enter into operating expenses. Therefore, the government naturally wishes to avoid paying excessive prices. It ought to do this. It is not only to the interest, but it is the right, of the public that the railways shall be operated under government control, as economically as is consistent with the rendering of service appropriate to present conditions, and with the payment of reasonable wages to labor and reasonable prices to the concerns from which equipment and supplies are bought.

But experience in the regulation of railway rates has shown that the word "reasonable" is susceptible of widely varying interpretations. To owners and managers of railways "reasonable" rates have meant rates high enough to keep the companies in a prosperous condition and enable them to raise sufficient capital adequately to develop their facilities. To most of the regulating authorities "reasonable" rates have meant the lowest rates that could be made which the courts would not hold confiscatory. The latter theory has prevailed in regulation, and in consequence we have seen numerous railways reduced to bankruptcy; capital frightened away from the transportation business; and both the extensive and intensive development of the railways almost entirely stopped. We have seen the railways, in the midst of the greatest of all wars, become unable to finance their requirements or adequately serve the government and people; and we have seen it become necessary, as a war measure, to suspend the entire system of regulation and to guarantee the financial returns of the railway companies.

In view of our experience with government regulation of railways there need be no surprise that the railway supply companies became filled with suspicion and apprehension when officers of the government Railroad Administration began to suggest the elimination of patents and royalties in the sale of their goods, to ask to see their cost accounts, to inquire how large their capitalizations and investments are, and what percentages of profit they have been making. Nor is it surprising that the supply companies are not restored to a sense of complete security when officials of the Railroad Administration give assurances that the government will be fair in dealing with them.

They recall that the railways have always been given assurances from official sources that they would be fairly treated. In most cases, these assurances have been sincere. Probably most of the regulating officials honestly believe today that the railways always have been fairly treated, and that the cessation of railway development with the consequent acute congestions of traffic and demoralization of business, have been due to causes other than regulation. But business men and the public know that the kind of regulation which has been applied to the railways has been the chief cause of these conditions. The railway supply concerns have only

too good reason to know so, and with the disastrous experience of their customers, the railway so fresh in mind, they naturally become greatly disturbed when they think they see government control beginning to assume toward their business an attitude similar to that which government regulation began to assume some years ago toward the railroad business.

The Director of Purchases in the Railroad Administration is John Skelton Williams, controller of the currency. Nobody has ever described the destruction of railroad credit more graphically, or stated the reasons for it more forcibly and accurately than Mr. Williams did in a letter which he wrote to the Interstate Commerce Commission, and which was published in the issue of the *Railway Age* for November 16, 1917, page 891. As an experienced business man and an important government officer Mr. Williams saw very clearly what the destruction of the credit of the railways and the interruption of their development meant to the country. He also saw clearly that what had caused these things was the unjust and excessive reduction and limitation of profits in the railroad industry.

Mr. Williams can hardly fail to see that similar reduction and limitation of profits in the railway supply business must and will have similar effects upon that industry; and that it is impossible to arrest the development of this or any other large industry without harmful effects upon the entire country. Patriotism forbids that any class of men or concerns should raise their prices excessively and practise profiteering during the war. These things the government should prevent. But patriotism does not require that concerns engaged in any essential industry shall forego normal, reasonable profits during the war; and certainly no essential industry should be singled out from all others, and required to do this.

It has been pointed out many, many times, with reference to the railroad business, that reasonable profits, from the standpoint both of the welfare of the companies and the country, are profits which will maintain the industry in a healthy condition and cause it to grow sufficiently to meet the increasing demands of the country upon it. Exactly the same thing is true of the railway equipment and supply business. This argument, with respect to the railroad business has fallen on deaf ears, and today the nation is paying for its mistakes in dealing with the railways, and paying dearly. Let us hope that it will not have to be said in future years that government control initiated a policy as ruinous to the railway supply industry as government regulation has proved to be to the railway industry.

Lehigh Valley

THERE WAS LESS CONGESTION on the Lehigh Valley in 1917 than in 1916. In fact, it was one of the few eastern roads which, in 1917, was not at one time or other pretty badly tied up. A remarkably good showing in operation was made. The train load in 1917 averaged 102 tons more than in 1916. The 1917 average for all freight was 778 tons. Carloading was considerably better, the average per loaded car being 29.10 tons in 1917 as against 26.64 tons in 1916; an increase of over 9 per cent. Whereas in 1916 the Lehigh Valley had a debit balance of \$512,000 for hire of freight cars, there was a credit balance of \$195,000 in 1917. The Lehigh Valley should, under normal conditions, have a credit balance for hire of freight cars; it is one of the roads which have followed the policy of buying a liberal supply of cars and the situation that arose in 1916 was brought about by the inability of the Lehigh Valley to get rid of other companies' cars which had been sent loaded on to its line. As an instance of this, large equipment orders for Russia were shipped to the Lehigh Valley and had to be held under load for a long period of time. Eventually, the cars were unloaded where they stood and released for service, but this long delay ran up the per diem to an

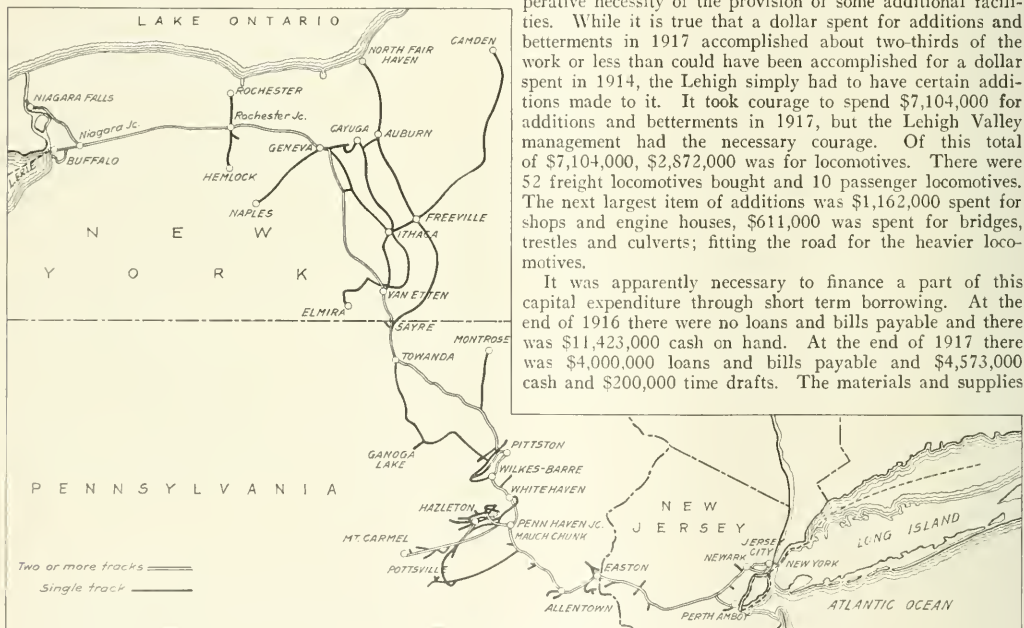

abnormal extent. In the matter of getting coal shipments through, the Lehigh Valley made a most creditable showing in 1917. The road was never, during the entire year, stopped to coal shipments.

The gain in train loading and car loading, the freedom from congestion, the successful efforts to keep coal moving, are all the more creditable because of the almost unbearable labor conditions which existed for the Lehigh Valley and, of course, also for other roads in its territory. The expenses ran up to an abnormal extent. Transportation expenses amounted to \$23,343,000, an increase of \$5,767,000 over 1916; while the increase in operating revenues was only \$4,499,000; the total operating revenues in 1917 being \$53,358,000. The Lehigh Valley's 10 per cent dividend calls for \$6,061,000 and, had it not been for the declaration of a \$2,398,000 dividend (a dividend of about 25 per cent) on the Lehigh Valley Coal Company stock, which the Lehigh Valley Railroad owns in its entirety, the railroad company would not have fully earned its dividends. The net income,

1902, became chairman of the board of directors and E. E. Loomis, vice-president of the Delaware, Lackawanna & Western, was elected president of the Lehigh. Mr. Loomis was a man very much respected and liked by all classes of officers and employees on the Lackawanna, and the operating results obtained under the rather staggering labor conditions of 1917 would appear to indicate that he has already succeeded in getting a fine spirit of team work on the Lehigh Valley. As a matter of fact, it was largely intensive supervision on the part of the higher officers which kept the road open during the entire year. There were times during the year when general officers went out to larger yards and lived there for weeks on end.

The Lehigh Valley, at the beginning of 1917, was a well maintained eastern trunk line which, however, compared to either its neighbor, the Lackawanna, or its neighbor, the Erie, had had little spent on it in recent years for additions and betterments. The great pressure of business in 1916 demonstrated, beyond a further question of doubt, the imperative necessity of the provision of some additional facilities. While it is true that a dollar spent for additions and betterments in 1917 accomplished about two-thirds of the work or less than could have been accomplished for a dollar spent in 1914, the Lehigh simply had to have certain additions made to it. It took courage to spend \$7,104,000 for additions and betterments in 1917, but the Lehigh Valley management had the necessary courage. Of this total of \$7,104,000, \$2,872,000 was for locomotives. There were 52 freight locomotives bought and 10 passenger locomotives. The next largest item of additions was \$1,162,000 spent for shops and engine houses, \$611,000 was spent for bridges, trestles and culverts; fitting the road for the heavier locomotives.

It was apparently necessary to finance a part of this capital expenditure through short term borrowing. At the end of 1916 there were no loans and bills payable and there was \$11,423,000 cash on hand. At the end of 1917 there was \$4,000,000 loans and bills payable and \$4,573,000 cash and \$200,000 time drafts. The materials and supplies

The Lehigh Valley

after including the coal company dividend and paying fixed charges, etc., available for dividends, were \$7,152,000 in 1917, and in 1916, without the inclusion of any dividends on the coal company's stock, was \$7,828,000.

Some conception of the difficulties under which the management worked may be had from the fact that 2,108 new men were hired as locomotive firemen, although the normal force was but 1,343 and 3,123 new trainmen were hired to maintain a regular force of 2,404. The increased cost of fuel alone amounted to \$2,036,000.

As a result of the increase in freight rates granted by the Interstate Commerce Commission on June 27, 1917, the average ton mile rate on merchandise freight was 0.017 cents, that is seventeen one hundredths of a mill greater in 1917 than in 1916, and the freight rate increase netted the company less than \$609,000.

During the early part of the calendar year, 1917, E. B. Thomas, who had been president of the Lehigh Valley since

account had increased from \$3,563,000 to \$6,229,000 but the increase in the value of supplies must account for a large part of this apparent increase. The same supplies, valued at \$6,229,000 at the end of 1917, would have been valued on June 30, 1914, at \$2,062,000 less.

The table shows principal figures for 1917 and 1916:

| | 1917 | 1916 |
|---|--------------|--------------|
| Avg. mile mileage operated..... | 1,443 | 1,444 |
| Coal & freight revenue..... | \$20,402,226 | \$18,330,880 |
| Merchandise freight revenue..... | 22,705,556 | 21,478,421 |
| Passenger revenue..... | 4,894,990 | 4,598,212 |
| Total operating revenues..... | 53,358,446 | 48,859,909 |
| Maintenance of way and structures..... | 5,553,466 | 4,967,202 |
| Maintenance of equipment..... | 9,998,610 | 9,118,815 |
| Traffic expenses..... | 1,013,395 | 1,009,061 |
| Transportation expenses (rail line)..... | 23,343,165 | 17,576,066 |
| Transportation expenses (water line)..... | 798,534 | 870,079 |
| General expenses..... | 1,147,267 | 1,075,189 |
| Total operating expenses..... | 41,826,166 | 34,764,977 |
| Taxes..... | 2,126,626 | 1,804,812 |
| Operating income..... | 9,403,324 | 12,279,778 |
| Gross income..... | 14,480,495 | 15,267,005 |
| Net income..... | 7,151,859 | 7,827,771 |
| Dividends..... | 6,060,800 | 6,060,800 |
| Surplus..... | 1,091,059 | 1,766,971 |

Railway Business Association Discusses Problems

Urges Inviolability of Patent Rights. Commends Conduct of War and Asks Loyal Support for McAdoo

THE ANNUAL MEETING of the Railway Business Association was held in the Hotel LaSalle, Chicago, on Monday of this week, the entire day being given over to the business sessions. Owing to the very general interest in the problems of the railway supply field the attendance exceeded all previous records for similar meetings of this organization, over 300 railway supply men being present.

George A. Post, president of the association, called the meeting to order at 11 o'clock. In his opening address he dwelt upon the problems now confronting the railway supply industry, referring to the more important ones specifically and in considerable detail. He outlined the conferences which he has had with the director general and the director of purchases relative to their attitude towards the railway supply industry. Mr. Post urged those present to refrain from criticism of the administration for apparent delays and emphasized the fact that while "the name of the firm may have been changed, the same people are doing business inside as before."

Pierson Talks on Trade Acceptances

At the conclusion of Mr. Post's address the meeting adjourned to an adjoining room for lunch, during which Lewis E. Pierson, president of the Irving National Bank, New York, and chairman of the American Trade Acceptance Council, spoke on "Proper Remittances for Goods Delivered." Mr. Pierson advocated the use of trade acceptances in place of open accounts in credit transactions in the railway supply business. (This plan of handling credits was described in the *Railway Age* of March 1, p. 463.) Mr. Pierson emphasized the fact that the trade acceptance method is a plan for the handling of credits and is not concerned with cash transactions. Trade acceptances represent value and usability. Being self liquidating with definite maturities their absorption is accomplished readily and automatically. Mr. Pierson stated that experience has shown that trade acceptances are paid promptly on maturity, while open accounts are not. Detailed investigation has disclosed that there is probably no industry in the country in which 75 per cent of the open accounts are paid on or before maturity, while the cases in which trade acceptances are not paid when due are so rare as to be negligible. With open accounts, a careful business man must make provision for slow payment.

Mr. Pierson emphasized particularly the opportunity for the introduction of trade acceptances by the railway supply industry at the present time. He called attention to the fact that although the railways are commonly able to meet their obligations when due, it is very generally true that they extend their payments beyond the specified dates. Trade acceptance will overcome this for no road will desire to weaken its credit by failing to make provision to pay the acceptances at maturity. At the present time when the government is in charge of the operation of the roads, and when it is also actively promoting the Federal Reserve plan, of which the trade acceptance is a feature, and when the Railroad Administration and the Treasury department are under a common head, it would appear to be a most favorable time to introduce the trade acceptance idea among the railroads.

Frank Rhea Speaks on Foreign Trade Opportunities

Frank Rhea of the Bureau of Foreign and Domestic Commerce addressed the association at luncheon on the opportunities for the sale of American railroad supplies in foreign

lands, and particularly in the Orient from which he recently returned after making a careful study of commercial conditions in that part of the world. The results of his investigations have already been covered quite exhaustively in the *Railway Age* of March 19, page 585, and the issue of March 22, page 697. In his remarks to the Railway Business Association he pointed out the great opportunity presented to that body to take a leading part in the development of foreign trade for American railway devices.

He was particularly emphatic in pointing out that foreign trade requires long preparation with deferred returns, and a most painstaking study of conditions peculiar to other countries. He stated that the United States would have to expect severe competition from other manufacturing nations, and mentioned in particular the careful and scientific preparation of the British to prosecute a vigorous campaign for commerce in the Orient at the conclusion of the war. The British, he said, had made foreign commerce a profession, and the best of their young men entered the field with the expectation of spending their whole lives in it.

He described the various methods in which American railway supplies have been marketed in the Orient in the past, which have already been outlined in the articles above mentioned in the *Railway Age*. In this connection he stated that he found the Locomotive and Car Builders' dictionaries to be an important factor in promoting American railway supply materials in Australasia and the Far East. He also stated that American railway and technical journals circulated in those countries and were held in high esteem.

One of the peculiarities of the Oriental market which he brought out is that the distance from the sources of supply makes it necessary for railroads to anticipate their requirements far ahead. New Zealand lines, for instance, contract for materials and supplies in some instances three years ahead. This condition, he pointed out, made it much more serious for those countries to change standards, and hence the life of equipment there was much longer than in this country.

Foreign business cannot be successfully carried on by individual companies. Competing American firms will find it advantageous to combine for purposes of foreign trade expansion, and in some instances may find it advantageous to pool their patents. The government can give some practical assistance to American manufacturers by selecting and tabulating information received from consuls in other countries, but at best the work of the government is more or less academic; practical details of definitely determining the requirements of foreign markets and painstakingly fulfilling them, will have to be worked out by the railway supply industry.

Although there is some truth in the statement that "business follows the investment," Mr. Rhea pointed out that a large proportion of the foreign roads are Government-owned, and therefore not tied by financial strings, while many privately owned lines are paying off their indebtedness and thereby becoming free to make their purchases wherever they please. American products stand high in the estimation of foreign countries, and only need intelligent marketing to win a large foreign trade. In this connection he mentioned the Chinese lines which are in great need of new equipment and new facilities. This, he said, could not be secured because of the difficulty of financing new purchases, and he suggested that American manufacturers might introduce the equipment trust scheme in that country with success.

Mr. Rhea is strongly of the opinion that a development of

foreign trade and the building up of a commercial fleet to carry it, will prove one of the strongest arms of our national defense in the future. Our entrance into that field, however, will demand our best efforts and our whole-hearted attention.

Afternoon Session

A large part of the afternoon session was devoted to a discussion of the policy of the director general with reference to railroad purchases. On this subject President Post amplified his remarks during the morning session, based on interviews with Mr. McAdoo. At the inception of the standardization movement, Mr. Post said, there was considerable misunderstanding of the purposes of the Railroad Administration and many of the manufacturers gathered the idea that it would mean the use of only one or a few devices to the exclusion of competing supply companies. On the contrary, standardization means uniformity of dimensions and locations of devices, and does not exclude any manufacturer who is willing to conform to these requirements. He further pointed out that the director general's office will only concern itself with major purchases running into millions of dollars, whereas the regional directors will supervise purchases of medium proportions and the individual purchasing agents of the various railroads will continue to make smaller purchases, consisting in the main of current supplies bought from month to month and those materials which have a fixed use on their lines.

In discussing the effects of standardization attention was called to the fact that even if orders were placed at the present time, several months would elapse before many manufacturers could change their patterns to conform with these new standards. The discussion closed with a brief consideration of the patent situation. In response to a request of the president for those men present to rise whose business rested largely on patent rights for which royalties had to be paid, it developed that a large number of those in attendance responded.

At the conclusion of the deliberations the Resolutions Committee, A. L. Humphrey, chairman, offered a number of resolutions which were passed by the organization. The first matter taken up was an amendment to the constitution providing for the insertion of a new Article 11 after Article 1, as follows:

"The government of this organization shall be vested in and its policy determined by the general executive committee as constituted in accordance with the by-laws." Mr. Humphrey explained that the purpose of this amendment was to facilitate quick action under the present uncertain conditions, and to make possible the formulation of policies and plans befitting the association's expanding opportunities for service.

Supply Manufacturers' Liberty Loan Day

The second resolution offered called attention to the fact that about 50,000 men were reported by railway supply companies to be in the service of the United States and recommended that the thousands who remain behind should back up the colors by purchasing Liberty Bonds. The suggestion that the director general of railroads designate April 20 as Railway and Railway Materials Manufacturers' Liberty Loan Day, was heartily approved.

The loyal support of the association to the President of the United States in the performance of his difficult responsibilities of prosecuting the war was pledged anew, and the work of the director general and the railways was commended.

Resolutions of thanks to Lewis E. Pierson and Frank Rhea for their addresses were passed unanimously. All manufacturers of railway supplies were invited to join the Railway Business Association in order to profit by the joint activities of that body.

Progress and Patents

The most important resolution passed by the association was that relating to the patent rights of railway supply manufacturers. It reads as follows:

"With satisfaction we observe that the evident aim in constructing the government standard equipment designs and specifications was to admit a broad scope of interchangeable appliances. We welcome also the assurance by the director general that the purpose is to encourage during government control the demonstration and adoption of improvements not yet established. These are policies of progress. They will tend to preserve and stimulate the industrial enterprises whose occupation it is to achieve mechanical advance in transportation science. We earnestly commend to the director general's consideration the fact that a large proportion of these enterprises is founded upon patent rights and that an indispensable essential to preserving the enterprises themselves is to maintain unimpaired the normal status of patents. The owner of the patent who leases to a manufacturer has a contract which cannot be abrogated without his consent and which he may not be in position to abrogate. The royalties are the earnings of his genius. The enterprise which owns patents has for an asset, in some cases its chief asset, as a going business the right to protection against under-bidding by concerns whose overhead cost has not included the experimentation, demonstration, development and improvement of the device."

Resignation of Mr. Post

At the annual dinner it was announced that George A. Post, president of the Railway Business Association since its formation, would decline re-election. This occasioned the presentation of the resolution expressing the deep appreciation of the Association for Mr. Post's able and indefatigable efforts in its interests and the sincere regret of the organization that the pressure of his private business demands his retirement. The resolution reads in part as follows:

"It will be impossible to measure the obligation which is owed to Mr. Post by the group of industries interested in the Association he has so ably fostered during the twelve years of its existence. It was he who first drew for us the picture of the isolated industrial craft units, each in its community possessing latent influence, but none of them using that influence upon the common problem; the picture of those crafts then portrayed illustrated how they might become with a common center of action. To unite those unco-ordinated units, this far-sighted leader perceived, would mobilize their knowledge, their wisdom and their strength and through organization apply their energy to beneficial activity. The Association which resulted from that suggestion has amply justified the prophecy.

"Serving without salary, a condition which he regarded as essential to his influence, Mr. Post has devoted himself to this movement with a prodigality of self-sacrifice that seems incredible to those who find it difficult to make much smaller contributions of time and energy to similar movements. We deplore that any circumstance should deprive us of his leadership. We rejoice to know that this actual circumstance is another and imperative activity and not age or infirmity. To us, under whatever leadership, his past example and present wisdom will always be as a beacon protecting us from hidden rocks. With one voice we fervently pray for his health, long life, prosperity and happiness."

The passing of this resolution was followed by an ovation to Mr. Post. Letters eloquent of appreciation regarding Mr. Post's work were read from H. H. Westinghouse, G. M. Basford, Samuel Rea and Frank W. Noxon.

The Committee on Nominations and Organizations (A. H. Mulliken, chairman), recommended that the plan for the reorganization of the association and election of officers for the coming year be referred to the present Executive Committee for action later; this resolution was adopted.

Railroad Administration's Motive Power Problems*

The Development of the American Locomotive and the Possible Effects of Standardization

By Alba B. Johnson

President, The Baldwin Locomotive Works, Philadelphia, Pa.

THE HISTORY OF RAILROAD development has been one of continuous improvement in size and power and in perfection and economy of details from the beginning of locomotive construction in England and America until the present time. The Rainhill trials conducted on the Liverpool & Manchester in 1829 demonstrated the practicability of Stephenson's "Rocket," which, in its essentials, combined most of the features of present day locomotives.

The Rocket and Old Ironsides, Mr. Baldwin's first locomotive, weighed about five tons each, and were scarcely larger than the motor trucks now commonly used on highways. It would be without the scope of this paper to trace the development of locomotives from Old Ironsides of 1832, to the latest triple compound Mallet, or the most approved Decapod of the present day. The 85 years which have elapsed since the successful trials of the John Bull on the Camden & Amboy; the DeWitt Clinton on the Mohawk & Hudson and the Old Ironsides on the Philadelphia, Germantown & Norristown, have been years of constant experiments and improvements, whilst corresponding experiments and improvements have been going on concurrently in the various countries of Europe. Each railway has endeavored to excel others in efficiency and power, and each locomotive builder has striven to excel his competitor.

Development of the Locomotive

Viewing the whole progress of locomotive development, one general fact is apparent; in years of excessive business the time and thought of railroad men have been so fully occupied with the movements of traffic as to leave little opportunity for the problems of improving methods and appliances. Waves of depression follow successively waves of expansion, and during years when earnings are small and the necessity for economies is urgent, much attention is concentrated upon problems of improvement. The result has been that each period of business depression has been followed by new developments in the art of transportation. It would not be difficult to trace the periods of minimum traffic which resulted in the changes in track from the 40-lb. to the 60-lb., the 60-lb. to the 80-lb., and the 80-lb. to the 100-lb. rail and now even to the 130 lb. rail; in the car, from the 20-ton to the 30-ton, the 30-ton to the 40-ton and the 40-ton to the 50-ton and 70 ton capacity and now in some cases to the 100-ton capacity; and in the locomotive from the 15-in. by 24-in. 30-ton locomotive of the '70's to the 17-in. by 24-in. 40-ton locomotive of the '80's; the 20-in. by 24-in. 60-ton locomotive of the '90's to the 22-in. by 28-in. 100-ton locomotive of the first decade of this century; and the development of the larger types of Mallet, Santa Fe and Mallet—ranging from 300,000 to 500,000 lb. weight—which have been built during the present decade.

The process of development has in each instance been somewhat as follows. It has been found that the readiest means of increasing revenues is to increase the carrying capacity of cars, so that a greater amount of revenue freight can be hauled for each unit of car mileage. The increase in car loading reduced the number of cars which could be

hauled per train, and resulted in a demand for larger locomotives capable of hauling no less a number of cars than before. This found its limit in the capacity of rails and bridges to sustain the increased axle loads. Again and again rails and bridges have been replaced to permit of the constantly increasing axle loads from 10 to 15 tons, from 15 to 20, from 20 to 30 and finally to about 35 tons, the present maximum axle load. If we stop to consider for a moment what this has meant to the industry of the country, we will realize that each change has involved practically the total replacement of rails, bridges, cars, and locomotives on existing lines throughout the whole country, and each step has resulted in a reduction of the cost per ton mile until the cost of transportation in the United States has gone far below that existing in any other country. In the majority of instances each contract for cars and locomotives has been made to new specifications and in comparatively few instances have existing contracts for either cars or locomotives been duplicated without incorporating the changes which have resulted from the combined causes of experience and competition.

Standardization of Locomotives

Standardization has been an ideal much talked of but never realized in actual practice, because standardization implies the crystallization of present practice as the practice of the future, and means that no further changes shall be made as the result of experience or invention. Carried to its logical extreme, the adoption of inflexible standards at any time during the history of locomotive development would have involved the stoppage of progress at that point. Many attempts have been made to fix standards for particular railroads and groups of roads, but in every instance these have given way to the urgency of keeping pace with other roads which have not attempted to bind themselves with the iron bands of standardization. The practical result of such attempts has been that those lines most rigidly adhering to their standards have lagged behind their competitors.

The result of more than eighty years of experience has convinced railroad men that the most advantageous route to standardization is in details rather than in the complete locomotive or car as a unit. Most of the advantages sought through standardization have been obtained by analyzing or standardizing the design of various parts common to a considerable number of classes. Whilst the American Railway Master Mechanics' Association and the Motor Car Builders' Association have perhaps accomplished more in procuring the adoption of complete standard units than advocates of standardization would have liked to see, they have done splendid service to the transportation interests of the country by the adoption of the numerous standard details, by their discussions and by their interchange of experiences. It may be said that their accomplishments have been as great as it was humanly possible to achieve under the conditions of diversity of managements, diversity of ideas and the necessity of constantly keeping abreast of the march of improvement. American railroad men need have no fear of comparison with other countries either in the practical common sense which has been shown in the conservative encouragement given to improvements in en-

*Read before the United States Chamber of Commerce meeting at Chicago, Ill.

engineering practice, or in the reductions which have been achieved in the cost of transportation. They have been quick to adapt to American conditions improvements which have been worked out abroad; they have maintained the suitability of American locomotives, not only for American conditions of operating, but they have also maintained the adaptability of American standards for all countries where the conditions approximate to those existing in the United States, thus developing a large foreign trade in railway equipment and materials.

War Brings New Conditions

The participation of the United States in the world-war has brought about new conditions. A mass of legislation and regulation which had accumulated during years of peace and which was predicated upon certain popular fears and prejudices resulted in the failure to allow increase in revenues corresponding to increased costs. The necessities of the war soon demonstrated that these regulations which prevented co-operation by insisting upon competition, did not make for efficiency, but prevented many measures of improved service which the railroad managers were themselves eager to adopt but which had been made prohibitive. In order at a single stroke to untangle this situation, the government of the United States decided that it was wise to assume control of transportation by placing all the principal lines in the control of a director general of railways, and to operate the roads as a unit during the period of the war and for a fixed time thereafter. For the first time in the history of the country all of the railroads became subject to a unity of management and to a unity of control in their purchases. For the first time it became practicable to adopt and to enforce standards to a large extent. The very forces of competition had brought about a uniformity of general dimensions and weights of locomotives for trunk line service. Inasmuch as all kinds of cars were being hauled indiscriminately over all railroad lines, there could be no reason why a diversity of details should exist amongst those belonging to different railroads. To a lesser degree, perhaps, these considerations apply also to motive power. If one type of locomotive could haul a given train across the continent to the west bank of the Mississippi river, there appeared to be no adequate reason why a locomotive of different type or different details should be required to haul the same train from the east bank where the grades and working conditions were not too divergent.

In the early days of railroading it was quite common for the same line to have different types of locomotives to haul its trains over different divisions of the road. The same conditions now exist upon a larger scale. Notwithstanding a certain amount of standardization of the locomotives on each road, there is a large diversity amongst different roads having practically the same operating conditions. The opportunity given to the director general of railways to unify the motive power of all railroads, was unique, and the conception a fascinating one. The work of preparing standard specifications and drawings was entrusted to a committee comprising eleven railroad officials who collaborated with representatives of the three principal locomotive builders. As the result of their diligent and continued work, twelve standard specifications have been agreed upon and recommended as follows, and their final approval is now under consideration. They are of the following types and weights:

| Type | Axle load | Total weight |
|------------------------|------------|--------------|
| Mikado | 55,000 lb. | 290,000 lb. |
| Mikado | 60,000 lb. | 325,000 lb. |
| Santa Fe | 55,000 lb. | 360,000 lb. |
| Santa Fe | 60,000 lb. | 390,000 lb. |
| Nallet (2-6-6-2) | 60,000 lb. | 440,000 lb. |
| Nallet (2-8-8-2) | 60,000 lb. | 540,000 lb. |
| Pacific | 55,000 lb. | 270,000 lb. |
| Pacific | 60,000 lb. | 300,000 lb. |
| Mountain | 55,000 lb. | 330,000 lb. |
| Mountain | 60,000 lb. | 350,000 lb. |
| Switcher (0-6-0) | 55,000 lb. | 165,000 lb. |
| Switcher (0-8-0) | 55,000 lb. | 220,000 lb. |

The tenders have been standardized with tanks of 8,000, 10,000 and 12,000 gal. respectively.

No one railroad will be compelled to order all of these 12 standards; even the largest trunk lines may find half that number sufficient.

Extent to Which Standardization Should Be Carried

A delicate and interesting question of policy is to what extent these standards should be confined to the essential elements of the locomotive, and to what extent they should be confined to its accessories. The committee wisely adopted the principle of defining only the essential locomotive, leaving a certain freedom to the railroads to maintain their standard accessories, and a certain freedom of competition among manufacturers of railway equipment. It must be borne in mind that the railway equipment business itself is a most important one, embodying as it does several hundred separate manufacturers, with invested capital running into the hundreds of millions and employing several hundred thousand men. These separate manufacturers have studied incessantly to improve their appliances and to reduce costs. Their productions are of two classes, first, those materials or devices which have become essential parts of locomotives, such as air brakes, tires, headlights, injectors, steam gages, etc., etc.; and second, those which are not strictly essential to locomotive operation but which contribute to efficiency and economy. Amongst the latter are such things as mechanical stokers, superheaters, feed water heaters, power reverse gears, etc. These devices are constantly shifting from the second to the first class. Most of those now universally conceded to be in the first class were at one time probationary. Many of those now rated in the second class are rapidly achieving recognition as essentials to be regarded as in the first class. To carry standardization to its extreme limit would involve a determination of the most desirable among many competing devices, and would destroy the market for all the others and throw their makers out of business. It would check the transfer into the first class of those items enumerated as of the second class and would also paralyze every effort toward the invention and introduction of new improvements.

The committee has wisely refrained from attempting a solution of these problems, and its further course with respect to them is yet to be ascertained. Some policy must eventually be adopted, however, either of leaving the railroads which are to receive and operate the standard locomotives, latitude to designate such specialties as in their experience have proved worthy of adoption, or for the director general of railways, through his advisers, to make a selection. The former would appear to be in every way the wiser course.

Standard Locomotives Will Complicate Repair Problems

I have stated above that the standard specifications have been recommended for approval. They have not yet been finally adopted, as a strong plea is made on behalf of the railroads similar in principle to that applicable to locomotive accessories, that each railroad should be allowed to continue to adhere to the standards already adopted. The choice of course involves the weighing of the respective advantages. It may be said for the railroads' contention, that under normal conditions locomotives are not shifted from one road to another, but are generally used continuously upon the same division to keep the traffic movement balanced, and are kept in repair continuously by the same shops. These shops are supplied with standard repair parts and the workmen are proficient in maintaining the repairs of these existing standard locomotives. To introduce a new government standard upon all lines as an entirely clean proposition would be simple

enough, but to introduce it on lines and conditions affecting an entire continent and already equipped is quite a different problem. It necessarily compels all lines to provide themselves with stores of repair parts adapted to the government standard locomotives. Thus, instead of simplifying the problem of locomotive maintenance, the introduction of government standards would complicate it.* These complications would last far beyond the period of government control and would continue as long as the railroad standard and the government standard locomotives operated side by side upon the same lines.

Railroad Managers Should Be Allowed to Choose Locomotives Best Suited to Their Conditions

It may be said that the workman who is responsible for the best workmanship, should be entitled to the selection of his own tools, and similarly, that the railroad manager who is responsible for his record of efficiency and economy, should be permitted the widest discretion in selecting locomotives which he regards as best fitted for the conditions of service upon his line.* If, however, it should be urged that the advantages of standardization to which the roads can work, would in the long run be sufficient to compensate for the disadvantages of present increased confusion, then some principle must be discovered by which standardization shall avoid the cessation, if not the extinction of improvements. Every improvement in some sense involves the destruction of standardization. It would be an evil day for American engineering and for American progress in the art of transportation, which would involve a policy of discouragement to new and useful improvements in the art. We should therefore look carefully before we leap, to make sure that we are not giving up the substance of continued growth in efficiency and economy, to grasp the chimera of standardization. Especially should this be considered most carefully when the world-wide danger of this war is upon us.*

Electric Locomotive Development

Any paper upon the subject of railway motive power under the national administration would be incomplete which did not touch upon the remarkable growth and development of electric power transmission in transportation service during recent years. At the Chicago World's Exposition in 1893, the first electric switching locomotive was shown suitable for industrial purposes, and tests were made of its hauling capacity in comparison with a steam switching locomotive of similar weight in which the advantage was shown to be decidedly in favor of the electric locomotive. Shortly thereafter the North American Company caused the construction, under the supervision of Sprague, Duncan & Hutchinson, of an electric locomotive for use on the Northern Pacific, but the failure of that company and the fact that it was far in advance of the general development of the times, caused its abandonment before it came into practical service.

Shortly after this the Baltimore & Ohio undertook the construction of its tunnels under the city of Baltimore and contracted with the General Electric Company for locomotives with large power to handle its trains through these tunnels for the purpose of avoiding smoke and gases. These locomotives proved to be highly successful, but it was several years after their construction before other electric developments succeeded. Meanwhile, however, there had been a continual growth in the adaptation of electric power to interurban trolley lines, to small industrial locomotive units and to mining and other underground problems. Then followed the application of electric power to the Hoosac Tunnel Line, the New York, New Haven & Hartford; the

West Jersey & Seashore 65 mile line to Atlantic City from Philadelphia; the Long Island; and the Grand Trunk tunnel under the Detroit river. Nearly simultaneously the Norfolk & Western and Chicago, Milwaukee & St. Paul decided upon extensive installations of electric power, both of which are now completed and are showing marked success.

The necessity of avoiding smoke and gases in railway operations in cities soon induced the adoption of electrification for reasons entirely independent of any economies. The elevated lines in New York City were the first and were soon followed by the New York Central and the New Haven Lines, forced thereto by the operation of the tunnels to the Grand Central station. Then when the Pennsylvania decided upon the construction of its extensive system of tunnels to give a continuous line under and through New York City, the adoption of electric power was unavoidable.

The third cause for the introduction of electric power has been the necessities of suburban traffic in and about New York, Philadelphia and other cities. Practically all these electric railway enterprises have involved different sets of conditions and have resulted in a study of their peculiar problems which has worked out a motive power well adapted to each case. So large a volume of experience has now been gathered that it may be said that electric transmission of power to railway service has largely passed the experimental stage and the efficiencies predetermined are realized.

The question arises as to what is to be the future relationship between steam and electricity. Doubtless the electrification of suburban lines and the application of electricity to lines having great density of traffic will be financially justified, and as these grow in number and join themselves together, electric zones will be created in which it will be more economical to adopt electricity exclusively as the motive power.

Any question of rivalry between the steam and electric locomotive may be set aside. The problem is wholly an economic one, the only question being as to which is the more efficient and suitable for the particular conditions, and the consequent adoption of one or the other is dependent upon the geographical or other circumstances governing each case.

The introduction of electric locomotives by reason of the cost of installation must be a gradual one. The increase of efficiency and economy must be clearly shown before capital can be induced to make the necessary investment. As these advantages are conclusively shown, so will the development of electrification grow, but it would appear that the great transportation problem of the country as a whole, outside of the larger cities and their suburban territory, must for some time rely upon steam locomotion as its most available and economical motive power.

Money for Improvements Restricted

The motive power of the country is admittedly inadequate to the service demanded of it under the present war conditions. During the depression preceding the war there was a small surplus of power which, as should have been foreseen, would be absorbed in traffic with the first increase of activity. As a rule, railroads have purchased locomotives largely under the spur of excessive traffic and have abstained from purchasing during periods of reduced earnings. This is contrary to the economics of the situation. Enlargements of facilities should be made in times of depression, because, first, that is the cheapest time to do it; second, it is the most convenient time to do it; and third, it is the time when the managers can give most attention to doing it; and fourth, the employment of labor arising out of large railway purchases tends to mitigate the severity of a general depression. The reason the railroads have not done this since 1907 is, that under the regulatory policy which went

*The emphasis is ours.—EDITORS

Photo from International Film Service.

Triple Wreck Near Amsterdam, N. Y., April 8, 1918

into effect at that time, railway managers have not been able to accumulate surpluses sufficient in their judgment to warrant bold construction in times of small earnings, and especially because future earnings have not been susceptible of approximate calculation even where the volume of traffic could be estimated in advance. Adequate provision of motive power, like adequate provision of other rolling-stock and other facilities, can only be assured when Congress places upon the functionary charged with the duty of regulating rates, the definite responsibility of making such rates as will yield earnings sufficient for thorough maintenance, for adequate improvements and sufficient to attract the capital necessary for providing additions and extensions.

Spectacular Wreck Near Amsterdam, N. Y.

THE EMPIRE STATE EXPRESS of the New York Central was wrecked at a point about $1\frac{1}{2}$ miles west of Amsterdam, N. Y., and 35 miles west of Albany, on Monday, April 8, and its engineman, John R. Botts, was killed; but the passengers and the rest of the trainmen all escaped with their lives, though the train was running at full speed. This train, first established in 1891, and for some time the most noted fast long-distance train in the world, has been said never to have had a derailment or collision in which a passenger was fatally injured; and this statement appears still to be true. And the train has made this remarkable record of 26 years, while running for nearly the whole of its route over a four-track railroad, meeting

(or passing) several times as many moving freight trains as would be met on a two-track road. And it is the fact that the road is four-track which makes this accident specially notable, for three trains were involved.

The first accident was to an eastbound freight. A car in this train was derailed by the breaking of a truck and several cars fell across the westbound passenger track. The Empire State Express (train No. 51) ran into this obstruction, and the engineman was killed and the fireman injured. The freight cars already blocked the northerly part of the roadway and the first two cars of the passenger train were thrown to the southward and across the eastbound passenger track, and one car lodged several rods south of the right of way. Into this obstruction, eastbound express passenger train No. 16 ran and its engine was partly overturned. The engineman and fireman were injured. The reports show that about 20 passengers in the westbound train were injured, but none seriously in the eastbound.

WILL BEAUTIFY SCENERY ALONG CHINESE RAILWAY.—The Empire Line, as the Peking-Hankow railway is known, is to be one of China's attractions to foreign travel, according to Dr. C. C. Wang, its enterprising managing director. A landscape gardener under Dr. Wang's direction is already drawing plans for a system of flower gardens and banks of shrubbery at the stations, and it is also intended to reforest the hills along the line so that the scenery everywhere will be attractive. Within a year or so Dr. Wang feels he will be able to get out an advertising folder that will attract the tourist traveler to a trip through the heart of China—*Oriental News and Comment*.

Eastbound and Westbound Passenger Trains Derailed by Obstructions Almost at the Same Moment

Railroad Traffic Activities Consolidated or Discontinued

IN ACCORDANCE with the general policy of discontinuing all competitive activities of the railroads, all traffic solicitation and most of the traffic advertising, Director General McAdoo has issued the following instructions to the regional directors, who, in turn, have issued them in circulars to the roads:

1. Discontinue the separate city freight or passenger offices where the public may be adequately served at the depot. This applies particularly to the smaller cities.
2. Consolidate or group all city ticket offices, placing the union office in convenient location where rental is reasonable providing sufficient space to properly accommodate the public.
3. Cancel all arrangements with tourist or other similar agencies for solicitations of passenger traffic or sale of tickets.
4. Discontinue all off-line traffic offices.
5. Employees released as a result of above to be assigned to other duties to the extent possible. Some now employed in off-line offices will be needed by the local line to strengthen its traffic forces in order to properly care for the additional work which will result from the above changes.

The functions and services formerly performed by the off-line offices in protecting the needs of the public will be incorporated in the offices of the initial lines.

Separate off-line traffic offices were created by the various transportation interests on account of existing keen competition for passenger and freight traffic, and were primarily headquarters for soliciting agents who were stationed in all commercial districts for the purpose of protecting the interests of the carrier by whom they were employed. Now there is no competition, which eliminates need for solicitation by the individual carriers. The policy is stated to be one of efficiency with all possible retrenchment and economy consistent with protecting the best interests of the public.

The employees released from their present duties as a result of this, are to be assigned to other duties as far as possible, with the same roads. Some now employed in off-line offices will be needed by local lines to strengthen other traffic forces to properly take care of the additional work entailed upon the initial lines on account of this change. In making this readjustment, it is intended to work as little hardship as possible upon the employees concerned. Many of these men have been in the service of their respective lines for long periods, and their railroad insurance and pension rights will be protected.

It is announced that no community will be deprived of adequate sources of information and advice as to matters

connected with passenger and freight service. It will be necessary for the lines directly serving each locality to see that their offices are manned and equipped to furnish the needed information and advice. This will include the issuance of through bills of lading, quotation of rates, passing reports of cars en route, advice to prospective passengers, and all other necessary information heretofore furnished by the off-line offices.

A circular issued by R. H. Ashton, regional director for the western roads, ordering the discontinuance of general advertising by the railroads, was noted in last week's issue. Similar orders have been issued by the other regional directors in response to an order issued by Director General McAdoo. Mr. McAdoo stated that during the period of government operation and control of railroads it is apparent that the large expenditures hitherto made by the carriers for various forms of publicity are unnecessary, and that the custom of exploiting train service, pleasure or health resorts and the like, must be discontinued until further notice. The orders affect all forms of general advertising, such as pictures, calendars, wall maps, etc., and newspaper and other advertising must be confined to the giving of necessary information to the public. A recommendation was asked as to the quantity and character of necessary newspaper advertising in each territory.

Time-table folders are also to be standardized and their distribution carefully checked to avoid waste. All advertising of luxurious trains, claims of superior service and extraneous matter of every description is to be omitted and the folders made purely informative. To bring about this standardization, committees of passenger traffic officers from the eastern, western and southern districts, with A. L. Craig general passenger agent of the Chicago Great Western, as chairman, has been appointed to work with the division of traffic. The committee is now in session at New York, and although representatives from the various departments who are familiar with the compilation of folders may be delegated to represent the members of the committee, the sessions will be continued until the work is completed and submitted to the Railroad Administration for approval.

According to the Interstate Commerce Commission's report for 1916, the total expense of the class I roads for "outside agencies" was \$24,471,940 and for advertising the expense was \$7,781,776. Not all of these expenses will be saved by the new orders because the salaries will be continued but there will be a very large saving in rentals and office expenses generally. In 1916 there were 6,043 traveling agents and solicitors and their compensation was nearly \$9,000,000. There were also 1,998 employees of outside agencies whose compensation was nearly \$2,000,000 and 705 other traffic employees whose compensation was \$785,930.

Accounting Under Federal Control

DIRECTOR GENERAL MCADOO has issued General Order No. 17 to the chief executive officers of carriers subject to federal control, prescribing the following rules and regulations to govern the recording of and accounting for all transactions which arise under federal control:

(1) For accounting purposes federal control began as of January 1, 1918. Immediate steps shall be taken by each carrier subject thereto, to open new and separate books of accounts, such as cash books, general and subsidiary ledgers and journals, and all supporting and subsidiary books and records incident thereto, upon which shall be recorded transactions which arise under and are incident to federal control on and after January 1, 1918. Such books shall be designated and are hereinafter referred to as "Federal Books."

(2) The totals of the accounts "Cash," "Demand loans and deposits," and "Time drafts and deposits" appearing on the corporation's books as of December 31, 1917, shall be transferred to the federal books, debited to accounts of the same titles, and credited to a deferred liability account styled "(Name of corporation)—Cash—December 31, 1917." On the corporate books the amount of such balances should be transferred to a deferred asset account styled "U. S. Government—Cash—December 31, 1917." All cash transactions subsequent to December 31, 1917, relating to operations prior or subsequent thereto, shall be recorded in the federal cash book opened as of January 1, 1918.

(3) The total of account "Net balance receivable from agents and conductors" appearing on the corporation's books as of December 31, 1917, shall be transferred to the federal books, debited to an account of the same title, and credited to a deferred liability account styled "(Name of corporation)—Agents' and Conductors' balances—December 31, 1917." On the corporate books the amount of such balances should be transferred to a deferred asset account styled "U. S. Government—Agents' and Conductors' balances—December 31, 1917."

(4) The total of account "Materials and Supplies" appearing on the corporation's books as of December 31, 1917, shall be transferred to the federal books, debited to an account of the same title, and credited to a deferred liability account styled "(Name of corporation)—Materials and Supplies—December 31, 1917." On the corporate books the amount of such balance should be transferred to a deferred asset account styled "U. S. Government—Material and Supplies—December 31, 1917."

(5) In addition to the assets above specified, there shall be likewise transferred to the federal books and similarly recorded thereon, such other working assets of the corporation as may be mutually agreed upon.

(6) There shall be currently entered, upon such federal books, in the manner and under the rules and regulations prescribed by the Interstate Commerce Commission or which may hereafter be prescribed, all transactions involving revenues, expenses, taxes and rentals, and other items corresponding to those which constitute the basis upon which the standard return to the carrier shall be determined. Such entries shall include corresponding assets and liabilities and the cash settlement thereof; also all transactions involving materials and supplies subsequent to December 31, 1917.

(7) Transactions of the corporation, including those arising out of cash receipts or disbursements, which do not affect or which do not enter into and form a part of those used in determining the basis of standard return, such as interest and dividends received or paid, miscellaneous rents, and other similar corporate transactions, including additions and betterments, shall not be recorded on or passed through such federal books unless such transactions be negotiated and conducted for account of the corporation by or under the direction of the Director General. Where such income transactions are

negotiated and conducted by or under the direction of the Director General the transactions shall be recorded on the federal books but credited or charged to an account to be opened, styled "(Name of corporation)—Corporate income transactions." Concurrently, corresponding entries should be made on the corporate books charging or crediting the accounts prescribed by the Interstate Commerce Commission or which may hereafter be prescribed, the offset being in an account styled "U. S. Government—Corporate income transactions." Where additions and betterments are made by or under the direction of the Director General, the expenditures shall be charged on the federal books to a deferred asset account "(Name of corporation)—Additions and Betterments." Concurrently, entries should be made on the corporate books, charging the appropriate accounts and crediting a deferred liability account "U. S. Government—Additions and Betterments."

(8) Current or operating assets, other than those prescribed in paragraphs 2, 3, 4 and 5 hereof, such as, balances due from individuals and companies, and liabilities, such as, vouchers, payrolls, etc., which were due to or by the corporation as of December 31, 1917, shall not be transferred in detail to the federal books; but as and when such assets are collected or the liabilities are paid, they shall be credited or debited as the case may be, on the federal books to a deferred liability account styled "(Name of corporation)—Assets, December 31, 1917, collected," or to a deferred asset account "(Name of corporation)—Liabilities, December 31, 1917, paid." There should be concurrently made, on the corporate books, corresponding entries debiting and crediting the U. S. Government with assets collected and liabilities paid.

(9) Transactions relating to operations, as defined in paragraph 6 hereof, if not previously accrued, shall be included in and shall form a part of the operating results of each carrier regardless of the date thereof. Items clearly applicable to the period prior to January 1, 1918, commonly called "lap-overs," shall be ascertained currently, set up on the federal books, and included in the appropriate accounts as heretofore. At the end of each month, the total of "lap-over" credit items shall be charged to an unadjusted debit account styled "Revenue prior to January 1, 1918," and credited to a deferred liability account styled "(Name of corporation)—Revenue prior to January 1, 1918." The total of "lap-over" debit items shall be credited to an unadjusted credit account styled "Expense prior to January 1, 1918," and charged to a deferred asset account styled "(Name of corporation)—Expense prior to January 1, 1918." Operating revenues which have been accrued currently in accordance with the established practice of the carrier, shall be considered as current revenues and not as "lap-over" items.

(10) The accounts between the U. S. Government and the corporation, for which provision is made herein, shall be adjusted in such manner as may be hereafter agreed upon.

(11) Inquiries as to the interpretation and application of the provisions of this order and the procedure to be observed under its requirements shall be addressed to the Director of Public Service and Accounting.

THEFTS ON GERMAN RAILWAYS.—It is hard to be hungry and remain honest, as the Prussian railway authorities have discovered. The Railway Minister has recently sent a circular letter to his chief directors of traffic calling attention to the fact that thefts of freight on the railways "are still increasing at a frightful pace"; and he announces methods for combating them. Railway stations and storage warehouses are to be better watched by military and police officials. Cars must be sealed and the seals regularly inspected by superior officials.—*N. Y. Tribune.*

Late Developments Regarding Transverse Fissures

Data Presented by Engineers Points to Origin of Defects in Mill Practice Rather Than Service in Track

ONE OF THE PAPERS presented at the annual meeting of the American Institute of Mining Engineers, New York, on February 20, was a discussion of transverse fissures by James E. Howard, engineer physicist of the Interstate Commerce Commission (abstracted in the *Railway Age Gazette* of November 30, 1917). Mr. Howard's conclusion expressed in this paper was that "transverse fissures are fatigue fractures and that they develop in rails which are structurally free from any known defect. It is a modified type of fatigue fracture in which there is a compressive component in the rail next the running surface of the head. The presence of this compressive component accounts for the interior origin of the transverse fissure. It constitutes the difference which the introduction of the term transverse fissure was intended to emphasize over the common type of fatigue fracture in which this component is absent and which in consequence thereof has an exterior origin."

This paper brought out considerable discussion on the part of railway men and the representatives of the rail manufacturers who have given this subject particular study. The discussion of C. W. Gennett, Jr., was abstracted in the *Railway Age* of February 22, page 421. Abstracts of several other discussions of special interest to railway men, which have just been made available for publication, appear below.

John D. Isaacs

John D. Isaacs, consulting engineer, Southern Pacific, New York City, submitted the following discussion.

In brief, Mr. Howard bases his conclusion upon the following facts:

1. The law of fatigue of metal was established 50 years ago. Repeated reversed stresses above 30,000 lb. per sq. in. cause failure of iron; and above 40,000 lb. cause failure of steel.
2. Steel rails in track are subjected to repeated alternate bending stresses, the magnitude of which depends upon magnitude of wheel loads.
3. Cooling stresses exist in rails from the time of manufacture; these are compression on surface and tension in interior.
4. Cold-rolling in service increases the surface compression.
5. Eighty per cent of the transverse fissures have occurred on the gage side, 20 per cent over the web and none on the outside.
6. Fissures have been located at will on the right or left side or central in the head by progressive gagging.
7. In the metal surrounding transverse fissures, neither microscope nor chemical analysis shows anything unusual.
8. No other theory as to the cause of transverse fissures has been proved.

From these facts Mr. Howard draws the following conclusion: Transverse fissures are fatigue fractures caused by excessively great repeated reversed stresses. He recommends that fiber stresses in rails be restricted to less than 40,000 lb. per sq. in.

The following facts appear to controvert this conclusion:

1. Transverse fissures have occurred in rails which showed very little wear.

2. Mere increase in the weight of rails has not brought immunity from transverse fissures and rails of the heavier sections have displayed transverse fissures after short service.

3. Transverse fissures are very rare (Southern Pacific reports show one failure in 114,000 rails per year). If fatigue were the cause, all of the old rails in heavy service should be breaking from this cause.

4. Transverse fissures are more prevalent in the product of some mills than in those of others.

5. The range of repeated stresses is greatest at the surface of the rail, as shown by Mr. Howard's table, which may be extended as shown in the accompanying Table 1.

TABLE 1—HYPOTHETICAL CASES OF LOADING A RAIL IN WHICH INTERNAL STRAINS PRE-EXISTED

| Rail under assumed loading stresses in head, pounds per square inch | Running surface of head | Interior element in region of transverse fissures |
|---|-----------------------------|--|
| 40,000 lb. compression | 55,300 lb. compression | 26,755 lb. compression. |
| 10,000 lb. compression | 45,900 lb. compression | 19,235 lb. compression. |
| 15,800 lb. compression | 38,600 lb. compression | 6,995 lb. compression. |
| No wheel load | 15,300 lb. compression | 5,245 lb. tension. |
| 15,300 lb. tension | Zero stress | 17,485 lb. tension. |
| 30,600 lb. tension | 15,300 lb. tension | 29,725 lb. tension. |
| 40,000 lb. tension | 24,700 lb. tension | 37,245 lb. tension. |
| Range of repeated stresses | 80,000 lb. or 125 per cent. | 64,000 lb. or 100 per cent. |

It is seen that the range of stresses at the region of transverse fissures is 64,000 lb. and 25 per cent more than this, or 80,000 lb. at the surface of the head. The effect of fatigue of metal should be greatest where the range of stress is greatest and if the rail failed from this cause, the break should start at the surface. This disposes of the principal argument upon which Mr. Howard's theory is based.

6. Mr. Howard could not locate transverse fissures "at will" lengthwise of the rail by progressive gagging nor could he produce transverse fissures in any specific plane, indicating that some inherent defect starts the fissure. Transverse fissures were developed by him by groping for the weak places—progressive gagging.

7. Service is required to develop any sort of a defect into a failure.

8. The relation that exists between wheel loads and track stresses has not been even approximately determined. Limitation to a definite intensity is therefore impossible at present.

In conclusion Mr. Howard's theory that transverse fissures are fatigue fractures caused by excessive and repeated reversed stresses has not been proved and cannot be true in the face of the above facts. A limit cannot be put upon the fiber stresses in rails in track until the relation of wheel loads and track stresses has been established beyond a doubt. Until this relation is known, the present practice, that of laying rails which experience shows will satisfy the traffic conditions, must be continued and reliance must still be placed upon failed-rail statistics, to show where caution is necessary and where reasonable safety is not provided.

Robert Trimble

Robert Trimble, chief engineer maintenance of way, Pennsylvania Railroad, Western Lines, Pittsburgh, Pa., submitted a table and a graphic chart containing information that he had accumulated regarding some rails manufactured by two steel companies, and laid in the main tracks of a railroad system under as nearly uniform conditions as it is possible to find, with reference to alignment, grades, road-bed and traffic conditions.

All of the rails referred to in the statement and chart were manufactured by the open-hearth process under the same specifications; that is, for any one year both mills used the same specifications. The rails are all 100 lb. per yard, and

of a uniform section throughout. In regard to service, if there was any difference at all it was in favor of the rails rolled at mill A.

Mill A furnished, during the period, 83,100 tons, of which 108 rails have been removed because of the discovery of transverse fissures. Mill B furnished, during the same period, 101,300 tons, of which 12 rails were removed because of the discovery of transverse fissures.

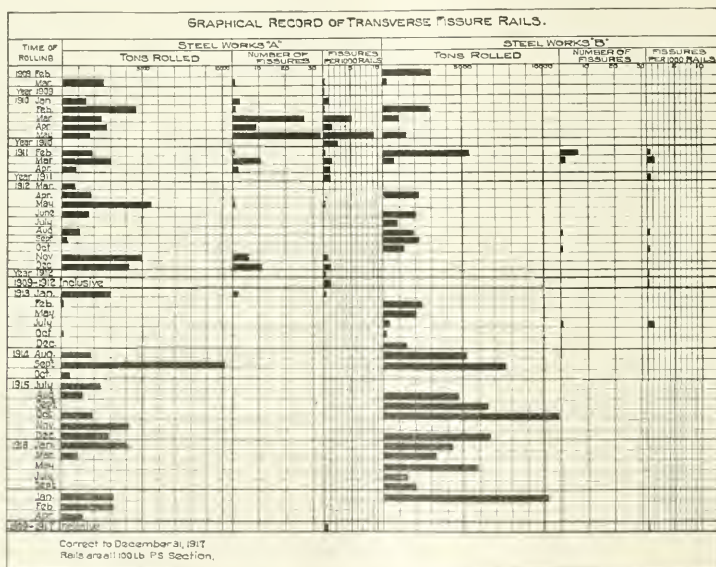

A study of the chart showed:

1. A relatively small number of failures of mill B rails compared with mill A rails: mill A has six times as many failures per 1,000 rails as mill B.
2. Mill A rails have disclosed failures in 13 out of 33 rollings; and mill B rails have disclosed failures in 5 out of 30 rollings.
3. Mill A rails furnished prior to February, 1913, show that 13 rollings out of 18 have disclosed transverse fissures; while mill B rails furnished during the same period show that 4 rollings out of 13 have disclosed transverse fissures.
4. Mill A shows great variation in the results from its

1913, 6,251 tons, a total of 16,295 tons of Bessemer rail. This rail is of the same section and is laid in the same tracks under the same conditions as the open-hearth rail, and none of this rail has disclosed transverse fissures so far.

A large tonnage of Bessemer rail rolled previous to 1909 is still in the tracks, subjected to the same service as the open-hearth rails, and the question arises: If transverse fissures are due to fatigue, why do we not have as many failures from this cause in Bessemer rail as in open-hearth rail? This question has not been answered by the mill men nor by Mr. Howard. A mill man's reply to this question was "open-hearth rail is not ductile enough to stand the heavy loads." It is reasonable to ask, is Bessemer rail more ductile than open-hearth? I do not understand that it is.

There is information in regard to two specific heats of rails rolled at Mill A. One heat, rolled in March, 1910, was removed from the track in January, 1916, because of disclosing numerous transverse fissures. Seventy-eight rails from this heat were investigated; 16 disclosed transverse

A Graphic Comparison of Transverse Fissures from Two Mills

rollings. One rolling of 1,700 tons in May, 1910, showing 33 fissured rails; a rolling of 2,600 tons in March, 1909, which had been in service 14 months longer, shows one fissured rail; and in another case of 4,600 tons rolled in February, 1910, there is but one fissured rail.

5. The rails from mill A show a very much more frequent occurrence of transverse fissures than the rails from mill B, with a correspondingly wider range of variation in regard to the failures developed in the various rollings.

In regard to the rails which have been found with fissures, there is information to show that the material furnished did not meet the specifications in some respects.

During all of this period there has not been brought to my attention a single failure of Bessemer rail with a transverse fissure on the mileage of road, covered by the statistics referred to above, and laid to open-hearth rails.

Mill A furnished, in 1909, 4,812 tons, and in 1911, 450 tons, a total of 5,262 tons of Bessemer rail. Mill B furnished in 1909, 8,544 tons; in 1911, 1,500 tons; and in

fissures, while the other 68 rails did not. Another heat, rolled in December, 1912, was removed from the track between February and May, 1917; 61 rails were examined, 21 disclosing transverse fissures, and 40 not disclosing them. In the case of this heat, the A rails were rejected at the mill, making this heat a suspicious one. All of these rails were in the track, the rails of each heat being subjected to substantially the same service for the same period of time.

The 78 rails rolled in March, 1910, taken from track, were examined by means of bending tests in a rail-gagging press. One purpose of the examination was to determine to what extent other fissures occurred in this heat of rails, and it was thought that this could best be done by gagging the rails with the head down so as to put this member in tension. The method adopted was to break the rails in two by nicking and bending in the gag press, and then to give each half a bend of about 4 in. Starting at one end, the rail was gagged at short intervals until the other end of the half length was reached, and if the rail stood this test with-

out breaking, the gagging was repeated in the other direction. The amount of the gagging was such as to produce a bend of about 4 in., measured as the distance or ordinate from a string spanning about 16½ ft. of rail, to the middle of its length. When subjected to this test, 58 of the 78 rails stood the bending without breaking. The other 20 rails broke in one or more places, and 10 of them showed transverse fissures, varying in size from some scarcely recognizable to some of large size. In the 10 rails that broke without showing fissures, the fracture radiated from a "gray spot" in the interior of the head, except in the case of rail No. 54 in which one break occurred 29 ft. 7 in. from the head end, the break seeming to start from the top surface, and in the case of rail No. 66, which had a horizontal flaw about ¼ in. from the top of the head and several inches along the side of the head.

A summary of results is given in Table 2.

| TABLE 2.—SUMMARY OF GAGGING TESTS | | | | | | |
|-----------------------------------|---|----|----|----|----|-----|
| Rail letter | A | B | C | D | E | F |
| Broken, showing fissures | 3 | 4 | 3 | 3 | 0 | 0 |
| Broken, without fissures | 3 | 8 | 7 | 0 | 0 | 10 |
| Total broken | 6 | 12 | 10 | 3 | 0 | 10 |
| Not broken | 2 | 5 | 5 | 11 | 14 | 58 |
| Total rails removed | 8 | 17 | 15 | 14 | 14 | 68 |
| Total in heat | 2 | 2 | 5 | 5 | 21 | 131 |

One noticeable feature of these results is that there was no breakage of any of the E or F rails, of which 26 of the 43 in the heat were tested. None of the E or F rails broke, and thus, also, no fissures were found in any of them. The highest breakage ratio was found in the B rails and the next highest in the C rails.

It will be noted that 20 rails broke, with a total of 49 breaks. Twenty of the breaks showed fissures, distributed among 10 rails, and 29 of the breaks were without fissures, distributed among 14 rails; thus 4 of the rails showed breaks both with and without fissures. It is interesting to note that 14 of the 20 fissures occurred in B rails and that 26 of the 29 breaks occurred in B and C rails. One C rail gave 7 breaks, and if we exclude this rail, 14 of the 22 plain breaks occurred in B rails. The A, C and D rails which showed fissures each showed 1 fissure, while the B rails which showed fissures averaged 3½ fissures per rail.

It would appear that we have well-founded reasons, from the facts heretofore set forth, for the following conclusions:

1. Obviously a large percentage of rails laid should show failure from transverse fissures if these are caused by fatigue due to a repetition of wheel loads.

For example, the figures herewith indicate one failure to about every 3,000 rails out of the entire lot, or 1/30 per cent. The other 2,999 rails were subjected to the same repetitions of the same wheel loads, and consequently to the same fatigue, and if failure is caused by fatigue, we are clearly justified in expecting a very much larger number of failures from this cause than we actually find, especially if the material is overstressed, as has been suggested.

It may be said that the above figures are unfair by reason of the fact that a large proportion of the rails had not been in service long enough to develop transverse fissures. To meet this case, let us take, for example, the average of the rails from 1909 to 1912, inclusive, in which case we have one failure to each 1,100 rails. This is about 0.1 per cent. We maintain that we should expect to find a higher percentage of failures than this if they are caused by fatigue from overstress.

2. As a corollary from conclusion No. 1, many rollings of rails have not disclosed transverse fissures after having been in service a longer time than rollings of rails which have disclosed transverse fissures. This would indicate that the latter rails must have contained some inherent tendency toward failures before being placed in the track.

The above discussion may not throw much light on the cause of transverse fissures, but it does seem to indicate that

the cause of such fissures cannot be definitely attributed to overstress in the rail caused by the present wheel loads.

On two of the systems of the Pennsylvania Lines, we had in track January 1, 1917, 219,000 tons of 100-lb. rail and 146,000 tons of 85 lb. rail. Assuming the rails to be 33 ft. long, this would mean about 788,000 rails in the track. The probability is that there is a larger number, by reason of short rails. During the year 1917 there were 451 breakages of these rails, or one to about every 1,700 rails. These breakages cover the oldest as well as the latest rails laid. Again it would appear that there should be a higher ratio of breakages if these rails are much overstressed by their present loads.

Dr. P. H. Dudley

P. H. Dudley, consulting engineer, New York Central Lines, New York, submitted a written discussion of which the following is an abstract:

There is a marked reduction in the number of interior transverse fissures developed in the rails manufactured in the past few years. The two main tracks of the New York Central between New York and Chicago contain about 625,000 rails, figured on a 33-ft. basis. We have had 517 rails fail from interior transverse fissures in these two main tracks in the last 5 years. Of these rails, 176 are from three small lots made by direct rolling in November and December, 1910, and January and February, 1911 amounting to about 15,000 tons. Should we subtract these 176 failures from the total, it leaves only 137 breakages during 5 years for the great majority of the rails, most of them made by direct rolling.

A Magnified View of a Transverse Fissure

The average service of rails in the main line is 8 to 10 years, and the rate of failures for the present larger tonnage will about double the former figure, or, say 275 for the main line. In 625,000 rails, 275 failures is at the rate of one in 2,250, per 10-year period, or one in 22,500 rails per year. Stated another way, this rate is one failure per 7 miles of track per 10-year period, or one failure per 70 miles of track per year. On a percentage basis, this is 0.44 per cent per 10 year period, yet successful efforts are being made to eliminate this small percentage in future rollings.

I have spent the parts of several years at the steel mills engaged in the manufacture of rails, and have then followed their service in the track year by year. I have measured the unit strains in the rails under moving locomotives and cars by my strainograph and have found some of the favorable relations which can exist between them and the rails in the roadbed. It should be stated that the maximum strains in the base of the rail occur directly under the wheels, also the maximum compression in the head of the rail. At the point

of flexure in the rail, these reverse to tension in the head, which may be one-fourth and sometimes one-third of that under the wheels.

The wheel spacing governs the spans of the bending rails rather than the tie spacing, which is not generally understood. I do not find in the many tests of the unit strains in rails with my stremmatograph, which autographically records those under the wheels in the base and also in the wheel spacing, that our rails are overstrained.

Personally, as one of the engineers who has had the responsibility of rail manufacture and the investigations of interior transverse fissures, I find so much that Mr. Howard has evidently overlooked that I am unable to accept his conclusions of their origin, or agree that they are fatigue fractures.

G. J. Ray

G. J. Ray, chief engineer, Delaware, Lackawanna & Western, Hoboken, N. J., also submitted a written discussion in which he stated that it was his opinion that there is ample evidence to show that mill practice does in some manner or other influence the transverse fissure. He said in part: We have found, in practice, that open-hearth steel rail 0.75 to 0.85 carbon or thereabouts, does not show any flow of metal to speak of under the present wheel loading and heavy traffic. We have also found, to our sorrow, that transverse fissures are most sure to occur in steel rail with carbon above 0.80 and, in order to reduce the number of failures by transverse fissures, we have very materially lowered the average carbon with correspondingly good results in reducing the number of transverse fissures and in extending the life of the rail before such failures begin to make their appearance. It seems to me this is pretty good evidence that practical results on the track do not in all cases correspond with Mr. Howard's laboratory results.

If the prevailing rail section, or the present track structure is wrong, the manufacturers and other critics have not as yet suggested a practical modification of either to overcome the trouble. If we have reached the point where the present wheel loading is too great for the steel, regardless of the weight or form of the rail, we are certainly in a deplorable situation.

Mr. Howard states: "Next, it is important to ascertain the limit of endurance of rails which have been in the track and have acquired a state of internal strain. There is no apparent reason why this barrenness of fundamental data upon steel rails should longer continue." The Lackawanna has lots of data for rails rolled back as far as 1908, and much evidence to show the limit of endurance in actual service. But, of course, we do not know anything about the internal strains acquired by the various rollings except in so far as they have been determined by Mr. Howard in certain samples furnished him for experimental purposes. We do know that certain heats are more susceptible to transverse fissures than others.

In 1913, the Lackawanna had 46 heats of steel rolled at one steel mill during the month of January. Before this rail had been in service a year, transverse fissures had occurred in one heat and it became necessary to remove that heat from the track by the time the rail had been in service two years. Until the spring of 1917, or after four years' service, no other transverse fissures had shown up in any of the remaining 45 heats, although the rail was all laid in the same track. The heat which failed was very low in ductility as compared with the average of the remaining heats.

I have noted many other similar instances to convince me that certain heats are subject to transverse fissures, at least to such an extent that they tend to develop earlier in the life of the rail. Very careful observation of a mass of data has shown conclusively that the per cent of elongation developed

under the drop hammer is uniformly less with the heats in which transverse fissures have developed than with heats in which no transverse fissures have occurred. It is undoubtedly a fact, as stated by Mr. Howard, that transverse fissures have occurred with rail of all weights and ages. Nevertheless, in my experience with 80-lb. Bessemer rail, rolled at Scranton, we never had a transverse fissure, although much of this rail was still in service and carrying heavy wheel loads and big tonnage up to within the last few years. Not only did transverse fissures never appear, but the rail never did give any trouble from breakage. If such rail could be manufactured in the '90s, why is it that it cannot be manufactured now?

My first experience with the transverse fissure was in 1909, some two years prior to the date of the wreck referred to by Mr. Howard. Ever since that time, I have been making an earnest effort to ascertain how to avoid accepting heats of steel in which transverse fissures are liable to occur. The more I study the subject, the more I am convinced that mill practice and chemistry do influence this type of failure. I am also convinced that it is entirely within the range of possibilities to manufacture rail with reasonably good wearing qualities and at the same time not be liable to failure due to transverse fissure, within a reasonable life of the rail, under the present wheel loading and dense traffic. With one steel mill putting out many thousand tons of rail rolled since 1911, we have had only one transverse fissure, and that was in 101-lb. rail rolled in 1913, after five years' service.

A. W. Gibbs

A. W. Gibbs, chief mechanical engineer, Pennsylvania Railroad, Philadelphia, Pa., submitted a written discussion, of which the following is an abstract:

It must, I think, be admitted that the service does very greatly affect the development, in the rail, of this as well as other kinds of failures, and that where the greatest density of traffic in combination with the greatest intensity of loading is found, the greatest number of rail failures of all kinds are to be expected. Mr. Howard's paper does not give proper consideration to the fact that in the same stretch of track, subject to identical service as to tonnage and speed, certain rails show one or a number of transverse fissures, while their neighbors remain sound. Is it not true, therefore, that it is the service which has the selective property of picking out these rails which are predisposed to failure of this kind? While not claiming that transverse fissures existed originally in the rail, I do claim that certain rails are predisposed, from the time they leave the mill, to the development of this kind of failure when exposed to service.

Unfortunately, it is not practicable to make an investigation of the interior condition of any given rail and afterward subject that rail to service, and a post-mortem in case it develops a transverse fissure. Therefore, the best that we have been able to do is to examine representative rails when new and others, associated in the same heats, which have failed from this cause. I cannot but believe that there is initially a difference in the rails which fail as compared with others in the same heat and service which do not fail, and until our investigations show us what this difference really is, we shall make no real progress toward applying a remedy.

Our records very clearly show that certain rollings have been entirely immune from this kind of failure, while other rollings have shown so large a number of them that it is impossible to believe that it is the service condition which accounts for it. To illustrate: Several years ago in the rolling of our heavy section, two mills each furnished almost exactly 10 per cent of the rails received for the year. One mill's rail has no failures to date; the other has closely 60 per cent of all failures for all mills rolling that section that year, and 63 per cent of the transverse fissures. There have been other instances almost as marked. It seems to me, therefore, that

work such as that instanced by Dr. Dudley, in tracing back to the mill in the effort to identify the cause of the failure, is the only helpful line of progress leading to a remedy.

One speaker suggested three remedies: Perfect track; reducing the weights of equipment; and heavier rail. This is simply begging the question. Perfect track has never existed, and can never be expected. No more can perfect equipment be obtained by any practical maintenance. Weights of equipment cannot be reduced unless we are to retrograde. Heavier rail must justify itself by a marked reduction in failures of all kinds; at present it is on trial. It must be said that the best rail we are now getting is good enough, judging by service results. On the other hand, we are getting, under the same specifications, rail which we cannot believe is good enough, judging by the results. Our problem is to detect, before failure, what produces this difference and apply a remedy for the bad rail.

H. D. Hibbard

H. D. Hibbard, Plainfield, N. J., submitted a written discussion which is abstracted below:

Admitting with the author that "brittleness of fracture in all grades of steel is characteristic of fatigue tests" we may yet look farther back to find out, if possible, why some rails and some steels are more prone to have transverse fissures than others, for it has been found that rails from certain heats of steel developed these fissures under a service which did not fissure rails of other heats. This demonstrates that some steels resist the fissuring conditions better than others, or to put it otherwise, that they are better.

It seems to me that a quickly developed transverse fissure in a rail results from a combination of causes which begin with the treatment of the molten metal in the furnace and end with the fissuring of the rail in the track. Briefly, these are poor steel, massive head, internal stresses in the head, and, given such conditions, to the wheel action in binding the rail and stretching the top surface metal of the head by cold rolling, as the author has described, the tendency being aggravated by gagging, which may at least determine the location of the fissures, or some of them. Thus the service stresses, instead of being the fundamental cause, may be, as it were, the last straw, and in the absence of internal stresses in the head, they might not be great enough to fissure the rail.

The quality of the steel is determined largely by the way it is finished in the furnace, a well worked, easily killed bath, not readily described in words, being wanted; this demands more time than furnacemen, who are paid for the tonnage produced, are sometimes willing to allow. Then sufficient time must be allowed after the final additions for the oxides and silicates (sonins) resulting from the consequent reactions at least to agglomerate into drops, and preferably enough time for the drops to rise to the top.

The heating and rolling which, of course, must be properly done are now rarely responsible for poor steel and presumably for transverse fissures. Nevertheless, it is quite conceivable that in rapid heating and rolling ingotism is not wholly obliterated and that cementite remaining undissolved between the grains weakens the metal. The additional time for this afforded when the blooms are reheated before going to the finishing mill may cause the diffusion of more carbon of the cementite, and so justify in a measure the opinion of those who think such reheating prevents transverse fissures.

The occurrence of fissures in open-hearth steel may be fairly laid to the more massive heads, which became common at about the same time that the use of open-hearth steel for rails became general, rather than to the process. The interior of the head of a rail, which cools last, is in a state of tension, as Howard and others have found; this is true of the interior of every piece of steel cooled in the open, and the more massive the piece the greater the tension. When the stresses from wheel action, added to that initially in the cen-

tral part of the head, exceeds the strength of the metal, fissuring begins to grow under continued service. The better the steel the better it will resist.

If this explanation of the genesis of transverse fissures be correct, the cure for the trouble, or at least a method for reducing it to the minimum, is fairly obvious:

First, have the steel well made, so that it will pass a more severe drop test than is now prescribed; this will cause the rejection of heats poorly made and therefore immediately liable to transverse fissures.

Second, heat properly and finish the rolling of the rail when wholly at a temperature near, but above, the recalescence point.

Third, retard the cooling of the rail after rolling so that it shall cool at a substantially uniform rate throughout; this will prevent internal stresses in the head and elsewhere. Rails to be so cooled would be hot-straightened and would not require to be cambered after rolling, as is necessary when they are to cool in the open air according to present practice. Then cold-straightening would be diminished, if not avoided.

Of course, rails thus dealt with could not be heat-treated by any process involving accelerated cooling unless it were followed by annealing. Rails so made could be safely made of higher-carbon steel than now, and for that reason would better resist cold-flowing and stretching of the surface. Heavier sections could also be employed, which would better resist the wheel action, which contributes toward the development of transverse fissures.

Railroad Engineers in the War

THE GOVERNMENT'S COMMITTEE on public information has issued a review of the first year of America's participation in the war, based on authorized statements by officials of the government departments concerned, which contains some information regarding the work of the railroad engineers, one of whose first tasks was the reconstruction and extension of a railroad 600 miles long from ports of embarkation to general bases of operation.

Of the special engineer units recruited for service on railroads and in the maintenance of lines of communication, many are already in France and others are awaiting recruitment to full strength in order to be ready for over-seas service. The first engineer troops, 1,100 strong, to be sent abroad, arrived in France about three months after war was declared. Since that time the number has been greatly augmented. These troops have been constantly engaged in general engineering work, including the construction of railroads, docks, wharves, cantonments, and hospitals for the use of the American Expeditionary Forces. They have, in some instances, in the performance of their duties, engaged in active combat with the enemy.

Through the inability of the Russian government to accept certain railroad equipment and supplies ordered in this country, the Engineer department has been able to secure 200 locomotives, by assuming a liability of \$11,000,000 therefor, with the understanding that the Russian government could purchase them later if desired. These locomotives have been rented to American railroads, and have thus assisted in reducing the shortage of motive power in this country.

Rails were obtained in the same way and in great part sent to France in return for rails loaned by the French government to the American Expeditionary Forces.

The office of the Director General of Military Railways, from the beginning of the war to February 20, 1918, had placed orders for railway supplies having an aggregate weight of 754,000 long tons and a value of about \$142,000,000.

Maps of the Bituminous Coal Zones

THE MAPS on this and the following page show in graphic form the zones for the distribution of bituminous coal which were announced by the Fuel Administration in the latter part of last month.

Each of the maps shows both the producing section and the zone to which it is allowed to ship coal following the taking effect of the order the first of this month. It will be noticed that in some cases the distributing zones overlap. No producing section is shown on the map for Zone B, coal for that zone being supplied from Lake Superior and Lake Michigan ports.

This series of maps has been compiled by the United States Railroad and Fuel Administrations. It supplements the announcement of the Fuel Administrator made last month, a detailed report of which, with the complete description of the various zones, was given in the *Railway Age* of March 22, page 723. Complete copies of the announcement may also be obtained in Publication No. 21 of the Fuel Administration, published March 22.

The producing sections for the several zones are as follows:

A—All producing districts in Missouri, Arkansas, Kansas, Oklahoma and Iowa.

B—Supplied through Lake Michigan and Lake Superior coal docks.

C—All producing districts in Illinois.

D—All producing districts in Indiana.

E—Producing districts in western Kentucky on the Illinois Central, Louisville & Nashville and Louisville, Henderson & St. Louis and short line connections.

F—Producing districts in Virginia on the Louisville & Nashville, only all producing districts in eastern Kentucky on the Louisville & Nashville, and the Cincinnati, New Orleans & Texas Pacific and short line connections, Tennessee mines on the Cumberland Valley division of the Louisville & Nashville and on the Middleborough Railroad.

G—All producing districts in Tennessee and Georgia; Kentucky mines on the Louisville & Nashville main line and branches connecting at and south of Corbin and on the Cincinnati, New Orleans & Texas Pacific south of Somerset; all Black Mountain and Stonega districts in Lee, Wise and Western Russell counties of Virginia located on the Louisville & Nashville, Virginia & Southwestern, Norfolk &

Western, Carolina, Clinchfield & Ohio and short line connections.

H—All producing districts in Alabama.

K—All producing districts in Ohio.

L—In the West Virginia high volatile fields, mines on the Kanawha & Michigan and the Kanawha & West Virginia and on the Coal & Coke (west of Dundon) and short line connections.

M—In the high volatile fields of West Virginia and Kentucky, mines in West Virginia and Kentucky, in the Thacker-Kenova and Kanawha districts on the Norfolk & Western and the Chesapeake & Ohio and Kentucky mines in the eastern Kentucky districts on the Chesapeake & Ohio and the Sandy Valley & Elkhorn and connections.

N—In the low volatile fields of West Virginia and Virginia mines in the Pocahontas, Tug River and New River districts on the Norfolk & Western, the Chesapeake & Ohio and the Virginian and short line connections and also mines in the high volatile Clinch Valley districts in Tazewell and Eastern Russell counties along the Norfolk & Western and on the Virginian.

P—All mines in Northern West Virginia, Pennsylvania and Maryland on the Baltimore & Ohio, Western Maryland, and the Coal & Coke east of Dundon and short line connections as well as all of the mines north of these lines are allowed to ship eastbound to all points in the states of West Virginia, Maryland, District of Columbia, Delaware, Pennsylvania, New Jersey, New York and the New England states reached by customary eastbound routes, including coal for transshipment to vessels at tidewater. They are allowed to ship westbound except to all Lake Erie ports for lake transshipment only, with the further exception that Pennsylvania producing districts are allowed to ship as far west in Ohio as the line of the Pittsburgh & West Virginia and the Wheeling & Lake Erie through Wellington to Lorain and the Pan Handle West Virginia producing district in Brooke, Marshall, Hancock and Ohio Counties, W. Va., as far west as the line of the Baltimore & Ohio, Cleveland, Lorain & Western branch, Bridgeport to Lorain, Ohio.

Railway Engineers Fought Shoulder to Shoulder With Canadians.

THE AMERICAN RAILWAY ENGINEERS who helped stem the tide of the onrushing Germans during the opening days of the battle now in progress fought shoulder to shoulder with Canadian engineers in carrying out their task, according to Associated Press despatches last Monday from the American Army in France.

They held their ground stubbornly and retired to previously prepared positions only when forced to do so and inflicted casualties by the thousand upon the Germans as they advanced in close formation, in one place as many as seven waves, each wave ten men deep with one hundred yards between the waves.

The Americans with the Canadians had all the ammunition they needed, and although they were unsupported by the artillery and armed only with rifles and with a few machine guns they poured scythelike streams of bullets into the enemy at several different times until their weapons were so hot as to be useless.

Fought Furiously for Days

This handful of American soldiers, who were not hardened to such terrific slaughter, were sickened by the shambles they created, but fought furiously for several days, helping to hold the enemy all the way from near St. Quentin to the vicinity of Noyon.

These were the Americans mentioned at the time in the

official communiqués, but these details of their exploits it has only now been possible to secure.

When the German attack began the Americans were working in the rear lines with the Canadians under Canadian command. They quickly threw down their tools and seized the weapons with which they had been armed for some months and formed themselves into a fighting unit. The Germans came on and finally reached the positions where the Americans were waiting.

The exact number of the engineers cannot be given, but they were comparatively few. They had no intention of retreating, and were bent upon killing all the Germans possible.

Held Their Fire

As the first gray enemy wave advanced the American forces let them come until they were within certain range, then opened fire, pouring in a storm of bullets. Gaps appeared in the advancing lines at many places, some of them large, where the machine guns had chewed through. Still the German waves came on, without firing a single shot—just advancing.

The Americans were unable to understand these tactics, but nevertheless were certain that it was a question of slaughtering the enemy or being themselves smothered under the advance. By this time their weapons were so hot, that they could not be used effectively, and the enemy was close, so that the engineers retired, fighting, took up another position, then turned and began operations again. A British officer who witnessed the engagement is reported to have said:

"They held on by their teeth until the last moment, inflicting terrific casualties on the enemy. Then they moved back, waited for the Germans and repeated the performance."

Sample for the Germans

By the time the engineers reached a place somewhere near Noyon they were nearly exhausted and almost without equipment. There they were given a chance to rest and re-equip. According to all reports, they were entitled to it, for certainly they gave the Germans a generous sample of what the enemy is to expect from the American army.

During a battle unusual stories always crop up, but the following is one which the correspondent heard from an unquestionable source, and it is said to have been verified:

In one of the periods when the American engineers and their Canadian comrades in arms were holding a position what appeared to be a British staff motor drove up. The driver was in the uniform of a British soldier, and the man in the tonneau was in the uniform of a British staff officer. The officer stepped out and asked for the commanding officer. He was taken to a Canadian officer near by. The staff officer ordered the commander to retire four kilometres, saying that the Germans were pressing on both flanks and he might be cut off.

For some reason the Canadian commander became suspicious. He had the staff officer searched when the latter failed to produce his authority, and papers were found on him proving that he was a German officer. He and his chauffeurs were immediately shot.

American engineers are said to have been present when this incident occurred.

RAILWAY RATES INCREASED IN GREECE.—By Royal Decree published in the Greek Government Gazette of December 15, 1917, all railways in Greece are authorized for the duration of the war, and for the period of one year after the conclusion of peace terms, to increase all passenger and freight rates by 30 per cent over rates existing as of December 15, 1917. All special discounts for freight transportation are to be abolished, and all classes of freight and express will be charged at 30 per cent more than the regular schedules obtaining on December 15.

The Railroad Drive for Liberty Loan Subscriptions

Nothing to Be Permitted to Interfere With Making Railroad Campaign a Maximum Success

UNDER THE LEADERSHIP of three railroad presidents, chairmen respectively of committees of other railroad presidents in the three railroad regional districts, the drive for Liberty Loan subscriptions is on in full swing. It is the intention of the railwaymen to reach by personal solicitation every employee on every railroad the country over, and nothing is going to be permitted to interfere with making the Railroad Liberty Loan Campaign a maximum success.

In this drive as in the other two campaigns, subscriptions by employees on a partial payment plan will be a leading feature. Employees will be allowed either to pay for their bonds in full in one payment or by installments, to be deducted from the payroll if desired, over a period not to exceed 10 months. In cases where payments covering prior Liberty Loans are as yet uncompleted, the ten months' payments on the forthcoming loan may commence from the completion of the present payments, but not later than three months from now.

The director general has announced his willingness that current operating revenues of the carriers should be used as far as may be necessary in advancing the payment for subscriptions pending reimbursement by officers and employees. In the case of carriers whose current operating revenues are not adequate to permit of their making payment in cash for the amount of bonds necessary to cover subscriptions of their officers and employees, arrangements will be made through the Regional Committee to secure loans through Federal Reserve Banks or other channels.

The Eastern Committee

The work of the committees during the past week or 10 days has dealt with bringing to the attention of every railroad president the importance of the campaign and in explaining the best methods to be followed to secure maximum results.

In a letter to the presidents of the eastern railroads, F. D. Underwood, president of the Erie and chairman of the Liberty Loan Committee for the Eastern Regional District, said:

"On this, the first anniversary of America's entry into the world war, our Government offers the people a third opportunity to display their loyalty by subscribing for Liberty Bonds. An immediate response will be necessary to win the war for democracy. A wide distribution of the Third Liberty Loan, paid for out of current and future earnings of the people, will be necessary to make it a success. A greatly enlarged sentiment in favor of the practice of economy, and a renewal of the spirit of self-denial and patriotism is looked for and urged. Economy practiced by everyone will help

to pay part of the expenses of the war, and will go far toward winning a victory for world freedom.

"In the previous two campaigns for the sale of Liberty Bonds nearly 650,000 railroad men demonstrated their loyalty in a substantial manner, and there is every reason to believe them to be even more fully impressed at this time with the necessity of participating in the government's plan to borrow for war purposes \$3,000,000,000.

"Thousands of railroad men have gone to the trenches, many sacrificing good positions, some of them their lives, in the cause of freedom; other thousands who remain at their posts are no less loyal and willing to do their part, which they can do in buying Liberty Loan Bonds. Such co-operation in previous loan campaigns had a wholesome material and moral effect. It is hoped that the effort to make a good showing will be doubly renewed, and that the reputation of railroad men as loyal and patriotic citizens will be permanently and firmly established when the Third Liberty Loan drive closes on May 4.

"The Liberty Loan Committee has been formed at the request of the secretary of the treasury to aid in providing the machinery for the men to subscribe for the bonds and pay for them in installments out of their future earnings and in a manner that will promote the general welfare and cause little hardship.

"It is hoped your company will actively co-operate in placing before all its officers and employees the opportunity to

perform this patriotic service. Reports to the committee during the progress of the former subscriptions indicated that the results did not come up to expectations until the effect of the efforts of special organizations or committees of officers and employees had become manifest. Too much stress cannot be made upon the importance of organization into various committees to make special efforts to appeal personally to each employee. Almost everyone can subscribe something, and it would be a failure in their bounden duty not to do so. The work, to be helpful, must be immediate and thorough. While each company will probably find it desirable to adopt machinery and methods of appeal suited to its own organization, we enclose by way of suggestion a draft of a circular to be brought promptly to the attention of officers and employees, and a draft of subscription blank for the subscriber to sign and indicate the denomination and amount of bonds subscribed for, and method of payment.

"These forms should be forwarded to the treasurer of your company, who will draw therefrom a list of the denominations of bonds required to cover the subscriptions made, for

"Fight—or Buy Bonds"

By E. E. Loomis

President of the Lehigh Valley, and a Member of the
Railroad Liberty Loan Committee for the
Eastern Regional District.

Every railroad man should be a subscriber to the Third Liberty Loan. Through the efforts of the Director General, it seems certain that they will be placed in deferred classifications for military service. This is as it should be. Skilled and experienced railroad men, conscientiously giving the best that is in them at their daily tasks, are rendering the nation as great a service as would be possible in the army itself. They go to make up the most vital force behind our fighting organization.

Special opportunities to subscribe are offered railroad men. They may buy bonds on the installment plan through monthly deductions from their pay. They do not have to begin paying for the third issue until payments for the first loan are completed.

These advantages make their duty as bond buyers all the greater.

To my mind railroad men, particularly, must answer the call.

"Fight—or Buy Bonds."

filing with the bank with which he has made his subscription arrangement.

"Although the committee can supply certain posters and advertisements on request, otherwise, it seems necessary that each company shall print its own circular letters and subscription blanks, prepare and distribute its own advertisements, and arrange with its own banks, or otherwise to purchase and carry the amount of bonds required to meet the subscriptions made.

"This committee will co-operate, and will heartily appreciate suggestions. In view of the shortness of the time, it will be desirable for each company to at once adopt such plans as seem best to accomplish the desired object. The committee requests advice as to the particular plan adopted. It should be advised weekly as to the amount of subscriptions received."

The Western Campaign

"Reports from presidents of the railroads in western territory indicate most patriotic support of the Third Liberty Loan by railway officers and employees," said W. G. Bierd, chairman of the Railroad Liberty Loan Campaign Committee for the western regional district, last Monday.

"Under a plan approved by W. G. McAdoo, Secretary of the Treasury and Director General of Railroads, all Liberty Loan subscriptions by railway officers and employees are to be solicited through railroad committees and representatives," continued Mr. Bierd. "The campaign organization which

campaign have been carefully considered, and it has been determined that the following form of organization should be immediately formulated upon each railroad, upon whom the importance of the work should be thoroughly impressed and by whom substantially the same methods and procedure will be followed by all lines in the Western Regional District:

I. *General committee*.—Headed by the president, or other executive officer, who will issue and enforce necessary instructions. He may select other officers to serve on this committee with him.

II. *General office committee*.—Three representative general officers, who necessarily must devote a portion of their personal effort, and in turn shall appoint captains under their jurisdiction in the various general office departments.

III. *Divisional committees*.—Three or more representative division officers or employees.

While these officials or employees can devote only a portion of their personal time, they must realize the importance of the ultimate success of this railroad campaign and follow up daily the work of such captains and leaders under their jurisdiction in the respective branches of the service, as they may see fit to appoint. It is suggested that all brotherhood representatives in the various crafts, both general chairmen, division chairmen, and local chairmen, be utilized to the fullest extent in the furtherance of this campaign.

IV. *Terminal committees*.—This committee should be composed of three or more such employees as station agent,

Subscription Card Suggested by Western Regional Committee

has been effected on every western railroad insures every person on its payrolls being personally solicited to subscribe to this Liberty Loan. A record will be kept by every railroad of the subscription of each employee. A summary of these records will show exactly how much the railway employees have contributed to this loan.

"It is the aim of every railroad president to have every officer and employee subscribe to this bond issue. It is already apparent that there will be keen rivalry between the western roads not only to reach the 100 per cent mark, but to have the largest subscription in proportion to the number of employees.

"In round numbers on the four hundred railroads in the Western Regional District, there are 800,000 officers and employees, and their annual wages are about \$50,000,000. Watch the railroad men go 'over the top' in this Liberty Loan Campaign."

The Use of Committees

In all three regional district campaigns, particular stress has been put on the necessity of using committees and of reaching every man. The organizations suggested by the Eastern and Western committees are similar. That following, however, is the plan suggested by Mr. Bierd:

The best methods for securing the maximum results in this

yardmaster, roundhouse foreman, car repair foreman, storekeeper, and such other employees in charge of large forces.

V. *Shop committees*.—A committee at each shop composed of three or more of the officers in charge, such as superintendent of motive power, master mechanic, master car builder, shop superintendent, general storekeeper, etc.

It may be necessary that further sub-committees be appointed in the mechanical department to cover all outlying shops and that numerous sub-committees and captains thereof be appointed in all large shops and repair yards.

VI. *The divisional committees*, of which the chairman would undoubtedly be the division superintendent, shall see that all other classes of employees not specifically covered are properly organized under their jurisdiction, such as local agents, track foremen and track men, bridge and building department employees, signal department employees, miscellaneous telegraph and telephone linemen and maintainers.

It is the intention that every employee of the railroads shall be personally urged to subscribe for as large an amount of Liberty Loan Bonds as possible by the officer on whose payroll he is carried, each such officer in turn reporting to his superior officer, and they in turn to the various committees having jurisdiction in this campaign over such officers and employees. It is important that no employee should be overlooked and that they should be solicited repeatedly by the

captain or leader having jurisdiction until such subscriptions as they may be willing to make have been secured.

A daily record should be made and turned in to each of the sub-committees, and in turn to the general committee, showing the amount of subscriptions received for the day. As these records are turned in from day to day to local committees, renewed efforts should be concentrated upon all employees not making subscriptions or not making sufficiently large subscriptions, and continued until it is definitely determined that no subscription can be secured from such employee.

With the elimination of all competition for traffic and the consequent reduction now being made in solicitation forces, there are quite a number of older traffic employees being transferred for duty in other departments. It is suggested that of these men, a sufficient number, and consisting of at least one man, should be delegated to each of the above named committees on each line, and if men are available that a greater number of such traffic officers be assigned to the committees most needed, these men to act in the way of a flying squadron, to be fully posted on all features connected with the Liberty Bond Campaign and in position to address gatherings of employees and members of the respective committees, and thereby give any desired information that may be required and stimulate a patriotic interest that should exist among all officers and employees. These men are generally of a type, and their experience has been such that they should be well fitted for undertaking work of this character. They can readily acquaint themselves with all the details of the campaign by carefully reading the literature and attending some of the general meetings that will be held in various communities for that purpose. It is the intention that these men will be subject to the instructions of the various committee chairmen, and will be despatched from one location to another as may appear necessary to stimulate the desired interest and accomplish the maximum results.

Chicago Supply Trade Organizes to Push Liberty Loan

The railway supply trade in Cook county, Illinois, has been organized to push the Third Liberty Loan. C. K. Knickerbocker, Griffin Wheel Company, is general chairman of the committee. Vice-chairmen are as follows: F. A. Poor, P. & M. Company; C. H. Riddell, Baldwin Locomotive Works; H. W. Wolf, American Car & Foundry Company; Thomas Finigan, American Brake Shoe & Foundry Company; R. H. Ripley, American Steel Foundries; A. P. Bowen,

Pullman Company; T. W. Aishton, National Malleable Castings Company; P. R. Smith, Ayer & Lord Tie Company; E. P. Wells, Charles H. Besly & Co., and G. K. Sage, Fairbanks, Morse & Co. The following supply trade men have volunteered their services in support of the drive: A. S. Goble, Baldwin Locomotive Works; C. S. Palmer, Pittsburgh Steel Company; John Ritchie, P. & M. Company; W. J. Pierson, C. B. Carson, H. G. Turney, A. S. Anderson, and F. J. Stender, Adams & Westlake Company; L. R. Dewey, C. P. Wright, J. G. Tawse, A. G. Delany, American Brake Shoe & Foundry Company; Eugene L. Williams, G. D. Casgrain, A. W. Brown, Griffin Wheel Company; Jack Patton, Ajax Forge Company; H. A. Smith, J. E. Gougeon and C. L. Bates, Railway Review; E. A. LeBeau, Chicago Railway Equipment Company; G. K. Sage, F. E. Church and F. F. French, Fairbanks, Morse & Co.; W. J. Morden, Morden Frog & Crossing Company; N. C. Naylor, Railway Steel-Spring Company and C. S. Boggs, A. W. Clarke and W. W. Taylor from the Central Liberty Loan Committee.

Rainbow Division Committee in New York

The railway supply firms in New York are organized for the Third Liberty Loan Campaign through the Rainbow Division's Special Liberty Loan Committee for the Machinery and Machine Tool Trades. The committee is headed by J. W. Lane, president of the E. W. Bliss Company. R. L. Patterson, president of the American Machine & Foundry Company is vice-chairman; Charles B. Houston of the E. W. Bliss Company is secretary and Charles A. Hirschberg, publicity manager of the Ingersoll-Rand Company, is publicity director. The committee itself is composed of over 40 members of which about 12 are associated with companies in the supply field. These 12 include L. Barron, secretary of the De La Vergne Machine Company; Leigh Best, vice-president of the American Locomotive Company; G. D. Branstetter, treasurer of Manning, Maxwell & Moore; C. I. Cornell, treasurer of the Pratt & Whitney Corporation; F. S. DeLano, treasurer of the American Car & Foundry Company; George Doubleday, president of the Ingersoll-Rand Company; F. F. Fitzpatrick, president of the Railway Steel Spring Company; Henry Fuller, vice-president of the Fairbanks-Morse Company; H. C. Our Foreign Trade in Railway Supplies

An "Exploration" of the Purchasing Commissions and
Export Houses in New York

By P. Harvey Middleton

Executive Assistant, Railway Business Association

TO OBTAIN INFORMATION of value to those members of the railway supply craft who may desire to enter the foreign field, I was requested by our Association to go down the line in New York. I was to imagine myself as a railway supply man who had never dealt in foreign accounts and who was disposed to explore the possibilities in that direction. When I had become somewhat saturated with the spirit of the character which I was to enact, my first impulse was a curiosity to see whether I could sell railway supplies to foreign railroads just as I could to domestic roads—without setting foot outside the country or risking the lives of members of my sales force on a trip through the haunts of the submarine. I found that starting from our New York office I could call upon the actual purchasing agents of some 20 foreign railways without going outside a belt of Manhattan bounded on the south by the Battery and on the north by the City Hall.

The Direct Method

At 17 Battery Place I sent in my card to A. Ankersmit, who is the American representative of the Netherlands Government and who buys supplies for the railways of the Dutch East Indies. Mr. Ankersmit, whatever the custom in the land of dikes, conforms while among us to a gracious practice which I understand is universal among railway purchasing agents in America—he hurried out to greet me and conducted me immediately to his private office. "We have bought in this country," said Mr. Ankersmit, "locomotives, freight cars, rails and accessories, also general equipment for the state railways in Java and Sumatra to an amount which I should estimate at about \$4,000,000 during the past two years. My government operates in Java and Sumatra 2,485 kilometers of standard gage track and 87 kilometers of narrow gage track, and we have 700 kilometers under construction.

"We have 513 engines in operation, 1,600 passenger cars and about 10,000 freight cars. When we buy material it is on the basis of f. o. b. factory. We attend to all the shipping details. This arrangement is during the war. In times of peace we would buy f. o. b. New York and I would attend to the shipments. I have placed orders recently with one company for about 9,000 tons of rails and have also ordered 4,500 tons from two other companies. I can tell American manufacturers that there is considerable business awaiting them in Java. Before the war the business went to England, France and Belgium. Holland does not export a great deal. With a population of 34,000,000, with 200 sugar plantations, with coal mines, with coffee and cotton plantations, and with lines of steamships connecting Java directly with New York and San Francisco, there is no reason in the world why Americans should not obtain valuable trade there."

I was assured by Mr. Ankersmit that railway supply salesmen would always receive a hearty welcome at his hands.

Some Specialties Not Bought

Then I went over to 43 Exchange Place to see J. P. Ripley of the J. G. White Engineering Corporation, which has the management of the Pacific Railway of Nicaragua, a little

republic where the United States marines are industriously protecting American interests. The J. G. White Corporation, also manages the Philippine Railway, which operates in the islands of Panay and Cebu. "All the purchases for these two roads are made from this office," said Mr. Ripley, "and we are always more than glad to meet railway supply salesmen. We buy about everything except rail braces, tie plates, anti-creeper, superheaters, power reverse gears, block signals, and six-wheel trucks. We haven't any use for these things. Our trains do not operate at high speeds and the weights carried are not heavy. All our trains are run on train orders." In this case also the buyer attends to the shipping.

I next called upon A. Palanca, an engineer representing the Italian State Railways, whose office is at 291 Broadway. "You can tell your people," said Mr. Palanca, "that we buy cars, car wheels, boiler plates, boiler tubes, lubricating and fuel oils and other miscellaneous supplies. All material is forwarded on our own ships and the Italian Ministry of Shipping maintains an office here."

Good Demand in Far East

At 17 Madison Avenue I interviewed Mr. Iyama, the purchasing agent of the Imperial Government Railways of Japan. "We have our own car and locomotive plants in Japan," he said, "which produce one-third more than we can use, the surplus going to China. We do, however, buy from American manufacturers steel plates, shapes, rails, lubricators, injectors, gages, spring steel and other semi-manufactured commodities. We recently placed an order with a Colorado company for 20,000 tons of standard American 75-lb. rails."

Purchases for the government lines and for the privately operated railways of Japan and China are also made by Mitsui & Co., the most powerful commercial concern in Japan, whose New York manager is Konosuke Seko. "In 1917," said Mr. Seko, "we made purchases in the United States of railway equipment \$2,300,000, of electrical machinery and appliances \$2,900,000, of steel products \$5,200,000 and of general machinery \$3,500,000." The Okura Company, whose New York manager is B. Imai, is another active Japanese railway purchaser. I called upon Mr. Imai at his office in 30 Church street. "We are changing from 60 to 75-lb. rails as fast as we can throughout Japan," he said, "and we are also going to widen our gage, which is at present 3 ft. 6 in. This will of course necessitate large buying of supplies." I glanced over Mr. Imai's record of recent orders, which included boiler tubes, buffers, cast steel forgings and steel castings, rolled steel wheel centers, couplings, plate glass, steel axles, steel bars and plates, boiler plate and firebox plate, steel channel and flat bars, steel frame plate for locomotives, steel round bars, steel rails, trestle bridge material, electric railway cars and equipment, etc.

Good Market in Cuba

A railway supply salesman will find a score of other foreign railways in the downtown district of New York. At 280 Broadway, for instance, I found the purchasing agent of the Bolivia Railway, an American corporation which has done considerable buying in this country for the new lines now being constructed in Bolivia. Among others interviewed was H. Bellefeuille, secretary of the Havana Central

* From a pamphlet written for distribution at the Railway Business Association meeting in Chicago on Monday.

Railroad at 42 Broadway. This company acts as purchasing agent for six railway companies in Cuba. "The supplies purchased for our companies," he said, "include every class of material used by steam and electric roads, and also all materials necessary for the maintenance and operation of electric power houses and lighting systems along our lines." The National Railway of Tehuantepec (which, in case you don't know it, is an isthmus in Southern Mexico) is at 65 Broadway. Other countries represented in New York are Peru, all the republics of Central America, Brazil, Haiti, Ecuador, and Panama.

A list of all purchasing agents of foreign railways with offices in the United States can be furnished by the Railway Business Association.

This gives a clear idea of the opportunities offered by the direct method. Another opportunity for securing direct orders is afforded by the occasional visit of railway purchasing agents sent here by foreign companies or governments. For instance, Justiniano Sotomayor, vice-general manager of public works of Chile, recently arrived at the McAlpin Hotel, having been sent to this country to buy railway supplies. Judicious enquiries at the principal hotels in various large cities will reveal the presence of these gentlemen from time to time.

The Commission House

Having exhausted the possibilities of dealing direct with the agents of foreign railways located in this country, I turned to another avenue at home which is open to the manufacturer. This is the export commission house.

I called upon Homer C. Johnstone, manager of the steel department of Gaston, Williams & Wigmore, Inc., one of the largest export houses, with established offices and sales forces nearly all over the world. Some idea of the size of this company may be gathered from the fact that it has over 400 employees in its New York office and over 1,000 in its Paris branch.

(The gist of Mr. Johnstone's remarks as reported by Mr. Middleton was given in Mr. Johnstone's article in last week's *Railway Age* on "How the Export Houses Help in Foreign Trade." In addition, however, to some of the things mentioned in his article Mr. Johnstone told Mr. Middleton, "We have supplied all our branches with copies of the Locomotive Dictionary and the Car Builders' Dictionary, so that our men in the field can familiarize themselves with the subject.—Editor.)

I next visited W. A. Will of Dutilh-Smith McMillan Co., 50 Broad street, an export commission house which purchases railway equipment for various countries in Latin America. "Our Buenos Aires office was opened especially to take care of railway supply business," said Mr. Will. "If a railway supply manufacturer desired us to take up the introduction of his products into the foreign markets served by us we would place the matter in the hands of our branch offices in Buenos Aires and Rio de Janeiro and instruct them to put their salesmen to work on it. They are seeing buyers all the time and have the advantage in dealing with them—which a railway supply manufacturer dealing direct would not have—that they not only sell them American goods but buy their products for the American market. On receiving an order we would pay cash for the goods at the plant of the railway supply manufacturer and he would have nothing further to do with it. The troubles connected with transporting the goods from his plant to destination and the extension of credits would be up to us."

The African Market

Then I called upon L. P. Lawrence, secretary of Arkell & Douglas of 44 Whitehall street, New York, an export commission house with branches or agencies in many foreign countries. "Our purchasers of railway material," said Mr.

Lawrence, "are exceedingly large, particularly for British and Portuguese South and East Africa. We purchase also for Australia, Mauritius, India and South America, but our African purchases are very much the largest, as we are the purchasing agents for this country and Canada for the Union of South Africa government. To give you an idea of the volume of this business, we might mention that we have on hand at the present time orders which will amount to over \$550,000." A call was also made upon Jardine, Matheson & Co., of 25 Madison avenue, who have 25 branches in China and Japan.

These are typical export commission houses. There are many reliable houses of this character in New York, Boston, New Orleans and other seaports. A list of such houses with their trade ratings and foreign connections can be furnished by the Railway Business Association.

The export commission house serves equally the foreign buyer and the exporting manufacturer. Transactions are greatly simplified. The foreign buyer, instead of corresponding with a score of manufacturers in the United States, located at various places, writes a letter to one commission house, combining the orders. The commission house distributes the order to the various manufacturers, collects the goods in one shipment, makes one bill of lading and one draft on the buyer. Only one set of shipping papers is necessary for the entire transaction. The commission house adds a percentage to the manufacturer's price to pay for its service.

Foreign Investments

I now decided to make an excursion into the realm of statistics to find out just what the foreign trade in railway supplies amounted to. I returned to the Association office and waded through the statistics of exports of domestic merchandise, picking out those articles which were obviously railway supplies, such as locomotives, cars and wheels, spikes, switches, ties, etc. I found that for the 12 months ending December, 1917, the exports of these articles totaled \$103,616,813. This figure would be materially increased if it were possible to separate railway purchases included under iron and steel, machinery, hardware, tools, etc. It was thus apparent that considerably over \$100,000,000 a year of American supplies were exported to foreign railways in spite of the heavy investments of Europe in those enterprises.

I called at the National City Bank to learn just what Americans were doing to overcome this handicap of foreign investments. Over 60 per cent of the railroads of South America are controlled by British capital. "A railroad constructed with British capital will buy its equipment and supplies in England," said Beverly D. Harris, vice-president of the Bank. "A debtor country must naturally make its purchases largely in the market of the country where credit may be obtained in some form or other for the settlement of trade balances. Recognizing this condition as fundamental, the American International Corporation with a capitalization of \$50,000,000 was created by the National City Bank for the permanent expansion of American foreign trade. Under its charter it can own and operate railway and street car lines and other public utilities and manufacturing establishments."

Following the lead given by Mr. Harris I went over to the Equitable building to the office of the American International Corporation, where I was informed that the Siems-Carey Railway & Canal Co. of St. Paul, Minn., will construct as soon as possible with money furnished by the American International Corporation over 3,000 miles of lines in the rich Chinese provinces of Szechuen, Hunan and Chihli—provinces with a population much larger than that of the entire United States—which will be opened up to foreign trade by these new American owned railways.

Having now personally investigated the various avenues

of export trade opened to railway supply manufacturers at home, my next inquiry was directed at the methods adopted in securing orders by direct contact with the buyers in foreign countries. I put the question up to George H. Charls, vice-president of the American Rolling Mill Company, who has recently returned from a trip to England and South America.

Co-operation in Foreign Trade

"There is only one avenue to success," he said, "and that lies in co-operation, if possible the forming of syndicates quite as strong and well organized as those of our foreign competitors. Under present conditions if 20 steel companies are persuaded to go after export business in Brazil, at least 20 men must be sent to that country. If 20 countries offer a field, at least 400 men must be sent abroad, and they will have to compete with one another. If 20 steel companies co-operate under the provisions of the Webb bill, one man can accomplish the result of 20. In the name of pure economy and self defense we cannot safely pursue any other course. The same plan will permit the joint co-operative advertising of all members."

As all authorities seem to agree that the American manufacturer must combine to secure his share of foreign trade I went back to the American International Corporation to have a talk with W. S. Kies, vice-president, who is regarded as an authority on export combinations. "Can you give me a rough outline," I asked Mr. Kies, "of how railway supply manufacturers could proceed in forming an export combination?" Mr. Kies replied as follows:

How to Form a Combination

"After the passage of the Webb bill," he said, "a group of both competing and non-competing manufacturers could form a railway supply exporting corporation, with branches in the strategic trade centers of the world. The leaders in the industry should be at the head of such a combination to make it successful. Each member at the beginning of the year would report to the corporation the amount of his product available for export during the year, conditions of delivery and acceptance of orders, and price at which he would sell in a foreign market. The sales force of the corporation would undertake the disposal of exportable surplus of its members on the terms and conditions specified, obtaining the best price possible, making use of its own branches, of export commission houses, trained salesmen, and every other agency of demonstrated value in building up foreign trade. The difference between the price quoted and the price obtained would belong to the export corporation as a profit, and upon all sales all members would pay to the export corporation a minimum percentage as a commission. Whenever a demand was found to exist in a particular market for a certain quantity of goods which must be sold at a lower price than quoted by any of the members, in order to meet foreign competition, all members would be notified of the possible order and given an opportunity to meet the foreign price, the lowest bidder or bidders receiving the order. The export corporation would provide an expert to gather statistical and other data of value to the industry, which would be distributed promptly to all members.

"If such an organization were created, with men of the right calibre at the head of it, the American International Corporation would be glad to co-operate with it." In this connection it should be borne in mind that the American International Corporation already owns the Allied Machinery Company of America, which does a large foreign business in machine tools, and also owns the Allied Construction Machinery Corporation, representing a group of non-competing manufacturers. This last company acts as sole direct foreign selling agent and representative for the products of the Lakewood Engineering Company, the Thew Automatic

Shovel Company, the Parsons Company, the Austin Manufacturing Company, the Western Wheeled Scraper Company and the Hydraulic Pressed Steel Company.

This little story describing a tour of observation only touches a few high spots. Every manufacturer of railway supplies has his own problems and probably no two would want answers to the same questions. Certainly there is no single place where all the questions of all concerned on this subject can be answered. The Railway Business Association office does not pretend to be so thoroughly equipped with information that all inquirers can be answered out of our own resources. It is probable, however, that any member who is afflicted with perplexity can save time by making use of our office which will either respond forthwith, or obtain the information for him, or advise him where he can get it.

New England Railroad

Executives' Committee

WHILE RAILROAD AFFAIRS are undergoing a rapid process of centralization under the direction of the Railroad Administration, a considerable degree of decentralization has been introduced in the eastern district by the organization of local district committees of railroad executives for the purpose of settling locally many problems which affect the roads serving various districts. The first of these district committees to be organized was that of the New England roads, which was suggested to the regional director, A. H. Smith, as the result of a conversation between the executives of two of the New England roads, Percy R. Todd, president of the Bangor & Aroostook, and J. H. Hustis, receiver of the Boston & Maine, on New Year's day. Later similar committees were organized for the New York & Niagara, Central, Philadelphia, Baltimore & Pittsburgh, Hampton Roads, Michigan and International Boundary districts.

The New England committee is known as the New England Railroad Executives' Committee and comprises the chief executive officers of the following roads: New York, New Haven & Hartford, Boston & Maine, Boston & Albany, Central New England, Maine Central, Bangor & Aroostook, Rutland, Central Vermont, Grand Trunk, Canadian Pacific Lines in Maine and the president of the New England Steamship Company. J. H. Hustis, receiver of the Boston & Maine, is chairman of the committee. Immediately after the formation of the committee representatives of the most important industrial organizations in New England, at the suggestion of Chairman Hustis, formed a committee composed of such men as the president of the Boston Chamber of Commerce, the chairman of the board of directors of the Old Colony Trust Company, the chairman of the Associated Manufacturers of Massachusetts, an officer of the Arkwright Club, composed of 100 cotton mills, and other men of that type, about 12 in number. This committee is known as the New England Transportation Conference and its object is similar to that of the Railroad Committee, to deal with the railroad in setting at home if possible all questions arising between the commercial organizations in New England and the railroads of that territory. The conference requested the Railroad Committee to appoint one of its members to sit with it each week at its meeting in Boston and to act as the medium of communication between the commercial and railroad interests. Mr. Todd was selected by the Railroad Committee as its representative for this purpose.

It is stated that the business men have displayed a splendid spirit in co-operating with the railroad executives to make government control of railroads during the war a success, and it is believed that they have set an example which could be followed with results mutually satisfactory to both

railroad men and representatives of the shippers in all parts of the country.

As an illustration of the character of the matters discussed at these meetings, at the first meeting of the conference a representative of the Arkwright Club set forth the condition of the cotton mills due to the fact that they had from 6,000 to 8,000 carloads of cotton in transit from Arkansas and other southwestern points to New England since the latter part of October and early in November, none of which had reached destination, but all of which had been paid for on order bills of lading. The aggregate amount that members of the club had paid out on this account was approximately \$80,000,000, and a banker member of the conference added that for the first time in twelve or fifteen years the New England cotton mills were borrowing money on short term notes to pay their current expenses because of their failure to receive the cotton and secure a return from its manufacture. This matter was taken up with the railroads and an arrangement reached by which one trainload a day was forwarded regularly out of the accumulation at St. Louis via the New York Central, as originally billed.

But as a result of one of the possibilities under government control most of the accumulation was handled via Memphis, Tenn., instead of via the New York Central, and forwarded to Savannah, Ga. Arrangements were made through the director general's office for the Shipping Board to furnish steamers to carry the cotton to New England ports. There were no through rates or divisions in existence from Memphis via the port mentioned to New England and the diversion could hardly have been made under private management of the railroads. But under the arrangement made the cotton was brought forward with such promptness that the situation was materially relieved. Most of the cotton mills were engaged in manufacturing for government purposes and if some such arrangement had not been made they would have had to close down. The movement of cotton via Savannah was mentioned in a recent issue of the *Railway Age*. A large number of more or less similar matters, many of them purely local to New England, have been taken up and disposed of through the medium of this weekly conference between the commercial and railroad interests.

Reports of Capital

Expenditures Required

PURSUANT TO GENERAL ORDER NO. 12, issued by the director general with respect to railroad work involving charges to capital account, the division of capital expenditures has issued a series of forms on which railroads are to report their schedules of proposed work for the recommendation of the regional directors and the approval of the director of the division of capital expenditures. The budgets of most of the roads for 1918 had already been submitted in preliminary form prior to the organization of this division and most of those for the larger roads have already been tentatively approved. The instructions regarding the reports, as given in D. C. E. circular No. 1, are as follows:

First. Please prepare promptly and forward not later than April 30, 1918, a schedule by class of work, of all uncompleted work contracted for or commenced prior to January 1, 1918, which involves charges to capital account after that date. Such schedule should be on D. C. E. Form 1 and should show location of work, brief general description, total estimated expenditure, value of salvage recovered from property retired, amount chargeable to operating expenses, amount chargeable to capital account, amount expended to December 31, 1917, chargeable to operating expenses and to capital account, respectively, amount required subsequent to December 31, 1917, to complete the work divided as between operating expenses and capital account, and should be

divided into classes on Form 1, in accordance with the classification given on D. C. E. Form 1A. There should be a recapitulation on D. C. E. Form 1A of the schedules given on D. C. E. Form 1. Copies of said forms are transmitted herewith and made part hereof. All projects involving a charge of \$5,000 or more to capital account subsequent to January 1, 1918, should be shown as separate items on D. C. E. Form 1, and projects involving a charge of less than \$5,000 to capital account should be reported as a single item at the foot of the schedule of each class of work and included in the total of the class.

Second. A monthly report, commencing with the month of January, 1918, of all work contracted for or commenced during the month involving a charge to capital account for any single project of less than \$5,000 should be made on D. C. E. Form 2, giving total estimated expenditure, value of salvage recovered from property retired, amount chargeable to operating expenses, and amount chargeable to capital account; and should be reported by classes as indicated on said D. C. E. Form 2. Reports for the months of January, February, and March should be forwarded promptly and before April 30, 1918, and reports for subsequent months should be prepared promptly and forwarded before the 15th day of the succeeding month. Copy of D. C. E. Form 2 is transmitted herewith and made part hereof.

Third. A separate report for each project contracted for or commenced subsequent to January 1, 1918, involving a charge to capital account of not less than \$5,000 or more than \$25,000 should be made within 10 days after the work has been or shall be contracted for or commenced on D. C. E. Form 3, and a separate blank should be used for each report. Projects of this description commenced or contracted for during January, February, or March should be reported as promptly as practicable before April 15, 1918. Copy of D. C. E. Form 3 is transmitted herewith and made part hereof.

Fourth. To obtain the authority required by section "Second" (for the construction of new lines, etc.), section "Third" (for purchasing or building new equipment), and by section "Sixth" (for work involving a charge to capital account in excess of \$25,000) of General Order No. 12 issued by the director general, application should be made on D. C. E. Form 4 and a separate blank should be used for each application. This requirement applies to all work involving a charge to capital account in excess of \$25,000 contracted for or commenced subsequent to December 31, 1917, even though included in the answer to the director general's questionnaire of February 2, 1918, and covered by any general approval of the budget embraced in such answer. Projects contracted for or commenced during January, February, or March should be reported as promptly as practicable and before April 15, 1918. Copy of D. C. E. Form 4 is transmitted herewith and made part hereof.

Fifth. D. C. E. Form 3 and D. C. E. Form 4 should bear separate serial numbers, each beginning with No. 1 and continuing consecutively; and these numbers will represent the record numbers of the Division of Capital Expenditures and the regional director as well as the carrier, and will constitute the reference for all correspondence in connection with the work covered thereby. The information given on these forms should be sufficient to afford an understanding of the general character of the work and the necessity therefor but need not be elaborate or in detail. Where the work was included in the answer to the director's questionnaire of February 2, 1918, reference should be made thereto.

Sixth. A monthly report commencing with the month of January, 1918, should be made on D. C. E. Form 5 of the total authorizations and expenditures to the end of the month, for capital account. The reports should embrace all uncompleted work contracted for or commenced prior to January 1, 1918, and all work subsequently contracted for, commenced or authorized which involves charges to capital account after January 1, 1918. The report should divide the work into

classes in accordance with the classification given on D. C. E. Form 5 and should show the total estimated expenditure; value of salvage recovered from property retired; amount chargeable to operating expenses; amount chargeable to capital account; expenditures prior to January, 1918, chargeable to operating expenses and to capital account respectively; expenditures for the month chargeable to operating expenses and to capital account respectively; and expenditures from January 1, 1918, to the end of the month chargeable to operating expenses and to capital account respectively, in accordance with said D. C. E. Form 5. Reports for the months of January, February, and March, 1918, shall be forwarded promptly before April 30, 1918, reports for subsequent months should be prepared promptly and forwarded before the 25th day of the succeeding month. Copy of said form is transmitted herewith and made part hereof.

Seventh. D. C. E. Forms 1, 1A, 2, and 5 should be prepared in triplicate and two should be sent direct to the Director of the Division of Capital Expenditures at Washington, and the other should be sent to the regional director for the district. D. C. E. Forms 3 and 4 should be prepared in triplicate and be sent to the regional director for the district. The regional director should at once transmit to the Director of the Division of Capital Expenditures the original and one copy, retaining the other copy for his file and information. In case he approves without qualification, he should sign the form accordingly. In case he disapproves, he should transmit with the form a memorandum of his views. One copy of each form will be returned to the carrier through the regional director, who should note on his copy the action taken by the Director of the Division of Capital Expenditures.

Eighth. Each carrier should immediately cause to be printed the blank forms necessary for him to comply herewith, upon a fairly good quality of paper, of sheets of the

exact size and following the style of type and ruling indicated by the sample blank forms transmitted herewith.

Ninth. The accounting methods prescribed by the Interstate Commerce Commission and now in force afford the data required for making the reports herein required and prompt compilation and return in all cases is urged. Uniformity should be maintained, and when in doubt in connection with the use of these blanks, the question should be submitted to the Director of the Division of Capital Expenditures. The classification of work as given on the forms is deemed sufficient for the purposes for which reports are required, but there may be some large and exceptional work which, in the case of some lines, might well be shown separately, and blank numbers are left in the classification for such cases. It is hoped, however, that these cases will be rare.

For the purpose of securing uniformity in reporting all work involving a charge to capital account a schedule is prescribed for the use of all roads under federal control. So far as is practicable while maintaining the identity of each separate improvement this conforms to the classification of investment in road and equipment as prescribed by the Interstate Commerce Commission.

In order that the division may be correctly informed of the amount expended by carriers, chargeable to capital account, during the years 1915, 1916 and 1917, carriers are requested to submit a report showing separately for each year the total expenditures for additions and betterments excluding equipment, total expenditures by classes for equipment, total expenditures for construction of new extensions and branches, also new lines, total expenditures chargeable to capital account and miles of road operated at the close of the year. These reports are to be sent both to the regional directors and to the director of the division of capital expenditures.

United States Standard Steel Sheathed Box Car

Specifications and Designs Are Similar to Other Box Cars.
Wooden Lining on Sides and Ends

THE RAILROAD ADMINISTRATION issued during the past week specifications and drawings for a 50-ton steel frame, steel sheathed box car having an estimated weight of 40,000 lb. As in other designs, every attempt has been made to have the details of these cars the same as the

| | |
|---------------------------------|------------------|
| Length inside | 40 ft. 11 in. |
| Width inside | 8 ft. 6 in. |
| Height inside | 9 ft. 8 in. |
| Length over striking plate | 44 ft. 1 1/2 in. |
| Width over roof sheets | 8 ft. 8 1/4 in. |
| Width over side plates | 9 ft. 4 in. |
| Width over all | 10 ft. 0 in. |
| Height from rail to top of roof | 11 ft. 9 in. |

One Type of Roof Construction Permitted on the Steel Sheathed Box Car

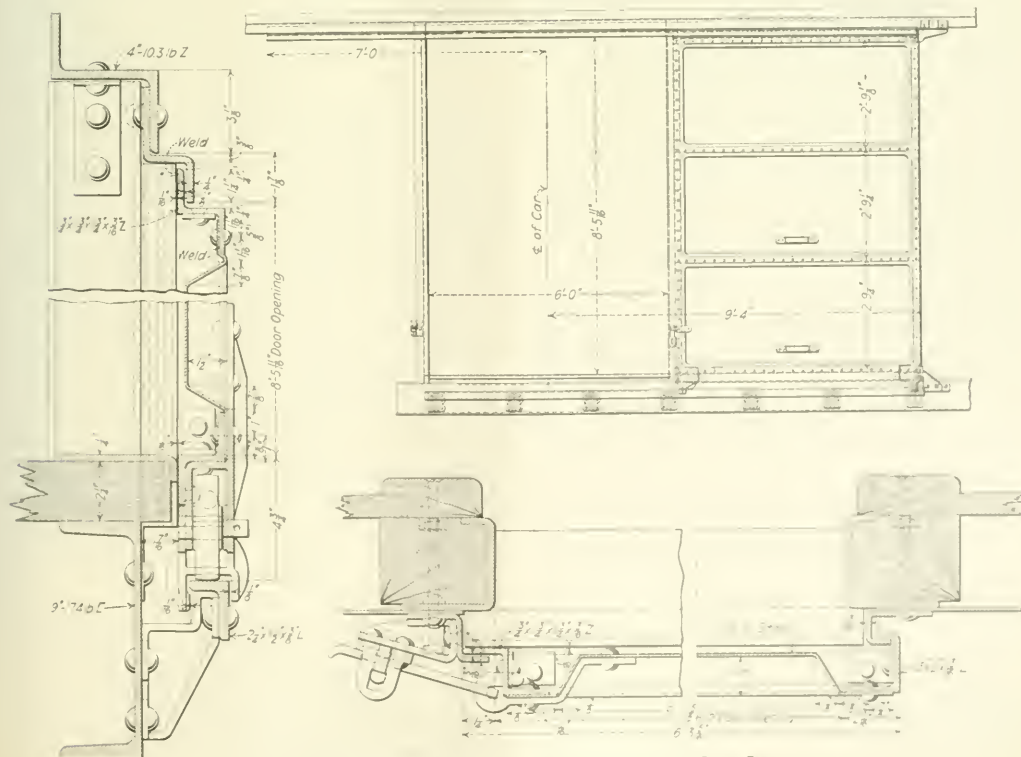

other standard box cars. The underframe is practically a duplicate of the single sheathed car, several of the door details are the same and the draft sill is the same with the exception of minor changes necessitated by the design of the car. The body specifications are the same as those for the box cars published in the *Railway Age* of March 29, page 785. This car is to be carried on the standard 50-ton truck and has the following general dimensions:

Underframe.—The underframe is very similar to that used for the single sheathed box car, having 12-in. channel

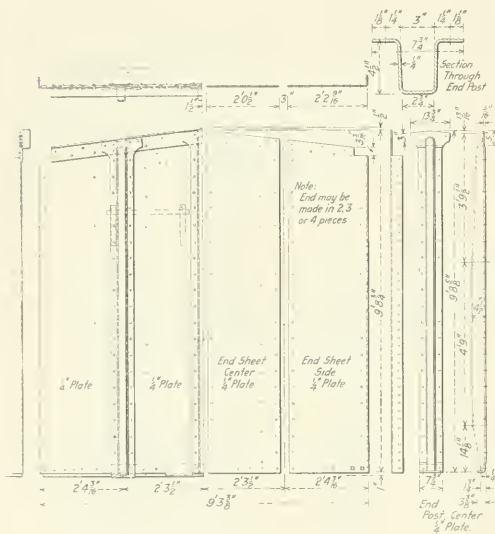

Section and End View of the Standard Steel Box Car

Steel Door for the United States Standard Steel Box Car

center sills with a 20 $\frac{1}{2}$ -in. by $\frac{1}{4}$ -in. cover plate, 9-in. channel side sills, $\frac{1}{4}$ -in. pressed steel floor supports, pressed steel diaphragm bolsters and 5/16-in. pressed steel corner braces. The crossbearers are the same, with the exception of the cover plates, which are slightly heavier for these cars. The end sills are 6-in. by 4-in. by $\frac{3}{8}$ -in. angles, on the outside of which is riveted the steel end. The draft sills are practically identical with those of the other box cars, the only change being in unimportant details made necessary for supporting the steel sheathing of the car. On account of the similarity in the designs of the underframes a reproduction of the underframe for this car is not shown.

Superstructure.—The designs for this car call for a 1/8-in. steel sheathing with a 13/16-in. lining at the sides and ends, and a steel roof of 3/32-in. plates. The same designs of steel ends are permitted as for the other box cars. The side framing is well illustrated in the view showing

Plain Steel End for the Standard Steel Box Car

the general plan of the car body. There are six pressed steel posts on each side of the car made from $\frac{1}{4}$ -in. plate. These are 8 in. wide and $3\frac{1}{2}$ in. deep. In addition to these there are eight 3-in. by $3\frac{1}{2}$ -in. wooden side posts to which is nailed the inside lining. The end posts for the plain end construction, which are shown in one of the illustrations, are pressed from $\frac{1}{4}$ -in. plate and are $7\frac{3}{4}$ in. wide by $3\frac{3}{4}$ in. deep. The corner posts are of wood. The side plates are 4-in., 10.3-lb. Z-bars, to which are riveted the side sheathing and the roof sheets. The end plate is a 5-in. by 3-in. by 5/16-in. angle.

There are two designs of roof permitted, that shown in the general plan and one shown in the roof section which has been reproduced. In both cases a 3/32-in. roof sheet is required. A pressed steel carline is used on the arrangement shown in the general plan and the running board is supported by angles bolted to a pressed angle curved to conform to the contour of the roof. In the other plan the roof sheets are supported by outside carlines pressed from 5/16-in. steel, which also support the running board.

An all-steel door of the underhung type is used, providing an opening 6 ft. wide by 8 ft. 5-11/16 in. high. This door is made up of three pieces of No. 15 gage steel, pressed as indicated in the drawings. The door framing is made up

of a $1\frac{3}{4}$ -in. by $1\frac{3}{4}$ -in. by $1\frac{3}{4}$ -in. by $3/16$ -in. Z-bar at the front, top and bottom, and by a 3-in. by 2-in. by $3/16$ -in. angle at the back. The rollers are carried on a $2\frac{1}{4}$ -in. by $1\frac{1}{2}$ -in. by $3/8$ -in. angle. There are many of the details of the door common to the doors used on the other box cars.

Transporting Railway Coal Under Government Control*

By Francis S. Peabody

Chairman of the Peabody Coal Company.

PRODUCTION OF COAL in the United States during the year 1917, although the greatest in the history of the industry, was far short of the requirements. Producing capacity of mines now in operation is in excess of the demands of the consumers in this and other countries relying on American coal for their supplies.

The 1917 production was limited very largely by transportation facilities, which, by reason of shortage of labor and inability to secure early delivery of material, cannot promptly be increased.

The conclusion is logical that any substantial increase in production must come through increased efficiency of the existing instrumentalities of transportation. Every car in coal service must handle more coal than during last year.

An exhaustive study of the movement of commercial coal has shown conclusively that saving of transportation with consequent greater car supply at mines and increased production can be secured by a system of zones, restricting the movement of cars to shorter distances, avoiding cross-hauling and preventing the movement of coal from far distant producing districts to consuming centers more accessible to other producing districts. A system of zones, with this object in view, has been put into effect by the fuel administrator to govern the movement of commercial coal, but this will apply to only two-thirds of the total production.

Railroads consume approximately one-third of the total bituminous coal production of the country. Economies can be secured by restrictions on the movement of cars used in handling railroad fuel, by the adoption of a plan somewhat similar to that under which commercial coal is moving.

At present purchases of railroad fuel seem to be made with regard only to quality or convenience from a transportation standpoint, with very little, if any, consideration to the distances involved in delivery and demoralization of labor conditions at mines. Many mines are given 100 per cent running time supplying railroad fuel only, as against a much lower running time for mines supplying commercial coal. The result of this practice is to demoralize labor conditions, as mine employees naturally seek those mines giving the greatest number of hours per week. This practice also reduces the producing capacity of commercial mines on which the public depends for their fuel supply, with consequent increased costs. All of this could be avoided by a more equitable distribution of the loading of railroad fuel.

The practice of coal originating railroads in securing their entire supply from a small number of mines and handling this coal to far distant terminals should be discontinued. A distribution of the entire requirements should be made proportionately with all mines located on their lines, except in cases in which coal from adjacent coal fields located on other roads could be handled with a much shorter haul.

The erection for temporary use of coaling stations nearer to producing districts would effect further saving.

Coal for non-originating coal roads should be procured from the producing districts nearest to the coaling stations;

*Mr. Peabody formerly was chairman of the Committee on Coal Production of the Council of National Defense.

a division pro rata to be made among all coal operators in the district. In the case of two or three non coal producing railroads requiring coal from the same or nearby coal producing centers, for the purpose of efficient and economical handling of trains, the orders for each railroad could be concentrated in certain definite sections so that movement could be by train-load rather than in smaller quantities.

As most railroads consume more coal in winter months than during summer months, shipments should be made during the months of April, May, June and July of not only the requirements for those months, but in addition an amount equal to the storage capacity, for use during the four winter months of November, December, January and February. It should be as much the duty of the railroads to store this coal to provide against extra winter demand, as it should be the duty of the coal operators to load it.

During the months of August, September and October the

current requirements of the railroads should be shipped and the storage left intact. During the months of November, December, January and February the tonnage ordered should be only that required for use during those months, less the coal already stored during the summer months. There should be no difficulty in securing by daily shipment during the month of March the current requirements.

Railroads should be required to repair during the summer months the old and useless (from the standpoint of regular shipments) coal and flat cars, for utilization during the winter months in handling storage coal to such points on the line as necessity requires, thereby releasing serviceable equipment for commercial use at that time.

A plan of this kind would not only bring about great economy in the use of equipment but would do away with the present disastrous condition and most effectively help the labor situation.

Regulations for Reconsignment of Carload Freight

Elaborate Provisions for All Reasonable Demands. Separate Rules for Inspection and for Coal

THE INTERSTATE COMMERCE COMMISSION has given its approval of new rules and charges for the diversion and reconsignment of carload freight proposed by certain carriers in response to the commission's decision in the reconsignment case and has authorized all carriers by rail to establish them, effective on May 1. The approval does not authorize the cancellation of diversion or reconsignment rules applicable to less than carload freight. The rules are as follows:

Application

Freight in carloads, except as provided below may be diverted or reconsigned on this company's lines, subject to the following rules, regulations and charges.

If request is made for the diversion or reconsignment of freight, in carloads, this company will make diligent effort to locate the shipment and effect diversion or reconsignment, but will not be responsible for failure to effect the diversion or reconsignment desired unless such failure is due to the negligence of its employees.

Definition

For the purpose of applying these rules, the term "Diversion" or "Reconsignment" means:

- A change in the name of the consignee.
- A change in the name of the consignor (See Rule 6).
- A change in destination (See Rule 5).
- A change in route at the request of consignor, consignee or owner.
- Any other instructions given by consignor, consignee or owner necessary to effect delivery which requires a change in billing or an additional movement of the car, or both (see Section f of Exceptions).

Conditions

The services herein authorized are subject to the following conditions:

- That shipments have not broken bulk.
- Orders for diversion or reconsignment will not be accepted under these rules at or to a station or to a point of delivery against which an embargo is in force.
- On "Straight" consignments the original bill of lading should be surrendered or other proof of ownership established. On shipments consigned "to order" original bill of

lading should be surrendered, or in its absence, satisfactory bond of indemnity executed in lieu thereof, or other approved security given at the time the diversion or reconsignment order is placed.

(d) Request for diversion or reconsignment must be made or confirmed in writing.

(e) *Prepayment or guarantee of charges.* All charges accruing under these rules must be paid or guaranteed to the satisfaction of the carrier by the person or persons requesting the diversion or reconsignment or reforwarding before shipments are forwarded.

Exceptions

These rules will not apply to:

- Ex-lake grain from lake ports or ex-lake rates. (For Central Freight and Trunk Line Associations' roads only.)
 - Grain, hay, straw or grass and field seeds held or stopped for official inspection. (General Diversion or Reconsignment Rules will be applied by Southern roads.)
 - Fresh or green fruits; fresh or green vegetables (including potatoes and onions); fresh berries and melons.
 - Coal and coke (not including petroleum coke).
- (General Diversion or Reconsignment Rules will be applied by Southern and Southwestern roads on Coal and Coke.)
- No charge will be made:*

- For a single diversion or reconsignment if order for such diversion or reconsignment is received at initial billing point before car leaves the yard at such initial billing point, provided the change involves no extra movement of the car.
- Where a car is placed for delivery at destination, and an order for the delivery of the contents thereof to other than the billed consignee is or has been presented to and accepted by the agent of this company at destination, and no change is involved in billing records, nor additional movement of car required.
- Where a change in route is made necessary by embargo placed against the billed destination or route thereof subsequent to acceptance of the shipment by carrier at point of origin.

Rules and Charges

Rule 1. Transfers and waybills covering shipments which have been diverted or reconsigned under these rules, should bear separate notation stating where and when the diversion

or reconsignment was effected, and charges if any were made.

Rule 2. Freight rate applicable: These rules and charges, will apply whether shipments are handled at local rates, joint rates, or combination of intermediate rates. The through rate to be applied under these rules is the rate from point of origin via the diversion, reconsigning or reforwarding point to final destination in effect on date of shipment from point of origin. If the rate from original point of shipment to final destination is not applicable through the point at which the car is diverted, reconsigned or reforwarded, in connection with this line, the Tariff rates in effect to and from the diversion, reconsigning or reforwarding point will apply, plus diversion or reconsigning charges.

Rule 3. Demurrage and track storage rules. Freight stopped, diverted, reconsigned or reforwarded under these rules will in addition be subject to demurrage and track storage charges lawfully in effect at point where stopping, diversion, reconsignment or reforwarding is accomplished.

Rule 4. (a) Application: The rules published herein, governing the diversion or reconsignment of freight, are applicable while the freight is in possession of this company also when it has reached billed destination on this line and has been delivered to switching road for placement.

(b) **Switching charges additional:** If diversion or reconsignment is made after arrival of car at billed destination and the car has been delivered to a connecting road, the switching charges of connecting road will be in addition to any other charge named herein.

(c) **Diversions or reconsignments beyond rails of this company:** When diversion or reconsignment is requested after shipment has passed out of possession of this company, or when request is received too late for this company to effect the change desired, such request will be transmitted to direct connecting carrier to which shipment was delivered, when the responsibility of this company will end; and the shipment will be subject to rules of the carrier on whose rails the diversion or reconsignment is accomplished (Except as per section a of this rule).

Rule 5. (a) Only one change in destination will be permitted by this company under these rules, except as provided in section b, and then only provided the car has not had a previous change in destination after leaving the initial billing point.

(b) If the consignor, consignee or owner requests a subsequent change necessitating movement of the car, the shipment will be treated as a reshipment from point of reforwarding and will be charged at the tariff rate therefrom, plus \$5 per car.

(c) If a car is stopped short of billed destination after it has had one diversion or reconsignment under these rules, charges will be made on basis of the tariff rates to and from the point at which the first diversion or reconsignment was accomplished plus five dollars (\$5) per car in addition to the other diversion or reconsignment charges previously accrued.

Rule 6. Change in name of consignor. The charge for a change in the name of consignor with no further change in billing instructions, will be \$1 per car, except as provided in Exceptions paragraph e.

Rule 7. Diversion or reconsignment in transit: If a car is diverted or reconsigned in transit prior to arrival at original destination, or if the original destination is served by a terminal yard, then prior to arrival at such terminal yard, a charge of \$2 per car will be made for such service.

Rule 8. Stopping in transit: If a car is stopped for orders for the purpose of delivery or diversion or reconsignment or reforwarding prior to the arrival at original billed destination, or if such destination is served by a terminal yard, then prior to arrival at such terminal yard, on request of consignor, consignee or owner, a charge of \$2 per car will be made for such service and the point where the

car is stopped will be considered the destination of the freight. If the car is subsequently forwarded from point at which held, the Provisions of Rules 9, 10, 11 or 12, as the case may be, will also be applied. The service of stopping as provided in this rule will not prevent one change of destination under the provisions of section c of Rule 5.

Rule 9. Changed at destination on orders given before arrival: If order for diversion or reconsignment is placed with local freight agent at billed destination or other designated officer, in time to permit instructions being given to yard employees prior to arrival at such billed destination, or if the original destination is served by a terminal yard, then prior to arrival at such terminal yard, a charge of \$2 per car will be made for such service.

Rule 10. Diversion or reconsignment to points outside switching limits before placement: If a car is diverted, reconsigned or reforwarded on orders placed with local freight agent or other designated officer after arrival of car at original destination, but before placement for unloading, or if the original destination is served by a terminal yard, then after arrival at such terminal yard, a charge of \$5 per car will be made if car is diverted reconsigned or reforwarded to a point outside of switching limits of original destination.

Rule 11. Diversion or reconsignment to points within switching limits before placement: A single change in the name of consignee at destination and (or) a single change in or a single addition to the destination of his place of delivery at destination will be allowed:

(a) without charge, if order is received in time to permit instructions to be given yard employees prior to arrival of car at destination, or if the destination is served by a terminal yard, then prior to arrival at such terminal yard.

(b) At a charge of \$2 per car if such orders are received in time to permit instructions to be given to yard employees within twenty-four (24) hours after arrival of car at destination, or if the destination is served by a terminal yard, then within twenty-four (24) hours after arrival at such terminal yard. (See Note).

(c) At a charge of \$5 per car if such orders are received subsequent to twenty-four (24) hours after arrival of the car at destination, or if the destination is served by a terminal yard, then subsequent to twenty-four (24) hours after arrival at such terminal yard.*

Rule 12. Diversion or reconsignment to points outside switching limits after placement: If a car has been placed for unloading at original billed destination and reforwarded therefrom without being unloaded, to a point outside of the switching limits, it will be subject to the published rates to and from the point of reconsignment, plus five dollars (\$5) per car reconsignment charge, except that in no case shall the total charge be less than the charge based on the through rate from point of origin to final destination, plus \$5 per car reconsignment charge.

Rule 13. Diversion or reconsignment to points within switching limits after placement: Cars that have been placed for unloading and which are subsequently reforwarded without being unloaded, to a point within the switching limits of the billed destination will not be subject to diversion or reconsignment charge, but will be subject to the switching or local rate in addition to the rate from point of origin to billed destination.

Rules and charges governing grain, seed (field), seed (grass), hay or straw, carloads, held in cars on track for inspection and disposition orders incident thereto at billed destination or at point intermediate thereto.

Grain, seed (field), seed (grass), hay or straw, carloads, may be held in cars on track for the privilege of National, State, Board of Trade or other official inspection and disposition orders incident thereto at billed destination or at a

*In computing time, Sundays and legal holidays (national, state and municipal) will be excluded. (When a legal holiday falls on Sunday the following Monday will be excluded.)

point intermediate thereto, subject to the following rules and charges. These charges shall be made in addition to demurrage, track, storage and other lawful charges, and shall accrue to the road performing the service and be noted on the waybill.

The term grain as used herein includes corn, barley, oats, rye, wheat, buckwheat, popcorn, grain screenings and seed screenings.

(Note.—The Southern Roads will apply the general diversion and reconsignment rules on commodities, specified above, diverted or reconsigned on their rails, at and south of the Ohio river and Potomac Yards).

RULES

CHARGE (See Note 1).

Rule 1. When disposition order is received prior to expiration of twenty-four (24) hours after first 7:00 a. m. after arrival,

\$2 per car.

Rule 2. If disposition order is received subsequent to the period prescribed in Rule 1, but within seventy-two (72) hours after first 7:00 a. m. after arrival,

\$2 per car for the first 24 hours plus a charge of \$1 per car for each additional 24 hours or fraction thereof.

Rule 3. If disposition order is not received within the seventy-two (72) hour period prescribed in Rule 2,

\$5 per car.

Note 1.—If delivery is taken and car is unloaded from track where inspected the above charges named in Rules 1, 2 and 3 will not apply.

Rule 4. In computing time, Sundays and legal holidays (national, state and municipal) will be excluded. When a legal holiday falls on a Sunday, the following Monday will be excluded.

Rule 5. For the purpose of disposing of car after it has been officially inspected the disposition order received after official inspection will be considered as being in lieu of consignment instructions under which car arrived at official inspection point.

Rule 6. If grain, hay, straw, field seed or grass seed, c. l., is held on track except for official inspection the general diversion and reconsignment rules published in I. C. C. No. — or subsequent issue, will apply.

Rules and charges governing the diversion or reconsignment of coal and coke.

(To govern in the territory north of the Ohio and Potomac rivers and east of the Mississippi, including Kentucky, West Virginia and Virginia).

Application

Coal, except Lake Cargo and Tidewater Coal, Boulets or Briquets, or Coke (except Petroleum Coke) in carloads, may be diverted or reconsigned on this Company's lines, subject to the following rules, regulations and charges.

If request is made for diversion or reconsignment this company will make diligent effort to locate the shipment and effect diversion or reconsignment, but will not be responsible for failure to effect the diversion or reconsignment desired unless such failure is due to the negligence of its employees.

Definition

For the purpose of applying these rules, the term "Diversion" or "Reconsignment" means:

- (a) A change in the name of the consignee.
- (b) A change in the name of consignor (See Rule 6).
- (c) A change in destination (See Rule 5).
- (d) A change in route at the request of consignor, consignee or owner.

(e) Any other instructions given by consignor, consignee, or owner necessary to effect delivery which requires a change in billing or an additional movement of the car, or both (See section *b* of exceptions.)

Conditions

(a) Orders for reconsignments or diversion will not be accepted under these rules at or to a station or to a point of delivery against which an embargo is in force.

(b) Request for diversion or reconsignment must be made or confirmed in writing, and be accompanied by satisfactory evidence of ownership.

(c) *Prepayment or guarantee of charges:* All charges accruing under these rules must be paid or guaranteed to the satisfaction of the carrier by the person or persons requesting the diversion or reconsignment or reforwarding before shipments are forwarded.

Exceptions

No charge will be made:

(a) For a single diversion or reconsignment if order for such diversion or reconsignment is received at initial billing point before car leaves the yard at such initial billing point, provided the change involves no extra movement of the car.

(b) Where a car is placed for delivery at destination, and an order for the delivery of the contents thereof to other than the billed consignee is or has been presented to and accepted by the agent of this company at destination, and no change is involved in billing records, nor additional movement of car required.

(c) Where a change in route is made necessary by embargo placed against the billed destination or route thereto subsequent to acceptance of the shipment by carrier at point of origin.

Rules and Charges

Rule 1. *Transfers and waybills* covering shipments which have been diverted or reconsigned under these rules, should bear separate notation stating where and when the diversion or reconsignment was effected, and charges if any were made.

Rule 2. *Freight rate applicable:* These rules and charges will apply whether shipments are handled at local rates, joint rates, or combination of intermediate rates. The through rate to be applied under these rules is the rate from point of origin via the diversion, reconsigning, or reforwarding point to final destination in effect on date of shipment from point of origin. If the rate from original point of shipment to final destination is not applicable through the point at which the car is diverted, reconsigned or reforwarded, in connection with this line, the Tariff rates in effect to and from the diversion, reconsigning or reforwarding point will apply, plus diversion or reconsigning charges.

Rule 3. *Demurrage and track storage rules:* Shipments stopped, diverted, reconsigned or reforwarded under these rules will in addition be subject to demurrage and track storage charges lawfully in effect at point where stopping, diversion, reconsignment or reforwarding is accomplished.

Rule 4. (a) *Application* The rules published herein are applicable while the shipment is in possession of this company also when it has reached billed destination on this line and has been delivered to switching road for placement.

(b) *Switching charges additional:* If diversion or reconsignment is made after arrival of car at billed destination and the car has been delivered to a connecting road, all switching charges of connecting road will be in addition to any other charge named herein.

(c) *Diversions or reconsignments beyond rails of this company:* When shipment has been delivered to connecting line before diversion or reconsignment can be accomplished, request to divert or reconsign should be made direct to such connecting line, except as provided in section *a* of this rule.

Rule 5. (a) *Only one change in destination will be*

permitted under these rules by this company, except as provided in section *b*, and then only provided the car has not had a previous change in destination after leaving the initial billing point.

(b) If the consignor, consignee or owner requests a subsequent change necessitating movement of the car, the shipment will be treated as a reshipment from point of reforwarding, and will be charged at the tariff rate therefrom, plus \$5 per car.

(c) If a car is stopped short of billed destination after it has had one diversion or reconsignment under these rules, charges will be made on basis of the tariff rates to and from the points at which the first diversion or reconsignment was accomplished plus five dollars (\$5) per car in addition to the other diversion or reconsignments charges previously accrued.

Rule 6. Change in name of consignor: The charge for a change in the name of consignor with no further change in billing instructions, will be \$1.00 per car, except as provided in section *a* of Exceptions.

Rule 7. Diversion or reconsignment in transit: If a car is diverted or reconsigned in transit prior to arrival at original destination, or if the original destination is served by a terminal yard, then prior to arrival at such terminal yard, a charge of \$2.00 per car will be made for the service.

Rule 8. Stopping in transit: If a car is stopped for orders for the purpose of delivery or reconsignment or diversion or reforwarding prior to the arrival at original billed destination, or if such destination is served by a terminal yard, then prior to arrival at such terminal yard, on request of consignor, consignee or owner, a charge of \$2.00 per car will be made for such service and the point where the car is stopped will be considered the destination of the freight. If the car is subsequently forwarded from point at which held, the provisions of Rules 9, 10, 11 or 12, as the case may be, will also be applied. The service of stopping as provided in this rule will not prevent one change of destination under the provisions of section *c* of Rule 5.

Rule 9. Changed at destination on orders given before arrival: If order for diversion or reconsignment is placed with local freight agent at billed destination, or other designated officer, in time to permit instructions being given the yard employees prior to arrival at such billed destination, or if the original destination is served by a terminal yard, then prior to arrival at such terminal yard, a charge of \$2.00 per car will be made for such service.

Rule 10. Diversion or reconsignment to points outside switching limits before placement: If a car is diverted, reconsigned or reforwarded on orders placed with local freight agent or other designated officer after arrival of car at original destination, but before placement for unloading, or if the original destination is served by a terminal yard, then after arrival at such terminal yard, a charge of \$5.00 per

car will be made if car is diverted, reconsigned or reforwarded to a point outside of switching limits of original destination.

Rule 11. Diversion or reconsignment to points within switching limits before placement: A single change in the name of consignee at destination and (or) a single change in or a single addition to the designation of his place of delivery at destination will be allowed:

(a) Without charge, if order is received in time to permit instructions to be given yard employees prior to arrival of car at destination, or if the destination is served by a terminal yard, then prior to arrival at such terminal yard.

(b) At a charge of \$2.00 per car if such orders are received in time to permit instructions to be given to yard employees within twenty-four (24) hours after arrival of car at destination, or if the destination is served by a terminal yard, then within twenty-four (24) hours after arrival at such terminal yard.

Except that on shipments of coal originally consigned to accredited terminal coal pool associations and ordered delivered to final consignee within twenty-four (24) hours after arrival of car at terminal yard, there will be no charge.

(To be published only by roads reaching such pool points.)

(c) A charge of \$5.00 per car if such orders are received subsequent to twenty-four (24) hours after arrival of the car at destination, or if the destination is served by a terminal yard, then subsequent to twenty-four (24) hours after arrival at such terminal yard.

Note.—In computing time, Sundays and legal holidays, (national, state and municipal) will be excluded. When a holiday falls on Sunday, the following Monday will be excluded.

Rule 12. Diversion or reconsignment to points outside switching limits after placement: If a car has been placed for unloading at original destination and forwarded therefrom without being unloaded to a point outside of the switching limits, it will be subject to the published rates to and from the point of reshipment, plus five dollars (\$5.00) per car reconsignment charge, except that in no case shall the total charge be less than the charge based on the through rate from point of origin to final destination, plus \$5.00 per car reconsignment charge.

Rule 13. Diversion or reconsignment to points within switching limits after placement: Cars that have been placed for unloading and which are subsequently reforwarded without being unloaded to a point within the switching limits of the billed destination will not be subject to diversion or reconsignment charge, but will be subject to the switching or local rate in addition to the rate from point of origin to billed destination.

Note.—Where no switching tariff is in effect, the charge will be ten cents a ton of 2,000 pounds, minimum five dollars a car.

General News Department

The station of the Southern Railway at Sheffield, Ala. was destroyed by fire on the night of April 6. Estimated loss \$50,000. Two men suspected of setting the fire have been arrested.

Express companies, it is understood, are negotiating with the government on a plan by which instead of being taken over they will be allowed to consolidate and enter into a contract with the government.

Garland P. Robinson, assistant chief inspector of locomotives for the Interstate Commerce Commission has been appointed assistant manager of the locomotive section of the Railroad Administration.

The Interstate Commerce Commission has announced that it will make an investigation to determine the proper limits of the first, second, third and fourth zones of standard time created by the Daylight Saving law.

The Minneapolis, St. Paul & Sault Ste. Marie offers land free to persons who desire to cultivate it—more than 50,000 acres in small parcels—along its lines. Applications from employees will receive first consideration.

The ten women train auditors who have been working on the trains of the St. Louis-San Francisco during the past six months are said to have found the work too hard, and the company intends to set them at work in some other department.

Employees of the Chesapeake & Ohio have given to the Red Cross two army ambulances to be sent to France. The money for this gift, about \$3,600, was contributed at various points on the company's lines all the way from Old Point Comfort to Chicago.

The senate committee on territories has announced that it will hold hearings on charges of mis-management in the affairs of the Alaska Railroad before taking action on the nomination of Thomas Riggs, Jr., a member of the Alaskan Engineering Commission, as governor of Alaska.

The Ann Arbor Railroad announces that it will resume carry service between Frankfort, Mich., and Menominee, Mich., and Marinette, Wis., on April 15. Connecting lines are requested to supplement their tariffs immediately as provided for by Rule 12, L. C. C. Tariff Circular No. 18A.

A. H. Smith, regional director, has issued an order to the presidents of the eastern railroads calling for advice as to the amount of their payments in 1917 for subscriptions to magazines and periodicals for distribution to officers and employees, showing the names of the publications, to whom furnished, and total cost.

At the request of the director general, the Interstate Commerce Commission has addressed a circular to the presidents of Class 1 carriers, asking them to furnish promptly information as to the deposit balances and cash on hand as of March 31, together with the amount of interest and dividend maturities on April 1 which were to be paid out of the balances reported as of March 31.

The railroad engineers in France are to be armed. In recognition of the excellent showing made by American railroad engineer troops in the battle of Cambrai and in recent engagements in Picardy, the War department has announced that special and auxiliary units of the army hereafter are to be armed. The railroad engineer units will be provided with rifles on the basis of 20 per cent of their enlisted personnel.

At Brunswick, Ga., the three principal railroads have consolidated both passenger and freight stations. The large freight houses of the Southern Railway are to be abandoned. The freight station of the Atlantic Coast Line will be used exclusively for outbound freight, and that of the Atlanta,

Birmingham & Atlantic for inbound. The three roads will use the passenger station of the Atlantic Coast Line and that of the Atlanta, Birmingham & Atlantic will be abandoned. T. J. Wright, general agent of the Atlantic Coast Line has been appointed general agent of all three lines. A similar consolidation has been made at Waycross, Ga.

Representative Esch, of Wisconsin, has introduced in Congress a bill, H. R. 11243, to amend section 5 of the interstate commerce act, (the Panama Canal act), in accordance with the recommendations made by the Interstate Commerce Commission in its annual report, to authorize the Commission to permit continuance of the railroad ownership, control or operation of water lines when the commission finds that the discontinuance of such service will be of substantial disadvantage to the convenience and commerce of the people and localities affected. As the law now stands the commission, before authorizing the continuance of such control, must find that it will not reduce competition.

A fine of \$8,420 was ordered by a jury in the county court at Lexington, Ky., April 4, as a penalty to be paid by the Louisville & Nashville Railroad for maintaining a common nuisance; this was the result of a trial of the road for allowing its trains to be run through the town of Shepherdsville at uncontrollable speed. It appears that there is no statute under which a satisfactory prosecution of the road could be made, and this suit was brought under common law procedure. The case against Engineman Wolfenberger, who was the runner of the express train which caused the Shepherdsville collision, was continued until the August term of the court, as some of the witnesses could not be brought into court at this time. The charge against Wolfenberger is involuntary man slaughter. The suit against the road was heard before Judge McCandless, and a motion for a new trial has been made. Acting on instructions by the judge, the jury dismissed the indictments against officers of the company.

Purchases of bituminous coal for the railroads, according to an announcement made at Washington this week, are to be managed exclusively through the office of the director general, at Washington, in co-operation with the Fuel Administration and with Bernard Baruch, chairman of the War Industries Board. How soon action will be taken is a question which, however, is left in the dark, as a difference of opinion is said to have arisen as to what prices should be paid. It is understood that when, recently, a number of railroads endeavored to renew their coal contracts at prices lower than those now prescribed by the government, Dr. Garfield took the position that the regular government prices should be paid. John Skelton Williams, director of purchases for the Railroad Administration, is said to have asked the coal operators to make new contracts with the railroads on the basis of about ten cents a ton above the cost of production.

Western Railway Club Meeting

At the monthly meeting of the Western Railway Club, which will be held at the Hotel Sherman, Chicago, on April 15, C. A. Greenough of the Baldwin Locomotive Works will present a paper on "Economy in Maintenance and Operation of Locomotives."

New York "Return-Loads Bureau"

The Merchants' Association of New York city is to establish a bureau for the benefit of long distance automobile truckmen and the merchants and manufacturers for whom they carry freight. Following the example which has been successfully carried out at Hartford and some other places, the bureau will provide telephone facilities so that a truckman bringing a load to New York can, with the least loss of time,

learn where he can find a load back to his starting point. The bureau will be simply a means of communication; it will have nothing to do with prices for transportation, and will not be liable either to truck owners or to merchants for safety of goods, insurance or anything else.

Car 302

The headquarters of the government railroad administration for the next couple of weeks will be in Car No. 302, in which Director General McAdoo is touring the country speaking on behalf of the Third Liberty Loan. Mr. McAdoo will be kept in constant touch by wire with the general headquarters in Washington, the car being fitted up as an office.

Webb Bill Passed

The Webb export trade bill, permitting American exporters to form combinations for the purpose of extending their foreign commerce, has finally been passed by both houses of Congress and was sent to the President on April 5. Export associations are made subject to the supervision of the Federal Trade Commission, which is given power to prosecute those guilty of unfair practices.

\$2,500,000 in First Three Days

Although the Liberty Loan campaign inaugurated by the western regional directors' committee was not yet in full swing, in the first three days of the campaign seven roads reported subscriptions for \$2,500,000, or an average of 85 dollars per employee. There are approximately 800,000 railroad employees in the western regional district. If this subscription average keeps up, the total for the western lines should reach close to \$70,000,000.

Conferences on Railroad Compensation

The proposed standard form of contract for the compensation to be paid by the government to the railways is still the subject of numerous conferences between the lawyers representing the railroad companies and the representatives of the legal department of the Railroad Administration. Last week the conferences were on the proposed draft submitted by the railroad counsel. Beginning on Monday conferences have been held on another draft by Nathan Matthews, assistant to John Barton Payne, general counsel of the Railroad Administration.

Railroad Administration Safety First Section

H. W. Belnap, manager of the safety section, is perfecting his organization to supervise, correlate and organize the safety first work on all railroads utilizing the organizations already in existence and calling on safety officers of various railroads to cooperate in a consulting capacity. Rufus F. Jarnigan, assistant to the general safety agent of the New York Central; C. M. Anderson, safety superintendent of the Nashville, Chattanooga & St. Louis, and Harry J. Bell, safety inspector of the Chicago & Northwestern, have been appointed supervisors of safety for eastern, southern and western regions. A questionnaire has been sent to all railroads to ascertain the extent of safety first work, and reports sent in by the roads are being studied. The principal safety first officers recently were called to Washington and held an all-day conference with Mr. Belnap.

Questionnaire on Equipment Construction and Repair

At the request of the Director General of Railroads the Interstate Commerce Commission has addressed to the railroads a questionnaire asking for complete detailed information relating to repairs to and construction of equipment. Roads are asked to report whether their present shop facilities permit, in addition to properly making all necessary repairs to the present equipment, the construction of new locomotives, freight cars and passenger cars, whether they own or operate under subsidiary companies shops at which locomotives or cars are built or repaired, together with the normal monthly capacity of such shops and the period for which the capacity is engaged on work now in hand or authorized. Information is also desired as to whether it has

been the practice to build any portion of the new equipment necessary to replace destroyed or retired locomotives or cars, the present monthly capacity of the shops for the construction of new equipment by classes, whether all necessary current repairs are made at company shops or by other railroads or at other than railroad shops. If such repairs have been made by other railroads during the past three years information is desired as to the terms under which the work was done. If they have been made by contractors information is requested as to the names of the contractors, the amount of work done and the detailed costs. If the repairs have been performed under express contracts complete information is asked regarding the contracts and in addition relating to prices of materials, labor costs, supervision of work performed, etc., which affect the aggregate costs of the work and will enable a comparison to be made with ordinary railroad shop operations, for the purpose of indicating economy on such repair work. Information is also asked as to repairs made at company shops for other railroads.

Government Investigating Railroad Insurance

Possibilities that the government may take over the business of insuring railroad property are seen in Circular No. 21, issued on April 8, by the Director General of Railroads, calling for information, covering the past three years, as to the general practice followed in the matter of insurance against loss or damage by fire both to railroad property and to other property in railroad custody. Pending a decision on this question, carriers are ordered not to negotiate any contracts of fire insurance covering a longer period than has heretofore been customary, nor in any event covering a period of more than one year, without special authority.

Extensive Use of Borrowed Locomotives

The following table while not strictly up-to-date will give some idea of the extent to which the railways are using other than their own locomotives:

| Name of road | Number of Locomotives borrowed from other roads | U. S. A. Locomotives | Name of road | Number of Locomotives borrowed from other roads | U. S. A. Locomotives |
|-------------------|---|----------------------|------------------|---|----------------------|
| B. & O. | 38 | .. | T. & O. C. | 22 | .. |
| B. & A. | 12 | .. | Virginian | 4 | 10 |

North Western's Contributions to Men Abroad

In a recent announcement to all officers and employees of the Chicago & North Western, R. H. Aishton, president, states that total contributions to the Christmas fund for the men of Company E, Thirteenth Engineers, made up of former North Western employees, amounted to \$5,165. The cost of the Christmas presents forwarded to the men totaled \$1,247. At the suggestion of the commanding officer of the company \$1,005 additional was remitted to his credit to be used in buying extra kitchen equipment and to supplement the company mess. A more recent letter from him advises that a ballot has been taken of the men in the company and that a large majority voted favorably on the proposition that the balance of the money be placed to the credit of "Company Fund, Company E, Thirteenth Engineers, order of the Commanding Officer, and used to supplement the mess and in purchasing things not furnished by the Government." In accord with that request the balance of the fund amounting to \$2,913 has been remitted to the men. In conclusion, Mr. Aishton says, "I have received word as to the receipt of the articles sent them (Company E) at Christmas, ex-

pressing the great pleasure and comfort afforded to them by this Christmas remembrance, and I take pleasure in extending to every subscriber of this fund on behalf of the men of Company E, thanks and appreciation."

New Quarters for the Railroad Administration

The United States Railroad Administration expects to have more commodious office quarters by the fall of this year. The government has bought the Arlington building in Washington, now under construction at the corner of H street and Vermont avenue, which will be used for the offices of a number of departments affiliated with the Treasury Department, and a considerable portion of the space is to be used for the Railroad Administration. Director General McAdoo and his staff are now located temporarily in the Interstate Commerce Commission building, but the space available is insufficient for the rapidly growing organization. In his letter to the President, recommending the purchase of the building, Mr. McAdoo said that the administration is seriously hampered even now for want of space and that this condition will grow more acute each day.

Regulation of Damage Suits Against Railroads

Director General McAdoo has issued an order designed to put a stop to the practice, so frequently resorted to by damage suit lawyers, of bringing suits against carriers in distant places. The order sets forth that the railroad control law provides (Section 10) "That carriers while under federal control shall be subject to all laws and liabilities as common carriers, whether arising under State or federal laws or at common law, except in so far as may be inconsistent with the provisions of this act or with any order of the President. . . . But no process, mesne or final, shall be levied against any property under such federal control"; and continues:

"Whereas it appears that suits against the carriers for personal injuries and freight and damage claims, are being brought in States and jurisdictions remote from the place where plaintiffs reside or where the cause of action arose; the effect thereof being that men operating the trains engaged in hauling war materials, troops, munitions, or supplies, are required to leave their trains and attend court as witnesses, and travel sometimes for hundreds of miles from their work, necessitating absence from their trains for days and sometimes for a week or more; which practice is highly prejudicial to the just interests of the government and seriously interferes with the physical operation of the railroads; and the practice of suing in remote jurisdictions is not necessary for the protection of the rights or the just interests of plaintiffs—

"It is therefore ordered, That all suits against carriers while under federal control must be brought in the county or district where the plaintiff resides, or in the county or district where the cause of action arose."

Circular on Relations with Labor

Director General McAdoo has issued the following circular to all railroads:

"My attention has been called to a report in reference to my General Order No. 8, in which it is stated that many officials of the railroads are filing strong protests with the Director General of Railroads because of the position he has taken in Official Order No. 8.

"It is only just that I should say that I have not received any protests from railroad officials because of Order No. 8.

"I feel that it is most important in this new era of railroad-ing in America that railroad officials and railroad employees shall not live any longer in an atmosphere of suspicion and distrust. I earnestly desire to see them brought together upon a plane of mutual understanding and helpfulness because I believe that it is to the interest of both that this shall be accomplished and because I know that it will promote the efficient and safe operation of the railroads, and, more than all, that it will help the country immeasurably in this time of national peril. In my Order No. 8 I emphasized my desire that the old enmities of the past should be obliterated and that the common peril now confronting America should make friends and comrades of us all.

"I deeply appreciate the assurances of loyalty and patriotic

support I have been receiving from railroad employees connected with all kinds of railroad work since the government took possession and control of the railroads. With the spirit of high purpose animating us all, from the humblest to the highest, I know that we can do a mighty work for America, and that we can win this war for liberty and democracy.

"Please bulletin this circular."

States Asked to Tax Roads Lightly

Director General McAdoo has addressed a letter to the governors of all the states, asking them to see that the tax burden on the railroads be made as light as consistent with the necessities of the states and their sub-divisions. He also made a plea for economy in state and local public expenditures requiring new capital. An effort was made to secure a provision in the railroad control bill prohibiting an increase of taxation during the period of federal control, but it was defeated in Congress. "Heretofore," wrote the director general, "railroad taxes have been paid entirely by the private owners of the railroads, but now these taxes will be paid by the government. * * * Manifestly in such circumstances the imposition of unnecessary state and local taxation on the railroads will be a distinct impediment to the carrying on of the war and an added burden upon the government."

Asks L. & N. Men to Be Good Soldiers

In an open letter to officers and employees of the Louisville & Nashville under date of March 29, Milton H. Smith, president, points to the importance of the railroads as carriers of troops and supplies during the war, and urges every employee to serve the government as loyally and as efficiently as he did the company under former conditions. The letter reads in part as follows:

"The property of this company will belong to the government as lessee . . . and every dollar now received or expended is the government's money. But with the property there passed as an asset of equal value the efficiency of an army of trained railroad men. Accordingly, the old organization of our company—its officials and employees—now constitutes a governmental agency engaged for the time being in the operation of this particular railroad system, but entirely subject to the supervision and direction of the director general or his duly constituted representatives.

"Necessarily, things will not be as they were. Mistakes, too, may occur as heretofore; but let there be no adverse criticism or disloyal spirit. If you have any suggestion which, in your opinion, will improve the service, tell it to your superior officer, who will report it to this department. If meritorious it will be brought to the attention of the regional director. The government will doubtless effect combinations of positions and adopt other methods of consolidation and re-employment, which may necessitate dispensing with the services of some persons now in the company's employ. Regrettable as this would be, it should be accepted as one of the exigencies of the war for the winning of which each one of us must make whatever sacrifice is required.

"My chief pride in administering the affairs of this company in the past has been the splendid loyalty and efficiency of its officials and employees. It is still my earnest desire that, in this new relation, you maintain these distinctive characteristics to the highest degree. . . . The one great necessity that stands out pre-eminent above all others at this time is an adequate transportation system. In undertaking itself to supply this the government has entered upon a huge experiment, the success of which is of vital importance. It must succeed, but it can do so only by the complete cooperation, absolute loyalty and devoted service of you and of men like you."

"Exceptional Fictional Instruction"

Must the railway folder go? The director of railways has ordered that "folders must be purely informative and contain no advertising of luxurious trains, claims of superior service or extraneous matter of any description." Thus another of the works of peace feels the blight of the war. The railway folder was a characteristic and highly developed expression of American literary genius. It was in the best sense educational as well. Many persons learned most of what they knew of American geography from a rapid perusal of folders while traveling or waiting for trains, and it was possible from a judicious selection of them to gain a liberal education in pictorial art and literature and American history as well as exceptional fictional instruction. It is to be hoped that their educational uses will save them from complete denaturing. Railway folders have contributed too much to the gaiety of travel and the increase of popular intelligence to be sacrificed to anything but the most urgent of economies.—*New York World*.

Dictator General on Relations with Labor

Director General McAdoo has given out the following letter written by him on April 2 to President Wharton of the Railway Employees Department of the American Federation of Labor:

"My attention has been called to a circular sent out by you in which it is stated that 'it has come to our knowledge that many officials of the railroads are filing strong protests with the director general of railroads because of the position he has taken in Official Order No. 8.

"It is only just that I should tell you that I have not received a single protest from any railroad official because of Order No. 8. I should be glad if you would let your membership know that this is true.

"I feel that it is most important in this new era of 'railroading' in America that railroad officials and railroad employees shall not live any longer in an atmosphere of suspicion and distrust. I earnestly desire to see them brought together upon a plane of mutual understanding and helpfulness, because I believe that it is to the interest of both that this shall be accomplished and because I know that it will promote the efficient and safe operation of the railroads, and, more than all, that it will help the country immeasurably in this time of national peril. You will recall that in my Order No. 8 I emphasized my desire that the old enmities of the past should be obliterated and that the common peril now confronting America should make friends and comrades of us all.

"I need not tell you how deeply I appreciate the assurances of loyalty and patriotic support I have been receiving from railroad employees connected with all kinds of railroad work since the government took possession and control of the railroads. With the spirit of high purpose animating us all, from the humblest to the highest, I know that we can do a mighty work for America, and that we can win this war for liberty and democracy.

"Will you now be good enough to circulate this letter among all the members of your organization? I shall also direct the officers of the railroads to put it on the bulletin boards of their respective systems."

The I. C. C. and the Overman Bill

Possibility of the exercise by the President of the powers conferred by the Overman bill to destroy the Interstate Commerce Commission was discussed in the Senate during the debate on the bill on April 3 and 4. The bill would authorize the President to co-ordinate or consolidate executive bureaus, agencies and offices in the interest of economy in the more efficient concentration of the government by making a redistribution of their functions. Provision is made that the act shall remain in force only during the continuance of the war and for a year after its termination. Senator Cummins declared that under this bill the President could transfer all the powers and functions of the Interstate Commerce Commission to the Federal Reserve Board or the Federal Trade Commission, or to any officer, agency or department of the government; and that he might transfer the functions of the Interstate Commerce Commission in the valuation of railroad property to any person he might select for that purpose. It was intimated during the debate that since the Interstate Commerce Commission by the provisions of the railroad control law was specifically given final authority in rate-making matters, the President might desire to have the power over the commission which the bill would provide. Senator Cummins had introduced an amendment to confine the possible reorganization under the bill to the executive departments, with the exception of the department of justice, but it had been voted down in the committee, as had an amendment proposed by Senator Reed of Missouri, specifically excluding the Interstate Commerce Commission. Senator Overman, who defended the bill, insisted it was necessary to give the President the power to take such action as necessary during the war, although he would not say that it would be necessary for the purposes of the war to interfere with the Interstate Commerce Commission. He declared that in the railroad bill Congress has given the President much greater powers than it is proposed to give him in this bill, but so far as the valuation is concerned, he said that \$12,000,000 had been wasted. Senator Reed insisted that no reason had been offered for granting

the President the power to transfer the authority of the Interstate Commerce Commission to some individual, and referred to the significance of the fact that members of the committee had voted against an amendment specifically intended to exclude the Interstate Commerce Commission from the operation of the bill. Senator Lewis of Illinois declared that the Interstate Commerce Commission had reached the end of its usefulness when the government took over the railroads, and that in many instances the commission might be an obstruction which would defeat the very object of the law putting the railroads in the hands of the President.

"I wish to express my concurrence in the view of the Senator from Minnesota," he said, "that the privilege that remains in the hands of the President under the bill presented by the Senator from North Carolina should not be interfered with by any power previously granted to the Interstate Commerce Commission."

International Railway General Foremen's Association

At a meeting of the executive committee of the International Railway General Foremen's Association it was decided to postpone the annual convention for 1918. This action was taken in consideration of the great demand for locomotives and cars and the need under present conditions of constant and increased supervision in the railroad shops. In order to maintain the continuity of the annual publications of the society, it was decided to compile and publish a year book. Five questions have been submitted to the members, each of whom is requested to express his opinion or give his experience on each question in writing to the secretary.

Foreign Trade Convention Next Week

One of the interesting facts in connection with the organization of the Fifth National Foreign Trade Convention, which will be held at the Gibson Hotel, Cincinnati, Ohio, April 18, 19 and 20, will be the further organization this year of the group sessions idea, with a view to having as many subjects handled by the case method as possible. By this group session method it is planned to make further use of the practical and personal experience of participants in foreign trade, and also to interest a larger number of the smaller manufacturers in the opportunity for foreign trade.

Another special feature in connection with the convention this year will be the greater use of the volunteer trade advisers and of the government representatives. There will be a special committee in charge of the work of the government and volunteer trade advisers, who will be available for consultation during the period of the convention.

The theme of the convention is "The Part of Foreign Trade in Winning the War," and the program as announced gives many speakers of national prominence, including: James A. Farrell, president of the United States Steel Corporation; Edward N. Hurley, chairman of the United States Shipping Board; Fred I. Kent, of the Bankers Trust Company, New York; J. J. Donovan, of the Blodel-Donovan Lumber Mills, Bellingham, Wash.; E. A. S. Clarke, president, Lackawanna Steel Company; C. A. Hinsch, president of the American Bankers Association; A. C. Bedford, Standard Oil Company of New Jersey; M. E. Farr, president, American Shipbuilding Company, Cleveland; George H. Charls, American Rolling Mills, of Middletown, Ohio; John Clausen, of the Crocker National Bank of San Francisco; George H. Smith, president of the American Manufacturers' Export Association; J. K. Armsby, president, California Packing Corporation; W. D. Wheelwright, president, Pacific Export Lumber Company, of Portland, Ore.; Frederick J. Koster, president, Associated Chambers of Commerce of the Pacific Coast; J. Louis Schaefer, of W. R. Grace & Co.; W. E. Farlton, of the Brown Shoe Company of St. Louis; Percival Farquhar, president of the Brazil Railways Company; Thomas L. Chadbourne, counselor to the War Trade Board; Burwell S. Cutler, chief of the Bureau of Foreign & Domestic Commerce, and F. W. Tausig, chairman of the United States Tariff Commission.

Merchants and manufacturers who are desirous of receiving invitations to attend the convention at Cincinnati are requested to send their names and addresses to O. K. Davis, secretary, National Foreign Trade Council, 1 Hanover Square, New York City.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JANUARY, 1918

Traffic News

The eighteen passenger and freight agents of American railways having offices in Toronto have called in their traveling agents; it is expected that shortly their offices will be closed.

Complying with the order of the director general of railroads for the discontinuance of outside traffic agencies, the Texas & Pacific and the International & Great Northern have closed all offices off their lines.

The Long Island Railroad has announced that freight in less than carload lots will be received on only three days a week. This rule applies at all of the company's stations, the days for receiving at different stations being announced in circulars to all interested. Where a shipping day falls on a legal holiday freight will be accepted on the day preceding.

The Fuel Administration officials are again complaining of a shortage of cars, although the Geological Survey reports show an increase in production compared with last year since the early part of February, and an almost steady increase since January 19. In the week ended March 23, the percentage of full time output lost on account of car shortage was 20.6, which is no greater than it has been for a long time.

The car service section of the United States Railroad Administration has issued a bulletin to all railroads calling their attention to the fact that the situation in the Southeast with respect to ventilated and refrigerator cars for the transportation of the early perishable crops is fast becoming acute and that energetic measures must be taken in order to keep up the supply of suitable cars. The necessity for returning promptly the cars owned by roads in that territory is strongly urged.

The production of bituminous coal and lignite (including coal made into coke) in February, 1918, according to the bulletin of the Geological Survey, is estimated at 42,438,000 net tons, an increase of 2,126,000 tons, or 5 per cent, compared with February, 1917. The production in the first two months of 1918 was, however, approximately 3,000,000 tons less than in the same months of 1917, because of the very low production in January, 1918, compared with the record month of January, 1917. The estimated average production per working day in February, 1918, was 1,783,000 net tons, compared with 1,643,000 tons in January, 1918, and 1,753,000 net tons in February, 1917. The average daily production in February, 1918, was slightly greater than the average for all 1917.

General Travel Conditions

In these days the traveler is jostled on every hand. Street cars seem everywhere filled to strap-hanging capacity; elevators are speeded to care for unusual numbers; automobiles, public and private, rush through crowded streets in increasing volume; sidewalks seem to have rush-hour crowds at all hours of the day; stores are filled with bargain counter patronage; theatres offer standing room only to late comers; railway coaches and Pullmans often have no space for belated passengers. Such is the traveler's barometer of the speed to which our national life has attained.

No doubt we are, as a people, going the pace that exhausts if it does not kill, but luckily, the usual vacation season, with its customary temptations to leisure, will be upon us soon, and in the meantime our social and economic life has been in large measure readjusted to the new conditions which the war has thrust upon us. The new grooves are being worn to a point where some sense of stability is acquired, and we shall dare to relax and accept the opportunity for necessary respite. The interest of the transportation world is naturally centered upon the development of the railroads under government control. The public has evinced not only a lively but a sympathetic and helpful interest in the government's work. The government has moved with skill and rare good judgment, carrying with it the confidence and the loyal support of the railway officials and employees and of the traveling public. —*American Express Co.'s Travel Bulletin.*

Commission and Court News

Interstate Commerce Commission

The application proposes increases in the present rates on lumber to Omaha, South Omaha, Lincoln, Neb., Council Bluffs and Des Moines, Iowa, and to certain intermediate points.

The commission has issued an amended order outlining the procedure to be followed in filing fifteenth section applications for permission to file tariffs containing increased rates.

The Commission has further postponed its order in the re-consignment case from April 1 to May 1 on account of the inability of the carriers to get their tariffs ready for filing.

Fifteenth Section Application No. 4829, filed by F. A. Leland in behalf of Southwestern Lines for authority to make increases in rates on lumber in order that petitioners may comply with the order of the commission in Docket No. 8301, has by direction of the commission been assigned to the formal docket under Docket No. 10121.

Fifteenth Section applications filed by the Michigan Central for authority to file increased switching charges at Detroit, Mich., and to establish a charge of 25 cents per 100 lb. on 1 c. l. shipments of freight between stations in the Detroit, Mich., switching district have been consolidated and assigned to the formal docket under Docket No. 10116.

The Pennsylvania Railroad has filed applications with the Commission for permission to cancel its special-train excursion fares from Philadelphia and Camden to Atlantic City, Egg Harbor and Ocean City, N. J., also its special one day excursion fares from New York to Asbury Park, Ocean Grove, Point Pleasant or Sea Girt, N. J., also to cancel the week-end roundtrip excursion rates of \$1.50 between Washington and Baltimore.

The Pennsylvania has also filed an application for permission to file a tariff establishing an excess train fare of 5 cents, to be retained by the railroad, in addition to the usual one-way ticket fare, for passengers boarding trains without valid tickets or equivalents, in lieu of the present charge of 10 cents in addition to the regular tariff fare, which is redeemable on presentation of the excess check. The proposed excess fare would not be collected from stations where tickets could not be bought.

Court News

Twenty-eight Hour Law

The Circuit Court of Appeals, Third Circuit, holds that, under the Twenty-eight Hour Law, a railroad company which, knowing that its lines were congested and delays were imminent, took a chance when the margin of safety was small, in attempting to transport cattle through to their destination without unloading and feeding, must, the animals having been confined beyond the prescribed time before they reached the destination, be deemed to have knowingly and wilfully violated the act, and so was liable for the penalty. —*P. & R. v. United States*, 247 Fed., 466. Decided January 16, 1918.

Conductor's Power to Arrest

The West Virginia Supreme Court of Appeals holds in an action against a railroad for false arrest that a conductor, as a conservator of the peace, has authority under the West Virginia statute to arrest without a warrant and eject from a car conveying passengers any person who in his presence and the presence of passengers contends with angry words to the disturbance of the public peace and tranquility; and an instruction telling the jury a conductor has no such right is erroneous. The passenger arrested had twice attempted to force his way into a coach while the vestibule, platform and

steps were occupied by passengers in the act of alighting, and on being detained by the conductor used the abusive language which led to his arrest. Judgment for the plaintiff was reversed.—*Marcucci v. Norfolk & Western (W. Va.)*, 94 S. E., 979. Decided January 29, 1918.

Loss of Valuables in Dining Car—

Contributory Negligence

In an action to recover for jewelry left in a dining car the plaintiff claimed that she put the jewelry, of the value of about \$1,500, in a handkerchief and tied up the handkerchief, and while in the dining car put the package on the dining table. She previously had it in a mesh bag, but had taken it out, apparently to use the handkerchief, although it contained the diamonds. She swore that when she left the dining table she left the handkerchief, with the diamonds in it, on the table, having thrown her napkin over it without noticing it. In about 20 minutes she discovered her loss and came back. She claimed to have shown that no one else could have come near this table, or taken these diamonds, except the defendant's servants, and therefore theft was shown on their part; and that, as well as the defendant's negligence, was the basis of a verdict and judgment in her favor. This has been reversed and a new trial granted by the New York Appellate Division for the following reason: "There is no sufficient proof of theft. No man is presumed to have committed a crime—the presumption is otherwise. Even if there be some evidence of the defendant's negligence, it is very slight, and I doubt if there be enough here to charge defendant with the loss of the diamonds. It is not at all impossible that she may have taken the handkerchief back with her into the other car and lost it on the way, or dropped it, or that the handkerchief may have been taken by the woman companion, even after she got back into the other car. The plaintiff's only cause of action here is for negligence, and I am unable to see why the contributory negligence of the plaintiff is not a complete defense; if not so as matter of law, certainly shown by the great weight of evidence. The jury might say that it was contributory negligence on her part to place a handkerchief containing \$1,500 worth of jewelry on the table and leave it in the dining room upon returning therefrom."—*Barden v. New York Central*, 168 N. Y. Supp., 742. Decided January 18, 1918.

Hours of Service Act: Effect of War

In an action under section 2 of the Hours of Service Act it appeared that enginemen and firemen employed on pushing engines, had much unoccupied time, and the plan was adopted of relieving them entirely, between trains, from all work or care of their engines. Though subject to call they were given opportunity to recuperate in rest houses, and in some places were allowed, though subject to call, to go to lodgings and elsewhere. The Circuit Court of Appeals, Third Circuit, held that, though the Hours of Service Act is remedial and for the benefit of travelers, yet, in view of the adoption of the plan while the United States was engaged in the prosecution of a war, making great demands upon its railroads, and of the fact that the crews of the pushing engines were relieved of all duties while awaiting other trains, it cannot, as a matter of law be declared that the defendant violated the act, although such employees, if the rest periods during which they received pay and were subject to call be counted, worked more than 16 consecutive hours a day; but that question can only be determined by consideration whether the periods off were restful. As the act declares that it shall be the duty of the Interstate Commerce Commission to enforce its provisions, and all powers granted to the commission are extended to it in the execution of such act it was said that the commission should promulgate a practical working scheme for compliance with the act, instead of leaving railroad companies to determine at their peril whether their plan violates the act; and such procedure should be followed in preference to prosecutions under the act; this being particularly true where, as a war measure, a railroad company is attempting to operate at maximum capacity. Judgment against the railroad was reversed and the cause remanded for further proceedings.—*Pennsylvania v. United States*, 246 Fed. 881. Decided December 19, 1917.

Equipment and Supplies

Railway supplymen will be particularly interested in the following articles in this week's issue:

Standard Locomotives Will Mean a Waste of Material, page 959.

Express Your Views on Standardization, page 959.

George A. Post and the Railway Business Association, page 960.

Two Great Industries—An Analogy, page 961.

Railway Business Association Discusses Problems, page 963.

Railroad Administration's Motive Power Problems, page 965.

Our Foreign Trade in Railway Supplies, page 983.

Government Cars and Locomotives

The placing of contracts for government cars is being somewhat delayed by conferences with the War Industries Board as to the possibility of using steel and lumber which may be needed for ship building. The War Industries Board has the determination of priority on such matters. The question of prices for cars is also still under consideration between the builders and the division of purchases.

It was expected that contracts for approximately 100,000 freight cars, to be ordered by the Railroad Administration from the standard specifications which have been described in these columns, might be placed by the end of this week, but there have been some delays incident to the negotiations as to prices between the car builders and the Division of Purchases, which apparently is making an effort to drive a close bargain, and to the conferences which have been held with the War Industries Board regarding the procurement of the steel and other materials. The War Industries Board has charge of the co-ordination of the demands of various departments of the government for raw materials and the requirements of lumber and steel for the cars must be considered in connection with the requirements of materials for shipbuilding, as 100,000 cars would require approximately 575,000 tons of steel plates alone, to say nothing of the shapes, bars, etc.

Tentative prices were submitted by the car builders, and a meeting to consider them was held between the builders and John Skelton Williams, director of the Division of Purchases, last week. Another meeting was held on Tuesday of this week at the call of Mr. Williams, who, it is understood, made numerous inquiries as to the profits and cost of the various companies.

A conference with the manufacturers of car specialties is expected to be held at an early date at which they will be asked to submit figures as to their costs. At a similar meeting held last week with the manufacturers of locomotive specialties at the call of the central purchasing committee of the Railroad Administration, they were asked to pool their patents and allow various plants to turn out patented devices without royalties. This idea aroused considerable opposition at the meeting and information was asked as to whether the suggestion came in the form of a request or whether it represented a definite policy. A final answer to the question was not forthcoming and it is understood that the matter has not yet been definitely determined, but it is said that Mr. Williams expects to take advantage of the fact that the government is now practically the sole purchaser to depress prices to a minimum—6 per cent above cost has been suggested. Some manufacturers have raised the point that they are under contractual obligations to pay royalties to the inventor, while others own their own patents and make no calculation for any royalty except as is represented by a return on their capitalization.

Whether the purpose of the Administration extends to cases where the manufacturer is under contract to pay royalties or whether it contemplates merely a plan by which the owners of patents would be required to permit their devices to be manufactured in a number of plants without the payment of royalties, has not been announced, but it is believed that the first example was not taken into consideration. The various builders of cars and locomotives submitting their bids were asked to state their profits for the last year, the previous year and the most profitable

year in their business, and other detailed costs as separated between material, labor and general expenses, together with a statement of the profit desired. They were also asked to express their attitude in case the government should furnish all materials. Later in the week the builders were asked to submit bids on 50-ton all-steel box cars in addition to the cars for which specifications had already been issued and bids will be asked later on refrigerator, flat, and general service cars.

The car builders were in session with Mr. Williams late Tuesday evening and adjourned to meet again Monday. The demands of the shipping board for priority in the use of steel may bring about a decision to decrease the number of steel cars and to use wood instead.

Locomotives

THE NEVADA NORTHERN is inquiring for a number of Consolidation locomotives.

THE PARIS, LYONS & MEDITERRANEAN has ordered 100 Mikado locomotives from the Baldwin Locomotive Works.

THE CENTRAL RAILWAY OF BRAZIL has ordered from the American Locomotive Company three Consolidation locomotives, weighing 165,000 lb.; one mallet (0-8-8-0) type locomotive, weighing 280,000 lb., and two Consolidation locomotives, weighing 167,000 lb. All these locomotives will be equipped with superheaters.

Freight Cars

THE DELAWARE & HUDSON is inquiring for 50 steel caboose underframes.

THE FINKBINE LUMBER COMPANY, Wiggins, Miss., is inquiring for 5 tank cars.

THE AMERICAN BRIDGE COMPANY, Pittsburgh, Pa., is inquiring for 108 50-ton trucks.

THE ACME PETROLEUM COMPANY, Tulsa, Okla., is inquiring for 25 to 50 tank cars.

THE ANACONDA COPPER MINING COMPANY, New York, is inquiring for 3 90-ton ore cars.

THE AMERICAN NITROGEN PRODUCT COMPANY, Seattle, Wash., is inquiring for 8 to 10 tank cars.

THE GREAT WESTERN CONTRACTING COMPANY, Kansas City, Mo., is inquiring for 100 to 200 tank cars.

THE HOUSTON RAILWAY CAR COMPANY, Houston, Tex., is inquiring for 25 to 50, 50-ton, 8,000-gal. tank cars.

THE NEW ORLEANS INDUSTRIAL ALCOHOL COMPANY, New Orleans, La., is inquiring for 18 40-ton 8,000-gal. capacity tank cars.

THE HAZEL ATLAS GLASS COMPANY, Washington, D. C., is inquiring for 3 to 4 8,000 to 10,000-gal. steel underframe tank cars.

THE EVANS-THWING REFINING COMPANY, Kansas City, Mo., has ordered 50 8,000-gal. capacity, 40-ton tank cars from the American Car & Foundry Company.

Signaling

THE BALTIMORE & OHIO has ordered from the Union Switch & Signal Company a Saxby & Farmer interlocking, 48 levers, for Outville, Ohio.

THE ATCHISON, TOPEKA & SANTA FE has ordered from the Union Switch & Signal Company a Saxby & Farmer interlocking, 16 levers, for Floyd, Mo.

THE PENNSYLVANIA LINES WEST will have a new interlocking at Smithville, Ohio, 32 levers; Saxby & Farmer machine, furnished by the Union Switch & Signal Company.

THE CENTRAL OF GEORGIA has completed the 9 miles of automatic signaling Hapeville to Atlanta, reported three months ago as under construction; and now has under construction 3 miles between Cuthbert, Ga., and Cuthbert Junction, single track, and one mile from Macon, Ga., to Macon Junction, double track.

Supply Trade News

Frank O. Bolton, chief inspector for Robert W. Hunt & Co., at the Edgar Thomson Steel Works, Pittsburgh, Pa., died in that city on April 1. He had been connected with Hunt & Co. for over 17 years.

D. B. Clark, who was formerly superintendent of the shell department at the American Brake Shoe & Foundry Company at Erie, Pa., is now general superintendent of the Watervliet Arsenal, Watervliet, New York. This Arsenal is the largest and oldest Arsenal in the United States and Mr. Clark has charge of the entire production of this plant.

The H. W. Johns-Manville Company announces that after April 1, its Youngstown, O., office will be located at 520 Market street. The same company has also found it necessary, owing to increased business on the Pacific coast, to open new offices at Tacoma, Wash. The office will be located at 1015 A street and will carry a complete stock of Johns-Manville products.

The rapid expansion of the business done by the W. J. Crouch Company, steel exporters, of 253 Broadway, New York, has necessitated the company's taking larger and better equipped quarters than those now occupied. It has leased for a period of years, the whole of the fifteenth floor at 68 William street, corner of Cedar street, where it will be located as from April 29.

The Abell-Howe Company, 332 South Michigan avenue, Chicago, has been appointed representative of the Standard Malleable Iron Company, Muskegon, Mich., for the sale of malleable castings through its several offices located at Chicago, Pittsburgh, Cleveland and New York. The company has also been appointed representative of the Northern Engineering Works, Detroit, Mich., builders of electric overhead traveling cranes, electric hoists and foundry equipment, for the sale of these products in the territory tributary to Chicago.

Carnegie Steel Company Changes

Effective as of April 1, 1918, Colonel Henry P. Bope has resigned his position as vice-president and general manager of sales with Carnegie Steel Company to devote his time to private interests.

Colonel Bope was born and educated at Lancaster, Ohio, and devoted himself at first to stenographic reporting in the Ohio legislature. In November, 1879, he became connected with Carnegie Brothers & Co. and has remained continuously in the sales work of that company and its successors up to the present time. His period of service has thus covered the wide expansion of the use of steel and the growth of great commercial and business organizations, in all of which he has had a most active part. In addition to these commercial activities he has been active in the social life of the community.

He has been succeeded in his office with Carnegie Steel Company by William G. Clyde. Mr. Clyde was educated in the Pennsylvania Military College, at Chester, Pa. He first entered the employ of Ryan & McDonald, contractors of Baltimore, Md., was then associated with Robert Wetherill & Co., machinists and founders, and was later superintendent of the plate mills of the Wellman Steel & Iron Company, in Thurlow, Pa. His connection with the United States Steel Corporation and its subsidiaries dates from 1894 when he became superintendent of the plate mills of the Illinois Steel Company at South Chicago.

On the formation of the American Steel Hoop Company he became traveling salesman for that company in Chicago, and five months later was made manager of sales at Philadelphia where he remained until 1902, when, after the formation of the United States Steel Corporation, the American Steel Hoop Company was merged with the Carnegie Steel Company. For the next three years Mr. Clyde was traveling salesman for the Carnegie Steel Company at Cleveland. In September, 1905, he was made assistant general manager of sales at Pittsburgh in charge of the bureau of bars and hoops, which office he retained until his

present promotion. Mr. Clyde by the promotion has also become a member of the board of directors of the company.

While Mr. Clyde belongs to the younger generation of steel makers his experience in the actual manufacture of steel, his wide experience in sales work, grasp of details, indefatigable energy and strength of character indicate that he will be a potent factor in the commercial activities of Carnegie Steel Company and the steel industry.

Charles L. Wood, long assistant to Mr. Clyde, has been promoted to be assistant general manager of sales in charge of the bureau of bars and hoops. Mr. Wood was born in Youngstown, Ohio, in the atmosphere of iron and steel manufacture. He was educated as a mining engineer at the Ohio State University and his first employment was with the Calumet Furnace Company, of Chicago, as chemist, followed by several years' experience in the practice of mining engineering in Colorado and the West.

Mr. Wood became associated with the American Steel Hoop Company on its formation, first in the order department. On the merger of the Hoop Company with Carnegie Steel Company his abilities caused his transfer to the sales department where, in the bureau of bars and hoops, he has long been Mr. Clyde's most efficient assistant. His promotion, therefore, comes as a logical recognition of his large experience in the sale of bar mill products and his wide acquaintance with their users.

Trade Publications

JOURNAL PACKING.—A new kind of car waste that is kept elastic and in contact with the journal, by means of interwoven brass spring wire, is described in a pamphlet issued by the Elastic Car Waste Company, Philadelphia, Pa.

FREIGHT CAR APPLIANCES.—The Wine Railway Appliance Company, Toledo, Ohio, has recently issued three circulars describing devices manufactured by the company for use on freight cars. A-40 Square Shaft Hand Brakes; A-41, Ratchet Lever Hand Brakes and A-50 Drop Door and Hopper Door Mechanism.

MILLING CUTTERS.—The "Stock List of Cutters," issued by the Cleveland Milling Machine Company, Cleveland, Ohio, under the date of March 15, 1918, contains a list of the different kinds and sizes of milling cutters made by that company. Various kinds of angular cutters, end mills, slotting and concave cutters are also listed.

TOOL HOLDERS.—Under the title of "How to Save Money on High Speed Steel," the Gisholt Machine Company, Madison, Wis., has issued a pamphlet showing three kinds of tool holders which may be used to advantage with high speed tool bits made by drawing out pieces of high speed steel which would otherwise have been scrapped.

DYNAMIC BALANCE.—The Norton Grinding Company, Worcester, Mass., has issued "A Treatise on Dynamic Balance" which will be of interest to all who do not understand the difference between the standing and running balance of machine parts which revolve at a high speed. The need of a running balance and a special machine to test it is very evident.

HEATING APPLIANCES.—The Macleod Company, 213 East Pearl Street, Cincinnati, Ohio, has issued Buckeye Catalogue E, describing several appliances now manufactured by the company, which use crude oil in the heating of locomotive parts. These appliances include a Buckeye flood-light locomotive fire kindler, paint sprayer, locomotive tire heater and several kinds of furnaces. The Buckeye oxy-acetylene welding outfit is also illustrated.

CAR INSULATION.—The Union Fibre Company, of Winona, Minn., has issued a booklet, entitled "Insulation of Railway Equipment," which takes up in considerable detail the insulation of refrigerator and other cars. The front of the booklet contains an interesting account of the beginning and evolution of the refrigerator car and a development of the theory of insulation. Further on a description is given of the manufacture of Linofel, which is composed mostly of flax fibre and is a good insulator. The back of the booklet is devoted to the discussion of a series of actual tests, conducted in 1908 by several railroads, with a view to determining the best practice in refrigerator car construction.

Railway Financial News

ATLANTIC, TOPEKA & SANTA FE.—W. D. HILLEN has resigned as chairman of the board of directors. Carl R. Gray has also resigned as director.

CHICAGO, MILWAUKEE & ST. PAUL.—For the third time since the first of the year, the directors have voted to defer action on the regular common and preferred stock dividends.

DENVER & RIO GRANDE.—It is understood that this company will file with the director general of railroads an application for an advance of \$2,500,000 to pay the interest, due February 1 and April 1, on its bonds. This represents about ninety per cent of the government guarantee for January, February and March.

ILLINOIS CENTRAL.—The State Public Utilities Commission of Illinois held a hearing on April 9 at Chicago to consider the petition of the Illinois Central for an order authorizing the acquisition of the capital stock of the Golconda Northern, a new road between Golconda, Ill., and Elizabethton, Hardin county, about 12 miles.

NEW YORK, NEW HAVEN & HARTFORD.—Director-General McAdoo, after conference with officials of the New York, New Haven & Hartford, has announced that the government would lend the road \$43,564,000 for one year at 6 per cent to enable it to meet a like amount of its one-year collateral trust notes which mature April 15. The funds for this purpose will be advanced out of the \$500,000,000 appropriation in the railroad bill. The notes will be discounted through the Federal Reserve banks. The government will accept as security the same collateral as was pledged under the original issue, which consists of stocks and bonds of various subsidiary companies, totaling about \$85,000,000 par value. Under the terms of the loan, the government reserves the right to sell any part, or all of the collateral, at such price as the Secretary of the Treasury may determine and apply the proceeds to the retirement of the notes. This action on the part of the government relieves the New Haven of the necessity of selling the collateral pledged under the original notes, the sale of which in the present market would involve a heavy sacrifice on the part of the road. Efforts to meet the notes at maturity, it is understood, met with but little encouragement in banking circles, and although an issue of preferred stock was authorized by stockholders it was thought that the full amount of the notes could not be readily absorbed in this way. The director-general also announced that the road would receive a rental sufficient to pay all fixed charges and leave a substantial surplus during the period of government control. In making the announcement, Mr. McAdoo said: "The director-general has investigated this subject carefully and has given due consideration to past and present records and earnings and to the future prospects of the New Haven system, whose gross operating revenues for the calendar year 1917 amounted to more than \$85,000,000, exclusive of the earnings of several allied companies. Realizing the high importance of maintaining the physical and financial integrity of this railroad system, which controls so largely the entire transportation facilities of several leading industrial states, which are essential to the war-making functions of the nation, and whose lines are already being taxed to perform service which is now more important than ever, and having a proper regard to the security offered for the loan desired, the director-general has decided to extend the relief needed. The road will have the right to renew the loan for one year more on the same terms."

SAN DIEGO & SOUTHEASTERN.—In a recent order the Railroad Commission of California has authorized the San Diego & Arizona to purchase the capital stock of the San Diego & Southwestern, a 68-mile line running out of San Diego, California, and to issue bonds for \$1,500,000 to cover the purchase.

WARASH.—Action on the dividend on the preferred stock A has been delayed.

Railway Officers

Executive, Financial, Legal and Accounting

H. Doescher has been elected secretary and treasurer of the Western Allegheny, with office at Pittsburgh, Pa., vice C. A. Young.

John T. Reid has been elected treasurer of the Charleston & Western Carolina, with office at Wilmington, N. C., succeeding J. F. Post.

E. C. Mann, auditor of disbursements of the Lehigh Valley, with office at Philadelphia, Pa., has been elected treasurer to succeed C. J. Kulp, deceased. Mr. Mann was born in 1868 at Altoona, Pa., and was educated in the public schools of his native town. He entered the service of the Pennsylvania Railroad as a clerk in the motive power department in 1896. Three years later he went to the Lehigh Valley as a clerk in the accounting department in the general offices at Philadelphia, Pa. He was steadily promoted through various positions in that department until in March, 1912, he was appointed auditor of disbursements which position he held at the time of his recent appointment as treasurer of the same road, with headquarters at Philadelphia as above noted.

C. C. Higgins, whose appointment as assistant to the vice-president of the St. Louis San Francisco, with office at St. Louis, Mo., was announced in these columns March 22, was born at Aurora, Ill. He graduated from the mechanical engineering course at the University of Minnesota in 1900, following which he entered the employ of the Chicago, Burlington & Quincy as a special apprentice. He remained with that road for five years, serving consecutively as assistant in the laboratory, roundhouse foreman and general foreman at various division points on the line. He was with the American Brake Shoe & Foundry Company, Chicago for the following four years, serving as sales engineer and salesman. Subsequently he was employed by the Atchison, Topeka & Santa Fe, with headquarters at Topeka, Kan., for three years, doing special work in connection with the bonus schedules in the mechanical department. After leaving the Santa Fe he became associated with J. W. Kendrick, consulting railway expert, Chicago, and during the following six years was engaged in making reports on various railroads in connection with valuation and rehabilitation. His present position with the Frisco was newly created and became effective March 15.

E. C. Mann

C. C. Higgins

A. W. Amis has been appointed auditor, of the Gulf & Ship Island and G. R. Kemp has been appointed claim agent; both with headquarters at Gulfport, Miss.

Edwin M. Kindler, chief clerk in the office of the secretary of the Union Pacific, at New York, has been elected assistant secretary of the Union Pacific and subsidiary companies.

J. B. Andrews, assistant secretary of the Denver & Rio Grande, with headquarters at Denver, Colo., has been appointed assistant to the president with the same headquarters.

E. H. Radcliffe, general accountant of the Lehigh Valley, with office at Philadelphia, Pa., has been appointed auditor of disbursements, with headquarters at Philadelphia, to succeed E. C. Mann, promoted.

E. E. Lloyd, auditor of stores and mechanical accounts of the Canadian Pacific, with office at Montreal, Que., has been appointed auditor of disbursements, vice W. H. Mouler, promoted, and W. H. Langridge succeeds Mr. Lloyd; both with headquarters at Montreal.

Lawrence Greer, vice-president and general counsel of the Western Maryland, with headquarters at New York, has been elected president and chairman of the board to succeed Carl R. Gray, who has been appointed director of the division of transportation in the United States Railroad Administration.

George T. Slade, first vice-president in charge of operation of the Northern Pacific, having been granted an indefinite leave of absence to enter military service, John M. Rapelje, general manager of the lines east, with office at St. Paul, Minn., has been appointed acting vice-president in charge of operation.

Operating

G. F. Morse has been appointed general superintendent of the Mississippi Eastern, with office at Quitman, Miss., vice G. H. Fordham.

L. L. Lamar has been appointed assistant superintendent of the Waycross & Southern, with office at Waycross, Ga., vice F. S. L. Grundy, resigned.

J. S. Reddock has been appointed superintendent of transportation of the Missouri & North Arkansas, with office at Harrison, Ark., succeeding H. S. Baumgardner, resigned.

E. E. Ramey, supervisor of trains of the Baltimore & Ohio, with office at Philadelphia, Pa., has been appointed supervisor of fuel consumption of the same road, vice W. L. Robinson, resigned.

A. M. Burt, chief engineer maintenance of way, of the Northern Pacific, with office at St. Paul, Minn., has been appointed acting general manager of the lines east of Paradise, vice John M. Rapelje. (See Executive, Financial, Legal and Accounting.)

Charles P. Angeli, trainmaster of the New Castle division of the Baltimore & Ohio, with office at New Castle Junction, Pa., has been appointed assistant superintendent in charge of terminals, on the Pittsburgh division, with headquarters at Pittsburgh.

F. W. Taylor, superintendent of motive power of the Missouri, Kansas & Texas, with headquarters at Denison, Tex., has been appointed general manager, with headquarters at Parsons, Kan., succeeding H. F. Anderson, who was transferred to San Antonio, Tex., as superintendent of terminals of the Missouri, Kansas & Texas of Texas, effective March 1.

George Masten, who has been appointed superintendent of the Tennessee Central, with headquarters at Nashville, Tenn., as has already been announced in these columns, was born on December 6, 1874, at Lincoln City, Del. He began railway work in October, 1891, with the Atlantic & Danville, now the Norfolk division of the Southern Railway and subsequently served first as agent and then as despatcher. From 1893, to 1902, he was consecutively despatcher and chief despatcher on the Denver & Rio Grande and in 1904 became chief despatcher on the El Paso & Northeastern, now a part of the El Paso & Southwestern system, at Alamogordo, N. M. In 1906, he went to the Seaboard Air Line, as despatcher and

the following year was appointed chief dispatcher on the Florida division. He subsequently served as trainmaster on different divisions of the same road until his recent appointment as superintendent of the Tennessee Central as above noted.

E. E. Regan, superintendent of the New London division of the New York, New Haven & Hartford with office at New London, Conn., has been appointed superintendent of the New Haven division, with office at New Haven, vice **F. S. Hobbs**; **F. M. Clark**, superintendent of the Old Colony division, with office at Taunton, Mass., has been appointed superintendent of the New London division, with office at New London, vice Mr. Regan, and **F. S. Hobbs** has been appointed superintendent of the Old Colony division with office at Taunton, vice Mr. Clark.

A. J. Dimaline, car accountant of the San Antonio & Aransas Pass, with headquarters at San Antonio, Tex., has been appointed division superintendent, with the same headquarters, and with jurisdiction over all employees of the transportation department, north and south of Kenedy, and including Kenedy Yard. **H. C. Franks**, general agent of the freight department, with headquarters at San Antonio, has been appointed assistant superintendent, with the same headquarters and with jurisdiction over the entire line. The territory of **J. H. Smith**, division superintendent, with headquarters at Yoakum, Tex., has been extended to Kenedy, exclusive of Kenedy Yard. The above changes were made following a grant of a leave of absence to **C. A. Maxwell**, division superintendent at Kenedy, to enter government service, and became effective March 27.

G. W. Nelson, whose appointment as superintendent of dining cars of the Northern Pacific, with headquarters at St. Paul, Minn., was announced in these columns on March 29,

was born at Monroe, Iowa, on May 16, 1868. At the age of 17 he learned telegraphy and he entered the service of the Chicago, Rock Island & Pacific as an operator in July, 1887. He stayed with the Rock Island during the subsequent six years, being promoted to ticket clerk and later to agent. Later he completed a course at Hess Business College, following which he was employed for one year by **G. M. Kenyon**, railway supply broker, St. Paul, Minn. He entered the service of the Northern Pacific in

1894 as stenographer and operator for the superintendent of dining cars and in April, 1903, was appointed assistant superintendent of that department. Upon the appointment of **H. J. Titus** as superintendent in July, 1908, Mr. Nelson was placed in charge of the headquarters' office at St. Paul and upon the resignation of Mr. Titus, he was promoted to superintendent, as above stated, effective April 1.

Engineering and Rolling Stock

T. Boles has been appointed chief engineer of the Ft. Smith & Western, with office at Ft. Smith, Ark., succeeding **B. F. Beckman**, resigned, effective March 1.

W. H. Winterrowd, assistant chief mechanical engineer of the Canadian Pacific, with office at Montreal, Que., has been appointed chief mechanical engineer in place of **W. E. Woodhouse**, who has resigned.

A. L. Roberts, mechanical engineer of the Lehigh Valley, has been promoted to master mechanic, with office at Wilkes-Barre, Pa., vice **M. R. Smith**, resigned. **W. I. Cantley**, assistant mechanical engineer, with office at South Bethlehem, has been appointed mechanical engineer; **J. P. Laux**, master me-

chanic, with office at Sayre, has been transferred to South Easton, Pa., vice **D. D. Robertson**, resigned, and **E. J. Kleinkauf**, general foreman at South Easton, has been promoted to master mechanic, with office at Sayre.

William Earle Barnes, whose appointment as general master mechanic of the Canadian Government Railways, with headquarters at Moncton, N. B., has already been announced

in these columns, was born on July 24, 1879, at Shediac, N. B., and was educated in the public schools. He began railway work on April 20, 1899, as draftsman apprentice on the Canadian Government Railways. In 1902 he served as draftsman, and in 1906 first as machinist and later as draftsman. In October, 1907, he was appointed letter and in January, 1909, again served as draftsman. In April, 1910, he was appointed enginehouse inspector and the following January became acting master mechanic. He

was appointed master mechanic, in September, 1912, and since August, 1917, was acting general master mechanic until his recent appointment as general master mechanic as above noted.

The offices of chief engineer and chief engineer maintenance of way, of the Northern Pacific, have been consolidated in charge of **H. E. Stevens**, chief engineer, with headquarters at St. Paul, Minn. (See Operating Officers.)

M. J. Powers, master mechanic of the Denver & Rio Grande, Colorado lines, with headquarters at Denver, Colo., has been appointed superintendent of motive power of the Colorado Midland, with office at Colorado Springs, Colo.

George A. Kirley, assistant signal engineer of the Boston & Albany, has been appointed signal engineer, with headquarters at Boston, Mass., vice **F. E. Whitcomb**, resigned to go with the Federal Signal Company; **E. I. Gardiner**, draftsman in the signal department, succeeds Mr. Kirley.

H. S. Wall, superintendent of shops of the Atchison, Topeka & Santa Fe Coast Lines, at San Bernardino, Cal., was appointed mechanical superintendent, succeeding **S. L. Bean**, deceased, with headquarters at Los Angeles, Cal., effective April 1. **A. B. Armstrong**, master mechanic at San Bernardino, Cal., has been appointed superintendent of shops, succeeding Mr. Wall, with the same headquarters, and **John Pullar**, master mechanic at Fresno, Cal., has been transferred to the Los Angeles division, with headquarters at San Bernardino, succeeding Mr. Armstrong, effective April 1.

Traffic

F. W. Robinson has been appointed general agent of the Chicago, Indianapolis & Louisville at Milwaukee Wis., succeeding **F. A. DeZotell**.

G. H. Dougherty, general agent of the Kansas City Southern, with office at Tulsa, Okla., has been assigned to other duties, and the general agency at Tulsa has been abolished.

J. A. S. Wallace, commercial freight agent of the Western Maryland, with office at Pittsburgh, Pa., has been appointed general western agent, with office at Chicago, vice **E. B. Webb**.

W. D. Burr, assistant general freight agent of the Chicago, St. Paul, Minneapolis & Omaha, with office at Minneapolis, Minn., has resigned and his office was abolished, effective April 1.

A. R. Malcolm, general agent for the Missouri Pacific,

W. E. Barnes

G. W. Nelson

at San Francisco, Cal., has been appointed acting assistant traffic manager, with office at New Orleans, La., succeeding **B. M. Flippin**.

J. P. Harkins has been appointed general agent of the Western Pacific at Stockton, Cal., succeeding **E. L. Gamble**, resigned to go with another company.

C. T. Slauson, foreign freight agent for the Missouri Pacific, with headquarters at Chicago, was promoted to manager of foreign freight traffic, with headquarters at St. Louis, Mo., effective March 25.

S. L. Parrott, general New England agent of the Chicago, Rock Island & Pacific, with headquarters at Boston, Mass., has been appointed commercial agent at St. Joseph, Mo., succeeding **J. I. Johnson**.

J. T. Wray has been appointed acting division freight agent, of the Central and Northern divisions of the Pennsylvania Railroad, with office at Erie, Pa., vice **E. S. Neilson**, who was division freight agent of the Central and Northern divisions.

E. S. Center, assistant general freight agent of the Atlanta & West Point and the Western Railway of Alabama, with headquarters at Atlanta, Ga., has been appointed general industrial agent of the Georgia Railroad, with headquarters at Atlanta, and his former position has been abolished.

E. R. Cobb has been appointed traffic manager and acting auditor of the Valdosta, Moultrie & Western, with office at Valdosta, Ga. The traffic and accounting departments have been removed from Albany to Valdosta, and the office of general freight and passenger agent at Albany has been abolished.

E. J. Carland, general agent of the passenger department of the Chicago, St. Paul, Minneapolis & Omaha, with headquarters at Duluth, Minn., was appointed acting general agent, succeeding **J. D. Mahon**, who was returned to Superior, Wis., in charge of freight and passenger traffic, effective April 1.

E. A. Donnelly, commercial agent of the Chicago, St. Paul, Minneapolis & Omaha, at Minneapolis, Minn., was appointed general agent of the freight department, with same headquarters, effective April 1. **T. J. Kenniff**, commercial agent at Minneapolis, has been assigned to other duties and the office discontinued, effective April 1.

Railway Officers in Government Service

Charles Barham, who has been appointed regional director under the National Food Administration, with headquarters at Atlanta, Ga., as has already been announced in these columns, was born on April 16, 1867, and began railway work in 1887 on the Richmond & Danville, now a part of the Southern Railway. He then served as stenographer to the commissioner of the Associated Railways of Virginia and the Carolinas, and then was soliciting freight agent of the Southern Railway at Richmond and later at New York. He subsequently was foreign freight agent of the same road at Norfolk, Va., until August 1, 1898, when he went to the Nashville, Chattanooga & St. Louis as chief clerk to traffic manager at Nashville, Tenn. From January, 1900, to September, 1906, he was assistant general freight agent, and then was made general freight agent of the same road, which position he held at the time of his recent appoint-

ment as regional director under the National Food Administration as above noted.

B. L. Swearingen, assistant general freight agent of the Missouri Pacific, has been appointed supervisor of oil traffic by the regional director of western roads, with headquarters at Kansas City, Mo.

John J. Sullivan, formerly in the office of vice-president and general manager of the Southern Pacific, and until March 1, 1918 general agent of the American Railway Association at Camp Cody, Deming, N. Mex., has received a commission as first lieutenant, and has been assigned to duty with the Thirty-sixth Engineers, at Camp Grant, Rockford, Ill.

Purchasing

G. H. Robison, general storekeeper of the Oregon Short Line, with office at Pocatello, Idaho, has been appointed acting purchasing agent in addition to his duties as general storekeeper, with headquarters at Salt Lake City, Utah, succeeding **A. E. Hutchinson**, deceased.

Obituary

L. D. Davis, supervisor of scales and weighing of the Baltimore & Ohio, with office at Baltimore, Md., died on April 2.

W. G. Neimyer, general agent for the Southern Pacific, with headquarters at Chicago, died in that city on April 4, aged 64 years.

Joseph H. Meglemry, assistant general freight agent of the Michigan Central, with office at Buffalo, N. Y., died in that city on April 2.

A. E. Hutchinson, general purchasing agent, of the Oregon Short Line, with headquarters at Salt Lake City, Utah, died in that city on April 3.

Dennis C. Zook, who was for the last 20 years master carpenter on the Western division of the Pennsylvania Railroad, Lines West, with headquarters at Fort Wayne, Ind., died on March 28, 1918.

Warren P. Taylor, traffic manager of the Richmond, Fredericksburg & Potomac, and secretary and treasurer of the Freight Claim Association, died on April 4 at Richmond, Va. He was born in September, 1868, and began railway work in 1884, as a clerk on the Richmond & Danville, now a part of the Southern Railway. In December, 1889, he entered the service of the Richmond, Fredericksburg & Potomac as chief clerk to the traffic manager, and since September 1, 1898 had been traffic manager of the same road. He was traffic manager also of the Washington Southern operated in connection with the Richmond, Fredericksburg & Potomac. He had served as secretary and treasurer of the Freight Claim Association since May, 1897.

S. H. Hardwick, who was passenger traffic manager of the Southern Railway from May, 1904 to June, 1915, died on March 26, at Montgomery, Ala. Mr. Hardwick served for several years prior to January, 1889, as general eastern passenger agent of the Virginia, Tennessee & Georgia Air Line, at New York. In August, 1889, he was appointed general passenger agent of the Georgia Pacific. From September, 1891 to June, 1892, he was assistant general passenger agent of the Richmond & Danville in charge of the Second division of the Central of Georgia. Then to January, 1901, he was assistant general passenger agent of the Richmond & Danville and its successor, the Southern Railway, at Atlanta, Ga. From January, 1901, to May, 1904, he was general passenger agent of the same road and then was appointed passenger traffic manager resigning from the latter position on account of ill health in 1915. He was then appointed general agent of the passenger department of the same road, with office at Montgomery, Ala.

MUKDEN-ANTUNG LINE CUT-OFF.—The South Manchuria Railway plans to construct a new ten mile line between Suchiatun on the main line and Chenshiangtun on the Mukden-Antung Line in the next fiscal year.—*The Far Eastern Review*.

EDITORIAL

Railway Age

Power! Power!—More Power!

WE NEED POWER to win the war. Make existing power do more work.

Make it work longer hours.

Shop facilities must be improved so that the power may be promptly repaired.

Engine terminals must be improved so that the power may be promptly turned.

Existing power must be improved so that it will do more work at less cost and with less physical demands on the engine crew.

Be sure the power is carrying its full load.

Improve the utilization of the power by better despatching.

Locomotives must be ordered *now* for next winter! Further delay will be dangerous.

The two principal arguments put forth by the Railroad Administration for standard locomotives are *tremendous* increase in locomotive production and a liquid reserve of power. We have it on good authority that *no* increase in production of locomotives can be expected this year if standard locomotives are adopted and that *perhaps* next year it may be possible to increase the output 10 per cent. There is every possibility of a *decrease* in locomotive production this year if orders for new locomotives are not placed immediately, and *now* is the time we need locomotives. By building locomotives to existing designs and by bringing the same pressure to bear on their production as would be brought to bear on the standard locomotives, the output of locomotives this year will be *increased*. The 10 per cent increase in locomotive production next year is open to question, as we are informed that a large part of the builders' manufacturing capacity will be taken up in making repair parts, with their new jigs, patterns and templates, for the roads on which the standard locomotives are to be used. We are also told the builders will have to provide space for repairing locomotives due to the lack of railway shop facilities! By building locomotives to existing designs and permitting the roads to supply their own repair parts, the builders' plants can concentrate on building new locomotives. The 10 per cent increase in production is, therefore, open to question, but the largest question is, will any increase justify the increased burden which will be placed on the railroads in maintaining and operating these standard locomotives. A liquid reserve of power has its advantages. Some 600 locomotives have been interchanged between roads, including the U. S. A. and Russian engines. Why?—Because the railways have found it impossible properly to maintain their own power. At no time, particularly if the roads had their power in shape, should there be a very great demand for such locomotives. Would it, therefore, not be more logical to build only that number which would answer the purpose of a liquid reserve, rather

than ask every railroad to operate locomotive of a design which is foreign to its line and which will complicate both the repair and operating problems? Increased production of locomotives and liquid reserve of power are not the only things to be considered in standardizing locomotives.

A practice which the railroads can justly be criticised for following in the past is the purchasing of large and heavy locomotives without providing proper facilities for housing and maintaining them. A few years ago the president of an eastern road consulted the officer in charge of the mechanical department

The Cart Before the Horse

on the matter of purchasing some of this heavy power, calling attention to the fact that one of the neighboring roads, which, by the way, had shop facilities far inferior to those on his own road, was purchasing such equipment. The mechanical department officer argued strongly against such a program until the road's shop facilities were improved to maintain the larger power. His advice was followed. Today the president, watching the results of the heavy power on the other road, has become fully convinced that the decision was wise. The poorly equipped road with the heavy power is repairing it at a cost twice what it would be had it been provided with proper facilities; indeed it is having some of the work done by outside plants equipped to handle repairs to heavy locomotives. Is the Railroad Administration going to make the same mistake? It is of vital importance that provision be made for maintaining new and additional power before it is received. Let us not put the cart before the horse.

The facilities for repairing and maintaining locomotives must be improved immediately. It is of the greatest importance that the improvement work be

Shop Facilities of Paramount Importance

started at once in order that the railways will be in shape to handle the necessary repairs to equipment next winter. Every railroad mechanical man in the country will agree that his shop facilities are not adequate. The Erie and the Baltimore & Ohio, for instance, have found it necessary to send some of their locomotives to the locomotive builders to be repaired because their facilities are inadequate. This not only takes up valuable space of the locomotive builders' plants which should properly be used in building new locomotives, but it also increases the cost of repairs some two or three times, as the builders cannot repair power as economically as the owning roads. With the new and heavier locomotives that will be introduced this year the repair problems will become more serious. Much has been done already to increase the output of locomotive repair shops by working longer hours. Reports from 101 of the principal railroads of the country show that during February, 1918, the shop output was 8,390 as compared with 6,824 during the same month of 1917, an increase of 1,566. While this figure does not represent accurately the increase in production because of the classifications used in the different shops, it does represent the actual increase in locomotives which were repaired and put into service during that time. The return on the investment in improved shop and round-

house facilities will be much greater now than ever before. The engine terminals particularly are sadly in need of improvement. Lack of facilities here was responsible to a very large extent for the condition of the motive power last winter. Let everyone concentrate on providing facilities properly to maintain the power. It is far more important to the railways at this time than the development of standard locomotives.

For the past week the Fuel Administration has been renewing its complaints that coal production is being retarded by the shortage of the car supply. No one can deny the fact but the way in which the Fuel Administration handles the facts seems calculated for the purpose of placing the blame on some one else rather than as an effort to explain what the true situation is. The Railroad Administration apparently has refrained from engaging in a controversy on the subject, but on Monday of this week, after Dr. Garfield had issued a statement based on a sharp reduction during the first week in April, it issued figures showing the number of cars of coal of all kinds loaded since the first of the year, which indicate a rather creditable performance in overcoming the handicap of the unprecedented weather of January. During the week ending April 6, according to the Geological Survey preliminary figures, there was a reduction of 14 per cent in the production of bituminous coal as compared with the previous week. This was attributed in the report largely to the holiday on April 1. Dr. Garfield attributes it largely to shortage of transportation. The report shows that with the exception of that week coal production had been above last year's average since the middle of February and the Railroad Administration's figures show that although there was a decrease of 79,000 earloads in the volume of coal loaded in January, there was an increase of 31,000 cars in February, of 46,000 cars in March, and of 7,750 cars in the first week of April. There has, therefore, been an increase of 6,441 cars so far this year. While the increase is small, it should count for more than the figures for one week's loss to which Dr. Garfield calls public attention.

No organization has been more emphatic in its expressions of loyalty to the government in the prosecution of the war than the Chamber of Commerce of the United States, which held its sixth annual meeting at Chicago last week. No class of men recognize more keenly the necessity for unified support of the administration in whatever policy it pursues than the business men of the country. Nevertheless, the transportation problem is such a vital one at this time and so far-reaching in its effects on the life of all interests in the nation that the business world has come to recognize it as a question intimately connected with its affairs and one demanding its closest attention and study. It was therefore not in the spirit of criticism but in the hope of offering helpful suggestions to the Railroad Administration in meeting the complex difficulties confronting it that the Chamber of Commerce of the United States passed certain resolutions voicing the sentiment of the organization on the railroad problem as it exists at the present time. The resolutions point out that railroad equipment is inadequate for present traffic and threatens to become so insufficient during the coming autumn and winter as seriously to restrict the industries and trade of the country. While standardization of cars and locomotives is recognized as important and meriting careful consideration, the Chamber urges the imperative necessity of placing orders for equipment at the earliest possible moment so that the increasing

traffic resulting from war demands may be handled expeditiously and without hindrance to the steady flow of supplies to seaboard for shipment to Europe. In questioning the advisability of further delay to locomotive and car manufacture through standardization, the Chamber has courageously struck at the crux of a problem which is weighing heavily upon the minds of both railroad officers and railway supply manufacturers at the present time. Its recommendations should and will, no doubt, gain the attention of the director general of railroads.

A meeting of various representatives of short line railroads was held with John Barton Payne at Baltimore on April 11. Mr. Payne, as the general counsel to the director general of railroads, discussed with the representatives of the short lines some of the problems that are involved under the bill as finally passed, providing for the government taking over the railroads. When the bill was under discussion, Director General McAdoo made it plain that his intention was to take over only such short line railroads as would prove necessary or profitable to the government. Congress then amended section 14 with the evident intention of providing that the government must take over the short lines as well as the larger roads. It would appear, however, from the somewhat general and rather indefinite statements of Mr. Payne, that the government believes that under the clause which provides that it can give up roads which it does not need if action is taken before July 1, in practice the government can avoid being burdened with the short lines. Under private management the short lines were able to drive a fair bargain with the larger roads with which they connected for a division of rates by threatening to divert traffic or to appeal to the Interstate Commerce Commission. With the government in control of the large roads, neither of these alternatives would be available. Quite a number of the short lines are now unprofitable and, if the present comparatively fair division of rates were to be abandoned, as Mr. Payne implied would probably be the case, many more would be unprofitable. Is the government going to prevent the owners of these roads from tearing them up and selling them as junk? To refuse to support them and yet to refuse to permit their abandonment would seem less than just. This is the question which ought to be decided at once. It would appear only fair that the government make some equitable arrangement with the short lines in accordance with the spirit of the amended section 14, or else, if the roads are not necessary to the government, permit their abandonment and sale as junk.

C. A. Greenough, vice-president of the Baldwin Locomotive Works, in a paper on Economy in Maintenance and Operation of Locomotives read before the Western Railway Club, presents in a diplomatic manner arguments in favor of and against locomotive standardization. The parts of his paper which deal directly with the subject are published elsewhere in this issue. For standardization he says: "Interchangeability between railroads, the possibility of some rapidity of construction, interchangeability of parts, and a somewhat lower cost." His arguments against standardization deal with the inadequacy of the standard locomotives to meet some requirements. He suggests the possibility of "discarded power" being purchased to meet conditions requiring lighter locomotives than those contemplated in the standardization program. He classes as "negative economy" the use of the

Chamber of Commerce on Railroads

Hard on the Short Lines

Another Baldwin Man Speaks on Standardization

heavy government standard locomotives for roads which have been in the past and are now equipped to use heavier locomotives than those considered by the government. He speaks of the radical changes that will be necessary in the construction of the standard locomotives for roads burning anthracite coal. He also mentions the fact that the standard designs have necessarily been cramped to conform to the minimum clearances of all roads. He says standardization ignores the various physical and climatic conditions which exist in this country. He tells of how standardization on the Pennsylvania and the Harriman Lines has not been entirely successful "because growing needs for larger and more efficient power and the improvements in the permanent way have invited and made possible increases in the sizes and capacity of locomotives." The *Railway Age* joins with him in his final statement: "The problem now before the administration is to decide whether or not the criticisms in favor outweigh those against the proposed standardization, and we all await the decision with the keenest interest and we all hope the decision, whatever it may be, will prove for the best." We sincerely hope that as much consideration will be given arguments against standardization as for it. We sincerely hope that the whole problem of standardization will be considered from the broadest angle, and that the decision will be governed by the part the railways are to play in winning the war.

Stand to the Colors!

THE GERMANS, as if by pre-arrangement with the Liberty Loan Committee, are staging today history's most impressive demonstration of the price of liberty. While we at home are being importuned to invest to our individual limits in a third Liberty Loan, the super battle in Flanders is lighting the eastern sky with letters of flame. "Liberty needs every man and every dollar. Stand to your colors now, children of light, or forever lie prostrate in the muck of Prussian dominion."

It is impossible to exaggerate the crisis before us; it is impossible to overestimate the value in such a crisis of huge oversubscription to the Third Liberty Loan. For the purposes of the present battle it will provide an irresistible moral stimulus so vital in that last quarter of an hour in which battles are won. For future battles, possibly even for this one if it lasts as long as some military experts are predicting, it will furnish an abundance of the men and materials without which we must wage war with gestures.

We do not need to go about wringing our hands in apprehension of the doom that threatens in Flanders and Picardy, nor need we permit our anxiety to interfere with food or sleep. A stiff upper lip and a serene attention to the task in hand are the American's duty in the present hour. But at the same time he should face the facts like a man and not like an ostrich. And the facts are grave.

Germany is plunging for the channel ports as she did after Antwerp, only with vastly greater force and a more desperate determination. Could she gain control of these she could so seriously interfere with further British efforts in France as to render them negligible. She might then turn her military steam roller to the business of crushing the unspeakably heroic French army, and from her multiplied bases she might unleash such a cloud of U-boats as would starve the United Kingdom and sever America from Europe.

These are the immediate possibilities of German victory in the present offensive. Like the desperate military gambler he is, the Kaiser is playing for huge stakes. He is pyramiding his bets in men with every reverse. He is committed irrevocably to a triumph on the western front, and

he will not cease to dash his hordes against that barrier of brave men which stands between us and the hideous night of Prussian tyranny until his defeat is too conclusive to permit of further argument.

The United States has its own men in that first line of defense. General Foch, commander-in-chief of the forces of liberty and civilization, has brigaded them with the British and French. The forces of the Allies at the front have been pooled to meet the shock, and now we at home are asked not only to back up our boys in the hell of Picardy and Flanders but to pool our unimpaired resources with the vast accumulation of Allied material built up through more than three years of the kind of pressure which we are experiencing today. We cannot be blind to the urgency; we cannot resist the plea.

"Our hearts, our reason," said Kipling recently to the people of Folkestone, "every instinct in us that lifts us above the mere brute, show us that the war must go on. Otherwise earth becomes a hell without hope. The men, the ships, the munitions must go forward to the war, and behind them must come the money, without which nothing can move. Where our hearts are there must our treasure be also."

The Rising Flood of Railroad Expenses

BEFORE GOVERNMENT CONTROL was adopted the operating expenses of all the railways of the country were increasing at a portentous rate. It was anticipated that this increase would continue, whether private control was continued or government control was adopted.

This anticipation is being fully verified. In January 172 roads had a decrease of \$13,605,871 in operating revenue and an increase of \$54,368,138 in operating expenses, as compared with the same month of last year, resulting in a decrease of \$67,974,009 in net revenue. Both the decrease in earnings and the increase in expenses were largely due to weather conditions, but a large increase in expenses would have been shown if the weather had been normal. In February 117 roads, for which statistics are available, had an increase of \$14,127,521 in operating revenues. This indicates that these roads handled more business than in February, 1917. The weather in February, 1918, was better than it was in the same month of 1917. Nevertheless, in February of this year the operating expenses of these roads were \$31,430,210 more than in the same month of last year, the result being that their net revenue was \$17,302,689 less than last year. In the two months 117 roads had an increase in operating expenses of \$64,300,000.

It is a significant fact that in both months large increases in expenses were shown by the railways in each territory—eastern, southern and western—the result being that in eastern territory the railways failed by large amounts to earn their operating expenses, while in both the south and the west there were heavy reductions of net revenue.

Everybody agrees that the main thing for the railways to do now is to move as much business as possible, and it is gratifying to find that they actually did move more in February, 1918, than in February, 1917. But second only to the moving of the maximum possible business is the importance of keeping down operating expenses. With expenses mounting as they have been, and with large advances of wages impending, it is evident that the Railroad Administration is in danger of being confronted with a huge deficit. The Railroad Administration has ordered various changes which will tend to save money. The most important of these, from the standpoint of economy, is the abolition of the outside traffic agencies, which have been maintained for competitive purposes, and which have cost the railways about \$25,000,000 a year.

But in the face of the rising flood of expenses, such sav-

ings as can be made by eliminating advertising, closing outside agencies, and requiring the companies to pay corporate and financial expenses from their guaranteed compensation will be comparatively negligible.

The really large economies always have been effected in this country by increasing carloads and trainloads. The Railroad Administration can continue to do these things; and it also has the advantages, which the railway managements under private control did not have, of being able to operate terminals jointly and to send traffic over the most direct routes.

For the last twelve years the railway managements have been engaged in an incessant struggle to effect economies which would offset the enormous advances in wages. Within recent years, to continued advances in wages, there have been added great increases in the prices of fuel, equipment and materials. The railway managements long were largely successful in effecting the needed economies. Before government control was adopted, however, the increases in expenses had begun to come so fast as to be overwhelming. The railway managements repeatedly appealed to the government regulating authorities for assistance and relief, but they either did not get adequate assistance and relief, or they always failed to get them in time. Now that the government itself has assumed control of and responsibility for railroad operation, perhaps government officers will come to a fuller and juster appreciation of the ever-increasing difficulty of the problems with which railway officers have been wrestling.

Meantime, railway officers, as far as they are given opportunity, should apply themselves with their old-time energy and efficiency to fighting expenses. That a large advance in rates will be required to save the government from having a heavy deficit appears certain; but railway managers should and undoubtedly will strive to make the advance in rates required as small as possible. The well-being of the public, the reputations of railway officers themselves, and the future welfare of the railways demand that they shall do so. As to the Railroad Administration, it should recognize the fact that the railway managers cannot do their best without adequate incentive and full opportunity.

Expedite the Rail Program

IN NORMAL YEARS, at this time, most of the roads have a large part, if not all of their season's purchases, of new rail on hand and distributed and have gangs at work putting it into the track as fast as possible. This year almost nothing is being done in this direction at present, although there is a greater need for prompt action than ever before. As the ordering of new rail and the authorization of programs of renewals involving charges to capital of any magnitude are now concentrated in the hands of the director general, the railways are unable to proceed with much of this urgent work until permission is received from Washington.

The roads have emerged from one of the most severe winters in their history, as a result of which the wear and tear on tracks has been particularly heavy. Furthermore, for the last year the roads have been handling an enormous traffic and as wear on rail is largely proportionate to the tonnage passing over it the depreciation has been more rapid than normal. This condition follows several years of inadequate rail replacements. As indicated in our issue of April 5, page 912, the rails rolled for domestic consumption during 1914, 1915 and 1916 averaged over 825,000 tons, or 28 per cent less than the average for the period of 1902 to 1913 inclusive. Considering the fact that the latter part of the period ending with 1913 was one of reduced railway earnings and that the mileage of tracks is increasing each year, it is evident that there is now an accumulated deficiency of several million tons of rails. One close student of this subject has placed

this figure as high as 10,000,000 tons, or more than the normal tonnage rolled in three years.

The present inactivity is disquieting in view of this large accumulation of deferred maintenance. The steel mills still have on their books a considerable tonnage of rails contracted for 1918 delivery. However, many roads have no rails on order and the director general has issued instructions that all rails will be ordered though the central purchasing department so that these roads are now without authority to order the rails so sorely needed. Furthermore, the steel mills themselves are working very largely under priority instructions, which determine the products to which they shall give attention. As a result, in spite of the fact that this is the season at which they should normally be rolling rails to capacity in order that the roads might get them into the tracks, they are now turning them out only to about 25 per cent of their capacity.

It may be worth while in this connection to call attention to steps which Canada has been forced to take to meet a similar, although somewhat more aggravated, situation, which has resulted from failure to make the normal renewals during the last three years. Following the outbreak of the European war in 1914 the Canadian steel mills came under the direction of the Canadian government to the extent that the products which they should turn out were specified. As a result attention was concentrated almost entirely on war materials to the exclusion of rails and other railway supplies. Last year the roads secured an emergency order for the rolling of a small tonnage of rails to tide them over. However, conditions have continued to become so acute that many tracks have been taken up to supply materials for service in others. Within the last few weeks the Canadian Minister of Railways has bought 37,375 tons of steel rails of 67.5 lb. section which were rolled in the United States for the Russian government, but which have been held at the eastern seaboard undelivered for some time. Although these rails are of a different section from any now used in Canada, they are being taken to relay branch lines from which heavier rails may in turn be released for main line use. Likewise the Canadian Minister of Railways has ordered 100,000 tons of 85-lb. steel rails from the Dominion Iron & Steel Company, which will be divided between the four principal roads of Canada, and has instructed this mill to work on them continuously until the order is completed.

While the railways of the United States have not yet been reduced to such sore straits a continuation of the present inactivity will hasten this condition very speedily. If the delay in ordering rails, in rolling those which are now ordered, and in granting authority for the laying of those which are now available is long continued it will be extremely difficult if not impossible to get the requisite tonnage into the tracks this year.

Furthermore, with the prevailing shortage of labor which will become more acute as the season advances, it will be impossible for the roads to build up and retain adequate forces if they come into the market after other employers have secured the best, if not all of the men. Even where it may be possible to recruit the necessary forces later, the decreased efficiency of the men then available and the more adverse working conditions during the hot summer months will add materially to the cost of the work.

Maintenance of way work of all classes is being allowed to lag this year, when of all years it should be pushed to the maximum. While the time already lost cannot now be recovered it is imperative that every possible step be taken to expedite the work from now on in order that the roadway and tracks may be placed in as good condition as possible to handle the abnormally heavy traffic which it now has and probably will continue to be called upon to carry. A large part of the more important maintenance of work is seasonal in character and a day lost now is more important than a week in the fall or winter.

Chamber of Commerce of U. S. Sounds Warning

Points to Danger of Further Delay to Manufacture of Railroad Equipment Through Standardization

RESOLUTIONS PASSED by the Chamber of Commerce of the United States at its annual meeting at Chicago last week indicate that business men recognize the railroad problem as a vital one in our national life and that they are taking a keener and more intelligent interest in transportation than ever before. They see the necessity of providing against a repetition of the railway crisis of the past winter and urge that standardization is secondary in importance to the prompt placing of orders for locomotives and cars. They also recommend the unified operation of railway terminals and the calling of a conference at some future date at which representatives of all interests affected by transportation can voice their views on the proper organization and control of the railways following the termination of government operation. All of the resolutions passed which bear on the transportation question follow:

Transportation Necessities

Resolved, That the Chamber of Commerce of the United States urge upon the Director-General of Railways the favorable consideration of the following suggestions relating to present pressing transportation problems:

(1) The efficiency of the railroads depends in large measure upon the unified control and operation of terminal facilities. To accomplish this effectively it is recommended that the operation and use of the railroad terminal facilities in each large city be placed under the supervision and control of a single competent individual.

(2) Railroad equipment, including motive power and car supply, is inadequate for present traffic and threatens to become so insufficient during the coming autumn and winter as seriously to restrict the industries and trade of the country. The public interests urgently require the promptest possible placing of orders for locomotives and cars in sufficient numbers to provide the transportation that the country must have in order to prosecute the war vigorously.

(3) While the standardization of railroad equipment is important and merits careful consideration, it should be recognized that standardization is secondary in importance to securing as quickly as possible the locomotives and cars required to handle the increasing traffic that must be transported in order to keep the industries of the country in full operation and to maintain the steady flow of materials to the seaboard for shipment to Europe.

Railroad Conference

Whereas, The Chamber of Commerce of the United States recognizes the vital importance of developing a definite public opinion as to the best methods of conducting the transportation service of the Nation, after the conclusion of the present government control;

Resolved, That the Board of Directors of the Chamber of Commerce of the United States be requested to call a conference which shall be truly representative of all the interests of the Nation—financial, industrial, commercial, agricultural, civic and social—affected by transportation, such conference to be called for such time and place as in the judgment of the Board seems advisable.

The purpose of this conference shall be to consider the broad aspects of the transportation problem and the formulation of a basis for the control and operation of the transportation facilities of the United States after the conclusion of the present government control.

Supreme Devotion An Inspiration Buy Bonds! Sacrifice Till It Hurts!

Washington, D. C., November 21, 1864.

Mrs. Bixley,
Boston, Mass.
Dear Madam:

I have been shown in the files of the War Department a statement of the Adjutant General of Massachusetts that you are the mother of five sons who have died gloriously on the field of battle. I feel how weak and fruitless must be any words of mine which should attempt to beguile you from the grief of a loss so overwhelming. But I can not refrain from tendering to you the consolation that may be found in the thanks of the Republic they died to save. I pray that our Heavenly Father may assuage the anguish of your bereavement, and leave you only the cherished memory of the loved and lost, and the solemn pride that must be yours to have laid so costly a sacrifice upon the altar of freedom.

Yours very sincerely and respectfully,
Abraham Lincoln.

Waterways and Highways

Whereas, It is apparent that the present traffic burden is beyond the capacity of the railroads, and that the vigorous and successful prosecution of the war is hampered thereby; that it is therefore imperative that our great rivers, canals and inter-coastal water routes, as well as our main highways, should be forthwith used to move freight;

Be it therefore resolved by the Chamber of Commerce of the United States that the government, through the President and the Director-General of Railroads, be petitioned

(1) To organize and operate existing equipment and construct new equipment for use upon the inland and coastwise waterways in accordance with the authority recently conferred by Congress in the Transportation bill.

(2) To complete trunk highways for heavy traffic where they can be useful in relieving railroad congestion.

(3) To adopt a permanent policy, assuring co-ordination of railroads, water routes and highways for traffic service.

The meeting of the transportation section of the Chamber of Commerce of the United

States took place in the Elizabethan room of the Congress hotel, Chicago, on April 11, with an attendance of about 250. Harry A. Wheeler, chairman of the Committee on Railroads of the Chamber, presided at the session devoted to railway transportation, and F. A. Seiberling, president of the Goodyear Tire & Rubber Company, was chairman of the subsequent session on highway transportation. Four papers were read at the railway session, one of which, on "Motive Power" by Alba B. Johnson, president of the Baldwin Locomotive Works, was published in the *Railway Age* of April 12, page 965. The other addresses were on "Terminals" by John F. Wallace, chairman of the Chicago Railway Terminal Commission; "Car Supply" by Samuel O. Dunn, editor of the *Railway Age*, and "Extensions" by Francis H. Sisson, vice-president of the Guaranty Trust Company, New York, and formerly assistant to the chairman of the Railway Presidents' Advisory Committee at Washington, D. C.

Francis H. Sisson's paper on Extensions is given below:

Laying the Rails for Future Business

By Francis H. Sisson,

Vice-President, Guaranty Trust Company of New York.

For a period of 30 years, with an increasing intensity of action, this country has pursued the policy of constriction and starvation towards its arteries of commerce, through which the life blood of the body economic must flow. Sclerosis and paralysis inevitably followed.

The present government control of the railroads, while representing a progressive step, cannot be considered as offering a solution; it is a temporary and extreme measure, forced by the exigencies of a great crisis for which there had been no preparation.

The incalculable importance of the railroads in every phase of our individual and national existence was dramatically, I might even say tragically, demonstrated last winter, when the grim spectres of cold, hunger and want stalked in the wake of transportation paralysis. Never before in our history have we so thoroughly appreciated the importance of distribution as an economic factor. It is to be hoped that we shall never forget this costly experience.

The demands of war, sudden and colossal as they are, have not been responsible for this deplorable state of affairs; they merely accelerated and accentuated the inevitable result which would have come sooner or later under existing conditions. We are simply reaping the harvest of a decade of railroad bailing born of ignorance, prejudice and political expediency, which, as a people, we did not understand, and the consequences of which we did not anticipate.

Punishment visited on the many for the sins of the few, the reduction and limitation of rates, the multiplication of regulations and regulating bodies, the increase of taxes and impositions, the rising costs of labor and material, have for the last 10 years added new bonds to bind this modern Gulliver of ours, until he lay helpless, the victim of those he should live to serve. The strong hand of the government, in taking over the railroad situation, has released many of these shackles, and by co-ordinating direction and operation is restoring that ability to serve which had been denied the achievement of its purpose.

But the foundations for the unprecedented economic struggle which inevitably will follow the present armed conflict must be laid now. We were woefully unprepared for war; we dare not be equally unready for peace. And one of the chief factors in preparing for the future unquestionably is that of railway extension; for the carriers will play as important a part in helping to win the battles of the prospective international combat in trade fields as they are today in speeding our military strength to the battleline of freedom for the victory which democracy must and will win.

Are these great weapons in our commercial warfare to be privately or publicly owned and operated? Why have they not been equal to the occasion and how can they be made so? Can preparations for the future be made in the light of the past?

It is certain, if we are to have private ownership of transportation, the cornerstone of the foundation of our future facilities must be the restoration of railway credit. The companies must be enabled to raise the means to develop those much needed facilities adequately. The folly of the government's attitude toward the railroads in the past has been strikingly exemplified in the policy of restricting the earnings of the roads without any guarantee of return to them. Naturally the result was to undermine railway credit and to rob the companies of the only source at their disposal for increasing their services to the public.

The increase in the population of the country in the ten years from 1908 to 1916 was a little less than 20 per cent. A commensurate increase in commercial and industrial ac-

tivity to meet this growth and the new conditions we face will require a proportionate increase of ton mileage per capita which can only be made possible by an increase in railroad trackage. Such extension can be made possible only with private capital, which will not be attracted to the railroad field until that field is put on a par with others.

The demands of war must be met at whatever price they exact, and there is no doubt that the government will proceed as far and as rapidly as possible to meet them. It is imperative to do so. But one cannot help thinking of the incalculable advantage which the government would have at present in speeding up our martial activities if the roads had been allowed sufficient return on the capital invested in them to have made the proper extensions and to have provided the necessary equipment. Money, materials and men which now could be devoted to the production of munitions will have to be allocated to the improvement of our transportation facilities. And every productive resource, every minute, is precious.

But this unfortunate state of affairs should have a beneficial effect. It ought to impress upon us the need for wider provisions, particularly with reference to intensive development in order to cope with the problems which will be created as soon as peace is declared.

Unless the government's future policy toward the railroads is such as to insure fair regulations and just returns, which will be absolutely essential if new capital in sufficient quantity is to be attracted to the extension of our transportation facilities, the development of our great resources in the West, Northwest and Southwest will be arrested. And the retarding of such development now, of all times, would be a national economic disaster.

During the remainder of the war, the government and industry will not be able to spare the productive energy to make these extensions. At best there will be an increase in the amount of equipment, and a co-ordination of railway lines and of terminal facilities will undoubtedly increase the ability of the railway system to carry a larger amount of traffic.

Under-maintenance of the existing roads is likely to be the characteristic feature of the operation of the railroads during the war, and it will mean that on the return of peace American railways will have to put a great deal of money into improvements and betterments and into extensions of the lines in order to catch up to the demands of the business of the country. It is roughly estimated that for every dollar of increased gross return, \$5 should be spent in extensions and improvements.

Construction work of any character at the present time would draw money, materials and labor from the more pressing and immediate needs of war. But we can and should plan for them at the earliest possible moment, and in the meantime we should make adequate provision for the maintenance of the roads, for unless the roads are properly maintained, new extensions would be almost futile.

The government should definitely protect holders of American railway stock by providing that the money equivalent of maintenance expenditures, plus a deferred maintenance reserve (which ought to be established) for each year of government operation, should bear a relationship to the average monetary expenditures of the railways for maintenance for 1915, 1916 and 1917, as indicated by the increased cost of maintenance materials in each year of government operation, as compared with the average cost for those three years.

One vital fact is apparent today above all others; the scepter in the railroad world has passed out of the hands of the railroads' executives and the bankers who financed them. The American people control the situation through their political representatives, and they will determine the whole course of the future. The burden of right decision

ties with them, and they will suffer, or prosper, in accordance with the wisdom shown.

No class of people will exercise so powerful an influence in reaching this decision as the shippers; they must learn, if they have not learned already, that the thing of most vital importance to them is getting their goods to market. The prices at which this service is rendered are incidental to having such service prompt and adequate. The long struggle of the shippers to hold down rates in defiance of the economic trend of the times, and the obvious necessities of the railroad situation, has worked the undoing of the shippers, as well as of the railroads, and they are suffering under the situation they themselves have largely caused. To serve their own ends in the future, they must take a constructive attitude toward the transportation question, and lend a hand in the successful solution of the problem.

It is obvious that we should adopt a definite, comprehensive and adequate policy for developing our railroad extensions, a policy based upon definite, determining factors. Our railroads must keep pace with our industrial expansion; it is imperative that this relationship be strictly maintained. Our transportation facilities must not be outstripped by the growth of our population; they must, in fact, respond fully to the increasing needs of our people. In other words, if we would avoid a repetition of the economic strain through which we have just passed as a consequence of the transportation situation, our railway extension policy must be directly predicated upon the increases in our population and our business.

Various suggestions of a central federal corporation, regional holding companies, government guarantees and plans calling for profit sharing with the government above a fixed return have been frequently made. Somewhere along this line of thought lies a rational solution. It is very certain that the old days of enforced competition, anti-trust laws, anti-pooling laws, conflicting state regulation, wasteful competition, duplication of service, would not be permitted by a public alive to its own interests.

It seems equally certain that government ownership would not be permitted if the public were equally alive to its real interests. The hour has arrived for the suggestion of some plan which will be ready for adoption when the crisis of war has passed, and the pressing needs of business demand the return of normal business conditions, and the operation of economic, rather than martial law. Somewhere, within the meaning of the words "co-operation" and "partnership" lies the answer. The public interest in transportation is paramount and must be protected, but public interest and

private interest need not be in conflict if intelligently regarded.

Regional companies representing both private and public capital under private operation with governmental participation in the management and earnings above a just guarantee would seem to assure the necessary extension of railroad facilities. In unity of interest and understanding progress towards the desired goal should be possible.

Problem of Car Supply Serious

Mr. Dunn spoke on the subject of Car Supply as follows:

Business men naturally are profoundly concerned at this time regarding the question of how nearly adequate to the demands the supply of railroad transportation will be the rest of this year, and, in fact, during the rest of the war. The subject assigned to me, as it appears on the program, is "Car Supply." I assume it was intended that I should discuss this subject in its broader rather than in its narrower aspects.

During the last 11 years we have become accustomed to the use of the terms "car surplus" and "car shortage." The transportation conditions denoted by these terms have not, however, been solely conditions of car supply. They have been conditions of transportation supply in the broadest sense. Paradoxical as it may seem to the uninitiated, you might actually have an excessive supply of cars upon the railways, and at the same time have reports and complaints of car "shortage" throughout the country. You may theoretically have sufficient cars for all transportation purposes, and yet have so many accumulated at seaboard ports or in terminal yards, or in the hands of shippers, for loading and unloading, that the total requirements made by shippers will exceed the number of cars the railways can furnish to them. These conditions may be due to inadequate facilities for loading and unloading cars, or to inadequate locomotive power, or to inadequate track or terminals. Such conditions actually have existed repeatedly.

In other words, car supply is not transportation supply. It is, however, an indication of the condition of transportation supply, and, in fact, is the best indication of it that we have. Now, it is hardly necessary to tell this body that as indicated by the freight car supply, there has been in this country for two years a serious deficiency of railroad facilities. On March 1, 1916, for the first time in 21 years the American Railway Association reported a net shortage of cars. This was due mainly to weather conditions and to an acute congestion at the eastern seaports. It soon disappeared and did not return for five months. On September 1, 1916,

Railway Men will Do Their Share

By William Sproule

President, Southern Pacific

The Third Liberty Loan is the third line of reinforcements in money for the support of the fighting fronts. The rank and file of railroad men know that it costs daily an immense sum for the upkeep of a railway system, and a railway system is not unlike an army system. A railway system combines large organization and healthy discipline with commercial flexibility; hence to railroad men the appeal is specially strong that money is the sinews of war. It is further enforced by the constant lessons they receive and practice in operating economies to avoid the waste of money. It finds them ready to perceive that it takes money to organize and maintain armies. As trained men in a system of highly developed organization intended for the pursuits of peace they are quick to realize the importance of adapting the organization now to pursuits of war also, and they are quick to see that military organization for purposes of war is akin to railroad organization, but on a complex, vast and strenuous scale.

By natural process, therefore, the mind of the railroad man gives easy access to the idea that underlies the Liberty Bond; namely, that we are fighting for our personal and industrial freedom and that it takes money in continuous flow to win the fight. The railroad man travels freely by virtue of his calling and knows the great extent and resources of this nation better than the average man, and he is a dullard who does not soon acquire for his country that admiration which is the essence of love.

The men of the rail have volunteered for the railway regiments and have met their country's call in a way that shows they will do their share in the Third Liberty Loan and will do it heartily.

however, a net shortage was reported again; and net shortages varying from 34,000 to 149,000 cars have been reported in every month since. This unbroken continuance of car shortage for over 20 months is without precedent in the history of American railroads.

The reasons for it become apparent when the records of increase in traffic, on the one side, and of development of facilities, on the other side, are compared. Never were there known such augmentations in the volume of business offered to the railways as have occurred since the fall of 1915. The freight traffic actually moved in the calendar year 1916 exceeded that handled in 1915 by 25 per cent, and exceeded that handled in the previous record year, 1913, by 20 per cent. Never before had there been an increase in one year exceeding 16.5 per cent. In 1917 there was a further increase over 1916 of about 10 per cent. The increase of 1917 over 1915 was 40 per cent and over 1913, 23 per cent.

What changes were occurring, meantime, in the car supply? As you know, there was a heavy decline in railway traffic and earnings in 1914, and a further decline in 1915. Owing to the fact that this was accompanied by advances in wages and other expenses, the net return earned by the companies on their cost of road and equipment was reduced in 1914 and 1915 to the lowest basis that had been reached since 1899. This reduction in net return caused the railways to buy such a small amount of equipment that in 1915 there were 7,343 less cars in service than in 1914, while in 1916 there were 22,292 less than in 1915. The average capacity per car advanced meantime, and in each year there was an increase in the total tonnage capacity of all cars. But the increase in the total tonnage capacity in 1916 over 1914 was less than 2 per cent, while the increase in 1916 over 1915 was less than 1 per cent. It was not a coincidence, but a correlative development that in 1915 the number of locomotives in service was 815 less than in 1914. In 1916 the number was 946 less than in 1915. There was a small increase in the aggregate tractive power of locomotives.

Considering the tremendous increase in traffic in 1916, and the actual two years' decrease in the number of cars and locomotives in service, it was not surprising that there developed in 1916 an acute congestion of traffic and shortage of cars. In the latter part of the year 1916 and the early part of 1917 there was considerable activity in the construction of equipment, and consequently the statistics show that on the average the number of cars and locomotives in service in 1917 was greater than in 1916; but, compared with the increases in volume of traffic, the increment in cars and locomotives was almost negligible. In 1917 there were only 3 per cent more freight cars and 1 per cent more locomotives in service than in 1916. After this country entered the war, for reasons which all know, it became impossible for the railways to get many new cars and locomotives. It is almost strictly accurate to say that the roads handled the enormous traffic of 1917 without any more cars and locomotives than they had three years before. Furthermore, many of the cars and locomotives used were such as under normal conditions would have been sent to the scrap heap.

We come now to the conditions of 1918. At this point we open a new chapter in the history of American railways, for here their operation was placed under government control. There are not as yet available any statistics showing the amount of traffic which has been handled thus far this year. We do know, however, that owing to weather and other conditions, the business handled in January was less than in January, 1917. We also know that on March 1, the net shortage reported was over 138,000 cars. This is one of the largest net shortages ever reported. Furthermore, it existed in spite of the fact that numerous embargoes are being enforced which cause shippers to refrain from ordering cars which they otherwise would requisition. In other words, if it were not that many shippers know that it would do

them no good to ask for cars, it is probable that the number of cars asked for would be much larger than it is, and that therefore the net shortage reported would be much greater.

Are we going to get any relief from this situation, and if so, how and when? Theoretically, relief might be obtained by operating the present facilities more efficiently, or by providing additional facilities, or by both means.

It would seem that it ought to be possible under government control and unified operation to utilize the existing facilities more efficiently. If more efficient utilization is secured, it must and will be expressed in terms of more traffic handled with each locomotive and each car. You may secure this greater service from each locomotive and car either by moving traffic over routes which are shorter between the points of origin and of destination than those heretofore used, or by loading each car and each locomotive heavier without reducing the average speed with which they are moved, or by both means. Many people believe that a large increase in efficiency will be secured by moving traffic over the shortest practicable routes. But in periods of heavy traffic the shortest routes between important terminals can handle only a comparatively small part of the total business; and the bulk of the business must be allowed to overflow into longer and longer routes until all routes may be filled up. While a gain may be made by re-routing traffic it would be easy to exaggerate the increase in efficiency which will or can be obtained by this means.

It probably is still true, as it has been in the past, that the most sure and feasible means of increasing the efficiency with which facilities are utilized is to load and unload cars as promptly as practicable, and to load both cars and locomotives as nearly as practicable to their maximum capacity. Doubtless more can be done along this line, but those who have closely followed the tremendous efforts which have been made year by year, and especially during the last two years, to increase the amount of traffic handled with each car and locomotive are likely to conclude that it is going to be a very difficult matter to so operate existing facilities as to cause them to handle any considerable larger amount of traffic in the near future. The facts appear to be that, as a result of developments during the last dozen years, and especially within recent years, with which you are all familiar, the growth of the country's transportation capacity has been much less than the growth of its productive capacity, and that there is no real remedy for the conditions resulting except an increase of transportation facilities.

What are the prospects of an early increase of facilities? Let us survey especially the situation with respect to freight cars. Cars, like most other things, wear out, and the statistics bearing on this matter indicate that in order merely to prevent an actual reduction in the number of really useful cars in service it is necessary to build at least 125,000 cars a year. The number built in 1917 was 119,000. Consequently, there are just about as many cars in service now as there were last year. Under normal conditions our car building plants could, perhaps, turn out upward of 250,000 cars in a year, but practically their capacity is limited at present by their ability to get materials and labor, especially materials. As I have already remarked, we have a large car shortage at present. The crucial period in every year's railroad operation comes in the fall and winter. Will there be before that critical period comes this year any considerable increase in the number of cars available? Since January 1 only 5,000 cars have been ordered, and they have been ordered to be built in the shops of one of the railways which has not yet financed the undertaking. The car builders have been working thus far this year on orders, both foreign and domestic, received last year. Practically all orders will soon be filled. The total cars built under them for domestic use this year may amount to 25,000.

The Railroad Administration, as you know, is preparing

to place an order for 100,000 cars. The material situation is such that if this entire order were placed today it would be practically impossible for the builders to begin to turn out the new cars before August 1. It would take them three months to procure their materials and get to work. They would then have six months of the year left. It has been estimated to me by a very high authority that it is highly improbable that all the car builders can build more than 8,000 or 10,000 cars a month. It would appear then that if they should be given the order for 100,000 cars now they could hardly build more than 50,000 or 60,000 of them before January 1. This would make the total year's output of cars for domestic use 75,000 to 85,000, as compared with the minimum of 125,000 which it is necessary to build merely to maintain the existing supply of equipment. It would appear, therefore, that there is likely to be during this year, as there was in 1915 and 1916, an actual reduction of the number of cars in service. Furthermore, not more than 30,000 to 40,000 of the new cars the Railroad Administration is planning to order can possibly be built in time to be available for service when the crisis in the transportation situation comes in the late fall and early winter. Similar general conditions prevail in the locomotive field.

Very soon after government control was adopted it was forcibly and repeatedly pointed out by persons familiar with conditions and with the normal course of events, in the transportation and the railway material fields, that it was extremely desirable for orders for locomotives and cars to be placed as early as practicable. The reasons for this were pointed out. What actually has been done? The Railroad Administration has prevented individual railroads from ordering cars and locomotives, and has spent several weeks in considering the question of standardization of equipment.

Having formulated its standard specifications, it is now spending additional weeks in negotiating with the railway equipment and supply manufacturers regarding the relinquishment of patents, the foregoing of royalties, and kindred matters which it seems neither right nor necessary to raise at this time. These delays in ordering cars are going to have a serious effect upon the number of cars built this year unless the orders for locomotives are placed soon. A similar effect will be produced in the locomotive field. If at the start the Railroad Administration had authorized the individual railroads to purchase their normal requirements of locomotives and cars in the usual way, giving them the backing of the government's credit, the prospect of an increase instead of a decline in the amount of available equipment during the year would be much brighter. The builder, before he can begin to build, must assemble his material and get his labor, and before he can do these things he must

know how many cars or locomotives he is expected to build. These things take time, and never did they take so much time as at present. Whether the Railroad Administration will in the long run save any money to the public by taking precious time to consider such questions as locomotive standardization and the relinquishment by manufacturers and inventors of their patent and royalty rights, is extremely doubtful; but that by doing so it is going to cause a slowing down rather than a speeding up of the transportation machine, when speeding up will be most necessary,

While I have dwelt chiefly on the car situation, because that is the subject specifically assigned to me, the locomotive situation is fully as serious.

A large part of the delays and congestions last winter was due to shortage of serviceable locomotives. Everything that ought to be done, but which is not done, to speed up the production of locomotives adapted primarily to the conditions under which they are to be operated will tend to cause a recurrence of the conditions which existed on our railways last winter.

We are in the midst of a revolution in the transportation business. Government control was adopted to save the railways from financial disaster and to speed up their operation and development so that they should be able to handle all traffic essential to carrying on the war and in addition as much other traffic as practicable. Perhaps it is unfair to say so, but to some observers it appears that in certain high places more effort is being made to effect a drastic and permanent change in the organization and methods of the railways than to so equip and operate them as to make them as rapidly as possible the most efficient transportation instrumentality possible for helping win the war.

What I have said about present and prospective conditions with respect to car supply is not adapted to cause

optimism regarding the transportation situation which is going to exist the rest of this year and in the early part of next year. It has not been intended to inspire optimism, but to present the facts. The two outstanding points with regard to the transportation situation seem to be that, first, the available freight traffic of the country is vastly larger than the railways can handle with present facilities and that, second, we cannot reasonably hope that under present conditions and with present methods the facilities will be materially increased for months to come.

In these circumstances it is necessary to do two things, first, for the railways and the shipping public to co-operate as closely and vigorously as they can to secure the best possible utilization of existing locomotives, cars and other facilities, and second, for the Railroad Administration, by vigorous use of embargoes and other methods, to give preference to traffic essential to carrying on the war and to providing

"Fight for Liberty"

By A. M. Schoyer

Vice President of the Pennsylvania Lines West of Pittsburgh, and Member of Liberty Loan Committee of Western Regional District

The Third Liberty Loan gives us another opportunity to show our President and our leaders that the railroad men—officers and employees alike—are behind the Government in this great "Fight for Liberty" to the limit of their resources and ability.

This Loan appeals to us even more than the others, because now we have our brothers and our friends at the front in engineer corps and fighting lines alike—because we cannot go ourselves, but must stay behind to keep the wheels moving in our efforts to move the food and munitions they need—and, because, being now ourselves cogs in the machinery of the United States, we are helping to make our own Government successful in its supreme effort.

From a selfish standpoint, the Third Liberty Loan offers us an opportunity for a solid investment with an adequate interest; and the Government's arrangements for subscription from railroad employees are so liberal that having saved the money through our economies we can pay it through the payrolls.

If we could make the railroad men's contribution to this Loan 100 per cent in point of number, and could see that every member of our families was represented in the list of contributors, we would be doing what must help encourage the Government and forward the great end of "Victory."

the public with commodities required for its subsistence and comfort. This will involve continuance of the denial of transportation to a large part of the non-essential businesses. The nation, by a narrow, unwise and unfair policy of railway regulation, prevented needed increases of railway facilities when they could have been made. It refused to listen to loud and repeated warnings as to the inevitable consequences. It must now in this terrible crisis pay the penalty for the injustices it has committed and the short-sightedness with which it has acted.

Now that the nation is paying the price of the policy of regulation it has followed, many persons who have a large and grave responsibility for having influenced the public to follow this policy are complaining that the railways have "broken down," and are attempting to put the entire blame for the alleged breakdown upon their owners and managers. Some of these architects of ruin are alleging that railway officers are "lying down" to discredit government control, an allegation equivalent under present conditions to a charge of treason, and advocating government ownership as the only solution of our railroad problem. The old order which they established having proved a melancholy and disastrous failure, they are becoming the prophets of a new, and as they contend, a holier dispensation.

It is rather difficult to believe that the American people will follow them farther. So long as the development of our railways under private ownership received encouragement instead of discouragement the expansion of railway facilities went on faster in this country than in any other in the world. In 1913 the freight cars of our railways had six times as much carrying capacity in proportion to our population as those of the railways of Germany, and they actually handled five times as much freight traffic in proportion to our population as did those of Germany—and the railways of Germany have relatively the greatest freight carrying capacity of any government-owned railways in the world. During the war we can do little to repair the harm our restrictive and repressive policy of regulation had done before the war. We can, however, inform ourselves of and disseminate the facts which demonstrate that private management is more conducive than government management to efficient operation and adequate development of railway facilities. We can insist that government control shall be used solely as a war measure, and not so as to make a return of the railways to private management almost impossible; we can apply ourselves to formulating a policy of private ownership and public regulation which, if adopted after the war, will cause the needed revival of the expansion of railway facilities; and we can devote some of our time to educating public opinion so that after the war there will be a chance to get a sane and constructive policy adopted.

Surely our transportation experience in the year before we entered the war, and in the year since we entered it, has taught us a lesson which we shall not forget after the war. This great body, representing all the large and important business interests of America, is ideally situated and ideally fitted to so educate and lead public opinion that the transportation conditions which now so greatly trouble us will be remedied, and their recurrence will be forever prevented.

Wallace on Terminals

Because of the unavoidable absence from the meeting of John F. Wallace, chairman of the Chicago Railway Terminal Commission, Edward L. Noonan, chief engineer of the Terminal Commission, read Mr. Wallace's paper on Terminals. An abstract of the address follows:

The terminal problem is really the big problem of our railroad transportation system and its solution will automatically solve most of our transportation complexities. While the total mileage of terminal tracks may not be too much—and in certain localities may even be insufficient—the rem-

edy lies not entirely in additional tracks but in a co-relation and readjustment of existing facilities and the operation within the terminal zone along lines that will secure the maximum of efficiency.

The investment in terminals more than equals the total investment in all of the railroad property outside the terminals. The investment in a recently constructed passenger terminal represented an amount sufficient to build a double track railroad—exclusive of secondary terminals—of a length equal to the length of all of the railroads entering that terminal.

Viewed from the standpoint of delays, the railway terminal becomes even a larger factor in the transportation problem. The average freight car travels about 25 miles a day. The average speed of a freight train between terminals is 10 or 15 miles an hour. It is therefore evident that the average freight car spends 12 hours in the terminal for every hour it spends between terminals.

Heretofore discussions as to the solution of the terminal problems of our country have been more or less academic. All of these discussions clearly pointed to the necessity of co-operative operation of railroad terminals and, in fact, of the railroad transportation system as a whole, but the railroads were without the legal authority to inaugurate this change. With the taking over of the railroads by the government it will now seem that if a proper treatment of the railroad terminal problem were worked out now the means were at hand to place this solution into practical operation. Important that the general public comprehend the fundamentals of the present transportation situation and the general nature of the changes in operation and control necessary to bring about a more efficiently operated transportation system. These changes will necessarily be of two kinds: First, physical changes in terminal facilities, and, second, changes in method of operation.

Following a discussion of the passenger terminal problem, Mr. Wallace took up the question of freight terminals.

In all modern city planning consideration has been given to the proper treatment of railroad properties. But more attention has been paid to the passenger than to the freight terminal. This has been due to the fact that the passenger station has always been more or less monumental and lends itself readily to harmonious architectural treatment in connection with other civic and governmental structures, while freight facilities have usually been accommodated in one-story, simple structures, intermixed with surface tracks.

Another reason has been—if this phrase can be permitted—that the passenger station has been in the front yard and the freight station in the back yard. Yet, as a matter of fact, in many localities existing superficial freight development has been the great barrier to the healthy and logical growth of municipalities.

The freight traffic of a railroad terminal is divided into c. l. freight and l. c. l. freight. Carload freight is divided into that which originates in or is destined to points in the terminal zone and that which is transferred from one railroad to another for hauling to points more or less distant from the terminal zone.

This interchange freight should receive first consideration. It frequently happens that a car of commodities consigned from a point in the West to a point in the East is handled successively by several railroads and at every place where it passes from one railroad to another it goes through a terminal, often passing through the hands of an intermediate company, occupying space in several yards, congesting interchange tracks and encountering days of delay.

The remedy for this condition is more direct routing—and a routing that will pass the car around rather than through the larger railroad terminals. Under present practice a car may be handled miles out of its direct course to destination in order to give a greater mileage to a preferential railroad. Frequently the shipper is equally guilty with the railroad for

this condition. The interest of economy demands that the car should pass in as direct a line as possible and with a minimum of delay from the point of origin to destination, over the most economic route.

The car originating in or destined to a point within the terminal zone is another problem, the solution for which is unified operation of railroad terminals. At present each railroad has its own system of tracks and terminals within the terminal zone and seeks to operate traffic to its individual advantage without regard to the ultimate economy of complete terminal operation.

To inaugurate unified operation it should be possible—even during the temporary period of government control—to provide that each railroad terminal zone should be operated as a unit by one local manager. This local manager should take over all of the railroad facilities within the terminal zone and handle all the traffic therein.

Railroads entering the terminal zone should turn over their traffic to the local manager at points designated by him, and he should proceed to handle this traffic to its destination within the terminal zone along the most direct and economic routes and with a minimum of switching and delays. Originating traffic should be handled in the same way.

If such a plan were put in operation—using only existing facilities—the beneficial results would be immediately apparent and future investment in terminal improvements should be along lines that would promote and not hinder this unified operation of terminals.

Competitive operation has been the principal factor in shaping the development of the present system of handling l. c. l. freight. Fundamentally, the application of the co-operative principle is the only solution of the present unsatisfactory condition, yet the application of this principle is most difficult because it involves a complete change in the present method of handling this class of business and requires the construction of facilities along radically different lines than now obtaining.

In the handling of l. c. l. freight three interests are involved: the shipper, the railroad and the municipality.

The shipper is interested in expedition of shipments, convenience of trucking and cost of service; the railroad is interested in the investment required to furnish the necessary facilities and economy of operation; the municipality is interested because facilities for handling l. c. l. freight are usually located contiguous to congested business centers and if not properly developed may restrict the logical growth of the city and cause congestion of street traffic.

Any solution that is put forward for handling this class of traffic must provide a well balanced scheme in which due consideration has been given to all of these interests.

This solution will require such an arrangement of facilities as will permit of a free flow of street traffic, economical railroad operation, expeditious handling of freight, and utilization of expensive real estate to the fullest possible degree.

With the possible exception of the freight facilities being constructed in Chicago at the present time by groups of railroads entering the Union station, there has been no advance in the past 40 years in the handling of the l. c. l. freight.

The railroads referred to occupy a restricted area and were prevented from expanding this area. As a consequence, they were compelled to resort to the utilization of more than one level, thereby marking the first real advance in this country in the method of handling l. c. l. freight.

The conditions which brought about these changes exist in other sections of this same city and in many of the larger terminals of the country, and it is believed that the operation of these freight facilities will be helpful in causing railroads to adopt similar treatment in other localities.

But this development in this particular territory would not be possible except through the co-operation of the railroads owning property in the district. It happened that these railroads did not serve competitive territory, so that while construction was along co-operative lines there was no necessity to take up the consideration of co-operative operation as applied to handling of freight to joint competitive territory.

These conditions will not exist in other localities so that ultimately the full principle of co-operative operation will have to be put into effect before a complete solution of the whole terminal problem can be brought about.

It is a safe general deduction that where a town situated some distance from a main distributing center is reached by two railroads, each of which reach the same distributing center, that one of these roads is the more economic—distance and grades considered. In other words, it will cost more to transport a car of commodities over one of these railroads than over the other to this particular town and in the interests of economy and efficiency the commodities to this town should be handled over the most economic route.

The full application of this principle cannot be made until there is unified operation

of transportation systems, either through government ownership, through the unified control of all of the railroad properties under one operating management or in groups serving natural traffic divisions, or until some form of pooling of earnings and expenses is legalized.

As an example: Under average conditions about 40 cars of l. c. l. freight are shipped each day from Chicago to Kansas City and these 40 cars are shipped over seven different railroads. All of these seven railroads are not of the same length between Kansas City and Chicago, nor have all of them equally low grades, nor are they all on a parity in regard to the other facilities which may make for economy of operation. It is therefore evident that the cars between these two towns that are not handled over the most economic route are handled at a loss and that this loss must be absorbed by all of the roads since, as a rule, advances in freight rates are predicated on the showing of groups and not of individual roads. This is but a single example. When it is remembered that, on an average, over 2,000 cars are shipped from Chicago daily and of these over 1,200 are shipped to competitive points, some appreciation can be had of the importance of applying a proper solution to this phase of the problem.

The average loading of l. c. l. cars is about seven tons, while the capacity of the car is usually several times this figure. By combining shipments, as outlined above, a

Why You Should Buy Liberty Bonds

By Howard Elliott

Chairman of the Executive Committee of the Northern Pacific, and Member of the Liberty Loan Committee for the Eastern Regional District

Every loyal citizen should subscribe as much as he or she can to the Liberty Loan.

The loyalty and patriotism of railroad employees is not excelled by any class of people in the United States, and I hope and believe this will be reflected in a prompt and generous response to the requests for subscriptions to the Third Liberty Loan now being made by the Government through the managements of the various railroads.

Only a few of us can go to the front and fight, but nearly all of us can practice self-denial and support those who do, and it is our duty to give this support to the limit of our ability.

heavier loading can be secured, which would be reflected in reduced operating expenses and relief in car shortage.

This heavier loading could be secured even under existing routing if, instead of loading cars to destination at the main terminal, shipments were grouped with reference to operating divisions of the railroad and handled in fully loaded cars to one or more division points distant from the main terminal and there sorted and reloaded in order of destination in the next division.

In conclusion it may be safely stated that the solution of all railway terminal problems as well as the operation of our transportation system as a whole must be predicated on a clear conception of the principle that there can be no conflict between the interests representing the railroads and the interests representing the public. Each is dependent on the other. An injury to one will be an injury to the other.

Existing investments in railroad properties are entitled to protection. The railroads must be permitted to make such a financial showing as will enable them to secure capital for future improvements at reasonable rates.

On the other hand, the public has a right to demand such reorganization of the transportation system as will permit the maximum of economy and efficiency. This can only be accomplished through joint or co-operative operation and such operation will eventually permit of a more scientific determination of freight rates and a readjustment of these rates along just lines. It is sincerely to be hoped that before the present governmental control is surrendered, a full discussion will be entered into on all of these matters and a method of treatment evolved that will be in harmony with these fundamental principles.

Discussion

There was considerable discussion of Mr. Wallace's paper. Emory R. Johnson, professor of transportation and commerce of the University of Pennsylvania, expressed the opinion that it was practicable to join roads in the large cities by laying connecting tracks and to introduce joint operation of terminals, but he believed that real unification in the physical sense of the term was not possible until the termination of the war. Mr. Noonan agreed with this view, but was confident that appreciable economies were available to the railways if they would place one local manager in charge of a terminal with authority to introduce unified practices regardless of the separate interests of the roads involved. Carload traffic destined to particular points could be concentrated and moved over a single line with less delay than under conditions of individual operation. Less than carload freight could be distributed among the various houses to prevent congestion on any line or lines. Certain stretches of track might be laid to complete existing belt lines, thereby facilitating the routing of freight around, rather than through, a city.

A. E. Beck, of the Merchants' & Manufacturers' Association, Baltimore, and N. B. Kelly, of the Philadelphia Chamber of Commerce, told of the unified practices which had been introduced in their cities. In both instances war emergency committees composed of business men and railway operating executives were formed previous to introduction of government control and freight traffic, both c. l. and l. c. l., was pooled to prevent congestion on one line while another line was open. The work of these committees has since been taken over by sub-committees of railroad officers reporting to the regional director of eastern railroads. In this connection, Mr. Kelly remarked that government control was, in effect, the legalization of pooling, and that pooling under private operation would have accomplished practically the same results that are now being achieved with the concentration of authority in the director-general.

F. C. Batchelder, president of the Baltimore & Ohio Chicago Terminal, stated that railway operation was now

unified in the Chicago terminal district and that while no one man was in charge, an equivalent result had been achieved by placing control in the hands of a single committee, made up of men thoroughly familiar with conditions in the city and with power to inaugurate any and all changes in practice that they deem advisable.

Discussion of Alba B. Johnson's Paper

The address of Alba B. Johnson, published in the *Railway Age* of a week ago, was followed by informal remarks which the speaker made in response to questions by his hearers. Chairman Wheeler inquired whether the capacity of locomotive shops in this country was adequate for the future needs of this country and her allies. On this point, Mr. Johnson stated that the total capacity of locomotive shops in the United States was roughly 7,000 locomotives per year. In the past the existing shops have rarely been taxed beyond capacity, and most of the time have been worked far below their capacity. The extraordinary expansion of the locomotive companies resulting from the increased foreign demands since 1915 would, he believed, provide capacity sufficient to take care of any probable demands by this country and her allies either for the present or for many years to come. These demands, however, will not be light. The wear and tear of the war has been particularly hard on motive power. The English have bled their roads of locomotives to supply the needs of their front in France. It will require the addition of 5,000 locomotives to put the French railways in good working order at the conclusion of the war. Disregarding a period of economic readjustment from war to peace conditions the productive capacity of the country will be taxed to the utmost for the next decade.

Nothing, he said, is more vital in war than an efficient transportation system, and good railroads are an impossibility without adequate motive power. The downfall of the Russian government was the direct result of its blindness in failing to maintain its railroads. While the needs of the Russian lines, according to their own engineers, demanded the construction of between 1,000 and 2,000 locomotives a year in the decade previous to the war, only about one-tenth of that number were actually built.

In reply to an inquiry as to the present output of the Baldwin plant as compared with its average production before the war, Mr. Johnson stated that in 1914 the company felt fortunate if it had orders for four or five locomotives per week, while in December, 1917, production averaged from 16 to 20 engines per day.

Water Transportation

At the conclusion of the Railroad Session Chairman Wheeler entertained the introduction of a resolution asking for more extended use of our waterway facilities, which was later passed and is published with the other resolutions in the forepart of this article. In the discussion of this subject it was pointed out that additional means of transportation of any and every kind should be used to insure a vigorous and successful prosecution of the war. The Erie canal and the Mississippi river between St. Louis and the Gulf of Mexico constitute two important existing waterways which, if properly utilized, can add 3,000,000,000 ton-miles to the freight movement of the country within 12 months.

Wheeler Speaks Before Chamber as a Whole

At a meeting of the Chamber of Commerce of the United States as a whole in the Auditorium theatre on April 10, Harry A. Wheeler, chairman of the Committee on Railroads, discussed the transportation problem from the point of view of the business man and the proper attitude to assume toward the question at the present time. He stated that the Chamber's advocacy of federal incorporation of carriers, federal regulation of securities and further centralization of rate regulation was for the time being unnecessary because

of the present scheme of railroad control by the federal government. While the immediate problem confronting the country was how to win the war, it is also imperative to look to the needs of the peace to come and to prepare a sound foundation upon which to build the scheme of transportation which will follow government control. Two groups of public men, he said, have been particularly active since Secretary McAdoo assumed the reins of railway management, one composed of these who insistent champion government ownership and the other comprised of those who just as strongly oppose it. The solution, he believes, must lie somewhere between government ownership and the old condition of private operation.

It is too early to urge any particular program and the Chamber of Commerce of the United States, representing American business men whose only interest is the most efficient system of operation, has the very definite responsibility of studying the problem carefully and assiduously with the sole purpose of championing such a course as seems to be to the best interests of the country. If it should appear that the adoption of government ownership is proper, the Chamber should have the courage to support it. If a return to private ownership, or the introduction of some new scheme of operation and control seems advisable, the organization should be equally outspoken in its favor. Preconceptions, prejudices, extraordinary conditions born of the war should be forgotten to the end that an open-minded, earnest and serious study of the problem may be undertaken and sound, practical conclusions may be reached.

Session on Highway Transportation

The group discussion of railroad transportation was followed by a session devoted to the subject of highway transportation. F. A. Seiberling, president of the Good-year Tire & Rubber Company, presided. In his opening remarks Mr. Seiberling expressed the opinion that motor truck service would dominate short haul transportation in the future. With good highways automobiles could, he thought, more than compete on even terms with the railroads within a range of from 50 to 100 miles. There are now approximately 400,000 motor trucks in the country and this number will be increased ten times within a few years unless highway development is unreasonably retarded.

Chapin on Motor Truck Transportation

Roy D. Chapin, chairman of the Highway Transportation Committee of the Council of National Defense, delivered an extended address on what is being done in the way of freight movement by motor truck at the present time and what steps are being taken to make this instrument of transportation a more important factor. He pointed to the experience of England which has found it necessary to conserve to the utmost every means of transportation. In that country, he said, all vehicles on the highways are registered

for the purpose of regulating and co-ordinating their activities to eliminate waste hauls. It is now almost a misdemeanor to operate a motor truck empty. Bureaus have been established which see to it that trucks bringing loads to a city are provided with loads to the points from which they come, and vice-versa. This plan was introduced in Connecticut during the transportation crisis of the past winter and also in Rhode Island, New Jersey and Philadelphia. In New York City particular attention has been directed to the problem of moving freight from the freight platform to the consignor and from the shipper to the platform. The store-door delivery plan, which will be introduced in that city, will have the effect of clearing the freight platforms every night and increasing the flow of business into and out of New York by 50 per cent.

Motor trucks can be of great service in moving the food supply from the country to the city. An efficient system of rural express lines is now in operation in Maryland.

These operate every day into Washington, Baltimore and other cities from points as distant as 47 miles. They are particularly advantageous because they reach many farms not on railroads or on inter-urban lines and permit the farmers to stay on the farm—a very important matter during a time of acute labor shortage. The U. S. Department of Agriculture now has a corps of investigators studying this rural express scheme and the possibilities of its extension.

Mr. Chapin cited the trains of loaded trucks destined for the front which are continuously plying our highways from points of manufacture to seaboard. In the middle of February, when the country was in the grip of unprecedented winter weather, a train of trucks made the trip from Detroit to Baltimore in 8½ days. This record was made possible by the patriotism of the communities along their route who saw to it that the

highways were cleared of snow. A time is coming, Mr. Chapin prophesied, when main highways will be cleared 365 days in the year. The Council of National Defense he said, recently passed a resolution recognizing the value of motor truck transportation and recommending that all obstacles in the way of properly utilizing it be removed.

A. C. Bedford, chairman of the board of directors of the Standard Oil Company of New Jersey and chairman of the Petroleum War Service Committee of the Council of National Defense, addressed the group on the importance of oil conservation during the war. "Oil production," he said, "must meet the demands of the United States and its allies and will meet them."

M. H. G. Shirley, chief engineer of the state roads commission of Maryland, outlined the studies he had undertaken to determine the traffic passing over the various highways of his state and the extent of the improvement demanded by each to make for unimpeded and expeditious vehicle movement. Maryland, he said, was carrying out an extensive highway program because it believed good roads as important as good rail lines during the world conflict.

A Special Call to Duty

By C. E. Schaff

Receiver of the Missouri, Kansas & Texas

The citizen employed in an essential industry who makes steady savings from his earnings and lends them to the government adds steadily to the Nation's power to prosecute the war.

The Liberty Loan appeal should therefore meet with special response from the men who make up the rank and file of the American railroad army. We are specially favored in the fact that while serving at home posts devoting our time and talents to the pursuits we have followed in peace, enjoying the comfort, safety and opportunity of home surroundings, we daily render vital service to the Nation in keeping open the arteries through which supplies essential to military efficiency flow to the fighting front.

From those who enjoy special opportunity for service special contributions are due. The call to all citizens to participate to the fullest extent in making the Third Liberty Loan a tremendous popular success is to the railroad rank and file a special call to duty.

Hog Island Shipbuilding Yards in Course of Construction

A Big Transportation Problem at Hog Island

Rapid Construction of World's Greatest Ship Yard Dependent on Ability to Deliver Men and Materials

ON MARCH 20 the Philadelphia Rapid Transit Company executed a contract with the Emergency Fleet Corporation for the construction of an extension from Eastwick Avenue to the Hog Island shipyard on the extension of Island Avenue, to be constructed by the City of Philadelphia, and has undertaken that it shall be in operation by July 1, 1918. The contract provides for the operation of one hundred new cars between Hog Island and the subway and elevated terminals of the Philadelphia Rapid Transit Company. The Fleet Corporation will advance funds to the transit company to the amount of the cost of the new construction and equipment, and at the close of the war this property will be taken over by the Philadelphia Rapid Transit Company at the appraised value for operation. The fares to be charged will be settled by the Public Service Commission.

On March 28 the Philadelphia Railways Company agreed to rehabilitate its line from Third Street over the Penrose Ferry Bridge and put down double tracks from there to Hog Island; the new lines are expected to be in operation in sixty days. The Street Corporation is advancing the money for the new construction work of the Railways Company, which will consist of new tracks, new power station and 25 additional cars. The cars will not be as heavy as those used on the Philadelphia streets for the reason that the Penrose Ferry Bridge cannot stand the weight; but the new cars will be larger than those now in use. The Railways Company also agrees to take over all the property at the end of the war at its appraised value.

Both of the above agreements were executed by Rear-Admiral F. T. Bowles, assistant general manager of the Emergency Fleet Corporation, who is located in Philadelphia.

A Remarkable Feat of Transportation

Possibly it is not strange that in these days of great accomplishments, a remarkable feat of transportation, in the

very heart of the East, should have been almost overlooked, not alone by the public but by the railway world as well. In ordinary times the installation, within a few months and under extremely unfavorable circumstances, of a transportation scheme involving the building of between 70 and 80 miles of track, the furnishing of a complete railway equipment and the development of an organization to operate it would be a noteworthy task. When, in addition to this, it was necessary to secure co-operation from street railways, steam roads and steamers to carry back and forth each day, through congested freight districts and with inadequate facilities and equipment, from fifteen to twenty thousand men and to insure the delivery and handling of from 200 to 300, or even more, carloads of freight each day, the task would seem to be almost superhuman. Such was the situation which confronted the American International Shipbuilding Corporation in the construction and operation of the Hog Island ship building plant, located on the banks of the Delaware river about six miles south of the center of Philadelphia.

Almost immediately after the entrance of the United States into the war, it was realized that the issue depended on the construction of ships on a scale hitherto unthought of. It was realized that ordinary methods would not meet the emergency, and Americans naturally turned their thoughts towards quantity production of units of a single type. It was therefore necessary to break away from ordinary shipbuilding methods, and develop an organization, which would combine not only shipbuilding skill, but knowledge of the manufacturing resources of the country and ability to lay out a construction program on a really tremendous scale.

The government, therefore, through its Emergency Fleet Corporation, made a contract with the American International Corporation to build a yard, with 50 ways, so that 50 ships could be under construction at the same time. The original plan contemplated also the construction of 200 ships of a

Hog Island Shipbuilding Yards in Course of Construction

similar type to have a capacity of 7,500 tons dead weight.

The ships were to be of steel of standard construction, so that the parts would be absolutely interchangeable. In this way the thousands of different parts could be fabricated at manufacturing plants throughout the country and be rapidly assembled at a central plant. A great amount of time could thus be saved compared with the general method of building ships in which the different parts are fabricated at the shipyard and carefully and laboriously fitted into place. By concentrating on the building of a standard design in a shipyard especially constructed for this particular design, the problem would be largely to arrange for the steady supply and distribution of material, to provide special facilities for handling the work expeditiously and to supply an adequate number of properly trained workmen to assemble the parts. The parts being fabricated elsewhere would make it possible to secure a maximum output from a given size plant with a minimum amount of labor; or, in other words, an erecting plant could be designed which would, with a limited number of men, say, 30,000 or 40,000, utilize the work of several hundred thousand workers scattered in small groups throughout the country—a total force so large that it would be impossible to house and take care of it at a central point in the short time available for preparation.

The contract between the Emergency Fleet Corporation and the American International Corporation was signed on September 13, 1917, and called for the construction of the yard and fifty $11\frac{1}{2}$ knot, 7,500 ton cargo vessels, each 400 feet long. A little over a month later on October 23, it was decided to build also seventy 15 knot 8,000 ton combined transport and freight vessels, each 450 feet long.

This second type required some modifications of the plans of the yard, as will be noted hereafter, but did not greatly, if at all, delay the work, though it did materially increase the cost of the yard.

To build these ships will require a steady force of about 30,000 men; 25 acres of covered buildings; 50 shipways, each 500 ft. long; and 7 outfitting piers, each 1,000 ft. long. Each outfitting pier or wet basin will accommodate 4 ships so that 28 ships may be fitted out at one time. In the neighborhood of 1,000 shops throughout the country, employing over 300,000 people, will build the various parts. For in-

stance, 75,000,000 ft. of lumber will be required, 400,000 tons of steel, 40,000,000 rivets, 570 boilers, and over half a million horse power of turbines.

Hog Island at the time of the awarding of the contract was a rough desert, thickly overgrown with underbrush. The island is two miles long, a mile wide and contains 900 acres. There were no freight or passenger lines reaching it, and the nearest approach by trolley was a mile and a half distant. The only way in which one could travel about the island was on horseback and there was no water supply and no source of power. The problem which confronted the shipbuilding company was to build and get into operation in a few months a shipyard which would have to build ships on a larger scale and at a greater speed than ever before attempted. Remember too, that this was at a time when the freight congestion was acute, construction materials were scarce, and skilled or unskilled labor almost impossible to get. The contract was let late in the fall and it was necessary to carry it on at high speed throughout the coldest and most severe winter that has been experienced for years. When the contract was signed, no surveys had been made nor were any but general sketch plans of the layout available. Plans were developed, and surveys and office work pushed to such an extent that construction was under way by the middle of October.

Difficulties Encountered

The difficulties under which it was necessary to build up the transportation system may be realized to some extent when it is known that in some cases angle bolts for the track were put on by using ordinary monkey wrenches with the nuts 8 or 10 inches below the water. Under normal conditions, a contractor would not attempt for a moment to put through a big project such as the Hog Island shipbuilding yard in cold or unfavorable weather and yet it was necessary to do so in this case in spite of the fact that the ground during mid-winter was frozen several feet deep and had to be dynamited in order to lay the water pipes and wire conduits; it had to be strained out before the piles could be driven. About 120,000 piles will be required for the completed plant; most of these being already driven.

When the work was first started, it was necessary to build a road $1\frac{1}{2}$ miles long to the nearest avenue and to bring

materials and men by auto truck from the city. As the work developed, a study was made of the location of the homes of the class of men who would be employed and of means to transport them to and from the work. The Philadelphia Railways Company, when the work started, was the only line that could be used and it required a walk of $1\frac{1}{2}$ miles to the island. This line, however, was entirely inadequate because of its physical condition, lack of equipment and the fact that only a single track could be operated over one of its bridges. By the end of September, 2,000 men were employed on the island and it proved necessary to call on the steam roads for help in spite of the fact that it would necessitate operating the trains through badly congested freight terminals.

The railroads finally consented to operate one train out of the Pennsylvania station at Broad and Washington Streets and one from the Philadelphia & Reading station at 31st Street and Girard Avenue. These ran over the Chester branch of the Philadelphia & Reading to North Essington and back over the Pennsylvania to a point near Hog Island. The Pennsylvania track was part of a branch being built by the P. B. & W. to Hog Island and connecting with the main line at Eddystone. The trains were operated with great difficulty because of the crowded condition of the Baltimore & Ohio tracks over which it was necessary to run for a short distance because the Chester branch was single track and because of the Pennsylvania branch to Hog Island being only partially completed. The arrangements for handling of trains at North Essington were also poor and the workmen were greatly discouraged by the loss of time and the poor service.

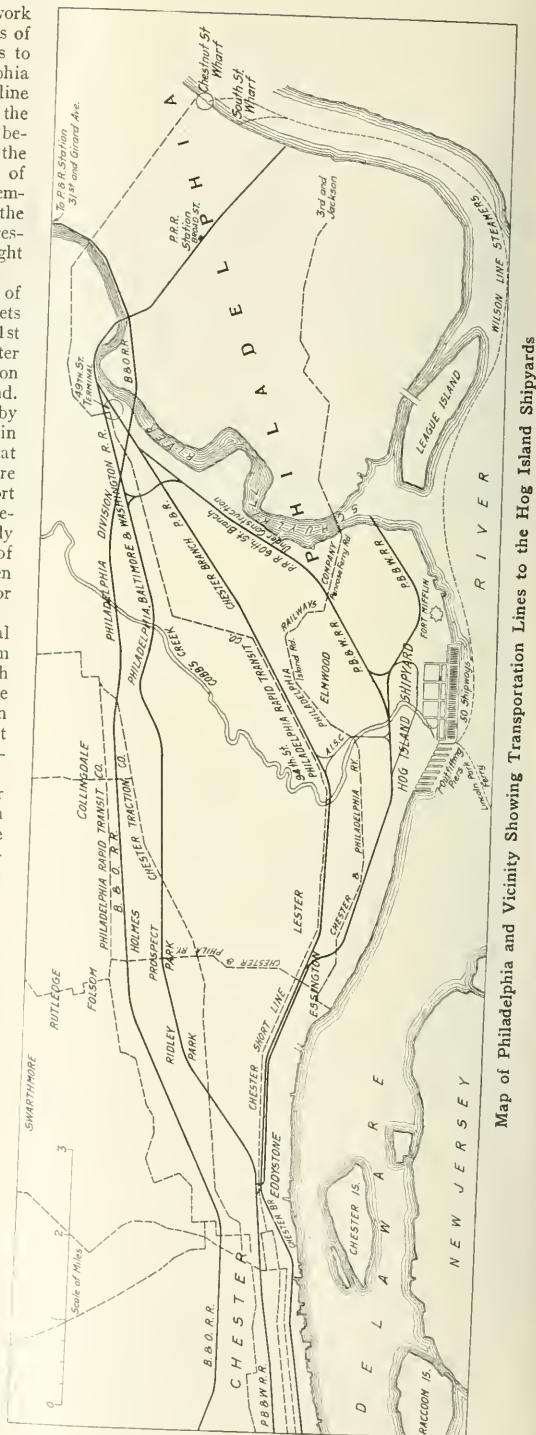

To meet this critical situation, the American International Shipbuilding Corporation built a track $1\frac{3}{4}$ mi. long from Hog Island to the Chester branch at 94th Street, over which the trains from the city could be operated and run to the center of the plant and over which shuttle trains were run to carry the passengers which came to 94th St. on the street cars. Meanwhile, the street car lines took measures to improve their service.

The transportation facilities still being inadequate, water service was investigated and arrangements were made with the Wilson Line to operate one of its steamers from the Chestnut street wharf—a run of about 40 min. Soon a second and later a third boat was added. Three boats being all the Wilson Line could spare, additional boats were leased at a high cost. Boats were also chartered for ferry service to Billingsport on the Jersey side of the river.

Additional trains were steadily added to the steam lines until five trains are now run out of the Broad and Washington street station, three from Girard Avenue and two from 49th street on the Philadelphia & Reading. The extreme weather this winter interfered to a greater or less extent with the schedules on the steam and electric roads, and for the first time in 37 years it was impossible for steamers to operate in the Delaware river, operation being discontinued for a period of about ten days. Operation on the P. & R. has been greatly improved by the double tracking of that line and the P. B. & W. has under construction a line from Hog Island to 60th street which will add greatly to the present facilities.

Barracks have been erected at Hog Island which will house 6,000 men. In addition to this, the city of Philadelphia is working on a housing plan to provide for several thousand workmen within a couple of miles north of Hog Island. The facilities, however, will be crowded to the limit when the plant is completed and a full force is at work building ships; more than 30,000 men will then be required.

Material is brought in over the P. B. & W. branch which connects with the main line at Eddystone. Great difficulties were experienced in the earlier stages of the work, but the intra-plant system, supplemented by better roads and motor trucks, has solved most of the difficulties.

Map of Philadelphia and Vicinity Showing Transportation Lines to the Hog Island Shipyards

Intra-Plant Transportation

The Pennsylvania Railroad (Philadelphia, Baltimore & Washington) runs along the northern side of the island.* The passenger trains coming from the north over the A. I. S. C. shuttle line unload at a station near the center of the plant. At the west end of the yard are inbound and outbound interchange yards. Alongside of the inbound yard is a classification yard. The inbound interchange yard has a capacity for 282 cars; the outbound a capacity for 252; and the classification yard a capacity for 340 cars.

Two material storage yards have been provided; one for the 7,500-ton vessels, and the other for the 8,000-ton vessels. These are arranged in such a way that definite locations are specified for each piece of material. There are at least 20,000 important parts required on each ship so that the planning of the storage yard and facilities was no small task. The material yards have a capacity for a two-weeks' supply of parts. The material storage spaces are separated by groups of three tracks with single tracks alternating. The single track is used by 85-ton Brownhoist cranes, with sufficient reach (50 ft.) to unload the cars on the opposite sides of the material spaces. The loaded cars are placed on the two outside tracks in each set of three tracks; the middle track, with its cross-overs being used to pull out cars which have been unloaded, or which it is necessary to place elsewhere.

Some 30,000 tons of material will have to be handled weekly at the time of maximum production—five ships per week—besides the coal, lumber, commissary supplies, etc., for the operation of the yard.

This material comes from a thousand different sources, and while some of the manufacturers can deliver parts for 5 or 10 ships at a time, some can only arrange to make and deliver not less than the whole quota of 50 or 100 parts. The material storage yards, therefore, act as storage reservoirs to hold the material as it is received, and facilitate its distribution to the ships.

At the eastern end of the yard is what is known as a holding yard. Every day such material as may be required for use at the shipways on the following day is loaded on flat cars in the material storage yards and placed in the holding yard until it is needed. From the holding yard it can easily be switched to any one of the shipways. South of one of the material storage yards near the center of the plant are a number of warehouses in which material is stored which cannot safely be left in the open. A track extends to each one of these warehouses so that at the proper time the material may be loaded and sent either to the holding yard or to the shipways. The small shops directly back of the shipways and between this material storage yard and the holding yard are not provided for the fabrication of material but more or less as an emergency measure to take care of any work that may have to be done in the way of modifications to parts or repairs. In other words, they are largely an insurance against delay. A small holding yard is also provided for at the western end of the plant for cars containing material that is to be stored in the warehouses back of the wet basins or which is to be delivered direct to the piers alongside of the wet basins.

At the west end of the yard are the receiving and despatching yards for inbound and outbound cars from, and to, the Pennsylvania Railroad. From the inbound yard, the cars are classified and then distributed to the material yards and warehouses, where they are unloaded and returned to the outbound yard. The distribution from the material yards and warehouses through the holding yard to the ships, is done with the yard equipment. It is expected therefore that the railroad cars will be held for the minimum possible length of time.

An interesting feature of the yard layout is the provision

*It is regretted that the censor asked that the detail map which accompanied this article be left out.

of a double set of thoroughfare tracks, throughout the yard, two tracks in each direction. Ample provision for both storage and against delay in moving from one part of the yard to the other, is absolutely necessary in order to secure the necessary continuity of operation. The schedule of construction is so laid out that any break in the supply of materials will tend to more or less serious disorganization, so that ample provision to guard against this is an absolute necessity and has very largely controlled the design of the yard.

It was thought at first that some of the trackage provided might not be absolutely necessary, but in view of the seriousness of delay, either in case of an insufficient stock of parts on hand or in distributing them to the ships, much more ample facilities will be required than would be necessary under ordinary conditions.

There are 50 shipways arranged in 5 groups of 10 each and extending one mile along the water front. The first keel was laid about the middle of February and it is estimated that 25 of the ships will be ready for delivery about the first of November of this year. One ship will be delivered for every two days during the 8½ months following the delivery of the first ships; at the time of maximum production it is expected that 5 ships will be launched each week.

During the construction period it was necessary to have 22 locomotives in service; several of these being leased. The final equipment will include 14 locomotives, of which three are heavy six-wheel switching locomotives for use in the classification yard. These are being built by the Lima Locomotive Works. They weigh 170,000 lb., have 57 in. drivers, carry 180 lb. of steam and have 21 x 28 in. cylinders. The permanent equipment will also include four eight-wheel passenger locomotives, three saddle tank locomotives and four six-wheel switchers.

Automatic signals are provided and an interlocking plant has been placed at the intersection with the Pennsylvania Railroad. The rolling stock equipment consists of 20 passenger coaches, which were purchased from the Central Railroad of New Jersey, 300—30-ton, flat cars, 100 new 50-ton flat cars and 50—40-ton box cars. The passenger coaches are used for shuttle service. At present these shuttle trains are making the round trip in 25 minutes but another train is about to be added and the trains will be operated under a 5 min. headway. The passenger yard at West 4th street has a capacity for 125 to 130 coaches with facilities for cleaning and maintaining them. The engine house to the west of this yard has a capacity for twelve engines at one time and is equipped with small tools for making running repairs.

The following table shows the extent of the track facilities.

| FREIGHT LINES | | Miles of track | Turn outs |
|---|-------|----------------|-----------|
| Interchange yards—inbound | 3.86 | 18 | |
| Interchange yards—outbound | 3.35 | 15 | |
| Main classification yards | 6.68 | 48 | |
| Hauling yard | 1.65 | 19 | |
| Shipways wet-basin tracks | 1.88 | 12 | |
| Shipways tracks | 11.87 | 59 | |
| Wet basin warehouse tracks | 0.87 | 6 | |
| Wet basin pier tracks | 11.54 | 21 | |
| Wet basin siding tracks | 1.65 | 1 | |
| Machine shop tracks | 1.00 | 6 | |
| Engine yard | 2.24 | 30 | |
| Cash yard | 1.11 | 1 | |
| School shipyard | 0.41 | 1 | |
| Total mileage of freight line tracks | 77.4 | | 498 |
| PASSENGER LINES | | Miles of track | Turn outs |
| South Side S. F. P. R. R. tracks | 6.08 | 29 | |
| All tracks are of standard gauge 57 in. A. S. C. E. rail; ballast 6 in. below ties. | | | |

While the road is not a very large one, it will operate under intense conditions and will probably have to live up to the size of its name: U. S. F. F. C.-A. I. S. C. In other words, the equipment is in the service of the U. S. Government through the Emergency Fleet Corporation and the American International Shipbuilding Corporation.

"They Shall Not Pass"

By A. L. Humphrey

President, Union Switch & Signal Company; Vice-President & General Manager, Westinghouse Air Brake Company; President, Employers' Association of Pittsburgh.

These are days that try men's souls and afford a supreme test of the Nation's resourcefulness, loyalty and patriotism. At this writing the enemy's guns are hammering at the very gate-ways of Calais. Haig's valiant army is fighting with its back to the wall. The Hun hordes, drunken with lust and power, and with reckless disregard of human sacrifices, are pushing back the forces of civilization at practically every point on the Western Front. It is indeed a solemn hour for the friends of Liberty.

Optimism is a characteristic of the American people and is a quality of mind that has grown on us with the expansion of our population and with the increase in our industrial and material resources. It has as its basis also our fancied security from foreign aggression, and the historical fact that our flag has never gone down to defeat. Just the same, it behooves us to recognize that we are threatened by the most formidable foe of all times, one that in all history has not been surpassed in diabolical ingenuity and cunning and who is ready and willing to stake his all on the triumph of autocracy over democracy, of force over decency and justice. I do not want to be considered an alarmist or pessimist, but, at the same time, we might as well look the facts squarely in the face, and if my note of warning does nothing else than bring home to a single lethargic person the serious situation that would confront the Allies in case the battles of Picardy and Flanders went against them, I shall consider these words as not having been written in vain.

Those of us who live in security in the United States and comprise what may be termed the "third line of defense" will have to adopt the slogan of the gallant Frenchmen: "They shall not pass," and do all we possibly can, in our limited way, to back the boys in the front line, morally and financially. At the moment there is no better way to do this than to buy Liberty Bonds. Don't let us buy them perfunctorily, but in a "win the war spirit," which calls for actual sacrifice and hardship.

In this era of rapid transit we have learned to look upon the steam railroads of the world as a potent factor in the conduct of the war, and it is hardly necessary for me to dwell upon the splendid, the magnificent support given the Federal Administration by the American railroads, from the highest official down to the laborer on the track. Unselfish devotion to duty is the order of the day, and if their purchases of Liberty Bonds of the preceding series can be taken as a criterion, they will surely "go over the top" in the present campaign with flying colors.

Closely identified with and vital to the railroads of the country, the railway supply manufacturers are giving and will continue to give the best that is in them towards a successful prosecution of the war. Seriously crippled in man power, thousands of their employees having joined the military forces of the United States and of our Allies, the manufacturers may not be able always to render the high grade

service heretofore the rule. They ask the railroads to bear in mind the difficulties the railway supply manufacturers, in common with all other interests, are laboring under and that we are doing our utmost to keep the wheels going around and backing up those who are fighting our battles at the Front.

Speaking especially of conditions in large manufacturing plants of Greater Pittsburgh, I know from personal experience that in connection with the Third Liberty Loan campaign it is not a question of whether the quota is going to be subscribed, but rather, whether it is going to be doubled or trebled. The apathy in certain quarters which characterized the first campaign has given way to unbounded enthusiasm, and if shipments get somewhat behind in the next few weeks, it will be because every workman has temporarily left his workbench and constituted himself a committee of one to make the Third Loan a huge success.

Apocryphal of the resolution passed at the last annual meeting of the Railway Business Association to ask the Director General of Railways to designate April 20th as "Railway and Railway Materials Manufacturers' Liberty Loan Day," permit me to call the attention of those concerned to the patriotic and wonderfully effective work done by the so-called Liberty Loan Loyal Legion, which has for its purpose the promotion of loyalty among the subscribers to Liberty Bonds, teaching the value of the bonds as an investment and obtaining pledges from the purchasers that they will not offer government securities for sale at less than par and interest, until three months after peace has been declared. The pledge exacted from members is as follows:

"I, the undersigned, as Subscriber to the Liberty Loan, hereby solemnly pledge my word and honor not to offer for sale any bonds or other evidences of indebtedness of the United States owned by me, at less than par and interest, except in case of extreme necessity, until three months after peace has been declared."

On February 7, 1918, Liberty Loan Loyal Legion No. 1 was formed in one of the large railway supply plants of the Pittsburgh district and four-minute men were recruited from the shop to give impetus to the movement. Today Legion No. 1 boasts practically 100 per cent membership and has become the nucleus of dozens of similar organizations throughout the Greater Pittsburgh district. May I not then, by way of a message to fellow members of the supply fraternity, urge the formation among their employees of Liberty Loan Loyal Legions throughout the length and breadth of this land? Once duly organized and in working condition, the Legions are certain to give a splendid account of themselves and will work wonders not only in the encouragement of thrift and Liberty Bond purchases, but also in the promotion of loyalty and the "will to win the war."

Kultur—Bar its progress with Liberty Bonds.

Doings of the United States Railroad Administration

Coastwise Steamships Taken; Comprehensive Statistical Studies to Be Made; Police Meet

Government Takes Over Coastwise Steamship Lines

PRESIDENT WILSON on April 11 issued a proclamation taking over for the government the property of the Clyde Steamship Company, the Mallory Steamship Company, the Merchants' & Miners' Transportation Company, and the Southern Steamship Company, which operate 65 vessels in coastwise service. The steamship lines owned by railroad companies had already been taken over under the proclamation by which the government assumed control of the railroads. The President, in his proclamation, also directs that the control and utilization of the steamship lines shall be exercised through William G. McAdoo, director general of railroads, who may perform the duties, so long and to such extent as he shall determine, through the boards of directors, officers and employees of the companies. The proclamation is similar to that under which the railroads were taken over and provides that the director general shall enter upon negotiations with the companies looking to agreements for compensation for the use of the properties. The government's operation became effective on April 13.

In General Order No. 19 the director general announces that pursuant to the proclamation of the President he has taken possession and assumed control of the steamship companies named, and until further order it is directed that all of their officers, agents and employees shall continue in the performance of their present regular duties, reporting to the same officers as heretofore, and on the same terms of employment; and that any officer, agent or employee desiring to retire from his employment shall give the usual and seasonable notice to the proper officer, to the end that there may be neither any interruption nor impairment of the service.

For the administration of the coastwise steamship lines the Coastwise Steamship Advisory Committee has been created, as announced in Circular No. 23, with office at 165 Broadway, New York City. L. J. Spence, director of traffic of the Southern Pacific, is appointed chairman with authority to form the committee from the officers of the following steamship lines: Clyde, Mallory, Merchants' & Miners', Ocean, Old Dominion, Southern Pacific, and Southern.

The chairman of the Coastwise Steamship Advisory Committee will report to the manager of the Marine Section of the Division of Transportation and will exercise supervision

over all coastwise lines under control of the United States Railroad Administration.

Wage-Adjustment Board

Railway Board of Adjustment No. 1, which is to adjust controversies between railroad companies and members of the trainmen's brotherhoods, has organized by electing Charles P. Neill, manager of the Bureau of Information of the southeastern railroads, as chairman, and L. E. Sheppard, vice-president of the Order of Railway Conductors, as vice-chairman. The board is now ready for the transaction of such business as may come before it, as provided in General Order No. 15. Circular No. 22 issued by the director general directs that every case submitted, except the unfinished business of the Commission of Eight, which is transferred to this board, should be accompanied by evidence that its submission is approved by the chief operating officer of the railroad upon which the controversy has arisen, and by the chief executive officer of the labor organization concerned. Where two or more organizations are jointly concerned, the submission should be joint, if practicable.

Article 11 expressly precludes a consideration by this Board of any matter unless officially referred to it in the manner prescribed in the memorandum of understanding.

Article 14 requires that in each case an effort should be made to present a joint concrete statement of facts as to any controversy. Statements of fact, whether joint or separate, should be sufficiently

comprehensive to give an understanding of the controversy that the board is called upon to decide. Where briefs, or additional evidence, are to follow, notice thereof should accompany the submission. Where additional matter is to follow the submission, the case will not be transmitted to the Board of Adjustment by the Division of Labor until the additional data shall have been received.

Monthly Statistics Called For

It is requested that three copies of the joint concrete statement be filed with the Division of Labor for matter of record and for the information of the board. Briefs and documentary evidence need not be furnished in duplicate, but whenever possible, should be attached to the three copies of the joint statement.

The Railroad Administration has taken steps to secure

Let Us All "Go Broke" Buying Liberty Bonds

By Frederick D. Underwood

President of the Erie Railroad, and Chairman of the Liberty Loan Committee, Eastern Regional District

To me it seems redundant to send to anyone exhortations to buy Liberty Bonds. The billboards, the daily papers, the moving pictures, and every other means of reaching the public, are charged with exhortations to that end. All of the invitations are good. Some of them should be preserved. This morning I noticed two in particular: "Come across, or the Kaiser will" and "If you can't shoot, buy Liberty Bonds."

It devolves on the railway fraternity to back up their fellows in France. The railway and engineering professions are almost in a class by themselves, in that they have recruited battalions. We owe it to our fellows abroad—and I am sure we will pay the debt, and without this reminder—to see that so far as money will buy the things they need, and crave beyond their needs, they are furnished them in abundance.

The rank and file of railroad men are free spenders, generous to a fault. Let us all further indulge our propensities in this direction, and for once feel proud of it. Let us all "go broke" for the time being in buying Liberty Bonds. Aside from doing our brothers good, we are doing ourselves good. The feeling of satisfaction from making a good sound investment is a thrill worth getting.

through the regional directors information on the performances of individual carriers to enable comparisons between railroad operation under government and under private control. Orders have been issued by the regional directors that monthly reports be sent to the director of transportation, including (a) detailed income reports showing comparisons with the previous year and indicating the expenses by primary accounts; (b) each report or statement used by transportation officers to measure efficiency and cost of operation; (c) reports used to measure efficiency and cost of locomotive performance, also (d) usual explanations provided for president or chief operating officer covering increases or decreases as shown in the above-mentioned statement.

Meeting of Railroad Police Officers

Chief special agents of some of the principal railroads of the country held a conference last week with P. J. Doherty, manager of the Section of the Railroad Administration which deals with the Protection of Railroad Property, with a view to co-operation in the work of theft-prevention at railroad yards and terminals. An advisory committee was selected, to co-operate with the representative of the Railroad Administration, consisting of Chief Special Agents J. W. Connelly of the Southern, W. G. Baldwin of the Norfolk & Western, T. T. Keliher of the Illinois Central, R. S. Mitchell of the Missouri Pacific, and J. R. McMahon of the New York, New Haven & Hartford.

Locomotive Service Data

Information with respect to locomotives and locomotive performances for the year ended December 31 and for the three months ended March 31 is called for from all railroads under federal control. This is by Circular D. C. E. No. 5, issued by R. S. Lovett, director of the division of capital expenditures, which asks for the number, weight and tractive capacity of locomotives owned or leased; number of serviceable locomotives, number contracted for and undelivered; locomotive miles in transportation and work train service, gross and net ton miles of revenue and non-revenue freight; pounds of tractive power available per 1,000 locomotive miles, per 1,000 gross ton miles and per 1,000 net ton miles.

The Short Lines

Officers of the short line railroads are greatly concerned because of the attitude of the Railroad Administration in its interpretation of sections of the railroad control law regarding the lines to be taken over by the federal govern-

ment. Section 1 provides that every railroad not owned, controlled or operated by another carrier company and which has heretofore competed for traffic with a railroad or railroads of which the President has taken the possession, or which connects with such railroads and is engaged as a common carrier in general transportation, shall be held and considered as within the federal control. Section 14 of the law, however, contains a provision that the President may, prior to July 1, 1918, relinquish control of all or part of

any railroad system of transportation, further control of which shall be deemed not needful or desirable.

The short lines had protested vigorously against the attitude taken by the Railroad Administration prior to the passage of the law, that many short lines would not be considered necessary and therefore would be excluded. These railroads declared that they would be placed in a serious condition if they were excluded. They were apparently satisfied with the provision of the law as it was enacted; but they have since learned that the Railroad Administration apparently does not intend to exercise jurisdiction over some of the smaller roads until the question as to whether they shall be retained under federal control after July 1 shall have been determined. Representatives of the short lines attended a meeting in Washington on April 11 and 12 at the call of the American Short Line Railroad Association, and they held a conference with John Barton Payne, general counsel of the Railroad Administration, on the subject. Many short lines have been released, both before and since the passage of the law, at their own request, but most of the officers of short lines take the position that all should be included under federal control and that that was the intention of Congress. Some of them say that if they are not to be included in the federal system their tracks should be taken up and operation abandoned; but they foresee difficulties

with state laws and state commissions in any attempt to do so. It is possible that a plan may be worked out by which the Railroad Administration can take over certain lines and then order their tracks taken up.

The decision of the Railroad Administration as to its course toward the short lines will be based mainly on information secured by the regional directors from the trunk lines in their territory; but the short railroad lines have been told that no line will be excluded without a hearing.

In order to insure that coal mines may be operated to capacity and to provide a store of coal for the winter months, R. H. Aishton, regional director of western roads, has re-

"As Sound As the Rock of Gibraltar"

By R. H. Aishton

President of the Chicago & North Western, and Regional Director of Western Railroads.

The government in floating the Third Liberty Loan is giving us all another opportunity to be of further service to the nation in the great and righteous cause we are fighting for. Every railroad officer and employee is now striving energetically for the government by satisfactorily and efficiently carrying out their duties in their line of work, in order that the transportation systems may successfully perform their part—and it is a large part—of the burdens that the nation is being called upon to face.

However, there is still a further duty that each railroad officer and employee owes to his country at this time and that is from the standpoint of a patriotic American citizen; namely, to preserve our great country inviolate from any invasion of a foreign foe, and to assist in the prosecution of the noble work now being carried on by our boys across the water, and to the end that those who have died fighting for our liberty, side by side with their British, French and Italian comrades and Allies, should not have died in vain, and to provide them with arms, ammunition and food.

We, who are left behind here at home, should each, individually, feel it our duty to subscribe to these bonds, which without a doubt, are the safest investment on earth, for the reason that they are safeguards of the future of the greatest nation in the world. It is indeed a privilege, as well as an act of wisdom, to put our money into an investment at an excellent rate of interest, when we know that this investment is as sound as the "Rock of Gibraltar."

Let us all, both officers and employees, without exception, stand shoulder to shoulder on this side, as are our boys on the other side, and subscribe to the greatest extent of our ability.

quested the lines under his jurisdiction to use coal cars only for coal traffic, except that they may be loaded locally in the direction of the nearest junction point of the owning line, or in the direction of the mines on the owner road, or to a destination on the owning line, provided that immediate loading is available. Cars must not be back-hauled to obtain loading. If it is found that loading coal cars in the homeward direction delays them to the extent that it is impossible to fulfill all requirements for coal loading, instructions will be issued to return the cars empty.

Recent Orders of Western Regional Director

In another communication Mr. Ashton points out that the movement of perishable freight from southeastern states is increasing rapidly and that every effort should be made to return promptly all ventilated cars belonging to roads in that territory.

The western regional director is taking steps to eliminate the service of one road where there is duplicate local freight service on lines jointly operated. Up to date, such reductions in service have resulted in a monthly saving of 8,080 train-miles.

All western lines have been asked to supply accurate information in detail concerning reductions in passenger train mileage (1) between June, 1917, and December 28, 1917, and (2) from December 29, 1917, to March 31, 1918. They are also requested to advise the regional director of western roads of further passenger train mileage which can be eliminated, having in view the operation of all roads as one system.

Plan to Expedite Oil Movement

Because of complaints that soldiers and sailors have been overcharged by railroad news agents and in hotels and lunch rooms, the lines in western territory have been requested to take steps to insure the discontinuance of this practice so far as it is within their control.

At a meeting between representatives of the railroads, the mid-continent oil interests and the United States Fuel Administration at the office of the regional director of western railroads on April 2 the importance of prompt movement of oil was given full consideration. It was disclosed that there has been a considerable reduction in the number of tank steamers available for the movement of oil from southern ports to the Atlantic seaboard. This condition, as well as a heavy increase in the consumption of oil by the government and various manufacturing plants engaged in war work, has greatly increased the demand for tank cars. In addition,

the oil producers are being urgently pressed by the government to make every effort to increase their output. Owing to the shortage of material and delays in deliveries it will not be possible to make any considerable additions to the available supply of tank cars in the near future. The only solution of the problem is the strictest economy on the part of all concerned in the use of tank cars.

To bring about the closest co-operation between all interested it was thought advisable that a representative of the regional director of western railroads be appointed to be associated with the representatives of the United States Fuel Administration and the oil interests in the so-called mid-continent field. To this end, B. L. Swearingen, assistant freight agent of the Missouri Pacific, was appointed supervisor of oil traffic, with headquarters at Kansas City, Mo., as mentioned in the *Railway Age* of April 12, page 1006. He will arrange to concentrate the oil movement so far as possible in trainload lots which will be moved intact via one destination or distributing center. The oil producers have agreed to discourage the reconsignment of oil, which is now the cause of considerable delay, to cars and will impress upon all receivers of oil the necessity for providing additional storage capacity to insure prompt unloading and a supply of oil for use during times of traffic interruption by winter weather or otherwise. The railroads have been requested to arrange for a systematic daily service for the return of tank cars and in solid trains, so far as is practicable, to distributing centers.

BRITISH PRISONERS ARE WORKING ON LIGHT RAILWAYS within six miles of the front, according to a correspondent of the Philadelphia Public Ledger.

BRITISH WRECK MEDINA RAILWAY.—British mounted troops have destroyed several miles of the track of the Hedjaz Railway, east of the River Jordan, on the Palestine border,

it was officially announced in London on March 30. The cutting of the Hedjaz Railway line severs the communication of the Turks with any of their forces that may be in the region southeast of the Dead Sea and with those in Western Arabia. The revolting Arabs in the Hedjaz district have been masters of the lower part of this railway for some time but the destruction of the line at this far more northerly point will, it seems probable, prove a far more serious blow to the Turks. The only rail route to Medina, just to the north of Mecca, the Mahometan shrine, is also destroyed by this blow.

Back Up the Boys "Over There"

To Railway Officers and Employees of the Western Regional District

By W. G. Bied

President of the Chicago & Alton, and Chairman of the Railroad Liberty Loan Campaign Committee, Western Regional District

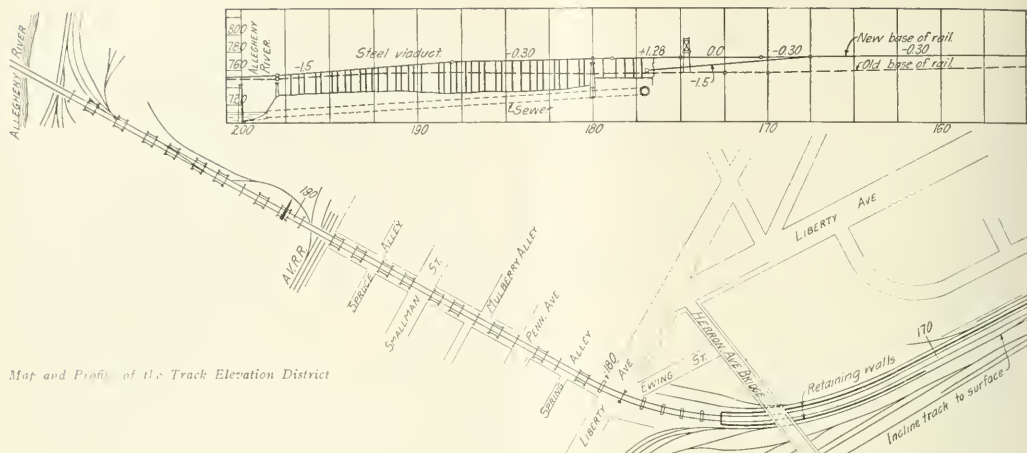

A crisis has come in the war which the United States and its Allies are waging for the highest ideals of humanity. Our very existence as a nation of freedom and liberty-loving people is at stake. We must win this war, no matter what the cost.

Those who are fighting "over there" must be maintained by the money of those who must stay here. This is why the government of the United States is offering Third Liberty Loan bonds with interest at $4\frac{1}{4}$ per cent per year, on the best security in the world today.

In this crisis it is the patriotic duty of every American citizen to subscribe to this bond issue to the full extent of his ability. The Director General of Railroads has approved a plan whereby those in railway service are offered easier terms of payment than any other class of citizens.

In the Western Regional District there are in round numbers 800,000 railroad officers and employees whose yearly wages amount to \$850,000,000 a year. It is anticipated that a large share of a general wage increase impending will be devoted to the purchase of Third Liberty Loan bonds.

There are over 70,000 American railway men fighting in France today in this war for Freedom. They are offering a supreme sacrifice of life for their ideals, for their country, its people and its institutions. They and those fighting with them will not fail for lack of the financial support of the railway officers and employees at home. Everyone in the Western Regional District will be personally solicited to subscribe to this Liberty Loan. The response will be another demonstration of the unfailing loyalty and patriotism of the railway forces of the nation.

Map and Profile of the Track Elevation District

Baltimore & Ohio Grade Separation at Pittsburgh

The Main Tracks Are Raised on an Earth Fill and Steel Viaduct for More Than a Mile

WORKING THROUGH A DISTRICT subjected to a very heavy traffic and with the work complicated by the reconstruction at a new grade of a double-track steel viaduct, approximately one-half mile long, in a space so constricted as to make necessary the use of special construction equipment, the Pittsburgh Junction Railway, a subsidiary of the Baltimore & Ohio System, recently completed a grade separation project at Liberty avenue, Pittsburgh, Pa., which involved the expenditure of more than \$750,000. The work consisted of the elevation of the main line tracks from a point 4,150 ft. east of Liberty avenue to the east end of the railroad bridge over the Allegheny river, a distance of more than a mile. From the east end of the improvement to a point 350 ft. east of Liberty avenue, a distance of 3,800 ft., the tracks were raised on a fill supported by concrete retaining walls, while from Liberty avenue west they were raised on a steel viaduct which replaced an existing structure.

Reasons for the Improvement

The improvement was made primarily to renew the old steel viaduct west of Liberty avenue, which, if rebuilt at the old grade, would have committed the railroad for many years to come to the objectionable features of the old layout which can be best pointed out by a description of the old line.

Within the district affected by the improvement the old line occupied a private right of way from the eastern limits to Liberty avenue where it entered Thirty-third street, on which it continued to the river. East of Liberty avenue the line was built on earth cuts and fills, while west of Liberty avenue it was carried on a steel viaduct. The line involved excessive grades and curvature. Again, beginning at the east the grade descended from the level of the Pennsylvania Railroad crossing to a crossing at grade with Liberty avenue on grades ranging from 1.45 per cent to 0.06 per cent. Leaving Liberty avenue an ascending grade of 0.35 per cent was encountered for 800 ft.; then a level stretch for 200 ft., before descending on a 0.58 per cent grade to the level of

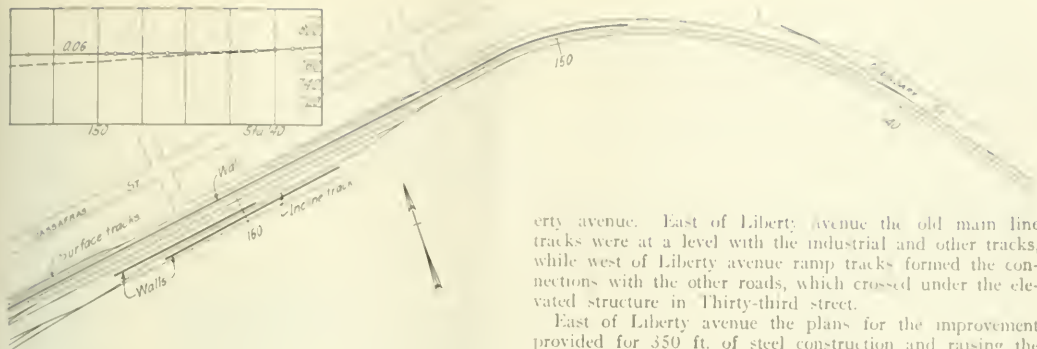

the Allegheny river bridge. The line also involved a 9 deg. and 30 min. curve across Liberty avenue.

East of Liberty avenue the only intersecting street, Forfar street, was carried over the tracks by means of the so-called Herron avenue bridge, while west of Liberty avenue all intersecting streets crossed under the elevated structure. Liberty avenue which crossed the railroad at grade with the tracks is the most important of any of the streets in the locality and one of the most important thoroughfares of the entire city, being the direct route from the center of the city to the Bloomfield and east end districts. At its intersection with the railroad it carries a double-track trolley line. The double-track main line of the railroad which crosses Liberty

Specially Designed Trestle Bents at the Carnegie Tracks

avenue carries all through freight and passenger traffic east and westbound between Pittsburgh and Youngstown, Akron, Cleveland, Chicago and all other points on the line west of Pittsburgh. For a 24-hr. period a traffic record taken for

one day showed 64 engines with trains and 41 light engines as passing over the crossing. During the same period 4,092 pedestrians, 1,703 vehicles and 358 street cars crossed the tracks.

By constructing the steel viaduct at a grade 7 ft. higher than the old one at the point of greatest change, it was pos-

A Section of the Retaining Wall

sible to eliminate the dangerous grade crossing at Liberty avenue, and secure an improved grade line for the entire distance. The plans were made accordingly. These plans also provided for a change in alignment to secure a better location for the main tracks and for the substitution of a 6 deg. 30 min. curve across Liberty avenue for the 9 deg. 30 min. curve in the old location. As built, the project involved 50,000 cu. yd. of fill, 50,000 lin. ft. of concrete piling, 25,000 cu. yd. of concrete and the erection of 4,000 tons of steel.

Unusual Conditions Encountered

In the district affected by the improvements numerous industrial plants join the right-of-way. A gantry yard also adjoins the main line just east of Liberty avenue. Interchange tracks were in service between the Pittsburgh Junction main line tracks and the Pennsylvania Railroad east of Liberty avenue and connection tracks with the Allegheny Valley Railroad, a part of the Pennsylvania system, and the river line of the Pittsburgh Junction Railroad west of Lib-

erty avenue. East of Liberty avenue the old main line tracks were at a level with the industrial and other tracks, while west of Liberty avenue ramp tracks formed the connections with the other roads, which crossed under the elevated structure in Thirty-third street.

East of Liberty avenue the plans for the improvement provided for 350 ft. of steel construction and raising the main tracks on an earth fill, leaving the yard and industrial tracks at the old level, making necessary the construction of 3,400 lin. ft. of retaining walls to sustain the fill under the main tracks. It also made it necessary to relocate the main line connections to the industrial and yard tracks. The maximum raise in grade in this section approximated 17 ft. and, to secure adequate overhead clearance, the grade of the Herron avenue bridge was raised. West of Liberty avenue the plans provided for the renewal of the steel viaduct in Thirty-third street at a grade above the old, the greatest grade change being approximately 7 ft. This change necessitated the reconstruction of the ramp connection tracks before mentioned and the raising of the track on the two easterly spans of the Allegheny river bridge. The construction plan adopted was hinged on the necessity of maintaining the heavy through traffic as well as the service to the various industries, yards, and connection tracks during the progress of the work. The restricted space in Thirty-third street added to the difficulties of construction under traffic and made necessary the use of special equipment.

The Improved Line

As is shown in the map and profile of the improvement, the new and old grades diverge just west of the Pennsylvania Railroad crossing. The connection between the two was made by means of a vertical curve, 1100 ft. long at the west end of which the new grade is 8.21 ft. above the old. The divergence of grades continues until the maximum separation of 17 ft. is made near Forfar street. Leaving Liberty avenue the grades converge gradually and join on the Allegheny river bridge. Only the two main tracks were raised to the new grades. On the north the main line connections to the industrial tracks were changed only in location, while on the south a ramp track was provided between the main and the low level yards at Liberty avenue.

To build the double-track line at the new grade it was necessary to provide a detour track and to operate a single track for a distance of 5,000 ft. during construction. Lack of space precluded the construction of two temporary tracks in Thirty-third street. Consequently the temporary track built by the American Bridge Company, contractors for the erection of the steel, from a point east of Liberty avenue to the river bridge was used for traffic purposes through this section. This track was constructed on the north side of the old tracks and of Thirty-third street, the detour being completed by building a temporary track about 600 ft. long between the American Bridge Company's high level track and the industrial tracks located on the north side of the main tracks. A ramp on a 1.5 per cent grade was provided between the high level track and the industrial tracks, and a gap was left in the north retaining wall to permit main track connections to be made with this detour track. The traffic over the single track detour was handled by an experienced telegraph operator stationed at

its easterly end who had control of train movements over the entire line. At the westerly end of the single track a switch tender and a signal operator worked under the direction of the operator at the other end.

Construction Progress

Work was begun on this project in September, 1915, and was continued without serious interruption till its completion early in 1917. As may be seen on the profile and map the change in the grade of the main track involved a maximum lift of approximately 17 ft. in the vicinity of the Herron avenue bridge. Approximately 50,000 cu. yd. of filling was placed by company forces in making this change in grade; 5,000 cu. yd. of which was secured from the excavation for the retaining walls and the remaining 45,000 cu. yd. was granulated slag and other materials secured from mills located along the lines of the system. In raising the main tracks to the new grade the traffic was diverted to the detour track and the tracks were jacked up in sections to permit the filling to be placed. No trestles were used.

In the old line, deck trusses were used to span the tracks at Herron avenue. These trusses cleared the top of the rail by only 24 ft. As the proposed raise in the tracks at the bridge was 16.8 ft., it was necessary to raise the bridge before the change in the grade of the tracks could be completed. In making the changes the clearance at the bridge was reduced to 21 ft., leaving a net raise of 13.8 ft. to be made. To avoid a corresponding raise in the roadway, through trusses were substituted in the span over the tracks.

Special Rigs Required for Driving Piles

In preparing the foundations for the retaining walls, bridge abutments and the pedestals supporting the steel viad-

duction piling for the steel viaduct in Thirty-third street were complicated both by surface and sub-surface conditions. Beneath the surface were city water and gas mains and an 8-ft. circular brick sewer, while in the street were located the tracks leading to the Carnegie Upper Union mills and the substructure for the old steel viaduct which occupied nearly the entire width of the street. The surface conditions were further complicated by the necessity of maintaining the high level detour track trestle on the north side of the viaduct. The trestle consisted of single timber frame bents and I-beam stringers ranging from 20 to 30 in. in

Arrangement of the Receiving Hopper and Delivery Pipes in Building the Concrete Wall

The Special Pile Driving Rig Used in Thirty-third Street

ducts, 50,000 lin. ft. of concrete piling was driven. The piles for the retaining walls and pedestals were cast-in-place and pre-cast piles were used in the piers and east abutment. The piles were driven for a 30-ton loading. The steel shells were furnished and driven by the Cranford Construction Company, Cincinnati, Ohio. The shells were withdrawn by means of six-way blocks.

The locating of the pedestals and the driving of the foun-

depth according to the length of the span except at Liberty avenue where double bents were erected to carry the temporary girders used in closing the opening over the street, and at the crossing of the Carnegie tracks. At the last point it was necessary to relocate the tracks to clear the falsework and to erect specially designed bents. The special construction is shown in one of the photographs.

Before locating the pedestals for the new viaduct a complete survey and a map of sub-surface conditions were made. Once the pedestals were located their construction was hampered by the surface conditions. Because of the limited headroom available it was necessary to employ a special rig in driving the foundation piles. This rig, which is shown in a photograph, was provided with 12-ft. leads and handled the steel shells in 8 ft. sections, leaving only 4 ft. available for the hammer. The shells were driven to depths as great as 56 ft. and the rig was equipped with a 6,000-lb. hammer to increase the efficiency of the driving. Frequently the headroom was so restricted that it became necessary to dig pits for the rig to secure ample clearance for its operation.

Concrete for Retaining Wall Distributed by Air

The change in the grade of the tracks east of Liberty avenue made necessary the construction of 3,450 lin. ft. of retaining walls of the gravity type. In considering means of placing the concrete the length of the wall influenced the decision to adopt the plan of utilizing compressed air.

This plan was followed out with complete success. By referring to the map it will be seen that the north wall extends 2,800 ft. east from the east abutment of the viaduct, while the south wall is about 600 ft. in length. Including

the length of the abutment the distance from end to end of walls measured along the wall is approximately 3,450 ft. To distribute the concrete through this distance by air pressure from a single central plant involved a maximum forcing distance of more than 1,500 ft.

The plant, which consisted of the mixers, boilers and the air compressor, was located on the north side of the main tracks near the center of the north wall. An 8-in. pipe was utilized to deliver the concrete from the plant to the forms. Blaw steel forms in 55-ft. sections were used throughout the work. These were mounted on wheels and were rolled forward by locomotive cranes as soon as a section of wall was sufficiently set to support the filling material.

The concrete was delivered to the forms under a pressure varying from 80 to 100 lb. At the start of the work the concrete was discharged directly into the forms, but the force of delivery was found to be too great for this practice and timber receiving hoppers were provided. These hoppers

The work was inaugurated under the general direction of I. J. Stuart, former chief engineer of the Baltimore and Ohio, and completed by R. N. Begien, his successor in office; W. S. Bouton, engineer of bridges, and Paul Didier, principal assistant engineer, were in direct charge of the work. The American Bridge Company was the contractor for the delivery and erection of the superstructure, the Cranford Construction Company, of Cincinnati, O., for the pile driving, and P. J. Joyce & Co., of New York, for the masonry.

ENGLISH "DOUBLE-HOME RAILWAYMEN."—A deputation of railwaymen was recently introduced to Lord Rhondda, the British Food Controller, by G. H. Thomas, general secretary of the National Union of Railwaymen, to point out the difficulties of about 43,000 trainmen, known as "double-home men," who had to sleep away from home probably every other night. In some few of these cases the

The Steel Forms Were Mounted on Wheels and Rolled to Place by a Locomotive Crane

were placed on the top of the forms and were fitted with flexible gravity discharge pipes by means of which the delivery of the concrete to the forms was controlled. The arrangement of the hoppers, and delivery and discharge pipes in reference to the forms is shown in one of the photographs.

The structural steel for the viaduct was delivered and stored in a storage yard just south of the west end of the viaduct, and, with traffic diverted over the detour trestle, the steel work between the east end of the river spans and the clearance line of the temporary structure was erected under traffic; that is, the old steel was removed and the new steel placed between trains. From this point to the east end of the improvement, the old structure was removed and the new structure placed without direct interference from traffic, by means of derrick cars and locomotive cranes, operating on the new structure, and removing the old steel and placing the new as they advanced.

men stayed in barracks or hostels provided by the railway companies, but the majority of the men stayed in lodgings. Ordinarily they took their food with them and had it cooked at the other end, but now there was a difficulty in their obtaining the food at home, and the landladies could not buy it for them, as they had not enough for themselves. Mr. Thomas suggested that the railway companies themselves might supply the men with food from their refreshment rooms, or from specially accumulated stocks. He also urged that, as a railwayman was frequently called upon to do nine or ten shifts a week, no system of rationing would be fair which did not take into account the necessary dividing up of his week into practically nine or ten days. Lord Rhondda, in reply, said that he fully realized the very exceptional circumstances and he hoped it would be possible to make arrangements to meet the difficulties of railwaymen who had to sleep from home.

General View of Ambulance Train No. 59 for the United States Army

An Ambulance Train for the United States Army

Runs Between the Front and Base Hospitals in France;
Built by Lancashire & Yorkshire Railway

THE LANCASHIRE & YORKSHIRE RAILWAY has just completed an ambulance train for the United States army, which is the sixth ambulance train constructed by this company since the war began. Two of these have been in constant use in Great Britain and four have been built for use on the continent. The company also has in progress two further trains for the United States army which will shortly be completed.

The latest train, which is intended for the conveyance of

The description of the train and the photographs which are here reproduced have been made available through the courtesy of Sir John Aspinall, general manager of the Lancashire & Yorkshire.

The train consists of 16 cars and has a total length of 948 ft. and weighs 442 (British) tons, when unloaded. It is vestibuled throughout and fitted with electric lights and fans, and there is a total water supply on the train of 3,100 gallons. The exterior of the train is painted khaki, with a Red Cross and the letters "U. S." on both sides of each vehicle, together with the car and medical numbers. The train is heated throughout by steam and each car is fitted with a hand brake and the Westinghouse automatic air brake. There are altogether 418 cots and berths in the train for patients and personnel, and when the bottom cots are used for sitting-up cases accommodation is provided for a total of 650 persons. Emergency salvage tools such as saws, axes, hammers and crowbars, are carried on the train, and extinguishers in all ward cars, kitchens, and the pharmacy. A set of workmen's tools is also provided in the stores van.

Ward Cars

There are ten ward cars on the train, nine of which are fitted with 36 cots each for lying-down cases, or a total of 324 beds, and the other being divided into four sections with a total of 24 cots for infectious cases.

The cars are each 56 ft. long and 9 ft. wide, a pair of double doors being arranged on either side near the center of the car with ample space for the easy manipulation of stretchers. Each car has its interior finished throughout in white enamel which tends to give the wards a bright and cheerful appearance. A supply of water is carried on each car in tanks with a capacity of 150 gal. each, which are built in the roof of the vehicle, and a six-gallon tank for drinking water is fixed near the center of each ward.

For ventilation purposes both fixed and portable electric fans are provided; a small bracket and electric plug are arranged opposite each cot for the portable fans to be used for gas cases. Further ventilation of the car is secured by means of side drop windows and a large number of air extractors placed in the roof.

The cots in all the ward cars are arranged in three tiers, and owing to the variation in the cases received for transfer to the hospital bases, the cots have been designed so that the center tier may be hinged down to form a back to allow of the bottom cots being used as seats, thus doubling the accommodation; at the same time the top tier of beds may be

Ward Car, with Cots Arranged for Lying-down Cases

wounded United States soldiers from the front to the base hospitals on the Continent is similar in general design to the ambulance trains previously built for the British War Office, but as the result of experience gained in the construction of these trains improvements have been made with a view to adding to the comfort and alleviating the sufferings of the sick and wounded soldiers. Everything possible has been arranged for ease in the transport of the wounded men, and for their welfare and treatment while on the journey to the base hospital, the equipment of the train being of the most complete description, and the workmanship and finish of the cars of the highest quality. At the same time every attention has been paid to providing the best arrangements for the accommodation and convenience of the medical officers, nurses, non-commissioned officers, and orderlies who travel with the train to look after the patients.

used for lying-down patients. All the mattresses are filled with wood fiber, and one flock and one feather pillow is supplied for each cot. In order to safeguard the transit of patients, two straps are fixed on the outside of each bed. The cots are numbered the same as in ordinary hospitals, and each ward is supplied with camp stools for the use of the nurses and portable stools for use when lifting patients

Ward Car, with Bottom Cots Arranged for Sitting-up Cases

into the top berths. A small drop table is fitted to the side of the car.

At the corners of the floor the linoleum is well rounded; this method is adopted throughout the train for hygienic purposes. Lavatory and cupboard accommodation are provided at the end of each of the ward cars. Ample provision has been made in the brake van and stores car for the conveyance of food, a desk also being fitted for the use of the storekeeper. Other little details have also been considered for the convenience of the patients, such as the provision of

Interior of the Pharmacy Car

paper racks, portable electric lamps, cuspidors and ash trays.

Pharmacy Car

This car is divided into five compartments consisting of a ward fitted with twelve cots, pharmacy, office, emergency room and stores. The car is placed in the center of the train with ward cars on either side. It has ample space for patients waiting to be dressed, and is fitted with cupboards, a folding table, hot water heater, sterilizer and sink.

One of the special features of the train is that patients can be carried on a stretcher from any of the nine ward cars into the pharmacy, the minimum gangway being 2 ft. 6 in. wide. The pharmacy car has water tanks of 500 gal. capacity, and two drinking water tanks each of six gallons capacity. The office is provided with a table, chair, cupboards, safe, and other necessary fittings. A soiled linen cupboard is fitted at the end of the car opposite the stores. The center electric light in the pharmacy portion of this car consists of a cluster of five lamps, all of which can be brought into use at once to give a greater amount of light when required for operations.

Kitchen Cars

There are two well appointed kitchen cars on the train, each 56 ft. long by 9 ft. wide, containing kitchens, 20 ft. long by 8 ft. 3 in. wide inside. One car has a linen store,

Nurses' Dining Room in the Staff Car

officers' pantry, cooks' room, sitting room for sick officers and bath room, and the other has, in addition to the kitchen, a personnel mess room, stores for officers' kits, and a mess room and lavatory for non-commissioned officers.

The kitchens are fitted with the French standard army range to burn coal, coke, or anthracite. This range has a copper boiler and hot water installation to keep a constant supply of 50 gal. of hot water. On the range are boiling pans recessed into the top plate and at the back over these pans is a water tap for filling purposes. A dresser, washing-up sink, hot and cold water supplies, and refrigerator are also fitted. A Sayer's stove is provided for use in case of emergency. The water tanks arranged in the roof have a capacity in each of these cars of 400 and 350 gal. respectively, and are fitted with gages, this feature applying to all water tanks throughout the train.

Electric fans are fitted in the kitchens, sitting room for

sick officers, cooks', personnel, and non-commissioned officers' mess rooms, the latter being provided with a seat which can be arranged to form two sleeping berths. The bath room has a white enamelled bath with hot and cold water supply, a folding wash basin, chair, sponge racks and other fittings. In addition, water may be heated by means of a steam jet from the engine.

Staff Car

This car gives accommodation for four medical officers and four nurses, and is provided with day and sleeping

Kitchen Car—Looking Towards the Range and
Soyer's Stove

compartments. The medical officers' mess room at one end of the car is fitted with a dining table and chairs, together with cupboards and shelves, and an electric fan. At one end is a lounge which can be arranged as a bed if required. There are three compartments with berths for the medical officers immediately adjacent to their mess room and entered from a side corridor. The berths are arranged on one side

Kitchen Car—Sitting and Dining Room for Sick Officers

of each compartment, and a seat portion can be drawn forward to make up a berth. On the opposite side is arranged a wardrobe, writing table, net rack, book shelves and a chair. For the use of the nurses a mess room has been provided at the other end of the car.

One of the features in this vehicle is that in addition to

the ordinary heating apparatus a self-contained stove and hot water system is provided to heat the car when standing in sidings. This has been arranged on account of the staff being regularly on the train.

The remainder of the personnel has accommodation in a separate car, and 33 cots are provided of a similar design to those in the ward cars so that the car can be used for carrying patients in emergency. The staff car is also provided with a self-contained heating apparatus.

This train, as well as the other hospital trains which have been fitted up by the Lancashire & Yorkshire, was built under the supervision of Geo. Hughes, chief mechanical engineer, at the road's carriage and wagon works at Newton Heath, Manchester. The composition of the train, which is designated as No. 59, is shown in the table:

| Number of cars | Accommodations for |
|---|----------------------------------|
| 1 Brake van with four infectious wards. | { 24 Infectious lying-down cases |
| 1 Staff car | { 1 Train guard. |
| 1 Kitchen car with sitting room for sick officers | { 4 Medical officers. |
| 4 Ward cars | { 4 Nurses. |
| 1 Pharmacy car | { 3 Cooks. |
| 5 Ward cars | { 10 Officers. |
| 1 Kitchen car | { 144 Lying-down cases. |
| 1 Personnel car | { 12 Lying-down serious cases. |
| 1 Brake van and stores car. | { 180 Lying-down cases. |
| 16 Cars | { 2 Non-commissioned officers. |
| | { 33 Orderlies. |
| | { 1 Train guard. |
| | { 418 Persons. |

With the bottom beds in the ward cars used for sitting-up cases, the accommodation is increased to 650.

The Most Remarkable Picture of the War

MANY STARTLING PICTURES have come to us from the war zone, but the one on the facing page, considering that it shows the activities behind the German lines as viewed by a French observer, is probably the most remarkable. The view shows a military railway destroyed by 420 mm. French shells and a new railway line which was built to replace it.

The following key is the identical information which was transferred to the French army staff. The photograph is practically the first of its kind to reach this country.

Key to Airplane Picture

1. Supply railway trains running on newly laid tracks.
2. Piles of supplies, chiefly timbers for use in building dugouts.
3. Rolls of barbed wire.
4. Piles of iron stakes for stringing barbed wire.
5. Steel roofing for dugouts.
6. Site of railroad station before it was destroyed by French artillery. Note the big shell craters (about 60 ft. across) caused by 420 mm. shells.
- 7-8-9. Remains of former railway tracks where they entered the station.
10. Broken ties of former railway tracks.
11. Other supplies piled up. Perishable goods covered with tent cloth.
12. Battery of four guns, with abris for the gunners.
13. Commander's dugout.
14. Ammunition park. Note the German soldiers standing around.
15. German soldiers standing in the road watching the French airplane.

The Destruction of a Railway Behind the German Lines as Viewed by a French Observer

Railway Personnel Under Government Control

Corporate Organizations Separated from Operating Functions; Policy of the Railroad Administration

WASHINGTON, D. C.

ONE OF THE MOST INTERESTING features of the plan of government control of the railroads is the effect that it is having and is likely to have on the personnel of the railroad organizations.

The process of railroad unification under government control has already progressed far enough to have an important effect in this respect and as the policies of the director general are being gradually developed and put into practice it is becoming apparent that some of the effects are likely to be even more far-reaching than was fully realized at the outset. While it has not yet been made entirely clear just how the policy is to be applied in specific instances, there have now been enough indications to give a fairly clear idea of what is to be expected in a general way, although there are many rumors as to still more drastic changes concerning which it is still impossible to speak with certainty.

The first effect on railroad personnel was the drawing into the government service of a considerable number of prominent railway officers as members of the organization of the Railroad Administration. Most of these appointments have been announced from time to time in the *Railway Age*, although there are several men who have been serving in the organization at Washington and elsewhere whose status has not been made permanent. In most cases the railroad officers who have been appointed to positions in the government organization have resigned all connection with their railroad companies and other corporations and in some instances the positions they formerly occupied have been filled by promotions.

Many of the other changes which are taking place or are under consideration result from the elimination of competition between railroads and their effect will be most noticeable in the traffic department. Others result from the separation of the financial and corporate organization of the companies from all connection with the operation of the properties, while still others result from the change in the relations of the roads to the government. Practically all of them are more or less influenced by the desire of the Railroad Administration to take advantage of the possibilities of unified operation to effect economies in operation, to offset in part, at least, the effect of the constantly increasing tendency toward increased expenses in nearly every direction, including the expected large increase in wages.

The fact that the government is directing the operation of the railroads has made unnecessary, from the govern-

ment's standpoint, many functions formerly carried on by the railway companies, and Director General McAdoo has made it clear that he does not intend to have the government pay for them. As the government is to pay the companies a fixed compensation for the use of their properties and is to collect the revenues and pay the expenses, it is apparent that all items of operating expense are in effect paid by the government. Mr. McAdoo's decisions on this subject, therefore, take the form of an order that the expense

concerned is no longer to be charged to operation, leaving the companies free to continue it, if they desire to do so, by charging it to the corporate accounts to be defrayed from the amounts they will receive from the government as compensation for the use of their properties.

It is assumed that the companies will consider it necessary to retain most of their general officers thus released, even though they may not be necessary to the purposes of the government. To the extent that they do retain them, the amount of their compensation from the government available for other purposes will therefore be reduced by the amount of the salaries and expenses involved that were formerly charged to operation. While the total expense of this kind would be smaller as compared with the total compensation it would be proportionately four times as large in comparison with a corporate income of \$950,000,000 as in comparison with total operating revenues of approximately \$4,000,000,000.

General Order No. 6

The first announcement of the policy of reduction of operating expenses by curtailing payments of salaries and expenses of officers and organizations came in General Order No. 6, issued in January, which provided that operating revenues should not be expended for the employment of attorneys not actually engaged in necessary legal work, legislative agents, or associations or organizations of carriers except as approved by the director general.

Because this order was not entirely specific and because of the difficulty of deciding what organizations were to be considered necessary most of them were authorized to continue until April 30, pending an investigation, which is still in progress, as to whether they are necessary to the operation of the roads under the circumstances.

The next manifestation of the same tendency was the issuance of a circular calling for information regarding the expenses of financial and corporate offices in New York and

A Liberty Loan Message

To Officers and Employees of Railroads
Southern Territory

By C. H. Markham

Regional Director, United States Railroad Administration,
Southern Territory

The honor and the resources of the richest government on earth are security for the Liberty Bonds and both are unimpeachable. Not only should we regard it as our patriotic duty to subscribe but we should consider it a great privilege to be able to contribute substantially toward sustaining our brave soldiers and sailors who are fighting for our safety and our honor.

We also owe it to our gallant Allies, who for four years have shed their blood and severely taxed their resources in defense of the liberties of the world, that they should be supported to the limit of our resources, not only in men but in money.

The obligation rests upon each and all of us to do and to contribute without stint. Do not stop with what you can readily spare. Only by united and constant sacrifice can we hope or shall we deserve to win.

There is no more important government service than rail transportation, and while you are faithful and efficient in this, the occasion demands more than mere performance of duty; it demands a sacrifice. I confidently appeal to you to subscribe to the fullest extent of your ability.

elsewhere. This was followed by an order on March 18 that the expenses of railroad offices, including salaries of officers devoted to financial and corporate affairs as distinguished from operation, should not be charged to operating expenses after April 1, except as expressly authorized by the Railroad Administration. The circular stated that carriers claiming that a part of such expense should be chargeable to government operation might file a statement of such claim for consideration.

It is understood that for a time the Railroad Administration contemplated a plan by which a part of certain office expenses or salaries might be charged to operation and a part to the corporate accounts, but that later this plan was deemed impracticable.

The policy as to the separation of the financial and corporate organization from the operating organization of the companies was further outlined in a general order that chairmen of boards of directors or of committees thereof shall not exercise functions connected with the operation of the railroads under federal control and in the circular stating that the director general is of opinion that the government ought not to pay the salaries and office and traveling expenses of officers whose services are not reasonably required for the operation of the railroads.

Corporations Separated from Properties

This makes it perfectly clear that the corporations are definitely separated from all control over their properties for the period of government control. Their situation has been illustrated by the analogy of a landlord who has leased his property to a tenant and who naturally expects to pay his own office and other operating expenses from his income from the rental. His contract or lease may provide for his making additions and improvements to the property

from time to time and also that the tenant shall maintain the property in good repair or pay for any failure to do so. In the case of the railroads the situation is somewhat complicated by the fact that the roads were taken over under the supreme war powers of the President, without any contract or conditions, and that the contracts are being negotiated after the property has been in the control of the government for over three months.

In some of the preliminary discussions of the subject, such as those which took place during the hearings before the congressional committees before the enactment of the railroad control law, some of the statements made to describe the situation were somewhat hazy. At one time Mr. McAdoo referred to his administration as having been superimposed upon that of the railroads and of the corporations as the agencies of the government to carry on the operation of the roads. He and other representatives of the administration consistently referred to the new regime as "government control" of railroad operation, rather than as government opera-

tion. Whether or not the term "control" was regarded as preferable to "operation" during the period when transportation was in a state of semi-paralysis caused by the unprecedented weather of January, it is now evident that the government is actually operating the properties. It is enforcing its own policies, it has formed its own organization, and instead of treating the corporations as its agencies it is treating them as landlords with which it has no relation except the obligation to pay the guaranteed compensation, (the amount of which is still to a considerable extent within its control, subject to the right of court review) and to adequately maintain the properties or pay for any failure to do so. In General Order No. 17 provision was made for keeping two sets of books for each company, one set to be known as federal books and to contain the operating accounts, and one set for the corporate accounts.

While the exact interpretation to be placed on the various orders that corporate expenses are not to be charged to operation has not been made clear, the administration has served notice that any expense which it considers to have been improperly charged may be charged back against the corporation after April 1. This indicates that it expects the companies, with their own knowledge of the facts in each case, to make the decision for themselves as to which officers and offices were reasonably necessary to operation, while reserving to itself the power of ultimate determination after consideration of the circumstances.

At any rate it would appear certain that the government does not expect to pay the expenses of such offices as stock transfer and bond registering offices or any of the expenses incident to the payment of dividends and interest, which in the case of an operating company were naturally included in operating expenses. It is also clear that the salaries of

chairmen of boards and of executive committees, and of the boards of directors themselves, are to be charged to the corporate accounts. In the case of roads that have financial vice-presidents it would naturally be assumed that they would also remain with the corporation and the same would be true of counsel with offices in New York whose principal functions were to advise the directors. There are numerous instances, however, where counsel located in New York in the case of eastern roads, were actually in charge of the legal work of the company pertaining to operation and where the general counsel or legal vice-president, although located at the headquarters of the road, devoted his attention mainly to corporate affairs and perhaps received a larger salary by reason of that fact than he otherwise would have been paid.

It is understood that many of these instances in the "twilight zone," as it were, have been decided by the companies themselves, with or without the advice of officers of the Railroad Administration, and that others are being con-

"While My Brother Suffered for Me, I, Too, Made Sacrifices"

By Wm. J. Harahan

President, Seaboard Air Line

The part the one and a half million railway employees with a daily wage of \$4,000,000 should play in the present crisis is to match with service and money the sacrifices of those from our ranks who with their bodies and brains shall free us from threatened autocracy and deliver us a guaranty of safety as a free people. The blow that is necessary to accomplish this end must be backed by the concentrated power of one hundred million people. The Third Liberty Loan is an arch stone upon which all else depends. Food, ships, clothing, ammunition, guns, aeroplanes and all those things of which our men must have a never-ending supply cannot materialize without money.

The third issue is for more than one-half the coined and paper money of the United States. The railroad employees must therefore give freely of their money and of their credit.

The offer made by the railroads of this country by direction of the Director General to purchase for employees bonds to be repaid in monthly payments from future wages should meet with such joyous and liberal response that each may say, "While my brother suffered for me, I, too, made sacrifices."

sidered by the administration. For example, word has occasionally been brought to Washington by railroad officers that this or that officer will probably remain with the corporation while certain others will remain with the operating organization; and Mr. McAdoo's circular has made it plain that he expects the counsel who are now representing the companies in the negotiations with the law department of the administration, regarding the form of contract covering the compensation, to be charged to the corporate accounts.

Executive Officers

As to the executive officers the question is raised as to what will be done in the cases where there is no chairman of the board or of the executive committee other than the president. Herewith is a list of 50 leading railroad companies with the names of the chairmen or presidents or both. Under Mr. McAdoo's order the chairmen are definitely separated from the operating organizations. Apparently it

will be necessary for each company which has a president as its chief executive officer to decide whether it wishes to retain him as the head of the corporation or whether to allow him to remain as the operating head under Mr. McAdoo's control. At present such men are in what may sometimes be an embarrassing position of divided allegiance, to the company that engaged their services and to the government that is now operating the property and paying the salaries. Even before the director general issued any order

on the subject the opinion was expressed by some railroad officers that men working either in Mr. McAdoo's own organization or under his control in charge of a railroad would eventually find it necessary to separate themselves from their corporations. There have been some rumors, as yet without confirmation, that Mr. McAdoo would decide eventually to dispense with the services of the presidents altogether on the theory that he and his staff are assuming the executive responsibility and functions which formerly rested with the head of each company.

In some cases the boards of directors have elected chairmen to succeed men who have resigned to become connected with the Railroad Administration. The Union Pacific elected C. B. Seger, chairman of the executive committee in place of Judge Lovett, and the Western Maryland elected L. Greer both chairman and president succeeding Carl R. Gray. The Atchison did not elect a successor to Walker D. Hines. Marvin Hughitt has resigned as chairman of the Chicago & North Western and no successor was elected.

Many chairmen, such as George B. Harris of the Burlington, are men advanced in years who have served as presidents and have practically retired from active affairs. Others, such as Frank Trumbull of the Chesapeake & Ohio, are active but devote their attention primarily to the larger questions of finance and policy. Others, such as John G. Shedd of the Rock Island, are not practical railroad men but represent financial interests in the road. Julius Krutchschmitt is the active operating executive of the Southern Pacific with three presidents under him.

If the presidents should be displaced undoubtedly some of the inactive chairmen might retire and the presidents could be elected chairmen, but this would remove from the field of railroad operations some of the ablest railroad officers and would be a distinct loss to the service.

An article outlining the policy already indicated or expected to be followed as to the reorganization of the traffic department was published in the *Railway Age* of April 5. This policy has since been confirmed by the issuance of definite orders by the regional directors, ordering the discontinuance of all off-line traffic offices and the discontinuance or consolidation of city freight and ticket offices. A previous order had discontinued most of the advertising and publicity work. Orders were issued by Mr. McAdoo, that the employees released by these orders were to be assigned to other duties to the extent possible, but to what extent he expects to be able to continue the services of traffic officers has not yet been announced.

FRENCH RAILWAYS AID DEFENSE OF AMIENS.—The dis-
appointment of Germany at the check to the offensive which was to end the war is considerable, says a correspondent of the New York Globe in a cable from Paris dated April 9. He says that the skill and rapidity with which the French troops were transported during those critical days is deserving of the highest praise. The camion service plied on all the roads day and night without a single hitch. The routing had to be done long before to meet every possible contingency. The chauffeurs drove night and day until they dropped from the seats. Even more important was the work of the railways, which were ready in advance for every emergency. The lines used by the Germans descend fanlike from Belgium into France, giving a considerable advantage over the French, whose roads parallel the front, and require transport for greater distances. The French roads were used to their absolute maximum, the equipment being supplemented by material borrowed from lines not immediately concerned. The railway men all worked at the greatest good humor for several days without sleep, carrying men, horses, guns, wagons, munitions, and supplies of every kind to the front and bringing back the wounded and the fleeing civil population.

Tentative Specifications for Standard Locomotives

General Dimensions of the Proposed Standards Have Been
Issued with Request for Number Desired

WHILE THE DETAILS of the designs of the standard locomotives for the United States government have not been completed a tentative specification has been drawn up giving the general dimensions of the 12 locomotives proposed. These have been sent to the railway companies with a request for the number of each design the road will need to meet its requirements for new locomotives this

coal capacity of 10 tons. Unless some good and sufficient reason is given with the order for the different locomotives the tenders shown with the specifications of the locomotives will be provided. The circular accompanying the specifications included a statement to the effect that special design for extreme grades or other operating features which require heavier locomotives than those included in the specifications

*Equivalent heating surface = total heating surface ÷ 1.15 for superheater surface.

year. No discussion of the designs was requested. The roads were cautioned to check the limiting dimensions carefully and to allow for axle loads slightly heavier than those shown, as an added precaution, for it may be possible that after the locomotives are built the axle loads will be higher than those shown in the tentative specifications.

There are three designs of tenders to be used with the 12 different locomotives, one having a capacity of 8,000 gal., another 10,000 gal., and the third 12,000 gal., all having a

were too few and extreme to require standardizing. It was also stated that requirements for locomotives for roads which could not operate locomotives of the wheel loads of the standard locomotives would be filled with locomotives of lighter axle load, which would be released by the standard locomotives.

A general outline of the different types of locomotives proposed and a list of the general dimensions and data is given in the illustrations and tables. In the main it has been the

desire of the committee designing the locomotives to provide designs which will best meet average conditions. For instance, freight locomotives of the Mikado, Santa Fe and Mallet types

creasing the boiler pressure. The Pacific and Mountain type locomotives for passenger service have tractive efforts of 40,700 lb., 43,800 lb., 53,900 lb. and 58,000 lb. The six-

Outline of U. S. Standard Mikado Type Locomotive

*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

73-in. wheel, the heavy Pacific a 79-in. wheel and both the Mountain types a 69-in. wheel. The wheels of both switchers are 51 in. in diameter. Superheaters and brick arches are used on all of the locomotives, and it has been said that the Santa Fe and Mallet types will be equipped with stokers. All designs except the switchers are provided with combustion chambers. It may be said that with a possible exception

Outline of Standard Pacific Type

of the two Pacific type locomotives, the boilers are of ample capacity.

The locomotives are all designed to traverse 19 deg. curves and grades of two per cent. The clearance limitations are practically alike, the over-all height being 15 ft., with the exception of the heavy Santa Fe type and the 2-8-8-2 Mallet, which have height clearance of 15 ft. 9 in. The width over

Outline of Standard Mountain Type

cylinders is 10 ft. 4 in. for all designs, with the exception of the heavy Santa Fe type and the large Mallet, which is 10 ft. 9 in. and the smaller Mallet, which is 10 ft. 6 in. The width over cab body and over cab eaves, including the cab handles, is the same for all designs, being 10 ft. in the first case and 10 ft. 2 in. in the second.

A casual study of these limitations indicates that there

Outline of Standard Six-Wheel Switcher

will be some difficulties, particularly around terminals, due to low bridges. The Boston & Maine has three bridges around Boston with a clearance of 14 ft. 9 in. There are the same limitations on some bridges in the vicinity of the Union Station in Cincinnati; between the Chicago Terminal and the California yards of the North Western there is a

Outline of Standard Eight-Wheel Switcher

limitation of 14 ft. 10 in. and on the C. B. & Q. between St. Louis and East St. Louis the limitations are 14 ft. 7 in. On the Michigan Central at Detroit the minimum clearance is 14 ft. 3 in. On the main line of the Chesapeake & Ohio, between Charlottesville and Clifton Forge, Va., a distance of 116 miles, the minimum clearance is 15 ft. This is in a

mountainous territory and it will be impossible to use either the heavy Santa Fe type or the 2-8-8-2 Mallet. The 2-6-6-2 Mallet will, however, come within these limitations. The Hoosic tunnel of the Boston & Maine has a height clearance of 14 ft. 8 in., which will prevent any of these standard locomotives passing through this tunnel.

It has been said that all roads requiring new locomotives are to be supplied with these standard designs and that any change that will be required to meet local conditions, such as will be necessary according to the grades of coal used, will have to be made by the railroads, as the locomotives are received from the builders.

Electric Switch Machines

With Distant Control

THE LOW-VOLTAGE SWITCH MACHINE is coming to be more extensively appreciated. The New York, New

Haven & Hartford is installing these machines at about 25 switches which are approximately one mile distant from the nearest signal station, and in their use will be able to save from five to ten or more minutes' time for each of numerous heavy freight trains, every day, by doing away with the stops which hitherto have been necessary, for such trains, to allow a trainman to set switches by hand preparatory to entering side tracks. This time, say an average of 7 minutes, is the estimated loss every time that a train has to go into a passing track to make way for a faster train. The switch machines are to be placed at all of the passing-track switches between New Haven and Boston which are not already operated from towers.

This investment of the New Haven road, amounting with signal changes to perhaps \$100,000, affords an interesting illustration of careful adaptation of the best methods and facilities under rather unfavorable circumstances. The portion of the line on which these machines are to be installed is that from New Haven, Conn., to Readville, Mass., 147 miles; that portion of the main line between New York and Boston which has not been four-tracked. This section is operated by the controlled manual block system, the signal towers in most cases being in the same locations at which

Fig. 1.—Signal Station with Two Passing Tracks.

they were placed when the system was put in operation about 25 years ago.

Nearly or quite all of the passing sidings on these divisions are so located that their outlets are at or near the block signal tower; and originally they were connected with the main track only at the outgoing end; all trains had to be backed in. (See Fig. 1.) As traffic has increased, these tracks have had to be lengthened and further point switches have been added, by which to let freight trains onto the sidings; and to insure safety, under the manual block operation these switches, hand-operated, have been electrically locked the lock being controlled by the signal station in the rear.

These sidings, 20 or more in number, are now provided liberally for both eastbound and westbound trains. They are long enough to hold 100-car trains and their locations are roughly indicated on the large drawing (A few of the switches were already electrically operated.) With hand-thrown switches the ordinary procedure, with a train having to make way for a passenger train, is to bring it to a stop before reaching the switch and to communicate by bell code

or telephone with the signal cabin; and, having got the switch unlocked, to move the train into the siding; the trainman at the rear of the train must then set the switch straight, and advise the signalman in the cabin that the main track is clear. With the long and heavy trains now common in through freight service this, of course, is a time-consuming process at best; and if, because of difficulty in starting, or for any reason, a coupling is broken, the delay may be considerable.

The stations at which these long sidings are situated, some stations having two and others having one, are as follows, the first six being in Connecticut, the next six in Rhode Is-

A typical station, that at East Haven, six miles from New Haven, is shown in Fig. 2. The switches remotely operated are those at the extreme left (or west) end of the drawing, about 4,200 ft. from the tower. The signals for these switches, A, B and F, are also operated by low-voltage machines. The Hayes derails, C and F, are operated with the switches, and the same is true of the three pot-signals at this location. These pot-signals, for westbound movements on track 6, westbound movements on track 2 and eastbound movements on track 1, are used very infrequently.

At electric interlockings, the new switches and signals to be added will be operated at 110 volts, the same as the ma-

Not to Scale

land and the other four in Massachusetts: East Haven, Madison, Clinton, Sound View, Midway, Stonington, Westerly, Bradford, Wood River Junction, Kingston, Wickford Junction, East Greenwich, East Junction, Attleboro, Mansfield and Sharon Heights. At Westerly there is an electric interlocking, but at all of the other cabins at which the long sidings are to be signaled the interlocking is mechanical.

A low-voltage switch machine has been in operation at East Greenwich for about two years, with satisfactory results. Electric power at 110 volts or higher is not conveniently available at this point and the use of a low voltage current, which can be supplied by either a primary or a storage battery, affords substantially all of the advantages of remote operation (making hand-throwing of switches unnecessary) at a reasonable cost. The only disadvantage, the slow movement of the switch, is no disadvantage at all, as the signalman has several minutes in which to make each movement.

chines and signals now in service, and power at 110 volts is available at one other place.

At all of the locations track circuits are to be installed to provide complete approach and detector locking. Whenever automatic block signals shall be introduced on this part of the road, the direct current motors, and other apparatus, can be replaced with alternating current equipment, and the arrangement of track circuits can remain practically unchanged. The switch-and-lock movements are operated at 20 volts, and they are about equally divided between the Union Switch & Signal Company's type M and the General Railway Signal Company's model 5. All of the signals are of the General Railway Signal Company's 2A type. Power for the low-voltage machines is supplied from three sets of four cells each of Exide storage battery. Facilities have been provided at division headquarters for recharging these batteries at stated intervals. It is cal-

Locations Indicated by Crosses (X).

Distances: New Haven eastward to New London, 51 miles; New London to East Greenwich, 50 miles; East Greenwich to Readville, 47 miles, and to Boston, 57 miles.

It is the favorable experience at this point which has led to the more extensive use here described. To secure the benefits of electrical operation of distant switches by any other means would be practically out of the question. To establish and maintain power plants at each station would involve prohibitive cost, while the purchase of power from local sources (where practicable) would introduce undesirable complications.

These long sidings do not comprise the whole of the facilities for running fast trains past slow trains, as there are several short sections of four-track line. The entrances to (and exits from) the sidings are in all cases through No. 20 turnouts, allowing speeds of 25 miles an hour and even faster.

culated that with the normal load—switch, switch lock, derail (pipe connected) and detector bar—a movement will be made in 35 seconds. The low-voltage machine will clear a signal in about 15 seconds.

The stations between New Haven and Boston, so far as they are of interest in connection with this article, are shown in the table, with the distances from New Haven.

The sketch of the line, shown below, is intended merely to show the relative locations of the passing tracks; and the stations are indicated by initials only. Each signal station (tower) is indicated by a small square, and the electric switch movements are indicated by small crosses. For example, at East Greenwich there are operated from the tower three low-

voltage machines; two on the west cone for eastbound trains entering the eastbound siding, one for westbound trains leaving the westbound, and one machine on the east for eastbound trains leaving). The letter *L* at a station, shown be-

low the track line, indicates an electric interlocking, with all switches and signals worked by 110-volt motors. No sidings

DURING THE RECENT severely cold weather there has been developed a novel and very interesting adaptation of the pneumatic tie tamper to break up frozen coal in unloading hopper bottom cars, and it is said that excellent results have been obtained at coal depots around New York, Chicago and several of the lake ports where the scheme has been introduced. At Chicago the tampers have also been applied to picking frozen ore in cars, clearing mill scale from the chutes at steel mills and breaking up frozen scale in gondola cars. At one point where the tampers were being used the experiment was tried of putting the tamper against the side of a car of unfrozen soft coal. The vibration set up caused the coal to let go and move out of the car with a rush.

For this work the tamping machines have been fitted with pointed picks in place of the usual tamping bars. The tools are of sufficiently light weight to afford convenient handling regardless of the work or its location. The two center pho-

Emptying a Car of Coal

are shown in the sketch. Those sections where more than two tracks are shown on the drawing indicate short pieces of road operated as four-track from one signal station to another (or, as at Wickford Junction and Mansfield, a freight running track extending from one station to the next station).

SWEDISH FUND FOR SUPPORTING FOREIGN TRADE AFTER WAR.—The Finance Minister has made a suggestion to the Swedish Parliament that the government create a fund for the operation and guaranteeing of a company to support foreign trade after the war, and especially to arrange for the import of necessary goods. It is proposed that the company have a capital stock of \$2,680,000, and that this stock be offered to a syndicate of banks which have already expressed a wish to subscribe. The stock is to be guaranteed by deposit of government bonds.—*Commerce Reports.*

topographs show the starting and the last stage in unloading a solidly frozen car of buckwheat anthracite after the usual steam thawing had been completed. At this coal dock it was found advantageous to station one man outside the car, as shown in the photograph at the left, to break up the lumps which clogged the chute. The general opinion is that the tampers are most effective in frozen bituminous and the smaller sizes of anthracite coal.

FREIGHT CARS TAKE WOUNDED TO GERMANY.—Trains carrying wounded Germans from the battle front in France are proceeding continuously along the frontier between Germany and Holland, according to a despatch to the *Telegraaf* from Kerkrade. It has been necessary to replace hospital cars by freight cars, in which the wounded lie on straw and shavings.

Hughitt Retires as North Western Chairman

Resigns After 46 Years of Service, Including 7½ Years as
Head of Board of Directors and 23 Years as President

THE RESIGNATION OF MARVIN HUGHITT as chairman of the board of directors of the Chicago & North Western marks the close of a career of nearly half a century with that company, during more than 30 years of which he has directed its affairs. This alone is an unusual record, which is rendered more remarkable by the consistently sound and excellent management of the property during the period of his leadership. In fact, it may well be said that in guiding the development of the North Western System Mr. Hughitt has built a great living monument to his own genius,—a justifiable source of pride as he lays down the reins in favor of younger men.

While it is difficult to avoid the use of superlatives in passing judgment on his work, Mr. Hughitt has always entertained a distaste for overdrawn publicity and has preferred to discharge his duties quietly and energetically with the one end in view of serving the public and strengthening his road. He has never undertaken any project or initiated any policy for the purpose of firing popular imagination nor has he ever yielded to the pressure of the political passions or fads of the moment. He has never sought the public eye and has yet to learn the meaning of the word "expediency." The growth of the North Western System, he modestly explains, is nothing unusual, but represents a consistent adherence to a sound policy of financing and operation throughout a period of years. Neither does it represent the work of one man but rather the joint efforts of an aggregation of loyal and conscientious officers and employees. There is no doubt that the excellent esprit de corps of both the officers and the men in the ranks explains, in considerable measure, the high standing of the road today, but there is no discounting the quality of the leadership which encouraged that spirit of co-operation and unflinching fidelity to duty. Mr. Hughitt's personality is a strong one, and he has projected his ideals and his policies into the work of his subordinates.

A keen thinker, endowed with the power of clear analysis, he has never vacillated after working out the problems presented to him, but relying on his decisions once they were made, he has acted accordingly. While he has valued the opinions of his business associates and assistants he has never hesitated to stand alone if his judgment demanded such a course. He has carried on all his business dealings on the highest plane of honor. A prominent Chicago business man who has known him since the 70's, declares that

Mr. Hughitt's unflinching adherence to his word won the respect of all with whom he came in contact. While positive in the support of his conclusions, sometimes to the point of aggressiveness, his broad vision and lucid analysis have been generally justified by subsequent experience.

With a keen sense of responsibility to the owners of the North Western and an innate aversion to unclean practices, he protected his charge from the curse of stock speculation and manipulation. As a result, not one share of North Western stock has been issued during his administration except in exchange for hard cash. The wisdom of his course is vouched for by the high standing of C. & N. W. stocks today. Mr. Hughitt spent millions from both earnings and from capital to improve the physical condition of his line, a policy which cost him much criticism although time has proved the soundness of his judgment.

At the present time the North Western is one of the best maintained and equipped lines in the world. It has been double-tracked from Chicago to Omaha and almost all of the way from Chicago to St. Paul and Minneapolis, and has four tracks between Chicago and Milwaukee. The development of the road has been carried on carefully and steadily in conformance with the increasing transportation demands of the section of the country served. Extensions and improvements have been added from time to time to develop the maximum traffic and to enable it to be handled with the maximum economy, with the double purpose of giving the public the best service it is possible to render and of making the property as profitable as possible to those who invested in it. While the North Western has not made investments without prospects of increased business, its management has generally anticipated the need for increased facilities.

The company has felt that its responsibility consisted of performing the best possible service and providing such extensions and improvements as were justified by the growth in population and production of the territory it traversed. It has not initiated new projects when existing facilities sufficed. This sound business policy is illustrated by the fact that Mr. Hughitt never allowed himself to be tempted into building an extension to the Pacific coast. The North Western for years has had satisfactory through traffic arrangements with the Union Pacific and other Harriman lines; the construction of a line to the coast would have made it a competitor of instead of a connection with those roads.

Marvin Hughitt

While the policy of the North Western has been careful and sound from a business point of view, it has not been ultra-conservative. When Mr. Hughitt became president in 1887 the total operated mileage of the North Western was less than 4,000 miles, while that of the Chicago, St. Paul, Minneapolis & Omaha was 1,340 miles. At the present time the North Western operates 8,108 miles and the Omaha 1,753 miles, while other subsidiaries have an operated mileage in excess of 300 miles.

As a consequence of its steady but never sensational development, the North Western has never been to any considerable extent burdened by unprofitable branches. Hardly a railway in the United States has a finer dividend record. It has never failed to pay a dividend in any year since 1878. From 1887 (when Mr. Hughitt became president) to 1894, it paid 6 per cent on its common stock; in 1895 it paid 4 per cent; from 1896 to 1899 it paid 5 per cent; in 1900 it paid 6 per cent, and ever since has paid 7 per cent.

Although Mr. Hughitt has not yet resigned as chairman of the board of the Chicago, St. Paul, Minneapolis & Omaha, it is understood that he will take such action as soon as the annual meeting of the stockholders of that road takes place. While resigning as the head of the board of the North Western, Mr. Hughitt is not giving up entirely his active connection with the company. He will continue to be a

director and a member of the executive committee of the road. Although he has passed his eightieth birthday, Mr. Hughitt retains all his faculties unimpaired.

Mr. Hughitt was born in Genoa township, Cayuga county, New York, on August 9, 1837. He entered railway service in 1856 on the St. Louis, Alton & Chicago, now the Chicago & Alton, which line he served as superintendent of telegraph and trainmaster. From 1862 to 1864, he was superintendent of the Southern division of the Illinois Central, following which he was promoted to general superintendent of the same road. In 1870 he was appointed assistant general manager of the Chicago, Milwaukee & St. Paul, and from 1871 to 1872, was general manager of the Pullman Palace Car Company. In 1872 he entered the service of the Chicago & North Western as general superintendent. He was promoted to general manager in 1876 and to vice-president and general manager in 1880. From 1887 to October, 1910, he was president of the road, and from the latter date up to the present time has been chairman of the board of directors. He has also served on the Chicago, St. Paul, Minneapolis & Omaha since 1882, when he was elected president. In 1907 he was elected chairman of the executive committee of that road, and from 1910 to date, has been chairman of the board of directors.

Arguments on the Standardization of Locomotives

Robert Quayle and C. A. Greenough Speak on the Question
at the Western Railway Club

AT A MEETING of the Western Railway Club held in Chicago on April 15, Robert Quayle, general superintendent of motive power of the Chicago & North Western and C. A. Greenough, vice-president of the Baldwin Locomotive Works, took occasion to make a few remarks on locomotive standardization in connection with a paper on Economy in Locomotive Operation and Maintenance. Mr. Quayle spoke in part, as follows:

"I want to say a word about the standard locomotives. I was a member of the committee of nine that was called on to prepare these designs. It was a big job to reconcile every member of the committee to each particular thing that was adopted. All the roads represented had their own standards, and they were all different. Many had to give up the fancy notions they cherished and had to take up notions of someone else, in order that the committee might agree. As a member I want to say that each man on that committee did his job splendidly. We saw that we could not bring in localism or sectionalism; what we did had to be for the good of the nation. It was essential that we get together and do what we could to help out. It is such sacrifice that brings results, and when men are ready to give up in order that democracy may prevail, we will get results."

Mr. Greenough presented arguments for and against standardization, his remarks being given practically verbatim as follows:

"The recent change in the controlling power of railroads has brought about the possibility of experimenting along lines which have long been under contemplation, but have been deemed outside the realms of the possible. I refer to the proposed standardization of the locomotive as a unit. The railroad administration, primarily to reduce the first cost of locomotives and with a view to effecting an interchangeability in repair parts which would enable locomotives to be transferred conveniently from one section of the country where transportation might reach a low ebb to another more congested district has through conferences with the builders and the railroad committee proposed to bring about a series of standard locomotives. The committees appointed have done their work efficiently and there are under consideration twelve designs of locomotives, in some

cases two of a single class, one heavy and one light. The heavy locomotives are designed to develop the greatest average efficiency possible with a weight limited to 60,000 lb. per driving axle, while the light locomotives are limited to 50,000 lb. per driving axle.

The arguments in favor of such standardization are in-

"Back Up Your Own"

By George A. Post

President of the Railway Business Association

"Back up your own by purchasing Liberty Bonds." That is what the Railway Business Association at its Chicago convention said to the railway supply craft, more than 50,000 of whose men are reported in the service of the United States.

Wherever American citizens are cooperating in projects for the common weal there will you find members of the railway supply craft. They are among the liveliest leaders and members of the community loan drive teams. It will be our pride to carry the subscriptions from our ranks up to the full measure of our means.

terchangeability between railroads, the possibility of some rapidity of construction, interchangeability of repairs and a somewhat lower cost. It is probable that the possibility of greater rapidity of construction has been lost for this year, because of the length of time which the administration has required to give consideration to the project. We could doubtless have built a larger number of locomotives, exact duplicates of those now on the railroads, had orders been placed two months ago, in a shorter time than we will be able to build the new types of locomotives, details concerning which are not yet settled.

"The arguments against standardization may be summed up as follows: The capacities of the locomotives are based upon average conditions; hence there is no provision for the extreme requirements which these locomotives do not cover. Where even the light locomotives are too heavy for service and where the heavy locomotives are not of sufficient capacity special locomotives will have to be provided unless those requiring lighter engines purchase from other roads discarded power, and those requiring the heavier locomotives change their system of operation so as to use the heavy standard government locomotive. In such instances where railroads have been equipped from one end to the other to use power of maximum capacity for the purpose of reducing train movements such action would prove a negative economy.

"The standard locomotives are designed for bituminous coal fuel and radical changes in their construction will be required for burning anthracite or an appreciable percentage of anthracite or for properly burning pulverized fuel. Oil fortunately requires no basic change. The limiting sizes of the locomotives of length, height and width must necessarily conform to the minimum to be found on the various roads over which the locomotives are designed to operate. These restrictions necessarily cramp the designs and limit their efficiency to the restrictions of the fuel. A limit of height of 15 feet has been proposed for all except the heavy Santa Fe and consolidation Mallet type locomotives; consequently steam space, domes and smoke stacks are mere shadows of what they would naturally be. In a country

as large as ours various physical and climatic conditions exist which the proposed standardization ignores; consequently the locomotives will afford maximum efficiency in some localities with a corresponding loss in others.

"No standardization of this extent has been dreamed of in the past; hence the task is relatively momentous. The Pennsylvania has for years given serious consideration and effort to the standardization of their equipment; likewise the Harriman Lines in 1905 proposed a series of standard locomotives for all roads controlled by them. Both of these efforts have resulted in an extensive standardization of parts, but not in a complete standardization of equipment, because growing needs for larger and more efficient power and the improvements in the permanent way have invited and made possible increases in the size and capacity of locomotives which have thrown to the winds any idea of standardization of locomotives which would extend over an appreciable period of time. In both instances the standard locomotives of today bear no comparison to the standard locomotives of ten years ago. The conservation of our resources will not permit of a system of standardization which is so inflexible as to choke further improvements and thus discourage the inventions which may now be in their incipency. Yet how can we maintain a standard which is permitted to change, and how can we progress without change. If standardization of locomotives as units is a war measure; if it will help us win, let us have standardization quickly and regard it as a war measure; but if it is an economic experiment the final net result may be the addition of just so many classes of locomotives to those now existing.

"The ideal standardization provides for the elimination of unnecessary diversity and progress invites and necessitates diversity, hence in spite of our ideals the standardization of locomotives may be limited to the standardization of the maximum number of parts.

"The problem now before the administration is to decide whether or not the criticisms in favor outweigh those against the proposed standardization, and we all await the decision with the keenest interest, and we all hope the decision, whatever it may be, will prove for the best."

Central News Photo Service

Small Ammunition Train on the Western Front

General News Department

The use of coal from Alberta, by the Grand Trunk Pacific Railway, will this year be more than twice as extensive as last year, orders having been given recently for 400,000 tons.

The car builders held another conference with John Skelton Williams, Wednesday and adjourned to meet again on Thursday without reaching any settlement on proposed contracts for freight cars.

Several railroads have turned over to the Railroad Administration the excess revenue earned by them since January 1; that is to say, the net revenue above their estimate of the amount of compensation due from the government.

The United States War Department has ordered for use in France 80 light locomotives, 60 centimeter gage, weighing 35,000 lbs., from the Davenport Locomotive Works, also 67 50 h.p. and 70 35 h.p. gasoline locomotives from the George I. Whitcomb Co.

Twenty-four inches of snow, reported at Sand Patch, Pa., on April 11, is supposed to be the final kick of the winter. The reports say that gangs of workmen had to be sent out with shovels to release 150 cars of coal at several points on branches of the Baltimore & Ohio.

Floors, good and bad, are the subject of the latest "Safe Practices" pamphlet, issued by the National Safety Council, Chicago. This is an eight-page leaflet, numbered 11, with numerous illustrations. It gives in detail the requirements of a good floor, and the dangers of broken, obstructed, slippery or uneven floors.

The Chesapeake & Ohio Employees' Magazine has been discontinued. The March number will be the last to be issued for the present. The meetings of the Safety First committees and such other data as it may be found advantageous to distribute in the interest of safety-first work will be published in some other manner.

Thomas Riggs, Jr., has been confirmed as governor of Alaska. The Senate took this action on recommendation of the Committee on Territories, which had delayed action until it had investigated charges made by J. E. Ballaine, of Seattle, Wash., who had alleged that Mr. Riggs, as a member of the Alaskan Railroad Commission, had been guilty of mismanagement in the construction of the Alaska railroad.

The United States Steel Corporation is expending from \$13,000,000 to \$14,000,000 a month on extensions to plants, almost all of which are for war work, according to the statement of Judge E. H. Gary chairman of the board of directors, at the annual meeting held in Hoboken, N. J., Monday. Mr. Gary said that the company would be able to continue the present dividends in addition to making the above expenditures from profits.

The quantity of rails needed by different important railroads has been under discussion both in the Railroad Administration and in the War Industries Board, and also the capacity of the mills to produce the rails in connection with other requirements of the government. It is understood to be probable that the amount of open-hearth rails must be reduced because of the amount of open-hearth steel required for munitions, and that the railroad companies have been asked through the regional directors to report as to what extent Bessemer rails can be used for all but important main track lines.

The Engineering Council, Engineering Societies building, 29 West Thirty-ninth street, New York, is compiling a calendar of conventions and other important meetings of engineering and related societies in order that information may be available in one place for the answering of inquiries and that the unnecessary conflict of dates be avoided. To assist in making this calendar complete and keeping it up to date, secretaries of engineering and scientific organizations are requested to send in-

formation about the time and place of proposed conventions and annual meetings to the secretary of the Engineering Council as early as practicable.

Charles M. Schwab, chairman of the Bethlehem Steel Company has been appointed Director General of the Emergency Fleet Corporation. At the suggestion of Charles Piez, the position of general manager, which he held, will be abolished in order that Mr. Schwab may be wholly unhampered in his control of production at all yards doing work for the Emergency Fleet Corporation. Mr. Piez still retains his position as vice president of the corporation. Mr. Schwab is said to have assured the President, at a White House conference preceding the announcement of his appointment that there would be no lack of steel for the carrying out of the ship-building program.

The Third Liberty Loan

Reports received up to noon, April 17, show that 281,958 officers and employees of western lines have subscribed for a total of \$21,817,835 in Liberty Loan bonds; this is an increase in subscriptions of \$4,153,150 in 24 hours, and an increase of 54,775 subscribers. The Rock Island System still leads the list with subscriptions amounting to \$2,487,200, representing 90 per cent. of its employees. W. G. Bied, chairman of the loan committee, western lines, predicts that by Saturday the western roads will have subscribed for \$30,000,000, or one per cent. of the total loan.

Valuation of Telegraph Companies

The Interstate Commerce Commission has instituted an investigation on its own motion of the property owned or used by the telegraph and cable properties of the Mackay system, the value of the property and the history and organization of the companies. The order covers increases or decreases of stocks, bonds or other securities in any reorganizations; moneys received by any of the corporations by reason of any issues of stocks, bonds or other securities; the syndicating, banking and other financial arrangements under which such issues were made and the expenses thereof; net and gross earnings; the expenditure of all moneys and the purposes for which the same were expended, and any other transactions which may give any information as to the history or present value of the property.

Publicity for Crossing Dangers

The expenditure of \$275,000, to carry on a campaign of publicity for the prevention of accidents at highway grade crossings, is the main topic of a circular which has been issued by the Steam Railroad Section of the National Safety Council, and the author of which is H. E. Reisman. Mr. Reisman presented his argument to a meeting of the Chicago Steam Railways Claim Conference on January 7 last. He would extend his campaign over a period of four months and would make use of 300 Sunday newspapers and 5,000 billboards. He estimates that about three-fourths of the population of the country live in 23 states and that by the use of the newspapers mentioned, together with two or three agricultural papers, he would reach a large portion of the population of the country. He says that the number of automobiles and auto trucks in use in the United States on December 31 was 5,148,063, and that about 86 per cent of these cars were registered in the 23 states, which contain over 72,000,000 of population.

Observing that the New York Central, the Union Pacific, the Southern Pacific and the Santa Fe spend annually from \$400,000 to \$600,000 each for advertising and that the estimated expense of his propaganda amounts to not much more than \$1 per mile of road, he thinks that the scheme should be accepted as very reasonable. He thinks that the saving will

be great, for the number of casualties at grade crossings is increasing. In 1917 the figures were nearly 100 per cent greater than in 1916, and he looks forward to nearly the same ratio of increase in 1918. Calculating the total number of casualties this year at between 3,000 and 4,000, he thinks that the railroads will have to pay from six millions to eight millions of dollars on this account; and any campaign which should reduce or check this loss, even in a small degree, would be a handsome success.

A Railroad Builder of 1830

The Baltimore & Ohio Railroad was opened for business (for 15 miles, Baltimore to Ellicott Mills) in May, 1830, almost eighty-eight years ago; yet the Baltimore & Ohio Employees' Magazine prints the portrait of a man, now living, who took part in the construction of the track! This man is John Bottomley, of Franklin, Ky. However, he is not a centenarian; his work on the road was carrying water and luncheons to his father, who was a stonemason, engaged in making and laying the stone blocks which served as supports for the rails; and the boy, now 92 years old, was then only four. It is not to be supposed that his name appeared on the payroll; but no one who is familiar with railroad officers' biographies will deny that then, as now, a water boy was an important figure in railroad construction work. Railroad managers, and presidents, whose first railroad position was that of water boy, are quite familiar figures in American railroad history.

Urgent Calls for Stenographers at Washington

The United States Civil Service Commission is making a nation-wide campaign to obtain candidates for typewriter operators and stenographers, numbers of new places being announced daily in connection with the great expansion of government work. Women are being engaged in large numbers and many more or wanted. Persons who need further training to fit them for the work are appealed to take, without delay, whatever instruction may be needed. Examinations are held in 450 principal cities of the country every Tuesday. The pay is from \$1,000 to \$1,200 a year, and competent operators are assured reasonably rapid promotion. Information in regard to the scope and character of the examination can be had from the Civil Service Commission at Washington, or from the examiners at Boston, New York, Philadelphia, Atlanta, Cincinnati, Chicago, St. Paul, St. Louis, New Orleans, Seattle, San Francisco, Honolulu and San Juan.

Machinery and Tool Convention

The enormous problem of manufacturing and supplying machinery and tools sufficient for the carrying out of the government program for the production of ships, shells, guns and aircraft will be the subject considered at the great "War Convention" of the machinery, tool and supply industry of the country to be held in Cleveland the week of May 13.

One thousand men who are bearing the brunt of the unprecedented demand for machinery will gather from all parts of the country to lay out a plan, with the aid of government officials, to keep the great munition program going at top speed. The big war convention will be a joint meeting of four great national associations, the American Supply & Machinery Manufacturers' Association, the National Supply & Machinery Dealers' Association, the Southern Supply & Machinery Dealers' Association and the National Pipe & Supplies Association, which will meet together in order to co-ordinate their efforts toward one goal, "More Ships, More Shells."

The Railway Regiments' Tobacco Fund

Samuel O. Dunn, secretary of the Railway Regiments' Tobacco Fund, has received a letter from R. L. James, first lieutenant and acting adjutant of the Seventeenth Engineers (Railway) Regiment, now in France, dated March 16, acknowledging receipt of a shipment of tobacco which has been distributed among the men. He said in part: "We appreciate very much the kindness of the different railroad organizations who are participating in making these tobacco shipments to the railroad men here in France. The supply of tobacco in France is limited,

and for that reason all tobacco received is all the more acceptable. We all thank you very much."

A letter has also been received from Morton Russell, captain adjutant of the Eighteenth Engineers (Railway) Regiment, written by order of Colonel Cavanaugh, acknowledging receipt of three cases which contained twelve 20-lb. packages of tobacco, which have been distributed to the regiment; and expressing the appreciation of the men in that unit.

Canadian Government Orders Rails

The Minister of Railways of Canada has ordered 100,000 tons of 85-lb. steel rails from the Dominion Iron & Steel Company, Sidney, N. S., for distribution among the four principal railways of Canada. Rolling was begun on April 1, and will continue at the full capacity of the mill until the entire order is completed. It is understood that the rails are being rolled on a cost plus percentage basis. The Canadian Pacific will receive 300 miles, the Canadian Northern 170 miles and the Grand Trunk and the Canadian Government 140 miles each of these new rails.

The Minister of Railways has also bought for the Dominion Government 37,375 tons of steel rails, which were rolled in the United States for the Russian Government, but which were not sent to Russia. These rails have been stored at the Atlantic seaboard for several months. They are of a section weighing 67½ lb. to the yard, and will be sufficient to lay approximately 355 miles of track. These rails will be laid in branch lines and sidings on the Canadian Northern and the Canadian Government Railways, to release heavier rails which will be transferred to main lines.

Railway Revenues for February

A preliminary bulletin of the revenues and expenses of 117 roads for February shows railway operating income of \$6,242,415 as compared with \$24,095,466 in February, 1917, which was one of the most unfavorable months in railroad history. In the month of January preliminary returns for 172 roads showed a deficit of over \$2,000,000. If a similar result is shown by the complete figures this will be the first time that the railroads have failed to pay operating expenses and taxes for a month since the monthly reports of the Interstate Commerce Commission were begun, in 1907. For the first two months of the calendar year the 117 roads for which the February returns are issued had operating income amounting to \$4,202,629 as against \$64,932,558 in 1917. To earn the compensation proposed to be guaranteed to the railroads on the estimated basis of \$945,000,000 for the year would require an average operating income of about \$78,000,000 a month, so that it is apparent that the Railroad Administration has begun the year with a heavy handicap. Operating revenues of the 117 roads, which operated 138,000 miles of line, amounted to \$166,034,510, as compared with \$151,906,989 in 1917. In January operating revenues showed a decrease. Expenses in February increased by over \$30,000,000, from \$129,089,920 to \$151,520,130. The two months' figures for the same roads show an increase in revenues from \$324,000,000 to \$329,000,000, while expenses increased from \$244,000,000 to \$308,000,000. The decrease in operating income of approximately \$60,000,000 in the two months is, therefore, practically due to increased expenses. The railroads of the eastern district show a deficit of \$4,869,418 for February and of \$14,038,785 for the two months. With a reduction of approximately \$6,000,000 in revenues, the eastern roads for the two months failed to pay operating expenses by nearly \$8,000,000.

Track Labor on Western Lines

As the result of a general conference of interested lines, the regional director of Western railroads has issued a number of instructions with reference to the employment of track labor during the present season. All lines are asked to make the fullest use possible of the United States government labor agencies. The standard day for all track labor will be 10 hours and the maximum rate of pay as follows: Central territory, 25 cents per hour; southwestern territory, 25 cents per hour; northwestern territory, 27½ cents per hour; all large terminals, 27½ cents per hour, and overtime pro rata. The present rates of pay will not be increased except in cases of necessity on account of the shortage

of labor, and when so increased will not exceed the maximum rates above specified. No allowances of any kind will be made for board or for any other reason that will have the effect of increasing compensation. Lines now paying higher rates in certain localities may, if they so desire, continue these rates, but there must be no extension of such excess rates. Laborers called for night service after being relieved from duty or performing Sunday inspection will be paid a minimum of five hours. Roads now paying or under contract to pay track men time and a half for Sunday and night work may continue this practice, and other roads in the same territory may adopt the same practice if they so desire.

It is essential for good service that clean, sanitary housing conditions for extra gangs or floating labor be provided. For this purpose railroads may provide at laborers' rates one man for every 75 men, or less, for the proper upkeep of the camps and also for one night watchman. For each gang of 10 men one cook may be allowed, and for each additional 25 men one water may be added. Railroads may transport free of charge food and essential camp supplies necessary, but this will not include food supplies for other than men employed in the camps, and does not include commissary supplies sold to the men.

Payment of the fare for laborers from the labor markets to the points needed and their return fare to the point where employed may be continued. The practice of labor agents recruiting laborers from the forces of any other roads is prohibited.

Preference List for Fuel Distribution

The War Industries Board of the Council of National Defense has issued a statement announcing the adoption by its Priorities Board of Preference List No. 1 for the guidance of all governmental agencies in the supply and in the distribution, by rail or water, of coal and coke. The board has not undertaken to classify any industry as non-essential or at this time to limit the quantity of fuel which any particular industry or plant shall receive; but it has listed certain industries whose operation is of exceptional importance, measured by the extent of their direct or indirect contribution, either toward winning the war or toward promoting the national welfare; and these industries will be accorded preferential treatment by the Fuel Administration in the shipment of coal and coke, and also in the transportation of such coal and coke by the railroads. The same plan will be followed in accord with preferential treatment to war industries and plants in the transportation of raw materials and supplies required by them in their manufacturing operations. The list as issued is not complete, but provision is made for certifying additional classes of industries and also individual plants whose operations are necessary as a war measure.

In determining what industries or plants are entitled to be entered, it is stated that two factors will control: (1) The relative urgency of the use or purpose for which the product is utilized, and (2) the per cent of the product utilized in war work or work of exceptional or national importance. No plant a very substantial per cent of whose product is not of exceptional importance can be accorded preferential treatment. No distinction is made between any of the industries or plants which are or may be included in the preference list, and no significance attaches to the order in which the industries or plants appear in the list. The list includes railways and shops making locomotives, freight cars and rails, and other plants engaged exclusively in the manufacture of railway supplies. It also includes the following: Aircraft, ammunition, army and navy cantonments and camps, arms, chemicals, coke plants, domestic consumers, electrical equipment, electrodes, explosives, farm implements, fuel, ferroalloys, fertilizers, fire brick, food, food containers, gas, guns, hemp, jute and cotton bags, insecticides, iron and steel, lumber, machine tools, mines, newspapers and periodicals, oil, oil production, public institutions and buildings, public utilities, railways, plants manufacturing railway supplies, refrigeration, sleds, ships, shipbuilding plants, soap, steel, tanners, tanning extracts, tin plate, twine and rope, and wire rope and rope wire.

WANTS ARMY OF SAVERS.—The purpose of the War Savings Committee is to create an army of savers who will, by saving, release labor and materials for the use of the Government in the war, and who will lend their savings to the Government to prosecute the war.

Traffic News

J. Van Dyke Norman, an interstate commerce attorney, addressed the Transportation Club of Louisville at a noon day luncheon on April 8, at the Henry Watterson hotel, Louisville, Ky., on "Government Operation of Railroads."

In a circular under date of April 12, the regional director of Western railroads announces new routes and schedules for the movement of fruit and vegetables from California points to Chicago. This traffic will move in trains consisting of a minimum of 25 cars from various concentrating points in California. Under the plan, all carloads of fruits and vegetables loaded in time to reach the proper concentration point before the time of departure will arrive in Chicago in time for morning team track placement, including delivery to auction houses, on the ninth day from loading station.

The Department of Agriculture announces that United States standard containers must be used for fruits and vegetables shipped this year in interstate traffic. That is to say, all packages must conform to the provisions of the United States Standard Container Act. The baskets, crates, hampers and boxes must be in sizes containing half-pints, pints, quarts or multiples of quarts; though slight variations, either over or under size, may be allowed provided the average for any shipment conforms to the standards. Many manufacturers have arranged to make no containers except those that comply with the statutory requirements, and even shippers whose products are usually consumed in their own state are said to favor packages complying with the federal law.

Live Stock Receipts

Receipts of live stock at markets in the western district, as reported by the United States Railroad Administration in the month of March were approximately 44 per cent greater than during March, 1917.

The receipts in carloads, were as follows:

| | 1918 | 1917 | Percent |
|-------------|-------|-------|---------|
| Chicago | 2,771 | 2,417 | 114.6 |
| St. Paul | 4,462 | 4,462 | 100.0 |
| Omaha | 4,462 | 4,462 | 100.0 |
| Sioux City | 4,462 | 4,462 | 100.0 |
| St. Joseph | 4,462 | 4,462 | 100.0 |
| Kansas City | 4,462 | 4,462 | 100.0 |
| Denver | 4,462 | 4,462 | 100.0 |
| Milwaukee | 4,462 | 4,462 | 100.0 |

Coal Production

A decrease of 1,500,000 tons in the total output of bituminous coal during the week ending April 6, or 14 per cent as compared with the preceding week, as reported by the Geological Survey, has brought out an exchange of statements from the Fuel and Railroad Administrations as to the coal situation. The coal production for the week including lignite and coal made into coke, was estimated at 9,365,000 net tons. The decrease was attributed by the Geological Survey partly to the observance of Mitchell day, April 1, the anniversary of the enactment of the eight-hour law, as a holiday. It is also understood that April 6, the day of the opening of the Liberty Loan campaign, was observed as a holiday in many districts. A chart showing the average total production per working day of bituminous coal, including coal coked, published with the report shows a steady increase from January 10 to March 30, but a falling off for the week ending April 6 to the lowest point since last June, with the exception of the week of December 12 and the week of January 19. The percentage of rail tonnage reported for the week ending March 30 was 62 per cent, and for the week of March 23, 63 per cent was attributed to car haulage. Comparisons of the effect of increasing car shortage on the production of coal have been renewed by the representatives of the Fuel Administration during the past week. The statement was made by the Railroad Administration that Mr. McAdams, when after Mr. McAdams had issued a

statement referring to the Geological Survey figures and attributing it to shortage of cars, the Railroad Administration issued a statement showing that up to April 6 the railroads had handled this year 6,441 cars of coal more than was handled during the corresponding period of 1917, in spite of the decrease of 79,172 cars in January.

At a conference of the state fuel administrators from all states east of the Mississippi, held at Washington on April 11, a resolution was unanimously adopted and presented to the United States Fuel Administrator, stating that due to the present over-burdened condition of the railroads, unless effective measures of relief are at once taken the supply of coal ore for the coal year beginning April 1 will fall seriously short of the needs of the country. All individuals, industries and communities were called upon unselfishly to endorse and support such acts of the government as may be needed to clear the railway tracks of any unimportant or unnecessary traffic congesting the railways and interfering with the prosecution of the war.

The National Coal Association also issued a statement stating that bituminous coal production during the first three months of 1918 has failed to keep pace with the growing demands of industrial and domestic users and that reports from virtually every bituminous field in the United States show that mine operations have been restricted by the lack of railroad cars.

In his statement Dr. Garfield said, "A large part of the shortage is due to the continued lack of transportation service as evidenced by the shortage of cars placed at the mines to be loaded. This is due to the general pressure of war traffic on the railroads. Continued shortage of cars at the mines in the fields supplying the eastern industrial territory has had the effect of keeping mine labor idle for days at a time and in some of the fields has cut the working time to one or two days a week. The Fuel Administration is gravely apprehensive lest this condition result in the complete demoralization of the labor supply of the bituminous mining industry. The Fuel Administration is convinced that unless there is immediate and material improvement in car supply efficiency the country faces the certainty of a serious shortage of coal." Among the causes of disturbance curtailing production, Dr. Garfield referred to the unsettled situation regarding contracts for railroad fuel. He said this question is under consideration by the Railroad and Fuel Administrators and will be settled at the earliest moment possible.

The Railroad Administration statement showed the number of cars of coal of all kinds loaded on all lines during the months of January, February, March and for the first week in April, for the years 1918 and 1917 comparatively, as follows:

| Month of January— | | | | |
|----------------------|-----------|-----------|---|--------------|
| | 1918 | 1917 | | Inc. or Dec. |
| Anthracite | 127,049 | 140,927 | D | 13,878 |
| Lignite | 19,707 | 16,870 | I | 2,837 |
| Bituminous | 658,236 | 726,367 | D | 68,131 |
| Total | 804,992 | 884,164 | D | 79,172 |
| Month of February— | | | | |
| | 1918 | 1917 | | Increase |
| Anthracite | 143,766 | 136,882 | | 6,884 |
| Lignite | 12,475 | 15,300 | | 2,725 |
| Bituminous | 727,710 | 705,519 | | 22,191 |
| Total | 888,951 | 857,701 | | 31,250 |
| Month of March— | | | | |
| | 1918 | 1917 | | Inc. or Dec. |
| Anthracite | 210,076 | 201,665 | I | 8,411 |
| Lignite | 13,189 | 16,269 | D | 3,080 |
| Bituminous | 960,202 | 918,920 | I | 41,282 |
| Total | 1,183,467 | 1,136,854 | I | 46,613 |
| First Week in April— | | | | |
| | 1918 | 1917 | | Inc. or Dec. |
| Anthracite | 43,642 | 41,526 | I | 2,116 |
| Lignite | 2,083 | 2,744 | D | 661 |
| Bituminous | 187,463 | 181,168 | I | 6,295 |
| Total | 233,188 | 225,438 | I | 7,750 |
| Year to date— | | | | |
| | | Decrease | | Increase |
| Month of January | | 79,172 | | |
| Month of February | | | | 31,250 |
| Month of March | | | | 46,613 |
| First week in April | | | | 7,750 |
| Total | | 79,172 | | 85,613 |

It was stated that the unprecedented weather conditions in January were responsible for the decrease in coal loading in that month and that notwithstanding the very heavy loss in loading in January, the loading since has increased until the production, at the end of the first week in April, shows an increase over last year of 6,441 cars.

Commission and Court News

Interstate Commerce Commission

The commission has approved the application of the Pennsylvania and Baltimore & Ohio to increase storage charges by reducing free time allowed on less than carload freight at Philadelphia.

The Interstate Commerce Commission has issued supplemental orders by which the increases of not to exceed 15 cents a ton on anthracite coal allowed in its orders of March 12 will apply to points in Official Classification territory and Canadian points not covered in the original order.

Fifteenth Section Application No. 3380 filed by Agent E. B. Boyd seeking authority to increase rates on hay and straw due to the cancellation of commodity rates in Western Trunk Line territory and the application of class rates in lieu thereof has, by direction of the commission, been placed on the formal docket and has been given docket No. 10100.

Application for a general investigation of the rates on petroleum and its products has been made to the commission by the National Petroleum Association, Western Refiners' Association and the Western Jobbers' Association, which also asked for a postponement of the operative date of the commission's decision in the supplemental 15 per cent case.

Fifteenth Section Application No. 3307 filed by E. B. Boyd as agent to increase rates on lumber and articles taking same rates, from points in Minnesota, Wisconsin, the Northern Peninsula of Michigan and Canada to Chicago, Racine, Milwaukee, Manitowish, Sheboygan and related points, has, by direction of the commission, been placed on the formal docket and has been given docket No. 10099.

Fifteenth Section applications filed by western railroads for authority to establish the same rates on nut coal as applies on lump coal from Colorado, Wyoming and New Mexico mines on the lines of these carriers to all destinations in Nebraska, Iowa, Kansas, Missouri and Oklahoma, and to certain points on the Chicago, Burlington & Quincy in Nebraska, have been consolidated and assigned to the formal docket under Docket No. 10117.

Fifteenth Section Application No. 570 filed by Agent Gomph to increase rates on forest products from points in Oregon, Washington, California and Nevada to points on the Atchison, Topeka & Santa Fe, in California, has by direction of the commission been assigned to the formal docket to be considered and disposed of in connection with the record made in I. & S. docket No. 912, which proceeding has been reopened for further consideration.

The commission has ordered an investigation into the rates and practices of common carriers governing transportation of petroleum and its products between points in official classification territory, with a view to prescribing just and reasonable rates. The recent increases in the rates on these commodities include wide variance in the amount and percentages of increase as between various localities and complaint has come to the commission concerning both the amount of the increases and the changes in relationship.

Fifteenth Section Application No. 4560 filed by carriers, for whom F. A. Leland is agent, for authority to cancel the effective commodity rates on pressed cloth, in carloads from Houston and Houston Heights to Memphis, Tenn., and from Clinton, Fidelity, Houston, Houston Heights and Port Houston, Texas, to Algiers, New Orleans and other points, class rates to apply in lieu thereof, has by the direction of the commission been assigned to the formal docket and will be set down for hearing as soon as the engagements of the commission will permit.

The commission is to investigate carload minimum weights on lumber and lumber products in all parts of the United States. Carriers serving North Pacific Coast points and points in the "inland empire" have prescribed carload minima based on the

cubical capacity of the cars, while carriers serving other lumber producing regions use other minima. There have been numerous complaints as to discriminations caused by this difference and by difficulties as to the application of rules based on the cubical capacity; and the commission will seek to ascertain whether the variations are reasonable.

Fifteenth Section Application No. 2516 filed by the Pennsylvania Railroad Company for itself and on behalf of other carriers participating in its tariffs for authority to cancel the present water competitive rates on certain kinds of lumber, and to apply in lieu thereof the so-called normal lumber rates applicable on forest products, and Fifteenth Section Application No. 2530 filed by Agent Chalenor in behalf of Southern Lines, also seeking authority to cancel water competitive rates on certain kinds of lumber and to apply in lieu thereof the normal lumber rates, have, by direction of the commission, been consolidated under formal docket No. 10098, and will be set down for hearing as soon as the engagements of the commission will permit.

The Interstate Commerce Commission has ordered a hearing to be held at the Hotel Sherman, Chicago, on April 22, before Examiner R. H. Kimball, on the protest of the New Orleans, Texas & Mexico to the tentative valuation of its property made by the Division of Valuation. The hearing will be devoted to all matters drawn in question by the protest, except matters pertaining to land. At the conclusion the hearing will be adjourned to some point on the lines of the road where evidence will be received on values and classification of lands, but no evidence will be received as to cost of condemnation and damages or of purchase. All parties are expected to produce their entire evidence at these hearings.

State Commissions

The Railroad Commission of Georgia has authorized an increase of 2½ mills a mile in the prices of thousand-mile tickets, making the rate \$22.50. The new rate goes into effect May 1. A similar increase has been authorized in the prices of party tickets. Books of two thousand miles will no longer be sold. For interstate travel, the \$22.50 rate already prevails.

Court News

Excessive Damages

The Texas Court of Civil Appeals holds that where a conductor, on the ground that his ticket had expired, ejected an aged man, whose ticket was valid, at a point six miles from the station, on a dark night, in a driving rain, and he suffered mental anguish and fear, and was threatened with pneumonia, though not confined, a verdict of \$2,000 was excessive, and was reduced to \$1,000.—*Houston East & West Texas v. Snow (Tex.)*, 201 S. W., 224. Decided February 15, 1918. Rehearing denied March 6, 1918.

Service of Process on Station Agent

The Kansas Supreme Court holds that where a railroad has been placed in the hands of a receiver under an order directing him to take into his possession and control all the assets and property of the corporation and to operate the railroad, service of summons, in an action against the railroad corporation, upon a station agent who is in the employ of the receiver and had formerly occupied the same position for the corporation, is not good service as to the corporation. The same question has arisen in a number of cases. The decisions, however, are controlled by statutes, some of which differ from the Kansas statute as to the manner of service on a railroad company.—*Chilietti v. M. K. & T. (Kan.)*, 171 Pac., 14. Decided January 12, 1918. Rehearing denied March 15, 1918.

Employees Crossing Tracks; Contributory Negligence

The Indiana Supreme Court holds that the rule which exacts of a traveler or other person about to cross a track the precaution to look in both directions, and also to listen, in order to ascertain whether a train is approaching, is not applied in all its strictness to railroad employees who are required to be on

or about such tracks, and the failure of such an employee, while in the discharge of his duties, to look and listen for approaching trains, may or may not be negligence under the particular circumstances of the case. Those who are engaged in the active work of railroad operation are not only required to be watchful and vigilant to conserve their own safety, but owe a similar duty to all others whose duties expose them to the same dangers, and all such employees have a right to rely to some extent on the care of each other and to assume that each one thus employed will use reasonable care to avoid injuring the others.—*Chicago & Erie v. Steele (Ind.)*, 118 N. E., 824. Decided February 27, 1918.

Expense of Crossing Another Railroad's Tracks

In an action by a street railway to recover from a railroad one-half the cost of renewing certain highway crossings where the tracks of the two companies crossed in a city, the Indiana Appellate Court holds that a contract whereby the railroad granted to the street railway right to forever maintain a single track across the tracks and right of way of the railroad in consideration that the street railway at its own expense maintain the necessary crossings, is invalid as against public policy, and in violation of the state statute providing that each company respectively shall keep and repair its own tracks so as at all times to provide a safe and convenient crossing. As the only consideration for the promise of the street railway to maintain the crossing was the privilege of crossing the railroad's tracks, a right which the former had without the latter's consent, there was no sufficient consideration to support a verdict.—*Vandalia v. Ft. Wayne, etc., Traction Co. (Ind.)*, 118 N. E., 839. Decided February 26, 1918.

Pennsylvania Stop, Look and Listen Rule

In an action against a railroad company for damages for injuries resulting from a crossing accident, the United States Circuit Court of Appeals, Second Circuit, says that the law of Pennsylvania, where the accident occurred, and which law governs the right of action, "makes it an obligation to stop, look and listen before crossing the tracks of a railroad company. This is not a rule of evidence, but a rule of law; peremptory, absolute and unbending, which the jury should never be permitted to ignore or evade or pare away by disjunctions and exceptions. Not to stop, look and listen is negligence per se. The decisions of the Supreme Court of Pennsylvania fully establish this." The plaintiff was struck in the nighttime by a train coming down grade by force of gravity merely. The train bore no light and the locomotive tender first. It was held that the plaintiff's testimony that he did stop, look and listen could not be rejected as incredible and contrary to the physical facts, and a verdict by the jury based thereon overturned.—*P. & R. v. Skerman*, 247 Fed., 269. Decided December 11, 1917.

Federal Employers' Liability Act Decisions

A railroad company engaged in intrastate and interstate commerce accepted the Michigan Workmen's Compensation Act, which, in part 6, §4, declares that the provisions of the act shall apply to employees and workmen engaged in intrastate commerce, and also to those engaged in interstate commerce or foreign commerce for whom a rule of liability, or method of compensation, has been or may be established by Congress only to the extent that their mutual connection with intrastate work may and shall be clearly separable and distinguishable from interstate and foreign commerce, but that any employer or employee may, subject to the approval of the Industrial Accident Board, and so far as not forbidden by any act of Congress, voluntarily accept and become bound by the provisions of the act. A conductor on one of the company's interstate trains suffered injuries resulting in his death. His wife instituted proceedings under the state Workmen's Compensation Act. The Michigan Supreme Court holds that, in view of the federal Employers' Liability Act, which was passed prior to the Compensation Act, and by which Congress indicated an intention to govern the whole field of compensation or relief for injuries suffered by railroad employees engaged in interstate commerce, no award could be made. The fact that the railroad accepted the act did not show a consent that the statute should apply to interstate

commerce transactions. Obviously the act might have been accepted by the company as applicable only to injuries arising out of intrastate commerce.—*Carey v. Grand Trunk Western* (Mich.), 166 N. W., 492. Decided February 19, 1918.

Where an engine has been specifically designated for a certain interstate train, and a hostler was told to fire and prepare the engine for such train, and while doing so was injured, he was held within the act.—*Cincinnati, N. O. & T. P. (Tenn.)*, 201 S. W., 128. Decided February 11, 1918.

A brakeman on a freight car loaded with cotton shipped to a point in another state, but to be taken to a point within the state to be compressed in transit, was held to be engaged in interstate commerce.—*Rock Island v. Hessenflow* (Okla.), 170 Pac., 1161. Decided March 5, 1918.

Condemnation Proceedings—Spur Track

Crossing Another Road's Right of Way

The Arkansas Supreme Court holds that damages in condemnation proceedings must be determined in the circuit court, the proceedings being strictly statutory and legal, and equity will interfere only when an attempt is made to take property for private instead of public purposes. In order to invoke equitable interference on this ground the cross-bill must state facts and not conclusions. A cross-bill in condemnation proceedings where a railroad was seeking to put a spur track across the right of way of another railroad, which stated that the purpose was only for private purposes and that the two roads were connected and had established switching charges, and that the defendant railroad could properly serve industries to be served by the proposed spur, merely stated conclusions, and did not give equity jurisdiction. It was also held that the evidence established the fact that the spur, when built, would be for a public use. It would serve several industries and the shipping public in a more convenient and expeditious manner. Decree dismissing the complaint was therefore reversed, and the cause remanded for the ascertainment by the circuit court of the damages to which the defendant railroad was entitled.—*Butler County R. Co. v. St. Louis, Kennett & Southeastern* (Ark.), 200 S. W., 1007. Decided February 11, 1918.

Duty to Record Delivery of Intoxicating Liquors

An express company was indicted for a violation of the Kentucky statute relating to the keeping of books recording particulars of the delivery of intoxicating liquors. The trial court sustained a demurrer to the indictment. The Kentucky Court of Appeals has set aside the trial court's order. The statute declares that the book to be kept shall be open to public inspection at any time during the business hours of the carrier and shall constitute prima facie evidence; failure or neglect to keep the record is a misdemeanor. An express company provided an appropriate book, but its local agent delivered liquors without requiring the consignee to sign his name. The Appellate Court holds that the carrier cannot avoid liability on the ground that its duty was fulfilled when it provided the book, and that the offense was committed only by the agent; the use of the disjunctive "or" in the penal provisions does not show any intent to relieve transportation companies and cast all burdens on their agents.—*Com. v. Adams Express Co. (Ky.)*, 200 S. W., 648. Decided February 19, 1918.

State Commission's Authority at Crossings

The Oklahoma Supreme Court holds that the Corporation Commission has no authority to require the performance by railroads of public duties which have no bearing on or relation to the transportation of either persons or property, or which do not relate in any way to the transaction of business by the public with such companies. The attorney general complained before the commission that the defendant did not maintain safe and suitable crossings where its tracks crossed two certain avenues. It was not claimed that the condition of the crossing affected the safety of either persons or property on defendant's trains, or that the improvements sought were necessary for the use of the public in transacting business with the defendant company. The commission made an order requiring the defendant to build a viaduct across one or the other of the two avenues.

It is held that the commission had no jurisdiction to make the order, and the railroad's application for a writ of prohibition was granted.—*Atchison, T. & S. F. v. Commission* (Okla.), 170 Pac., 1156. Decided December 15, 1917. Rehearing denied February 26, 1918.

Methods of Acquiring Rights of

Way and Station Grounds

Under the act of Congress (Act March 3, 1875, c. 152, 18 Stat., 482), a railroad company may acquire right of way by the actual construction of the railroad over the public domain; or, under the fourth section, the right of way and station grounds may be acquired by (1) location of the road; (2) filing a profile of it in the local land office; and (3) the approval thereof by the Secretary of the Interior. If, at the time the railroad seeks to appropriate public lands of the United States, such land is subject to entry and sale, the road is entitled to the benefit of the act, notwithstanding that such land may have been reserved from entry and sale at the date of the law (March 3, 1875). The status of the land at the date the appropriation is sought controls the right of the railroad company; not its status at the date of such act. The Supreme Court of New Mexico holds that the provision of section 4, requiring a profile to be filed, is directory, and a railroad may file such map and secure the benefits of the act after the stipulated period (12 months) has elapsed, if it so elects. The fact that it has completed its railroad does not prevent it from obtaining station grounds under the act if the land is public land, subject to entry and sale, at the time it applies therefor. The approval by the Secretary of the Interior of the filed profile is conclusive against collateral attack.—*Jackman v. Atchison, T. & S. F. (New Mex.)*, 170 Pac., 1036. Decided January 14, 1918. Rehearing denied February 23, 1918.

Trespass on Adjoining Land—

Cutting Brush and Diverting Water

In a suit by an abutting owner against a railroad to enjoin trespass the evidence tended to show that brush left on the plaintiff's land was cut with her permission along the right of way by the railroad's agents, in order that a better view of a semaphore signal might be obtained by locomotive engineers. The Oregon Supreme Court therefore held that the cutting of the brush was not a trespass. If by leaving it on the land when it should have been burned after it was cut the land owner was injured her remedy was the expense reasonably to be incurred in removing it and not the damages which might result by reason of her inability to use the land for grazing. An action at law to recover the outlay thus necessitated affords an adequate remedy and no exigency exists for resorting to a court of equity. In changing its roadbed the railroad diverted the water of a brook so that it seeped through the embankment and damaged the plaintiff's land. It was held that such act constituted a continuing trespass; but as the plaintiff for seven years asserted no rights and sought no relief her long delay precluded equitable intervention.—*O. W. R. & Nav. Co. v. Reed* (Ore.), 170 Pac., 300. Decided January 29, 1918.

Limiting Liability of Connecting Carrier

The Tennessee Supreme Court holds that an agreement by the agent of a carrier to pay damages, not occurring on its lines, to goods shipped under a bill of lading providing that no carrier shall be liable for loss other than on its own lines, is a discrimination against the uniformity of responsibility required of carriers of interstate commerce, and is unenforceable. The Carmack Amendment, making the initial carrier responsible for transportation to destination, does not preclude limiting the responsibility to the shipper by a connecting carrier to damages on its own lines, and such limitation is good at common law. A connecting carrier is not estopped by a promise to settle, to rely on a provision in a bill of lading limiting liability to loss occurring on its own lines, to defeat recovery on an unlawful contract made by its agent to pay such loss on interstate shipments. The carrier cannot waive the terms of the bill of lading contract. Under the acts of Congress it is unlawful for any shipper to receive any benefit or advantage to which all other

shippers are not entitled at the hands of a carrier. An estoppel cannot be invoked to obtain for a shipper an unlawful preference. —*Southern v. Lewis* (Tenn.), 201 S. W., 131. Decided February 11, 1918.

Government Control and State Commissions' Orders

The Oklahoma Corporation Commission made an order requiring the St. Louis-San Francisco to remove its present station in Miami and to replace it by a modern fireproof structure. The railroad appealed. Since the submission of the case in the Supreme Court the United States has taken control of the railroad, and the Supreme Court continued the cause until the further order of the court. The court said it knew judicially, as everyone knows, "that it will require the utmost conservation of the resources and energies of this country and will require vast stores of supplies and materials, such as will be required to comply with the order appealed from, to carry on the prosecution of the war to a successful termination, and that the revenues of the railroads, their rolling stock, and the services of their employees will be taxed to the utmost in the speedy and efficient transportation of troops, munitions, and other war supplies. Matters of this kind must and will have precedence over matters of private convenience and local ambition, and . . . we are of opinion that compliance with said order should be suspended until the further orders of this court." —*St. Louis-San Francisco v. State* (Okla.), 170 Pac., 1146. Decided February 12, 1918.

Reasonableness of State Commission's Rate Order

In response to a rule to show cause why the Oklahoma Corporation Commission should not issue an order providing that rates now charged for freight and passenger service shall not be advanced by any carrier until such advance is approved by the commission, several railroads appeared and filed a protest denying the jurisdiction of the commission to make such order. Thereafter, and without taking any extrinsic evidence tending to show the necessity for or reasonableness thereof, a final order was issued, providing that the railroads "shall not advance the rates now charged for freight or passenger service until such advance is approved by the commission and tariffs regularly filed with the commission." The Oklahoma Supreme Court holds that the order was a reasonable exercise of the power and authority conferred on the commission by the constitution and laws of the state, and invades no substantial right of the railroads, either state or federal. It also holds that the taking of extrinsic evidence is not necessary to support the order where its necessity and reasonableness are apparent from the mere statement of conditions contained in the record, of which the courts and the commission may take notice. The court adds: "Of course, this and all other general rules and orders of a similar nature promulgated by the Corporation Commission, prior to the taking over of the railroads by the federal government as a war measure, must be administered in the light of these changed conditions." —*Atchison, T. & S. F. v. State* (Okla.), 171 Pac., 43. Decided February 12, 1918.

Right to Maintain Snow Fences Along Highways

Action was brought against a railroad for the death of the driver of a sleigh by being precipitated from the top of a load of straw on the sleigh which he was driving along the highway adjoining the railroad. The accident happened when the forward part of the sleigh descended into a hole in the snow in the highway, overturning the sleigh and its load. The railroad maintained a right board fence, about 7 feet high, along the division line between its road and the highway, to keep snow from blowing on the track. The highway passes over an elevation, and the tracks are in a cut from 4 to 6 feet deep. Prior to the building of the fence the snow did not drift into the highway at this point, but the effect of the fence was to cause the snow to drift and to a considerable extent obstruct the highway, contributing to the development of pitch holes between the drifts. The complaint charged negligence in maintaining the fence and thereby creating a nuisance. The question left to the jury was as to whether the fence was a nuisance, in that it obstructed the highway by causing an accumulation and piling of snow which but for the fence would not have occurred. The precise question presented does not appear to have been

decided in any reported case, or to have been treated by any text writer. From a verdict and judgment for the plaintiff the defendant appealed. The New York Appellate Division has reversed the judgment and dismissed the complaint. It held that a railroad running alongside a highway may maintain snow guards on the line of the right of way, although they cause snow to drift in the highway, obstructing and making it dangerous, as anyone can erect structures wholly on his own land without incurring liability for its accidental effect on the adjoining highways or landowners. The court said:

"It would seem that the railroad companies would have the same right to erect fences and other structures upon their right of way as to raise embankments, although the effect of the embankment would be to cause snowdrifts in the adjoining highway. A farmer's barn may cause drifts in the highway, at it has never, so far as I am aware, been contended that this would subject the farmer to liability for creating a nuisance in the highway. All highway fences do tend to produce drifts, except, perhaps, the modern wire fence." —*Conney v. Northern Central*, 167 N. Y. Supp., 805. Decided November 14, 1917.

Assignability of Contracts Between Railroad and Telegraph Companies for Maintenance of Wires

A telegraph company entered into a contract with a railroad company for the construction and maintenance of a telegraph line along the railroad right of way, the railroad company to furnish an easement over its right of way, furnish the labor and maintain and operate the line, giving office room at stations. Employees of the railroad were to act as custodians of moneys received for commercial messages. The railroad company became insolvent and the receiver operated the railway and telegraph systems, discharging the contract obligations of the railroad company. On the expiration of the receivership the property was sold to another railroad company and the court's order of sale, which included all rights of the railroad company as well as the rights of the mortgagees, gave the plaintiff 90 days in which to disavow contracts by its predecessors. After the purchaser took possession of the road it was notified by the telegraph company that it elected to terminate the contract on account of the foreclosure proceedings and threatened to discontinue service and remove its line. To prevent it from carrying its threats into execution the railroad company filed a bill for injunction. The questions involved were: (1) Was the contract between the telegraph company and the plaintiff's predecessor assignable? (2) Was the contract assigned?

The Michigan Supreme Court holds that as the contract was obviously made by the telegraph company to obtain a right of way for its telegraph system, and by the railroad to obtain a telegraph system for the operation of its trains, the contract was assignable; an executory contract not necessarily personal in its character being assignable when it can, consistent with the rights and wishes of the parties, be fairly and sufficiently executed as well by the assignee as by the original contractor. As the plaintiff did not within the 90-day period disavow liability on the contract, but instead used the telegraph system, which was essential to the operation of the road, the contract must be treated as having been adopted by the plaintiff, and hence the telegraph company could not after the expiration of the 90-day period rescind the contract on the ground that the insolvency of the original company destroyed the mutuality of the agreement. Moreover, as the telegraph company acted by the agreement while the road was in the receiver's hands, and made no attempt to disavow it on account of mutuality until he property had passed to the plaintiff it would not, because inequitable, be allowed thereafter to disavow the contract on the ground of want of mutuality. Though the original railroad company had mortgaged its property before contracting with the telegraph company for the construction of the line, yet as the contract was assignable, and as the order for the sale of the railroad property contemplated not only the disposition of the rights of the mortgagees but of the rights of the railroad company and the receiver, the contract passed to the plaintiff, the purchaser at the sale. Decree for the plaintiff was affirmed. —*Detroit, Toledo & Montreal v. Western Union Tel. Co.* (Mich.), 166 N. W., 494. Decided February 19, 1918.

Equipment and Supplies

Freight Cars

F. M. PEASE, Philadelphia, Pa., has ordered 500 tank cars from the Cambria Steel Company.

THE MUTUAL SALES COMPANY, Warren, Pa., is inquiring for 10 40-ton, 8,000-gal. tank cars.

THOMPSON & STARRET COMPANY, Charleston, W. Va., has ordered 400 gun cotton cars from the Kilbourne & Jacobs Manufacturing Company.

THE J. G. WHITE ENGINEERING CORPORATION, New York, is inquiring for 40 to 50 10,000-gal., 50-ton steel underframe tank cars for the Gulf Sulphur Company.

THE UNITED STATES GOVERNMENT has ordered 76 flat, 8 box, 4 narrow gage flat cars and 36 transfer trucks from the American Car & Foundry Company; and 10, 30-ton, insulated tank cars for the Ordnance Department from the American Car & Foundry Company. In addition the government is inquiring for 4, 75-ton steel flat cars for the Navy, and is asking for prices on 20, 40-ton flat cars.

Canadian Orders for Cars and Engines

A statement of recent orders for equipment, presented in Parliament at Ottawa on April 9, by Hon. J. D. Reid, Minister of Railways, gives the following contracts:

Canada Car & Foundry Company, 5,000 forty-ton steel frame box cars, \$13,750,000; National Steel Car Company, 1,000 cars, \$2,750,000; Eastern Car Company, 750 forty-ton flat cars, \$1,777,800; Eastern Car Company, 650 fifty-ton coal cars, \$2,066,675; Hart-Otis Company, 250 side-dump cars, \$760,000; Hart-Otis Company, 200 side and centre-dump cars, \$625,000; Pressed Steel Car Company, 25 general service tanks, \$134,956; Pressed Steel Car Company, 25 water service tanks, \$129,593; Canada Car & Foundry Company, 250 refrigerator cars, \$1,024,250; Pullman Car Company, 14 sleeping cars, \$502,460; Pullman Car Company, 7 dining cars, \$238,700; Montreal Locomotive Works and Canada Locomotive Company, 50 consolidation freight engines, \$2,900,000; 10 switching engines, \$405,000; 30 Pacific type engines, \$1,800,000; 60 Mikado type engines, \$3,720,000; Canada Locomotive Company, six switching engines, \$246,000; four narrow gauge engines, \$136,080. Total cost of all equipment ordered, \$32,966,515. This does not include the 100,000 tons of rails recently purchased.

In reply to a question, Dr. Reid said he might yet have to purchase ten or fifteen snow ploughs at a cost of \$100,000, while the National Railway Defense Association was asking him to buy 100 tourist cars for carrying troops. He might also have to purchase 19 baggage cars.

Iron and Steel

THE CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA has ordered 112 tons of steel for the construction of deck and through plate girder spans for use at Palisade, Minn., and Waukesha, Wis.

Miscellaneous

CHICAGO, BURLINGTON & QUINCY.—This company has ordered six 150-ton steel coal chutes from the Ogle Construction Company, Chicago, to be installed at Clayton, Wyo., Powder River, Orin Junction, Echeta, Lysite and Seneca, Neb.

Signaling

THE SOUTHERN PACIFIC has ordered 50 automatic block signals, Union, style B, two-arm, to be kept in stock to fill short-notice requisitions for use on small jobs, such as additional signals where a side-track is lengthened.

Supply Trade News

H. Arnold Jackson, sales agent of the Bethlehem Steel Company, at Boston, has been elected president of the Chicago Pneumatic Tool Company, with office at Chicago, vice W. O. Duntley, resigned.

Major Warren R. Roberts, Quartermaster's Reserve Corps, president of the Roberts & Schaefer & Co., Chicago, has been promoted to lieutenant-colonel. At present he is an executive officer for the constructing branch of the construction division of the United States Army.

The Liberty Car & Equipment Company, 20 West Jackson boulevard, Chicago, has been incorporated with P. H. Joyce as president, and has bought the freight car plant of the Central Locomotive & Car Works, Chicago. The locomotive plant of the latter is being utilized for the manufacture of farm tractors.

M. F. Emrich, formerly of the Glidden Company, Cleveland, Ohio, has been appointed assistant general manager for Berry Brothers, Detroit, Mich. Mr. Emrich was with the Glidden Company for 28 years, having filled various positions, from the bottom up to the position of assistant to the president. He began his services with Berry Brothers on April 1.

Rufus Franklin Emery, secretary and treasurer of the Westinghouse Air Brake Company, died suddenly on April 11, in his office at Wilmerding, Pa. He was born in 1869 at

R. F. Emery

Chatham, Mass., and was educated in the grammar and high schools of his native town. He entered business life at an early age and after service with several business interests in the Pittsburgh district, entered the service of the Westinghouse Air Brake Company in September, 1892, where he held various positions of trust and responsibility, until 1909 when he was elected secretary and treasurer. At the time of his death, Mr. Emery was an officer and director in a number of business and financial institutions in the Pittsburgh district.

The International Oxygen Company, 115 Broadway, New York, announces the appointment of A. E. Ward as sales manager. Mr. Ward was formerly associated with the Prest-O-Lite Company, and in the course of years of association with the compressed gas industries has gained recognition as an expert in the industrial applications of oxygen, hydrogen and acetylene.

George W. Bender, assistant to the vice-president of Mudge & Co., Chicago, has been appointed eastern manager of that company, with office at 30 Church street, New York; and Clyde P. Benning, assistant to the vice-president, has been appointed western manager, with office in the Crocker building, San Francisco, Cal., and will have charge of the business of Mudge & Co., in the Pacific Coast states.

F. E. Whitcomb, whose resignation as signal engineer of the Boston & Albany was announced last week, has become special representative of the Federal Signal Company, with headquarters at New York. Mr. Whitcomb has been in railroad service about 21 years, having entered the employ of the Boston & Albany as a lineman in October, 1898. In 1902 he was promoted to foreman and two years later was made electrical assistant to the signal engineer. In February, 1905, he was appointed division foreman of the signal department of the Al-

bany division, with headquarters at Springfield, Mass. In 1910 he was again promoted, becoming engineer of maintenance of signals, with office at Boston; and the following year was made signal engineer, which position he has just resigned.

No Supply Exhibit at Convention of Fuel Association

At a recent meeting of the International Railway Supply Men's Association at the Hotel Sherman, Chicago, resolutions were passed suspending dues for the year 1918. This action was taken following a request by the International Railway Fuel Association that no exhibit be held at the coming convention of that organization. All entertainment features by the supply association will also be dispensed with.

The Haskell & Barker Car Company

The financial statement of the Haskell & Barker Car Company, Michigan City, Ind., for the year ended January 31, 1918, made public at the annual meeting of the stockholders held in New York last week, shows net earnings nearly three times those of the previous year. The balance, after making deductions for repairs, renewals, etc., reached the figure of \$2,340,859, as compared with \$829,617 in the previous 12 months. Applied to each of the 220,000 shares of the company's stock outstanding, the net earnings were equal to \$10.64, as against \$3.77 a share for the preceding fiscal period. After deducting reserves for extraordinary replacements the surplus was equal to \$9.27 a share, as against \$3.15 for the preceding 12 months.

The income account and balance sheet as of January 31, 1918, with comparisons, follow:

| INCOME ACCOUNT | | 1918 | 1917 |
|---|--|--------------|--------------|
| Gross earnings | | \$2,634,192 | \$1,135,366 |
| Repairs, renewals, etc. | | 293,333 | 305,749 |
| Net earnings | | 2,340,859 | 829,617 |
| Dividends | | 660,000 | 165,000 |
| Balance | | 1,680,859 | 664,617 |
| Reserve for renewals | | 300,000 | 135,000 |
| Surplus | | 1,380,859 | 529,617 |
| BALANCE SHEET | | | |
| ASSETS | | | |
| Cash | | \$1,411,951 | \$680,885 |
| Accounts receivable | | 1,538,118 | 2,054,175 |
| Employees' liberty loan subscriptions | | 133,450 | |
| Securities owned | | 984,815 | 45,578 |
| Inventories | | 3,082,739 | 3,368,298 |
| Property and plant account | | 5,121,121 | 5,067,043 |
| Totals | | \$12,272,197 | \$11,215,983 |
| LIABILITIES | | | |
| Capital stock | | \$9,332,000 | \$9,332,000 |
| Audited vouchers, payrolls, taxes, etc. | | 552,788 | 1,189,794 |
| Reserves | | 476,931 | 164,572 |
| Surplus | | 1,910,275 | 529,617 |
| Totals | | \$12,272,197 | \$11,215,983 |

At the annual meeting of the stockholders, A. J. McAllister was elected to the vacancy in the board. The retiring directors were re-elected.

Trade Publications

SELF-OPENING DIES.—A booklet, entitled "Wells Self-Opening Dies," has been issued recently by the Greenfield Tap & Die Corporation, Greenfield, Mass. It contains a detailed description and illustration of the self-opening die manufactured by that company and shows the tool to be very serviceable and adaptable to widely varying conditions. The different kinds of tripping arrangements, including the pull trip, rim trip, face and lever trip are illustrated.

THE BAKER LOCOMOTIVE VALVE GEAR.—Under this title a book of pocket size, bound in stiff paper covers, has been published by the Piliold Company, 30 Church street, New York. This publication is a treatise on the Baker locomotive valve gear, which is completely described and illustrated and for which a large amount of data is given in tabular form as to valve events, proportions of parts, etc. About one-half of the book is devoted to a description of the methods of setting the valves, each step in the explanation being accompanied with an example. Several pages are also devoted to the Sentinel low water alarm, which is manufactured by the Piliold Company. For general distribution a price of 25 cents is quoted.

Financial and Construction

Railway Financial News

CHICAGO & NORTH WESTERN.—E. D. Hulbert, president of the Merchants Loan and Trust Company of Chicago, and Henry C. McDowd have been elected to succeed Zenas Crane and James Stillman as directors. Marvin Hughtit has resigned as chairman of the board.

GEORGIA & FLORIDA.—John E. Lewis, president of the Citizens Bank of Valdosta, has been appointed as one of the receivers of this road, to succeed Harry R. Warfield of Baltimore, resigned. A few weeks ago Mr. Lewis, with his brother, E. B. Lewis of Montezuma, Ga., purchased the holdings of the Baltimore Trust Company in the Georgia & Florida.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—J. B. Morgan of Nashville has been elected a director to succeed J. H. Hall of New York, resigned.

NEW YORK CENTRAL.—The directors have declared the regular dividend of 1 1/4 per cent payable May 1 to stock of record April 13. A special meeting of stockholders will be held June 5 to authorize or ratify an agreement between the company and the United States Railroad Administration. Special meetings of the companies controlled by the New York Central will be held on or about May 22 for the same purpose.

NORTHERN PACIFIC.—Howard Elliott and George F. Slade have been elected directors to succeed, respectively, William S. Tod, resigned, and Grant B. Schley, deceased.

OREGON SHORT LINE.—At the annual meeting of this company old board of directors was re-elected with the exception of Marvin Hughtit, who was succeeded by his son Marvin Hughtit, Jr. At the organization meeting of the directors the election of W. A. Harriman to the executive committee was to fill the vacancy caused by the retirement of Marvin Hughtit.

Railway Construction

CANADIAN NORTHERN.—Contracts have been given by this company for building a steel bridge, with concrete piers and abutments, over the St. Maurice river at Grand Mere, Quebec, as follows: For the foundations, to Joseph Gasselin, Quebec; and for fabricating and erecting the steel, to the Dominion Bridge Company, Lachine. The cost of the improvements, including grading approaches, steel and masonry work, will be about \$170,000.

CHICAGO, BURLINGTON & QUINCY.—This company has awarded a contract for the construction of a freight house at Scott's Bluff, Neb., to Harvey Wood, Aurora, Neb. The building will be a wooden frame, brick structure, 40 ft. by 120 ft., with asbestos shingle roof.

CHICAGO & NORTH WESTERN.—The stockholders of this company have authorized the directors to appropriate \$1,500,000 for completing the construction of the Milwaukee Connecting Railway, comprising a belt line of 12 miles on the western and southern sections of Milwaukee.

KANAWHA & MICHIGAN.—This company has started work on the first section of a 15-mile double-tracking project between Charleston, W. Va., and Nitro. The first work consists of building 1 1/2 miles of new line between Charleston and West Charleston, connecting with existing passing sidings. The work is being carried out by company forces and includes constructing a gauntlet over the Elk River bridge.

KANSAS CITY, MEXICO & ORIENT.—The Texas legislature recently passed a resolution asking the director general of railroads to authorize the extension of this line from San Angelo, Tex., to Del Rio on the Rio Grande border, a distance of about 155 miles. The resolution points out that the grading of the proposed line has been completed from San Angelo to a point 80 miles south and from Del Rio north 25 miles, leaving a gap of 50 miles yet to be graded.

Railway Officers

Executive, Financial, Legal and Accounting

E. M. Hyzer, vice-president and general counsel of the Chicago & North Western, with office at Chicago, has resigned.

The resignation of **Marvin Hughitt** as chairman of the board of directors of the Chicago & North Western is commented on elsewhere in this issue.

Operating

E. T. Campbell, general traffic manager of the Erie, with office at Chicago, has been appointed assistant general manager, with office at New York, and his former position has been abolished.

D. B. Fleming, superintendent of the Buffalo division of the New York Central, with office at Buffalo, N. Y., has been appointed superintendent of the Mohawk division, with headquarters at Albany, N. Y., succeeding **D. L. Sommerville**; **L. S. Emery**, superintendent of the St. Lawrence division, with office at Watertown, succeeds Mr. Fleming; **J. W. Evans**, superintendent of the Rochester division, with office at Rochester, succeeds Mr. Emery, and **D. L. Sommerville**, superintendent of the Mohawk division, with office at Albany, N. Y., succeeds Mr. Evans.

A. W. Brant, master of trains of the Louisville & Nashville, with office at Nashville, Tenn., has been appointed assistant superintendent of the Nashville division, with headquarters at Nashville; **J. P. Polk**, assistant master of trains, has been appointed master of trains, with office at Nashville, vice Mr. Brant; **B. F. Burrell** has been appointed assistant master of trains of the main stem second, Nashville & Decatur and Lewisburg divisions, vice Mr. Polk, and the territory of **T. C. Sullivan**, assistant master of trains, with office at Nashville, has been extended to the Nashville & Decatur and Lewisburg divisions.

Engineering and Rolling Stock

George A. Kirley, whose appointment as signal engineer of the Boston & Albany, with headquarters at Boston, Mass., has already been announced in these columns, was born on August 31, 1880, at Fairfield, Vt., and received his preparatory education at Brigham Academy, Bakersfield, Vt., following which he took a course in engineering at the University of Michigan, graduating in 1907. The same year he entered the service of the New York Central as a draftsman in the signal department at New York. In May, 1909, he went to the Boston & Albany, and since that time has been in the continuous service of the signal department of that road. He served consecutively as draftsman, as chief draftsman, and later as assistant engineer, until his recent appointment as signal engineer of the same road as above noted.

Traffic

Charles B. Irwin, livestock agent of the Union Pacific with office at Omaha, Neb., has been appointed general agent, with headquarters at Cheyenne, Wyo.

G. H. Corse, Jr., resigned on April 1 as foreign passenger agent of the Union Pacific System to become traffic manager

for G. Amsinck & Co., Inc., New York City, and the office of foreign passenger agent of the Union Pacific has been abolished.

The title of **Archibald Fries**, assistant general freight traffic manager of the Baltimore & Ohio, with office at Baltimore, Md., has been changed to general freight traffic manager.

The duties of **C. A. Gornally**, commercial agent of the Grand Trunk, with office at Chicago, and the duties of **H. W. Ploss**, commercial agent of the Grand Trunk, with office at Milwaukee, Wis., have been extended to include traffic, except bulk grain, via the Canada Atlantic Transit Company.

Lyman Sholes, division freight and passenger agent of the Chicago, St. Paul, Minneapolis & Omaha, at Omaha, Neb., resigned, effective April 15, on account of ill health, after 45 years of service with the North Western lines. The office of division freight and passenger agent at Omaha has been abolished. **Edgar A. Gray**, general agent at Helma, Mont., has been transferred to Omaha, effective April 16.

Special

W. J. Dudley, assistant superintendent of the relief department of the Baltimore & Ohio, with office at Baltimore, Md., has been promoted to superintendent of that department, succeeding the late **S. R. Barr**, and **W. M. Kennedy** has been appointed assistant superintendent of the same department.

Railway Officers in Government Service

George E. Tebbetts, bridge engineer of the Kansas City Terminal, Kansas City, Mo., has received a leave of absence to assume a civilian position with the Emergency Fleet Corporation, Washington, D. C.

Major F. E. Lamphere, Quartermaster's Reserve Corps, formerly assistant engineer of the Baltimore & Ohio Chicago Terminal, has been promoted to colonel. He is now stationed at Port Newark Terminal, Newark, N. J.

Obituary

Albert A. Burleigh, who was president of the Bangor & Aroostook previous to 1900, and then to January, 1907, served as vice-president of that road, died on April 8, at Houlton, Me., at the age of 77.

Frank L. Sheppard, resident assistant to vice-president in charge of operation, of the Pennsylvania Railroad, with headquarters at New York, died on April 13, at his home in New York. He was born in 1851 at Bridgeton, N. J., and entered the service of the Pennsylvania Railroad in 1868 as an apprentice at the Altoona (Pa.) shops. He subsequently served in various capacities until 1881, when he was appointed superintendent of the Sumbury division of the Philadelphia & Erie, and then was consecutively superintendent of motive power at Altoona, general superintendent of the Pennsylvania Railroad division, general superintendent of the United Railroads of New Jersey division, which was later changed to the New Jersey division and included the Pennsylvania tunnel and terminal line; also, as general superintendent of the West Jersey & Seashore. On May 1, 1916, he was appointed to the newly created position of assistant to vice-president in charge of operation.

CONTEMPLATED HIGHWAY DEVELOPMENT IN 1918.—Combined forces of the government, states and counties will spend for highway improvement in 1918 the amazing total of \$263,096,610. This is the announcement contained in the first detailed survey of the nation's road building plan issued by officials of the touring bureau of the B. F. Goodrich Rubber Company, who have been in contact daily for two months with highway commissioners of the states. While this sum seems staggering, eclipsing by eighty-two per cent the expenditures of any previous year and in money figures that of 1917 by \$118,797,750, road officials of the government and states said it represented merely a "drop in the bucket" of what should be spent before the war was concluded. Calculations by government officials are that with good highways, motor trucks and motor vehicles are capable of carrying approximately 200 per cent more freight than the railroads. In these same calculations they estimate the value of our highways at \$6,240,000,000.

G. A. Kirley

EDITORIAL

Railway Age

EDITORIAL

On another page we publish an article concerning the latest developments regarding the standardization of locomotives.

Standardization of Locomotives

The *Railway Age* has for some weeks been discussing the subject fully and earnestly. It has not been inspired in doing so by any spirit of antagonism to the Railroad Administration. The railways must be operated efficiently if America is to play its part in the war; the Railroad Administration now has the primary responsibility for the operation of the railroads, and it is therefore entitled to the loyal and energetic support of every concern, person or publication in a position to affect railroad operation. But if any person or publication believes the Railroad Administration is in danger of making a serious mistake, it is that person's or publication's duty to say so and give the reasons for the belief. The *Railway Age* has believed that the Railroad Administration has been in danger of making a serious mistake in the matter of locomotive standardization, and it has said so and told the reasons for its belief. The time has now come when the question should, for the present, be settled in some way, and that orders for some kind or kinds of locomotives should be placed. It is to be hoped, however, that the standardized locomotives will be treated as what they are actually, viz.: an experiment; that the number of them ordered will not be excessive; and that the individual lines which require other types will be given an early opportunity to obtain them.

Although the American Railway Engineering Association is primarily an engineering organization, it includes in its

An Opportunity for Operating Studies

membership a considerable number of railway men in operating and executive positions. Some of these are men who joined the association when in the engineering department, and who have since been transferred or promoted into operating positions. Others who have risen through the operating department have become identified with this organization in order to participate directly in the benefits resulting from membership. With the continually increasing necessity for the application of more scientific methods of operation there is a growing realization of the value of accurate analyses of grade lines, train loading, track capacities and other operating conditions. The American Railway Engineering Association has given consideration to the engineering phases of such problems in the past through its Committee on Economics of Railway Location, while other committees such as that on Yards and Terminals, have studied special phases of operation. Last year the association went a step further and created a new standing Committee on Economics of Railway Operation. It now has, therefore, an organization, through which studies of operating problems of other than an engineering nature may be undertaken. This committee offers a medium through which operating men can work together to solve the problems which are confronting them.

Furthermore, the activities of this committee will undoubtedly lead to the development of valuable information for inclusion in the proceedings. This in turn should prove an incentive to other operating men to enroll in its membership to secure access to this data. In covering this field of activity the American Railway Engineering Association is entering a sphere not occupied by any other organization. It is to be hoped that operating men will avail themselves generally of the privilege of membership in this organization in order that the investigations of an operating nature which are undertaken may be made the most valuable and may be placed in the hands of the largest number of interested railway men.

The matter of trespassing on railways is an important one at any time. It is especially important under present conditions. About 5,000 persons are killed and 5,000 seriously injured annually as a result of this practice. At a time when the nation needs all its manpower as it never needed it before—

Trespassing Under Govern- ment Control

and, let us hope, will never need it again—no reasonable effort should be spared to stop the careless or reckless conduct which results in the killing and maiming on the railways of an average of 30 persons every day in the year. With the railways being operated under government control, there is another phase of the matter which should appeal to public officials. Trespassers on the railroads in many instances interfere with operation and do damage to railroad property. In many cases the killing and injuring of them results in damage suits. While the railways are under government control the expense which directly and indirectly results from trespassing must be borne by the government itself. The Interstate Commerce Commission, before government control was adopted, recommended the consideration by Congress of federal legislation to prevent trespassing. The arguments for legislation on this subject and for its strict enforcement always have been strong, but they are stronger now than ever before.

Keeping highway crossing gates closed, except when the highway must be opened for traffic, has proved very satisfactory. This is the conclusion of the

Increased Safety at Highway Crossings

chief inspector of the New York State Public Service Commission (first district) after a review of six months' experimental operation of this rule at 144 crossings in New York City. The rule, which went into effect August 22, is in force from midnight to 5 a. m. One taxi-cab has broken through a gate, but the driver was called into court and pleaded guilty. No person has been injured, during the five-hour period, at any of these crossings. At the hearing given by the Commission, prior to the issuance of its order, some one presented the theoretical objection that to keep gates closed when no train was coming would invade the constitutional rights of travelers on the highway; but the only request received by the commission for a suspension of the rule was one from the Staten Island Civic League, saying that in their territory there are no scheduled trains after midnight, it was not granted

Whether the members of this league are particularly addicted to traveling in the "small hours" does not appear; but the commission called attention to the obvious fact that extra trains, though infrequent, introduce more risk than do the regular trains. The prevention of accidents to persons is a sufficient justification for keeping gates normally closed at night, for no one has discovered any better way of dealing with the sleepy attendant; but the rule has also proved a much-appreciated relief to engineers; they have a feeling of security where, before, they frequently observed gates left open and attendants asleep or lazy. Now, the attendant who does not promptly open the gates for motorists, or others, not only risks being complained of by the travelers but also risks censure from his superior for not preventing damage to gates, as in the case noted. More than two-thirds of the 144 crossings covered by this rule are on Long Island.

A Good Record in Moving Coal

THE COMPLAINT of the fuel administrator, Dr. Garfield, that the railways moved less coal in the week of April 6 than in previous weeks has directed attention once more to the important problem of coal transportation. The statistics regarding the coal moved thus far this year which have been made public by the Railroad Administration show that while the complaint of the fuel administrator was based on facts it was also very unjust.

The *Railway Age* published in its issue for April 19 statistics showing that to the end of the first week in April the railways had moved a total of 6,441 more carloads of coal this year than they did during the corresponding period of 1917. Statistics regarding the coal movement for the second week in April are now available. They show that to the end of the second week in April the railways had loaded 28,660 carloads more than during the corresponding period of last year. In other words, while there was a decline in the amount of coal loaded in the single week ending on April 6, there has been in the entire period since January 1 an increase over last year in the total number of cars loaded of almost 29,000 cars.

The record made by the railways thus far this year is even better than these figures indicate. Nobody has forgotten that the weather of January, 1918, was the most severe that has been experienced in many years. Principally because of this there was in that month an actual decrease of 79,172 in the number of cars loaded. On the other hand, in the months of February and March and in the first two weeks of April there was an increase in the number of cars loaded over the same period of last year of 107,832 cars, or $4\frac{1}{2}$ per cent. In other words, the net increase of 28,660 in the number of cars loaded in the first three and one-half months of the year was made in spite of a large reduction in the amount of coal moved in January.

In a statement regarding the decline in the amount of coal loaded in the week ending April 6, Dr. Garfield said, "A large part of the shortage is due to the continued lack of transportation service, as evidenced by the shortage of cars placed at the mines to be loaded." His statement referred especially to the situation in the bituminous coal fields. Since then statistics of the United States Geological Survey for the week to which he referred have become available. These do not support his statement. They show, on the contrary, that while the bituminous mines produced 38.1 per cent less than their maximum capacity, only 12.5 per cent of this failure was due to car shortage, while 25.6 per cent of it was due to labor shortage, strikes and other causes. The United States Geological Survey specifically says, "The exceptional loss of production in the week of April 6 is therefore to be attributed to labor shortage rather than car

shortage, in all fields reported with the particular exception of Ohio and New River districts."

It is unfortunately true that the railways are and long have been unable to transport as much coal as the mines can produce. It is probable that this condition will continue indefinitely. But neither the Railroad Administration nor the railway companies are responsible for the existing inadequacy of railway facilities. The present transportation situation is mainly the result of the nation's persistence for over ten years in pursuing a policy of repressive regulation which rendered it impossible adequately to increase railway facilities.

Furthermore, nothing is to be gained by picking out exceptional weeks, as was done in this instance, as a basis for criticising the railways, and ignoring the fact that, excepting in occasional brief periods, they are loading more coal than in corresponding periods of previous years. And certainly nobody is going to be benefited by attempts to put on the railways the blame for failure in exceptional weeks to increase the loading of coal when the facts show, as do those for the week on which Dr. Garfield based his complaint, that most of the failure to secure greater production of coal was not due to transportation conditions.

Railroad Influence in National Movements

A UNIQUE FUEL CONSERVATION CAMPAIGN now being carried on by the Northern Pacific is described elsewhere in this issue. This adds another item to the long list of worthy movements which the railroads have been active in fostering, not only as they affect the interests of the companies and their employees, but designed in a broad way to promote the best interests of the country and the public at large. In the past the railroads have lent their support to colonization work, to the movement for the conservation of natural resources, to the safety first propaganda, to public sanitation work and other similar activities. Although in their inception the work of the railroads in furthering these movements was in most cases undertaken because it was felt that it would be of advantage to the roads, in the majority of instances it has been carried to the point where it involved the interests of large classes of people, or whole sections of the country, or even assumed importance as a nationwide movement.

The advantages of a broad policy in such matters can hardly be overestimated. It is important for the railroads to know the attitude of the public and also to bring the people to see the viewpoint of the road. Such educational campaigns furnish one of the best means at their disposal for bringing home to the people the fact that in the broad questions of public policy, the interests of the railroads are identical with those of the country as a whole. Unselfish work for national movements is one of the best methods that can be adopted for promoting good feeling in the public mind toward the carriers. Public sentiment in matters concerning the railroads is less antagonistic than it was a few years ago, and this good feeling should be fostered in every way possible. It may be necessary to make reductions in passenger service and to use other means of saving fuel which may cause inconvenience to the patrons of the roads. Despite the fact that the responsibility for the operation of the roads has been assumed by the government, unpopular measures will still react on the carriers. Such campaigns as that now in progress on the Northern Pacific will do much to assure an understanding and a sympathetic co-operation by the general public under such circumstances and deserve the railroads' hearty support.

Prices of Coal for Railroads

THERE RECENTLY has been going on a controversy between Dr. Garfield, the head of the Fuel Administration, and John Skelton Williams, director of purchases of the Railroad Administration, regarding the prices which railroads should be required to pay for coal. Dr. Garfield has contended that the railways should pay the same prices as other large consumers. Mr. Williams has contended that the railways should be sold coal at lower prices than other large consumers.

Dr. Garfield bases his stand largely on theoretical considerations of equity. He seems to think it is morally wrong for railways to be given coal for less than other users. He also argues, it is understood, that the payment by railways of the regular government prices is necessary to keep all mines now operated open and to secure maximum output.

There seems to be an impression that Mr. Williams in asking for differential prices for the railways is asking for something new and even revolutionary. As a matter of fact, he is seeking a continuance of practices which have prevailed in the past and which always have been recognized as based on sound commercial principles. Just how much less railways should be charged for coal than other consumers is an open question, but that they should not be required to pay prices which have been fixed as reasonable for other consumers seems clear. The railways in the past have been made lower prices than other consumers for several reasons. In the first place, they are wholesale customers. They use from one-fourth to one-third of all the coal produced. Now, obviously, regardless of the matter of car supply, it does not cost a coal operator as much per ton to furnish coal to a single very large customer, such as a railway, as to furnish it to many smaller customers. Most of the selling and overhead expenses he incurs in furnishing coal to a railway are relatively less than those he incurs in selling to smaller customers.

Furthermore, the railway furnishes to the coal operator the means of transporting his product, and when he has a railway for a customer it can arrange to furnish him as many cars as he requires in order to fill his contract with it. With an ample car supply than he otherwise would have he can secure a larger output than he otherwise could obtain, and the larger and more regular the output he can obtain the cheaper he can produce the coal. It is argued that the railway should distribute its cars equitably among the mines along its line and should not be allowed to use its power to furnish cars as a means of forcing down the price. But each railway must, as a matter of public necessity, be furnished all the coal that it requires. If the railways do not get all the coal they need they will be rendered unable to operate to their maximum capacity; and if they are unable to operate to their maximum capacity they cannot haul the greatest practicable amount of freight, including coal. Since in order to enable the railway to handle the maximum amount of coal and other traffic for other persons it is necessary that it shall be furnished all the coal that it requires, and since when it furnishes a full supply of cars to a mine it becomes possible to operate that mine more regularly and therefore to produce coal from it more cheaply, it seems to follow that the coal produced for the railway should be sold to it at a lower price than coal is sold to other customers who are smaller purchasers and who do not furnish the car supply which makes it possible to operate the mine more economically.

If a railway were a concern which entered into competition with other concerns to which the coal was sold, the objection to selling to it at a lower price than to other customers could be urged with more force. But the railway is not a commercial competitor of other consumers of coal, and the actual effect of selling it coal cheaper than other consumers is to enable it to operate more economically, and

thereby to render transportation service cheaper than it otherwise could to other users of coal.

We do not understand that the present government prices for coal originally were fixed with the intention that they should be paid by the railways as well as by commercial consumers. They were fixed with a knowledge of the fact that the railways were getting and always had got their coal cheaper than other consumers. Therefore, to require the railways to pay the government prices would be to raise the cost of coal to them without reducing it to other consumers. The effect, while the railways are being operated under government control, would be to increase their operating expenses at the expense of the government itself.

It would seem that it ought to be possible for the Railroad Administration and the Fuel Administration to reach some agreement under which the railways would be granted reasonable, differential prices for coal. If, however, theoretical principles of equity rather than commercial principles of long standing are to prevail and the prices charged railways are to be made the same as those charged other consumers, it would seem that the increase in prices to the railways should be accompanied by some reduction in the prices to the public, provided this would not interfere with securing the largest output of coal which the railways can transport. So necessary is it to secure the maximum practicable output of coal that the question of prices ought, of course, to be subordinated to the question of the best means of securing maximum production.

Norfolk & Western

HAD IT NOT BEEN for the increase of over 100 per cent in taxes, the Norfolk & Western would have had almost as much available for dividends in the calendar year 1917 as in its banner year 1916. Briefly summarized, the reasons for this rather extraordinary result are the increase of 7.35 per cent in the average revenue per ton per mile and the increase of 4.21 per cent in tons carried per train; a slight decrease in the amount spent for maintenance of way; the large increase in the credit balance for hire of equipment and rent of other equipment; and an increase of nearly 18 per cent in passenger revenue with an increase of only about 2.28 per cent in passenger train mileage.

Norfolk & Western's cost of moving the business ran up in much the same way as with other eastern roads. Transportation expenses amounted to \$20,808,000, an increase over 1916 of \$6,030,000, or 40.81 per cent. Maintenance of equipment also cost more, the total in 1917 being \$12,052,000, an increase of 16.53 per cent over the previous year. These increased labor and material costs were nearly offset by the factors mentioned above. There was charged to taxes, however, \$5,095,000, or \$2,615,000 more than in 1916, an increase of over 105 per cent. It would appear that this charge to taxes makes ample provision for all new federal taxes imposed during 1917. After paying interest charges and rentals, Norfolk & Western had \$18,946,000 available for dividends, as compared with \$21,800,000 in 1916. The 4 per cent dividends on the preferred calls for \$20,000; the company paid a total of 8 per cent, which includes an extra dividend of 1 per cent declared in March, on its common stock, making a total dividend payment on both common and preferred of approximately \$10,500,000.

There was actually less coal carried by the Norfolk & Western in 1917 than in 1916, and the average length of haul was shorter. The bituminous coal carried in 1917 was 29,005,000 tons, or only 60.18 per cent of the total revenue freight carried. In the three years preceding 1916, bituminous coal has furnished more than 68 per cent of the total revenue freight tonnage and in the fiscal year ended June 30, 1915, it formed over 71 per cent of the total ton-

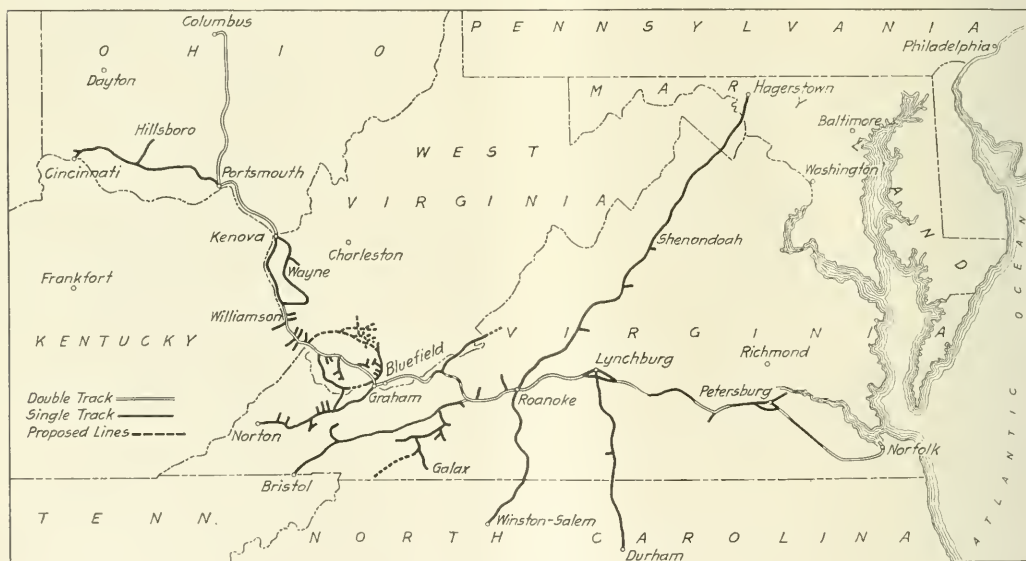

nage. In 1916 it was over 60 per cent of the total tonnage. The average revenue for coal per ton mile, however, was 4.53 mills in 1917, as against 4.43 mills in 1916. As an offset to the smaller coal traffic, there was an increase of 397,000 tons of coke carried—the total in 1917 being 2,359,000 tons—and of 440,000 tons of ore—the total in 1917 being 1,756,000 tons—and a very large increase in the tonnage of manufactured products, the total in 1917 being 6,987,000 tons, an increase of 1,357,000 tons over 1916.

These changes in traffic conditions gave the Norfolk & Western a better balanced freight movement, so that with an average freight train, excluding the caboose, of 45.77 cars in 1917, 29.27 of these were loaded and 16.50 empty; while in 1916, with an average train of 46.73 cars, 28.86 were loaded and 17.87 empty. This was a factor favorable to a heavier trainload, but, on the other hand, the fact that there was a smaller proportion of coal and a larger proportion of manufactures, made it more difficult to get an increased trainload. The Norfolk & Western, however, has now joined the class of the Chesapeake & Ohio, with an average revenue trainload of over 1,000 tons. In 1917 the revenue trainload averaged 1,021 tons and the loading per loaded freight car

division. On this division steam locomotive repairs average \$19.03 and fuel cost \$30.54, or considerably more than the average for all steam locomotives. The Norfolk & Western management figures the cost of repairs, retirements and depreciations of freight steam locomotives per thousand ton miles moved at 32 cents in 1917 and 29 cents in 1916 and the repairs, retirements and depreciations of the electric freight locomotives at 10 cents per thousand ton miles in 1917 and 8 cents in 1916.

In 1917 the Norfolk & Western spent \$8,573,000 on additions and betterments, which included \$2,584,000 for new equipment completed or under construction during the year. The new equipment received included eight steam passenger locomotives, 20 steam freight locomotives, fifty 90-ton steel flat bottom, gondola cars, and 438—57½-ton drop bottom, gondola cars. The largest single item of expenditure for roadway and track was \$886,000 for sidings and spur tracks. There was \$495,000 spent for block and other signal apparatus.

Norfolk & Western has bought the leasehold interests in 3,800 acres of coal lands in Mingo County, West Virginia, and Pike County, Kentucky. This will furnish about one-

The Norfolk & Western

mile averaged 34.87 tons. The Norfolk & Western's grades are not so good as the Chesapeake & Ohio's but it is believed that the electrified portion of the Norfolk & Western has greatly aided both in facility of movement and economical operation. It is estimated that the cost of freight movement on the electrified division in October, 1917, was 26 per cent less than if steam locomotives alone had been used. This does not presumably, of course, take into consideration any overhead (capital) charges.

It is rather interesting to note that the average cost of repairs of electric locomotives per 100 miles was \$38.96 in 1917, as against \$28.21 in 1916, and of steam locomotives, \$15 in 1917 and \$12.72 in 1916. Fuel cost per 100 miles for the electric locomotives was \$44.95 in 1917 and \$27.74 in 1916, and for steam locomotives, \$24.14 in 1917 and \$11.48 in 1916. It must be remembered, however, that these comparisons are not fair to the electric locomotive, because of the inclusion of a large number of light steam locomotives. The electric locomotives are used on the Pocahontas

sixth of the fuel coal consumed and this coal is especially adapted to the use of mechanical stokers.

There was a decrease of \$1,270,000 in the amount of available bonds outstanding, these bonds having been exchanged for stock. There was also \$1,300,000 equipment trusts which fell due and were paid off. At the end of the year the company had on hand \$4,214,000 and no loans and bills payable. The following table shows the principal figures for operation in 1917 and 1916:

| | 1917 | 1916 |
|---|--------------|--------------|
| Average mileage operated..... | 2,085 | 2,080 |
| Freight revenues | \$56,381,036 | \$51,114,186 |
| Passenger revenues | 7,023,153 | 5,956,081 |
| Total operating revenues | 65,910,242 | 59,449,982 |
| Maintenance of way and structures | 6,176,369 | 6,771,473 |
| Maintenance of equipment | 12,651,912 | 10,342,501 |
| Traffic expenses | 809,723 | 739,052 |
| Transportation expenses | 20,808,290 | 14,778,086 |
| General expenses | 1,217,101 | 977,998 |
| Total operating expenses | 41,161,503 | 33,508,732 |
| Taxes | 5,095,000 | 2,480,000 |
| Operating income | 19,651,816 | 23,459,266 |
| Gross income | 23,182,056 | 26,166,872 |
| Net income | 18,946,137 | 21,800,074 |
| Dividends | 10,552,297 | 10,013,856 |

The Fifth National Foreign Trade Convention

"The Part of Foreign Trade in Winning the War," the Theme
of Meeting in Cincinnati Last Week

THAT NEXT TO WINNING THE WAR, the most important task before American business today is to prepare for the enormous foreign trade that will be open to America at the close of the war, was the sentiment of everyone of the thousand or more leaders of American business who attended the Fifth Annual Foreign Trade Convention in Cincinnati last week.

"The Part of Foreign Trade in Winning the War," was the theme of the most successful Foreign Trade Convention that has yet been held, but again and again in the sessions it was brought out that we shall have no more excuse for being unprepared for the coming of peace than we were for the coming of war.

Shipping, the part that industry is playing in helping win the war, the work of the War Trade Board, the assistance now being given to American exporters by the government Bureau of Foreign and Domestic Commerce, banking facilities, foreign credits, and co-operation in foreign trade, were among the important matters brought up for extended discussion at the convention.

Speakers brought out how American industry was bending every energy today in war work. They showed how much of this work would have a lasting value with the return of peace, particularly from the standpoint of foreign trade and pleas were made for a recognition of that fact by the American people and their constituted authority in Congress. Thus in speaking of the shipping situation, experts pointed with pride to the progress that has been made with our shipping program and to the rapid expansion that has taken place and to the more rapid expansion that will take place in America's merchant marine and in our shipbuilding capacity. Attention was drawn to the fact that this merchant marine will all be available after the war for American export trade, but it was shown that full use of this merchant marine could not be made with the present discriminatory laws against American shipping now on the statute books of Congress. It has been on account of these laws, said Robert Dollar, in his paper, that we have had to work with might and main to build ships enough in a few months to carry our men to France, whereas with more equitable laws a sufficient merchant marine would have been on hand when war began. Similarly so drastic have been the laws that American shipping has been practically driven from the Pacific, so that Japan now has an absolute monopoly of shipping on that ocean and is in a position to direct foreign trade over it as best suits her

own interests. For these reasons, urgent pleas were made for the repeal of the most obnoxious of these laws. That of Mr. Dollar's was one such plea. Another was made at the group meeting on Banking Facilities over which he presided, by C. A. Hirsch, president of the American Bankers Association, in which he said:

"We are in the midst of a shipbuilding program, which if carried forward to a logical conclusion will provide this nation with a tremendous fleet of ships, which will be of great benefit for and during the period of the war, in carry-

ing supplies of all kinds to our boys at the front and to our allies, but unless our laws are changed what is to become of this splendid fleet at the termination of the war? The La Follette Bill, known as the Seaman's Act, should be eliminated from our statute books, and a government subsidy in some form should be provided which will place the shipping of this country on a basis which will enable it to compete successfully with the shipping of other nations. Never again should we be placed in the embarrassing position in which we found ourselves when ships flying the flags of other countries were commandeered by those nations to carry supplies needed by them for the successful prosecution of the war thus leaving us completely stranded and at the mercy of other nations for the transportation of our products to all parts of the world. There is no time like the present to take an inventory

of our needs, and to proceed at once to place ourselves in an impregnable position so that we can hope to compete successfully with other nations when peace shall be re-established."

Particular attention was paid by several speakers to the urgent necessity of making plans now for foreign trade after the war, and in every case their arguments met with the most hearty approval. It was shown how England, France, Canada, Japan and Germany were already laying their plans despite the tremendous demands upon them for war time work. The argument was made that we must similarly prepare. The great sums of money that we have sent abroad the fact that we are now a creditor instead of a debtor nation the enormous increase in our factory production, far beyond our peace time needs, and the urgent demands that will be made upon us for the materials of reconstruction leave no doubt that we are going to have an export trade of great volume or of the great necessity of preparing now to expand and maintain that trade. The steps that England, France,

James A. Farrell

President of the United States Steel Corporation and Chairman
of the National Foreign Trade Council

Japan and Germany are taking similarly to prepare for trade after the war leave no doubt that we are only going to hold our export trade against keen competition.

"At this critical time," said Mr. Hinsch, "a great many people do not see the necessity or desirability of discussing the subject of foreign trade, but there is an old adage that 'in time of peace prepare for war,' and I think we can, therefore, very properly reverse the saying, and 'in time of war prepare for peace.'"

"This struggle has already been instrumental in bringing us to a full sense of realization of our inefficient, haphazard methods of doing business. If we would profit by our own experience, we should begin now to prepare for the struggle for commercial supremacy that will obtain when peace shall have been re-established in this troubled world."

Another important and similar aspect of this necessity of preparing now was brought by M. A. Oudin of the General Electric Company, speaking at one of the general sessions on "American Economic Interests in the Asiatic East." He said:

"In the United States there is a disposition to push aside all problems except the vitally important one of how to win the war. We are confident of the unselfishness of our motives and the disinterestedness of our aims. But no one can predict how far these policies and these principles will prevail at the peace conference. These principles must be backed up by more than a conviction on our part of their high moral character, by more than powerful naval and military forces. We will invite embarrassment if we do not take stock of our economic and industrial and of our agricultural and mineral resources. We will court disaster if we unduly delay taking the necessary constructive measures for the improvement of our economic position. It is certain that at the peace table a knowledge of the exact state of our resources and those of our Allies and the possession of a strongly fortified economic position will be trump cards. They will help us secure a better peace for ourselves and for the world, in which our role is that of a leader of democratic peoples."

General Sessions

The great importance that is being placed on foreign trade by the business men of America today is evidenced by the attendance at the convention of the representative leaders of American industry. Those who took part in the convention's deliberations included the leaders of all branches of American business, and despite the fact that so many of our industrial captains are now busily engaged on war work, the Fifth National Foreign Trade Convention was the best attended and most successful yet held.

The first session of the great meeting was called to order Tuesday morning, April 18, at the Hotel Gibson. The chairman of the Council is James A. Farrell, president of the United States Steel Corporation. Mr. Farrell attended all of the three days' sessions, but the work of presiding over the meeting was in charge of E. A. S. Clarke, president of the Lackawanna Steel Company, who was later assisted by George Ed. Smith, president of the Royal Type-writer Company, and head of the American Manufacturers' Export Association. O. K. Davis, secretary of the National Foreign Trade Council, was secretary of the convention.

The sessions of the convention were divided into three general sessions and eight group sessions, the latter to discuss particular problems of export trade. At the opening general session there were presented nine reports, detailing the war contributions of various factors of foreign trade. These papers were given by men high up in their respective industries and included reports on textiles, lumber, chemicals, automobiles, finance, metals, oil, agriculture and coal.

The second general session was devoted almost entirely to the activities of two government bodies—the Bureau of Foreign and Domestic Commerce and the War Trade Board. Burwell S. Cutler, chief of the Bureau, read a paper on

"American and Foreign Government Trade Encouragement Agencies," and another paper following detailed the trade promotion work of the consular service.

The work of the War Trade Board was explained in an exceedingly well received paper by Thomas L. Chadbourne, counselor to the War Trade Board, who was followed by three department chiefs of the Board, who explained the work respectively of the Contraband Committee, the Bureau of Exports and the Bureau of Imports. The meeting was enlivened by a period following in which the three department chiefs were called upon to answer questions concerning the work of the Board in licensing imports and exports.

The topic of the third general session, Friday morning was "The American Merchant Marine." Papers were presented on "The Relation of Inland Water Ways to the Development of Foreign Trade," by Walter Parker, general manager of the New Orleans Chamber of Commerce; on "American Economic Interests in the Asiatic East," by M. A. Oudin of the General Electric Company; on "Trade Follows the Flag," by Frank Waterhouse of Frank Waterhouse & Co., Seattle; on the "Development of an American System of Marine Insurance," by Hendon Chubb of Chubb & Son, New York. Robert Dollar was unable to attend but an able paper written by him was read by the secretary.

Group Sessions

The group sessions, four of which were held Thursday evening and four Friday afternoon, saw the presentation of several interesting papers.

Group I directed its attention to Banking Facilities for Foreign Trade and Investment. Several interesting papers were presented, that of Mr. Hinsch, who presided, having already been mentioned above.

Group II, dealing with Initiatory Problems in Foreign Trade, had as the feature of its meeting, the discussion by several members on "What Beginning in Foreign Trade Can Be Made with \$10,000, and How?" Some interesting facts were also brought out by the chairman, who, in opening the meeting, brought out some general suggestions with reference to foreign trade. He pointed out that it was necessary; first, to know the markets; second, to know the people; third, to know the seasons in foreign countries; fourth, to differentiate between different sections of comparatively large countries; and fifth, to know the language of the country to which it is desired to export.

Group III was devoted to Commercial Education for Foreign Trade.

Group IV's problem was Co-operation in Foreign Trade.

Reviews of the systems to be inaugurated in Great Britain and Germany for foreign trade after the war aroused the members present to the character of the competition that the United States exporters will have to meet in the struggle for the world's commercial supremacy. Papers, prepared by officials of the Bureau of Foreign and Domestic Commerce, on German and British organization, plainly indicated the care and attention which those countries have given to this matter.

In Germany there may be mandatory monopoly—government or otherwise; in England, co-operation which will perhaps be under governmental supervision and urged by the government. In this country we have no definite policy as yet.

The need for co-operation in foreign trade and of a concerted plan of action on the part of the exporters of this country in enlarging foreign trade activities, was strongly emphasized.

A great part of the discussion followed the suggestion as to the practical organization of an export association under the Webb-Pomerene Bill. A number of inquiries were made as to certain provisions of the bill, and much light was thrown on the probable working of this measure.

Group V dealt with Foreign Credits and Credit Informa-

tion and was held in co-operation with the National Association of Credit Men.

Group VI, held in co-operation with the American Manufacturers' Export Association, took up the Problems of the Smaller Manufacturer and Merchant.

After a thorough discussion of the export situation now and after the war, the session addressed itself in particular to a consideration of several of its more important phases. Attention was called to the difficulty of building up a successful overseas trade without extending to foreign purchasers the long-time credit to which they are accustomed, and the difficulty of obtaining accurate credit information through foreign sources.

Group VII, which discussed Pacific Overseas Trade Extension was brought sharply up against the replacement of American and other shipping on the Pacific by vessels under the Japanese flag.

The discussion of this subject brought out the fact that the steamship which transports products across the ocean very largely controls the commodity, not only while it is in its custody as freight but from its point of origin to its ultimate destination, and that it dictates who shall buy and who shall sell. And the ocean lines in the Pacific being principally in the hands of the Japanese, it has come to pass that the Japanese buy our cotton, for example at interior points in the South, and sell it to the user in Japan. They are thus doing the business that a few years ago was done by American commercial houses located in this country through their branches in foreign lands.

The only remedy for this situation lies in the maintenance of a substantial fleet of steamers operated under the American flag. Now the situation (prospectively at least) has changed. The United States will find itself possessed at the close of the war of a large fleet of merchant steamers, and the suggestion was made that the government retain that ownership and lease the ships to its citizens under the Government form of time charter.

Another of the features of Group VII was an able paper by Frank Rhea on "Transportation Facilities in the Far East." A detailed abstract of this paper will appear in an early issue of the *Railway Age*.

Group VIII dealt with Latin American Trade Relations. One of the best papers presented at this group meeting was by Robert H. Patchin of W. R. Grace & Co., on "Essential and Non-Essential Foreign Trade."

The Banquet

The feature of the entire convention, however, was the banquet held Friday evening. Over 900 were present, but the patriotic enthusiasm that was manifested for the remarks of the speakers would have done justice to twice that number. Taking their cue from L. A. Ault of Ault & Wiborg, Cincinnati, the toastmaster, the speakers directed their remarks to comment on the war with suggestions that a constructive plan for peace conditions should be in process of formation now. All laid stress on the necessity of a victorious peace and spoke against any compromise with those who had started the world conflagration.

Edward N. Hurley, who was to have been the leading speaker at the banquet, was unable to attend, but he sent the following telegram, which was read by Mr. Farrell:

"Please convey my sincere regret to the members of the National Foreign Trade Council that I am unable to be with them. I hoped until the last minute to be able to get away from Washington, but find now that it is impossible. I wanted to be with you because I knew that all of you are working for your country; that you are all helping the nation to win the war against Germany.

"In Washington we are all deep in this immediate task. We are so deep in it that some of us forget that if the righteous purposes of this war are to be achieved we must

fill our trade function in the future. America never again can return to the provincial attitude of the past. We have become a world leader in war, and we must maintain our world position in peace. The share of world commerce to which the United States aspires is that to which the resources, the skill, and the resourcefulness of our people entitle us in fair and friendly competition with the nations who are at once our customers, and our suppliers of materials and merchandise.

"We are building ships first and foremost for the war but they will be useful for the future world trade as well. Remember that once their part in the winning of the war is ended a large number of them will be engaged in bringing back to home and industry the victorious soldiers, and in transporting to Europe the materials necessary for reconstruction of normal life freed from the menace of avaricious autocracy. These vessels will serve the commerce of other nations equally with our own, their facilitation of the trade of the world will be the corollary of the freedom of the seas we fight to assure. And if there are any men among you who doubt that we are going to have a vast fleet I will simply ask whether you have heard of a well-known man in our organization whose name is Charles M. Schwab."

To make up for Mr. Hurley's absence also extracts from another of his speeches showing the recent rapid progress of the shipbuilding program were read by another speaker.

The most important paper read at the banquet was that of Mr. Farrell, the chairman of the Council on "Foreign Trade Aspects." An abstract of this paper is given below.

The closing session of the convention was on Saturday morning. The feature of this session was the presentation of a Declaration of Principles, prepared by the general convention committee.

Foreign Trade Aspects

By James A. Farrell

Chairman National Foreign Trade Council; President
United States Steel Corporation

When President Wilson declared that the freedom of the seas must be maintained and that the ocean-borne commerce of the United States must be allowed to be carried on without molestation, national recognition was given to the fact that our export and import trade was a controlling factor in our national existence. Then too, it quickly became obvious that the world was dependent as never before upon the products which we could send them. Exports which in any year prior to 1915 had not exceeded two and a half billion dollars, reached in 1916, before our entry into the war, an aggregate of four and one-third billions, while in 1917, notwithstanding the destruction of shipping and the reduced tonnage available for transport, they totaled nearly six billions three hundred millions of dollars.

Under the conditions that confronted this nation a year ago, it did not require a prophet to tell us that unless a comprehensive shipbuilding program should be adopted and pressed to completion at no distant date, our future participation in the commerce of the world would be negligible. It had, indeed, become patent, long before our entry into the war, that the future of our foreign commerce was indissolubly associated with the up-building of our mercantile marine. No discussions have figured more prominently at these Foreign Trade conventions during the past four years than those whose subject and motive have been the great question of American shipping. When the war has been won and a vast fleet of modern steamers return to the use of peaceful ocean commerce, the danger of our foreign trade being hampered by the lack of bottoms to carry it will have finally passed away.

But autonomous control of our foreign-going shipping is

only one of the requisites for the gaining and keeping of overseas commerce. By all the industrial nations of the world vast preparations are already being made for participation in the economic contest that will ensue for trade in the world's markets. There can hardly be a question that for a good many years after peace is restored the rehabilitation of the vast territory wasted by war, and the replacement in neutral countries of equipment which has necessarily suffered from deterioration while replacements have been impossible, will provide a large outlet for surplus production. Moreover, the creation of conditions hitherto non-existent of equal opportunity for international commerce and industrial enterprise, should so quicken the world's demand for manufactured products as to insure a long period of industrial prosperity.

America, it may be hoped, will maintain the position of offering to the world all its requirements which can be supplied here, on terms and conditions that are fair and just. There is no evidence now of any intention to take undue advantage of our economic and productive strength, and we shall in the future be as little disposed to turn to personal profits the necessities of a war-worn world, or the exceptional influence of our position as exporters and importers. The sacrifices that are being cheerfully endured today by men engaged in foreign commerce in the necessary curtailment of their business through the conservation of shipping, are an earnest of the elevation of method and of purpose which will control the conduct of our external trade in the near future. Now that Congress has at last recognized the necessity of legalizing combinations for export trade, the field ought to be open for the participation of hundreds of small manufacturers who have not hitherto been able to enter it. One of the greatest of after-war problems must be the employment of surplus labor and the utilization of the surplus products of industry. Organizations should be perfected in every line of American production seeking foreign trade so that no matter to what extent they may desire to co-operate under the provisions of the Webb-Pomerene law, they may at least co-operate to the fullest extent in securing information respecting foreign conditions and competition, in regard to the demand for our products abroad and the proper utilization in import and export trade alike of our enlarged merchant marine.

At the present moment, our foreign trade, both export and import, is inevitably restricted by the scarcity of steamers available for service other than that of transporting our armies to France and of keeping them and our Allies supplied with necessary food and munitions. This condition is likely to continue until the additional tonnage under construction becomes available. There are, however, certain commodities, procurable only from overseas countries, which are essential to the successful prosecution of the war. We constantly need as raw materials in our manufactures and particularly for the production in sufficient volume of munitions, as well as for the consumption of our own people, replacing domestic products which we send to our Allies: Meat, rubber, coffee, cocoa, hides and manganese ore from Brazil; wool, meat, hides and wheat from Argentina; copper, cotton (of the long stapled variety) and sugar from Peru; copper, tin and rubber from Bolivia; nitrates, copper, wolfram, tungsten and other ores from Chile; tin and rubber from the Malay peninsula; jute and jute bags from India, and this by no means exhausts the category. Such is the usual urgency of our need of these commodities, or most of them, that the government must provide, to the extent permitted by the other requirements of the war, steamers for the purpose of importing them. The possible export trade with the countries from which these products must come is, therefore, at present limited to the available space on such steamers as the government may be able to provide for the import trade, and until such time as new tonnage

becomes available, there can be no increase or expansion of our export trade with these markets.

We Should Prepare

In the meantime there is obvious necessity that we should prepare against the time when the present restrictions have been removed and adequate transportation facilities are again available. With our enormously increased capacity in manufactures, and the natural products of the mines, farms and forests, we shall have to spare, added to the necessity for the employment of our merchant marine which should amount by the end of next year to at least ten million tons of shipping, we shall be urgently in need of foreign markets. Our European competitors, past and future, notwithstanding the tremendous demands upon their energies and resources which the prosecution of the war involves, are not neglecting to prepare for the foreign trade of a time of peace. It is said that Germany has already taken steps, in the building of a new merchant marine, to render herself independent of the shipping of foreign countries, even though she should find herself at the end of the war bereft of that large part of her fleet which was interned in foreign ports. It is certain that the German organization of banks and mercantile houses which, before the war, was co-extensive with the world, is still practically intact in South America and other markets in which we are particularly interested. We may reasonably expect that to the extent she is able to recover, be it soon or late, her trade connections and to repair the diminished man power, Germany will be as potent a competitor for the markets of the world as she was before.

One imperative duty of gatherings like this is therefore to impress upon the people of the United States the immediate necessity of mobilizing their surplus resources as a preparation for the demands of the foreign trade of the immediate future. It may well be that after the war has been brought to a successful termination, we may be able to speak in terms of co-operation, on the broadest and most generous scale, with the manufacturers and producers of our present Allies, rather than in terms of keen competition. But effective co-operation can be rendered only if we have first organized among ourselves a co-operative system of foreign commerce.

It is reasonable to expect that with a secure peace established among nations divested equally of the power and the desire to make war on each other, great world enterprises will be undertaken under the stimulus of international combinations of capital, and of a common surplus of materials available for improvement and reconstruction. No longer should it be the case in future years, when it may become possible for us to lend financial aid to the present neutral countries of the world for the development of their enterprises, that America should withhold its proper participation and expect the European countries to carry the entire load of foreign financing. Neither would it seem just or equitable, should we emerge from this war with sufficient surplus capital to warrant generous investment in foreign enterprises, that we should selfishly disregard the claims of our present allies to that participation in such financing which insures an adequate share of resulting trade.

Whatever may be the eventual terms of peace, one conclusion would seem to be reasonably certain: We and our allies will have sacrificed our blood and treasure in vain if we have not succeeded in insuring hereafter conditions of peace under which we shall be free to carry on our domestic and foreign commerce without the fear of military dictation or aggression.

VENEZUELA IMPORTED RAILWAY MATERIALS in the six months from January to June, 1917, to the value of \$424,073.—*Commerce Reports.*

Modern Versus Standardized Railway Equipment

Provide Standard Equipment Only for an Emergency Fleet: Speed Up Repair and Improvement Work

By J. E. Muhlfeld

IN YOUR APRIL 12 ISSUE you request an expression of views on the adoption of complete standard types of locomotives for all the railroads in this country.

At this time when we are waging a war of the transportation of tonnage against tonnage of men, munitions and supplies for the massing and protection of the battle fronts, it is well to carefully consider just how far the government and the railroads can safely go in a policy as yet untried by any country in the world, without the risk of failure.

Why should the mechanism of mobile power used as a means of transportation, such as water and air ships and locomotives, be selected for complete standardization and its progressive development throttled, any more than that of the automobile, stationary power plant and the machinery of industries which produce foodstuffs, wearing apparel, building materials and the other living necessities, all of which are dependent upon rail and water transportation for their distribution?

Had the mechanism essential to wire and wireless telegraph and telephone, lighting, heating, mining, agricultural and industrial equipment been standardized ten or even five years ago in what condition would the United States be today to combat Germany's machine power? And what would be the present state of the art of the automobile and auto truck had standardization been inaugurated even three years ago?

Cheap wood, coal, gas and oil have made us prodigal in the use and utilization of the energy generated by our natural fuel resources for transportation and industrial purposes, but this condition has now changed. The fuel bill has almost doubled itself during the past year; wood and gas are practically unavailable; oil is going, and coal will annually become of average poorer quality and higher cost. With either steam or electric locomotives converting only from 4 to 7 per cent of the heat value in the fuel into effective work at the track rail, how can we expect to keep pace with the economics of the situation without the daily development of the railway prime mover, particularly in this country where it consumes about one-third of all the coal produced?

Railway equipment orders have not kept pace with the locomotives and cars put out of service on account of obsolescence and inadequacy, to say nothing of meeting the requirements of expansion and increased business. This applies principally to locomotives and freight cars, as while those newly built have been of progressively greater capacity than the existing equipment, that factor has not been sufficient to meet the requirements, and *modernized freight locomotives and cars* must be provided as rapidly as the railway shops can repair and the builders can produce them if the war plans of the government are to be carried out expeditiously.

Would not the adoption of a single government standard Mikado type locomotive and box, coal, passenger, postal and baggage and express car—or a total of six (6) standard pieces of railway equipment—for the purpose of providing an "Emergency Fleet" of equipment for such distribution and diversion as the seasonal traffic and other abnormal conditions require on each railroad be the most feasible plan for government standard equipment? Then by per-

mitting the various railway lines and systems to order the most modern design that they have in use or for which the builders now have the necessary drawings, patterns, formers, dies and other shop equipment for their construction, and for which the railways have the necessary shop and engine house equipment for their maintenance and handling, for their normal traffic requirements, the local conditions could be most successfully met with the least confusion, the properties could be continued in operation on the most effective and economical working and up-keep basis, the greatest productive capacity of the builders' plants could be obtained with the least cost for the output, and the time and waste in construction and maintenance, as well as the railway capital and operating expense, would be substantially reduced.

However, at the moment, there are many other factors beside the complete standardization of the various types of locomotives as units that must be given prompt consideration if a repetition of the past four months' rail traffic condition is to be avoided, as the immediate necessity is for *modernized production, maintenance and operation* of both existing as well as *new equipment*, rather than standardization, all of which can best be brought about by:

First.—Appropriations and authority for speeding general repair and modernization work on existing equipment at railway shops.

Second.—Appropriations and authority for producing maximum output from builders' plants of new locomotives from existing designs, patterns, templates, formers, dies, jig and shop equipment.

Third.—Authority for the use of the regional materials most readily available and for such distribution of the orders for materials and devices entering into locomotive and car construction, renewals and repairs, that the capacity of the largest number of producing concerns will be utilized to the fullest extent.

Fourth.—An emergency fleet of a single modern design of government standard locomotive, box car and coal car suitable for any trunk line carrier which can be most expeditiously produced by the builders in the largest quantities with the least lost motion and waste from the most readily available and suitable materials and appliances, for distribution to those lines requiring assistance during abnormal traffic, maintenance or operating conditions.

Fifth.—An adequate supply of repair and renewal parts for the government standard equipment for the railways of which they will be operated.

Sixth.—Adequate and suitable locomotive and car handling, supplying, inspection and repair facilities.

Seventh.—Single, double and swing crew all locomotives practicable and provide for less arduous labor and greater convenience, cleanliness and comfort in their operation for engineers and firemen.

Eighth.—Provision for equitable compensation, stock ownership in property, fair and full adjustment of grievances and for proper standards of working, living, education and saving for employees.

Ninth.—Improvement in fuel and water supply and in equipment and methods for utilization for the purpose of eliminating avoidable delays, waste and expense.

Tenth.—Elimination of divided responsibility by concentrating authoritative direction, other than for the govern-

ment standard equipment designs, of the mechanical design, operation and maintenance of locomotives and cars in a vice-president in direct charge of both the locomotive and car departments on each railroad.

Alba B. Johnson, president, and Grafton Greenough, vice-president, of the Baldwin Locomotive Works, in their recent papers before the United States Chamber of Commerce and the Western Railway Club, respectively, have not only set forth the probable consensus of opinion of the officials of one of the largest locomotive building plants in the country, but also that of many other builders and railways with respect to standardization. Of the many reasons stated by them for and against complete locomotive standardization, the advantages are greatly overbalanced by the disadvantages.

The complete standardization of locomotives as applied to 500 or 1,000 mile regional units of railway may be consistent, successful and economical so long as progress is not retarded. The Virginian Railway—practically new built and equipped during recent years from the Atlantic tidewater to the West Virginia coal mines—had an ideal opportunity, and as I understand it, attempted to standardize locomotives and cars. A report as to what has actually been accomplished in that direction and the reasons therefor, would be most interesting.

As applied to any considerable mileage which involves different bridge limitations, tunnel clearances, track strength, gradient, alignment, climatic, fuel, water, labor, enginehouse, shop, length of run, train loading, passing track, divisional and terminal yard and other operating conditions, complete locomotive standardization is not consistent for the most effective and economical transportation or maintenance results, and standardization must then be limited to the interchangeability of the maximum number of detailed repair and renewal parts. The Harriman lines undertook the complete standardization of locomotives and cars in the most serious and drastic manner that this problem has ever been attacked in the United States, but soon found it necessary to deviate from the adopted complete unit standards and confine their practice to the interchangeability of detailed parts, or otherwise assume the burden of increased transportation and maintenance costs.

On the 120,000 miles of government, and 100,000 miles of privately owned or controlled steam railways in Europe no scheme of complete locomotive standardization has as yet been worked out. This applies as well to Canada, Australia, Brazil, Argentina and other countries where the steam roads are both state and privately owned or controlled.

Locomotives and cars for steam railways are usually a combination of the results of specialized invention, designing and development of types, materials and appliances that have been found to best meet the requirements of progress and to be most adaptable for the various needs, local requirements and conditions, and so long as advancement and progress along mechanical and operating lines is to be made, this same process in the development and building of motive power and cars must be followed out.

The factors of waste in construction and haulage of unnecessary material as compared with the use of locomotive types and designs best suited to the local height, width, length and weight limitations must certainly not be overlooked, as one of the most severe, and in many cases just, criticisms to which steam railway equipment designers have been subjected in recent years is that of too great a percentage of non-productive as compared with total weight. For example, why should Pacific or Mikado types of locomotives be used when Ten-Wheel and Consolidation types, respectively, would be more suitable?

While the first cost of the most modern, effective and economical designs of new equipment may be somewhat higher than that of less modern suitable equipment, the results from a railway operating and maintenance standpoint will many times over justify the increased cost for

the interest on the investment. In fact, the lesser depreciation for obsolescence and inadequacy will, in itself, more than make up the difference in the fixed charge. Therefore, the logical way to purchase new equipment is to disregard the item of first cost so long as extravagance is eliminated, and give due consideration to those factors that will best meet the requirements from an operating standpoint and give the greatest average effectiveness and economy for its entire life. Furthermore, if the builders, or rather the assemblers of the detailed designs, materials and devices are to provide for the greatest possible production it is essential that the parts entering into each completed piece of equipment shall be distributed among the greatest number of manufacturers practicable in order that the erecting capacity of the plants can be fully utilized.

If the traffic offering is to be moved safely and expeditiously and the operation is to be performed with any degree of economy, the railway situation must be improved, whether by an increase in rates, or by taxation or by both, and railway credit is government credit.

With the "transportation expense" making up about 55 per cent, a "maintenance of equipment" 25 per cent, "maintenance of way" 15 per cent, and "traffic and general" 5 per cent of the total United States railway operating expense, and with taxes equal to about 8 per cent of this total in addition, it is easy to recognize the importance of a high average revenue trainload if the railways are to meet with any degree of success in moving the traffic now offering with the existing facilities and at the present rates. During the last 10 years the average revenue freight trainload has increased about 40 per cent, and during the past 20 years it has increased about 140 per cent, while the revenue per passenger and ton mile has gradually decreased. Had locomotives been standardized such a record would have been impossible.

The Pacific, Mikado, Mountain, Santa Fe and Mallet types of locomotives, which make up 10 of the 12 proposed government standards, have all been originated and developed in the United States during the past 15 years, and many of these have had to undergo continued change in detailed equipment to maintain them in a modernized and effective condition for operation. This applies particularly to those devices that affect the work of the locomotive engineers and firemen who are certainly entitled to the results of progress in the way of developing practical improvements, and to as much, if not more, consideration in this regard as stationery power plant operators. The necessity for hazardous and arduous manual labor in the operation of steam locomotives can and should be substantially reduced, and while a great deal has been accomplished in this direction during the past 15 years, much more remains to be done.

As the relation between cost, weight and tractive power of locomotives is practically constant, the measuring stick to determine relatively what they are accomplishing in repayment for the money, labor and material that has gone towards their creation and maintenance, is available hauling capacity. It is a lamentable fact that the locomotives of the United States as a whole have depreciated in the revenue tons hauled one mile per pound of tractive power available, largely due to insufficient maintenance, modernization and mileage, all of which demands that adequate appropriations and authority for equipment repair and improvement work and maintenance of facilities shall be provided. The fact that the direct maintenance and operation of locomotives and cars makes up about one-half of the total railway operating expense justifies that each item pertaining to equipment upkeep and working shall be given full consideration and attention.

The practice of transferring other than the "emergency fleet" locomotives from one railway division, operating district, or shop to another must be avoided if the disadvantages resulting from different rail, fuel, water, engine-crew and like factors are to be minimized and the interest of the men responsible for their safe, effective and economical upkeep

and working is to be maintained. Furthermore, provision must now be made so that all possible locomotives will be in first-class condition for next winter's use, and as a proper safeguard, every existing and new locomotive as it is turned out of the shop, and can be spared from service, should be stored until that time.

Railway operating expenses, due to a combination of traffic, weather and physical conditions, have, during the

past few months, brought about heavy reduction in net revenues and in many cases operating expenses have not been earned. As the general and traffic expenses offer negligible opportunities for large savings, and maintenance must be increased, transportation expense, which represents about 55 per cent of the total, must be looked to for improvement through increased train and carloads and reduced fuel, water and non productive costs.

Doings of the United States Railroad Administration

The Week Has Been a Notable One Because of Many Important Developments Which Have Taken Place

WASHINGTON, D. C.

Negotiations on Contract for Railroad Compensation

IN ACCORDANCE WITH THE PROVISIONS of the federal railroad control act of March 21, a committee representing the government, headed by John Barton Payne, general counsel of the Railroad Administration, and a committee representing the railways, headed by Alfred P. Thom, general counsel of the Railway Executives' Advisory Committee, have had several conferences respecting the agreement which the act provides the President may make with the railways for the compensation for the use of their property during the period of federal control. At these conferences various phases of the act and of the form which the agreement shall take have been under consideration. The general conditions which are to govern the agreement are provided in the act, but the entire subject is of such great importance, and there are so many complicated questions involved in the proposed terms of the contract, that the negotiations have been protracted and are likely to continue for some time before settlement is reached.

At the outset each side prepared and submitted a tentative draft of a standard form of contract intended to take care of a majority of the cases involved. Naturally, the original drafts were rather far apart as to some of the details of the provisions included, and to some extent as to fundamental principles, but as the conferences have progressed both drafts have been extensively modified.

One question under consideration is whether the certificate of the Interstate Commerce Commission as to the amount of the just compensation which the companies are to receive shall be absolute or whether the commission shall reserve the right to change the amount either in favor of the government or of the railways, provided on further examination of the reports of the companies it shall be found that wrong computations have been made or reports have not been made, either by mistake or otherwise, in strict compliance with the classification and rules of accounting of the commission. There are so many companies involved that if these certificates have to await the re-examination of all the reports it would be some time before the commission could safely certify the amount of the compensation which each company should receive under the act, and it is quite probable that an agreement will be reached reserving to the commission the right to make such corrections as are necessary.

Another subject as to which a great deal of consideration has been given involves the question as to what deductions are to be made from the just compensation, allowed any company, to reimburse the United States for the cost of any additions and betterments made to the property, which are considered not justly chargeable to the United States. Under the act the government is required to return the railroads in substantially as good repair and in substantially as complete equipment at the end of the period of federal control

as they were in the beginning, and in maintaining the property up to the required standard it is probable that in some cases the government will be obliged to expend money for certain additions and improvements, and such part of the cost thereof as is not considered properly chargeable to the government, but properly to be borne by the company, may be deducted from the compensation before the payment of any installment thereon. This problem involves particularly the case of a road having deferred maintenance according to its own standards, as in such case the net income of the road will have been increased by the amount which it failed to put into adequate maintenance.

Another question involves the rate of interest which should be allowed to any company in case any part of the annual compensation over and above what is necessary to pay interest charges, federal taxes, rentals, corporate expenses and the rate of dividends which had been paid during the three years ended June 30, 1917, is used by the government in making additions, improvements, road extensions, terminal improvements, etc., during the period of federal control. The act provides that the President may allow such reasonable rate of interest on the amount so expended as in his judgment may seem proper. There is also involved the question of expenditures for so-called non-productive improvements which do not add to the earning capacity.

There has been a proposal that the government should pay interest on the cost of additions or improvements made on order of the director general only up to a point not exceeding a certain percentage of the net income, which should be taken as representing the amount fairly to be devoted to non-productive improvements, and 15 per cent has been tentatively suggested.

A great deal of consideration has been given to the exact statement of what shall be charged to the corporate expenses. It is expected that the government will agree on the basis of compensation which will be sufficient to cover necessary interest, federal taxes, dividends and the corporate expenditures necessary to maintain the existence of the corporation, but that investments in non-operating property shall not be deemed proper corporate expenses unless approved by the President.

It has also been proposed that the government shall take care of the usual losses, such as those incident to fires and floods, but that an exception shall be made so that the government will not be held responsible for the results of extraordinary losses, such as would result from an earthquake, a great fire or an invasion.

There have been other questions of lesser importance respecting what shall be treated as a compliance by the government with its obligation to maintain the property during the period of federal control so that it may be returned to the carrier at the end of federal control in substantially as

good condition as when it was taken. This involves the question of depreciation charges and how they shall be made, reserve funds, etc. It is thought that if any controversy arises at any time between any railway company and the government as to whether this maintenance is being properly done, the question of fact may be referred to the Interstate Commerce Commission for investigation and decision. There are other questions arising from the adjustment of overlapping accounts which existed at the beginning of the period of federal control, and which will occur at the end of the period when the roads are turned back to their owners.

The latest form of the tentative draft of the contract as proposed by the government, and after many modifications had been made as a result of the discussion, is dated April 23. It contains a preamble and recitals of the fact that the government has taken over the railroads, etc., eight sections on alterations, definitions, controversies, etc.; property taken over; acceptance; accounts during federal control; upkeep; taxes; compensation; and final accounting, and forms for the execution of the contract, call for the stockholders' meeting to ratify the agreement and a certificate of the stockholders' vote.

Section one provides that the provisions of the agreement may be altered, amended or added to, but only by an instrument in writing signed by the director general and by some officer of the company duly authorized by the directors. It is also provided that in case of questions arising as to the interpretation of provisions of the agreement, the matter shall be referred upon application either of the director general or of the company, to the Interstate Commerce Commission.

In the section regarding accounts during federal control it is provided that "all salaries and expenditures incurred by the company during federal control for purposes which are incidental to the existence and maintenance of the corporation, or which are connected with any property of the company not taken over by the President, or which are connected with negotiations, contracts, valuations, or any business or controversy with the government or any branch thereof, and which are not specifically authorized by the director general, shall be paid by the company; except that all engineering, land and accounting expenses connected with the valuation now being carried on by the company in co-operation with the valuation bureau of the commission shall be paid by the director general and charged to railway operating expense, to the extent that said expenses are in the opinion of the commission necessary for the purpose."

Section 5 provides that the director shall provide for the maintenance of the property in order that it may be returned in substantially as good repair and complete equipment as on January 1, 1918, and that an annual expenditure for such purposes of an amount equal, subject to certain allowances, to the average annual expenditure for such purposes during the test period shall be taken as a full compliance with this covenant. In comparing the amounts expended with those expended during the test period, due allowance shall be made for any difference that may exist between the price of labor and materials and between the amount of property operated during federal control and the average for the test period, so that the comparison may be reduced as nearly as may be to a basis of relative physical reparation. The company shall have the right to inspect its property at all reasonable times during federal control.

One of the most important features of the proposed contract is the section relating to compensation. This, it is provided, shall be paid to the company quarterly on the first days of April, July, October and January, except that the first installment shall be due upon the execution of the agreement and shall include all prior installments then unpaid, but from each installment there shall be deducted such

amount as may then be due for excess payments or credits made by the director general for maintenance, repairs, renewals and depreciation. The net quarterly compensation, together with the company's other income, shall be applied by the company to sinking fund payments as may be required by any contract in force December 31, 1917, such as for leased roads and properties, interest, taxes and assessments payable by the company, dividends lawfully payable under the federal control act, and such sums as may be reasonably necessary to support the company's corporate organization or to carry out the lawful corporate purposes of the company.

It is provided, however, that no part of such compensation or income shall be invested without the approval of the director general and the balance of the compensation and other income shall be used to pay the cost of such additions, betterments and extensions as shall be made to the property of the company during federal control with the approval or by the order of the director general. During federal control the company shall not, without the approval of the director general, issue securities or make or take any lease of any railroad or system of transportation or enter into any contracts or agree to pay any larger amount of interest on its debt or for the rent of leased roads and property or for dividends on its stock than the amounts payable as of December 31, 1917. On additions, betterments and extensions made by the company interest shall be paid at rates fixed by the director general and on additions, betterments and extensions made by order or approval of the director general out of the fixed compensation or other income interested shall be paid the company at such rate, not exceeding 3 per cent, as the director general shall fix.

Universal Interline Way-billing

The director general has issued General Order No. 21 prescribing Simplified Bases for Apportioning Inter-road Freight Revenues to Carriers Performing the Service, as follows:

(1) Pursuant to the provisions of paragraph 13 of General Order No. 11, dated March 16, 1918, with respect to the adoption of universal interline waybilling, the following regulations will be observed beginning with the May, 1918, accounts in apportioning freight revenues to individual carriers subject to federal control which perform inter-road freight service.

(2) In cases where interline billing has been in effect covering all or a major portion of freight traffic interchanged between two or more carriers via the same route, although the interline waybill may not cover the movement from origin to final destination of the traffic:

(a) The waybill destination carrier shall determine, from interline division statements for the period of twelve months ended December 31, 1917, the aggregate freight revenue on interline freight traffic from each initial way-billing carrier separately via each route. There shall likewise be determined the amount apportioned to each individual carrier separately via each route. There shall be included in such aggregate freight revenue, and in the amounts due to each carrier, as their interests may appear, terminal allowances, bridge tolls, lighterage, insurance, and other arbitraries. If the interline method of accounting became effective via any route subsequent to January 1, 1917, the division statements for the longest period obtainable (not exceeding twelve months) prior to May 1, 1918, shall be used.

(b) From the aggregate freight revenue, and the revenue due to each carrier via each route, ascertained in the manner prescribed in the preceding paragraph, the ratio of the revenue allotted to each carrier via each route to the total revenue shall be determined and stated in two figure

percents; such percents shall be designated as "road to road" percents. The percents thus determined for each route shall be used for apportioning the revenue from the traffic moving over it on interline waybills to be accounted for beginning with May, 1918 accounts, until and unless otherwise ordered.

(c) When the accounts for commodities moving in large volumes, such as coal, have, as a matter of general practice, been kept separately, separate road to road percents, based on revenues from that class of traffic, may be determined as above prescribed and used in apportioning the revenues therefrom.

(3) In cases where interline waybilling has not been in effect or where it has been applied to only a small part of the traffic moved between two or more carriers via the same route:

(d) Destination carriers of the freight shall apportion and settle the revenues on interline waybills to be accounted for in May, 1918, accounts on bases of established divisions. From the totals of proportions thus settled, destination carriers shall compute two figure percents for traffic from each initial carrier via each route. Such percents are herein designated as "road to road" percents and shall be used thereafter to apportion revenues via such roads and routes respectively, on that class of traffic unless and until otherwise ordered. When traffic moves only in small volume, destination carriers may compute two figure station to station percents based on revenues produced by the application of established division bases, and use such station to station percents instead of the road to road percents.

(e) In the event freight traffic moves during the month of June, 1918, or thereafter via routes over which there were no freight movements covered by interline waybills prior thereto, destination carriers shall apply the established divisions in apportioning the revenue on such shipments during the month in which the traffic first moves. Thereafter, the revenue on such traffic shall be divided on either road to road or station to station percents as may be applicable.

(f) When the accounts for commodities moving in large volumes, such as coal, have, as a matter of general practice, been kept separately, separate road to road percents based on revenues from that class of traffic may be determined as herein prescribed and used in apportioning the revenues therefrom.

(4) In cases where freight traffic moves via unusual or diverted routes over which no divisions apply and via which no experience can be obtained, destination carriers shall apportion the revenues therefrom on a twenty mile block mileage basis, each carrier to be allowed at least twenty miles and originating and terminal carriers an additional twenty miles each as constructive mileage.

(5) The formulae prescribed herein for apportioning interline freight revenues to carriers performing the service, are intended to preserve, as equitably as practicable, the integrity of the revenues of individual carriers, and their use shall be generally observed. If by reason of new traffic developments, or the abnormal shifting of traffic, the continued application of the road to road percents herein provided for might seriously distort the revenues of interested carriers, the destination carrier may, upon its own initiative or by request, test apportionment of revenues for a specific month or period by applying the established division bases thereto. If results thus obtained vary substantially from the results obtained by the application of road to road percents as herein provided for, and the change appears to be permanent, application may be made to the Director of Public Service and Accounting to adjust the divisions to such bases as will produce more equitable results. Applications for changed apportionment bases based upon ordinary traffic fluctuations will not be considered.

Modification of Practices in Accounting for Freight and Related Revenues:

(6) Destination carriers shall completely revise waybills as to rates, classifications, extensions, footings, weights, etc., thus insuring the correctness of the revenues based on tariffs applicable, and they shall account to interested carriers for their respective proportions of such revenues in the manner hereinbefore prescribed. If flagrant or continued use of erroneous rates or classifications be observed by destination carriers, the attention of billing carriers must be specially called thereto. Where ordinary changes or corrections are made in waybilled revenue by destination agents, correction notices need not be made to intermediate or originating carriers, unless advances or prepaid charges be involved.

(7) Paragraph 10 of General Order No. 11 provides that settlements by destination carriers with all other interested carriers shall be accepted as final. This provision discontinues the adjustment among carriers of overcharges and undercharges in revenue, but does not prohibit the adjustment of differences in advances and prepaid items; clerical errors, in addition and divisions, or errors due to omissions-divisions, etc.

(8) Effective at once no apportionment shall be made among carriers of charges absorbed, such as switching, elevation, transfer charges, terminal delivery charges, icing, cost of grain and coal doors and other similar items accruing during federal control; such absorbed charges shall be borne by paying carrier.

The order also includes the following modifications and interpretations of General Order No. 11:

(9) Paragraph 11 of General Order No. 11 prescribes certain forms to be used in preparing Audit Office settlement accounts. Until further ordered, carriers may use such prescribed forms, or they may use those now in use by them in settlement of interline freight accounts until such time as a more complete study is made of the forms which will later be prescribed.

(10) Sub paragraph b, of Paragraph 8 of General Order No. 11, provides that: "Only the original and one copy of the waybill shall be made." This provision is hereby amended to the extent of permitting carriers taking such additional copies of waybills as may be necessary to maintain the integrity of the accounts. The first copy must be printed in the same form as the original, but may be on a lighter weight of paper. Any additional copies beyond the first may be prepared on blank paper.

(11) While Paragraph 8 of General Order No. 11 provides for a standard form of waybill, such order does not prohibit the continuation or adoption of a color scheme for waybills for specific or special traffic when such color scheme tends to expedite or protect the freight.

(12) If, under prevailing practices, freights originating on or destined to points on switching or tap lines are waybilled from or to trunk line junctions or connections with such switching or tap lines, and junction settlements are made at such points of connection, such practices may, until further ordered, be continued.

Many Railroad Associations Abolished or Reorganized

A large number of associations and committees heretofore maintained by the railroads and charged to operating expenses, but which the Railroad Administration does not consider necessary to operation under government control will go out of existence on April 30 or shortly thereafter, except such as the railroads may see fit to maintain and charge to corporate expenses to be paid out of the amounts they receive from the government as compensation. Others will be retained and may be charged to operating expenses, but in many cases will be reorganized or consolidated.

General Order No. 6, issued by the director general on

January 28, provided that operating revenues should not be expended "for the payment of the expenses of persons or agencies constituting associations of carriers unless such association is approved in advance by the director general."

This includes many organizations which were maintained by dues paid by individual railroad officers but which were charged by them to their expense accounts.

Most of the organizations were authorized to continue until April 30 pending an investigation of the circumstances in each case by the division of public service and accounts, of which C. A. Prouty is director, and Luther Walter, assistant director. Most of the cases have now been passed upon and letters have been sent out either authorizing the railroads to continue to contribute to the expenses of the organizations in the form of assessments or dues, or ordering that operating revenues shall be no longer expended for the purpose. In some cases the approval is temporary, pending the working out of plans for a reorganization.

The various traffic associations, tariff issuing bureaus, classification committees, weighing, inspection and demurrage bureaus, are approved from month to month, pending the working out of plans for a reorganization and simplification of their work by the division of public service and accounts and the division of traffic.

The American Railway Association and some of the other operating associations are also approved but will probably be subject to a reorganization that will fit in with the regional organization of the roads under federal control.

Railroads may continue to be members of chambers of commerce, commercial clubs and traffic clubs in communities reached by their rails on the same basis as industrial concerns, but may have only one membership. In the case of traffic clubs, if they desire to pay the dues of more than one officer the approval of the director general must be secured, but this will probably follow as a matter of course. A railroad may have one membership in the Chamber of Commerce of the United States. Special contributions to such organizations will not be allowed.

Industrial development bureaus are to be discontinued, but agricultural development bureaus are approved.

Local freight associations, collection bureaus, and car interchange associations and similar organizations engaged in working out the problem of unifying terminal operation are to be continued. Fast freight lines are to be abolished. The various superintendents' associations, the various general managers' associations, such as those at Chicago, New York, St. Louis and in Texas, all accounting committees except the national association, the Association of American Railway Accounting Officers, and the Committee of Railway Accounting Officers on Accounts of Express Companies, are to be abolished. Such organizations as the Railway Executives' Advisory Committee, the Bureau of Railway Economics, the Bureau of Railway News and Statistics may no longer be charged to operating expenses. The statistical bureau of the western lines will be discontinued except as to a part of its work, which will be amalgamated in some form with other organizations to maintain traffic statistics. The Presidents' Conference Committee on Federal Valuation is still under consideration. Coal pools are under consideration. The Freight Claim Association is approved from month to month pending reorganization. The Southern Iron Committee and the Coal Traffic Bureau are not approved. The Special Committee on Relations of Railway Operation to Legislation will be discontinued. The Eastern Railroad Association and the Western Railroad Association, which devote their attention to patent matters, are approved. Various other associations and organizations have not yet been passed upon, but will be within a few days.

Some of the organizations specifically approved are as follows: American Association of General Baggage Agents, Association of Dining Car Superintendents, American Association of Passenger Traffic Officers, American Association

of Railway Surgeons, American Railway Engineering Association, American Railway Perishable Freight Association, American Refrigeration Association, Association of Railway Electrical Engineers, Association of Western Railways, Bureau of Information of the Eastern Railroads, Bureau of Information of the Southeastern Railroads, Eastern Association of Car Service Officers, International Association of Ticket Agents, Master Car and Locomotive Painters' Association, Perishable Freight Association, Railroad Young Men's Christian Association, Railway Signal Association and Train Despatchers' Association.

Wage Commission to Report Soon

In Circular No. 24 Director General McAdoo announces that the Railroad Wage Commission appointed for the purpose of making a thorough investigation of the wages paid to all railroad employees, whether members of labor organizations or not, expects to submit its report on Mr. McAdoo's return to Washington upon the conclusion of the present Liberty Loan campaign on May 4, when he will promptly review the report and render a decision upon its findings and recommendations. Any increase in wages made as a result of the report will become effective as of January 1, 1918.

"The task confronting the Railroad Wage Commission was greater in magnitude than any task of a similar character ever undertaken," said Mr. McAdoo. "The commission immediately applied itself to the work with great energy and with unremitting labor to a study of the large and complex questions involved. In matters of such magnitude adequate time is essential to intelligent consideration and wise conclusions. Meanwhile, no employee's interest is being hurt or prejudiced, because whatever increases may be granted will accumulate in the form of savings and will not have been spent in the meantime as might otherwise have been the case."

The director general takes this occasion to appeal to railroad employees who will have several months' back pay coming to them in a lump sum to take advantage of the opportunity to invest in Liberty bonds.

"I hope," he says in the circular, "that every railroad employee in the United States will lend all the money he can, consistently with his individual circumstances, to his government by buying Liberty bonds; they pay four and one-fourth per cent interest per annum and are the safest investment in the world—as safe as the money of the United States and safer than deposits in banks. In lending your money to the government you not only save the money for yourselves, but you help every gallant American soldier and sailor who is fighting in this war now to save your lives and liberties and to make the world safe for Democracy."

Prices for Railroad Fuel Coal

President Wilson is understood to have settled the controversy between the railroad and fuel administrations regarding the prices to be paid for railroad fuel coal and although no official announcement has been made an order is expected by which the railroads will pay more for their coal than formerly, although somewhat less than the regular government price, while the Fuel Administration will be given complete jurisdiction over questions of distribution of fuel. Heretofore railroads have paid a much lower price for coal than other consumers, partly for the reason that a full car supply was guaranteed for such shipments and because the railroads were large consumers and there was no selling expense for the coal companies on the business. The railroads had made their contracts for coal last year before the general government prices had been fixed, but after the government took over the railroads the fuel administrator, Dr. Garfield, took the position that the railroads should pay the full price. This position was controverted by the Railroad Administration, represented by John Skelton Williams, director of finance and purchases, and numerous conferences on the subject were held with coal operators and representa-

tives of the Fuel Administration and the War Industries Board. The dispute was finally laid before the President at a meeting of the war council last week. The exact decision has not yet been made public, but it is understood that railroads will be required to distribute the car supply ratably among all mines, without preference for railroad fuel, and that they will be allowed a concession from the general price on account of their being the largest consumers. It has been estimated that at the government prices for coal the railroads' fuel bill would be increased by approximately \$40,000,000 annually.

Passenger Fares to Be Based on Mileage

The elimination of competition between railroads is going to result in an important readjustment of passenger fares throughout the United States. Passenger rate clerks representing roads in various parts of the country have been at work in Washington this week for the purpose of compiling a nation-wide table of distances as the foundation for a plan of basing passenger fares mainly on mileage without regard to the competitive conditions under which the rates have been made by the short line between any two points, regardless of the distance in many cases. This will result in many increases in fares for travel via circuitous routes. For example the rates from Chicago to Pacific Coast points have been in general the same via the Southern routes or Northern routes as via the direct lines but under the new plan the rate will be proportionately higher for the longer route. It is not proposed to adhere rigidly to the mileage plan but rates will be made the same via different routes which are of approximately the same length, as, for example, in the case of lines between Chicago and New York.

Express Companies to Be Consolidated

Plans for consolidation of the express companies into a single corporation, with a capitalization of \$40,000,000, which will make a contract with the United States Railroad Administration for handling express business on the railroads, are being worked out in a series of conferences between officers of the express companies and the division of public service and accounts. The companies will be given stock in the consolidated company in exchange for physical property on a dollar for dollar basis, and the combined company will handle the express business on the basis of a percentage of the earnings. The companies will be allowed to pay dividends of 5 per cent if the earnings warrant and they will be given an incentive to efficiency and economy by a plan for division of the net income above 5 per cent between the companies and the government. For example, if the company earns enough to warrant a 7 per cent dividend, it may be allowed to pay 6 and pay the government 1 per cent.

Checking of Inter-Road Bills Discontinued

The director general has provided for a large reduction in clerical labor in General Order No. 20, which provides that: "Effective at once, technical and arithmetical examination and checking of all operating bills such as bills for freight and other claims, joint facilities, car repairs, and other similar bills and all statements of accounts such as distribution of freight and passenger revenues and other similar statements, rendered by one carrier subject to federal control, or against another carrier subject to federal control, which accrued or which may accrue on or subsequent to January 1, 1918, shall be discontinued. The carrier rendering such statements, bills, etc., shall take the necessary measures to insure the correctness thereof."

Baltimore & Ohio Trains Use Pennsylvania Terminal

In accordance with an order issued by Director General McAdoo, to take effect April 28, Baltimore & Ohio express trains between Washington and New York will be transferred from the Central of New Jersey terminal in Jersey City and will run to and from the Pennsylvania terminal in

New York City at Thirty-third street and Seventh avenue. Trains will use the Philadelphia & Reading, as at present between Philadelphia and Bound Brook, N. J.; from Bound Brook to West Newark Junction, 22 miles, they will run over the Lehigh Valley, and from West Newark Junction to New York, 12 miles, over the Pennsylvania. This rerouting of the Baltimore & Ohio trains is ordered for the purpose of utilizing them to capacity, thereby relieving the Pennsylvania between New York and Washington and affording the public greater facilities. There are six trains each way, daily.

General Manager Canal Operations

General Order No. 22 issued by the director general announces the appointment of G. A. Tomlinson as general manager of the New York Canal section of the United States Railroad Administration in charge of the construction and acquisition of equipment for use upon the New York State Barge Canal, and, as an incident thereto, for use upon the waters connecting with the canal. He will operate such equipment for the director general, and he is empowered to enter into contracts either in his own name as general manager or in the name of the director general for the construction, acquisition or chartering of such equipment, for the purchase of supplies needed in operation, and for the transportation of property upon the canal and other waters.

Cars for War Department

In Bulletin No. 11, issued by the car service section, H. M. Adams, director of inland transportation of the War Department, calls attention to the fact that some misunderstanding exists with respect to the placing of orders for cars to load for account of the War Department. Mr. Adams states that his department does not undertake to extend its jurisdiction to the ordering of cars, this being the function of the individual shipper. It should be made plain, however, the circular states, that cars must not be furnished for loading to destinations against which restrictions are placed by the War Department, as indicated in Order No. 2, unless transportation orders are presented to cover such shipments.

Adjustment Board No. 2

Plans for the organization of Board of Adjustment No. 2, to handle controversies between the railroad managements and members of the shop craft organizations, are being worked out under the direction of W. S. Carter, director of the division of labor. The board will be similar to that formed to handle similar controversies with members of the brotherhoods and will consist of six railroad mechanical officers and six officers of the shop craft unions.

Protection of Railroad Property

Willard Robinson has been appointed assistant manager of the Section for the Protection of Railroad Property, and H. L. Van Sicker has been appointed attorney for the section.

Administration to Operate New York Barge Canal

The Railroad Administration has decided to take over the operation of boats on the New York State Barge Canal. Director General McAdoo has announced that, acting upon the recommendations of the committee on inland waterways of the Railroad Administration, which has been negotiating for some time with the state authorities he will build as quickly as possible and put into operation a line of barges to be operated by the government on the canal. The barges will be of modern construction of the most approved type and will be operated in conjunction with and as a part of general railroad and waterways transportation of the country under the control of the director general. This will insure the complete co-ordination of the canal facilities with the railroad facilities and, it is hoped, will greatly enlarge the available transportation facilities in the eastern territory. The title of the canal property remains with the state. G. A. Tomlinson of Duluth, Minn., a member of the committee on

inland waterways and a man of large practical experience in lake navigation, has been appointed general manager of the canal operations, including the construction of the barges and general equipment. He will report to the Eastern regional director. Under government control there can be diverted to the canal from the railroads all of the traffic that can be handled to the best advantage by water. Many delegations have been to Washington since the government took over the railroads to urge that the Railroad Administration take over the operation of the waterway.

Chesapeake & Ohio Canal

The Railroad Administration announces that it has not found it necessary or advisable to undertake the operation of the boats on the Chesapeake & Ohio Canal, for which there has been considerable agitation.

However, the statement says, the Railroad Administration is interested in bringing about the transportation of the largest possible tonnage of coal from the coal fields to Washington by way of the canal. It is to be assumed that under private management the railroads reaching Washington preferred to handle the coal by rail, but under existing conditions the Railroad Administration is anxious to relieve the railroads reaching Washington, to the greatest possible extent, of the burden of carrying the coal tonnage needed by Washington and its vicinity. To accomplish this purpose the Railroad Administration has arranged to co-operate to the fullest extent with the companies maintaining and operating the canal and expects that as a result a substantially increased tonnage of coal will be carried to Washington by the canal during the current year.

Service on the Great Lakes

The Railroad Administration on April 18 established a lake line service between Chicago and Milwaukee and Buffalo under the name of the Lehigh Valley Transportation Company. Seven large modern electric-lighted steamships have been assigned to the service, using as a nucleus two of the ships owned by the Lehigh Valley Railroad, whose right to continue the operation of the lake line service is now in litigation, and five ships chartered from the Great Lakes Transit Corporation, which purchased a number of the railroad-owned boats after they were required to give up their operation of lake line service. It is stated that additional ships will be added as the service requires. The purpose is to relieve the car situation as much as possible. Cars that have been held up on western railroads by the congestion on central railroads will be released with the opening of lake navigation and the loads may be moved east by the way of the lakes and railroad lines east of Buffalo, thereby relieving the railroads in the Central Freight Association territory by a saving of power, fuel and cars that can be devoted to other business. It is expected that shippers of heavy staple commodities from the east, such as sugar, coffee and manufactured articles, will also take advantage of the service. It is intended to work night and day shifts at the terminal points so that the boats can be turned rapidly and afford the greatest possible relief to the railroads. The eastern trunk lines will be served over a common terminal at Buffalo. All-rail rates will prevail in both directions so that in case of congestion on the railroads the freight can be immediately diverted through the lake and give continuous movement to destination. The lake rates, however, will include marine insurance.

Suits Against Carriers

Director General McAdoo has issued General Order No. 18-A, amending General Order No. 18, which was issued on April 9, to read as follows: "It is, therefore, ordered that all suits against carriers while under Federal control must be brought in the county or district where the plaintiff resided at the time of the accrual of the cause of action, or in the county or district where the cause of action arose."

Progress in Locomotive Repairs

Rapid progress is being made in the repairing of locomotives, toward which special efforts have been directed by the Railroad Administration, according to reports received by Frank McManamy, manager of the Locomotive Section. Locomotives have recently been put through the shops at the rate of about 4,500 a week, or at the rate of about 800 a week more than during the corresponding weeks of last year. During February 1,641 more engines were repaired than during February, 1917, and recently a series of weekly reports has been started. These show that during the week ending March 23 there was an increase of 560, during the week of March 30 it was 954, and during the week of April 6 the increase was 946.

These results are being obtained largely as a result of the agreement reached by the Railroad Administration with the shopmen's organizations by which the employees agreed to work longer hours. The shop hours have been increased from schedules of 48 or 55 hours a week to 60, 65 or 70 hours, varying with the conditions at different shops, and the increase in hours for 225,000 men on 45 roads for which figures have been compiled amounts to about 14 per cent.

Another factor in the improved record is the practice of sending locomotives for repairs to the shops of other lines which have more available capacity. About 80 locomotives a week are being sent to foreign line shops, particularly from eastern roads to the shops of western roads at Chicago. About 400 locomotives are now undergoing repairs at foreign shops, and for a little over three weeks locomotives that were earlier sent to the foreign shops have been coming out in sufficient numbers to have an appreciable effect on the transportation situation.

There have also been more locomotives requiring repairs this spring than last year because of the fact that the roads got behind with repairs during the winter. On March 23 there were 4,465 locomotives due for shopping as compared with 4,161 on the corresponding date in 1917.

The Locomotive Section has prepared a standard classification of repairs to locomotives and tenders to be used beginning June 1 by all carriers for reporting repairs made at their various shops and roundhouses, as follows:

CLASS 1.

New boiler or new back end. Flues new or reset.
Tires turned, or new.
General repairs to machinery and tender.

CLASS 2.

New firebox, or one or more shell courses, or roof sheet.
Flues, new or reset.
Tires turned, or new.
General repairs to machinery and tender.

CLASS 3.

Flues all new or reset (superheater flues may be excepted).
Necessary repairs to firebox and boiler.
Tires turned, or new.
General repairs to machinery and tender.

CLASS 4.

Flues part or full set.
Light repairs to boiler or firebox.
Tires turned, or new.
Necessary repairs to machinery and tender.

CLASS 5.

Tires turned, or new.
Necessary repairs to boiler, machinery and tender, including one or more pairs of driving-wheel bearings refitted.

General repairs to machinery will include driving wheels removed, tires turned or changed, journals turned, if necessary, and all driving boxes and rods overhauled and bearings refitted and other repairs necessary for a full term of service.

Running repairs unclassified.

Suffix "A," to any class of repairs, will indicate that the repairs are required on account of accident.

Suffix "B" will show the initial application of stoker.

Suffix "C" will indicate the initial application of superheater.
 Suffix "D" will indicate initial application of outside valve gear.
 Suffix "E" will indicate locomotive was converted from compound to simple, or from one type to another.

Mallet locomotives will be indicated by a star following classification.

Locomotives receiving class 1, 2 or 3 repairs must be put in condition to perform a full term of service in the district and class of service in which they are to be used.

Locomotives receiving class 4 repairs must be put in condition to perform not less than one-half term of service in the district and class of service in which they are to be used.

Locomotives receiving class 5 repairs must be put in condition to perform not less than one-fourth term of service in the district and class of service in which they are to be used.

The purpose of the standard classifications is to enable comparisons to be made readily and fairly between the results accomplished at different shops. It has heretofore been difficult to compare the work of different shops of even the same capacity and number of men because of the different classifications under which the roads recorded the work done; an effort was made to put them on a fairly comparable basis by reports based on the time required for shopping. It is expected that having reports which may be checked against each other will have a good effect on performance.

Circular C. S. 7

In order that a car supply for shipments of lake coal and ore during the season of navigation may be provided, the manager of the Eastern Railroads Car Pool is instructed in circular No. C. S. 7, issued by the Car Service Section, to all railroads not members of the Eastern Open-Top Car Pool, to assemble all hopper or so-called self-clearing cars of Eastern Car Pool (designated in the Official Railway Equipment Register under M. C. B. Classes "H" and "GD") and confine them to that service to the extent that all like coal and ore carrying roads may transport lake coal and ore which will offer for movement during the season of navigation. To accomplish this purpose, all roads not members of the Eastern railroads car pool are directed that all hopper or so-called self-clearing cars (M. C. B. Classes "H" and "GD") of the member railroads must, until further notice, when released from original lading on railroads other than members of the Eastern Railroads Car Pool, be returned empty by the most direct route to the nearest pool-member road. Any "member" road will be considered the "home road" for cars included in this arrangement.

Emergency Rule 1 of General Order C. S. 1, dated April 26, 1917, is modified in accordance with the above.

Seventeen Years Life From Treated Ties

Seventy-Three Per Cent of Those Installed on Burlington Line
 in Western Nebraska in 1900 Are Still in Service

IN 1900 when the Chicago, Burlington & Quincy built the line from Bridgeport, Neb., to Sterling, Colo., forming a part of what is now the Sterling division of the Burlington, a considerable mileage of the new track was laid with treated ties. One section of a mile laid with treated ties and another of two miles were later designated as test sections, and a careful record has been kept of all tie renewals within these limits. It is now 17 years since the ties were laid, a sufficient time to develop the effectiveness of the treatment, and the results of an inspection recently made constitute a most conclusive demonstration of the value of tie preservation. In addition to the efficient control on the part of a well-organized timber-treating department, these test sections of ties have been under the continuous supervision of one man, James Toohey, who has been roadmaster on this line ever since it was placed in service.

Between Sidney, Neb., and Peetz, a distance of 14 miles, all the ties laid in 1900 were 6 in. by 8 in. hewn Black Hills or bull pine ties, treated with zinc chloride. In the two miles just north of Peetz where a careful record of all renewals has been kept, 77 per cent of the original ties are still in the track, the 23 per cent of replacements including renewals for all reasons—breakage and cinder burning as well as decay, tie cutting, etc. There are still many continuous stretches of 20 or more of the old ties in place, and, in one case observed, 65 successive ties of the original lot were noted.

Near Bridgeport, Neb., records have been kept on a mile of 6 in. by 8 in. by 8 ft. sawed Douglas fir ties also treated with zinc chloride. There were 3,200 of these ties in all and now, after 17 years, 2,703 of them, or 84.5 per cent, are still in service. In this case a more emphatic demonstration of the value of timber treatment was obtained through the fact that a mile of untreated Douglas fir ties was laid at the same time in the track directly south of the mile of treated ties and under as nearly duplicate conditions as it is possible to provide. The untreated ties commenced to come out of the track within five years after they

were laid, most of them had been removed after 7 years, and the last one was replaced in the eighth year. In other words, 100 per cent of the untreated ties had less than half the life of 84½ per cent of the treated ties.

Further details of these tests are of interest. All of the ties were treated at Edgemont, S. D., with 0.33 lb. of zinc chloride per cu. ft. of timber, the condition of treatment being such that the actual content of the preservative varied from 0.19 lb. to 0.6 lb. While this treatment is less than that usually given at the present time it was the standard treatment at the Edgemont plant previous to July, 1900. The amount of preservative was changed at that date to 0.4 lb. per cu. ft., and in 1902 to 0.5 lb., which is the regular treatment at the present time. It is also to be noted that the ties were subjected to steaming before treatment under a pressure of 15 to 20 lb. per sq. in. for several hours, a much more severe heat treatment than is considered good practice at present.

The ties were placed 18 to a 30-ft. rail in gravel ballast. The rail weighed 75 lb. per yd. and no tie-plates were used. The roadbed has been in a generally good condition, no trouble being experienced in this territory with soft embankments or cuts. The annual rainfall is about 15 in. The rail on the bull pine ties was renewed in 1910, and that on the Douglas fir ties in 1913, the new rail being 90-lb. A. R. A. type A rail laid with tie-plates. The ties were respaced with the rail renewal and there are now 20 ties to the 33-ft. rail. Several ballast raises have been made during the 17 years.

While the traffic was light during the first few years of operation, it has grown steadily and now includes a considerable ore tonnage hauled in 100,000-lb. capacity cars overloaded 20 per cent and handled by Mikado locomotives, the heaviest of which weighs 303,400 lb.

One of the most important factors in the value of this record of tie service is in the system of inspection under which the condition of the ties has been observed. In addition to the personal attention of the roadmaster, the

ties are under the care of the superintendent of timber preservation, in connection with the study of some 26,000 ties now under observation on various parts of this railroad. These ties are installed in sections of a 1,000 or more, each section containing ties of various species treated by one or more processes, or placed in the track without treatment. Through the agency of a system of numbering, marking and records, it has been possible to keep an accurate account of the ties in these sections which are inspected by the superintendent of timber preservation, the roadmaster, the section foreman and usually the division superintendent or general superintendent.

These inspections have taken place annually since 1909, when the first section of test ties was installed. The two special sections of treated ties on the Sterling division described above are also examined in the course of each of these annual inspection trips and receive the same careful attention according to the regular test sections. The ties on the Sterling division were installed under the direction of F. J. Angler at that time superintendent of timber preservation on the Burlington, now superintendent of timber preservation, Baltimore & Ohio, Baltimore, Md. He also originated the system of special test sections and their annual inspection, and this work has been continued by his successor, J. H. Waterman, superintendent of timber preservation, Chicago, Burlington, & Quincy, Galesburg, Ill.

Eighth Annual Report of the Test Sections

Since the regular 1,000 tie test sections on the different lines referred to above were eight years old at the time of the inspection last fall, a sufficient age to develop the full life of a large part of the untreated ties, a study of the records obtained with the various species of timber and the different forms of treatment during this period is instructive and indicative of the final results. Accordingly the summary of Mr. Waterman's report is abstracted below, showing the result of these tests in the eight states of Wisconsin, Illinois, Missouri, Iowa, Nebraska, Colorado, South Dakota and Wyoming.

SUMMARY

Total ties, various kinds, various processes, placed in experimental tracks, 1909 and 1910. C. B. & Q. Railroad.

| Process | Total placed | Total removed to date | Percentage removed to date | Percentage removed account decay causes |
|-------------------------|--------------|-----------------------|----------------------------|---|
| Straight creosote | 3,264 | 64 | 0.3 | 1.6 |
| Card process | 15,817 | 730 | 0.6 | 3.9 |
| Burnettizing | 2,488 | 162 | 2.7 | 3.8 |
| Untreated | 3,270 | 2,740 | 80.2 | 3.4 |

NOTE—These percentages include only the ties placed in the thousand lots on various divisions.

Mr. Waterman's remarks regarding the service being secured from various classes of timber are also of special interest and are abstracted below.

"Kind of treatment—I am of the opinion that the best treatment for the lines east of the Missouri river is a mixture of creosote and zinc chloride or of water-gas tar and zinc chloride, while for the dry territory supplied with ties from Sheridan, Wyo., we get splendid service out of ties treated with zinc chloride only.

"I list the ties which will give the best service treated, after giving this matter a great deal of thought and close observation as follows: (1) Red oak, (2) fir, (3) cypress, (4) pine, (5) various other inferior woods, as follows: Elm, soft maple, hard maple, beech, birch, hickory, red gum and tupelo gum. These latter-named woods are never to be considered unless they can have personal supervision from the time they are cut in the woods until they are delivered in the tie plant yard for seasoning. I am in favor of using only 7 in. by 9 in. by 8½ ft. red oak ties for our principal main lines. For branch main lines and passing tracks where we have reasonably heavy traffic, I would use the standard 6 in. by 8 in. by 8 ft. red oak ties when I can get them. There is no question about the service that we

can get out of red oak ties properly treated—that is past the experimental stage. The red oak ties at Mystic, South Dakota, have now given us 17 years' service and 71 per cent are still in the track.

"I am disappointed in our pine ties. I do not believe their average life will be over 10 years. Last year I saw indications which led me to believe that we are not going to get results from our sap pine ties that we had hoped. I am afraid the trouble is that many of our sap pine trees are banked on the river in the hot months, during which time the sap becomes more or less sour and the ties are partially decayed before we get them. The Santa Fe overcomes this by sawing the ends off every tie before treating it. Decay is very easily detected if the ties are sawed.

"We are getting most excellent results from ties bought in the Black Hills, and there is no question but that the

A Section of the Track Built in 1900

Black Hills pine ties give us as good results as the fir ties. There is no bug infested Black Hills timber today and we have thousands of these ties in the track and they will give us 15 years' life.

"Ties deteriorate in a few days or weeks at the most, if they are not properly handled. If these ties become dotey, the best treatment in the world will not do them any good. If I were in authority and accepted ties of the woods named, I would have an inspector to look after them and have him thoroughly trained what to look for, and what to expect, if I expected to get the best possible results out of them. The summary shows wonderful results obtained from some of these woods, and yet they are dangerous to handle unless we are willing to pay two or three times as much for inspection and care as we pay for red oak, cypress, fir and pine.

"I would not take a white oak tie at any price unless I treated it. In my judgment, it is a waste of money to buy white oak ties and put them in track without treatment.

"I have carefully watched the results obtained from treated bridge ties and I have come to the conclusion to recommend that we discontinue treating bridge ties with zinc chloride, because they check badly, even worse than they would if they were not treated. I believe we will get very little longer service from bridge ties treated with zinc chloride than untreated. I believe that if we treat bridge ties with creosote, we will get 20 to 25 years' life out of them.

"Few of us appreciate the full value of seasoning ties before treatment. (1) You can treat more ties in a given length of time when they are properly seasoned. (2) I believe the ties will give better service after treatment. (3) Ties properly air seasoned will not check as badly as ties treated green.

"Red oak ties and other similar kinds of hardwood ought to season one year, fir ties ten months and pine ties from six to eight months."

Keeping Progress Records

By Wm. P. Munger

IN MODERN ENGINEERING, as in modern manufacturing, progress charts are not only used to make the condition of the work quickly apparent to the man higher up, but are frequently so designed as to be of great assistance to the man who must keep the work in balance. When the work is of a simple nature, such as laying out a water pipe along the track, a map or profile colored with various colored pencils as each of the operations progress is adequate.

In rebuilding a series of culverts a number or description

Key to Progress Records for Maps and Profiles

of the culverts written across the top of a sheet of paper ruled off in squares and the name of the operation written in the column on the left hand side of the page is a good form for a chart. In use, the squares opposite the various operations are filled in under the culvert numbers as the operation in question is performed on that culvert. This filling in may be done in various ways according to the units of operation written in the column at the left and the detail desired. If "concrete" was the operation then the square under the proper culvert would be outlined when the mixing started and filled in solid when complete. Greater detail could be shown by making one side of the square when the materials were ordered, one side when delivered, one side when machinery was ordered, one side when delivered, one diagonal when forms were set up, one diagonal when pouring started, the solid filling showing completion. If the operation was "stone," the top half of the square would contain the date ordered, and the bottom half the date when delivery was begun, and solid filling or the outlining of the square would indicate that the delivery was complete. Again, if the square is large enough it can be filled in from day to day so as to represent the percentage of required stone which has been delivered.

For a long and complex job, like a valuation map of a railroad system, a chart should be devised which requires the minimum of special training to understand, is compact, easy to operate, and yet impressively tabulates the progress. The operations follow no set order and in some cases there

is a necessary delay of several months between the beginning and the end of one operation. Two number systems are essential as the map sheets are numbered independent of the mile posts by which all of the available information is generally indexed.

To cope with these conditions a chart on the order of Fig. 1 is desirable. Here the valuation section number and name is shown in columns at the left and the number of the valuation sheets composing each section stretch across the top. At the intersection of the name line and the sheet number column there is plotted an outline ring better shown in the first entry in Fig. 2 and indicating a map to be made. The number of these outline rings following the section name depends directly on the length of that section. The Pine Branch, 3.6 miles long, requires four sheets, and hence four outlines were plotted in the first four positions. Similarly with other sections.

The small figures in the center indicate the high mile posts shown on that sheet. Index maps and certain terminals would be shown in a space between the line column and column 1. Other than right of way maps and track maps no distinction is made between those miles requiring one sheet and those requiring several sheets. The outline ring shown as the first entry in Fig. 2 consists of a heavy black line circle about 5/16 in. in diameter and concentric with this, a light printing ink (red or blue) circle about 9/16 in. in diameter with radial lines between the two, dividing the ring into the desired number of parts. The heavy ring or circle is the convention for maps to be made

| No | Name | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 |
|----|-------------|---|---|---|---|---|---|---|---|---|----|----|
| 1 | Main line | | | | | | | | | | | |
| 2 | Pine branch | | | | | | | | | | | |
| 3 | Lane br | | | | | | | | | | | |
| 4 | Kane br | | | | | | | | | | | |
| 5 | Mire line | | | | | | | | | | | |
| 6 | Transfer | | | | | | | | | | | |
| 7 | River br | | | | | | | | | | | |

Typical Progress Record

and serves as a base on which to build the ring as the segments are added. The light ink circle and radial line serve as a guide when filling in the various segments. It is also a help to the eye in observing quickly the various segments filled in. The chart should be made on tracing cloth and posted periodically, the daily posting from the time cards being carried on a print by a clerk. This print is filed when it has been posted on the tracing and the print filled to show the progress during the given period. A new print is taken for the clerk's use after each posting of the tracing.

In using the chart when an operation on a certain map is begun the outer circumference of the segment for that operation is filled with a heavy black line, and when the operation is shown to be complete by the time cards, the whole segment is filled in.

In choosing the number, value and meaning of each segment considerable judgment must be shown, and the learning of the key can be greatly facilitated by a proper grouping of the operations. In Fig. 2 all operations pertaining to plotting are shown above the center line and those pertaining to the tracing below the center. The right of

way work is shown to the left and the track to the right. There are five divisions above and six below, the notes received being split if required. The government notes can be split if required. This item can well occupy the central circle because the mile post numbers are of no further value. Fig. 111 shows the same built-up system developed on a square and worked out to show the progress on valuation profiles. Although these systems can be used with any time card system which tells much of anything about the work, the printing of a few outlines on the time cards and

Freight Operations in January

THE EFFECTS OF SEVERE WEATHER and the results of accumulated congestion during the month of January, the first month of government control of the railways, are strikingly illustrated in the report of freight operations for the month compiled by the Bureau of Railway Economics for the American Railway Association. The revenue ton miles of freight handled decreased 17.2 per cent as compared with January, 1917, and the average mileage per

FREIGHT OPERATIONS OF STEAM RAILWAYS FOR JANUARY, 1918.

having the men fill in segments representing the operation on which they work will undoubtedly save many mistakes.

WAR WAGES OF ENGLISH RAILWAYS.—According to the speeches of the various chairmen at the recent annual meetings of the English railway companies, the war wages paid to their employees is costing as follows: Great Western, \$17,500,000 a year; Midland, \$20,000,000; Great Northern, \$8,500,000; Furness, \$450,000; Taff Vale, \$110,000; and Highland, over \$500,000. Nor is this in some cases all, as the sums do not include the consequent increase for overtime and Sunday duty, which are now taken into account when calculating war wages.—*The Engineer, London.*

locomotive per day was only 59.4 as compared with 68.5 in January, 1917, a reduction of 13.3 per cent, while the average miles per car per day fell from 25.3 to 18.3, or 27.7 per cent. There was also a reduction of 3.5 per cent in the average trainload, but an increase of 12.1 per cent in the tons per loaded car.

In the eastern district the reduction in revenue ton miles handled was 25.3 per cent. The locomotive mileage per day was only 56.6 and the mileage per car per day was reduced to 14. In the southern district the ton mileage was reduced 18.5 per cent and in the western district 5.2 per cent.

The comparative summary for the month for the railways as a whole and for the three districts is shown in the table.

Determining When Rail Should Be Renewed

A Description of the Methods in Use on the Santa Fe to Secure Uniformity in Practice and Proper Standards

By C. W. Baldridge

Assistant Engineer, Atchison, Topeka & Santa Fe, Chicago

WHEN IS A RAIL WORN OUT? This is a question, the answer to which is the same as the answer to many other questions of similar portent—"it depends." In the case of rail, it depends upon the class of the track in which the rail happens to be in use; the standard of maintenance attempted by the company, and also upon what other use the company has for the rail and how urgent that other use may be. With some companies, insufficient earnings, or insufficient returns on the business handled, may compel the postponement of the renewal of rail, which, judged by all other conditions, should be renewed. Other factors may

Fig. 1—Two Views of the Rail Contour Instrument

enter into the answer, and, indeed, sometimes none of the factors determine, as rails occasionally become so worn out that safety compels their renewal.

On the Atchison, Topeka & Santa Fe the practice has been established for several years of purchasing no new rail for use on branch lines, but to supply the requirements of branch lines and new lines constructed from rail released from the tracks of main lines. This practice does not control the removal of rail from main line tracks, but is one of the factors to be considered.

The method followed in determining when the rail in main line tracks shall be renewed, is to have each roadmaster make an inspection of his district each spring and report the rail which will require renewal the following spring. The roadmasters pass their lists to their superior officers by whom, after such checking and inspection as is deemed necessary, they are consolidated into a list for each grand division and forwarded to the general officers of the company.

The chief engineer of the system then sends out an assistant to make a careful inspection of rail shown on the list for renewal, in order to determine its physical condition to the end that the rail most in need of renewal may be given preference. The method of inspection consists in going over the track on a motor car at a speed slow enough so that the rail can be looked over carefully, and of stopping at occasional locations where measurements of the rails are taken. These consist of contours of the rails to show the amount of wear; measurements of the extent to which

the rail ends are low to show the amount of permanent set and of batter at the ends of the rails; measurement of the width of opening (space left for expansion) between rails, and the gage of the track.

The number of locations at which measurements are taken varies of course with the length of the stretch of rail to be renewed. Usually not less than eight locations are taken for measurements, and as many more as may be required to show the average condition of the rail. Ordinarily, the measurements are taken at one point on each mile.

The contours of the rails are taken by means of the rail contour instrument shown in Fig. 1. This instrument is so designed that the face of the base of the instrument is in contact crosswise and on the underside of the base of rail, also with a guiding shoulder on the instrument in contact with the edge of the base of the rail, thus insuring that the contour or section is taken perpendicular and at right angles to the axis of the rail, thereby getting a true section of the rail. The contour is drawn by the instrument upon white paper, which is carried in a roll in the paper magazine on the instrument, and with the end stretched tightly across the drawing plate and clamped in position while receiving the pencil record of the rail. After removal from the instrument, each contour sheet is labeled with the location and such other information as may be desired for making up the report. Upon receipt in the office, these contour sheets are sent to the drafting room and are spread under tracings of theoretical original sections of the particular type of rails under investigation. The field contour is then traced into the original section, the difference of the two showing the amount of wear.

The amounts which the rail ends are low are measured by means of a 30-in. straight edge (Fig. 2), equipped with a multiplying indicator pivoted near the end of the straight

Fig. 2—Measuring the Batter at Rail Ends

edge, as shown. The short end of the indicator blade is pushed down into contact with the face of the rail and the amount the joint is low is shown in hundredths of an inch, by the scale under the long end of the indicator blade.

The amount of space between rail ends is measured by means of a taper gage (Fig. 3), which is graduated to hundredths of an inch, the taper gage being thrust between the rail ends, crosswise to the rail, as far as it will go and the opening read on the gage.

The gage of track is measured by means of a two-piece extension rule (Fig. 4), sometimes called a glazier's rule.

The rule is placed against the head of one rail at the gaging point, and is then extended until it makes contact with the opposite rail at the gaging point. The width of track is then read on the face of the rule where the end of the top half cuts the scale on the bottom half of the rule.

Measurements of the amount that the rail ends are low, the amount of space left for expansion, and the gage of the track, are made on a uniform number of joints in each rail, following the point where rail contours are taken, in order

Fig. 3—Taper Gage to Measure Openings Between Rails

to determine the average condition of the rails in these respects.

The results of the measurements thus made and of the inspection also serve as a check upon the maintenance of the tracks, which naturally is a large factor in the life of rail. Another factor bearing on rail renewals and which cannot be measured or arrived at in any similar manner is worn spots, defective spots, and driver burns on the rails.

Fig. 4—Measuring the Gage of the Track

The condition of the rail in this respect can only be judged through observation by an experienced man.

After the inspection is complete and the rail contours plotted are in the drafting room, a report is prepared giving the location of the rail under consideration, a history of the rail as to date laid, etc., the approximate tonnage carried by the rail, the characteristics of engines in use over the rail, a tabulation of the joint measurements described above, prints of the rail contours taken, and a statement of the condition of the rail as found by the assistant who

Fig. 5—Typical Rail Contour Sections

made the inspection, with a conclusion as to the necessity for renewal or otherwise based on the physical conditions only.

These reports are then forwarded to the chief engineer of the system, who takes up the question of rail renewals with the general managers and the situation is discussed by all concerned. In addition to the physical condition of the rail, the requirements for relayer rail for use on branch lines, for the construction of new lines, and for the renewal

and construction of yards and sidings, the advisability of anticipating future renewals in order to avoid too much work on one roadmaster's district in a single year, and all other factors are considered. The results and conclusions are reported to the vice-president, by whom the final decision of allotments is made.

Figure 5 shows a sheet of rail contours as worked up in the drafting room for enclosure in a report. This sheet covers rail on double track, both tracks of which were listed for renewal. The rail sections were taken by commencing on the left-hand rail and working across both tracks. By this method, the paper in the contour recording machine is advanced for each section, but is not torn off until all four rails are traced. This arrangement aids in keeping the rail contours in order and saves repeating notes.

Train Accidents in March¹

THE FOLLOWING IS A LIST of the most notable train accidents that occurred on the railways of the United States in the month of March, 1918:

| Collisions | | | | | |
|-------------|------------------|---------------|---------------------|---------------|-------------|
| Date | Road | Place | Kind of Accident | Kind of Train | Kil'd Inj'd |
| 4. | Atlanta, E. & A. | Talbotton | xc | F. & F. | 2 0 |

| 21. | Balt. & Ohio | Youngstown | bc | P. & F. | 1 0 |
| *23. | Penn. | Trenton | rc | F. & F. | 1 2 |
| Derailments | | | | | |
| Date | Road | Place | Cause of Derailment | Kind of Train | Kil'd Inj'd |
| 4. | Pennsylvania | Canton, O. | neg. | F. & P. | 1 2 |
| 9. | Louisville & N. | Bonnieville | acc. obst. | F. | 2 1 |
| 14. | Pennsylvania | Portageville | washout | P. | 3 0 |
| 15. | Pennsylvania | Elizabethtown | slide | P. | 2 24 |
| 17. | M., K. & Texas | Schell City | d. switch | P. | 0 1 |
| 25. | Chesapeake & O. | Buffalo Creek | acc. obst. | P. | 2 1 |
| 26. | Del. & Hudson | Slingerlands | d. journal | F. | 0 1 |
| 30. | Del. & Hudson | Cadyville | washout | F. | 0 3 |

| Other Accidents | | | | | |
|-----------------|-----------------|---------|-------------------|---------------|-------------|
| Date | Road | Place | Cause of Accident | Kind of Train | Kil'd Inj'd |
| 22. | Fort Worth & D. | Electra | boiler | F. | 3 0 |

The trains involved in the collision near Talbotton, Ga., on the night of the 4th were eastbound extra freights No. 207 and No. 212. The last named train had been stalled on an ascending grade and a part of the cars had to be taken forward to a side track and set off. The engine, on its return to the rear part of the train accidentally started the standing cars down grade, without coupling to them, and they became uncontrollable, although there were two men on them, and collided with train 207. One engine, one caboose and 10 loaded cars were wrecked, and the conductor and engineman of 207 were killed.

The trains in collision on the Missouri, Kansas & Texas, at Huber, Tex., on March 17 were southbound passenger No. 25, and a northbound extra freight, which was standing on a side track. The passenger train, drawn by two engines, ran over a misplaced switch and into the head of the freight, badly damaging three locomotives, one baggage car and one coach. Four trainmen were injured, one of them fatally. The collision occurred at 1:25 a. m. A brakeman of the freight, sent to the switch to turn it after the passage of the passenger train, turned it immediately in front of that train, thus causing the collision. It appears that, while waiting for the passenger train, the brakeman had been asleep in the caboose; and that he turned the switch while his mind was not clear.

The trains in collision at Youngstown, Ohio, on the night

¹ Abbreviations and marks used in Accident List: re, Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc. obst., Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—P, or Pass., Passenger train—F, or Ft., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Pagger, One or more passengers killed.

leave and return to the same job in the course of a few days; the lost time being spent in idleness. Co-operation between railways and local authorities and better housing and working conditions would greatly ameliorate this condition. It will be noted in the statement that the average length of service for 1917 is materially increased over that of 1916. This is in part due to improved boarding and housing facilities.

A War-Time Fuel Conservation Campaign on the Northern Pacific

THE NORTHERN PACIFIC is now pushing a unique fuel conservation campaign, consisting of lectures with moving pictures and demonstrations, given daily to employees and to all others interested in the subject, in a car especially equipped for the purpose. From the large attendance and interest displayed this educational work has been found to produce good results. The present campaign will extend over a period of three months, during which time consumers of fuel in all the states through which the road passes, will be appealed to as well as employees of the railroad company.

At a number of cities, school children have been brought to the instruction car as a special feature in the course of their training. In many of the cities visited an open session for the public is held in a large hall, which is arranged for by the commercial clubs. Those attending the

fuel but make the work easier as well. The proper combustion of gases in the firebox is treated by demonstrations which leave no question in the minds of those who see them as to the conditions necessary for the best results. As from 35 per cent to 50 per cent of the heat value of soft coal may be derived from the volatile combustible matter (the gases) a great loss of heat occurs when any considerable amount of the gases escape unburned. Opportunity for saving fuel lies principally in the burning of the free hydrocarbon gases.

It is pointed out that the most efficient fireman is the man who carries a light, even fire, also that the popping of safety valves, loss of coal from overloading tenders, kicking coal from the gangways, etc., are willful wastes of fuel and unpatriotic acts. As fuel is war power required to keep munition factories running, armies and navies supplied and transportation units moving, all are under obligation to save it, because victory in the war depends just as much on those who remain at home as on the boys in the trenches. To add to the interest of the lecture and to appeal to the patriotism of those in attendance, moving pictures of soldiers are shown, including a number of moving-pictures of actual trench-life and battle scenes taken in France.

The public press in the cities visited has taken a lively interest in the work of the fuel conservation campaign and newspapers have unstintingly furnished space in their desire to place the necessity of fuel conservation before the public. This patriotic co-operation has greatly assisted the work of reaching the public effectively. Pamphlets prepared by the railroad concerning the economical use of

Views in the Northern Pacific's Fuel Conservation Car

meetings are impressed with the fact that our country will require, during the first year of the war, not less than 100,000,000 tons of coal more than we have ever produced in one year; that it is not expected the production will meet the demand; and that it is expected that every one will do his bit in saving fuel in order that our military operations and those of our allies may be successful.

For the benefit of the railroad men it is brought out that the roads in the United States will require about 130,000,000 tons of coal for this year's work and that probably 25 per cent of the total fuel tonnage handled by the roads will be used to operate the roads. It is explained that this offers a splendid opportunity for railroad employees who handle coal to contribute their share in winning the war by using as little coal as possible, not wasting any themselves nor permitting others to waste it.

The cinematograph shows good and bad practices in locomotive and stationary plant operation. Black smoke is clear evidence of waste, and employees are instructed to follow light firing methods, which not only save considerable

fuel in heating buildings are also freely distributed at the lectures.

When the Northern Pacific fuel conservation campaign is finished it will have given practical demonstrations and carried the message of fuel conservation by word and illustration to thousands of persons who handle millions of tons of coal each year.

NEW RAILWAY IN TRAVANCORE, INDIA.—A new line of railway, 38 miles long, connecting Quilon and Trivandrum, two small seaports in Travancore State, South India, was opened to traffic on January 1. This will link up the east with the west coast in a part of the country that has been more or less isolated from the rest of India. Quilon has heretofore been the terminus of the Travancore branch of the South Indian Railway, a trunk line from Madras extending over 1,700 miles in peninsular India. The peculiar engineering difficulties in the Paravoor and Kilimukku Lakes greatly increased the cost of construction of the line, which ultimately came to \$1,751,940.—*Commerce Reports*.

Short Line Railroads Object to Being Left Out

AT A CONFERENCE of representatives of the short line railroads from all parts of the country held at Washington on April 11 and 12, plans were laid for a vigorous campaign to have carried out what the short line representatives believe was the intention of Congress when it passed the railroad bill, that the independent short line railroads should be made a part of the federal railroad system. The law division of the Railroad Administration has taken the position that, under section 14 of the act, it may exclude such lines at any time before July 1.

Under resolutions adopted at the meeting, an executive committee representing the entire field of short line industry was appointed to carry out the directions of the conference and to sit at Washington continuously until July 1, or for as long as may be necessary, for the purpose of assisting interested lines in their negotiations with the government. The resolutions under which the committee is acting are as follows:

"Whereas, Congress, by an Act approved March 21, 1918, entitled 'An Act to provide for the operation of transportation systems while under Federal control,' has declared (in effect) that every railroad not owned, controlled, or operated by a trunk line was and is under federal control and thus, for the period therein fixed, made part of the trunk road or system line with which any such road connects, but conferred on the President power, prior to July 1, 1918, to relinquish control of any trunk or system line together with such short road or roads as may connect therewith, and

"Whereas, it was the intent and purpose of Congress to make all such independent, or short, roads a part of the federal controlled railroad system, so that such short lines might continue to exist and be enabled to perform important public service under war conditions, and

"Whereas, the Railroad Administration now construes said law as giving power to the President to exclude from federal control any or all short lines while continuing to operate the trunk line or lines with which they connect, and the said Railroad Administration has advised that it would not exercise jurisdiction or control over the short roads of continental America but, to the contrary, has informed the owners of such roads that the question of whether or not they shall be used as part of the federal railway system is yet to be determined, and

"Whereas, the short line roads are already suffering a great loss by being compelled to operate independently from the trunk lines now operated as the government railway and such losses, if continued, must and will force a great number of such roads now filling important economic positions in the transportation system of the United States to completely suspend operations so long as the government continues to operate the larger roads as a government utility, and such suspension will result in financial ruin to such roads and great and irreparable damage to the many communities and industries they now serve—

"Now, therefore, be it resolved, as the sense of this Conference—

"1st. That we hereby appeal to the Railroad Administration, both as representatives of the short line roads and as citizens loyal to the great cause in which our country is engaged, to reconsider the idea of releasing, save by mutual agreement, any short line road so long as the trunk line with which it connects is operated by the government. With our country at war there is and should be a place for every citizen and every industry able to perform any sort of substantial service. The ruin of the short line roads or any one of them when considered along with the loss to the communities served and the banks and citizens whose money

was invested on the faith of pre-war conditions, will go far beyond any loss the government might sustain from operating the short roads. Any other policy than one which shall earnestly and honestly seek to conserve these industries for their usefulness in the present as well as the future is unwise and shortsighted. The saving of a dollar which has been collected into the government treasury cannot justify the wastage of five dollars or ten dollars of the general wealth of the Nation.

"2nd. In order that this appeal to the Railroad Administration may be fully and fairly presented and the policy of said administration toward the short roads definitely ascertained; and, further, in order that all of the other short line problems may be handled as efficiently as possible, it is therefore further resolved, that an executive committee of five representatives of interested lines be appointed by the chairman of this conference, of which committee the chairman shall be a member ex officio, the duties of which committee shall be the following:

"(a) To confer with the Director General of Railroads, or such representative as he may select, and to ascertain and report definitely, the policy of the administration concerning short line railroads.

"(b) If it be ascertained that the fixed policy of the administration is to exclude from federal control without agreement, the short line roads or any number of them, said executive committee shall advise interested lines promptly and shall at once prepare and submit to the members of Congress a full statement of the facts and shall appeal to Congress to correct the manifest economic error involved in such dealings with the short line problem.

"(c) To sit in Washington, D. C., continuously until July 1, 1918,—or such portion of this time as may be necessary—for the purpose of assisting interested lines in their negotiations with the government.

"(d) To levy assessments equitably against interested lines for the purpose of providing for the reasonable expense of such committee, a statement of the receipts and disbursements to be furnished monthly for the information of interested lines.

"(e) To do all other things, herein not specifically mentioned, to the end that short line roads shall be of the greatest possible assistance to the government in this crisis, and in turn that the government shall omit no possible fairness in its handling of the short line problem.

"3rd. There is very great need of an officer or department in the Federal Railroad Administration to deal solely with the short line railroad situation. There are about 800 short line railroads in the United States, with problems and conditions peculiar to themselves. The great trunk line problems fall largely into well defined classes, whereas the short line problems cannot be dealt with in classes, and the solution of one problem of a short line would probably not be applicable to many other short lines. In addition to the wide variance between short line and trunk line conditions, there are such a large number of short lines in the United States that it is physically impossible for the federal railroad machinery as now organized to deal effectively and satisfactorily with the short roads. Coupled with this situation there are thousands of security holders and creditors of short line roads and a great number of communities served by such roads who are much concerned over the fact that their problems are being solved largely by trunk line representatives and we believe the appointment of an experienced short line representative would go a great way towards allaying this feeling of alarm now abroad in the Nation. There should be selected at once a man of extensive short line experience who should be made Director of Short Lines, or given some other similar title, with power to immediately organize an efficient department to the end that the short line situation may be handled as effectively, promptly and sympathetically

as the trunk line situation is handled. Very much doubt and uncertainty exists at the present time and if no new machinery is created for the disposition of the short line problem this doubt and uncertainty will probably continue for too long a period after settlement of the government problems with the trunk lines. Some of the problems peculiar to short lines that must be dealt with rationally and effectively are the question of just compensation for the use of short lines (which requires careful investigation and analysis in each case); the matter of wage adjustment in each case, and proper operation, bearing in mind consistent and sufficient service; and, most of all, the financial requirements of the short lines, which must have careful study and wise decision."

Pursuant to these resolutions, the committee has addressed a circular letter to the short line railroads of the country pointing to what is termed "the gravity of the economic error" involved in the relinquishment of any material number of short lines from federal control and the vital necessity of every short line railroad lending its unqualified and whole-hearted support to the cause of the short lines. Also a post-card questionnaire has been sent to the short lines asking whether they approve of the conference action and the appointment of the committee, whether they approve the committee's urging the appointment of a short line railroad man to the staff of the director general, and whether they will lend active moral and financial support to the movement. The executive committee is as follows: Ben. B. Cain, chairman, vice-president and general manager Gulf, Texas & Western, Dallas, Texas; John W. Powell, vice-president and general manager, Virginia Blue Ridge, Washington, D. C.; Henry I. Moore, vice-president, Salt Lake & Utah Railroad, Salt Lake City, Utah; Bird M. Robinson (chairman of the Short Line Railroad Conference), receiver, Tennessee Railway, Oneida, Tennessee; W. M. Blount, president, Birmingham & Southeastern, Union Springs, Alabama; C. D. Cass, general manager, Waterloo, Cedar Falls & North-ern, Waterloo, Iowa.

The American Short Line Railroad Association, which has heretofore been leading the campaign of the short lines and which represented them during the hearings on the railroad bill before the congressional committees, was represented at the conference by its officers and 40 of its members. The Short Line Railroad Association was represented by its attorney and representative at Washington and by several delegates. The Western Association of Short Line Railroads

was represented by Henry I. Moore and a telegram pledging co-operation was received from the president. The conference held at the time of the meeting with John Barton Payne, general counsel of the Railroad Administration, was noted briefly in last week's issue. The official account of the proceedings of the conference, which has since been issued, gives the following statement of the position of the Railroad Administration as announced by Judge Payne:

Judge Payne stated that he construed the act to mean that all short lines and other railroads were under government control, but that Section 14 of the act gave the President authority to relinquish to its owners any railroad, prior to July 1, 1918, and in the meantime that the Railroad Administration will not exercise jurisdiction over any short line until the question as to whether they shall be retained under federal control shall have been determined.

In reply to questions propounded by Chairman Robinson, Judge Payne said that:

Some short lines had been relinquished at their own request, but that no decision had been reached as yet to eliminate any other line;

Instructions had been issued to the regional directors to investigate the conditions of every short line and the conditions surrounding it, and that they were now engaged in making these investigations;

When the recommendations of the regional directors were received, he would consider them carefully and notice of the decision as to each line would thereafter be sent to the owners.

He said further that it was the intention of the director general to retain all lines that would be serviceable to the government in the prosecution of the war, but that he did not intend to retain any line that was not serviceable for their purpose; and he would grant an oral hearing to any line that desired to be heard, in the event that it had been decided, or was about to be decided, to relinquish such road from federal control to its owners.

He could not express an opinion as to how independent short line railroads could hereafter purchase equipment, as that would depend upon the showing made by each road.

The divisions of through rates would not be disturbed except by affirmative action on the part of the Railroad Administration.

He could not now express an opinion as to whether shippers' routing of freight and traffic contracts would be recognized.

A Busy Light Railway Terminal

International Railway Fuel Association Convention

THE INTERNATIONAL RAILWAY FUEL ASSOCIATION, an organization composed of the officers of American and Canadian railway fuel departments and coal operators, recently tendered its services to the government to aid in the effort to stimulate coal production and to enhance economy in its use. This offer has been accepted by the United States Fuel Administration and by the United States Railroad Administration, and those two government departments, in co-operation with the officers of the Fuel Administration, have arranged for a convention to be held in Chicago on May 23 and 24, 1918.

The two government administrations and the officers of the Fuel Administration believe that this convention will provide an opportunity to arouse renewed interest in the fuel problem and to stimulate greater effort on the part of all concerned in the production and use of fuel; and they hope to attain these ends through a series of inspiring addresses by representatives of the various interests involved, which, by appeals to patriotism, shall seek to stimulate enthusiasm and to enlist co-operation. The speakers on this occasion are all men of national prominence, whose previous experience or present contact with the fuel situation will enable them to speak with authority to mine operators, mine workers, railway officers, and railway employees. Through the co-operation of the two government bureaus there is certain to be in attendance at this convention a large audience composed of men, who, in their daily work, can directly affect the production of coal, both as regards quality and amount and its economical use on the railways of the United States and Canada. The fact that the railways use nearly one-third of all the coal produced is, in itself, an earnest of the importance which the government attaches to its conservation and to this convention.

Subsequent to the convention, it is intended to distribute very widely to coal operators, miners, railway officials and railway employees the substance of the various addresses, and in this way, as well as by the direct influence of those who have been able to attend, to reach back into the mining industry, and to men on the railroads, and to relay to them something of the inspiration and stimulus which is the chief aim of this meeting.

The general arrangements for the convention are going forward under the direction of C. R. Gray, Director of the Division of Transportation, United States Railroad Administration, and P. B. Noyes, Director of Conservation Division, United States Fuel Administration. The details of the program are being arranged by a committee consisting of E. W. Pratt, president, International Railway Fuel Association; J. G. Crawford, secretary of this association; Eugene McAuliffe, president, Union Colliery Company, St. Louis, Mo., representing the United States Railroad Administration; Major Edward C. Schmidt, representing the United States Fuel Administration and Morgan K. Barnum, assistant to the vice-president, Baltimore & Ohio Railroad.

The program for the convention, as tentatively outlined, is as follows:

Introductory address, E. W. Pratt, President International Railway Fuel Administration.

The Fuel Problem in the War, H. A. Garfield, U. S. Fuel Administrator.

The Railroads and their Relation to the Fuel Problem, C. R. Gray, Director Division of Transportation, United States Railroad Administration.

What Can Be Done for Our Northern Ally, Sir George Bury, Chairman, Canadian Railways War Board.

The Need for Fuel Conservation, P. B. Noyes, Director Conservation Division, U. S. Fuel Administration.

The Coal Operator and His Responsibilities in the Fuel Situation, Edwin Ludlow, vice-president, Lehigh Coal and Navigation Co., Lansford, Penn.

What the Men on the Locomotives Can Do, W. S. Stone, Grand Chief, Brotherhood of Locomotive Engineers.

What the Coal Miner Can Do to Help the Government, the Railroads, and the Men at the Front, John P. White, Labor Advisor, U. S. Fuel Administration.

The Motive Power Department and Fuel Economy, R. Quayle, general superintendent, Motive Power and Car Dept., Chicago & North Western Ry.

What the Coal Operator Can Do To Help Win the War, H. N. Taylor, vice-president, Central Coal & Coke Co., Kansas City.

The Railroad Industrial Army—a Component Part of the American Expeditionary Force and the Allied Armies, W. S. Carter, Director, Division of Labor, United States Railroad Administration.

The Supply and Distribution of Fuel, J. D. A. Morrow, Director, Distribution Division, U. S. Fuel Administration.

Relation of Locomotive Maintenance to Fuel Economy, Frank McManamy, Director, Division Locomotive Maintenance, United States Railroad Administration.

The Transportation Department and Fuel Economy, F. H. De Groot, Jr., Assistant Manager, Car Service Section, Division of Transportation, U. S. Railroad Administration. More and Better Coal, Eugene McAuliffe, president, Union Colliery Company, St. Louis.

Railway Engineers Commended for Part in Battle of Picardy

SECRETARY BAKER MADE PUBLIC last Friday a cable report from General Pershing, showing the importance of the work done by units of American engineers in the battle of Picardy, and showing that for the period of 13 days covered by the report these forces were almost continuously in action. They were among the forces hastily gathered by General Carey to stem the German advance.

The Americans were in the very thick of the hardest days of the great German drive, and the report from General Pershing embodies a communication from General Rawlinson, Commander of the British Fifth Army, in which the latter declared that "It has been largely due to your assistance that the enemy is checked."

General Pershing's report covers the fighting period from March 21 to April 3. The former date marked the beginning of the Hindenburg offensive along the whole front from La Fere to Croisilles. The text of the report follows:

In reference to mention in summary of activities, from March 24 to March 25, of American troops fighting with British armies, and to the daily cable summary of the battle March 29, 1918, the following has now been established from official reports:

The commanding officer of a United States engineer regiment has received a copy of the following letter commending the action of the troops of his regiment:

"I have received the following from the commanding general, ——— Corps: 'I desire to convey to you and ranks under your orders my admiration of the splendid service which you and they have rendered in connection with corps light railroad. Thanks to the untiring energy of officers, non-commissioned officers and men, who have risen to the occasion in a manner beyond all praise, and their gallantry, much of what might otherwise have fallen into the enemy's hands has been saved.'

"I should like to add my own appreciation of the excellent

services rendered by the officers, non-commissioned officers and men of the light railroad service of this army directorate, in connection with the present operation. Will you be good enough to acquaint all ranks serving under you of the appreciation accorded to their untiring service?"

Details of the work done by the engineers are given in General Pershing's report as follows:

"Certain units of United States Engineers, serving with a British army battalion March 21 and April 3, while under shell fire, carried out destruction of material dumps at Chaumes, fell back with British forces to Moreuil, where the commands laid out trench work, then proceeded to Demuin, and was assigned sector of defensive line which was constructed and manned by them, thence moved to a position on the line near Warfusee-Abancourt and extending to north side of Bois de Toillauw. The commands started for this position on March 27, and occupied it until April 3, during this time the commanding officer of a unit of United States Engineers being in command of the subsector occupied by his troops. This command was in more or less continuous action during its stay in this position. On April 3 the command was ordered to fall back to Abbeville.

"The casualties during the period March 21 to April 3 were: Officers killed, 2; wounded, 3. Men killed, 20; wounded, 52; 45 men reported missing, but it is believed by the British authorities that they were not all captured, and that many of them were separated from their command and are now with other British organizations. This report of casualties does not consider one detachment of 57 men from which no report has been received."

The commanding general of a British cavalry division sent the following commendatory communication after he had received the commendation of the army commander for the conduct of his division:

"Commanding Officer United States Engineer Battalion, ———— Engineers:

"As the United States Engineer Battalion was fighting

your command fought most gallantly alongside the British cavalry. I am most grateful to you and the unit under your command for the invaluable assistance you gave us on March 30, 1918. Please convey my thanks and congratulations to all ranks.

(Signed)

"Major General Commanding ———— Cavalry Division."

The Commanding General of the British ———— Army commended these troops in a communication as follows:

"Army, April 1st, 1918.

"Colonel ————, Lt. Col. Engineer, commanding ———— Regiment, United States Engineers:

"The army commander wishes to reconvey officially his appreciation of the excellent work your regiment has done in assisting the British army to resist the enemy's powerful offensive during the last ten days. I fully realize that it has been largely due to your assistance that the enemy is checked, and I rely on you to assist us still further during the few days which are still to come before I shall be able to relieve you in the line. I consider your work in the line to be greatly enhanced by the fact that for six weeks previous to taking your place in the front line your men had been working at such high pressure erecting a heavy bridge over the Somme. My best congratulations and warm thanks to you all.

(Signed)

"RAWLINSON,

"General Commanding."

Weekly Reports of Railroad Earnings

THE RAILROAD ADMINISTRATION has inaugurated a series of weekly reports of railroad operating revenues from some of the leading systems of the country for the purpose of obtaining prompt information as to the general trend of conditions. Two of these reports compiled by the Bureau of Statistics of the Interstate Commerce Commission

OPERATING REVENUES OF STEAM ROADS

| Name of road | Operating Revenues, 2nd week in April | | | Operating Revenues, 1st and 2nd weeks in April combined | | |
|---|--|--------------------------|--|--|--------------------------|--|
| | 1918 | Same period last year | Per cent of increase or decrease (D) | 1918 | Same period last year | Per cent of increase or decrease (D) |
| Eastern District: | | | | | | |
| Baltimore & Ohio R. R. | \$2,588,000 | \$2,315,000 | 11.8 | \$4,960,000 | \$4,620,000 | 7.4 |
| Boston & Maine R. R. | 1,262,000 | 984,000 | 28.3 | 2,353,000 | 2,094,000 | 12.4 |
| Erie R. R. (Including Chic. & Erie R. R.) | 1,522,000 | 1,433,000 | 6.2 | 2,928,000 | 2,837,000 | 3.2 |
| New York Central R. R. | 4,359,000 | 3,908,000 | 11.5 | 8,182,000 | 7,785,000 | 5.1 |
| New York, New Haven & Hartford R. R. | 1,686,000 | 1,691,000 | (D) 0.3 | 3,368,000 | 3,338,000 | 0.9 |
| New York, Philadelphia & Norfolk R. R. | 133,000 | 88,000 | 51.1 | 258,000 | 178,000 | 44.9 |
| Pennsylvania R. R. | 6,022,000 | 5,485,000 | 9.8 | 11,929,000 | 11,141,000 | 7.1 |
| Pennsylvania Lines West of Pittsburgh | 3,016,000 | 2,755,000 | 9.5 | 5,845,000 | 5,483,000 | 6.6 |

| Chicago, Burlington & Quincy R. R. | 2,486,000 | 2,265,000 | 9.8 | 5,216,000 | 4,639,000 | 12.4 |
| Chicago, Rock Island & Pacific Ry. | 1,935,000 | 1,733,000 | 11.7 | 3,644,000 | 3,230,000 | 12.8 |
| Great Northern Ry. | 1,539,000 | 1,681,000 | (D) 8.4 | 3,068,000 | 3,199,000 | (D) 4.1 |
| Northern Pacific Ry. | 1,700,000 | 1,720,000 | (D) 1.2 | 3,237,000 | 3,318,000 | (D) 2.4 |
| St. Louis-San Francisco Ry. | 1,205,000 | 1,063,000 | 13.4 | 2,345,000 | 2,060,000 | 13.8 |
| Southern Pacific Co. (Pac. System) | 2,610,000 | 2,393,000 | 9.1 | 5,150,000 | 4,718,000 | 9.2 |
| Total | \$16,944,000 | \$15,858,000 | 6.8 | \$33,478,000 | \$31,328,000 | 6.9 |
| Grand total all roads reporting | \$43,402,000 | \$39,780,000 | 9.1 | \$85,069,000 | \$79,190,000 | 7.4 |

*Report not received.

with the ———— Cavalry Division in the line on March 30, the army commander's congratulatory message applied to them equally with units of the ———— Cavalry Division. It has been brought to my notice that the men under

have now been received. The report for the second week in April and the first and second weeks combined, showing a considerable increase in earnings, is given in the above table.

Latest Developments in Locomotive Standardization

Roads Permitted to Ask for Special Designs for Conditions Not Met by the Standard Types

THE STANDARDIZATION of locomotives has been the subject of conferences held at the headquarters of the Railroad Administration in Washington during the last week. The conference held last Friday was attended by C. R. Gray, director of the division of transportation, by the regional directors, by Henry Walters, who has been in general charge of the matter of locomotive standardization, and by S. M. Vauclain.

The Railroad Administration until this week never officially indicated whether in case an order is placed for the proposed standard locomotives individual lines will be allowed to get locomotives which their management may consider needed to meet special conditions. The Railroad Administration has thrown light on its attitude regarding this point by sending, as a result of the conferences, the following memorandum to the managements of the various lines:

"It is appreciated that there are special conditions upon some railroads, in which there is an unusual or unique situation to be met.

"In these circumstances it is understood that any such railroad is privileged to make representation to the director general as to its individual necessity for a departure from the standard type."

It is obvious that the effect which the principle enunciated in the foregoing will have upon the locomotive situation will depend on how broadly the principle stated is interpreted and applied. Strictly interpreted, it would mean that only a few railroads having very special conditions or unique situations would be furnished with any locomotives departing from the standard type. On the other hand, broadly interpreted, it might result in all railways having special conditions being allowed to get locomotives adapted to those special conditions. Now, as there is hardly a railway management which has not believed in the past that it had had "special conditions" on at least part of its lines, the broad interpretation of the principle would result in the ordering of many locomotives besides the standard locomotives.

While the Railroad Administration has by this memorandum conceded that it is desirable to have locomotives which best meet the physical requirements of the roads, it would appear that the problems of maintaining the standard locomotives have not been given the consideration they deserve. The committee of builders appointed by S. M. Vauclain on instructions from the director general made certain statements and recommendations in its first report which never heretofore have been made public. This report was handed to Mr. Vauclain on February 19. The statements and recommendations referred to were as follows:

"Inasmuch as there are now, approximately, 70,000 locomotives in service on the railways of this country, it would seem desirable to call your attention to the care and study which should be given to the working up of any plan of future standardization, in order to obtain the greatest possible economy in maintenance and to preserve, as far as advisable, the existing railway standards. Under the conditions existing in the past, it has always been considered advisable when designing a new locomotive for any particular road to have consultations with the motive power officials so that the design could be best worked out to suit the particular shop methods and facilities for repairs on that road. If we are to be called upon to work up standard classes of locomotives suitable for all the railways of the country, we believe the

same care should be taken and numerous consultations with the motive power officials would be necessary in order to secure the best results. After these consultations there still remains the actual working out of each detail on the basis of providing the greatest interchangeability with present standards.

"While it may be said, and truly so, that these standard designs could be rushed out quickly and the building of locomotives from them accomplished within a few months, if this is done the factors just mentioned cannot be taken into consideration, and within the limits of time given, and effort would have to be directed toward standardizing the details among these new types proposed without any reference to the standards now in use. This, in our opinion, would not be advisable, and we feel that the proper execution of such a series of standard designs cannot be carried out in time to permit the building of any of these locomotives for 1918 delivery. As the builders now have a considerable amount of untaken capacity for this year, we would respectfully suggest that if it is your desire that this year's full capacity be utilized, the railways be permitted to order for quick delivery, or until these standard designs can be worked out, such locomotives as they require exact duplicates of those now in service on their lines. This can be done without in any way retarding the progress in the direction of the standardization which you suggest."

It would seem that this part of the report has been ignored and there is reason for doubting whether it ever reached the director general, although it was addressed to him. It will be seen from the foregoing that the committee of locomotive builders recommended that no effort be made to build any standard locomotives for delivery in 1918.

Present indications are that about 1,000 of the standard locomotives will be bought at first and that they will be intended primarily to serve as a flying squadron which can be used on the lines which have not enough locomotives to handle all the traffic which must be moved over them.

It is estimated that there are now about 600 engines in service on foreign lines. As the standard locomotives are delivered it is probable that they will replace these foreign engines and that the foreign engines will be returned to the home lines. While the foreign engines have been taken from numerous railways, they are being used on a comparatively small number of lines. Therefore, if the standard locomotives are used mainly to replace them, the result will be that in the early stages, at least, they will be used on only a comparatively small number of roads. As a matter of fact, the Railroad Administration does not know where it will send the standard locomotives at first, but it is considered by some officers of the administration that it will be logical to send home as rapidly as possible the engines that are now off the lines of the owning roads and to replace them with the standard locomotives.

The interchange of power is a questionable practice at any time. Under existing conditions, however, it has been found necessary. If standardization is considered at all, it should apply only to such locomotives. And only that number which is necessary for a liquid reserve should be built. Roads requiring new power should be furnished locomotives which best meet their needs and which they are prepared to maintain. The lack of sufficient shop and enginehouse facilities is the main reason for the pres-

ent lack of motive power. To further burden the maintenance forces which are already overtaxed, by calling upon them to handle power which is strange to them and for which they have not facilities to repair, is to still further increase the heavy load they are now called upon to bear.

The question of standardization is by no means settled. It is a well-known fact that neither the soundness of the principle of standardization nor the desirability of its application on our railways in time of war was thoroughly discussed and fully considered before the standardization program was entered upon. On the contrary, the program of standardization was entered upon somewhat hastily and practically all the consideration and discussion of its desirability have occurred since it was practically decided to standardize. It is difficult to find many experts, either among the locomotive builders, on one side, or among the railway men on the other, who unreservedly express belief in the principle of standardization of locomotives, while it is easy to find many experts, both builders and railway men, who do not believe in it.

In these circumstances future developments will be followed with much interest. Probably whether additional locomotives of the same types or of other standard types will be ordered will depend to a considerable extent on the results secured with these locomotives. The Railroad Administration intends to appoint a special committee to study the results of the operation of the standard locomotives. One thing seems certain and this is that the principle of standardization of locomotives has not been finally established even for the period of government control and the future developments and discussion have yet to determine whether it will finally become firmly established.

The Railroads' Liberty Loan Campaign

"I HOPE THAT EVERY RAILROAD EMPLOYEE in the United States will lend all the money he can, consistently with his individual circumstances, to his government in buying Liberty Bonds," says Director General McAdoo in Circular No. 24 of the Railroad Wage Commission. "They pay four and one-fourth per cent interest per annum and are the safest investment in the world—as safe as the money of the United States and safer than deposits in banks.

In lending your money to the government you not only save the money for yourselves, but you help every gallant American soldier and sailor who is fighting in this war now to save your lives and liberties and to make the world safe for democracy."

With an organization that reaches every employee in railway service, from the presidents down, the railway men of this country are enthusiastically working to take a large share of the total issue of the Third Liberty Loan, and are doing their utmost to live up to their brothers who are making a record for themselves in the railway engineer regiments in France.

The Eastern Committee, of which President Underwood of the Erie is chairman, reports that the Liberty Loan campaign is making fine progress on the railways of the eastern regional district. Details as to the number of subscribers and the amounts taken, however, have only been received from a few roads. Up to Saturday night, April 20, subscriptions were reported from 93,509 employees for a total of \$5,971,100.

One of the features of the campaign on the Erie is a Liberty Loan train. This train is now on its way from Hammond, Ind., to Jersey City and will stop at the division points and shops on the route. With the train is the Erie's general office band. General Manager R. S. Parsons

is accompanying the train and he and local speakers will address the Erie employees at the important centers along the route.

Western Railwaymen Take \$30,000,000

In the western regional district, more complete returns have been received, so that on Monday, W. S. Bied, the president of the Chicago & Alton and chairman of the Western Regional District Committee, was able to report that subscriptions of \$30,000,000, or 1 per cent of the total loan, had been taken by employees in that district.

In the bulletin issued Monday to executive officers of Western railroads, stating this fact, Chairman W. G. Bied added:

"While the results so far secured are highly gratifying, now that all lines have completed their campaign organizations, it is expected that subscriptions toward the next thirty millions, or an additional 1 per cent of the total loan, should be reported much more rapidly than the first thirty millions.

"All carriers should put forth renewed efforts with this end in view."

Monday's summary showed that 437,645, or 58.08 per cent of the employees of Western roads, had subscribed \$33,387,525 for Third Liberty Loan bonds. The average subscription per capita was \$76.29.

Ten Western railroads had reported up to Monday subscriptions exceeding \$1,000,000. They were:

| Road | Per cent of employees | Subscriptions | Average |
|--------------------------------|-----------------------|---------------|---------|
| Chicago, Rock Island & Pacific | 96.22 | \$2,689,150 | 69.21 |
| Chicago, Milwaukee & St. Paul | 74.30 | 2,461,150 | 69.84 |
| Northern Pacific | 83.58 | 2,398,450 | 90.00 |
| Chicago & North Western | 60.19 | 2,337,300 | 71.90 |
| Atchafalpa, Topeka & Santa Fe | 49.43 | 2,327,350 | 73.60 |
| Great Northern | 58.83 | 1,987,050 | 99.35 |
| Missouri Pacific | 71.25 | 1,961,450 | 70.97 |
| Chicago, Burlington & Quincy | 50.44 | 1,714,450 | 73.51 |
| Union Pacific | 55.21 | 1,722,800 | 73.88 |
| Southern Pacific | 33.21 | 1,109,850 | 71.90 |

Seventy-two railroads reported that over 70 per cent of their employees had subscribed to the Third Liberty Loan.

Southern Regional Committee

E. T. Lamb, president of the Atlanta, Birmingham & Atlantic, is chairman of the Liberty Loan Committee which has been appointed for the southern regional district by Regional Director C. H. Markham. The other members of the committee are H. W. Miller, vice-president of the Southern; C. A. Wickersham, general manager of the Georgia Railroad; and W. L. Stanley, assistant to president of the Seaboard Air Line.

Committees of Employees

The Liberty Loan campaign on the railroads has been so well organized that every railway man has been reached by the members of a committee in his department or branch of service. Apparently the work of some of these committees has been as insistent as it has been enthusiastic. The Altoona Tribune, for example, had the following interesting story in a recent issue:

"Twenty-six men in one Altoona machine shop department yesterday placed a strenuous objection with officials when three of their mates failed to acquire war bonds of the present issue. An ultimatum was issued and if the trio continues to ignore the solicitors after 7 a. m. today they must quit or the twenty-six loyalists will.

"Several clerks in one of the offices at the same shops yesterday made it known they weren't going to wear the red-white-and-blue button designating the subscribers to the third loan. A petition was hastily drawn up and all other workers in the office signed it, stating they would resign if the status of the affair wasn't changed favorably."

Torpedoes as Fog Signals on Belgian State Railways

By L. Weissenbruch

Chief Signal Engineer, Belgian State Railways

IN HIS REPORT on the Kirtlebridge accident in 1916, Colonel Pringle, the British Board of Trade Inspector, said that "an unusual and disturbing feature of this case is the assertion by the four enginemen of the postal train that they did not hear the explosion of four torpedoes, which had been laid on the line just before their train approached." The inspector suggested that the Railway Employment Safety Appliances Committee should investigate the question as to the most suitable torpedo for use on railways. The Railway Gazette, of London, in referring to the mat-

ter of time, which may be months or years. To prevent misfiring, the companies' rules say that torpedoes must be tested every two months and not kept longer than three years. After a careful inquiry, the Railway Gazette, of London, rightly states that there is a source of weakness somewhere. Our experiences on the Belgian State Railways had led us to the same conclusion 15 years before the war.

We found that the cause of the steady and progressive deterioration of the torpedoes was the use of tin cases, which were liable to rust. With the tin, the little and invisible imperfections of the soldering gradually get worse and worse through the rust. The use of brass plates of 0.2 millimeter in thickness (0.079 in.) was found to be efficient and cheap if the case were beaten out of one piece of metal and the ends rolled and folded up on wax cork, as shown in the illustrations in Fig. 2. With such torpedoes it is very easy to form a double signal, but if two torpedoes are placed on the rail close together there is always a liability that the explosion of the first one will blow away the other, during the infinitesimal space of time that the wheel is traveling from one to the other. To overcome this, the holder for the torpedoes is made with an upwardly projecting rib or partition between the two. This rib is formed by suitable press tools with a longitudinal depression or groove on the underside of the holder which raises the metal on the upper side. When the holder is of the pattern used in fog signalling

British Torpedoes—Ordinary Type

ter in its issue of March 16, 1917, recalled the fact that torpedoes have been used on railways since 1841 and observed that it was surprising that, during all the years that have passed since then, no standard fog signal had yet been produced.

There are two different kinds of torpedoes in use in England, viz.:

1. The ordinary torpedo, made of a watertight tin case containing black shooting powder with three caps of mercury fulminate. In foggy weather or during falling snow, when the enginemen cannot see the signals clearly, it is the general practice, both in England and in Belgium, to maintain two such torpedoes on the track 10 yards apart, some distance in the rear of each distant signal which the fogmen have to repeat.

2. The duplex, or double torpedo, which is really only two signals in one case, and which gives only one report on exploding. The sole purpose of using two torpedoes is to safeguard against one being defective. The duplex renders the task of the fogman easier, and it saves the installation of two machines, where such are employed to avoid the placing of torpedoes by hand. In any case the price of one duplex torpedo is less than that of two ordinary ones. Each English maker has his own pattern of duplex, but, the number of makers being few there are not many patterns and they differ only in details. The duplex torpedo used in England is always a double-chambered signal with three caps in the center chamber and three or four in the annular chamber, the weight of powder being slightly different. In Fig. 1 may be seen illustrations of the two types of torpedoes mentioned.

All the British torpedoes—the ordinary or the duplex—have tin cases, and experience has taught that they become unreliable and cease to be watertight after a certain lapse

New Type Torpedo, Showing Rib

apparatus, having a projecting tang to be held by clips, the rib or partition is continued all along the tang so as to strengthen it. It was found that practically none of the new torpedoes misfired.

The English rule of destroying the torpedoes that had been kept for three years was at first in force on the Belgian State Railways, but the period was gradually extended after 1907, first to 4, then 5 and finally to 15 years. At first the tenders for the new duplex torpedoes were higher in price than for the English tin pattern, but gradually the prices descended to the same level. An additional saving has also been effected by the fact that torpedoes that have been kept in the stores have no longer to be destroyed, but as their

efficiency has a direct bearing on safety, economy is of but secondary importance. Figs. 3 and 4 show the two designs of holders employed, and the central rib mentioned may be seen. All dimensions on the figures are given in millimeters.

Treated Canvas Roofing for Steel Passenger Cars

CONSIDERABLE DIFFICULTY has been experienced in the maintenance of the roofs on steel passenger equipment where steel has been used throughout in the construction. Owing to the action of cinders along the top of the cars there is great difficulty in keeping the steel properly covered with a protective coat of paint. As soon as the paint covering becomes broken or cracked, deterioration of the steel plates begins and proceeds rapidly especially where the joints in the roof plates project above the smooth surface of the roof, due to the formation of sulphuric acid from the action of water on the cinders. It is also a fact that no matter how stiff the construction of a car may be, there is always more or less weaving of the roof, which is evidenced by the condition of the joints in the sheets after they have been in service for some time.

A special type of canvas roofing, the material of which is impregnated with a treatment making it both waterproof and proof against mildew has been furnished for several years by the Tuco Products Corporation, 30 Church street, New York, and much of this material is now in use on

Type of Passenger Roof Construction Using Wood Sheathing and Treated Canvas Covering

wood passenger equipment. In the application of this material the use of white lead is unnecessary, thereby effecting a saving of labor and material. Otherwise, the same practice is followed as with any other canvas roofing, the special advantage being that should the protecting film of paint become cracked, thereby permitting moisture to come directly in contact with the material, it does not deteriorate from mildew as is the case with untreated canvas. Within the past few years a number of railways have adopted a semi-wood roof construction in order to secure the advantages of this type of roof covering, which has demonstrated its advantages through many years of service on wooden equipment.

A type of wood roof construction for steel equipment is shown in the illustration. The tongued and grooved wood sheathing is applied directly to furring strips bolted to the

steel carlines and projecting slightly above their upper surfaces. Intermediate wood carlines are placed between the steel carlines to provide additional nailing strips for the sheathing. The Tuco Standard car roofing is then applied to the sheathing in the usual manner. This construction provides its own insulation, a considerable saving in itself, and also eliminates the troubles with the joints of the metal roof, due to the weaving action and the rapid deterioration of the projecting surfaces caused by the impinging action of the cinders and corrosion. There are now a large number of steel passenger cars on which this or a similar type of roof construction and Tuco Standard roofing has been used.

The treated canvas roofing when properly applied and well sanded is fireproof and serves all the purposes of the steel roof. In addition its life is much greater than that of the steel. Cars with roofs covered with this material are now in service with the roofs in good condition after ten years' service. The material is furnished in three weights, designated as "CC," "AA" and "FF," which correspond to No. 4, No. 6 and No. 8 duck, respectively.

Air Brake Association Will Hold Convention

THE AIR BRAKE ASSOCIATION will hold its 25th annual convention in Cleveland, Ohio, May 7 to 10, with headquarters at the Hotel Winton.

Director Prouty, of the division of public service and accounting of the Railroad Administration, in a letter dated April 23 to President C. H. Weaver, has advised that Director General McAdoo desires to encourage members to attend the convention as it seems to be understood that the Air Brake Association members are the men who are actually on the firing line in keeping the air brake apparatus in a state of perfect efficiency. Transportation is granted to those members in actual work of repairing, maintaining and conditioning air brakes. Leave of absence without loss of pay has also been granted to those members attending.

The work of the convention this year will be directed especially toward greater safety of train movement, less expense of maintenance, and more efficient inspection with a particular effort to put air brakes in a condition to help the roads through the coming severe winter campaign. The important papers to be presented are as follows:

The subject "What Is the Safe Life of an Air Brake Hose?" is presented by a painstaking committee which has made upwards of 50,000 examinations of air brake hose at different terminal and repair points to ascertain, if possible, when a hose actually becomes dangerous if left in service. Porosity of the rubber and rupture of the rubber and fibre frequently cause break-in-tuos of long trains, collisions of the parts running together, frequently throwing wreckage on the opposing track and menacing the safety and lives of other trains due to collisions. The committee's report embodies suggestions as to how accidents may be prevented if due care is taken to remove worn out hose.

"Recommended Practice of the Air Brake Association" is a code of rules covering the installation, maintenance and repair of air brake parts on locomotives and cars. Each year's experience brings information which, if employed, not only reduces the cause of air brake maintenance, but makes it better and produces greater safety.

"Conditioning Air Brakes on Freight Trains to Prevent Troubles Enroute," is the subject of a committee report and embodies detailed instruction to all workers concerned in conditioning air brakes on locomotives and freight cars in yards and shops.

"Maintenance of the 8½-in. Cross Compound Compressor" is a committee report of investigations made in very severe service where compressed air production is absolutely essential to the safe handling of trains down heavy grades. A considerable portion of the paper is given over to recommendations as to length of piping with a view of reducing the likelihood of water getting into the air brake system in winter time, freezing up and causing train accidents.

"Preventing Shocks on Long Passenger Trains" is a report prepared after two years' investigation by a large committee composed of the best air brake men on the roads throughout the country. Every phase of shocks coming from brake applications has been investigated, weighed and recommended for.

"Repair and Maintenance of Feed Valves" is an individual author's paper covering his experience of several years' specialist work to maintain feed valves to an accuracy of movement which insures no stuck brakes, wheels skidding, etc.

Improved method of M. C. B. freight brake stencilling, no cleaning, etc., is a recommendation from the North West Air Brake Club, suggesting a betterment of this practice which will enable the work to be done more cheaply, more effectively and with better maintenance results than the old practice.

Eliminating Trap Car Service

WITH INCREASED COMPLICATIONS in large railway terminals there has been a tendency to eliminate the use of standard equipment for the shorter hauls. Trap car service has been found to be uneconomical and slow in certain cases, leading to the use of motor truck service or some other substitute. In other instances traffic congestion has led to specific restrictions on switching and trap car service to permit a greater use of the existing facilities for long haul service. One arrangement undertaken recently has been the use of tractors and freight house trucks to haul

Rounding a Curve on a Two Per Cent Grade

freight from one warehouse to another in Chicago over a distance of 1,678 ft. and thereby eliminate the use of freight cars and the switching service which this transfer would otherwise have involved.

The goods were transferred from government warehouse at Ashland avenue and Thirty-ninth street, for a distance of 678 ft. through this building, across a 1,000 ft. wooden tramway and distributed to their proper storage place in the main warehouse at Thirty-ninth and Robey streets. The tramway was built of 2-in. by 6-in. pine planks and is

just wide enough for two trucks to pass without difficulty. The trucks were loaded in warehouse A, where the tractor hooked onto a train, varying from two to six trailers, and proceeded through the building, across the tramway up a two per cent grade on a sharp double turn and into the main warehouse where the trailers were dropped at elevators or doorways for final unloading. The tractor was then hooked onto a train of empty trailers, or, as was the case much of the time, a train loaded with material for warehouse A, and the return run was made.

It was figured at the time the various methods were being considered, that it would cost approximately \$4 per car to move this material by railroad and as there were 200 carloads to be moved, the total cost, exclusive of the loading and unloading, would have been about \$800. Instead, five tractor trains were used, each handled by two men who

Tractor with a Six-Car Train

were paid an average of \$3 per day each or a total of \$30 per day. As it required four days to complete the job, the total labor charge was \$120. It cost approximately \$2.50 per day each to operate the tractors, or \$12.50 a day, or \$50 for the four days' operation. At 6 per cent interest on the investment in the tractors, amounting to \$5.64, and with \$2 for depreciation at 20 per cent per year, the total cost of handling the 200 carloads of package material amounted to \$177.64. In all about 2,000 tons were handled at a cost of about 8 4/5 cents per ton. This charge, of course, is for cartage only. The cost of loading and unloading either trucks or cars has not been figured. The equipment used by the government on this job was five Type Z Mercury tractors made by the Mercury Manufacturing Company, Chicago, which were equipped with 30 A-6 Edison batteries each.

AMERICAN RAILROAD MEN IN MANCHURIA—A despatch of the Harbinsky Vestnik from Vladivostok says that a detachment of 20 American railroad men has arrived here for work on the Manchurian Ussuri Railway, in the northeast corner of Manchuria. Many American engineers have been arriving in Siberia to serve on the Siberian railway. By way of experiment, some of them operated trains at Tomsk with a remarkable result. Russian engineers thought that, at best, their American comrades would be able to run 24 trains only during the 24 hours. It was therefore with great surprise and admiration that they found the Americans actually running 70 a day without a hitch. Thanks to their skill, the freight, which had accumulated at Tomsk and neighboring stations, was disposed of in the course of one week.—*The Far Eastern Review* (December, 1917).

General News Department

Snow early this week blocked trains on the Creston, Iowa, division of the Chicago, Burlington & Quincy and on the Rock Island, near Beatrice, Neb.

The **Railway Development Association** announces that its annual meeting, scheduled to take place in May, has been abandoned on account of the war.

Sir Sam Fay, formerly general manager of the Great Central has been appointed director general of movements and railways, in the British Government, succeeding **Sir Guy Granet**. The director general has a seat on the war council.

C. V. Gallagher, assistant general freight agent of the Minneapolis, St. Paul & Sault Ste. Marie, with office at Chicago, has been appointed western traffic manager of the Grain Corporation of the United States Food Administration, with headquarters at Chicago.

Senator E. D. Smith, of South Carolina, chairman of the Senate Committee on Interstate Commerce, has been elected chairman of the special Joint Congressional Committee on Interstate Commerce, which has been conducting a general investigation of the problems of railroad regulation, succeeding the late **Senator Newlands** of Nevada.

At a meeting of the directors of the **Illinois Manufacturers' Association** in Chicago on April 23, resolutions were passed lodging a formal protest with the director general of railroads and the regional directors for the abolition of line traffic officers. The resolutions claim that the closing of the offices will inconvenience shippers and is no real step towards economy.

Bids of the car builders have been under consideration this week and orders were expected to be placed on Thursday. The locomotive specialty manufacturers were asked on Wednesday to submit bids by April 29, which they were requested to itemize showing the amount of any royalties on patents. The mechanical committee is to meet on Tuesday to consider final designs for locomotives and of the question of specialties.

Dining cars, hotels and restaurants, of the Southern Pacific, now serve no wheat or wheat products of any kind. This action follows the plea of the U. S. Food Administration for still further conservation of wheat. The Southern Pacific chefs are attending special cooking schools to learn the utmost use that can be made of other cereals. This road serves approximately 6,000,000 meals annually and this discontinuance of the use of wheat will effect a large reduction in the amount consumed.

A fine of \$24,000 has been imposed on the Toronto Railway Company of Toronto, Ontario, for failure to provide new street cars as ordered. This is by the action of the Ontario Railway and Municipal Board. A fine of \$1,000 a day for twenty-four days. The board has adopted this order as a penalty for not placing one hundred new cars on the lines as ordered by the board more than a year ago. This action by the board was made possible by legislation passed at the last session of the Ontario Legislature. The act fixed the maximum fine at \$1,000 a day, and the board imposed it from the time the bill received the assent of the Lieutenant-Governor on March 26 until April 19.

R. H. Kendall, examiner of the Interstate Commerce Commission, is holding a hearing at Chicago this week on the protest of the New Orleans, Texas & Mexico on the tentative valuation prepared by the division of valuation of the Interstate Commerce Commission. Those who have so far testified include: W. D. Pence, member of the engineering board, division of valuation; I. G. Hedrick, consulting engineer, of

Kansas City; C. H. Chamberlin, formerly chief engineer of the Texas & Pacific, and I. A. Cottingham, special engineer and chairman of the valuation committee of the Southern Pacific, Texas and Louisiana lines. The hearing will later adjourn to some point on the protesting road to discuss the land matters that are in dispute.

An **Associate Statistician**, at from \$3,000 to \$4,500 a year is advertised for by the United States Civil Service Commission to fill a vacancy in the Interstate Commerce Commission. The duties of the appointee will be to take charge of statistical investigations and to assist the statistician in planning the statistical work of the Bureau of Statistics. Competitors will not be required to report for examination at any place, but will be rated upon the sworn statements in their applications and upon corroborative evidence adduced by the Commission. They must have graduated from a college or university of recognized standing and have had at least three years' responsible experience in directing economic and statistical investigations; and must show that they have made a general study of railway transportation problems and have had actual experience in railroad accounting, or show by other evidence that they are proficient in handling railroad statistics. Applicants must have reached their twenty-fifth but not their fiftieth birthday, and must file their applications with the Civil Service Commission, Washington, by May 14.

The Liberty Loan

Returns from western railroads received up till noon of April 24 show total subscriptions to the Third Liberty Loan of \$37,353,000, or an increase of \$1,759,000 in the last 24 hours; 465,000 out of 751,000 employees of the western roads have so far subscribed to the loan. The Rock Island system leads with subscriptions for 98.55 per cent of its employees.

Railway Signal Association

The *Journal* of this association will be issued about June 20, notwithstanding the omission of the summer meeting of the association. This issue of the *Journal* will contain the minutes of the meeting which was held in Chicago last month, together with such reports of regional committees as may be available. It is the intention of the secretary also to print all reports of standing and special committees which may be received prior to the date of going to press.

Rock Island's Gifts to Its Soldiers

Officers and employees of the Rock Island System have shipped tobacco costing \$324 and flashlight equipment costing \$330 to the former Rock Island men who now compose Company B, Thirteenth Engineers (Railways) in France. Because the train rules under which the men work do not permit the use of ordinary lanterns, it was thought that flashlights would be of service to them. Consequently, equipment sufficient to last the company over a year was forwarded, consisting of 184 flashlights, 1122 extra batteries and 200 Mazda lamps.

Meat Train Schedules on Western Roads

In a circular dated April 17 the regional director of western railroads announced revised schedules for trains carrying packing house products from Missouri river points and South St. Paul and also new rules to apply in handling those trains. Under this order cars must reach the first icing station within 24 hours from the loading platform. The arrangement of schedules to permit re-icing within each 24-hour period will also apply to individual cars moving from distributing centers for distribution

from the car at one station or by local service to several stations. Investigation of damage claims indicates a lack of attention to the re-icing of cars set out for bad order, and it is ordered that local arrangements be made, if necessary, to re-ice such cars, to prevent loss. Empty refrigerators must be returned to loading points regularly and without unnecessary delays. To economize in transportation and to insure regularity in movement, refrigerator cars should be returned to packing centers in such a manner as will balance the loaded haul.

Loss of Foodstuffs in Transportation

In a recent bulletin E. D. Hawley, superintendent of freight claims of the Pere Marquette, throws light on the extent of losses of foodstuffs in transportation. In a period of eight months that road paid over \$40,000 for loss and damage to food and foodstuffs, as outlined below:

| | | | |
|------------------|---------|-----------------|---------|
| Butter | \$1,721 | Meats | \$2,189 |
| Cheese | 429 | Poultry | 572 |
| Eggs | 2,283 | Codins | 5,174 |
| Flour | 1,212 | Flour | 5,558 |
| Potatoes | 4,649 | Groceries | 5,552 |
| Vegetables | 544 | Beans | 4,700 |
| Live stock | 1,334 | Sugar | 4,259 |

Mr. Hawley estimates that this loss represented enough provisions to feed 40,000 people for one day or, say, 100 persons for more than a year. Some of this loss, is due to accidental causes, but the greater part is due to carelessness on the part of either shippers and carriers; all avoidable if we could have "safety first" at 100 per cent efficiency.

Women in Railroad Service

The Pennsylvania Railroad now has in its service 6,513 women, an increase of more than 5,000 since May 1, 1917. The number of females in each of several occupations is given as follows:

| | | | |
|---|-------|------------------------------------|-------|
| Clerks and stenographers | 3,551 | Mechanics' helpers | 5 |
| Telephone operators | 778 | Painters | 4 |
| Track laborers | 293 | Hammer operators | 6 |
| Messengers and assistant messengers | 192 | Turntable operators | 2 |
| Typists | 121 | Power operators (electrical) | 7 |
| Machine hands | 29 | Cool inspectors | 1 |
| Draftswomen | 20 | Total | 5,009 |

The number of women now employed on prominent English roads is given in a recent statement as follows:

| | | | |
|-----------------------------|-------|------------------------------|-------|
| London & Northwestern | 8,392 | Northeastern | 8,520 |
| Great Western | 6,174 | Great Central | 3,200 |
| Midland | 9,000 | Glasgow & Southwestern | 1,202 |

The Midland has increased its forces by 2,700 since last July. Over 1,000 of the women on the Northeastern are employed in the shops, making shells.

To Expedite Movement of Government Lumber Orders

In order to insure the filling of government orders for spruce and fir lumber the regional director of western railroads has notified railroads in Idaho, Oregon and Washington that all shipments made on government orders must be accepted and moved promptly to destination; and mills working on government orders must be furnished cars sufficient to move as much of their side cut as may be necessary for continued efficient operation of their plants. No car loaded by a mill on a commercial order shall be re-consigned, nor shall such a car be loaded until assurance has been given that it will be promptly unloaded at destination. Side cuts, consisting of commercial lumber from any one mill, shall not exceed two cars for one car of government orders; and must be further limited to such shipments as may be necessary for continued efficient operation of the plant.

Responsibility for determining what cars shall be furnished under the above-mentioned conditions and the places where and the times when they will be needed has been entrusted to a committee representing the government, composed of Col. Disque, Col. Bloedel and H. B. Vanduser. This committee will discharge its responsibility through requests made by it upon J. C. Roth, or some other authorized representative of the Car Service Section of the Railroad Administration. The committee and the Car Service Section will at all times work in close co-operation, to the end that the Railroad Administration may be promptly advised of the need of cars.

Safety Council Meeting

The executive committee of the Steam Railroad Section of the National Safety Council met in Washington, D. C., on April 2. J. T. Broderick, supervisor of special bureaus of the Baltimore & Ohio and chairman of the accident causes committee, exhibited a report showing in detail the ten most prolific causes of injuries in the transportation, maintenance of way and mechanical departments. R. S. Jarnigan, assistant to the general safety agent of the New York Central lines and chairman of the grade crossing and trespassing committee, reported that all city ordinances and rules of public service commissions and laws passed during the past year affecting safety in transportation have been abstracted for presentation to the annual congress of the Council next fall.

H. W. Belpap, manager of the Safety Section, Division of Transportation of the United States Railroad Administration, attended the meeting and outlined the relation of the Safety Section to individual railroads. He told of the appointment of regional representatives to supervise safety work as heretofore noticed in the *Railway Age*.

C. H. Blakemore, chairman of the safety commission of the Norfolk & Western and chairman of the membership committee, reported the receipt of the following additional memberships, the Georgia & Florida, the Augusta Southern, the Louisiana & Northwest, the Pacific Great Western, the Pittsburgh, Allegheny & McKees Rocks and the Lake Champaign & Moriah. It was announced that questionnaires sent out by the Council in the future will be handled by the officers of each section. They will be mailed out one at a time, separate from the bulletins, and in no case oftener than every two weeks. The meeting of the executive committee was held under the direction of H. J. Bell, chairman (safety inspector of the Chicago & North Western) and C. M. Anderson, secretary (superintendent of safety of the Nashville, Chattanooga & St. Louis).

Recent Circulars Issued by M. C. B. Association

Circulars No. 28 to 33 inclusive, were issued on March 20 by the executive committee of the Master Car Builders' Association.

Circular No. 28 calls attention to the absolute necessity of having all cars equipped with safety appliances by September 1, 1919 and points out that in order to accomplish this it will be necessary and advisable to equip empty foreign cars when passing over the regular freight car repair tracks. The equipment can thus be applied without undue detention to the car. Under the provisions of Rule 33, the repairing line may be reimbursed for the expense of equipping cars with these appliances.

Circular No. 29 is an answer to the question which has been raised as to how the braking power at the brake shoe should be figured in the specifications regarding the adjustment of hand brake power on tank cars.

Attention is called in Circular No. 30 to the necessity from the standpoint of safety that all axles purchased should conform fully to the standards of the association. Axles are being made and offered to railroads which do not conform to the M. C. B. standards. They are made full at the center and hub, but between these two points are under standard size. The circular contains an illustration of the axle in question, that of 100,000 lb. capacity, showing in broken lines the outline of the rough forge axles which are being offered.

In circular No. 31 the executive committee announces the discontinuance of the requirements of circular No. 20, asking for reports as to the number of cars held for material ordered from the owners.

In circular No. 32 is announced an extension of the date after which the requirements for the adjustment of hand brake power on tank cars, set forth in circular No. 22, become effective. The extensions are: (1) On new equipment built after July 1, 1918, (2) on existing equipment by January 1, 1921.

In circular No. 33 the executive committee asks for a statement from the various railroads showing the location on each road of all triple valve test racks which fully conform to the standard requirements of the association for testing triple valves.

MONTHS OF JANUARY. 1918

| Name of road. | Average mileage operated during period. | | | Operating revenues. | | | Maintenance of way and structures. | | | Operating expenses. | | | Operating ratio. | Net railway operation. | Railway tax accruals. | Operating income (or loss). | Increase comp. with last year. | |

More Acknowledgments of Tobacco Shipments

F. A. Ioor, chairman of the Railway Regiments' Tobacco Fund, Chicago, has received acknowledgments of the receipt of shipments of tobacco from three railway regiments in France. Ernest Graves, lieutenant colonel of the Fifteenth Regiment, U. S. Engineers, writes under date of March 16, that two shipments of tobacco have been received in good condition and distributed to the men. The first shipment contained 240 lb. of Bull Durham and 5 lb. of Tuxedo smoking tobacco and the second shipment contained 540 lb. of Bull Durham and 15 lb. of Lucky Strike. He stated that "There is no doubt but that the men greatly appreciated both shipments."

H. Burgess, colonel of the Sixteenth Engineers Railway Regiment, has written under date of March 12 that the shipment made on December 16 finally reached them although it arrived and was put into the warehouse just a few hours before the latter burned. "The result was that our tobacco was burnt in a fashion different from that intended. One case however, was rescued and distributed, and all the men very much appreciate the gift."

H. H. Maxfield, lieutenant colonel, commanding the Nineteenth Engineers, Railway Regiment, wrote on March 16 to acknowledge receipt of a shipment of tobacco and stated "The men appreciate this tobacco a great deal more than might be expected, since American troops are entirely dependent upon supplies sent from the States."

Railroad's Initiative Saves Great Food Crop

In response to appeals for maximum food production a year ago the acreage of pinto beans was increased over 500 per cent. Pinto beans, which are particularly adapted to dry regions, were grown extensively on lands which had never produced before, particularly in Colorado, New Mexico and southern Wyoming, and thus constituted a real addition to the food production of the country. When the farmers came to sell their crop, however, it was found that there was no market. This was due to the fact that pinto beans were not known in consuming centers and, while equal to white beans in food value, would not sell because of their spotted appearance.

The Burlington road, which had been particularly active in the spring of 1917 in encouraging the planting of these beans on dry lands and had distributed over 200,000 lb. of bean seed to several thousand farmers, felt a responsibility for finding some means of disposing of the crop, and an extensive publicity campaign was initiated, under the direction of J. B. Lamson, agriculturist. This included the distribution of 25,000 advertising circulars giving facts about the bean, 20,000 copies of recipes for cooking it and 3,000 lb. of samples of the beans. Every retailer in Chicago, every daily newspaper and all wholesalers, jobbers and brokers east of the Mississippi and north of the Ohio river and in the states of Iowa, Missouri, Minnesota and Nebraska were circularized in an effort to create a market. This plan, while effective, was not sufficiently successful to solve the problem, and Mr. Lamson made a special trip to Washington, where he presented the facts to Mr. Hoover personally, and impressed upon him the necessity of utilizing this crop and preventing losses to farmers which would discourage the maximum cultivation of dry lands in 1918. This conference resulted in Mr. Hoover's decision to buy the entire crop remaining in the hands of the growers, for the government, at eight cents a pound to the grower. Members of the agricultural department of the Burlington lines were requisitioned by the government and commissioned to make the purchase and to introduce the pinto bean into the larger cities of the country, thereby continuing the work which they had already initiated. Over 20,000 contracts were made with growers and 150 contracts with elevators in western states. As a result over 55,000,000 lb. of beans have been contracted for and approximately 700 carloads are now being shipped to eastern points as rapidly as possible. Over 300,000 cases of canned pinto beans have been sold to the British army and 150 carloads of the dry beans have been sold to the French government for shipment abroad. The remainder of the beans are being concentrated in warehouses in the larger cities of the country to be disposed of as the market demands or to be shipped to the armies abroad. The Food Administration has arranged to sell pinto bean seed to growers at nine cents a pound, whereas they paid from 15 to 20 cents last year; as a result there is now a prospect of an increase in production over the large yield of last year of about 20 per cent.

Traffic News

Anthracite coal shipments in March amounted to 7,276,777 tons or 280,000 tons each working day. This compares with 6,989,075 tons in March, 1917, and is an increase of 1,464,695 tons over February. The total exceeds by 165,827 tons the October (1917) shipments which, until now, had represented the high-water mark in monthly shipments.

Railroads under the jurisdiction of the regional director of western railroads have been asked to prepare statements showing the names, duties, annual salaries and expenses of men employed in development work, both industrial and agricultural. The request specifies that the list should include those whose titles are colonization agent, immigration agent, industrial agent, agriculturist, etc.

Thirty-three freight and passenger offices in Boston are to be closed at once, according to the Boston Transcript. Those of the Baltimore & Ohio, the Chicago & North Western, the Chicago, Rock Island & Pacific, the New York, Chicago & St. Louis, the Pennsylvania and the Southern have already been closed. The three roads centering in Boston—the Boston & Maine, the Boston & Albany and the New York, New Haven & Hartford—will establish a joint passenger and freight office in a central locality.

The Chicago, Rock Island & Pacific announces that in accordance with the orders of the Railroad Administration it has discontinued outside commercial offices at Atlanta, Boston, Buffalo, Cincinnati, Cleveland, Detroit, Indianapolis, Los Angeles, Louisville, Milwaukee, New Orleans, New York, Oakland, Philadelphia, Pittsburgh, Portland (Oregon), Sacramento, Salt Lake City, San Francisco, Seattle and Spokane. Shippers are advised that matters heretofore handled by these offices should be taken up with the lines on whose rails they may be located.

The statistical report of lake commerce passing through the canals at Sault Ste. Marie, Mich., and Ontario, during the season of 1917 shows that 89,813,898 tons of freight was carried in 1917 as compared with 91,888,219 tons in the season of 1916, or a decrease of about 2 per cent. There was an increase of 13 per cent in the movement of soft coal and 16 per cent in the movement of hard coal, while flour, wheat, grain, copper, iron ore and pig iron traffic decreased quite materially. The report was prepared under the direction of Col. F. W. Altstaetter, Corps of Engineers, United States Army.

Eight hundred canal boats of the old style will be available for use in the New York state barge canal this year, nearly half of this number being suitable for use in carrying grain. This statement has been made on the authority of General W. W. Wotherspoon, New York State Superintendent of Public Works. Inasmuch as the proposed construction of larger boats by the federal government will not probably provide actual means of transportation for several months yet, General Wotherspoon believes it important to encourage the owners of these old boats to make use of them without delay. He has lately made an investigation and finds in cities along the canal zone, more than 50,000 tons of freight now awaiting movement, having been delayed because of railroad embargoes.

Wheatless Dining Cars

The principal railroads are to refrain from the use of wheat foods until after the next harvest, a pledge to this effect having been given to the Food Administration on behalf of the dining car services of the country by B. S. Harvey, chairman of the administrative committee of the Association of Dining Car Superintendents. Mr. Harvey advises that 59 out of 63 dining car services in the country have ratified this pledge, and are not using wheat in any form; and the other four are expected to take similar action. Reports received at Washington from the railways show that during the month of February the dining car services of the country saved 424,198 pounds of meats and 251,138 pounds of wheat flour.

Buffalo to Baltimore, Eight Days

Major G. F. Bailey, commanding the army motor truck service, announces that a motor truck train, carrying war materials to the Atlantic seaboard will leave Buffalo regularly every morning, and that the trip to Baltimore, Md., is scheduled to be made in eight days, as follows:

First stop, two miles west of Canandaigua, 84.15 miles; second stop, six miles east of Vernon, 109 miles; third stop, four miles west of Albany, 100.6 miles; fourth stop, four miles south of Poughkeepsie, 82 miles; fifth stop, three miles west of Newark, 80 miles; sixth stop, three miles west of Philadelphia, 87 miles; seventh stop, Baltimore (Cohasset Creek), Md., 79.5 miles.

The motors are to avoid large cities, and run around the outskirts of towns; and the men will sleep on the trucks and cook their own meals. Acting on complaints from certain cities, some of the drivers have been censured for running at excessive speed.

Modification of Coal Zone System

Under an order modifying the zone system of distribution, bituminous coal originating on the Pennsylvania, Monongahela, and Huntington & Broad Top Mountain railroads, and their short line connections, in the states of Pennsylvania, West Virginia and Maryland, when routed via the Pennsylvania Railroad, is embargoed from Baltimore and Washington markets. To meet this situation, the United States Fuel Administration will arrange for the essential supply to the points designated from mines on the Baltimore & Ohio, the Western Maryland, and their connections, which lines afford a much more direct route to these points. As a consequence the Pennsylvania lines can deliver increased quantities to points in Eastern Pennsylvania, New Jersey and New England. The order forbids the shipment of bituminous coal over the railroads named for delivery in Baltimore, and also all stations on the Baltimore division of the Pennsylvania from Loudon Park, Md., to Catonsville, Md., inclusive and Arbutus, Md., to Washington, D. C., and Rosslyn, Va.; including Popes Creek branch. Consumers located on the Pennsylvania and Baltimore & Sparrow's Point will continue to receive their coal at their regular points of delivery, the coal moving over the Baltimore & Ohio and Western Maryland being delivered to the Pennsylvania at junctions near destinations.

Coal Production

Production of bituminous coal increased 1,000,000 net tons, or over 17 per cent, during the week ended April 13, compared with the preceding week, according to the weekly report of the Geological Survey. The total production, including lignite and coal made into coke, is estimated at 10,947,000 net tons, an average production per working day of 1,824,000 net tons, compared with an average of 1,777,000 tons for the past year and 1,680,000 in April, 1917. Anthracite shipments rose from 32,223 cars to 37,760 cars, an increase of over 17 per cent. The percentage of full time output produced during the week ending April 6 was 61.9 per cent. The percentage of full time output lost on account of car shortage was reduced from 23.2 in the preceding week to 12.5 per cent, while the percentage lost on account of labor shortage increased from 2.6 to 14.2 per cent. The decrease of 14 per cent during the week of April 6 is attributed to the miners' holiday on April 1 and a partial one on April 6 and, the report says, "the exceptional loss of production in the week of April 6 is, therefore, to be attributed to labor shortage rather than car shortage in all fields reported, with the particular exception of the Ohio and New River districts."

In the monthly bulletin for March the production of bituminous coal, including that coked, in the first three months in 1918 is estimated at 135,514,000 net tons, an estimated increase over the same period in 1917 of 744,000 tons, or 1 1/2 per cent, but a slight decrease compared with the same period in 1916. January, mainly because of severe weather, was an abnormally low month. Production in February was greater than in February, 1917, but less than in February, 1916. March was a record month exceeding both March, 1917, and March 1916, and was exceeded in total tons in those years only by October and November, 1917.

Commission and Court News

Interstate Commerce Commission

F. C. Donald, agent for the lines in Central Passenger Association Territory, and F. L. Bevington, J. E. Hannegan and E. E. MacLeod, agents for the western lines, have filed fifteenth section applications with the Interstate Commerce Commission proposing an increase in the charge for the one-way movement of special passenger cars to a minimum of \$30 for first class fares in place of 25, and a minimum of \$50 for each movement in place of \$25.

E. B. Boyd and Eugene Morris, agents for the western trunk lines and the Central Freight Association lines, respectively, have filed fifteenth section applications with the Interstate Commerce Commission proposing to establish the C. F. A. scale of class and commodity rates governed by the official classification and exceptions thereto between points in Illinois, including nearby related points in Wisconsin, Indiana, Kentucky, Missouri and Iowa, in lieu of the present rates governed by the Illinois and western classifications and the Illinois mileage scale.

Fifteenth Section Application No. 5356 filed by M. P. Washburn, as agent, for authority to make readjustment of the rates on lumber and articles grouped therewith from points of origin in the states of Florida, Georgia, Alabama, Mississippi, Louisiana, on and east of the Mississippi River, Tennessee, Kentucky, Southwest Virginia, and a few points in North Carolina to eastern port cities Virginia cities and interior basing points, has, by direction of the commission, been placed on the formal docket, and will be set down for hearing as soon as the engagements of the commission will permit.

In a hearing held at New York, April 22, conducted by George T. Bell, chief examining attorney, the Commission took testimony in a complaint of the Pneumatic Scale Corporation, Ltd., of Norfolk Downs, Mass., asking the Commission to prescribe lower freight rates on packages of merchandise in theft-proof and damage-proof metal containers. Complainant asks that such an order be directed not only to the railroads but also to the express companies of the country. C. F. Doble, sales manager of the Pneumatic Scale Corporation, declared that the use of metallic collapsible boxes would benefit newspapers and other printing interests by eliminating the waste involved in the use of wood fibre containers.

Water and Rail Rates Advanced

At the request of the United States Railroad Administration, Division No. 2 of the Interstate Commerce Commission has issued a 15th section order authorizing all carriers subject to the commission's jurisdiction without formal hearing to file schedules increasing the joint rail-and-water, water-and-rail; rail-water-and-rail rates, and all-water rates for the transportation of freight on a level not higher than the existing all-rail rates between the same points, the water rates to include marine insurance. The purpose is to enable freight to be diverted readily from rail to water lines so that they may be utilized in the most efficient way and to avoid congestion. It is provided, however, that the rail-and-water rates to and from Duluth and points grouped therewith shall not be higher than the rates to and from Chicago, and that the rail-water-and-rail rates to and from Minneapolis and points grouped therewith shall bear the relationship to the rail-and-water rates to and from Duluth and points grouped therewith as prescribed by the commission in the second Duluth case, 46 I. C. 585. The rates may be established up to not less than five days' notice. In another order the carriers are authorized to establish such rates as they may see necessary to take advantage of this authority without observing the long and short haul provision of the fourth section.

Court News

Contract for Special Service

A station agent after telegraphing about the matter told a shipper that a certain train arriving during the night would take his cattle, on which statement the shipper relied. The Arkansas Supreme Court holds that this did not constitute a contract for special service and a discrimination in violation of the Elkins Act.—*Rock Island v. Stallings* (Ark.), 201 S. W., 294. Decided February 18, 1918.

Ejection of Passenger—Exemplary Damages

The Texas Court of Civil Appeals holds that the mere retention in employment by a railroad company of a conductor, after knowledge that he has wrongfully ejected a passenger, does not allow the passenger to secure judgment for exemplary damages against the company; such retention alone not being an adoption or ratification of the malice or violent conduct of the conductor.—*Texas & New Orleans v. O'Connor* (Tex.), 201 S. W., 437. Decided February 21, 1918.

Unauthorized Delivery—Ratification

The Iowa Supreme Court holds that a carrier is not liable for conversion by delivering freight before obtaining the bill of lading, if it afterwards rightfully obtains the bill. It also holds that the delivery of a shipment by the carrier to the buyer, if unauthorized, is ratified by the shipper thereafter, with knowledge of the facts, demanding payment of the price from the buyer, and the shipper is estopped to sue the carrier for conversion. The carrier cannot be held liable for conversion of the goods, consisting of giving them to some one who was not entitled to them, where the plaintiff declares that the buyer owes him the purchase price. The action was one against both the buyer and the carrier.—*Midland Linseed Co. v. American Liquid Fireproofing Co.* (Iowa), 166 N. W., 573. Decided March 6, 1918.

Notice of Claim for Damages

A bill of lading for a shipment of meat provided that claims for loss, damage or delay must be made in writing to the carrier at the point of delivery within four months. The shipper's branch manager and the railroad's freight agent both inspected the meat on arrival and found it damaged. The manager wrote the freight agent the following letter: "This is to confirm our verbal notice of the poor condition of C. R. L. car 3725." The Kansas City Court of Appeals holds, in an action for damages to the meat, that, as there was nothing in the letter mentioning any claim or intended claim of damages, it did not comply with the requirements of the bill of lading. The fact that the plaintiff was investigating the cause of loss did not necessarily mean that it had made up its mind that either of the carriers was liable.—*Cudahy Packing Co. v. Atchison, T. & S. F. (Mo.)*, 201 S. W., 623. Decided February 18, 1918.

Extracting Oil from Right of Way

In 1907 a landowner executed a general warranty deed, in the usual form, conveying to the Wichita Falls & N. W. a strip of land 100 feet wide in Wichita county, Texas, for the consideration of \$1 paid and the further consideration of the enhanced value to the remainder of the owner's land by reason of the construction of the line through it. The company built its road and fenced the right of way. In 1917 it and its lessee, the M. K. & T., leased the right of way to the W. Oil Company, empowering it to prospect for oil, gas and other minerals. In the meantime the landowner sold the remainder of his land "less the right of way." The purchaser leased the land to the P. Oil & Gas Company, which drilled many wells adjacent to the right of way. The W. Oil Company was proceeding to drill wells on the right of way property, when the P. Company sought to enjoin it. The Texas Court of Civil Appeals holds that the conveyance to the Wichita Falls & N. W. vested that company with title to the strip of land and not merely a right of way across it; and as it owned the fee of the land it could not be restrained from extracting oil

therefrom, notwithstanding the Texas statute providing that no corporation shall employ or use its property directly or indirectly for any other purpose than to accomplish the legitimate objects of its creation, or those permitted by law to be applicable.—*Crowell v. Howard* (Tex.), 200 S. W., 911. Decided January 23, 1918. Rehearing denied, February 13, 1918.

United States Supreme Court

Limitation of Liability in Bills of Lading

The Supreme Court of the United States has affirmed the judgment of the Supreme Court of Vermont (90 Vermont, 176), giving a shipper damages for loss occasioned by delay in delivering cattle as a result of the railroad's negligence. The plaintiff had shipped the cattle upon paying the reduced rate under the Uniform Live Stock Agreement. The court said, in part, by Mr. Justice Day: "In the bill of lading now under consideration there is an express agreement limiting liability from unusual delay and detention, caused by the carrier's negligence, to the amount actually expended by the shipper in the purchase of food and water for his stock while so detained. This stipulation contravenes the principle that the carrier may not exonerate itself from losses negligently caused by it, and is not within the principle of limiting liability to an agreed valuation which has been made the basis of a reduced freight rate."—*B. & M. v. Piper*. Decided April 15, 1918.

Rest, Water and Feeding Act

The Supreme Court of the United States has reversed a judgment of the Federal District Court for the Northern District of Illinois, affirmed by the Circuit Court of Appeals (234 Fed. 268), imposing a penalty for alleged violation of the Rest, Water and Feeding Act. The animals were loaded at Ringsted, Iowa, 438 miles from destination—Union Stock Yards, Chicago—at 6 P. M. October 4, and left Clinton, Iowa, 138 miles from Chicago, at 6 P. M. October 5. The ordinary schedule time from Clinton to Chicago is nine hours, but without increase of actual moving speed the run had been made in about six. While passing through Proviso, sixteen miles from destination, a drawbar came out and derailed the car. A delay of two hours and fifty-two minutes followed—not undue, the railroad contended, but the government maintained unreasonably long. Later, at Brighton Park an air hose burst, causing further delay of twenty-eight minutes. The car reached the stock yards at 9:05 A. M. October 6—thirty nine hours after being loaded. The court, by Mr. Justice McReynolds, said: "The statute must be construed with a view to carrying its humanitarian purpose into effect and the exception in favor of the carrier given proper latitude and enforced in the light of practical railroad conditions. Nothing indicates the running schedule was unduly slow; and the jury were improperly given to understand that, conceding matters were properly handled when accidents occurred at Proviso and Brighton Park, they might nevertheless decide the railroad could have got the car to destination within 36 hours if due diligence had been exercised in laying out such schedule. * * * We find nothing in the act indicating a purpose to interfere directly with the carrier's discretion in establishing schedules for trains: the design was to fix a limit beyond which animals must not be confined, whatever the schedule, except under the extraordinary circumstances stated. In general, cattle can be unloaded only at specially prepared places or final destination. If in the exercise of ordinary care, prudence and foresight, the carrier reasonably expects that, following the determined schedule, the car will reach destination or some unloading place within the prescribed time it properly may be put in transit. Thereafter the duty is on the carrier to exercise the diligence and foresight which prudent men, experienced in such matters, would adopt to prevent accidents and delays and to overcome the effect of any which may happen—with an honest purpose always to secure unloading within the lawful period. If, notwithstanding all this, unloading is actually prevented by storm or accident, the reasonable delay must be excused."—*C. & N. W. v. United States*. Decided April 15, 1918.

Supply Trade News

Government Orders for Locomotives and Freight Cars Soon to Be Placed

After three weeks of conferences regarding the priority to be given the various activities of the government as to their requirements for steel, an agreement was reached at a conference on April 19 between representatives of the War Industries Board, the Shipping Board and the Railroad Administration, by which the Shipping Board, the Army and the Navy will have priority over the railroads. The Railroad Administration was assured the steel required for the construction of the 2,000 locomotives proposed to be ordered, and for the 100,000 cars, but the car program was required to be changed so as to reduce the quantity of material and especially of steel plates that would be needed.

As a result the all-steel box cars, for which standard specifications were recently adopted, will not be built at this time and less steel than was originally planned for will be used in other types of cars. For example, the 55-ton hopper car will probably be built with wooden sides.

The Railroad Administration was represented at the conference by John Skelton Williams, director of finance and purchases, who, with H. B. Spencer, chairman of the Central Advisory Purchasing Committee, had held conferences previously with J. L. Replogle, the steel expert on the War Industries Board. The Shipping Board had objected to the amount of steel asked for by the railroads and it is the negotiations on this subject, together with the negotiations with the car builders on the question of prices which have caused the long delay, in consequence of which the placing of the orders for cars has not yet been accomplished.

It was expected that the Railroad Administration would let contracts during the week for 100,000 freight cars on a basis of cost plus 5 or 6 per cent. The builders had asked for cost plus about 10 per cent but it is understood that the officers of the administration are confident that their terms will finally be accepted.

It is planned to place orders for approximately 100,000 additional cars in about 6 months.

The proposed standard designs and specifications for 12 standard types of locomotives were approved in general by the Regional Directors at a meeting on April 19 and orders are to be placed shortly for probably 1,000, which are expected to be delivered before January 1.

Preliminary consideration has also been given to the rail situation. It is stated that about 40,000 tons of rail are being delivered weekly on old orders.

Freight Cars

THE NEWBURGH & SOUTH SHORE is asking for prices on 100 gondola car bodies.

SWIFT & Co., Chicago, has ordered 100 tank cars from the Pennsylvania Tank Car Company.

THE ILLINOIS ZINC COMPANY has ordered 10 hopper cars from the American Car & Foundry Company.

Iron and Steel

THE WESTERN PACIFIC wishes to sell 1,000 tons of 35-lb. rail and 2,000 tons of 40-lb. rail.

THE LOS ANGELES & SALT LAKE CITY has offered the following rail for sale for use in necessary industrial, logging and mining tracks and other necessary work: Forty-seven track miles of 75-lb. rail; eight track miles of 60-lb. rail; three track miles of 56-lb. rail and 13 track miles of 52-lb. rail.

THE LONDON & NORTH EASTERN EMPLOYS 8,520 WOMEN as compared with 1,575 employed before the war.

The Hall Switch & Signal Company announces that effective May 1 its general offices will be located at Garwood, N. J.

The Maloney Oil & Manufacturing Company has removed its New York office from 50 Church street to 17 Battery place.

Frederick W. Parks, for 10 years advertising manager of the American Well Works Company, Chicago, died in that city on March 25.

George W. Bender, whose appointment as eastern manager of Mudge & Co., Chicago, with office at 30 Church street, New York, was announced in these columns on April 19, was born

G. W. Bender

at Pittsburgh on August 20, 1884, and at the age of 17 entered the engineering department of the Pressed Steel Car Company of that city. In 1906 he accepted a position with the American Locomotive Company, where he had charge of the extra work order department. In 1910 he became associated with Mudge & Co. as chief draftsman, and subsequently was given charge of the mechanical department. Later on he was made assistant to the vice-president, a position he held until his appointment as eastern manager in charge of the business of Mudge & Co. in the New England and Atlantic Coast states.

Charles J. Donahue, formerly assistant vice-president in charge of sales of the American Locomotive Company, died at his home in New York, April 20, after a long illness.

Mr. Donahue was the son of a locomotive engineer. He was born at Cleveland, March 8, 1871. His first position in railway service was in the motive power department of the Lake Shore & Michigan Southern at Cleveland. Here he showed marked ability and was rapidly promoted. He served successively as chief clerk to the superintendent of motive power of the Lake Shore under G. W. Stevens, W. H. Marshall and H. F. Ball, and as chief clerk to W. H. Mordue, general manager. From there he was called to Chicago as chief clerk to C. E. Slaff, vice-president of the Lake Shore. In September 1, 1908, he was appointed secretary to W. H. Marshall, president of the American Locomotive Company, and two years later was appointed assistant vice-president in charge of sales, which position he held up to July, 1917. He retired from the American Locomotive Company to form a company to handle railroad supplies, but ill health prevented the accomplishment of this purpose.

C. J. Donahue

The Grip Nut Company will move its offices from the McCormick building, Chicago, to the Railway Exchange building, on May 1.

N. M. Garland, of New York, district manager for the Ohio Brass Company, has been elected a member of the board of directors of that company.

N. D. Chapin has been appointed director of the interstate commerce and railway traffic department of the LaSalle Extension University, Chicago.

Clyde P. Benning, whose appointment as western manager of Mudge & Co., with office in the Crocker Building, San Francisco, in charge of the business of that company in the Pacific Coast states was announced in these columns on April 19, was born in Atchison, Kan., on September 20, 1888, and was educated in the public schools of that city. In 1903 he entered the service of the Missouri Pacific and held positions as messenger in the chief despatcher's office, telegraph operator and freight office and yard clerk. In 1904 he was employed as timekeeper in the master mechanic's office of this road, remaining in that position until April, 1905, when he entered the Missouri Pacific shops as machinist apprentice, later being promoted to machinist. He left the road in 1910 to accept a position with the Tool and Railway Specialty Company at Atchison, remaining with that concern until December 15, 1914, when he entered the service of Mudge & Co. as shop inspector. He was soon after appointed chief inspector and subsequently held the position of service engineer. In 1916 he was made assistant to the vice-president, which position he held until his appointment as western manager, as noted above.

C. P. Benning

H. A. Jackson, whose election as president of the Chicago Pneumatic Tool Company, Chicago, was announced in the *Railway Age* of April 19, was born in Bethlehem, Conn., on July 7, 1881. He is a graduate of the Lawrence Scientific School of Harvard University, class of 1903, but devoted an additional year to a special course in metallurgical work in the graduate school there. Mr. Jackson entered the employ of the Bethlehem Steel Company in July, 1904, where he served an apprenticeship in the various departments of the works, thus gaining practical experience and an intimate acquaintance with the steel business by personal contact with the production end. He later entered the sales department of the Bethlehem organization. A number of years ago Mr. Jackson was sent to Boston to open the Bethlehem Steel Company's office there and to organize its sales and executive forces in that territory. He continued in the position of sales agent at Boston until his election as president of the Chicago Pneumatic Tool Company at a special meeting of the board of directors held in New York on April

H. A. Jackson

19. He is not an entire stranger in Chicago, where he now has his headquarters, as he was sales agent in that city for the Bethlehem company for several months early in his career. As president of the Chicago Pneumatic Tool Company he succeeds **W. O. Duntley**, resigned.

P. L. Maher, business manager of the Eastern Car Company, Limited, of New Glasgow, N. S., has been appointed assistant to the president of the Damascus Brake Beam Company, Cleveland, Ohio, effective April 15. Mr. Maher will specialize on shop operation and efficiency.

Paul W. Wendt of the P. W. Wendt Company, railway supplies, Chicago, has been appointed assistant production manager in charge of steel, of the Emergency Fleet Corporation, United States Shipping Board, in the Chicago district comprising, Michigan, Indiana, Illinois, Wisconsin, Minnesota and Iowa.

G. E. Warren, assistant division engineer of the Universal Portland Cement Company, Chicago, has been promoted to division engineer, with the same headquarters. **J. W. Lowell**, assistant division engineer at Chicago, has been promoted to division engineer at Pittsburgh, succeeding **K. H. Talbot**, who has received a commission as first lieutenant in the construction division of the Quartermaster's Department of the United States Army. **G. S. Eaton** succeeds Mr. Lowell as assistant division engineer at Chicago.

The Ohio Electric & Controller Co., 5900 Maurice Avenue, Cleveland, has been incorporated with a capital stock of \$200,000 for the purpose of manufacturing lifting magnets and electrical controlling devices. Lifting magnets will be built at once and controlling devices later. The officers of the new company include **F. W. Jessop**, president; **W. B. Greene**, vice president; and **A. D. Walter**, secretary and treasurer. Mr. Jessop was formerly works manager of the Electric Controller & Manufacturing Company, Cleveland. He has had an extensive experience in the manufacture of lifting magnets and electrical apparatus for the control of motors.

The Schroeder Headlight Company, Evansville, Ind., manufacturer of locomotive oil and electric headlight and turbo generators, has been purchased by **W. A. Carson**, vice-president and general manager of the Evansville (Ind.) Railways, the Owensboro (Ky.) City Railroad and the Henderson (Ky.) Traction Company, and a number of associates, some of them interested with him in the Evansville Railways. A new company known as the **Schroeder Headlight & Generator Company** has been organized with Mr. Carson as active vice-president and general manager. Mr. Carson has been connected with the Evansville Railways since July, 1908. He was assistant to the general superintendent of the Indianapolis & Cincinnati Traction Company from 1903, to 1906, and assistant general manager of the Indianapolis, Columbus & Southern Traction Company from 1906 to 1908. Since his connection with the Evansville Railways the company has constructed a number of interurban connections and through a syndicate of the officers of that company, of which Mr. Carson was a member, has purchased the city lines of Henderson and Owensboro, Ky. In 1912 a lease was secured on the line of the Illinois Central Railroad between Evansville and Henderson and this property was electrified by the Evansville Railways. A gasoline car ferry was installed to transfer the interurban cars across the river. In 1913 the Crescent Navigation Company was incorporated with Mr. Carson as president to operate on the Ohio river in connection with the railway properties. Mr. Carson retains his connection as vice-president and general manager of the Evansville Railways in an advisory capacity and will continue as president of the Crescent Navigation Company.

Trade Publications

PIPE TOOLS.—Catalogue 38, entitled "Pipe Tools" and issued by the Greenfield Tap & Die Corporation, Greenfield, Mass., shows the complete line of pipe tools made by this corporation. The quick release and quick return features of the Greenfield reeding pipe threader are emphasized, and the catalogue contains an extensive list of stocks and dies, burring reamers, pipe cutters and wrenches. The back of the catalogue contains considerable useful information and several tables.

THE LOCOMOTIVE FURNACE. Bulletin No. 1 of the American Arch Company is a condensed treatise on combustion and the relation of locomotive furnace and boiler proportions to the efficiency of combustion and heat absorption in the locomotive boiler, prepared by J. T. Anthony. The text is illustrated with charts, diagrams and drawings and is based upon a thorough study of the available data bearing upon the subject. It should be in the hands of every locomotive designer.

MOTOR-DRIVEN COMPRESSORS. The Westinghouse Traction Brake Company, Pittsburgh, Pa., has issued a high-grade, finely illustrated booklet describing in detail its complete line of motor-driven air compressors, both stationary and portable, ranging in capacity from 11 to 110 cu. ft. Compressed air accessories for doing almost every possible kind of work are included. Users of compressed air tools will find many new features and valuable labor-saving devices in this book, which is designated as publication No. 9035 and has been copyrighted.

PACKING AND MECHANICAL RUBBER GOODS. Jones Packings is the title of a 28-page catalogue which has been issued by the Jones Packing Company, 50 Church street, New York. A complete line of fibrous packings for oil, ammonia, steam, acid, water, syrup, air, alkali, etc., is illustrated and briefly described, with price quotations. The line includes ring, spiral and coil packings of various sections and types of construction; sheet packing; asbestos, duck insertion and tubular gaskets; pump valves, water and steam hose; diaphragms, etc.

LIFTING JACKS.—Catalogue "F," recently issued by the Joyce-Cridland Company, Dayton, Ohio, contains descriptions, illustrations and prices of a complete line of lifting, pulling and pushing jacks. The hydraulic jacks include both inside and outside pump types with a wide range of capacity up to 200 tons. The line of geared screw jacks in capacities of 25 to 75 tons, include types suitable for both bridge and railroad shop work. The line also includes automatic geared jacks, automatic lever jacks, track jacks, telescope screw jacks, traversing bases for lifting jacks and jacks for special classes of service. Repair parts for the various jacks are illustrated and listed in convenient form for ordering.

Financial and Construction

Railway Financial News

BUFFALO, ROCHESTER & PITTSBURGH.—The New York Public Service Commission has authorized this company to issue \$1,500,000 4½ per cent 50-year consolidated mortgage bonds. The company has also received authority from the commission to pledge all or any part of the bonds as collateral security for short-term loans under certain prohibitions. The proceeds of the loans are to be used to pay for cost of additions and betterments.

CANADIAN NORTHERN.—Hon. A. K. Maclean, Acting Minister of Finance at Ottawa, has given notice of a resolution making provision for dealing with the maturing obligations of the Canadian Northern. It is as follows: "Resolved, that it is expedient to provide that as five-sixths of the six hundred thousand shares of the capital stock of the Canadian Northern Railway Company have been transferred to the Minister of Finance, as required by chapter 24 of the statutes of 1917, the Governor in Council may assist the Canadian Northern, or any company included in the Canadian Northern System, in renewing or postponing the payment of any indebtedness of any such company, on such terms as may be agreed on, by guaranteeing in whole or in part the payment thereof, with interest, or the notes or obligations given for such renewal or postponement provided that the amount of principal to be so guaranteed shall not exceed the amount of the indebtedness, the payment of which is renewed or postponed; and, further, that the guarantee shall be in such form and signed by such person as the Governor in Council may approve, and shall insure for the benefit and security of the holder for the time being of the indebtedness or the notes or other obligations representing the same; and that any payments which may be required to be made pursuant to any such guarantee shall be made out of the consolidated revenue fund of Canada, and the order in Council authorizing such guarantee shall be conclusive evidence for such holder that the terms and conditions of this resolution have been complied with, and that such guarantee is legal and binding."

CHESAPEAKE & OHIO.—Garrett B. Wall has been elected a director to succeed Decatur Astell, who resigned as vice-president and director in February. Other retiring directors were re-elected. A resolution was passed at the annual meeting authorizing the directors to negotiate agreements with the United States Government for operation of the road under Government control, and for compensation to the railway company for the use of its property. Another resolution, authorizing the company to incorporate in itself, for convenience in accounting and management, various subsidiary companies, of which it owns all, or practically all, of the capital stock, failed because the three-fourths majority of the capital stock, required by the charter to be represented at a meeting taking such action, was not obtainable. The meeting accordingly adjourned until May 3, when it is hoped the required amount of stock representation may be obtained.

ILLINOIS CENTRAL.—C. B. Seger has been elected a director to succeed Judge Robert S. Lovett, resigned.

NEW YORK CENTRAL.—The regular quarterly dividend declared by this company was 1½ per cent and not 1¼ per cent as was incorrectly stated in the *Railway Age* last week.

NEW YORK, NEW HAVEN & HARTFORD.—At the annual meeting of the stockholders, Vice-president Buckland explained the government's operation of the property by agreement. He said that the basis of reimbursement first established the net operating revenues at \$21,500,000. Out of this the company must pay \$18,000,000 for rentals of leased lines and interest on indebtedness, leaving about \$3,500,000 available for dividends, to which will be added the benefit of 1 per cent, saved in interest in the refinancing of \$43,000,000 by the government. The law, how-

OVER THE TOP TOGETHER

ever, gives the President power to compel the putting back into the road for betterment of all kinds a portion of the whole of the net revenues available for dividends. Stockholders asked what the dividend would amount to and Mr. Buckland thought it might be 1 per cent. The matter of dividend rested with the President and would be determined by the amount of net surplus made available. While on the face of things the amount available might appear to be as high as $3\frac{1}{2}$ per cent, there was no certainty that the dividend would be that.

Walter B. Lashar of Bridgeport was elected a director to succeed Eli Whitney of New Haven, resigned.

NORFOLK & WESTERN.—See editorial comments elsewhere in this issue.

PENNSYLVANIA RAILROAD.—An agreement was approved by the Pennsylvania Public Service Commission by which the Pennsylvania Railroad will acquire the stock ownership of the Cornwall & Lebanon and the Susquehanna, Bloomsburg & Berwick railroads. For years the Pennsylvania has held a controlling interest in these companies.

UNION PACIFIC.—R. S. Lovett has been succeeded as a director by Henry W. Clark, counsel of the company, and Marvin Hughitt has been succeeded by his son Marvin Hughitt, Jr. The following executive committee has been appointed: C. B. Seger, chairman, W. A. Harriman, Otto H. Kahn, William Rockefeller, Mortimer L. Schiff, and Frank A. Vanderlip.

WESTERN PACIFIC.—Alvin W. Krech, of New York, has been re-elected a director and has also been chosen chairman of the board of directors.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company is building a transfer freight house at Argentine, Kan., 32 ft. wide by 1,000 ft. long, 300 ft. of which will be two stories in height. The building will be a frame structure resting on a concrete foundation. J. E. Nelson & Co., Chicago, have the contract for the work, which will cost about \$70,000.

CHICAGO, BURLINGTON & QUINCY.—This company has awarded contracts for the construction of a freight house and a storehouse at Casper, Wyo., to G. A. Johnson & Sons, Chicago. The freight house will be 50 ft. by 110 ft., 90 ft. of which will be two stories. It will be a steel frame structure resting on concrete foundations with brick walls and a composition roof. The storehouse will be of brick construction, 48 ft. by 70 ft., resting on a concrete foundation and covered with a composition roof.

SOUTHERN PACIFIC.—The Public Service Commission of Oregon recently granted the application of the Oregon State Highway Commission for the elimination of the crossing at grade of the West Side highway with the Newberg branch of the West Side division of the Southern Pacific in Washington county, Oregon. The commission has ordered that an undergrade crossing be installed at this point approximately 200 ft. west of the present grade crossing, with a minimum lateral clearance of 24 ft. and a minimum vertical clearance of 15 ft. The cost of the overhead structure, the necessary grading and filling and the additional cost of drainage incident to the construction of the crossing, will be borne in equal proportion by the Southern Pacific and the Oregon State Highways Commission, and the cost of maintaining the overhead structure and necessary abutments will be borne by the railroad, while the expense of maintaining the roadway and surface thereof will be borne by the highways commission.

SOUTHERN RAILWAY.—This road in connection with the building of the government nitrate plants at Muscle Shoals has authorized the following work at Sheffield, Ala., and vicinity. Additional tracks and extension of existing tracks in the Northern Alabama yards; additions and alterations to the Union passenger station and the construction of a baggage room in connection therewith; construction of a two story extension to an office building in connection with the freight station which is to be enlarged, all at Sheffield; and rebuilding four piers of the bridge over the Tennessee river at Florence.

Railway Officers

Executive, Financial, Legal and Accounting

Henry F. Green has been appointed general real estate and tax agent of the Chicago & Alton, with headquarters at Chicago, Ill., succeeding T. A. Rittenhouse, who has been granted an indefinite leave of absence.

J. L. Beven, terminal superintendent of the Illinois Central at New Orleans, La., has been appointed assistant to the executive vice-president of that road and of the Yazoo & Mississippi Valley, with headquarters at Chicago, effective April 19.

L. R. Deevers, whose appointment as auditor of the Wheeling & Lake Erie, with headquarters at Cleveland, Ohio, was mentioned in these columns on April 5, was born at Pittsburgh, Pa., on January 14, 1884. Following his graduation from Westminster College, Pa., in 1906 he entered the service of the Wheeling & Lake Erie as a clerk in the office of the auditor of disbursements. On September 1, 1909, he was appointed shop accountant of the car shops at Toledo, Ohio. He remained there until March 1, 1914, when he went to Cleveland, Ohio, as chief clerk to the auditor. He was promoted to assistant auditor on June 1, 1915, and on September 1, 1917, was appointed acting auditor during the absence of the auditor on account of illness. On April 1, 1918, he was promoted to auditor to succeed C. H. Holmes, resigned.

S. T. Bledsoe, whose appointment as general counsel of the Atchison, Topeka & Santa Fe was announced in the *Railway Age* of April 12, was born in Clinton county, Ky., on May 12, 1868. He was educated in the Southern Normal School and Business College at Bowling Green, Ky., and at the University of Texas. He entered railway service as a local attorney for the Gulf, Colorado & Santa Fe at Ardmore, I. T., in 1895, and was appointed attorney for Indian Territory for the same company in 1907. From 1908 to July, 1912, Mr. Bledsoe was a member of the firm of Cottingham & Bledsoe, solicitors in Oklahoma for the Santa Fe lines. On the latter date he became general attorney for the Santa Fe at Oklahoma City, Okla., retaining his connection with the firm of Cottingham & Bledsoe. On January 1, 1915, he was appointed assistant general solicitor of the road, with headquarters at Chicago, having special charge of valuation and tax matters, supervision of proceedings before state commissions and of litigation resulting from their orders and from legislative acts. On April 2, 1918, he was appointed general counsel to succeed Walker D. Hines, who resigned to accept service with the government.

S. T. Bledsoe

J. C. Davis, attorney for the Chicago & North Western at Des Moines, Iowa, has been appointed general solicitor in charge of the legal department of the company under government control. The entire law department of the road has been reorganized in conformance with the order of the Railroad Administration to divorce corporate matters from operating matters. The officers here given will confine their activities to work concerned with the operation of the road. **W. G. Wheeler** and **A. A. McLoughlin**, attorney for the North Western in Nebraska, have been appointed assistant general solicitors. **E. R. Hart**, general attorney, retains that title

under the new organization, and R. H. Witticombe, commerce attorney, has also been appointed general attorney. The offices of assistant general counsel and commerce counsel have been discontinued. These changes were effective on April 22.

Operating

J. E. Fairhead has been appointed general superintendent of the Pittsburgh & West Virginia and the West Side Belt, with office at Pittsburgh, Pa., vice E. M. Alvord, resigned.

A. M. Burt, whose appointment as acting general manager of the Northern Pacific lines east of Paradise, Mont., was mentioned in these columns on April 12, was born at Syracuse, N. Y., on May 1, 1860. He entered railway service as a rodman on the Colorado Midland in 1885.

In 1889 he went with the Northern Pacific as an instrument man, later being appointed assistant engineer. From 1892 to 1897 he was assistant engineer on the Adirondack & St. Lawrence, the Wisconsin Central and the Chicago & North Western. On January 1, 1897, he reentered the service of the Northern Pacific as supervisor of bridges and buildings, and in March, 1901, was appointed assistant superintendent. From October, 1902, to January 1, 1914, he was superintendent of various divisions in Dakota, Montana and Washington. From the latter date until April 1, 1918, he was chief engineer maintenance of way, with headquarters at St. Paul, Minn. As acting general manager he succeeds J. M. Rapelje, promoted, and will continue to have headquarters at St. Paul.

L. M. Davis, whose appointment as superintendent of the Northern division of the Great Northern, with headquarters at Crookston, Minn., was announced in these columns February 22, was born in 1881. He entered the service of the Chicago & North Western as a telegraph operator on June 3, 1899. He was later promoted to relief agent and worked at various points on the line until July 1, 1905, on which date he was promoted to train despatcher in Chicago. On May 1, 1907, he was appointed night chief despatcher and on June 15, 1909, was appointed chief despatcher of the Wisconsin division, with the same headquarters. On May 1, 1913, he was promoted to trainmaster of the same division, which position he held until January 1, 1916, when he resigned to enter the service of the Great Northern as chief despatcher at Minot, N. D. On September 10, 1916, he was transferred to Grand Forks, N. D.; on November 1, 1916, he was promoted to trainmaster of the Dakota division, with the same headquarters, and on July 1, 1917, he went to St. Paul, Minn., to take a course in the accounting department of the Great Northern. The course expired December 31, 1917, and he was returned to Grand Forks as trainmaster, which position he held until February

20, 1918, on which date his appointment as noted above became effective.

J. F. Alsip, trainmaster of the Northern Pacific at Tacoma, Wash., has been appointed acting assistant to the general superintendent of the western district, with the same headquarters, effective April 10.

E. D. Hungerford, assistant superintendent of the Chicago, Rock Island & Pacific at Minneapolis, Minn., has been appointed acting superintendent of the Cedar Rapids division, with headquarters at Cedar Rapids, Iowa, succeeding G. A. Merrill, who has been granted leave of absence on account of illness. F. M. Patt has been appointed acting assistant superintendent at Minneapolis, to succeed Mr. Hungerford.

G. A. Morson, general manager of the Cuban Central, has been appointed general manager of the United Railways of Havana, the Western Railway of Havana, the Havana Central, and the Cuban Central, with headquarters at Havana, Cuba, and T. E. Keyworth, superintendent of locomotives on the Cuban Central, with office at Sagua-la-Grande, has been appointed assistant general manager of the Cuban Central, with headquarters at the same place.

Victor Parvin whose appointment as superintendent of the Virginian Railway, with headquarters at Princeton, W. Va., has already been announced in these columns, was born on July 6, 1883, at Laurel, Del., and was educated in the graded schools. He began railway work on November 1, 1899, with the Baltimore, Chesapeake & Atlantic, and served as operator and agent until June, 1901, and then went to the New York, New Haven & Hartford in the same capacity. In March, 1902, he returned to the service of the Baltimore, Chesapeake & Atlantic, as despatcher and from July, 1904, to February, 1907, served consecutively as operator, clerk, car distributor and despatcher on the Washington, Danville and Durham divisions of the Southern Railway. He then returned to the service of the New Haven as chief despatcher on the Western division. From October, 1912, to July, 1914, he was chief despatcher on the Minneapolis & St. Louis, and then was appointed trainmaster on the same road. From February to June, 1917, he was car distributor in the office of the general superintendent of transportation of the Southern Railway Lines West, and then was appointed yardmaster of the Baltimore & Ohio, with office at Newark, Ohio. In December, 1917, he entered the service of the Virginian Railway as trainmaster, which position he held at the time of his recent appointment as superintendent of the same road as above noted.

Traffic

Tinsley Smith, commercial agent of the Central of Georgia, with office at Denver, Colo., has been appointed division freight and passenger agent, with office at Chattanooga, Tenn., vice W. E. Stewart, assigned to special service.

Dan C. Pettibone, manager of mail traffic and general baggage agent of the Northern Pacific, has been transferred to the president's staff, with headquarters at St. Paul, Minn., retaining the title and office of manager of mail traffic, effective April 11. In addition, he will perform such other duties as may be assigned to him.

C. P. Barrett, general western passenger agent of the Delaware, Lackawanna & Western, with office at Chicago, has been appointed division passenger agent, with office at Buffalo, N. Y.; E. J. Quackenbush, division passenger agent at Buffalo, has been appointed division passenger agent, with office at Syracuse. The general western passenger agency and the traveling passenger agency at Chicago will be abolished on May 1.

John A. O'Brien, general agent in the passenger department of the Chicago, St. Paul, Minneapolis & Omaha at Minneapolis, Minn., has been assigned to other duties and his office has been abolished. The traffic offices of the Omaha at Helena, Mont., and Tacoma, Wash., were closed on April 15. Freight and passenger matters previously under the jurisdiction of the Tacoma (Wash.) office will hereafter be handled by Frank W. Parker, general agent at Seattle, Wash. Matters previously under the jurisdiction of the Helena (Mont.) office will be handled directly from the traffic department headquarters at St. Paul, Minn.

A. M. Burt

L. M. Davis

Engineering and Rolling Stock

O. J. Egleston has been appointed chief engineer of the Utah Railway, with office at Salt Lake City, Utah, vice **H. G. McMechen**, resigned to accept service with another company.

Frank A. DeWolff, master mechanic at the Sagua-la-Grande, (Cuba) shops of the Cuban Central, has been appointed assistant superintendent of locomotives, with office at the same place.

O. R. Hale, assistant superintendent of locomotives of the Cuban Central, with office at Sagua-la-Grande, Cuba, has been appointed superintendent of locomotives, with headquarters at the same place.

Herbert S. Wilgus, engineer maintenance of way of the Pittsburgh, Shawmut & Northern, with office at Angelica, N. Y., has been appointed chief engineer and his former position has been abolished.

John L. Smith, master mechanic of the Pittsburgh, Shawmut & Northern, with office at St. Marys, Pa., has been appointed superintendent of motive power and equipment, and his former position has been abolished.

E. H. Mattingly, general car foreman of the Baltimore & Ohio, at South Chicago, Ill., has been appointed general car foreman in the Chicago district of the Baltimore & Ohio and the Baltimore & Ohio Chicago Terminal.

H. K. Fox, chief draftsman in the motive power department of the Western Maryland at Hagerstown, Md., has been appointed engineer of tests of the Chicago, Milwaukee & St. Paul, with headquarters at Milwaukee, Wis., succeeding **W. T. Bennisson**, resigned.

J. A. Conley, master mechanic of the Atchison, Topeka & Santa Fe at Raton, N. M., has been transferred to the Valley division, with headquarters at Fresno, Cal., succeeding **John Pullar**, transferred to the Los Angeles division, with headquarters at San Bernardino, Cal., effective April 11.

Robert H. Boykin, division engineer of the Erie, with office at Susquehanna, Pa., has been appointed assistant superintendent of maintenance, with office at New York, vice **H. Knight**, promoted; **Charles M. Lewis**, assistant division engineer at Susquehanna, has been appointed division engineer of the Delaware division and the Wyoming division and branches, vice Mr. Boykin, and **H. D. Row**, supervisor at Jamestown, N. Y., has been appointed assistant division engineer, with office at Susquehanna, succeeding Mr. Lewis.

F. H. Masters, division engineer of the Elgin, Joliet & Eastern, with headquarters at Gary, Ind., has been promoted to assistant chief engineer, with office at Joliet, Ill., succeeding **G. H. Jennings**, resigned to become general manager of the Powers-Thomson Construction Company, Joliet. **Arthur G. Dorland**, assistant engineer at Joliet, has been transferred to Gary and placed in charge of the engineering work previously handled by Mr. Masters. **J. W. Webster**, valuation engineer at Joliet, has assumed the duties of Mr. Dorland, in addition to his present work. All of these changes were effective April 15.

Railway Officers in Government Service

Shelby S. Roberts, consulting civil engineer, Chicago, has joined the staff of the regional director of southern railroads at Atlanta, Ga.

Ralph Peters, Jr., assistant superintendent of the Long Island, with office at Jamaica, N. Y., has received a commission as second lieutenant in the Railway Transportation Corps of the National Army.

W. R. Wood, mechanical engineer of the Great Northern, St. Paul, Minn., has been appointed mechanical engineer on the staff of **Ralph Budd**, assistant in charge of capital expenditures to the regional director of western railroads, Chicago.

B. M. Bukey, assistant general passenger agent of the Atchison, Topeka & Santa Fe at Chicago, has been appointed assistant to **H. P. Anewalt** who is in charge of naval traffic for the U. S. Railroad Administration, with headquarters at Washington, D. C.

First Lieutenant **G. C. Kennedy** of Company F, Thirteenth Engineers (Railways) in France, has been promoted to captain. Mr. Kennedy was formerly chief despatcher of the Gulf, Colorado & Santa Fe at Beaumont, Tex. Second Lieutenant **S. S. McConnell** of the same company, formerly clerk in the superintendent's office of the Atchison, Topeka & Santa Fe at Emporia, Kan., has been promoted to first lieutenant, and **E. P. Dudley**, also a Santa Fe man, has been commissioned second lieutenant.

W. E. MacEwen, traffic manager of the Peerless Transit Line, Cleveland, Ohio, has been appointed director of traffic for the Western Petroleum Refiners' Association, with headquarters at Kansas City, Mo., and will work in conjunction with **O. M. Conley**, representative of the oil director of the U. S. Fuel Administration, and **B. L. Swearingen**, representative of the regional director of western railways, in connection with the problem of expediting the movement of tank cars to meet the demands of the government and its allies.

Obituary

Henry Russell Lloyd, fuel agent of the Chicago, Milwaukee & St. Paul until his retirement in 1910, died at his home in Chicago on April 12.

H. S. Hills, master mechanic of the Louisville & Nashville, with office at Ravenna, Ky., died recently at his home in Irvine, Ky., at the age of 52.

Joseph W. Taylor, secretary of the American Railway Master Mechanics' Association, Master Car Builders' Association, and Western Railway Club, died suddenly on Wednesday morning of this week.

EQUIPMENT OF AN INFANTRYMAN.—A table showing that more than eighteen pounds of metal enter into the composition of articles required for the equipment of each infantryman has been prepared by the Ordnance Bureau of the War Department. The metal equipment carried by each infantry soldier weighs 294.65 ounces, consisting of 153 ounces iron and steel, 12.35 ounces tin, 62.7 ounces brass, 24.2 ounces aluminum, 36.4 ounces of metal in bullets, consisting of lead, tin and cupro-nickel, and 6 ounces of other metal. An additional weight of 114.7 ounces is added by equipment of cotton, wool, leather and wood.—From *The Engineering and Mining Journal*.

BRITISH LOCOMOTIVE WORKS IN SPAIN.—Filson Young, writing from Madrid to the London Daily Mail, on March 5, says a powerful combination of British and Spanish industrial interests, involving an initial capital of \$5,000,000, has been completed between Messrs. Babcock & Wilcox and some of the most important industrial forces in the country, including the Altos Hornos Company, of Bilbao, the only steel producers in Spain. He adds: "The principal object of the combination is the manufacture of high-class locomotives, marine and land boilers, and solid drawn tubes on a new principle which will supersede the Mannesmann process. Works which will be by far the largest in Spain will be erected near Bilbao and give employment to 2,000 men. Messrs. Babcock & Wilcox will undertake the equipment of the factory with British machinery and will direct the technical management until the year 1940. No complete boilers have hitherto been constructed in Spain, and locomotives have almost exclusively been imported from Germany, the value imported in 1913 being \$2,500,000. Although a few have since been imported from the United States at a cost of \$50,000 each, the transport of the country has been practically paralyzed for the last year and a half. This enterprise will make Spain independent of outside supplies for many years to come, and will greatly facilitate the provision of light railways, which is one of the most urgent of the country's needs. The King of Spain, who received the managing director of the British company on his recent visit here, has taken a great interest in the combine, which is generally regarded with enthusiasm as the forerunner of many similar commercial alliances between the two countries."

WAKE UP!—Thus far, we are certain, the Germans haven't invented any long range gun that will carry across the Atlantic. But it would require such a gun to awaken some Americans to the realization that we are in this war.—*Utica Herald-Dispatch*.

EDITORIAL

Railway Age

EDITORIAL

There must be no longer delay in making the necessary improvements in shops and engine terminals for the oncoming winter. At the present time, because of lack of facilities, railway shops are working about 15 per cent overtime in order to get the motive power back into good condition after the severe winter.

Repair Facilities Must Be Improved

One reason for the poor condition of the power was the lack of proper engine terminal facilities. If the railroads are to pass through next winter without a serious power shortage, conditions must be improved. Even with the new locomotives to be received this year, the power will be taxed to the utmost next winter. Everything that can must be done to keep the power in condition, to turn it promptly at the terminals, and to keep it on the road doing work for the greatest possible percentage of time. This cannot be done unless immediate attention is given the facilities for handling and repairing the power.

A letter by T. J. Foley, vice-president of the Illinois Central system, published in this issue, focuses attention upon a phase of the labor situation in this country which is very much out of harmony with the spirit of the times. In spite of an acute shortage of labor on the farms, in the factories and on the railways, Mr. Foley's observations during a recent trip over the southern lines of the Illinois Central system led him to believe that at least 10 per cent of the labor supply of the South is idle at this time. This is a condition which adds force to the demand for the conscription of labor. Americans of whatever color or position in life who fail to put their shoulders to the wheel to back up the men who are fighting their battles are disloyal to their country in its time of need. To work for one's country is a small sacrifice compared with shouldering a gun, and all those who insist upon idling should be held up to public scorn. If an aroused sentiment against idlers fails to drive these men to work they should be conscripted.

Of vital interest to the public in general and the railways in particular, will be the convention of the International Rail-

Fuel Problems to Be Discussed in Convention

way Fuel Association which will be held in Chicago, May 25. This convention is to be conducted under the auspices of both the Railroad and Fuel administrations. The general arrangements are under the direction of C. R. Gray, director of the Division of Transportation of the Railroad administration, and P. B. Noyes, director of the Conservation division of the Fuel administration. Fuel problems will be discussed which are of vital interest to both the transportation and mechanical departments of the railways. The trying times experienced last year due to coal shortage have shown what an important part the railroads bear to the entire fuel problem. Prominent speakers from both the United States and Canada are to discuss this question. Never before has there been such a group of authorities on fuel gathered together for the pur-

pose of discussing the fuel problem in a broad way. It behooves every railroad to have their transportation and mechanical officers in attendance that the messages may be sown on fruitful ground.

There is an impression prevailing that the standard locomotives to be purchased by the government will be used only as a liquid reserve and to meet the requirements of interchange power. Such a plan has received commendation. To compel the railroads desiring locomotives for their particular use to purchase

Standard Locomotives for Interchange Service

standard locomotives would be asking them to purchase locomotives which perhaps would not best meet their conditions and which they are not prepared to maintain. Take the Pennsylvania for instance. That road has perhaps more carefully studied its motive power requirements and spent more money to develop locomotives which best meet its conditions than any road in the United States. It is obvious that any standard locomotive, which of necessity is of a compromise design, will not be as efficient as the locomotives it now operates. The same applies to other roads. On the other hand there are roads which are now operating locomotives which may not be as well designed as the standard locomotives. In such cases these roads would undoubtedly be glad to purchase the standard locomotives, *provided the details of the design are changed to accord with their own existing standards.* A railroad cannot be blamed for not wanting to buy the completely standardized locomotives. If they buy them the maintenance difficulties due to the fact that they will be different from any other locomotives they operate, will be with them until the locomotives pass out of existence or until a substantial sum is spent to change them over to meet their own standards. This leads to the question as to what the government is to do with the standard locomotives it purchases, after the railroads pass back into the hands of the private owners. It is obvious that standard locomotives would be of no further use to the government. They undoubtedly would be sold to the highest bidder. Being of a detail design different from that used on any railroad in the country, it is apparent that they are very likely to be sold at a loss. Is it wise for the government to order two fleets of these locomotives? Is it not better to permit the roads to order locomotives best suited to their own needs?

Parts of railroad systems which before the war were operated very satisfactorily under manual block signaling are now

Relation Between Signals and Track Capacity

fully congested by the heavy movement of war traffic. It is essential to every railroad system to make as possible. Where congested conditions exist on such lines, through trains of passenger, mail and mail-trains must wait on sidings and main tracks to meet or allow other trains to clear the block before they can then proceed. This introduces a large amount of dead time and such delays are equivalent to reducing much additional equipment and of service. Even more serious is the movement of through trains across main tracks and are moved slower

will be released and ready for other duties just that much sooner. One problem before the Railroad Administration and the operating officers of the railroads today is the elimination of as much of this dead time on sidings and main lines as possible. The problems confronting the administration are large and varied in number, and details must necessarily wait their turn, but it would appear to be advisable for problems such as those noted above to receive the early attention not only of railroad officers but the Railroad Administration as well. When it is considered that, on one stretch of single track 15.7 miles long where more than one hour was formerly required to get four important south-bound trains through, the installation of automatic signals has enabled this to be accomplished in less than half the time, it would appear that such installations can be expected to eliminate some of the present congestion. Since signals can be installed at a much less cost per mile and with a considerably smaller number of laborers than other classes of work from which the same returns may be obtained, and as such installations will cut down to a very great extent the amount of dead time in the movement of the present traffic it would appear that this subject should receive careful and early consideration.

Price Versus Speed

THE PURCHASING DEPARTMENT of the Railroad Administration has this week placed the orders for about 100,000 freight cars and 1,025 locomotives. These are the first cars and locomotives that have been ordered for the railroads of the United States this year, although one-third of the year is now passed. The St. Paul planned to build 5,000 cars in its own shops but has given up this plan. Furthermore, the statement that these cars and locomotives have been ordered is subject to an important qualification. The specialties which are to be put on them have not been ordered yet; and until the car and locomotive builders get these specialties they cannot actually begin to turn out the equipment. The delays which already have occurred in placing the orders will considerably reduce the number of locomotives and cars that can be built before the rush of business comes this fall. Any further delays in ordering the specialties will further reduce the amount of equipment that can be delivered before fall. Many supply companies are now practically or wholly out of orders and will have to close down their plants and let labor go if they do not get orders soon. It would appear, however, that there are to be further delays, since the supply people have been asked to furnish a large amount of information regarding their costs which they must first work up, and which the Purchasing Division must later compile if the data is to serve any useful purpose.

In entering upon its program of locomotive and car standardization, and in adopting the policy it has in negotiating with the equipment and supply companies, the Railroad Administration has been prompted by worthy motives. Its purpose has been to increase the efficiency of the railroads and to get equipment and supplies for them at the lowest prices practicable. The policy adopted by it regarding standardization of cars is eminently wise and fair. Its scheme of locomotive standardization is, in our opinion, very unwise. The Purchasing department has succeeded in placing the orders for cars on a basis of 5 per cent profit as compared with the 10 per cent originally asked by the builders. This is a victory for the Purchasing department which will save the railroads several million dollars, although it has created intense dissatisfaction on the part of most of the car builders. It is probable that the Purchasing department will succeed in getting the locomotives on a similar basis, which will save the

railroads several million dollars more. But it would seem that in the handling of these important matters of standardization and purchases a matter far more important has been given insufficient consideration. This is the imperative need for avoiding anything which will cause delay in providing new cars and locomotives as fast as they can be built.

The railroads, under the direction of the Railroad Administration, are now being operated, from a purely transportation standpoint, with a high degree of efficiency, and apparently are moving more essential traffic than ever before. But the crucial test for the railroads is going to come in the year 1918, as it did in the year 1917, not in the spring or summer, but in the fall and winter, and how the railroads will be able to stand the test next fall and winter will depend mainly, first, on the condition of their old locomotives, cars, track and other facilities, and, second, on how many new locomotives and cars they have and on what additional facilities they are provided with. Now, from present indications the railroads will not get enough new cars and locomotives before next fall merely to replace those that will have to be scrapped this year; and they certainly will not unless the Purchasing Division very soon places all the orders for the car and locomotive specialties as well as for the building of the equipment itself.

We respectfully submit that in present circumstances *speed* is more important than a *small difference in prices*; and that the amount the country may be caused to lose next fall and winter in railway earnings, commercial profits and output from mines and factories by an avoidable deficiency of locomotives and cars may greatly exceed all that the railroads may be saved by further protracting the negotiations with the railway equipment and supply companies.

Patents and Royalties

on Railway Supplies

THE EXTENT TO WHICH PATENTS and royalties upon patents will be recognized by the purchasing department of the Railroad Administration in buying equipment and supplies is still a subject of discussion. The purchasing department has asked the supply companies in presenting the data showing their costs of manufacture, to list separately the amounts paid by them in royalties. The question involved really has three phases, one of law, one of economics and one of morals.

The legal phase of the matter is concisely covered in an article by Paul Synnestvedt, the eminent patent lawyer, which we publish in another column. Mr. Synnestvedt summarizes two recent decisions in which the United States Supreme Court has passed upon the question as to whether certain patents must be surrendered for the use of the government without compensation. One of these related to the use of some of the patents on the Marconi wireless telegraph apparatus, the other to the use of some Curtis marine turbine patents.

While the government has the same right to commandeer patents as any other property, these decisions show that it cannot do so without providing for just compensation for the patentee. In other words, it cannot authorize one concern to make an article on which another concern owns the patents in such a way as to protect the former against a successful proceeding for damages by the latter. If the Railroad Administration should desire to get more devices of a particular kind than the owner of the patents could make, it could require the owner to let competing concerns make the additional number, but the competing concerns which made the device would have to pay the owner for the use of the patents.

As an economic matter, it is questionable if there would be many instances in which the Railroad Administration would

gain anything by buying more articles of a particular kind than the manufacturer owning the patents could make. If, for example, it should desire to buy only one kind of friction draft gear for 100,000 cars instead of buying from several concerns their different kinds of draft gear probably the concern owning the patents on the particular draft gear selected would be unable to supply enough of them to equip the cars as fast as the builders could turn them out. If, however, other concerns were asked to manufacture this particular draft gear it would be necessary for them to make changes in their organizations and plants which would take a long time and involve a large expenditure. Disregarding the element of time, since a manufacturer who has been making one kind of draft gear would have to incur the expense of preparing his plant and organization to make another kind, it is doubtful if he could make that other kind as cheaply as the concern whose business it has been to make it and which has built up its plant and its organization for that purpose.

Furthermore, the concern which owns the patents on a device and whose prospective business is based on making that device and making it as well as possible, has an incentive, to make it well and to cause it to give good service, which no other concern possibly can have. It always has been customary for the manufacturer of railway supplies to co-operate with the railway management which buys a device in using it properly and getting the best possible service from it. Almost every manufacturer of a patented device in this field has experts who are constantly engaged in teaching railway employees how to use it and in working with railway officers for the purpose of correcting any shortcomings and making any improvements in it that may prove to be necessary or desirable. While the owner of the patents on the device has an obvious incentive to render such service, any competing concern which was authorized to make it would just as obviously not have any such incentive. From an economic point of view probably it will be best for the Railroad Administration, in dividing its orders among the manufacturers, to buy from them, as far as practicable, the particular kind of devices they have been used to making.

As to the moral phase, the Railroad Administration has the right to make any suggestion regarding patents and royalties that may occur to it. It would not be fair, however, for it to use the position of monopoly which government control gives it practically to coerce railway supply companies into making extreme concessions which concerns in other lines of business are not required to make either to the government or to other customers. The government of the United States has given patent rights to inventors of railway devices just as it has given them to other inventors. It has permitted and encouraged companies to buy these patents and build up their businesses on them, just as it has permitted and encouraged other kinds of concerns to buy patents and establish businesses on them. In these circumstances, the railway supply companies are entitled to be treated by the government with the same consideration as other concerns which are making and selling patented articles to the government and other customers.

Undoubtedly, all departments of the government have the right to demand that the concerns from which they buy goods shall not, especially in these war times, charge the government excessive prices and profiteer at its expense; but plainly there is no reason in law, economics or morals, why the Railroad Administration, which is one branch of the government, should make demands of the railway supply companies which other branches of the government do not make upon other manufacturing concerns. The Railroad Administration does not contend that labor employed on the railways should be discriminated against merely because it is working for the railways under government control. It would, however, be as logical to make this contention as to take the position that concerns which are making equipment and supplies for the

railways while under government control should be treated differently from other concerns with which the government is doing business.

Negotiations Regarding Railway Compensation

MANY PEOPLE, even including leading financiers in Wall street, apparently thought that when the railroad control law was passed what compensation should be paid to the railway companies during the period of government control and what they would be allowed to do with the money were practically settled. When, however, the representatives of the Railroad Administration, on the one side, and the representatives of the railroad companies on the other side, presented to each other the terms they had respectively drawn up for incorporation in the contracts, it became apparent that the question of compensation was far from settled. As the negotiations have progressed, the representatives of the two sides have drawn closer together, but regarding some very important matters they are still far apart.

The most important questions which have arisen relate, first, to whether the companies shall be given the maximum compensation provided for by the law; second, as to the use which the companies may be permitted or required to make of the surplus part of their guaranteed compensation, and of their income from outside properties; and, third, as to the policy of the Railroad Administration regarding maintenance.

The law authorizes the President, and he has authorized the director general, to pay to each company an annual return not exceeding the average net operating income earned in the three years ending June 30, 1917. When the control bill was pending representatives of the railways opposed this provision on the ground that it would not give the companies enough compensation, while some members of Congress opposed it on the ground that it would give them, or at least some of them, too much. Those who advocated the proposed basis, including the *Railway Age*, did so upon the ground that while it was not ideal, it represented the experience of the railways under regulation during the last three complete years for which data were available, and that, therefore, it probably was a fair and reasonable a basis to be used in a war measure as could be adopted. It is still contended in some quarters that to give the companies, and especially the more prosperous, the maximum provided by the law, would be to give them too much. Many lawyers believe that a company which carried the question into court could get judgment at a rate equivalent to that which it was earning when its railway was taken over, and most roads earned a larger return in the calendar year 1917 than the maximum compensation allowed by law. Therefore, the government might lose rather than gain by taking a stand which would force the companies into the courts.

If the companies should be given in the contracts the maximum return permitted by the law, some companies would have surpluses after paying their interest and dividends, while others would have surpluses after paying their interest. It has been the custom of most railways having surplus income to invest most of it in additions and betterments. Persons belonging to the radical school of thought contend that surplus invested in the properties really belongs to the public and that, therefore, the companies should not be allowed to derive any return from it. The spokesmen for the companies, on the other hand, always have contended that surplus earnings belong to the companies and that, therefore, property created by the investment of these earnings belongs to them. They have said that some investment of surplus earnings must be made to offset concealed obsolescence, to provide unproductive im-

provements, etc., and have in effect conceded that no return should or even could be paid upon such investment; but at the same time they have maintained that the companies are entitled to earn and pay a return upon surplus invested in productive improvements.

This old question, which has been a bone of contention in almost every important hearing regarding rate regulation or valuation has now arisen to vex those who are negotiating regarding the compensation contracts. The two extreme contentions advanced are that the companies should be required to invest all their surplus compensation and receive no return on it, and that they should not be required to invest any of it and should receive a nominal rate of interest, say, 6 per cent on all of it that they voluntarily invest. One basis suggested was that they should invest 15 per cent of their total net income—including in this both their guaranteed compensation and their income from outside properties—without asking any return on this and that on all additional investment made by them they should be paid a return. The 15 per cent basis has not, however, been pressed, chiefly, no doubt, because, while some companies could invest 15 per cent and have substantial surpluses left, many others could not invest anywhere near this much and have any surpluses at all left.

It is difficult to see why income from outside properties should be considered in this connection. The government has not taken over these properties and assumed the risk and responsibility of operating them; the income from them was not considered in framing the compensation law; and no guarantee of the income from them has been made, or even suggested.

It would seem that the sensible thing to do would be to adopt some compromise basis and expressly provide by a saving clause that the basis adopted should not be regarded as establishing any precedent affecting management or regulation after the termination of government control. Probably the most reasonable compromise basis which could be adopted would be one on which the companies would be paid a return on all investment made from surplus compensation, but which fixed a low percentage of return, perhaps 4 per cent.

The law requires the government to return the physical properties to the companies at the termination of government control in substantially the same condition that they were in when taken over. If the government does not adequately maintain a railway it will be obliged, on the termination of control, to pay the company owning it a sum sufficient to offset the deferred maintenance. Suppose, on the other hand, that the Railroad Administration decides that there was deferred maintenance on a railway when it was taken over and that it must by making larger expenditures for maintenance, improve the property's condition during the period of control. It is being contended, in effect, by some representatives of the Railroad Administration that money expended in taking up deferred maintenance should be deducted currently from the guaranteed compensation of the company owning the property.

This does not seem to be logical. Since a company whose property is allowed to deteriorate under control is not to be recouped for its deterioration until the termination of government control, it would appear that a company whose property is improved by increased expenditures should not be required to settle with the government for this until the termination of government control. Each company should be paid during the period of control its current compensation regardless of current expenditures for maintenance. Nobody can tell until the termination of government control what condition any road will be in when it is returned to its owner. What shape each will be in will depend not merely on what shape the Railroad Administration may desire to keep or put it in, but also on the material and labor situation meantime.

If those conducting the negotiations regarding these contracts should attempt to settle all the difficult problems regard-

ing the rights of the railways, on the one side, and the public on the other, which have been raised in time of peace, and which again will be raised in time of peace, they will hardly be able to agree on a basis which will prevent wholesale litigation. In order to prevent litigation from occurring instead of contracts from being made, it will probably be necessary for them to avoid trying to establish precedents for peace time, and to adopt a series of compromises which will carry out the intent of the railroad control law, which was that government control should be used solely as a war measure, and that the problems of peace should be left to be solved when peace returns.

Shall the Roads Return to Bessemer Rails?

RAILWAY ENGINEERS are much concerned over the reports which have been emanating from Washington during the last few days to the effect that it is going to be necessary for the railroads to go back to Bessemer rails this year because of the demand for the entire output of open hearth steel for munitions and ships. As pointed out in these columns two weeks ago the railways are now far behind in their rail renewal work for this season and although approximately 2,000,000 tons or two thirds of a normal year's output of rails is still undelivered on old orders the mills are now turning them out at the rate of only about 30,000 tons per week, or less than 30 per cent of capacity, and no new orders have been placed so far this year by the government which has notified the roads that it will purchase the rails required for them.

While the principal work now confronting this country is the winning of the war and all other activities should be made subsidiary to this, it is equally true that existing practices should not be disturbed unless such disturbance will contribute to the success of our military efforts. From this standpoint it is, therefore, important to consider the necessity for the transition from open hearth back to Bessemer rails.

Bessemer rails were rolled almost exclusively until ten years ago and large quantities of them are still in the track where they are giving good service. However, about 1908, high grade Bessemer ores suitable for rail making began to run out and the mills went into the manufacture of open hearth rails and they have readily commanded a premium of \$2 per ton over the price of Bessemer rails because of their better quality. Following this transition some of the mills dismantled their Bessemer furnaces or converted them to other uses so that the Bessemer rail capacity today is only a fraction of that of a few years ago. Thus in 1916 (the latest year for which statistics are available) of the 2,709,692 tons of rails rolled, only 440,092, or 16 per cent, were of Bessemer steel. The depletion of the high grade Bessemer ores has continued so that a return to this class of steel can only be made at the sacrifice of service and of safety in the track.

The reduction in the Bessemer capacity of the country which has taken place also acts as a controlling factor, limiting any radical change in rail manufacture. At the present time only four of the large mills of this country which produced rails used by steam roads are equipped to roll Bessemer rails. One of these mills is located on the Atlantic seaboard where it has no accessible supply of Bessemer ores, while another mill can roll Bessemer steel only at the sacrifice of an equivalent tonnage of open hearth. This leaves only two mills in a position to roll Bessemer rails to any advantage, both of these being located in western Pennsylvania. Furthermore, the Bessemer furnaces of these mills are understood to be working practically to ca-

capacity, one of these mills being reported as operating both its Bessemer and open hearth plants to 78 per cent of capacity a week ago.

At a series of conferences between the representatives of the War Industries Board, the Shipping Board and the Railroad Administration, it was decided a few days ago that the Shipping Board, the Army and the Navy will take precedence over the railroads in demands for steel. Open hearth steel is naturally to be preferred for many forms of construction. This has undoubtedly led those departments which have precedence to ask for a large part if not all of their requirements in open hearth steel, taking almost the full output. One of the leading papers in the steel trade field stated last week that the government had so monopolized the steel output that "domestic consumers of steel and steel products will have no more chance to get steel for other than war material construction, than a fat missionary has at a cannibal feast."

It is entirely possible that an analysis of the uses for which the Shipping Board, the Army and the Navy desire steel will show that a considerable portion of the demand can be met just as satisfactorily with Bessemer steel. The use of Bessemer steel in ways such as this where it can be done without the sacrifice of safety or other important considerations will release a certain output of open hearth steel for rails and other uses where it has a marked advantage over Bessemer.

The roads supplanted Bessemer rails with open hearth steel several years ago at an increase in cost of \$2 per ton because of the greater service and security from breakage. To return to Bessemer rails at this time would be a step backward which would be expensive and involve some increased hazards. No railway man will question the advisability of taking this step with all of its disadvantages if the demand for open hearth rail steel for military purposes is really such as to make it necessary, but it is important to ascertain whether the demands of the government can not be met satisfactorily while at the same time giving the railways the open hearth rails which they need.

In solving the rail problem, attention may well also be directed to the location of the mills with reference to the point of use of the finished product. As pointed out above the only two mills which could roll Bessemer rails to advantage are located in the vicinity of Pittsburgh, although large open hearth rail mills are situated as far west as Gary, Ind., and Pueblo, Colo. At the present time when munition work is requiring such a large percentage of the steel output of the country it is well to recall the fact that these munitions move in general to the Atlantic seaboard for trans-shipment, while rails are distributed throughout the entire country. It would, therefore, appear advisable from the transportation standpoint, when the facilities of the roads are taxed to their utmost, to so place all orders for steel products (which run into tonnage rapidly) that the minimum haul will be necessary, other conditions being equal. To illustrate the conditions at present, only a few weeks ago a Colorado mill was rolling munition materials for shipment east to St. Louis at a time when a mill at Gary, Ind., was rolling rails for a road in the southeast and an eastern mill was providing the rails for a line west of Chicago. For the period of the war it would appear advisable for the government, which has assumed control of the output of the steel mills, so to distribute the priority orders that the transportation resources of the railways will be conserved as far as possible. To protect the manufacturers this will make necessary the placing of prices for all steel products upon a comparable basis.

The railways need rails. They need them badly. They should not be required to depart from their existing standards of open hearth to Bessemer steel unless necessary. The rails should be produced as far as possible in those mills nearest to the point of final use.

Letters to the Editor

Duty of the Public to Punish Trespassers on Railroads

ALBANY, N. Y.

TO THE EDITOR:

Your recent editorials on the trespassing evils have served as a much needed "clarion appeal"; only the clarion ought to be louder. There has got to be a good deal of vigorous agitation before we shall see any signs of movement in this mountain of delay, disgrace and death. The state railroad commissioners, to whom you appealed last January (page 148) are indeed neglecting their duty, unless they hammer night and day at this subject until they get the lawmakers aroused; but much more is needed. Your reference to what the New York Central has done is very much to the point. I recall the vigorous address on this subject by Mr. Dow, the general safety agent of that road, reported in your paper about a year ago.* Mr. Dow and his assistants went right to the root of the difficulty—one of the most important roots—by patiently interviewing, instructing and arousing the local magistrates along the New York Central lines in the State of New York. This is slow work, and not very inspiring; but if it is practicable and profitable for the New York Central, why not for other roads?

What is the use of going to Washington? This is a matter in which state autonomy is a well-settled principle; a principle on which all conservative men are agreed. In such a purely local matter we suspend the principle and substitute federal for state authority only because we find legislatures and state officers inefficient. But the extension of federal activities has long since made our Washington government top-heavy. (It is not a mere question of war-time emergencies.) We have a duty to avoid enlarging that unwieldy Washington machine. This is as important as to avoid building one big central railroad station for New York or Chicago which would clog its own working by its very bigness. Centralization cannot go on forever.

To put a stop to trespassing the federal government would have to appoint policemen in almost every town. Comparison may be made with the enforcement, by the Treasury Department, of the laws forbidding the illicit manufacture of whiskey. The revenue officers succeed in this only by the aid of a rigid tax law—which taxes the law-abiding as well as lawbreakers—and of a fairly strong public opinion.

Public sentiment ought to be educated in the matter of the trespassing evil; but public opinion needs such a *great quantity* of education that no man can guide the educational scheme for 48 states. It would be pretty safe to call it an impossible task. The logical way would be to concentrate on one state, say Massachusetts, or New York, and then educate by their example. The public indifference is largely based on that fundamental element in human nature which holds it right and proper that people who are ignorant, lazy or foolish should actually suffer the punishment that their ignorance, laziness and foolishness impose on them. This is brutal, but it is really what is the matter with us. To ignore this point is to misdirect our energy.

The problem, broadly speaking, is of the same class as that of the prosperous community succumbing to the temptation of helping the unwary to escape the consequences of their ignorance or wickedness. And this enterprise *always loses*. No city poor-fund is big enough to cure more than half the

*Address before the Albany Chamber of Commerce, January 14, 1917. See Railway Age, Vol. 24, 1917, page 654.

poverty and distress that the almoners would like to tackle. But while, for the reasons suggested, I believe federal activity in this line would be wrong, it is quite possible that if the authority of the cities and towns—say all the way from Albany to Buffalo—could be transferred to the state government, perhaps something might be accomplished. Everybody knows how local municipal officers have failed. Their shiftlessness is everywhere apparent. We must call in some authority sufficiently distant to be free from the influences of local sympathy; but the state capital is sufficiently distant; the federal capital is too distant.

Referring again to Mr. Dow, let us heed the lessons of his valuable experience, and go forward to accomplish the results that he accomplishes. He says that "a strict railroad anti-trespass law in every state in the Union, rigidly enforced, and augmented by a systematic campaign of education, conducted, not by the railroads alone but by some authorized public officer, to teach all persons that the law was framed for their own protection, and to save human life, and not for the mere purpose of guarding the railroad tracks against unlawful intrusion, would in time solve the problem."

This means that railroads not only have got to influence every public officer, to the best of their ability; they must strive to secure the necessary action by governors, or other state authorities, to have appointed an officer of the state who can and will inaugurate and carry on a systematic campaign of education.

W. H. BRIGGS.

Standards

LOUISVILLE, Ky.

TO THE EDITOR:

Anyone who knows anything about the manufacturing business is aware that in volume and duplication there is profit. Turning out ton after ton of the same manufactured article day in and day out, invariably means success and big dividends. Manufacturers are tickled to death when repeat or duplicate orders come in, likewise at the receipt of a requisition covering ten, twenty or a hundred thousand pieces of the identical same pattern.

Think what this means in the locomotive and car business alone, not to mention ships, etc. Small drawing force, no new engineering, an insignificant coterie of experts, no new patterns, no new designing—simply a case of order your machine numbers, one, two, three, just like a club breakfast, taking your choice by the card with little or no thought as to the details.

As an apprentice draftsman, I made many tracings of stationary tubular boilers, all of them labeled "Standard." For years they were turned out in this manner, until it seemed old Father Time would overtake me still standardizing. At that time there seemed to be a hazy understanding among us that once these standard boilers were completed the engineering force would automatically shrink. Time ran on and the standards multiplied, until we had eight or ten 60 in. boilers, ten or twelve 72 in. and scores of the smaller sizes. Slowly the deceitfulness of the title dawned upon us and we began to understand the thin significance of the word "Standard." Our force continued to increase.

When I hear standards discussed, no matter what the angle or by whom, it has the same deceitful veneering—camouflage, if you please—of the original variety. Don't misunderstand me. I am a firm believer in modern system, standard practice, etc., etc., and advocate it as far as it is practicable, but when it comes to a wholesale standardization of locomotives, cars, cranes, ships, machine tools and other ponderous pieces of mechanism, it is not to be done in this age, nor any other, except at a loss.

In order to standardize a locomotive intelligently, the conditions under which it is to operate must be considered, or

else it will most certainly have to be rebuilt to accommodate those conditions. Requiring men to accomplish daily abnormal tasks in a definite specified schedule time without the fullest consideration of the conditions surrounding them, is unreasonable, to say the least. If these things we call conditions are ever standardized then there may be some hope—otherwise, there is none. The next Herculean job is to standardize the nerve racking ubiquitous human element and compel the operators in this section to perform exactly like those in another part of the country altogether. It is quite as easy and no more unreasonable to expect a standard prescription to do for this patient what it did for the other.

Brushing aside all obstacles for the sake of argument, the outstanding, foremost, dominating objection is that mechanical genius will receive its death blow. If all bright ideas and clever designs are first to pass censorship and suffer the knife, they will lose their flavor and become stale, flat and unprofitable before they see the real light. Put a ban, if you will, on inventive genius and you knock the props from many an enterprising firm and individual and instead of progression we will have retrogression, narrowness and dry rot. Let us see to it that this excellent, well meaning thing is not perverted and run into the ground. Let us take a firm stand and say, "Thus far and no further, Mr. Standard."

MILLARD F. COX.

Who Wastes the Coal?

GREENVILLE, TEXAS.

TO THE EDITOR:

The article written by "Master Mechanic" which appeared in the *Railway Age* for February 8, in which the writer attributes a waste of coal to the delayed movement of trains caused by dispatchers, makes me think of how the different departments of a railway try to shift responsibility from one to another, when called upon for an explanation. Let some minor accident occur, such as the derailment of a few cars, not serious enough for a government investigation, and you will find the following results:

"Accident not caused by fast running."—Train and Enginemen. "Not caused by bad order cars."—Car Department. "Track in first class condition."—Track Department. "Cars properly loaded."—Station Help.

And so on down, if taken any farther, until there is not a reason on earth for the derailment. So it is with the waste of coal—lay it on some one else, if you can get by with it.

I suppose the reason for this practice is, first, fear of a reprimand, and second, each department trying to show that it is absolutely perfect; which is absurd. All make mistakes, from the management down, and this includes master mechanics and train dispatchers. But in behalf of the train dispatchers, I wish to say that after superintendents' and trainmasters' investigation of the standard delay report, which all good roads use, showing delays from five minutes up, they find the excessive delays caused by dispatchers are few, and in nearly every case can be satisfactorily explained. When a good explanation is not given, the dispatcher usually gets his—our officers are too well onto their jobs to overlook poor work on the part of the dispatcher.

Present conditions are not what they were a few years ago; we now have larger engines handling more cars than most of our side tracks will hold; this causes saw-bys. A dispatcher, to avoid a saw-by, often lays a train out at a certain point to avoid a worse delay at the point where the trains should meet if conditions were favorable.

The government has taken many men from all departments on every railway, and this has caused a shortage of help at many stations. Boys and girls new in the business are being used. This is responsible for some delays; a des-

patcher is often unable to raise the office he wants for orders; then, again, for "Safety First," he will refuse to work with an operator he has reason to fear. Many offices have been closed as far as telegraphing goes on account of the inability to secure men. This same condition exists in the engine department. A student fireman is sent out; because he is unable to perform a fireman's duties, he delays the train he is on as well as opposing trains. A despatcher cannot be responsible for these conditions.

Why do some engineers dislike to send a message advising condition of their engine when leaking a little or unable to handle tonnage, but instead will drag all the way over the division, delaying themselves and all opposing trains? This is true on many roads. Are they held responsible for a condition they cannot help? These cases are referred to just to show that there are other delays besides those caused by the despatcher.

P. CAIN.

Blunders in Handling Labor and the Solution

CHICAGO, Ill.

TO THE EDITOR:

One of the liveliest, if not the very liveliest, topic confronting the railroads and, in fact, our entire nation today is the labor problem, and, if handled with the greatest efficiency, much tact and diplomacy must be displayed immediately. The writer is a railroad superintendent whose reason for writing under the nom de plume of "Observer," is that he does not care to have the employees in different parts of the United States whom he shall mention, know that he is using their cases for illustration.

Back in the early nineties, I was a telegrapher on a Western road which had won a strike against its telegraphers the year prior to my entering its service. At the time I was employed I had no labor affiliations and paid no attention thereto, but in a few months my work took me to a joint office with another road where the telegraphers were well organized and had a very strong division in the town where I was located. I soon became a member of that division and enjoyed the association very much. Later I was transferred to another superintendent's division and the Telegraphers Journal followed me. It was here that I learned for the first time that there was any ill feeling on the part of the officers toward the telegraphers' brotherhood.

I was summoned to the superintendent's office—a fellow telegrapher had informed the superintendent that I was a dangerous character because I was an "order" man. His first question was, "I understand you belong to the Order." My answer was "Your understanding is correct." He then asked, in a bull-dozing tone of voice, if I thought a man could work for the interest of that company and belong to the Order. My answer was that I had been giving the very best service I knew how for the past two years and knew of no reason why I should not continue—that I considered an O. R. T. man could be just as loyal as an O. R. C. man or any other Order man. The superintendent himself was holding a withdrawal card from the O. R. C. After some more bulldozing and humiliation, I was allowed to return to my position with the admonition that if I ever tried to influence any of the telegraphers of that division to affiliate with the order, I would be dismissed by wire.

This was furthest from my mind, but a few years later, after I had left the telegraph service and was handling terminal stations and yards, the road was organized and I became the first chairman of the schedule committee, all because I still felt that I had been unjustly censured when I was attending to my business with no thought of disloyalty toward the company.

After our schedule was granted and I returned to my station (at division headquarters) the superintendent—one in whom I had the utmost confidence and I also enjoyed his confidence—wrote me a curt pencil note to the effect that as system chairman for the telegraphers I had been furnished a card pass, but it was not to be used for the purpose of running around and further perfecting our organization. The facts were that the only time in two months that I had used the pass was in going to a badly handled station where the superintendent had trouble in keeping help, and working almost continually for two nights and a day to straighten out some bad tangles.

These instances are mentioned merely to show how the personal feelings of officers have been allowed to build up and encourage antagonism among the working class.

Some Correct Methods

It may be that some of the raps I received caused me to be more charitable when I got to the position of "Boss." If so, I should be and am thankful therefor. Early in my career, it was my good fortune to be associated at times, with a real humane "higher up" official. One of the strongest points in philosophy he gave me was this expression: "In dealing with the other fellow, no matter what his position, always remember that he is just as smart as you are and maybe he has you beat." His contention was that if he gave him that consideration, he would not make many mistakes in handling men. In dealing with labor problems, I have since used this as my basic principle.

The first terminal station I took charge of had but one switch crew and this crew had more or less trouble through careless work. A careful analysis revealed the cause—the foreman was addicted to excessive drinking. A subscription was taken among the various men at the terminal and he was given the cure. When he returned we had a battle to keep him away from temptation. We finally won by getting him in debt for a home and interested in a garden, also the raising of blooded chickens, in other words, we got him interested in something for himself.

Later I took charge, as yardmaster, of a congested terminal in the South where we were trying to handle 2,500 cars in a 500-car capacity yard. The switchman problem was a serious one. The second week on the job a typical boomer blew in and had a clearance right from Pocatello. We will call him "Red Wilson." On account of his experience he was immediately put to work in charge of an engine. His first night on duty, he came into the yard office, about 1 a. m., and demanded his time, saying he had sideswiped a cut of cars. I asked him if he did it purposely, and he said "Of course, not." I then told him he couldn't quit until morning and to come to my office when he went off duty at 7 a. m. and talk it over.

What an interview that was. I began by asking him to tell me of his experience, which covered service on 26 different roads. Always discharged and the offences not always dischargeable ones. We formed a partnership. He was to stick to me, at least until our congestion was broken up, and I was to stay by him. He had left a wife and five children in Denver. I got passes for them and what a reunion that was. I happened to be looking out of the window of the ticket office when they arrived—a careworn little woman and babe in arms and four others, the eldest a girl of nine years. The first thing he said when he took his wife in arms was "I have found a real boss and we are going to stay here and quit roaming around." Her answer, with tears in her eyes, was "I am so glad."

Pretty soon I began to get ill. He owed at different places and it became necessary for me to appoint myself receiver for him—and it was some job. I took 40 per cent of his wages and apportioned it among his creditors and he and his wife seemed happy to think a way was being provided

to get rid of the nightmare of debt. We paid him out in 14 months, then made him buy a home with lots of garden and chicken yard space. He is there today but has three pieces of rental property beside his home.

Last Summer I was called back to that town to attend the funeral of an old friend. At the cemetery a neat looking little lady stepped up and spoke to me, saying she was Mary "Wilson" and was teaching school in a State college located at that place. It was 15 years since she had stepped off the train at that town, poorly fed and clothed. Now she was a highly refined young lady and one of our Nation's educators. When she walked away there was a feeling of pride in my breast, I could not help but think that I had contributed to that young lady's career by taking an interest in her father when he was a boomer switchman and I am satisfied the girl felt the same way about it and only spoke to me to let me know that my name was a topic in their household.

Ten years ago a yard that has since been placed in my jurisdiction, had a pretty hard name for its antagonistic attitude toward the company. The switchmen were unionized to the guards and spent a great deal of time in labor activities generally. We placed a yardmaster in charge who carried out my theory of getting all the men to own homes. You never saw such an improvement from the standpoint of wrecks and derailments. And now you never hear of one of those men taking part in union activities. They are too busy attending to their own affairs when off duty and do a better job attending to company affairs when on duty. This is the only yard I know of that operated last year—the first year of the 8-hour law—for nearly seven cents per car cheaper than the past nine year average.

It seems to me that the open forum, now being prominently mentioned in many of our leading publications, should find a large field among our railroad employers and employees as the plan provides for the employer and employee getting closer together. Surely we need that more than anything just now to insure a better understanding among ourselves.

When you can get the laboring classes to making payments on homes and saying, "This is my home," you have taken a long step toward solving the labor situation and stamping out anarchy. Therefore let us, as railroad officers, commence being our "brother's keeper" and inject just a little humane intelligence and toleration for the man in the lower rank, who, after all, may be our superior in ability were our positions reversed.

OBSERVER.

Consolidation vs. Mikado Locomotives

ST. MARY'S, PA.

TO THE EDITOR:

In the discussion of standard locomotives it may be well to draw attention to the subject of relative efficiency of the different types of ordinary freight locomotives that are in common use with regard to their weight pound for pound. The present necessity of speeding up the delivery of supplies, munitions, etc., compels us to exert every effort to make every pound of material perform its most efficient duty in the shortest time, at the least first cost and at the same time at the least cost of maintenance.

This is particularly true of locomotives required at this time. For some years past American railroads have practically adopted the Mikado type (2-8-2) as the standard type of freight locomotive; this is an efficient machine from the transportation standpoint as compared with the hauling power of smaller locomotives that it has succeeded, but it is a decidedly inefficient machine when compared with the Consolidation (2-8-0) or the Decapod (2-10-0) types pound for pound of locomotive. The writer would like to draw attention to the article appearing on page 961 of the May 7, 1915,

issue of the *Railway Age Gazette* under the title "Factor of Adhesion in Steam Locomotives" and to the contribution to "The Locomotive of Recent Developments" found on pages 109, 110, and 111 of the proceedings of the Central Railway Club of May, 1915.

Considering the Mikado (2-8-2), the Consolidation (2-8-0) and Decapod (2-10-0) types of the same weight in working order, exclusive of the tenders, the Mikado is only about 83 or 84 per cent efficient in hauling power. Comparing the three types with following approximate dimensions we have:

| Type | Mikado | Consolidation | Decapod | Loss in productive weight and tractive power in the Mikado |
|---------------------------------|---------------------|---------------------|---------------------|---|
| Diameter of drivers..... | 63 in. | 63 in. | 63 in. | |
| Weight on engine truck..... | 25,000 lb. | 22,000 lb. | 22,000 lb. | |
| Weight on drivers..... | 220,000 lb. | 263,000 lb. | 263,000 lb. | 43,000 lb. |
| Weight on trailer truck..... | 40,000 lb. | None | None | |
| Total weight in working order | 285,000 lb. | 285,000 lb. | 285,000 lb. | |
| Cylinders | 26 in. by 30 in. | 28 in. by 32 in. | 28 in. by 32 in. | |
| Approximate tractive power..... | 52,000 lb. | 62,000 lb. | 62,000 lb. | 10,000 lb. |
| Factor of adhesion..... | 4.23 | 4.23 | 4.23 | |
| Boiler pressure..... | 185 lb. | 185 lb. | 185 lb. | |
| Valve gear, type..... | Outside | Outside | Outside | |
| Superheater (same type)..... | Yes | Yes | Yes | |

Some objections have been raised to the driving axle load of the Consolidation which would be 65,750 lb., but the following prominent railroads have used axle loads as great or greater:

| | |
|--------------------|--|
| Erie Railroad..... | (2-10-2) weight on drivers 335,500 lb., axle load 67,100 lb. |
| D. L. & W..... | (4-6-2) weight on drivers 197,300 lb., axle load 65,700 lb. |
| D. & R. G..... | (2-10-2) weight on drivers 337,500 lb., axle load 67,500 lb. |
| Pennsylvania..... | (2-10-0) weight on drivers 334,500 lb., axle load 66,900 lb. |

It is to be noted that the axle load on the Decapod would be 3,400 lb. less than that of the Mikado. The Consolidation and Decapod types are approximately 20 per cent more efficient pound for pound than the Mikado; each type having the same weight (285,000 lb.). In other words, considering the three types (2-8-2), (2-8-0), (2-10-0) pound for pound and the maximum tractive power to be 52,000 lb. and the same weight on the drivers we have:

| Type | Mikado (2-8-2) | Consolidation (2-8-0) | Decapod (2-10-0) | Loss of the Mikado over the Consolidation and Decapod |
|-------------------------------|-------------------|--------------------------|---------------------|---|
| Weight on engine truck..... | 25,000 lb. | 22,000 lb. | 22,000 lb. | |
| Weight on drivers..... | 220,000 lb. | 220,000 lb. | 220,000 lb. | |
| Weight on trailer truck..... | 40,000 lb. | None | None | |
| Total weight in working order | 285,000 lb. | 242,000 lb. | 242,000 lb. | 43,000 lb. |

The weight of either the Consolidation or the Decapod (242,000 lb.) divided by the excess weight of the Mikado (43,000 lb.) = 6.63 or for every 6.63 Mikado locomotives built we lose the use of one Consolidation or Decapod locomotive of 52,000 lb. tractive power. Carrying this to a conclusion in the purchase of 2,000 Mikado locomotives we could have built 2,354 Consolidation locomotives at a gain of 354 locomotives having 18,408,000 lb. tractive power.

Again, basing the cost of the three types at fifteen (15) cents per pound:

| | |
|--|----------|
| The Mikado would cost 285,000 × .15 = | \$42,750 |
| Either the Consolidation or Decapod would cost 242,000 × .15 = | \$36,300 |
| A loss in the Mikado of..... | \$6,450 |
| —for the same amount of tractive power, viz., 52,000 lb. | |

The driving boxes, shoes and wedges, engine truck, rod brasses, crossheads, grates and many other parts can be made interchangeable with the existing heavy Mikado locomotive and at the same time eliminate the trailer truck with its attending upkeep.

Many examples of existing locomotives will show that a 63 in. driving wheel can be put under the firebox. The article in the *Railway Age Gazette* referred to above indicates that we can get sufficient wheel base to build a boiler large enough to generate sufficient steam for Consolidation or Decapod locomotives having a tractive power of 62,000 lb.

E. F. GIVIN,

Pittsburg, Shawmut & Northern Railroad.

Doings of the United States Railroad Administration

Regulation of Export Freight; Consolidation of Ticket Offices, and Other Retrenchments

WASHINGTON, D. C.

THE CAR SERVICE SECTION in Bulletin No. 12, addressed to all railroads, asks for detailed information concerning standard gauge revenue freight cars of all types and initials on their lines as of May 1, 1918, and roads are asked to take care to see that all freight cars not actually retired from revenue freight service are included. The information is desired as to the number of home cars on foreign lines, the number of home cars on line, the number of foreign cars on line, private line cars on line, and total cars on line.

Expense Accounts of Railroad Officers

The United States Railroad Administration desires that expense accounts of railroad officers be itemized with more particularity hereafter than has sometimes been the case in the past. Director Prouty of the division of public service and accounts has addressed a circular on the subject to the regional directors, who are asked to bring it to the attention of the presidents and to have copies placed in the hands of all officers who render expense accounts. It is ordered that all expense accounts must be so itemized that the nature of the expenditure can be readily understood. For example, the account must indicate how much is paid for room, and separately for meals, and transportation should be shown in reasonable detail to show the division between expenditures for railroad travel, cab hire, etc.

Regulation of Export Shipments

The Car Service Section has issued Circular No. C. S. 2-A, prescribing regulations for export shipments, as follows:

I. In accordance with the provisions of the proclamation of the President of the United States, dated February 14, 1918, effective February 20, 1918, all articles of commerce shall require an export license from the War Trade Board for exportation via any port or border point to whatsoever destination, except to points in the noncontiguous possessions of the United States.

(For Canadian shipments, the articles enumerated in list appended hereto require individual license.)

II. You will immediately instruct all concerned that the furnishing of equipment for shipments consigned, re-consigned, to be re-consigned or intended for export shall be contingent upon—

- The issuance of said license.
- The presentation of license number.
- The marking of bill of lading "For Export."
- The waybill bearing license number. (License or partial shipment authority may or may not accompany waybill, but must be in hands of Collector of Customs at point of exit on or before arrival of freight at that port.)

III. Shipper's Export Declaration, of which there shall be four copies, must be delivered to the Collector of Customs at points of exit from the United States on or before arrival of shipment at such port. For shipments to noncontiguous possessions Shippers' Export Declaration in duplicate only is required.

IV. All shipments are further subject to such regulations and permits as may be required by the various railroad committees controlling export shipments.

V. The Car Service Section of the Division of Transportation of the United States Railroad Administration is

authorized to permit the shipment of commodities intended for export prior to the issuance of an export license, if said Car Service Section shall be satisfied that there is storage room available, or that it is the custom of the trade to move such commodities to seaboard for storage or grading.

VI. With the exception of Paragraph III, the foregoing, for the present, will not in any way apply to any commodities for the exportation of which a special license has been or shall be hereafter issued by the War Trade Board, dispensing with the requirement of an individual license. Such special licenses are at present in force covering the following commodities:

- Any shipments made on Government bills of lading or consigned to the Navy Department, or War Department, or by or to any of the bureaus or other subdivisions thereof, the billing of such shipments to be marked "Export License RAC-18."
- Raw cotton shipped to Great Britain, France, Italy, or Japan, and their colonies, possessions, and protectorates. (Not Sea Island or Egyptian cotton, which requires an individual license.)
- All shipments of coal or coke.
- Shipments to Canada and (or) Newfoundland of all commodities *not* on the Export Conservation List of the War Trade Board, as appended hereto, unless otherwise specified therein.
- Shipments to all countries, other than Canada and Newfoundland, of all commodities *not* on the Export Conservation List of the War Trade Board, provided that value of no one commodity in the shipment exceeds \$100.

VII. That a shipment from one consignor to one consignee, which shall exceed one carload, and which is intended for export, will only be permitted with the provision that the car or cars are loaded to full visible or carrying capacity.

Ticket Offices Consolidated

Director General McAdoo has announced that arrangements have been made for the consolidation of city ticket offices in the following cities in the eastern region:

| | |
|----------------------|--------------------|
| New York City, | Reading, Pa. |
| Boston, Mass. | Williamport, Pa. |
| Philadelphia, Pa. | Newark, N. J. |
| Baltimore, Md. | Cincinnati, O. |
| Wilmington, Del. | Columbus, O. |
| Pittsburgh, Pa. | Detroit, Mich. |
| Atlantic City, N. J. | Dayton, Ohio |
| Buffalo, N. Y. | Chapel Hill, N. C. |
| Syracuse, N. Y. | Indianapolis, Ind. |
| Rochester, N. Y. | Toledo, Ohio |

There will be five offices in Greater New York—four on Manhattan Island located as follows: 66 Broadway, Stewart building on Chambers Street, facing City Hall Park; somewhere in the lower 80's in the hotel district in that section; No. 114 W. Fort Street, and one office in Brooklyn on Fulton Street, the present offices of the Pennsylvania and New York Central. The rental of the offices vacated in these cities is approximately \$1,070,000 per year. The rental of the consolidated offices will be \$213,200 per year.

Arrangements are also being made to consolidate the offices in Chicago, St. Louis and Louisville. These are border line

points and require joint action on the part of the Eastern and Western districts. Similar consolidations will be made in the Western and Southern districts, and will be announced later.

Committee on Mail Transportation

The Railroad Administration has appointed a committee on mail transportation, reporting to the division of traffic, with Guy Adams, mail traffic manager of the Union Pacific system and chairman of the committee on railway business mail of the American Railway Association, as chairman. The committee is to study the entire subject of mail transportation and one of its purposes is to effect a greater degree of co-operation between the railroad mail service and the post office department. At the request of the Postmaster General, Rudolph Brauer, superintendent of the railway mail service at Omaha, has been appointed a member of the committee, and the other members are G. P. Conard, secretary of the Association of Transportation and Car Accounting Officers, who was also a member of the committee on railway business mail; H. L. Fairfield, manager of mail traffic of the Central of Georgia, representing the southern region; J. C. McCahan, Jr., manager mail traffic of the Baltimore & Ohio, representing the eastern region; and H. T. Mason, manager of mail traffic of the Frisco lines. The committee has its headquarters in the Southern Railway Building at Washington. The announcement says: "It is expected the committee will accomplish important economies and efficiencies in the handling of mails on the railroads.

Guy Adams was formerly in the railway mail service in the post office department and for 20 years has been connected with railway mail service on roads in almost every part of the country. In this work he has been associated in one way or another with the installation of many of the important fast mail trains. He was born on December 5, 1868, at Abingdon, Ia., and was educated in the common schools. He entered railway service in 1882 as a messenger in the trainmaster's office of the Chicago, Rock Island & Pacific, and from 1884 to 1892 he was railway postal clerk. From 1892 to 1896 he was manager of the Rocky Mountain Official Railway Guide at Denver and from 1896 to 1898 general passenger agent of the Union Pacific, Denver & Gulf, and Denver, Leadville & Gunnison railroads. He was later traveling passenger agent of the Lehigh Valley, general agent of the Chesapeake Beach, and traveling passenger agent and division passenger agent of the Delaware, Lackawanna & Western. From 1904 to 1912 he was manager of mail traffic of the Chicago, Rock Island & Pacific at Chicago; from January 1, 1912, until December 1, 1913, manager of mail traffic of the Frisco lines, and since December 1, 1913, has been mail traffic manager of the Union Pacific.

A short time ago Mr. Adams gave 40 acres of a ranch in Colorado and organized the Railroad Men's Mountain Home Association to build a recuperation camp for convalescent soldiers and sailors who were formerly in railroad service.

Guy Adams

Car Shortage Reports Discontinued

The monthly reports of car surpluses and shortages which have been compiled and published monthly by the American Railway Association since 1907, with the exception of a brief period when they were discontinued from motives of economy at a time of a large surplus, have now been discontinued at the instance of the Railroad Administration. While it has generally been considered that the report was a valuable barometer of the state of car supply, at least as reflecting comparative tendencies, it has also been regarded as an imperfect reflection of the exact conditions and the semi-monthly bulletins now compiled by the Car Service Section of the Railroad Administration showing the percentage of freight cars on lines to ownership, by individual roads and by groups, together with more special reports which are received, are considered to afford a better index of conditions. The shortage and surplus reports were regarded as defective for the reason that in times of shortage a shipper would frequently place orders with several roads at the same time in the hope of obtaining cars somewhere and the order would, therefore, be duplicated in the total shortage report. Also a surplus and a shortage would be shown at the same time on one road when at the time of compiling the report the surplus cars were in transit to fill orders.

Since the government took over the railroads the A. R. A. figures have not been published but they were compiled for January 1, February 1 and March 1, and showed net shortages on those dates respectively as follows: 89,995, 98,044 and 138,102. At present, according to reports received by the Car Service Section, the car supply situation is much easier than it has been for some time and except in a few localities shows a general recovery from the condition of last winter.

Freight Traffic Committee

A committee to control freight traffic passing through Potomac Yard, Va., Hagerstown, Md., and Hampton Roads, Va., has been appointed by the division of transportation of the Railroad Administration. The committee is to secure all necessary reports covering traffic through these gateways or held for any of them on account of congestion; will give particular attention to the handling of freight for the government, recommending any measures that will facilitate its movement, and will decide upon all embargoes affecting traffic passing through these gateways, placing them through the regional directors and keeping the Car Service section constantly advised. The members of the committee are: George R. Loyall, assistant vice-president of the Southern Railway, chairman, O. H. Hobbs, H. Billings, and E. T. Wilcox.

Advances to Railroads

The \$500,000,000 revolving fund appropriated for the Railroad Administration by the railroad control law has already begun to serve its purpose. The first large withdrawal from the fund was \$43,000,000 advanced to the New York, New Haven & Hartford to protect its maturing obligations, and since that time advances of various amounts have been made to roads which find themselves in need of small amounts to meet approaching maturities or for other purposes, because the amount of compensation which they are to receive from the government is still undetermined, pending negotiations on the form of contract. The advances in most cases are made as installments for account of compensation and are secured by collateral.

Car Service Section

The Car Service section has issued Bulletin 9-A superseding instructions in Bulletin 9 which conflict with the following: "Until further advised you will handle the

following private line refrigerator cars as hereby directed.

"Pacific Fruit Express cars will be delivered to the Union Pacific System, Southern Pacific (Pacific System), or as directed by the officers of the Pacific Fruit Express Company.

"American Refrigerator Transit and Dairy Shippers' Dispatch cars will be delivered to the Wabasha, Missouri Pacific, or as otherwise directed by the officers of the American Refrigerator Transit Company.

"Union Refrigerator Transit cars in series 1000 to 1999 inclusive to the Illinois Central, and series 40,000 to the Illinois Central or Mobile & Ohio, as most convenient. All other Union Refrigerator Transit cars to roads operating in Wisconsin.

"Fruit Growers' Express cars should be returned to the Atlantic Coast Line and Seaboard Air Line for fruit and vegetable loading.

"Santa Fe Refrigerator Dispatch cars should be deliv-

ered to the Atchison, Topeka & Santa Fe, and Frisco Refrigerator Line cars to the Frisco, or in accordance with directions of the officers of these companies."

Bulletin No. 13 has also been issued saying: "Because of the increased demand in connection with the war program for raw materials which are required in the manufacture of artificial ice, there is likely to be some curtailment in the supply of these commodities making it more essential that all practicable demands for transportation of natural ice shall be met. Will each railroad take such action as is necessary to give this question full protection."

Protection of Railroad Property

Daniel B. Leonard, of Parkersburg, W. Va., has been appointed attorney for the Section on Protection of Railroad Property, and has been assigned to Toledo, Ohio, where a large number of cases of pilfering from freight cars has been discovered.

Minnesota Track Scale Specifications and Tolerances

Rules Adopted by the State Railroad and Warehouse Commission Contain Some New Provisions

THE MINNESOTA RAILROAD and Warehouse Commission has adopted specifications and tolerances for railroad track scales which become effective December 1, 1918, and which represent a large amount of constructive work on the part of the department of weights and measures in co-operation with the railroad scale manufacturers and the United States Bureau of Standards. Following the passage of a statute in 1907 placing track scales under the supervision of the state railroad commission, steps were taken to inspect them and a test car was purchased. The testing of scales throughout the state brought to light an unsatisfactory condition of affairs. It was found that few scales in the state were built on the same plan, foundations were commonly inadequate and the weighings were frequently far from accurate. In an effort to improve conditions the first

manufacturers, particularly as to the manner of rating the capacities of scales, the formulation of a complete specification was urged in some quarters and after a study of the subject, in co-operation with the various associations of men interested in scales, a draft of a second specification was prepared in 1916. This was submitted to the railroads and the manufacturers and to various experts, and finally to the Bureau of Standards. After various hearings and revisions, an amended draft was submitted to the Railroad and Warehouse Commission which adopted it on November 6, 1917, to become effective on December 1, 1918. The specifications are based to a certain extent on those prepared by the United States Bureau of Standards, but go into greater detail. Important features of these specifications and items which differ from those contained in the specifications of the Bureau of Standards and features more or less new are abstracted below.

Abstract of Specifications

CAPACITY

Capacity Defined: "The capacity of the scale shall be construed to be 'equal to the weight of the heaviest loaded car it will weigh, provided that it will support a train of such cars passing over it without stresses being developed in the members thereof, which are in excess of those herein specified.' The scale weigh bridges and dead rail beams, when used, shall be deemed to be included in the term 'in the members thereof.'"

Capacity Required: The scale shall have a capacity of at least 200,000 lb. (Following this a set of rules and formulae is given, indicating the methods by which the various parts of the scale may be investigated. The working stresses are the same as those given in the Bureau of Standards Specifications.—Ed.)

SCALE LIVES

Finish. The finished levers shall follow the pattern lines, as far as practicable, and shall not be unduly warped from those lines; they shall be free from blisters and large sandholes and other imperfections, and shall be brought to a reasonably smooth finish. Levers that are to be equipped with nose irons shall have those portions of the lever ends,

Manner of Applying Steel Weather Strips to Live Rails

step taken was the drafting of the first Minnesota foundation and scale setting requirement, which became effective November 13, 1912. A weights and measures department was created in the meantime, which assumed supervision over all weighing and measuring devices in the state.

Discussions of these preliminary requirements led to questions as to the strength of the weigh bridges, which, after conferences with the engineers of the railroads and the scale manufacturers, resulted in the adoption of the requirement that the strength of weigh bridges and cross I-beams should be determined by the engine loading. This was amended further in 1914 with requirements covering concrete construction.

Owing to a lack of uniformity in the practices of the scale

receiving them machined for the full distance over which they are to move.

SCALE PIVOTS

Material: Scale pivots shall be manufactured from high carbon steel or special alloy pivot steel, which will give, when tempered, a maximum toughness, combined with that degree of hardness, that will insure the least wear under the heaviest loads to be applied.

Design: All pivots shall be designed and manufactured so that the two sides joining to form the knife-edge shall form an angle that will not exceed 90 deg., the sides of which shall be as nearly equal in length as possible.

NOSE IRONS

Design: The design of the nose irons shall be such—(a) That the clamp screws or bolts will not make indentations in the lever, and shall be independent of the means provided for adjustment; (b) That these screws or bolts shall force and hold the nose iron against the lever in the same direction as it would be forced by the load; (c) That the movement of the nose iron shall be controlled by means of machine screws of United States standard size and thread, and be made from a non-corrosible material.

BEARINGS, BEARING BLOCKS AND LINKS

Material of Bearings: (Same as for pivots.)

Mounting: All bearing steels shall be separable and interchangeable, and shall be firmly fastened in their respective

Front Elevation.

Ground Plan.

Standard Scale Beam House

seats in means of non-corrosive set screws of United States standard size and thread or other suitable means of fastening which will prevent their movement except for renewal. The use of interchangeable blocks that are self-aligning having bearing steels fastened therein in accordance with the foregoing will be acceptable.

LOOPS AND CONNECTIONS

Design: They may be of any type desired, provided the radius of the portion of the bearing making immediate contact with the knife-edge and the radius of the eye of the loop

shall not be less than the length of the longest side of the cross-section of the pivot to be used in the loop.

WEIGHING BEAM ACCESSORIES

Main and Fractional Poises: The poises shall be designed so as to present the least number of recesses or projections in or on which dust or dirt may accumulate. Rollers or other means should be provided to secure as free a movement along the beam as possible. On type-registering beams the fractional poise shall be equipped with means to insure a positive stop at any 20-lb. notch, and a shoulder stop shall be provided to prevent the movement of the fractional bar beyond its proper travel in either direction. A substantial double hand grip shall be provided to facilitate the printing of the weight ticket with the least possible disturbance of the beam.

Marking: Each beam shall be given a serial number, which shall be stamped on the beam. The pivots and all

Elevation and Section of an Automatic Ventilator for Scale Deck

poise parts shall have stamped on them identification marks to show to which beam each belongs, and the pivots shall also be marked to indicate the proper position in the beam.

Beam Fulcrum Stand: The beam shall be set, or supported on the beam fulcrum stand provided with compensating bearings, and shall not be suspended or hung from hooks or supports.

Finish: The base of the stand shall be machined to the plane perpendicular to the axis of the upright portion of the stand and shall be suitable for the capacity of the scale in which the stand is to be used.

Trig Stand Loop and Beam Clamp: The trig loop and beam clamp shall be made of a non-magnetic material. The play of the beam in the trig loop shall be two per cent of the distance from the trig loop to the knife-edge of the fulcrum pivot.

Type of Weighing Beam: Scales that are to be used for spot weighing of cars or carload freight shall be equipped with a type registering beam of a capacity that will enable the entire load to be weighed in one draft without the use of additional weights of any kind. Scales that are to be used for motion weighing of cars or carload freight, either by hand, or by the use of an automatic recording device or machine, shall be equipped with a beam suitable for that purpose, and the beam and machine (if used) shall both be approved by the department before the scale may be placed in service.

ANTI-FRICTION POINTS AND PLATES

Material: Hardened steel anti-friction points and contacts shall be provided to limit the lengthwise displacement of the pivot knife-edges on their bearings.

Design: Plates carrying the anti-friction points shall be securely attached to the levers. Hardened, smooth surfaces to oppose the anti-friction points shall be formed on the bearings. The construction and application of these points

and contacts shall be such that the contact that may be made between them shall be on the line of the pivot knife edges, and will produce a minimum of friction. The clearances between the anti-friction plates and the anti-friction points shall not exceed $\frac{1}{8}$ in.

TOLERANCES

The tolerance to be allowed on the test of all new railroad track scales shall not exceed 0.025 per cent of the test load applied. The same tolerances shall not be exceeded on the test of all railroad track scales over which grain or oil are to be weighed.

Commercial Scales. The tolerance to be allowed on the test of all railroad track scales used for the weighing of cars or carload freight (except grain and oil) shall not exceed 0.1 per cent on the test load applied.

FOUNDATION

Depth: (a) All foundations must extend to at least nine feet below the surface of the ground, and shall include a concrete mat at least two feet in thickness, formed to and upon which shall be set the side, end, neck, and approach walls, except where solid rock formation is found at a depth of less than nine feet. (b) The pit floor shall, in all cases, be cemented over with a smooth coat of cement mortar with a pitch provided to a common point of drainage to prevent the formation of pockets in which water might stand.

SCALE BEAM HOUSE

Dimensions: A suitable and substantial scale beam house shall be provided. The minimum width of the house shall be four feet, inside measurement, and the minimum length shall be sufficient to allow for the installation of a full-sized beam shelf and regulation beam of the proper capacity for the scale. It shall be provided with front and corner windows, the construction to be such that no part of the beam shelf shall make a contact with the ends or front of the scale house. The windows shall be of a sufficient size and shall be placed with the lower edges about on a level with the top of the beam shelf, so as to give the weigher a full view of the scale and car when he is handling the beam.

WEIGH BRIDGES

Platform Ties: The live rail platform ties (weigh bridge ties) may be made up of sound body timber of the hard variety, or of steel I-beams, or of cast steel, stand and tie combined cast in one piece. If the scales are to be used for motion weighing, no wooden ties may be used.

Live Rails: Scale rails shall be continuous without splices or joints. These rails shall be securely bolted to the cast iron pedestals, or fastened to them by means of malleable iron clips. If fastened by clips, each rail shall be equipped with not less than six rail anti-creepers, three spaced each way from the center.

Clearance Along Live Rail: The clearance along the live rail pedestals shall be two inches, which opening shall be protected from the weather and from dirt.

Steel Weather Strips: Steel weather protecting strips cut into lengths of not more than five feet, made from $\frac{1}{4}$ -in. steel, $\frac{7}{8}$ in. in width, shall be provided to protect the scale from the weather and dirt.

Motion Weighing: (a) On scales equipped with automatic recording machines for the motion weighing of cars or carload freight, "transfer rails" or "easer rail joints" of a type to be approved by the department shall be provided to introduce the load to the scale without undue impact.

(b) For motion weighing in train order, where cars or carload freight is to be weighed coupled and under engine control, electric signal targets shall be placed at least two train lengths from the end of the scale to indicate to the engineer the proper speed for the train. These targets shall

be provided with three different signal lights and boards to indicate: "Correct speed," "Speed too fast" and "Speed too slow." The control for these signals shall be arranged so that they may be operated by the weigher, while he is doing the weighing, without leaving the beam.

DEAD RAILS AND CAR PULLER

Dead Rails, When Required: (a) When the scale track is connected at both ends. (b) When a car puller is not used to handle cars over the scale and the scale is not located at the end of a stub track. (c) Dead rails to be constructed to same elevation as approach and live rails.

Dead Rails, When Not Required: (a) When the scale is located at the closed end of a stub track. (b) When a car puller is used to handle cars over the scale.

LIGHT, DRAINAGE, VENTILATION AND CLEANING

Light: Sufficient light for a proper lighting of the scale weighing beam, scale house, scale deck and scale pit shall be provided.

Drainage: Scale pits must be kept free from water. Where possible to construct it, a drain shall be installed, connected through a water-sealed trap to a sewer, cess-pool, or to an outlet to natural drainage. In all other cases the drain shall be connected to an outside water-tight cistern, which shall be kept pumped out.

Ventilation: (a) All scale pits should be ventilated to meet the needs of each particular case, the object being to have the least possible amount of moist air in the pit, to prevent rusting of scale parts and structural steel. (b) (Suggestion by Bureau of Standards:) "One opening, or set of openings, shall be made in the deck of the scale, which are to connect with flues which terminate near the bottom of the pit, and that another opening, or set of openings, be made in the neck in the ordinary way." (c) We suggest a ventilating pipe be extended upward from the opening in the neck to the top of which pipe there be connected a ventilating hood, or jack, similar to the one shown in the drawing.

PROTECTION FROM CORROSION

Painting: All metal parts of the scale and all structural steel shall be painted with not less than two coats of paint before delivery for erection, or before being assembled and erected. All surfaces coming into contact, where such surfaces are to be riveted together, shall be painted before being riveted.

Material: The material for the paint specified above shall conform to one of seven formulas and specifications; [given in the report.—F.I.]

We are indebted for the above information to W. E. Thompson, supervisor of scales for the State of Minnesota, who has been largely responsible for the preparation of the specifications attached above.

BRITISH FLIERS WICK FOUR GERMAN TRAINS—The statement on aerial operations issued by the British War Office at London on April 20 says: "There was no improvement in the weather on Friday, but a certain amount of flying was done between storms of rain and snow, and reconnoissances were carried out at low heights. Four and a half tons of bombs were dropped on the T. 1 railway station and ammunition dumps and targets in the battle area. Only a few indecisive combats occurred in the air. None of our machines is missing. After dark our night flying squadrons were very active. Sixteen tons of bombs were dropped on Armentieres, Warneton, Estaires, Bapaume and the Chaulnes railway junction. Direct hits were observed on four trains, one of which, judging from the explosion that was caused, was undoubtedly full of ammunition. All our machines returned safely."

The Southern Pacific's Snow Shed Problem

THE MAINTENANCE of uninterrupted operation through the Sierra Nevada mountains with a maximum annual snowfall of 65 ft. has led the Southern Pacific to spend over three million dollars in the construction of 29 miles of snow sheds in a total distance of less than 30 miles. A brief history of the development of these sheds and of the problems involved in their maintenance was contained in a paper prepared by George W. Rear, general bridge inspector of the Southern Pacific at San Francisco, Cal., and published in the Proceedings of the American Railway Bridge & Building Association for 1917, just issued, from which the following information is abstracted.

The following figures show the annual snowfall at various points along the line of the Southern Pacific where it crosses the Sierra Nevada mountain.

| Station | Elevation | No. years record | Average seasonal snowfall |
|--------------|-----------|------------------|---------------------------|
| Blue Canyon | 4,695 ft. | 14 | 17 ft. 3 in. |
| Cisco | 5,939 ft. | 33 | 30 ft. 10 in. |
| Emigrant Gap | 5,230 ft. | 29 | 23 ft. 7 in. |
| Summit | 7,017 ft. | 44 | 35 ft. 0 in. |
| Truckee | 5,819 ft. | 35 | 16 ft. 0 in. |

Truckee is at the eastern base of the range and gets less snowfall than stations at the same elevation on the western slope. This is due to the fact that the clouds move easterly from the Pacific coast and drop their moisture before getting over the range. The moisture is deposited in the form of rain to an elevation of about 3,500 ft., snow seldom extending below that height in this latitude. The maximum snowfall at Summit occurred in 1879-80 in which year 65¼ ft. fell, but this record was nearly reached again in 1890 when 64 2/3 ft. fell.

This snow falls in a period of about three months and very little goes off during the winter, but it keeps settling down until the average depth on the level is about 15 ft., although 26 ft., has been measured on the level many times. This makes the snow very heavy, with streaks of ice in it, and it is hard to handle with plows. Rotary plows are used in the territory at each end of the sheds where the snow-fall is less. On certain slopes and in certain canyons the snow piles up to great heights, well onto 100 ft. deep.

The snowsheds in this territory are built of wood and are of two general types: (1) Those designed to keep snow off the track only, (2) Those designed to convey snow and snow-slides over the track. There are 30 miles of these sheds in all, covering a territory of about 40 miles, there being some breaks near the lower ends where the snow-fall is less and where sheds are used in cuts only.

The first sheds were built in 1868, the frames being constructed of round timber cut alongside the track and the heathing being cut in neighboring sawmills. They were of the pitch roof type and had the fault of crowding out of line when unevenly loaded with snow and were extremely hard to restore to line. The vertical clearance was only 17 ft. in 1868, but this provided nearly as much clearance above the cars as our present 22 ft. does above modern cars.

The sheds were no sooner built than complaints were made that they shut off the view and many efforts were made to overcome this objection. Windows were put in at the most interesting points and shutters that could be opened in the summer were tried, but for one cause or another all had to be abandoned, until the scheme of placing vertical slats something like a picket fence opposite the car windows was adopted. They are now put in wherever possible, except of course, where there is nothing to see in any case. This arrangement provides the maximum view and yet keeps out the snow.

When it became necessary to renew some of the sheds, the present flat roof type was developed and this has been in

successful use for many years. One of its principal advantages is the ease with which it can be lined up if crowded over by the weight of snow slides.

There are approximately 100 million feet of lumber in these sheds and outside of damage from fire, their life is about 27 years. The fire risk is somewhat great, largely as a result of fires started from the outside. The large timber has been cut in this neighborhood but there is considerable brush, which takes fire, usually from fires left by careless campers. While the risk is, thus, somewhat great, the fire loss is small, owing to the precautions taken to prevent its spreading.

In the longer stretches of the sheds, telescoping sections 100 ft. long are built as often as feasible. These sections are mounted on wheels and are rolled back into enlarged sections of the adjacent shed during the summer, making a break of 100 ft. These telescopes divide the sheds into short sections, so that no great length is liable to burn at one time. It should be understood that a fire in these sheds burns the track ties and bends the rail in knots, destroying not only the shed but the track also.

To detect fires, a system of patrols is maintained, each patrolman reporting at an alarm box every hour. These alarm boxes are a little less than a mile apart and each report is registered automatically on a tape which is under constant observation at Summit station and is duplicated in the roadmasters' office at Truckee. When an alarm is rung in, the nearest fire train is notified and the main line is cleared of traffic. (The line is single track but, with sidings every two miles, little time is lost in getting trains into clear.) There are four fire trains in service during the summer, each consisting of a locomotive, a pump, and two water cars, having capacities of about 20,000 gal. These trains are constantly under steam and ready to start on an instant's notice. The locomotives are equipped with high pitched whistles, which are blown almost continuously while the trains are running, enabling workmen to get out of the way. It is reported that no fire has yet gotten by the fire train after it arrived at the scene of the fire.

In addition to these precautions a lookout station is maintained on Red Mountain at an elevation of 7,860 ft. from which point almost all of the 27 miles of the sheds can be seen, there being only two small sections hidden by spurs of the mountain range. At this lookout station two men are on constant watch, reporting by telephone every half hour. They have an engineer's transit mounted in their cabin, to which is attached an aluminum pointer which travels over a chart attached to a stand in front of the transit. There is also a line etched on the bay window of the cabin, which shows the lines of the sheds as seen through the transit. By training the transit on the fire the indicator will point out exactly what part of the shed is on fire or nearest to the fire, if it is not actually in the sheds.

These sheds are built to sustain 25 feet of snow, weighing 25 lb. per cubic foot, and, as the territory through which they pass has very little wind, and the snow is soft and sticky, great loads of snow rest on the sheds, especially in cuts. Some trouble was experienced in early years owing to the snow combing and extending a considerable distance out from the edge of the roof. This was overcome by nailing vertical boards about 8 ft. apart extending about 8 ft. above the eaves. In this range of mountains there are some snow slides, which usually carry with them large boulders. Where they are likely to occur special types of sheds with sloping roofs are provided.

SCOTTISH FISH TRAFFIC.—For the fish traffic carried by the Great North of Scotland from the middle of last June to the middle of September, 406 special trains with a total of 8,830 trucks were required.—*The Engineer, London.*

Grand Station, Rome, Italy

Italian Railways Under Government Management

The Value of Unified Direction Exemplified as a War Measure During Three Years of Struggle

By Our Special European Correspondent

HAS GOVERNMENT MANAGEMENT been justified in Italy, and particularly by the handling of the transportation situation during the war?

This question may be answered in the affirmative from the point of view that Italy's railroads really have done a great war service, have held together, and are still running after three years of mauling, of wear and tear. The question of whether they might have done better under private management on less money becomes absolutely academic in the light of the stake involved—the fate of the Italian nation. The result before us is that so far they have kept going, have never failed the nation—and no more can be asked.

Before writing this article I went one sunny winter's day to the chief of the operating department to ask him a few questions. This chief I found a very cool, pleasant-faced man standing over a desk piled up with telegraphic slips.

"If I had coal, these protests wouldn't be here!" he exclaimed, waving his hands lightly over his desk in comic-tragic despair. "They want me to move troops and freights all over Italy, and you can't run steam locomotives without coal, can you? It's been this way ever since the war began. You're an American. Can't you persuade your government to send us coal?"

The history of railroading does not give another example like that of Italy during this war. For nearly four years her railroads have been operated on an ever decreasing coal supply. The case of Russia cannot in any sense be compared to this, because so many other elements entered in railroading conditions there. In Italy every technical and financial phase of operation has been weekly, if not daily, subject to the sole consideration of her coal supply. Trains

have frequently been run empty for long distances because there was no coal to run them loaded, and yet the cars, of military necessity, had to be at a given point at a given time. Engines have been laid up, idle, because there was no coal to run them. Trains have run at a ten-mile an hour speed because it took more coal to run them rapidly.

Before the war Italy, herself having no coal, imported some 10,000,000 tons, mostly from England. About one-third of this coal was used by the railroads and two-thirds went into industry and commerce and into the heating of private houses. By degrees that supply has been cut down, partly because the less coal used the more money kept in the country, and partly because enemy submarines have made coal importation by sea hazardous. At present (March) Italy is getting about 10,000 tons of coal per day, by hook or crook, or about one-third of her importation before the war, and this coal is of such poor quality as to be injurious to locomotives. All of her short line railways have been stopped or their schedules reduced, main line trains are running but with military freight having the right of way and passenger trains are crowded until the aisles are jammed and even standing room at a premium.

The coal situation is the only condition that has prevented Italy's railroads from giving in war times the same service as before the war. When it is remembered that the war has revolutionized many aspects of railroading, particularly as to carrying unexampled quantities of freight, of troops, and of performing these functions under peculiar conditions, the weight of this statement will be understood.

The whole question of government ownership, so far as general Italian opinion is concerned, is that Italy's railroad's

were better run before 1905, under the private companies, but that for this war it has been better to have them under government control. Italy is a free country, with much liberty of expression of opinion, and it is frequently regretted that before the war the private companies with their faster passenger trains and quicker freight deliveries, had not retained their management.

For war, however, the only solution is government control, and in European countries of near frontiers, with a possible enemy ever just over the border, government management of so powerful a war arm as the railroads must be maintained in peace times. In peace times there is too much political interference with the operation and management of all phases of the roads. Congressmen and senators have too many henchmen to please, have too many voters to satisfy among the employees, and when this is not the case they interfere in technical matters with impractical ideas when they do not speculate in railroad contracts and supplies.

From a war point of view there is also the danger of foreign powers using their moneys and influence to obtain control in peace times of this all-important military arm. On all the railroads of Europe Germany had her fingers, both financially and through her secret agents in the operating departments. As regards Italy's railroads, for instance, in the spring of

and foot, with all the inevitable expenses accompanying government employ, it is claimed that government ownership of railways has been and is the best plan for Italy.

Railroad Conditions Peculiar to Italy

In order to understand what has happened and is happening in Italy from a railroad point of view, I think it is necessary to tell a few salient elementary facts about the country itself, about the people, about national finances, about the war's conduct, and other national conditions with which the management of a railroad and its prosperity and efficiency must necessarily be linked.

Right off, it must be understood that Italy is not a rich country according even to European standards, and is a very poor country according to our conceptions of wealth. We Americans frequently forget how rich we are, rich in timber, water, soil, mines, climate, natural advantages over and natural protections from other peoples the like of which cannot be found elsewhere on the globe. In our pride we sometimes forget that it is the land we live in which is responsible for our prosperity rather than the people who have developed all this. It takes living abroad in war time, when nations in Europe are staking their freedom, their very existence, on a few paltry hundreds of tons of coal, or of iron ore, or of grain to realize how fully we are blessed with all these things. If we had had to go into this war lacking so much, as did Italy, we as a people might have tried to squirm out of it as a bad business, or having gone in, we might not have accomplished as much and with as light hearts as have the Italians.

From the point of view of Europe, Italy's national wealth is rated at somewhere around fifth in the list. The old pre-war figures used to be 20 billion dollars, with France 50 billions, Germany 80, England, Scotland and Ireland at 85, Russia 40, Spain 5½, and Switzerland 4 billions. The old estimated wealth of the United States was 200 billions, or ten times that of Italy. In the light of war financing, it is difficult to state just how poor any nation is. In measures of dollars Italy has already spent 5 billions on the war, about one-fourth or one-third of her previously estimated national wealth and there are those who claim she is about as rich as usual, with every prospect of doing well industrially if the war ever stops.

It has always been the kind of people who have inhabited Italy that have given her the importance she has always enjoyed. In ancient times, as at this very hour, Roman soldiers were fed on food from abroad. Then it happened to be the fertile Nile countries, now it is America. These people of to-day, however, are far different from the Romans. For one thing the Romans were severely just when not atrociously cruel, whereas the Italians are kind-hearted to a fault, careless of money, indifferent of social values, and yet liberty loving, proud as Romans, as jealous of freedom. This is why Italy can hardly ever become a Russia, why she is now bearing up under the immense strain occasioned by the military losses of last fall.

Geographically Italy is well located as an exchange transportation center, and as she was once rich four or five centuries ago, she will again be rich for the same reason. However, her area of land is a little less than the size of the States of Kentucky, Tennessee and Ohio, or a little more than that of Wyoming. With a population of 35 millions, her soil for agricultural purposes is on the average not so rich at its best as that of Kentucky, and her many mountains contain nowhere any of the coal, oil, iron and zinc treasures of Kentucky. Geologically, Italy came late upon earth, as indicated by her volcanoes. Her iron ore production is a meagre million tons a year, her lead and zinc but a quarter of a million, and she has neither oil or coal, those essential handmaidens of industry and transportation. During the

The State Railroads of Italy

1916 a great quantity of German-owned securities was turned back to the Italians, the Germans having need of money, and feeling no longer the need of such ownership. The securities were transferred through neutral Switzerland, and, it is stated, were for the most part picked up by the Italian government which, it is also said, will in the future exercise a closer control over the sale of her railroad securities. In passing, it may be pointed out that these securities have dropped but 25 points under their sales value of 1914, which indicates what the Italians think of their railroad securities as guaranteed by the government.

With all the hardening of the arteries that belongs to governmental conduct of affairs, with all the horrible and irrevocable inefficiency of the government bureaucrat, with all the dodging of responsibility which ends by tying systems hand

war some 15 million tons of lignite have been dug up, but it is so rich in sulphur and so poor in combustion that it is a purely war substitute.

Politically the Italy of today is hardly 50 years old. If one could forget the background afforded by her ancient history, the material refinements of the Middle Ages, the marvels of her architecture, the wonders of her art of past centuries, the Italy that existed four years ago might have been compared, materially, with any one of our old Southern States, where life ran along easily, was pleasant, with railroads tolerated and industry regarded as a vulgar Northern product.

Government ownership of railways in Italy has always been a political, as well as an industrial necessity. Politically, Italy has been rent by internal dissension for the past 1,500 years, with every city and every hilltop feared against its neighbor, and without any visible outward symbol to point out the necessity of union. Without going into the story of how Napoleon dreamed of uniting Italy, of how many patriots dreamed this dream until it came true after Garibaldi, during our Civil War, and particularly during the Franco-Prussian War, it may be stated that this union has been

coming from Austria, the old mistress of the Venetian provinces, that a change be made. The political effect of holding provinces together by good roads and rapid means of communication was one of the secrets known and applied by the Romans. The old truth was remembered by the new rulers of united Italy, who at once began improving the various railroad lines, spending money that was sorely needed in other directions. Mark Twain did not understand the truth and said so when he was in the year 1867, visiting Italy of those days. "There are a good many things about this Italy which I do not understand, and more especially I cannot understand how a bankrupt government can have such marvels of turnpikes. Why, these latter are as hard as adamant, as straight as a line, as smooth as a floor, and as white as snow. And yet no tolls are charged.

"As for the railways, we have none like them. The cars slide as smoothly along as if they were on runners. The depots are vast palaces of cut marble, with stately colonnades of the same royal stone traversing them from end to end, and with ample walls and ceilings richly decorated with frescoes. The lofty gateways are graced with statues, and the broad floors are all laid in polished flags of marble.

"These things win me more than Italy's hundred galleries of priceless art treasures, because I can understand the one and am not competent to appreciate the other. In the turnpikes, the railways, the depots, and the new boulevards of uniform houses in Florence and other cities here, I see the genius of Louis Napoleon, or rather I see the works of that statesman imitated. But Louis Napoleon has taken care in France there shall be a foundation for these improvements—money. He has always the wherewithal to back up his projects; they strengthen France and never weaken her. Her material prosperity is genuine. But here the case is different. This country is bankrupt. There is no real foundation for these great works. The prosperity they would seem to indicate is a pretence. There is no money in the treasury, and so they enfeeble her instead of strengthening. Italy has achieved the dearest wish of her heart and become an independent state, and in so doing she has drawn an elephant in the political lottery. She has nothing to feed it on. But it is an ill wind that blows nobody good. A year ago, when Italy saw utter ruin staring her in the face and her greenbacks hardly worth the paper they were printed on, her parliament ventured upon a coup d'état that would have appalled the stoutest statesmen under less desperate circumstances. They, in a manner, confiscated the domains of the Church"

Being an outsider, Mark Twain hadn't the time to study in his brief visit the political aspects of the effort to make Italy not a union of states, but a single, closely knit nation. The taking of the property of the Church, which was completed in 1870 by the taking of the city of Rome and the Papal states about Rome, was a measure of doubtful financial wisdom, but it helped to clear the way for a greater Italian nation, as in the same sense that the present war will, when successful, shove Italy forward into the Alps and along the shore of the Adriatic to the port of Trieste and thus complete her geographical entity. As a financial proposition, it looks very expensive, but in the long run her benefactor it will be worth while. Indeed, it is part of a plan conceived by the patriots of 50 years ago and not only carried out.

With the taking of Rome, Italy established her capital at Rome, took over the Papal railway connecting Genoa with Rome and Naples, and so far her only has improved the road system, sometimes under private management, sometimes under some form of government control, with the object of paying for the most part being never surrendered, but mostly leased to private companies for a relatively short term of years.

(To be continued.)

On the Genoa-Spezia Line

slowly effected during the past 50 years in the face of interlocking financial struggles.

Through patient national economy, through sacrifices which are still remembered with bitterness, through the gradual inflow of tourist money, through moneys sent to the Holy See, through moneys sent home by emigrants living in North and South America, in France, in England, Italy's money finally before the present war had reached a par exchange value of that of countries with a gold standard.

Italy Just Beginning to Prosper When War Came

Just before the war Italy had caught her breath, nationally. She had ceased to look behind, was about to put into execution an ambitious transportation scheme which would have remedied some of her natural handicaps, increased internal traffic, improved her canals and ports, and prepared the way for reaching out after world freight for making Italy a transshipping center for Southern Europe, the Mediterranean, and more distant points east and west, as in the olden days when Venice, Genoa, Naples and Pisa thus grew wealthy. German money and models were helping in the scheme, and their teaching was worth having.

United Italy began business in 1870 with 1,202 miles of railway, 1,125 of which were mostly in the north country. But 77 miles of railway line were in the south of the peninsula and in Sicily. These railways have helped a lot in holding Italy together, in keeping united the various provinces and cities which were constantly prey to the suggestion of separation.

The Preparation and Handling of Package Freight

Illustrations from the Diary of a Freight Inspector—Views in Some
North Carolina Freight Houses

By A. C. Kenly

THE public, which is the happy term we all use in referring to everybody else in a lump, has a hazy idea of railroads. Through its eye, not its mind, it receives the impression of great affluence and unlimited wealth. It sees the magnificent terminals, the luxurious passenger trains, the endless trains of freight cars, the ceaseless activity, and the army of employees necessary for all this, all of which the public demands and all of which the railroads gladly give, and want to give, when they can earn enough to afford it; and which they give eagerly and fast enough, without waiting to be asked, when their receipts justify it. They are

to be delivered at the same time; or a case may be lost. In the case number and date of shipment are shown on each package, it is an easy matter for consignee to keep perfect record of all cases received and in case of non-delivery of a case, to determine its contents.

Photograph No. 1 shows how a shipper of watermelons solved his difficulty by pasting on each melon a slip of paper bearing consignee's name and address. Another method is to scrape off part of the outer rind and mark with a pencil on the exposed surface. Still another is by scratching through the outer rind with a nail or other pointed implement.

Photo 2 shows the well prepared articles in photo No. 2. All glass parts and highly polished surfaces should be fully protected. Household goods, the poor relation of furniture, is another prolific source of claims. When you consider the large proportion of the articles shipped are accepted by carriers prepared for shipment as shown in photo No. 3, it does not require a Solomon to detect the cause. An article of commerce which causes carriers much wailing and gnashing of teeth, as well as pecuniary loss, is the cast iron stove. Some shippers still contend it is not necessary to crate stoves, but the crated stove is increasing all the time. Shipments in sacks also produce many claims. A poor quality of material is often used; sometimes, with heavy contents, the sack has broken by merely lifting it. Another source of trouble is leakage due to mouths not being properly sewed.

Photo 4 is a common scene; rolls of wall paper poorly protected. Photo 5 is a package affected by meat shippers; the boards marked C which form the top and bottom are nailed to the inside of the cross piece A. If you load heavy articles on boards marked C the pressure forces them down, leaving an opening like the one shown. It is surprising how often this happens, and it is a difficult break to repair. In this case, the cooper simply nailed the piece B across the opening

in trade to make a living out of it, just as everybody else is, and just as anxious to please their patrons. The public often looks with envy and unfortunately sometimes with hatred, at the president, vice-president and other officers who whirl by in private cars. The dear public should look at the real facts. Private cars are not castles of ease and indulgence but, rather, business cells of perplexing problems, troubles and worries, and many, many sleepless nights.

One of the great problems now being considered by railroad men is the conservation of freight. Millions of dollars are annually paid by carriers in settlement of claims for freight which is lost or damaged. A few years ago, carriers, shippers and consignees seemed possessed with the idea that freight was fated to be lost or damaged; and that that was all there was to it. Now all three work together to prevent it. The improvement is slow, but sure, and the object of this article is to help the cause along. The carriage of freight is a partnership between the shipper and the carrier. The shipper must "tote fair" by properly preparing his goods for shipment. What a multitude of carelessly marked packages pass through a large freight house in a single day!

The proper marking of a box is a simple thing, yet what varied neglect we see. The example in the next column illustrates proper marking methods. It is always best to show no other letters, figures or words on the top, or on the sides that contain the shipping directions.

A good business man shows his name and address on his business envelopes; he will find it a great advantage to show this information on every package he ships; then in case of trouble, the carrier is able to promptly write him direct. The case number and date of shipment should be put on by all shippers who ship frequently to regular customers, as occasionally a shipment of a later date may arrive before a previous one; or shipments may become mixed in transit and

BEST MARKING & CO.
PLAIN CITY, MD.

The way to remedy the trouble is to drive nails through the sides of the case into the boards C when first packed.

Photos 6 and 7 are examples of fibre-board packages. This is a very good package when properly made, properly glued and sealed and properly used—and a very poor package when these conditions are not complied with. Photo 8 comes under the "net complied with" category, the principal trouble being that the weight of the contents is too heavy for the package. Photo 7 shows a most excellent method of shipping two or more fibre-board packages to one consignee. Photo 9 is an excellent method for shipping empty cans. Photo 10

shows an approved method of shipping numerous small packages to one consignee; it not only prevents the danger of a small package being overlooked or lost, but it reduces the cost of marking. By wiring the five half-buckets of candy together, it was only necessary to mark the name of consignee and destination once instead of five times.

A striking difference in kegs is shown in photo 11. If you were ordering a keg of nails and you knew *A* used the two kegs on the left and *B* used the one on the right, from which merchant would you buy? Photo 12 shows one way of preparing butter dishes for shipment; and the natural results.

The loading of freight in station order is an art by itself, especially when there comes along an unwieldy article like a harbor-light buoy, a gas engine, or a piece of long piping which must be loaded on the floor of car. It is gratifying to note the increasing study and time carriers are now giving to the loading of freight and its protection to insure its reaching destination in good condition.

The foregoing notes are not the suggestions and ideas of one man, but of many, widely separated, all working with a common purpose; and that purpose is the reduction of loss and damage to freight. If I have shown even in a slight degree the need of earnest co-operation of the manufacturers of containers, the shippers, the consignees and the carriers, I have not written in vain.

The Business Press and the Railway Question

By Samuel O. Dunn

THERE HAS BEEN SOME DISCUSSION recently as to whether the existing facilities of our railways are adequate. I do not understand how any intelligent person can have any doubt regarding that matter. In every month for 21 months a net freight car shortage has been reported. The shortages have varied from 34,000 to 150,000 cars. This great car shortage has prevailed month after month in spite of the most efficient and effective operation of railway facilities ever known. We will gain nothing, but may lose much, by closing our eyes to the truth. We are confronted today with the fact that the capacity of our railways is not equal, or anywhere near equal, to all demands. The long-continued car shortage expresses only roughly, but in a general way it does express, the general transportation situation.

What can we and should we do about this situation? It cannot be cured during the war. Cannot it at least be remedied or ameliorated? There are only two ways in which it can be improved. One is by increasing the facilities. The other is by using them more efficiently. The railways are now being operated under the control of the government. Government control was adopted primarily to render it possible to increase the facilities and to operate them more efficiently.

There will be some increases in facilities made this year, but they will not be large in proportion to the existing demand for transportation service. In every effort the railways may make to enlarge their facilities they will encounter great difficulties created by the shortage of labor and of materials caused by the war. In consequence, while the Railroad Administration undoubtedly will this year spend substantial sums in enlarging facilities the conditions of war will render it necessary to expend them primarily with a view, not to making it possible for the railways to handle more business of a general character, but with a view to making it possible for them to handle more traffic whose movement is essential to carrying on the war.

Arm-chair authorities on railway affairs have been telling us for years that an enormous increase in the efficiency of railroad operation could be secured by consolidating the railways and operating them as a single unified system. Unified control of operation, whether secured by the voluntary action of the railways themselves, or by the exercise of governmental authority, was necessary in order to secure the transportation of the greatest possible amount of traffic essential to carrying on the war.

But it would be easy to exaggerate the increase in the amount of traffic in general which government control will make it possible to handle. Government control makes it possible to direct all traffic by the shortest available routes. But when business is so heavy as at present, the shortest routes soon become crowded, and it continues to be necessary to send business by all available routes, short and long. Government control makes it possible to operate all the terminals in large centers of industry as single units. But before the most advantageous co-ordination in the operation of terminals can be secured, they must be co-ordinated physically; and to bring this about will require time, labor and money.

Furthermore, it must be remembered that, primarily, the problem of the Railroad Administration and of the railways is not that of moving the greatest possible amount of traffic of all kinds, but that of moving the greatest possible amount of the kinds essential to carrying on the war. Now, in some cases, in order to move the greatest possible amount of essential traffic, it is necessary to so dispose matters as actually to reduce the total traffic accepted.

The Railroad Administration includes some of the ablest railway men in America, and they and the managers of the individual lines are devoting all their ability and all their strength to the solution of the problems presented. But it is a condition, not a theory, which confronts them. For almost twelve years the railroads of this country were subjected to a policy of regulation so unfair, so unintelligent and so destructive that, as was long ago foreseen and repeatedly predicted, their development rapidly slowed down, and finally came almost to a stop. Then suddenly, in 1916, there was thrown upon a railway system which had become unequal even to the normal requirements of the country the largest increase of traffic ever known; and within a few months the country entered the greatest of all wars, with the result that additional demands, heavy and abnormal beyond all precedent, were made. The present transportation problem of the United States is the joint product of those twelve years of prejudiced, punitive and repressive regulation and of conditions created by the great war; and if those charged with the operation of the country's railways are not able to make them meet all demands, this is due less to shortcomings on their part than to the fact that they are confronted with problems which no amount of energy and genius could, within a few months, or even a few years, solve satisfactorily.

The movement of cars while in the hands of the railways should and probably will be expedited by sending traffic by the shortest routes as far as may be practicable and by more unified and scientific operation of terminals. But cars are not in the hands of the railways all the time. They are in the hands of shippers and consignees a large part of the time, and upon shippers and consignees mainly depends how heavily they shall be loaded, how long they shall be held for loading and unloading and how long and how many times they shall be detained for reconsignment. The Railroad Administration can increase demurrage rates; it can reduce the time allowed for reconsignment; it can advance minimum carload weights; but unless it can secure the cordial and constant co-operation of shippers and consignees it cannot by any or all means and measures secure the greatest practicable efficiency in the use of cars. The co-operation of shippers and consignees during the last year has contributed

Present address delivered before the Business Papers Division of the Cleveland Advertising Club, Cleveland, O., on May 1.

greatly to the increase of car efficiency; but they must co-operate even more cordially and energetically if the railways are to be enabled to render the largest practicable amount of service to the country as a whole.

In a meeting of this kind the question naturally arises as to what part, if any, the business press can play in helping to solve the transportation problems with which the country is confronted. Some of the business papers reach more especially persons who are directly engaged in the operation of the railways. This is true of the group of publications with which I am connected. Most business papers reach chiefly persons and concerns that come in touch with the railways mainly as users of railway service.

The duty of railway papers under present conditions is clear. The papers with which I am connected saw that the time had come when it was necessary for the government in one way or another, to come to the assistance of the companies to save them from financial disaster and to relieve them from the trammels imposed by the anti-trust and anti-pooling laws in order to enable them to operate with the utmost efficiency. They did not believe it was necessary or desirable for government officials to take the control of railway operation out of the hands of railway officers. When, however, government control was adopted, we recognized the fact that it was the duty of every patriotic citizen to do all possible to make it a success; and our papers have acted, and will continue to act, on that principle. The editors of our papers do not consider that loyalty to the government or the Railroad Administration requires that we shall refrain from criticising things done or proposed to be done by the Railroad Administration which we do not consider right or wise, any more than in the past we considered that we ought to refrain from criticising things done or proposed to be done by the railway companies which we regarded as wrong or unwise. Consequently, when the Railroad Administration entered upon a program involving the standardization of locomotives and the relinquishment by railway supply companies of patents essential to the existence of their businesses we did not hesitate to voice our opposition. On the whole, however, our policy thus far has been, and we hope and believe it will be possible for it to continue to be, one of support and commendation rather than one of antagonism and criticism.

Mr. M. Adoo, the director general of railroads, is a man of ability. He labored effectively to secure legislation which would fix a fair basis for compensating the railways for the use of their properties; he has put able and experienced railway men in the most important places in his organization; he has given very little opportunity for politics or politicians to influence operation; and he is keeping uppermost the object of so operating the railways as to make them an efficient instrumentality for helping win the war. Our papers have tried to give him full credit for these things; we have tried to give full weight to the difficulty of his position and the magnitude of his problem; and we sincerely desire above all other things to help in this crisis to so influence the course of events as to make government control of railways a success.

The business papers outside the railway field approach the transportation problem from a different direction. Their constituencies are composed mainly not of those who operate the railways or purvey to them, but of those who use their service. The present transportation situation certainly is not a happy one from the standpoint of the shipper or traveler. It is, of course, entirely proper and highly desirable that the entire business press should investigate the causes of the present transportation situation, should criticize the managements of the individual railways and the Railroad Administration for all shortcomings with which investigation may show that they are properly chargeable, and should offer sug-

gestions for the improvement of conditions which special knowledge of conditions in the various branches of industry render the editors of business papers competent to offer. But the business press should especially endeavor to make sure that all its criticisms of the individual railways and of the Railroad Administration are based on facts rightly understood and that its suggestions for improving conditions are the result of knowledge and good judgment.

Constructive, helpful discussion of the present transportation situation must be predicated on a frank recognition of the fact that railroad facilities are inadequate and that it will be impossible for a long time to make them adequate. It necessarily follows that the most constructive thing the railway managements, on the one hand, and the users of railway service, on the other, can do to improve the situation is to make the best possible use of existing facilities. The business press reaches the shippers of the country, and there is no more useful service it can perform than constantly to keep before its readers the reasons why it is their duty to the country and themselves to co-operate in every way they can with the railway companies in securing the heaviest possible loading and the most expeditious possible handling of freight cars.

Government control is making great changes in the organization and operation of our railways. The longer the war lasts, the greater these changes will be. The determination of the kind of system with which the old system of management and regulation shall be replaced after the war will have a most important effect upon the economic, social and political future of the United States.

Many believe government ownership will be adopted. Government ownership of railways means government monopoly of railways. The railways are the largest purchasers of coal. They are the largest purchasers of iron and steel. They are the largest purchasers of lumber. We cannot establish a permanent government monopoly of railroads without producing profound effects upon the business of all the concerns, and upon the employees of all the concerns, of which the railways are the largest customers. Every person in the country uses the service of the railways. This means that under government ownership every person would have to do business permanently with a huge government monopoly.

The establishment of a permanent railroad monopoly, if the monopoly were in private hands, would mean the concentration of an enormous power in the hands of those who managed the monopoly. If, however, the monopoly were in private hands it would be subject to government regulation, and this would limit its opportunity to abuse its power. If a government railroad monopoly were established the management would be under as much a temptation—temptation in this case, primarily of a political nature—to abuse its power as the management of a private monopoly.

What means would there be for sold goods to the railways who used their service or one worked for them, have of protecting their rights and interests? They would have but one means, and that would be to appeal from one branch of the government to another, from the Railroad Administration to Congress. Even if the holders of the government monopoly did not abuse their power, the very fact that they were exercising the power of a government monopoly would arouse suspicions and apprehensions that they were abusing or intended to abuse it. People would then inevitably appeal to their representatives in Congress for protection. I am not saying anything as to the merits. These very suspicions and apprehensions regarding government monopoly already have been developed under government control, although it has existed less than four months. Numerous cases of persons already have begun to be taken to the offices of their senators and representatives in Washington to tell their pro-

tection or their help in dealing with the Railroad Administration.

The adoption of government ownership of railways would establish a precedent for the adoption of government ownership of other public utilities. The railways consume from one-fourth to one-third of all the coal produced, and what would be more natural than for the argument to be made, and effectively made, that the government should produce the coal for its own railroads? You would then have the beginning of what probably would end in government ownership and operation of all the coal mines. If the government should not be satisfied with the prices made to it by manufacturers of cars, locomotives and other railway materials, what would be more natural than for it to be argued that the government should engage in the manufacture of these things for itself? This would be the beginning of what probably would end in a programme under which the government would engage on a large scale in the manufacturing business. In brief, the logical and inevitable result of the adoption of government ownership of railways would be the acquisition by the government of so many other industries that we would soon be embarked on a wholesale policy of state socialism. There is, as a matter of fact, no difference between government ownership and management of the railways and socialism itself, except one of degree. You cannot advance a single argument for government ownership and management of railroads which the socialist does not use in favor of the adoption of socialism. The socialist is logical in that he applies the same reasoning to all property. The advocate of government ownership is illogical in that he applies his reasoning only to some kinds of properties—these always being kinds of property which he does not own himself!

Since there is no natural or logical halting place between government ownership of railways and socialism, it is time for all of us to make up our minds whether we are going to advocate government ownership of railways as a long advance toward socialism or oppose it for the purpose of preventing a long advance toward socialism. It especially behooves the editors of business papers thoroughly to study and frankly to recognize existing tendencies and to discuss them upon their merits and with a view to the effects which if unchecked they will produce upon the entire industrial and political future of the United States. In my opinion, within a very few years there will be a great struggle in this country over government ownership of railways, and the outcome of that struggle will largely determine the economic, political and social future of this country. Those who favor government ownership will really be favoring socialism with all that it would involve. Those who oppose government ownership will really be opposing socialism with all that it would involve.

The business press can make itself one of the most potent and effective agencies for presenting to the public not only the arguments against government ownership, but also the arguments for a new, fairer and more constructive policy of government regulation.

AMERICAN ENGINEER IN CHINA IS RELEASED.—George A. Kyle, of Portland, Ore., the American engineer who since March 5 has been held captive by Chinese bandits in the province of Honan, China, has been released, according to advices to the State Department from the American Legation in Peking, forwarded to the Siems-Carey Railway & Canal Company of New York. Two other Americans and a Chinese engineer previously had been freed. The message to Mr. Kyle's employers here gave no details of how the captive's release was brought about. He was the chief engineer of the Siems-Carey Company and was engaged in making a survey for 2,600 miles of railroad when captured with E. J. Pursell, another engineer, and a Chinese assistant.

Idle Labor in War Time

IN A LETTER RECENTLY sent to all agents of the Illinois Central system, T. J. Foley, vice-president in charge of operation, calls attention to the surprisingly large amount of idle labor which he observed during a recent trip over the southern lines of the road at a time when there is an acute shortage of labor for railway purposes. He suggests that idleness on the part of Americans at this time is equivalent to disloyalty and believes that an aroused public sentiment in each community against idling will have a most salutary effect. Mr. Foley's letter reads in part as follows:

"On my trip I observed great numbers of both white and colored men on our trains, traveling from place to place. I wondered why they were traveling around at this season of the year, when their services are so badly needed on the farms and in the manufacturing industries, as well as on the railways. Passing through the towns, I saw enough idle labor standing around the depots, gazing at the trains to supply the needs of this company, as well as the needs of a good many farms and industries. At one town of approximately 1,200 inhabitants I counted 55 colored men standing at the depot. At another town of about 5,000 inhabitants I counted 165 colored males, including boys, young men and middle aged men. At another place of 500 inhabitants I counted 23 at the depot, standing around with their hands in their pockets, apparently doing nothing whatever. The thought occurred to me that about 10 per cent of the labor supply of the South is idle at this critical time.

"The one job which we have on hand at present is winning the great war, and it follows that every person who is able to work, but who is not at work, is a liability instead of an asset to his country, and should be held up to scorn. My interest in this matter is just like the interest of every other loyal citizen anxious to do his full duty by his country. I firmly believe that a strong public sentiment against idlers in each community would make it so uncomfortable for the idlers that they would be driven to work. Some of them would drift into agriculture, others into manufacturing industries and the railroads would get their share. This is a free country, but it will not remain free unless every person exerts himself at this time to the very limit of his capacity. If idling is to be permitted, it ought not to be permitted now, and this should apply to the rich as well as to the poor. You should direct the attention of local authorities and leading citizens to the idlers around the depots and do what you can in every proper way to arouse public sentiment against idlers. If there ever was a time to attack idlers, it is now. If there ever was a time when every person, regardless of age, color or station in life, should be at work, it is now. Rest and leisure should be deferred until after the war has been won, until after individual freedom has been enthroned and made secure for all time. At present, a part of the business of every community should be to see that everybody is at work.

"These are my individual views. If you can make any use of them, I hope that you will do so. We need labor on the railroad and need it badly. The problem will be solved when the idlers are driven to work. Just as a matter of information, I would like to request you to acknowledge receipt of this circular and give me the benefit of your views; also to advise me approximately the number of idlers in the towns and communities served by your respective stations."

THE PERIODICAL "LA TECHNIQUE MODERNE" suspended its publication after its issue of August 1, 1914, because its managers, editors and the majority of the contributors had been mobilized. After three and a half years of suspension the *Technique Moderne* has resumed its publication. The *Railway Age* is advised that the *Technique Moderne* would be pleased to receive and publish articles bearing on scientific and technical developments in this country.

Speeding Up the Operation of Terminals

A Series of Practical Suggestions of Ways to Take Up the Slack and Increase the Output of Transportation

By M. E. Burk,

Transportation Department, Norfolk & Western, Roanoke, Va.

A GREAT EFFORT has been made since our entrance into the world war to formulate general policies for railroad operation. Meetings have been held where the necessity of absolute co-operation has been emphasized, but few definite plans have been given to the local officers to guide them in ways of increasing their efficiency. In fact, the general officers have been so crowded of late with outside duties that they have not been able to spare even the time for their usual supervision and criticism. It is found that terminal delays to trains are increasing. The same is true of the time between terminals. The former is usually accounted for by terminal congestion and the latter is credited to motive power not being kept up to as high a standard as formerly and to inferior fuel. There is no question as to the partial truth of these explanations, but they, by no means, fully cover the situation.

Assuming that the proper car was given the shipper, that he loaded it to capacity plus 10 per cent and did not take his good time in so doing and that the agent did not fail to provide the proper billing, no special provision has been made to assure a continuous movement of the car (barring accidents). It would be practical for each road to use a set of symbols in the form of conspicuous cards with letters large enough to draw the attention of every yard checker, car tracer and yard conductor, this card naming the last terminal on the system to which the car is to be taken on a through freight schedule.

Another splendid opportunity for increasing efficiency is offered in standardizing yard organizations. It is surprising to note cases where a yard on one division will be much further advanced in its methods of operation than on another (this is often true in neighboring yards on the same division). One yard will use an elaborate, up-to-date tag system, while the other will still hold on to the old method of chalking cars; one yard will use semaphores for switching purposes, while the other still wastes one or two brakemen per crew in forwarding signals for long trains. The clerical organization in yards is also far from being standardized, thus preventing the general officers from being able to measure the degree of their efficiency. Whenever you see a yard congested most of the time, you can almost always feel assured that it has no organization to speak of. If the ever-increasing demand for transportation is to be met successfully, the railroads will have to keep complete records of every movement in the yards for it is here that the additional efficiency is to be sought. Much help can be gained from a daily record showing the time an engine is put on and taken off the "spark" track, the time it is put on the train, and the time the train pulls out of the terminal, requiring the terminal trainmaster or general yardmaster in charge of the yard to explain any delays. The receiving and de-patching of trains in any yard of considerable size ought to be entrusted to a responsible employee. It is surprising how often such an important duty is left to an inexperienced clerk while the man really in charge of it is occupied elsewhere.

Close co-operation between the chief dispatcher's office and the yard office is absolutely indispensable to the efficient handling of trains in and out of yards. The yard office must be kept constantly informed of the number of trains, the time

they left the initial terminal, the probable time of arrival and their consist. If anything unforeseen happens and the trains are delayed on the road, such information must be given to the yard at once so that other arrangements may be made.

The bunching of trains in and out of terminals is a very wasteful practice. In most cases it is the result of short-sightedness on the dispatcher's and yardmaster's part. It can almost always be avoided by running uniformly loaded trains, properly spaced. While there is no rule prohibiting the running of trains of the same class around one another, it is not being practiced because the crews object to it. Trains uniformly loaded and properly spaced will eliminate bunching in a terminal. As it is, the yards are now taxed to their utmost. When three or four trains are waiting to be let in, with a passenger train often due at the same time, the question no longer becomes that of the proper disposition of those trains. The only problem is to get them out of the way. This usually culminates in a congested yard. The necessity of keeping the classification yard open cannot be over estimated and this can only be accomplished by a proper combination of judgment exercised in the dispatcher's office and by the yardmaster, the former spacing the trains and keeping them uniformly loaded and the latter having a competent man to handle the incoming and outgoing trains, if he cannot attend to it himself. Yardmasters do too much clerical work which can better be done by a regular clerk at decreased expense.

The increase as well as the change in the character and requirements of the present business have led some chief dispatchers to wrong conclusions. They seem to think that reducing the tonnage rating of engines will expedite the business and fail to realize that the reverse is true, that the actual moving of freight between terminals is only about 15 per cent of the problem and that by decreasing tonnage ratings the number of trains is automatically increased, which, under present conditions, means the use of inexperienced road crews—all of which contributes much to the delays at water and fuel stations, and for that matter, all over the line. Any trick dispatcher will exercise better judgment when handling fewer trains.

At this point it is apropos to mention that the train sheets are analyzed less than any other record, yet they contain the most valuable information relative to efficiency in train operation. A study of train sheets will show plainly whether the dispatcher is careful enough in fixing the meeting points for trains, whether the conductors are losing time at stations in calling for their orders and whether the station operators are alive to their responsibility. An analysis of train sheets will also show whether or not the trains are spaced properly and whether or not the crews are held unnecessarily long at the terminals.

Not only is the practice of reducing tonnage ratings wasteful from a road standpoint, but it also is a hardship on the terminals. Terminal congestion is directly proportional to the number of incoming and outgoing trains. It would be more profitable, therefore, to change the policy of reducing tonnage to that of increasing supervision. Each division should have enough trainmasters and engine foremen to be able to follow up the operation of trains closely. The custom

formed on many roads of using the trainmasters and engine foremen to "chaperon" private cars should be abolished. A trainmaster, as a rule, does not belong on passenger trains. There are too many freight crews to look after. As matters now stand, any unusual delay is taken up through correspondence by some office man, and the answers matched up and filed away for future reference.

In line with a search for greater efficiency, much work can be done to advantage in bringing about greater harmony between the mechanical and yard organizations. The number of orders for power cancelled by the yard office every 24 hours is a criticism of the care exercised in handling this important part of the work. The difference between the time estimated to get engines ready and the actual time they are made ready for service is so great as to call for more attention. Both of the above can and should be lessened through careful and continuous analysis of the practices.

A daily record of cancelled orders will lead the man ordering power to keep more closely in touch with the general situation so that he can order power when needed and be ready to use it as soon as it is furnished. A similar record of the "hits and misses" credited to each roundhouse foreman who estimates wrongly the time an engine will be made ready for service will cause him to learn the situation before reporting it. His information will then offer a practical basis for the yard to work on. As it is, the yard now orders a whole day's supply of engines at one time. The roundhouse foreman tries to fill these orders as soon as received so as to be able to report to his chief, "No unfilled orders on hand."

The bunching of power by the roundhouse people is due primarily to two definite reasons; (1) Trains not uniformly loaded and properly spaced arrive in bunches. When such is the case, the roundhouse turns them out in the same way. The solution of this lies with the chief dispatcher and the terminal trainmasters. (2) Since the eight-hour law went into effect, necessitating three shifts during 24 hours, three distinct periods can be noted during each 24 hours when the roundhouse does not turn out much power. To study the situation more closely it will be necessary for each master mechanic to plot an hourly record of the daily output of engines for a week or so. He will soon become convinced that during the changing of shifts there is always a period of unproductiveness. This can be overcome, as far as maintaining a uniform output of engines, by getting the shifts to overlap each other. The difference in overtime will be more than offset by the extra use the company will make of its power.

Conclusions

To assure additional efficiency great enough to offset the ever-increasing demand for transportation, it will be necessary:

(1) To standardize all similar organizations of the system. Its effect will be twofold: (a) a man from one office can be sent to a similar office elsewhere when occasion arises and be qualified to fill the requirements; and (b) the management will be in a better position to check up the efficiency of each organization, the unit of requirement being the same.

(2) To emphasize the fact to all concerned that the "Average" is an imaginary quantity, and that it, therefore, does not represent actual operation. It is intended only as an auxiliary method of calculation. The average would be a fair enough figure to work on if the railroad dealt with only one person—the good practice would then offset the bad. As it is, the loss caused to one from bad practice is not balanced by the gain resulting to another from good practice. The individual practice, therefore, must coincide very closely with the imaginary average.

(3) To rearrange, where necessary, all reports pertaining to operation so as to show individual responsibility. Tabulate such information in the proper way so as to enable the

management to credit one and discredit the other, making this policy known to all concerned. The initiative of the average railroad employee is at a very low ebb due to the fact that each feels that he is lost in the crowd. A fair and prompt recognition of individual ability is the only solution to this condition. Too much shifting of responsibility is a direct outcome of it. A railroad management will have to recognize the individual if it wants individuality.

(4) To determine the merits of each practice on the system by its relation to other practices. Too much wrong economy is found almost everywhere, owing to the fact that each official attempts to make a showing for his division, disregarding the fact that his apparent gain may be more than offset by a loss to the company elsewhere.

(5) To remember that the conditions which the railroads are now facing are different from any previous experiences and that it is not strange to find many of the old practices not efficient enough to meet the present situation. Some of the older officers are very sentimental when it comes to changing practices. It is up to the management to take the necessary steps for immediate readjustment wherever this has not already been done.

(6) To shift the center of interest from the road to the yards and terminals, realizing that they comprise from 70 to 80 per cent of the problem.

(7) To reduce as much as possible the number of freight trains. See that there are no avoidable delays to trains on the road but do not try to reduce tonnage ratings to shorten time between terminals. Advocate and enforce uniformly loaded and properly spaced trains.

(8) To see that the mechanical department takes charge of each engine as soon as it is relieved by the crew; that all repairs are made to the engine before it is put on the "spark" track (too much delay to trains in terminals is caused by the mechanical department having to work on an engine after it has been put on a train, thus resulting in overtime to the engine and train crews, as well as in tying up the yard); and that the engine is taken off the "spark" track and put on the train without delays.

In discussing the mechanical situation one asks himself, "Is the time not ripe for the government to realize that machinists must not be taken away from the railroads? With the supply of new power cut off, with not enough force to maintain the present power, with the increased business necessitating the using of power to its limit—what will be the final result?" The railroads can not attempt to hold their machinists by increasing the pay, for their expenses are already not in accord with their revenues. The government will have to regulate the supply of labor whether the railroads call for it or not. Enough emphasis has been laid on the importance of the railroads in the present crisis, but they will not be able to continue to do their share unless their motive power is in working condition. The present arrangement of pooling power will only relieve the situation temporarily. It takes machinists to keep an engine in good repairs.

(9) To solve the question of fuel, not by getting coal, but by saving it. Very few roads are keeping a scientific check on the fuel used. There seems to be little realization of the fact that the improper use of fuel is not only expensive in wasting coal but also in wasting time on the road. The damage done to an engine whenever a fire has to be cleaned on the road is known to every mechanical man.

(10) To get close to the railroad employees, and to make them feel that their co-operation is necessary, noted and appreciated. Energize the organization and success will follow.

AEROPLANES ATTACK FRENCH TRAINS.—The suggestion has been made that trains in France be supplied with machine guns as a defense against aeroplanes which swoop down on them, especially when the train has come to a standstill.

The Passenger Car Distributor and His War Job

The Man Who Provides the Passenger Cars Has Had a More Important Task Since Troop Movements Began.

By John W. Roberts
Chief Passenger Car Distributor, Boston & Maine.

THIS NARRATIVE is meant to bring out some facts concerning an old type of provider known only to a few of his own craft and undoubtedly never thought of by millions of the traveling public—the *passenger car distributor*.

In peace times he has made possible the carrying out of the pleasurable desires of the vacationist; the business men go to their offices daily on his developed shrewdness; the babies of the land share his interpretation of Christian charity; Helen's letters owe their safe delivery to him; Race-track Phil, our well known theatrical stars, and, lately, to a greater degree than ever, Wall street, have felt his assistance to such an extent that they are all his debtors.

After war was declared by the United States, this individual—the passenger car distributor—became puzzled as to how he was to handle his soldier dependents and still take care of his regular business. Although not schooled in military tactics, the command—"We move—provide"—is like an order from the captain and his dealings with the United States government have developed in him such a respect for its compliance that it might well be said that his loyalty takes on the unquestionable aspect of the soldier and causes his patriotic concern to place him in the cast of the regular army man—that is, sacrificing his all for America's interpretation of democracy.

Every one remembers the call in the Mexican border crisis—nobody any better than the soldier in this story. He was on the job at 5 A. M. that memorable day, getting all available equipment together to move the largest number of men the longest distance on record. Later his heart throbbed when he heard that the big commander complimented his chiefs on the success of the undertaking, and only in his own humble way did he consider the part he played. Unlike the recognized soldier, he was not made a sergeant, lieutenant or captain for his work, but was allowed to stay on the job as a private and utilize the benefit of this experience as a guide on the next big movement—the one in which we are now engaged.

It is estimated that for the movement of one field army of 80,000 men, 6,229 cars made up into 366 trains are required. Consider, if you will what this meant in cars for the national draft army of 687,000 men and 350,000 regulars recently moved to the various camps and canton-

ments, involving a haul anywhere from 25 to 1,500 continuous miles.

When it has been decided that our boys are to move somewhere, an order is given stating how many men, officers, horses and how much impedimenta are involved. The order is passed along through the various officers and as soon as possible placed in the hands of the passenger car distributor. He figures the actual requirements, basing them on the rules and regulations of the government with respect to over-night journeys or day runs, keeping in mind at the same time the restrictions placed by the roads over which the troops move, the electric third rail and tunnel clearances, the lighting, and the different requirements effective in various states.

Orders received may involve an assignment of from 10 to 250 extra cars at a time. The order is absolute and, with the severe shortage of all types of cars now being experienced by all roads, the difficulties of furnishing the wherewith to transport the boys on schedule are various, especially when the public, which has been kept entirely in ignorance of the move, must also receive the service to which it has always been accustomed. The public does get protected. The boys leave for "somewhere" on schedule. Little do they know, however, what arrangements have to be made to insure their safe departure. The passenger car distributor robs his regulars, gets in touch with his foreign allies (the roads via which the trains are to move), and in his own way obtains an appreciable amount of assistance at a very expensive empty haulage rate. He has the shop situation thoroughly canvassed and gets everything with wheels that is suitable to run and can be spared without closing down the big plant for want of equipment. Extra cars are brought from all points of the road, sometimes involving long hauls, and in a word every available car is sent to the originating point.

The cars are shifted into regular train units, turned over to another department for cleaning, oiling and general inspection, and await the arrival of the boys who are to use them to parts only known by their commanders and the various railroad officers who arrange for their safe movement to destination.

In one of the first regiments to go to France was a young lieutenant who by profession was a very well known pas-

senger car distributor on the line over which his regiment was to move. Ordinarily his business would require that he know all about such a movement, and you can bet he always did. Just before they left I had occasion to go to this camp with some of the equipment required for the movement, and in saying good-bye to my friend was surprised to find that he had an inference that he was going to a training field in one of our states instead of to a well known port of embarkation. This to me was rather pitiful. Here was an officer, only out of his regular line of endeavor a short while, and not in possession of that knowledge, which now would be of interest to himself, and which he always had had for the interest of others.

It is no uncommon sight for the commuter to glance up from his morning paper and see from the car window a number of foreign ownership cars that have an unfamiliar look. Sometimes the cars get a great distance from home. In his wonderment Mr. Commuter asks himself if the owning road has lost this equipment. The answer is, yes, but only temporarily. In a short while after the troops have left the originating point, the passenger car distributor, still in the game, has his orders for the return of the cars, taxing the Western Union and the energy of the mail man, requesting the various lines involved in the movement (sometimes eight or ten), to effect the prompt return via service route. This means that each line in some instances has received the order in advance of the arrival of the cars, and when the request is received it is then only a matter of getting the power lined up to start and keeping the cars moving on their homeward journey for another big assignment. This return movement is not accomplished on the mere presentation of a request, and must be followed much closer and with greater difficulty than the service movement.

When it has been decreed by Him that the North Pole has some samples of whistling winds, treacherous but beautiful icicles, new brands of granulated snow described by the poets, which are not required at all periods of the year in that region, they are sent us. The passenger car distributor then experiences an aggravated amount of trouble—freezing up of steam pipes, causing bursting and requiring shopping of cars affected, thereby reducing his maximum supply of equipment materially. He is not daunted, however, by that word trouble, as certainly every one in the railroad business has his troubles, and so he overlooks them, and he won't admit that he has any more than the other fellow, although in his heart he thinks he has.

The omission of this feeling could be carried on successfully from day to day if it were not for the mass which he has been trying faithfully to serve—the public—who as individuals are better classed as conservatives, but when considered in the public category are prone to reflect their critical traits across the horizon of public service corporations, principally because of misinformation or more often through lack of information which may not be available in some cases on account of strict government orders.

The writer is one of the public himself. He knows full well how the feelings of the public are sometimes aroused through the action of some of the corporations to which our people have to look for assistance. In short, he sometimes cannot but agree that the complaint rendered is just, and that corrective action is necessary if the good will of the public is to be retained. But in the role of the conservative he often sees the unjust and irresponsible citizen, in these times especially when sacrifices are asked to be made, displaying a conceitful attitude.

In a large railroad terminal, or in many of these terminals these days, congestion is a familiar sight at certain periods of the day. The congestion is caused possibly by slow backing of trains into the station. Perhaps, however, some of the trains are cut, a car having been taken from their normal make-up because four or five thousand soldiers are being transported over the system that day, and the management finds it necessary to inconvenience its regular patrons a small amount in order to carry out the obligation placed upon it by the government. We are transporting our brothers, our protectors, who are on their way to fight for us—for the public—but this same public does not want to put up with even this small sacrifice, and when discommodated to this small extent actually heaps voluminous abuse upon the railway which is trying to carry out orders from Washington, and at the same time take care of thousands of commuters with the least possible inconvenience.

The passenger car distributor does not mind this abuse—he is accustomed to hearing it—but at the same time he classifies the citizens who make it with those of the unthinking and unpatriotic class. The intensity of their unfairness is somewhat modified, however, to his mind, because they do not know that the drain of the normal resources is being made for their own benefit—a fact which emphasizes to him how well the government desires to keep the secrecy of such important matter are being adhered to.

Increases in Rates in New England Allowed

Financial Condition Reviewed. Higher Rates and Fares Authorized. Mileage Abuse Criticized

THE INTERSTATE COMMERCE COMMISSION on April 27 rendered its decision in the New England rate case, allowing certain increases in class freight rates and establishing local and joint one-way passenger fares based on a rate of $2\frac{1}{4}$ cents per mile on New England lines or portions thereof where the one way fares are now on a lower basis. The order also provides for the sale of mileage tickets at the same rate per mile as one-way tickets or, in the carrier's discretion, on a basis of one-tenth of a cent or one-eighth of a cent per mile below the regular one-way fares. It also provides for the withdrawal from sale of open and unlimited trip tickets, for the sale and use of 25-trip family tickets limited to three months from date of sale on a basis of $2\frac{1}{4}$ cents per mile in instances where the continuance or establishment of such tickets is proposed in the pending applications, establishes party fares on a basis of $2\frac{1}{2}$ cents per mile, and provides for increased zone fares on the Providence, Warren & Bristol branch of the New York, New Haven & Hartford. Proposed increased class freight rates by the Bangor & Aroostook and the Canadian Pacific are held not to have been justified. The report, by Commissioner Anderson, includes an interesting analysis of the financial condition on the New England railroads.

The proceeding grows out of the filing by all of the New England roads of applications under the amended fifteenth section asking permission to file numerous and substantial increases in passenger fares and class freight rates. Members of each of the public service commissions of the six New England states and of the Second District of the state of New York sat with the representatives of the federal commission in order that the whole rate situation might, if practicable, be dealt with promptly and in order that all the officials charged with public responsibility in transportation regulation might have the benefit of a joint hearing. Most lines of industry in New England were also represented at the hearings. The report points out at the outset the distinctive nature of the New England transportation problem, growing out of the facts that the New England lines serve directly almost none of the territory outside of New England, and that the traffic of the New England roads is poorly balanced because of the excess of raw materials moving into New England over the amount of manufactured products moving westward. Probably there is nowhere in the country, the report says, a substantially equivalent population living upon a comparable area so dependent upon transportation as the New England community. Yet this community "has allowed its chief railroads to be wrecked by mismanagement equalled in but few instances reflected in our reports. It would be difficult to exaggerate the handicap with which New England is now suffering from this mismanagement."

Condition of New England Roads

Like other carriers in eastern territory, the report says, the New England roads have recently found their operating expenses increasing more rapidly than their operating revenues. The applications were filed primarily to obtain as speedily as practicable additional revenue to offset present and prospective cost increases. Most of the interests represented at the hearing not only admitted the carriers' need of additional revenue and that it should be provided at the earliest possible date, but expressed their willingness to pay during war times any additional rates which the commission might find reasonable and proper, with the qualification,

however, that the rates proposed by the carriers were not thought to be scientifically constructed and were not considered as constituting a proper or satisfactory basis for a permanent rate structure. Some objection was also offered to any increases in rates unless accompanied by an improvement in the service. Shippers recognized, however, the report says, the dependence of the community upon efficient transportation service and that that service must be paid for. Therefore, the issues presented have been approached as a problem of general importance and private individuals and concerns have largely subordinated their interests to those of the general public.

In the report in the Fifteen Per Cent Case, the commission observed that "Among eastern carriers those located in New England appear to present the most serious condition." That the cost of operation on New England roads has increased sharply during the last year is not open to question. For seven typical New England carriers increases in wages in 1917 actually granted prior to the hearing in the latter part of November and the first part of December amounted to about \$8,950,000 annually, and other demands were pending. The increased annual cost of fuel for the seven roads was estimated at \$12,450,000, based on the September prices. In spite of a decided increase in traffic during the last few years the financial condition of the New England roads as a whole has been less favorable as far as net income is concerned, except for the year 1916, than it was during the period prior to 1913. The net income for the seven roads decreased during 1917 by \$11,429,000, while the gross operating revenues increased by substantially the same amount. High interest and renewal charges on short term notes were among the potent causes of unsatisfactory net results. The monthly report of eight New England railroads show for the calendar year 1917 a gross railway operating revenue of \$200,593,559, an increase of \$12,555,779 over 1916, but the operating expenses were \$150,369,991, an increase of \$23,860,891. The railway operating income shows a decrease of \$12,028,817.

New Haven

The report then takes up the revenue needs of the individual railroads. Regarding the New Haven it is stated that it is impossible to deal with or even superficially consider its income needs and rights without becoming involved in the labyrinthine maze of its financial past. "In a word," the report says, "both the present corporate structure and the financial history of this so-called railroad shows that it now is and for some time has been everything that a railroad should not be. With one of the finest opportunities in the world for successful railroading, with a property which for years prior to 1903 had been managed conservatively and steadily if not very progressively, its present status is such that neither its present management nor the regulating commissions under whose jurisdiction it falls can do anything more than make the roughest kind of guess as to their proper course of procedure. Its condition is the result of a decade of attempting to run a great railroad property regardless of either ethics or mathematics." It is stated that any present finding on rates must be understood to be subject to thorough revision if and when the controlling facts become ascertainable.

After discussing conflicting evidence on the subject, the report says that the percentage earned on investment in prop-

erty used or usable for "possibly legitimate railroad purposes" by the New Haven as nearly as can now be computed was 5.48 and 6.04 for the fiscal years 1915 and 1916, respectively, 5.98 for the calendar year 1916 and 5.23 for the calendar year 1917 (estimated in part). It follows that the New Haven as a railroad has been making fair earnings, the report says, but its investment in additional railway facilities for the last twelve years has not shown a proportionate increase in traffic units. The gist of the New Haven's troubles is said to be in its so-called "other investments," the amount of which, the commission finds it impossible to state, but making allowance for variations and uncertainties, it is stated that the New Haven as an investment enterprise has now about \$200,000,000 invested in outside properties yielding a return of less than 2 per cent, a large part of which therefore must be charged off as loss.

Regarding the attitude which the commission should take toward this situation, the report says in part:

"We do not overlook that under our present form of corporate management the great majority of the stockholders in the New Haven enterprise were even more the victims of the mismanaging directors than were the patrons of the road. It is common knowledge that the directors of these great corporations are in fact selected by banking or other interests in too many instances actuated by motives essentially adverse to the interest of the stockholders toward whom they bear a fiduciary relation. But as long as our public policy is represented by the law as it now is, this commission must, so far as rate making is concerned, hold stockholders responsible for the mismanagement of directors who, in contemplation of law, are selected by them. Until this commission, or some other governmental body with adequate power, permanently controls the issue of carrier securities and, within reasonable limitations, the application of the proceeds thereof, stockholders and other investors in carrier securities are certain from time to time to be subjected to such perils of mismanagement and resultant losses as have accrued to the stockholders of the New Haven, the Rock Island, the Pere Marquette, the Cincinnati, Hamilton & Dayton, and others. We say this with reference to future conditions, not overlooking the adequate, but temporary, safeguards now obtaining under federal control.

"After a railroad corporation like the New Haven and some of our other well-located and prosperous railroads has had a long career of business success and reasonably safe management, its stock becomes widely distributed among investors who pay little or no attention to guarding their investments. But this situation, fraught with grave danger to the investing public, is one with which the Congress must deal. As the law now is, this commission is powerless to afford any real remedy for past misdoings or in the future to protect other similar bodies of stockholders from deceptions and losses of an analogous kind. We can do no more than investigate and condemn after the evil has been accomplished, and make a "report" of losses and sufferings which we were powerless under the law to prevent. Private capital invested in carrier companies can not be generally safe under such lack of security regulation as has existed prior to federal control.

"This commission has frequently in its annual reports to Congress urged the necessity of remedial legislation along the lines indicated above. But the absolute necessity of such legislation, if the nation is on return of peace to continue to rely upon private capital for the extension and development of its transportation system, takes on new pith and point when considered in connection with a concrete situation such as that presented by the New Haven, the Rock Island, and other fraudulent or wasteful exploitations above referred to. The regulating commission is presented with a problem impossible of sound and satisfactory solution. On the one hand we have the claimed necessity of

approving such rates as will under private control establish credit and invite new capital for the public service. On the other hand we have a history of waste and wrecking, demonstrating that lower rates might have been adequate had the carrier corporation managed its business with some fair regard to law and sound principles. After the evil has been done, the money wasted, the stockholders victimized, then there follows, as in the present case, the stern necessity of some measure to provide needed transportation facilities. The regulating commission is then urged to 'adopt a constructive policy,' 'not to dwell upon past errors,' etc. Interpreting these euphemistic phrases, the real demand is that the regulating commission shall, through the medium of excessive rates, take money from the rate payers to make up the losses which the carrier corporation's directors have caused by their lawless or unfaithful administration.

"The fate of the New Haven stockholders is a hard one. But we have no alternative except to hold them chiefly responsible for losses which, in contemplation of law, they brought upon themselves through their chosen directors. There is no exact mathematical basis for determining a just and reasonable return. We limit our present conclusion to finding that under all the circumstances of the New Haven case a reasonable return upon the carrier property investment shown upon its books may be justified."

It follows, the report says, that the New Haven railroad is entitled to such rates as will keep its return on its carrier property at least up to the standard of the past three years, but after taking into consideration the rapidly increasing costs and the railroad's estimates of the increased revenues to be expected from the rate increases asked, doubt is expressed as to whether the revenues from the proposed rates will exceed or even equal the increased expenses.

Boston & Maine

Regarding the Boston & Maine, it is stated that none of the parties to the record questions and the facts demonstrate the need of additional revenue, but its right to such increases requires more careful consideration. The road had deficits in 1913 and 1914, and it is estimated that final returns will likely show a deficit for the year 1917 of more than \$400,000. The financial organization of the system, the report says, has for many years been intrinsically unsound. Even before it came under New Haven control its management was never conservative of the rights of its investors nor progressive in furnishing facilities and service to its patrons. The report also refers to reckless and destructive financing under New Haven control, but declares that the stockholders have already been heavily penalized for the mismanagement and that therefore it cannot be said that the system is not now entitled to rates adequate to pay a reasonable return upon its investment in carrier property. There is nothing in the record to indicate the possibility of such economies in management and operating expenses as to provide such return. The only relief seems to be a substantial increase in rates.

A speedy consolidation of the lessee company with its chief leased lines, it is declared, would greatly simplify and strengthen the financial structure and make possible substantial economies, particularly in connection with the Boston terminals. Such reorganization is plainly demanded in the interest of both the public and the security holders.

Maine Central

As to the Maine Central, the report shows that the increased expenses in 1917 were expected to amount to \$2,720,633, whereas the proposed increases in revenue from the proposed increases in rates were estimated at \$1,670,000. Therefore, the additional revenue expected is more than a million dollars less than the estimated additional costs, and

there is no present indication that the carrier may reasonably expect a decided increase in tonnage during the year 1918.

Boston & Albany

As to the Boston & Albany, it is estimated that the increased freight rates proposed will add \$200,000 annually to the revenues and that the additional revenue from increased passenger fares will amount to approximately \$600,000. The increase, the report says, seems plainly demanded in the public interest.

In discussing the reasonableness of the proposed passenger fares and the changes in mileage book and trip tickets, the commission says in part:

Reasonableness of Proposed Passenger Fares

"Since the report in *The New England Investigation* was published the New England roads, following the recommendations of a joint conference of representatives of the several state railroad commissions of New England, and a member of the Interstate Commerce Commission, have revised their passenger fares upward and at the present time the basis for one-way fares in southern New England is $2\frac{1}{2}$ cents a mile (except in the Boston suburban zone, where it is 2 cents a mile) and for mileage tickets $2\frac{1}{4}$ cents a mile. It is proposed by the roads operating in southern New England to increase the basis uniformly to $2\frac{3}{4}$ cents a mile for one-way fares and to $2\frac{1}{2}$ cents a mile for mileage books. It is also proposed to increase the rate for party fares from a maximum of $2\frac{1}{4}$ cents to a maximum of $2\frac{1}{2}$ cents a mile. It appears that in trunk line territory and central freight association territory generally the present basis for interstate one-way fares is $2\frac{1}{2}$ cents a mile and for mileage tickets $2\frac{1}{4}$ cents a mile. In *Western Passenger Fares*, 37 I. C. C., 1, after an exhaustive investigation involving interstate passenger fares in a number of midwestern states, we found as reasonable in the state of Illinois; Wisconsin; Michigan, upper peninsula; Minnesota; Iowa; Nebraska; Missouri, north of the Missouri River; and in Kansas on and north of the main line of the Union Pacific Railroad from Kansas City to the Colorado state line, a basis of 2.4 cents per mile for one-way fares and a basis of 2.25 cents per mile for 1,000-mile tickets; and in the state of Missouri, south of the Missouri river, and in the state of Kansas, south of the main line of the Union Pacific Railroad, a basis of 2.6 cents per mile for one-way fares and 2.5 cents per mile for 1,000-mile tickets. At page 33 of the report in *Western Passenger Fares*, appears the following table:

GENERAL STATISTICS

| | Territory | | | |
|--|-------------|------------|------------|------------|
| | New England | Trunk line | Central | Western |
| 1. Average population per square mile. | 105.7 | 136.7 | 89.8 | 24.9 |
| 2. Average population per mile of road. | \$27.0 | \$51.1 | 444.0 | 244.0 |
| 3. Average passenger-train revenue per mile of road. | \$8.0 3 | \$7.676 | \$4.110 | \$2.961 |
| 4. Average number of passengers carried 1 mile per mile of road. | 431,387 | 357,779 | 169,743 | 124,069 |
| 5. Average distance in miles each passenger was carried. | 11.45 | 25.45 | 39.65 | 44.39 |
| 6. Average receipts per passenger per mile. | \$0.01777 | \$0.01755 | \$0.01917 | \$0.01911 |
| 7. Average receipts per passenger-train mile. | \$1,111.0 | \$1,464.20 | \$1,320.70 | \$1,333.03 |

"The conclusion to be drawn from these data is that normally the passenger fares in New England should not be on a higher basis than in the other parts of the country referred to in the foregoing table, but that the proposed fares may be approved as an emergency or war measure.

"There is probably no part of the country where the sale of mileage books on a substantially lower basis per mile than regular one-way fares has resulted in such flagrant abuses, such unjust discriminations, and such impairment of railroad revenues as in New England.

"It is customary in the greater part of New England to sell 500-mile books, good to bearer, and good until used, at

a rate of $2\frac{1}{4}$ cents a mile. In southern New England the regular one-way fare is over 11 per cent higher than the mileage fare, and in northern New England the regular fare, in many instances, on a 3-cent basis, is $33\frac{1}{3}$ per cent higher than the mileage fare. The result is that ticket "scalpers" thrive in all parts of New England; and they and others make a business of dealing in mileage books which are displayed like ordinary merchandise in the store windows, at reduced prices. Certain individuals engaged in this traffic have constantly on hand as many as 200 mileage books, and it is estimated that their profits amount in single instances to as much as \$3,600 annually.

"The fundamental evil in the sale of mileage books, at least in New England, is that they accord preferential fares to those who use them. In northern New England, for example, a man with sufficient capital to buy a mileage book, may ride 100 miles for \$2.25. A less fortunate individual riding between the same points in the same train and on the same car, must pay \$3 for the same service. Witness after witness testifying for the carriers, when asked upon what theory such discrimination could be justified, replied that it could not be justified on any principle. It is clear that the mileage book evil in New England must be eliminated, either by canceling the mileage fares entirely or by increasing them more nearly to the basis of regular one-way tickets. If travelers want mileage tickets as a convenience and not as a discrimination, there is no great objection to permitting their sale.

"Most of the objectionable features of mileage books are found also in certain forms of trip tickets. These are sold in New England usually in strips of from 5 to 50 tickets, good to bearer and until used. The rate ranges from 1 cent to 2 cents per mile, resulting in many instances in passenger fares less than one-half the regular one-way fare. The extent of the discrimination in favor of purchasers of these tickets is even greater, therefore, than in the case of mileage books. This form of ticket is used quite generally in southern New England, but more particularly to and from the city of Boston within a 15-mile zone. Such tickets are used not only for travel wholly within the zone but also for the purpose of breaking down the through fares between the city of Boston and points beyond the suburban zone. It is proposed to increase by 25 per cent the charge for trip tickets within the Boston suburban zone. The New Haven proposes to withdraw from sale trip tickets on other parts of its line and similar proposals are made by the Boston & Albany.

The general passenger agent of the Boston & Maine testified that the 12-trip tickets, which are said to be sold in no other part of the country, result in greater abuse than any other form of ticket. The misuse of these tickets not only results in according preferential fares to certain persons but it seriously impairs the carriers' revenues. There is little, if any, evidence of record in justification of the continuance of these tickets, and considerable evidence in support of their withdrawal. While these trip tickets in the Boston zone are recognized by an act of the Massachusetts legislature, the Massachusetts Public Service Commission now seems to have full rate-making power.

In principle there is no easy justification for the continuance of trip tickets within the Boston zone only. Such tickets are not sold between New England points and New York City. The usual 60-trip monthly commutation tickets and 25-ride family tickets, to be later discussed, would seem to meet most of the legitimate demands of the Boston commuters for special fares. At any rate, some method should be devised to prevent such misuse as we have just described.

The general withdrawal of open and unlimited trip tickets with respect to interstate transportation and their continuance for intrastate travel within the Boston zone on the low basis proposed is of questionable propriety. The proposal

to eliminate such tickets with respect to interstate travel is approved.

Freight Rates

Regarding the reasonableness of the proposed increased class rates, the report says that one cannot study the structure of class freight rates in New England without being impressed with the fact that the rates as a whole are relatively low and that there is no reason as far as it is advised why the rates in Southern New England should be lower than in Central Freight Association territory, but that as a matter of fact they are substantially lower. The railroads had proposed two mileage scales of class rates, one to apply to the division of New England roads known as class A and the other to class B roads. The commission makes some modification in the division of roads between classes A and B and finds that a logical and proper rate structure will result if the rates now in effect in Central Freight Association territory, zone B, are applied to class A lines in Southern New England. The rates for class B lines, it finds, should not be more than 10 per cent higher than those for class A lines, and the rates for any haul embracing both a class A line and a class B line should be made on the class B basis. The report also says that the prevailing impression that less-than-carload traffic is not generally remunerative is supported by the evidence in this and other cases. Investigation of the profitability of less-than-carload traffic made under the direction of a committee of eastern railroads including the New Haven, tends also to the conclusion that this traffic is not remunerative. These considerations suggest the propriety of establishing in New England a rate structure that will have the effect of imposing on the merchandise traffic a greater portion of the transportation burden than it has hitherto borne, and the commission finds that this result would be effected by establishing for class A lines in New England the zone B rates in effect in Central Freight Association territory.

After discussing the proposals of the Bangor & Aroostook Railroad, the commission finds that the evidence submitted by this carrier in support of the proposed increased class rates does not establish their reasonableness. It is suggested that the Bangor & Aroostook undertake a thorough revision of its tariffs, particularly its commodity tariffs, with a view to making such moderate increases as may be needed to offset its increasing costs, but primarily for the purpose of reconstructing its rates on a logical and equitable basis, so that their propriety can then be determined upon an adequate record.

Relative Results of Freight and Passenger Operation

A careful study was made by one of the commission's expert accountants of the relative cost of freight and passenger operation on the Boston & Maine, the Boston & Albany, and the New Haven for the first nine months of 1917 as compared with the years ended June 30 and December 31, 1916. The Boston & Maine figures for 1917 cover only the first six months of the calendar year. An examination indicates that on the Boston & Albany and on the New Haven the passenger service is more profitable than the freight service, and that on the Boston & Maine the two classes of service appear to produce about the same relative result. An allocation of revenues and expenses as between the passenger and freight service shows that with respect to the Boston & Albany and the New Haven the operating ratio for the passenger service increased much less rapidly in 1917 than the operating ratio for the freight service. Among other interesting statistics shown it will be noted that the wages of freight enginemen and trainmen absorbed in 1917 a slightly greater proportion of the freight service revenue than in 1916, while the wages of passenger enginemen and trainmen absorbed in 1917 a somewhat smaller proportion of the passenger service revenue than in 1916 and

that out of every dollar of passenger service revenue in 1917 the Boston & Maine and the Boston & Albany spent 14.56 cents and 14.06 cents, respectively, for fuel for passenger locomotives, as compared with 8.62 cents and 8.96 cents for the calendar year 1916. The relatively satisfactory showing of the passenger service as compared with the freight service is due principally to the fact that in 1917 the daily average mileage of passenger trains and locomotives decreased, while contemporaneously there was an increase in the number of passengers per car-mile and per train-mile and also an increase in the passenger service revenue.

Other Possible Sources of Revenue

It was stated by the officials of certain of the New England lines that a proposal was in process of development to establish a charge for checking baggage and also to assess an extra charge in addition to the regular or normal ticket fare against passengers occupying sleeping and parlor cars because of the alleged additional cost of passenger transportation in Pullman cars over that in ordinary day coaches. In addition to this, the opinion was expressed by several traffic and other officials that (a) the minimum charges for less-than-carload shipments of freight should be increased from 25 cents to 50 cents (b) that many of the exceptions to the official classification involving rates, rules, minimum weights, etc., should be canceled; (c) that special less-than-carload commodity rates should as far as possible be eliminated and (d) that certain carload commodity rates, notably those applicable to lumber and pulp wood, should be increased. The report says that if unduly low or unremunerative rates have in the past been established to meet conditions that obtained at the time of their inception, and if conditions have now changed so that there is no justification for maintaining such rates, they ought to be increased to a basis where they will be remunerative.

Another Use for a Ford

THE MICHIGAN CENTRAL has developed a new use for a Ford automobile, using it in the manner shown in the photograph to haul men back to the hump at its West Detroit classification yard. The car is fitted with flanged

A Ford Car in Hump Yard Service

wheels and draws a trailer which will carry from 15 to 20 men at a time, or practically the entire crew of riders on the hump.

LOCOMOTIVE PRICES IN ENGLAND.—The Taff Vale Railway of England has recently given orders for some new locomotives which, the chairman of the railway company says, will cost £7,000 (\$35,000) each instead of the pre-war price of £2,300 (\$11,500) each.

The Actuary Theory of Depreciation of Physical Property Values*

By E. J. Kates

ONE OF THE MOST DIFFICULT questions confronting valuation engineers, accountants and economists of the present day is that regarding depreciation of the values of physical property. With the Government appraisal of railroad properties well under way, various conflicting theories now being advocated should be crystallized into some one rational and workable basis.

Before a determination of the proper method of arriving at the amount of existing depreciation can be reached, it is necessary to decide what elements or factors shall be given

The second plan reverses the proposition and gives but little consideration to the expectancy of future service but rather attempts to measure the deferred maintenance or cost of repairs necessary to put the article into a 100 per cent operating efficiency. Here the locomotive after coming from the shop with a general overhauling would be rated close to 100 per cent, while the one just ready for general repair would be given a much lower rating.

Just what attitude the courts will eventually take in regard to this matter, is not as yet clear, though there are considerable grounds for the belief that the final interpretation of the meaning of the terms "realized depreciation" as a deduction to be made from the value new of physical property will be the first of the two definitions given above or in other words, a measure of the used service compared with the remaining

consideration. Depreciation has been described as representing a wastage of serviceable life. Present value has been described by some as representing the proportion of service remaining in the property and by others as representing the present physical condition of the property, considering the state of repairs and its adaptability to meet current requirements. The first gives but little consideration to the actual condition of the article so far as its need of repairs is concerned since an article, such as a locomotive, may reasonably be expected to have as great an expectancy of future serviceable life just before it goes into a shop as it will have just after it comes out of the shop with the needed repairs made.

service in the article. If this method be adopted, then some rational basis for the determination of the relation of future expected service to total expected service must be found.

Various methods have been advocated such as the "Straight line theory," the "Sinking fund theory" and the "Average age of dollar invested theory" but to all of these there are serious objections. In the first place they depend upon a fixing of an average life for each class of property which is used as a measure with which each individual or group of individual articles are compared. Averages are not applicable to individual cases without a considerable element of error being considered. Neither are averages applicable to individual cases where the realized life has exceeded the expected aver-

*Copyright, 1918, by E. J. Kates.

age. To overcome this feature it is quite commonly the practice to use a minimum service value, past which depreciation is not figured, but this in itself violates the basic principle of averages.

To overcome the objections to the various methods heretofore used, the writer has devised what has come to be known as the "Actuary theory." This name is due to the fact that the same principles are used here as are used by the actuary in computing the risks of an insurance company. The fact that these principles have stood the test of time in the modern business world, is surely one point in their favor, when applied to the question of depreciation of physical property values.

In the development of the mortality and expectancy tables and curves for railroad equipment, the writer has been fortunate in having access through the various commissions and by reason of his connection with a number of the larger rate cases during the past nine years, to the records of practically all the railroads west of Chicago. The data are a composite from these various roads and covers an extended period of time. For illustration three tables and four charts are shown herewith, giving the general average data for each of the three general classes of railroad equipment.

TABLE 1

THE KATES DEPRECIATION STUDIES FOR LOCOMOTIVES

| Years in service | Per cent remaining in service | Expectancy in years of service | Expectancy in per cent of remaining service | Expectancy in per cent of remaining value |
|------------------|-------------------------------|--------------------------------|---|---|
| 0 | 100 | 25.4 | 100 | 100 |
| 1 | 100 | 24.4 | 96.1 | 96.5 |
| 2 | 100 | 23.4 | 92.1 | 92.9 |
| 3 | 100 | 22.4 | 88.2 | 89.4 |
| 4 | 100 | 21.4 | 84.3 | 85.6 |
| 5 | 100 | 20.4 | 80.3 | 82.3 |
| 6 | 100 | 19.4 | 76.4 | 78.8 |
| 7 | 100 | 18.4 | 72.5 | 75.3 |
| 8 | 100 | 17.4 | 68.5 | 71.6 |
| 9 | 99.5 | 16.5 | 64.7 | 68.2 |
| 10 | 99 | 15.6 | 60.9 | 64.8 |
| 11 | 98 | 14.7 | 57.2 | 61.5 |
| 12 | 97 | 13.8 | 53.5 | 58.2 |
| 13 | 95.5 | 13.0 | 50.0 | 55.0 |
| 14 | 94 | 12.2 | 46.6 | 51.9 |
| 15 | 91 | 11.6 | 43.6 | 49.2 |
| 16 | 88 | 11.0 | 40.8 | 46.7 |
| 17 | 84 | 10.4 | 38.0 | 44.2 |
| 18 | 80 | 9.9 | 35.5 | 42.0 |
| 19 | 75 | 9.5 | 33.3 | 40.0 |
| 20 | 70 | 9.1 | 31.3 | 38.2 |
| 21 | 64.5 | 8.8 | 29.5 | 36.6 |
| 22 | 60.0 | 8.4 | 27.6 | 34.8 |
| 23 | 54.8 | 8.1 | 26.1 | 33.5 |
| 24 | 50.5 | 7.7 | 24.3 | 31.9 |
| 25 | 46.0 | 7.4 | 22.9 | 30.6 |
| 26 | 41.2 | 7.1 | 21.4 | 29.3 |
| 27 | 37.0 | 6.8 | 20.1 | 28.1 |
| 28 | 33 | 6.5 | 18.8 | 26.9 |
| 29 | 29.2 | 6.2 | 17.6 | 25.8 |
| 30 | 25.7 | 5.9 | 16.4 | 24.8 |
| 31 | 22.5 | 5.6 | 15.3 | 23.8 |
| 32 | 19.2 | 5.4 | 14.4 | 23.0 |
| 33 | 16.5 | 5.1 | 13.4 | 22.0 |
| 34 | 13.9 | 4.9 | 12.6 | 21.3 |
| 35 | 11.8 | 4.6 | 11.6 | 20.4 |
| 36 | 9.6 | 4.4 | 10.9 | 19.8 |
| 37 | 8.0 | 4.1 | 10.0 | 19.0 |
| 38 | 6.5 | 3.8 | 9.1 | 18.2 |
| 39 | 5 | 3.6 | 8.5 | 17.7 |
| 40 | 4 | 3.3 | 7.6 | 16.8 |
| 41 | 3.0 | 3.0 | 6.8 | 16.1 |
| 42 | 2.2 | 2.8 | 6.0 | 15.6 |
| 43 | 1.6 | 2.5 | 5.5 | 15.0 |
| 44 | 1.0 | 2.3 | 5.0 | 14.5 |
| 45 | .7 | 2.0 | 4.3 | 13.9 |
| 46 | .4 | 1.7 | 3.6 | 13.2 |
| 47 | .1 | 1.5 | 3.1 | 12.8 |
| 48 | .08 | 1.3 | 2.6 | 12.3 |
| 49 | .02 | 1.0 | 2.0 | 11.8 |

It is not contended that these ratios will exactly fit conditions on each and every road, nor is it contended that they will exactly fit conditions on any road under the present war time methods of operations. Indeed the writer prefers whenever possible to make an individual study of the conditions on each road involved, with a derivation of tables and curves more especially adapted to any peculiar conditions thereon. However, it may be said that in general the data shown herewith are applicable without any considerable change to nearly any western road operating under the conditions exist-

ing prior to the present war. Again, the data for freight cars come more nearly meeting actual conditions when divided into the various groups or classes of equipment such as coal, flat, box, stock and refrigerator cars.

In all three charts the curve designated "Mortality curve" is derived from the actual history of thousands of items of equipment and represents the per cent remaining in service at the end of each year or inversely the per cent taken out of service during any year after the date of building. This curve is exactly analogous to the actuaries' mortality curve.

TABLE 2

THE KATES DEPRECIATION STUDIES FOR PASSENGER CARS

| Years in service | Per cent remaining in service | Expectancy in years of service | Expectancy in per cent of remaining service | Expectancy in per cent of remaining value |
|------------------|-------------------------------|--------------------------------|---|---|
| 0 | 100 | 33.16 | 100 | 100 |
| 1 | 100 | 32.16 | 97 | 97.5 |

| 33 | 46.2 | 7.3 | 18.1 | 31.0 |
| 34 | 41.5 | 7.0 | 17.0 | 30.0 |
| 35 | 37.7 | 6.6 | 15.9 | 29.1 |
| 36 | 34.0 | 6.3 | 14.9 | 28.3 |
| 37 | 30.2 | 6.0 | 14.0 | 27.5 |
| 38 | 26.5 | 5.7 | 13.0 | 26.7 |
| 39 | 23.2 | 5.4 | 12.0 | 25.8 |
| 40 | 20.0 | 5.0 | 11.1 | 25.1 |
| 41 | 17.0 | 4.7 | 10.3 | 24.4 |
| 42 | 14.0 | 4.3 | 9.7 | 23.9 |
| 43 | 11.5 | 4.0 | 9.1 | 23.4 |
| 44 | 9.0 | 4.2 | 8.7 | 23.0 |
| 45 | 7.7 | 3.7 | 7.6 | 22.1 |
| 46 | 6.5 | 3.3 | 6.7 | 21.4 |
| 47 | 5.0 | 2.9 | 5.8 | 20.6 |
| 48 | 3.5 | 2.3 | 5.3 | 20.2 |
| 49 | 2.7 | 2.3 | 4.5 | 19.5 |
| 50 | 1.8 | 2.0 | 3.9 | 19.0 |
| 51 | 1.0 | 1.7 | 3.2 | 18.4 |
| 52 | 0.5 | 1.4 | 2.6 | 17.9 |
| 53 | 0.2 | 1.0 | 1.9 | 17.3 |
| 54 | 0.0 | 0.0 | ... | ... |

From it we can see, for instance, that of every group of freight cars placed in service, an average of 51.4 per cent have been found to be in service at the end of 20 years and 11.1 per cent at the end of 25 years. If history shows a certain rate of vacations in the past, it is well within the laws of probabilities to assume the same rate of vacations for the future unless some radical changes in operation are introduced.

From this curve or the data upon which it is built, we can derive an expectancy table showing the probable number of years of future service. To illustrate, from the curve and data for freight cars we find that at the end of 20 years there will remain an average of 51.4 per cent of the original number of cars and that these will have an average additional life of 3.8 years. We now have the two factors needed to establish the ratio of expectancy of future service to total service. If the car has been in service 20 years and has 3.8 years expectancy, the total will be 23.8 years and the per cent of remaining service will be the ratio of 3.8 to 23.8 or 15.3 per cent. This represents the expectancy of service. To

find the per cent of remaining value we of necessity apply this per cent to the depreciating portion of the total value and add to the resultant, the non-depreciating portions. With freight cars having an average salvage value of 24.7 per cent, the depreciating or wearing portion of the value is 75.3 per cent. With 15.3 per cent expectancy in remaining service at the end of 20 years, the expectancy in remaining value becomes (15.3×75.3) plus 24.7 or 36.2 per cent.

The expectancy in per cent of remaining value then becomes the measure of present value. It will be noticed that the present value curve never quite reaches the non-depreciating value line because so long as the article is in service there is some expectancy of future service.

In the data from which these curves have been drawn, the writer has included vacations from all causes. Cars and locomotives are all finally wrecked, destroyed by fire, con-

the same liability of accidental destruction and conversion into work equipment as are new cars.

A very interesting comparison of efficiency of design of any series of cars can be made by means of mortality curves such as are here presented. That is, if a curve be developed to show the average performance of a certain class of cars on a given road then a new series coming into service may, after it has been in service a few years, have its mortality curve developed, and from this a comparison made which will show readily whether or not the series is holding up to the average expectancy. Or the mortality curves for a given road may be compared with the average for all roads or for any one selected as a criterion and very interesting and instructive conclusions may be drawn.

TABLE 3

MORTALITY DEPRECIATION STUDIES FOR FREIGHT CARS

| Years in service | Per cent remaining in service | Expectancy in years of service | Expectancy in per cent of remaining service | Expectancy in per cent of remaining value |
|------------------|-------------------------------|--------------------------------|---|---|
| 0 | 100 | 20 | 100 | 100 |
| 1 | 99.8 | 19 | 95 | 96.2 |
| 2 | 99.6 | 18 | 90 | 92.5 |
| 3 | 99.3 | 17 | 85 | 88.7 |
| 4 | 99.1 | 16 | 80.2 | 84.9 |
| 5 | 98.8 | 15.2 | 75.2 | 81.3 |
| 6 | 98.4 | 14.2 | 70.3 | 77.6 |
| 7 | 97.9 | 13.3 | 65.5 | 74.0 |
| 8 | 97.3 | 12.4 | 60.8 | 70.5 |
| 9 | 96.1 | 11.5 | 56.1 | 66.9 |
| 10 | 95.0 | 10.6 | 51.4 | 63.4 |
| 11 | 94.0 | 9.7 | 46.8 | 59.9 |
| 12 | 92.3 | 8.9 | 42.6 | 56.8 |
| 13 | 89.6 | 8.1 | 38.4 | 53.6 |
| 14 | 86.5 | 7.4 | 34.6 | 50.8 |
| 15 | 83.6 | 6.6 | 30.5 | 47.7 |
| 16 | 79.5 | 5.9 | 27.0 | 45.0 |
| 17 | 74.5 | 5.2 | 23.4 | 42.3 |
| 18 | 68.4 | 4.6 | 20.3 | 40.0 |
| 19 | 61.3 | 4.0 | 17.4 | 37.8 |
| 20 | 53.4 | 3.8 | 15.3 | 36.2 |
| 21 | 41.0 | 3.3 | 13.6 | 34.9 |
| 22 | 32.4 | 2.9 | 11.7 | 33.5 |
| 23 | 21.7 | 2.6 | 10.1 | 32.3 |
| 24 | 16.7 | 2.3 | 8.7 | 31.2 |
| 25 | 11.1 | 2.1 | 7.3 | 30.2 |
| 26 | 6.4 | 1.8 | 6.5 | 29.6 |
| 27 | 3.4 | 1.5 | 5.3 | 28.7 |
| 28 | 1.3 | 1.3 | 4.4 | 28.0 |
| 29 | 0.3 | 1.2 | 4.0 | 27.7 |
| 30 | 0.09 | 1.0 | 3.5 | 27.3 |
| 31 | 0.04 | 1.0 | 3.1 | 27.0 |
| 32 | | 1.0 | 3.0 | 26.9 |
| 33 | | 1.0 | 2.9 | 26.8 |
| 34 | | 1.0 | 2.8 | 26.9 |
| 35 | | 1.0 | 2.7 | 26.8 |
| 36 | | 1.0 | 2.6 | 26.7 |

verted into work equipment, dismantled or sold. Whatever the method by which its final abandonment is accomplished, the fact remains that so soon as the article is placed in service it becomes subject to a liability of destruction, obsolescence, inadequacy or decrepitude, and the measure of this liability is the measure of the effect that each of the various causes making vacations have had on similar equipment in similar service in the past.

As stated above, the exception comes where there is a radical change in operating conditions. For instance, up to the present time the roads have universally dismantled freight cars when they reached a condition such that a practical rebuilding became necessary. Within the past year, however, this plan has just as universally been abandoned and the carriers are now rebuilding almost anything that has a number. This will, if carried on, give an extension to the average serviceable life of equipment. A fair approximation of what this extension will be can be determined if the mortality curves data for individual classes of cars, such as box cars, be divided so as to show the effect of the various causes making necessary the vacations. With such a division we find that a certain per cent of cars have been dismantled and also we find the ages or periods in which such dismantling has occurred. With this data in hand we can then compute the number of rebuildings possible, assuming that during the added life, these rebuilt cars will be subject to

United States Supreme Court on Patentees' Rights

By Paul Synnestvedt

IN CONNECTION with the discussion which has recently arisen relative to the question whether or not all rights in that species of property known as Letters Patent should be surrendered to the government during the period of the war without compensation to the patentee or owner, much importance would seem to attach to two recent decisions of the United States Supreme Court reported in the early April advance sheets of the Supreme Court Reporter of the West Publishing Company of St. Paul.

The two cases referred to are a suit relating to some of the patents on the Marconi wireless telegraph apparatus, the litigation on which went to the Supreme Court from the United States Circuit Court of Appeals in New York, and a suit relating to some Curtis marine turbine patents which went to the Supreme Court from the United States Circuit Court of Appeals sitting in Philadelphia.

In the Marconi case the Federal Court in New York had held in substance that under the present statutes touching the rights of a patentee against unauthorized use of his invention by the government, a competitor of the patentee could bid against the patentee, and if awarded the contract, could supply the government with the patented apparatus without other remedy to the aggrieved patentee than an action in the Court of Claims, under the federal Statutes relating to patent cases, for damages against the government arising out of the unauthorized use.

The Supreme Court strongly advanced the opposite view, condemning such violation of a patentee's rights as unlawful and unjust, while at the same time recognizing, of course, that it is within the sovereign power of the government to commandeer anything needful to government use, and that it is not open to any individual to obtain injunctive relief against such sovereign authority. The exercise of such sovereign right to appropriate for government use private property not surrendered by contract or consent was held to be proper only in accordance with the law that is, according to proper and legitimate means, and with ample provision for safeguarding or protecting the owner of such commandeered property as against damage or loss.

The Supreme Court further refused to endorse the theory that had been advanced in the lower courts, and sustained in New York, that because of certain provisions in some federal statutes recently passed the government should be regarded as holding a general license for the use of all patented inventions such as would enable it to obtain such patented apparatus from competitors of the patentee without the owner of the patent rights having any other relief than a suit for damages in the Court of Claims against the United States.

The net result of the Supreme Court rulings is that the

rights of a patentee against infringement by competitors in unlawful appropriation of patented inventions supplied to the government remain as before and unimpaired, and while the government clearly cannot be stopped from appropriating and using any invention which it may desire or need especially for promoting its activities in the war, such patented mechanism must be secured by or through the owner of the rights who, exactly as is the case with other personal property, has a right to look for and expect reasonable compensation.

Substantially the same questions arose in the litigation relative to the Curtis marine turbine patents, some of which had been incorporated without license in navy boats built for the government by The Cramp & Sons Shipbuilding Company; and this again came up in the United States Circuit Court of Appeals in the Third Circuit in connection with a controversy as to whether certain ships that had been so equipped were to be included with others in calculation of recoveries held to be due under patents which had been sustained by the United States Circuit Court of Appeals in Philadelphia.

The effect of the decision by the Supreme Court in both cases was to grant to the patentee his right of recovery against the infringer who supplied the government with the infringing turbines, and this action by the Supreme Court was apparently in support of the view held by the Philadelphia court.

Railroad Employees Breaking All Records in Liberty Loan

"I AM VERY PROUD, too, of the splendid work the officers and employees of the railroads of the United States are doing for the Third Liberty Loan. Their enthusiasm and loyalty have been conspicuous," said Director General McAdoo in Chicago last Sunday after his arrival from his trip through the South and Southwest.

Eastern Regional District

The Eastern Regional District Liberty Loan Committee, of which F. D. Underwood, president of the Erie, is chairman, reported on Wednesday that it had heard from 39 roads reporting total subscriptions of \$23,925,050, about \$21,000,000 of this having been taken by 325,000 men.

Several of the eastern roads are trying to break all records for total subscriptions, number of subscribers and percentage of subscribers to total employees.

The Delaware Lackawanna & Western, on May 1, was able to report the following percentages:

| | Number | Subscribers | Per cent |
|-------------------------------------|--------|-------------|----------|
| Station employees | 1,078 | 1,078 | 100.0 |
| Conductors | 258 | 258 | 100.0 |
| Trainmen | 852 | 827 | 97.0 |
| Switchmen | 716 | 716 | 100.0 |
| Yardmen, tins and clerks | 329 | 329 | 100.0 |
| Superintendents' offices | 121 | 121 | 100.0 |
| Shoppers, roundhousemen and car men | 5,704 | 5,376 | 94.3 |
| Locomotive engineers | 904 | 937 | 94.1 |
| Locomotive firemen | 928 | 831 | 90.0 |

Several other departments have reported 100 per cent and the number is still increasing.

The total number of subscribers Wednesday had reached 29,893 and the total subscriptions \$1,738,400. For all departments of the railroad the percentage of subscribers to total employees was 81.2 per cent.

On the Lehigh & Hudson River, the result of intensive work on a small road has been shown in subscriptions taken by 745 employees, 100 per cent of the personnel and a perfect record.

The Baltimore & Ohio reported up to the evening of April 29, subscriptions for \$2,445,100.

The Erie up to Wednesday morning reported that 19,550

subscribers had taken \$1,244,650. The mechanical department employees of the Marion division, including the Hammond, Ind., shops, turned out the splendid record of no less than 1,137 subscribers out of 1,150 employees.

The Pennsylvania Railroad System, lines east and west, on April 27 had taken \$8,444,850 in bonds, there being 141,800 subscribers. On the lines west 71.83 per cent of all employees subscribed up to April 27.

New York Central

The New York Central up to noon April 30 had reported total subscriptions for the entire system by 109,446 employees, 63.8 per cent of the total employees, for \$7,773,550. In the second loan 33,872 employees subscribed for \$2,256,450. The New York Central's figures are as follows:

| NEW YORK CENTRAL LINES LIBERTY LOAN COMMITTEE | | | | | | | | | |
|---|---------------------------|-------------------------|----------------------------|-------------|-------------------------|----------------------------|-------------|-------------------------|--------|
| SUBSCRIPTION TO THIRD LIBERTY LOAN REPORTED UP TO NOON, TUESDAY, APRIL 30, 1918 | | | | | | | | | |
| Road | Total Number of Employees | First Loan | | | Second Loan* | | | | |
| | | Number of Subscriptions | Percent of Total Employees | Amount | Number of Subscriptions | Percent of Total Employees | Amount | Number of Subscriptions | Amount |
| NYCRR, East | 64,248 | 40,552 | 63.1 | \$3,001,700 | 13,450 | 20.9 | \$873,300 | | |
| NYCRR, West | 34,045 | 24,334 | 71.4 | 1,623,000 | 7,158 | 21.0 | 553,550 | | |
| B. & A. | 8,149 | 1,831 | 22.4 | 120,850 | 471 | 5.8 | 32,200 | | |

* Figures for Second Loan not available.

Special note—Total number of employees given 171,372—is entire payroll of all classes and departments of labor at this date, including large numbers of transient or "floating" workers, many of whom remain only for a few days, the constant changes making the "turn-over" often above 100 per cent a month.

On the New York Central there are 650 divisional and departmental committees, each with specific responsibility, territory and lists, these embracing as active workers more than 3,500 employees.

A specially-designed "Honor Flag" is awarded to each department showing 75 per cent of its personnel as subscribers to bonds, a star being added for each additional 5 per cent. Already numerous departments have reported "100 per cent subscribed" and claimed the flag with five stars. In the general offices at the Grand Central Terminal, New York, no less than 158 offices, some with a hundred or more employees, have received the 100 per cent flag.

Depew Shops 100 Per Cent

But the banner for the entire New York Central System to date apparently goes to the Depew shops where out of 650 employees 650 subscriptions were reported.

Girl employees with brothers or family members at the front form a unique branch of the New York Central organization selling Liberty bonds. They are the special "storm troops" or "shock squads," as it were, of the army of 3,500 bond canvassers, being used to win over those "hard cases" when other appeals have failed. When an employee who is well able to invest resists all efforts and is reported by the regular "team" as hopelessly indifferent or laggard, a "squad" of the girls makes the final effort. Every one of the girls has a brother, husband or father in the fighting forces, this being a necessary qualification, and with thoughts of the needs of their loved ones "over there" which the bond money would supply as an inspiration, their pleas seldom fail to convert reluctant investors.

For the final week of the bond-selling on the New York Central, the "Safety First" organization has changed its

slogan to "Liberty First." The regular "safety meetings" held by employees under direction of local committees have been devoted instead to arousing enthusiasm for the third bond issue.

"Safety First" Yields to "Liberty First"

Marcius A. Dow, general safety agent of the system, as this is written is holding a series of Liberty bond mass-meetings for railroad employees, on a fast tour that will cover all the big centers to Buffalo. Commencing at the Harmon shops, the schedule includes big rallies for employees at West Albany, Rensselaer, Utica, Frankfort, Syracuse, Depew, Rochester, Buffalo and Niagara Falls.

Two veterans of the war, invalidated for wounds, accompanied Mr. Dow and addressed the railroad employees' gatherings, telling of conditions and their personal experiences in the trenches. These were Private L. C. Bugess, a bomber who saw three years' service with the famous Canadian "Princess Pats" and lost an eye for liberty, and Private H. J. Pickell, who served three years with the 24th Battalion, Canadian Infantry, and was wounded at Vimy Ridge.

The meetings in shops, roundhouses, at stations and in switching yards have been marked by the greatest enthusiasm, the railroad men being particularly interested in hearing about the American railway engineers who threw down their shovels and seized rifles at Cambrai, thereby becoming the first of our expeditionary forces in battle.

Western Regional District

W. G. Bied, chairman of the Liberty Loan Committee for the western regional district, reported up to Saturday, April 27, total subscriptions of \$40,878,030.

The reports of the leading railroads up to April 25 showed:

| Road | Subscriptions | Per cent of employees |
|--------------------------------|---------------|-----------------------|
| Atchison, Topeka & Santa Fe | \$2,802,400 | 59.97 |
| Chicago, Rock Island & Pacific | 2,762,556 | 98.10 |
| Chicago & North Western | 2,536,650 | 65.72 |
| Chicago, Milwaukee & St. Paul | 2,500,100 | 75.41 |
| Nor. Pacific | 2,398,450 | 83.58 |
| Great Northern | 2,204,350 | 74.33 |
| Missouri Pacific | 2,055,000 | 78.48 |

Some idea of the way the Liberty Loan is going in the western district is shown by the complete tabulation of Class I roads up to April 25:

| | |
|--------------------------------|--------------|
| Total employees | 714,973 |
| Total subscribers | 481,633 |
| Per cent | 67.36 |
| Total subscriptions (April 25) | \$36,673,780 |
| Average per subscriber | \$74.67 |

THE FUTURE OF DISABLED EMPLOYEES was considered at the recent meeting of the London & North-Western of England. Sir Gilbert Cloughton, chairman of the company, said that the question of providing suitable employment on their return to civil life of those members of the company's staff who were disabled through war service, had engaged the attention of the directors and officers, special attention being given to those who were, or might be, incapacitated owing to the loss of a limb or an eye. In 57 such cases suitable work had been found for them by the company in positions such as time-keepers, ticket-collectors, watchmen, etc. Of the 1,987 men who had returned to the company, 1,913, or 96 per cent, had taken up their former positions at their proper rates of pay or had been placed in equally good positions at not less than their former remuneration. There were no cases where men had returned disabled and ready and fit to resume work that had not been provided for.—*Railway Gazette, London.*

A High Lift Industrial Truck

IN THE EFFICIENT HANDLING of freight and stock from platform to storeroom, different forms of industrial lift trucks are becoming more and more important factors and their use has spread to railroad repair shops and freight houses. One of these trucks, recently developed by the Lewis-Shepard Company, Boston, Mass., intended especially for railroad work, is shown in the illustration.

With a capacity of 3,500 lb. and large rear wheels to insure easy rolling, it combines the added advantage of a universal joint which permits the load to be raised with the handle in any position. In this way it is possible to use the truck in freight cars and other cramped quarters hitherto inaccessible, and a total lift of 21 1/2 m. allows the wooden platforms to be pulled over inclines and other irregularities in the floor.

The load is elevated by a combination of levers re-

Model 10 W S B Jacklift Master Truck

quiring from four to six short strokes of the handle and a ratio of 40 to 1 gives a powerful purchase. In lowering, a release check permits the load to descend slowly to the floor and eliminates the possibility of spills.

At one freight depot where this truck is in use, all incoming freight is unloaded directly onto small platforms made for the purpose. Platform and freight are then moved by the aid of a truck to destination without rehandling.

GERMAN RAILWAY TRAVELING.—In an article in the London Daily Mail, E. L. Pyke, a London business man who has recently been released from Ruhlleben after 3 1/2 years' internment, writes: "The Germans, even if they had food, are handicapped by the immense deterioration of the railways, of which I have heard nothing in England except an occasional suggestion that there is a shortage of axle-grease in Germany. I came back along the well-known Berlin-Flushing line from Charlottenburg to Goch. Before the war the Germans were proud not only of their roadbed but also of their rolling-stock. Well, the German railways are now no place for those who like smooth traveling. Although I was on the way to freedom and in the height of good spirits, the state of the railway wheels, but more particularly the state of the track, rendered conversation and sleep impossible. One wag of the party suggested that the wheels were square."

General News Department

Senator Jones, of Washington, has introduced a bill in Congress, S. 4370, to prohibit trespassing upon the cars or trains of common carriers in interstate commerce.

Ink, mucilage and paste are among the things which the Southern Pacific now makes for itself. The 45,000 employees of the Pacific system have also been encouraged to apply thrift to their office work. They are using 10,000 paper tubes to put over pencil stubs. The company uses 4,000 quarts of ink annually and 2,400 quarts of mucilage, and difficulty experienced in securing these articles led to manufacturing experiments at the Sacramento shops.

The shops of the Lake Erie & Western, at Lima, Ohio, were destroyed by fire on the night of April 24, together with 15 passenger cars and a number of freight cars. Estimated loss, including damage to 14 locomotives, \$500,000. The fire is supposed to have been incendiary.

The conflagration followed a blaze discovered in the same place two hours earlier and later flames were discovered at three different places in the plant. Federal agents have been investigating the fire and one suspect has been arrested.

The New York-New Jersey Port Development Commission, a joint commission established by the states of New York and New Jersey, will soon begin the investigation of general traffic conditions at the port of New York, the legislature of New York having followed that of New Jersey in making an appropriation of \$100,000 for the expenses of the commission. The chairman of the commission is William R. Willcox of New York City, formerly chairman of the New York State Public Service Commission, First District.

Twelve hundred war gardens were planted by employees of the Pennsylvania Railroad last year, and in a circular which has just been issued, urging employees to do even better this year, it is stated that the estimated value of the crops raised by the employees in these gardens last year was \$250,000. The company leases these lands to employees at one dollar an acre. There are, on the lines east of Pittsburgh and Buffalo, about 2,800 acres of land owned by the company, none of it on the right of way. Garden primers have been secured from Washington and one will be given to every employee who is interested.

New York to Washington and back the same day, by two men in a Breguet biplane, is the latest American aeroplane record. This trip was made on Wednesday, April 24, by two French officers connected with the Aviation Mission to this country, Major Tulasne, and Lieutenant Flachaire. They left the Mineola field, 20 miles east of New York, at 9 a. m.; arrived in Washington at 12:15; started back at 3 and arrived at Mineola at 6 p. m. The distance traversed was approximately 500 miles, making the average rate of speed about 80 miles an hour. On Sunday, April 28, a flight from Washington to Mineola was made in about three hours by a 450 hp. airplane carrying four men.

Concrete barges, four of them, are to be used by the Navy Department for service in New York harbor to transport fuel oil. The order for the construction of the barges has been given to the Ambursen Construction Company, 61 Broadway, New York City. The vessels are designed to carry in the hold about 800 tons of oil and also may be used for carrying the same tonnage of coal or other cargo. This is the first official recognition by the Navy Department of the adaptability of reinforced concrete to ship construction. The vessels will be built at the yards of the Ambursen Company on the Hackensack river, and it is expected the first one will be launched by June 15.

Increases of fares on electric roads, made necessary by the high cost of living now imposed on these lines, seem likely to throw some passenger business to steam railroads, here

and there. On the Boston & Maine, northward from Springfield, Mass., to Holyoke, eight miles, between which cities there are a dozen local trains each way daily, the fare (on these local trains) is 10 cents, reduced several years ago partly because of trolley road competition; but now the electric line has advanced its fare to 20 cents, and for those passengers to whom the railroad is convenient the lower fare in the steam cars will be a decided attraction. The Boston & Maine expects, also, some increase in travel on its through trains, the fare on these trains, 20 cents, being no higher than that on the slow electric cars. From Westfield, ten miles west of Springfield, many workmen ride daily to the latter city, and the Boston & Albany, the parallel steam line, has been asked to put on additional local trains.

Annual Meeting of Pacific Railway Club

At the annual meeting of the Pacific Railway Club on March 14 at San Francisco, Cal., the following officers were elected for the coming year: President, P. P. Hastings, assistant general freight agent of the Atchison, Topeka & Santa Fe; first vice-president, G. W. Rear, general bridge inspector, Southern Pacific; second vice-president, J. H. Leary, assistant superintendent of the Western Pacific; treasurer, C. E. Norton, chief train dispatcher, Southern Pacific. The club, which was organized in March, 1917, now has a membership of 279.

War Finance Corporation

President Wilson on Monday nominated four directors of the War Finance Corporation, who, with Secretary of the Treasury McAdoo, will administer the work of this organization in extending financial assistance to essential war enterprises. The directors nominated are W. P. G. Harding, governor of the Federal Reserve Board; A. B. Forbes of New York; Eugene Meyer, Jr., of New York; and Angus McLean of Wilmington, N. C. Members of the new capital issues committee, which is to investigate and pass upon proposals of industrial concerns to issue securities in excess of \$50,000, were also nominated as follows: Charles S. Hamlin, member of the Federal Reserve Board and former Assistant Secretary of the Treasury, John Skelton Williams, controller of the currency and director of finance and purchases of the Railroad Administration, Frederic A. Delano, member of the Federal Reserve Board, Henry C. Flowers of Kansas City, Frederick H. Goff of Cleveland, James B. Brown of Louisville, Ky., and John S. Drum of San Francisco.

Associations Approved by the Railroad Administration

In last week's issue there was given a partial list of organizations the expenses of which the Railroad Administration has decided may or may not be charged to operating expenses after May 1. Additional organizations have since been approved until further order, including the following:

The International Railway Fuel Association, the Association of Transportation and Car Accounting Officers, the Railway Storekeepers' Association, the American Wood Preservers' Association, the Air Brake Association, the Master Car Builders' Association, the Bridge and Building Association, the Roadmasters' and Maintenance of Way Association, all car interchange bureaus, the Ore and Coal Exchange, the Tidewater Coal Exchange, the American Steamship Association, the New Orleans Steamship Association, the Kansas City and St. Joseph Clearing Houses, and various Texas associations.

Some organizations, including the American Railway Master Mechanics' Association, has not been passed on because they failed to file application. All local freight associations are approved until further notice, but their expenses must not exceed those of last year, except after specific authorization. The va-

rious claim associations, tariff issuing bureaus, classification committees, freight and passenger traffic associations and inspection bureaus have been given letters, saying:

"Consideration is now being given to the possible necessity of re-organization of associations similar to your own, with a view to economical and efficient operation. It is therefore impossible to determine how long the present method of organization and expenses should continue. Only such assessment as is necessary to meet your current expenses to May 30, 1918, should be with the understanding that if no order has been issued prior to that date you may continue to make such assessments until such notice is given."

Other organizations specifically disapproved are the Association of Railway Telegraph Superintendents, the Society of Railway Financial Officers, the American Society for Testing Materials, the Western Association of Short Line Railroads, the American Museum of Safety and the National Safety Council. The Bureau of Railway Economics may continue until July 1.

Expenses for R. Walton Moore, commerce counsel of the southeastern roads, have been approved until June 30.

Railroad Traffic in England

The Railroads of Great Britain find their passenger traffic now as heavy as it has been at any time in their history, although early in 1917, the government increased fares 50 per cent for the express purpose of diminishing the amount of travel. There was a falling off for a time, though not to the extent that had been anticipated; and now, according to a statement made by the president of the Board of Trade recently in Parliament, the volume of traffic has gradually risen so that the effect of the increase in fare is no longer apparent. The president of the Board of Trade was making a general statement on the condition of railway traffic and explaining how train service would have to be further curtailed, mainly because of an increase in the traffic in coal by rail because of the withdrawal of steamers from the coasting service. These steamers had been carrying about 3,000,000 of tons of coal yearly. The railroads have not been able to add any new cars or engines since the beginning of the war, while a good many locomotives and several thousand freight cars have had to be sent to France. Today, both passenger and freight traffic is heavier than ever before, and has to be carried on with a diminished number of cars and engines and a reduced personnel.

Government Advances to Railroads

The railroads to which the director general has furnished funds, either in the way of loans or as advances on account of rentals, to April 30, are reported as follows:

| | |
|---|--------------|
| New York, New Haven & Hartford..... | \$43,964,000 |
| New York Central (including the Michigan Central, the Cleveland, Cincinnati, Chicago & St. Louis and the Pittsburgh & L. E.)..... | 28,500,000 |
| Pennsylvania | 7,000,000 |
| Baltimore & Ohio | 5,000,000 |
| Chicago, Rock Island & Pacific..... | 3,000,000 |
| Wabash | 1,300,000 |
| Minneapolis & St. Louis..... | 750,000 |
| Chicago, Indianapolis & Louisville..... | 500,000 |
| Buffalo, Rochester & Pittsburgh..... | 400,000 |
| Detroit, Toledo & Ironton..... | 200,000 |
| Total | \$90,614,000 |

All of these advances were in the shape of loans, except \$13,000,000 advanced on account of rentals for the first quarter of the current calendar year to the New York Central lines and \$1,300,000 similarly advanced to the Wabash. Of the above aggregate of \$90,614,000 advanced, \$77,514,000 was obtained from the Treasury through the revolving fund provided for in the Railroad Act, and \$13,000,000 was derived from funds turned over to the Railroad Administration from their surplus funds by certain railroad corporations. The payments to the New York Central include \$10,000,000 for the New York Central itself, \$900,000 each for the Michigan Central and the Big Four and \$1,200,000 for the Pittsburgh & Lake Erie.

Overman Bill

Rejecting all amendments designed to limit the President's authority, the Senate on Monday, April 29, passed the Overman bill, which contains a general grant of power to the executive to coordinate and reorganize executive or administrative commissions, bureaus, agencies and offices of the government, by a vote of 63 to 13. An amendment proposed by Senator Cummins to except the Interstate Commerce Commission was voted down by a vote of 43 to 31. Throughout the protracted debate on this bill many senators had opposed it on the ground that it included authority to reorganize agencies of the government such as the Commission, the Federal Trade Commission and the Federal Reserve Board, which the opposing senators felt it was not necessary to affect because of any war condition. Because such determined opposition was manifested by the Administration leaders to any exception from the blanket authority it was frequently intimated that one of the purposes of the bill might be to give the President power to transfer the functions of the Interstate Commerce Commission to some other body. Senator Overman finally gave the Senate an assurance that it was not proposed to interfere with the Federal Reserve Board, the Interstate Commerce Commission and some other bodies, but a special effort to except them was made both during the consideration of amendments and at the time of the final passage of the bill. The proposed standard form of contract between the railroads and the government to govern the amount of compensation for the use of railroad property during federal control seems to contemplate the continued existence of the Interstate Commerce Commission, which is given the function of passing upon any question that may arise as to its interpretation.

Call for a Single Terminal Manager in Chicago

In a recent letter to Director General McAdoo, John F. Wallace, chairman of the Railway Terminal Commission of the Chicago City Council, recommends the unification of terminal operation in Chicago, under one manager; and the construction of such connecting tracks and other facilities as may be immediately necessary to render joint operation more practicable. His letter reads in part as follows.

"While the commission appreciates that the full development of a co-operative system will involve the construction of certain joint or common facilities which require careful consideration, it, however, believes that the existing facilities can be so arranged and operated as to substantially promote both efficiency and economy; and the purpose of this letter is to suggest to you the immediate appointment of a local manager and staff to operate all of the railway terminal facilities within the Chicago terminal district as a unit. The commission will be pleased to give to such a manager the benefit of its study of the terminal situation and will assist him in any way in its power.

"The commission believes that large efficiencies and economies can immediately be obtained by this procedure and that the actual operation of the Chicago terminal facilities as a whole will promptly develop practical steps for the development of the co-operative principle, and that the practical application of this principle in the manner suggested will demonstrate its desirability both to the railroads and to the public.

"The commission proposes to continue the preparation of its report, but it believes that the adoption by you of the suggestion above made need not await your consideration of any particular plan of terminal operation.

"If, however, suggestions other as to a general plan of operation or as to any particular point or phase of the matter would in your judgment be helpful, the commission will be glad to present such suggestions."

For the purpose of working out a plan for the unification of Chicago terminals, R. H. Ashton, regional director of western roads, has already appointed a committee of railroad officers with George Thompson, general manager of the Indiana Harbor Belt, as chairman. Spoken for by the Railway Terminal Commission recently that Mr. Thompson's committee is doing valuable work but contend that the committee plan of operation has the fault of recognizing individual

railroad systems as a basis. The Railway Terminal Commission, on the other hand, favors the obliteration of all forms of separate authority and interest in terminal matters and the re-organization and operation of the railroad terminal facilities of the Chicago district upon the basis of complete unity.

Western Regional Director's Orders

Misuse of Officers' Names.—In a letter sent out to the railroads on April 27, R. H. Ashton, western regional director, warns them to watch for the unauthorized use of government officers' names by shippers to expedite the movement of freight.

No Advertising for Labor.—In supplement No. 1 to circular No. 63, on Track labor, the regional director of western lines, reiterates the request that roads utilize as far as possible the employment service of the United States Department of Labor in securing track labor. Railroads should advertise for labor only in exceptional cases.

Grouping of Purchases of Stationery.—In circular R. P. C. No. 9 sent out by the Regional Purchasing Committee of the Western Railroads, attention is called to the wide discrepancy in prices paid by different roads for printing forms D, C. E. 1, 2, 3 and 4. Purchasing agents in the same locality should get together on matters of this kind and make all their purchases at one time. The same idea can be carried out to a large extent in connection with accounting and operating blanks.

Branches to New Coal Mines.—The regional director of western railroads has asked the lines under his jurisdiction to secure the approval of the United States Fuel Administration at Washington before completing arrangements for the construction of tracks for the opening of new mines. While the Fuel Administration realizes the necessity of keeping up the production of coal, it does not believe new mines should be opened unless the work can be done without taking labor from mines already developed and capable of producing more coal than at present. It is urged that transportation facilities serving existing coal mines, where inadequate, be enlarged before new undertakings are initiated. Approval for the building of tracks to new mines should be obtained from the United States Fuel Administration through the mining company interested.

Statistics of Receipts and Expenses.—Circular No. 69, issued by the regional director of western railroads, directs the lines in his district to send to C. R. Gray, director of the division of transportation, Washington, two copies of the following reports, and one copy to the regional director, for the months of January, February and March; and for each month thereafter: (1) Detailed income with comparisons with last year, and expenses by primary accounts; (2) Transportation officers' reports used to measure efficiency and cost of operation; (3) Report used to measure efficiency and cost of locomotive performance; (4) Usual explanations provided for president or chief operating officer covering increases and decreases.

Cement Estimates.—The regional purchasing committee of western roads has addressed a communication to purchasing agents pointing out that there may be a shortage of cement and asking that they file with the requirements division estimates of their needs for the year; (a) The number of barrels required. (b) What part of your requirements has been contracted for or purchased? (c) Names and addresses of companies with which you have contracts, or with which you have placed orders, the quantity, price, and f. o. b. point in each instance. (d) Location of mills from which the balance of your supply would naturally come, in order to most economically serve your company, taking into consideration transportation and price.

HANDLING OF COMPLAINTS AND CAR REPORTS

In circular No. 81, recently issued by the regional director of western railroads, lines in western territory are requested to acknowledge promptly inquiries or complaints from patrons. Some lines are said to be lax in this regard. Complaints sent to individual lines by the regional director's office need not be acknowledged to the regional director unless the communication

of transmittal so requests. In handling these complaints roads should communicate directly with the complainant and where the complaint appears to be serious should have representatives adjust the matter by conference. Traffic officers relieved from other duties can be used to good advantage in this work. All communications from the regional director's office requiring answers should be given prompt attention.

Western roads are also instructed to systematize the making of reports to the regional director's office and to the Car Service Section of the Railroad Administration, as well as to their representatives at various points, so that it will be unnecessary to telegraph or telephone for reports that have been overlooked. Where this work is of great volume it may be advisable to establish special representatives in larger terminals and general offices to prepare these reports.

The roads are also requested to advise the regional director from time to time on matters of general interest as the following: (a) crop conditions; (b) general movement of traffic, as compared with last year; (c) impending large movement of any particular traffic and arrangements made to handle it; (d) general car situation; (e) changes in methods of operation effecting economies; (f) labor situation; (g) traffic interruption due to storms or otherwise; (h) serious collisions or derailments; (i) suggestions for changes in handling traffic that will result in economies or in expediting movement.

COMMITTEES TO BUY TIES

The regional purchasing committee of western railroads recently issued circular No. 6 containing the names and territories of sub-committees for the purchase, inspection and handling of cross-ties as follows:

- Michigan and Wisconsin—
I. E. Seddon, purchasing agent, C. St. P. M. & O., St. Paul, Minn., chairman.
- E. T. Stone, purchasing agent, M. St. P. & S. Ste. M., Minneapolis, Minn.
- I. S. Carroll, general purchasing agent, C. & N. W., Chicago.
- Minnesota and West to Cascade Mountains, and South to Northern Boundary of Iowa, South Dakota, Wyoming and the Salmon River in Idaho—
F. G. Prest, purchasing agent, N. P., St. Paul, Minn., chairman.
- J. W. Taylor, assistant to president, C. M. & St. P., Chicago.
- F. A. Bushnell, purchasing agent, G. N., St. Paul, Minn.
- West of Cascade Mountains and South to California Line and South of Salmon River in Idaho—
G. W. Saul, purchasing agent, O. W. R. & N., Portland, Ore., chairman.
- F. G. Prest, purchasing agent, N. P., St. Paul, Minn.
- F. A. Bushnell, purchasing agent, G. N., St. Paul, Minn.
- California, Nevada, Utah, Arizona and New Mexico—
F. W. Taylor, general purchasing agent, S. P., San Francisco, Cal., chairman.
- M. J. Collins, general purchasing agent, A. T. & S. Fe, Chicago.
- W. T. Jacobs, purchasing agent, W. P., San Francisco, Cal.
- Colorado, Wyoming, South Dakota, Nebraska and Iowa—
L. N. Hopkins, purchasing agent, C. B. & O., Chicago, chairman.
- F. D. Reed, general purchasing agent, C. R. I. & P., Chicago.
- W. F. Lefavre, purchasing agent, D. & R. G., Denver, Col.
- Missouri, Kansas, Arkansas, Oklahoma and Illinois—
N. M. Rice, second vice-president, St. L. S. F., St. Louis, Mo., chairman.
- C. A. How, general purchasing agent, M. P., St. Louis, Mo.
- W. S. Atkinson, purchasing agent, K. C. S., Kansas City, Mo.
- Texas and Louisiana—
N. J. Randolph, purchasing agent, Sunset Central Lines, New Orleans, La., chairman.
- T. H. Ryan, purchasing agent, V. S. & P., New Orleans, La.
- R. I. Irwin, purchasing agent, T. & P., New Orleans, La.

Each committee is to make a comprehensive survey of its respective territory and report to the regional purchasing committee. This circular is accompanied by a questionnaire, regarding tie requirements.

JOINT SWITCHING ARRANGEMENTS

The regional director of western railroads recently issued circular No. 82 on the subject of joint switching, his purpose being to determine what further action is necessary in connection with economies in switching where two or more lines serve the same industry. Where conferences have not been held between interested lines to consider joint operation they are requested to do so at once. In determining as to joint operation at any point, full consideration must be given to: 1. Public convenience. 2. Rights of men involved. 3. Expediting movement of traffic. 4. Economies to be effected. Where a joint arrangement proposed will seriously affect public convenience, a conference should be arranged with concerns interested; and where rights of men are involved and the plan is likely to cause protest from them, it should not be put in effect until agreement is made with the organizations interested.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JANUARY, 1918

| Name of road. | Average mileage operated during period. | Operating revenues | | | Operating expenses | | | General. | Total. | Operating ratio. | Net from railway operation. | Railway tax accrual. | Operating income (or loss). | Increase (or decrease) last year. |
|--------------------------------|---|--------------------|------------|---------------------|------------------------------------|---------------|----------|-----------|-----------|------------------|-----------------------------|----------------------|-----------------------------|-----------------------------------|
| | | Freight. | Passenger. | Total (inc. misc.). | Maintenance of way and structures. | Equip. mortg. | Traffic. | | | | | | | |
| Midland & West Point | 4,948 | \$71,083 | \$165,736 | \$236,819 | \$17,535 | \$8,898 | \$4,113 | \$59,467 | \$118,404 | 71.49 | \$47,244 | \$7,400 | \$54,644 | \$18,316 |

Two Months of Calendar Year, 19

Traffic News

The Railroad Administration has sent questionnaires to all the railroads asking for detailed information concerning the number of tariffs and tariff supplements issued each year and the cost of their preparation. It is probable that this investigation will lead to the extensive consolidation of individual tariffs into joint tariffs. This policy, for a time at least, will mean an increase in work for the joint tariff committees.

The Railroad Administration is taking cognizance of numerous protests from shippers regarding the abolition of off-line agencies. The traffic division is investigating the question of organizing local offices to handle information and other service formerly performed by outside agencies. J. F. Holden has been specially assigned to this investigation, and the traffic assistants to the regional directors considered the matter at a meeting this week in Washington.

Western Regional Traffic Committees Appointed

Instructions issued by the director general on March 28 provided for the appointment of committees in each railroad region to handle current traffic matters. Accordingly a passenger traffic committee consisting of five men was created recently to handle all passenger matters in western territory; and this committee is directed to appoint, from time to time, such sub-committees as may be necessary to work out detailed matters. A freight traffic committee of five members has also been appointed for the western region with similar instructions. The freight traffic committee consists of A. C. Johnson, of the Chicago & North Western, chairman; S. H. Johnson, of the Chicago, Rock Island & Pacific; J. B. Baird, Northern Pacific; F. B. Houghton, Atchison, Topeka & Santa Fe; Gentry Waldo, Southern Pacific. The passenger traffic committee consists of P. S. Eustis, Chicago, Burlington & Quincy, chairman; A. Hilton, St. Louis-San Francisco; W. J. Black, Atchison, Topeka & Santa Fe; L. M. Allen, Chicago, Rock Island & Pacific, and Chas. S. Fee, Southern Pacific.

Coal Production

The output of bituminous coal increased 366,000 net tons, or 3.4 per cent, during the week ended April 27, compared with the preceding week, according to the weekly bulletin of the United States Geological Survey. Total production, including lignite and coal made into coke, is estimated at 11,230,000 net tons, and the average production per working day at 1,872,000, compared with 1,811,000 the previous week and 1,680,000 in April, 1917. Losses attributed to car shortage amounted to 18.1 per cent during the week ended April 13, as compared with 12½ per cent the preceding week.

The National Coal Association has issued a statement declaring that coal production has been curtailed by inadequate car supply and that interference with the war program will soon be inevitable unless something is done to prevent other traffic crowding coal off the rails. "The mines are not working at top speed nor at a rate even approaching top speed," the statement says, because of insufficiency in the supply of cars at the coal mines and practically no headway has been made to meet the estimated shortage of 50,000,000 to 75,000,000 tons of coal. The statement adds:

"It is understood that the railways are hauling far more traffic as a whole than they ever hauled before. It is evident, therefore, that freight of other classes than coal is responsible for all or practically all of this increase. It would seem that the time has come for the War Industries Board, or whoever is running the war, to decide upon a readjustment of traffic over the eastern railways, so that coal may be handled in sufficient tonnage to take care of the industrial and domestic requirements of the eastern states.

"Unless such readjustment is made very soon there will be inevitable interference with the war program and shortage of domestic fuel in the New England, Atlantic, middle Western and other states throughout the year."

Commission and Court News

Interstate Commerce Commission

The Commission has amended its regulations for the transportation of dangerous articles by express to provide that during the period of the war shipments of dangerous articles other than explosives as defined in the regulations, to or from the War or Navy Departments or recognized offices thereof, may be transported when packed, including requirements as to weight and quantity, in a manner approved by the department.

Eugene Morris, agent for the lines in Central Freight Association territory, has filed a fifteenth section application with the commission proposing the establishment of diversion and reconignment rules to provide for a charge of two dollars a car for stopping freight in transit for orders for the purpose of delivery, reconignment, diversion or reforwarding, and also charges ranging from \$2 to \$5 a car for diversion or reconignment before the arrival of the car at the first billed destination. These rules are to apply on green fruit, vegetables, berries, melons and grapes, both within Central Freight Association territory and interterritorially.

The Commission has issued an order to protect shippers whose consignments may be diverted by a railroad by providing that in instances in which, under the director general's order No. 1, shipments have been or are consigned by routes over which the rates are higher than over the routes designated by the shipper, or over routes not provided for in through rate schedules, carriers participating in such transportation are authorized to adjust the charges to the basis of those applicable by the route designated by the shipper or of those applicable by the route by which the freight would ordinarily have been sent. The director general's order No. 1 requires that existing schedules of rates and outstanding orders of the commission are to be observed; that through routes which have not heretofore been established because of short hauling or other causes are to be established and used whenever expedition and efficiency of transportation will thereby be promoted, and that for this purpose the designation of routes by shippers is to be disregarded.

The commission has amended the diversion and reconignment rules prescribed in its fifteenth section order of March 26, as follows: Paragraph B, page 2, and paragraph A, page 6, are changed to read: "Orders for diversion or reconignment will not be accepted under these rules at or to a station or to a point of delivery against which an embargo is in force. Shipments made under authorized permits are not subject to this condition." Eastern trunk line and New England carriers which have lawfully on file with the commission terminal tariffs providing specific rules governing at eastern seaboard terminal points, are authorized to add an exception, to the effect that the rules will not apply to freight at Boston, New York, Philadelphia and Baltimore, for which other tariffs are provided. (Reference to be made to such tariffs.) The rules and charges governing grain, seed (field), seed (grass), hay or straw, carloads, held in cars on track for the privilege of national, state, board of trade or other official inspection at billed destination or points intermediate thereto, set forth on pages 5 and 6 of the order of March 26, 1918, are postponed until further order.

Court News

Suspension of Proposed Tariff

The New Mexico Supreme Court holds that neither by the State Constitution nor by statute is the state corporation commission given the power to suspend a proposed tariff, and the law does not cast upon a railroad the burden of justifying a proposed rate. The commission cannot cast this burden upon the carrier by serving it with an order to show cause why a given rate should not be established. In re Coal Rates in New Mexico (N. Mex.), 171 Pac., 506. Decided February 16, 1918.

Injuries from Cinders from Engines

The Texas Court of Civil Appeals holds that one into whose eye a hot cinder is thrown by an engine 174 feet distant has the burden of proving negligence. No spark arrester that will permit a reasonable use of a locomotive will prevent the emission of cinders of the small size shown to have entered the plaintiff's eye. The rule of burden of proof in case of fires resulting from sparks escaping from engines will not be extended to cases of this kind. *Missouri, K. & T. v. Langford* (Tex.), 201 S. W., 1087. Decided March 13, 1918.

Assumption of Risk by Roundhouse Employee

The Texas Court of Civil Appeals holds that a roundhouse helper who had worked for over two years about engines and a turntable which was always lighted the same way, the lever handle of which had always been the same length, and the electrical turner had for months been in the same condition, all of which he knew, assumed the risk of injury from such conditions, and it was error to charge that he could recover if the master was negligent—*Fr. Worth & Denver City v. Miller* (Tex.), 201 S. W., 1049. Decided March 23, 1918.

Demurrage—Ownership of Private Tracks

As the prompt movement of cars is necessary to carry on the business of carriers, as well as to prevent discrimination among shippers, the Federal District Court for the Western District of Pennsylvania holds that a carrier may impose demurrage charges on privately owned tank cars used in its business. A railroad's tariffs provided for demurrage and storage charges on shipments of explosives, c. l. and l. c. l. Under an agreement with a shipper, the railroad laid a side track partly on its property and partly on the shippers, the contract providing that the railroad should have the right to use, without cost, any part of the siding in connection with other business, provided such use did not interfere with the shipper's business. Privately-owned tank cars were held by the shipper on the siding for longer than the free time. It is held that, as the purpose of the law is to prevent discrimination, the railroad was entitled to charge demurrage on such tank cars, though they stood on a track partly owned by the shipper.

Under the tariff, carload shipments of dangerous articles were subject to both demurrage and storage charges. Less charges were prescribed for the storage of less dangerous and relatively safe explosives, c. l. and l. c. l. It is held that, under these rules, the railroad could, where gasoline was stored in tank cars on sidings, collect both demurrage charges and storage.—*Pittsburgh, C. C. & St. L.*, 247 Fed., 573.

Liability for Fires—Proof of Cause

By Arkansas Acts, 1907, p. 336, §1, a railroad company is liable for the destruction of or injury to any property which may be caused by fire or result from any locomotive, engine, machine, train, car or other thing used on such railroad, or in the operation thereof, or which may result from or be caused by any employee, agent or servant of such company upon or in the operation of the railroad. The Arkansas Supreme Court holds that under this section a railroad company, while absolutely liable, not only for fires set out by its locomotives and machinery, but for fires set out by its employees while engaged in cleaning or repairing the roadbed or right of way, is not absolutely liable for fires which may have spread on the railroad right of way, and which its servants have failed to extinguish, or which may have been lighted thereon by other persons, and which the railroad employees have not restrained or extinguished, and in such case proof of negligence is essential to recovery. In an action for the destruction of the plaintiff's property along the right of way, evidence of a forest fire in the vicinity which might have caused the destruction of the property is admissible. In such an action, where there was evidence that the fire might have resulted from some cause other than the negligence of the railroad company, an instruction that the verdict should be for the railroad company if the probabilities were equal that the fire might have resulted from causes for which the company was not liable was held proper. Judgment for the railroad was affirmed.—*Clark v. St. Louis, I. M. & S.* (Ark.) Decided February 4, 1918.

Equipment and Supplies

1,025 Locomotives and 95,000

Cars Ordered by Government

The Railroad Administration announced on Tuesday the placing of orders for 1,025 locomotives and 95,000 cars to the American Locomotive Company and 470 to the Baldwin Locomotive Works. These locomotives will be built to the standard designs recently evolved by the committee of builders and railroad experts, there being six types, each of a heavy and light design. The total cost of the orders is approximately \$60,000,000.

Under the terms of the contracts between the government and the two locomotive builders actual construction must begin at once. Deliveries are promised to begin in July and continue monthly during the remainder of the year, the locomotives being allotted on completion to the railroads where they are most needed. The locomotives will all be lettered with the initials U. S.

The Lima Locomotive Works was not given any of the first orders because it is now working to capacity.

The locomotives will require 200,000 tons of steel, including 100,000 tons of plates. The prices range from approximately \$35,000 for the switching locomotives to \$90,000 for the heavy Mallet locomotives.

The locomotive builders are to be paid 5 per cent of the estimated cost of manufacture if the cost does not exceed the estimates. If the cost is less than the estimates the difference is to be equally divided between the builders and the government. The locomotive appliances to be used and the basis of profit thereon have not yet been decided.

In announcing the order the Railroad Administration made the following statement:

"The awarding of this contract marks the establishment by the government of the standardized type of locomotives, specifications for which have been developed and perfected by committees of experts, who, for many weeks, have devoted time and study to the subject.

"The six standard types of locomotives, two sizes of each class, are expected eventually to supersede the many miscellaneous types and varieties of locomotives in service embracing engines built according to 500 or more varying specifications. This is the first time that any real forward steps have been taken looking to the wide standardization of locomotive engines."

It is understood that the 555 locomotives ordered from the American Locomotive Company will be supplemented by another order in about 60 days for 145 locomotives, also for 1918 delivery, making a total of 700 locomotives. The first 555 are understood to include approximately the following types:

| | |
|-----|---------------------|
| 40 | Mallet 2-8-2 |
| 35 | Heavy Santa Fe |
| 150 | Light Santa Fe |
| 100 | Heavy Mikado |
| 290 | Light Mikado |
| 50 | Six wheel switching |

555

This distribution as to types however, has not been given out officially and in fact may not be definitely determined.

BIDS FOR APPLIANCES AND SPECIALTIES

The letter sent by the Central Advisory Purchasing committee to manufacturers regarding proposals to furnish appliances for the locomotives enclosed information which the committee believed sufficient on which to base an intelligent bid. If any further details were desired they might be obtained by an inspection of the drawings of the locomotives at the office of the committee. It was stated that no bid would be considered unless the device offered was interchangeable in its application with similar devices offered by other manufacturers, that the prices named should cover delivery of the articles at the different locomotive works and that the bids should include a detailed analysis of the prices asked, showing kinds and quantity of material with unit prices, cost of productive labor, overhead expenses, royalties, if any, freight charges, margin of profit and total price. Op-

portunity was offered to include a quantity factor if desired; that is, one price for equipment for 100 locomotives or less and another price for 200 locomotives or more. Manufacturers were also requested to state definitely their productive capacity and at what rate per week or per month they could guarantee delivery. If they were prepared to give any guarantee under bond as to length of service, cost of maintenance, or efficiency, of the device, it was stated that this should form part of the proposal.

95,500 CARS ORDERED

The United States Railroad Administration has placed the following orders for cars:

| | |
|---|--------|
| American Car & Foundry Company..... | 30,000 |
| Canadian Car & Foundry Company..... | 7,500 |
| Standard Steel Car Company..... | 13,500 |
| Pressed Steel Car Company..... | 13,500 |
| Pullman Company..... | 7,500 |
| Haskell & Barker Car Company..... | 7,500 |
| Bethendorf Company..... | 3,000 |
| Liberty Car & Foundry Company..... | 1,000 |
| St. Louis Car Company..... | 1,000 |
| Cambria Steel Company..... | 3,000 |
| Railton Steel Car Company..... | 3,000 |
| Pacific Car & Foundry Company..... | 3,000 |
| Mt. Vernon Car Manufacturing Company..... | 2,000 |

The builders, like the locomotive builders, are to be paid 5 per cent of the estimated cost of manufacturing these cars if the cost does not exceed the estimates. If the cost is less than the estimates the difference is to be equally divided by the builders and the government. It is understood that this basis was proposed by the American Car & Foundry Company and accepted by the other builders.

The car and locomotive specialties to be used and the basis of profit specialty people will be given have not yet been decided on.

The mechanical committee and Frank McManamy, manager to the locomotive section, met Tuesday and Wednesday to decide on the locomotive specialties and some further details as to specifications. They were to have taken up the car specialties similarly on Thursday.

PRIORITY

The Railroad Administration is working with the War Industries Board with a view to securing priority in all materials, and the builders have been given opportunity to arrange for some materials in advance. The government does not expect to actually purchase any of the materials, but it will co-operate. Any maximum prices on raw material fixed by the government will prevail. The question of financing the builders has not yet arisen.

Locomotives

THE LACKAWANNA STEEL COMPANY has ordered 2 eight-wheel switching locomotives from the American Locomotive Company.

THE CAMBRIA & INDIANA has ordered 2 Mikado locomotives from the Baldwin Locomotive Works.

Freight Cars

THE GENERAL CHEMICAL COMPANY, New York, is inquiring for 10 to 25 wood lined tank cars.

THE MIDWEST IRON COMPANY, Kansas City, Mo., is inquiring for 25 to 50, 40-ton, 8,000-gal. tank cars.

THE CERTAIN-TEED PRODUCTS CORPORATION, St. Louis, is inquiring for 5, 50-ton, 10,000-gal. tank cars.

THE KING CHEMICAL COMPANY, New York, is inquiring for 3 to 5 sulphuric acid, 50-ton, 7,000-gal. tank cars.

THE AMERICAN STEEL COMPANY has ordered 50, 60-ton, steel hopper cars from the Pressed Steel Car Company.

THE CHICAGO, MILWAUKEE & ST. PAUL, which has been contemplating the construction of 2,500 box and 2,500 coal cars, has failed to negotiate the sale of equipment trust certificates to cover their cost, according to a recent statement by President H. E. Byram. It will therefore be necessary for the government to provide the funds, but thus far arrangements have not been completed with the Railroad Administration for this purpose.

Supply Trade News

The Ogle Construction Company, Chicago, announces that after April 20 it will be located at 1504 Steger building, 28 East Jackson boulevard.

The Sprague Electric Works of the General Electric Company announces the removal of its Boston office from 201 Devonshire street to 84 State street.

Albert Tate Smith, lately manager of the R. U. V. Company, 50 Broad street, New York, has returned to the Permutit Company, with which he was formerly connected, to take the position of assistant manager of sales.

McCord & Co., Chicago, have purchased several parcels of property in the vicinity of 112th and Green streets, Chicago. The property is adjacent to the company's present plant and will be used for future extensions.

Fred H. Jones has been appointed resident manager for the General Railway Signal Company in charge of its eastern territory, whose offices are located at 30 Church street, New York. Mr. Jones has been connected with the General Railway Signal Company since the time of its organization in 1904. During this period of 14 years, he has occupied a number of important positions with the company including that of assistant resident manager of the Chicago office and resident manager of the San Francisco office. Mr. Jones assumed his new duties as Resident Manager of the New York office on May 1.

W. S. Henry, acting resident manager of the General Railway Signal Company at New York, has been appointed service engineer of the recently created service department at

Rochester, N. Y., effective May 1. He has been connected with the company since the organization of the Taylor Signal Company in 1900. In September, 1900, he served as superintendent of construction, with headquarters at New York. In 1904, when the Taylor Signal Company was consolidated with the Pneumatic Signal Company, forming the General Railway Signal Company, Mr. Henry was transferred to the engineering department at Buffalo. In April, 1905, he went to the Lehigh Valley as assistant signal engineer, resigning in August of that year to return to the General Railway Signal Company as assistant engineer on the engineering work of the New York Central electric zone signaling. Later he was transferred to New York City as resident engineer on the same installation, and in July, 1907, returned to the engineering department as development engineer, in connection with circuit and apparatus design. After serving a year and a half in this capacity he was promoted to the position of principal assistant engineer, which position he held until his appointment as acting resident manager in charge of the New York office.

W. S. Henry

Frank Hopewell, head of the firm of L. C. Chase & Co., Boston, Mass., died April 25, at the age of 61. Mr. Hopewell was born in Shelburne Falls, Mass., in 1857. His father, a native of London, England, came to the United States at the age of 14 and settled in Springfield, Mass., where his son, Frank, graduated from the Springfield High School in 1875 and the Springfield Collegiate Institute in 1879. In 1881, Frank Hopewell became associated with L. C. Chase & Co., of Boston, selling

agents for Sanford Mills, Troy Blanket Mills, Reading Rubber Manufacturing Company, and Holyoke Plush Company, becoming a partner in 1887. He became treasurer of Sanford Mills in 1896, holding this office until 1915.

Independent Pneumatic Tool Company

A re-organization has been effected of the Independent Pneumatic Tool Company a New Jersey corporation, and the Aurora Automatic Machinery Company, which is incorporated in Delaware. Both companies were owned by the same interests, the Independent Pneumatic Tool Company representing the selling division for the Thor pneumatic and electric tools, and the Aurora Automatic Machinery Company being the manufacturing department. The latter company also manufactures and sells Thor motorcycles and gasoline engines.

The combining of the two companies under one corporate name is for convenience in handling business.

Under the re-organization plans the Company is known as the Independent Pneumatic Tool Company, incorporated in Delaware for \$3,000,000. Ten directors will serve on the board as follows: John P. Hopkins, former mayor of Chicago, chairman; John D. Hurley, James J. McCarthy, William A. Lickeman, Leonard S. Florsheim, Edward G. Gustafson, Robert T. Scott, Ralph S. Cooper, August Gatzert and Fletcher W. Buchanan.

The officers are John D. Hurley, president; Ralph S. Cooper, vice-president; Fletcher W. Buchanan, secretary and Edward G. Gustafson, treasurer.

The general offices of the company are in the Thor building, at 1307 South Michigan Boulevard, Chicago.

Trade Publications

RED CROSS CIRCULAR.—E. S. Jackman & Co., Chicago agents for the Firth-Sterling Steel Co., are sending out an attractive folder prepared by Edwin S. Jackman in the interests of the American Red Cross.

SMALL TOOLS.—The small tools department of the Pratt & Whitney Company, Hartford, Conn., has issued catalogue No. 9 covering the taps, dies, milling cutters, reamers, punches, drills, etc., manufactured by that company. The catalogue has 315 pages, 4½ in. by 7½ in. and in the miscellaneous section in the back there are several valuable tables.

DRIVING BOX LUBRICATION.—The Franklin Railway Supply Company, Inc., New York, has issued bulletin No. 500 describing the Franklin automatic driving box lubricator. Instructions are given for applying the lubricator, also for its proper inspection and care, and in connection with the lubricator, a special method of grooving the brasses is described and recommended.

CABLE-WAY CARRIAGES.—The Blaw-Knox Company, Pittsburgh, Pa. has issued a folder describing its automatic single-rope cable-way carriage, designed for the operation of the Blaw single-line clam-shell buckets on overhead cables. The folder is illustrated with four views showing various steps in the operation of the bucket by means of the carriage.

INDUSTRIAL LIGHTING.—The importance of proper lighting as an aid in securing the maximum production in the shops is well brought out in a booklet published by the Cooper-Hewitt Electric Co., Hoboken, N. J., under the title, "Lighting for Production and Safety." The intensity of illumination, system to be used, character of light source and units, are discussed and the application of the principles set forth is illustrated by several drawings showing typical lighting arrangements as installed in various manufacturing plants.

ELECTRIC WELDING.—A 6-in. by 9-in., 45-page manual entitled "Electric Welding" has been issued by the Wilson Welder & Metals Company, Inc., New York. This manual provides instructions covering the installation, care, operation and maintenance of Wilson electric welding equipment. Also, directions are given regarding the welding of various kinds of metal, the grade of welding wire to be used, the amount of current to employ, etc. Some interesting illustrations are given of the broken cylinders on the converted German steamships which were successfully repaired by the electric welding process.

Financial and Construction

Railway Financial News

ATTOPEKA, TOPEKA & SANTA FE.—At the annual meeting of the stockholders of the Attopeka, Topeka & Santa Fe at Topeka, Kan., on April 25, Dewitt Cuyler of Philadelphia and Augustus Juillard of New York were elected directors. D. L. Gallup, controller, New York, was elected a director by ballot. Carl R. Gray who resigned recently to become an assistant to the director general of railroads at Washington.

CHICAGO, MILWAUKEE & ST. PAUL.—The directors at the monthly meeting on April 25 again postponed action on the dividends. H. E. Byram, president, said that nothing would be done in connection with the semi-annual payments until after the contract between the Government had been signed, an operation which he hoped would be completed before the annual meeting next month.

MARSHALL & EAST TEXAS.—Through the action of W. G. McAdoo, director general of railroads, the Marshall & East Texas will not be junked. The owners of the property have been seeking for some time to abandon that part of the road running between Marshall and Winsboro, a distance of 74 miles, and to dispose of the rails. Court proceedings prevented the plan from being carried out and it has been effectively stopped by order of Mr. McAdoo, who has taken over the line on behalf of the Federal Government. Provision for a resumption of train service over the division has not yet been made.

NATIONAL RAILWAYS OF MEXICO.—The directors for the ensuing year were elected at the annual meeting at Mexico City, on April 24. Constituting the board of directors in Mexico: Carlos Basave y del Castillo N., Elias S. A. de Lima, Aquiles Elorduy, General Pablo Gonzalez, Fernando Gonzalez Roa, Thomas P. Honey, Mario Mendez, Rafael Nieto, Alberto J. Pani, Francisco Puga, Ignacio S. Rodriguez and General Jacinto B. Trevino. Constituting the New York Local Board: Henry Bruere, Justo Acevedo, Alfredo Catargli, Adolfo de la Huerta, J. J. Hanauer, J. Hirschman, L. F. Loree, W. T. Rosen and H. H. Wehrhane.

NEW YORK CENTRAL.—Holders of the \$10,000,000 one year 5 per cent notes of the New York Central, maturing on May 1, were paid off with funds obtained by that company from the government. An interesting phase of the New York Central financing growing out of government operation was that the company borrowed \$13,000,000 from the government. That amount, together with cash on hand, enabled the New York Central to pay off the \$10,000,000 notes and meet \$9,000,000 quarterly interest and dividend payments now due. This is the first case known where the government has advanced a railroad money to make good the guarantee that annual income so long as the war lasts shall be as large as the average for the three years ended June 30, 1917.

Railway Construction

CANADIAN GOVERNMENT RAILWAYS.—Bids were received recently for carrying out improvements at Halifax, N. S., to include a temporary station, mail, baggage, express and commissariat building, car repair building, two transit sheds, subway and water and sewer systems. The cost of the work will be about \$700,000.

CHICAGO, BERKLEY & QUINCY.—This company is building a second track between Crawford, Mo., and Scotland, Mo. The contract for the work has been awarded to S. R. & Nelsky. The track is to be used by the railroad forces.

This road has ordered from the American Bridge Company, steel for 5 turnouts for the following lengths: Loma, Ill., 100 ft.; Edgemont, S. Dak., 100 ft.; Prosser, Neb., 100 ft.; Seneca, Neb., 100 ft.; Denver, Colo., 100 ft. The last mentioned is for the Colorado & Southern.

Canadian Pacific Railway Company

Annual Meeting of Shareholders, May 1, 1918

ADDRESS BY

THE RT. HON. LORD SHAUGHNESSY, K.C., M.P., Chairman

Compared with the return for the calendar year 1916 the Thirty-seventh Annual Report of the Directors now before you for consideration and approval shows an increase in gross revenue from transportation of \$12,660,000, but this amount was more than absorbed by the working expenses, which increased \$16,590,000, so that the net income from transportation in 1917 was less by \$3,930,000 than it was in the previous calendar year.

Notwithstanding the larger volume of traffic in 1917, it will be gathered from the statistics incorporated in the Report that there was a substantial decrease in traffic train mileage and loaded car mileage, indicating still further improvement in operating efficiency. In normal times this should be reflected in the working expenses, but its effect was minimized by the higher scale of wages and the enhanced cost of fuel and other materials required for the maintenance and operation of the railway that prevailed during the year and that added \$15,350,000 to the operating expenses.

These conditions were not exceptional in the case of your Company, but applied in a proportionate degree to all the other Canadian carriers.

In view of the abnormal and constantly increasing cost of railway operation, the Board of Railway Commissioners, after long deliberation, authorized an increase of ten to fifteen per cent. in specified zones in the tariff of charges for the carriage of passengers and freight. This concession to the Railway Companies to assist them in meeting, in part, the increased cost of the transportation services that they are providing is very moderate indeed when compared with the increased prices due to similar causes which the public has to pay for all other commodities. It was clear that without higher rates many of the Railway Companies would be compelled to face large deficits, and in so far as it applied to these lines, some of them being wards of the Government, the Order of the Board appeared to arouse little objection or criticism. But certain trade bodies and others appealed to the Dominion Government for the disallowance of the Order of the Board of Railway Commissioners on the ground that the additional revenue resulting from the higher rates would be paid to the Canadian Pacific Railway Company, have the effect of supplementing that Company's substantial surplus income after the payment of fixed charges and dividends.

To enable the weaker Companies to reap the benefit of the higher rates, and at the same time to meet the objections that have been urged to the participation of the Canadian Pacific in like benefits, the Government decided to permit the advance in rates for the carriage of traffic authorized by the Board of Railway Commissioners to become effective March 15th, 1918, but concurrent with this decision there was an Order of the Governor-General in Council under the War Measures Act, substantially as follows:—

1. The Canadian Pacific Railway Company, hereinafter called "the Company," shall pay to the Government of Canada the following special taxes:

1st.—One half of its net earnings from railway operation in excess of seven per cent. on its Common Stock (after paying fixed charges, appropriation for Pension Fund, and dividends on Preferred Stock).

2nd.—Income tax on the Company's special income (inclusive of all the Company's income, except earnings from railway operations), under the provisions of The Income War Tax Act, 1917, or any amendment thereof hereafter enacted.

Provided that the total amount to be paid each year by the Company shall not be less than—

(1) The Company's net earnings in such year from railway operations, and from special income as defined above, in excess of 10% on its Common Stock (after paying fixed charges, appropriation for Pension Fund and dividends on Preferred Stock), up to \$7,000,000, or

(2) The amount by which its net earnings from railway operations exceed the net earnings from railway operations for the fiscal year ended December 31st, 1917, due to the increase in freight and passenger rates granted by the Order of the Board of Railway Commissioners, dated 26th December, 1917.

3. Payment in full of special taxes under this order shall in respect of earnings: from and after January 1st, 1918, relieve the Company of liability under the Business Profits War Tax Act, 1916, and any other Dominion Act of like nature hereafter enacted, and (save as hereinbefore provided) under the Income War Tax Act, 1917.

4. This order shall be deemed to have come into force and effect on the first day of January, 1918, and to continue in force and effect during the present war, and until further ordered.

Priety stated, this Order-in-Council not only deprives your Company of any improved revenue that might result from the higher tariff, but imposes upon it a measure of discriminatory taxation, and, therefore, your Company might with propriety question its fairness or justification. A state of war, with its enormous demands upon the National Treasury, and other financial burdens brought upon the Country by an unfortunate railway policy, coupled with the threatening hostility of your Company's affairs, were in all probability taken as furnishing reasonable warrant for the Government's action.

Since the outbreak of war your Company has deemed it a duty to render to Canada and the Allies all the practical and financial assistance in its power, and while it is not possible with constantly changing conditions to form at this time even an approximate estimate of the tax, the amount, whatever it may be, will be paid without protest or embarrassment to your finances. It must not be assumed that in the adoption of this measure the Government was actuated by any spirit of hostility to the Company. On the contrary, it may be stated without reservation that at no other time has your Company enjoyed the confidence and support of Parliament, the Government and the people to a greater extent than at present. Nor should the Government be assumed to forecast the future of the Country so as to might jeopardize investments in Canadian Government, Municipal, or Corporation Securities.

What is commonly called "Canada's Railway Problem" has, for some months past, occupied a place in the attention of the Canadian people, not only to the affairs of war, and expedients designed to lighten the burden imposed on the Public Treasury by the railway situation have been considered and discussed by the Public and the Press.

Not unnaturally your Company has, by reason of its outstanding position in the financial affairs of the country, been brought into the discussion. It

was evident that some of the writers and speakers who took part had but imperfect information or were guided by traditional misconception when dealing with the affairs of your Company.

Although more than 90% of its securities are owned abroad, your Company is essentially Canadian in its inception, progress and aspirations, and therefore the Directors feel that it is not out of place at this time to give you, for the information of the Canadian public as well as the investors in the property, a brief review of some salient features of the Company's financial policy and progress leading up to its present stable position.

Under the terms of the contract of October 21st, 1880, between the Government of Canada and the Syndicate acting for the Canadian Pacific Railway Company in anticipation of the Charter, the Government undertook to give, by way of subsidy, to assist the Company in carrying its enterprise to successful completion, certain sections of railway between Lake Superior and Winnipeg and between Savona and Port Moody in British Columbia then in process of construction under Government auspices, \$25,000,000 in cash and 25,000,000 acres of land suitable for settlement. After work had been in progress for two or three years it was found that the cost was substantially in excess of the estimates, and the Company applied to the Government for further temporary aid by way of loans. When, in 1885, the repayment of the loans was being arranged, the Government decided to accept in part payment for two or three years of the Land Grant in place of \$10,000,000 in cash; in effect, therefore, the subsidy consisted of \$35,000,000 in money, 18,300,000 acres of land, and the sections of railway in process of construction by the Government to which reference has already been made.

At the outset the Company had expected to raise the requisite funds for the execution of the work by sales in the English market of Capital Stock and of Bonds secured by the Land Grant, thus keeping the railway property free from bonded debt, but it soon became manifest that this was impossible, and, therefore, Parliament was asked to authorize the Company to issue of \$35,000,000 5% First Mortgage Bonds and \$65,000,000 Ordinary Share Capital. Despite a determined effort on the part of the Directors to give confidence to investors by depositing in cash with the Government an amount in Canadian currency of 6,700,000 acres of the Land Grant in place of the rate of 3% per annum on the Common Stock for ten years, unfriendly influences at home and abroad were so prejudicial in the English, American and Continental markets that the original \$65,000,000 only yielded to the Treasury of the Company an average of somewhat less than 4% of its face value. The unwillingness of investors to pay a higher figure for the Stock in those early days need not be considered extraordinary, however, when we learn that as late as 1895, when the railway had been completed and in operation for more than nine years, the Stock was offered in the market at as low as 33% with but few takers.

In 1885 the President of the Company, now Lord Mount Stephen, induced Baring Brothers to find purchasers for the \$35,000,000 First Mortgage Bonds, and by this means the Company was enabled to repay the loans from Government and to meet its floating debt.

It was evident that the main line described in the Agreement, serving as it did thousands of miles of territory almost uninhabited, could not be kept going unless it was brought into touch with the more important commercial centres of Eastern Canada and was provided with branch lines and connections that would contribute traffic to its rails, and, therefore, arrangements were made to reach Montreal, Ottawa, Toronto, and at later stages Quebec, Hamilton, the more important manufacturing towns in Ontario and Quebec and the Winter point at St. John's, New Brunswick. The lines established at various points along the frontier from the Atlantic to the Pacific with railway systems in the United States. These extensions, feeders and connections were obtained by agreements with a number of Canadian Companies for the acquisition or lease of their properties, and consideration in most cases being a guarantee of interest on their securities by way of rental, and in other cases the Company's credit was utilized for the construction of new lines. In circumstances when the interchange of traffic was a matter of prime importance, the connecting lines in Canada were only built to the International Boundary after the Company had taken the requisite steps to ensure the observance of traffic agreements by the railway lines on the other side of the International Boundary.

Inevitably this policy would lead to a variety of securities in the shape of Bonds assumed by the Company with reference to acquired properties or created and issued to furnish money for construction of new lines, each series secured by a mortgage on the particular property to which it applied.

In order to avoid this undesirable situation the Company decided, with the consent of the Utilization Committee, to issue Debenture Stock in the purchase or conversion of existing Bonds, and to provide funds for building or acquiring such additional mileage as might appear to be required from time to time for the advantage of the Country and the Company. This Consolidated Debenture Stock is perpetual and is redeemable at the option of the Company in that it gives no right of foreclosure in the event of default. The holders have a first claim on the revenues of the Company for their semi-annual dividends after the working expenses and taxes or fines have been paid, and the contract demands of existing bondholders have been satisfied. If by any chance the Company failed to pay, within a fixed period, the dividend accrued on the Consolidated Debenture Stock the holders of that Stock would become the Shareholders of the Company and would control its affairs until the default was made good, when the property would automatically pass back to the Preference Shareholders.

In the early period of its history the Company was hest by many difficulties and disappointments, but on the whole its progress was not unsatisfactory.

In 1899 the Company had 7,000 miles of railway; its gross earnings were \$29,200,000 and after the payment of working expenses there were net earnings of \$12,200,000; the funded debt secured by Mortgage Bonds was \$47,000,000. Debenture Stock had been sold to the amount of \$54,237,000, and the annual interest charges were \$6,800,000. Shareholders in 1916 the operating system comprised 13,000 miles, with net earnings of \$50,000,000 and an increase of only \$3,500,000 in the annual interest charges.

CAPITAL EXPENDITURE

After 1899 the Company's traffic commenced to show considerable growth and the necessity for more rolling stock, equipment and for traffic facilities and improvements of every possible description became imperative. Year by

Company's resources during the period required to bring to a productive basis these branch lines, which at the outset earned neither interest nor, in most cases, operating expenses.

With the exception of the comparatively small advantage given to the Shareholders when, in 1914, they were offered the 6% Note Certificates secured by outstanding land contracts, all of the net money that came to the Company from the sale of these lands was devoted to the railway property, taking the place of that much capital and reducing the Company's annual interest charges proportionately.

The exemption from taxes of the Canadian Pacific Land Grant for a period of 20 years after their selection has been a source of considerable adverse comment, but the delay in selection was largely due to circumstances already explained, over which the Company had no control, and it is manifest that at the time the Grant was made, and for some years after, no one could have afforded to take the lands as a free gift if they were subject to taxation. When the lands were sold, however, the purchaser became a tax payer, and the records show that the 14,000,000 acres thus far sold have brought to the Public Treasury in taxes an amount exceeding \$20,000,000.

THE TEN PER CENT. CLAUSE

The Dominion Railway Act in force in 1880, when the contract was made for the construction of the Canadian Pacific Railway, authorized a return of Fifteen Per Cent. on the capital invested by any railway company in its enterprise before the tariffs for the carriage of passengers and freight could be scaled down by the Government authority named in the Statute, but in the contract with the Canadian Pacific Railway Company, confirmed by Act of Parliament, this limit was reduced to Ten Per Cent. per annum. This is what is known as the "Ten Per Cent. Clause" in the Company's Charter. Years ago this Clause became ineffective when the Company admitted that the net earnings had reached Ten Per Cent. on the capital invested, and its Tariffs came under the control and supervision of the Board of Railway Commissioners.

The suggestion made in some quarters that the spirit and intent of this Clause was to limit the Company's dividends to Ten Per Cent. is entirely out of harmony with the clear, unquestionable language of the instrument. The Clause had no more relation, direct or indirect, to the Canadian Pacific dividends than it had to the dividends of any other Railway Company, or of any commercial or industrial corporation. The Company has been and is absolutely untrammelled in the declaration of such annual dividends as the Directors may feel justified in declaring out of the revenue, and Seventeen Per Cent. instead of Ten Per Cent. per annum might properly have been distributed from the average earnings of the railway and the income from investments and extraneous assets during the past few years, had the Directors not been convinced that a prudent and conservative policy was in the best interest of the property.

The total capitalization of the Canadian Pacific Railway Company's transportation system, comprising 13,400 miles of railway in Canada operated directly by the Company, with the rolling stock equipment and steamboat craft on inland waters, its splendid terminal stations and facilities, and other accessories, is \$623,000,000, but this amount is far below the actual cost of the property, which, excluding the cost estimated at \$31,000,000 of the sections of railway constructed by Government and handed over to the Company, is carried in the books at \$687,000,000, after having been reduced by \$131,000,000 provided from surplus earnings, land sales and other sources, expended on the property and written off without being capitalized. So that, based upon cost, the transportation system represents an outlay of \$818,000,000, or about \$61,000 per mile, which is lower than the average cost per mile of the other principal Canadian railways, and about half the cost per mile of the railway system of the Grand Trunk in Canada, based upon its outstanding capital.

In addition to the mileage to which reference is made, the Company owns or controls 948 miles of railway lines in Nova Scotia, Quebec and British Columbia that are operated separately for economic or other reasons, but their affairs have no reference to the figures that have been quoted.

The great benefits resulting from the conservative financial policy pursued by the Canadian Pacific Directorate are strikingly illustrated by the fact that the net earnings per mile required to meet the annual interest charges on the Grand Trunk, Canadian Northern, Grand Trunk Pacific and National Transcontinental railways, would suffice to cover the annual interest charges, dividend on the Preference Stock, and 7% dividend on the Common Stock of the Canadian Pacific.

EXTRANEOUS INVESTMENTS

The extraneous investments and available resources belonging to the Shareholders of the Canadian Pacific are quite distinct from the transportation system and play no part in the transportation accounts. They are made up of the Ocean and Coastal Steamship Lines, investments authorized by Parliament in shares of Railway Companies outside of Canada, made, in most cases, many years ago when the shares that now command high prices had only a nominal market value, Government Securities and Loans, money set aside for investment, and other items, amounting in the aggregate to \$137,000,000, and available resources in unsold lands, amounts payable on lands already sold, coal mining and other properties, having an estimated present and prospective value of \$116,625,000, after providing for the retirement of the outstanding Note Certificates.

The total appraisal of these items, namely, \$253,000,000, is substantially below the market value. Large as is the amount, it was not accumulated by speculation or risky exploitation. Apart from the temporary loans and money it represents the accumulated worth of properties and resources many of which had little or no value when they came into the possession of the Company, but were developed and safeguarded until they became profitable.

Doubtless such development in its conception and execution had its selfish side, but no one familiar with the details of Canada's progress in the last quarter of a century will deny that every work of development undertaken by the Company, quite aside from its railway enterprise and its vigorous immigration policy, has given to the Country a return infinitely greater than any received by the Company or its Shareholders.

SUMMARY

Summarized it would appear:—

1. That the Canadian Pacific Railway, as originally designed, forms but a small part of the present great system with its comprehensive operating traffic and business organization, through which in normal times thousands of people are brought every year to and through Canada from all portions of the civilized world, thus helping to people the Country and to bring her vast resources under general notice.
2. That the cost of the transportation system as described in this Memorandum was \$818,000,000, against which there is outstanding capital of all classes amounting to \$623,000,000.
3. That every share of \$100 Ordinary Stock in the hands of the public represents the payment into the Company's Treasury of \$112 in cash, and \$31 from surplus income, or a total of \$143.
4. That it has been the Company's policy to avoid mortgage debt and mandatory interest charges with their attendant dangers.
5. That lands and resources capable of development, belonging to the original Company or that came into its possession through the acquisition of other railways, have been husbanded, developed and utilized so successfully and advantageously that, distinct from their railway transportation system, the Shareholders have extraneous assets valued on a moderate basis at \$253,000,000.
6. That the highest dividend paid to Shareholders from transportation revenue, namely, 7% per annum, is only equivalent to 2 1/4% per annum on the cost of the railway system, and if the dividend of 3% from Special Income be added, making a total of 10% per annum, the distribution is less than 2 1/2% on a conservative valuation of the Company's total assets.
7. That the average rates per passenger mile and per ton mile for the carriage of passengers and freight, respectively, received by the Canadian Pacific were lower than those received for the same services by any combination of railway lines in the United States constituting a through route between the Atlantic and the Pacific Ocean.
8. That the wages paid by the Canadian Pacific in every branch of its service are at least as high as, and the cost of its rails, fuel and general supplies is higher than United States railway companies are required to pay, and in all of these items the increase in both Canada and the United States has been abnormal since the outbreak of the War.
9. That the Company's successful effort to keep its capitalization substantially below the real value of its property and assets deserves the commendation of the Canadian people and should not, in any case, be made a pretext for penalizing the Company when rates for the carriage of traffic, or other matters relating to general railway policy, are before Parliament or Government for consideration and decision.

The Shareholders and Directors of the Company have always been impressed with the idea that the interests of the Company are intimately connected with those of the Dominion, and no effort or expense has been spared to help in promoting the development of the whole Country.

A Light Railway Carrying Strange Freight

Railway Officers

Executive, Financial, Legal and Accounting

J. M. Johnson, vice-president of the Missouri Pacific, with headquarters at Chicago, has been transferred to San Francisco, Cal., where he will have charge of the road's Pacific coast interests. Mr. Johnson's office in Chicago has been discontinued.

James C. Davis, whose appointment as general solicitor, in charge of the legal department of the Chicago & North Western, was announced in these columns on April 26, was born in Keokuk, Iowa, on September 2, 1857. He attended the public schools there and the Hellmuth Boys' College at London, Ont. His legal training was gained while employed in the law office of C. P. Lomax, Keokuk, Iowa. He was admitted to the bar in 1877 and practiced law at Keokuk between 1877 and 1903. During the period between 1881 and 1883 he was city solicitor of Keokuk. On January 3, 1903, he was appointed general attorney for the Chicago & North Western, for the state of Iowa, with headquarters at Des Moines, which position he held continuously for 16 years, until his appointment as mentioned above. As general solicitor he will have headquarters at Chicago.

John M. Rapelje, whose appointment as acting vice-president, in charge of operations for the Northern Pacific lines east of St. Paul, was announced in these columns on April 12, was

J. M. Rapelje

born at Chippewa, Ont., on January 22, 1857. He began railway work in August, 1879, as a brakeman on the Grand Trunk, and then became a fireman on the Atchison, Topeka & Santa Fe. From May, 1882, to November, 1887, he was conductor on the Canadian Pacific, and from January of the following year to June, 1898, was conductor on the Yellowstone division of the Northern Pacific. He was then appointed trainmaster on the same division, and subsequently was again a conductor until June, 1902, when he was re-

appointed trainmaster on that division. From April, 1905, to July, 1908, he was superintendent of the same division at Glendive, Mont., and from the latter date to May, 1910, was superintendent of the Rocky Mountain division, at Missoula, Mont. He was then transferred to the Idaho division, at Spokane, Wash., where he remained until April, 1912, when he was appointed general superintendent of the lines from Mandan, N. D., to Paradise, Mont., with headquarters at Livingston, Mont. In May, 1914, he was promoted to assistant general manager at St. Paul, Minn., remaining in this position until October, 1914 when he was appointed general manager of the lines east of Paradise, Mont. He continued as general manager until his recent promotion to acting vice-president in charge of operation at St. Paul, Minn., as mentioned above.

Operating

S. W. Crabbe, has been appointed superintendent of the Schreiber division of the Canadian Pacific with headquarters at Schreiber, Ont., vice **G. J. Fox**, transferred.

H. E. Whittenberger, general superintendent of the Ontario lines of the Grand Trunk, with office at Toronto, Ont., has been appointed general superintendent of the Western lines, with

headquarters at Chicago. **C. G. Bowker**, general superintendent of the Eastern lines, with office at Montreal, Que., succeeds Mr. Whittenberger, and **W. R. Davidson**, general superintendent of the Western lines, with headquarters at Chicago, succeeds Mr. Bowker.

W. R. Hudson, formerly general superintendent of the Chesapeake & Ohio, has been appointed general superintendent of the Seaboard Air Line, with headquarters at Hamlet, N. C., succeeding **R. S. Marshall**, resigned.

J. L. McKee, superintendent of the Buffalo division of the Delaware, Lackawanna & Western, with office at Buffalo, N. Y., has been appointed assistant general superintendent of the Michigan Central, with headquarters at Detroit, Mich.

Claude R. Young has been appointed trainmaster of the Illinois Central, Cairo district, with headquarters at Fulton, Kentucky, succeeding **Herbert W. Williams**, transferred to the Fulton district, in place of **Edward Bodamer**, transferred, effective April 1.

A. E. Staub, superintendent of car service of the Delaware, Lackawanna & Western, with office at Scranton, Pa., has been appointed superintendent of the Buffalo division, with headquarters at Buffalo, N. Y., **F. J. Lawrence**, acting superintendent of the Scranton division, with office at Scranton, has been appointed superintendent of the same division, and **A. J. Miller**, traveling car agent, with office at Scranton, has been appointed superintendent of car service, succeeding Mr. Staub.

John Carter Stamm, whose appointment as superintendent of the Vicksburg, Shreveport & Pacific, with headquarters at Shreveport, La., has already been announced in these columns, was born in 1872, at Sattartia, Miss., and was educated in the common schools. He began railway work in 1885, with the New Orleans & Northeastern division of the Queen & Crescent as a telegraph operator at the age of 13, and his entire railway service has been with the same system. He served later consecutively as train dispatcher, chief train dispatcher and trainmaster until his recent appointment as superintendent as above noted.

A. J. Sullivan, assistant superintendent of the St. Louis-San Francisco at Sapulpa, Okla., has been appointed inspector of passenger train service with office at Springfield, Mo.; **W. H. Malone**, superintendent of locomotive performance, has been appointed inspector of freight train service, with office at Springfield; **L. N. Bassett**, superintendent of terminals at Springfield, has been appointed superintendent at Sapulpa, Okla., in place of **A. W. MacElveny**, resigned; **F. G. Faulkner**, assistant superintendent at Birmingham, Ala., has been appointed superintendent of terminals at Springfield, Mo., in place of Mr. Bassett; **B. F. McDonough** and **C. S. Hall** have been appointed transportation inspectors, with headquarters at Springfield, Mo.

W. S. Cooper, general superintendent of the Southern district of the Chicago, Milwaukee & St. Paul, has been appointed assistant to the vice-president with office in Chicago. **W. M. Weidenhamer**, inspector of transportation at Chicago, has been promoted to general superintendent of the Southern district, succeeding Mr. Cooper, with headquarters at Chicago. **N. P. Thurber**, superintendent of the Southern Minnesota division with headquarters at LaCrosse, Wis., has been transferred to the Kansas City division with headquarters at Ottumwa, Iowa, succeeding **J. M. Oxley**, assigned to other duties. **M. J. Larson** has been appointed superintendent of the Southern Minnesota division, succeeding Mr. Thurber. All these changes were effective May 1.

Edward Flynn, whose appointment as general superintendent of the Chicago, Burlington & Quincy with headquarters at Lincoln, Neb., was announced in these columns on April 5, was born at Benet, Ill., on May 19, 1873. He began railway work in April, 1900, as a brakeman with the Chicago & Eastern Illinois. For the next few years he was employed consecutively in the track department of the Wabash, as a brakeman with the Southern Pacific, the Wabash, and the Burlington, and as a conductor on the last-named line. On November 15, 1906, he was promoted to trainmaster of the Burlington, with headquarters at Omaha, Neb. Two years later Mr. Flynn was promoted to assistant superintendent

at Lincoln, Neb., and on April 15, 1909, he became superintendent, with office at Omaha. On May 20, 1911, he was transferred to McCook, Neb., two years later to La Crosse, Wis., and on June 1, 1917, to Chicago. He remained at Chicago as superintendent, which position he held until his recent promotion to general superintendent of the Nebraska district, as mentioned above.

Traffic

C. T. Slauson, foreign freight agent of the Missouri Pacific at Chicago, has been transferred to St. Louis with the title of manager of foreign freight traffic.

John Bickel, commercial agent of the Duluth, South Shore & Atlantic at Chicago, has been transferred to the general superintendent's office at Marquette, Mich.

George T. Stocks, commercial agent of the Central of Georgia, with office at Rome, Ga., has been assigned to other service; **F. D. Robinson**, commercial agent at Oklahoma City, Okla., has been assigned to service on the line and the agencies at both places have been closed.

R. B. Robertson, assistant general freight agent of the Chicago, Indianapolis & Louisville has been placed in charge of the Chicago district office of inland traffic service of the U. S. War Department, effective May 1. Matters heretofore handled by Mr. Robertson will be taken care of by **A. C. Tummy**, general freight agent.

John A. Jackson, assistant general freight and passenger agent of the Gulf, Mobile & Northern, with office at Mobile, Ala., has been appointed general freight and passenger agent, with office at Mobile, vice **W. L. O'Dwyer** resigned to accept service elsewhere, and the position of assistant general freight and passenger agent has been abolished.

N. B. Wright, assistant freight traffic manager of the Central of Georgia, with office at Savannah, Ga., has been detached from the service of the company to serve as a member of the Freight Traffic Committee for the Southern regional territory; **J. G. Carlisle**, general freight agent, with office at Savannah, has been appointed assistant freight traffic manager and will exercise the authority heretofore delegated to Mr. Wright; **F. L. Corwin**, Florida freight agent at Jacksonville, Florida, has been assigned to service on the line; **J. R. Randolph**, commercial agent at Jacksonville, has taken a position in the office of the regional director, and the Florida freight agency at Jacksonville has been closed; **H. E. Shepard**, commercial agent at Tampa, Florida, and **S. L. Peeples**, commercial agent at Memphis, Tenn., have been assigned to service on the line, and the agencies at both places have been closed.

Engineering and Rolling Stock

D. Hubbard has been appointed division engineer of the Newark division of the Baltimore & Ohio, with headquarters at Newark, Ohio, succeeding **C. R. Diermar**, who has been transferred.

D. Rounseville, engineer maintenance of way of the Chicago & North Western, at Chicago, has been appointed assistant to the chief engineer, and the office of engineer maintenance has been discontinued.

W. H. Penfield, assistant to the vice-president of the Chicago, Milwaukee & St. Paul at Chicago, has been appointed engineer of track maintenance with the same headquarters, effective May 1.

F. W. Fritchey, of the Division of Locomotive Inspection, Interstate Commerce Commission, District 15, has been appointed superintendent of shops of the Wheeling & Lake Erie, with headquarters at Brewster, Ohio.

W. Wright, division master mechanic of the Canadian Pacific, with office at Toronto, Ont., has been transferred as division master mechanic to Brownville Junction, Me., replacing **C. Powers**, who has been made division master mechanic at Toronto.

Railway Officers in Government Service

J. M. Guild, safety agent, of the Union Pacific, on May 1, left the service to report to the School of Military Aeronautics, Berkeley, California, for training as an aviator.

Eugene McAuliffe, president of the Union Colliery Company and formerly general coal agent of the Frisco Lines has been appointed manager of the Fuel Conservation Section, Division of Transportation of the United States Railroad Administration, and will give attention to the conservation of fuel on all roads, with special reference to its preparation and proper use. He will also investigate and make recommendations in connection with its transportation to and handling at fuel stations; **Major Edward C. Schmidt** now with the Fuel Administration has been appointed an assistant to Mr. McAuliffe, who will have headquarters both at Washington and at St. Louis.

Obituary

Balie P. Waggener, general solicitor of the Missouri Pacific for Kansas, Nebraska and Colorado, with office at Atchison, Kan., died at his home in that city on April 28. Mr. Waggener was born in Platte county, Neb., on July 18, 1847. He was admitted to the bar in June, 1867, following which he began the practice of law at Atchison. From 1876 to 1910, he was general attorney of the Missouri Pacific for Kansas and Nebraska, and from 1910 to the date of his death he was general solicitor of the same road for Kansas, Nebraska and Colorado.

Joseph W. Taylor, for 19 years secretary of the American Railway Master Mechanics' Association, the Master Car Builders' Association and the Western Railway Club died

J. W. Taylor

suddenly at his home, 4102 Calumet avenue, Chicago, on the morning of April 24, from organic heart disease. Mr. Taylor was one of the most widely known and best liked men in railway mechanical circles. He died in the harness, so to speak, having been at his desk the day before he died and in apparently good health. Mr. Taylor was born in Saltsburg, Pa., on March 9, 1862. He started railroad work on the Pennsylvania in his native town and later went with the Erie Railroad, rising to the position of

chief clerk to the general manager and secretary to the vice-president. On leaving the Erie, he became secretary to John W. Cloud, who was formerly secretary of the mechanical associations. In 1899 Mr. Cloud went to London to take charge of the British office of the Westinghouse Air Brake Company and in June of that year Mr. Taylor was appointed secretary of the associations. Throughout his long tenure of these offices Mr. Taylor discharged his duties in a thorough, efficient and most trustworthy manner. He is said to have never betrayed the confidence of his position. The reports and proceedings which he edited were always models of correctness. Mr. Taylor's personal characteristics endeared him to a large circle of acquaintances. Straightforward and open in his manner, sympathetic and always ready to lend assistance, he went about it in a quiet way, aiding many without the knowledge even of his intimate friends. Mr. Taylor was a 32nd degree Mason and his funeral was held in Chicago, Saturday, April 27 under the auspices of the Knights Templar. Mr. Taylor is survived by a brother; a son, Joseph W. Taylor, Jr., and his widow, who is in very delicate health and has on that account resided in El Paso, Texas, with her son for a few years past.

IN MILITARY SERVICE

Patrick Ryan, locomotive engineman of the Illinois Central, a member of the American Railway Engineers' Regiment in France, was killed in action on April 18.

EDITORIAL

Railway Age

EDITORIAL

With the placing of orders for the 1,025 standard locomotives for the Railroad Administration there has been launched one of the greatest experiments ever tried in the history of American railroading. With the order came the statement, "This is the first time that any real forward step has been taken looking to the wide standardization of locomotive engines." It is evident that whoever prepared this statement intended to convey the impression that from now on, while the railroads are under the control of the government, none but standard locomotives are to be ordered. This is contrary to the statement issued by the Railroad Administration a short time ago that railways having peculiar conditions would be allowed to order suitable engines. It is evident there is still some misunderstanding on this extremely important subject. Doubtless the policy to be followed and the reasons for it will be clearly defined later on. It would seem at present, however, that the purpose is to restrict the railways just as far as possible to the purchase of the standardized locomotives, regardless of important differences of operative conditions. In other words, those in favor of an extreme policy of standardization seem to have prevailed. This is highly regrettable. Undoubtedly there should be a reduction in the number of classes of locomotives in use on our railways, but the disadvantages of an unnecessary multiplication of classes have been far less than would be the disadvantages of too stringent limitation of the number of classes. The number of different conditions under which locomotives must be operated is very great; and the most economical and efficient operation of the railways as a whole never could have been and never can be obtained without the use of enough classes of locomotives to meet all conditions. Fortunately there is some reason for hoping that a continuance of full and frank discussion of the subject will ultimately cause those in authority to recognize the fact that it is easier and more practical to adapt the locomotive to the operating conditions than to adjust the operating conditions to the locomotive.

Are those who are responsible for placing the orders for the government's standard locomotives more interested in firmly

Standardization and Speed in Production establishing the standard locomotives than they are in obtaining the new locomotives as fast as possible? The manner in which the orders for the 1,025 standard locomotives were placed

last week would seem to indicate that they are. The distribution of the orders was first arranged so that both the American Locomotive Company and the Baldwin Locomotive Works would have as large a number of one class to build as possible, with the exception of the 400 light Mikados, which were split equally—200 locomotives to each company. The manner in which the order was finally placed divided the number required of each class between both builders. The table shows an outline of both plans of distribution. The final plan gives the American orders for units of 3, 5, 10, 10, 15, 20, 25, 30, 70, 75, 75 and 217 locomotives, and Baldwin orders for units of 2, 10, 10, 15, 15, 15, 20, 20, 20, 30, 75 and 183 locomotives where the first arrange-

ment permitted the orders to be placed in lots of 10, 15, 50, 100, 150 and 200 for the American and 5, 10, 10, 15, 150 and 200 for Baldwin. Now each builder will be obliged to make patterns, dies, jigs, etc., for each of the twelve standard types, whereas the first arrangement required the American to build six designs and Baldwin seven. The former arrangement would have made it possible to turn out the present order more quickly while the present ar-

| Types | First Distribution | | Final Distribution | |
|-------------------|--------------------|---------|--------------------|---------|
| | American | Baldwin | American | Baldwin |
| Mikado (light) | 100 | 200 | 217 | 181 |
| Mikado (heavy) | 100 | | 70 | 30 |
| Santa Fe (light) | 100 | | 75 | 75 |
| Santa Fe (heavy) | | | 20 | 40 |
| Mailet (2-6-6-2) | | 0 | 15 | 15 |
| Mailet (2-8-8-2) | 20 | | 5 | 15 |
| Pacific (light) | | 0 | 10 | 20 |
| Pacific (heavy) | | 0 | 10 | 10 |
| Mountain (light) | | | 20 | 15 |

| Switcher (10-8-0) | 0 | 183 | 75 | 75 |

angement would make it possible to turn out a future order of the standard engines more quickly; and this probably explains the arrangement adopted. Meantime, fortunately the builders still have yet to build almost two thousand locomotives, orders for which were placed by individual railways last year. Since January first the eastern lines have received 704 new locomotives, including 62 which were built for the western lines, 23 which were built for the southern lines, 122 which were built to be sent to France, and 125 which were built for Russia. The southern lines have received 98, including 15 which were built to be sent to France and 60 built for Russia. The western lines have received 53. This makes a total received this year of 855. Additional engines to be received on orders that were placed before January first includes 1,015 for eastern lines, 834 for western lines and 140 for southern lines, a total of 1,993. This number, together with the 1,025 standard locomotives which have just been ordered, makes a total of 3,018 locomotives now on order for the railways of the United States.

Can Local Lines Take Over Work of Off-Line Agencies?

THE RECENT PROTEST of the Illinois Manufacturers' Association against the discontinuance of off-line traffic offices is representative of the attitude of a large proportion of American shippers and focuses attention upon one of the most radical changes so far made by the Railroad Administration. It is the contention of the shippers that while solicitation is now superfluous because of the absence of competition, the informative services performed by the off-line representative are still necessary. These duties included the quoting of domestic and foreign rates, the filing of passing reports on the railroad shipments of patrons, thereby facilitating the tracing of delayed cars, supervision over package car service and the prompt tracing of delayed mer-

chandise, the adjustment of claims, the handling of foreign freight matters, including bookings and clearances, the re-assignment of carload freight and the diversion of delayed or embargoed freight to connections. While shippers admit that the performance of this work does not require the maintenance of separate off-line offices, they contend that local lines will be unable to discharge this function satisfactorily and that the proper solution of the problem is the establishment of a joint off-line office in each important city. Supporters of the action of the Railroad Administration maintain that local lines will be able to perform this informative work satisfactorily if shippers assume a reasonable and co-operative attitude toward them.

In the past the keen competition between roads has put a premium on service to the shipper with the result that traffic representatives have exerted themselves to get into the good graces of their patrons. This condition, supporters of the Railroad Administration say, led to the rendering of many services which were unnecessary and unreasonable, but which the shipper has come to consider properly due him. Having grown accustomed to being sued for his favor by railway solicitors, it is naturally difficult for the shipper to adjust himself to a new situation in which traffic is not sought after. It is unfortunate that the discontinuance of off-line agencies will prove a hardship on many traffic representatives who have spent years in solicitation work and will have some difficulty in adapting themselves to different positions. Every effort, however, is being made to provide new places for these men in other kinds of railway work. It is also to be regretted that the off-line agencies were abolished before adequate means were provided for furnishing to shippers, not the same service as before, but the service to which they are entitled. However, since the powers that be believe that the offices of local lines can take over the work of off-line agencies, this new plan should be given a fair trial before passing final judgment upon it.

The Problem of the Contractor

WHILE MOST OF THE MORE IMPORTANT construction contracts which have been let by the roads during the last year have been on the basis of cost plus a percentage, or cost plus a fixed sum, a considerable amount of work under contracts awarded on a unit price basis, before our entrance into the war, is still uncompleted. The railroad contractor who is working under such an agreement at the present time, is in a dilemma. Almost every factor entering into the cost of his work has risen; labor rates are much higher than 15 or 18 months ago, and even then it is practically impossible to maintain sufficient forces to enable the work to be pushed to the best advantage and maximum economy; materials and supplies have risen in price, while delays in deliveries result in further disorganization and increased cost. Therefore unless the roads come to the relief of these contractors, they are confronted with the option of completing the work at a large loss, or of abandoning it and forfeiting their bonds.

The conditions giving rise to this situation are beyond the control of the contractor or the road. In many instances materials arranged for in adequate time have been taken by the government and in other cases working conditions have been so disarranged directly or indirectly by government work that forces have become demoralized. In general the engineers of the roads have realized the seriousness of the situation and have taken steps to reimburse the contractor for the actual and necessary increases in costs. This action has not been universal, however, and in instances where it has not been done hardship has resulted.

This situation is not confined to the roads, but is prevalent in all construction work. One notable illustration is the new subway system in New York, where the contractors are working under such adverse conditions that an attempt is now being made to secure relief for them through special legislation authorizing the Public Service Commission, which made the original contracts, to make proper and equitable adjustments.

The object of any contract is to provide for the building of a facility to the satisfaction of the road and at the minimum cost, consistent with the earning of a fair and reasonable profit by the contractor. Any return less than that, particularly if brought about by conditions which were unavoidable and which neither party anticipated when the contract was signed, is certain to result in mutual dissatisfaction. The most unsatisfactory and expensive contractor on a road is one who is losing money and who is therefore looking for every opportunity to reduce the cost, frequently at the expense of the finished work. Under present conditions the roads should, in all fairness to contractors working on pre-war contracts, consider carefully the terms of the contracts to ascertain if justice is being done and if not to take such steps as will insure fair treatment for them.

The Co-Ordination of Terminals

THE DIVERSION of BALTIMORE & OHIO passenger trains from the terminal of the Central Railroad of New Jersey on the west shore of the Hudson River at Jersey City into the Pennsylvania terminal on Manhattan Island a week ago last Sunday is the most radical step which the Railroad Administration has yet taken to unify the operation of terminals. The unification of terminals has been a much-favored topic among the city planning enthusiasts in a number of cities, notably Chicago, for many years. On the surface the idea has much to commend it. However, the deeper one studies into the practical phases of the subject the more does he realize the difficulties which exist.

When the government assumed control of the roads the popular idea was that the administration would be able to save millions of dollars through the common operation of terminals and that the delay and congestion would disappear as if by magic. It is to the credit of the Railroad Administration that it has not allowed itself to be stampeded by this clamor at a time when errors would add seriously to the congestion and that it has proceeded to study the subject carefully, availing itself of the services of railway men conversant with local conditions in the various cities. While this method is not as spectacular as some enthusiasts desire it is having a more important beneficial influence on operating methods.

Railway men will agree that many improvements in terminal operation can be effected through unified control, for this control of the roads removes many of the barriers to the joint operation of terminals inherent in individual management. At the same time many of the existing practices are the result of legitimate demands for service which still exists and which must be met. If the roads were all to be wiped out and rebuilt new today there is no question but that many of the terminals would be located and built differently. However, to consider the operation of terminals on this basis at this late day is an idle dream, for the roads are now located in certain places and they must be operated as they now exist.

While in some instances it may be practicable to adopt as radical methods as the diversion of the Baltimore & Ohio trains into the Pennsylvania station at New York, in most instances the most immediate results, and those most effective in winning the war, can be secured by improving conditions

at one point or another, which while perhaps relatively minor in themselves, become large in the aggregate.

It is to be expected that the officers on the individual roads are best able to handle terminal operations on their own lines. It is when two or more roads come in contact with each other in joint operations that the government has the greatest opportunity to effect economies by co-ordinating efforts. As an instance, the interchange of cars has commonly been made at the point and under the conditions most convenient to the receiving line, frequently regardless of the expense to the delivering road. Unified control now enables this interchange to be made at the place and in the manner which will result in the greatest common good to both roads. As another example, the western regional director has already taken steps to avoid duplicate switching at industries served by two or more roads. While measures such as these are not necessarily original, for they have been worked out locally by mutual agreement between roads, in many instances they are now being extended to more general use.

It is possible that ultimately roads with modern terminal facilities of sufficient capacity may be asked to share them with other roads less favorably situated during the period of government control in order that the public may best be served with the minimum investment. In some instances this will undoubtedly make necessary the construction of connections between existing roads and the building of other facilities for joint operation. However, the Railroad Administration is proceeding for the present along the most practical lines by undertaking first those improvements which will yield most direct and the quickest results.

Is a Labor Monopoly Advisable?

GOVERNMENT CONTROL is already resulting in a number of marked changes in the established practices of the maintenance of way department, the outcome of which is being watched with much concern. Orders have been issued that the roads shall not purchase rails, but that the Central Purchasing Board will take over this work. As a result no orders for rails have been placed since January 1, mills are rolling at less than 30 per cent capacity on unfilled orders and many roads have little or no rails on hand at the season when their renewal is normally well advanced. Likewise, the authority of the roads to purchase ties has been restricted and most of this work turned over to the government so that a shortage for replacement purposes exists on many lines.

The most recent and probably the most radical departure is the fixing of maximum rates for track labor and the consolidation of railway and private agencies with the government bureaus. In an order issued by the western regional director the maximum rate of .25 cents an hour has been fixed for the central and southwestern territories and .27 cents an hour in the northwestern territory and in large terminals. The only exception is that lines now paying higher wages in certain localities may continue those rates, but shall not extend them.

No one will deny that abuses have existed in the labor field in times of business activity and competition for men. Roads have bid against one another and labor agents have encouraged gangs to transfer from one line to another on slight pretext, with the result that the cost of the work has been increased while the total output of labor has been reduced rather than enlarged. Nothing seems to demoralize the labor market more rapidly than this practice, and this promiscuous competition for men should be eliminated.

Many of the labor agencies have also been the source of abuses and have exploited the men to their own benefit, while playing one road against another. The consolidation of these agencies under government control should eliminate abuses of this character. The establishment of a fixed rate over a wide area prevents the roads from meeting competition with outside industries at local points, and the manufacturer or contractor will now be able to secure all the men he desires from the railway forces, knowing that the roads are unable to meet his rates. As a result while the rate established may be satisfactory in small, isolated communities, it will not be sufficient to enable the roads to retain adequate forces in the busy industrial and agricultural communities where labor is at a premium. This condition will result in many men being attracted from the railways into other work.

The consolidation of private labor agencies under the supervision of the government, also possesses disadvantages. In spite of the commonly recognized abuses of private labor agencies, they have built up systems and acquaintances by means of which they have been able to secure men for the roads in past years when the government bureaus have been unable to do this. In general the roads have secured little assistance from state or national labor bureaus in the past. With the private labor agencies closed, the advantage of the federal agencies will, of course, be increased, but it is doubtful if bureaus which are engaged in the recruiting of labor for all classes of government activities will not allow the roads to suffer.

Furthermore, with the incentive of private gain removed, the labor agents working under government control will very probably not show the same zeal in securing men for railway service that they have in the past.

There is now an acute shortage of labor and this situation will become more serious as the season advances. There is, therefore, a wide difference of opinion among railway men regarding the advisability of disarranging existing practices so radically, when the main object is to secure an adequate supply of labor and when the wage rate although important, is secondary to the importance of completing the work. There is a fear that the disadvantages resulting from these radical steps may be more serious than the abuses which they are designed to correct. Time and a thorough test of the plan alone will determine this.

New York Central

THE NEW YORK CENTRAL is in a very different position today from what it was three years ago. The merger in the latter part of 1914 of the Lake Shore & Michigan Southern and the New York Central & Hudson River was a financial readjustment which gave an impetus and greatly strengthening the general condition of the New York Central Lines by making available directly to the parent company the "plowed in" surplus profits of the Lake Shore. No matter how skillful, however, an outside manager could not be the rock bottom foundation on which they have got to be predicated is the earning power of the railway property itself. Even after the merger with the Lake Shore the New York Central's financial situation was not so improved that an extravagant or mistaken policy of operation might not have seriously weakened it. As a matter of fact, the operating results obtained in the last three years have immensely strengthened this structure.

The New York Central came through even the unprecedentedly trying year of 1917 with a fine showing. In the three years since the merger with the Lake Shore the New York Central has increased its average train load by over 10 per cent and during this time it has held down train mile ex-

penses to an increase rather less proportionally than the increase in wages and cost of materials.

In 1917 the New York Central with its 5,685 miles of line, of which the main line is a four-track road from New York to Chicago, earned \$216,268,000, an increase over 1916 of \$14,682,000. Expenses increased by \$23,859,000, but even so, the operating ratio was 71 per cent in 1917 as against something over 64 per cent in 1916. Taxes increased by \$2,758,000, "other income" decreased by over \$7,000,000 due to a very much smaller profit on separately operated properties and lower dividend declarations of controlled companies, so that net corporate income available for dividends amounted to \$25,599,000 in 1917 as against \$45,659,000 in 1916. But even in 1917 the five per cent dividend took less than half of the amount available, leaving a surplus of over \$13,000,000. In 1916 the surplus was \$30,693,000. The piling up of surpluses in the years 1915, 1916 and 1917 which could be carried to profit and loss are of an importance that it is hard to overestimate. One need only try to figure what the 1917 balance sheet would have looked like had the company not been able to add more than \$46,000,000 to its surplus during these three years. The addition of this \$46,-

LIABILITIES.

| | January 1, 1915 | December 31, 1917 |
|--|-----------------|-------------------|
| Capital stock | \$249,590,500 | \$249,849,400 |
| Debt | 703,413,900 | 729,185,500 |
| Total capitalization | \$953,004,400 | \$979,034,900 |
| Current liabilities | \$32,805,500 | \$46,552,700 |
| Deferred and unadjusted liabilities... | 33,152,900 | \$7,410,600 |
| Surplus | 29,405,900 | 75,803,700 |
| | \$1,048,368,700 | \$1,158,801,900 |

The increases in revenue in 1917 as compared with 1916 were the result of a considerably larger freight movement, a much larger passenger business and a somewhat higher average ton-mile rate and passenger-mile rate. Freight revenue amounted to \$135,979,000, an increase of \$8,113,000. The total tonnage of freight carried was 110,238,000 tons, an increase of 3,830,000 tons, and the average haul of revenue freight was 204 miles in 1917 and 201 miles in 1916. The average revenue per ton of freight was 6.03 mills in 1917 and 5.98 mills in 1916.

Passenger revenue amounted to \$49,987,000, an increase over the previous year of \$4,466,000 and the total number of passengers carried was 57,288,000, an increase over 1916

The New York Central, the Cleveland, Cincinnati, Chicago & St. Louis, and the Michigan Central

000,000 to liabilities is a bookkeeping transaction, but it is actually contained in assets. Try to picture the assets' side without this \$46,000,000. Below is a condensed comparative balance sheet of 1915 and 1917.

| Assets. | January 1, 1915 | December 31, 1917 |
|--|-----------------|-------------------|
| Road and equipment | \$620,480,100 | \$693,619,200 |
| Improvements on leased property | 82,942,900 | 92,132,200 |
| Miscellaneous physical property | 6,011,900 | 8,680,600 |
| Securities of affiliated companies | 224,678,800 | 194,534,900 |
| Securities of other companies | 34,312,800 | 44,429,300 |
| Total property | \$968,426,500 | \$1,034,396,200 |
| Current assets | 69,161,200 | 84,827,800 |
| Deferred and unadjusted assets | 10,781,000 | 39,577,900 |
| | \$1,048,368,700 | \$1,158,801,900 |

of 1,759,000. Nearly all of this increase, however, in number of passengers carried was in commutation passengers. Nevertheless the average passenger journey was 44 miles in 1917 and 42 miles in 1916. In other words, the average of the interline journeys and local passenger journeys other than commuters' journeys must have increased very considerably so as to offset the larger proportion of commuters' journeys. The average revenue per passenger per mile was 1.96 cents, as against 1.934 cents in 1916.

Notwithstanding an increase of 1,137,000,000 ton-miles handled by the New York Central, the freight train mileage decreased by 1,212,000, totaling in 1917 26,620,000. Reductions in passenger service enabled a saving of 727,000 passenger train-miles, the total in 1917 being 27,735,000.

The average number of passengers per train-mile was 92 in 1917 as against 82 in 1916.

The reduction in freight train mileage is really a remarkable achievement. The average train load of all freight in 1917 was 227 tons, an increase of more than 80 tons over 1916. It is true that there was a decrease in empty car mileage, the average number of empty cars per train being 16.59 in 1917 as against 17.57 in 1916; there was also a decrease in the movement of loaded cars per train, the average in 1917 being 34.94 and in 1916 35.83. There was a notable increase in car loading, the average loading per loaded car was 26.54 tons in 1917, as against 25.63 tons in 1916, an increase of over 12 per cent. There was no great increase in the number of heavy locomotives in service during the year. Five locomotives were added to freight service and 15 retired, and none were added to passenger service. The increased car loading and reduction in empty car mileage materially reduced, of course, the tare weight which had to be hauled for each ton of revenue freight. But making allowance for this, it would still appear that in a year in which pressure of business, labor unrest and in some months very unfavorable weather conditions, had all tended to demoralize railroad operation, the operating management of the New York Central succeeded in showing a marked improvement even over the banner year 1916.

Some of the increases in transportation expenses are fairly startling when we consider how good the showing is measured in business moved and train-miles consumed in moving it. The cost of fuel per train locomotive, excluding yard and switching locomotives, was \$14,482,000, or \$5,816,000 more than in 1916. This increase in train locomotive fuel alone is equal to more than two per cent on the stock of the New York Central. Fuel for yard locomotives cost \$3,938,000, an increase of \$1,671,000. Train engineers' wages amounted to \$7,363,000, an increase of \$1,064,000, and trainmen's wages amounted to \$8,617,000, an increase of \$1,198,000. There was a heavy increase in loss and damage to freight, the total amount paid on this account in 1917 being \$2,920,000, or \$1,087,000 more than was paid in 1916.

There was spent on maintenance of way and structures \$20,704,000 in 1917, an increase of \$1,739,000 over 1916. Apparently this increase does not by any means represent the difference in cost of the same standard of maintenance in 1917 and 1916. For instance, whereas there was a charge of \$615,000 for rails (a comparatively small charge) made in 1916, there was a credit taken of almost the same amount for rails in 1917, making a total difference in this account as between the two years of \$1,240,000. It may be presumed that inability to get deliveries of rails was a factor in cessation of the rail relaying program. Maintenance of equipment cost \$38,447,000, an increase of \$2,451,000. Much larger expenditures for repairs to locomotives, freight cars and passenger cars was offset in part by large decreases in the amount charged for retirements. In other words, in 1916, with the very large net earnings available, the New York Central found it expedient to retire an extraordinarily large amount of equipment and to charge the difference between accrued depreciation plus scrap value and original cost to retirements. In 1917 charges for retirements were comparatively small.

The following table shows the ratio of each class of operating expenses to total operating revenues:

| | 1917 | 1916 |
|-----------------------------------|-------|-------|
| Maintenance of way and structures | 9.57 | 9.41 |
| Maintenance of equipment | 17.78 | 17.85 |
| Traffic expenses | 1.35 | 1.44 |
| Transportation expenses | 38.35 | 37.24 |
| Miscellaneous operations | 1.37 | .29 |
| General expenses | 2.28 | 2.15 |
| Total | 79.70 | 64.36 |

In 1916 the New York Central had planned to issue and sell at par to stockholders \$25,000,000 stock, but market

conditions were such that the offer was withdrawn. The market price of New York Central dropped below par. The company, however, issued \$20,000,000 4½ per cent refunding and improvement mortgage bonds, which were deposited as collateral for \$15,000,000 two year five per cent notes, due September 15, 1919, which were sold. The company also sold \$8,205,000 4½ per cent equipment certificates, but finding itself unable to call more of these certificates to the public, itself took \$1,805,000 additional. A total of \$34,271,000 was charged to additional investment in property, but this included the purchase of the Dodgeville & Salisbury Railway Company and the Cornwall Bridge Company, both of which were already controlled and operated by the New York Central. The actual amount spent for enlargements of yards and terminal facilities was \$5,867,000, of roadway and bridge improvements \$2,917,000 and elimination of grade crossings \$1,120,000. In addition there was an increase of \$15,973,000 in the investment in equipment and \$3,737,000 in "improvements on leased railway property."

The following table shows the principal figures for operation in 1917 as compared with 1916:

| | 1917 | 1916 |
|-----------------------------------|---------------|---------------|
| Average mileage operated | 5,665 | 5,689 |
| Freight revenue | \$135,599,133 | \$127,777,022 |
| Passenger revenue | 4,872,843 | 4,712,129 |
| Total railway operating revenues | 216,672,517 | 201,559,049 |
| Maintenance of way and structures | 20,704,000 | 18,965,000 |
| Maintenance of equipment | 38,447,000 | 35,996,000 |
| Traffic | 1,350,000 | 1,440,000 |
| Transportation | 81,674,400 | 64,208,508 |
| General expenses | 2,280,000 | 2,150,000 |
| Total operating expenses | 153,797,400 | 129,738,369 |
| Taxes | 1,239,600 | 841,549 |
| Operating income | 51,410,322 | 63,444,071 |
| Gross income | 6,873,006 | 85,367,446 |
| Net income | 5,799,140 | 15,669,217 |
| Dividends | 1,447,003 | 1,466,611 |
| Appropriated for retirement | 1,004,004 | 2,560,000 |
| Sinking fund | 1,004,004 | 30,692,666 |
| Surplus | 1,004,004 | 30,692,666 |

Michigan Central and Cleveland, Cincinnati, Chicago & St. Louis

THE MICHIGAN CENTRAL and the Cleveland, Cincinnati, Chicago & St. Louis are the two principal controlled lines of the New York Central. In many ways they are strikingly different one from another. The Michigan Central is nearly all main line. It runs from Buffalo through Ontario along the northern shore of Lake Erie to Detroit, Mich., and to Toledo, Ohio, with a main line east and west across the southern boundry of Michigan and around the lower end of Lake Michigan to Chicago and with a north and south line from Detroit through Bay City to the northern point of the Michigan peninsula—Mackinaw City. The mileage operated totals 1,862 miles. In contrast to this the Cleveland, Cincinnati, Chicago & St. Louis, or Big Four, as it is usually called, operates a network of lines radiating over western Ohio, Indiana and eastern Illinois, with a western through line to St. Louis, Mo. It connects the lake cities of Cleveland, Sandusky and Toledo with Columbus, Springfield, Dayton and Cincinnati, Ohio, and with Indianapolis and Terre Haute, Indiana. In all the company operates 2,587 miles of line.

In 1916 both companies enjoyed quite extraordinary prosperity and the following figures for 1916 show the principal characteristics of the two roads under these conditions: The Michigan Central operating revenue was \$24.93 per mile, the Big Four, \$19.550 per mile. The freight density of the Michigan Central was 2280,000 ton miles, of the Big Four 2,471,000 ton miles. The average ton mile rate on the Michigan Central was 7.14 mills and on the Big Four 5.56 mills. The average length of haul of freight on the Michigan Central was 167 miles and on the Big Four 178 miles. The passenger density on the Michigan Central

was 289,000 passenger miles, on the Big Four, 211,000 passenger miles. The revenue per passenger per mile on the Michigan Central was 2.190 cents and on the Big Four 2.007 cents. Of the 24,948,000 tons of freight carried by the Michigan Central 4,778,000 tons was furnished by bituminous coal, 2,154,000 tons by stone and sand and 1,230,000 tons by anthracite coal. Of the total 32,903,000 tons of freight carried by the Big Four, 14,509,000 tons was furnished by bituminous coal and 2,025,000 tons by stone and sand, and a negligible amount by anthracite coal. About the same tonnage of grain was handled by the two roads and the Michigan Central handled a somewhat greater tonnage of manufactured products. The average train load of all freight in 1916 on the Michigan Central was 606 tons and on the Big Four 654 tons. In 1916 the Michigan Central had \$6,837,000 available for dividends and the Big Four \$8,332,000.

It is rather interesting to see how these two roads, both controlled by the same interests but with such widely different operating conditions, were affected by the extraordinary traffic and operating changes which took place in 1917.

The Michigan Central's net income available for dividends was about cut in two, amounting to only \$3,438,000, as against \$6,837,000 in the previous year, despite an increase of \$6,461,000 in operating revenues. The Big Four's net available for dividends held up rather better and amounted to \$5,258,000 in 1917 as against \$8,332,000 in 1916. Moreover, the gain in operating revenues was only \$5,973,000 for the Big Four. By a coincidence the Michigan Central with its 1,800 miles of line earned quite nearly the same amount as the Big Four with its nearly 2,400 miles of line. The exact figures are shown in the table at the end of these remarks.

The Michigan Central's gain in freight revenue was about half a million dollars more than the Big Four's gain. Nearly the entire increase of tonnage on the Big Four was bituminous coal; the other products showing an increase were offset by a numerous list of products showing decreased tonnage. On the other hand the Michigan Central's bituminous coal tonnage increased in actual amount considerably less than that of the Big Four, but the proportion of increase to total tonnage carried was greater and there are numerous other classes of commodities showing fairly large increases in tonnage with comparatively few offsetting losses in tonnage. Furthermore, the average ton mile rate on the Michigan Central increased by 0.12 mills, amounting in 1917 to 7.26 mills, while the Big Four's ton mile rate increased by 0.10 mills averaging 5.66 mills in 1917.

The Michigan Central did a much smaller business in handling local passengers, but showed a gain in this class of business of 159,000, against a gain by the Big Four of 155,000. The Michigan Central, handling a larger number of interline passengers than Big Four, showed a gain of only 110,000 in this class of business as against a gain for the Big Four of 237,000.

Total operating expenses of the Michigan Central amounted in 1917 to \$38,289,000, an increase over 1916 of \$7,643,000. The Big Four operating expenses amounted to \$38,059,000 and the increase over 1916 was \$6,837,000. The increase in the out-of-town pocket-cost of handling freight and passenger business (transportation expenses) was a little greater on the Michigan Central than on the Big Four. These expenses in 1917 on the Michigan Central amounted to \$22,211,000, an increase over 1916 of \$5,805,000. Corresponding expenses on the Big Four amounted to \$21,460,000, an increase of \$5,644,000. The greatest difference on the two roads was the increase in cost of fuel. In 1917 the Michigan Central spent \$4,529,000 for fuel for train locomotives; this was an increase of \$1,904,000—nearly 73 per cent. The Big Four in 1917 spent \$3,844,-

000 for fuel for train locomotives, an increase of \$1,558,000—68 per cent. The increased cost of fuel for yard locomotives was even greater proportionately on the Michigan Central as compared with the Big Four. On the other hand the Michigan Central showed a comparatively small increase in wages of train engineers, the amount spent in 1917 being \$1,731,000, or only \$224,000 more than in 1916, while the Big Four spent \$2,025,000 on this account in 1917, an increase of \$369,000.

Total train mileage of revenue trains was 14,249,000 on the Michigan Central in 1917, an increase over the previous year of 108,000 train miles. On the Big Four total revenue train mileage was 17,984,000, an increase of 329,000 train miles.

The average total train load of the Michigan Central was 683 tons, an increase of 77 tons over the average in 1916. The Big Four's train load in 1917 was 745 tons, an increase over 1916 of 67 tons. The Big Four, however, labored under the disadvantage of having a more unbalanced traffic in 1917 than in 1916. The average number of empty cars per train was 12.6 for 1917 as against 11.6 in 1916, while the Michigan Central had the advantage of a better balanced traffic in 1917 than in 1916, the average number of empty cars per train being 10 last year and 12 the year before.

Expenditures for maintenance probably reflected to a less extent than ever heretofore, taking the country as a whole, the policy of retrenchment or the reverse of the management, because in 1917 the exigencies of the situation were such as to in considerable part take the matter of how much work should be done out of the hands of the management. In general the pressure of business was so great that all the maintenance work which could be done with the labor and materials available was authorized. The Michigan Central spent \$5,390,000 on maintenance of way in 1917, an increase of about \$223,000 over the previous year and spent \$8,026,000 for maintenance of equipment, an increase of \$1,351,000. The Big Four spent \$4,378,000 for maintenance of way, a decrease of \$169,000 and spent \$9,808,000 for maintenance of equipment, an increase of \$1,122,000. Like the parent company, the New York Central, the Michigan Central and the Big Four both had a credit in 1917 for rails. In other words, there had been charged prior to 1917 more for rails than was actually represented by rails used and nothing was charged in 1917, but the previous excess charges were taken up that year. Like the parent company, also, less was charged out in 1917 for retirements of equipment both by the Michigan Central and the Big Four, with the exception, however, of a large charge for retirements of freight train cars made by the Michigan Central.

Neither the Michigan Central nor the Big Four issued any bonds during the year and the expenditures for additions and betterments amounted to \$1,719,000 in the case of the Michigan Central and \$2,222,000 in the case of the Big Four; the net addition to equipment amounted to \$6,891,000 for the Michigan Central and \$4,092,000 for the Big Four. At the end of 1917 the Michigan Central had \$3,710,000 cash and \$15,828,000 loans and bills payable. The Big Four had \$2,966,000 cash and \$3,763,000 loans and bills payable.

Just a word ought to be said in particular about the progress which the Big Four has made since the floods in 1913. During these four years it has been necessary to take up in operating expenses very large expenditures for repairs due to flood damage. It has been necessary to operate at times under unusually trying conditions and yet the Big Four has improved its position so materially that it can no longer be called one of the poor relations of the New York Central Lines.

The following table shows the principal figures for oper-

ation for the Michigan Central and the Cleveland, Cincinnati, Chicago & St. Louis in the two years 1917 and 1916:

| | Michigan Central, 1917 | Big Lake, 1917 | Michigan Central, 1916 | Big Four, 1916 |
|--------------------------|------------------------------|----------------------|------------------------------|----------------------|
| Average mileage operated | 1,862 | 387 | 1,86 | 2,387 |
| Freight revenue | \$33,888,447 | \$36,077,390 | \$9,810,576 | \$32,536,544 |
| Passenger revenue | 12,889,809 | 12,606,347 | 11,146,344 | 10,026,742 |
| Total operating revenue | 52,879,434 | 57,683,737 | 49,418,790 | 46,675,240 |
| Maintenance of way | 5,389,671 | 4,378,408 | 5,166,001 | 4,547,817 |
| Maintenance of equipment | 8,065,084 | 9,808,418 | 6,674,868 | 8,686,251 |
| Traffic | 865,761 | 1,647,706 | 819,783 | 1,028,789 |
| Transportation expenses | 25,111,761 | 1,816,558 | 16,406,747 | 15,815,902 |
| General expenses | 973,011 | 1,014,133 | 878,085 | 929,532 |
| Total operating expenses | 38,289,136 | 38,059,441 | 30,646,261 | 31,211,977 |
| Taxes | 1,972,237 | 2,738,986 | 1,686,010 | 1,686,720 |
| Operating income | 12,604,655 | 13,884,881 | 14,076,169 | 13,759,866 |
| Gross income | 13,474,457 | 13,411,830 | 15,011,009 | 15,061,346 |
| Net income | 3,438,216 | 5,257,807 | 6,237,371 | 8,331,702 |
| Dividends | 749,456 | 499,628 | 749,456 | 374,944 |
| Surplus* | 2,436,157 | 4,656,979 | 3,886,932 | 6,999,964 |

*In addition to dividends there were made appropriations to sinking funds, additions and betterments, etc., amounting to the figures given for surpluses were \$11,611,611.

Hocking Valley

THERE IS ONE ROAD in the east at least on which increased expenses did not more than consume larger revenues in 1917. It is a short one, the Hocking Valley, but a very important coal carrier. There may be, when all the annual reports come in, other roads showing an increased operating income in 1917 as compared with 1916, but it is pretty safe to say that they will be comparatively few in number. The Hocking Valley earned \$10,696,000 in 1917, an increase over the previous year of more than 30 per cent. The company operates 350 miles from Toledo, Ohio, to the Ohio river at Gallipolis and Pomeroy. The road now has a connection from Columbus, Ohio, over the Norfolk & Western and the Chesapeake & Ohio Northern with the main line of the Chesapeake & Ohio at Portsmouth, Ohio. A majority of the Hocking Valley stock is owned by the Chesapeake & Ohio.

The Hocking Valley is a coal road with comparatively little other freight tonnage except manufactures. In 1917 the total tonnage of all freight carried was 14,867,000 tons and of this over 81 per cent was products of mines, bituminous coal alone furnishing more than 71 per cent of the total tonnage. The increase in tonnage carried as compared with 1916 was 1,867,000 tons and the increase in tonnage of bituminous coal alone was 1,375,000 tons. Besides the increase in tonnage there was a considerably higher average ton-mile rate received. The average in 1917 was 4.56 mills; certainly a figure that does not sound high, but this was an increase of 12 per cent over the average received in 1916.

With an increase of 30 per cent in revenues there was an increase of only 12 per cent in expenses, the total in 1917 being \$7,499,000. Despite an increase of 41 per cent in taxes, operating income amounted to \$2,455,000, an increase of about 22 per cent over the operating income of 1916. A decrease in miscellaneous income was more than offset in decreased rental payments and after paying 5 1/2 per cent dividends, the company had a surplus of \$1,529,000 in 1917.

The interesting feature of the Hocking Valley's annual report is the indications which are given as to how expenses were held down nearly in proportion to the increase in revenue. Maintenance of way expenses showed a very considerable increase, amounting in 1917 to \$946,000, or an increase of 20 per cent over 1916. In some way or other the Hocking Valley apparently was able to obtain track labor sufficient in quantity to carry on quite extensive renewal work, especially of ties. Track laying and surfacing, which is a labor cost, amounted to \$601,000 in 1917, an increase

of \$64,000. Ties, which is a material cost, amounted to \$235,000, an increase of \$5,000. The Hocking Valley, like so many other roads, apparently found rails impossible to obtain or obtainable only at prohibitive prices. There was only a nominal sum—less than \$7,000—spent for rails in 1917.

Maintenance of equipment cost \$3,666,000, an increase of \$210,000, or nearly 10 per cent over 1916. The greater part of this increase is due to much heavier expenditures for repairs to locomotives in 1917, \$515,000 being spent for repairs to locomotives, an increase of \$145,000. This was an average in 1917 of \$8,750 for repairs per locomotive.

It is obvious from the above that it was not by large savings in maintenance that the Hocking Valley was able to hold down operating expenses.

While it is true that transportation expenses increased 57 per cent, this increase, coupled with the increases in maintenance expenditures, was not great enough to offset by more than half a million dollars, the increase in revenues.

Transportation expenses in 1917 amounted to \$3,716,000, an increase over the previous year of \$1,352,000. The increased cost of fuel was the most staggering of the increases in transportation expenses. For both train locomotives and yard locomotives, fuel costs increased by more than 100 per cent. These two increases alone accounted for nearly half a million dollars of the \$1,352,000 increase in transportation expenses. Wages of trainmen, yard conductors and brakemen, engineers and other employees make up the greater part of the rest of the total increase. With an increase of over 100 per cent in fuel costs, there was an increase of only eight per cent in freight train mileage and practically no increase in passenger train mileage.

On a road doing so largely a coal business, we would expect to find heavy average train loading, but it must also be remembered that on the Hocking Valley the coal cars have to be hauled south empty. The average number of loaded cars per train northbound in 1917 was 47.7 and of empty cars northbound 2.5, while the average number of loaded cars southbound was 13.2 and of empty cars 40.8 per cent. An average trainload, therefore, of 1,368 tons is a showing that the Hocking Valley may well be proud of. This trainload was 151 tons, or 10.6 per cent greater than the average in 1916. Even more remarkable, however, are the results which the Hocking Valley has obtained in car loading. The average loading per loaded car even in 1916, was 40 tons. This would be good car loading even if all of the traffic of the Hocking Valley were coal, because while its own coal cars average 47 tons capacity, it has to handle a certain number of foreign cars of lower capacity, but it must be remembered that there is also a considerable tonnage of merchandise and of manufactures and the Hocking Valley's 3,685 box cars average only 20 tons capacity. In 1917, an average loading per loaded car of 44 tons was obtained, an increase of over one car load above the very high figure of 1916. This reflects a tremendous campaign on the part of the management and operating officers to obtain orders to load cars to full capacity and an effort to get on the part of the operating men to operate with the Hocking Valley.

M. J. Carls, resident vice president of the Hocking Valley and a member of the executive committee of the Chesapeake & Ohio, the line now leased and operated by the company, a very low ratio of transportation charges in operating revenues by means of very heavy trainloads. The very good showing which the Hocking Valley has made under the enormous pressure of coal business in 1917 would appear to be in good part due to the success of the efforts of the operating men to get on the part of the road certain principles of operation and to those for which

the Carolina, Clinchfield & Ohio was especially designed.

The following table shows the principal figures for operation in 1917 as compared with 1916.

| | 1917 | 1916 |
|---|-------------|-------------|
| Average mileage operated | 350 | 350 |
| Freight revenue | \$8,974,873 | \$6,681,262 |
| Passenger revenue | 961,700 | 917,935 |
| Total operating revenue | 10,696,434 | 8,200,420 |
| Maintenance of way and structures | 945,590 | 787,949 |
| Maintenance of equipment | 2,365,944 | 2,156,129 |
| Traffic expenses | 120,675 | 101,989 |
| Transportation expenses | 3,716,354 | 2,364,020 |
| General expenses | 261,469 | 187,802 |
| Total operating expenses | 7,409,123 | 5,597,889 |
| Taxes | 832,748 | 590,470 |
| Operating income | 2,447,845 | 2,011,438 |
| Gross income | 3,141,108 | 2,585,415 |
| Net income | 1,933,912 | 1,376,127 |
| Dividends | 604,973 | 439,980 |
| Surplus | 1,328,939 | 936,147 |

Chesapeake & Ohio

IN MARCH, 1916, the directors of the Chesapeake & Ohio decided to appropriate during the three years ending March 30, 1919, \$7,500,000 from income toward additions and betterments, or for other capital expenditures, or for the reduction of liabilities. The company had found itself in a position where it was necessary to refund \$33,000,000 of five per cent secured notes and to provide additional

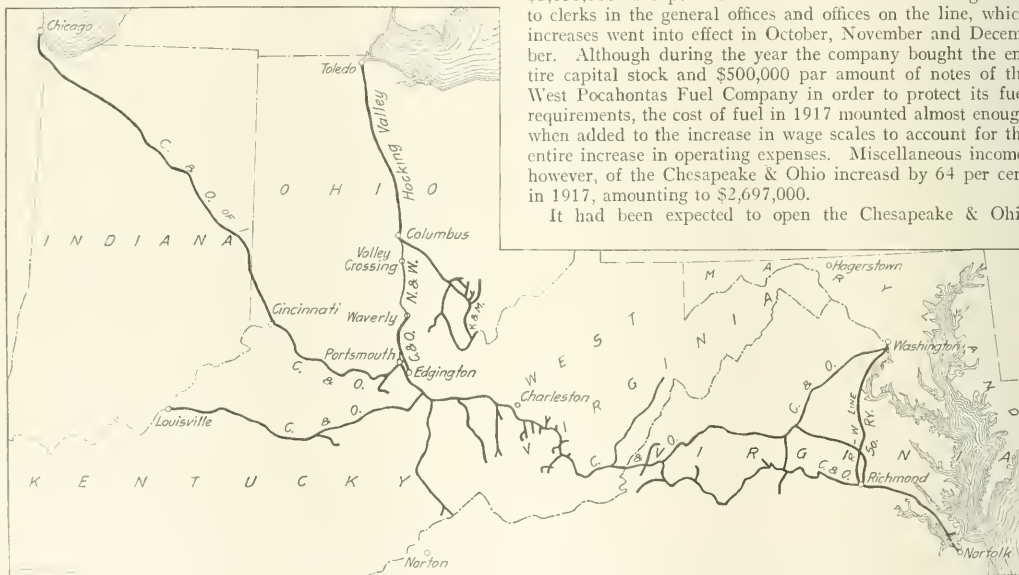

the difference should be represented by an expenditure on the property or a retirement of liabilities made from income.

The company out of a net income from May 1, 1916, to December 31, 1917, has appropriated \$7,500,000 for capital expenditures. In other words, the whole three years' program has already been taken care of. It is rather unusual to find a railroad able and willing to anticipate its obligations in this way under the conditions which prevailed in 1917. The Chesapeake & Ohio, however, although it did not do quite as well in respect to net income in 1917 as in 1916, earned \$7,066,000 available for dividends, or the equivalent of 11.25 per cent on its outstanding stock. The company is now paying dividends at the rate of four per cent, calling for \$2,511,000 in 1917.

In reviewing the annual report for the calendar year 1916 it was said that: "Present prospects are encouraging in respect to the ability of the property to earn net somewhere in the neighborhood of \$7,000,000." Even under the quite extraordinary conditions of 1917 the property justified this estimate.

Total operating revenues in 1917 amounted to \$54,644,000, an increase of \$4,809,000, or 9.65 per cent over the previous year. Operating expenses amounted to \$38,106,000, an increase of \$5,407,000, or 16.54 per cent. Increased wage scales alone accounted for an increase of approximately \$3,051,000 in expenses. This included an increase granted to clerks in the general offices and offices on the line, which increases went into effect in October, November and December. Although during the year the company bought the entire capital stock and \$500,000 par amount of notes of the West Pocahontas Fuel Company in order to protect its fuel requirements, the cost of fuel in 1917 mounted almost enough when added to the increase in wage scales to account for the entire increase in operating expenses. Miscellaneous income, however, of the Chesapeake & Ohio increased by 64 per cent in 1917, amounting to \$2,697,000.

It had been expected to open the Chesapeake & Ohio

Chesapeake & Ohio

capital for additions and betterments. The proportion of funded debt to stock outstanding on the Chesapeake & Ohio was already higher than was consistent with what is generally accepted as sound railroad financing. The Chesapeake & Ohio stock, however, was selling very considerably below par and a bond issue appeared to be the only means of financing the maturing notes. An issue, therefore, of \$40,180,000 five per cent 30-year convertible notes was sold. These notes are convertible up to April 1, 1920, into common stock at 75, between 1920 and 1923 into common stock at 80, between 1923 and 1926 at 90 and after that up to April 1, 1936, at par. The resolution to set aside from income \$7,500,000 was dictated by the thoroughly sound principle that if bonds were converted into stock at less than par,

Northern for operation early in 1917, but actually the road was not opened until the middle of September. The Chesapeake & Ohio Northern consists of 29 miles of road built by a subsidiary of the Chesapeake & Ohio from Limeville, Ky., to Waverly, Ohio, with trackage rights from Waverly over the Norfolk & Western for 62 miles, to a connection with the Hocking Valley and with trackage rights for about a mile over the Hocking Valley to Parsons yard at Columbus, Ohio. For the greater part of the year, therefore, Chesapeake & Ohio earnings were not benefited at all by getting a connection with the Hocking Valley, and even from September to the end of December only a part of the traffic which will under ordinary circumstances be handled over this line, moved that way.

Letters to the Editor

Locomotive Cost as Related to Service

WASHINGTON, D. C.

TO THE EDITOR:

The Purchasing Department of the Railroad Administration, in placing orders for locomotives and freight cars, has exacted a basis of approximately estimated cost plus five per cent profit for both classes of equipment.

A freight car is constructed mainly of unmachined parts by a large percentage of unskilled labor. Refined workmanship, material and appliances are vitally essential to only a limited extent in a freight car as a whole to insure proper safety, operation and maintenance, as it is not subject to pressures, stresses and conditions such as a locomotive.

A steam locomotive is a highly specialized piece of mobile machinery, generating the power necessary for its propulsion and for the development of great hauling capacity. Its running gear, boiler and engines must be of such design, workmanship and material, and equipped with control and other auxiliary mechanism of such refinement as will insure maximum safety, precision of manipulation and ease of handling at all times. Furthermore, it must be so equipped that the labor, fuel, water, lubricants and other supplies required for its operation can be effectively and economically utilized.

Railroads in the United States have gotten just what they were willing to pay for, the same as purchasers of other commodities—no more, no less. Perhaps the locomotives were good enough, but are we not now aiming at a lower standard?

To place the profit on a locomotive at a figure so low that an unavoidable interruption of the plant output from any of many possible causes or increases in labor and overhead charges might jeopardize the making of any profit whatsoever or possibly incurring a loss, would seem to result in but one tendency—that of lowering a standard of excellence none too high.

In the locomotive building industry the builder, unlike the manufacturer of a staple article whose costs are known from day to day, bases his proposals for new locomotives upon an estimate computed from previous performances in connection with the building of locomotives of as nearly the same design as can be obtained. However, owing to variation in designs and material and construction specifications, it is impossible to secure a correct check on the cost figures and it often happens that an estimated profit may be greatly reduced or actually converted into a loss. The filling up of the building plants with locomotives of an entirely new design places the matter of profit in a much more precarious position than were the builders to receive part of their orders in duplicates of previous designs. It is hardly to be expected that the Government can guarantee the labor and material figures that the builders must use in their estimates, and if these should be lower than anticipated, the Government will benefit through existing taxation.

How does the Government expect to secure all that is vitally essential to the best interests of the railways and of the officers, engineers, firemen, mechanics and others directly concerned in the locomotive supervision, working and upkeep, upon whom it is dependent for the final result, if the first cost of design, material and construction is to be placed on a parity with that for a freight car? What assurance is given to those directly concerned that the standard practice heretofore developed is to be maintained? The Government should certainly set a higher standard throughout than has been obtained from private management, not only in first construction but in the "follow up" service.

Other countries having both Government and private ownership of railways work on the basis of intensive competition and high-grade individual interest, endeavor, design and workmanship. Why, then, should not the United States do the same? Steam railway locomotives have, during the past twenty years, gone through a great development stage. Many failures have occurred in new combinations of designs and materials embodied in cylinders, frames, fireboxes, axles, rods, motion gear, and mechanical appliances which have necessitated a certain amount of renewal and reconstruction. Are we to now throw many of the results of these years of accomplishment into the discard through any incentive to lower the standard of design, workmanship and material in order to meet a relatively low first cost?

The director general's advisors are establishing an untried practice in the purchase of locomotives that is bound to result in chaotic conditions, and which, if continued, will cause serious embarrassment to not only the Government and its employees, but to the general commercial and shipping public and all others who are directly involved and dependent upon transportation for the prosecution of the war and industrial activity. Unfortunately, the railways, their employees, and the people will ultimately be required to assume the burden of and pay for the experiment. LIBERTY BONDHOLDER.

Constructive Rehabilitation Pays

SCARSDALE, N. Y.

TO THE EDITOR:

At this time when the owners of all classes of railway securities in all parts of the world are watching with keen interest the administration of the railways in the United States by the government, the case of the Kansas City Southern may be cited to show what can be accomplished by the vigorous prosecution of a definite rehabilitation program.

This railway is a relatively small property and extends from Kansas City, Mo., which is in the vicinity of the geographical center of the United States, to the Gulf of Mexico, a distance of about 800 miles.

During 1917 it hauled about 35 per cent more freight and 25 per cent more passenger traffic, at lower freight and passenger rates, with 15 per cent less locomotives at an operating ratio of about 8 per cent less, as compared with ten years ago, and at the same time did not put out a single embargo but accepted and expeditiously moved all traffic offering along its own line and from connections.

This was the outcome of the constructive policy of the management that has obtained on that property during the past ten years, and which has resulted in doubling the revenue freight train load by improvements in grade and alignment; operating divisions, and shop and enginehouse facilities; strengthening equipment by the substitution of new types of locomotives and cars more suitable for the operating conditions for those that were obsolete and inadequate, and by the modernizing and reinforcement of existing locomotives that could, by that change, be made to perform more effective and economical service.

While the neighboring and competitive railways, such as the Wabash; Missouri Pacific; Iron Mountain; Missouri, Kansas & Texas; Frisco; Texas & Pacific; Missouri, Oklahoma & Gulf; International & Great Northern; Cotton Belt, and others have—during the past ten years—either passed their preferred stock dividends or otherwise defaulted in interest or gone into the hands of receivers, the Kansas City Southern has been earning and paying its preferred dividends and building up a substantial surplus besides, in addition to paying the interest on long-term bonds and the interest and principal on equipment notes that it has put out to take care of the rehabilitation work that has made its performance possible. J. E. MUEHLFELD.

Commission Recommends Increases of \$300,000,000

Graduated Scale Suggested—43 Per Cent to Those Paid \$46
a Month Down to \$1 for Those Paid \$249 a Month

THE REPORT OF THE RAILWAY WAGE COMMISSION to Director General McAdoo, recommending increases in wages estimated to approximate \$300,000,000 a year over the present payroll was given out Wednesday, although still under advisement by McAdoo for his decision, because of premature newspaper publication.

The commission reached the conclusion and recommends that the fairest method of dealing with the problem of wage increases is to award increases on a percentage scale ranging from 43 per cent for employees receiving \$46 a month and under, down to \$1 for those receiving \$249. These percentages are based on the rates of December, 1915. The percentages awarded by \$10 grades are as follows:

| Wages per Month. | Per Cent of Increase. |
|------------------|-----------------------|
| \$50 | 43 |
| 60 | 41 |
| 70 | 41 |
| 80 | 40.44 |
| 90 | 36.38 |
| 100 | 31.29 |
| 110 | 27.12 |
| 120 | 23.64 |
| 130 | 20.69 |
| 140 | 18.16 |
| 150 | 15.96 |
| 160 | 14.04 |
| 170 | 12.34 |
| 180 | 10.83 |
| 190 | 9.48 |
| 200 | 8.26 |
| 210 | 7.16 |
| 220 | 6.15 |
| 230 | 5.24 |
| 238 | 4.56 |

239 to 250 increases are enough to make up \$250.

The increases per month therefore range from \$1 up to \$34, which is the increase for employees now receiving around \$85 a month.

If an employee has received an increase since December 31, 1915, it will be used to make up the recommended increase. The commission has also made some investigation of salaries of officers receiving above \$5,000 yearly, and states that substantial readjustment may be made and efficient operation of roads promoted thereby. The commission recommends that during the period of government conduct of the roads no salaries be paid to officials not essential to operation of roads shall be charged as a part of operating expenses and that careful study be made of the proper relation between salaries of higher officials and their subordinates with a view to readjustment.

The commission recommends also that there should be constituted a tribunal or tribunals to continue the study of railroad labor problems and says that the existing state of war prohibits anything approximating a determination of ideal conditions.

The requests made for wage increases would involve an additional outlay in wages of somewhat over one billion dollars a year.

At the outset it was seen that there were the gravest inequalities in wages paid, but to reclassify employments would call for more time, skill, insight and knowledge than that possessed by the commission. The commission made an

exhaustive investigation of the increased cost of living and found large increases necessary to meet it, saying each dollar now represents in power to purchase a place to live, food to eat and clothing to wear, but 71 cents as against 100 cents on January 1, 1916.

Statistics gathered by the commission showed that 51 per cent of all employees in December, 1917, received \$75 per month or less. Eighty per cent received \$100 per month or less. Among locomotive engineers the preponderant number received less than \$170. Between the grades receiving from \$150 to \$250 per month there are included less than 5 per cent of all employees, 66,000 out of 2,000,000. The greatest number of employees are in the class receiving between \$60 and \$65 per month.

Reductions in hours are not to be regarded as increases in pay, the report says; as to those who have already received increases, the railroads scale should be adhered to, but there should be no reduction. A practical plan for increases in harmony with the scale has been devised for application to piece work and wages for recognized overtime.

A similar practical plan has been devised for application to the mileage rates for trainmen, which will be increased proportionately. The commission believes that this is not a time to reduce hours of work, and while it is strongly disposed to a standard day, its judgment is that existing hours of service should be maintained for the period of war.

Existing rules and conditions of payment for overtime should not be disturbed during the war, but should be made the subject of study. Increases shall be effective as of January 1, and members of organizations and non members must stand upon the same footing.

"Whatever its effect upon the mind may be," the commission says in discussing amount of the increase, "we regard such an expenditure as necessary for the immediate allaying of a feeling that cannot be wisely fostered by national inaction in and as not one dollar more than justice at this time requires. It will make hard places smoother for many who are now in sore need. It gives no bounty, it is not a bonus. It is no more than an honorable meeting of an obligation."

INCREASED COST OF EGYPTIAN RAILWAY FUEL—The Egyptian Budget for 1918-1919 shows that the increase in expenditure is due to the high prices of material, food and fuel, the extra cost of fuel for railways amounting to £950,000 (\$4,750,000).—*Railway Gazette, London*

CHINESE EASTERN RAILWAY STOCKHOLDERS have severed the official connection of the road with Petrograd, according to press despatches, and have named a new board of directors. The road was built with Russian capital and the contract provided that half the board should be Russians. The decision reached by the shareholders was based on "present conditions in Russia."

GOODS STOLEN ON PRUSSIAN STATE RAILWAYS—The Prussian State Railways in 1917 paid 57,000,000 marks (\$14,250,000 at pre-war rates) compensation for property lost or stolen in transit, compared with 4,000,000 marks (\$1,000,000) in 1914. The German Post Office paid 5,000,000 marks (\$750,000) in 1917 for similar losses compared with 100,000 marks (\$250,000) in 1912. The robberies on the Austrian railways are reported to be probably even greater than in Germany.

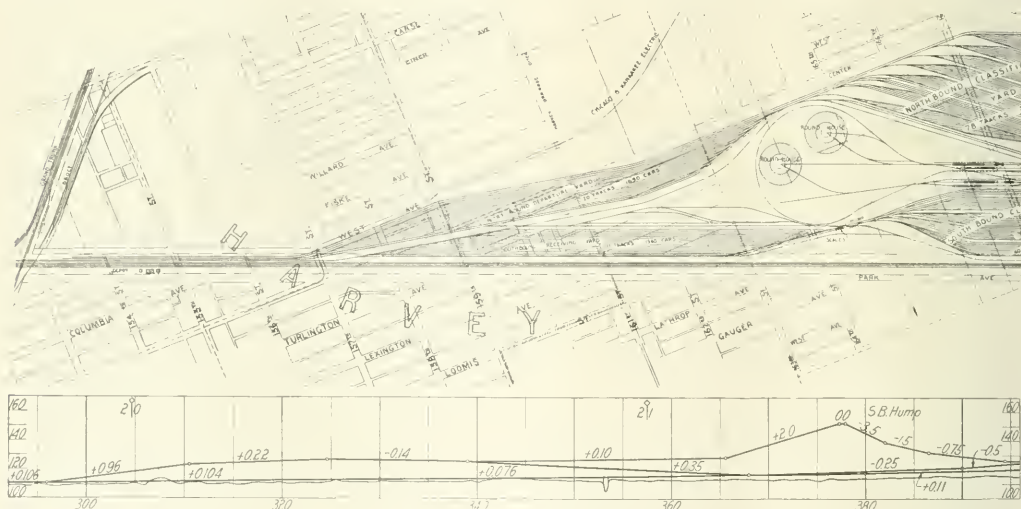

Two Large Railway Terminals Under Construction

Yards Being Built By the Illinois Central and the New Haven,
Will Embody a Number of Novel Features

TWO LARGE CLASSIFICATION YARDS, one under construction for several months and the other one recently authorized, offer an interesting opportunity for a comparison of railway facilities designed for heavy traffic conditions, but in which the physical conditions and traffic requirements are of a distinctly different character. The first of these terminals is the Cedar Hill yard of the New York, New Haven & Hartford, near New Haven, Conn.; the other is the proposed Markham yard of the Illinois Central, just south of Chicago. The first involves a complex, highly specialized arrangement to classify and dispose of cars entering and leaving over four different lines. The second embodies a relatively simple plan, although carried out on an

enormous scale, to handle the very heavy traffic entering and leaving Chicago via a single route, the main line of the Illinois Central to the south. In the one case, crossings of main arteries of traffic necessitated six grade separations; in the other movements of main traffic across one another are entirely avoided.

fer junctions in the Chicago switching territory, and the relation of the proposed location of the yard to the possible limits of a future electrified zone for the Chicago district. It is the intention that the new yard will serve as a terminal for all road trains on the main line to the south, and that all movements north of this terminal will be handled by transfer crews. This yard does not in any way affect the terminal facilities for the Illinois Central's line to Omaha, since the latter connects with the main line to the south only a short distance south of the South Water Street yard, the northern terminus of the railway. A yard is located on this western line about seven miles west of the city, where cars coming in over this line are classified for city distribution. Moreover, since the

North Half of the Markham Yard

enormous scale, to handle the very heavy traffic entering and leaving Chicago via a single route, the main line of the Illinois Central to the south. In the one case, crossings of main arteries of traffic necessitated six grade separations; in the other movements of main traffic across one another are entirely avoided.

The Illinois Central Yard

The Illinois Central yard will have a total capacity of over 13,000 cars and will be notable because of a north-bound classification yard which has 62 tracks of a total capacity of 2,931 cars served from a single hump. Located between Harvey, Ill., and Homewood, the center of the yard is about 21 miles from the South Water Street terminal of the Illinois Central, in the business center of Chicago. It was found desirable to place the yard at this distance from the city for several reasons, chief among which were the absence of available areas of adequate length further north, the impracticability of enlarging any of the road's existing yards, the desirability of locating the terminals south of all important trans-

bulk of the traffic interchanged between the Omaha and the Memphis-New Orleans line is handled via the north and south line between Freeport, Ill., and Centralia, the interchange between the two main lines at Chicago is relatively small.

This large improvement has been found necessary because of the great increase in the traffic entering and leaving the city from the south, which is rendering the existing yards of the Illinois Central inadequate. An idea of the growth of this traffic is to be obtained from the following table, showing the number of loaded cars arriving at the Chicago terminal from the south for the month of March in the years 1913, 1917 and 1918:

| | Number | Average per day |
|-------------------|--------|-----------------|
| March, 1913 | 17,897 | 577 |
| March, 1917 | 29,315 | 945 |
| March, 1918 | 33,899 | 1,093 |

At the site of this yard the main line of the Illinois Central now comprises four main tracks—two passenger tracks on the west and two freight tracks on the east. The proposed yard will occupy a large tract of land east of the

present right-of-way. By throwing the northbound freight track to the extreme east side of this tract and placing the new yard between this track and the existing southbound freight track, a layout is secured which can be operated without any cross-over movements. An examination of the profile shows that there is a rise of about 50 ft. from the north to the south in the three mile length of the site. As a consequence the grades are generally favorable to the northbound or loaded car movement. As laid out there is a 0.96 per cent grade into the southbound receiving yard, and a 1.0 per cent grade between the southbound classification yard and the departure yard, the grade through the latter being 0.55 per cent. The maximum grade opposing the northbound movement, with the exception of the hump grade, is 0.35 per cent. More advantageous grades might have been obtained if it had not been necessary to elevate the tracks to separate the grades from those of the streets of Hazelcrest, Homewood and Harvey, which cross the tracks in the three miles included within the limits of the yard. The grades ascending the humps are 2.0 per cent in both directions, but the descending grades

serving the two outside tracks on the east side of the classification yard.

Special Arrangement to Return Riders

Both classification yards of this terminal will be provided with special facilities for returning the riders to the humps. A similar plan is to be carried out in the New Haven yard. One or more tracks will be provided in the body of each yard for the use of motor cars to accommodate the riders. To avoid the ladder tracks radiating from the hump, these motor car tracks will enter subways in the vicinity of the hump, passing underneath the approach tracks and out to the side of the hump embankment, where the cars can be conveniently brought to a destination along the side of the summit. As a further convenience in the Illinois Central plan, midway of the length of the classification yards, small pedestrian subways are to be provided crosswise of the yard with entrances between tracks at convenient intervals and affording ready access to the motor car tracks. Thus it will be possible for the riders to reach the motor cars without hav-

South Half of the Markham Yard

of the southbound hump are 3.5, 1.5 and 0.75 per cent respectively, as against 3.0, 2.0 and 1.0 per cent on the northbound hump.

The Northbound Yard

The northbound yard consists of a receiving yard of 20 tracks, having a total capacity of 2,389 cars, a classification yard of 62 tracks, with a capacity of 2,921 cars, and a departure yard of 20 tracks with a space for 1,650 cars. The large number of tracks proposed for the classification yard are planned to permit necessary distribution of cars called for by the many different transfers and important industries served in the Chicago terminal district. In most cases one track is provided for each transfer, but the clearing yard and a few other especially large transfers are allotted more than one track each. One special part of this yard comprises a grid of 16 tracks holding 13 cars each on which trains are subdivided into cuts of cars destined for the various industries on the Illinois Central's line in the city, so that the transfer engines can make deliveries with the minimum switching. Another feature of the yard is an icing station

ing to climb over a great many cars standing on the yard tracks.

The Southbound Yard

The southbound yard has a receiving yard of 20 tracks with a capacity of 1,577 cars; a classification yard of 40 tracks, with space for 2,051 cars, and a departure yard of 20 tracks, with a capacity of 2,072 cars. The tracks in the southbound classification yard are relatively longer than those in the northbound yard, some of the tracks in the former accommodating over 70 cars. This greater length is desirable in the southbound yard on account of the classification of the large number of empty coal cars.

Transfer Station

Parallel to the southbound departure yard and with convenient connection with the southbound classification yard, the plan provides for a less-than-carload transfer station, where freight received in trap cars and from the different city stations may be consolidated for movement to destination. This station will consist of five platforms 700 ft. long with

tracks on either side, and with a supporting yard immediately to the south of equivalent track capacity, so that a rapid shift of the cars at the platforms may be made at meal times or other periods of the day when the men are not working on the platforms. The south end of the transfer yard is connected directly with the northbound receiving yard, so that any cars in the transfer for destination north may be re-handled over the northbound hump.

A repair yard of 21 tracks, holding 660 cars, with convenient connections with both humps, is provided between the two yards. To the north of the repair yard space is arranged for an engine terminal to serve both road and transfer engines.

The plan contemplates complete engine terminal facilities, including two roundhouses, a large coaling station, etc. For the purpose of turning engines without the necessity for using the turntables, a circle track is proposed, as shown on the map. This is intended primarily for the use of the transfer engines, which will be turned frequently without need of entering the roundhouses.

The project will involve the placing of about 6,000,000 cu. yd. of filling, which will be sand taken from a pit about two miles from the yard. As may be seen from the profile, a large part of the yard will be on fill varying from 2 to 15 ft. in height. The northbound hump requires a fill of 30 ft. and the southbound hump a fill of nearly 40 ft. The work contemplated for the present season includes the placing of about 2,000,000 cu. yd. of filling.

The street subways under the yard constitute a formidable feature of the work. There will be five subways for the city of Harvey, three of which are the full width of the street and two, 8 and 10 ft. wide respectively, for the use of pedestrians only. The one for One Hundred and Fifty-ninth street, 66 ft. by 125 ft. in section, will pass under 40 tracks. Several other subways are proposed for streets in the village of Homewood, but have not been definitely determined upon.

The New Haven Freight Terminal

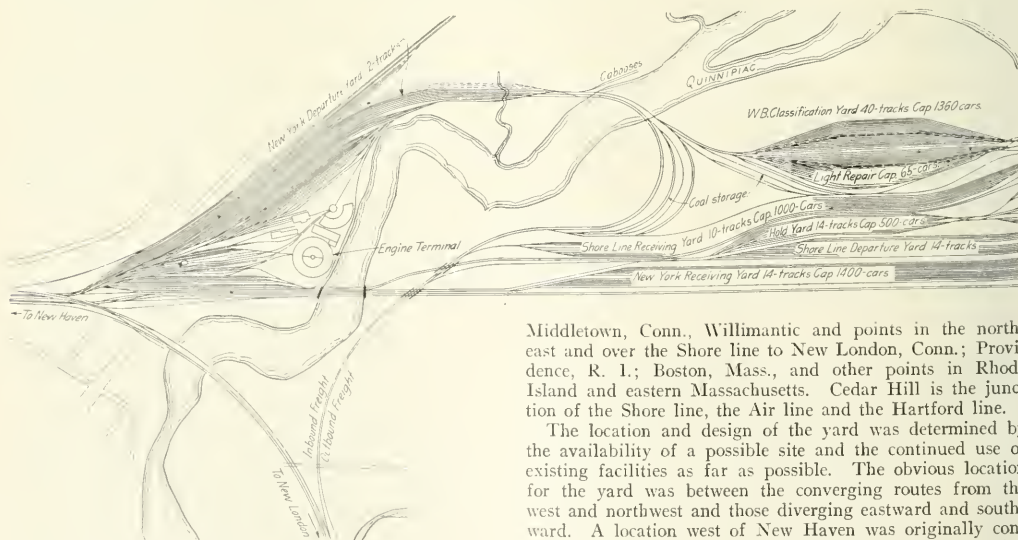

The New York, New Haven & Hartford Railroad is constructing a terminal and classification yard at Cedar Hill, New Haven, Conn., to relieve the congestion in existing yards and terminals caused by the unprecedented industrial development in New England since 1915, during which period business in many places has grown more than 100 per cent. It will furnish the facilities to receive trains from all routes converging at New Haven and the classification of the received cars into trains for their proper destination.

The terminal, including connections, is 6 miles long and $\frac{1}{2}$ mile wide. The present installation is to have a standing capacity of 6,500 cars, and when entirely complete the terminal will have a capacity for 11,000 cars. The project involves 2,836,000 cu. yd. of grading, consisting of sand and gravel, 23,000 cu. yd. of concrete, 2,000 piles for masonry supports, and 3,000 lin. ft. of single-track trestle for river crossings.

The 95 miles of track to be laid require 13,000 tons of rail and 460 switches. The work has been carried on since June, 1917, by railroad forces consisting of from 275 to 500 men, with mechanical equipment including 7 steam shovels, 2 Jordan spreaders, 120 air dump cars of 16 and 20-cu. yd. capacity, and 4 pile drivers. Thus far 525,000 cu. yd. of sand and gravel have been removed.

Handles Traffic of Several Routes

A location near New Haven was chosen for the yard site because of the relative importance of this city to the entire New Haven system. As shown in the map, important lines radiate from New Haven to New York; to the west over the Poughkeepsie bridge route; to the north via the Canal line to Holyoke, Mass., and Northampton; to Waterbury, Conn., and Winsted; via the Hartford line to Hartford, Conn., and Springfield, Mass.; via the Air Line to

Southwest Half of the Cedar Hill Yard

The terminal plan also contemplates interlocking plants, electric lighting, pneumatic tube systems for the despatching of way bills, automatic scales at the hump, and other modern facilities.

Middletown, Conn., Willimantic and points in the north-east and over the Shore line to New London, Conn.; Providence, R. I.; Boston, Mass., and other points in Rhode Island and eastern Massachusetts. Cedar Hill is the junction of the Shore line, the Air line and the Hartford line.

The location and design of the yard was determined by the availability of a possible site and the continued use of existing facilities as far as possible. The obvious location for the yard was between the converging routes from the west and northwest and those diverging eastward and southward. A location west of New Haven was originally considered, but was abandoned because of the rock excavation necessary as disclosed by tests, and other difficulties which made this location prohibitive. The site chosen for the yard is in the eastern portion of the city of New Haven and is partly on tide land and partly on uplands composed largely of sand. This provides excellent material for grading, and the contour of the site is such that the excavation and filling

balance. The course of the Quinnipiac river necessitated the location along the Air Line, with a connection at the northern end of the yard across to the Hartford division.

Arrangement Is Complex

The yard is of the hump type and consists of two main divisions, one for westbound traffic and the other for east

Relation of the Cedar Hill Yard to the New Haven Lines

and northbound traffic, each division embodying receiving, classification and departure yards. In addition, provision

Northeast Half of the Cedar Hill Yard

has been made for a receiving and a departure yard for the Shore line trains and an l. c. l. transfer station with a supporting yard by which it is served through the agency of a third hump. There will also be a coal storage yard, a material yard and engine terminal facilities.

The westbound division consists of a southbound receiving yard of 12 tracks with a capacity for 1,200 cars, a classification yard of 40 tracks having capacity for 1,360 cars, and a westbound departure yard of 12 tracks with capacity for 960 cars. The arrangement for the north and eastbound divisions is similar to the westbound division and consists of a receiving yard of 12 tracks, with capacity for 1,400 cars, a classification yard of 40 tracks having a capacity for 1,350 cars, and a northbound departure yard of 12 tracks with capacity for 1,200 cars. The Shore line receiving yard consists of 10 tracks with capacity for 1,000 cars. A connection is provided from this yard to both the westbound

and the north and eastbound classification yard. The north end of the Shore line departure yard, which consists of 16 tracks, with capacity for 1,600 cars, is located in close proximity to the lower end of the eastbound classification yard, and the north end of the Shore line receiving yard adjoins the hump end of the westbound classification yard. With this arrangement the deadhead mileage of road power and yard power is minimized. Instead of making the light going or returning movement, as is customary in the usual hump yard, the light movements of the road engines are reduced, while yard engines will handle cars in both directions. The yard movements of power to and from trains is, within limits, comparatively close to the engine terminals. The Shore line departure yard will have both east and westbound connections at the southerly end, which will permit it to be used by through trains not requiring classification, but which require change of power, cabooses, inspection and possibly icing. Tracks for light repairs will adjoin each classification yard.

Speeder or motor car tracks for car riders will be provided between each pair of leads in each of the classifica-

tion yards. As in the Illinois Central yard, these tracks will pass under the tracks at the throat of the yard below the hump and extend along the hump, terminating beyond it, opposite the point where the car riders take the cut-off cars they are to handle.

The relative location of the new yard and the tracks of the Shore line make it necessary for the heavy traffic of the Shore line to enter and leave the yard at the same time, making special arrangements and design necessary. It was necessary to provide for the separation of grades at several points as well as a re-routing of the northbound passenger trains to Hartford and Springfield around the east side of the yard, instead of west of it, as previously. At Air Line junction the westbound Shore line passenger trains will be carried overhead. At a point about one mile further east the westbound Shore line main will be carried beneath the eastbound freight connection from the yard. Both of the

Shore line freight connections, inbound and outbound, will pass over the Air line, the northbound passenger main to Hartford and the freight tracks over which traffic is received from the Harlem river and Poughkeepsie bridge routes.

The north-bound passenger main to Hartford will pass under the Air line, the material yard and other connections near the north end of the yard.

Special Facilities

The transfer station for less-than-carload freight, with its supporting yard, is located approximately in the center of the yard. This will be convenient for the receipt of such cars from the various routes and for the delivery of northbound cars to the various points from which the trains will depart.

On the completion of the yard, traffic from and to Plainville and the north on the Canal line to Holyoke and Northampton and other points will be routed into the new yard via New Britain and Berlin. At the same time through traffic via the Poughkeepsie bridge, heretofore handled over the pusher grades at Sandy Hook and Terryville, via Plainville, and for points east and north, will be routed over the low grade line through the Cedar Hill yard.

The New York-Maybrook departure yard is already electrified to the extent necessary for motors to reach and handle outbound trains. The electrification will be extended to include three or four tracks in the Shore Line departure yard.

The improvement includes a second turntable 95 ft. in length and an additional roundhouse of 18 stalls. Later additional facilities will be provided for the inspection and care of electrical power. These involve a small shop, inspection pits and pantograph inspection platforms.

The Illinois Central yard is being designed and will be constructed under the direction of A. S. Baldwin, chief engineer, and F. L. Thompson, assistant chief engineer. The New Haven yard was designed under the direction of Edward Gagel, chief engineer, who also exercises general supervision over the construction. The prosecution of the work is under the immediate direction of I. D. Waterman, construction engineer.

Railroad Administration

Organizes to Stop Thefts

THE LOSSES OF ONE WESTERN RAILROAD resulting from thefts totaled over twice as much in 1917 as in the previous year. This marked increase was due in part to advances in prices of the materials stolen and to increased traffic, but also in considerable measure to increased lawlessness on the part of employees and the public alike. This growing disrespect for law and order seems to be a manifestation of the unrest and callousness which is generally a concomitant of war. The problem of suppressing this anti-social spirit, which is equally acute on all railroads of the country, has been undertaken by Philip J. Doherty, recently appointed manager of the Property Protection Section of the Division of Law of the Railroad Administration.

Mr. Doherty is unifying the detective forces of all the carriers for the purpose of securing the highest degree of co-operation among them in combating the pilferage evil. He has already appointed T. T. Keliher, chief special agent of the Illinois Central, and R. S. Mitchell, chief special agent of the Missouri Pacific, as his local representatives in the Chicago and St. Louis districts, and will no doubt appoint other men to represent him in the remaining important railway centers. In addition, he will have a corps of secret service agents and attorneys reporting directly to him, who

will assist the staffs of individual lines and check their work.

Section XI of the Railroad Control bill will prove a most effective aid to the Property Protection Section, as it is by far the strongest legislative enactment so far passed to prevent the theft of railroad property. It provides a maximum penalty upon conviction of ten years' imprisonment or a \$5,000 fine, or both, and not only designates theft as a crime, but also tampering with or knowingly impeding the operation, use or possession of railroad property.

Prosecutions for violations of this section of the Railroad Control act will all be in the district courts of the United States under the direction of the attorney-general. The first conviction under the new law was recently secured in Chicago in the court presided over by Judge Kenesaw M. Landis.

This case was disposed of with despatch and forecasts expedited prosecutions of other cases which may come up under the Railroad Control act in the future. On February 2, Dante Cecchetto and Herman A. Heyne were arrested for stealing \$150 worth of copper wire from the Illinois Central in Chicago. On March 29 the men were indicted, and on April 5 were convicted, fined \$1,000 apiece and sentenced to three years in the Federal penitentiary at Leavenworth, Kan.

There are two classes of thieves on the railways, i. e., those who work individually and take property in small lots, and those who carry on their activities in well-organized groups. The latter class is more common in the large railway centers, where the chance of detection is smaller and the disposition of stolen goods easier. Sometimes the entire contents of a car are hauled away in trucks and wagons by these gangs. These organizations often have confederates among the railroad employees, thereby rendering it more difficult to trace them. A recent case of bootlegging discovered on a middle western line indicates the extent to which railroad employees are sometimes involved in these conspiracies. Through the connivance of train crews and yard men regular shipments of liquor were made from a wet state into dry territory, where they were disposed of at great profit to all concerned. As all the railroad employees who handled the cars participated in this traffic, no record of the car movements reached higher railroad officers, and as a result the practice continued for some time before it was detected.

The proportions of the theft problem may be gathered from a recent statement in the press by G. S. Ward, chief special agent of the Wabash, who estimates that \$35,000 worth of freight is stolen from the railroads in the St. Louis switching district every month. The property taken is usually such as will gain a ready sale, such as cigars, shoes, clothing and hardware. Journal brasses are also stolen in large quantities. These are removed from freight cars by the use of hydraulic jacks or other means of raising the body of the car from the truck. As the price of brass is exceptionally high, thieves find it very profitable to sell their stolen goods to junk men. In the past it has been almost impossible to prosecute this class of thieves because of the difficulty in proving the road to which the stolen brasses belonged. In the future, however, under the provisions of the Railroad Control act, it will only be necessary to prove that a brass was stolen from a railroad car and the federal authorities will do the rest.

In Chicago the unification of the secret service work of the railroads has led to the organization of a committee which will give special attention to the apprehension of thieves in the Chicago switching district. T. E. Pratt, chief special agent of the Chicago, Burlington & Quincy, is chairman of this committee, and the other members are H. H. Germain and William Briggs, of the Chicago, Rock Island & Pacific and Pennsylvania Lines, respectively.

Government Car and Locomotive Orders

Distribution of the Orders with a Discussion of the Prices, Specialties and Policies

THE UNITED STATES RAILROAD ADMINISTRATION has announced the placing of orders for 100,000 freight cars, to be built to its standard specifications, including 50,000 box cars, and 50,000 hopper and gondola coal cars, divided between 17 car building companies, and 1,025 locomotives also of its standard types, 555 from the American Locomotive Company and 470 from the Baldwin Locomotive Company.

The total cost of the cars is placed at from \$250,000,000 to \$300,000,000 and of the locomotives at approximately \$60,000,000, although the specialties have not yet been awarded and the final detailed contracts have not yet been executed. It is understood that 145 additional locomotives are to be awarded to the American Locomotive Company, and 30 to the Baldwin Locomotive Works, in about 60 days, and that approximately 1,000 additional locomotives and about 100,000 additional cars are to be ordered in about six months.

The first order for cars, 30,000 to the American Car & Foundry Company, was announced on April 25, and announcement of the allotment of orders for 70,000 additional cars was made on May 2. The locomotive orders were announced on April 30. A partial list, incorrect in some particulars, was published in last week's issue. It is now possible to give the complete list, with the division of both the cars and the locomotives by types and by companies, although there may be some modifications in the number and types of cars apportioned before the detail contracts are executed.

Cars

The total order includes cars of five types as shown in the following list:

| | | |
|---------|--------|---------------------|
| 35,000 | 40-ton | double sheathed box |
| 25,000 | 50-ton | single sheathed box |
| 10,000 | 50-ton | composite gondola |
| 5,000 | 70-ton | low side gondola |
| 5,000 | 55-ton | hopper |
| 100,000 | | |

The distribution of the order by companies and types is as follows:

| | | | |
|----------------------------------|---------|--------|---------------------|
| American Car & Foundry Co. | 9,000 | 40-ton | double sheathed box |
| | 9,000 | 50-ton | single sheathed box |
| | 2,000 | 50-ton | composite gondola |
| | 6,000 | 55-ton | hopper |
| Pittsburgh Steel Car Co. | 6,500 | 50-ton | composite gondola |
| | 5,000 | 55-ton | hopper |
| | 2,500 | 70-ton | low side gondola |
| Standard Steel Car Co. | 2,000 | 40-ton | double sheathed box |
| | 3,500 | 50-ton | composite gondola |
| | 3,000 | 55-ton | hopper |
| | 2,000 | 70-ton | low side gondola |
| Pittsburgh Car | 6,000 | 50-ton | single sheathed box |
| | 3,000 | 55-ton | hopper |
| Haskell & Barker Car Co. | 6,000 | 50-ton | single sheathed box |
| | 2,000 | 50-ton | composite gondola |
| | 2,000 | 55-ton | hopper |
| Ruston Steel Car Co. | 2,000 | 50-ton | composite gondola |
| Camden Steel Co. | 2,000 | 55-ton | hopper |
| Mingo Car Corporation | 2,000 | 50-ton | composite gondola |
| St. Louis Car Co. | 1,000 | 50-ton | single sheathed box |
| Mt. Vernon Car Co. | 4,000 | 40-ton | double sheathed box |
| Pacific Car & Foundry Co. | 3,000 | 40-ton | double sheathed box |
| Liberty Car & Equipment Co. | 3,000 | 40-ton | double sheathed box |
| Kent Car Mfg. Co. | 1,000 | 40-ton | double sheathed box |
| Lacoma Car Co. | 1,000 | 40-ton | double sheathed box |
| Bettendorf Co. | 3,000 | 50-ton | single sheathed box |
| Leroux Car Works | 2,000 | 40-ton | double sheathed box |
| Barney & Smith Car Co. (pending) | 1,000 | 40-ton | double sheathed box |
| Total | 100,000 | | |

Locomotives

The locomotive order was divided, 555 to the American Locomotive Company and 470 to the Baldwin Locomotive Works as follows:

| American | Baldwin | Types |
|----------|---------|-----------------------|
| 247 | 183 | Light Atlantic |
| 70 | 30 | Heavy Atlantic |
| 30 | 11 | Light Mountain |
| 1 | 2 | Heavy Mountain |
| 40 | 20 | Light Pacific |
| 10 | 10 | Heavy Pacific |
| 5 | 10 | Light 210 2 |
| 80 | 30 | Six wheel switching |
| 75 | 77 | Eight wheel switching |
| 15 | 15 | 2-6-2 Miller |
| 1 | 1 | 2-8-2 Miller |

The division of types given in last week's *Railway Age*, whereby the American Locomotive Company's 555 locomotives included only six types, was afterwards changed to the above.

This order for 1,025 locomotives will be increased probably before July 1 to 1,200, the American Locomotive Company being given 145 more locomotives to make 700 locomotives, and the Baldwin Locomotive Works 30 more, to make 500.

Prices

The car orders were all placed upon the basis of the minimum bids as to costs for labor and materials with the understanding that any reduction in costs which may be obtained from these fixed prices will be divided equally between the Railroad Administration and the car builders, but any increase in these costs will be borne exclusively by the builders. The government will have supervision or control as to the prices of the materials required in construction and in cases where the government has fixed prices these will be the maxima, but an effort is to be made to secure steel and other materials at prices below those previously fixed. In this case the builders will have an opportunity to share in the saving.

The compensation of the builders in the case of both cars and locomotives will be approximately 5 per cent on the cost, as estimated on the minimum bid. The contracts with the locomotive builders provide that the government guarantee the cost of material and that if any saving is made on the estimates other than that on the material, that it be divided equally between the government and the builders.

In the case of the locomotives, the announcement stated that deliveries are to begin in July and continue monthly during the remainder of the year, and in the case of the cars that it is hoped that the entire order will be completed in time for the fall and winter business of the railroads.

The general specifications and dimensions of eight types of freight cars as designed by the administration's car committees were published in the *Railway Age* of March 29, and the general drawings were published the following week. In the issue of April 12 the designs for an all-steel box car were published. After negotiations with the War Industries Board it was found necessary to curtail the steel requirements of the car program to a considerable extent because of the needs of the Army, Navy and Shipping Board, and the cars ordered are of five types. While both a 40-ton and a 50-ton steel frame single sheathed box car were designed, the orders are for the 50-ton type. The 50-ton steel gondola,

the 70-ton hopper car and the all-steel box car have not been ordered, and it was necessary to make some changes in the design of the 55-ton hopper car to use wooden sides and ends. Some additional minor changes in the designs have since been made and designs for flat, stock and refrigerator cars are still under consideration.

The tentative specifications and dimensions of the locomotives were published in the issue of April 19. These have been undergoing some final changes and are expected to be completed by the latter part of this week.

The question of specialties has been under consideration for several weeks. The manufacturers of locomotive specialties were called into conference with the Central Advisory Purchasing Committee on April 1, and were requested to submit bids by April 29. The bids on car specialties were to be in by May 4, but in both cases some additional time was allowed.

The Railroad Administration's mechanical committee held meetings last week to determine the specialties to be used, but announcement will not be made until the contracts are awarded. The question of specialties was to be considered at a joint meeting of the mechanical committee and the Central Advisory Purchasing Committee this week. The prices for the cars, according to the announcement from the office of the director general, average between \$2,500 and \$3,000 apiece. These include an arbitrary figure for the specialties and the final price will depend on the actual cost of the specialties and labor and materials. The cost of the locomotives averages a little less than \$60,000, and it is understood ranges from about \$35,000 for the light switching engines to about \$90,000 for the heavy Mallet.

The statement given out regarding the locomotive order says: "The contracts were awarded on terms much more favorable to the railroads than the bids originally submitted by the builders." The terms for both the cars and the engines were the subject of protracted negotiations between John Skelton Williams, director of the division of finance and purchases, and the builders. It is understood that the car builders originally asked for cost plus 10 to 12 per cent, and that the locomotive builders originally asked 15 per cent. But they were required to submit their costs in detail, together with information as to their capitalization, previous profits, etc., and it was made evident that the Railroad Administration intended to drive a closer bargain than many departments of the government have.

The American Car & Foundry Company finally accepted approximately the terms proposed by Mr. Williams, and actually itself made the proposition which was adopted as the basis for the contracts. The other car building companies had to agree to accept the same terms to get orders. There has been much criticism in the railway supply field both of the government for using its monopoly power as the only purchaser of cars in the market to force down prices, and of the car company for accepting such terms. The American Car & Foundry Company has large orders from other departments of the government, on which it is understood to be receiving a much higher rate of profit, but had some untaken space that it could devote to cars. One company having accepted the low terms, it was manifest that others that refused to would not receive orders.

Specialties

A similar policy has been followed as to the specialties. When the manufacturers were asked to submit bids it was suggested that they forego royalties on patents and pool their patents so that several companies could manufacture the same device at the same time. While there has been no definite announcement of policy on the part of the Railroad Administration, it has asked the manufacturers in submitting their costs to itemize their royalties, and while there has been a great deal of opposition manifested to the idea

on the part of the supply manufacturers some for various reasons have offered to waive royalties.

Meetings with various groups of manufacturers are being held this week by committees representing the purchasing department of the administration at which an effort is being made to break down the iron and steel prices previously fixed by agreement by the War Industries Board and the Iron and Steel Institute, which in many instances represented considerable reductions under the prices which had previously prevailed. One difficulty about the plan is that the manufacturers of railway materials and supplies will have to compete for labor in many cases with neighboring industries handling other government contracts on the basis of 10 per cent profit on whatever the cost happens to be.

The attempt which is being made by John Skelton Williams, director of purchases of the Railroad Administration, to break down the government prices on iron and steel may lead to some very interesting developments. The existing iron and steel prices were fixed by President Wilson, effective on January 1, 1918, through his approval of an agreement reached by the government's War Industries Board, on the one side, and a committee representing the American Iron and Steel Institute, on the other hand. The agreement was reached in December and fixed prices on plate, shapes and bars which were based on the previous prices prevalent in the five pre-war years 1910-15, multiplied by certain differentials, which gave prices of \$2.90 per 100 lb. for steel bars, \$3 per 100 lb. for shapes and \$3.25 per 100 lb. for plates. By the terms of this agreement it was stipulated that there should be no reduction in the prevalent rate of wages in the industry. Subsequently the manufacturers of side frames, bolsters, couplers and similar articles, submitted to the Iron and Steel Institute a scale of prices which involved a reduction of 15 per cent from the prices in effect during the last quarter of 1917. Later, prices for malleable iron, springs, brake beams, etc., were submitted and verbally approved, though they have not been published. The iron and steel prices fixed have been mentioned in the published statements as "maximum" prices, but actually have been used as both minimum and maximum prices, and millions of dollars' worth of iron and steel products have been sold to the railway companies and other industries on the basis of these prices.

The contention of the Railroad Administration is that the iron and steel prices accepted by the War Industries Board are maximum, but not minimum prices, and that the railways should be sold iron and steel commodities at prices below the maximum. The railway specialty people point out, as already indicated, that millions of dollars' worth of commodities have been sold on the basis of these prices, that they have not been treated merely as maximum prices, and that since they were fixed there have been substantial increases in the wages of labor. One point which is urged with great force is that if the Railroad Administration succeeds in forcing down the government prices other government departments and commercial concerns will be left in the position of paying higher prices, that other government departments and commercial concerns will probably try to get the railroad prices and that the result will be to destroy the entire fabric of government iron and steel prices. Because of fear of this result the policy of the purchasing department of the Railroad Administration is arousing much antagonism among iron and steel manufacturers. It seems not improbable that the question of iron and steel prices to the railroads will get up to the War Industries Board and even to President Wilson before it is settled, as was the case with the question of prices of coal for the railroads.

Standardization Policies

The placing of the car and locomotive orders gives some additional indications of the government's policies as to

standardization. The statement issued regarding the locomotives says:

"The six standard types of locomotives, two sizes of each class, are expected eventually to supersede the many miscellaneous types and varieties of locomotives now in service, embracing engines built according to 500 or more varying specifications. This is the first time that any real forward step has been taken looking to the wide standardization of locomotive engines."

The announcement of the car orders also include the following:

"The five types of cars represent the standard forms of freight cars adopted by the Railroad Administration. These standards are the result of the labors of a committee of experts who for weeks past have been working upon the problem. The adoption of these standard types, it is believed, will eventually substitute a few scientifically worked out designs for the numerous miscellaneous varieties of cars, representing probably more than a thousand different old styles and specifications now in use, the accumulations of the past."

We have here a definite announcement that the standard types of car and locomotives are expected to represent a nucleus for eventually standardizing the entire motive power and car equipment of the railroads. They have not been adopted for the purpose of saving time in the placing of the car orders, for other orders for cars have been prohibited pending the adoption of the standard designs, and the fact that the five heavy Mountain type locomotives will be divided between the two companies, whereas they naturally could be turned out more quickly and at less expense if awarded to one company, indicates that they are expected to be the foundation for future similar orders to both companies.

While it is not expected that the six types (twelve designs) of locomotives and the five types of cars will meet all of the requirements in the way of varying conditions, it is understood that they have been selected as the types that will meet the greatest number of conditions, and will meet the most pressing demands. It is stated that the engines "will be allotted, upon completion, to the various railroad systems where they are most needed," that they will be lettered "U. S." and will remain the property of the government during its control of the roads. While the various railroads had been asked to signify how many of the standard locomotives they desired, they were given no opportunity to order any other kind, and they have filed their various requests for the number they desired to have allotted to them.

It is no secret that there has been a considerable difference of opinion in the Railroad Administration as to the extent to which the locomotive standards should be adhered to. Certain of the officers who have had to deal with the question have insisted on rigid standardization, while others have insisted that roads having special requirements should be allowed to order engines of their own designs. The memorandum recently addressed to the roads, in which it was stated that a road having unusual or unique situations to be met might make representation to the director general as to its individual necessity for a departure from the standard types, indicates a compromise between the two views. It has been stated that while it has never been expected that the types of locomotive adopted would serve all requirements, and that further variations would not be required, the intention is to make the more special types conform as closely as possible to those already ordered, using as many as possible of the standard parts. The requests for bids for specialties stated that no bid would be considered unless the device offered was interchangeable in its application with similar devices offered by other manufacturers, so that if various types of specialties are ordered a road may use the types it has on hand to replace others on any of the standard locomotives.

The list of car orders shows that the cars have been well distributed among the available plants, which will not only give each company a share of the business, but will probably insure more rapid delivery of a large number of cars than if the orders were placed with fewer companies. The distribution of the orders geographically will also simplify the distribution of the materials and avoid cross hauling. The Canadian Car & Foundry Company made strong efforts to secure a part of the orders, and at one time it was understood to have been awarded 7,500 cars, but the American companies opposed this, and the cars were later distributed to other companies. If later orders are found to take the capacity of the plants in this country the Canadian company will probably be considered.

The Railroad Revolution*

By W. G. McAdoo,

Director General of Railroads.

WITHIN THE LAST FOUR MONTHS we have gone through a tremendous revolution in this country, so far as the railroads are concerned. By one stroke of the pen, the President of the United States has transformed all these railroad systems, these separate, competitive systems, into one great unified transportation system for the purpose of making it certain that we, with the aid of our gallant soldiers and sailors, shall finish the military despotism of the Kaiser, and restore peace and liberty to a distracted world.

It is not only our soldiers and our sailors who are going to hand something to the Kaiser, but we railroad men are going to hand him something before we get through. We have it up our sleeves for him. He does not know it yet, but he will find it out before this war is ended.

The railroads of the United States have for a long time been the football of finance, of politics, and of all sorts of things. I am frank to say that I think it has been very hurtful to the country. I do not mean to reflect upon public bodies or officers or employees of railroads. I am not criticizing; I am only speaking of facts. The things that have happened back of us are of no consequence except in so far as they teach us useful lessons for the future. So long as the railroads of the United States were used primarily for private and selfish ends, so long as they were made a political question, the difficulties of reconciling contending and competitive interests with the public interest have been insuperable. Railroads have been controlled too much in times past by the financial powers of the country, and there again I speak in no critical sense. I speak of it only because I want you to understand the conditions and what it is that we must do in the future to handle the railroads wisely. We must learn useful lessons of the past and apply them in the way that will best serve the vital interests of America.

The old private control has been abolished. We have a competitive system of railroads in the United States no longer. When I look at a locomotive or a freight or passenger car passing me, I do not care what name is painted on it—I can not see it. The only thing I can see on them is "U. S." I see those great machines going by, pulsating with life and energy, representing the majesty of America with Uncle Sam's engineers and firemen in the box and Uncle Sam's freight men and trainmen in control, and I see Uncle Sam's officers, train masters, train dispatchers, clerks, yardmen, and trackmen and everybody else in the railroad service of the United States on duty and keeled up with a desire to make themselves of the greatest service

*Extracts from an address to railroad employees at El Paso, Tex., April 7, 1918.

to the country in this hour of national peril. When I see these things it makes me very proud of you railroad men and very eager to be able to measure up to the great responsibilities that have been put upon me, to help you men do this great job for our beloved country. I doubt my own fitness and capacity, but as the President has chosen me for this service, like a good soldier I have responded, determined to do and to give the very best that is in me. Because I do not know it all, I want to learn all I can, and I know that I can not do this great job unless I have the loyal support and co-operation of the real soldiers of the railroads, because you, my friends, are soldiers in the ranks. You are soldiers of liberty. You are fighters for freedom. You and your officers are those upon whom I must rely if my services in this great railroad enterprise, this unified government control, are to be worth anything to the country or to you.

The railroads must function to the highest degree. Do you realize that we can not send our men across the high seas and protect them there, give them a chance to fight for their lives and for our safety, if the railroads do not function—not 50 or 60 or 90 per cent, not even 100 per cent, gentlemen, but 150 per cent, if necessary. If we make the railroads function even 150 per cent, is that comparable to the sacrifices that an American soldier makes upon the bloody battle field when he gives his life for us, or is maimed for life while fighting for us? By contrast, my friends, there is nothing we can do here that can compare with the sacrifices that our sons must make for us before the world is free again.

So I want to beg every railroad man—not only the officers, but the employees as well—to rededicate themselves to the service of their country. You are no longer the employees of any private railroad or corporation. You are employees of Uncle Sam. We are all enlisted in this one great service as fellow soldiers in the legion of liberty. If we pull together, if we do our work to the limit, if we spare ourselves in no way to accomplish the results, we shall certainly get them; there will not be an American soldier in Europe who will suffer because the railroads have not done their full part.

One thing we must all learn is this—that the old conditions have disappeared. We are all serving a common master—we are serving Uncle Sam. We are partners in a great and glorious enterprise. We must not encourage suspicion of each other. We must co-operate with each other. We must devote ourselves whole-heartedly to our work. We must respect our superior officers as we expect our superior officers to respect us. We must go forward with an unalterable determination that the rule of individual action must now be one thing and one thing only—an unselfish and unrelenting

love of country—a pure and undefiled Americanism above everything else.

I have to speak judiciously about the question of wage increases for the moment, because, having selected a commission to investigate the subject, I must let the commission complete its investigations and make its recommendations before I take action. But when the report comes in, I shall make a decision as promptly as I can after I have read the report. I am as anxious as you are to get these questions back of us. Perhaps I may be inadvertently a benefactor of all the men and their wives who are involved in this problem, because if an increase is granted, the full amount will have been saved for them, and can be invested in Liberty bonds. You will not have spent the increase in the meantime. Sometimes enforced saving is a mighty good thing. I wish Uncle Sam would hold back some of my pay and enforce savings upon me, if I could stand it. But Uncle Sam does not give me, as you know, any pay whatever for running the railroads of the United States. I am serving as Director General of Railroads without a cent of compensation, but I am delighted to serve for nothing if thereby I can be of the least value to my country.

But I do not want you men to serve for nothing, and I do not want you to be inadequately paid or unjustly treated. Railroad men have been cuffed about the country a great deal during the last few years, when there has been so much prejudice against the railroads, and the public attitude toward railroad managements as well as toward railroad employees has not been sympathetic, to say the least. Now we are all servants of the people of the United States, and I am sure that the public attitude is going to be different. It rests with us to make it different. We can earn the respect, sympathy and good will of the public by giving it a square deal, as we want the public to give us a square deal. You railroad men are all my boys now, and so long as you do your duty I do not intend to let anybody kick you around. You will find that I will defend you to the limit of my power as long as you are right, and I know that you will not expect me to defend you if you are wrong, because I won't. I am sure, however, that you will not be wrong, because we have a new inspiration to service now—to serve our great and glorious country in this desperate war between our democratic ideals and the repulsive ideals of the German military autocracy. We are, therefore, serving no private interests but our own interest, so long as the government controls the railroads, and we can go forward shoulder to shoulder, as patriotic and loyal citizens, determined to do our best, and in doing our best to serve ourselves as well as to serve our country. I want to express my appreciation to the railroad men of the United States for the subscriptions they have made heretofore to Liberty bonds.

Director General Returns to Washington Where Many Important Affairs Await His Attention

DIRECTOR GENERAL McADOO returned to Washington on May 7 after an absence of nearly a month on his tour of the country making Liberty Loan speeches and a brief period of rest at White Sulphur Springs. There were many important matters awaiting his attention or decision, which had been developed by his staff during his absence, but an attack of tonsillitis compelled him to remain at his home for a few days.

One of the important matters which was expected to be decided soon after his return was the report of the Railroad Wage Commission. This has now been completed, or practically so, and a copy was taken to him to look over at White Sulphur Springs for his decision. It is understood, however, that the report is not yet entirely ready to be given out but it is known in a general way that it will recommend increases in wages for practically all classes of railway employees which will amount to several hundred million dollars a year.

Another matter which is practically ready for his approval is the contract with the express companies, which are to be merged into a single company and make a contract with the Railroad Administration for handling the express traffic on the basis of an approximately equal division of earnings. The negotiations have been carried on by the representatives of the express companies and the Division of Public Service and Accounts.

The question of what prices the railroads are to pay for coal, whether the standard government price or a lower price, is also expected to be settled as soon as Mr. McAdoo can be consulted. This has been the subject of a controversy between John Skelton Williams, director of finance and purchases, who insisted on the railroads being allowed to make contracts at a lower price than other consumers, and the Fuel Administration, which has insisted on the regular price. The question was referred to President Wilson. Involved with it is also the question of car distribution. It is reported that the President has approved a plan by which mines furnishing railroad fuel coal will no longer receive preference in car supply, but that the cars will be distributed ratably to all mines and the Fuel Administration will regulate the distribution of the coal. It is expected that Mr. Williams' efforts to break the other government standard prices on raw materials will also be taken up with Mr. McAdoo and possibly with the President.

Rates to Be Increased

Increases in freight and passenger rates are also expected to be taken up by the director general shortly. It is understood that the preliminary work looking to increased rates is now being done by the Division of Traffic and that the amount of the increases to be proposed will depend to some extent upon the amount of the wage increases to be made.

The preliminary reports issued by the Interstate Commerce Commission of earnings and expenses for the first three months of the year show alarming decreases in operating income even without the effect of the wage increase, which is to be retroactive from January 1.

Standardization of passenger fares, and possibly to some extent of freight rates, is to play a considerable part in the move for higher rates. Rate clerks from roads in all parts of the country are at work in Washington on the compilation of a national mileage table, showing the distances be-

tween all points, which it is understood is to be made the basis for a mileage system of fares and will obviate to a large extent the necessity for rate clerks and complicated tariffs because fares will be based largely on mileage, although equalized to a certain extent between common points. The basic rate of fare has not yet been determined, although there have been reports that it would be a minimum of three cents a mile.

Although the complete reports of earnings and expenses have not yet been issued for any month of this year, it is becoming well understood that without large rate increases the Administration is facing a large deficit and the proposed rate increase when announced is expected to make the increases formerly asked by the railroad companies, which have aroused such protracted and bitter controversies, seem rather insignificant in contrast.

The director general is expected also to interest himself in the negotiations regarding the standard form of contract governing the compensation of the railroad companies, which have been conducted by committees representing the companies and the Administration. The conferences on this subject have been protracted and although it is understood that the two sides are gradually approaching an agreement it is said to be possible that the presence of the director general may serve to expedite matters.

Consolidated Ticket Office at Washington

The United States Railroad Administration's consolidated ticket office at Washington, which in some respects is a model for the centralized ticket offices to be established throughout the United States, was opened on Monday, May 6. The office is centrally located at the corner of Thirteenth and F streets and replaces nine offices formerly maintained by the individual railroads. The general plans for the Washington ticket office were worked out by a committee of passenger officers appointed by the Railroad Administration, consisting of H. F. Cary, general passenger agent of the Southern; J. P. Anderson, passenger traffic manager of the Pennsylvania; and W. B. Calloway, passenger traffic manager of the Baltimore & Ohio.

The Washington office consists of a long, rather narrow room with a broad ticket counter about 80 feet in length running nearly the full length. Behind the counter are two large ticket cases, each of which carries a full set of ticket forms which can be used to reach any point in the United States, Canada or Mexico and Cuba. Sixteen ticket sellers are on duty and each one is expected to be able to handle ticket sales to any point and to complete the entire transaction, including the selling of Pullman accommodations and making arrangements for the transfer of baggage.

A special feature, which is to be used also in other offices is a new method of handling Pullman reservations. All Pullman diagrams are centralized at the ticket office in the Union Station and a private telephone system consisting of 22 direct lines has been installed between the ticket office and the station so that each ticket seller is able simply by lifting the receiver of his telephone to secure the attention of the diagram office, obtain the information desired and reserve space. The telephone calls do not pass through an exchange and the ticket clerk can talk to the Union Station office and fill out his ticket blanks more easily than he could look up a diagram in his own office. The fact that the ticket clerks sell both passage and Pullman tickets

avoids the necessity of passengers having to stand in line twice.

While a considerable saving in rentals was made by the discontinuance of the separate offices and the centralization in one office, the entire ticket selling force of the separate offices was taken over and in some cases salaries were increased. The office has been rather crowded thus far since it was opened, but it is expected that customers can be accommodated more rapidly as soon as the clerks become more accustomed to selling to all points. For example, the first ticket was sold by a man formerly in the Baltimore & Ohio office to an obscure point on the Southern Railway, while the second was sold by a Southern Railway man to a point in North Dakota. The clerks were naturally less familiar with the consolidated ticket stock than with the stocks they had been used to handling.

In the Washington office, as in each of the other consolidated ticket offices, a man is stationed to answer inquiries regarding freight transactions. While he is not equipped to quote rates or to issue bills of lading, he is expected to furnish general information desired by the public and if necessary to refer inquirers to the proper office of an individual road.

In the basement is a well equipped locker room for employees and here are also kept reserve ticket stocks, etc.

Tickets to Be Standardized

A ticket standardization committee appointed by the division of traffic of the Railroad Administration has been at work in Washington for the last week or so on plans for simplifying ticket contracts and ticket forms. It is probable that the work of the committee will also result in interchangeable tickets similar to that already adopted for use between Chicago and St. Louis, which will be good for passage over any route between the points named. The committee consists of O. P. McCarthy, formerly passenger traffic manager of the Baltimore & Ohio, chairman; C. A. Fox, secretary of the Central Passenger Association, secretary; J. D. Rehner, general passenger agent of the Florida East Coast, and J. V. Lanigan, assistant general passenger agent of the Illinois Central, representing the southeastern roads; W. J. Cannon, assistant general passenger agent of the Chicago, Milwaukee & St. Paul, and F. E. Batturs, general passenger agent of the Southern Pacific, representing the western roads, and W. L. Pratt, chairman of the New England Passenger Association, who, with Mr. McCarthy, represents the eastern roads.

Handling of Live Stock

The Car Service Section has issued a bulletin stating that it is advised by the Director of Inland Transportation, War Department, that it has been decided that all shipments of live stock made by that department shall be handled in strict accordance with the twenty-eight-hour law, and that attendants are directed not to sign release permitting confinement for a longer period without unloading for feed and rest in accordance with the law regulating the handling of live stock, except in the most extreme cases, when, due to unavoidable delays, it may be impracticable to unload within the twenty-eight-hour limit.

Weekly Financial Reports

All carriers subject to federal control are required by General Order No. 23 to render a weekly report of cash resources and requirements to the treasurer of the United States Railroad Administration, showing also estimated cash receipts and requirements during the remainder of the current month and the subsequent month.

GUATEMALA IMPORTED RAILWAY SUPPLIES to the value of \$128,170 in 1917.—*Commerce Reports*.

Orders of the Western Regional Director

DURING THE PAST WEEK R. H. Aishton, regional director of western railroads, Chicago, has issued the following orders to the lines under his authority:

Execution of Contracts

In a circular dated April 30, the regional purchasing committee has supplemented its letter of April 24, in reference to the submission of contracts to it for approval, as follows:

Contracts recommended for approval should be executed by the railroad and forwarded in duplicate, one copy to be retained by this committee. Your action in executing contract before submitting it, indicates that you assume responsibility for its being the most advantageous contract that you can secure as a result of competitive bids.

Please see that all contracts submitted for approval are complete in every respect. In those cases where a contract is executed by the seller before submitting, it must be understood that it is not binding and should not be delivered until approved by this committee.

Passenger Cars and Freight Cars on Order

Circular No. 94 asks for the following information on passenger and freight cars that railroads have on order: Name of builders, shop, date of contract, purchaser, description of cars, number due on January 1, 1918; number delivered January 1 to March 31, number due April 1, deliveries scheduled.

Inspection of Materials, Locomotive and Car Construction

Circular No. 91 calls for an inventory of the facilities and forces as now organized upon the various railroads for material inspection and construction inspection. The circular reads as follows: Herewith find blank forms and a sample form which has been filled out for the A. B. & C. Railroad to illustrate the way in which this form should be made out, showing the present organization of your material inspection forces. In connection with this form, please note that if the foreman in charge acts as field inspector for more than 50 per cent of his time, he should be classed as field inspector only.

There are also attached separate blank sample forms which are to be filled out showing the various construction inspectors carried by the railroads, one form for locomotive inspectors and one for car inspectors. If more forms are required, the railroad will reproduce the necessary number. If the forms as made out do not exactly cover the conditions on certain railroads, it is desired that supplemental data be furnished to cover the full intent of the form.

Also advise to whom communications should be addressed regarding: (a) Materials—inspection and test; (b) locomotive building inspection; (c) car building inspection.

This report does not include tie inspectors. Roads having a separate organization for inspection of ties will continue it under direction of the regional purchasing committee.

Selling or Reclaiming Scrap

Circular No. 92 reads as follows: On account of the shortage of iron and steel, the War Industries Board and the Council of National Defense call attention to the necessity for picking up and either selling or reclaiming every piece of scrap iron or steel, dismantled machinery, obsolete iron and steel material or machinery that can be found on each road.

The Railroad Administration directs that special attention be given this matter and all such scrap metals and material be disposed of to the best advantage as soon as possible. A thorough canvass of the entire situation should be

made, taking into consideration unused plants with obsolete machinery, or rail and fastenings laid in abandoned gravel pits, industry tracks, logging roads, etc., etc., which are no longer of use. Each road will please report to this office on or before May 31, what has been accomplished.

Employees' Magazines

Western railroads which publish employees' magazines have been requested to supply the regional director with copies of their last issues and the following information: 1 How frequently published; 2 Total expense of publication; 3 Revenue derived from advertising; 4 Net expense for publication; 5 Advantages expected to be obtained from publication.

Diversion or Reconsignment of Freight

In a communication dated May 4, the regional director says: The question has been raised on orders for diversion or reconsignment of freight traffic while in possession of rail carriers, whether the road receiving the diversion orders from the shipper or other party in interest, or the road in possession of the freight should determine whether the diversion order should be accepted and the diversion made; also with which road the financial responsibility lies in case of the acceptance of diversion order from an irresponsible party or for other reasons the acceptance and accomplishment of the diversion order results in the liability of one or more of the roads handling the freight.

It is held that the road receiving the order for diversion or reconsignment from the shipper or the party in interest shall determine whether that order shall be accepted and accomplished, and should any financial liability result from the acceptance and accomplishment of the order, then the road that received it from the shipper and determined that it should be accepted and accomplished will be financially responsible to its connections for any loss or liability that may result.

Tariffs Naming Intrastate Rates

In order to permit an intelligent consideration of the question of uniformity in state and interstate rates, western lines have been instructed to prepare an analysis in duplicate of freight tariffs published by them which contain rates, rules or charges applicable on intrastate traffic only. The purpose of this analysis is to have ready at the earliest possible moment a detailed statement of the tariff or tariff items which may have to be amended, cancelled or filed with the Interstate Commerce Commission, to eliminate conflicts, bring all rates to a new basis and have one rate and only one published for each service, and that rate applicable on all business, both state and interstate and filed with the Interstate Commerce Commission. The information asked for in this letter (dated April 30) is to be listed on two forms, one covering interstate tariffs naming intrastate rates and the other state tariffs not filed with the Interstate Commerce Commission.

Publication of Freight Tariffs

In Circular No. 93, the regional director gives the following instructions: The cost of compiling and printing freight tariffs in the United States is variously estimated from \$5,000,000 to \$8,000,000 per annum. An attempt will be made to reduce this cost by simplification and consolidation of tariff issues. For this purpose, you are asked to furnish in duplicate a statement of your tariff issues according to a form attached. One copy of this statement will be sent to Washington and the other copy will be retained here. It is understood that exact answers cannot be made to many of these questions, but the best possible estimate should be furnished and your report should show whether the figures are actual or estimated.

Among the questions asked in the form accompanying this circular are the number of freight tariffs and the number of supplements and amendments thereto published by each road in 1917, the cost of compiling, printing and distributing them; the total amount paid for freight tariffs (including amendments and supplements) issued by freight associations, bureaus or publishing agents, the proportion of space in all freight tariffs, amendments and supplements (issued by each road and in effect December 31, 1917), covering rates, rules, etc., applying locally between points on each road, and the proportion applying jointly with other lines; the proportion covering rates, rules, etc., on tariffs which have been competitive with other roads and which were a practical duplication of matter published by another road or by a publishing agent; and the proportion which were the same or substantially the same or exceptions to those printed in a classification or circular issued by a publishing agent.

Industrial and Agricultural Development Work

Circular No. 97, dated May 2, states that the staff of the director general has reached the following conclusions as to expenditures for industrial and agricultural development work:

- 1 Nothing should be expended in these days for industrial development. Our man power is too little for the industries already established other than those which relate to the immediate activities of the war.
- 2 Carriers may, to some extent, continue expenditures for agricultural development. In no case should expenditures for the year 1918 exceed those for 1917 and ordinarily they should be less.
- 3 It is felt that railroads in making these expenditures should get into close touch with the Agricultural Department (at Washington) and should permit that department to occupy what may be termed the scientific or special field of that work.

Conserving Supplies and Materials

The director of the division of Transportation has issued the following instructions dated May 6, which should be observed in connection with Circular No. R. P. C. 10:

"In view of the increasing difficulty in obtaining a sufficient amount of steel and iron products, it is more important now than ever that every effort be made to reclaim and make repairs to old material instead of using new, and under no circumstances must material be scrapped until

1. It is known positively that it cannot be satisfactorily repaired.

2. That the cost of repairs will be prohibitive.

"Each road will appoint a 'reclaim committee,' which will make a study of the proposition and put into effect the necessary methods to carry out the desired results and make recommendations for devices or apparatus that will best serve the purpose of conservation of all kinds of material."

Overtime Payments to Trackmen

Paragraph "C" under Section 2 of Circular No. 63 reads as follows: "Roads now paying, or under contract to pay, trackmen time and a half for Sunday and night work may continue this practice, and other roads in the same territory may adopt the same practice, if they so desire."

Statements have been made that some lines have not been observing these instructions. There should be no deviation from the rules as outlined in Circular 63 without definite approval from this office. Any railroad that was not paying time and a half for overtime for Sunday work to track labor when this circular was issued should not institute the practice without definite approval from this office.

Surety Bonds

In order to prevent any question as to whether surety bonds cover also the interests of the United States, it has been arranged to place a rider on all surety bonds issued to any railroad under Federal control to cover this point. Nine surety companies have been requested to arrange for its attachment to surety bonds.

Extensive Reductions in Western Passenger Service

Readjustments of Schedules Involving Elimination of
Nearly 12,000,000 Train-Miles a Year

ADDITIONAL REDUCTIONS in passenger train service on western railroads amounting to 11,728,218 train-miles per year will become effective on June 1, or shortly thereafter. The changes will be made in conformance with a detailed report recently prepared by the passenger traffic committee of the western region, P. S. Eustis, chairman, and approved by the director general. Changes recommended by this committee will be substantially as outlined in the report as summarized below, although a few additional alterations of the proposed schedules may yet be made before June 1. It will be observed that no radical reductions in train service have been made. On the contrary, it has been the purpose of the committee to provide through service ample for the needs of the traveling public, although in doing so the schedules of individual lines have been disregarded and the service of all the lines involved has been considered as a whole. At the same time, it has been the aim of the committee to preserve on each railroad sufficient trains to serve local needs as well as the needs of individual communities for through service.

Four northbound trains between Chicago and St. Paul have been removed and two new trains added, making a net reduction in service of two trains. Southbound between the same points five trains have been taken off and two trains added, making a net reduction of three trains. The new schedules, therefore, will provide 19 northbound and 16 southbound trains daily between Chicago and St. Paul, compared with 21 northbound and 19 southbound under the old schedules.

Under this plan the Chicago & North Western will operate two day trains and three night trains between Chicago and St. Paul as compared with two day and four night trains under the present schedules. Southbound it will have two day trains and two night trains as compared with two day and three night trains under the present plan. The North Coast Limited will not run south of St. Paul. The Chicago, Burlington & Quincy, Pacific coast train leaving Chicago at 10:30 a. m. and the southbound coast train leaving St. Paul at 11:30 p. m. have been removed, while the southbound coast train leaving latter point at 8:30 a. m. will remain in service. Under the revised schedules the Burlington will have two night trains and one day train northbound and one night and two day trains southbound. This is equivalent to a net reduction of one train each way on the Burlington. All four of the Pacific coast trains on the Chicago, Milwaukee & St. Paul have been retained. The only trains discontinued between Chicago and St. Paul are the northbound train now leaving Chicago at 9:40 p. m. and the southbound train leaving St. Paul at 7:30 p. m. The only additional change in service between Chicago and the Twin Cities is the lengthening of the schedule of the Chicago Great Western train leaving Chicago at 8:30 p. m. to 13 hours.

Between Chicago and Omaha a net reduction of three trains each way will be made. Westbound the North Western trains leaving Chicago at 9:40 and 10:00 p. m. and the St. Paul train leaving there at 10:05 a. m. will be discontinued, while eastbound the North Western trains leaving Omaha at 8:35 and 10:10 p. m. and the St. Paul train leaving at 7:50 p. m. will be eliminated. The schedule of the Illinois Central train leaving Chicago at 5:30 p. m. will be lengthened to 15 hours. All of the trains removed are Pacific coast trains.

Between Chicago and Kansas City there will be a reduc-

tion of three trains each way. The Atchison, Topeka & Santa Fe trains leaving Chicago at 10:30 and 4:45 p. m. and leaving Kansas City at 8:30 a. m. and 6:15 a. m. have been eliminated. The 10:30 p. m. train westbound has also been discontinued between Kansas City and the coast, while the train leaving Kansas City at 8:30 a. m. for Chicago has been discontinued from the coast to Kansas City.

On the Rock Island the Pacific coast trains leaving Chicago at 9 a. m. and 8:05 p. m. will be discontinued between Chicago and Kansas City, but will continue to operate from there to Tucumcari, N. M. Eastbound, the Pacific coast trains arriving in Kansas City at 10:40 p. m. and 7:35 p. m. will no longer operate to Chicago.

On the El Paso & Southwestern one train in each direction will be removed between Tucumcari, N. M., and El Paso, Texas.

The Great Northern and the Northern Pacific will continue to operate the same number of trains between St. Paul and the coast. One train in each direction has been discontinued on the Los Angeles & Salt Lake between Salt Lake City, Utah, and Los Angeles, Cal. The Southern Pacific will discontinue the operation of its westbound train leaving Ogden, Utah, for San Francisco at 1:30 a. m., and its eastbound train leaving San Francisco for Ogden at 12:40 p. m. The time of its westbound train from New Orleans to Los Angeles, leaving the former city at 11:30 a. m., has been lengthened to 64 hours, while the schedule of the eastbound train between the same points, leaving Los Angeles at 8:30 a. m. has been similarly lengthened. One train in each direction has been discontinued between Los Angeles and El Paso.

On the Union Pacific three westbound and three eastbound trains have been discontinued between Omaha and Ogden. In addition two trains in each direction have been consolidated.

The service between Portland and Seattle has been reduced by three trains in both directions. The schedules have been finally approved and will go into effect on May 14.

The committee is still studying the train service between St. Paul and Omaha, and it is not unlikely that one train will be removed between these points. It will also issue a supplementary report containing proposed changes in service between St. Louis and Kansas City and between St. Louis and Kansas City and Texas points. The readjustment of service outlined in this article involved a considerable number of changes in the times of departure and arrival which we have not attempted to cover. The following table shows the reductions in train-miles per year for the individual roads which will be affected by the new schedules:

| PASSENGER TRAIN MILEAGE REDUCTIONS. | |
|-------------------------------------|------------|
| A. T. & S. F. | 1,560,010 |
| C. & N. W. | 815,738 |
| C. St. P. M. & O. | 298,570 |
| C. B. & Q. | 573,780 |
| C. M. & St. P. | 1,012,116 |
| C. R. I. & P. | 973,820 |
| E. P. & S. W. System. | 241,650 |
| Great Northern | None |
| I. A. & S. L. | 621,960 |
| Northern Pacific | 235,790 |
| Southern Pacific | 1,548,330 |
| Union Pacific | 2,383,430 |
| Union Pacific (OSL) | 178,850 |
| Union Pacific (O-W) | |
| Portland-Seattle Lines | 403,690 |

| Total | 11,728,218 |

Philadelphia—Chestnut Hill Electrification

Latest Improvements in Catenary Construction Used on
This Branch of the Pennsylvania

THE CHESTNUT HILL electrification is an extension of the Philadelphia-Paoli electrification, connecting with it at a point near West Philadelphia, and extending over the main line to North Philadelphia and over the Chestnut Hill branch to Chestnut Hill. The distance from Broad Street to Chestnut Hill is twelve miles. The length of the new electrified Chestnut Hill line is 10 miles, 2.5 miles of which is four track and 7.7 miles double track.

There are at present in daily operation 21 trains, totaling 88 cars, in each direction. It is expected that this service

Hill was 55 minutes, or a schedule speed of 20 miles per hour. The electric service is at present operating on former steam schedule, but when the next time table is issued this schedule will be reduced to 33 minutes. The westbound schedule being chiefly down grade is three minutes shorter than the eastbound.

The average grade between North Philadelphia and the junction with the Philadelphia-Paoli electrification is .38 and the maximum grade is 1.3 per cent, near the easterly approach to 36th Street tunnel. The difference in elevation between the junction of the Chestnut Hill branch with the main line at North Philadelphia and the end of the track at Chestnut Hill is 297 feet, or an average grade .84 per cent. The maximum grade on this branch is 2.5 per cent between Highland station and Chestnut Hill. A map of the Chestnut Hill branch and its connection with the Philadelphia-Paoli line are shown in Fig. 1.

Of the total of twelve miles of Chestnut Hill electrification, eight miles are on tangent and four miles on curved track. The heaviest curve at North Philadelphia is 11 deg. and is about 2 miles in length. The remaining curve track varies from 0 deg. 40 min. to 50 deg. 20 min., most of which is on rising grade.

There are 11 stations on the Chestnut Hill branch, spaced about one half mile apart, except in one case where the distance between stations is one and one half miles.

Power System, Transmission and Distribution

Power for the Chestnut Hill electrification is furnished by the Philadelphia Electric Company. The power station is on the east bank of the Schuylkill river at Arsenal bridge. Three phase power is generated at 13,200 volts, and is

Fig. 1—Map Showing Location of Newly Electrified Section

will be increased when more normal traffic conditions permit. The electric equipment is designed to handle a service of 32 trains each way per day, the rush-hour service being eight-car trains on a five-minute interval. The running time of the steam trains eastbound from Broad Street to Chestnut

transmitted over four 350,000 c.m. three conductor submarine cables to the Arsenal bridge transformer station, which is located on the west bank of the river, about opposite the power house.

Power for the Paoli electrification was taken from one-phase of the Philadelphia Electric Company's system. With the Chestnut Hill load added, the three-phase power (somewhat unbalanced) is transmitted to the Arsenal bridge transformer station, in which two groups of Scott connected transformers are employed for transforming the supply into two-phase 44,000-volt power. Phase balancers are installed in the Philadelphia Electric Company's power house to correct the unbalancing which occurs due to the variation in load requirements of the Paoli and Chestnut Hill systems. From the high tension sides of the step-up transformers there are four 44,000-volt single-phase feeders, two for Paoli and two for the Chestnut Hill electrification. The middle point of the high tension winding on each of the transformers is connected to ground through a resistance, thus reducing the voltage between any wire and ground to 22,000 volts. From the Arsenal bridge transformer station the four single-phase transmission lines run to the West Philadelphia transformer station, where connections are made to each line. From the West Philadelphia transformer station they continue west, two running to the Bryn Mawr and Paoli transformer stations of the Paoli electrification, and two to the North Philadelphia and Allen Lane transformer stations of the Chestnut Hill electrification.

For the Chestnut Hill supply, transmission lines are of

Fig. 2—Transmission Pole Carrying 44,000 Volt Line

stranded aluminum steel reinforced wires, having a conductivity equivalent to 2/0 copper, carried on cross arms on separate transmission poles of sufficient height to clear all highway bridges and crossings. A signal power line of stranded aluminum steel reinforced wires, having a conductivity equivalent to 1/0 copper, is carried from North Philadelphia to Chestnut Hill on cross arms placed on the transmission poles below the power transmission cross arms. The signal power line of insulated copper wire, from

the source of supply at West Philadelphia transformer station, is carried underground in ducts to North Philadelphia, where a one to one ratio transformer separates it from the aerial aluminum line, thus sectionalizing the underground line from the aerial. The transmission lines are protected by a 3/8-in. Siemens-Martin galvanized steel ground wire carried on top of the transmission poles. A general view of a transmission pole is shown in Fig. 2. It was decided to use aluminum steel reinforced transmission wire because of the material saving in cost as compared with copper.

Safety ties of special design are used on both the power and signal transmission lines on poles adjacent to highway

Fig. 3—North Philadelphia Transformer Station

crossings and station platforms in order to insure against burning off and falling of wires in case of insulator failure. These safety ties consist of flat galvanized iron plates, 3 1/2 in. wide, placed under and clamped to the transmission wire and to yokes on the insulators. The plates extend about 18 in. beyond the insulators. Two insulators are used at highway crossings and on sharp curves.

The equipment in the West Philadelphia transformer station originally consisted of two 2,000-kva oil insulated water cooled step-down transformers. In order to take care of the Chestnut Hill electrification, two 3,000-kva oil insulated water cooled transformers were installed in this transformer station and connected to the Paoli phase. The 2,000-kva transformers which they replaced were connected to the two Chestnut Hill transmission lines and trolleys. At the North Philadelphia transformer station, located 4.4 miles from the West Philadelphia transformer station, provision is made for sectionalizing the two transmission lines where they cross on the steel structure of the station, and each of the transmission lines is connected to the high tension bus through an oil circuit breaker. From this point the two transmission lines continue on for a distance of 5.3 miles to the Allen Lane transformer station, where they dead-end, and are connected through oil circuit breakers to the high tension bus.

Both the North Philadelphia and Allen Lane transformer stations are of the outdoor type and each is equipped with two 3,000-kva single phase radiator type self-cooled oil insulated transformers, stepping the voltage down from 44,000 to 11,000 volts. All of the transformer station

apparatus is designed for outdoor service. The terminals on all transformers and oil circuit breakers are equipped with high voltage porcelain insulators, and all of the live parts and operating mechanisms are enclosed in weather-proof cases. The transformer station equipment is protected from lightning discharges and surges by means of electrolytic lightning arresters on the high tension and trolley feeders. In each of the transformer stations there is a small brick or concrete building in which the relays for automatic circuit breaker tripping and the magnet or relay switches for closing the oil circuit breakers are located. These buildings also contain a filter press for cleaning and drying the oil in the transformers and oil circuit breakers.

In the case of the Allen Lane transformer station the building also contains a small storage battery and motor generator set for charging the battery, which is used for automatic circuit breaker tripping. Power for this purpose in the case of the North Philadelphia transformer station is obtained from a storage battery in GD Signal Tower. Each transformer station is equipped with a large tank of sufficient capacity to hold the oil from one transformer, and, in addition to this, small tanks are provided into which the oil from circuit breakers is pumped for cleaning and drying. All oil circuit breakers are mounted on angle iron frame work and are equipped with a tank lifter for raising and lowering the tanks to permit easy inspection and repairs to

down transformers in each transformer station. One of these transformers is connected to the 44,000-volt bus and the other to the 11,000-volt bus. The voltage used for remote control closing and tripping of circuit breakers is 440-volt A.C., while 60-volt D.C. current is used for automatic tripping by relays. A view of the North Philadelphia transformer station is shown in Fig. 3.

The catenary system is carried on bridges spaced about 300 ft. apart. Catenary construction consists of a steel messenger or supporting wire, secondary messenger or auxiliary trolley and a contact trolley. The secondary messenger and contact trolley are clamped together with bronze

Fig. 4—Structural Pole Without Guys for Two Track Construction

Fig. 5—Extra Heavy Tubular Pole Without Guys for Two Track Construction

clamps, spaced 15 ft. apart, and both are supported from the messenger by flat steel galvanized hangers every 50 ft. on tangent track, and 15 ft. on curved track. The type of catenary hanger is the same as that used on the Philadelphia-Paoli electrification.

The catenary is anchored approximately every mile on either overhead highway bridges or signal bridges designed to support the catenary over all tracks on either side of the bridge in case of a break in the catenary system on the opposite side. Catenary supporting bridges are of several types, designed to fit different conditions and locations. Wherever possible tubular pole construction with guys is used, shown in the illustration at the beginning of this article. This type of construction is used exclusively for supporting the catenary over the two tracks on the branch. Structural poles and extra heavy tubular poles, bracket type construction, without guys, as shown in Figs. 4 and 5, are used over the two track construction on the branch where space will not permit the use of guys. Other types of bridges are shown in Figs. 6 and 7.

The messenger wire is of $1\frac{1}{2}$ -in. extra high strength seven wire steel strand galvanized, having a breaking strength of 27,000 lb. The secondary messenger is of 2/0 grooved

circuit breakers. Transformers are equipped with a thermostat alarm which operates in case of excessive heating.

The North Philadelphia transformer station is controlled from GD signal tower, which is located a short distance away, and the Allen Lane transformer station is controlled from CW signal tower located near the transformer station. Lead covered control cables, carrying the necessary conductors, are run from the transformer stations to the towers in trunking underground. Power for closing circuit breakers and for auxiliary purposes is obtained from two small step-

copper wire. The contact trolley is of 3/0 grooved copper alloy (phono-electric) wire. The cross catenary consists of a messenger wire of 3/4-in. extra high strength 19 wire steel strand galvanized with a body strand of 1/2-in. diameter wire of the same material.

The catenary system is insulated from supporting bridges by three shell suspension type Locke insulators, as shown in Figs. 4 and 5. The catenary system is insulated from the overhead highway bridges by Ohio Brass post type insulators, as shown in Fig. 8.

The rails of the main line tracks are double bonded at each joint with two pin type expanded terminal bonds of No. 1/0 B. & S. gage, each bond consisting of 37 strands

underground in trunking on the Chestnut Hill branch. These lines parallel the tracks at an average distance of 20 feet. Recent tests which have been made demonstrate the fact that booster transformers in the track circuits are

Fig. 6—Tubular Pole Type of Bridge for Use Over Four Tracks

of soft drawn copper wire. The rails carrying the propulsion current return are sectionalized at each signal block; the propulsion current flowing through impedance bonds which are connected around these points. These impedance bonds are designed to allow the flow of propulsion current

Fig. 7—Structural Bridge for Use Over Four Tracks

and to sectionalize track against the flow of the 60 cycle signal current. A view of the bond is shown in Fig. 9.

Telephone and Telegraph Lines

The telephone and telegraph lines of the railroad are carried underground in ducts along the main line, and

Fig. 8—Catenary Is Insulated from Overhead Highway Bridges by Post Type Insulators

not necessary with the transformer stations located about five miles apart.

Multiple Unit Car Equipment

The multiple unit car equipments are similar to the car equipments used for the Paoli electrification, except in the following principals: The compressor is driven from a separate motor instead of from the blower shaft. The main transformer is designed to operate on a lower magnetizing

Fig. 9—Railroad Joint Showing Type of Bond Used. Note That Only a Small Amount of Copper Is Exposed

current and the insulation improved. Preventative coils are used in connection with switch groups instead of resistances, resulting in a reduced power consumption. A low voltage relay is provided, making it possible to operate cars with 1,000 volt greater variation of trolley potential. Increased illumination is provided in the cars.

Car inspection and repairs will be conducted in the car inspection building located in Paoli yard, where the inspection and repairs for the equipments of the Paoli line is also done. The multiple unit cars which are used on both the Paoli and Chestnut Hill lines are interchangeable for either line, and the repairs and maintenance will be handled in the one inspection building. The maintenance of the Chestnut Hill line equipment will be handled by the same main-

tenance force as formerly handled the maintenance of the Paoli line, its headquarters being at West Philadelphia.

Engineering and Construction

The design and construction was conducted by Gibbs & Hill, consulting electrical engineers for the Pennsylvania Railroad, in the same manner as the Philadelphia-Paoli installation. The multiple unit car equipments were installed by the railroad at the Altoona shops. All signal equipment and the necessary work in connection with telephone and telegraph lines was done under the direction of the railroad signal and telegraph departments.

Following is a list of the manufacturing concerns which furnish the principal materials for the equipment: Motor car equipments, transformer station equipment, Westinghouse Electric & Manufacturing Company; structural poles and signal bridges, Lackawanna Bridge Company; miscellaneous structural material, consisting of highway bridge supports, substation structural material, protection screens, Steward & Stevens Iron Works and Belmont Iron Works; tubular poles, National Tube Company; steel messenger, cross span and ground wire, J. A. Roelings's Sons Company; aluminum transmission wire and fittings, Aluminum Company of America; contact trolley wire, Bridgeport Brass Company; secondary messenger wire, Waclarke Wire Company; bonds, American Steel Wire Company, Electric Service Supplies Company, Ohio Brass Company; insulators, Locke Insulator Manufacturing Company, Ohio Brass Company; guy rods, Oliver Iron & Steel Company; steel castings, Atlantic Steel Castings Company; malleable iron castings, Eastern Malleable Iron Company; catenary fittings, bolts, nuts, hanger rods, pull-off rods, etc., West Philadelphia Shops, Pennsylvania Railroad Company, American Iron & Steel Company; sockets and turnbuckles, Thomas Laughlin & Co., J. A. Roelings's Sons Company; and block and automatic signal equipment, Union Switch & Signal Company.

Annual Government Signal Bulletin

THE LENGTH OF RAILROAD in the United States, January 1, 1918, on which the block system was in use, was 98,954 miles, as compared with 97,927 miles on January 1, 1917. These are the totals after deducting duplications, as shown in the annual bulletin which has just been issued by the Interstate Commerce Commission. These duplications, representing sections of road used jointly by two companies, and reported by both, aggregate no less than 577 miles. The increase in automatic block signal mileage is 2,242 miles and the decrease in non-automatic block signalling is 1,215 miles, making a net increase of 1,027 miles of road for the year. The commission's bulletin, making additions and deductions without eliminating the joint mileage, makes a net increase of 1,123.8 miles.

The totals for five years are shown below.

Miles of Road on Which the Block System Is in Use

| | Jan. 1, 1918 | Jan. 1, 1917 | Jan. 1, 1916 | Jan. 1, 1915 | Jan. 1, 1914 |
|-----------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Automatic | 34,719 | 34,587 | 33,714 | 32,600 | 26,570 |
| Manual | 64,135 | 63,340 | 64,202 | 66,079 | 60,167 |
| Total | 98,954 | 97,927 | 97,916 | 98,679 | 86,737 |

There is a large mileage of road in the United States used exclusively for freight traffic, on which block signals are in service; some of these roads include such mileage in their statements and some do not. Four roads, the Baltimore & Ohio, the Pennsylvania, the Southern and the Wabash, report considerable lengths of automatic signals in manual block signal territory, not included in the tabular statements. These, presumably, are isolated signals, one in a place, con-

trolled by one or more track circuits, and used for protecting trains at stations, etc.

The principal increases and decreases shown in the bulletin, as compared with January 1, 1917, are as follows:

| Names of railroads | Increase. | | Decrease, non-automatic. |
|--|-----------|----------------|--------------------------|
| | Automatic | Non-automatic. | |
| Aetehson, Topeka & Santa Fe System..... | 40.0 | 39.7 | — |
| Baltimore & Ohio System..... | 77.7 | — | 143.5 |
| Central New York Southern..... | — | 34.7 | — |
| Central of Georgia..... | 131.6 | — | 19.4 |
| Chicago & North Western..... | 179.4 | — | 176.9 |
| Chicago, Burlington & Quincy..... | 257.3 | — | 295.2 |
| Chicago Great Western..... | 35.2 | — | — |
| Chicago, Milwaukee & St. Paul..... | 263.8 | — | 171.1 |
| Frio..... | 267.8 | 34.0 | — |
| Illinois Central..... | 267.8 | — | — |
| Los Angeles & Salt Lake..... | 151.8 | 44.2 | — |
| Louisville & Nashville..... | 72.0 | — | 49.7 |
| Missouri Pacific..... | 73.9 | — | 222.4 |
| Mononahela..... | 33.6 | — | — |
| Norfolk & Western..... | 61.3 | — | 62.7 |
| Northern Pacific..... | 215.5 | 113.0 | — |
| Philadelphia & Reading..... | 56.1 | — | 37.1 |
| Richmond, Fredericksburg & Potomac..... | 56.1 | — | 56.1 |
| Southern..... | 37.1 | — | 230.6 |
| Southern Pacific (Pacific System)..... | 14.6 | 213.8 | — |
| Galveston, Harrisburg & San Antonio..... | — | — | 76.5 |
| Houston & Texas Central..... | 33.4 | — | — |
| Toledo & Indiana..... | 73.3 | 52.0 | — |
| Union Pacific..... | 54.7 | — | — |
| Green Short Line..... | 26.3 | — | — |
| Union Traction Co. of Indiana..... | 26.3 | — | — |
| Washington Southern..... | 26.5 | — | 26.5 |

↑ Roads which have zero increase reported block-signal mileage

Table No. 2 in the bulletin, showing kinds of automatic signals in use, gives the miles of road on which electric motor semaphores are used, as 31,702 (50,014 miles of track) an increase during the year of 3,169 miles of track. Other kinds of signals show slight changes, except that the column of "Not Classified" shows an increase of 169 miles of road (177 miles of track). This column includes light signals and miscellaneous designs used by trolley roads; but the principal increase is that shown by the Chicago, Milwaukee & St. Paul, 177 miles, this item covering the three-position light signals introduced on that road in connection with the introduction of electric traction on the line over the Rocky mountains. This road also shows a considerable increase in mileage of semaphores.

The length of railroad on which the Morse telegraph is used for the transmission of train orders is 142,119 miles, a decrease during the year of 7,337 miles; while the length of road on which the telephone is used for this purpose, 110,404 miles is 7,011 miles greater than the year before. The aggregate length of the roads reporting in regard to telegraph and telephones, is 244,356 miles.

BRITISH RAILWAYS AND THE PALESTINE CAMPAIGN.—A British official war film, produced under the direction of the Ministry of Information—"With the Forces in Palestine"—throws an interesting sidelight on the extent to which the campaign in this theatre of war has been aided by railways and other forms of mechanical transport. Roadway has already been constructed over 140 miles of desert by British, Egyptian and Indian labor. The line is standard gauge, and the sections shown on the film have involved practically no work in the way of excavation or embankment, thanks to the level nature of the country. As fast as the rails are placed in position, a construction train follows, the vehicle being only a few yards distant from railroad. One of these trains, as depicted on the film, was made up of Egyptian State Railway flat cars hauled by a standard London & Southwestern Railway 0-6-0 freight engine, an unusual combination which visualizes the way in which English railway companies have sent rolling stock to the various fronts.

Organization of the United States Railroad Administration

DIRECTOR GENERAL OF RAILROADS W. G. McADOO

Oscar A. Price, Private Secretary,
913 I. C. C. Bldg., Washington.

The Problem of the Short Line Railroads

A Discussion of the Intent of the Legislation Regarding Their Disposition and Operation During Federal Control

By Sanford H. E. Freund

Assistant General Counsel, Great Northern, St. Paul, Minn.

THERE ARE ABOUT 800 short line railroads, so-called, in the United States. There are strong roads and weak roads; roads which form valuable links between Class I roads; and roads for whose building or existence there is little excuse. There are some which are substantially plant facilities, and some which, in addition to bringing out the products of an industry, serve a developing community.

Should some or all of these roads be kept in federal control? And if not, who, pending final disposition, is responsible for their operation and how shall their operation be conducted and co-ordinated with the operations of roads under federal control after these have been relinquished? The first consideration for determining the answer to these questions is to be found in the purpose of the President in taking possession and assuming control of the railway lines in the United States.

The act of August 29, 1916, provided "the President in time of war is empowered . . . to take possession and assume control of any system or systems of transportation, or any part thereof and to utilize the same . . . for the transfer or transportation of troops, war material and equipment or for such other purposes connected with the emergency as may be needful or desirable." Acting in pursuance of the power thereby granted the President by proclamation on December 26, states: "*I . . . do hereby . . . take possession and assume control at 12 o'clock noon on the 28th day of December, 1917, of each and every system of transportation and the appurtenances thereof located wholly or in part within the boundaries of the continental U. S. and consisting of railroads and owned and controlled systems of coastwise and inland transportation engaged in general transportation, whether operated by steam or electric power, including also terminals, terminal companies and terminal associations, sleeping and parlor cars, private cars and private car lines, elevators, warehouses, telegraph and telephone lines and all other equipment and appurtenances, commonly used upon or operated as a part of such rail or combined rail-and water systems of transportation;*"

He then directs that the possession and control, operation and utilization of such transportation systems shall be exercised by and through William G. McAdoo.

He continues, "by subsequent order and proclamation, possession, control and operation in whole or in part may also be relinquished to the owners thereof of any part of the railroad systems or rail and water systems, possession and control of which are hereby assumed." The proclamation further states "From and after 12 o'clock on said 28th day of December, 1917, all transportation systems included in this order and proclamation shall conclusively be deemed within the possession and control of said director without further act or notice."

A statement of the President accompanied the proclamation. In this statement the President says, "This is a war of resources no less than of men, perhaps even more than of men, and it is necessary for the complete mobilization of our resources that the transportation systems of the country should be organized and employed under a single authority and a simplified method of co-ordination which have not

proved possible under private management and control. The government itself will thereby gain an immense increase of efficiency in the conduct of the war and of the innumerable activities upon which its successful conduct depends.

"The public interest must be first served and, in addition, the financial interests of the government and the financial interests of the railways must be brought under a common direction."

In the address delivered at a joint session of Congress, January 4, 1918, the President says, "Transportation supplies all the arteries of mobilization. Unless it be under a single and unified direction, the whole progress of the nation's action is embarrassed."

"It had become unmistakably plain that only under government administration can the entire equipment of the several systems of transportation be fully and unreservedly thrown into a common service without discrimination against particular properties."

"It is necessary that the transportation of troops and of war materials, of food and of fuel and of everything that is necessary for the full mobilization of the energies and resources of the country, should be first considered."

"Our first duty is of course to conserve our common interest and common safety and make certain that nothing stands in the way of the prosecution of the great war for liberty and justice, but it is also an obligation of public conscience and public honor that the private interests we disturb, should be kept safe from unjust injury, and it is of the utmost consequence to the government itself that all great financial operations should be stabilized and co-ordinated with the financial operations of the government. No borrowings should run athwart the federal treasury, and no fundamental industrial values should anywhere be unnecessarily impaired."

Extensive quotation has been made from the proclamation, statement and address of the President. Taking possession and assuming control of the railway lines of the United States, though done by legislative authority, was primarily an act of executive discretion, and as the problem to be considered is one which involves elements of fairness, of justice and economic expediency as well as of operating efficiency, the purpose of the government must be looked for in the words of the President acting as its spokesman, as well as in the letter of the law.

Further, by Section 9 of the Act of March 21, 1918, it is expressly provided that the act of August 29, 1916, shall remain in force and effect except as expressly restricted by the act of March 21, 1918, and that the President shall have such other and further powers as are necessary and appropriate to give effect to the powers conferred in both acts. The act of March 21, 1918, thus adopts and confirms what has been done.

The quotations above made seem to establish conclusively:

First, that the short line railroads are in the possession and control of the federal government unless relinquished. The President took possession and assumed control of each and every system of transportation and appurtenances there-

of located wholly or in part within the boundaries of the United States and consisting of railroads, etc. This is comprehensive enough to include the short line railroads; and they are not covered by the only exception to wit: street electric passenger railways, including interurbans. The President himself states that all transportation systems included in his order and proclamation "shall conclusively be deemed within the possession and control of the said director without further act or notice."

Second: The purposes for which the control was assumed were:

(A) To use the transportation facilities of the country in the most efficient manner by having a unified control.

(B) To provide for the large financial requirements of the railroads without embarrassing the government in its financial operations and without putting too great a burden on the railroads by making them borrow in competition with the government.

(C) To protect the interests of the owners of the railroads in this emergency.

Has Congress in the Act of March 21, 1918, evidenced any different intentions? Or is there anything in that act which affects these conclusions?

In the first paragraph of the act it is stated, "The President having in time of war taken over the possession, use, control and operation (called herein federal control) of certain railroads and systems of transportation (called herein carriers), is hereby authorized to agree with and guarantee to any such carrier making operating returns to the Interstate Commerce Commission," etc. The language is different from that of the proclamation of the President but it does not exclude any of the railroads or systems of transportation taken by the President unless they do not fall within the definition of a "carrier making operating returns to the Interstate Commerce Commission."

Another pertinent paragraph of section one reads as follows: "That every railroad not owned, controlled, or operated by another carrier company, and which has heretofore competed for traffic with a railroad or railroads of which the President has taken the possession, use and control, or which connects with such railroads and is engaged as a common carrier in general transportation, shall be held and considered as within "Federal control," as herein defined, and necessary for the prosecution of the war, and shall be entitled to the benefit of all the provisions of this act: *Provided, however*, That nothing in this paragraph shall be construed as including any street or interurban electric railway which has as its principal source of operating revenue urban, suburban, or interurban passenger traffic, or sale of power, heat, and light, or both."

Section 9 of the act provides *inter alia*, the provisions of this act shall also apply to any carriers to which federal control may be hereafter extended.

In Section 14 it is provided "That the President may, prior to July first, nineteen hundred and eighteen, relinquish control of all or any part of any railroad or system of transportation, further federal control of which the President shall deem not needful or desirable; and the President may at any time during the period of federal control agree with the owners thereof to relinquish all or any part of any railroad or system of transportation. The President may relinquish all railroads and systems of transportation under federal control at any time he shall deem such action needful or desirable. No right to compensation shall accrue to such owners from and after the date of relinquishment for the property so relinquished."

From the foregoing it would seem that all of the short lines are within federal control; that prior to July 1, 1918, the President may relinquish control of any of them by his own act; or at any time before that, or thereafter, may relinquish control by agreement with the owners. Under Sec-

tion 9 the President can at any time resume control of a road that has been relinquished.

Though the proclamation of the President and the act of March 21, 1918, make it plain that control of the short lines was assumed, and though there has been no direct expression of opinion that they are not within federal control, nevertheless some doubt has been expressed as to responsibility for their operation at the present time. If it is correct to say that they are and remain in federal control unless relinquished, then the responsibility for their operation since December 28, 1917, is upon the United States Railroad Administration, and settlement must be made under the provisions of Sections 2 and 3 of the act of March 21, 1918.

Coming to the question of the disposition of the short line railroads, the determining criteria for retaining or relinquishing any road, should be (a) whether the short line railroad in question is needful in the mobilization of the transportation facilities of the country to the highest degree of efficiency; (b) whether a road so needed for that purpose could properly be operated and financed during the period of federal control of the railroad systems of the country without being included therein; (c) whether incommensurate hardship would be done the owners by relinquishing the road.

Applying these criteria the director general could at once release that class of road for whose existence there never has been any genuine reason or need, which is a financial cripple and which but for the intervention of federal control would have been sold, abandoned or scrapped.

The director general could also release the short line road which is essentially a plant facility, a road which the industry has maintained for its own benefit and is capable of and necessarily will maintain, in order to market its product. Such a road may be deemed neither needful nor desirable in a unified national transportation system. But the short line road which in addition to being a plant facility does general transportation from a fair sized community or through a country which is developing, may well be considered a proper part of a unified comprehensive transportation system.

The short line railroad which is in competition with the larger systems would seem to be covered by the paragraph quoted above from Section 1 of the act and held to be within federal control and *prima facie* necessary for the prosecution of the war; though like all other roads subject to relinquishment.

The argument on the one hand, of a short line railroad that needs financial assistance, of the hardship upon it of not being taken into federal control, or the argument, on the other hand, of the short line railroad that has been successful, that it does not need federal assistance, and prefer to be outside of federal control, is not conclusive in either case.

If a short line is a necessary part of a comprehensive transportation system and thereby may be deemed necessary for the prosecution of the war it should be retained even though it might need financial assistance. It should not be abandoned to finance itself amid the difficulties that exist for private financing today. But though the President specifically stated that it was intended that no hardship should be done to the owners of railroads by the taking of federal control, it was not intended, on the other hand, that federal control should be used to bolster a useless road.

On the other hand there is no reason because a road has been successful and its owners would prefer to keep it in their own control that it should be left out of the comprehensive national transportation system. The primary object now is the national needs, and if the mobilization of the transportation facilities of the country under unified control is essential, it should cover short lines as well, and

the preference of such lines should not be considered as against the national purpose.

Two other classes of short line railroads require consideration from another point of view: (a) the railroad in the course of construction but not completed and in operation on December 28, 1917, and (b) the road already in financial difficulty, either being in receivership or burdened with debts which it is unable to pay, and which in ordinary times would cause receivership, foreclosure or other legal proceedings.

The road which is not completed and in operation on December 28, 1917, can be taken under federal control under the provisions of Section 9 of the act of March 21, 1918. When such road had been taken, agreement might be made with it (though the case is not specifically covered) under that paragraph of Section 1 covering exceptional cases, which provides that "The President may make with the carrier such agreement for such amount as just compensation as under the circumstances of the particular case he shall find just," or payment might be made for use under Section 2. The provision in Section 9 conferring upon the President such other and further powers as are necessary or appropriate to give effect to the powers conferred, gives ample scope to care for exceptional cases.

If the conclusions previously stated are correct, that the President's proclamation covered each and every railroad, then the road in receivership was taken over, along with the others. The proclamation states that the director general of railroads may perform the duties imposed upon him so long and to such extent as he shall determine, through (among others) receivers. In the proclamation it is further stated "Except with the prior written assent of said director no attachment by mesne process or on execution shall be levied on or against any of the property used by any of said transportation systems in the conduct of their business as common carriers; but suits may be brought by and against such carriers and judgments rendered as hitherto until and except so far as said director may by general or special orders otherwise determine."

Section 10 of the Act of March 21, 1918, provides, "That carriers while under federal control shall be subject to all laws and liabilities as common carriers whether arising under state or federal laws or at common law, except insofar as may be inconsistent with the provisions of this act or any other act applicable to such federal control or with any order of the President. Actions at law or suits in equity may be brought against such carriers and judgments rendered as now provided by law; . . . But no process, mesne or final, shall be levied against any property under such federal control."

Though the receivership would continue, the court under the provisions of Section 10 would give attention to the orders of the director general made pursuant to the act, it being the intention of the act that so far as the operation of railroad properties are concerned its provisions shall be paramount to other laws or law. In any event, no taking of property on execution and no foreclosure or sale of property would be directed.

Likewise, in the case of the road burdened with debt, but not in receivership, the creditors could bring their actions at law or suits in equity, but when judgment had been obtained no process would be levied against any of the property. Consequently, the use and operation of the property under federal control would not be affected or hampered. This, of course, interferes with the rights of creditors and is particularly an interference with what has been ordinarily considered the most valuable right of a bondholder. But there is no provision in the constitution imposing upon Congress the limitation placed upon the state to "pass no law which shall impair the obligation of contracts." Ulti-

mately, the rights of creditors are not lost; the exercise of some of them is temporarily postponed. The judgment remains in effect, and on the termination of the period of federal control can be enforced.

Further, debts incurred before December 28, 1917, are debts of the corporation. Whether or not payment could be obtained from the corporation during federal control need not now be decided. Though it would seem that if the corporation has ample funds and the operation of the properties under federal control would not be interfered with, there would be no reason why corporate funds should not respond to corporate debts previously incurred.

Can all the short line railroads be released and at the same time such arrangement made that a comprehensive national transportation system will be operated in which the short line railroads will do their part? The matters of chief concern to the short line railroads are these:

- (a) Financing;
- (b) Divisions of through rates;
- (c) Car supply;
- (d) Material;
- (e) Labor.

Fundamentally, there would be no difficulty or impossibility for the government to enter into agreements with the short line railroads which would adequately protect the short line railroads.

The ultimate question is whether the existence of the particular short line railroad is needful or desirable for the national purpose. If it is, the government must care for it either by retaining it under federal control, or by making arrangements with it that will protect it if left outside of federal control. If a large number of the short lines are to be relinquished, it would almost seem that it were better to relinquish all and work out a standard agreement between the short lines and the railroads operated under federal control. Whether operating the short line railroads or leaving them in the hands of their owners to be operated under such standard agreement would be better for the national purpose, is a question beyond the scope of this article.

AUSTRIA-HUNGARY TO MANUFACTURE LOCOMOTIVES.—The Hungarian State Railways intend to establish a new locomotive factory. They already possess one at Budapest, says the *Neue Freie Presse*, capable of turning out some 300 locomotives a year. As the Hungarian State owns suitable ironworks, a large new factory would add considerably to its output and its power to compete in exporting, especially to the Balkans. The question has also been raised whether the Austrian State should not undertake the manufacture of rolling stock. The Austrian locomotive factories produced over 400 locomotives per annum in time of peace, 366 in 1916, and 328 in 1917. The Skoda Works intend to establish a locomotive plant. *Commerce Reports*.

HIGHER FRENCH RAILWAY CHARGES.—After very lengthy discussion among all the interests concerned, the French Chamber has passed a single-clause act empowering the railways to make an all-round increase of 25 per cent in their charges. This act applies to the main systems, and the Paris Ceinture Railways as well as private sidings. One of the most interesting details of the increase is that it is to be maintained for six years after December 31 of the year in which peace is declared, subject to the proviso that should the increase in revenue surpass a certain amount, the surplus is to be paid into the National Treasury. This proviso is hardly expected to become operative, but it was introduced in the bill to prevent the possibility of shareholders receiving more than the dividends guaranteed them under their agreements with the state.—*Railway Gazette, London*.

The Importance of Organized Safety Work*

A Plea for Universal Application of Methods of Reaching the Employee in Accident Prevention Campaigns

By H. W. Belnap

Manager, Safety Section, United States Railroad Administration.

IN OUR INDUSTRIAL LIFE, men engaged in manufacturing and transportation employed but a few laborers. In nearly every vocation employees knew each other by name, and were familiar with each other's work to such an extent that accidents which occurred were usually explainable and could in a measure be guarded against. But with the advent of the inventor came complicated labor-saving machinery. This labor-saving machinery led to the employment by one man or corporation, not of a few men but of hundreds, and by transportation companies of thousands. As an employee's safety was dependent upon influences which he could not control, accidents increased, until at last they became so serious in number and in character that an aroused public opinion was directed to their underlying causes.

It was quickly recognized that before any remedial action regarding accidents could be taken, accurate information as to the class, kind, and circumstances were necessary. This was particularly true in the great transportation industry, so in 1887, when Congress passed the Act to Regulate Commerce, the Interstate Commerce Commission, created by that Act, was required to gather statistics on accidents that were occurring upon interstate railroads.

When these statistics were available, the country was staggered by their total. The record of killed and injured by the use of the link-and-pin couplers then in general use and because the drawbars of cars were of uneven height clearly established a reason for legislation to correct the conditions that were responsible for so many of these distressing casualties. The first attempt of the Federal Government to deal in a legislative way in accident prevention on railroads, was the enactment by Congress in 1893 of the Safety Appliance acts. These acts have amply vindicated the wisdom of their enactment, and every representation made by those who advocated them has been established and confirmed by the practical results obtained. In the year 1893, 44.33 per cent of all accidents suffered by trainmen were due to coupling and uncoupling cars; in 1916 less than 6 per cent of all accidents to trainmen were due to this cause.

The hazard of railroad employment has been lessened and life has been made safer and injuries less frequent by the mandatory obligations of these laws. The enforcement of these acts so as to safeguard the lives and limbs of employees and travellers upon railroads marks the entrance of the Interstate Commerce Commission into its "safety first" activities.

The commission's safety work, in its scope and in its results, stands forth as a splendid example in effectively preventing death and injury on railroads. Its effectiveness has been demonstrated. Its whole basis has been accident prevention. Long before railroad managements were aroused to the necessity of more extreme vigilance to prevent the frequency with which employees were involved in fatal or serious injuries, the commission, in its annual reports, called the attention of Congress and of the public to the absolute necessity of preventive legislation in the interest of greater safety.

All accidents that occur upon interstate railroads are reported monthly to the Interstate Commerce Commission, and are made public in the Commission's "Accident Bulletin,"

issued quarterly. In these accident bulletins accidents are classified under five general heads, i. e.;

- Accidents to passengers.
- Employees on and off duty.
- Other persons not trespassing.
- Trespassers.
- Non-train or industrial accidents.

Bulletin No. 62, which gives the figures for the year ending December 31, 1916, shows that there were a total of 206,723 casualties reported for that year, 10,001 being deaths and 196,722 injuries. There were 291 passengers killed and 8,008 injured. Of train service employees on duty, 2,210 were killed and 48,310 injured, and of train service employees not on duty 303 were killed and 811 injured.

The Trespassing Evil

Of other persons not trespassing, 1,744 were killed and 5,060 injured, while in non-train or industrial accidents, 525 persons were killed and 129,740 injured. By far the largest number of deaths under one classification are those caused to trespassers upon railroad property, there being 4,928 deaths and 4,793 injuries in this class of casualties.

An analysis of these totals for the one year, which is indicative of every year's record, impresses one by the surprisingly large number of trespassers they include. There is no reason nor excuse for this class of accidents. When it is considered that more than one-half of all of the fatal accidents that have occurred upon the railroads in this country have occurred to persons who have no right upon railroad premises, it becomes apparent that there is a fertile field for reform in dealing with the trespassing problem. Several studies have been made of the death toll to trespassers, which show, contrary to the general opinion, that the large majority of these persons are not tramps or hoboes. Probably less than 20 per cent are really tramps. Two-thirds of these accidents occur to people who live in the immediate vicinity of the place where they are killed and injured, and nearly all are wage-earners. About 15 per cent are children under 18 years of age. That this matter has received serious consideration, is evident by the recommendations that have been made by the National Association of Railroad Commissioners, representing the railroad commissions and public service commissions of all the states in the union, recommending preventive legislation, as well as by the fact that the Interstate Commerce Commission in its last annual report to Congress recommended:

"That Congress consider the advisability of prohibiting by statute, under appropriate penalty, trespasses on the trains of interstate carriers and on the tracks of such carriers at places where there are two or more tracks, or within the limits of incorporated towns, or at places where the carrier by appropriate sign or warning gives notice that trespassing on its tracks is prohibited, providing that nothing therein is to be considered as making lawful any trespass which would be unlawful under state laws; and further consider the advisability of conferring concurrent jurisdiction upon federal and state courts for the enforcement of such statute."

Vigorous measures should be undertaken to make people

*Presented at the annual meeting of the Association of Railway Chief Surgeons held at Chicago on May 6.

understand that railroad tracks are not public highways, and the use of them as such should be prohibited by law.

Educate the Employees

Regardless of the splendid results that are so apparent as a result of the enactment and enforcement of the Safety Appliance Acts, railroads continue to have an ever increasing casualty list up to the present time, and these casualties have not been classified in such a manner as to point out the specific legislation necessary to bring about substantial relief.

That certain legislation such as a law against trespassing will give some relief is admitted by all, but to the student of accident prevention, it is manifest that other methods and efforts are also essential in order to bring about a substantial reduction in accidents. Serious accidents have always received public attention, so that it is generally understood what was the cause and what can be done to prevent recurrences, but the casualties that swell the total and which demand our serious attention are the minor accidents which each year appear to become more and more frequent. Almost all, if not all students of this problem, have reached the conclusion that the best and most scientific method in accident prevention work is to reach the employee in an educational way, and by proper instruction and supervision keep constantly in the minds of all the necessity of exercising more than ordinary care in the performance of their work, as well as to bring about an elimination of all the useless and purposeless taking of chances, and by these means bring about the prevention of the little accidents as well as the big accidents that are constantly occurring on railroads.

Thirty per cent of all the people killed and 90 per cent of all the people injured on the railroads in this country are railroad employees. One employee is killed every $3\frac{1}{2}$ hrs., and one employee is injured every 10 min. in train accidents alone, and taking into account all accidents, one employee is either killed or injured every 3 min. during the entire year.

The "safety first" movement has already accomplished much in bringing about safer conditions of employment, but its work has only begun; it is yet in its infancy. The crying need of the hour is to get every person who works for a railroad, regardless of the capacity, interested in the safety movement. No safety organization will be successful unless it has the active and sympathetic co-operation of all concerned. For that reason, the one main purpose of such an organization is to secure the co-operation of the employees, not only in suggesting additional safeguards to be provided so that existing hazards may be removed, but also, by educational means, to bring about an elimination of dangerous practices wherever found to exist.

Limitations of Safety Devices

The use of safety devices is an important factor in the prevention of accidents. Good results are undoubtedly obtained from their use, but no mechanical safeguard can fulfill its purpose without the co-operation of efficient and ever-alert human beings having a keen appreciation of their duties and responsibilities. Such devices can not be expected to eliminate accidents entirely, however, as the human equation must always be taken into account. Our efforts must therefore be directed to the training and the development of the human equation—of the employee—so that when the test comes he will take no chance. If it can be instilled into the minds of railroad employees that it is their duty at all times to be cautious and prudent and that they must not take unnecessary risks in the performance of their duties, a great reduction in accidents will most certainly result.

Judging by the experience of those who have given this matter the most careful thought, the best method to reach all

interested appears to be in the formation of safety committees. These committees are composed of officers and employees co-operating in striving to reduce accidents in every possible way. Such organizations should certainly be commended, and deserve the loyal and hearty support of each officer and of each employee of every railroad in the United States. The benefit of such organizations can not be measured. If it is true to its purpose, it means greater efficiency in every department of the service, greater security to the lives and limbs of the employees, and better and safer service to the public, all of which are of vital importance.

Safety Committees

Such safety committees on railroads have been in operation for a number of years. On some railroads these organizations reach out into every terminal and every shop. Other railroads have perfected organizations wherein the safety features have been discussed only by the officials in charge. Both plans evidently have done some good, but the record clearly establishes the fact that those which have accomplished the most have been those organizations in which the employees have participated the largest.

After all, it appears to me that unsafe conditions and unsafe practices are known and understood best by those who work in continual connection with the unsafe conditions and the unsafe practices. That this is evident is shown by the record of recommendations that have been brought to the attention of safety committees for the purpose of correcting the unsafe conditions or practices. A complete record of the safety suggestions made by employees through their safety committees of all the railroads is not available, but from a report of a large eastern railroad, which I have just recently received, in a five-year period, 27,496 recommendations were made. Of this number 20,918, or 76 per cent, were of sufficient merit to receive attention and correction. Upon another railroad in the western territory, in a four-year period 15,559 safety suggestions were received from employees, of which number 11,708, or 75 per cent, were practical suggestions and received consideration by the committees to which they had been reported.

As indicative of the opportunity that is today presented to every employee who carefully studies unsafe conditions or unsafe practices, and reports them so that they may be changed, one employee on a western railroad made 149 safety suggestions, in 12 months, 132 of which were considered practicable and placed in effect. This man was not used exclusively in safety work; he was following his usual occupation daily and was not even a safety committeeman, yet he was so observant of the conditions that prevailed that he was able to have many unsafe conditions and practices changed and rectified. This shows what a wonderful opportunity each employee of a railroad has, if he will but exercise judgment to see to it that safe conditions are at all times established and maintained.

Experience in organized safety work has shown that casualties can be materially reduced by proper methods of education, discipline and supervision. An analysis of the records of some of the railroads that have efficient, workable "Safety First" organizations is worthy of consideration.

Chicago & North Western Record

On the Chicago & North Western the organization of "safety first" committees was commenced in May, 1910, but a complete organization was not in effect until January, 1911. In the seven and one-half years ending December 31, 1917 during which time these "safety committees" were in operation, using as a basis the number of accidents occurring in the year ending June 30, 1910, the following reduction in accidents is reported as having occurred on this railroad: There were 315 fewer employees killed, a decrease of 8.9 per cent, 16,443 fewer employees were in-

jured, a decrease of 25.3 per cent; 7 fewer passengers were killed, a decrease of 8.8 per cent; 1,454 fewer passengers were injured, a decrease of 20.8 per cent; 337 fewer outsiders were killed, a decrease of 19 per cent; and 169 fewer outsiders injured, a decrease of 3.7 per cent. Considering the totals, there were 659 fewer persons killed, a decrease of 24.6 per cent; and 18,066 fewer persons injured, a decrease of 23.6 per cent. During this same period the business of this railway increased nearly 50 per cent; more than 500 miles of new line had been completed; and the number of employees, as well as the number of locomotives and cars in service, materially increased. In six years, 27,082 recommendations made to "safety committees" were adopted and put into effect, and during this same period only 1,201 recommendations were rejected. Six thousand individual employees have served as "safety committeemen." By rotating the men who serve as safety committeemen, it is believed that the permanent employees will sooner or later all have opportunity to serve on committees. Such service inspires every committeeman with the importance of the conservation of human life and limb.

Norfolk & Western

On the Norfolk & Western "safety committees" were first organized in 1912, and the record in the reduction in the number of accidents on this railroad since the organization of these committees shows splendid results. The volume of business of the railroad steadily increased, showing a 42 per cent increase in 1916, as compared with 1912, and casualties decreased all during this period. On the basis of the number of accidents occurring in the year ending June 30, 1912, the record shows a decrease in the number of employees killed of from 23 per cent in 1913 to 49 per cent in 1916, a decrease in the number of employees injured from 22 per cent in 1914 to 41 per cent in 1916, and a decrease of employees injured in industrial work of from 21 per cent in 1914 to 24 per cent in 1916, regardless of the fact that the volume of business handled on this railroad was constantly increasing during this five-year period. During this period 7,047 safety recommendations were made, of which number 5,989, or 85 per cent, were accepted as meritorious and acted upon, and only 619, or 9 per cent, of the number submitted by the employees were rejected.

New York Central

On the New York Central an employee was appointed as early as 1910, with instructions to devote his entire time to investigate and study the cause of accidents with a view of reducing them. The need of extensive work of this kind, as a result of this one man's endeavor, was soon appreciated and in 1912 the New York Central created its "safety bureau." The decrease in deaths and injuries on this road since the time "safety committees" were organized indicates the benefit derived from organized safety work.

Using the number of accidents occurring in the year ending June 30, 1913, as a basis, the records on this railroad show a decrease in the number of employees killed in all classes of work, of 45 per cent in 1914, 43 per cent in 1915, and 24 per cent in 1916, while the decrease of employees injured in all work is 30 per cent in 1914, 29 per cent in 1915, and 7 per cent in 1916. Since the organization of "safety committees" on the New York Central, more than 40,000 safety recommendations have been made, 93 per cent of which have received favorable consideration.

The substantial decrease in the number of accidents on these three railroads, taken from different parts of the United States and operating under entirely different conditions, each having an effective and efficient safety committee organization, indicates the possibility of what may be accomplished if organizations along similar lines are created upon every railroad in the United States.

Every effort, then, to promote the co-operation of all forces interested in the enforcement of industrial efficiency of railroad employees and to eliminate accidents should meet with the encouragement of all classes. And to the support of no movement should that common encouragement come more willingly and certainly than to a safety campaign, the sole purpose of which is the elimination of accidents. For those employees who work in constant risk, there should be ready sympathy and quick relief. Money wisely and carefully spent in protecting employees is not a burden on the industry, but is without question a splendid investment.

Safety Section of Railroad Administration

In this crusade against accidents we need the active, sympathetic co-operation of every officer and every employee of every railroad, and one of the purposes of the Safety Section of the Railroad Administration is to facilitate this co-operation, in order to prevent waste of energy. At the time this section was created, it was understood it was to deal directly with each railroad, to bring about uniformity in practice, supervise such organizations for safety as are already available, and suggest such others as are desirable.

In its "safety first" work the Safety Section of the Division of Transportation, United States Railroad Administration intends to utilize to the fullest extent the safety organizations now in operation on such railroads as have working organizations, and to assist those railroads not having a safety organization to perfect such an organization as will keep constantly in the minds of all officers and employees the necessity of care and caution so as to insure greater safety in every possible way.

This is a great humanitarian work in which science, labor, business enterprises, and the government must all unite. In science we appeal especially to the mechanical engineering professions to furnish us the safest equipment; to statistics and economics to furnish us with facts and to supply the methods of investigation and of prevention; but we need most of all the help of labor, which has the greatest immediate interest in the matter, but which is too often handicapped by the lack of scientific knowledge, or by a lack of means of making itself heard. All organizations and all societies can be of material benefit and of great service in pointing out fields of investigation, so that unsafe conditions may be corrected, but better still assist in instilling into the mind of every employee the fundamental rule—that no chances of any kind must be taken.

You may rest assured that the safety movement will have the hearty support and co-operation of all government agencies to assist in the advancement of any method that will bring about a reduction in accidents. Everyone can have a great part in this philanthropic work. To make the "safety first" movement on American railroads a vital, living, energetic force for good devolves upon the officials and employees of the great railroad systems, today unified into one splendid organization working untiringly for the welfare of the greatest nation on earth.

MARCH FOREIGN TRADE SHOWS INCREASE.—March imports and exports show a partial recovery from the decline in recent months, according to a statement issued by the Bureau of Foreign and Domestic Commerce, exports for March amounted to \$531,000,000, an increase of \$119,000,000 over February. For the nine months ended with March exports were valued at \$4,394,000,000, a decrease from the \$4,637,000,000 recorded for the nine-month period a year ago. Imports were valued at \$242,000,000, a gain of \$34,000,000 over February. During the nine months ended with March imports amounted to \$2,084,000,000, against \$1,818,000,000 a year ago.

Steam Railway Statistics to December 31, 1916

Interstate Commerce Commission's Annual Abstract of Year's Operations. Reduction in Mileage

THE INTERSTATE COMMERCE COMMISSION has issued its advance abstract of statistics of railway operations for the calendar year 1916, giving figures for roads of Class I, Class II and Class III, but excluding switching and terminal companies. Probably for the first time on record the physical mileage shows a decrease on December 31 as compared with June 30.

Mileage

The physical mileage (single track) of steam roads in the United States exclusive of switching and terminal companies, compiled from both official and unofficial information, excluding duplications, is shown below for recent years:

| Year ended | Mileage at close of year | Year ended | Mileage at close of year |
|-------------------|--------------------------|---------------|--------------------------|
| December 31, 1916 | 254,045.83 | June 30, 1914 | 252,104.98 |
| June 30, 1916 | 254,250.62 | June 30, 1913 | 249,776.84 |
| June 30, 1915 | 253,788.64 | June 30, 1912 | 246,776.75 |

| Item | Class I roads | | Class II roads | | Class III roads | | Total | |
|--------------------------|---------------|---------------------------|----------------|---------------------------|-----------------|---------------------------|-----------|---------------------------|
| | Number | Aggregate capacity (tons) | Number | Aggregate capacity (tons) | Number | Aggregate capacity (tons) | Number | Aggregate capacity (tons) |
| Box cars | 1,021,757 | 37,096,132 | 8,892 | 274,490 | 1,215 | 28,624 | 1,031,864 | 37,399,156 |
| Flat cars | 117,355 | 4,426,49 | 12,579 | 984,135 | 3,619 | 97,068 | 133,553 | 4,507,416 |
| Stock cars | 82,559 | 2,674,685 | 1,300 | 46,805 | 7 | 1,387 | 83,931 | 2,721,877 |
| Coal cars | 884,880 | 42,155,468 | 22,117 | 986,601 | 1,543 | 58,662 | 908,539 | 47,090,711 |
| Tank cars | 9,507 | 383,630 | 261 | 8,146 | 134 | 4,932 | 9,802 | 397,608 |
| Refrigerator cars | 51,257 | 1,663,345 | 128 | 3,305 | 6 | 150 | 51,391 | 1,666,806 |
| Other freight-train cars | 85,296 | 3,880,826 | 6,653 | 18,876 | 2,311 | 50,134 | 94,278 | 4,159,836 |
| Total | 2,253,111 | 92,280,335 | 51,930 | 1,964,268 | 8,231 | 204,087 | 2,313,272 | 94,440,660 |

The following statement of mileage operated on December 31, 1916, represents the miles of all tracks covered by operating returns to the Interstate Commerce Commission and necessarily contains duplications because of the inclusion of 11,977.40 miles used under trackage rights and reported by more than one company:

| Item | Class I roads | Class II roads | Class III roads | Total |
|----------------------------------|---------------|----------------|-----------------|------------|
| Miles of main track | 19,215.78 | 8,817.31 | 359,705.18 | 377,738.27 |
| Miles of second main track | 1,060.00 | 5.33 | 29,414.28 | 30,479.61 |
| Miles of third main track | 716.3 | 5.04 | 2,721.27 | 3,442.61 |
| Miles of fourth main track | 1,933.48 | | 1,932.48 | 3,865.96 |
| Miles of all other main tracks | 252.3 | | 252.30 | 504.60 |
| Miles of yard tracks and sidings | 98,334.3 | 3,615.10 | 154.46 | 102,083.81 |
| Total, all tracks | 36,444.89 | 13,043.88 | 397,014.32 | 416,503.09 |
| Number of roads represented | 181 | 81 | 410 | 854 |

The number of operating switching and terminal roads that made annual reports to the commission not covered by the above statement is 209.

The growth in the number of miles of road operated and of all tracks operated, including duplications, as covered by reports of operations to the commission, is shown in the following statement for a series of years:

| Year ended | Miles of road operated at close of year | Total miles of all tracks at close of year |
|-------------------|---|--|
| December 31, 1916 | 39,505 | 397,014 |
| June 30, 1916 | 39,411 | 344,944 |
| June 30, 1915 | 42,560 | 391,142 |
| June 30, 1914 | 56,547 | 397,208 |
| June 30, 1913 | 71,420 | 379,508 |
| June 30, 1912 | 49,852 | 371,238 |

Equipment

The number of locomotives in service on December 31, 1916, as reported by Class I, II, and III companies as compared with the number in service on June 30, 1916, is shown below:

| Kind of locomotive | Number in service | |
|--------------------|-------------------|---------------|
| | Dec. 31, 1916 | June 30, 1916 |
| Steam | 68,710 | 61,178 |
| Other | 31 | 304 |
| Total | 68,741 | 61,482 |

For the same classes of roads, the number of cars in service was reported as follows:

| Kind of car - Freight train cars, all classes | Number in service | |
|---|-------------------|---------------|
| | Dec. 31, 1916 | June 30, 1916 |
| Freight train cars, exclusive of cars in service of the Pullman Co. | 2,469,999 | 2,469,997 |
| Company service cars | 28,881 | 14,664 |
| | 99,660 | 16,338 |

The following statement shows the number of freight-train cars that were classified. Caboose cars (28,504) are not included:

| Item | Class I roads | | Class II roads | | Class III roads | | Total | |
|--------------------------|---------------|---------------------------|----------------|---------------------------|-----------------|---------------------------|-----------|---------------------------|
| | Number | Aggregate capacity (tons) | Number | Aggregate capacity (tons) | Number | Aggregate capacity (tons) | Number | Aggregate capacity (tons) |

| Total | 2,253,111 | 92,280,335 | 51,930 | 1,964,268 | 8,231 | 204,087 | 2,313,272 | 94,440,660 |

Employees

The number of railway employees is arrived at by averaging the number in service on four days, respectively, in the middle of January, April, July, and October. Thus the number of employees does not represent the number of full-time workers. The number of employees and their aggregate compensation were reported as follows for the years ended December 31, 1916, and June 30, 1916:

| Item | Average number | | | |
|------------------------|----------------|---------------|---------------|---------------|
| | Dec. 31, 1916 | June 30, 1916 | Dec. 31, 1915 | June 30, 1915 |
| Number of employees | 1,111,075 | 1,075,107 | 1,075,107 | 1,075,107 |
| Aggregate compensation | \$1,111,075 | \$1,075,107 | \$1,075,107 | \$1,075,107 |

Capitalization and Dividends

In the returns to the commission securities issued are divided as between those actually outstanding, those nominally outstanding, and those nominally issued. Nominally outstanding securities are those reacquired by or for the issuing company and held alive. Nominally issued securities are those which have been signed and sealed but not sold.

The following statement shows the outstanding capitalization reported for the years ended December 31, 1916, and June 30, 1916:

| Item | Capitalization reported | |
|---|-------------------------|---------------|
| | Dec. 31, 1916 | June 30, 1916 |
| Stock and funded debt actually outstanding | \$10,600,000 | \$10,600,000 |
| Class I roads | 10,600,000 | 10,600,000 |
| Class II roads | 143,000 | 143,000 |
| Class III roads | 1,747,000 | 1,747,000 |
| Non-operating companies | 72,000 | 72,000 |
| Total | \$12,512,000 | \$12,512,000 |
| Stock and funded debt nominally issued or nominally outstanding | \$1,111,075 | \$1,111,075 |
| Class I roads | 1,111,075 | 1,111,075 |
| Class II roads | 143,000 | 143,000 |
| Class III roads | 1,747,000 | 1,747,000 |
| Non-operating companies | 72,000 | 72,000 |
| Total | \$2,143,075 | \$2,143,075 |

For the companies under consideration, the relation of capital stock and dividends was as follows:

| Item— | Year ended— | |
|---|-----------------|-----------------|
| | Dec. 31, 1916 | June 30, 1916 |
| Capital stock actually outstanding..... | \$8,755,403.517 | \$8,743,106,639 |
| Capital stock actually outstanding paying no dividends..... | \$3,325,280.282 | \$3,463,678,685 |
| Per cent paying no dividends..... | 37.98 | 39.62 |
| Amount of dividends declared during the year by operating and nonoperating companies..... | \$366,561,494 | \$342,109,396 |
| Ratio of amount of dividends declared to— | | |
| Dividend-paying stock.....per cent | 6.75 | 6.48 |
| All actually outstanding stock.....per cent | 4.19 | 3.91 |

Investment in Road and Equipment

The figures presented under this caption include returns for investment in road and equipment shown by operating roads of Class I and Class II, as well as by their subsidiary nonoperating roads (leased, operated under contract, etc.). The expenditures for additions and betterments, as well as the expenditures for new lines and extensions, during the year ended December 31, 1916, are analyzed in the following tabular statement:

| | |
|---|------------------|
| Investment to December 31, 1916 (239,120.61 miles of line represented)..... | \$17,681,126,339 |
| Investment to December 31, 1915..... | 17,349,632,708 |
| Increase, 1916 over 1915..... | \$331,493,631 |
| Investment during the year: | |
| In new lines and extensions..... | \$7,335,064 |
| In additions and betterments— | |
| On owned lines.....\$327,456,492 | |
| On leased lines.....19,234,034 | |
| | 346,690,506 |
| Total investment during the year..... | 354,025,570 |
| Adjustments..... | 22,432,435 |
| Difference between record value of grantor and purchase price of grantee in cases of roads sold, merged, consolidated, etc..... | 44,964,374 |
| Total during the year..... | 22,531,939 |
| Net increase during the year..... | 331,493,631 |

Public Service of Railways

The following table gives comparative figures for the years ended December 31, 1916, and June 30, 1916, pertaining to public service of railways and covers returns for roads having operating revenues above \$100,000 for the year:

| Item | Year ended— | |
|---|-----------------|-----------------|
| | Dec. 31, 1916 | June 30, 1916 |
| Number of passengers carried..... | 1,039,012,308 | 1,005,683,174 |
| Number of passengers carried 1 mile..... | 35,121,675,959 | 34,213,596,127 |
| Number of passengers carried 1 mile per mile of road..... | 141,305 | 137,818 |
| Number of tons of revenue freight carried, including freight received from connections..... | 2,316,088,894 | 2,225,943,388 |
| Ton-mileage, or number of tons carried 1 mile..... | 365,771,824,741 | 343,099,937,805 |
| Freight density, or number of tons carried 1 mile per mile of road..... | 1,470,274 | 1,380,349 |
| Average number of ton-miles of revenue freight per train-mile..... | 550.15 | 534.95 |
| Average receipts per passenger per mile.....cents | 2.046 | 2.006 |
| Average receipts per ton per mile.....cents | 0.715 | 0.716 |
| Passenger-service train revenue per train-mile..... | \$1,442.24 | \$1,386.91 |
| Operating revenues per train-mile..... | \$3,838.28 | \$3,828.28 |
| Freight revenue per train-mile..... | \$2,905.61 | \$2,800.74 |
| Operating expenses per train-mile..... | \$1,906.62 | \$1,832.79 |
| Ratio of operating expenses to operating revenues.....per cent | 65.62 | 65.44 |

Revenues and Expenses

The operating revenues for the year ended December 31, 1916, of the railways in the United States herein presented (average mileage operated 257,324.61 miles) were \$3,691,065,217, or \$14,344 per mile of line operated; their operating expenses were \$2,426,250,521, or \$9,429 per mile of line operated. The corresponding figures for the year ended June 30, 1916, were: Operating revenues, \$3,472,641,941, or \$13,485 per mile of line operated; operating expenses, \$2,277,202,278, or \$8,844 per mile of line operated. The following tables present a statement of the operating revenues in detail and a statement of the operating expenses assigned to the eight general classes:

Railway Operating Revenues, Year Ended December 31, 1916

| Item | Class I roads | Class II roads | Class III roads | Total |
|--|-----------------|----------------|-----------------|-----------------|
| Freight..... | \$2,560,988,111 | \$57,306,587 | \$12,797,259 | \$2,631,091,957 |
| Passenger..... | 706,608,630 | 13,376,857 | 2,373,884 | 722,359,371 |
| Excess baggage..... | 6,064,359 | 97,448 | 14,844 | 6,176,651 |

Income Account and Profit and Loss Account

The tables following present for the year ended December 31, 1916, the condensed income account and the profit and loss account of the operating roads and their subsidiary nonoperating roads. The figures given include such intercorporate payments as may be involved in the items stated. Returns for a few small roads have been omitted because of incompleteness. The accounts of the operating roads include both operating and financial transactions, while the accounts of the nonoperating roads are confined for the most part to receipts and payments under leases, contracts, and agreements.

INCOME ACCOUNT, YEAR ENDED DEC. 31, 1917

| OPERATING INCOME | Operating roads | | | | Non-operating roads | | | |
|--|-----------------|----------------|-----------------|-----------------------|---------------------|----------------|-----------------|---------------------------|
| | Class I roads | Class II roads | Class III roads | Total operating roads | Class I roads | Class II roads | Class III roads | Total non-operating roads |
| Railway operating revenues | \$1,968,865,766 | \$1,718,347 | \$16,481,103 | \$1,986,054,116 | \$1,699,000 | | | |

Over \$100,000,000 Subscribed by Railway Employees

THE RAILWAY EMPLOYEES of the United States by their subscriptions to the Third Liberty Loan have shown themselves worthy to be represented by their railway engineer regiments in France. Their subscriptions in the Loan have considerably exceeded \$100,000,000 and are at least three and possibly four times as great as their totals in the Second Loan.

The total employees' subscriptions in the Second Loan were \$36,000,000. In the Third Loan the Liberty Loan Committee for the eastern regional district with incomplete returns reported on Wednesday subscriptions by 660,000 employees for \$45,000,000. Similarly the western regional district Liberty Loan Committee reported 650,000 subscribers for \$50,013,000.

The railroad employees in each of these districts handsomely exceeded the total subscriptions by employees on the railroads of the entire country in the Second Loan.

In the southern regional district incomplete returns on Wednesday showed \$9,628,000, making a total for the country of \$104,641,000.

The following table will show how well the employees of several important railroads in the east topped their totals in the Second Loan. The reports for the Third Loan, it will be understood, are not complete.

| Pennsylvania System. | | |
|---------------------------------|-------------|-------------|
| Lines East and West. | Subscribers | Amounts |
| Second Loan | 124,789 | \$9,243,500 |
| Third Loan | 201,350 | 12,061,900 |
| New York Central System. | | |
| Second Loan | 33,284 | 2,210,050 |
| Third Loan | 143,562 | 10,402,900 |
| Erie Railroad. | | |
| Second Loan | 15,610 | 1,097,000 |
| Third Loan | 34,867 | 2,134,100 |
| Delaware, Lackawanna & Western. | | |
| Second Loan | 17,671 | 1,071,500 |
| Third Loan | 20,920 | 1,282,250 |

| | | |
|---------------------------------|--------|-----------|
| Lehigh Valley. | | |
| Second Loan | 9,915 | 625,650 |
| Third Loan | 22,801 | 1,396,100 |
| Baltimore & Ohio. | | |
| Second Loan | 6,496 | 501,800 |
| Third Loan | 53,182 | 3,872,450 |
| Boston & Maine. | | |
| Second Loan | 3,464 | 320,000 |
| Third Loan | 21,515 | 1,400,000 |
| New York, New Haven & Hartford. | | |
| Second Loan | 242 | 21,700 |
| Third Loan | 27,518 | 1,725,350 |

Reports received until noon Wednesday showed 650,000 subscribers to the Liberty Loan out of 731,000 employees of the railways in the Western Regional District. The total amount subscribed was \$50,013,000, and adding corporate subscriptions \$51,962,000. The average subscription by employees was \$77. Sixty-one roads reported that all of their employees had subscribed and 177 roads that over 70 per cent subscribed. The largest amount subscribed on any individual line was \$4,530,000 on the Southern Pacific System. The Santa Fe lines were next with \$4,000,000. Of thirteen roads with subscriptions totaling over \$1,000,000, the Rock Island Lines alone showed subscriptions for 100 per cent of their employees. The Missouri Pacific was next with 99.38 per cent. The highest average subscription on these roads was on the Northern Pacific, \$91.00.

TRAVEL PERMITS ON RAILWAYS.—In connection with the proposed issuing of permits for railway traveling in England, a correspondent points out that a scheme of the kind has for some time past been in operation in Belgium under the German military authorities, civilians being obliged to obtain official sanction before moving from one part of the country to another. It was apparently proposed to adopt the idea for Germany but the Prussian State Railways Administration decided against it on the ground that it would not be feasible in the present circumstances.—*Railway Gazette, London.*

British Troops Boarding a "Leave" Train in the Rain

General News Department

The enginehouse of the Boston & Maine at South Vernon, Vt., was destroyed by fire on April 25; estimated loss, including a cottage adjacent and damage to two locomotives, \$20,000.

The freight house of the Baltimore & Ohio at Braddock, Pa., was destroyed by fire on May 2, estimated loss including a large amount of freight, \$225,000. The fire is believed to have been incendiary.

The union station at Houston, Tex., is now used by the passenger trains of the International & Great Northern, which, until the consolidation of interests following government control, ran to and from the I. & G. N. station at Congress avenue.

The Atlanta (Ga.) Chamber of Commerce has aided in securing positions in Atlanta for a number of the railroad traffic men whose offices in that city have been abolished. According to a local newspaper there are 114 men affected by the order discontinuing solicitation of passengers and freight, of whom about one-third desired to remain in Atlanta.

The Overman Bill, authorizing the President of the United States to reorganize government departments, which has passed the Senate, was on Tuesday reported favorably to the House of Representatives. The proposed amendment to exempt the Interstate Commerce Commission from the operation of this law was not included, having been defeated in the Judiciary Committee by a vote of 12 to 6.

The Brotherhood of Railroad Trainmen, according to statements of its officers in the newspapers, now has in its membership nearly all of the brakemen on the Louisville & Nashville. Until the issuance of the circular by the director general saying that there should be no discrimination between union and non-union men in the railroad service, the brakemen of the Louisville & Nashville had not belonged to any union.

Investigation of the fire which destroyed the shops of the Lake Erie & Western at Lima, Ohio, on April 24, mentioned in the *Railway Age* of May 3, page 1138, indicates that there is no substantial evidence that it was caused by an incendiary. The suspect who was arrested has been released. Less equipment was destroyed than was first reported, only six small locomotives, about 25 years old, one old baggage car and one old coach.

The United States Shipping Board, Edward N. Hurley, chairman, is now organized in six divisions, and the Emergency Fleet Corporation, subordinate to the Shipping Board, has eleven divisions; and the two organizations, the Shipping Board and the Emergency Fleet Corporation have agencies in 15 cities. An outline of these organizations, with a list of the officers and local representatives, is printed in the May number of the Official Railway Guide.

The Quartermaster's Department of the United States Army, following its reservation of space in the new Pennsylvania freight station in Chicago issued orders to those unions which were striking to resume work on the building immediately. Accordingly all have returned to work with the exception of electricians installing elevators in the building. These men refuse to return to work until the Otis Elevator Company meets an agreement made before the state arbitration board.

In a letter to western roads, dated May 7, regional director R. H. Ashton, of the Western Regional District, asks that officers best qualified to handle the full economy campaign, personally attend the convention of the International Railway Fuel Association to be held in Chicago May 23 and 24. He has suggested that this representation include general managers, general

superintendents, superintendents of motive power, train dispatchers, master mechanics, traveling engineers, purchasing agents, superintendents, etc.

The locomotive boiler inspectors of the government will receive substantial increases of salary, if Congress accepts a report presented in the House this week by the Committee on Interstate and Foreign Commerce. By the bill as reported the chief inspector will be advanced from \$4,000 to \$5,000; two assistant chief inspectors from \$3,000 to \$4,000; and fifty district inspectors from \$1,800 to \$3,000. The report says that the legislative agents of the brotherhoods of enginemen, conductors and firemen, supported the bill.

Stenciling Freight Cars

The Executive Committee of the Master Car Builders' Association has issued Circular No. 40 requesting that the placing of reporting marks on freight cars between two horizontal bars be considered as a Standard of the Association.

The Railway Regiments' Tobacco Fund

Colonel Wildurr Willing of the 12th Engineers (Railway) has acknowledged receipt under date of April 10, of two shipments of tobacco. He states that "This tobacco was divided among the enlisted personnel of the regiment and I am sure the men have had no greater treat since entering the service of the government."

The Supply of Steel

Practically the entire output of steel has been commandeered for the government by the War Industries Board. The surplus remaining after the government's war needs have been met, together with a certain part of the output not required for such purposes, will have to answer for the non-war industries, under strict government supervision. This plan was outlined to a meeting of the American Iron & Steel Institute at New York last week by J. L. Replogle, the steel director for the War Industries Board, who said that altogether too much steel was being absorbed by non-essentials and that the government's requirements would require practically the entire output. Among the requirements for steel he mentioned the quantities needed for cars and locomotives and added that the director general of railroads had asked for 2,000,000 tons of rails.

To Guard Railroad Securities.

The National Association of Owners of Railroad Securities has issued a letter to the directors of railroads, now under government control and operation, calling to their attention the fact that they now have the responsibility of representing all classes of securities issued by their respective railroads as the contracting parties on behalf of the owners of the properties, in the execution of the proposed contract which each railroad is to make with the government.

The sub-Executive Committee of the association has held several conferences with railroad men and financiers, as a result of which there has been appointed a special committee representing owners of railroad securities, the same consisting of S. Davies Warfield, President of the Continental Trust Company, Baltimore, chairman; Gordon Abbott, chairman of the Old Colony Trust Company, Boston; James Brown, of Brown Brothers & Co., New York; Frederick H. Ecker, treasurer of the Metropolitan Life Insurance Company, New York; and John J. Pullen, president of the Emigrant Industrial Savings Bank, New York. Samuel Untermyer and E. H. Inness Brown, the latter of the firm of Hornblower, Miller, Garrison & Potter, have been named as counsel to the committee.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JANUARY, 1918

Railway Revenues and Expenses

The Interstate Commerce Commission has given out the following partial summary of railway returns for March and three months of the year, covering the reports of 114 large roads. Only partial summaries have thus far been given out for January and February as there has been a delay on account of a change in the monthly report form. The preliminary figures are as follows:

22, between the British Columbia Minister of Railways and the various individuals forming the Pacific Great Eastern and the subsidiary companies.

This agreement virtually gives the province of British Columbia complete possession of the entire railway, and the property and credits of the subsidiary companies, and provides that all claims by the several parties named against either of the companies shall be released to the government forthwith, and upon the performance of these terms the

OPERATING REVENUES, EXPENSES AND INCOME OF 114 LARGE ROADS

Note—There are included in this statement 56 roads in the Eastern District, 22 in the Southern District, and 36 in the Western District. Total, 114 roads.

The Pacific Great Eastern Agreement

The controversy between the province of British Columbia and the promoters of the Pacific Great Eastern which has been a cause for extended litigation has been settled recently by an agreement signed by the parties involved. The Pacific Great Eastern is a line projected from Vancouver in a northerly direction about 400 miles to Prince George, a station on the Grand Trunk Pacific about 450 miles east of Prince Rupert. The company was incorporated in 1912, the promoters including among others, members of the contracting firm of Foley, Welch & Stewart, which firm agreed to build the line, and D'Arcy Tate, who had secured a traffic agreement with the Grand Trunk Pacific upon a guarantee of bonds by the British Columbia Government. Construction was started but the company got into financial difficulty and received further assistance from the government. In 1916 further assistance was asked but owing to a change of administration this request led instead to an extended investigation that disclosed a series of irregularities in the management of the project. These consisted primarily of overpayments estimated at \$5,700,000 and it was found that it would cost \$12,000,000 more to complete the line, which the contractors had undertaken to build upon a guarantee of \$20,160,000 in bonds. This investigation resulted in the issuance of writs against the Pacific Great Eastern, the subsidiary companies and all others concerned, for an accounting, for an injunction restraining them from proceeding with the work, for specific performance of the original agreement and for damages for breach of agreement. These were issued on May, 1917, since which time negotiations have been in progress, which led to an agreement signed on February

government will release the other parties from their engagement. Detailed provisions are made for the release of the several parties upon the fulfillment of their obligations in accordance with one or more options. The agreement is not to become operative until ratified by the legislature and the several parties have agreed, on request of the Province, to apply for the necessary legislation.

The Government has outlined a plan for the future of the railway. The first section of the line from North Vancouver is Whytecliffe, 13 miles, will be placed in good operating condition as soon as possible and connected with the North Vancouver lines of the British Columbia Electric Railway. The completed line from Squamish to Clinton, 167.7 miles, will have to be put in good condition, while the line from Clinton to Prince George, 185 miles, will be completed as speedily as possible.

Official Guide Fifty Years Old

The Official Railway Guide announces that with its current issue (May) it completes the 50th year of its publication. The first number was that for June, 1868. It was then called The Travelers Official Guide, and was published at No. 644 Broadway, New York City. Edward Vernon was the editor.

The issue for June, 1868, shows no road west of the Missouri River except the Union Pacific, which was in operation to Cheyenne, and the Central Pacific, building eastward from Sacramento, had arrived as far as Cisco—92 miles.

The size of the page at that time was 6 x 4½ inches, but the Guide has now become undoubtedly the largest monthly publication in the world.

Not only do its pages contain the history of the roads themselves, but they have a human interest. To a young man entering upon railroad work it has been one of the first signs of success when he achieved a rank which entitled his name to appear in *The Official Guide*; and as he advanced his name mounted, until many times it has reached the top line. The titles of *The Guide* contain the most complete record of many phases of transportation development, particularly in the combination of through routes, the accelerated time of trains, improvements in comfort, and many other features which distinguish American travel. So far as is known, but one complete set exists. That has been placed in the New York Public Library, where future historians may have access to it.

Loyal L. & N. Employees

The letter of President Milton H. Smith, of the Louisville & Nashville, to the employees of the road, calling for patriotic devotion to their duties noticed in the *Railway Age* of April 12, page 997, was responded to by a committee of employees including representatives from all branches of the service, in a manifesto, expressing intelligent and earnest loyalty, which is quite unusual. This letter, addressed to President Smith, and signed J. D. Keen, chairman, reads in part as follows:

"We note with pleasure that you have regarded our loyalty and efficiency in the past, and you have urged us to maintain these distinctive characteristics as we now are devoted to a mission of greater importance in the direct service of our government in time of war.

"Practically the entire organization of our company is composed of those who from their boyhood days have grown up in the service of the L. & N. Under your thoughtful leadership both officers and employees have been methodically trained and thoroughly skilled. As loyal employees, we have always gladly shared the misfortunes of our company, whenever the dark clouds of commercial depression lowered thick and heavy about us; but we have all rejoiced when the sunlight of prosperity returned. In comparing our wages with the dividends some of us may have felt at times that the divisions made were not equitable, but whether this be true or not, you may rest assured that the great majority of us have been able to understand that you were prudently providing not only for our vast army of employees, but also for meeting the many phased conditions of our natural growth and to provide reasonable accommodations in deference to the ever-changing demands of a restless public.

"While vast sums of money have been spent in driving our new extensions through the wilderness of the South, you have lifted thousands of miles of our old road out of the mud of the low and treacherous lands, and placed it upon a firm bed of good ballast, with heavy ties and rails. You have built beautiful stations at all our important terminals, and have encouraged the habitation and cultivation of boundless tracts of rich farm lands.

"As president of the Louisville & Nashville you have wisely developed and practically completed a vast structural and functional railway system of inestimable value to the civil life of our entire country, a grand monument to a clear perception, a steadfast purpose, boundless energy, a good heart and great executive ability.

"The timely act of our government in providing a suitable railroad commission and adjustment board, in the unusual circumstances, delegated to adjust wages and working conditions, seniority, etc., we look upon as wise. It will greatly reduce if not entirely eliminate the possibility of dissatisfaction. And, in the language of the director general, every employee may now devote himself unreservedly and patriotically to his work with the assurance that his rights and interests will be justly dealt with. Your kindly letter to us will promote a better understanding, a fuller and more certain knowledge of our obligations, and a more enthusiastic loyalty in our new relations. We, with you, pledge ourselves to make, willingly, whatever patriotic sacrifices are required, to give steadfast co-operation, devoted and unswerving service, and absolute loyalty to our government, that together we may all work for universal liberty and for a world made safe for Democracy."

Roadmasters' Association Work

Among the subjects which have been selected for committee investigation and report by the Roadmasters' and Maintenance of Way Association this year are the following:

Data on Mechanical Devices Used in Track Maintenance; J. B. Oatman, roadmaster, Buffalo, Rochester & Pittsburgh, Du Bois, Pa., chairman.

Labor Saving Devices; J. W. Powers, supervisor, New York Central, Rochester, N. Y., chairman.

Fencing, Including Cattle Guards, Farm Crossing Gates and Anchoring of Fences; Charles Newberg, roadmaster Chicago & North Western, Mayfair, Ill., chairman.

A paper will also be presented on Best Methods of Raising Track by George Beckingham, superintendent of track, Grand Trunk, Montreal, Que.

The convention will be held at the Auditorium Hotel, Chicago, on September 17, 18 and 19.

Traffic News

The United States Shipping Board announced, at Washington on May 2, that authority had been given for the construction of 50 new wooden barges for use in carrying coal to New England, each barge to be of 3,500 tons capacity.

The Kansas City Southern, the Texarkana & Ft. Smith, the Arkansas Western and the Poteau Valley have closed their commercial offices at New York City, Pittsburgh, St. Louis, San Antonio, Chicago, Dallas, Houston, and New Orleans.

A request for cheaper transportation for agricultural workers recruited by the United States Employment Service for distribution among agricultural communities has been filed by Louis F. Post, assistant Secretary of Labor, with the Railroad Administration.

The Louisville & Nashville announces the closing of its freight traffic offices in seventeen cities, namely, Augusta (Ga.), Buffalo, Cleveland, Chicago, Detroit, Dallas, Houston, Indianapolis, Jacksonville (Fla.), Kansas City, Little Rock, Macon, New York, Oklahoma City, Pittsburgh, Savannah and Tampa.

Between Houston, Tex., and Texas City, 43 miles, all freight in less than carloads must henceforth be sent by the Galveston, Houston & Henderson. Shippers offering freight at the stations of the other two roads, the Missouri, Kansas & Texas, and the Southern Pacific, will be directed to go to the freight station of the G. H. & H.

Special orders providing for the diversion of coal to New England, issued during the critical period of last winter, have been revoked by Fuel Administrator Garfield, this arrangement being superseded by the zone system. District representatives of the Fuel Administration will attend to the filling of emergency and other essential requirements for bituminous coal from the different producing fields.

The Railroad Commission of Georgia, after considering the subjects for many months, examining 35,000 pages of exhibits and taking thousands of pages of testimony, has announced its approval of a general advance in freight rates in that state, by percentages which are expected to increase gross freight revenues 8 per cent. It is said that intrastate freight constitutes only 15 per cent of the freight traffic of the Georgia Railroads.

The "Return Loads Bureau," of the Merchants' Association of New York city, established for the benefit of automobile trucks carrying freight to and from other cities, reports that hundreds of trucks have already been registered; and applications are constantly being received from out of town trucks for which loads are desired from New York. Somebody in New York is preparing to send trucks to Charleston, S. C., a distance of over 700 miles, to bring back 12 tons of merchandise.

The Post Office Department announces that aeroplanes, to carry letters, will begin making regular trips between Washington and New York on May 15. The price for letters is to be 24 cents an ounce, which will include special delivery. The announcement says that, during the early stages of the service, no attempt will be made to send out aeroplanes on days when rain or fog is likely to obscure the vision of the aviators. On such days the letters will be sent by special messenger, by railroad train, starting at 11 A. M.

The number of carloads of export freight on hand at North Atlantic ports on May 1, exclusive of coal and grain, was 28,588, of which 24,166 were consigned to the United States or to one of the Allied governments. The total compares with 41,202 cars on January 1, of which about three-fourths were government shipments. Of the total on the first of May, 13,256 carloads consisted of freight lying on the ground; 6,290 carloads were in warehouses and 9,042 were cars not yet unloaded. More than half of the 28,588 carloads reported on May 1 were at New York city.

The Merchants' Association, of New York city, has complained to the Railroad Administration, at Washington, that certain railroads have refused to accept silk for shipment from New York city, for the reason, it is said, that serious losses have been sustained because of thefts from freight cars. Some of the railroads have referred shippers to the express companies, but these do not wish to accept any lot of more than five bales.

Plans for the restriction of the movement of anthracite coal from the United States to Canada during the present coal year have been formulated by the United States Fuel Administration, in co-operation with the Fuel Controller of Canada. A representative of the Fuel Administrator attended a recent conference of representatives of coal operators, coal miners and railways in Canada at which this problem was discussed. Anthracite supplies to points in western Canada will be materially restricted. No American anthracite will be available for shipment to points west of Winnipeg.

Port and Terminal Improvement Commission

The United States Shipping Board has appointed a Commission on Port, Terminal, and Harbor Improvement, headed by Edward F. Carry, director of operations of the Shipping Board, and composed of representatives of the Army, Navy, Railroad Administration, and ship interests. The commission is designed to bring about a more economic arrangement and utilization of the ports and harbors of the Nation. In the interest of the army it will see to it that embarkation ports are so arranged that there will be adequate railroad, warehouse, and other facilities. It will deal with bunkering facilities, which is of interest to the Navy and will work to avoid wasteful journeys of freight. The program that will be considered by the commission is designed to eliminate all waste motion.

In addition to Mr. Carry, as chairman, the commission includes B. L. Winchell, S. M. Felton, Capt. A. C. Hodgson, George S. Dearborn, J. H. Rossiter, and Edwin F. Gay.

Coal Production

In the week ended April 27 the government reported not only the largest rate of production of bituminous coal during the past 12 months, but the third successive week of rising production, according to the weekly bulletin of the Geological Survey. Production of bituminous coal, including lignite and coal made into coke, is estimated at 11,668,000 net tons, an increase of 5.7 per cent over the preceding week. The average production per working day is estimated at 1,946,000 net tons compared with 1,840,000 net tons last week, and 1,680,000 net tons during April, 1917.

Production for the month of April, 1918, is estimated at 46,478,000 net tons, an increase of 4,400,000 net tons or 10 per cent over April of last year. Production for the four months ended April, 1918, is estimated at 181,992,000 net tons, an increase of over 5,000,000 net tons or 3 per cent compared with the same four months of 1917. Anthracite shipments slightly increased during the week of April 27, 9 roads reporting 39,522 carloads compared with 39,130 during the preceding week.

The percentage of full time output during the week ended April 20 was 72.2, the largest for several weeks, and the percentage of full time output lost due to car shortage was 16.2.

The Interstate Commerce Committee of the Senate, through its chairman, Senator E. D. Smith, of South Carolina, has instituted a preliminary inquiry into what efforts the Railroad Administration is making to furnish immediate adequate supplies of cars at the mines in order to avert a possible coal shortage next winter. Senator Smith has conferred with representatives of the Railroad Administration and secured information on the subject, and it is planned to obtain similar statements from the Fuel Administration and these will be considered by his committee to determine whether public hearings ought to be held.

Up to April 27 the railroads had moved 82,000 more cars of coal, including both anthracite and bituminous, than in the corresponding period of the previous year, after making up for a considerable decrease during January and the first part of February.

Commission and Court News

Court News

Federal Employers' Liability Act

The New Jersey Court of Errors and Appeals holds that, in a widow's proceeding to recover compensation for the death of her husband under the State Workmen's Compensation Act, the burden was on the petitioner in the court of first instance to show affirmatively that the deceased was engaged in intrastate service not regulated by the federal act, a fact not to be presumed in the absence of proof. *Lincks v. Erie* (N. J.), 103 Atl. 176. Decided March 4, 1918.

Conductor's Duty to Passengers

In an action for damages alleged to have been caused by incorrect information given to the plaintiffs as to necessity for change of cars, the North Carolina Supreme Court holds that a conductor was not negligent in failing to volunteer information that the train did not stop at the station to which the plaintiffs had tickets, since he might assume that they intended to alight at a nearby station and continue the journey by a local train or otherwise.—*Hutchison v. Southern* (N. Car.), 95 S. E., 181. Decided December 7, 1917.

Limitation of Time for Actions Against Railroads

The New Jersey Court of Errors and Appeals holds that, under section 58 of the State Railroad Act of 1903, as amended in 1912, all actions accruing from injuries to persons caused by the wrongful act, neglect or default of a railroad, shall be commenced within two years after the cause of action accrued and not after; and the infancy of the person injured will not exempt him from the operation of this statutory rule.—*Grabert v. Central of New Jersey* (N. J.), 103 Atl., 212. Decided March 4, 1918.

Liability of Consignor for Freight Charges

Freight was shipped "charges collect," and a sight draft was drawn on the consignee, with bill of lading attached, which was paid. There was no special contract binding the carrier to collect the freight charges from the consignee. In the absence of this, the Georgia Supreme Court holds that although the carrier had delivered the goods to the consignee without payment of the freight, it could recover from the consignor.—*Southern Cotton Oil Co. v. Southern* (Ga.), 95 S. E. 251. Decided February 15, 1918.

Regulation of Station Stops

Where the facts showed that the train service otherwise furnished a county seat, California, Mo., was reasonable and adequate, the Missouri Supreme Court affirmed a judgment setting aside an order of the Public Service Commission, requiring a certain interstate mail train to stop there on flag. The train stopped there only to let off passengers from St. Louis. It was held that the fact, standing alone, that the train stopped on flag at certain smaller places was of little, if any weight. *State ex rel. Mo. Pac. v. Commission* (Mo.), 201 S. W., 1143. Decided March 5, 1918.

Recovery by Initial from Connecting Carrier

The Oklahoma Supreme Court holds that the words "required to pay," as used in the Carmack Amendment, authorizing recovery by the initial carrier against the connecting carrier of damages it may be required to pay the shipper for loss or injury occurring on the connecting carrier's line, mean asked to pay, or asked of right and by authority of law to pay, and do not require as a condition precedent to recovery that it shall have actually paid a judgment recovered against it by the shipper.—*St. Louis & San Francisco (Okla.)*, 171 Pac., 467. Decided December 11, 1917. Rehearing denied March 19, 1918.

Injury to Employee—Scope of Employment

A telegraph operator, while off duty, was injured by a defect in a roadmaster's gasoline speeder on which he was traveling to a nearby town to procure food supplies for himself. The Montana Supreme Court holds that the railroad was not liable to him as employee, since he was going neither to nor from his work, was engaged on his own private business, and was actuated in his choice of ways to reach his destination by motives entirely personal. Nor was the company liable on the theory that he was a passenger. He was a mere licensee, to whom the company owed no duty to keep its speeder in good order or to operate it with caution. And the roadmaster, by his invitation, had no authority to create any higher relation of such employee to the railroad than a mere licensee, his duties being circumscribed and confined to maintenance of way. Even if it were assumed the operator was a guest the railroad's only duty would be to use reasonable care for his safety; and if the happening was not necessarily inconsistent with ordinary care the rule of *res ipsa loquitur* could not apply.—*Glover v. Chicago, M. & St. P.* (Mont.), 171 Pac., 278. Decided February 26, 1918.

Employers' Liability Act Decisions

The Iowa Supreme Court holds that a conductor of a work train unloading ties to repair a track used for interstate traffic is employed in interstate commerce and therefore within the act, although the train is operated along a route wholly within the state, and although at the time of the accident he was not engaged in distributing ties, but was returning from work in charge of the train.—*Eley v. C. G. W.* (Iowa), 166 N. W., 739. Decided March 18, 1918.

A railroad company contracted with T. to keep coal chutes from which its locomotives were supplied filled with coal and to keep the ashes cleaned out of a turntable pit. He employed his own assistants, one of whom was injured in the work and sued the railroad. The South Dakota Supreme Court held that the evidence showed that the railroad did not retain control over the time of T. or his helpers, or over the manner of doing the work, but only reserved control of the results, and the plaintiff was not employed by the railroad so as to make it liable under the federal Employers' Liability Act.—*Polluck v. Minneapolis & St. Louis* (S. Dak.), 166 N. W., 641. Decided March 8, 1918.

Contract to Complete Logging Line—

Discrimination in Freight Rates

A railroad contracted to build and put in operation a line from a timber tract to a point on the main line. The road had until June 1 to finish construction of the line. The Tennessee Supreme Court holds that the construction of a line in which the curves were fully tied, but the straight portions of which were half tied, but which enabled an engine and cars with additional ties to be sent forward and to put it in condition to bear any traffic tendered by the lumber company, and where heavy mill machinery was hauled over the line early in April, and the road was thereafter steadily improved, it was constructed and placed in operation for general traffic; the word "constructed" having substantially the significance of the word "completed." The railroad contracted to transport lumber, etc., at a certain rate. The court holds that the shipper, if entitled to the part of the joint through rate paid by the connecting carriers to the railroad for originating traffic, would have an undue and forbidden preference over other shippers, and a contractual obligation that it should receive such distribution would not justify such discrimination, and it refused to enforce the contract.—*Caroline Spruce Co. v. Black Mountain* (Tenn.), 201 S. W., 154. Decided February 11, 1918.

Medical Attendance to Injured Employees

A foreman of track repairers, in attempting to board a moving freight train in the course of his employment, was thrown under the caboose, which cut off both his legs. His wife and several of his friends came up immediately after the injury and one of the friends went for the local doctor. They did

not object when the conductor proposed to take the injured man in the caboose to a hospital some miles distant, without waiting for the doctor, and the injured man assented to this course. He subsequently died from his injuries. His wife sued the railroad, alleging that death was caused by the railroad's failure to permit the deceased to remain at a point where he was injured, at least until the local doctor arrived. The Kentucky Court of Appeals held that it was incumbent on the plaintiff to show with reasonable certainty that, if such course had been pursued the deceased's life could have been saved. With regard to the railroad's duty in such circumstances, the court made the following rulings: Where a railroad servant is injured and adult members of his family are present when the accident occurs, or come to him before his removal by the company, or at any time thereafter, and express a desire to take charge of him, the railroad should deliver over to them the care of the case and do what they advise; also the wishes of the injured person, if he is capable of understanding conditions, should be respected. When the conductor, believing that the man could have more skilful treatment at another town, took charge of the matter of removing him thereto, such assumption of control, though with the consent of the injured man and his wife, carried with it the duty to exercise the required care. What a railroad must do necessarily depends on the time, place, character of the injury and surrounding circumstances. It was held that the conductor exercised reasonable care to save the life of the injured man, thus performing the railroad's duty to him. Judgment for the defendant was affirmed.—*Troutman's Adm'r. v. L. & N.* (Ky.), 200 S. W., 488. Decided February 5, 1918.

What Amounts to Conversion of Goods Transported?

The rule as commonly stated is that a common carrier is liable in conversion for misdelivery or nondelivery of property intrusted to it for transportation, and that on the making of an adverse claim and demand by a third person the carrier assumes the risk of correctly deciding between the claimant and the shipper or consignee. The result of this is that, though the carrier is without adequate means of information, it will be held in conversion if it errs in its decision. In the statement of the rule it is generally recognized as productive of much hardship to common carriers impartial as between the contending parties and desirous only of discharging the duties imposed on them by law. It has been suggested as a possible relief that a carrier in such a position might file a bill of interpleader and bring the parties in to settle their own controversy, but difficulties of jurisdiction, the loss of market, the perishable character of the property, etc., would seem to impair its adequacy. The hardship of the rule has resulted in adding the compulsion of legal process to the exceptions of "the act of God and the public enemies," and it is held that the carrier will be protected against the shipper or consignee if the property has been seized or taken from its possession by attachment, replevin, or search warrant at the instance of a third person. The carrier should, however, give notice of the proceeding. It is also settled that it will not be held liable should it decide correctly, and then voluntarily surrender the property to the adverse claimant who is in fact the true owner. The plaintiff in this case had owned and used hotel cars in its land business, and sold them to a third party, reserving title until the purchase-money notes were paid. Thereafter the plaintiff asserted a default. The purchaser, claiming to have paid in full, leased the cars for use in a traveling show. The railroad company, for a consideration, granted the lessee the use of the spur track near his residence as a space for storage of the cars; the agreement reserving to the railroad company no power or right of supervision. While the cars were on the storage track the plaintiff made formal demand therefor on the railroad. Thereafter the latter transported the cars for the lessee and redelivered them to him. The Circuit Court of Appeals, Eighth Circuit, holds that in view of the defendant's obligation as a common carrier to transport for any person it was not liable, for when the demand was made it had no control over the cars, and when it transported them it was not guilty of connivance with the lessee.—*Atchison, T. & S. F. v. International Land, Etc. Co.*, 247 Fed., 265. Decided November 26, 1917.

Equipment and Supplies

The Government Orders

Complete information concerning the Railroad Administration's orders for 1,025 locomotives and 100,000 cars will be found on page 1169 of this issue.

After this article was in type, however, announcement was made of the appointment of a committee consisting of W. G. Phelps, purchasing agent of the Pennsylvania Lines West; W. C. Bower, purchasing agent of the New York Central Lines East, and H. C. Pearce, general purchasing agent of the Seaboard Line, to arrange for the materials for the car and locomotive orders. The committee has held meetings with the producers and is working with the raw materials committees of the Council of National Defence. Whether the materials will be purchased by the government or by the car builders has not yet been determined.

Locomotives

THE ALABAMA & VICKSBURG has ordered 3 Mallet type locomotives from the Baldwin Locomotive Works.

THE ALTO CEDRO SUGAR COMPANY has ordered one Mogul locomotive from the American Locomotive Company.

THE FERROCARRILES DEL NORTE DE CUBA have ordered five ten-wheel locomotives from the Baldwin Locomotive Works.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, is in the market for one second-hand Mogul type locomotive, with 19 by 24 in. cylinders, and having a total weight in working order of 60 tons and a steam pressure of 180 lb.

Freight Cars

THE UNITED STATES NAVY is inquiring for 6, 50-ton flat cars.

THE ILLINOIS CENTRAL is inquiring for 7 10,000-gal. tank cars.

THE TODD INTERESTS, Gainesville, Tex., are inquiring for 200 tank cars.

THE MUTUAL OIL, Kansas City, Mo., is inquiring for 50 tanks of 8,000-gal. capacity.

THE GENERAL ELECTRIC COMPANY, Erie, Pa., is inquiring for 3 all-steel gondola cars.

THE MARCELL INTERESTS, Chanute, Kan., are inquiring for 15 10,000-gal. capacity tank cars.

THE ZIMMERMAN ALDERSON CARR COMMISSION COMPANY, Dallas, Tex., is inquiring for 10, 8,000-gal. tank cars.

THE AMERICAN INTERNATIONAL STEEL CORPORATION, New York, is inquiring for 25, 18-ton and 25 22-ton wooden flat cars for export to South America.

Miscellaneous

THE HOCKING VALLEY has awarded a contract to the Roberts & Schaefer Company for the installation of Robertson coaling conveyers at Toledo, Ohio, and Marion.

THE CHICAGO GREAT WESTERN has ordered from the Railroad Water & Coal Handling Company, of Chicago, a coaling station of 100-tons' capacity to be built at Talmadge, Ia.

THE PENNSYLVANIA RAILROAD has awarded a contract to the Roberts & Schaefer Company, engineers and contractors, Chicago, for the installation of a 300-ton, two-track, automatic electric, reinforced concrete locomotive coaling plant and two separate "Rands" gravity sand plants of concrete construction for installation at Kane, Pa. A contract has also been given to the same company for the construction of a concrete 100-ton coaling plant at Rainey Junction, Pa.

Supply Trade News

John J. Cummings, president of the McGuire-Cummings Manufacturing Company, Chicago, died on May 4.

The Union Switch & Signal Company announces the removal on May 1, of its Montreal office from 510 Canadian Express building to 803 McGill building.

F. E. Lauderbach, in charge of southern territory for the National X-Ray Reflector Company, with office at St. Louis, Mo., has resigned, and that office has been abolished.

The Certes Supply Company, St. Louis, Mo., has been appointed selling agent for the Burden staybolt and engine bolt iron, and iron rivets for St. Louis and territory tributary thereto.

The Southern Railway Supply & Equipment Company, St. Louis, Mo., announces the purchase from the Scarritt-Comstock Furniture Company of that company's car seat department, and the reorganization of that end of the business as the Scarritt Car Seat & Manufacturing Company.

J. M. Riordan, until recently sales engineer of the Grant Lees Gear Company, Cleveland, and formerly representing the Fellows Gear Shaper Company of Springfield, Vt., in the central states, is now connected with the sales organization of the Cleveland Milling Machine Company, 18511 Euclid avenue, Cleveland, Ohio.

Press G. Kennett, southern railway sales manager for the Flint Varnish & Color Works, with headquarters at St. Louis, Mo., has been appointed western railway sales manager, with headquarters at Chicago, succeeding Rex W. Hudson, resigned to engage in other business. J. C. Jonas has been appointed southern railway sales manager at St. Louis, succeeding Mr. Kennett.

The property and plants of the Lehigh Foundry Company and the Lehigh Car, Wheel & Axle Works, of Fullerton, Pa., have been merged into one organization, the Fuller-Lehigh Company, with its office and works at Fullerton, Pa. The properties of the two companies are adjoining and have been for a number of years under the same management. The change is one of name only. The executive personnel remains the same.

E. C. Peck, superintendent of the Cleveland Twist Drill Company at Cleveland, Ohio, has received an appointment as lieutenant-colonel in the engineering bureau of the ordnance department. Mr. Peck will have charge of the gages used in the production of munitions and kindred materials for the above department. His duties will be the supervision of design of gages and the settling of limits of variance which will be satisfactory to both manufacturer and the ordnance department itself.

D. R. Morris, assistant engineer of the valuation department of the New York Central (Buffalo and East), resigned May 1 to accept a position with the Federal Signal Company as sales engineer. Mr. Morris graduated from the Chicago Manual Training School in June, 1898, and entered the signal field on the Chicago & North Western July 9, 1898, remaining with this company for four years. The next six years were spent on signal construction with the General Railway Signal Company. From 1908 to August, 1912, he was with the Illinois Central as signal inspector and general foreman of construction; from August, 1912, to April 15, 1914, he was signal engineer of the El Paso & South Western, and from April 15, 1914, to June, 1916, he was with the Federal Signal Company and Protective Signal Manufacturing Company; he became connected with the New York Central in June, 1916. Mr. Morris will be located at the company's New York office.

Jesse Lowe, contracting engineer, died at his home in Chicago on April 17. Mr. Lowe was born at Omaha, Neb., on January 17, 1861, and graduated from the Rensselaer Polytechnic Institute, Troy, N. Y., in 1885. For a short time after his graduation he was assistant to the city engineer of Omaha, and assistant engineer in locating the Omaha Belt line and in the preliminary and location surveys of the Missouri Pacific west of Omaha. In 1886 he was located at Lincoln, Neb., as resident

engineer of the Missouri Pacific. From there he went to Birmingham, Ala., as assistant manager of the Birmingham Bridge & Bolt Works. In 1887 he formed a partnership at Omaha with Andrew Rosewater and George B. Christie for the purpose of engaging in civil engineering work. The following year the firm was dissolved and the firm of Christie & Lowe was organized for similar purposes. This firm was continued until 1913. Among the projects completed by this firm are the following: The cable street railways, Denver, Colo.; piers for the Bellefontaine Bluffs bridge over the Missouri river and the Harlem street culvert at St. Louis for the Keokuk & Northwestern; the Fullerton avenue loop at Chicago, the first underground trolley line in America, and the Fifth street railway in Washington, D. C. He also constructed two miles of the Chicago drainage canal and the controlling works, including the Great Bear Trap dam which regulates the flow of water from the Great Lakes to the Gulf. The firm did considerable other railroad and bridge work for lines in the Middle West and river and harbor improvement work for the United States government.

Trade Publications

SMOOTH ON IRON CEMENT. The sixteenth edition of the "Smooth-On" instruction booklet, which has just been issued, contains 144 pages, each one with an illustration showing in an interesting manner how the different "Smooth-On" iron cements are used for repairing purposes.

CLAM SHELL BUCKETS. The Blaw Knox Company, Pittsburgh, Pa., has just issued an attractive 24-page booklet, printed in colors, describing its single line clam shell buckets. The booklet describes the uses to which this bucket may be adapted and shows it in various positions. The book also contains data regarding weights, dimensions and clearances.

BALANCE DRAFT.—The Engineer Company of New York has issued bulletin 16 entitled "Balance Draft," giving an analysis of combustion conditions and boiler operation when nearly atmospheric pressure is maintained in the furnace chamber. Bulletin No. 18 issued by the same company explains in detail the advantages of balance draft and describes the apparatus necessary to maintain it.

BOILER METERS. In bulletin No. 41, issued by the Bailey Meter Company, Boston, Mass., and entitled "How to Save Coal," there is considerable useful information regarding boiler capacity, efficiency and the amount of air necessary for complete combustion. Bailey meters give continuous records of steam flow, air flow and temperature variations and this bulletin points out the necessity of such records for efficient boiler operation.

TRUCK BATTERY CHARGING.—Publication No. 234, issued by the Cutler-Hammer Manufacturing Company, Milwaukee, Wis., is a six-page illustrated folder describing the C-H sectional battery charging equipment for industrial electric trucks, which has been extensively used in public and private garages. Two pages are devoted to illustrating a number of large and small equipments in industrial establishments, piers and railroad terminals.

"AFTER FIFTY YEARS."—The United States Switch Company, Eau Claire, Wis., has issued an elaborate 32-page book describing its automatic switch lock for the protection of facing point switches. The design and construction of this device are described in detail, as well as its service in high speed main lines extending over a period of more than six years. The book is attractively prepared and the information is presented in a concise manner.

PUMPS FOR CUTTING COMPOUND.—The Fulflo Pump Company, Cincinnati, Ohio, has recently issued a bulletin describing the impeller type of pump for the distribution of coolant which this company manufactures. It has also prepared for free distribution a booklet entitled "The Scientific Lubrication of Cutting Tools." This booklet gives a short history of cutting tool lubrication and describes the methods of application of cooling compounds which have been found most effective in increasing the life of tools.

INCREASED WAGES FOR MANCHURIAN RAILWAY EMPLOYEES.—Beginning with March 1 the employees of the South Manchuria Railway were granted a general increase in their wages.

Financial and Construction

Railway Financial News

CHESAPEAKE & OHIO.—See editorial comments elsewhere in this issue.

CHICAGO, BURLINGTON & QUINCY.—Howard Elliott of New York and Hale Holden have been elected directors for the term ending May 1, 1922. Mr. Elliott succeeds Maj. George T. Slade who has gone to France in the United States military service.

MICHIGAN CENTRAL.—See editorial comments elsewhere in this issue.

NEW YORK CENTRAL.—See editorial comments elsewhere in this issue.

NEW YORK, CHICAGO & ST. LOUIS.—The board of directors was increased from thirteen to fifteen members at the annual meeting on May 1 by the election of T. H. Ginn and W. G. Turner, both of Cleveland, as new members. Mr. Turner is secretary of the company.

OZARK VALLEY.—The Bender Iron and Supply Company of Shreveport, La., purchased the 35-mile line on April 22 at Greenville, Mo., for the price of \$188,500.

PITTSBURGH & WEST VIRGINIA. Walter L. Hachulac has been elected a director to succeed E. R. Timber.

Railway Construction

ATLANTIC COAST LINE.—Work is to be started at once on the construction of a passenger station at Lakeland, Fla. The building will be two stories high, of brick construction, and the work will be carried out by the railroad company's forces.

ILLINOIS CENTRAL.—This company has awarded a contract to T. S. Leake & Co., Chicago, for the erection of an inbound freight house at East St. Louis, Ill., which will cost approximately \$150,000. The building will be a one-story structure, 50 ft. by 612 ft., except for a section at the middle of the building 38 ft. by 28 ft., where second story space will be provided for office purposes. It will be a brick building, similar to the outbound freight house constructed last year.

The Illinois Central has also given a contract to the Ferro Construction Company, Chicago, for the erection of the steel superstructure of the new St. Charles Air Line bridge, Chicago, and the removal of the old bridge. The steel for the new bridge was purchased from the American Bridge Company late in 1916.

PENNSYLVANIA RAILROAD.—Contracts have been given to Cuthbert Brothers, Pittsburgh, Pa., for putting up the following buildings at West Brownsville, Pa.: 5-stall engine house and machine shop, 132 ft. by 120 ft., on concrete foundations, to be of frame construction, with wood block floor, metal siding and slag roof; storeroom, office and oil house, 30 ft. by 75 ft., two stories high, on concrete foundations, to be of frame construction, with wood block floor and metal siding, and a power plant, 40 ft. by 80 ft., on concrete foundations, to be of frame construction with metal siding. The total cost of the work will be about \$65,000.

PHILADELPHIA & READING.—A contract has been given to C. P. Bower for rebuilding bridge No. 57 north of Hellertown, Pa., on the Bethlehem branch. The existing structure is a stone arch carrying two tracks. The new bridge is to be a concrete box structure with 26 ft. clear span over a public road with top reinforced with steel I-beams, and will carry 15 tracks.

BRITISH AMBULANCE TRAINS FOR U. S. ARMY.—The Great Western of England has supplied 104 locomotives and over 4,000 cars for the railways overseas. It is building two ambulance trains for the United States troops in Europe. Altogether, fifteen such trains are being or have been built by British railways.—*The Engineer, London.*

ANNUAL REPORTS

New York Central Railroad Company—Report of the Board of Directors to the Stockholders

To the Stockholders of

THE NEW YORK CENTRAL RAILROAD COMPANY:

The Board of Directors herewith submits its report for the year ended December 31, 1917, with statements showing the results for the year and the financial condition of the company.

The mileage covered by this report is as follows:

| | Miles |
|--|----------|
| Main line and branches owned..... | 3,702.75 |
| Leased line..... | 1,527.02 |
| Line operated under trackage rights..... | 455.66 |
| Total road operated..... | 5,685.43 |

a decrease of 3.36 miles, due to reassignments made in connection with Government Valuation and the abandonment of trackage rights over small pieces of road of other companies. On January 15, 1917, the Dolgeville and Salisbury Railway Company was merged with this company and its mileage, 3.70, added to the Dolgeville Branch. On June 23, 1917, the Cornwall Bridge Company conveyed all its property to The New York Central Railroad Company and its mileage was added to the Ottawa Branch. These two acquisitions did not affect the total mileage operated but simply changed its classification.

The President of the United States, by his proclamation of December 26th and by virtue of the power vested in the Chief Executive in time of war by Acts of Congress, took possession and assumed control of the operation of the property of this company through the Secretary of War, at twelve o'clock, noon, on December 28, 1917, the accounts of the company to be continued to the end of the year.

SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME

| | 1917 | 1916 | INCREASE OR DECREASE |
|--|------------------|------------------|----------------------|
| | miles operated | miles operated | 3.36 miles |
| OPERATING INCOME..... | 5,685.43 | 5,685.43 | |
| RAILWAY OPERATIONS..... | | | |
| Revenues..... | \$216,267,517.22 | \$201,585,048.68 | \$14,682,468.54 |
| Expenses..... | 153,597,905.35 | 129,738,369.19 | 23,859,536.16 |
| NET REVENUE FROM RAILWAY OPERATIONS..... | \$62,669,611.87 | \$71,846,679.49 | —\$9,177,067.62 |
| Percentage of expenses to revenues..... | (71.02) | (64.36) | (6.66) |
| Railway taxes accrued..... | \$11,239,638.42 | \$8,481,549.11 | \$2,758,089.31 |
| Uncollectible railway revenues..... | 19,395.51 | 17,906.84 | 1,488.67 |
| RAILWAY OPERATING INCOME..... | \$51,410,577.94 | \$63,347,223.54 | —\$11,936,645.60 |
| MISCELLANEOUS OPERATIONS..... | | | |
| Revenues..... | \$5,713.27 | \$1,758.59 | \$3,954.68 |

By action of the several State Commissions having jurisdiction, authority was given for the issue of \$25,000,000 of the capital stock of the company to reimburse its treasury for expenditures on capital account. Of the amount so authorized, however, only \$258,900 was actually issued during the year.

Authority was obtained from the Public Service Commissions of the states of Illinois, Michigan, New Jersey and New York in the months of April and May, 1917, for the issue of \$10,000,000 of this company's Refunding and Improvement Mortgage bonds, Series A, and authority from the same commissions was obtained in September for the issue of a further \$10,000,000 of bonds of the same series. The \$20,000,000 of bonds so authorized, and which will bear interest at the rate of 4½ per cent per annum, have been executed and pledged as collateral for \$15,000,000 of two-year Collateral Trust Gold notes, due September 15, 1919, bearing interest at the rate of 5 per cent per annum, payable semi-annually on March 15th and September 15th.

The New York Central Railroad Equipment Trust of 1917, authorized by the Board of Directors on October 19, 1916, has become effective and, of the equipment provided for in the agreement, 16 steam and 9 electric locomotives, 4,000 steel underframe box cars and 3,000 steel coal cars have been delivered. In February \$8,205,000 of the certificates, bearing interest at the rate of 4½ per cent, were sold at a small premium. Since that time it has been found impossible to secure a satisfactory market for the certificates, and in order to procure equipment as needed this company has purchased, at par, \$1,305,000 of the certificates, of which \$500,000 were pledged as security for short term loans and \$805,000 carried in the treasury of the company. On December 31st, \$87,000 of these certificates were redeemed.

There has been no long term debt matured during the year, but the usual installments on the various equipment trusts have been paid.

The changes in the funded debt of the company are shown in the following statement:

Amount as reported at the beginning of the year..... \$672,929,007.38 which has been increased as follows:

| | |
|---|-----------------|
| Refunding and Improvement Mortgage bonds, Series A, nominally issued and pledged as collateral for notes..... | \$20,000,000.00 |
| Two-year Collateral Trust Gold notes..... | 15,000,000.00 |
| Mortgage, East Cambridge Land Company..... | 100,000.00 |
| Equipment Trust of 1917 certificates, \$9,510,000 of which \$1,305,000 were purchased by the company, \$860,000 of them being pledged as collateral for short term loans..... | 9,510,000.00 |

a total increase of..... \$44,610,000.00 and has been reduced as follows:

Payments falling due during the year and on January 1, 1918, on the company's liability for certificates issued under equipment trust agreements as follows:

| | |
|--|----------------|
| N Y C Lines Trust of 1907, installment due November, 1917..... | \$1,492,884.74 |
| N Y C Lines Trust of 1910, installment due January, 1918..... | 1,406,413.74 |
| N Y C Lines Trust of 1912, installment due January, 1918..... | 688,398.90 |
| N Y C Lines Trust of 1913, installment due January, 1918..... | 742,117.61 |
| Boston & Albany Trust of 1912, installment due October, 1917..... | 500,000.00 |
| N Y C R R Co Trust of 1917, installment due January, 1918..... | 634,000.00 |
| and by transfer of trust locomotives to the Michigan Central Railroad Company..... | 192,106.20 |

a total decrease of..... \$5,655,921.19 making the net increase during the year..... \$38,954,078.81

leaving the funded debt on December 31, 1917, at..... \$711,883,086.19

Since the date of the annual meeting on January 24, 1917, the number of stockholders has grown 5,530, the total number at the end of the year being 27,102, of whom 26,771 are in the United States and 331 abroad. The par value held by those here is \$247,579,960 and by those abroad \$2,269,400, the average holdings being 92½ and 68½ shares respectively. In 1915 the numbers reported were 22,270 here and 2,772 abroad, the general average holding being, approximately, 100 shares while now it is 92 shares.

The great increase in the cost of labor and material is reflected in the heavy operating expenses of 1917, which more than absorbed the added revenue for the year. This, together with decreased returns from subsidiaries and investments, heavier taxes and added charges for interest on debt, reduced the company's net corporate income, as compared with the year 1916, by \$20,059,997.50.

In the operation of the Pension Department 233 employees were retired and placed upon the pension roll, of these retirements 128 were authorized because of the attainment of seventy years of age, and 105 because of total and permanent physical disability. 180 pensioners died during 1917, and at the close of the year 1,527 retired employees were carried upon the pension rolls. The average monthly pension allowance of these is \$25.78, and the total amount paid in pension allowances during the year was \$464,379.37.

Expenditures during the year for improvements on property were as follows:

| | |
|---|-----------------|
| Improvements on owned property, used in operation, and cost of equipment of Dolgeville & Salisbury Railway Company and Cornwall Bridge Company..... | \$13,878,381.55 |
| Equipment purchased and acquired, less equipment retired and transferred..... | 15,973,048.32 |
| Improvements on leased property..... | 3,737,044.15 |
| Improvements on miscellaneous physical property..... | 682,399.46 |

the net increase in property investments, as shown in detail on other pages, during the year 1917, being..... \$34,270,873.48

The New York Central Railroad as constituted on December 31, 1917, was in operation three years. During these three years the gross revenue increased about one-half and the net income was about tripled. The percentage of gross revenue saved for net corporate income in 1914 was 6.1 per cent and in 1917 was 11.8 per cent.

A brief synopsis of the relative balance sheets of January 1, 1917, and December 31, 1917, is as follows:

| Assets | | January 1, 1917 | December 31, 1917 |
|-------------------------------------|--|-----------------|-------------------|
| Real and equipment | | \$620,480,100 | \$694,619,840 |
| Improvements on leased property | | 82,942,900 | 92,132,200 |
| Miscellaneous physical property | | 6,011,900 | 8,680,600 |
| Securities of affiliated companies | | 24,678,900 | 194,534,900 |
| Securities of other companies | | 34,312,800 | 44,429,300 |
| Total property | | \$968,426,500 | \$1,034,396,200 |
| Current assets | | 69,161,200 | 84,827,800 |
| Deferred and unadjusted assets | | 10,781,000 | 39,577,900 |
| | | \$1,048,368,700 | \$1,158,801,900 |
| Liabilities | | January 1, 1917 | December 31, 1917 |
| Capital stock | | \$249,590,500 | \$249,849,400 |
| Debt | | 703,413,900 | 729,185,500 |
| Total capitalization | | \$953,004,400 | \$979,034,900 |
| Current liabilities | | 32,805,500 | 46,552,700 |
| Deferred and unadjusted liabilities | | 33,152,900 | 57,410,600 |
| Surplus | | 29,405,900 | 75,803,700 |
| | | \$1,048,368,700 | \$1,158,801,900 |

The abnormal conditions during the year and the curtailment of working forces by enlistments, conscription and resignations, placed an unusual burden of work upon the officers and employees of the company, which has been faithfully borne, and grateful acknowledgment of their service under trying conditions is hereby made.

For the Board of Directors,
ALFRED H. SMITH,
President.

CONDENSED GENERAL BALANCE SHEET, DECEMBER 31, 1917

| | \$5,867,272.79 |

The Michigan Central Railroad Company—Seventy-second Annual Report

To the Stockholders of

THE MICHIGAN CENTRAL RAILROAD COMPANY:

The Board of Directors herewith submits its report for the year ended December 31, 1917, with statements showing the results for the year and the financial condition of the company.

The report covers the operation of the same mileage as the previous year, as follows:

| | Miles |
|--|----------|
| Main line and branches owned | 1,182.84 |
| Line jointly owned | .71 |
| Leased lines | 578.16 |
| Lines operated under trackage rights | 100.06 |
| Total road operated (as shown in detail on another page) | 1,861.77 |

There was no change in capital stock during the year, the amount authorized being \$18,738,000.00 and actually outstanding \$18,736,400.00.

The funded debt outstanding December 31, 1916, was..... \$53,915,193.92

It has been increased during the year by:

| | |
|--|-----------------|
| Additional liability for certificates outstanding under 1913 trust, account of transfer of 10 locomotives from The New York Central Railroad Company | 192,106.20 |
| | \$54,107,300.12 |

It has been decreased during the year by:

| | |
|--|-----------------|
| Payment of pro-rata of installments on account of equipment trust certificates | |
| Trust of 1907, due November, 1917 (N. Y. C. Lines) | \$260,425.45 |
| Trust of 1910, due January, 1918 (N. Y. C. Lines) | 393,960.44 |
| Trust of 1912, due January, 1918 (N. Y. C. Lines) | 151,710.90 |
| Trust of 1913, due January, 1918 (N. Y. C. Lines) | 262,359.54 |
| Trust of 1915, due October, 1917 (M. C. R. R.) | 1,368,456.33 |
| Total funded debt outstanding December 31, 1917 | \$52,738,843.79 |

Certificates were issued under the Michigan Central Railroad Equipment Trust Agreement of 1917, to an aggregate amount of \$4,845,000.00, but as these were concurrently acquired by the company, there is no change in the funded debt in this connection.

The changes in the road and equipment account during the year, and as shown in detail on another page, were as follows:

| | |
|--|-----------------|
| The amount charged to December 31, 1916, was | \$86,134,182.07 |
| Expenditures during the year, for additions and betterments—road | 1,718,723.25 |
| Cost of equipment acquired under trust agreements | \$6,144,861.47 |
| Excess cost of new equipment purchased, and additions and betterments to equipment over value of equipment retired | 746,428.67 |
| | 6,891,290.14 |
| Total amount charged to road and equipment December 31, 1917 | \$94,744,195.46 |

The changes during the year in the account showing amount of improvements on leased railway property, and as shown in detail on another page, were as follows:

| | |
|--|----------------|
| The amount charged to December 31, 1916, was | \$2,241,578.40 |
| Expenditures during the year, for additions and betterments—road | 288,182.02 |
| Total amount charged to December 31, 1917 | \$2,529,760.42 |

At a meeting held on February 7, 1917, the stockholders authorized the execution of a Refunding and Improvement Mortgage, to be dated January 1, 1917, to secure the company's new outstanding debentures of 1909, amounting to \$7,634,000.00, and to secure equally and ratably with the debentures, bonds to be issued under the mortgage to an amount not exceeding \$10,000,000.00. By the terms of the mortgage, the Board of Directors is given the power to authorize the issue of bonds in series, maturing on such dates not later than January 1, 2017, and bearing interest at such rates as shall be fixed and determined by the Board for the purposes specified in the mortgage; and it is provided that where the amount issued for the purposes other than the refunding of debentures or prior debt shall be \$10,000,000.00, no additional amount of bonds shall be issued in respect of work done or of property acquired, in any amount exceeding 70% of the cost of such work or property. The execution of the mortgage and the issuance thereunder of \$8,000,000.00 of bonds have been authorized by the Michigan Railroad Commission and the Public Utilities Commission of Illinois, but as yet no refunding and improvement mortgage bonds have been issued.

The Michigan Central Railroad Equipment Trust of 1917 was established by agreement dated March 1, 1917, which provides for a total issue of \$9,000,000.00 equipment trust certificates, bearing interest at 4½% per annum. Under the provision of the trust 10 passenger train cars and 3,450 freight train cars were received, 80% of the cost of which was covered by certificates and the remainder by cash payments. The certificates issued during the year amounted to \$4,845,000.00, but owing to the fact that the general market has been practically closed to railroad securities, the company through the medium of short term loans acquired all of the certificates, paying a greater part of them as collateral, pending more favorable conditions for their sale.

On May 15, 1917, this company issued its one year promissory notes for \$8,000,000.00 bearing interest at the rate of 5% per annum, the proceeds being used to take up other notes aggregating \$6,000,000.00, and the balance for corporate purposes.

During the period July 1, 1912, to May 1, 1916, this company advanced to the Indiana Harbor Belt Railroad Company, for additions and betterments, the sum of \$769,884.02, which amount was covered by notes of the Belt Company. In exchange for these notes The Michigan Central Railroad Company received 7,650 shares of the stock of the Indiana Harbor Belt Railroad Company of a par value of \$765,000.00 being its pro-rata increase in the capital stock of that company from \$2,450,000.00 to \$5,000,000.00, and it further received a demand note dated November 23, 1917, bearing interest at the rate of 5% per annum, for \$4,884.02. By acquiring this stock the company increased its holdings in capital stock of the Indiana Harbor Belt Railroad Company to 15,499 shares.

In addition to the \$769,884.02 above mentioned, this company on June 26, 1917, advanced to the Indiana Harbor Belt Railroad Company \$262,616.63, bearing interest at the rate of 5% per annum, to cover proportionate expenditures for additions and betterments and the redemption of notes issued by that company to cover advances for additions and improvements. By the acquisition of this stock the company's holdings of the capital stock of the Detroit Terminal Railroad Company were increased to 5,000 shares.

The Michigan Central Railroad Company had in its treasury December 31, 1917, contributed its ownership proportion or \$150,000.00 towards an increase in the working fund.

The company acquired 4,068 shares of the capital stock, par value of \$406,800.00, and a demand note dated June 15, 1917, amounting to \$35,848.02 of the Detroit Terminal Railroad Company in liquidation of notes issued by that company to cover advances for additions and improvements. By the acquisition of this stock the company's holdings of the capital stock of the Detroit Terminal Railroad Company were increased to 5,000 shares.

The Michigan Central Railroad Company had in its treasury December 31, 1917, par value of the first mortgage 3% gold bonds of the Bay City and Battle Creek Railway Company, the property of which had been acquired by purchase in 1916. On March 14, 1917, the Board of Directors authorized the cancellation of the bonds, and pursuant to such authority, they were destroyed by cremation on June 7, 1917.

On April 8, 1917, The New York Central Railroad Company became a tenant of this company's freight and passenger terminal facilities in Detroit, Michigan.

In the operation of the Pension Department, 46 employees were retired and placed upon the pension roll. Of these retirements 29 were authorized because of the attainment of seventy years of age, and 17 because of total and permanent physical disability. 30 employees were retired during 1917, at the close of the year 293 retired employees were carried upon the pension rolls. The average monthly pension allowance of these employees was \$22.45, and the total amount paid in pension allowances during the year was \$560.84.

The President of the United States, by his proclamation of December 26th, and by virtue of the power vested in the chief executive in time of war by acts of Congress, took possession and assumed control of the operation of the property of this company, through the Secretary of War, at 12 o'clock, noon, on the 28th day of December, 1917.

SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME

| | 1917 | 1916 | |

INCOME BALANCE TRANSFERRED TO CREDIT OF PROFIT AND LOSS

Profit and Loss account

AMOUNT TO CREDIT OF PROFIT AND LOSS DECEMBER 31, 1916 \$1,113,432.94

Add:

Surplus for the year 1917 \$7,436,566.66
 Proceeds from sale of unclaimed and re-fused freight 41,959.81
 Insurance collections on property not re-placed 11,100.00
 Sundry adjustments and cancellations net 15,373.01
 \$19,612,022.44

Deduct:

Expenses, Michigan Central Railroad equipment trust of 1917 \$9,560.00
 Discount, commission and expenses, NYC Lines equipment trusts of 1910 and 1913 5,305.87
 Expenses, Michigan Central refunding and improvement mortgage 15,937.75
 Depreciation unaccrued prior to July 1, 1907, on equipment retired during 1917 346,923.74
 Federal excise tax on 1916 income (U. S.) 148,930.79
 Business profits war tax on 1916 income (Canada) 404,665.25
 Abandoned property 97,566.49
 \$18,589,136.74

BALANCE TO CREDIT OF PROFIT AND LOSS DECEMBER 31, 1917 \$18,589,136.74

The total gross revenue for the year was \$52,879,434.29, an increase of \$6,460,644.18, due principally to the general expansion of business conditions throughout the country, there having been an unprecedented volume of traffic incident to the war and the abnormal conditions resulting therefrom.

The total operating expenses were \$38,289,136.32, an increase of \$7,642,875.60. By groups the increases were as follows:

Maintenance of way and structures \$223,269.43
 Maintenance of equipment 1,351,215.46
 Traffic 45,457.07
 Transportation 5,804,513.44
 Miscellaneous operations 1,349,279.91
 General 94,927.41
 Total \$7,642,875.60

The increase in operating expenses can be attributed in a large measure to greater traffic, higher rates of wages and increased cost of fuel and other supplies.

The railway tax accruals for the year were \$1,972,236.73, an increase of \$286,226.67 as compared with the previous year, due principally to war tax in the United States and the Dominion of Canada, partly offset by a reduction in rate of ad valorem tax in the state of Michigan.

The total deductions from gross income were \$10,036,240.36, an increase of \$1,860,613.73. The principal fluctuations were as follows:

Hire of equipment increased \$1,272,998.61, due to higher rates and increased traffic, partly offset by additional equipment purchased and put in operation the latter part of the year.
 Separately operated properties—loss increased \$326,445.01, of which \$318,020.11 was operating guarantee to the Indiana Harbor Belt Railroad Company.

Interest on unfunded debt increased \$347,958.46, on account of the larger amount of short term notes outstanding.
 Interest on funded debt increased \$370,366.19 and rent for leased roads decreased \$483,993.18, due almost entirely to the absorption of various leased lines mentioned in the 1916 report.

We regret to record the death on the eighteenth of October, 1917, of Louis D. Heuser, Assistant General Passenger Agent, who was for many years a faithful and valued employee.

George H. Webb, Chief Engineer of this company, was commissioned Lieutenant Colonel of the 10th Regiment Railway Engineers, United States Army in June, 1917, and is now in active service in France.

The following appointments were effective during the year:

January 1st Henry Russel, Vice President
 January 1st Frank E. Robson, General Counsel
 March 14th Edmond D. Bronner, Vice President and General Manager
 June 28th James F. Deimling, Acting Chief Engineer
 July 1st Arthur L. Survey, Valuation Engineer
 August 15th Carl Howe, Traffic Manager
 August 15th Preston G. Finlay, General Freight Agent

Acknowledgment is hereby made to officers and employees for faithful and efficient service.

For the Board of Directors

WILLIAM H. SMITH

President

Cleveland Cincinnati Chicago & St. Louis Railway Company Twenty-ninth Annual Report

To the Stockholders of
THE CLEVELAND CINCINNATI CHICAGO AND ST. LOUIS RAILWAY COMPANY:
The Board of Directors herewith submits its report for the year ended December 31, 1917, with statements showing the results for the year and the financial condition of the company.

The mileage embraced in the operation of the road is as follows:

| | Miles |
|-----------------------------------|----------|
| Main line and branches owned..... | 1,693.03 |
| Proprietary lines | 126.09 |
| Leased lines | 202.42 |
| Operated under contract | 201.37 |
| Trackage rights | 164.00 |
| Total road operated..... | 2,386.91 |

By the corporate action of this company and that of the Saline Valley Railway Company, approved by the State Public Utilities Commission of Illinois, the latter company conveyed its railway and other property to this company and a merger thereof with the railway of this company was effected on the tenth day of April, 1917. For this reason the table above shows an increase in the mileage of main line and branches owned of 5.16 miles and a corresponding decrease in mileage of leased lines as compared with the year 1916.

A statement showing in detail the mileage of road operated will be found on another page.

The President of the United States, by his proclamation of December 26th and by virtue of the power vested in the chief executive in time of war by acts of Congress, took possession and assumed control of the operation of the property of this company through the Secretary of War, at 12 o'clock, noon, on the 28th day of December, 1917.

| Balance to credit of profit and loss December 31, 1917..... | | | \$9,661,133.72 |
|---|--|--|----------------|

Gross operating revenues for the year were \$52,650,920.24, an increase of \$5,972,679.80, of which \$5,778,718.82 was in transportation revenue and \$193,960.98 in incidental and joint facility revenues.

Total revenue tonnage carried was 35,802,523, an increase of 2,899,940, of which 2,871,367 was in bituminous coal, smaller fluctuations in the other classes of traffic practically offsetting one another. The average revenue per ton per mile was 5.66 mills, an increase of 1 mill, due largely to increases in rates granted by the federal and state commissions during the year. The revenue train loading was 691 tons, an increase of 37 tons or 5.66 per cent, while freight revenue per train mile was \$3.91, an increase of \$0.27.

The total railway operating expenses were \$38,059,421.05, an increase of \$6,837,444.55. Fluctuations by groups were as follows:

| | |
|--|--------------|
| Maintenance of way and structures—decrease..... | \$169,478.39 |
| Maintenance of equipment—increase | 1,122,166.70 |
| Traffic—increase | 13,936.80 |
| Transportation—rail line—increase | 5,643,656.10 |
| Miscellaneous operations increase | 46,811.04 |
| General—increase | 124,599.27 |
| Transportation for investment—credit—decrease..... | 55,753.03 |

| | |
|--------------------|----------------|
| Net increase | \$6,837,444.55 |
|--------------------|----------------|

Pay rolls increased \$3,848,262.76, of which \$2,323,944.21 was due to increases in rates scheduled by the various departments made necessary by industrial competition and increased cost of living. An analysis of the prices on a representative list of material items used in large quantities by the company shows an increase of about 40 per cent in the prices on such material over the previous year. There is also an increase in the item of fuel for locomotives of \$2,099,848.57, of which \$1,607,894.60 is due to increase in prices.

The net income for the year was \$5,257,807.10, a decrease of \$3,073,895.28. Dividends aggregating 5 per cent or \$499,925.00 on the outstanding preferred stock of the company, were paid and charged against the net income. The surplus for the year was \$4,656,972.12, a decrease of \$2,342,991.91.

During the year there was charged to income the company's proportion of the deficit resulting from the operation of the Central Indiana Railway for the year amounting to \$60,627.35 or \$1,027.26 more than the previous year.

The operations of the Kankakee and Seneca Railroad (for which separate accounts are maintained) show revenues for the year \$119,303.93, operating expenses, including fuel, oil, and maintenance, and interest, of \$66,575.73, the half of which \$34,787.86, was assumed by this company and charged to income in 1917.

The Mount Gilead Short Line (for which separate accounts are maintained) shows revenues for the year \$975,218, operating expenses and taxes \$2,404,220, non-operating income \$132.50, deficit \$2,319.61, all of which was charged to income by this company in 1917.

The summary of financial operations affecting income includes the operations of the Peoria and Eastern Railway, Indianapolis, Indiana, and the operations of Illinois. Separate accounts for this line are maintained, and the operations for the year 1917 show revenues amounting to \$2,544,826.30, operating expenses and taxes \$2,248,046.37, operating income \$296,779.93, non-operating income \$460,116.91, gross income \$756,896.84, deductions from gross income \$653,943.32, surplus \$102,953.47. Sundry adjustments of profit and loss and other items during the year aggregated \$61,437.54, leaving \$141,615.93

net surplus for the year, which deducted from \$456,788.66 due this company for advances on December 31, 1916, makes the indebtedness on December 31, 1917, \$415,172.73.

In connection with the federal valuation of the company's property, the work of investigating the cost of grading, bridges and buildings was continued by the valuation forces during the year. Complete survey of the cost of adjacent lands was made independent of that made by the Government land appraisers, which force made during the year investigation of the cost of adjacent land upon about two-thirds of the line. The work of compiling quantities in the company's structures was continued, and the engineering forces are ready to check tentative valuation. The Government forces have been getting their data together, and it is expected that tentative report will be made some time during the year 1918.

In the operation of the Pension Department 46 employees were retired and placed upon the pension roll. Of these retirements 30 were authorized because of the attainment of seventy years of age, and 16 because of total and permanent physical disability. 39 passengers died during 1917, and at the close of the year 370 retired employees were carried upon the pension rolls. The average monthly pension allowance of these retired employees is \$21.58, and the total amount paid in pension allowances during the year was \$57,176.86.

There was no change in the capital stock during the year the amounts authorized and issued to December 31, 1917 being as follows:

| | |
|---|-----------------|
| Preferred stock authorized | \$10,000,000.00 |
| Common stock authorized | 50,000,000.00 |
| Total stock authorized | \$60,000,000.00 |
| Preferred stock issued | \$10,000,000.00 |
| Common stock issued | 47,056,300.00 |
| Total stock issued | \$57,056,300.00 |
| Balance common stock authorized but not issued, December 31, 1917 | \$2,943,700.00 |

The funded debt maturing outstanding December 31, 1916, was \$100,586,224.16.

It has been decreased during the year as follows:

| | |
|---|--------------|
| Big Four Ry. equipment trust certificates payable June 1, 1917 | \$373,000.00 |
| Big Four Ry. equipment trust certificates payable July 1, 1917 | 115,000.00 |
| Pro rata New York Central Lines equipment trust certificates payable November 1, 1917 | 246,689.81 |
| Pro rata New York Central Lines equipment trust certificates payable January 1, 1918 | 476,249.73 |

| | |
|--|-----------------|
| C. & St. L. & Ry. Co. general first mortgage bonds retired | 73,000.00 |
| C. & St. L. & Ry. Co. first mortgage bonds retired | 6,000.00 |
| Central Grain Elevator Co. first mortgage bonds retired | 25,000.00 |
| C. & St. L. & Ry. Co. first mortgage bonds retired | 40,000.00 |
| lateral trust mortgage bonds purchased for sinking fund | 1,549,979.54 |
| Total funded debt outstanding December 31, 1917 (detail on another page) | \$99,128,462.62 |

Under Big Four Railway Trust Agreement of June 1, 1917, authorized by the Board of Directors, May 9, 1917, five passenger locomotives, seven freight and fifty freight train cars and fifty passenger train cars were contracted for at an estimated cost of \$1,488,000.00. Trust certificates were issued during the year to the total amount of \$1,488,000.00, but as these were concurrently acquired by the company, there is no change in the funded debt in this connection. Of the new equipment contracted for, fifteen locomotives, fifteen passenger train cars and all of the freight train cars were received and put in service during the year.

The additions to the road and equipment account during the year were as follows:

| | |
|--|----------------|
| Additions and betterments road | \$1,221,971.89 |
| Equipment acquired under trust agreement | \$3,084,987.49 |
| Owned equipment in excess of retirements | 1,006,753.61 |
| 4,093,712.99 | |
| Total per detail on another page | \$6,313,712.99 |

In the six years ended December 31, 1917, there were marked increases in the growth of business and train loads. These increases are reflected in the average net corporate income of the Company which for the three years ended June 30th, 1917, was nearly three times that for the year 1911, and in surplus of the Company which at the close of 1917 shows an increase of \$7,500,000 for the period. Along with these favorable results it should be borne in mind that this Company has absorbed in the six years period the losses entailed by the flood in 1913. The per cent of gross revenue saved for net corporate income was about six per cent in 1911 and ten per cent in 1917.

On June 1, Walter R. Gibbons was appointed Real Estate and Tax Agent and William J. Hiner, Purchasing Agent.

Thanks and appreciation are extended to the officers and employees for their loyal and efficient service during the year.

For the Board of Directors,

ALFRED H. SMITH,
President

The Chesapeake and Ohio Railway Company—Fortieth Annual Report

Richmond, Va., April 8, 1918.

TO THE STOCKHOLDERS:

The Fortieth Annual Report of the Board of Directors, for the fiscal year ended December 31, 1917, is herewith submitted.

The average mileage operated during the year by The Chesapeake and Ohio Lines was 2,412.1 miles, an increase over the previous year of 33.4 miles. The mileage at the end of the year was 2,478.3 miles, an increase of 6 miles over mileage on December 31, 1916.

RESULTS FOR THE YEAR.

| | |
|--|-----------------|
| Operating Revenues were | \$54,643,793.52 |
| Increase \$4,806,481.34, or 9.65% | |
| Operating Expenses were | 38,105,805.89 |
| (Increase \$5,407,130.04, or 16.54%) | |
| Net Operating Revenue was | \$16,537,987.63 |
| (Decrease \$597,648.70, or 3.49%) | |
| Taxes were | 2,439,331.04 |
| (Increase \$802,727.03, or 49.05%) | |
| Operating Income, Tax deducted, was | \$14,098,656.59 |
| (Decrease \$1,400,375.73, or 9.04%) | |
| Miscellaneous Income was | 2,697,161.50 |
| Increase \$1,026,618.52, or 4.35% | |
| Operating Income before taxes was | \$16,795,818.09 |
| (Increase \$40,184.00, or 4.5%) | |
| Income for the year available for interest was | \$15,656,173.05 |
| (Decrease \$393,541.81, or 15%) | |
| Interest (\$4.87% of amount available, amounting to | 8,589,794.60 |
| Increase \$206,901.51, or 2.47%) | |
| Net Income for the year, equivalent to 1.5% on capital stock outstanding, amounting to | \$7,066,378.45 |
| (Decrease \$600,503.32, or 7.33%) | |
| Dividends paid during year: Two dividends of 2% each, aggregating | \$2,311,044.00 |
| Residual devoted to improvement of physical and other assets | \$4,555,114.45 |

RETURN ON PROPERTY.

The following table shows the amount of return to your Company, including subsidiary companies, from transportation operations only, upon the investment in road and equipment at the termination of each year of the six year period ended December 31, 1917.

| | Property Investment | Total Operating Income | Percentage Return. |
|---|---------------------|------------------------|--------------------|
| Year ended December 31, 1917 | \$263,397,068.67 | \$14,871,450.45 | 5.64% |
| Year ended December 31, 1916 | 250,247,098.33 | 15,359,715.14 | 6.14% |
| Year ended December 31, 1915 | 244,068,206.05 | 12,465,058.24 | 5.11% |
| Year ended December 31, 1914 | 243,144,711.90 | 9,314,430.78 | 3.83% |
| Year ended December 31, 1913 | 236,165,971.07 | 9,382,649.18 | 3.97% |
| Yearly average for five years ended December 31, 1917 | \$247,384,611.20 | \$12,578,662.54 | 4.96% |

FINANCIAL.

The changes in funded debt in the hands of the public during the year were as follows:

| | Sold | Retired |
|--|----------------|----------------|
| 4 1/2 per cent Equipment Trust Certificates—Series "P" | \$2,500,000.00 | |
| 4 1/2 per cent Equipment Trust Certificates—Series "R" | 3,780,000.00 | |
| 4 per cent Big Sandy Ry. First Mortgage Bonds | | \$53,000.00 |
| 4 per cent Coal River Ry. First Mortgage Bonds | | 20,000.00 |
| 4 per cent Greenbrier Ry. First Mortgage Bonds | | 20,000.00 |
| 4 per cent Raleigh & Southern Ry. First Mortgage Bonds | | 12,000.00 |
| Equipment Trust Obligations | | 1,150,000.00 |
| Net Increase | \$6,280,000.00 | \$1,255,000.00 |
| Other changes in obligations shown under funded debt on balance sheet of December 31, 1917, were as follows: | \$5,025,000.00 | |

| | Payments |
|---|----------------|
| 5 per cent Equipment Trust Standard Steel Car Co. | \$660,047.01 |
| 5 per cent Equipment Trust (Central Lines) motive and car works | 71,411.24 |
| 6 per cent Equipment Trust American Locomotive Co. | 170,602.43 |
| 4 1/2 per cent Equipment Trust Central Locomotive and car works | 450,000.00 |
| Total | \$1,352,059.73 |

Four and one-half per cent. Equipment Trust Certificates, Series "P," \$2,500,000.00, and Series "R," \$3,780,000.00, in amounts, were issued and sold to provide funds for payment of equipment shown in table on page 19.

Your Company acquired during the year 9,450 additional shares of the capital stock of The Chesapeake and Ohio Northern Railway Company, payment for which was made with cash derived from sale of stock of The Kanawha and Michigan Railway Company. From the proceeds of the sale there is still deposited with the Trustee for future investment the sum of \$528,600.00.

There were also acquired 1,450 additional shares of the capital stock of the Pond Fork Railway Company, and 150 additional shares of the capital stock of the White Sulphur Springs, Inc.

Your Company has purchased the entire capital stock, 1,500 shares, of the Piney River and Paint Creek Railroad Company at a cost of \$270,000.00, and also the Price Hill division of the White Oak Railway Company for \$77,500.00.

Additional First Mortgage Bonds of The Chesapeake and Ohio Railway Company of Indiana were issued in respect of the cost of certain additions and betterments made to that line, and were pledged under your Company's First Lien and Improvement Mortgage.

During the past year your Company acquired at par the entire capital stock, 10,000 shares, and \$500,000.00 par amount of coupon notes of the Western Pocahontas Fuel Company, a corporation owning the Dorothy and Sarita coal properties in West Virginia, so as to protect the Company's fuel requirements.

A statement of charges to property accounts will be found on page 16, showing a net addition of \$10,583,655.63; that is, \$2,632,648.04 was added to cost of road and \$7,951,007.59 was added to cost of equipment.

During the past nine years your Company's increase in capital liabilities in hands of the public, its principal acquisition of stocks and bonds of other companies, and its expenditures for equipment, branch line construction, second track and other additions and betterments, have been as follows:

| CAPITAL OBLIGATIONS ISSUED OR ASSUMED: | PAR VALUE. |

GENERAL REMARKS.

At the annual meeting of the stockholders held October 23, 1917, the by-laws were amended by changing the date of the annual meeting from the Tuesday preceding the last Tuesday of October to the Tuesday preceding the last Tuesday of April in each year, so as to correspond with the change in the fiscal year of the Company, which as noted in last year's report, now ends on December 31st.

The equipment inventory as of December 31, 1917, was as follows:

| | | | |
|----------------------------------|-----|------|----|
| Locomotives owned..... | 645 | Dec. | 3 |
| Locomotives leased..... | 228 | Inc. | 50 |
| Total..... | 873 | Inc. | 47 |
| Passenger train cars owned..... | 334 | Dec. | 1 |
| Passenger train cars leased..... | 62 | Inc. | 13 |

| | | | |
|---|--------|------|-------|
| Total..... | 396 | Inc. | 12 |
| Freight train and miscellaneous cars owned..... | 32,427 | Inc. | 5,616 |
| Freight train cars leased..... | 17,006 | Dec. | 2,696 |

| | | | |
|-------------------------|--------|------|-------|
| Total..... | 49,433 | Inc. | 2,920 |
| Floating Equipment..... | 19 | Inc. | 1 |

There were undelivered December 31, 1917, 856 steel gondola cars purchased under Equipment Trust Series "R," as shown on page 19 of this report, that are not included in the above table.

The changes during the year in the accrued depreciation of equipment account were as follows:

| | |
|---|----------------|
| Balance to credit of account December 31, 1916..... | \$5,846,710.51 |
| Amount credited during year ended December 31, 1917, by charges to: | |
| Operating expenses..... | \$1,352,053.82 |
| Profit and Loss..... | 297,472.07 |
| | \$1,649,525.89 |

Charged to account for: Accrued depreciation on equipment retired during year—

| | |
|--|----------------|
| 3 locomotives and 372 freight train and work cars..... | \$73,963.31 |
| | \$1,576,562.58 |

Balance to credit of account December 31, 1917.....\$7,423,273.09

In general, all branches of the Company's operations were effective during the year. An additional increase was granted to the clerks in the General Offices and at various points along the line, taking effect during the months of October, November and December. The increased cost to the Company on account of the above increases during the year approximated \$3,051,000.00.

| | 1917 | 1916 |
|----------------------------|-----------------|-----------------|
| Operating Revenues..... | \$54,643,793.52 | \$49,834,312.18 |
| Net Operating Revenue..... | \$16,537,906.33 | \$17,815,636.63 |
| Operating Ratio..... | 69.7% | 65.6% Inc. |

| | | |
|----------------------------------|----------------|----------------|
| Tons of Revenue Freight..... | 10,262,440,801 | 10,437,225,643 |
| carried one mile..... | 1,043 | 1,043 |
| Revenue tons per loaded car..... | 35.6 | 34.1 Inc. |

The revenue coal and coke tonnage was 26,230,768, a decrease of 3.9 per cent; other freight tonnage was 11,648,957, an increase of 4.4 per cent.

Total revenue tonnage was 37,879,725 tons, a decrease of 1.5 per cent. Freight revenue was 42,998,222.58, an increase of 7.8 per cent. Freight train mileage was 9,841,024 miles, a decrease of 5.1 per cent. Revenue ton miles were 10,262,440,801, a decrease of 1.7 per cent. Ton mile revenue was 4.19 mills, an increase of 0.7 per cent. Revenue per freight train mile was \$4.369, an increase of 13.6 per cent. Revenue tonnage per train mile was 1,043 tons, an increase of 3.6 per cent; including Company's freight, the tonnage per train mile was 1,112 tons, an increase of 4.0 per cent. Tonnage per locomotive, including Company's freight, was 979 tons, an increase of 3.5 per cent. Revenue tonnage per loaded car was 35.6 tons, an increase of 4.4 per cent. Tons of revenue freight carried one mile per mile of road were 4,254,567, a decrease of 3.0 per cent.

There were 7,557,722 passengers carried, an increase of 7.8 per cent. The

number carried one mile was 361,311,394, an increase of 19.7 per cent. Passenger revenue was \$7,899,451.91, an increase of 2.8 per cent. Revenue per passenger per mile was 21.60 cents, an increase of 2.6 per cent. Number of passengers carried one mile per mile of road was 149,791, an increase of 18.6 per cent. Passenger revenue per train mile was \$1,468, an increase of 18.9 per cent. Passenger revenue per train mile was \$1,468, an increase of 18.9 per cent, including mail and express, it was \$1,774, an increase of 17.4 per cent. Passenger service train revenue per train mile was \$1,740, an increase of 17.1 per cent.

The Chesapeake and Ohio Northern Railway connecting with the Chesapeake and Ohio Railway near Limeville, Ky., and extending to Parsons Yard, Va., was placed in operation effective September 16, 1917. The total length of this line is 92.3 miles, of which 60 miles are constructed between Limeville, Ky., and Waverly, O., at which point it connects with the Norfolk and Western Railway. The Norfolk and Western Railway tracks are used from Waverly, O., to Valley Crossing, O., a distance of 62.0 miles. From Valley Crossing, O., to Parsons Yard, Va., 30.3 miles, the Chesapeake and Ohio Northern Railway tracks are used. This line has been completed between Limeville, Ky., and Waverly, O., with the exception of widening the railroad, removing slides which have come in on the completed grade, and building section headwaters.

Extensions during the year have been as follows: An extension of Windy Gulf Extension, Times Creek Branch at Stone Coal, W. Va., to connect with the Virginian Railway 0.1 mile, Marsh Fork extension of Cabin Creek Branch 4.5 miles.

The Ivy Creek Branch of Coal River Branch, 1.7 miles, was taken over for operation during the year. The Ivy Creek Branch, 1.7 miles, was taken over for operation during the year. The Ivy Creek Branch, 1.7 miles, was taken over for operation during the year.

Seco II track between Walkerford and Riverdale, Va., 3.1 miles has been completed and put in operation, and 2.0 miles of the second track under construction between Harboursville and Claver Valley, W. Va., on Gwando Division is in operation.

Third track between Limeville, Ky., and junction of Chesapeake and Ohio Northern and Chesapeake and Ohio Railway has been completed and put in operation.

There was 3,190 tons live rail (63.5 tons 120 lb., 33.2 tons 125 lb., 0.05, 4 tons 90 lb., and 4,394 tons 90 lb.), equal to 162 miles of track, used in renewal of existing track. There were 1,477,696 cross ties used in maintaining existing tracks, a decrease of 119,544.

There were 654,466 yards of ballast (383,581 yards stone) used in maintaining existing tracks, a decrease of 1,251,648 yards. The motive power was \$3,789,200. The average amount expended for repairs per locomotive was \$3,789,200 per passenger train car \$1,076.73; per freight train car \$91.81.

In order to provide for coal storage for the Government at Newport News, it has been arranged to construct a coal storage plant at that point, the capacity of which when completed to be 20,000 tons, which can be increased to 30,000 tons by the extension of tracks and trestle, and the loading out capacity to be 6,000 tons per day, which can be increased to 12,000 tons with two cranes.

Your Company has furnished its quota of men to the Nation's Military and Naval forces, and has received \$25,000,000 in Liberty Bonds issued by the Federal Government, as follows:

First issue \$30,000,000
Second issue \$10,000,000

In accordance with resolution of your Board, there were added to Property Investment Account \$1,375,711.15, for extraordinary expenditures for property made and charged to operating expenses and income accounts during the fiscal year ended June 30, 1917, inclusive (see table 4).

In accordance with resolution of your Board, there were added to Property Investment Account \$1,375,711.15, for extraordinary expenditures for property made and charged to operating expenses and income accounts during the fiscal year ended June 30, 1917, inclusive (see table 4). In accordance with resolution of your Board, there were added to Property Investment Account \$1,375,711.15, for extraordinary expenditures for property made and charged to operating expenses and income accounts during the fiscal year ended June 30, 1917, inclusive (see table 4).

In March, 1916, your Board decided that it would appropriate out of the net income of the Company during the three years beginning May 1, 1916, an aggregate sum of not less than \$500,000 to be used for additions and betterments and for capital expenditures, or reduction of capital liabilities, in proportion to the difference between the price at which its five per cent convertible thirty year secured gold bonds may be converted, and the par amount of the stock in respect of which the same were issued, and the year period ended June 30, 1917. The President addressed a message to Congress on January 4, 1918, and Congress has passed an act providing for Governmental operation for the period of the war and two years thereafter, at the expiration of which this act was signed by the President on March 21, 1918, of peace. This act was signed by the President on March 21, 1918, of peace. This act was signed by the President on March 21, 1918, of peace.

The following appointments became effective during the year: April 1, Mr. L. D. Lacy, Auditor of Passenger Traffic, succeeding Mr. L. D. Briggs, Jr., deceased; May 1, Mr. H. E. Webb, Superintendent, Gwando Division; June 1, Mr. W. L. Bush, General Superintendent of Transportation; and on October 28, his title was changed to Assistant General Manager; Mr. L. H. Carle, Superintendent Freight Transportation; and on October 28, Fuel Agent; and on same date Mr. A. T. Lowmaster, Assistant Superintendent Freight Transportation; Mr. L. A. Barker, Superintendent Terminals, Chicago; and Mr. C. H. Mason, Auditor of Car Accounts; October 1, Mr. M. I. Caples, Resident Vice President, Columbus, O.

Effective October 28, 1917, Mr. W. R. Hudson, General Superintendent, Western General Division, was transferred to Newport News, Va., as General Agent Transportation, American Railway Association, and the Central General Division was consolidated with the Western General Division under Mr. L. B. Allen, General Superintendent.

The acknowledgments of the Board are renewed to the officers and employees for all faithful and efficient service.

By order of the Board of Directors,

FRANK TRUMBLE, Jr.,
Chairman.

GEO. W. STEVENS,
President.

GENERAL INCOME ACCOUNT

For Year ended December 31, 1917, and Comparison with Year ended December 31, 1916.

RETURN ON PROPERTY.

The following table shows the amount of return to your Company, from transportation operations only, upon its investment in road and equipment at the termination of each year of the five year period ended December 31, 1917:

| YEAR ENDED DECEMBER 31: | PROPERTY INVESTMENT. | TOTAL OPERATING INCOME, (including hire of equipment and other items). | PER CENT. OF RETURN. |
|-------------------------|----------------------|--|----------------------|
| 1917 | \$46,237,480.24 | \$3,060,174.97 | 6.62 |
| 1916 | 45,198,144.03 | 3,052,123.37 | 6.75 |
| 1915 | 44,802,665.64 | 2,041,149.36 | 4.56 |
| 1914 | 45,475,978.73 | 1,673,012.19 | 3.68 |
| 1913 | 42,525,047.49 | 2,547,540.52 | 5.99 |
| Average | \$44,847,863.23 | \$2,474,800.08 | 5.52 |

Railway Officers

Executive, Financial, Legal and Accounting

J. A. McCort has been appointed assistant auditor of the Wheeling & Lake Erie, with office at Cleveland, Ohio.

F. W. Pullen has been appointed general agent of all departments of the Nacozari Railroad Co., with office at Chicago.

Charles Donnelly, assistant general counsel of the Northern Pacific, with headquarters at St. Paul, Minn., has been appointed general solicitor.

Henry L. Adams, assistant attorney for Iowa of the Chicago & North Western, has been promoted to attorney for Iowa, with headquarters at Des Moines, Iowa, succeeding **J. C. Davis**, promoted to general solicitor.

L. B. Shepherd, southwestern passenger agent of the Chicago & Alton, at Dallas, Tex., has been transferred to the controller's office at Chicago and the position of southwestern passenger agent, at Dallas, Tex., has been abolished.

A. A. McLoughlin, whose appointment as assistant general solicitor for the Chicago & North Western Company, with headquarters at Omaha, Neb., was announced in these columns on April 26, was born at Webster City, Iowa, on May 13, 1868. He was educated in Iowa State College at Ames, Iowa, and in the University of Michigan, at Ann Arbor, Mich., graduating in the law department in 1892. After graduation Mr. McLoughlin began the general practice of law at Des Moines, Ia., and on March 1, 1903, was appointed assistant attorney for the Chicago & North Western for the State of Iowa, which position he held until his appointment on October 1, 1912, as attorney for the State of Nebraska for the same company. He continued in this position until his recent promotion to assistant general solicitor as mentioned above.

A. A. McLoughlin

Operating

Peter Groome has been appointed safety agent of the Union Pacific, with headquarters at Omaha, Neb., vice **J. M. Guild**, resigned to enter military service.

L. G. Waldrop, general agent of the Louisville & Nashville, with office at Nashville, Tenn., has been appointed assistant superintendent of the Nashville Terminals.

H. N. Atwood, general agent of the freight department of the Missouri Pacific at St. Louis, Mo., has been appointed inspector of freight transportation, and **J. G. Hollenbeck**, general passenger agent at St. Louis, has been appointed inspector of passenger transportation; both with headquarters at St. Louis.

J. W. Deneen, superintendent of the Monongah division of the Baltimore & Ohio, with office at Grafton, W. Va., has been appointed superintendent of the Cumberland division, with office at Cumberland, Md., succeeding **George D. Brooke**, who has been assigned to special duty, with headquarters at Baltimore.

J. W. Farrell, trainmaster of the Grand Trunk at Richmond, Que., has been appointed trainmaster of the First district, with headquarters at Island Pond, Vt., and **N. P. North** has been

appointed trainmaster of the Second and Third districts, with headquarters at Richmond. The position of assistant trainmaster, First and Second districts, has been abolished.

Charles B. Rodgers has been appointed general manager of the Davenport, Rock Island & North Western, with headquarters at Davenport, Iowa, succeeding **O. B. Grant**, effective May 1. Mr. Rodgers was born at West Point, Iowa, on October 4, 1861. He entered railway service with the Chicago, Burlington & Quincy in 1880 and has been with that road continuously until his recent appointment as mentioned above.

E. K. Fleming, general agent in the freight department of the Chicago, Burlington & Quincy, at Chicago, has been appointed on the vice-president's staff to look after over, short and damage matters, with headquarters at Chicago, succeeding **C. B. Rodgers**, resigned to accept service with another company. **H. R. Freed**, general agent at Clinton, Iowa, has been appointed on the vice-president's staff to look after station matters, with headquarters at Chicago, effective May 1.

C. B. Floyd has been appointed assistant to the general safety agent of the New York Central, with office at New York, succeeding **R. S. Jarnagin** who has gone to Washington to take a position in the Safety Section, Department of Transportation. Mr. Floyd has been for several years past a division safety agent, located in the Chicago territory of the New York Central Lines. He will be succeeded in that territory by **J. W. Johnston**, who for past two years has been division safety agent on the Big Four at Indianapolis, Ind.

H. J. Humphrey, superintendent of the Canadian Pacific at Brownville Junction, Me., has been appointed superintendent of the Laurentian division, with office at Montreal, Que., in place of **W. Tansley**, transferred; **J. H. Boyle**, superintendent at Farnham, Que., has been appointed superintendent of the Brownville division, succeeding Mr. Humphrey; **J. B. Blair**, assistant superintendent of the Montreal Terminal division, has been appointed superintendent of the Farnham division, with office at Farnham, in place of Mr. Boyle; **W. E. McGill**, assistant superintendent at Sudbury, Ont., has been appointed assistant superintendent of the Montreal Terminals division, in place of Mr. Blair, and **C. E. Towle** has been appointed assistant superintendent, with headquarters at Sudbury, vice Mr. McGill.

W. B. Darrow, superintendent of transportation of the first division of the Atlantic Coast Line, at Rocky Mount, N. C., has been appointed superintendent of transportation, with authority over the system, with office at Wilmington, N. C.; **J. Lowell White**, district superintendent at Norfolk, Va., has been appointed superintendent of transportation of the First division, with office at Rocky Mount; **C. M. Cobb**, trainmaster at Taboro, has been appointed superintendent of the Norfolk district, with office at Norfolk; **R. B. Hare**, assistant superintendent at Florence, S. C., has been appointed superintendent of the Columbia district, with office at Florence, vice **G. G. Lynch**, retired, and the position of assistant superintendent of the Columbia district has been abolished; **W. H. Newell, Jr.**, has been appointed trainmaster of the Norfolk district, with office at Taboro.

Frank W. Taylor, whose appointment as general manager of the Missouri, Kansas & Texas, with headquarters at Parsons, Kas., was announced in these columns on April 12, was born at Water Valley, Miss., on October 24, 1875. Mr. Taylor began his railroad career as a machinists' apprentice with the Illinois Central at Water Valley, in June, 1892. After serving four years in this capacity he was transferred to the Burnside shops, Chicago, where he remained a short time. He then returned to Water Valley, Miss., and worked as a journeyman machinist until October, 1901, when he was appointed night roundhouse foreman. On October 1, 1902, Mr. Taylor was transferred to Jackson, Miss., as general foreman at that point, and in the following year he was transferred to Louisville, Ky., in the same capacity. In October, 1908, he was promoted to master mechanic, at Mattoon, Ill., and on April 1, 1912, was transferred to Waterloo, Iowa, as master mechanic of the Minnesota and Iowa divisions. On January 1, 1915, Mr. Taylor was appointed superintendent of motive power of the International & Great Northern, with headquarters at Palestine, Tex. On January 1, he became

superintendent of motive power of the Missouri, Kansas & Texas, with headquarters at Denison, Tex. On March 1, of this year he was promoted to general manager on the Missouri, Kansas & Texas, as mentioned above.

J. E. Fairhead, whose appointment as general superintendent of the Pittsburgh & West Virginia, with headquarters at Pittsburgh, Pa., has already been announced in these columns, was born on August 4, 1879, at Urbana, Ill., and was educated in the common and high schools at Covington, Ky. He began railway work in November, 1901, as clerk to trainmaster on the Chesapeake & Ohio, and later served consecutively as stenographer in the general manager's office of the Cleveland, Cincinnati, Chicago & St. Louis, secretary to president of the Wabash-Pittsburgh Terminal Railway, at Pittsburgh, Pa.; chief clerk to superintendent of the same road; secretary to general manager of the Cincinnati, Hamilton & Dayton, with office at Cincinnati, Ohio, and secretary to president of the Kansas City Southern. From February, 1907, to August, 1912, he served as chief clerk to general manager and vice-president and general manager, and then was appointed superintendent of car service of the same road, remaining in that position until April 1, 1918, when he became general superintendent of the Pittsburgh & West Virginia.

Traffic

William T. Price, commercial agent of the Union Pacific System, at Pueblo, Colo., has been appointed traffic manager and property agent of the Denver (Colo.) Tramway and the Denver Interurban.

Charles H. Ryan, Jr., commercial agent of the Louisville & Nashville, at Indianapolis, Ind., has been appointed general agent, with office at Nashville, Tenn., to succeed L. G. Waldrop, transferred.

A. C. Odenbaugh, general agent in the passenger department of the Northern Pacific, at Chicago, has resigned, to become connected with the bond department of the Chicago Savings Bank in that city.

Henry Adema, lake grain agent of the Delaware, Lackawanna & Western, with office at Buffalo, N. Y., has resigned to become secretary of the White Pine Association of the Tonawandas, with office at Tonawanda, N. Y.

John B. Mordecai has been appointed traffic manager of the Richmond, Fredericksburg & Potomac and the Washington Southern, with office at Richmond, Va., to succeed the late Colonel Warren P. Taylor.

B. H. DaCosta, commercial agent at New York, and **J. W. Jones**, commercial agent at Cincinnati, Ohio, of the Central of Georgia, have been assigned to service on the line and the agencies at both places have been closed.

H. P. Cornick, assistant general freight agent of the Louisville & Nashville at Evansville, Ind., has been appointed general freight agent, with headquarters at Evansville, vice **Lee Howell**, deceased, and his former position has been abolished. **C. H. Ryan, Jr.**, has been appointed general agent, with headquarters at Nashville, Tenn., vice **L. G. Waldrop**, promoted to other duties in the transportation department.

Engineering and Rolling Stock

Tazwell Ellett, Jr., assistant division engineer of the Baltimore & Ohio, with office at Cumberland, Md., has resigned.

E. S. FitzSimmons, mechanical superintendent of the Erie, with office at New York, has resigned to go into other business.

T. R. Stewart, master mechanic of the Baltimore & Ohio, at Connelville, Pa., has been transferred as master mechanic to Cumberland, Md.

H. P. Creighton has been appointed bridge and building master of the Canadian Pacific, with headquarters at Schreiber, Ont., vice **E. T. Draper**, transferred.

The authority of **E. C. Sasser**, superintendent of motive power of the Southern Railway, with office at Charlotte, N. C., has been extended to cover the entire lines east; **W. S. Murrian**, having resigned to engage in other business, the position

of superintendent of motive power at the middle district has been abolished.

H. L. Archbold has been appointed division engineer of the Tucson division of the Southern Pacific, with office at Tucson, Ariz., succeeding **J. D. Mathews**, resigned.

F. C. Haney, signal foreman of the Chicago, Rock Island & Pacific, on the Chicago terminal territory, has been appointed signal supervisor, with headquarters at Ft. Worth, Tex., succeeding **J. G. Stoll** transferred to the Chicago District and assigned to other duties, effective May 1.

H. J. Hanlin has been appointed sanitary engineer of the St. Louis Southwestern lines, with headquarters at Texarkana, Ark., succeeding **H. W. Van Hovenberg** who has resigned to become sanitary engineer in the United States Public Health Service. This appointment was effective May 1.

H. C. Phillips, general secretary of the Railroad Presidents' Conference Committee on Federal Valuation of Railroads, with headquarters at Philadelphia, Pa., has resigned to become chairman of the Western Group of the Engineering Committee at Chicago. The offices of the Western Group were moved on May 1 to 110 South Dearborn Street, Chicago, where facilities have been provided for meetings of sub-committees which are making special studies of cost data and unit prices.

W. H. Winterrowd, whose appointment as chief mechanical engineer of the Canadian Pacific, with headquarters at Montreal, Que., has already been announced in these columns, was

W. H. Winterrowd

born on April 2, 1884, at Hope, Ind. He attended the public schools at Shelbyville, Ind., and graduated in 1907 from Purdue University. In 1905 he was employed for a short time as a blacksmith's helper on the Lake Erie & Western, at Lima, Ohio, and in 1906 he was a car and air brake repairman on the Pennsylvania Lines West, at Dennison, Ohio. After graduation he became a special apprentice on the Lake Shore & Michigan Southern, and in 1908 he went with the Lake Erie, Alliance & Wheeling as engine-

house foreman at Alliance, Ohio. In 1909 he became night enginehouse foreman of the Lake Shore & Michigan Southern at Youngstown, Ohio, and in 1910 was made roundhouse foreman at Cleveland. Later in the same year he was promoted to assistant to the mechanical engineer of the Lake Shore. Since September, 1912, he has been with the Canadian Pacific, at first as mechanical engineer, and in May, 1915, was appointed assistant chief mechanical engineer.

H. O. Whitney, roadmaster on the Denver & Rio Grande, with headquarters at Glenwood Springs, Colo., has been promoted to general roadmaster of the Utah lines, with headquarters at Salt Lake City, Utah, effective April 29. **R. C. Violett**, roadmaster on the St. Louis South Western at Mt. Pleasant, Tex., has been appointed general roadmaster of the Colorado lines of the Denver & Rio Grande, with headquarters at Denver. **B. T. Johnson** has been made supervisor of maintenance equipment.

J. A. McFerran, master mechanic of the Louisville & Nashville, at Covington, Ky., has been appointed master mechanic of the Mobile & Montgomery division and branches, with office at the Montgomery (Ala.) shop; the position of **T. A. Nelson**, assistant master mechanic at Montgomery, has been abolished, and **J. D. Maxwell**, master mechanic at Mobile, has been relieved of supervision over mechanical matters on the Mobile & Montgomery division and branches; **C. W. Matthews** has been appointed master mechanic of Cincinnati terminals and Kentucky division, with office at Central Covington (Ky.) shop, vice **J. A. McFerran**; **B. E. Dupont** has been appointed master

mechanic of the Howell (Ind.) shops, Henderson and St. Louis divisions and St. Louis terminals, vice **Henry Hardie**, deceased; **F. W. Oakley** has been appointed master mechanic of the Eastern Kentucky division, with office at Ravenna (Ky.) shops, vice **Harry S. Hills**, deceased, and **T. F. Ryan** has been appointed assistant master mechanic of the Cincinnati terminals and Kentucky division, with office at Central Covington shop.

Railway Officers in Government Service

F. P. Pfahler, master mechanic of the Baltimore & Ohio at Cumberland, Md., has been appointed mechanical engineer of the Locomotive Section, United States Railroad Administration.

A. K. Morris, freight coal agent at the Erie, New York, has been granted a furlough to serve as director of tidewater coal traffic on the Anthracite Committee of the Fuel Administration, with headquarters at New York.

W. S. Basinger, general passenger agent of the Union Pacific, and **C. A. Fox**, secretary of the Central Passenger Association, have been appointed assistants to Gerrit Fort in the passenger department of the division of traffic at Washington.

Paul A. Bevan, motive power inspector, Central System, Pennsylvania Railroad, Western Lines, has been granted a furlough to enter the Ordnance Department of the United States Army, as engineer of tests. Mr. Bevan is located at the United States Cartridge Company, Lowell, Mass.

Charles M. Anderson, superintendent of safety of the Nashville, Chattanooga & St. Louis, has been appointed supervisor of safety of the southern railroads with headquarters at Atlanta, Ga. Mr. Anderson is the first of three regional safety officers to be appointed to assist H. W. Belnap, manager of the Safety Section of the United States Administration at Washington. Mr. Anderson was born at Owingsville, Ky., in February, 1887. He began his railroad career in 1906 as a clerk in the office of the superintendent of the Louisville & Nashville at Middlesboro, Ky. He was advanced to chief clerk in that office and in 1912 he was appointed chief clerk in the office of the superintendent of construction. In 1914 he entered the service of the Nashville, Chattanooga & St. Louis, and in 1916 was placed in charge of the organization of safety work on the system with the title of superintendent of safety. Mr. Anderson is also secretary of the steam railroad section of the National Safety Council. He will open his office in Atlanta on June 1.

C. M. Anderson

Obituary

Charles D. Porter, master mechanic of the Pennsylvania Railroad, at Pittsburgh, Pa., died in that city on May 2, at the age of thirty-five.

S. L. Bean, mechanical superintendent of the Atchison, Topeka & Santa Fe, coast lines, who died at Los Angeles, Cal., on March 24, as announced in the *Railway Age* on April 12, was born in Franklin, N. Y., on March 25, 1851. He learned the machinist's trade in the Manchester Locomotive Works and entered railway service with the Wisconsin Central in 1873. On June 10, 1903, he was appointed division master mechanic for the Santa Fe at Albuquerque, N. M. and on April 20, 1914, he was promoted to mechanical superintendent, with headquarters at Los Angeles, Cal., which position he held until his death. Mr. Bean was 67 years of age.

William H. Barnes, director of the Pennsylvania Railroad and formerly president of the Allegheny Valley, died on May 5, at his home in Philadelphia, Pa. He was born in July, 1829, in Philadelphia and entered the service of the Pennsylvania Railroad in March, 1848, with an engineering corps at Greensburg, Pa. Mr. Barnes was one of the charter members of the Pennsylvania company, and in 1871 served as treasurer of that company. In 1884 he became receiver of the Allegheny Valley and later, when it was reorganized, he became president of that road. Since December, 1889, he was a director of the Pennsylvania Railroad Company and was also director of a number of other corporations affiliated with the Pennsylvania Railroad system.

Robert Morrison Olyphant, chairman of the executive committee of the Delaware & Hudson Company, died on May 2, 1918, at his home in New York City. Mr. Olyphant was born on September 9, 1824, at New York, and graduated from Columbia College in the class of 1842. On September 15, 1876, he was appointed assistant president of the Delaware & Hudson Canal Company, and had served continuously in the service of that company and its successor, the Delaware & Hudson Company, until his death. From May, 1882, to August, 1884, he was vice-president and then served as acting president until October of the same year. He was elected president in October, 1884, and since May 14, 1903, has been chairman of the executive committee.

R. M. Olyphant

IN MILITARY SERVICE

Major Charles G. Baird, commanding officer of the 413th Telegraph Battalion Signal Corps now in service in France, died in France on April 28. Major Baird was born on February 10, 1880. He entered the service of the Pennsylvania Railroad on March 9, 1893, and became interested in telegraphy. He left the Pennsylvania Co.'s service on September 25, 1901, to enlist in the U. S. A. Signal Corps, and served four years in the Philippines. On March 23, 1905, he returned to the service of the Pennsylvania Railroad, and in 1910 he had charge of the construction and installation of all the signal, telegraph and telephone lines in the Pennsylvania station, New York. He was

Major C. G. Baird

division operator on the New York division at the time he was furloughed for service in France. Major Baird was a veteran of the Spanish War, and it was largely through his efforts that the 413th Telegraph Battalion was organized. The unit consists of telegraph operators and electricians, nearly all of whom were Pennsylvania Railroad employees. His executive abilities were promptly recognized, for even though he had been in France but a short time, he was recently appointed to the position of superintendent of telephone and telegraph traffic of the American Expeditionary Forces.

EDITORIAL

Railroad men did their part splendidly in making the Third Liberty Loan a big success. Doubtless many of those who

Your Duty as an Individual

subscribed will have to suffer various inconveniences in order to meet the payments; your country needed your support in order to play its full part in the world war for democracy and in backing it up. At the same time you made a safe and sound investment for yourself which will serve you well in the future. Next week is Red Cross Week and you will give fully—without thought of investment for self—to back up this magnificent organization in ministering not only to the wounded and dying on the battle field, but in relieving distress wherever it is found. An agency of mercy truly; also a great force for the upbuilding of the morale of our armies. Your support of the Liberty Loan and Red Cross is fine, but there is another big thing for you to do. Our boys on the other side are working under great hardships in spite of all we can do for them. Their souls are being tried to the limit and they are laying down their lives, or suffering injury with a smile on their faces. The successful outcome of the war depends on many things, but a vital link in the chain is transportation in this country. For humanity's sake be an optimist. Be an inspiration to those about you. Give of yourself as you have never given before. Don't slack on the job because you think, or know, you are not getting as much out of it as you should or as someone else is. We have all got to make sacrifices, if we are to win the fight. Can you afford to be a dollar chaser, or slacker, when your brothers are giving their very lives in the great cause? The call to military service, the draft and the competition of industries which are paying excessive wages and salaries have depleted the railroad ranks of skilled and experienced workers and executives. A great responsibility rests upon you.

One of the most flagrant evils of unrestricted competition between railroads has been the building of duplicate lines

The Elimination of Duplicate Lines

where one could serve the territory adequately. This country has witnessed examples of this practice in practically every period of its railway development. Probably the most conspicuous examples of earlier days were the construction of the West Shore and the Nickel Plate roads parallel to what is now the New York Central. In more recent years the most active competition of this character has been in the northwest, where the struggle between the Hill and Harriman systems led to the construction of duplicate lines in several instances. The most notorious example was the building of the Oregon Trunk and the Des Chutes railways down opposite sides of the narrow canyon of the Des Chutes river for approximately 100 miles to reach a territory which, after several years, had not yielded enough traffic to justify even one line. With unified control of the roads the waste of funds for the construction of duplicate lines has been stopped. As an instance, arrangements are being completed whereby the Chicago, Milwaukee & St. Paul may be enabled to use a belt line of the Chicago & North Western northwest of Chicago and thereby avoid the construction of a parallel line which it had been contemplating for several

years. Steps are also being taken to correlate existing facilities already built to afford greater economy and capacity without any sacrifice of service. The Wyoming Railway Commission has already asked that the Chicago & North Western line be abandoned between Shoshoni, Wyo., and Orin Junction, a distance of over 100 miles, and that the trains of this road be operated over the parallel line of the Burlington. A similar suggestion has been made relative to the two lines in the Des Chutes canyon, while the Western Pacific and the Southern Pacific are negotiating for the operation of their two single track lines as a double track road for a couple of hundred miles in Nevada. Railway men will agree that changes such as these are in the interest of efficiency and economy, regardless of whether the roads are operating under unified or individual control. For this reason the contracts now being made should extend for a sufficient number of years to insure the continuance of the plan after the roads have been returned to their owners.

The Railroad Wage Commission touched in its report upon the salaries of railway officers. It says, "It is reasonably

The Salaries of

Railway Officers

certain from the facts gathered by the commission that a substantial readjustment of such salaries can be made and the efficient operation of the properties thereby promoted. . . . Some salaries may well be abolished altogether, others greatly reduced, while in some cases of lesser paid officials an increase would be warranted." There can be no serious question that a large part of the lower paid officers of the railways, from division superintendents downward, are paid too little. In many cases conductors and locomotive engineers earn more than yardmasters, trainmasters, roadmasters, traveling engineers, master mechanics and division engineers; and in some cases they actually earn more than superintendents. Officials as well as employees who are receiving less than \$250 a month will receive advances if the recommendations of the Wage Commission are adopted. Many division officials, however, should be given increases in excess of those recommended by the Wage Commission. It is anything but conducive to discipline and efficiency for officials to receive less pay than employees who are working under their direction. In practically every such case either the employee is being paid too much or the official too little. The statistics of the Interstate Commerce Commission show that in the year ended June 30, 1916, there were 14,401 general and divisional officers who received less than \$3,000 a year, and that their average wage was only \$1,664, or less than \$140 a month. Many advances in salary have been made since then, but they have not been numerous enough or great enough; and a careful survey of the situation should be made by those in charge of railway management with a view of putting the salaries of the lower paid officials on a proper basis. What should be done about the salaries of the higher paid officials—say, from the general managers and their staffs upwards? Since the adoption of government control there has been much talk about the reduction of salaries, but nothing definite has been said officially as to whether any reductions are to be made, and

if so where they are to begin and end, and how large they are going to be. The average salary of the 4,247 general officers receiving over \$3,000 in 1916 was \$6,462. This is not a "fancy" sum. It is modest, indeed, considering the responsibilities and duties of railway general officers. It includes, however, some very high salaries; and perhaps it was merely these that the wage commission referred to in saying that some salaries should be "greatly reduced."

The reduction of railway salaries has now been a subject of agitation for almost five months. If the Railroad Administration intends to do anything along this line more than it has done, the sooner it does it the better. Railway officers, like other human beings, are not able to work as efficiently when their minds are disturbed as when they are easy; and the man who can have an easy mind with a reduction of his income hanging over him which may affect his standard of living, has not been born, no matter how large his income is. Just how it can be thought that any considerable economy will be effected by a reduction of the salaries of the higher paid officers we do not understand. The total compensation paid to all railway officers receiving over \$5,000 is \$30,000,000 a year. That is about 1 per cent of operating expenses. The really high salaries probably do not constitute one-tenth of one per cent of operating expenses. The Railroad Administration needs the loyal and enthusiastic support of all the able men on the railways much more than it needs to secure the negligible saving that could be effected by reducing the salaries of these men or losing them from the service. Railway expenses are increasing fast already. The less first-class brains there are kept in the railroad business, and the less opportunity and incentive the first-class brains are given to work to their full capacity, the faster expenses will continue to increase.

Should Railroads Furnish Detailed Plans for Steel Bridges?

FEW RAILWAY NECESSITIES are purchased on so strictly a competitive basis as steel bridges. The patented device or design plays only a minor part in these structures, and variations in practice in the design or construction of different bridges arise rather through differences of opinion on the parts of railway bridge engineers than from an exploitation of particular proprietary features on the part of the individual bridge companies. Contracts for railway bridges are advertised, estimated and awarded on the basis of plans submitted by the railroad, there being exceptions to this only in the case of movable spans, where there may be a preliminary consideration of several patented designs.

Some variations as to this custom arise in the degree of detail shown on the plans supplied by the railroads. Some companies provide only a bare outline of the structure, together with specifications for the design, while others submit detailed shop drawings. The more common procedure is a mean between these two; in other words the preparation of general drawings showing the makeup of the members and limiting dimensions, while leaving the completion of the shop drawings to the bridge company.

The present tendency is almost entirely toward the preparation of at least the designing plans by the railroad, coupled with a thorough check of the shop drawings prepared by the bridge shop. The basis of payment in bridge contracts is now almost universally the pound price. The lump sum price with its various abuses is a matter of the past, but with inadequate engineering supervision, even the pound price has its disadvantages. The fabricator is

naturally interested in selling as large a tonnage of structural steel as possible, and while the design under which he furnished the bridge may result in a most excellent structure, it may not be the most economical structure for the site. The submission of comparative designs considered clearly from the standpoint of the advantages to the railroad may easily result in a much cheaper structure which will fulfill all the requirements just as well. In view of these considerations there seems to be little question but that the railroad should supply the design, and where it has no staff competent to execute the work it should retain a consulting bridge engineer.

A more perplexing problem arises in connection with the preparation of the shop drawings. In most cases this work is left to the bridge company, but a few railroads have obtained no small degree of success in doing this work in their own drafting rooms. The real question as regards the preparation of the detailed plans is one of economy, including both the cost of preparing the drawings and the relative cost of the shop work as done from plans prepared under the two arrangements. The structural steel fabricators maintain that their own drawing rooms, through training, experience and close relation with the shop can prepare the detailed plans for less money, and that the finished drawings are better adapted to obtain shop economies than plans prepared in the railroad offices. In view of this, it is their contention that the price which they submit for a job for which they prepare the plans, will show a definite saving to the railroad company.

Without doubt the small railroad cannot economically maintain a force of detailers for the average run of work. On the other hand a few of the larger roads prepare detail drawings of all their bridge work. There are also special circumstances in which it has been found particularly advantageous for the railroad to prepare drawings in detail, for while the bridge company lays special emphasis on the close relation of its drawing rooms to the shop, it may ignore the relation of the drawing room to the field. Some structures involve such complications as to alignment, grades and clearances that the details can be worked out efficiently only by the man who has been in close touch with the project from the start.

Following this idea railroads have on occasion developed their own organizations and accomplished results that have been eminently satisfactory. Only recently a railroad in the middle-west built a complicated city viaduct structure and found that by following this practice it could not only prepare plans much faster with its own forces than could have been done by a bridge shop force unfamiliar with the job, but it also completed the plans at a very satisfactory cost per ton. As a further example, some years ago another railroad renewed a great many high timber trestles with steel viaducts. A large force of draftsmen was organized, standard designs and details were prepared which were applied to the various structures and although the work was subdivided among a number of fabricating shops the designs were uniform throughout, since they were all prepared by one group of men rather than by the widely separated drafting rooms of the several bridge companies.

Success of this kind depends as much on the service of skilled structural detailers as on the character of the supervision, and owing to the well known transitory nature of this work it has been possible during normal times to secure an adequate number of men with a thorough knowledge of bridge shop practice. It must be borne in mind, however, that structural detailing is virtually a trade, and while it is best done by men who follow this work as a vocation, such men cannot as a rule be used efficiently on other classes of drawing room work. There is therefore no economy in maintaining a force of steel detailers unless there is plenty of work to keep them busy.

In presenting the advantages and disadvantages of these two plans for the preparation of shop drawings, it would be well to call attention to some intermediate plans which have been found of advantage in certain cases. Briefly these consist of various forms of close co-operation between the office of the railway bridge engineer and the drafting room of the fabricator. In the case of one of the largest railroad bridges built in recent years, the bridge engineer desired to have the shop drawings prepared in his own office where he could keep in close touch with the work, but, to insure that the plans would be completed in a way that would facilitate the shop work to the utmost, an arrangement was made whereby a squad foreman from the bridge shop drawing room supervised the work in the railroad office. Another and probably more common practice for accomplishing the same results, is to have the man who designed the bridge for the railroad assigned to the bridge company's drawing room during the time that the shop plans are in preparation.

The Proposed Advances in Railway Wages

THE REPORT of the Railroad Wage Commission, which was appointed by Director General McAdoo soon after the adoption of government control of railways, was made public last week. The appointment of this commission and the assignment of its duties constitute one of the best pieces of work Mr. McAdoo has done since he has been director general. The commission was instructed not merely to investigate and pass upon the claims of railway employees who had complained about their wages, but to investigate and make recommendations regarding what ought to be paid to all classes of employees. The selection of Secretary of the Interior Franklin K. Lane as chairman was ideal. and the rest of the personnel of the commission was good.

The report and recommendations made are what were to be expected from a body having such high character and which was given the opportunity it was to deal in a big way with so important a problem. The commission did not attempt to decide the many difficult questions which can be raised as to the reasons why some classes of railway employees receive much higher wages than other classes, and as to just what the relationship of the wages of the various classes should be. Nor did it give any weight to the amount of organized pressure which any particular class had brought or could bring to bear in support of its demands. It did recognize the "one dominating fact," to which attention repeatedly has been called in these columns, that the lower grades of railroad employees are paid much less in proportion than the higher grades. Therefore, it recommends an advance of 43 per cent with a minimum of \$20 a month, in the wages of all employees receiving less than \$50 per month, and smaller percentages of increase for the higher paid. For example, employees who were receiving from \$51 to \$75 a month on December 31, 1915, would under its plan receive an advance of 41 per cent, those receiving \$115 a month, 25 per cent, those receiving \$239 a month, 4.56 per cent; while employees receiving \$250 or more would receive no advance at all.

As above indicated, the proposed advances are not based on the wages being paid at present but on those which were being paid in December, 1915, and they are predicated almost entirely on the increases in the cost of living which have occurred during the last two years. The commission made a thorough investigation and found that the increase in the cost of living had been about 40 per cent. It will be seen, therefore, that under its plan the advance in the wages of the lowest paid employees would be in proportion to the

increase in the cost of living since 1915, while for the higher paid employees the advance would be less, and for the highest paid much less, in proportion, than the increase in the cost of living.

The commission was not empowered to determine what should be done, but merely to make recommendations to Director General McAdoo. It will hardly be questioned by any humane and well-informed person that the advances it recommends should be made. They ought to be made as a matter of justice to railway employees. They practically must be made as a matter of public expediency, because the wages paid by the government and by other large industries are so large that without further advances in railway wages the roads cannot hold enough men to operate efficiently.

The advances which the Railroad Wage Commission recommends would aggregate about \$300,000,000 a year. That part of the press which is bent upon using all the results of government control that it can as an argument for government ownership is exploiting them as evidence of the fairness and generosity with which railway employees may expect to be treated under government ownership, the implication being that under private management the railways made practically no advances in wages. Those who discuss the subject in this way ignore a significant statement made by the Railroad Wage Commission. This appears on page 13 of its report, and is as follows: "It is hardly realized that the roads themselves have in two years, 1916 and 1917, increased wages approximately \$350,000,000 per year if applied to the present number of their employees."

It is worth while in this connection to review the advances in wages which the railways have made over a still longer period. The system of federal regulation which prevailed until it was supplanted by government control was adopted in 1906. In the fiscal year 1906 the average wage paid to railway employees was \$588. In the calendar year 1917, as shown by the Wage Commission's report, the average wage per employee of the Class I roads was \$988. The Class I roads had 1,939,399 employees in 1917. The increase in the average annual wage having been \$400, it follows that in 1917 the Class I roads paid to their employees \$775,760,000 more than they would have if the average wage had been the same as in 1906.

The increase in the average wage between 1906 and 1917 was 68 per cent. Meantime, the average passenger rate remained about stationary and the average freight rate declined from 7.48 mills in 1906 to 7.15 mills in 1916, the last year for which the figure is available. The advance in wages recommended by the Railroad Wage Commission would amount to \$288,000,000 for the Class I roads, and would make the average wage paid by them \$1,137 a year. This would represent an advance over the average wage of 1917 of 15 per cent. During the period of 11 years when the railways under private control were being steadily forced to make large advances in wages their managers repeatedly went to Washington and appealed to the Interstate Commerce Commission for offsetting advances in rates. The commission in most cases told the managers to go home and manage their railways more efficiently; and that thereby they would be able to effect economies which would offset the increased expenses. The railway managers returned home as bidden, and they did achieve increases in efficiency which enabled the companies to absorb most of the advances in wages and other expenses. They were not able, however, to absorb anywhere near all of them, and, in consequence, the ratio of expenses to earnings constantly increased and the percentage of operating income earned constantly decreased.

The railroads are now under government control. What will the Interstate Commerce Commission say to the Director General of Railroads if and when he makes advances in rates to offset the advances in wages and other expenses which are occurring under government control?

The Heavy Losses of Railway Net Income

HOW CLOSE THE RAILWAYS of the United States were to financial disaster when government control was adopted is shown by statistics regarding their earnings and expenses in the first three months of 1918, which have been compiled by the Interstate Commerce Commission. The statistics in question are for only 114 roads operating 165,258 miles, but probably they accurately forecast what the figures for all lines will disclose when they are available.

The reports of these 114 roads show that in January, February and March their total earnings were \$726,000,000, an increase of almost \$38,000,000 over the same months of 1917. Their operating expenses, however, were almost \$638,000,000, an increase of \$125,000,000 over the same months of 1917. In consequence in these three months these roads suffered a decline of almost \$87,200,000 in net revenues. Their net revenues in the first three months of 1917 were \$175,400,000, while in the first three months of 1918 they were only \$88,200,000. The decline in their net earnings in these three months was almost 50 per cent. The ratio of their operating expenses to their earnings increased from 74½ per cent in the first three months of 1917 to 80 per cent in the first three months of 1918.

The statistics of "operating income" have become unusually interesting recently because the compensation the government is to guarantee the companies for the use of their properties is based on the average operating income earned by them in the three years ended on June 30, 1917. Operating income is what is left of earnings after the payment of expenses and taxes, including "war taxes." In the first three months of 1917 the operating income of these 114 roads was \$144,000,000, while in the first three months of 1918 it was only \$54,000,000, a decline of \$90,000,000 or 60 per cent.

The railways in all three territories, eastern, southern and western, had increases in their total earnings, but still greater increases in their operating expenses and taxes during these three months, with the result that in every territory there was a heavy decline in operating income. The showing made by the eastern lines, however, was much the worst of all. In the first three months of 1917 these railways earned almost \$56,000,000 in operating income, while in the first three months of 1918 they did not earn any operating income at all, but had an actual deficit in this item of over \$1,000,000.

Relatively the greater parts of the increase in operating expenses, and the loss in operating income, were due to the severe weather and difficult operating conditions in January and early in February. In March, however, the weather was very good and still the increase in operating expenses was so great as to cause declines in net revenue and in operating income. The total operating revenues of these 114 roads in March, 1918, exceeded \$284,000,000, an advance over March, 1917, of almost \$36,000,000. Their operating expenses, however, increased about \$42,000,000 over the same month of last year and in consequence there was a decrease of net revenue of over \$6,000,000. The operating ratio of these roads in March, 1917, was less than 72 per cent, while in March, 1918, it was over 77 per cent. In March, 1917, their operating income was almost \$57,600,000, while in March, 1918, it was only \$50,630,000.

These statistics do not tell the whole story even for the roads on whose reports they are based. A general advance in railway wages is soon to be made and it will be retroactive to January 1. This will add about \$25,000,000 a month to operating expenses or approximately \$75,000,000 to the expenses of these three months. This will wipe out all of

the operating income earned in the first quarter of the year.

When railway security owners and railway managers contemplate these statistics they may well breathe a sigh of relief because at the commencement of the present year the government relieved them of the responsibility of providing for the financial requirements of the companies. It might be interesting, but it would be futile, to speculate as to whether the increase in operating expenses would have been so great if the railways had been left under private control. If private control had been retained there certainly would have been a very great increase in operating expenses and probably many of the railways, including some of the largest systems, would have been thrown into bankruptcy, and there would have been a financial cataclysm in this country. The increases in expenses were coming very fast in 1917, especially during the latter part of that year, under private control, and no human ability or energy could have prevented them from continuing to come. Whether it was or was not desirable for the government to assume control of the operation of the railways is a question which is still debatable; but that for the protection of the railway companies and the country it was necessary for it to come to the rescue of the companies financially, there can be no doubt.

These great increases of operating expenses which were occurring when government control was adopted, which have come still faster since it was adopted, and which promise to continue at an accelerated rate, throw light on some questions which were much agitated before the adoption of government control. One of the most important of these is that of advances in rates. When the reports of earnings and expenses in February, 1917, began to come in, the managers of the railways, especially those of the eastern lines, became much frightened and appealed for a 15 per cent advance in rates. They submitted during the ensuing weeks much testimony and statistical data to show that the increases in expenses were sure to continue and to become larger because of the rapid advances in wages and labor and in the prices of materials and fuel. The Interstate Commerce Commission, as usual, heard them with doubt and suspicion, decided that they were unduly alarmed, and in June granted only part of the advances asked for. Subsequently the case was reopened, and finally in March, after government control was adopted, the commission granted the eastern lines practically all the advances in rates they had originally sought. By that time, however, the increases in expenses had so completely justified the ominous anticipations of the railway managers that an increase of 15 per cent was entirely insufficient.

With expenses increasing as they are and with an enormous advance in wages to be added to them, it is evident that the Railroad Administration will very soon have to make a large advance in rates or be confronted with an enormous deficit. Theorists regarding railway matters have contended that very large economies could be effected by operating the railways of the United States as a single system. One of these doctrinaires estimated in his testimony before the Newlands committee that a saving of \$400,000,000 a year could be made in this way. It is possible that by unified operation savings amounting to as much as one-fifth or one-fourth of this amount may be made, but when all of them that can be made have been made they will be small compared with the increases in expenses produced by advances in wages and prices, and by other causes.

It is assumed that the total compensation guaranteed by the government to the railway companies will be about \$950,000,000 a year. If the operating results of the first three months of the year indicate what results may be expected during the rest of the year the operating income of the roads in 1918, in the absence of any advances in rates or of wages, would be insufficient by at least \$500,000,000 to pay the guaranteed compensation. The proposed wage

increase of \$500,000,000 would increase the deficit to \$800,000,000 a year. It is evident that the Railroad Administration is facing a very serious situation.

It would be highly undesirable from every standpoint to allow the railways to have a huge deficit which would have to be paid in taxes. Therefore, steps ought to be, and, indeed, already are being taken toward general advances in both passenger and freight rates much greater than any ever heretofore suggested.

Is It Necessary for the Roads to Use Bessemer Rails?

IN AN EDITORIAL entitled "Shall the Roads Return to Bessemer Rails" published in the *Railway Age* of May 3, we referred to the reports emanating from Washington to the effect that the railways would be required to use Bessemer instead of open hearth rails this year, and urged that this be done only after a legitimate effort had been made to use the Bessemer steel output for those essential military purposes where it could be employed without detriment so that, if possible, the roads would not have to return to a grade of steel which they had discarded in large measure in recent years as inferior, both in wearing qualities and breakage. In its issue of May 9, the *Iron Age* takes exception to these statements in an editorial which implies that (1) the transition from Bessemer to open hearth rails was made at the instance of the roads, (2) that Bessemer rails are not inferior to open hearth for service and (3) that there has been practically no reduction in the Bessemer production capacity of the steel mills of this country, and that it is necessary to roll the Bessemer steel in order to utilize the capacity which might otherwise be idle.

We do not question the advisability of reverting to Bessemer rails if the open hearth steel output of the country is actually needed for war purposes for which Bessemer steel will not serve as well. However, we do think it a mistake to take this backward step until it is shown that a legitimate effort has been made to substitute Bessemer for open hearth, where this can be done without detriment to service or to production capacity. As we stated in the previous editorial existing practices should not be disturbed unless such disturbance will contribute to the success of our military efforts.

The *Iron Age* implies that the transition from Bessemer to open hearth was made at the instance of the roads. It also takes exception to our reference to the depletion of "high grade" (used in the sense commonly understood in this connection, viz., a low-phosphorus content) ores and makes the statement that "much Bessemer ore is available and it is of such character as to produce as good Bessemer steel as formerly." These statements are surprising in view of the fact that it has been common knowledge among all familiar with the negotiations between the manufacturers and the railways during the last ten years that the manufacturers have pointed out to the roads the necessity of going to open hearth steel for at least a large proportion of the rail requirements because of the unquestioned depletion of low-phosphorus ores. As early as 1908, the Committee on Standard Rail and Wheel Sections of the American Railway Association reported that "In the matter of chemistry specifications for Bessemer steel rail statistics were obtained from the officers of the Ore Producers' Association which convinced the committee that it would be impossible for the mills to furnish more than a small percentage of the total rail requirements of the railroads with a phosphorus specification less than 0.10 (per cent). . . . Members desiring to obtain low phosphorus rails will have the further option of using open hearth steel. The committee conferred with a number of disinterested experts . . . on the phos-

phorus question. These gentlemen all agreed that . . . it would be unreasonable to require less than 0.10 (per cent) phosphorus in a specification for Bessemer rails intended to cover purchases for all American railroads." The importance of the phosphorus content lies in the fact that the Bessemer process does not affect the amount of this element originally contained in the iron, while in the open hearth process the phosphorus can be easily removed to the desired point, enabling iron high in phosphorus to be used.

Further on, the *Iron Age* brands as untrue our statement that "a return to this class of steel (Bessemer) can only be made at the sacrifice of service and of safety in the track," the implication being that the *Iron Age* contends that Bessemer rails do give as good service as open hearth. Such a statement indicates a lack of knowledge regarding the service of steel products which is surprising. It is common knowledge among railway men that open hearth rails give a life considerably greater than Bessemer rails, and this life is commonly estimated as approximately twice that of Bessemer rails. Further, with respect to safety the best information regarding breakage is that contained in the annual analyses of rail failures made by the American Railway Engineering Association. In its latest report for the year ending October 31, 1916, and published in Bulletin No. 199, dated September, 1917, the failures are classified according to their years' service in the track as follows:

FAILURES OF OPEN-HEARTH AND BESSEMER COMPARED

| Year Rolled | Failures per 100 track miles | | Comparative failures | |
|-------------|------------------------------|----------|----------------------|----------|
| | Open-Hearth | Bessemer | Open-Hearth | Bessemer |
| 1911 | 161.9 | 214.1 | 100 | 132 |
| 1912 | 74.2 | 107.7 | 100 | 145 |
| 1913 | 43.3 | 60.1 | 100 | 135 |
| 1914 | 18.9 | 32.3 | 100 | 171 |

This report also states that "It will be noted that the failures of Bessemer rails per 100 track miles were considerably greater than those of the open-hearth rails." It is probably also true that the open-hearth rails were, in general, in more severe service, so that the actual difference under the same conditions may have been greater.

Furthermore, the best evidence that open-hearth rails are superior to Bessemer is the fact that the roads have been willing to pay the premium of \$2 per ton which the mills have charged for these rails and at the same time the ratio of open hearth rails to the total has risen until in 1916 (the latest year for which the figures have been made public) over 80 per cent of all the rails rolled were of this character.

The *Iron Age* also challenges the statement that "the reduction in the Bessemer capacity of the country which has taken place also acts as a controlling factor," and goes at length into an effort to show that there is a large Bessemer capacity in this country which can be utilized to manufacture rails at present. To intimate that mills such as the Ohio works of the Carnegie Steel Company and the Lorain Steel plant are available for the rolling of rails, when they have not been so employed during recent years when the steel manufacturers have been more congested with orders than at any previous time in their history and when manufacturers now have 2,000,000 tons of rails on order, a large part of which are overdue, only serves to belud the issue. It is to be assumed that, owing to the urgent demand for steel for government and other uses, all of the steel mills of the country have been and are working to their maximum capacities, and that those which have Bessemer as well as open hearth furnaces are operating them in a manner to produce the maximum tonnage. This is borne out in the statement of the *Iron Age* itself of April 25 that the leading producer in the Pittsburgh district was operating to 98 per cent of its Bessemer and open hearth steel capacity, although in the more recent editorial an attempt is made to convey the impression that this plant has a Bessemer capacity available

for rails of 1,000,000 tons. In view of its own statements that the plants are working to capacity it is difficult to understand its attitude in its issue of May 9, in which it urges the substitution of Bessemer for open hearth rails as a means of "utilizing our steel making capacity."

One need only turn to the statistics of the American Iron and Steel Institute (the association of the steel manufacturers) to verify our statement that there has been a reduction in the Bessemer capacity of this country in recent years. The proceedings of this institute for 1916 (the latest available) show a capacity of 12,054,658 tons, a reduction of 2,410,067 tons or 17 per cent in the one year. It is difficult to reconcile the implication of the Iron Age that there has been no material reduction in the Bessemer capacity with these figures.

If the steel mills of this country were free to disregard other orders, there is no question but that they could roll a sufficient tonnage of Bessemer rails to meet the demands of the railways which J. Leonard Replegle, director of steel supply of the government, stated a few days ago have been placed at 2,000,000 tons by the Railroad Administration. However, this is not the situation. The mills are overwhelmed with orders, and it has become necessary to separate the essential from the non-essential and to adopt other expedients to increase production. To take a Bessemer converter now employed in duplexing in the open hearth process from this service and allow it to make straight Bessemer rail steel will gain little in ultimate tonnage. Likewise, the rearrangement of plant operation which would be necessary to roll rails at another mill referred to by the Iron Age as having 250,000 tons rail capacity and three times this of Bessemer steel making capacity would be so radical as to result in a reduction of tonnage in other departments probably as great as that gained in Bessemer steel. Therefore to refer to such plants as being available for the manufacture of rails only serves to becloud the issue and in no way assists in increasing the output. The fact that the mills have not followed this suggestion in the time of their greatest congestion and accumulation of orders indicates that the expedient offered by the Iron Age has not been taken seriously by steel makers.

The problem now confronting the steel mills of this country is that of producing the maximum tonnage of rails and other essential materials. This cannot be done while methods are being changed with the resulting disorganization of forces. Bessemer rails have largely ceased to be rolled for heavy sections. To return to them under present conditions would, therefore, appear to be unwise from the standpoint of the mills as well as of the roads unless it is necessary solely as a war measure.

New Books

Regulation of Railways. By Samuel O. Dunn, Editor of the *Railway Age*. 354 pages, 5½ by 7½ in., bound in cloth. Published by D. Appleton & Co., New York. Price, \$1.75 net.

This book really covers three different phases of the railway situation in the United States. It describes the conditions which existed on the railways during the last year before this country entered the Great War and the first year after it entered the war, and tells of the work done by the Railroads' War Board in the effort of the railways voluntarily to co-ordinate the operation of their facilities, and of the events which led to the adoption of government control. It shows that the railways had become unable because of the reduction of their net earnings, their arrested development and restrictive laws, to solve without some form of government assistance the problems presented to them by this country's entrance into the war.

Having reviewed the developments which more immediately preceded the adoption of government control, the book shows that these developments were very largely, and even mainly, the result of the policy of regulation of railways which had been followed in the United States since 1906. In other words, government control was precipitated at the end of 1917 by the rapidly rising expenses of the railways, the inability of most of them to raise new capital, the inadequacy of their facilities and the fact that laws designed to enforce competition between them hampered them in making the arrangements necessary in order to secure the kind of operating efficiency needed to enable them to meet war conditions. It is pointed out, however, that their declining net earnings, the inadequacy of their facilities and their inability to operate as far as it was desirable as a single system were due to the system of regulation which had been applied to them in spite of every effort which the managers could make to secure reforms in regulation.

It is assumed that, as the railroad control law specifically provides, government control is to be used exclusively as a war emergency measure, and that therefore the question of what shall be done with the railways after peace has returned is entirely unsettled. The experience of the past affords the best guide as to what ought to be done and what ought to be avoided in the future. Therefore about one-half of the book is devoted to an account and a discussion of the policy of railway regulation followed up to the end of 1917. The headings of the chapters in this part of the book indicate the nature of their contents and are as follows: "What Is the Matter with Railway Regulation?" "Functions of Government in Relation to Railways," "Commission Versus Legislative Regulation," "Federal Versus State Regulation," "Regulation of Rates," "Valuation in Relation to Regulation of Rates and Securities," "Regulation of Securities," "Regulation of Railway Operation."

The author outlines the reforms in regulation which he believes should be adopted if the railways are to be returned to private management after the war. He recognizes the fact, however, that there probably will be a great struggle over the question whether they shall be returned to private management, or government ownership and management shall be adopted. Therefore, a large part of the book is devoted to discussion of the general subject of "Government Regulation Versus Government Ownership." The headings of the chapters dealing with this general phase of the matter indicate their contents, and are as follows: "Railway Ownership and National Defense," "Efficiency of Production as Affected by Private or Government Management," "Equity of Distribution as Affected by Government Management or Government Regulation," "Some Political Phases of Government Ownership," "The Failure of Government Ownership in Canada."

In the last two chapters of the book the discussion which has preceded is summarized. The general conclusion reached is against government ownership and in favor of private management subject to an improved system of regulation. The changes which should be made in regulation if the railways are to be managed in the future as heretofore, as numerous separate systems, are outlined. The fact is recognized, however, that it may be considered undesirable by both the government on the one side and the owners and managers of the railways on the other, for the railways to be operated in future as many separate systems, as has been the case in the past. Therefore, a plan is tentatively outlined for the reorganization of the railways into five to ten regional groups, each of which group would be owned by a regional holding company.

The book is strictly up to date in point of both the information and the discussion in it, as it was finished, and all parts of it which had been previously written were carefully revised, after the adoption of government control of railways

A Discussion of the Pneumatic Method of Concreting*

Describing the Equipment Used and Illustrating Practical Applications of the Process

By H. B. Kirkland

President, Concrete Mixing and Placing Company, Chicago

THE PNEUMATIC METHOD of mixing, conveying and placing concrete is a comparatively recent development in engineering methods of construction. This method should not be confused with the cement gun process, which is a plastering process and is entirely different in operation and purpose. Both methods are patented. The pneumatic method is adapted for heavy, difficult concrete work, using ordinary ingredients with aggregates up to 4 or 4½ in. in diameter.

Briefly described, this method consists simply in blowing

chamber is a 90-deg. elbow which forms the connection to the discharge pipe. The door and piston is the only moving part of the mixer and the inside contains no mechanical mixing apparatus and is entirely smooth and free from obstructions. An air jet located at the heel of the bottom elbow of the mixer is the prime means of conveying and mixing the concrete. It is supplemented by other air jets located at the top of the mixer. The main air jet is directed into the center of the discharge pipe where it catches the material as it falls from the cone-shaped hopper above. The upper air jets create a pressure from above the batch, forcing it downward into the discharge pipe where it is caught by the main jet. To admit air to the mixer, two valves are used, one located on the air supply line leading to the lower jet and the other on the line leading to the upper jets placed above the level of the batch.

In operating, after the batch containing cement, aggregate and water is placed in the mixer, the door is closed and the main jet is opened. This is followed by opening the valve to the upper air jets. Many operators vary this method but the effect of this sequence of control is to start the batch forward at the bottom of the machine, detaching successive portions of the batch at the tip of the cone. The materials in the mixer flow downward in the same manner that sand flows from the upper chamber of an hour glass, but the speed of the flow is accelerated by the air pressure.

The conveying pipe consists of any standard smooth steel pipe with joints made with bolted flanges or any type most easily and rapidly handled in making connections. The most rapid wear on the pipe occurs at the points where there is apt to be a slight irregularity or a shoulder. Threaded pipe is also thinner where the threads are cut and of course wears through there first. For making deflections of the pipe line, cast elbows are used. An ordinary cast iron elbow will last sometimes less than a day, but a case-hardened steel elbow will usually last a few weeks. The best elbow is cast manganese, which will almost outlast the pipe itself. These elbows are made in 45 deg. with a thickness of 5/8 in. on the inner curve and 7/8 in. thickness on the outer curve. This gives a weight of about 220 lb. for an 8-in. elbow. The radius of the elbow is 5 ft. minimum, as a shorter radius is too sharp a turn and causes plugs in the line. Shorter radius elbows may be used, however, at the discharge end of the pipe. A split elbow of 90 deg. has also been used for 6-in. pipe. This elbow is split lengthwise so that the outer half of the curve which usually wears rapidly may be replaced.

A means of deflecting or guiding the discharge of concrete in the forms consists of a series of slightly tapered pipes, fitting together like stovepipe. Two or three sections of this light pipe about three or four feet long are all that are needed in a tunnel form for diverting the discharge from one side wall to the other and for guiding the concrete discharge around points of rock projecting from the roof. Where the tunnel is very wide, however, as in a double track railroad tunnel, a wye branch is used in the line, so there are two lines of pipe entering the tunnel form. A side valve or gate is placed in the wye for diverting the batches through one line or the other.

A suitable type of compressor is used and the one ordi-

The Pneumatic Mixer

batches of concrete through a pipe from a central point of supplies to their place in the concrete forms. The materials for a batch of concrete (½ cu. yd.) are proportioned in a measuring device and dropped into the pneumatic mixer without previous mixture.

Equipment

The plant for pneumatic mixing and placing consists of a mixer, a pipe conveying system and a compressed air plant. The mixer consists of a steel shell having the shape of an inverted cone surmounted by a cast steel cylinder in which a door is operated by a small air piston. The door is opened by releasing the air in the cylinder, allowing it to drop open by its weight. At the bottom of the inverted cone

* Abstracted from a paper presented before the Western Society of Engineers, Chicago, May 13.

narily employed is a straight line, one- or two-stage machine, compressing to 80 to 125 lb. per sq. in. The motive power may be steam, oil or electricity as is most economical under the conditions prevailing. When possible it is desirable to locate the plant near the mixer, but it is necessary to provide air storage close to the mixer sufficient at least to store enough air to discharge a batch of concrete at the maximum distance required. This storage should be at least 100 ft. capacity with 30 cu. ft. capacity added for each 100 ft. of pipe line. There should be additional storage at the compressor if the mixer is located a considerable distance away (for example, more than 300 ft. away).

The amount of air required to convey concrete depends upon the specific gravity of the materials, the smoothness of the pipe, the number of bends in the pipe line and their radii, the distance conveyed vertically and horizontally and upon the pressure or velocity of the air used. For the standard size mixer this is about 2 cu. ft. of actual free air compressed to 100 lb. per sq. in. per lin. ft. of pipe per batch. In other words, to convey one batch 500 ft. it will take 1,000 cu. ft. of actual free air compressed to 100 lb.

Based upon this figure, the diagram shows the amount of air required to convey concrete at various distances. This curve is based upon practical observations on a number of

capacity of the compressor should be great enough to build up the air pressure in the storage tank in the time required to shoot a batch.

The Mixing Process

One of the first questions asked by the engineer is, "How is the concrete mixed?" This is explained by a study of the conditions which affect the batch from the time it is placed in the mixer until it is delivered in place in the forms.

In loading the mixer the ingredients, cement and water, are usually placed in a measuring hopper, so that when the hopper is emptied into the mixer the first commingling of

Vertical Section of the Mixer with the Door Closed

Air Consumption and Cost of Air

jobs, and certain assumptions have also been made in order to complete the figures. It is assumed in this curve that certain conditions of the concrete operations are as follows: 20 sec. are allowed for opening the door and charging the mixer after each batch has been discharged and the air valves closed; 5 sec. are taken as the length of time to convey a batch each 100-ft. and as the distance becomes greater the number of batches per hour decreases until at 2,500 ft. the number is 24, and the amount of air at this distance is 2,000 cu. ft. per min. It should be borne in mind that if it is desired to get the maximum output possible the ca-

the ingredients takes place. This first commingling is not particularly important, as it is very slight. When the air is turned on that portion of the batch which is at the bottom of the mixer, in front of the conveying air jet, is first to move and is instantaneously followed by portions dropping from above. As the mixer has the shape of an hour glass, the central portion of the batch in the mixer flows down first, and the portion in the sides follows in the stream from the upper part, exactly as sand flows in an hour glass. During this operation the mingling of the different ingredient parts causes the smaller ingredients to flow into the voids between the larger ingredients. As the portions of the batch drop into the lower air stream, which has a velocity of about 5,000 ft. per sec., these portions are carried along in suspension much as dust is carried along in a storm, except that the particles are much closer together. Although the speed of the air jet is very high, the speed of the concrete materials is much lower. The speed of the concrete varies according to the amount of voids in the materials which permit the air to pass through. The air in passing through tends to carry with it the smaller ingredients; that is, the sand tends to fill the voids between the rocks and the cement tends to fill the voids remaining, and, as the voids become filled up with the smaller ingredients passing through, the speed of the mass increases, the pressure of the air behind the mass increases with the decrease of the voids in the mass, and the speed of the mass concrete increases.

Now, in this explanation of the mixing process, I have assumed that the air velocity passing through the pipe is sufficient to keep the materials in suspension, and it is important to have a sufficient air pressure to keep the materials in suspension, because when the air velocity is reduced the

materials simply roll and tumble along the bottom of the pipe. The concrete will also mix in this manner, but it is not conducive to good operation and makes a dirty pipe line, which is liable to become plugged. In shooting concrete, therefore, it will be found that with an 8 in. pipe and with materials of the specific gravity of limestone, the pressure should not fall below 50 lb. per sq. in., as the materials will then commence to drag along the pipe. Any air expended below 25 lb. is wasted when blowing concrete through an 8-in. pipe.

Three general types of pneumatic installations have been

developed through the requirements of different classes of work. These are central plant or scheme of locating the mixer at a central point from which the conveyor pipe is laid to the forms, portable plant or outfit upon which the mixer is carried and is either loaded from bins carried on the same conveyance or supplied by a belt or other loading device, and the scheme of loading the mixer at various points as at the bottom of manholes in shallow tunnels and supplying it with materials through a chute from the various corresponding points along the surface. The last is a form of central plant made semi-portable.

Doings of the United States Railroad Administration

Rate Increases Expected Shortly; Proposed Amalgamation of Railroad Associations; Information for Shippers

WASHINGTON, D. C.

ALL SIGNS point to early action by the Railroad Administration to bring about a general increase in both freight and passenger rates and while those who are in touch with the work that is being done in that direction are not talking about it, there is no attempt to deny the statements which are being published that the amount of the proposed advance will be such as to make railroad officers who have on several occasions spent a year or more at a time in efforts to secure increases of 10 or 15 per cent, marvel at their timidity. An examination of the available figures of railroad earnings and expenses for the first three months of this year, although the complete figures have not yet been given out, when taken in connection with the proposed \$300,000,000 wage increase, is enough to show that the kind of relief the railroads used to ask when they were facing a similar situation would amount to merely a drop in the bucket under the present conditions.

Based on these figures, rough estimates are being made that a deficit of from \$800,000,000 to \$1,000,000,000 would be shown for the year, and while it may be expected that operating conditions will be more favorable than they were in January, February and March, there are many other factors, such as the prospective increase in the price of coal, which will tend to keep expenses on an upward trend. Figuring in this way it is easy to reach a conclusion that an increase of at least 25 per cent in freight rates and an increase in passenger fares from an average of about 2 cents to 3 cents a mile would hardly more than meet the situation even if the increases could be made available throughout the year. On the contrary the operating deficit, when the wage increases are put into effect as of January 1, will have prevailed for about six months before any relief can be expected from rate increases if they can be made available by July 1. Based on last year's earnings a 25 per cent increase in freight rates would amount to about \$700,000,000, while a similar increase in passenger fares, on the assumption that a basic rate of 3 cents a mile would increase the average rate by no more than that proportion, would add about \$200,000,000 more, making a total of \$900,000,000.

It is understood that a report recommending the increase in passenger fares is now about ready for the director general's consideration and that the matter of freight rate increases is being worked out by the various committees that have handled similar subjects for the railroads in all parts of the country. It is stated also that Mr. McAdoo has given some consideration to the matter, although he has been confined to his home by illness ever since his return from the Liberty Loan tour. He has not yet acted upon the report of the Railroad Wage Commission, and no definite announce-

ment as to rates is expected until he has, but as soon as the wage increase is an accomplished fact the rate matter will probably take definite shape.

Under the terms of the railroad control bill the President, who has delegated his authority to the director general, may initiate increased rates and have them put into effect at once by filing with the Interstate Commerce Commission a certificate that the increases are necessary to defray expenses, after which the Interstate Commerce Commission may enter upon an investigation as to the reasonableness of the rates. Nothing is said in the law about any investigation by state authorities nor has any one suggested audibly that the state commissions be consulted in the matter. In fact there is a general belief that a part of the increase is to be accomplished by leveling up state rates to the interstate basis.

In order that agencies or lines publishing tariffs may be prepared to make quickly any changes in rates that may be decided upon, all publishing agents, bureaus and individual railroads under government control, that publish tariffs have been requested to prepare an analysis of freight tariffs which contain rates or charges applicable on intrastate traffic only, including tariffs filed with the Interstate Commerce Commission, which contain such rates and tariffs filed with state commissions but not filed with the Interstate Commerce Commission. The circular letter says: "The purpose of this analysis is to have ready at the earliest possible moment a detailed statement of the tariffs or tariff items which may have to be amended, cancelled, or filed with the Interstate Commerce Commission as amended, to eliminate conflicts, bring all rates to a new basis and have one rate and only one published for each service, and that rate applicable on all business, both state and interstate, and filed with the Interstate Commerce Commission."

Furnishing Information to Shippers

Edward Chambers, director of traffic for the Railroad Administration, has addressed a letter to the regional directors giving instructions, to be carried out under their direction, for rendering the service to the shippers formerly performed by the off-line traffic offices in the way of furnishing information. The letter, which refers to his previous letter of April 5 in connection with the director general's order on the subject, follows:

"There seems to be some alarm on the part of the shipping public that they are not going to receive from the existing traffic organizations as complete and satisfactory service as heretofore given in the larger cities together by the home railroad offices and foreign line offices, the changed conditions now placing the responsibility for the entire serv-

ice upon the home line office. It was suggested in my letter above that the latter equip itself so as to be in position to render service completely.

"In the principal commercial centers railroads have joint tariff bureaus fully equipped with expert tariff men. The tariff files in these bureaus can be readily adjusted to contain all the rate information which the business interests in the particular city or territory may need. They are the very best source for proper and correct tariff information. For example, either Central Freight Association or Western Trunk Line office in Chicago could readily and with very little additional expense carry a complete set of the principal tariffs of all railroads placing itself in position to answer all inquiries promptly. This in addition to the tariff files in the general offices of individual lines would, I am sure, fully satisfy the need of the shipping public. The principal tariff bureaus are located at New York, Chicago, St. Louis, Atlanta and San Francisco with sub-bureaus in most of the larger shipping sections. The sub-bureau could also be equipped with such tariffs as necessary in the section of the country it covered.

"As to passing reports on high class non-perishable traffic, this is a service the responsibility for which is largely upon the individual line and is a necessary service to the shipper but not to the extent, however, that it has been given in the past under competitive conditions. Traffic officers of railroads should be instructed to confer with interested shippers for the purpose of determining the information of passings needed by the shippers. It should be a mail service. I do not anticipate any difficulty in shippers and carriers agreeing upon a plan satisfactory to both interests. The point at which the passing report should be made in the different sections of the country are well established by the practice of the past.

"As to passing reports on livestock and perishable traffic, this is largely a telegraphic service. The points at which these reports should be made have been established by long practice. The shippers' marketing plans are based upon them as well as the railroads' diversion arrangements. As to this service it is not necessary to continue the amount of telegraphing which has been done in the past and shippers do not now expect it. The responsibility for this work is also largely upon the individual carrier. I am sure from my discussion of the subject with representatives of shippers' organizations that no difficulty will arise to prevent a plan being adopted satisfactory to shippers and carriers alike with minimum amount of telegraphic service. Some consideration, I understand, has already been given this subject by carriers and shippers and it may be that arrangements have already been completed. I suggest in this connection that it is very desirable the routing through to destination so far as possible be shown on the waybills at the shipping point so as to have minimum of rerouting in transit of perishable traffic. This may be accomplished by traffic officials at point of origin keeping in close touch with the transportation conditions on railroads, particularly east of Chicago and Mississippi River, and advising shippers.

"As to tracing delayed freight, passing reports would save a vast amount of telegraphic inquiry for goods delayed in transit, but where evidence of unreasonable delay is presented to representative of any carrier in the through route of the freight, such representative should take whatever action might be necessary either using wire or mail to secure prompt information. For service of this character between agents of carriers no charge should be made to the shipper, but where inquiry is made by a shipper which requires answer by commercial telegram such answer should be sent at the expense of the applicant. There may be some objection by the shippers to this rule but unless there is a check of this kind, many duplications and unnecessary telegraphing will take place. Railroads should give special

attention to this character of service. This rule should be uniform on all railroads.

"Many inquiries have been received as to where shippers, particularly in New York, would go to secure through bills of lading on export traffic via the Pacific ports after foreign line offices in New York City are closed, it having been the practice for many years for the representative in New York City of the Pacific Coast terminal line delivering the traffic to the water carrier at the port to take up the railroad shipping receipt and issue in its place a through export bill of lading. These bills of lading are generally negotiated through New York banks. Through rail and water bills of lading on export traffic today are practically confined to New York and to the routes via Pacific ports. I suggest Pacific Coast terminal railroads authorize Mr. C. C. McCain, secretary of the Eastern Freight Committee, to act as their agent in issuing these through export bills of lading. Mr. McCain's committee has taken the place of the Eastern Trunk Line Association. He is, therefore, equipped with a large office space and an organization which can properly supervise issuance of bills of lading. With comparatively little additional expense he can add to his present force, if necessary, a sufficient number of clerks experienced in this work who are now employed in the New York offices of the Pacific Coast terminal lines and who will shortly be released.

"I would like for you to get these matters shaped up as soon as possible because shippers are concerned regarding this service. It may, however, occur to either of you that a somewhat different plan would better serve the shipping interests in your section, in which event it will be satisfactory to me to have you work it out in your own way, but the tracing rules should be uniform."

Proposed Amalgamation of Railway Associations

The director general of railroads has started a movement for the amalgamation of the leading railway technical associations of the country. At his suggestion a meeting was held in New York on May 2 which was attended by the acting president of the American Railway Association and the presidents of the American Railway Engineering Association, the American Railway Master Mechanics' Association, the Master Car Builders' Association, the Association of American Railway Accounting Officers and representatives of some other organizations. The general plan was discussed at this meeting and the heads of the various associations were asked to prepare and submit to the executive committee of the American Railway Association their suggestions as to how the scheme could best be carried out. Their suggestions will be considered in about ten days or two weeks at a meeting of the executive committee of the American Railway Association. It is expected that after that a series of meetings of representatives of the various associations will be held and that finally a report with recommendations regarding the whole subject will be made to Director General McAdoo.

One plan which probably will be considered will be that of uniting all associations in a single organization. Another will be the establishment of relations between them, which will make the other associations subsidiaries of the American Railway Association. Under this plan recommended practice adopted by the subsidiary associations would be referred to the American Railway Association and if approved it would be submitted to the director general. If the recommended practices received his approval they would, it is assumed, be put into effect and made obligatory upon all of the railroads.

In the past the various associations have adopted recommended practice, but as they have been unable to enforce their recommendations, in most cases they have been adopted

only by part, although in many cases a large part, of the railways

Inland Traffic Service War Department

A reorganization of the Division of Inland Transportation of the War Department, effective on May 1, is announced in a circular just issued by H. M. Adams, manager of the division. The circular says in part:

Effective May 1, 1918, the Transportation Field Force of the Division of Inland Transportation will be known as the Field Force of the Inland Traffic Service, War Department, and branch and district offices, in charge of the persons indicated, will be located as follows:

New York Branch—Room 526, 45 Broadway, New York, N. Y.; B. M. Flippin in charge.

Albany District—1 Post Office building, Albany, N. Y.; Captain L. S. Lansing in charge.

Atlanta District—Forsythe building, Atlanta, Ga.; Captain F. E. DuBois in charge.

Baltimore District—Light and German streets, Baltimore, Md.; Captain S. A. Fulman in charge.

Boston District—25 Huntington avenue, Boston, Mass.; Captain E. H. Pillsbury in charge.

Buffalo District—530 Federal building, Buffalo, N. Y.; Captain L. M. Turnbull in charge.

Charlotte District—202 Mint building, Charlotte, N. C.; Lieutenant J. B. Beddingfield in charge.

Chicago District—Southern Pacific building, 35 Jackson boulevard, Chicago, Ill.; R. B. Robertson in charge.

Cincinnati District—213 Post Office building, Cincinnati, Ohio; Captain C. V. Link in charge.

Indianapolis District—314 Post Office building, Indianapolis, Ind.; Captain F. A. Leith in charge.

Jacksonville District—707 Heard building, Jacksonville, Fla.; Willis Callaway in charge.

New York District—Room 526, 45 Broadway, New York, N. Y.; Lieutenant Miles Ross in charge.

Philadelphia District—742 Weidner building, Philadelphia, Pa.; Captain S. A. Tubman in charge.

Pittsburgh District—Tenth floor, Chamber of Commerce building, Pittsburgh, Pa.; Lieutenant R. O. Roberts in charge.

Richmond District—425 Post Office building, Richmond, Va.; Lieutenant D. Mayer in charge.

San Francisco District—San Francisco, Cal.; Captain H. A. Manning in charge.

St. Louis District—826 Pierce building, St. Louis, Mo.; J. L. Hohl in charge.

Toledo District—415 Ohio building, Toledo, Ohio; Captain J. D. Anderson in charge.

The duties of those in charge are as follows:

Will represent the Inland Traffic Service in all matters within its jurisdiction.

Will promptly and effectively respond to all requirements of shipping officers of the War Department in matters pertaining to the securing of cars required and the movement of same, when loaded, subject to the methods of procedure established by the Inland Traffic Service from time to time.

Will exercise supervision at all depots, posts, camps, aviation fields, warehouses and other War Department institutions over matters within the jurisdiction of the Inland Traffic Service, including those pertaining to maximum loading of cars, prompt unloading of cars, demurrage charges, expediting the movement of property, tracing, freight rates, prompt accomplishment of bills of lading, etc.

Will periodically visit all points to and from which government property is shipped, review the methods and conditions prevailing, suggest such changes in methods as are necessary to establish uniform system, and shall check and review the manner of accomplishment of bills of lading, requiring, when necessary, a check with the carriers or by

other method, to determine whether or not unaccomplished bills of lading are held covering property which has been received.

Will, as the opportunity may offer, confer with railroad officials for the purpose of determining whether or not War Department property is being delayed en route, and for such other review of the situation as may be necessary from time to time.

The practice heretofore followed of tracing cars in person will be discontinued. The Railroad Administration will establish at Washington, D. C., on May 15, 1918, a Car Record Bureau wherein the shipment, interchange, junction passing and arrival at destination of government shipments in carloads will be recorded, and this record will be resorted to in tracing delayed shipments. Those in charge of Inland Traffic Service Branch and district offices will rely upon the Tracing Section of this office for data available from this record, and discontinue, so far as may be practicable, personal tracing of property shipments.

Will keep in touch with the situation at important centers and junction points, and will promptly report all congestion of railroad facilities involving government property and causes therefor.

Will review records of such express shipments of government property as may be made within their respective districts, and where such shipments appear to have been unnecessary, report the facts to this office for further action.

Will make such visits as may be necessary to the several ports within their jurisdiction, noting conditions, and render such assistance as may be necessary to avoid congestion, and make such recommendations as may be pertinent to overcome any apparent difficulty.

Will exercise and perform such other functions and duties as may be prescribed by the Chief, Inland Traffic Service War Department, or by his authority from time to time.

The services of the branch and district offices are available to all bureaus of the War Department alike, and their activities will be exercised in connection with the property of all such bureaus without preference or prejudice.

New England Protest Against Abolition of Differentials

A large delegation of New England shippers called on the traffic department of the Railroad Administration last week to protest against the proposed elimination of the differential rates from New England to western points via the Canadian lines. All differential rail-and-lake rates have been abolished and the Canadian lines have been asked to concur in taking out their differentials from New England. The protest was based on the ground that some of the shippers are located directly on the differential routes and would be put to a disadvantage if their rates were advanced with out relation to the rates of competitors in other localities.

Reduction in Western Passenger Service

Some additional details regarding the plan for a readjustment of passenger service on the western roads, which was described in last week's issue, are contained in an announcement issued this week from the office of the director general. The announcement states that the director general has approved the recommendation of Regional Director Ashton for a reduction in the train service west of Chicago amounting to 11,728,000 miles per annum, effective on June 1 and continues:

"This economy has been accomplished by abandoning duplicate service between Chicago and the Pacific Coast cities and assigning to the short and direct routes to each city the fastest through service. Under this plan the Atchafalaya, Topeka & Santa Fe will be the preferred route to Los Angeles, Chicago & North Western Union Pacific Southern Pacific to San Francisco, Burlington Northern Pacific to Portland and the Chicago, Milwaukee & St. Paul to Seattle.

The fast trains will make the run in 72 hours to each city. There will be a secondary train carrying all classes of equipment scheduled in 78 hours. The other trans-continental roads will operate such service as may be necessary to accommodate their intermediate travel on reasonable schedules.

"On the same date the mail schedules will be adjusted so that there will be a parity of mail service between Chicago and each of the rival commercial centers on the Pacific coast. The fast mail trains will cover the distance between Chicago and Pacific coast terminals in 65 hours.

"The public will be adequately served under the new arrangement, although it is probable that more upper berths will be sold in the future than in the past.

"The passenger committee for the Western district has now started working on the rearrangement of the schedules to the Southwest, where important economies can also be effected without affecting public convenience."

Steel Supply Limits Car and Locomotive Increase

Some interesting facts regarding the relation of steel supply to the car and locomotive situation are contained in a letter addressed by C. R. Gray, director of transportation of the Railroad Administration, to Senator E. D. Smith, chairman of the Senate Committee on Interstate Commerce, who has been making a preliminary inquiry for the committee as to what action has been taken by the Railroad Administration to supply the deficiency in motive power and cars for the transportation of coal.

The fundamental need is for motive power, Mr. Gray said, and it is the intention to utilize the maximum capacity of the locomotive plants, both commercial and railroad, to the limit, but the steel supply is the controlling factor and the orders just placed for cars and locomotives would have been greater, particularly in the case of engines, if the steel had been available. The orders will consume all the steel which the War Industries Board could place at the disposal of the railroads.

Mr. Gray estimated that the railroads under peak load are short approximately 4,000 locomotives and from 200,000 to 250,000 freight cars. On April 1 the builders had on hand unfilled orders for 2,127 locomotives, while the 1,025 just ordered make a total of 3,152, and the director general stands ready to place orders for the balance as rapidly as they can be produced.

The unfilled car orders on April 1 amounted to 27,525 and orders have been placed for 100,000, including 50,000 box cars, 45,000 coal cars and 5,000 cars for steel products. The average production of freight cars for American railroads in the seven years ended December 31, 1917, was 98,215 annually.

On January 1, 1918, Mr. Gray showed, there were on order 2,448 locomotives. In three months the builders had delivered only 321, due to shortage of material and the construction of locomotives for Russia and for our military railroads in France. In addition, however, the railroads have received 147 Russian locomotives and 105 U. S. A. locomotives which were allotted to them temporarily. The builders estimate that the order for 1,025 locomotives placed this month, together with the locomotives on order for the railroads and for the War Department, will consume their capacity for the balance of the year. On January 1 there were also on order 42,696 freight cars, of which 15,171 had been received up to March 31.

Mr. Gray showed also that up to the third week of April the railroads had handled 3,522,919 cars of coal, an increase of 49,638 over the corresponding period of 1917.

Mr. Gray's figures indicate that the lack of sufficient steel is likely to prevent any considerable net addition to the car equipment of the railroads this year, because the addition of 98,000 new cars per year during the past seven years was sufficient only to increase the total of freight cars in serv-

ice from 2,195,511, in 1911, according to the Interstate Commerce Commission statistics, to 2,342,699 on December 31, 1916. This represents an increase of 148,000 over the number of cars retired during the period. Since 1915 there has been a decrease. On June 30 of that year there were 2,356,338 freight cars. On June 30, 1916, 2,326,987 were reported and on December 31, 1916, there were 2,342,699. The 1917 figures showing the number of cars in service are not yet available.

The number of locomotives had increased from 61,327 in 1911 to 64,073 in December 31, 1916. In this case also there was a decrease from 1915 when there were 65,099.

Additions and Betterments

The director general on May 8 issued Circular No. 25, directing the roads to make a report as to additions and betterments, as follows:

"Each carrier shall at once make a report in duplicate, sending one original to the Director of the Division of Capital Expenditures and the other original to the Regional Director, giving full advice as to whether the carrier is proceeding with all practicable expedition to construct and put into operation all additions and betterments on its lines which may have been approved by the Director of the Division of Capital Expenditures, and all equipment which may have been so approved, and which the carrier may be constructing in its own shops.

"If a carrier shall not have commenced any project so approved, or, having commenced it, shall not be prosecuting it vigorously to completion, the carrier shall specify in the above-mentioned report each such project and state fully the reasons why it has not been commenced or why, if commenced, it is not being vigorously prosecuted to completion.

"If a carrier shall not have, on hand or arranged for, the necessary funds to construct and put into operation without delay all the additions and betterments which have been so approved, and if it anticipates that this condition is likely to delay any of such work, the carrier shall in addition make a report at once to the Director of the Division of Finance, stating its financial needs in order to enable it to complete all such work expeditiously."

Car Record Office for Government Freight

The Car Service Section announces, in Circular No. CS—8, the establishment on May 15 of a car record office, by the Car Service Section, at Washington, D. C., for the purpose of recording the movement of carload shipments of United States government freight as follows:

- (a) Supplies and materials consigned to an officer, depot, warehouse, or port of embarkation, for account of the War Department (Army).
- (b) Supplies and materials consigned to the Navy Department, to Navy Yards, Naval Stations, or the Marine Corps.
- (c) Supplies and materials consigned to or for account of the United States Shipping Board, Emergency Fleet Corporation.
- (d) Supplies and materials consigned to: the United States Treasury Department, the United States Post Office Department, the Bureau of Engraving and Printing, the Department of the Interior, the Public Printer.

Before executing bills of lading for United States government freight, agents must ascertain from shipper the department to which the shipment is consigned, and must plainly indorse the bill of lading accordingly. The waybill must be stamped on both face and back "UNITED STATES GOVERNMENT FREIGHT," in order that such freight may be readily identified.

Agents executing bills of lading for United States gov-

ernment freight designated in paragraph 1 must mail one legible copy of each such bill of lading to Car Record Office, Car Service Section, Washington, D. C., on the date the shipment is received for.

Agents at the junction points named in a list of 56 points must mail daily to Car Record Office a report, Form CS—2, covering all carloads of United States government freight, delivered to connecting lines. This report must be made for each 24 hours ending at midnight, and must be completed and deposited in the mail prior to noon of the following day.

It may develop that it will be advisable to have interchange reports mailed direct from other points, in which case supplementary instructions will be issued.

Agents at all junction points of the railroads receiving these instructions must show in the remarks column of their standard interchange report, opposite each car of government freight, "U. S. Govt."

The officer in charge of car records of each railroad receiving these instructions will report daily to Car Record Office all cars of United States government freight delivered to connecting lines at other than the junction points named. Reports rendered each day must include all cars of United States government freight shown on interchange reports received in the office during the previous day. More than one date may be included on one report, but the date of interchange must be shown for each car.

When a carload of United States government freight is transferred, a report of the transfer showing old and new car initials and numbers, must be rendered to Car Record Office by the agent of the delivering line at the first junction point after the transfer has been made.

Destination agents—that is, agents who take the waybills into their accounts—must report daily to Car Record Office arrival of all cars of United States government freight. These reports must be compiled and placed in the mail before noon of each day.

Director General Saves N. Y. C. 1 Per Cent

Director General McAdoo issued the following statement with regard to application of the New York Central for authority to issue \$6,000,000 collateral trust notes for six or twelve months for the purpose of paying off certain obligations of the New York Central System maturing this week.

The director general was informed by the company that the best terms on which the money could be obtained at this time would be 7 per cent per annum. The New York Central was advised that a 7 per cent rate on notes of this character was not justified, as such a transaction would have the effect of encouraging high rates for money. The director general thereupon made inquiry of the Central Trust Company of New York as to whether it could arrange to place the \$6,000,000 needed by the New York Central for six months at 6 per cent per annum interest, and was promptly informed that the Central Trust Company would gladly provide the funds on the terms suggested.

Interline Waybill Order

C. A. Prouty, director of public service and accounting, has issued the following circular regarding the interpretation of the interline waybilling order:

"Paragraph 3 of General Order 11 provides: 'Waybills for carload freight must move with the cars. Waybills for less carload freight must be moved with the cars when practicable; otherwise so as to reach the transfer point or destination with or in advance of the cars.'

"In order to expedite the moving of meats and packing-house products from Chicago and other points from which these commodities are shipped, the following telegram was

addressed to Regional Director Ashton: 'Am advised Car Service Committee at Missouri River and other packing house shipping points decline to move cars without copy bill of lading. Please advise all concerned that they may disregard first sentence paragraph three, General Order 11, on eastbound packers' traffic from Chicago, applying merchandise car practice there outlined to packers' cars, pending further consideration here. See no reason why card waybills cannot be used, mailing waybills to destination or division points as heretofore.'

"The rule announced in this telegram cannot be said to be in conflict with the principles contained in paragraph three of General Order No. 11. It provides that the cars containing meats and packing-house products of a perishable nature may be forwarded in advance of the waybills therefor, and such waybills will be sent forward as quickly as possible so as to catch the cars before their arrival at destination or will reach destination in advance of the cars. Commodities shipped by packing interests other than those named herein and which are not of a perishable nature, shall be waybilled as provided in General Order No. 11."

Regional Director Confers With Western Short Lines

OVER 200 REPRESENTATIVES of western short lines convened at the Hotel Muehlebach, Kansas City, on May 8, for the purpose of discussing the relations between the Railroad Administration and short line roads. The meeting was opened with the election of D. M. Swobe, president of the Western Association of short line Railroads, as chairman of the conference, and C. M. Oddie, secretary of that organization, as secretary of the meeting. R. H. Ashton, regional director of western railroads, was present, with a number of the members of his staff, and explained in detail why some short lines will be relinquished from government control while others will be retained. He stated that those lines which will be retained will be operated by the trunk lines with which they connect and intimated that if this is done the officers of the short lines in question will be removed and the short line shops closed. The owners of lines which are taken over by the government will be reimbursed, provided they enter into a particular form of agreement which will be prescribed by the Railroad Administration.

Mr. Ashton's remarks relative to the disposition of short lines which will be retained led to a general discussion of the treatment which should be accorded to those lines which will pass out of government control. In general, the following policy was recommended by the meeting:

1. Short lines not retained under government control should be affiliated as a class with the government and conducted under a uniform policy, which will insure them a proper division of all through rates and, in the event of any advance in rates on the trunk lines, a proportionate share of the increased revenue.
2. The non-controlled lines should receive their fair share of equipment in car distribution and should not be forced to pay excessive car rentals.
3. The prices for supplies and equipment paid by the controlled roads through their regional purchasing agents should also apply to the non-controlled roads.
4. Non-controlled companies should receive fair treatment with respect to routing over their lines.
5. Agreements should be made by all short lines to accept all priority orders of verified freight and passenger traffic which are promulgated by the Railroad Administration.

Those members of Mr. Ashton's staff who attended the conference were M. J. Gormley, operating assistant to the regional director; Ralph Budd, assistant in charge of capital expenditures, and J. G. Woodworth, traffic assistant.

Developments in Western Railroad Region

AMONG RECENT CIRCULARS issued by R. H. Aishton, regional director of western railroads at Chicago, are the following:

Routing of Freight by Shippers

Circular No. 101, dated May 7, gives detailed instructions on the routing of freight: Paragraph 4 of the director general's Order No. 1 provides that the designation of routes by shippers is to be disregarded when speed and efficiency of transportation service may be thus promoted. To prevent misunderstandings and to observe uniformity in applying this rule, the following rules should be observed:

1.—A rate, charge or privilege covered by tariff properly published and filed cannot be embargoed or canceled except by correction of the tariff in the manner required by law.

2.—A route covered by tariff properly published and filed may for sufficient reasons be temporarily embargoed, but cannot be discontinued except by correction of the tariff in the manner required by law.

3.—Where a shipper specifies a route to which under the tariffs transit privileges and terminal rights apply, when such route is not under embargo, the transit privileges and terminal rights must be protected without additional cost to the shipper should his routing be disregarded by the railroads for efficiency reasons.

4.—When traffic is forwarded by the railroads for efficiency reasons via a route to which a higher rate applies than over the route specified by shipper, the rate via the shipper's route must not be exceeded as a charge for the movement over the substituted route.

It is the intent of Paragraph 4 of Order No. 1 that while the railroads may in the interest of efficiency make use of the most desirable routes without regard to the directions of the shippers, the rates, charges and privileges as published and filed in tariffs of the carriers will not be denied, and the Interstate Commerce Commission has issued an order authorizing the adjustment of charges in accordance with this principle. It is desired that all reasonable and economical routes shall be properly published so that they may be available when needed, and if in an emergency a route not provided by tariff is used such route should be covered by tariff immediately, unless it is of such a character as not to warrant its permanency. Nothing in these instructions shall be considered as giving to shippers the right to rates, charges or privileges applying to routes which may be embargoed at the time of shipment.

Authority for Expenditures

Circular No. 105, dated May 11, reads as follows: A number of the railroads are submitting D. C. E. forms 3 and 4 with the word "blank" or "nothing to report" typed thereon. Please do not submit D. C. E. forms 3 and 4—requests for authorities—unless there is something to report or authority is requested in connection with some work chargeable to capital account.

Reservations—Sleeping, Parlor Car, Etc.

Circular No. 102, dated May 8, sets forth the following rules governing sleeping car reservations, etc.:

1.—Railroad agents or representatives will not pay for telegraph or telephone messages covering sleeping, parlor car or steamer reservations. Passengers desiring such reservations made for them by railroad representatives will be required to pay the established charges for the necessary telegraph or telephone service in both directions.

2.—Assignments of space to offices located off the line of sleeping and parlor car runs must not be made.

3.—Agents at intermediate points on sleeping or parlor car runs, at which space is not available, or to which space is not assigned for the sale of tickets, may make use of railroad wires, without charge to passengers, in arranging for accommodations to be taken at such points.

Shipments of Government Lumber

Circular No. 95, dated April 30, sets forth the details of a plan for the consolidation of shipments of government lum-

ber from Pacific coast territory, effective May 6. According to the plan as outlined, shipments will be consolidated, kept intact, and given continuous movement from concentrating points in solid trains. Fifteen cars will be considered a minimum number for any one train, to be filled out with other tonnage to rating, provided there is not sufficient tonnage for a full train of government lumber. Concentrating points for this lumber are as follows: Great Northern, Delta, Wash.; Northern Pacific, Auburn, Wash.; Chicago, Milwaukee & St. Paul, Cle Elum, Wash.; Oregon-Washington Railroad & Navigation Company, Portland, Ore.

Joint Live Stock Offices

Terminal committees reporting to the regional director of western railroads are working out plans for the consolidation of live stock agencies at Kansas City, Mo.; Omaha, Neb.; St. Louis, Mo., and Chicago. The handling of live stock shipping activities from one large office in these cities will effect a considerable saving in office rentals and, it is believed, will prove advantageous to shippers, in that it will give them a choice of routes which will make for more expeditious car movement. It is probable that the plan will be extended to other cities if local conditions make it appear advisable.

Responsibilities of Railroad Men*

By Robert Quayle

General Superintendent of Motive Power, Chicago & North Western.

"THERE IS A GREAT RESPONSIBILITY attached to railroad men today. I sometime think that we should stop occasionally and consider what our responsibilities are. What can we do that will make for greater efficiency, that will make for success? What will allow us to reduce the man power in our shops, to do work with less men? The man who does this now, will be the man who will stand in the forefront, because he is doing something worth while. When you have a job that you must do you respond to the call and do it. We have a big task now; let us be on the job all the time, so that we can make good at it. We are at war, let me emphasize it, we are at war, and we are just beginning to realize it. We are expecting a great deal of the railroads, but we are not going to expect too much, because railroad men are thoroughly loyal, thoroughly efficient, and will measure up to what is demanded of them. One thing you must do now and that is your level best. This is no time for pessimism, this is a time for optimism. We must cheer everyone with whom we come in contact.

"We must be loyal and give men here and there, even though we are having a hard time. Let us do our part to back up our men, that the stars and stripes may shine with more glory than ever before. Let us do our work with clean hands. Democracy must prevail—democracy will prevail! Let us as a nation do something to lift the world out of the depths it is in, that the world may rise up and call us blessed. But let us not forget those who are close to us. The men in your shops need more than knocking. It has been said that you can't saw wood with a hammer. It is just as certain that you can't lift men with a hammer. We are going to do our part if we help those about us; we are going to do our part by doing our work cheaper and better than ever before. And when the country asks more of us we are going to take another notch in our belt, and march forward, and do the best we can."

Salvaging the Railway Facilities at Halifax, N. S.

An Account of the Damage Done by the Disaster of
December, 1917, and Work of Restoration

By F. B. Tapley

Assistant Engineer Maintenance of Way, Canadian Government Railways, Moncton, N. B.

THE COLLISION OF THE STEAMERS "Imo" and "Mont Blanc" in the narrows of Halifax harbor, on December 6 last, caused an explosion of the cargo of the "Mont Blanc," which wrecked about one-third of the area of the city and water front, and damaged the railway facilities in the vicinity of Richmond yard and North Street station, and along the water front at Deepwater, which is farther south. The evidence on the ground would lead one to believe that the "Mont Blanc" exploded in the vicinity of Piers 6 and 8, the greatest damage being done there, and extending southwesterly to the North Street station, and northeasterly to Willow Park Junction,—the radius of the greatest force of the explosion extending about 5,000 ft. While there were evidences of the force of the explosion all over the area of the city, the greatest damage was within the radius mentioned.

Extent of the Damage

On Pier 9, which is the most northerly railway pier along the water front, a wooden shed was so badly shaken by the force of the explosion that it collapsed in a heap. The sub-structure of the pier was not damaged, although with the large amount of wreckage piled on it, it took considerable time to find it out. Pier 8, next down the water-front, was destroyed from the water level up, a portion of the old crib below the water level remaining. It was a wooden pier of crib construction, ballasted with stone. Pier 6, a wooden pile pier, without a shed, was completely blown away, and no trace of it remains to mark the spot where it stood.

At Richmond Yard station, the car repair buildings and cattle pens were blown to atoms, while the switchmen's

shanties throughout the yard were so badly wrecked as to be unfit for repair.

The North Street passenger station sustained very heavy damages. The front and back thirds of the tram shed roof were blown upward with the blast of the explosion, and then collapsed and fell down inside the brick walls. Thirteen of the roof trusses in the centre of the shed, with the roof boarding, framing and sash on them, remained standing, but were later pulled down for safety. The glass was blown out of all the windows, and the doors out of the casings, but, being vertical, counterweighted, sliding doors, many could be operated afterwards. In the head-house of the station, which is a solid brick structure, the damage was very heavy. Downstairs all the doors, windows and fixtures were blown off. The main partitions stood up under the force of the explosion, but the light wood counters, ticket wickets and similar fixtures were blown down and badly broken. The brick walls were found to be in good condition, except for a few loose bricks next to the roof timbers; these, no doubt, were loosened by the disturbance in the roof.

On the second floor, all doors and windows were blown off, and the plaster partitions bulged and broken. The damage to the third floor was practically the same as on the second floor, and a portion of the roof on the monitor was blown upward. Later in the heavy storm of Sunday, December 9, this portion of the roof collapsed. The power plant and power house, adjoining the station, suffered broken pipe-connections and a wrecked roof, all doors and windows being blown off or broken.

The damage at Deepwater, where the local freight and ocean-passenger facilities are situated, was heavy, but fortunately did not put the facilities entirely out of business.

Further down the harbor, at Pier 5, which was abandoned for shipping purposes last summer, the latrines erected for the sanitary convenience of troops last fall were badly shaken up and had to be rebuilt. Pier 4 is a wooden pile pier, with two outside tracks, and a wood shed of the single-deck type. Repairs were underway when the explosion occurred. The pier was unharmed, but the shed was completely wrecked. Pier 3 is a wooden pile pier, with single story wooden shed and four tracks, two outside and two inside of the shed. The pier was not damaged, but the roof trusses on the north half of the shed were all broken and all the doors and windows blown off. The electric wiring fell down onto the floor. The south half of the frame was not damaged.

Old Pier 2, an open wood pile pier with two tracks, was not damaged. New Pier 2 is a passenger pier, built of reinforced concrete pile construction with a slab deck and has a double-deck reinforced concrete shed with four tracks, two outside and two inside the shed. The shed and pier proper were practically undamaged. That it was under heavy stress was evidenced by the condition of the fixtures. The heavy steel doors were all blown off the north side, both upstairs and down, and practically all the glass broken. On the south side of the pier, eight of the large steel doors downstairs were blown off, and a number damaged. The upstairs doors were also damaged, but not to the same extent as on the north side. Some of the north side doors were blown nearly across the shed, and one or two were found wrapped around the concrete columns in the middle row.

In the military hospital upstairs, the light wood temporary partitions were badly shaken up, and in falling broke some of the steam radiators clear of the pipes, and carried down some of the temporary electric wiring fastened to them. The power plant was not damaged, although the building housing it was shaken up. The glass in this shed was wire glass set in metal frames, and while it was practically all broken, a large proportion of it remained in the sash, affording some protection from the weather, and it did not fly out in the

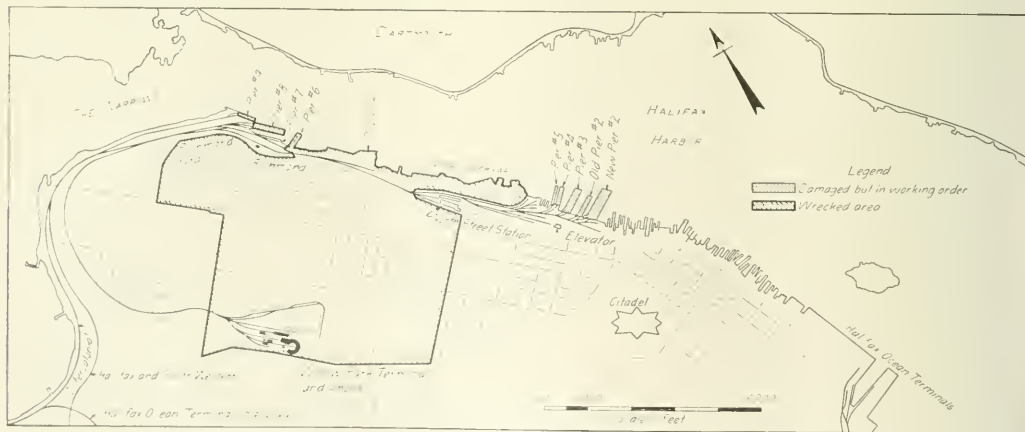

The 500,000-bu. grain elevator, which is of wood construction, had the roof over the bins so badly damaged that it had to be rebuilt. All of the windows in the working house and shipping galleries were blown out, and a hole was blown in the northerly side of the working house. This hole blew outward and toward the explosion, showing that it

Damage to Freight Cars Near Richmond

was caused by reduced air pressure outside the building. The power plant was not harmed, and was put under steam on the afternoon of the seventh.

At Willow Park, where the engine terminal is located, the damage was quite severe. By looking at the map, it will be seen that Willow Park is situated directly behind Pier 6, in front of which the explosion occurred. It is on top of a hill from which the land slopes down to the harbor. The doors

Map of a Part of Halifax, Showing the Affected Area

form of fine particles like the plain glass, which caused so many cases of blindness.

The Deepwater local freight shed, a brick structure, situated behind the piers, was not greatly damaged, except for a short section of the roof next to the office portion, which opened up along the ridge for a distance of 60 ft., and the loss of the glass in the office windows and transoms over the freight doors.

and windows in the car shop, stores, planing mill, oil house and engine house were blown out; the roof of the engine house was badly damaged, and the greater portion of it collapsed. The roofs of the machine shop, boiler house and blacksmith shop were found to be badly shaken up, and had to be rebuilt. These roofs were of concrete, reinforced with expanded metal, and were of poor construction. The reinforcement was badly rusted and the concrete very lean in

ement. The condition of the roofs was probably a contributing factor to their giving way under the shock of the explosion. The power transmission line from Willow Park to North street and Deepwater, which ran along the city streets, was wrecked, and the power had to be obtained from the Nova Scotia Power Company's plant in the south end of the city. The Willow Park power plant was damaged, but was repaired and put into service in two days.

The telephone train despatching line between North Street station and Rockingham was wrecked, but was repaired, and put into service temporarily on December 9. All automatic signals between North Street station and Willow

sleeping cars heated by locomotives. The office work was carried on in the office building of the Halifax Ocean Terminals' engineering staff. After full train service was resumed out of North Street station on December 10 less delay was encountered. The walls of the North Street station were left standing, and a covered concourse was built next to the head house to form a covered way for the protection of passengers. The station will not be rebuilt as the passenger business will be shifted to the South End terminals next summer, plans now being under way for a passenger station and the necessary facilities at that point.

Immediately after word was received of the explosion, wrecking and relief trains were started from Moncton, Truro, Stellarton, and Sydney, and all the men who could be spared were taken along, as it was feared that the loss of life had been heavy, and the railway would be handicapped in handling the traffic which was bound to pour into Halifax as soon as the extent of the damage was known. First estimates were found to be surprisingly accurate, and all the men taken along on the first trains were not sufficient to fill all the gaps in the railway forces, and more men had to be sent for, and an almost entirely new working force recruited from the railway service outside.

The Salvage Work

After the train service was restored, the work of surveys and repairs was at once organized. A diver was sent down to examine all the structures below water level, and careful surveys of the damage to all structures above water and on land were made.

The forces working on these surveys were taken from the Halifax Ocean Terminals' staff, the division engineer's staff at Moncton, the resident engineer's at Truro, and the chief engineer's office at Moncton.

An organization was at once made up to handle the work of rehabilitating the railway structures, which was later extended to include the repairs to the Naval dock yard. This consisted of a manager of construction, an architect, and a naval man, assisted by two contracting superintend-

How Rails Were Bent at Richmond

Park Junction, a distance of 7,000 ft., were badly damaged, and would not work; they have since been restored. Train operation was carried out without their aid while repairs were being made. The new ocean terminals in the south end of the city were practically unharmed, some slight damage being done to the windows and doors of sheds 23 and 24.

The loss to rolling stock was heavy, consisting of 122 sleeping, dining, commissary, hospital, tourist, first and second class and baggage cars. There were 93 box cars wrecked, and 342 damaged. The passenger cars were immediately shipped at Moncton and Amherst, and the repairs completed, and cars put back into service as quickly as possible.

Restoring Train Service

Although the damage to the railway property was heavy, it was fortunate that the two main tracks leading to the North Street station were intact, as this gave the wrecking cranes a chance to start work immediately. By Saturday noon, two heavy cranes had cleared the tracks to the North Street station, and preparations were made to tear down the standing portion of the train shed roof. At 6 p. m., Saturday, December 8, 1917, the first passenger train was sent out of the North station, and full train service was resumed on Monday the tenth. Meanwhile, trains were run over the main line of the Halifax Ocean Terminals Railway, a belt line which girdles the city to the South End terminals. All passenger and relief trains were handled here, while the work of clearing up the wreckage at the North Street station was progressing. Train despatching was done between the South End terminals and Rockingham yard by city telephone, and trains were re-despatched from there on the regular railway telephone circuit from the despatching office at Truro. The accommodations at the South End terminals were rather crude, and delays were encountered, as the engines hauling trains between there and Rockingham had to be of small size to clear the falsework of structures being erected.

Accommodation was provided for doctors and nurses in

Boat Blown from the Water Onto Pier 9

ents, who acted in a consulting capacity. Under this board there were assembled office and field engineers, draughtsmen, auditors, purchasing agent, storekeeper, material men and commissary men.

The office of manager of construction is held by C. B. Brown, assistant general manager of the Canadian Government Railways, and the execution of the work is under the

direct charge of W. A. Duff, the assistant chief engineer.

The damage to the railway property is estimated as follows:

| | |
|--|-------------|
| Structures in Halifax, piers, buildings, tracks, machinery, power, telegraph lines and signals..... | \$751,600 |
| Structures in Dartmouth (across the harbor)..... | 52,700 |
| Rolling stock | 178,000 |
| Commissary stores | 17,200 |
| Steamer | 70,000 |
| Miscellaneous costs, operating department, labor, relief trains, supplies, etc., in cleaning up and relief work..... | 155,000 |
| Total | \$1,225,000 |

Such warehouse and dock space as was lost in Richmond will be duplicated in restoring it at the south end. Work has been underway since the explosion, and is now practically complete so far as the lost warehouse space is concerned, two warehouses having been erected on the shore end of Pier A. The remainder of the damaged structures have been pretty well restored at this time, some four months after the explosion. Tenders for the South End passenger station have been taken, but the work has not been contracted for to date.

Frictionless Side Bearings and Coal Conservation

By A. M. Engineer

TO DETERMINE THE VALUE of frictionless side bearings in a practical way the Union Railroad recently made a unique test in which no outside factor was permitted to come into play. It was decided to use the same car, the same load and the same curve in all the tests and to use only gravity in starting the car.

An old car, loaded with ore, was taken from the yard. It was equipped with a frictionless side bearing, which the railroad had adopted some years ago as its standard. It

The car was turned loose at the point *A* and after it came to rest at *D*, its position was carefully determined, and as a check, the car was dropped the second time. Then the side bearings were converted into plain bearings, by blocking all the movable parts. This was done within an hour, so that the track and weather conditions remained unchanged. Likewise, the journal box conditions and the journal lubrication were the same. The car was again turned loose twice from the same starting point. This time it came to a standstill sooner, as shown in dotted lines, or 545 ft. from *B*. With the frictionless side bearings it had run 602 ft., hence gained 57 ft., or 10.4 per cent.

Such a saving in track resistance must be appreciated by everyone and as there was no calculation necessary, other than measuring the distances, this test can be repeated at will.

It should be borne in mind that the car was loaded with ore, which means a low center of gravity. Had it been loaded with coal, the relieving influence of the frictionless side bearing would have been still greater. The curve is a gradual one. Had it been shorter, the above percentage would again have been increased; and the further fact that the distance from *B* to *C* was on the down grade instead of on a level, affected the results again very materially in the same direction; so that the percentage measured on the track would be greatly enhanced by compensating for these three items. This was not done, as it was deemed more desirable to have an absolute concrete result, one that could be duplicated at will, instead of a figure obtained by theoretical deductions.

The saving of 10.4 per cent of power on the curves of course means much more tonnage per engine in a train and a saving of coal, which ultimately would mean a conservation of millions of tons. Besides that, it also is evident that there must be a great saving in wheel flanges and rails and a decided reduction of wheel flange pressure against the rail, thus keeping the wheel from climbing the rail and causing derailments.

Track Over Which Side Bearing Test Was Made

was taken to Gascola and run over a curved track as indicated in the illustration. The approach to the curve from *A* to *B* was straight and down grade, which permitted the car to accumulate a fixed amount of momentum at the beginning of the curve. The portion *B-C* of the curve was also down grade, while the remainder of the curve and the track from there on was practically level. Points *A* and *B* were marked carefully and the rail from *B* to *D* was measured off and marked every 25 ft., so as to facilitate the measuring afterwards and to eliminate any possibility of error in doing so.

PROPOSED INCREASE IN ARGENTINE RAILROAD RATES.—The leading railroads serving the Rosario district have given notice of a further increase in freight rates of 10 per cent, to take effect May 1, 1918. An increase of 10 per cent was put into effect October 1, 1915, and an increase of 22 per cent was made effective October 20, 1917. With the increase now contemplated the rates would be approximately 47.6 per cent higher than they were three years ago. Rising cost of material and labor is given as the reason for the proposal. A protest has been made by the Rosario Chamber of Commerce, and other opposition is expected. Current railway receipts are showing very substantial increases as compared with the last year.—*Commerce Reports*.

FUEL OIL CONSUMPTION BY RAILROADS IN 1917.—The Geological Survey authorizes the following: The immense increase in railroad traffic due to the active participation of the United States in the war increased correspondingly the quantity of petroleum and of petroleum distillates consumed as locomotive fuel in 1917, despite their mounting cost and growing scarcity. Statistics compiled under the supervision of J. D. Northrop, of the United States Geological Survey, from reports submitted by all railroad companies that operated oil-burning locomotives in the United States, show that the quantity of fuel oil consumed by them in 1917 was 45,707,082 barrels, a gain of 3,580,665 barrels, or 8.5 per cent over 1916, and a larger consumption than in any other year. The total distance covered by oil-burning engines in 1917 was 146,997,144 miles, and the average distance covered per barrel of fuel consumed was 3.2 miles. Oil-burning locomotives were operated in 1917 over 32,431 miles of track in 21 states.

The Trade Acceptance in the Supply Field

Would the Use of Acceptances Help the Railways Catch Up on Their Present Overdue Accounts?

A DETAILED DISCUSSION of the use of the trade acceptance in the railway supply field naturally divides itself into two parts: (1) its use in sales to railway supply companies, and (2) in sales to railways.

There are many essential differences between the financing of sales to supply companies and those to railways.

The supply companies buy goods for resale to the railways or to other supply companies or for manufacture into goods which are so sold. They sell on credit and are considered on the whole good paying customers, the discounting of bills for cash, where such discounts are allowed, being the rule rather than the exception.

The railways, on the other hand, buy goods only for consumption, and there is no resale. They sell their only commodity—transportation—for spot cash, but despite the fact that they operate what has been termed the greatest cash business in the world, they are proverbially poor payers. They buy on terms such as 30 days net cash, but pay not at the expiration of 30 days, but in 60, 90, 120, 150 days. In fact, the situation in the railway field today is causing no small anxiety to the supply companies, conditions having actually gotten considerably worse since the government took over control of the railroads.

The operations of supply companies seem, on the whole, to lend themselves in great degree to the use of the trade acceptance. A few companies are already planning to put the trade acceptance into use in their dealings with fellow manufacturing companies.

The use of the trade acceptance in the railway field is at present largely for the government, through the Railroad Administration, to determine. Nevertheless, something must be done, and done at once, to secure more prompt payment of invoices of supplies sold to railways. It is essentially wrong that the railways should sell for cash and pay for goods on invoices that are months overdue. Perhaps, the trade acceptance may prove the remedy.

As was noted in a previous article on this subject in the *Railway Age* of March 1, page 463, the trade acceptance is defined by the Federal Reserve Board in regulation A, series of 1917, as a draft or bill of exchange drawn by the seller on the purchaser, of goods sold, and accepted by such purchaser; and a bill of exchange, within the meaning of this regulation, is defined as an unconditional order in writing, addressed by one person to another other than a banker, signed by the person giving it requiring the person to whom it is addressed to pay, in the United States, at a fixed or determinable future time, a sum certain in dollars to the order of a specified person.

The trade acceptance is meant primarily to cover sales of goods by a manufacturer to a jobber or by a jobber to a retailer who expects to sell the goods and realize upon them before the 60 or 90 day maturity of the acceptance. Its idea, in any case, is to change the open book account, with its indefinite terms of payment, to a definite obligation, and with definite maturity. No hindrance, whatever, is offered to the merchant who wishes to discount for cash, as it is the rule to allow the seller to pay in time to take his discount or to give his trade acceptance instead.

The sale of goods to railway supply companies does not partake absolutely of the nature of a sale to a jobber or retailer, but there are many points of similarity. The producer of raw materials or the specialty house sells to the

railway supply firm, which in turn deals with the railways directly, or uses these raw materials or specialties in the manufacture of goods which he then sells. The supply houses, as a rule, are in a position to discount their bills, but, of course, this by the very nature of things, cannot be invariable. This is where the trade acceptance comes in. It helps finance the transaction between the time the goods are sold and the time their manufacture into other goods is completed and they are sold as a finished product to the next party in line. Thus the raw material producer, to take the first firm in the entire transaction, on selling his goods will draw a trade acceptance on the house to which he sells. This trade acceptance, the buyer will accept and the original producer can consider the open book account closed. At the end of 90 days the trade acceptance is paid. In the meantime, the producer may need funds. He will take the trade acceptance to his bank, discount it as he would a note, and he will find it very much to his advantage to do so should the necessity arise. He can usually borrow only to the extent of 50 per cent of his open book accounts. On the trade acceptance he can realize on 100 per cent, and owing to the favor with which the Federal Reserve Board looks on the trade acceptance, he can also secure his money at a lower discount.

In the meantime, the buyer will have sold the goods or have fabricated them into a finished or semi-finished product which he in turn has sold, possibly with the discount for cash, or on a trade acceptance. The second trade acceptance, in such a case, would, if necessary, be available to pay for the first. As the first acceptance comes due, our original buyer, now a seller, will take this acceptance, the second in this transaction, to his bank, discount it and funds will be available at the bank for payment of the first acceptance. This, of course, is more or less of an ideal case, but it is not impossible. At any rate, it will be seen how the trade acceptance will help carry the accounts even if conditions may not let it carry them entirely.

The advantage of having, instead of an open book account with its indefinite term of maturity, an obligation with a definite term and in a security which can be realized upon at the bank at any time on most favorable terms is evident.

In these times when prices are so high, when deliveries are so poor that big inventories of material are an absolute necessity and when conservation of men, materials and money is the order of the day, the advantages of the trade acceptance where it can be used are immeasurable. The men behind the trade acceptance include many of the country's leading bankers and business men. These two facts make certain the prophecies of the trade acceptance enthusiasts that it is only a question of time when the acceptance idea will be in general use. The railway supply industry can certainly be put down as one of those fields in which the trade acceptance, once its advantages are understood and realized, will meet with increasing favor.

Railway Purchases

The manner in which the railways have been making payments on invoices from railway supply companies during the past few months is becoming of serious moment to the railway supply field. Bills that should have been paid in 30 days are running over to 90, 120, 150 and even 180 days, and under government control, payments instead of becoming

ing more prompt have been becoming slower and slower. This condition is beginning to prove serious to many supply companies and everybody is hoping that remedies will be taken and taken at once to overcome a situation that is manifestly wrong and unfair.

No supplyman will read into the foregoing, it is hoped, a supposition that the railways have been noted for their prompt payment of invoices in the past. Some roads have paid their bills promptly, but others, including many of excellent financial standing, have actually had to be importuned to make some kind of reasonably quick payment. There are, of course, many reasons why payments might be delayed to some extent—delay in receiving the goods, the necessity of carefully checking the shipment and in reporting its receipt complete and in good order, as well as the complexities of putting vouchers for payment through a large and busy organization. But the fact that some roads have paid in reasonably quick time shows that others should be able to do the same. It certainly is not right in the very nature of things that a big railway receiving spot cash for everything it sells, and particularly a railway company with a good balance of cash in its treasury, should make the supply companies finance its purchases over an unreasonable length of time.

Many remedies are being suggested—among them the trade acceptance. Is the trade acceptance a possible solution and is its introduction in railway purchases a likely event?

The introduction of the trade acceptance into the railway field today depends almost entirely upon the Railroad Administration. Mr. McAdoo has not expressed himself as yet on the trade acceptance, but that is only because, with his many other activities, he has not had opportunity to pass upon its merits. It should always be borne in mind that Mr. McAdoo is a member ex-officio of the Federal Reserve Board, and that both the board and the law which created it are decidedly favorable to the use of trade acceptances.

There are many objections to the introduction of the trade acceptance in the railway field and much hard work will be required to overcome them. One of these objections is the competition in the supply field. If one company alone in a particular branch of the field should begin asking for acceptances from the railway customers, it would find that it had uphill work. The railways, presuming that they were not particularly enthusiastic over the idea, could say that its competitors were not asking for acceptances and declare that if acceptances were necessary in doing business with that company they might prefer to trade elsewhere. But it should in all fairness be shown that the railways might be converted to the idea of using acceptances and that if a few big manufacturers or a group of manufacturers in a similar line could work together, the idea might easily be put over.

Another objection lies in the fact that, on the whole, the railway supply companies are large, well-backed financially, and do not need the advantages that go with the trade acceptance. The argument is backed by the fact that many supply companies do not allow discounts for cash payments and that even when discounts are allowed they are proportionately small. It is quite different from the hardware trade, that is to say, where discounts of 2 per cent for cash payment in 10 days are a common rule. This is a valid argument—not, however, against the use of the trade acceptance but against taking the efforts that would be required in extending its use. Conditions of the present day, however, emphasize features that may not have been considered so important in times past, particular reference being made to the unusual need for available funds and to the necessity, because of uncertain deliveries, of holding unusually large stocks of material to ensure steady production. The use of the trade acceptance should help immeasurably in financing

these inventories, and the fact that the trade acceptance may be converted into cash at a favorable discount at any time is an advantage that is not to be despised.

The introduction of the trade acceptance in the railway field meets with another objection in that the purchases of a railroad include a staggering total of transactions and that to enter and keep track of trade acceptances would be a tremendous task. In view of the fact that acceptances might be given for monthly accounts and that adjustments could easily be made if necessary, this does not seem a real obstacle. Those who are already using trade acceptances say, in fact, that by their use they save work rather than create more of it for their accounting forces to handle.

No stock need be taken in the plea that for the railways to catch up on their payments from 150 to 180 days to the 60 or 90 days preferred for trade acceptances would necessitate large sums of money. The railways have got to catch up on these accounts somehow and the trade acceptance may be just the thing that will enable them to do it. It should be further noted that trade acceptances can be made out for any maturity, 60, 90, 120 days, or any other term—60 or 90 days is preferred because the Federal Reserve Board will only discount acceptances within 90 days of their maturity. It is also patent that no concern, especially one selling for cash, buying on a 30-day term, should feel justified in taking three, four or five times that term.

How Trade Acceptance Might Be Used

In considering how the trade acceptance might be used in the railway field let us take a hypothetical case in which a company sells to a railway a consignment of sizable value. When the goods are shipped the supply company will draw on the railway a trade acceptance with maturity of 60 or 90 days. This the railway will accept, making it payable at its bank, and return to the seller of the goods. The seller as has been noted above, may hold the acceptance or he may discount it at his bank, realizing on his sale in such case not in 90, 120, or so days, from the date of his invoice, but immediately. By the end of the 60 or 90 days—that is by the time of maturity—the railway will have received the goods, will have been able to check them and pass the vouchers, so that when payment of the acceptance is made by the railway's bank, the transaction will be entirely completed.

The large consignment of this kind would undoubtedly prove the ideal one for the use of the trade acceptance. It could also be used, however, in the case of monthly accounts, covering several sales of smaller amount.

In view of the foregoing, the advocates of the trade acceptance feel it safe to say that the trade acceptance could be used to good advantage in railway purchases. There is good reason to believe, they add, that the objections to its use represent the difficulties of introduction rather than possible hindrances to its use after introduction.

The use of the trade acceptance would certainly put railway purchases on a firmer basis, substituting, as it would, definite obligations with definite terms of maturity for open book accounts with most indefinite terms. It would help the supply field by giving it a considerable amount of liquid assets rather than the open book accounts. Liquid assets at this time particularly are one of the things most to be desired in business, and in the supply field they would prove of special value to assist in the financing of large stocks of materials which must be kept on hand to insure continued and steady production.

What benefits the supply field will indirectly benefit its railway purchasers. The matter of continued production may be taken as a leading example, for to a railway now, deliveries of equipment, appliances or material are more to be desired than fine gold.

There is no doubt, despite all the arguments for or against

the use of the trade acceptance in railway purchases, that its introduction is going to take time and is going to be uphill work. Government control, in itself, adds another complication, and, as has been noted, the question today is almost entirely up to the Railroad Administration and to Mr. McAdoo himself.

Something must be done and done immediately, however, to get out of the slough of despond into which the payments of railway bills has fallen. Some say that one of the reasons

is that the government has been so slow in paying its transportation bills to railways. Whatever the reason may be, it is a fact that the supply companies are becoming hard pressed for cash by reason of having to finance railway purchases over such unusual lengths of time. If conditions go on as they are going now, for the railways to catch up to a reasonable basis of payment will become more and more difficult. No doubt, however, the Railroad Administration will shortly be able to remedy present conditions.

Report of the Railroad Wage Commission

Increases Amounting to \$288,000,000 to Be Added to Increases of \$306,000,000 Made By Railroads

THE SALIENT FEATURES of the report of the Railroad Wage Commission to Director General McAdoo, recommending increases estimated to aggregate \$300,000,000 a year in the wages of all railway employees receiving less than \$250 a month, including officers whose salaries are less than that amount, were published in last week's issue. The report itself, including appendices and statistical tables, makes a book of 150 pages comprising a comprehensive statement of the railway wage situation and detailed explanations of the application of the scale of increases to various classes of employment. An abstract of the main report, as signed by the commissioners, Franklin K. Lane, C. C. McChord, J. Harry Covington and William R. Wilcox, is as follows:

To make an investigation of the wages and hours of the more than 2,000,000 railroad workers now in the employ of this government has been a matter of engrossing interest. To ask of a man, "What wages should you in justice receive?" is to ask perhaps the profoundest of all human questions. He must go into the whole involved problem of his relationship with his fellows, and to answer the question aught he must in the end come to a judgment which will be nothing less than a determination of what policy or plan of wage adjustment will make for the permanent well-being of the state.

We have searched for no such ultimate answer, if there can be one. But our investigation sought to reveal the insistent problems that confronted these workers, and such recommendations as we make are the practical answers to an immediate and direct question: What does fair dealing at this time require shall be done for these people who are rendering an essential service to the nation in the practical conduct of this industry? The existing state of war prohibits anything approximating a determination of ideal conditions. The exceptional call that has been made upon the railroads, and upon practically all other forms of industry in the country, since the United States entered the war over a year ago, has created an abnormal demand for labor.

As a result of the war, the prices of the necessities of life have been mounting to unheard of levels. The railroads, with the pressure upon them for greatly increased transportation facilities, have been confronted with the problem of asking increased exertion on the part of labor at a time of extreme competitive labor demand and at a time when the purchasing power of the pay is shockingly small. The commission has consequently considered the railroad wage problem with the idea that the government must courageously direct its attention toward the maintenance of rates of wages for the railroad employees which are still adequate for those who, as they patriotically labor, recognize that the war has brought to us all the necessity for sacrifice.

Requests for \$1,000,000,000 a Year

The requests which have come to us for wage increases would, if fully granted, involve an additional outlay in wages of somewhat over \$1,000,000,000 per year in excess of the wage fund of last year, which exceeded two billions. Some asked for an increase of 100 per cent in their pay, and from this they graduated downward to 10 per cent. None were satisfied with their present wages.

If we assume that this total sum should be given, the problem would at once arise as to its distribution. Quite evidently the need or the desert of each class of labor is not to be measured by its demands. The bolder should not be given all they ask merely for their boldness, while the more modest are insufficiently rewarded for the service they render because of their modesty. Some had evidently thought out their claims with particular respect to their power to compel concessions, while others based their demands upon the exceptional character of the services given, the long experience, and the training or character required. Still others found this a proper time to put forward claims which they felt were but a slender part of what justice would award were the whole scheme of wage making to be taken up afresh under a new order of things.

To reclassify the many hundreds of employments in which the 2,000,000 railroad workers engage would be a task calling for more time, skill, insight, and knowledge than we possess. At the outset, it was seen that there were grave inequalities in the rates of wages paid. But who should say what relationship each class of employees should bear to the other?

In the world of economics this situation has been met by the simple application of supply and demand, which is in turn now varied, affected, and modified by those limitations arising out of the artificial but necessary and historic, methods of collective bargaining.

Lower Grades Deserve Greater Increase

These forces have classified employments. In the growth of the railroads there has consequently been evolved no other plan for such classification, and no scientific relationship between the wages paid. The proposal that a new classification should be attempted is one which, to say the least, may not be accepted now. Nevertheless, there stands out one dominating fact, recognized by railroad workers as well as by railroad officials—a conclusion compelled by that large sense of equity which governs where logical processes fail—that the lower grades of railroad employment, those in which the supply of labor has been less restricted, and where organization has been difficult, if not impossible, deserve wage increases out of proportion to the increases for those in superior grades.

Should there be any increase in wages to these men in the railroad service? The railroads themselves have for the past two years been answering this question by yielding, some with a wise prevision, and others too slowly for their own good, to the requests of their employees. It took neither tables nor charts nor briefs to make evident that, if the roads were to hold those men they had, concession must be made to the imperious demand of rising prices for the staples of living.

\$350,000,000 Increase in Two Years

Furthermore, an unprecedented call had come for men of certain trades in connection with the new industries that had been created by the war in Europe. To meet this competition the roads had advanced wages by slow steps at first, and later more rapidly. It is hardly realized that the roads themselves have in two years, 1916 and 1917, increased wages approximately \$350,000,000 per year, if applied to the present number of their employees.

But these advances were not in any way uniform, either as to employments or as to amounts or as to roads. The situation had been dealt with as pressure made necessary, and naturally those who, by organization or through force of competition, could exert most pressure fared best. Things came to a head just before the government took over the railroads. Another three months of private management and we would have seen much more extensive concessions in wages, or there would have followed an unfortunate series of labor disturbances. The government, therefore, has now to meet what would have come about in the natural course.

Government's Distinctive Position

The government now enjoys this position of distinction—it is not yielding to threats; it is not compelled to a course by fear of any unpatriotic outburst; it is not making concessions to avoid disaster. There has been no hint that such a policy would be pursued by those who have it within their power. By what amount have the railroad workers been disadvantaged by reason of the war and how may that disadvantage be overcome with the largest degree of equity, assuming that, in common with all who do not wish to exploit the opportunities which the war affords, these workers can not have and will not expect a full meeting of the entire burden?

The course of first suggestion is to allow a uniform increase of so many dollars per month to each worker. This is the policy England has pursued. It has the advantage of simplicity; but to our minds it fails primarily in drawing the distinction between those whose need is greatest and those who have largest leeway for sacrifice. To make a uniform wage increase of, say, \$20 per month, would increase the railroad budget by nearly \$500,000,000 a year. It would be a boon to many whose wages are low, but in its uniformity it would fail to adapt itself to the varying needs of those whom it is intended to serve.

We have had a most exhaustive study made of the cost of living today as contrasted with the cost of living in the latter part of 1915, when by the reaction of the European war the American people first felt keenly the increase in the burdens of life and the need for higher wages. And to our minds it conclusively establishes two things, (1) that the cost of living has increased disproportionately among those of small incomes, and (2) that there is a point up to which it is essential that the full increased cost shall be allowed as a wage increase, while from this point on the increase may be gradually diminished.

This study of the cost of living was not made from paper statistics exclusively, by the gathering of prices and comparisons of theoretical budgets. It was in no inconsiderable part an actual study from life, one of the most interesting and valuable groups of figures having been gathered by the

newspapers of the country, by interviews with those of the working class, and the inspection of their simple books of accounts. Roughly, it may be said that the man who received \$85 a month on January 1, 1916, now needs 40 per cent additional to his wage to give him the same living that he had then. Below that wage a larger percentage must be allowed, because the opportunity for substitution and other methods of thrift decline almost to a vanishing point; while above that wage a growing proportion of the increase will go to those things essential to cultured life, but nonessential to actual living.

Increase to Meet Living Cost

In fairness, therefore, a sufficient increase should be given to maintain that standard of living which had obtained in the prewar period, when confessedly prices and wages were both low. And upon those who can best afford to sacrifice should be cast the greater burden.

Another argument that is compelling as against the uniform increase in existing wages is the unalterable fact that to give an equal amount, now, to all, would be giving to some a double increase, that which they had received from the railroads during the last two years, and that which the government might award. For not all of the railroads made increases to the same classes, and no two made awards in the same percentages, even within the same groups of employments.

Average Railroad Wages

It has been a somewhat popular impression that railroad employees were among the most highly paid workers. But figures gathered from the railroads disposed of this belief. Fifty-one per cent of all employees during December, 1917, received \$75 per month or less; and 80 per cent received \$100 per month or less. Even among the locomotive engineers, commonly spoken of as highly paid, a preponderating number receive less than \$170 per month, and this compensation they have attained by the most compact and complete organization, handled with a full appreciation of all strategic values. Between the grades receiving from \$150 to \$250 per month, there is included less than 3 per cent of all the employees (excluding officials) and these aggregate less than 60,000 men out of a grand total of 2,000,000.

The greatest number of employees on all the roads fall into the class receiving between \$60 and \$65 per month, 181,693, while within the range of the next \$10 in monthly salary there is a total of 312,761 persons. In December, 1917, there were 111,477 clerks receiving annual pay of \$900 or less. In 1917 the average pay of this class was but \$56.77 per month. There were 270,855 section men whose average pay as a class was \$50.31 per month; 121,000 other unskilled laborers, whose average pay was \$58.25 per month; 130,075 station service employees, whose average pay was \$58.57 per month; 75,325 road freight brakemen and flagmen, whose average pay was \$100.17 per month; and 16,465 road passenger brakemen and flagmen, whose average pay was \$91.10 per month.

These, it is to be noted, are not prewar figures; they represent conditions after a year of war and two years of rising prices. And each dollar now represents in its power to purchase a place in which to live, food to eat, and clothing to wear, but 71 cents as against the 100 cents of January 1, 1916. That there has been such steadfast loyalty to the railroads, and so slight a disposition to use the lever of their necessity and their opportunity to compel, by ruthless action, an increase of wages, is not without significance and should not be passed without public recognition.

With the various conditions which have been detailed all in mind, the commission has reached the conclusion that the fairest method of dealing with the problem of wage increases is to award increases on the following scale:

| THE SCALE RECOMMENDED | | | | | | | | | | | |
|--|---------------------------------------|---|---|--|---------------------------------------|---|---|--|---------------------------------------|--------|--------|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | | |
| The monthly rate of pay of men receiving in December, 1915, the amounts named in this column | Add the per cent named in this column | Equivalent to amount named in this column | Making new rate per month as shown in this column | The monthly rate of pay of men receiving in December, 1915, the amounts named in this column | Add the per cent named in this column | Equivalent to amount named in this column | Making new rate per month as shown in this column | The monthly rate of pay of men receiving in December, 1915, the amounts named in this column | Add the per cent named in this column | | |
| Under \$40.00 | | \$50.00 | | 152.00 to 153.00 | 1.56 | 153.80 | 176.80 | 153.00 to 154.00 | 1.36 | 155.36 | 178.36 |
| \$46.00 to 47.00 | 43.00 | 66.00 | 567.1 | 154.00 to 155.00 | 1.56 | 155.56 | 178.56 | 155.00 to 156.00 | 1.36 | 156.36 | 179.36 |
| 47.01 to 48.00 | 43.00 | 66.00 | 567.1 | 156.00 to 157.00 | 1.49 | 157.49 | 180.49 | 157.00 to 158.00 | 1.49 | 158.49 | 181.49 |
| 48.01 to 49.00 | 43.00 | 66.00 | 567.1 | 158.00 to 159.00 | 1.49 | 159.49 | 181.49 | 159.00 to 160.00 | 1.49 | 160.49 | 182.49 |
| 49.01 to 50.00 | 43.00 | 66.00 | 567.1 | 160.00 to 161.00 | 1.49 | 161.49 | 182.49 | 161.00 to 162.00 | 1.49 | 162.49 | 183.49 |
| 50.01 to 51.00 | 43.00 | 66.00 | 567.1 | 162.00 to 163.00 | 1.49 | 163.49 | 183.49 | 163.00 to 164.00 | 1.49 | 164.49 | 184.49 |
| 51.01 to 52.00 | 43.00 | 66.00 | 567.1 | 164.00 to 165.00 | 1.49 | 165.49 | 184.49 | 165.00 to 166.00 | 1.49 | 166.49 | 185.49 |
| 52.01 to 53.00 | 43.00 | 66.00 | 567.1 | 166.00 to 167.00 | 1.49 | 167.49 | 185.49 | 167.00 to 168.00 | 1.49 | 168.49 | 186.49 |
| 53.01 to 54.00 | 43.00 | 66.00 | 567.1 | 168.00 to 169.00 | 1.49 | 169.49 | 186.49 | 169.00 to 170.00 | 1.49 | 170.49 | 187.49 |
| 54.01 to 55.00 | 43.00 | 66.00 | 567.1 | 170.00 to 171.00 | 1.49 | 171.49 | 187.49 | 171.00 to 172.00 | 1.49 | 172.49 | 188.49 |
| 55.01 to 56.00 | 43.00 | 66.00 | 567.1 | 172.00 to 173.00 | 1.49 | 173.49 | 188.49 | 173.00 to 174.00 | 1.49 | 174.49 | 189.49 |
| 56.01 to 57.00 | 43.00 | 66.00 | 567.1 | 174.00 to 175.00 | 1.49 | 175.49 | 189.49 | 175.00 to 176.00 | 1.49 | 176.49 | 190.49 |
| 57.01 to 58.00 | 43.00 | 66.00 | 567.1 | 176.00 to 177.00 | 1.49 | 177.49 | 190.49 | 177.00 to 178.00 | 1.49 | 178.49 | 191.49 |
| 58.01 to 59.00 | 43.00 | 66.00 | 567.1 | 178.00 to 179.00 | 1.49 | 179.49 | 191.49 | 179.00 to 180.00 | 1.49 | 180.49 | 192.49 |
| 59.01 to 60.00 | 43.00 | 66.00 | 567.1 | 180.00 to 181.00 | 1.49 | 181.49 | 192.49 | 181.00 to 182.00 | 1.49 | 182.49 | 193.49 |
| 60.01 to 61.00 | 43.00 | 66.00 | 567.1 | 182.00 to 183.00 | 1.49 | 183.49 | 193.49 | 183.00 to 184.00 | 1.49 | 184.49 | 194.49 |
| 61.01 to 62.00 | 43.00 | 66.00 | 567.1 | 184.00 to 185.00 | 1.49 | 185.49 | 194.49 | 185.00 to 186.00 | 1.49 | 186.49 | 195.49 |
| 62.01 to 63.00 | 43.00 | 66.00 | 567.1 | 186.00 to 187.00 | 1.49 | 187.49 | 195.49 | 187.00 to 188.00 | 1.49 | 188.49 | 196.49 |
| 63.01 to 64.00 | 43.00 | 66.00 | 567.1 | 188.00 to 189.00 | 1.49 | 189.49 | 196.49 | 189.00 to 190.00 | 1.49 | 190.49 | 197.49 |
| 64.01 to 65.00 | 43.00 | 66.00 | 567.1 | 190.00 to 191.00 | 1.49 | 191.49 | 197.49 | 191.00 to 192.00 | 1.49 | 192.49 | 198.49 |
| 65.01 to 66.00 | 43.00 | 66.00 | 567.1 | 192.00 to 193.00 | 1.49 | 193.49 | 198.49 | 193.00 to 194.00 | 1.49 | 194.49 | 199.49 |
| 66.01 to 67.00 | 43.00 | 66.00 | 567.1 | 194.00 to 195.00 | 1.49 | 195.49 | 199.49 | 195.00 to 196.00 | 1.49 | 196.49 | 200.49 |
| 67.01 to 68.00 | 43.00 | 66.00 | 567.1 | 196.00 to 197.00 | 1.49 | 197.49 | 200.49 | 197.00 to 198.00 | 1.49 | 198.49 | 201.49 |
| 68.01 to 69.00 | 43.00 | 66.00 | 567.1 | 198.00 to 199.00 | 1.49 | 199.49 | 201.49 | 199.00 to 200.00 | 1.49 | 200.49 | 202.49 |
| 69.01 to 70.00 | 43.00 | 66.00 | 567.1 | 200.00 to 201.00 | 1.49 | 201.49 | 202.49 | 201.00 to 202.00 | 1.49 | 202.49 | 203.49 |
| 70.01 to 71.00 | 43.00 | 66.00 | 567.1 | 202.00 to 203.00 | 1.49 | 203.49 | 203.49 | 203.00 to 204.00 | 1.49 | 204.49 | 204.49 |
| 71.01 to 72.00 | 43.00 | 66.00 | 567.1 | 204.00 to 205.00 | 1.49 | 205.49 | 204.49 | 205.00 to 206.00 | 1.49 | 206.49 | 205.49 |
| 72.01 to 73.00 | 43.00 | 66.00 | 567.1 | 206.00 to 207.00 | 1.49 | 207.49 | 205.49 | 207.00 to 208.00 | 1.49 | 208.49 | 206.49 |
| 73.01 to 74.00 | 43.00 | 66.00 | 567.1 | 208.00 to 209.00 | 1.49 | 209.49 | 206.49 | 209.00 to 210.00 | 1.49 | 210.49 | 207.49 |
| 74.01 to 75.00 | 43.00 | 66.00 | 567.1 | 210.00 to 211.00 | 1.49 | 211.49 | 207.49 | 211.00 to 212.00 | 1.49 | 212.49 | 208.49 |
| 75.01 to 76.00 | 43.00 | 66.00 | 567.1 | 212.00 to 213.00 | 1.49 | 213.49 | 208.49 | 213.00 to 214.00 | 1.49 | 214.49 | 209.49 |
| 76.01 to 77.00 | 43.00 | 66.00 | 567.1 | 214.00 to 215.00 | 1.49 | 215.49 | 209.49 | 215.00 to 216.00 | 1.49 | 216.49 | 210.49 |

1915, as listed in Column 1, the amount named in column 4, on the same line.

The inclusion of the percentages contained in column 2 is merely to explain the method of arriving at the amounts contained in column 3, which added to the maximum amount for each group named in column 1 produces the "new rate per month" shown in column 4, on the same line.

Application of these new wages to the present pay rolls of the railroads, as nearly as may be, indicates that the net wage increases granted will approximate \$300,000,000 a year. The magnitude of this amount is not staggering when the whole expenditure for wages on the railroads is considered. And whatever its effect upon the mind may be, we regard such an expenditure as necessary for the immediate allaying of a feeling that can not be wisely fostered by national inaction, and as not one dollar more than justice at this time requires.

Application of the Scale

These increases are to be applied to the rates of wages in effect on December 31, 1915. They do not represent a net increase at this time. Because our figures as to the increase of living costs have been gathered with reference to the two-year period January, 1916, to April, 1918, the wage increases are reckoned with respect to the same dates. The telegrapher who holds the same position today that he did the last day of December, 1915, and who then received \$75 a month and has received no increase since, will receive an additional wage of \$30.75 per month. If he has received an increase in these two years of \$10 per month, the recommended increase of his wage will be cut down by that much, making his net advance \$20.75. The section hand who on December 31, 1915, received a wage of \$50 per month will receive an increase of \$21.50 per month, less whatever his monthly wage as section man may have been advanced in the intervening two years.

In the application of the scale the wage runs with the place. If in the past two years an employee has been promoted, his new wage is based upon the rate of increase applicable to the new schedule governing the new place.

Reductions in hours are not to be regarded as increases in pay. This rule is made necessary, first, by its justice, for it is not to be contemplated that hours are reduced to decrease earnings; and, second, by the impracticability of applying any other rule. In some cases the decrease in daily hours did effect an increase in total wages paid, by reason of overtime, but in other cases, where the railroads adjusted themselves to an eight or a nine-hour day, there was no increase in the monthly compensation. To differentiate between these cases would be an interminable task. Moreover, we assume the good faith of all reductions in hours as being what they pretend to be.

There are some few cases where the roads, by reason of abnormal conditions, largely local, and arising out of the extreme competition in certain trades, have granted wage increases which will well-nigh cover, if not altogether cover, the increases here made. As to those who have received such increases, we advise no other course than that the scale be adhered to, for it has its foundation in principle and not in the compelling force of any unusual competitive conditions. In no event, however, should there be any reduction in wages from those now obtaining.

In the application of the scale, that percentage of increase is to be applied which is awarded to the normal time wages paid to the individual in each position in the railroad service on December 31, 1915. There are, however, employees of certain classes, and upon a number of roads, whose wages are paid upon a piecework basis, and there are also numbers of employees on practically all the roads whose hours of service at times run beyond the straight hours of service established for a day's work of the kind they perform. A

practical plan for wage increases, in harmony with the scale, has been devised for application to piecework wages and wages for recognized overtime.

We have found much difficulty in adapting the plan to the elaborate and intricate schedules of the trainmen, from which there is apparently no desire on the part of the railroad operators or the trainmen to depart. This, however, we have succeeded in doing in such manner as to translate the increases into mileage rates, thus maintaining the existing schedules relating to the method of pay. Accepting the average monthly earnings of employees in the train and engine service for the fiscal year ended 1915 as accurately reflecting the rates paid to those classes we have adopted, as the percentage of increase to be applied to the mileage rates obtaining for the several classes of trainmen, that percentage of increase which is awarded to employees generally whose earnings are equal to the average earnings of each of the several classes of trainmen. Thus, in the case of road passenger engineers, their average earnings in 1915 were \$178.46. The individual employee in any other branch of the railroad service whose monthly wage is \$178.46 will receive a wage increase of $11\frac{1}{4}$ per cent, and the road passenger engineers as a class will receive an increase of $11\frac{1}{4}$ per cent in their existing mileage rates. And the same method obtains for each of the classes of trainmen paid on the mileage basis.

The Question of a Shorter Work Day

Slowly and steadily, by force of law somewhat, but also by the voluntary act of the employers, a shorter workday is being put into effect. This tendency will continue, and the shorter day will come to be regarded, not as a means of minimizing the returns which the worker gains, but as a conservator of the human material upon which industry rests. This matter of work time must be submitted to the pragmatic test. Society will come to see that there is a maximum which is beyond the plimsoll mark of wisdom, and a minimum that makes society in many ways the sufferer. The line of moderation, the medial line, is one that must be proved by experience. The wise employer will look with sympathetic eye to find it, and the wise employee will attempt in good faith to make it manifest. It would be a splendid achievement if we could at this time crystallize the experience of the world into a conclusion concerning the length of the workday that would be of universal application. But this is not possible now for many reasons, not the least of which is an insufficiency of data touching so many and such diverse employments.

This, moreover, is not the time, in the judgment of the commission, to make experiments which might lessen the output of that commodity which railroad men produce—tons of freight hauled and numbers of passengers carried. The one thing now imperative is volume of and speed in railroad output.

Hours of Labor Cannot Be Shortened

The railroad employees have asked for the shorter day, saying frankly that they did not wish an increased rate for overtime save as a means of compelling the observance of shorter hours—a penalizing of the employers for too long a work day. At this time, however, when urgent and serious necessity compels sacrifice from all, to penalize the government for working its men as long as they have been in the habit of working under their private employers, the railroad companies, is to take advantage of the two-fold embarrassment of the government—its need for the work and its inability to call in outside men. The commission does not believe that the railroad employees really want thus to hamper the transportation facilities of the country in its hour of need.

While the commission is strongly disposed to a standard

day, in so far as the nature of the service will permit it, its firm judgment consequently is that the existing hours of service in effect on the railroads should be maintained for the period of the war.

But with this we earnestly urge that a most exhaustive study be made of this matter of hours of service, not with a view to the adoption of some arbitrary and universal policy which shall have no regard to the kind of work done, or to the effect upon the railroad service, but with these very considerations in mind.

Overtime Pay

Closely allied to the matter of hours of service is that of extra pay for overtime. In fact, the whole theory of those who speak for labor is that extra pay for overtime is the logical way to force the standard day of reasonable hours with no work thereafter. In that theory there may or may not be force; but quite apart from such view, certain it is that in harmony with the broader idea that fair hours of rest and recreation are the laborer's right, the use of those hours in industry may well be obtained only at a wage much above the normal. With overtime as with hours of service, however, the commission believes that the existing rules and conditions of payment should not be disturbed during the period of the war. But at the time when the study of the matter of hours of service is made, that study must sympathetically cover also the broad and kindred field of compensation for the overtime which is necessary in certain classes of service.

Apprentices

Organized labor realizes that at a time when men are being speeded up in the colleges by being given special courses in chemistry and other scientific subjects necessary for war work, the rules of inhibition touching the term of apprentices must be liberalized so that those who are competent shall the more quickly be enabled to place their full skill at the Nation's service. It is the view of the commission that the full measure of the increases herein suggested shall go only to those above 21 years of age, and that those from 18 to 21 shall have three-fourths of such increases, and those under 18 one-half of such increases. This rule, however, might well be modified to this extent, that if apprentices are graduated into the full status of journeymen before they have reached 21 years they shall have the full pay of this new status.

Floating Equipment Employees

This award shall be construed to apply to employees of railroads operating ferries, tugboats, lighters, barges and any other floating equipment operated as terminal or transfer facilities, but shall not be construed as applying to railroad employees on, or in connection with the operation of, cargo and passenger carrying equipment on lakes or rivers, or in coastwise or ocean traffic.

Wage Adjustment by Other Boards

The award of the commission shall not be applicable to those employees whose compensation is the result of adjustments by or through any agency established for the purpose by the Navy Department, the War Department, the Department of Commerce, the United States Shipping Board, or any other government agency created since the entry of the United States into the war.

Effective as of January 1

The wage increases provided for in the scale shall be effective as of January 1, 1918, and are to be paid to all who were then in the railroad service or who have come into such service since and remained therein, according to the time served. The proper ratable amount shall also be paid to

those who have been for any reason since January 1, 1918, dismissed from the service, but shall not be paid to those who have left it voluntarily, because remaining in the service was the consideration of the promise to make the increases effective from the date mentioned. Men who have left the railroads to enter the army or navy shall be entitled to the pro rata increases accruing on their wages up to the time they left, as they have continued in the service of the Nation. The same rule shall apply to those who have moved from one branch of the railroad service or from one road to another.

Employment of Women

The employment of women is one of the important problems confronting those in charge of the actual operation of the railroads. Up to the time of the abnormal demand for labor created by the European war, women were not extensively employed by the railroads except as stenographers and clerks in the offices, and as charwomen, car washers, and cleaners, and other employments of like character. Since the war they have entered the shops, have engaged in handling freight and baggage, and have even been employed upon the tracks. Much of this work requires a physical effort beyond the strength of women, and some of it is carried on under conditions menacing to health, safety and morals.

The labor in our shops and elsewhere must be diluted as the war takes to itself an increasing number of men. Women must, to some degree, take these places. They should be cared for. Their burden should not be such as to hazard their health. Their hours should be reasonably short. Their working conditions should be healthful and fitted to their needs. And their pay, when they do the full work of men, should be the same as that of men.

Discrimination Against Employees

The investigation of the commission disclosed many inequalities of pay in the same branch of service, not only as between different sections of the country but in the same section. The attention of the railroad managers should be directed to these inequalities, with a view to removing them whenever the discrimination is not justified by differences in the efficiency of the labor, the cost of living, or other conditions legitimately affecting the rate of wages. In every case where the same service is rendered there should be the same pay without regard to sex or race.

Members of organizations and non-members must stand upon the same footing. In some branches of the service, and this is peculiarly true of those least paid, there are no organizations, or, if any, they are limited in their membership and restricted in their locality. But, whether organized or unorganized, the purpose must be duly to consider every branch of the service and to accord fair treatment to all.

Salaries of Officers

In carrying out the direction to "make a general investigation of the compensation of persons in the railroad service," the investigation obviously included a consideration of the compensation of those persons who are classed as officials. The commission, therefore, by an individual questionnaire which all officials were required to answer, and also by a report obtained from each railroad, secured the names of all persons receiving a compensation of \$5,000 and upward, together with a full statement of the services performed by each of them.

The total compensation for the year ending December 31, 1917, paid to such officials is approximately \$100,000,000. The individual salaries varied from \$5,000 to \$100,000. It is reasonably certain from the facts gathered by the commission that a substantial readjustment of such salaries may be made and the efficient operation of the railroads promoted

thereby. Such readjustment of salaries, however, presents an individual proposition as applicable to each official. Some salaries may well be abolished altogether, others greatly reduced, while in some cases of lesser paid officials an increase would be warranted.

The commission recommends that during the period of government conduct of the railroads no salaries paid to officials who are not essential to the operation of the roads shall be charged as part of the operating expenses, and that a careful study be made of the proper relation between the salaries of the higher officials and those of their subordinates with a view to readjustments in the interest of the highest efficiency of the service.

There should be constituted a tribunal or tribunals to continue the study of railroad labor problems composed, in part at least, of men experienced in this kind of work, for as to these problems there can be no finality. Many complaints have been made to us by individuals and groups of men which it was impossible for us to investigate, and which should be investigated and redress afforded if the complaints are well founded. Among these are differences of pay where there are no, or only negligible, differences in the services rendered. Conditions of employment are described which, if the descriptions be true, demand amelioration. A commission for each of the general divisions of the railroad system would undoubtedly be fully occupied for a long time in dealing with such matters. In the meantime the managers or other officials operating the several roads could do much to improve the situation by dealing with the conditions on their respective roads.

Importance of Railroads

It would be impossible to magnify the importance of the American system of railroads in the conduct of the war. That England should want for bread because American railroad equipment was unwisely distributed or unnecessarily immobile is a thing not to be explained to the Englishman, who regards our system of railroads and our method of railroading as the model for the world, excelling either public or private systems elsewhere.

For our needs and for our pride this standard of superiority must be maintained, and to this end no other one thing will so greatly conduce as wisdom and justness in dealing with the actual workers on the roads. What has been here done is perhaps all that can be done now. The spirit which prompted the commission should not be permitted to languish or to flatten out into expansive inefficiency. The labor problem is never one exclusively of wages or hours. When it does become no more than the human element has gone out of the management; it has become too remote in space or in spirit to make good. The table of wage increases presented in this report we urge should be construed in the largest spirit of liberality, so as to draw forth from the men a recognition of that sense of reciprocity which it speaks—good wages for good service. The policy comes from above; its sympathetic application must be left to those below.

We desire in closing this report to express our most sincere appreciation of the services rendered to the commission by Frederick W. Lehmann, as counsel; by William A. Ryan, as secretary; by Edward J. Barcalo, Riley L. Redpath, and Lathrop Brown, as the board of examiners; and by William A. Hathaway, J. C. Bowen, Charles P. Neill, Fred A. Burgess, A. O. Wharton, and C. W. Hillman, as special statisticians.

Appendix

Appendix 1 is a report of Special Statistician W. A. Hathaway of studies of the methods adopted by the British and French governments to adjust the wages of railroad employees to meet the war emergencies.

Cost of Living

Appendix 2 gives the results of an exhaustive inquiry instituted by the commission into the question of the cost of living during 1917 and 1918 compared with the pre-war period. The investigation was divided into two parts, Relative Price Changes, and Family Budgets. Since there was no material rise in prices until the latter part of 1915 the investigations were confined to the period 1915 to 1917. The increases in the various items of the family budget from January 1, 1916, to January 1, 1918, were ascertained to be: Food 52 per cent, rent 10 per cent, clothing 44 per cent, fuel and light 31 per cent, sundries 35 per cent. Weighing these increases according to the proportion of expenditure for each item for different sized incomes, the following percentages of increase in the cost of living were obtained:

| | |
|--|-------------|
| Families with incomes up to \$600..... | 40 per cent |
| Families with incomes from \$600 to \$1,000..... | 38 per cent |
| Families with incomes from \$1,000 to \$2,000..... | 37 per cent |

These figures were later revised in a supplementary report on April 25, based on later price changes to 43 per cent, 41 per cent and 40 per cent, respectively. It is stated that these figures show how much more it would have cost to live in 1918 than on January 1, 1916, provided the standards of living remained the same, but because of the difficulty in determining accurately the relative increase in the cost of living the figures were interpreted conservatively and applied in a general rather than in a precise way.

The 265 family budgets collected by the commission through the newspapers are grouped by districts and by incomes. The average annual income of the 265 families in 1915 was \$1,031 and in 1917, \$1,162, while the average annual expenses were \$955 in 1915 and \$1,210 in 1917. In 1915 the average family, therefore, had a surplus of \$76 while in 1917 the average family had a deficit of \$48. In 1915, 169 families had a surplus, while 73 had a deficit. In 1917, 96 families had a surplus, while 140 had a deficit.

Monthly Wages

In Appendix 3 is given a statement compiled from the returns of Class 1 railroads and certain switching and terminal companies showing the rates of pay for the month of December, 1917, graded according to the monthly rates. These rates are discharged of all compensation for overtime or extra service and, therefore, constitute a table of wages, not of earnings. The table is as follows:

| NUMBER OF EMPLOYEES OF ALL CLASS 1, SWITCHING AND TERMINAL RAILROADS IN THE UNITED STATES, GRADED ACCORDING TO MONTHLY RATES OF PAY | | | | | | | | | |
|---|---------------------------|----------------------------|---------------------------|----------------------------------|------------------------------|------------------------------|--|--|--|
| (Col. 1) | Eastern District (Col. 2) | Southern District (Col. 3) | Western District (Col. 4) | Total for United States (Col. 5) | Per cent by classes (Col. 6) | Cumulative per cent (Col. 7) | | | |
| \$30 or less | 8,319 | 10,173 | 8,871 | 27,363 | 1.41 | 1.41 | | | |
| \$30 to \$35 | 5,626 | 18,450 | 8,464 | 32,540 | 1.68 | 3.09 | | | |
| \$35 to \$40 | 8,239 | 25,362 | 17,716 | 51,367 | 2.65 | 5.74 | | | |
| \$40 to \$45 | 11,167 | 18,381 | 17,930 | 47,478 | 2.45 | 8.19 | | | |
| \$45 to \$50 | 14,841 | 20,961 | 44,173 | 79,975 | 4.11 | 12.30 | | | |
| \$50 to \$55 | 40,185 | 18,727 | 50,964 | 109,876 | 5.67 | 17.97 | | | |
| \$55 to \$60 | 71,060 | 17,553 | 67,952 | 156,565 | 8.07 | 26.04 | | | |
| \$60 to \$65 | 101,054 | 15,480 | 65,159 | 181,693 | 9.37 | 35.41 | | | |
| \$65 to \$70 | 76,078 | 15,514 | 45,767 | 137,359 | 7.08 | 42.49 | | | |
| \$70 to \$75 | 70,947 | 20,347 | 74,108 | 165,402 | 8.53 | 51.02 | | | |
| \$75 to \$80 | 77,285 | 17,416 | 54,323 | 149,024 | 7.72 | 58.74 | | | |
| \$80 to \$85 | 60,660 | 13,575 | 48,244 | 122,479 | 6.32 | 65.06 | | | |
| \$85 to \$90 | 53,759 | 11,726 | 35,881 | 101,357 | 5.23 | 70.29 | | | |
| \$90 to \$95 | 49,497 | 10,653 | 36,316 | 96,466 | 4.97 | 75.26 | | | |
| \$95 to \$100 | 45,374 | 7,838 | 34,959 | 88,171 | 4.54 | 79.81 | | | |
| \$100 to \$110 | 55,688 | 16,391 | 45,589 | 117,668 | 6.07 | 85.88 | | | |
| \$110 to \$120 | 42,618 | 10,638 | 31,307 | 84,538 | 4.36 | 90.24 | | | |
| \$120 to \$130 | 33,895 | 4,865 | 20,252 | 59,012 | 2.99 | 93.23 | | | |
| \$130 to \$140 | 18,080 | 5,412 | 18,233 | 41,725 | 2.16 | 95.39 | | | |
| \$140 to \$150 | 13,074 | 4,748 | 14,802 | 32,624 | 1.68 | 97.07 | | | |
| \$150 to \$160 | 9,119 | 1,924 | 5,246 | 16,289 | .84 | 97.91 | | | |
| \$160 to \$170 | 5,814 | 2,153 | 5,833 | 13,800 | .71 | 98.62 | | | |
| \$170 to \$180 | 4,693 | 1,035 | 3,342 | 9,070 | .47 | 99.09 | | | |
| \$180 to \$190 | 1,672 | 702 | 1,947 | 4,321 | .27 | 99.36 | | | |
| \$190 to \$200 | 2,436 | 698 | 2,015 | 5,149 | .36 | 99.72 | | | |
| \$200 to \$210 | 1,113 | 296 | 711 | 2,120 | .11 | 99.73 | | | |
| \$210 to \$220 | 714 | 238 | 551 | 1,503 | .08 | 99.81 | | | |
| \$220 to \$230 | 714 | 262 | 558 | 1,534 | .08 | 99.89 | | | |
| \$230 to \$240 | 338 | 74 | 258 | 670 | .03 | 99.92 | | | |
| \$240 to \$250 | 717 | 210 | 644 | 1,571 | .08 | 100.00 | | | |
| Totals | 884,818 | 291,777 | 762,804 | 1,939,399 | 100.00 | | | | |

Wages by Classes

Another table shows the average earnings per month of employees in each occupational class in each district and for the United States as a whole separately presented for each of the years 1915, 1916 and 1917, compiled as to 1915 and 1916 from reports to the Interstate Commerce Commission and for 1917 from reports to the Railroad Wage Commission, as follows:

The aggregate annual compensation of the same men based on the average monthly earnings during the year ended December 31, 1917, is \$1,917,419,220, showing that the railroads during that period had made increases amounting to \$306,000,000. The aggregate annual compensation based upon the application of the commission's schedule to the average monthly earnings for the year ended June 30, 1915, is \$2,205,432,938, showing an increase compared with 1915

AVERAGE MONTHLY EARNINGS OF EMPLOYEES OF CLASS 1 RAILROADS IN THE UNITED STATES, DURING THE FISCAL YEAR ENDED JUNE 30, 1917, AND THE CALENDAR YEARS ENDED DECEMBER 31, 1916 AND 1917, RESPECTIVELY

| Occupations | 1915 | | | | 1916 | | | | 1917 | | | |
|--|-------------------|--------------------|-------------------|-----------------|-------------------|--------------------|-------------------|-----------------|-------------------|---------------------|--------------------|------------------|
| | (1) East district | (2) South district | (3) West district | (4) Total U. S. | (5) East district | (6) South district | (7) West district | (8) Total U. S. | (9) East district | (10) South district | (11) West district | (12) Total U. S. |
| 1. General officers, \$3,000 p. a. and upwards..... | \$161.02 | \$222.12 | \$102.18 | \$151.88 | \$169.36 | \$136.09 | \$147.42 | \$151.91 | \$168.02 | \$131.13 | \$122.47 | \$151.61 |

Effect on Operating Cost

The commission made an estimate of the probable effect of the new rates upon the cost of operating the railroads during 1918 by applying to the average monthly earnings of each class of employees the rate per cent of increase prescribed for that amount, as disclosed by the table of increased rates in the main body of the report. This estimate was based only on Class 1 railroads, including 1,939,399 employees. The aggregate annual compensation based upon the average monthly payment of men in the same classes during the year ended June 30, 1915, is \$1,611,567,384.

of \$593,805,554 or 36.85 per cent, and an increase as compared with December 31, 1917, of \$288,013,718, or 15.02 per cent.

The report also includes tables of increases of daily wages for a 26-day month or a 31-day month and of hourly wages. For example, where the old rate per day was 75 cents, the new rate is \$1.52 for a 26-day month and \$1.40 for a 31-day month. These figures are arrived at by computation from the table of percentages applied to the monthly earnings. Where the old hourly rate was 10 cents the addition of \$20 per month makes a new hourly rate of 19.75 cents.

for eight-hour workers, 18.5 cents for nine-hour workers, 17.75 cents for ten-hour workers, 17 cents for eleven-hour workers and 16½ cents for 12-hour workers. The following illustrations are given of the application of the rates to employees on daily, hourly and monthly rates of pay:

Application of Rates to Employees on a Daily Rate of Pay

Sectionman C was employed in 1918, but not in 1915. The rate of pay on the division where he is employed in 1918, in 1915 was \$1.10 per day of 12 hours, 7 days a week. The 1918 rate of pay is, on the same division, \$1.50 per day, for the same hours. The monthly rate in 1915 was therefore \$33. It is now \$45. Under the commission's plan of increases he will be entitled to \$53 per month (\$20 increase), or \$8 per month more than his present rate for straight time. He will, therefore, be entitled to receive from January 1 to April 30, \$32 back pay and in the future to receive \$53 per month of 360 hours. His back pay will be computed in the same manner for all overtime worked since January 1, 1918.

Employees on an Hourly Rate of Pay

Machinist "D" was employed in the same shop in 1915 and in 1918 on the same class of work. His hourly rate in 1915 was 35 cents for 9 hours, 26 days a month. He was paid for overtime and Sunday work at time and one-half. In 1918 his hours were reduced to 8 and his rate increased to 40 cents.

According to the commission's plan his increase will be computed on the basis of his standard 1915 hours at the 1915 rate, viz.: 234 hours per month, \$81.90 per month, entitling him to 40 per cent increase in his hourly rate, or 49 cents per hour. In 1918, from January 1 to April 30, he worked 234 hours per month, or an average of 1 hour daily overtime, on the 1918 schedule. This for four months gives him 104 hours overtime. He has been paid as follows:

| | |
|--|----------------|
| 832 hours straight time at 40 cents..... | \$332.80 |
| 104 hours overtime at 60 cents..... | 62.40 |
| | <hr/> \$395.20 |

His back pay will be computed as follows:

| | |
|---|----------------|
| 832 hours straight time at 49 cents per hour..... | \$407.68 |
| 104 hours overtime at 73½ cents per hour..... | 76.44 |
| | <hr/> \$484.12 |
| Deduct payment at 1918 rates..... | 395.20 |
| | <hr/> \$88.92 |

and his future rate per hour will be 49 cents.

If the rate per hour for this particular position had been increased to 50 cents on January 1, 1918, there would be no back pay due, and the rate of 50 cents per hour would be continued.

In the case of machinist "E" who was employed in a shop where the rate for his position was 35 cents per hour for 8 hours work in 1915, with time and one-half for overtime, but in the same position and same shop with the same hours in 1918 his rate is 45 cents per hour; his earnings in 1915 in the standard 208 hour month would be \$72.80 per month, and he would be entitled to 41 per cent increase in his hourly rate, viz.: to 49½ cents per hour. His straight time and overtime earnings and back pay would be computed in exactly the same manner as machinist "D." The principles illustrated will apply to all men paid by the hour, whatever their occupation may be.

Employees on a Monthly Rate of Pay

Chief Clerk A occupied the same position in 1915 and in 1918:

| | |
|-------------------|-----------------|
| 1915 salary | \$150 per month |
| 1918 salary | 175 per month |

Commission's basis of increase on salaries of \$150 per month is 16.17 per cent, or \$24.25 per month. Increased

salary under commission's plan, \$174.25; present salary, \$175. Present salary undisturbed.

Clerk B in 1915 received \$100, and on the same desk in 1918 received \$112.50 per month. Commission's basis of increase on \$100, 31.75 per cent, or \$31.75. Increased salary under commission's plan, \$131.75. Present salary \$112.50. Clerk B is entitled to receive back pay from January 1 to date of the award, at the rate of \$19.25 (the difference between \$131.75 and \$112.50) and to receive monthly, hereafter, \$131.75 instead of \$112.50. Back pay due January 1 to April 30, \$77.

Application of Increases to Pieceworkers

The piece worker is to receive for each hour worked the same ratio of increase per hour as is awarded to the hourly worker engaged in similar employment in the same shop. If the hourly rate has been increased since 1915 to an amount greater than the increase awarded by the commission, then the higher rate shall prevail. Where there was no piece rate for an item or operation in the piece rate schedule of 1915, the current price is to be adjusted by such an amount as a similar item or operation has been increased or decreased since December 31, 1915, or as near such a plan as practicable. When a pieceworker works overtime or undertime, he is to receive that proportion of the increase provided in the schedule, which the time actually worked bears to the normal time in the position.

The plan devised for translating the increases applied to employees generally into mileage rates as applicable to employees in train and engine service is stated in Appendix 6 as follows: There are nine classes of train and engine employees in the Interstate Commerce Commission's classification.

The commission has computed the average monthly earnings of each of these classes for the fiscal year 1915 and applied to the mileage rates paid to these classes in 1915 the same rate per cent which is awarded to the other employees whose monthly straight time wages equal that average. This process is more clearly disclosed by the following table:

| | Average monthly earnings 1915 | Rate per cent increase in mileage rates |
|--|-------------------------------|---|
| Road freight engineers and motormen..... | \$152.75 | 15½% |
| Road freight firemen and helpers..... | 94.10 | 34½% |
| Road freight conductors..... | 131.59 | 20½% |
| Road freight brakemen and flagmen..... | 85.83 | 39½% |
| Road passenger engineers and motormen..... | 178.46 | 11½% |
| Road passenger firemen and helpers..... | 106.87 | 28½% |
| Road passenger conductors..... | 153.57 | 15½% |
| Road passenger haggagemen..... | 87.03 | 38½% |
| Road passenger brakemen and flagmen..... | 85.23 | 39½% |

The actual application of this percentage system has been worked out in tables showing that for the rates for passenger engineers and motormen in 1915 ranging from \$4.10 per 100 miles to \$7 per 100 miles will be substituted new rates ranging from \$4.56 per 100 miles to \$7.79 per 100 miles. This plan will apply to all employees of the train and engine service that are paid on the mileage basis. On railroads upon which men in the train and engine service are paid on a monthly wage the employees will be entitled to the increased rates provided in the standard table. Rates for overtime now in effect are to be increased by the same percentage as straight time rates. If there were mileage rates in effect in 1915 which are not included in the tables they are to be increased in accordance with the percentages contained in the standard table. The following illustration is given of the method of applying increases to employees paid on a mileage basis.

Increases to Employees Paid on a Mileage Basis

Engineer "G" received \$4.25 per 100 miles in 10 hours in 1915. According to the commission's plan, although in 1918 this rate was \$4.25 per 100 miles in 8 hours, the rate

will be increased $11\frac{1}{2}$ per cent to \$4.75 per 100 miles (47281 equalized as \$473). He will be entitled to back pay, for every 100 miles run at the rate of 48 cents per 100 miles.

If the schedules provide for time and one half for overtime or any other rate in excess of the straight time rate, then he shall be entitled to receive a proportionate increase of pay for overtime mileage.

If the schedules provide for pro rata payment for overtime, back pay will be computed on that basis.

Rates for future earnings will be as fixed by the commission's schedule of increases to employees paid on the mileage basis. If any increase has been made in the mileage rates of employees paid on that basis in 1915 it will be understood that the per cent of increase allowed by this commission is inclusive of such interim increases and that the new rate per 100 miles is computed from the base rates of 1915.

Hours of Service

Charts are presented in Appendix 7 showing the prevailing hours of service in railroad employment in December, 1917, based on a study of 262,637 employees. Of these 64.25 per cent worked six days a week and 35.75 per cent worked seven days a week. Of the six-day workers 1.17 per cent worked 12 hours or more per day regularly, 1.42 per cent worked 11 hours, 40.12 per cent worked 10 hours, 7.3 per cent worked nine hours and 14.25 per cent worked eight hours. Of the seven-day workers 11.75 per cent worked 12 hours, 3.21 per cent worked 11 hours, 12.59 per cent worked 10 hours, 2.35 per cent worked nine hours and 5.84 per cent worked eight hours. Another series of charts shows the percentage of employees working six or seven days per week who regularly perform overtime service. Of the six-day workers 96.8 per cent worked no overtime, 1.74 per cent worked one hour overtime, .67 per cent worked two hours overtime, .76 per cent worked three hours overtime and .03 per cent worked four or more hours overtime. Of the seven-day workers 93.28 per cent worked no overtime, 2.32 per cent worked one hour overtime, 1.85 per cent worked two hours overtime, .67 per cent worked three hours overtime, and 1.88 per cent worked four or more hours overtime.

In Appendix 8 is given a table for the years ended June 30, 1915, December 31, 1916, and December 31, 1917, showing the average earnings per year of each class of railroad employees. From this table may be ascertained the extent of the increases made by the carriers and the wages of their employees in each district in the past three years.

In Appendix 10 are given separately statistics concerning the rates of wages and conditions of employment of employees of the Pullman Company which it was not found feasible to combine with those of the roads. These are presented as an indication of the effect which the commission's plan of increases may have upon that company and its employees.

SOLDIERS USE OLD RAILWAY TIES—Condemned and discarded railroad ties have been utilized by American soldiers stationed at Fort Hancock, Texas, to build semi-permanent houses for the headquarters and other buildings of the army camp patrol headquarters. The ties are stood on ends to make the walls of the houses and discarded railroad rails are used for rafters. Ties are then laid over these to form the flat roof and a coating of adobe mud spread over these clinked ties to make the roof watertight. The crosstie houses are more comfortable in winter and summer than tents. The orderly room, the day room and canteen and the quartermaster supply room are all made of these materials, the canteen having a brick floor and plastered roof.

Proceedings of the Air Brake Association Convention

THE TWENTY-THIRD ANNUAL CONVENTION of the Air Brake Association was held at the Hotel Winton, Cleveland, Ohio, on May 7 to 10 inclusive, with C. H. Weaver, supervisor air brakes, New York Central Lines west of Buffalo, presiding.

Opening Addresses

In opening the convention President Weaver reviewed the circumstances which led up to the decision of the executive committee to hold the convention, and said in part as follows:

At no time in the history of our association can the air brake man be of such value to his company as at the present war period, by seeing that all air brake work is properly performed and no material wasted. Work slighted or improperly done causes failure. Failures mean delays to traffic and even disaster.

Let the slogan of this convention be to improve the efficiency of the air brake man, thereby making his service to the railroad more valuable. We are not assembled here today as individual units each representing some particular railroad, but as each railroad represents a part of the whole, we are united under one head, organized for the purpose of winning this war.

Following Mr. Weaver's address, D. R. McBain, superintendent motive power of the New York Central Lines west of Buffalo, addressed the convention in behalf of better maintenance of piping, cylinders, pipe connections, etc., on freight car equipment. He called attention to the effect a concerted campaign on the part of all of the members of the association, scattered as they are, all over the continent, might have in improving the condition of freight car brake equipment, especially at the present time when no thought of competitive activity as between the various railroads should be given consideration.

A report on Slack Action in Long Passenger Trains was then presented, of which the following is an abstract:

Slack Action in Long Passenger Trains

Slack action in any train is produced only by a change in velocity between the various cars comprising such train, the degree or severity depending upon the rate at which the change in velocity takes place, and the weight and number of cars involved. Shocks may be produced by: (a) Shutting off the engine throttle quickly and applying the engine and train brakes somewhat heavily; (b) applying the engine brakes and then the train brakes; (c) trains with brake conditions that produce effective braking power on the engine and head cars in advance of the rear cars; (d) cars in a train having a lower percentage of braking power than the balance of cars, which may be due to their being loaded in one case and empty in another; (e) inability to produce a low-brake cylinder pressure in the beginning of a brake application.

Even though all these conditions exist with the exception of the last one, if the engineer so manipulates the brake that light brake cylinder pressure will be obtained when the brake application is first started, any slack action will, of course, occur slowly, and will not be noticeable in the form of shocks.

Inability to produce low brake cylinder pressures may be due to small brake cylinder volumes in proportion to auxiliary reservoir volumes, short piston travel, or the use of too large auxiliary reservoirs. If it is possible to provide and maintain a piston travel that will permit of low cylinder pressures being obtained, this would be the only change necessary in existing types of brake equipment.

Under pneumatic operation of the brakes, increasing the

percentage of braking power on the locomotive and also on the load carrying cars, which might be operated in the forward end of trains, might prevent the slack running out in the form of jerks, but at very low speeds it would increase the tendency for a collision between the head end and rear end of the train, unless provision was made to apply the brake so slowly that the slack action would not be noticeable.

A form of foundation brake gear can be employed which will permit of a longer piston travel being maintained than is common with the single shoe type so largely employed at the present time. This can be depended upon, if equipped with automatic slack adjusters, to maintain the piston travel at practically that for which the operating parts of the brake were designed; viz., eight inches, without greatly increasing the piston travel during brake applications when the train is running, thus insuring a low brake cylinder pressure in the beginning of brake applications, regardless of the train's speed.

With the single shoe type of foundation brake gear now in common use, considerable false piston travel exists. Under such conditions, if the piston travel cannot be maintained sufficiently long when the car is standing to provide necessary flexibility when the car is running and it is not desired to increase the brake shoe clearance, it is necessary to provide an increased brake cylinder volume in order to permit of a low brake cylinder pressure being obtained in the beginning of brake applications; or to reduce the auxiliary reservoir volume so that the proportion of the auxiliary reservoir and brake cylinder will be such that a low brake cylinder pressure will be possible.

If it is impossible to maintain the piston travel sufficiently long to provide for brake flexibility and brake shoe clearance, on account of the action of automatic slack adjusters or excessive false piston travel, it would be necessary in the former case to move the slack adjuster connection towards the nonpressure brake cylinder head to provide the desired increased travel. In the latter case it would be necessary to provide additional movement for the brake piston before striking the nonpressure cylinder head.

If existing types of brake operating equipment are to be maintained intact, the foundation brake gear must of necessity be modified, and any change in this direction should contemplate a brake gear that will provide the minimum of false piston travel and the maximum of effectiveness and convenience, and economy for maintenance.

It is necessary that we depart from the practice of heavy service brake applications, regardless of the train's speed, and that instead of applying the brakes to their maximum in one continuous reduction, the reduction should be made so that the brake application will be gradually produced. For pneumatic operation, the brake application should be timed automatically so that the engineer is able to build up the brake cylinder pressure at a certain rate to some predetermined point in the application, and that this rate be dependent upon the operating conditions obtaining for any particular railroad. Any modification of the service brake does not necessarily involve the emergency brake, so that its effectiveness need not be disturbed. Modifying the service brake by increasing the brake cylinder volume, or by reducing the reservoir volume, can be compensated for by increasing the brake pipe pressure so that the stopping distance would remain the same.

Where the single shoe type of foundation brake gear is in common use and it is the practice to run the piston travel short, necessary shoe clearance is not obtained, with the result that a great many brake shoes are rubbing the wheels very hard when the brakes are released. This increases the difficulty of starting the trains. Increasing the piston travel to provide more flexibility for the service brake, automatically increases the shoe clearance and reduces the diffi-

culty of starting, with a consequent reduction in slack action and also a reduction in the power necessary to start and propel the train. Increasing the piston travel to provide more flexibility for the service brake, also automatically reduces the difficulty of releasing brakes, because it necessitates slightly heavier applications to produce effective braking power.

What Is the Safe Life of an Air Brake Hose?

At the 1917 convention, your committee was instructed to continue their investigation. For the 1918 report we decided to turn our attention to the matter of porous hose, with a view to determining about the average term of service of hose that might be found porous.

The committee obtained records of 25,000 air hose in service. These were inspected in five different groups.

If we accept 25,000 hose as a sufficient number upon which to base a set of averages for the country at large, we may expect to find porous 18.1 per cent of all hose in service, as that is the average percentage of hose found porous from the number of hose inspected.

No data was collected this year covering burst hose, nor did we figure the average length of time in service of those non-porous which we inspected; but did find, as was found last year, that the average life of the air hose still in service was considerably less than those which were found burst or porous, this being due to the fact that hose inspected did not burst until they were in service an average of 28½ months, and might reasonably be expected to burst at any time after that length of service. We find, however, that comparing the average life of the porous hose as of this year with the average life of burst hose as inspected last year, there is only a difference of two tenths of a month in the average life.

Every member is well aware of the detrimental effect of brake pipe leakage, but it is possible that each of us may not give due weight to the effect that a few porous hose in a train may have. In order to determine that, one of the committee caused five trains to be tested for leakage, inspected for porous hose, and again tested for leakage, after the porous hose were removed. The train in each case consisted of 65 cars, and therefore, represented 132 hose, exclusive of those between the engine and tender. The results are shown in Table I.

TABLE I—EFFECT OF POROUS HOSE ON BRAKE PIPE LEAKAGE

| Train No. | Leakage per min. before testing | No. hose found porous | Percent of hose porous | Leakage per min. after removing porous hose |
|-----------|---------------------------------|-----------------------|------------------------|---|
| 1 | 15 lb. | 6 | 4.55 | 7 lb. |
| 2 | 12 lb. | 5 | 3.79 | 8 lb. |
| 3 | 20 lb. | 8 | 6.06 | 6 lb. |
| 4 | 12 lb. | 6 | 4.55 | 6 lb. |
| 5 | 14 lb. | 7 | 5.30 | 7 lb. |

It will be seen from the foregoing that a vast improvement is brought about by inspecting these trains for and removing porous hose, and yet the average number found porous in five trains was only 4.85 per cent. When we remember that of all hose inspected, the general average found porous was about 18 per cent, we may begin to realize the handicap under which our enginemen, as well as our inspectors, are working, and also the out-bound terminal delay due to inaudible brake pipe leakage in the porous hose.

The committee urgently recommends that the various railroads put into effect, when weather permits, a system of inspection and soap suds tests at least on repair tracks, for the purpose of detecting and removing from service all porous hose.
