GENERAL INDEX

[Illustrated articles are indicated thus *, Editorial material by letter in Editor's list.]

A

Abandoned Railways in 1917, 49*

Accident:

- Failure of Draw Span, 54*
- Houston & Texas Central at Hammon, 1, 181
- I. C. Bulletin No. 63, 139, No. 64, 1349
- Louisville & Nashville at Shepherdsville, 88, 137, 181, 488*, 493, 1533
- Michigan Central at Ivanhoe, 1547*, 1570*
- Monthly Summaries—December, 157; January, 715; February, 803; March, 1078; April, 1440, 1884
- New York Central at Ansted Dam, 98*
- New York Central at Schuylkill, 1585
- Pennsylvania at Elizabethtown, 729, 790*
- Southern Railway at Lardmond, 139
- Southern Railway near Columbia, 473

Accounting (See also Association of American Railway Accounting Officers) also Valuation

- Clearing Bureau for Freight Bills in San Francisco, 90
- Depreciation, Actuary Theory of, 1133*
- Depreciation, G. C. Hand on, 1502, 695*
- Mechanical Office Devices, 1405*, 1433
- Rules Under Board Control, 970, 1404
- Washington, Universal Interchange—Order of Director General, 728, 794*, 1008, 1229

Adams, Guy

- Chairman of Committee on Mail Transportation, 1112*
- Ranch for Convalescent Soldiers, 729, 1284*, 1535

Adams, H. M.: Inland Traffic Service War Department, 1227

Adamson Eight-Hour Law, Report of Commission on, 223, 240*, 259, 373

Additions and Betterments:

- Expenditures for, 1228, 1261*, 1262*, 1267, 1313, 1363*, 1406*, 1424, 1453*, 1560
- Lovett, R. S., Director of, 521*, 570

Administration: Bill (See Legislation)

Advances (See Finance)

Advertisement:

- Contracts for Exchange of Transportation, 811
- Discontinuance of Advertising Ordered by Railroad Administration, 909, 921
- Liberty Loan, Third, 730
- Regulations Respecting Advertising, 1538
- Afghanistan, A Free Route to, 565*

Agriculture:

- Development Work of Canadian Pacific, 97*, 105*
- Development Work Under the Government, 1422
- Farm Bureaus in New York State, 323
- Marketing and Transportation, 134

Air Brake Association: Annual Convention, 1088, 1245, 1293

Aircraft Conditions and the Railroads, 822*

Aishton, R. H.:

- Increased Efficiency Under Government Control, 137
- Orders of, 1026, 1140, 1174, 1230, 1306, 1345, 1386, 1430, 1475
- Knox's Relation to Fuel Problem, 1339*
- Regional Director, Appointment as, 201*, 1439
- Short Lines, Conference with, 1229
- Train-Load Plan of Moving Freight, 1261*, 1275

Aitchison, Clyde B.: Testimony on Administration Bill Before Senate Committee, 132

Ajax Rail Anchor Company, P. & M. Company's Relation to, 378

Alaskan Railroad Construction Progress, 1300, 1442, 1458*, 1534

Allied Construction Machinery Corporation:

- Conference of Allied Manufacturers and Publishers, 1542

Allis-Chalmers Manufacturing Company Annual Report, 1401

Amalgamation of Railway Associations, 1069, 1138, 1226, 1262*, 1310*

Ambulance Trains for U. S. Army, 319*, 1032*

American Association of Engineers' Election of Officers, 1300

American Car & Foundry Company Annual Report, 950

American Export Trade (See Foreign Trade)

American Federation of Labor: Representatives, 418

American Institute of Consulting Engineers: Officers Elected, 526

American International Terminals Company: Package Freight Terminal at Jersey City, 455*, 486*

American Iron and Steel Institute:

- Prices for Track Materials, 90
- Rail Production in 1917, 1562

American Locomotive Company:

- Consolidation Type for French Railways, 504*
- Report, Semi-Annual, 180
- U. S. Rubber Company: Brass Plant, 735

American Railway Association:

- Amalgamation of, 1069, 1138, 1226, 1262*, 1310*
- Car Shortage Inquiries for, 101, 111
- March, 238, 111

American Railway Bridge and Building Association: Southern Pacific, 880

American Railway Engineering Association:

- Address at President's Reception, 618, 62*
- Annual Dinner, 657*
- Committee Chairman, 64*
- Committee on Economy of Railway Operation, 670*
- Convention, Annual, 67, 47*
- Definitions, Most B. A. Letter, 67
- Election of Officers, 63*
- Management Steel Road Tests, 16
- Members in Military Service, 641*
- Plans for 1919 Convention, 67*
- Proceedings, 623*, 660*, 738*, 740*
- Registration, 619*, 645, 685*, 737*, 774
- Report on Ballast, 652*, 67*
- Report on Buildings, 619*, 635*
- Report on Conservation of Natural Resources, 619*, 628*
- Report on Economics of Railway Labor, 629*, 657*, 662*
- Report on Economics of Railway Operation, 670*, 1057*
- Report on Electricity, 67*
- Report on Iron and Steel Structures, 737*, 754*
- Report on Masonry, 745*
- Report on Rail, 765*
- Report on Records and Accounts, 638*
- Report on Roadway, 753*
- Report on Rules and Organization, 632
- Report on Signals and Interlocking, 636*
- Report on Signs, Fences and Crossings, 750*
- Report on Stresses in Track, 733*, 764
- Report on Ties, 753*
- Report on Track, 769*
- Report on Uniform General Contract Forms, 679*
- Report on Water Service, 619*, 633*
- Report on Wood Preservation, 74*
- Report on Wooden Bridges and Trestles, 737*, 74*
- Report on Yards and Terminals, 658*, 660*
- Resolutions, Closing, 774
- Screw Spike Tests, Pennsylvania, 704*, 307*, 435*, 441*

American Railway Master Mechanics' Association:

- Locomotive Feedwater Heaters, J. Snowden Bell on, 1531*
- Proceedings, 1479*, 1514*
- Registration, 1513
- Report on Design and Maintenance of Locomotive Boilers, 1532*
- Report on Fuel Economy at Smoke Prevention, 1516
- Report on Semi-Elliptic Springs, 1528*
- Report on Specifications and Tests for Materials, 1510*
- Report on Standards and Recommended Practices, 1524*
- Report on Train Resistance and Tonnage Rating, 1535*
- Schlafke, Wm., Address of, 479*, 514*
- American Short Line Railroad Association, 139
- American Society of Civil Engineers: Officers Elected, 231
- Report on Columns, 192
- Report on Stresses in Tracks, 399, 463*

American Society of Mechanical Engineers:

- Coal, Preventable Wastage of, 107, 134
- American Steel Foundries, Annual Report, 550
- American Wood Preservers' Association: Annual Convention, 72, 68*
- Amsterdam Wreck, 101, Y. C. 68*

Anderson, George W.:

- Administration Bill, Reaffirmation of, 41
- Administration Bill, Testimony Before Senate Committee on, 132
- Railroad Officers' Testimony, 134

Anti-Loss and Damage Insurance:

- Arch (See Bridges and Structures)
- Argentina, Railway Steel Bridge, 101
- Arkansas, Further Construction, 101, 101
- Arrested, "Spit Sank" (Editorial), 77*
- Associated Business Press, 101, 101
- Recruitment of, 101, 101
- Association of American Road & Builders Builders:

- Annual Meeting, 101, 101
- Mechanical Office, 101, 101
- Association of Railway Engineers: Importance of Organization, 101, 101

GENERAL INDEX—Continued

[Illustrated articles are indicated thus *; Editorials thus †; Letters to Editor thus ‡.]

- Bureau of Explosives: Agents of U. S. Bureau of Mines, 283
 Bureau of Foreign Commerce, 857
 Bureau of Internal Revenue: Excess Profits Tax Law, 326
 Bureau of Railway Economics:
 Freight Operations, for October, 169; November, 546; December, 808; January, 1076; February, 1282; March, 1580
 Freight Operations for Years 1915, 1916 and 1917, 1470
 Revenues and Expenses for January to October, 1917, 121, 43*
 Revenues and Expenses for October, 138; November, 337; December, 533†, 548
 Burlington, Postmaster General:
 Mail Pay Reduced, 1535
 Mail Trains Late, 156, 1301
 Bush, E. F.: Regional Director, Appointment as, 1439*
 Bush, Irving T., Chief of Embarkation, 332, 428
 Bush Terminal Taken by War Department, 92
 Business Papers Advise Shippers, 341†, 363
 Business Press and the Railway Question, 1122
 Business (See Foreign Trade)
- C**
- Caisson (See Bridges and Buildings)
 Caldwell, B. D., 1377*
- Canada:
 Development Work of Canadian Pacific, 97†, 105*
 Lord Shaughnessy on Railway Situation, 128, 148*
 New Brunswick Lines Taken Over, 1394
 Rails Ordered by Government, 1010†, 1048
 Railway Engineers in France, Story of, 862
 Railway Progress in 1917, 36*, 849†, 1438
 Rate Increases, 92, 731
 Victory Loan Subscription, 83
 Canadian Northern:
 Government Contract, 37
 Stock Value, 1562
 Canadian Pacific:
 Annual Report, 777†*, 817
 Development of Western Canada, 97†, 105*
 Lord Shaughnessy's Address to Shareholders at Annual Meeting, 1148
 Canadian Railway Association for National Defense:
 Appeal for Car Conservation, 731
 Organization, 38, 849*
 Traffic, Wartime, 408
 Canadian Society of Civil Engineers: Bridge Over Kettle Rapids, 1406†, 1411*
 Capital (See Finance; also Labor)
- Car:
 Connection, Barco Steam Heat, 722*
 Development of the Steel Car, 461
 Frictionless Side Bearings Tested, 1334*
 Fuel Conservation, M. P., 1058†, 1080*
 Lumber Record, Carload of, 541*
 Orders, Government, 1104†, 1145, 1153†, 1162†, 1169, 1202, 1448, 1454†, 1540, 1557
 Orders in 1917, 725, 131, 65†, 139
 Orders in 1918, 896
 Orders, Unfilled, on April 1, 1228
 Roofing, Tucco Standard, 1088*
 Scale Test, N. C. & St. P., 371*
 Tank, M. C. B. Report on, 1505*
 Tank Car Tests, M. C. B., 230
 Wheels, M. C. B. Report on, 1512*
 Car Building Plants and Railroad Repair Shops, 915
 Car Conservation (See Car Service)
 Car, Freight:
 Hopper; C. M. & St. P., 249*
 Hopper; E. J. & E., 1563*
 Hopper; N. & W., 313*
 Maintenance, M. C. B. Discussion on, 1478†, 1487
 Orders for Future, 293†, 485†
 Orders, Government, 1104†, 1145, 1153†, 1162†, 1169, 1202, 1448, 1454†, 1540, 1557
 Orders in 1917, 131, 65†
 Refrigerator—Box Bunker and Basket Bunker, 119*
 Refrigerator, Michigan Central, 561*
 Standard, 777†, 869†, 987*
 Stenciling, M. C. B. Ruling on, 1195
 Wheels, Changing, 1549†
 Car Record Office, Washington, D. C., 1228
 Car Service:
 Bill Checking Discontinued, 1071, 1551†
 Box Cars Sent West, 141*
 Conservation in China, 303*
 Conservation Records; Pennsylvania, 217, 572
 Demurrage on Heatless Days, 520
 Demurrage Rates Increased by Director General McAdoo, 115, 202, 371, 332
 Freight Operations, Statistics of, 169, 546, 808, 905, 1076
 Loading Campaign, Results of; Pennsylvania Lines West, 217
 Loading Lumber in Open Top Cars, 147†, 163*
 Loading Lumber—Record Carload, 542*
 Car Service (Continued):
 Loading Rules, M. C. B. Report on, 1478†, 1497*
 Repair of Freight Cars, 149†, 913
 Shortage Reports, A. R. A., 728, 1112
 Terminal Conditions, January 1, 109, 117
 Car Service Section of the Railroad Administration:
 Car Record Office, 1228
 Distribution of Cars, 915
 Division and Reconsignment Rules, 1557
 Embargo Rules, 408, 915
 Export Shipments, Regulation of, 1111
 Loading Rules, 1422
 Office at Chicago, 1538
 Organization, 360
 Refrigerator Car Handling, 1112
 Rules for Handling Freight for the War Department, 497
 Sailing Day Plan Urged, 806
 Car Shops at Port Huron; G. T., 1309†, 1331*
 Car Supply:
 Coal Production, 1008†, 1049, 1058†, 1095
 Dunn, Samuel O. on, 1013
 Future Prospects, 213
 Carbocool—A New Fuel, 324
 Cash (See Finance)
 Caterpillar Trouble: McCloud River R. R., 1347*
 Cement (See Concrete)
 Central Advisory Purchasing Committee:
 Car and Locomotive Orders, 1104†, 1145, 1153†, 1162†, 1169, 1202, 1448, 1454†, 1540, 1557
 Committee to Buy Ties, 1140, 1286
 Personnel of, 418, 545
 Selling to Railroads Under Government Control, 543, 853, 1454†
 Specialties for Cars and Locomotives, 1145, 1170, 1448, 1454†, 1540, 1586
 Central Railway Club:

William G. McAdoo

Secretary of the Treasury and Now Also Director General of Railroads

Nation's Railroads Now Under Government Control

W. G. McAdoo Taken Charge as Director General of Railroads

Transferring Control of the Railroads to the Government. (According to The New York Times)

WASHINGTON, D. C., January 1, 1918.—The railroads of the United States passed from the control of their individual managements and into the possession and control of the government for the period of the war, at noon on Friday, December 28, under the direction of W. G. McAdoo, who now combines the office of Secretary of the Treasury in President Wilson's cabinet with that of Director General of Railroads. Although for accounting purposes the new plan of government control did not become effective until midnight, December 31, by that time the director general had issued several general orders to emphasize the fact that the railroads are to be operated as a co-ordinated system, had accepted the resignation of the Railroads' War Board (the Executive Committee of the Special Committee on National Defense of the American Railway Association), and had created an entirely new organization for centralizing the direction of railroad operations. He had also put in motion all the available machinery of organization for the purpose of relieving congestion and expediting the movement of freight.

The New Organization

The new organization consists of a temporary advisory committee or cabinet of assistants to the director general as follows:

John Skelton Williams, secretary of the currency and formerly president of the Southern Air Line, as adviser on financial matters.

Hale Holden, president of the Chicago, Burlington & Quincy and a member of the former Railroads' War Board, to supervise the organization built up by the War Board.

*The photograph is a reproduction of a picture taken by the Associated Press. It shows the seven members of the Railroads' War Board, and Mr. McAdoo, who is standing in the center. From left to right the men are: Mr. McAdoo, Mr. Skelton Williams, Mr. Holden, Mr. Williams, Mr. Skelton Williams, Mr. Holden, and Mr. Williams. The photograph is a reproduction of a picture taken by the Associated Press.

including the Commission on Car Service and the various subcommittees.

Henry Walters, chairman of the Atlantic Coast Line, as operating adviser.

Edward Chambers, vice-president in charge of traffic of the Atchafalpa, Topoka & Santa Fe, and chief of the bureau of transportation of the United States Food Administration, as adviser on traffic matters.

Walker D. Hines, chairman of the Executive Committee of the Atchafalpa, Topoka & Santa Fe, as adviser on legal matters.

In addition, A. H. Smith, president of the New York Central, was appointed temporary assistant to the director general and assigned to the phase of operation in Official Classification territory. He was also given charge of the organization of the General Operating Committee of the Eastern Railroads, which was dissolved.

Particular attention has been given by the director general to his conference with the railroad officers, his assistance to the members of the Executive Committee, Commission and others, to the movement of mail to the districts where mailmen and other concentrating points are located and especially to New England. He has also conferred regarding the situation with members of the Food and Fuel Administration, the Shipping Board and the Army and the Navy. For the purpose of speeding the war movement, the Executive Committee has authorized the director general to make such use of the railroads as he may deem necessary, and to make such use of the railroads as he may deem necessary, and to make such use of the railroads as he may deem necessary.

A statement was made by the director of New York City and Long Island City, who is in charge of the city's transportation, that the city's transportation is in the hands of the director general of the railroads and that the city's transportation is in the hands of the director general of the railroads.

Mr. McAdoo, President Williams and Director General McAdoo are expected to have some further consideration to the terms of the transmission which the President will

make to Congress in a message soon after Congress reconvenes regarding the compensation to be paid the railroads in the form of a guarantee based on the average net operating income for the three years ending June 30, 1917, and President Wilson conferred on the subject on December 31 with Chairman Sims of the House Committee on Interstate and Foreign Commerce and Senator Pomerene of the Senate Committee on Interstate Commerce, as these committees will have charge of the proposed legislation.

Mr. McAdoo's Preliminary Statement

On the day following his appointment Mr. McAdoo issued the following preliminary statement.

"This new task is of great magnitude and difficulty. It cannot be done in a moment, and it cannot be done at all unless the people of the United States as well as the officers and employees of the railroads give to the railroad director their intelligent and patriotic support. I earnestly seek the co-operation and assistance of every good citizen in this great work.

"The operation of the railroads as a thoroughly unified system is of fundamental importance to the success of the war. Without it we cannot get the effective use of our resources. The supreme test in this war will probably come in the year 1918. Victory will depend upon our speed and efficiency. We can get neither speed nor efficiency unless the railroads are equal to the demands of the situation.

"I can only say at the moment that the problem will be taken hold of vigorously and that plans and policies will be announced from time to time as rapidly as it is possible to mature them. Meanwhile the business will be conducted through existing railroad organizations, with all the support and power of the government asserted in behalf of more efficient and satisfactory operation.

"The Director General of Railroads, upon invitation of the Interstate Commerce Commission, has accepted office in the Interstate Commerce building. The commission has also placed at the disposal of the director the entire work and facilities of the commission."

"The hour of the transition to government control found the members of the Railroads' War Board, Judge R. S. Lovett, director of priority, and John Barton Payne, counsel for the Shipping Board, who had been assisting Mr. McAdoo in a legal way, in conference with the new director general. The railroad executives offered their hearty co-operation and that of their organization in any way desired, and were told that Mr. McAdoo desired the committee to continue to function at least until some better organization could be devised if it were considered desirable to do so. He asked to be more fully informed as to the organization which the railroads had voluntarily developed and which had been directing the operations of the railroads of the country for eight months. There was a general discussion of possible ways for improving the railroad situation by the exercise of the new power delegated to Mr. McAdoo, and he asked the railroad executives to submit to him any suggestions they had to offer. He particularly desired an early report on the possibility of larger and more efficient use of terminals by joint operation. The railroad men also urged consideration of their recommendation of a list of non-essential commodities.

Later in the day, as his first official act, Mr. McAdoo sent the following telegram to the presidents and directors of all railroads coming within the terms of the President's proclamation of December 26:

"Having assumed the duties imposed upon me by, and in pursuance of, the proclamation of the President dated December 26, 1917, you will, until otherwise ordered, continue the operation of your road in conformity with said proclamation. You are requested to make every possible effort to increase efficiency and to move traffic by the most convenient

and expeditious routes. I confidently count on your hearty co-operation. It is only through united effort, unselfish service and effective work that this war can be won and America's future be secured."

This request was expressed in general terms to be amplified and made more specific later on and was evidently intended as preliminary announcement of policy more than anything else. However, by this simple request for the use of the most convenient and expeditious routes, it was explained afterward, the laws against pooling, giving the shipper the right to dictate the routing of his freight and prohibiting railroads from making agreements which in ordinary times would be considered "in restraint of trade" but which are now considered necessary to make trade possible, were thrown into the junk-pile. While the laws are still on the books, to be restored to force when the war is over unless Congress by that time sees fit to change or repeal them, they no longer apply to action taken under the authority of the director general.

On December 27 Mr. McAdoo issued a more specific order as follows:

Mr. McAdoo's First Order

"All officers, agents and employees of transportation systems may continue in the performance of their present regular duties, reporting to the same officers as heretofore and on the same terms of employment.

"Any officer, agent or employee desiring to retire from his employment shall give the usual and reasonable notice to the proper officer, to the end that there may be no interruption or impairment of the transportation service required for the successful conduct of the war and the needs of general commerce.

"All transportation systems covered by proclamation and order shall be operated as a national system of transportation, the common and national needs being in all instances held paramount to any actual or supposed corporate advantage. All terminals, ports, locomotives, rolling stock and other transportation facilities are to be fully utilized to carry out this purpose without regard to ownership.

"The designation of routes by shippers is to be disregarded when speed and efficiency of transportation service may thus be promoted.

"Traffic agreements between carriers must not be permitted to interfere with expeditious movements.

"Through routes which have not heretofore been established because of short hauling or other causes, are to be established and used whenever expedition and efficiency of traffic will thereby be promoted; and if difficulty is experienced in such through routing, notice thereof by carriers or shippers or both be given at once to the director by wire.

"Existing schedules or rates and outstanding orders of the Interstate Commerce Commission are to be observed, but any such schedules or rates or orders as may hereafter be found to conflict with the purposes of said proclamation or with this order shall be brought immediately by wire to the attention of the director."

Following the issuing of this order, a supplemental statement was issued as follows:

"Director General of Railroads McAdoo announced today that, pending the organization of a permanent staff, he had requested Walker D. Hines, of New York, to act as assistant pro tempore to the director general of railroads. Mr. Hines has accepted the appointment.

"In like manner the director general has appointed Alfred H. Smith, of New York, as assistant pro tempore to the director general of railroads, in charge of transportation in the trunk line territory east of Chicago and north of the Ohio and the Potomac rivers.

"The director general has called upon all presidents of railroads to take up vigorously and at once with all rail-

roads in their respective territories the means of making use of terminals and parallel lines, wiping out all competitive prohibitions, if any survive, and waiving the competitive control or solicitation of traffic.

"The director general has specifically requested that terminal facilities in the Chicago district be treated to as far as capacity and efficiency will be promoted as possible, and that all railroads having terminals in New York take up promptly the question of pooling docks, car floats, lighters, and other facilities for distributing traffic in New York Harbor including marketing facilities now controlled by individual railroads.

"The director general also requested the Interstate Commerce Commission to have its railroad inspectors make an immediate investigation of conditions existing on all the trunk line railroads in eastern territory, and to submit a report at the earliest possible moment.

The director general instructed the presidents of the Pennsylvania, Erie, Baltimore & Ohio, Lackawanna, New Jersey Central, and Lehigh Valley railroads to make an immediate study of the terminal facilities on the New Jersey waterfront at Port of New York and to report as quickly

To this letter Mr. McVhee replied on the same day as follows:

I have been greatly gratified by your support of—especially in the problem with our grapes. The change, however, which has necessarily come to some of our personnel, are almost entirely due to a desire they had to come to the

A. H. Smith
President, New York Central

as possible what rearrangements of passenger and freight train operations could be made that would increase the efficiency of these terminals."

Mr. McAdoo had spent Saturday in conference with members of the Interstate Commerce Commission and others for the purpose of obtaining exact information as to the situation and the field agents of the commission were ordered to investigate and report immediately on the state of transportation in various parts of the country. Commissioner McChord has been placed in charge of this investigation. Two inspectors were assigned to the freight yards in the vicinity of Washington, where there has recently been a considerable congestion, due largely to delays by consignees in removing their freight.

War Board Resigns

On Monday, December 31, the Railroads War Board tendered their resignations to the director general in the following letter:

"When you assumed control of the railroads under the President's proclamation of December 26, our function, being one of private initiative, came to an end."

"At our conference with you on Friday morning, last, we offered you the full measure of our co-operation, collectively and individually, in any capacity. You requested us until further notice, to continue this organization to exist, to hold together our sub-committees and, meanwhile, to advise you on certain specific questions which you put to us. We

views you express. In accordance with your request, I express no dissent to your decision to bring the original work of your committee to a close.

I propose to designate one of our members and to provide pro tempore of our Adviser Committee, and to ask the group designated to take over with further under the various sub-committees of the American Railways Association's Special Committee on National Defense and the consolidated information and resources of the various departments of the problem of construction, the railroad and the Federal State.

orders under the direction of the Committee on Car Service of the American Railway Association."

Instructions to Eastern Lines

In pursuance of the order Mr. Smith issued instructions to all eastern lines as follows:

"By order of the Director General of Railroads, Judge Lovett concurring as to priority modifications, please direct every attention to clearing your line of any congestion that exists, wiring me of any condition which is beyond individual control, with suggestions as to most available method of relief.

"You are authorized to disregard priority orders to the extent necessary to clear up a serious congestion, keeping in mind vital necessity for moving food and fuel.

"Wire me particularly where coal is congested without prospect of immediate movement, so that matter of diversion to open lines, or markets, can be arranged with the Fuel Administrator.

"Embargo any consignee who does not release freight promptly on arrival.

"So far as practicable, annual passenger trains which interfere with giving necessary freight service.

"Keep in touch with your connections and afford help to each other in any way possible to further general movement, change routing, short haul freight, and make any mutual arrangements that will facilitate movement and delivery of traffic.

"Call on all employees to lend their efforts in this matter of service to the Government and the people.

"Endeavor to start trains promptly from terminals and load to permit of prompt movement over divisions.

"Advise by wire daily to New York number of cars of freight you have to move above capacity, location of congestion in the order of extent, with prospects of gaining or losing on the situation in the following 24 hours.

"If you have capacity to handle more business on any part of your line, advise between what points and how much, and what you can best handle and dispose of.

"If you are holding freight for connections, give number of cars, loads, or empties, and divide loads into coal, food, Government freight, and other."

General Order No. 2

Mr. McAdoo also issued the following General Order No. 2, addressed to the chief executives of all railroads:

"Pursuant to the authority vested in me by the President of the United States in his proclamation of December 26, 1917, wherein it was stated that, for purposes of accounting, possession and control of the railroads shall date from 12 o'clock midnight on December 31, 1917, you are notified that, until otherwise directed, no changes in the present methods of accounting, as prescribed by the Interstate Commerce Commission, will be required. The accounts of your respective companies shall be closed as of December 31, 1917, and opened as of January 1, 1918, in the same manner as they have heretofore been handled at the close of one fiscal period and the beginning of another, and in the same manner that you should have handled your accounts had the Government not taken possession and control."

The final action of the Railroads' War Board before adjourning sine die was to send the following telegram to the Presidents of all the railroads that have supported the committee:

"The function of the Railroads' War Board under the resolution of April 11 last came to an end with private railroad management. At the request of the Director General of Railroads we have remained here to furnish him with certain information, but that duty being now complete, we have requested and received permission to terminate our activities and return to our individual responsibilities. Mr. Holden has been designated pro tempore a member of the

Director General's Advisory Committee to take over until further order the various sub-committees of the American Railway Association's Special Committee on National Defense. We thank you cordially for your support and assistance during the past eight months."

The Effect of the Announcement of the New Plan

The only outward and visible sign of this momentous event in railroad history on December 28 was a strong upward tendency in the market quotations of railroad securities, depressed by weeks of uncertainty as to the future and neglected for Liberty Bonds, but now encouraged by the prospect of a Government guaranty.

Among railroad officers the event produced varying reactions. There was gloom among those who felt that they had been told they had failed to make good, and a feeling of relief on the part of many who realized that a great burden of responsibility for railroad credit had been lifted from their shoulders and that they would be left free to operate the roads with the help of the Government instead of under its restrictions. Mr. McAdoo received hundreds of telegrams of congratulation from railroad executives, bankers and security holders expressing enthusiastic approval of the plan and promises of co-operation. There was also the usual anxious speculation as to how the new boss would act, but a general willingness to co-operate with him to the full.

The New Director-General

William Gibbs McAdoo, who now combines the office of Secretary of the Treasury with that of Director General of Railroads, thus becomes, if he was not before, the most powerful individual in the administration under President Wilson. As Secretary of the Treasury he was in charge of the important function of financing the war and he now is charged with the duty of co-ordinating with the government's financial requirements those of the railroads, which had been necessarily neglected while the government was monopolizing the investment market for its own purposes. This doubtless represents one of the important reasons for Mr. McAdoo's selection and while some surprise has been expressed that two such important offices should have been given to one man, Mr. McAdoo has indicated that he intends to leave the operation of the railways largely in the hands of railroad men.

While Mr. McAdoo has had little experience in steam railroad matters, he was at one time a railroad lawyer in Tennessee, and, without having had previous experience in large business affairs, he made a reputation for himself by his successful financing and execution of the project for building the Hudson river tunnels from New Jersey into New York City. As Secretary of the Treasury he has demonstrated marked executive ability in the handling of the Liberty Loan campaigns and has shown the faculty of enlisting the co-operation and of utilizing the advice of the most experienced leaders in the financial field. By many he is regarded as the ablest man in the Cabinet, and the importance of his office has been greatly increased by the responsibility imposed upon it by the necessity of raising huge loans for the prosecution of the war and for the assistance of our Allies.

Mr. McAdoo was born near Marietta, Ga., on October 31, 1863. He was educated at the University of Tennessee. In May, 1882, he was appointed deputy clerk of the United States Circuit Court for the southern division, eastern district of Tennessee. In 1885 he was admitted to the bar, and he practiced law at Chattanooga, Tenn., until 1892, when he removed to New York. For a number of years, until 1903, he was a partner with William McAdoo in the practice of law at New York. He then engaged, as president and director of the Hudson & Manhattan Railroad, in the work of financing and constructing the Hudson river tunnel system, which completed on March 8, 1904, the

first tunnel under the Hudson river. The first Hudson river tunnels between Hoboken, N. J., and South Hackensack and Nineteenth street, New York City, were opened in 1908. On February 25, 1908, and the fourth tunnel under the river was completed on March 11, 1908. Louis M. McAdoo became prominently identified with the Democratic political campaign. He was a delegate to the Democratic National Convention at Baltimore in 1912, later was chairman of the Democratic National Committee, and he was acting chairman for the greater part of the campaign which resulted in the election of President Wilson. On May 14, 1915, he became Secretary of the Treasury in President Wilson's Cabinet. Mr. McAdoo is also ex officio member of the Federal Reserve Board, chairman of the Federal Farm Loan Board, and chairman of the United States section of the International High Commission.

Probable Changes Under New Regime

While the important question of the compensation to be guaranteed for the protection of railway security holders remains to be settled by act of Congress, after President Wilson has made his promised recommendations to it in a message, certain important features of the plan under which the railroads are to be operated have been made clear of advance by the terms of the President's proclamation and by Director McAdoo in his order and in his talk to newspaper men. There are many important details, however, which have not yet been settled and will not be until Mr. McAdoo has had time to receive further information and advice and to give them careful consideration.

The railroads will continue to be operated directly by their own officers except and until the director general shall find occasion to order a change. They will be given a "square deal," he has promised, and every opportunity to make good, with such help as the government can give them and under the presumption that they will not be disturbed except for good cause. Of course the director general's power is paramount, but his authority is superimposed upon that of the existing organizations and not substituted for it. If a railroad president should die or resign, his successor would be elected by the directors in the usual way, subject, of course, to the approval of the director general. On the other hand, if a railroad officer proved recalcitrant he undoubtedly could be dismissed.

Mr. McAdoo intends to conduct his railroad work from his office in the Interstate Commerce building. He realizes that a colossal task has been placed upon him and he does not intend to proceed rashly or to try to revolutionize the railroads at a single stroke. His purpose is to secure the greatest possible efficiency from the use of the existing instrumentalities of the railroads, and he believes that with the individual interests of the railroad companies absolutely submerged by the government guarantee it will be possible to work out many plans for co-ordinating their facilities which have been impracticable for the railroads under the prohibition of the laws and under the pressure of their individual interests.

He has been giving considerable study to the possibilities of common use of tracks and the use of all kinds and while he has not yet given careful consideration to the recommendation that non-passenger freight be carried from transportation he has made it plain that the vital needs of the government for the prompt movement of warlike and supplies of all kinds must take precedence over all other traffic and that if necessary the government should have a way

Interstate Commerce Commission to Co-operate

Mr. McAdoo expects a final use of the provisions of the Interstate Commerce Commission will not and will not interfere with its course of providing of railway service.

Government Debt Not to Be Canceled Free

pressed their hearty approval of the plan. There has been some expression of opinion that the guarantee proposed by the President is too liberal and there may be a prolonged contest over the question, but the general feeling in Washington is that Congress will adopt the President's recommendations.

A few, particularly among the Republicans, have already expressed doubts as to the wisdom or the necessity of taking over the railroads, but the President's action has placed that subject in the category of academic questions. It is likely, however, that the Republicans will make an issue of an idea of extending the plan to government ownership.

The average net operating income for three years will undoubtedly work out more favorably for some companies than for others, particularly for such roads as have had only one good year out of the three instead of two out of the three, which has been the general experience. The proclamation provides, however, that nothing shall be done under it to impair the rights of stockholders and other interests in the properties to receive "just and adequate compensation" and it has been suggested that this is intended to provide for unusual cases.

The Wage Question

One of the important problems soon to be faced by the railroad director is that of the wages of employees. The executive officers and legislative agents of the four brotherhoods of train service employees held a conference with the President at the White House on December 27 and afterward expressed to the newspapers their hearty approval of the plan of government control. It was given out that they had asked for the appointment with the President and it was generally supposed that they had promised their support and also laid further foundations for the consideration of their demand for higher wages. The Railroads' War Board some time ago had placed the interests of the railroads in the matter unreservedly in the hands of the President. On December 29 it formally declined the demands and thereby placed the responsibility for dealing with the wage question in the hands of the government, but it is understood that the brotherhoods will not press their de-

mands for the present until some of the fundamental features of the new arrangement have been settled.

It was announced that Mr. McAdoo would meet the representatives of the brotherhoods to discuss the situation on Thursday.

For the purpose of improving the New England coal situation Mr. McAdoo has taken up with the Shipping Board the plan of putting some additional boats into service to replace those that were taken away earlier in the year, thereby increasing the burden of the railroads.

Before its dissolution the Railroads' War Board had addressed a telegram to its group chairmen suggesting that immediate study be given to the construction of convenient interchange tracks to link together heretofore competing terminals in all important cities; also to the rerouting of traffic which had formerly been competitive to accomplish the most expeditious switching deliveries.

Director McAdoo and his staff were busy all day Tuesday, New Year's day, in efforts to clear up the congestion of freight, especially in the eastern states. Mr. McAdoo recommended, and Judge Lovett took the necessary action, to have all existing priority orders suspended. Particular attention was paid to the desperate situation of New York City in the scarcity of coal for dwellings and offices, as well as for factories, and Mr. McAdoo ordered that coal, and also other freight, be sent through the Pennsylvania tunnels to the fullest extent practicable. These tunnels, hitherto used only for passenger traffic, afford a direct rail route from New Jersey terminals to the borough of Queens, and the movement of coal by this route is expected, under the present difficulties incident to extreme cold water and ice in the river and bay, to save several days' time in the movement of coal to Queens and Brooklyn; and also to parts of Manhattan. The Sunnyside yard, at the eastern end of the Pennsylvania tunnels, is adjacent to the Sixtieth street bridge leading to Manhattan.

It is expected that President Wilson will go before Congress today (Friday) with his recommendations for such legislation as may be necessary to carry out the purposes stated in his proclamation taking possession of the railroads of the country.

Bringing Up Cases of Shells on a Light Railway Behind the French Lines

ment in road and equipment, in the three years ended June 30, 1917:

| | Investment in road and equipment | | Operating income (net) | | Per cent operating income on investment in road and equipment |
|---------------------|-------------------------------------|----------|------------------------|----------|--|
| | Total | Per mile | Total | Per mile | |
| 1915.. | \$17,247,018.81 | \$72,689 | \$7,821,079 | \$2,972 | 4.09 |
| 1916.. | 7,535,576.908 | 73,309 | 1,043,839.822 | 4,247 | 5.80 |
| 1917.. | 74,600 | 73,909 | 1,050,000.000 | 4,257 | 5.72 |
| Average per year... | | | 940,683,967 | 3,819 | 5.20 |

The figures in this table for the years 1915 and 1916 are from the annual report of the Interstate Commerce Commission for 1917. The figures for the year ended June 30, 1917, are estimates made by the Bureau of Railway Economics. The Interstate Commerce Commission in its annual report estimates the percentage of return earned in the year ended June 30, 1917, at 6½ per cent. This is clearly too high. The Interstate Commerce Commission originally estimated the returns for the fiscal year 1916 at 6.35, while the Bureau of Railway Economics estimated it at 5.9, and the final figure of the Commission itself is only 5.8 per cent. The Commission's estimate for 1917 is too high for the same reason that its original estimate for 1916 was, namely, that it does not make allowance for certain factors which will finally have to be included.

Our estimate of the average return on investment in road and equipment earned by the railways in the three years ended June 30, 1917, is 5.2 per cent. This is almost exactly the same as the average earned in the ten years 1901-1910, which was 5.19 per cent. It is true that it is more than was earned in the five years ending with 1915, which was 4.54 per cent; but this was the worst five years the railways have had since the depression following the panic of 1893, and it can hardly be regarded as affording a fair basis of compensation.

Speaking in actual figures instead of in percentages, the basis suggested would give the railways as a whole an operating income of about \$941,000,000 a year. This would be \$102,000,000 less than their operating income in 1916 and \$109,000,000 less than their operating income in 1917. It is no evidence of fairness for anybody to contend that a basis which would give the railways over \$100,000,000 a year less than their average operating income of the last two years, and would yield them less than 5¼ per cent on the investment in their road and equipment, is unduly favorable to the railways. The opposite contention could be made with much more force.

It is true the prices of railway securities advanced when the President's plan was announced, but this was because investors in railway securities knew that the return earned by the railways was declining; because they were in great uncertainty as to how far this decline would go; and because they felt that the President's recommendation tended to remove this uncertainty. The owners of railway securities would, of course, rather have the return earned in 1916 or 1917 than the one the President proposes to guarantee, but they recently have been filled with dread lest their return would soon be back where it was in 1914 and 1915.

While, as applied to the railways as a whole, the financial plan of the President is as favorable to the railways as could reasonably be expected, it would do great injustice to some individual companies. There are, for example, several roads which became bankrupt in 1915, and which had only partially recovered in 1916, but which have got on fairly solid ground in 1917. Such cases, which are exceptional, will require special consideration and treatment, and the plan of the President is broad enough to permit this. The adoption of the President's plan probably would stabilize railway securities during the war and make it practicable for most large railways, with the lacking of the government, to raise the capital required to enlarge their facilities. Unfortunately the recommendations of the President do not solve the finan-

cial problem. They must, before a solution is reached, be acted on by Congress. There seems no good reason, however, for doubting that after some discussion the President's plan as a whole will be adopted. The objection that it would give the railways too much is based on a misunderstanding which discussion will soon remove.

3. Effects of the Plan on Railroad Efficiency.

In assuming control of the operation of the railways Mr. McAdoo will have some disadvantages which the Railroads' War Board has not had, but he will also have some great advantages it has not had.

As to his selection for director-general, it may be said without hesitation that once the President had decided to choose a man from his own official family he made the best choice available. With one possible exception, Mr. McAdoo is the ablest man in the Cabinet. He first demonstrated his ability by financing and constructing the Hudson and Manhattan tunnel when to most men who were considered competent judges the undertaking, especially by one almost unknown in the fields of finance and railroad construction, seemed like the "baseless fabric of a vision." When he was appointed Secretary of the Treasury he had had little experience with such affairs as it is concerned with, and there was no reason to assume he would have any weightier problems to solve than have been solved by his various predecessors since the Civil War. As things have turned out, he has had the hardest work to do and the most prodigious problems to solve that have ever been presented to any incumbent of his office, and no higher tribute to him could be paid than to say—and it can be said truly—that he has at all times proved equal to the situation. He has put the Federal Reserve System on a sound basis, and he has raised all the huge sums required for making large loans to our allies and for financing the requirements of our government in the war. Either his achievement in putting the Federal Reserve System on a successful working basis, or his achievement in raising funds for the war, would be enough to stamp him as an administrator of a high order. The railways and the nation may well congratulate themselves that when President Wilson decided to take over the railways, he appointed as director-general one of the very few first-class men in his administration.

One of Mr. McAdoo's disadvantages as director-general will be that he will have many other duties to perform. He retains the secretaryship of the treasury and three or four other important government offices. What effect his retention of these other offices will have on his direction of the railways will depend greatly on how he goes about the latter task. Few minds seem to be able to grasp the colossal magnitude of the railroad system of the United States and the consequent colossal magnitude of the work of operating it as a single system. The railways of the United States have a mileage of 260,000 miles, or about 40,000 miles more than all the railways of Europe. They have an army of one and three-quarter millions of employees. They cover an area almost equal to that of Europe. They handle more freight traffic than all the railways of Europe. No man who ever lived or who ever will live could direct the operation of this railway system in the same sense that the President of a railway system of 5,000 or 10,000 miles directs its operation. Indeed, very few men can be said ever to have measured up fully to the task of managing 10,000 miles of railroad, and those who have done so have always owed it to the fact that they have shown extraordinary capacity, first, for choosing able lieutenants, and, second, for giving their lieutenants a free hand in working out their problems. Even then the number of great problems which has come up to even the ablest presidents of large systems have been so numerous that in most cases they have been able to stand the strain only a few years.

with the situation that it is giving to Mr. McAdoo the War Board could have and would have increased even more than it has the efficiency with which the railways are operated. The one thing most essential to Mr. McAdoo's success is to enlist and keep something the Railroads' War Board has had, and that is the loyal support of the railway officers of the country. In view of the wisdom, the ability, the energy and the courage which he has shown in other fields, we believe Mr. McAdoo will succeed in doing this, first, because we believe railway officers are a unit in really wanting to support him, and, second, because we believe he will demonstrate that he deserves their support.

The experiment in railroad control which the government is making would be a gigantic and a most important one at any time. It is vitally important at present. The welfare of the nation imperatively demands that it shall succeed; it must be made to succeed; and it is the duty of every man in any way concerned with it to devote his utmost ability and energy to the task of making it succeed.

Effects of Unwise Regulation Illustrated by 1917 Statistics

JUST ABOUT TEN YEARS AGO the national and state governments began effectively to apply a system of railroad regulation which prevailed until noon on Friday, December 28. On this date the order as to both railroad regulation and railroad management which had lasted ten years passed away. A Director General of Railroads took charge, under whose yoke have been compelled to pass not only the railway managers, but also all the national and state regulating bodies.

Comparisons of the conditions which existed at the beginning and at the end of this ten years of regulation are not only interesting but very significant.

In the year 1907 there were built in the United States 5,212 miles of railroad; in the year 1917, as statistics published elsewhere in this issue, show there were built only 979 miles. While there were actually torn up 451 miles, operation was abandoned on 491 miles more, and the owners of 396 miles more asked permission from state authorities to abandon it.

In 1907 the railways ordered 151,711 freight cars. In 1917 they ordered only 79,367.

In 1907 they ordered 3,482 locomotives; in 1917 only 2,704.

It may be said that the condition of arrested development exhibited by the railways in 1917, as shown by the statistics gathered by the *Railway Age* and given elsewhere in this issue, was due to the war. Let us then compare the last three years of the period ending with 1907 with the last three of the period ending with 1917.

In the ten years from 1897 to 1907 the freight handled by the railways increased 150 per cent; and at the end of that period the development of their facilities was proceeding rapidly. Then began the period of regulation. In October, 1907, came the "rich man's panic"—so-called, perhaps, because the course of events during several months previous had thrown rich men into a panic.

The period of active railroad development only briefly overlapped the period of railroad regulation. The increase in traffic, as we have seen, was relatively greater in the ten years from 1897 to 1907 than in the ten years from 1907 to 1917. There were congestions and delays to traffic in the years at the end of the former period, but they were relatively no more serious than those which have occurred recently, and until toward the end of 1907 the railway companies were engaged in providing the remedy for these conditions in the form of increased facilities.

During the last three years, on the other hand, the railway companies have not been providing the remedy for similar conditions. The number of miles of line built and of locomotives and freight cars ordered in the two three-year periods 1905-7 and 1915-17 are given in the accompanying table. The number of miles of new line built in the three years ending with 1917 was 80.2 per cent less than in the three years ending with 1907. The number of freight cars ordered was 55.8 per cent less. The number of locomotives ordered was 53.1 per cent less.

Is it any wonder in view of such facts that recently the facilities have proved unequal to the demands upon them?

The latter half of 1915 and the years 1916 and 1917, like the years 1905, 1906 and 1907, were periods of large gross and net earnings as compared with previous years. Why, then, were there not large increases in railway facilities in the three years ending with 1917, as there were in the three years ending with 1907? Chiefly because railway regulation had destroyed the confidence of investors in the railroad business. After the United States entered the war in April, 1917, of course, the amount of equipment which the railroads could buy was limited by government priority orders; but the time during which this country has been at war covers only nine out of the thirty-six months which ended on December 31.

The final effect of the kind of regulation to which the railways have been subjected for over ten years has been to cause President Wilson to decide that in order to enable them to be operated with maximum efficiency during the war the government must take direct control of their management.

This being the record of the railroad regulation which prevailed from 1906 to 1917, no effort should be spared to make sure that we shall never return to it, with all its stupidities, its vexations and its disastrous effects. Perhaps we can never return to the management of railways by individual companies, such as formerly prevailed, without also returning to the kind of regulation we have had. If so, then let us frankly recognize the fact and act accordingly. If to get a better system of government regulation or control it is necessary to change our system of railroad ownership and management, let us proceed with the changes in ownership and management necessary to secure needed changes in regulation.

"The old order changeth, yielding place to new,

And God fulfills himself in many ways."

It is easy to hope and to expect that this new experiment of government control which we are beginning will have better results than those of the ten years' experiment of government regulation. The Director General of Railroads is free from all those trammels which government has imposed upon the managers of the railways. He can route traffic any way he pleases. He does not have to take orders from state legislatures as to how many men he shall employ in a train crew. He can reduce service as much as he thinks desirable. He can reduce as much as he likes the time given shippers to unload their freight and he can raise freight and passenger rates as high as he pleases. He can control the use of freight preference orders by government representatives. If, unlike most of the regulating authorities, he acts wisely and fairly he can get the loyal support of railway officers. With the country at war and a government officer in charge, the public will demand less of the roads and be more patient with their shortcomings.

We are obviously in a period of transition. Perhaps the new system of war control will be the means by which the ground will be cleared of a vast accumulation of rubbish so that a new constructive railroad policy can be built upon it. One thing, however, we must never forget or let the public forget, and that is that unwise and inefficient railroad regulation and not unwise and inefficient railroad management produced existing conditions. In view of these conditions

The effect of such a plan upon deliveries is amply demonstrated by the results obtained by the United States government in securing locomotives for use in France. Its disadvantages, from the standpoint of the interests of the individual railroads, would be no greater than those now being suffered through the transfer of existing locomotives from one railroad to another on which traffic is more congested. Whether or not such a plan proves to be wholly feasible, it can be adopted to the extent of holding in abeyance all plans for the building of locomotives of new designs, none of which have ever previously been built. Let the builders work to existing designs and deliveries will be expedited.

Construction Activities in 1917

A RECORD of three consecutive years in which railway extensions averaged only 1,000 miles of new line per year, or less by nearly 40 per cent than in any other three consecutive years since the Civil War, would indicate a condition of distress under any circumstances, but occurring during a period of most remarkable industrial and commercial expansion it is irreconcilable evidence of the sore straits in which the railways find themselves. To contradict the suggestion that the network of railroads has become so comprehensive over the country as to make further extensions unnecessary, attention is called to the fact that a single railway, the Santa Fe, has undertaken 300 miles of extensions in a single year, some of which was started after our entrance into the war to meet the demands for transportation facilities from communities now without them.

Granting that intensive development is more necessary at the present time than expansive growth, attention need only be called to the contrast between additions to second track during the past three years as compared to the preceding three to show that the same restrictive condition prevails. During 1915, 1916 and 1917 only 1,282 miles of second track was added, as compared with 2,901 miles added during 1912, 1913 and 1914.

In the case of terminals we find that work on very few classification yards of first magnitude or extensive belt line projects has been undertaken in the past three years. Activities in terminal work have been directed largely to numerous small improvements made in efforts to relieve conditions of congestion in the shortest possible time and with relatively minor expenditures. It must be said in justice that this policy on the part of the railroads is not entirely a result of limited funds. The labor shortage extending over the past two years and the enormous increase in the costs of both material and labor with a consequent enormous increase in the obligations incurred in any improvements at this time are partly responsible. The change in policy introduced by our own entrance into the War with the enforced need of curtailing the use of men and materials has had an even more marked effect.

In pursuance of this policy municipal and state authorities have generally taken a broad stand in regard to grade separation, passenger station and other projects having no direct bearing on the expeditious movement of traffic, recognizing that the times demand the postponement of work unnecessary to the prosecution of the War. A striking exception to this rule is the demand of the United States War Department for the raising of river bridges at Pittsburgh, in connection with which the Pennsylvania Lines are making an expenditure of nearly \$1,000,000.

The public has taken a less favorable attitude in regard to a number of railway improvements sorely needed to relieve congestion, and has in several instances evinced an almost childish obstinacy in blocking the projects. Among these may be cited the New York Central's proposal to spend \$100,000,000 for improvements on Manhattan Island and the plan for a new bridge across the Hudson below Albany

to be used in connection with a belt line to reduce congestion through that city. In Chicago, the Atchison, Topeka & Santa Fe and the Illinois Central have been unable to proceed with important improvements because of what appears to be a definite policy of insisting on wholesale electrification in all cases where the railways are compelled to negotiate with the city.

While it has been necessary to display careful judgment in improvement budgets during the years past it will be necessary to exercise even greater discrimination in deciding upon the construction work to be done during the coming year. Unquestionably the government administration of the railroads will exercise some bearing on this matter but a more marked influence will be felt through the designation of priority on the necessary materials. The shortage of labor will also act as even more of a deterrent than in the past and unquestionably constitutes the most formidable obstacle confronting the railways at the present time in the completion of the additions and betterments to their properties so necessary to the expeditious handling of the war traffic.

A Review of Maintenance Conditions

THE YEAR WHICH HAS JUST CLOSED has been without precedent in the maintenance of way department as in other branches of railway service and in industrial activities in general. Not the least unusual has been the fact that the roads were unable to spend all of the money available for the upkeep of their properties, or which should have been expended. As a result a large amount of deferred maintenance has accumulated and the net earnings of the roads have been swelled by these unexpended portions of maintenance, appropriations the equivalent of which will have to be returned to the physical properties with liberal interest at no late date if their efficiency is not to be impaired.

The past year has been one of unprecedented traffic, the gross earnings being estimated to be over \$450,000,000 greater than in the preceding year. For the first time in history the gross earnings of the railways of the United States passed the \$4,000,000,000 mark. This heavy traffic has exacted its toll from the track and structures through the added wear and tear which must be made good if the property is not to be allowed to deteriorate. The statistics of the Bureau of Railway Economics for the first ten months of 1917 show an increase in total operating revenues of 11.8 per cent per mile of line as compared with the same months of 1916. For the same period expenditures for maintenance of way and structures showed an increase of 6.1 per cent. On its face this comparison is not unsatisfactory, for an increase in the amount of business handled should not lead to a corresponding rise in the cost of maintaining the property since a considerable part of the charges are independent of the traffic and others are only partially affected by it.

The difficulty arises from the changing conditions which have affected the factors involved in these comparisons during the past year. The rates received for transportation have been practically stationary during the two periods compared; therefore, a comparison of the operating revenues is a fair measure of the amounts of work done and of the wear and tear on the property. In studying the expenditures to overcome this deterioration, however, conditions are different, for a dollar of expenditure did not produce the same relative improvement in 1917 as in 1916. The effect of the rising prices of materials had begun to make itself felt in 1916 and in some instances great advances had already occurred. However, this tendency toward increased costs continued steadily throughout the first nine months of 1917 so that a dollar bought less material in that period than in 1916. The same is true of labor. Wage rates have risen steadily and they were accompanied by decreased efficiency on the part of the men so that the labor returned per dollar of expenditure fell

sharply. As a result the increase in expenditures of 6.1 per cent resulted in a dollar increase in productivity an actual decrease of no more than 10 per cent in terms of productive work on the property. This occurred at a time when the facilities were being taxed to their utmost to handle the traffic and when the wear and tear on the way was correspondingly great. This condition has necessarily led to an accumulation of deferred maintenance which will be necessary to take up in the near future if the industry is to continue to perform the efficient service which the country is now demanding of them.

To the men in the maintenance of way department the outstanding feature of the past year's work has been the constantly increasing scarcity of labor. The constant influx of open immigration, the shutting out of the Mexican supply through the enactment of the alien laws have the transfer of over 1,000,000 men from unskilled to military service and the widespread activity in industrial work have all served to increase the shortage of men throughout the country.

One development of the past year in this respect has been a marked improvement in the living conditions provided for transient laborers by the railroads. In an effort to hold as many men in their employ as possible many of the roads have given more attention to the provision of better housing and feeding facilities and have provided more entertainment in their camps. While many men individually have enjoyed these measures for a number of years, the general acute shortage of labor has forced the managements to adopt these as means of self-protection.

The competition for men between the railways and other industries and also between individual roads has led to considerably higher wages, the rates paid for track laborers on some roads now being twice those of two or three years ago. This competition for men and the bidding of one road against another has served further to demoralize the labor market and, as is inevitably the case, has resulted in a serious decrease in efficiency. Not only is there an absolute shortage of men, but the character of the men employed in railway service is probably lower than ever before and the return in productive work per dollar of expenditure has probably been lower than in any previous season.

Conditions in the material market have been also equally chaotic. Prices of materials have been climbing higher at an alarming rate, while even more serious is the fact that it has been almost impossible to secure many materials except with long delays. This has made it practically impossible to proceed with extensive programs of work with any certainty that they would be completed at definite dates. The formation of the Priorities committee late in the year has already assisting the roads as the committee is in constant giving preference to materials for which the road can show an immediate need, thereby giving them an advantage over other work less necessary for the public welfare at the present time. The fixing of prices has also resulted in numerous reductions in some instances and equally important has tended to stabilize the market and put a stop to the speculative trading which has been going on for some months.

Because of the rapidly changing conditions of the market it is difficult to predict what the next year will bring with little hope can be held out for an improvement of the labor situation. The industries of the country will undoubtedly be forced to operate at high speed for the remainder of the year and as long as these conditions exist the railroads will continue to suffer from a shortage of labor and the efficiency of that which they can secure. The principal relief will be the substitution of mechanical equipment for men wherever this can be done and the securing of new and additional mechanical development of labor saving equipment for the maintenance of way field. With resources of material the Priorities committee will undoubtedly be of direct assistance

in the future in securing these resources. Once materials are distributed on a more systematic basis, the railroads will undoubtedly be limited by the time necessary for the movement of material from plant to plant and by the time necessary for the movement of material from plant to plant. The railroads will undoubtedly be limited by the time necessary for the movement of material from plant to plant. The railroads will undoubtedly be limited by the time necessary for the movement of material from plant to plant.

Car Development in 1917

During the past year the car development of the industry has been a most interesting one. The industry has been in a position to develop a new type of car, the so-called "new" car, which has been developed by the industry. This car is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry.

One of the most important developments of the year has been the development of the "new" car. This car is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry.

The industry has also developed a new type of car, the so-called "new" car. This car is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry.

The industry has also developed a new type of car, the so-called "new" car. This car is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry.

The industry has also developed a new type of car, the so-called "new" car. This car is a new type of car, which has been developed by the industry. The industry has also developed a new type of car, the so-called "new" car. This car is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry.

The industry has also developed a new type of car, the so-called "new" car. This car is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry. It is a new type of car, which has been developed by the industry.

usually a shell within a shell, the inner lining being self-sustaining and separated from the outside lining by four continuous layers of insulation extending from side sill to side sill over the top of the inner steel wall in one continuous piece. The cars are provided with basket bunkers, an insulated solid bulkhead and the space between the bulkheads is divided into three compartments. The Baltimore & Ohio and the Michigan Central have built refrigerator cars which are particularly well insulated, the insulation being applied solid instead of with the usual intervening air spaces. These cars have the basket ice bunker with the solid bulkhead.

The Virginian 120-ton capacity coal car marks a most important step in the construction of this type of equipment. It is provided with the Lewis articulated six-wheel truck having a wheel base of 9 ft. The car weighs 73,900 lb. and has a ratio of revenue load to total load, with 10 per cent overload of 76.4 per cent. It represents a design which has been given the most careful study, and contains many interesting features. The Pennsylvania 85-ton capacity hopper car with five hoppers, has a light weight of 60,000 lb. and a gross cubical capacity of 3,228 cu. ft. as against 4,422 cu. ft., the maximum cubical capacity of the Virginian car is also noteworthy.

Among the passenger cars those built for the Delaware & Hudson and for the Erie represent real progress in the design of all-steel passenger equipment. The Delaware & Hudson cars are 72 ft. 8 $\frac{3}{4}$ in. long over body end sills, they weigh 138,700 lb. and have a seating capacity for 90 passengers. The Erie cars are interesting on account of the ingenious construction of the superstructure. The distribution of metal is such that a stiff construction has been obtained with a saving in weight. These cars are 70 ft. long over the body end sills; they weigh 110,900 lb. and have a seating capacity for 76 people, including 12 seats in a smoking compartment.

The prospects for improvements in design during the coming year are promising, particularly in freight cars. With the heavy demand for freight equipment new cars will be built and every means will be taken to get them promptly. With private and corporate interests being held subordinate to the nation's needs, the "standard car" will receive more serious consideration. A committee of the American Railway Association has been working on this problem for some time. Sample cars have been built and much study has been given the question. The committee has been unable as yet to come to an agreement. It is extremely desirable that the matter be settled as promptly as possible so that the designs can be used for the large amount of new equipment which must be constructed in record time during the current year.

Optimism in the Supply Field

OPTIMISM is the word that most aptly characterizes the feelings of railway supply men as to the outlook for the car and locomotive markets in the coming months. The car and locomotive builders and the specialty manufacturers have not by any means had a bad year in 1917—but they have, nevertheless, had to do considerable worrying. The combination of circumstances during the past fortnight, however, has put an entirely new and brighter aspect on the situation. The President's taking over the railways has been received with favor in the supply field. For one thing, it is confidently expected that the guaranty of the average earnings for 1915, 1916 and 1917 will now permit the railways to get back once more into the market for new equipment and that in the very near future. For another thing the fact that the President has appointed one of the biggest men in his Cabinet to be Director-General of Railways is understood to indicate that the administration realizes more

fully than ever the importance of railway transportation in winning the war. In other words, supply men confidently expect that railway equipment requirements will receive much prompter attention than they have been receiving for the last six months. And, as if good always had to come in bunches, it also happens that the material situation has eased considerably recently both as to prices and deliveries.

The labor situation still looks bad, but the railway supply people are no worse off than any other of the country's industries. The Russian situation, bad as it is in the broader aspects, even lends some small grounds for optimism. The collapse of Russia has been a very serious event for America, but there is a silver lining to every cloud. In the case of Russia's plight, the silver lining seems to relate to the American locomotive situation. Russia has placed orders on our books this year for something like 700 locomotives. It was about to close for 1,500 more, and shop arrangements had even been made for them to the detriment of deliveries on orders for our own roads at home. The orders for the 1,500 Russian locomotives will now undoubtedly be side-tracked and work will be begun immediately, in fact, has already begun, on American orders which have been held up for months, and the American railroads need the locomotives badly.

Receiverships and Reorganizations

THE REORGANIZATIONS of railroad properties effected in 1917 are important. The receiverships that took place are quite unimportant. Three large railroad systems were reorganized during the calendar year, two—the Missouri Pacific and the Pere Marquette—by means of foreclosure sales, and one—the Chicago, Rock Island & Pacific—by means of a voluntary exchange of debentures for preferred stock and a subscription on the part of a syndicate of bankers to approximately \$30,000,000 preferred stock, and on the part of former directors, to \$5,000,000 preferred stock.

If the Chicago, Rock Island & Pacific reorganization had been an immediate and unquestioned success it would have proved a striking example of the exception to the general inability of railroads to do any financing in recent years through the issue of stock. As a matter of fact, however, the reorganization has not as yet by any means demonstrated itself a success, and the purchasers of the new preferred stock are faced with the possibility of a heavy loss. When the road went into the hands of receivers there were various individuals and financial institutions with conflicting interests in it. There were the Reid-Moore people, including D. G. Reid and Judge W. H. Moore, who were in control prior to the receivership. There were also various Chicago capitalists and estates representing conservative, legitimate investment interests, and, of course, in addition, a great number of individual bondholders, including large financial institutions in the East. Superimposed on this, or rather inserted in this complication, were the followers of N. L. Amster, a Boston banker, who himself had comparatively a small investment interest in the property.

Most of the eastern capitalists and financial institutions, with the exception of the followers of Mr. Amster, favored a foreclosure sale and thorough reorganization. Amster's followers held out for a reorganization without foreclosure, and they were rather surprisingly aided by the unprecedented prosperity which the Rock Island enjoyed in 1916. Whereas in the previous three years total net income had averaged less than \$15,500,000, the total net income in 1916 was \$23,429,000. It was this fact, probably, which had a good deal to do with persuading the conservative Chicago investment interests to side with the Amster faction. The fact that there was \$23,429,000 available for interest in 1916, and that interest charges without foreclosure sale and scaling down of outstanding securities was only \$15,350,000, was an argu-

Comment on Government Control of Railways

Newspaper Cartoonists and Editorial Writers Discuss Various
Phases of the New Situation

[Philadelphia Public Ledger]

SURELY, WITH THE ADVANTAGES of unification which governmental control now opens up, American skill and managing ability can speed freight shipments to double or treble the record made under the wastes of division and private competition. Mr. McAdoo retains his secretaryship of the treasury. Thereby, the President says, Mr. McAdoo's double authority will enable him to co-ordinate systematically the financial interests of the railroads. The advantages of system, unity and co-ordination which the mere fact of direction under the commander-in-chief of the army and navy permits will have an instant effect in heightening the productive capacity and value of the great carriers. Their combined strength and the strength of their staffs will be added to Mr. McAdoo. He will be responsible. But every facility is offered him for grasping his responsibility splendidly. It is his portion to help win the war with the most powerful of all instruments for waging war, namely, the best-built system of transportation in the world.

[Wall Street Journal]

No better solution of the railroad problem could have been chosen than that which has been adopted by the President. It takes from the railroad managers the problem of finance, leaving them to the expert business of operating their roads. It transfers to the shoulders of the United States Treasury the financial burdens which have harassed railroad management. It gives to the holders of securities a guarantee which amply justifies the striking recovery in Thursday's prices.

Among the members of Mr. Wilson's Cabinet, not one has matured and broadened more notably than Mr. McAdoo. It may be said that the Secretaryship of the Treasury alone is a man's size job, and that the control of 250,000 miles of railroad calls for all the time and ability of a first-class man. But Mr. McAdoo will have the best assistance, and it may be taken that his Government and Treasury experience will be directed to general policy and financing, while the railroad operating officers will work out the technical problem of the movement of freight and passengers.

[New York Sun]

Ten men's brain power, ten men's nerve energy and physical endurance, would not be more than adequate to the load that rests upon the Secretary of the Treasury in this time of war in his own official sphere. How manfully Mr. McAdoo is carrying the burden everybody knows. At what physical cost and personal risk nobody but himself can know. Perhaps he himself doesn't know.

If that makes a ten man-power job, surely a twenty or a fifty-man-power job is that which the Dictator of Transportation is now bravely undertaking at the President's instance; an untried experiment; an unmeasured work of organization, of co-ordination, of application of special knowledge to countless problems of policy and detail involved in the unification, operation and financing of two hundred and fifty thousand miles of railroad for the period of the war.

[Cleveland Plain Dealer]

The railroads have failed signally to meet the requirements of war. It may be profitless now to discuss the reasons; the fact stands confessed. Palliative methods have proved insufficient. At a time when the conditions of national life put unprecedented demands upon our trans-

portation systems, these systems have shown weaknesses unsuspected. They have failed to meet the test.

It is vital to the national safety that the railroads shall render the highest service they are capable of. It is in part a matter of management, or co-operation, and in part of finance.

The various systems must be operated as a single, efficient unit. There is no excuse for play of selfish interests; there can be no question of advantage between one line and another. From now on each road is to contribute its individual share toward the efficiency of the whole.

[Florida Times Union]

It may be that this step will help solve the transportation problem. The roads will continue to be operated by their regular force though under a head appointed by the government. They will be able to act as one while without such action as the government has taken or the repeal of laws forbidding pooling they would have been compelled to continue a competition that whether healthful or not in normal times would have been a hindrance under present circumstances. The result ought to bring improvement from the reasons stated without considering any other reasons.

But when we consider the labor problem we see where a decided improvement may be made. The railroads will be as much a part of the government as the armies will be. Interference with the operation of the railroads will be as truly an act of mutiny as interference with the operations of the army would be. A strike that would impair the efficiency of the transportation system would naturally stand on the level with a refusal to fight on the part of a combination of soldiers.

All this would be logical but we shall have to wait to see whether the government will act on it. It may be that the government, in acknowledged control of the railroads, will make concessions to every demand of labor as it forced concessions when in virtual control; or it may prove true that it will expect as much patriotism and require as great a display of patriotism from high priced men safe from danger as from the thirty dollars a month soldiers at the front who are in range of German cannon. If the government pursues a policy of giving labor unions everything they demand and charging it up to the people, the railroads will find later greater difficulties than they ever experienced at holding up to a level their business cannot pay when it is back in their hands and they are not permitted to charge up any deficit to the people.

[Indianapolis News]

Though new legislation will be necessary, and will doubtless be forthcoming, the director-general, even under present conditions, will have vast powers. Also he faces a heavy responsibility. He announces that he will utilize the services of the Railroads' War Board, and rely for advice on the experts of the Interstate Commerce Commission. Of course, he will work through the staffs that are now operating the roads. Questions of finance and reconstruction will be dealt with later. In regard to them the co-operation of congress will be necessary.

It is a great experiment that the country is now trying. If the result is to make the nation more efficient in the war, even those who doubt the wisdom of the policy, and fear its extension, will rejoice. All know that the railroad situation was very bad. It is hoped and believed that there will be a speedy bettering of conditions.

American Railway Efficiency During the War

Review of Accomplishments and Increased Service in Nine Months Since United States Entered Conflict

THE RECENT DISCUSSION of proposals for new ways of dealing with the transportation system of the country and President Wilson's action in taking control of railway operations during the war has obscured to some extent the remarkable record of accomplishment the railways have already achieved under their own direction and with little assistance from the government.

It is now practically nine months since the United States became an active participant in the great world war, and only a few days less since the organization was formed under which the railroads of the country have been working to perform their important share in the great enterprise. In view of the change in the policy under which their service is to be rendered, therefore, this is an opportune time to review the results of their operations during that period, although their activities have been rather fully described currently in the *Railway Age Gazette* during the past year.

The change in the railway policy of the country is sometimes referred to as an attempt to repair a "breakdown" of the transportation system. Far from having "broken down," however, the railways of the United States during the past nine months and even for a considerable period before that time have made a record for efficiency which in comparison with many other industries and all previous records of their own, is nothing short of remarkable, especially under the conditions with which they have been confronted.

The co-operation of the railways with the government and the efficient service they have been rendering have been frequently recognized and commented upon by prominent officers in the government in various public statements.

Railway Co-operation Appreciated by Government

President Wilson in his statement announcing the taking over of the railroads said:

"The committee of railway executives who have been co-operating with the government in this all-important matter have done the utmost that it was possible for them to do; have done it with patriotic zeal and with great ability; * * * and if zeal and ability and patriotic motive could have accomplished the necessary unification of administration it would certainly have been accomplished."

Secretary of War Baker, in his annual report for 1917, said regarding the way in which the railroads have co-operated with the War Department:

"In this general connection it seems appropriate to refer to the effective co-operation between the department and the transportation agencies of the country. For a number of years the Quartermaster General's Department has main-

tained close relations with the executives of the great railway systems of the country. In February, 1917, a special committee of the American Railway Association was appointed to deal with questions of national defense, and the co-operation between this committee and the department has been most cordial and effective, and but for some such arrangement the great transportation problem would have been insoluble. I am happy, therefore, to join the Quartermaster General in pointing out the extraordinary service rendered by the transportation agencies of the country, and

I concur also in his statement that 'of those who are now serving the Nation at this time of stress, there are none who are doing so more wholeheartedly and efficiently than the railroad officials who are engaged in this patriotic work.'"

The Quartermaster General of the Army in his annual report said:

"The Special Committee on National Defense is a voluntary organization of the railways, serving purely through a spirit of patriotism. Its activities have been extended far beyond what was originally contemplated, even for the military service. The railroads of the country are operated practically as one continental system with the result that the congestion, which would have been intolerable without such an organization, has been in every case ameliorated and in many cases completely removed. The Railroad War Board has been in practically continuous session

at Washington since April 23. No more patriotic or self-sacrificing body of men is at this time serving the government.

"It has extended to the distribution of power between the railroads, the adjustment of passenger train service in accordance with national requirements, has furnished personnel and material for rehabilitation of the railways in France, has aided in every way possible the great national endeavor which has become the duty of every citizen of the country."

A special committee of the National Association of Railway Commissioners, in its report to the recent convention of the association, said:

"The fine sense of duty on the part of the leaders of the country's transportation systems that prompted this resolution deserves our respect and praise. We believe, moreover, that this resolution must also be considered as a most important document in American railroad history. The pledge of these men that they will operate their properties as a 'continental railway system,' that they are merging during the war 'all their merely individual and competitive activities in the effort to produce a maximum of national transportation efficiency,' opens a wide outlook. It must be remembered that it is the executive heads of the railroads who

Railway War Service

Railroads have furnished more service than ever before in their history.

Military traffic handled without abatement of commercial traffic.

Fourteen per cent more freight carried than in 1916, including 18 per cent more coal.

Passenger service breaks all records.

Over 2,000,000 soldiers and their equipment transported safely and without delay.

Over 134,000 carloads of freight moved to cantonments and training camps which still require 2,500 carloads of supplies daily.

Nine regiments of railroad men in service in France.

Box and coal cars pooled and competition ignored in routing of troops and military supplies. Facilities of eastern railroads pooled under direction of Operating Committee.

diers safely and without delay, the freight service performed is the most important index of their usefulness to the nation. Freight operating statistics since the end of September are not yet available, but the freight earnings as reported by the Interstate Commerce Commission for the 10 months including October show nearly as much business handled in 10 months of this year as in the whole of 1916, while the freight business in October was greater than for any previous month in railroad history. As there was a slight falling off in traffic in September, but a very large increase in October, it is probable that later figures will show an even greater increase in traffic than is shown in the six months' report. The railways have succeeded in securing much more service from every track, every car and every locomotive than ever before in their history. In fact, practically the only material they have had to deal with whose efficiency has not been increased has been the almighty dollar. Even during the month of November they succeeded in reducing the number of unfilled requisitions for freight cars from 140,000 on November 1 to 117,000 on December 1. This represents an increase of only 10,000 in the shortage, as compared with December 1, 1916, when the United States was still at peace.

Increasing Efficiency

Probably the most important single step toward increasing the efficiency of the available facilities has been the campaign for heavier loading of freight cars, in which the hearty co-operation of shippers, the Interstate Commerce Commission, and many of the state commissions was obtained. The result so far as the figures are available is seen in the report showing that for the first six months after war was declared an average of 2.2 tons has been added to the average carload, which has been increased from 24.8 to 27 tons, or 8.9 per cent. As the freight car miles amounted to over 8,250,000,000, the addition of over 2 tons to each carload meant that 18,150,000,000 ton miles more freight was carried with the same number of cars.

In addition to the heavy carloading, stricter supervision on the part of railroad officers also enabled them to increase the average number of tons per train from 626 in 1916 to 675 in 1917, while the average mileage per car per day was increased from 27.3 to 27.9 and the mileage per locomotive per day was increased from 65.8 to 68.7. In the six months alone the railroads handled over 25 billion ton miles of revenue freight more than in the corresponding period of 1916. Also the percentage of freight locomotives in shop or awaiting shop was reduced by 9.1 per cent and the percentage of freight cars in shop or awaiting shop was reduced by 7.8 per cent.

The first plan announced by the Railroads' War Board after its organization, in the direction of increasing the efficiency of the railway plant by greater co-ordination of the available facilities was the pooling of box cars, by suspending the car service rules and placing their distribution under the direction of the Commission on Car Service. This commission has since ordered the movement of box cars without regard to individual ownership but in accordance with the requirements of the traffic. Under its direction 222,000 cars have been ordered moved empty since May 1, often in trainload lots, from roads on which the prevailing direction of traffic had caused them to become accumulated to roads which needed them for loading. At first coal and refrigerator cars and other special equipment were not pooled, but were left subject to the rule that they should be returned, when made empty, to the owning road. Recently, however, a pool of open-top cars has been established under the direction of the General Operating Committee of the Eastern Roads and an effort is being made to include in it not only railroad-owned cars but the cars owned by coal companies.

Another measure adopted at the suggestion of the War Board, which undoubtedly would have laid the roads open

to a charge of conspiracy in other times, was a general movement toward curtailment of unnecessary passenger service in order to release cars, engines, men, fuel and track room for the more necessary freight service. Since May 1 the railroads have been able to reduce their passenger service by approximately 28,656,983 train miles, thereby facilitating the movement of military traffic and coal, food products and supplies needed by the government, by saving 1,800,000 tons of coal per year and releasing 570 locomotives and 2,800 trainmen for freight service. For a time most of these reductions were on branch lines of little traffic and resulted in handling on one or two well filled trains the same number of passengers formerly served by two or three half filled trains. Of late, however, it has been necessary to take more drastic steps, such as the discontinuance of the Broadway Limited and other through trains and several roads have used newspaper advertising to urge people to refrain from unnecessary travel at Christmas time.

Troop Movement

One of the first of the military tasks with which the railroads were confronted was the transportation of the enormous tonnage of freight needed for the hurried construction of the army cantonnments and training camps. Here competition was in most cases ignored and supplies were routed over the lines that were in a position to give the best service. Agents of the War Board organization were stationed at all camps and concentration points and at military headquarters to co-operate with the war department officials in every way possible. A total of 134,000 carloads of freight have had to be hauled to the National Army and National Guard camps and approximately 2,500 carloads of food and other necessities are being delivered daily.

Soldiers have been moving in large numbers, both to the seaboard for embarkation and to the various training camps, since about August 1 and the total movement up to date has amounted to over 2,000,000 men. This figure, of course, includes the duplications involved in handling the same men more than once, as to the training camps and later from the camps to concentration points or seaports. Of the total approximately 687,000 men were included in the mobilization of the national army, who were without equipment, but the other soldiers have usually been accompanied by their impedimenta, which has required the use of many express, baggage and freight cars. Of course, all of this traffic has complicated matters and increased the difficulty of moving the freight traffic. While the addition of an equal number of ordinary passengers to the railroad traffic would have been handled without difficulty, the troop movement has required special schedules and 3,600 special trains. Here again the old methods of competition were discarded and the traffic was virtually pooled according to routings worked out by committees of passenger and operating officials in such a way that the most direct routes were used and no line was allowed to become congested.

The Railroads' War Board has also performed important services in co-operation with the representatives of the Allies in co-ordinating the movement of export food, munitions and other supplies and the various railroads individually have taken an active part in the campaign for food conservation and for the sale of Liberty bonds.

18 Per Cent Increase in Coal Traffic

While the fact that the shortage of coal may be attributed in part to scarcity of railroad equipment has probably been the cause of more complaint against the railroads than anything else it is still true that probably the best example of their increased service is afforded by their record in moving coal. During the eight months, April to November, there were moved by rail 1,101,677 more carloads of anthracite and bituminous coal than in the same months of 1916, an

increase of 15 per cent in coal-mining output per ton of bituminous over the last record year (1949-50). The increased coal production this year has been due to the 10 per cent, but the railroads have had to carry 15 per cent more tonnage formerly moved by water.

During the summer months, when one can assume that one could even have a coal production rate being reduced by fuel troubles and other causes, are the hotels up and unable to handle properly an increase and an increase even as is desired, their situation is that they are in a situation from that of most of the other hotels. They have been unable to produce all the coal that they have been asked to produce any more than the hotels. Naturally, and to be more exact, even the coal service have been able to handle an increase in service as is desired.

The reason for this shortage is in the fact that the railways, as in the case of other industries, have been not only anywhere near the money they need, but have lost many of their most efficient and experienced employees in the service of the government and the front, and it has been impossible for them to get enough material and supplies in sufficient quantities. The railways have also been affected by a factor that has not been present in the case of most industries: they have been unable to adjust their prices to provide the needed revenue for additional facilities. In the year or two before the war were they could have secured cars and locomotives at favorable prices, most of them were not in a financial condition to do so, and during the past year they have had to allow their order for cars and locomotives to be postponed so that the burden could send their output to France and Russia.

Railroad Men at the Front

While the most important part played by the railroads in the work of the war naturally has been in the direction of increasing their normal activities in this country, they have also contributed their share toward the actual fighting. Under the direction of S. M. Felton, director general of railways, nine regiments of railroad men have been recruited in this country and sent to France to aid in building and repairing railroads, shops and terminals, both on and back of the firing line, and some of them have already given a good account of themselves as the first of the forces from the United States to become engaged in actual hostilities. A considerable number of American railroad officers are now engaged in transportation work in France under General Atterbury and another large unit of railroad employees and officers was recently despatched to Russia to organize the operation of the Russian railway system.

Over Seventy Thousand Railway Men Join Colors

Railway Regiments Were First United States Troops Ever Reviewed by the King of England. Photo Copyright by Underwood & Underwood.

RECENT REPORTS from American railroads indicate that approximately 70,000 men have left railway service to join the colors. Inquiries addressed to all lines, 100 miles in length or over, brought replies from 122 railroads with a combined operated mileage of 202,634, or almost 78 per cent of the mileage of the country. These roads reported that about 54,000 officers and employees had joined the armed forces of the United States since the declaration of war, of whom 1,408 received commissions. It is reasonable to assume that the remaining railroads of the country have supplied the army and navy with a proportionate number of men. At the rate at which employees of the 122 lines volunteered or were drafted, the number for the remaining carriers should approximate 16,250, making the total number of railway men in army or navy service nearly 71,000, or over four per cent of all the railroad employees in the United States.

Some individual roads were exceptionally heavy contributors to the nation's military and naval forces. The Pennsylvania system alone has 9,019 in the army and navy, or about one man to every mile of line operated. The New York Central system has the next best record with 7,143 men under arms. Other roads which gave large numbers of employees to the colors are the Santa Fe lines, approximately 3,000 men; the Southern Pacific system, 2,185 men; the Union Pacific system, 2,008; the Illinois Central system, 1,916; the Baltimore & Ohio, 1,760; the Chicago, Milwaukee & St. Paul, 1,645; the Northern Pacific, 1,638, and the Chicago & North Western, 1,573. The patriotic sacrifices of American lines compare favorably with those of neighboring roads in Canada which have been sending large numbers of men to the trenches ever since 1914. The Canadian Pacific alone has supplied about 13,000 men to the Canadian overseas forces.

The highest commission held by any railroad man is that of W. W. Atterbury, vice-president of the Pennsylvania Railroad, now director-general of American-operated railways in France, with the title of brigadier-general. A large number of railroad officers have been commissioned colonels and majors. The Pennsylvania system has five colonels, one lieutenant-colonel and seven majors in army service. The Southern Pacific lines have one colonel and four majors in the army; the Baltimore & Ohio, five majors; the Chicago, Mil-

waukee & St. Paul, three majors; the Chicago, Burlington & Quincy, a lieutenant-colonel and a major; the Northern Pacific, a lieutenant-colonel and two majors; the Louisville & Nashville and the North Western, one colonel each; the Erie, the Chicago, Rock Island & Pacific, the Chicago, St. Paul, Minneapolis & Omaha, the Delaware & Hudson, and the Southern, two majors each.

Owing to the fact that the carriers are burdened with an unusually heavy traffic and are short of men, some roads were able to supply partial information only, concerning their contributions in men to the army and navy. The New York Central, which undoubtedly furnished the nation's armed forces with a large number of officers, did not find it possible to compile a list of employees who have received commissions. The Great Northern, on the other hand, was unable to furnish data showing the total number of employees who volunteered or were drafted. On the whole, the information received from the various railroads is complete and accurate.

The inquiries sent out by the *Railway Age* asked, first, for a list of the railroad officers of ranks equal to or above trainmaster, division engineer, master mechanic or general agent who had entered military or naval service, with the military rank, department and assignment of each. The returns for 122 lines showed that 160 railroad officers of this class had gone to the colors. The names of all other employees who had received commissions in the army or navy were also requested. The data at hand shows that 1,248 employees of this class are now army or navy officers. Inasmuch as roads with 202,634 miles of line supplied a total of 1,408 officers for our armed forces, it is probable that statistics from all American roads would show that 1,800, or more, railroad men now hold commissions.

Railway men are serving their country in practically every department of the army and in various capacities in the navy. In addition, they are doing special service of great importance to the success of our armies in the nine railway regiments, organized last spring, which have taken over the operation of railroads serving the battle front in France. Two additional regiments of this kind, a car construction regiment and a light railways regiment, recently completed their organization at Camp Grant, Rockford, Ill. Late this fall, 200 railway officers from roads in the Northwest left

for Russia where, it political conditions permit, they will rehabilitate the Trans-Siberian railway. The organization known as the Russian Railway Service Corps, made up of commissioned officers, ranging from colonel down to second lieutenant. Colonel George H. Emerson, formerly general manager of the Great Northern, will take charge of the operation of the Trans-Siberian. He has under him two general superintendents with the title of lieutenant-colonel and 12 division superintendents with the title of captain and their staffs. The organization of the Russian Railway Service Corps and the railroad regiments for service in France has been carried out under the direction of S. M. Feltus, president of the Chicago Great Western and director general of railways with headquarters at Washington, D. C.

Although the transportation system of the country is placed next to the army and navy in its importance in the prosecution of the war, the railroads have not asked blanket concessions for their employees. In spite of a very heavy traffic and the importance of the expeditious movement of government supplies, the carriers asked no favors. A consideration of the number of special railway units organized, in addition to the loss of men who volunteered in other branches of service or were drafted, leads one to the conclusion that the railroads have not only contributed their share of men to the armed forces of the land, but more than their share.

The following statistics from 119 railroads show the num-

Railway Progress in Canada During the Year 1917

The Roads Have Worked Under Heavy Pressure With a Shortage of Labor; This Will Continue

By J. L. Payne,

Comptroller of Statistics, Department of Railways and Canals, Ottawa, Canada.

NO WITHSTANDING ABNORMAL CONDITIONS, the railways of Canada did well in 1917. That is to say, they had larger gross earnings than ever before. For the statistical year 1916 they created a new record, with a total of \$263,527,157; but this year they will go considerably beyond that aggregate. The official figures, which will tell the full tale, are not yet available. The published weekly returns of the three largest lines, however—the Canadian Pacific, the Grand Trunk and the Canadian Northern—which in normal years represent nearly 80 per cent of the total for all roads, show something like \$230,000,000 for the year ended June 30 last. If the ratio of other years is maintained, it would mean that gross earnings for all lines in Canada for the year 1917 will exceed \$285,000,000. November was the best month which the Canadian Pacific has ever had, and it may be assumed with safety that all other roads have in some degree shared in the prevailing activity. Of course, there is another side to the whole matter.

Railway Mileage Has Grown Too Fast

The full significance of \$285,000,000, merely as a total of gross earnings, is not realized without a retrospective survey. Ten years ago the receipts were \$146,738,214, and a decade back of that they were but \$52,353,276. The comparison suggests remarkable progress, and, from the viewpoint of volume, that deduction is as sound as it is gratifying. But there is at least one vital qualification. The greater gain was made between 1907 and 1917; yet, when measured by the standard of mileage in operation, the betterment loses some of its seeming significance. Gross earnings per mile of line in 1897 amounted to \$3,163; in 1907 to \$6,536; and in 1917 to say \$7,300. In other words, the increase per mile for the former ten-year period was equal to 106.6 per cent, and for the latter decennial 11.7

per cent. The explanation of this striking difference between mere totals and percentages is found in the fact that in 1897 there were 16,550 miles of railway in operation in the Dominion; in 1907 there were 22,452; and in 1917 probably 38,800.

The really salient feature of Canadian railway history is the growth of mileage during the past twenty years. Extensions of old lines and the construction of new have out-run earnings per mile. This is due to the fact that optimism found expression in the rapid spreading of transportation facilities. Up to three years ago there was a universal conviction in the Dominion that the building of railways could not proceed fast enough. This was particularly true of the western provinces, into which settlers were flowing in a swelling tide. The war stopped that rush from Europe and the United States for free or cheap land, and it also brought a sharp halt to construction; but, apart from the overwhelming cataclysm which has fallen on the world, the year 1914 would have given definite warning that there had been undue haste. Railway earnings had begun to decline five months before Germany invaded Belgium. So that, if we have a railway problem in Canada today it will not be understood in its essence unless regard is had to these facts. To the main features of that problem reference will be made a little farther along.

A Busy Year For Canada

Of the character of the traffic which led to a gain of probably \$22,000,000 in earnings for the year 1917 nothing specific can be written. The facts will be disclosed in the official statistics of the Department of Railways and Canals. But, as railway executives well understand, traffic is created by commerce. One is the mere reflection of the other; and Canada has been very busy during the past year. It is no compensation in the final reckoning to know that while

for any further allusion to the matter. Government did not give effect to the majority recommendations, to the course of action proposed by Mr. Smith, nor to the voluntary advice tendered in a public way by Sir Thomas Tait and W. F. Tye. It did the one thing which was most urgent, and took over the entire Canadian Northern system, including express, telegraph, steamship, elevator and other subsidiary interests. This was done in August last so far as Parliamentary action is concerned. Without going into details which would take up considerable space, let it be said that Government has simply taken the place of Messrs. MacKenzie and Mann, the sole owners, assuming all liabilities and paying merely whatever value may be assigned to the common stock by Chief Justice Sir William Meredith and his associate arbitrators after full investigation. Actual possession will follow the arbitration proceedings.

Government already owns and operates the National Transcontinental, which was built as the Moncton-Winnipeg section of the Grand Trunk Pacific; so that Canada now takes a prominent place among nations in the matter of state ownership. The extent of that ownership may be gathered from the following summary of mileage:

| | |
|---------------------------------|--------|
| Intercolonial | 1,553 |
| Prince Edward Island | 275 |
| National Transcontinental | 2,002 |
| Canadian Northern | 9,600 |
| Total | 13,430 |

During the consideration of the Drayton-Acworth report there was considerable discussion throughout the country on the general question of nationalization. There were a few open advocates of a sweeping policy, a larger number who were in favor of taking over some, or all of the principal systems, and still many others who stood up for corporate control of all railways. The matter scarcely reached the position of a clear-cut issue. At this date of writing a general election is in progress throughout the Dominion and the entire railway question is subordinate to the war. Conscription and other vital matters growing out of Canada's participation in the great conflict command public interest to the exclusion of nearly all else.

The compensations which have come to a people agonized by losses on the battlefield are many and varied. We are learning the useful lesson, even in railway service, of what women can do when their brothers, husbands and sweet-hearts are called away to fight; but scarcely secondary is the discovery of the latent strength of the nation in monetary resources. There is today an outstanding liability of \$1,085,000,000 in railway bonds, and it is safe to say that 98 per cent of it is owned abroad. Whenever prior to 1914, it became necessary for any purpose whatever to borrow more than two or three million dollars Canadians appealed to London or New York—almost invariably the former. Nearly every dollar represented in the national debt came across the Atlantic. When Government found it imperative to finance part of Great Britain's war purchases in Canada it tried the seemingly hazardous experiment of borrowing at home. Up to date it has succeeded in raising nearly \$800,000,000 and has not struck bottom. The November Victory Loan was placed at \$150,000,000. The people subscribed nearly three times that sum. They are apparently good for the balance of a billion without serious inconvenience.

There has been little or no labor trouble during the year. Adjustments were made with certain classes of employees by several of the larger roads; but there was not at any time a serious menace to peaceful relations. The concessions were all on the side of higher operating cost however.

Railway Mail Pay

At this juncture the railways are appealing to the Board of Railway Commissioners for a larger allowance for the carriage of mails. They are resting their case very largely on the decision of the Interstate Commerce Commission last

year. In the United States the rates are based on 21 cents per car mile for full cars to roads which have not received state aid. In Canada the rate is 16 cents for full cars, 9 cents for half cars and 4 cents for the use of baggage cars. All roads are on the same footing. There is, however, a substantial difference in the service demanded across the boundary. In Canada the post office department supplies all the labor, both on and off the cars, except in the case of baggage cars; but, on the other hand, the railways do not receive any terminal allowances. The case is to be argued about the middle of December.

Despite the larger volume of freight traffic which the railways have been called upon to handle during the past two years immaterial additions have been made to equipment. The prudence of heavy purchase in 1912, which brought thousands of new cars into service in 1913, has been vindicated by events. The principal trouble during the past year in the car department, was in securing expeditious repairs. At times the situation in that regard was very trying.

Canadian Railway War Board

To meet extraordinary conditions growing out of the war, there was organized during the past year the Canadian Railway Association for National Defence, with headquarters in Montreal. The primary object of this organization, in which is represented the best railway judgment of all operating companies, is to develop the highest possible efficiency and co-ordination during the term of the war. Car shortage stood in the way of effective service, and the new Association at once addressed its activities toward securing a better interchange as between Canada and the United States. That balance at the outset was greatly adverse to Canada. That disability has in large measure been overcome. The next task was to increase the average carload, so as to make existing equipment give the highest possible service. Excellent results have been achieved. Collateral to carload was the important matter of reducing the time for loading and unloading, and here again co-operation has done wonders. In a word, the problem of moving traffic, in all its aspects, has received special and concentrated attention, and it can now be said that this voluntary co-operation of railways, without a penny of expense to the state, has yielded betterments which would have been beyond the power to accomplish of any extraneous body.

Looking Forward

The railways of Canada will enter upon the new year with all departments working at extreme tension. Earnings have been showing fair gains right up to the present moment, which is another way of saying that the rising freight movement persists. If these conditions are not modified ere long the car service officers will probably be compelled to call for more rolling stock. Taken altogether, the outlook is encouraging. The entrance of the United States into the war has created new business in Canada, and there are no grounds for suspecting a reduction in the volume of orders from Europe. The outflow of foodstuffs should increase. The shipment of munitions may even be raised to a larger scale. In spite of higher operating expenses the railways appear able to hold their own in the matter of net earnings. The scarcity of labor is troublesome, but is not so acute at this time as it was a year ago. Conscription, which went into effect in November, has not been hitting the railways with special severity, since they had practically let out every man who wanted to go overseas, and there is a disposition on the part of the military authorities to recognize the vital importance of preventing impairment of transportation service.

All said and done, however, there is nothing in either present conditions or prospects which suggests lighter burdens for those upon whose shoulders rests the grave responsibility of keeping the great railway machine up to the highest standards of efficiency at this period of infinite crisis.

stock at any time after one year. This stock in the past has been quoted as high as 120.

Bolivia

Bolivia with its 708,195 square miles could include within its limits the combined areas of California, Nevada, Utah, Idaho, Arizona, Oregon and Washington. With vast tablelands pushed up into the heart of the continent to a height of more than 14,000 feet, hemmed in by huge mountains, it is the highest inhabited country on the face of the earth. A country presenting obvious difficulties in railway construction, and one which has therefore attracted the American capitalist and railway engineer. American capital to the extent of \$17,000,000 has been invested in Bolivian railways, chiefly through the banking house of Speyer, the National City Bank, and W. R. Grace & Co. Negotiations have been entered into at various times to extend further the Potosi-Sucre Railway to Puerto Suarez, on the Paraguay river. The concession at last accounts was controlled by an Italian syndicate, the Fomento de Oriente Boliviano. The length of line, which has been partially surveyed, will be between 425 and 450 miles, and its cost will probably exceed \$10,000,000. The Bolivian government has agreed to guarantee a certain percentage on a portion of the construction cost.

Another Bolivian project is for the construction of a line from Yacumba on the Argentine frontier—between which point and the town of Embarcacion the Argentine government is constructing a railway—northward to Santa Cruz, tapping the oil country as well as other important although little developed sections of the country. This line would approximate 250 miles in length and would encounter some difficult grades. Concessions have been granted by the government for the line's construction, and much of the route has been surveyed. A line has also been surveyed from La Quiaca on the Argentine frontier (terminal of its government line) to Tarija, Bolivia, which is a town of some importance and the center of an agricultural area of great fertility. The length of this line would probably not exceed 125 miles.

The most important railways under construction are the extension of the Yungas Railway from La Paz to Coripata, and from that point on to Rurrenabaque on the Beni river. Then there is the route from Cochabamba to Santa Cruz, from Santa Cruz to Trinidad and from Potosi to Sucri, this last rapidly nearing completion. When the short distance from Tupiza to La Quiaca—now under construction—has been completed it will connect the Pacific on the West with the Atlantic at Buenos Aires, Argentina, on the East. This is a part of the proposed Pan-American Railway route.

The La Quiaca-Tupiza and La Paz-Yungas lines are being constructed with funds obtained in France and the United States, and the Potosi-Sucre Line with money appropriated by the Bolivian government. There is also to be constructed a line from Tupiza to Atocha, the Bolivian government having been authorized by the national Congress to enter into a financial transaction for \$5,000,000 guaranteed by the shares which the government owns in the National Bank. The total cost of the railroads constructed by the Bolivian government amounts to \$30,316,965. The materials for the Yungas Railway and for the Potosi-Sucre Railway have all been ordered in the United States.

The activity of the Bolivian government in recent years in the construction of railways, the establishment of automobile routes, and the building of new trails into the vast agricultural regions of Eastern Bolivia, has been favorably commented on throughout South America. There are at present in operation in Bolivia about 840 miles of railroad, besides some 1,100 miles in course of construction, and about 3,000 miles more or less definitely projected.

The Antofagasta and Bolivia Railway has taken over

under lease the Bolivia Railway, which was incorporated in the United States in 1907, and holds a perpetual concession from the Republic of Bolivia for the construction of lines in the republic. Practically all the equipment of the Bolivia Railway is of American manufacture. The Arica-La Paz Railway, which traverses a mountainous region and operates 28 miles of rack rail, recently purchased a rack locomotive in the United States.

Brazil

In Brazil, that greatest of all South American countries, with its 3,300,000 square miles of territory, 4,000 miles of coast, and vast tracts of totally unexplored land, an American has made the greatest success in the railroad field. Percival Farquhar of New York, president of the Brazil Railway Company (a \$250,000,000 corporation), has responded with such energy to the call of the Brazilians for help in the development of their country that a movement was actually launched recently by certain members of the Brazilian Congress against what they called "the Farquharizing of Brazil." Mr. Farquhar's company not only owns and operates thousands of miles of railways in Brazil, but also owns hundreds of thousands of head of cattle, millions of acres of grazing and timberlands, and has numerous other colossal enterprises. Another New Yorker, F. S. Pearson, is the president of A. Luz, the great syndicate which owns and controls the light, power, street railway and telephone systems of Rio de Janeiro.

The *Diário Oficial* of Rio de Janeiro published a decree in February, 1917, approving the revision of contracts entered into between the Brazilian Government and the Brazil Northern Railway Company relative to the construction of the Tocantins Railway. The company undertook to complete and open to traffic the second section of the line (from Alcobaca to a point 65 miles therefrom) by December 31, 1917. The construction of the first and third sections (from Cameta to Alcobaca, and from the termination of the second section to Chambioaz) were to be commenced simultaneously within a period of six months from a date to be named by the government. The switch section of the line, from Chambioaz to Santa Maria, and the Tocantins branch line, were to be commenced within six months after the completion of the third section. Compared with the difficulties encountered in the construction of that great achievement of tropical engineering, the Madeira and Mamore Railway, the Tocantins line is a much simpler proposition, as it is nearer the coast and the country is more healthy.

The certainty of continuance of railroad activity in Brazil opens up a field for railway equipment of all kinds. On government owned roads the government calls for bids on equipment purchases, but only accepts bids from those licensed to do business in Brazil. The license fees are not heavy. As there are no local factories manufacturing railway equipment, the foreigner has almost an open field. Calls for tenders are usually published in the *Diário Oficial*, but this method is not strictly adhered to, and many cars have been purchased recently by the Central de Brazil by private contract without competition.

Another method employed is to call for bids in the *Diário Oficial*, specifying the types and quality of equipment made by one or more manufacturers, in which case local agents endeavor to have their type of equipment or rolling stock specified. Sales cannot be effected by correspondence from the United States without an agent in Brazil, as there is rarely time for specifications to reach the United States and return in the allotted period. All negotiations for purchases take place in Rio de Janeiro. Compliance with the law is neither expensive nor exacting, and one American firm has recently established its own branch office in Rio to bid direct on the large government contracts and thus save commissions. Probably the best method, however, under normal

conditions is to have a local construction force in both Rio de Janeiro and Sao Paulo, the two railway centers, not as agent, supported by a technical representative of the American manufacturer, who can travel extensively and watch opportunities as they arise.

The President of Brazil by decree of August 30, 1916, granted a concession to Alberto Alvim de Azevedo, of Centro of Rio de Janeiro for the construction and operation of a railway from Cuyaba, the capital of the state of Mato Grosso, through the town of Sant' Anna, on the Paranaíba River, to communicate with the Araguaia Railway at Itagüda, or at San José do Rio Preto. This total extension will be about 620 miles in length and will furnish direct rail communication between the city of Cuyaba and the ports of Rio and Santos. During the period of the concession (60 years) the government will not authorize the construction of any other railway within a zone of 12 miles on each side of the center of the roadbed, but will permit the laying of branch lines for private use. Plans for the first section, 60 miles, must be submitted to the government before June 30, 1919, and construction work must be begun within one year from the date of approval of these plans by the government. Construction must be carried on at the rate of 31 miles a year. The concession calls for a single line of meter (1.58 ft.) gage.

Chile

Since Wheelwright of Newburyport, Mass., built his first line in 1851 from Caldera to Copiapo, Americans have had a very definite interest in the railways of Chile. Wheelwright also constructed a line that was to connect Valparaiso with Santiago, but through lack of funds he was only able to complete it as far as La Laja, but another American, Harry Meiggs, of Catskill, N. Y., came along a few years later and finished it. In Chile the railways are largely operated by the government, which owns 1,979 miles. Passenger coaches are of the American pattern, and many of them are built in the United States.

Practically all the rolling stock for the government lines is purchased by the Ministro de Industria y Obras Publicas, Santiago, Chile, after asking for bids through the Diario Oficial. Not more than 60 days are given by these notices, and then the rolling stock must be built according to plans and specifications on file in the government offices at Santiago, so it is necessary to have an agent or representative there. On October 17, 1917, the American ambassador at Santiago called that tenders had been requested by the Chilean government for 15 locomotive boilers. With their bids American manufacturers were required to present the requisite export licenses.

At the present time Justiniano Sotomayor, vice general manager and vice minister of public works of Chile is at the McAlpin Hotel, New York, having been sent to this country by his government to try to obtain a certain number of locomotives and cars. The length of the Chilean State Railways is 3,570 miles, or 75 per cent of the total. The present administration of these government lines has sent a number of Chilean engineers to this country to learn American railroading. A few of them have been admitted to the motive power and maintenance of way departments of the Pennsylvania Railroad in Allentown, Pa., and Emerson, N. J. Jorge Beaumont, master mechanic of the Concepcion shop, is now in the United States inspecting machinery to be used in an up-to-date locomotive shop which is being erected in San Bernardo, near Santiago. He was obtained from engineering concerns in America and Europe and the contract was awarded to the Niles-Bement-Pond Company.

Costa Rica

Philip W. Chamberlain, of San José, Costa Rica, a member of the American Society of Civil Engineers, has a proposal for the construction of a railway from Alajuela to Grecia, a

distance of about 18 miles. The proposed line requires right-of-way and will be built on former Costa Rican Government 35-inch-gauge tracks, with crossing on the right-hand 15-inch-gauge tracks, and sidings, crossings, and other accessories, estimated at 100,000. The Government of Costa Rica is ready to be the promoters, the station on the proposed line being designated Alajuela, San José, Costa Rica. Many of the projects of the government, several of which are under way, are being carried out with the aid of American financial support from the American Export Corporation.

Colombia

It is proposed to build a railway from Medellin to Pereira, 100 miles in length. The Government of Colombia has authorized the construction of this railway as a business enterprise for a period of 50 years, or until the expiration of the concession when the government shall have the right to buy the railway at cost of materials of the station.

Guatemala

A 12-mile branch, now under way on December 12, 1917, to serve the building and construction industry, is being built from Guatemala City to the town of San Juan, 12 miles distant. The Government of Guatemala has authorized the construction of this railway as a business enterprise for a period of 50 years, or until the expiration of the concession when the government shall have the right to buy the railway at cost of materials of the station.

Peru

A study of the railway and canal of Peru's railway system is being made by the United States engineers of the Panama Canal Company. The study is being made by the United States engineers of the Panama Canal Company. The study is being made by the United States engineers of the Panama Canal Company.

The proposed railway from Lima to Arequipa is now under way. The Panama Canal Company is now under way. The Panama Canal Company is now under way. The Panama Canal Company is now under way.

Panama

In May, 1917, the National Assembly of Panama approved a contract made with the United States engineers of the Panama Canal Company. The study is being made by the United States engineers of the Panama Canal Company.

Uruguay

Uruguay is the smallest of the South American republics, about 100 miles long and 100 miles wide. The railway system of Uruguay is now under way. The Panama Canal Company is now under way. The Panama Canal Company is now under way. The Panama Canal Company is now under way.

a 5 per cent basis of guaranty it may be stated that usually earnings up to 6 per cent are retained by the railway company, while the excess over 6 per cent belongs wholly or partly to the government. Improvements to the value of \$30,000,000 have been made in the port of Montevideo, which in point of depth, capacity and ease of access ranks among the first of the ports of the South Atlantic. The port railway system is a connecting link between sea and land traffic, and passengers as well as freight may be transferred from steamers at the docks to railway cars. The department in charge of all matters connected with the railways is the Ministerio de Obras Publicas, Montevideo.

Venezuela

An American company obtained a concession in Venezuela in August, 1917, for a railway from deep water to its mining properties in the Goajira peninsula. The contract calls for the construction of a port at Castilletes. From the port a railway 93 miles long and with branches three miles in length is to be constructed. The line is to be American standard gauge and to have a one-way capacity of 10,000 tons daily.

Asia

Turning from Latin America to Asia, it is now certain that America's part in the railroad development of China will in the future by no means be confined to furnishing part of the construction material and equipment needed by the many new lines of communication with which the teeming millions of the Celestial Empire are to be provided. American surveyors are already at work. American capital is in the field. The Siems-Carey Railway and Canal Company of St. Paul, Minn., will construct as soon as possible, with money furnished by the American International Corporation of New York, 1,500 miles of railroad through the richest section of China, with an optional contract to build another 1,500 miles later. Negotiations for the project were started in May, 1916, during the visit to China of W. F. Carey, and it is said that the probable cost will be in the neighborhood of \$100,000,000. The concession covers principally the provinces of Szechuen, Hunan and Chihli. These provinces are rich and thickly populated. They contain large deposits of coal, and the tea trade is likely to furnish considerable traffic, while the dense populations—106,652,501 in the three provinces—obviously offers a field for development of a general business which these new railroads will do much to stimulate. The American surveyors are proceeding as rapidly as possible, and in a short time actual construction should commence.

The following statement has just been issued by the American International Corporation:

"The expedition in China has made good progress in spite of the unsettled conditions which have prevailed in the country since the signing of our contract. Reconnaissance of 1,090 miles and preliminary survey of 540 miles have been carried out on the Chouchiakou-Hsiangyang line from Chouchiakou in Hunan province to Hanchungfu in Shensi. A reconnaissance is now being made to determine whether this line cannot be extended to Chengtu in order to tap the province of Szechuen, said to be the richest in China, which has a population estimated at about 70,000,000. The survey of the Chuchow-Chinchow line, which is to open up a rich coal and antimony mining district, from Chuchow in Hunan to Chinchow in Kwantung, has been completed with 994 reconnaissance and 503 preliminary miles, making a total for both lines of 2,084 reconnaissance and 1,043 preliminary miles. These lines, if constructed, will be the first lines to be built west of the Peking-Hankow and Hankow-Canton Railways, and will open up six new provinces to foreign trade."

In March, 1917, Japan was granted the right to lay five railroad lines in Manchuria and Mongolia. A scheme is being prepared by the authorities concerned for the extension

of the line to Taonanfu, while laying a line between Kaiyuan and Hailung Cheng. This Kaiyuan-Hailung Cheng line will be 120 miles long, touching many prosperous towns of Eastern Manchuria.

When Commodore Perry made his first trip to Japan in 1854 he presented a miniature locomotive to the Shogun, and from that period dates the remarkable advance made by the Japanese in the development of their railways. Twenty years later the pioneer line was opened between Yokohama and Tokyo, and today the islands of Japan, from Hokkaido on the north to Kyushu on the south, are well equipped with railroads built upon the most approved standards, and handling heavy tonnage and passenger movement. Japan has about 5,000 miles of railroad. Through trains carrying sleeping and dining cars operate on several of the main lines. The cities have electric suburban lines.

A special mission representing the Imperial Japanese Railways recently arrived in the United States to study American transportation and industrial methods. The Imperial Japanese Railways are represented on the mission by Jiro Nakamura, assistant traffic manager; Akio Kasama, secretary and purchasing agent; Dr. Yasujiro Shima, director of machinery and rolling stock, and S. Kobayashi, resident engineer of New York.

The Imperial Japanese Diet in October, 1917, passed a bill authorizing the expenditure of 10,000,000 yen (\$4,980,000) for the extension of the Boryo and Giran Railway in Taiwan. The purchases for the government railways are all made by the Imperial Railway Board at Tokyo, usually by public tenders. Bids are accepted only from such bidders as have qualified and been placed on the list of bidders of the railway board. These bidders must conform to certain requirements of the board regarding their financial responsibility, and foreign firms or manufacturers must have a branch or agency regularly maintained in Japan to have their bids received. An official is, however, sometimes sent abroad to investigate the merits of various makes of appliances, and in some instances he makes purchases. There is a Japanese Government representative in New York who is empowered to make purchases of railway materials. Mr. Iyama, of 17 Madison avenue.

Africa

In Africa we find that there is a project to extend the railway from Quelimane, in Portuguese East Africa, for another 50 kilometres (31 miles) as soon as possible. Quelimane, one of the ports for the Zambesi delta, is without question the outlet for the richest and most productive section of Portuguese East Africa. The Zambesi Company, which holds a large land grant from the Portuguese government, owns the present railway. The gage is 3 ft. 6 in. The government railways in Portuguese East Africa have introduced American locomotives of the Mallet type. American manufacturers should address A Direccao do Porto e dos Caminhos de Ferro, Laureano Marquez, Portuguese East Africa.

Spain

The Spanish Ministerio de Fomento granted a concession on January 12, 1917, to Don Miguel Otamendi for the construction and operation for 90 years of an underground electric railway system in Madrid. There will be four double-track lines and a total length of 8.7 miles. A period of eight years will be allowed for the work.

SPAIN TO BUILD ITS OWN LOCOMOTIVES.—Commercial Attaché C. W. A. Veditz reports from Paris, France, that the four great Spanish railway companies—the Northern of Spain, the Madrid-Sarragosa, the Andalusian Railway and the Madrid-Cateres Company—have joined in the formation of an important company to manufacture locomotives.

Railway Earnings and Expenses for the Year 1917

Heavy Falling Off in Operating Income in Spite of Unprecedented Traffic Which Was Handled

By Frank Haigh Dixon
Chief Statistician, Bureau of Railway Economics

RAILWAY REVENUES for the calendar year 1917 have in all probability crossed the four billion mark, which is higher by some four hundred million dollars than the point attained in 1916, which broke the record by many millions. It is within the memory of young men that revenues were less than one-half what they are now. The aggregate crossed the two billion mark in 1905 and the

record this year lies scarcely at the same level of high equilibrium of 1914, we just pass on the failure of railway operation grown during the past five years.

Net revenue from railway operation has declined in 1917 by not less than fifty millions, while the amount paid of about fifty million will bring the total figure of operating revenue for the year to a point lower than that of 1916 by one hun-

Diagram Showing Operating Revenues, Expenses, and Income Per Month Last Six Months Calendar Year

three-billion mark in 1913; it has needed but four years to bridge the gap between three and four billions. Even in these days of war financing by one billion, this record of growth in railway service to the American public cannot but lead one to pause and wonder.

Railway expenses are on an even sharper incline. They amounted to more than \$2,500,000,000 in 1917, when a nearly five hundred million profit was made in 1916. The

total revenue of 1917, however, was only \$4,000,000,000, which is not much more than the \$3,500,000,000 of 1916, but that must possibly be a temporary dip.

The decline in operating income has been most marked in the Eastern Division, where the results for the year were not so good as in the Western Division, and the results of the year were not so good as in the Western Division, and the results of the year were not so good as in the Western Division.

of the total decrease in operating income for 1917 occurred in the East, the remaining fourth being divided rather unequally between the West and the South, the West having the larger share. Eastern roads suffered a loss in operating income during every month of 1917; in fact, their operating income has been on the decline since September, 1916. For the Western roads, the sharp downward turn occurred in August, while the Southern roads showed slight decreases in August, September and October, and nearly held their own for the year as a whole.

This phenomenal turn in operating income is clearly indicated in Table I. In that table, the operating income per mile for each month of 1917 for which statistics are available is compared with the operating income for the corresponding month in each of the preceding three years, that for 1917 being taken as 100, and the earlier years being shown as a percentage of that for 1917. The extreme falling off in some of the months of 1917 as compared with 1916 is evident for the United States as a whole, for the Western district, and especially for the Eastern district. In the South operating income has followed a more even course.

As compared with the years 1915 and 1914, operating income in 1917 was usually greater. But it will be noted that the general tendency from month to month in 1917 has been to exceed these earlier years by a smaller and smaller margin, except as compared with 1914 in the South. In this, again, the exceptional situation of the Eastern roads stands out conspicuously.

Standing out in bold relief against the year's gross receipts is the steady, resistless rise in operating costs. Every month of 1917, and each of the three districts in every

on, the rate of increase in expenses was distinctly upward; and third, that the gap between the rates of increase in revenues and expenses was growing steadily wider as the months went on.

This increase in operating expenses, which, with an even greater increase in taxes, has created the remarkable result already noted, that operating income has actually fallen off in 1917, notwithstanding an extraordinary increase in gross operating revenues, is set out in the chart. Operating revenues are there seen to have followed in the last four years their regular cycle, with a generally ascending trend. The appearance of a markedly greater rate of ascent in 1917 is due to the fact that revenues recovered from an abnormally low slump in February. The line representing expenses, after falling with the great decline in business in the last part of 1914, rises almost steadily until 1917, when it turns rapidly upward. The effect of this more rapid rise of expenses, as also of taxes, is reflected in the lower general level of the line representing operating income in 1917.

To appreciate the significance of this outstanding fact in the railway operations of 1917, we may turn to an analysis of the expenditures during the first ten months—January to October—for which statistics are now at hand. Operating expenses per mile increased 19.2 per cent during these nine months; it was almost certainly over twenty per cent, or one-fifth, for the twelve months closing with December 31. Transportation expenses, which represent one-half of total operating expenses, during the ten months increased 28.0 per cent. This marked increase was largely due to the rise in unit cost of the two largest items of transportation expense, namely, fuel and labor, especially labor involved in train operation. The upward trend in fuel prices is well

TABLE I
RATIO TO OPERATING INCOME PER MILE IN 1917 OF OPERATING INCOME IN 1916, 1915 AND 1914, BY MONTHS

| Month | UNITED STATES | | | | EASTERN DISTRICT | | | | SOUTHERN DISTRICT | | | | WESTERN DISTRICT | | | |

| May | 100.0 | 99.0 | 64.9 | 48.9 | 100.0 | 114.6 | 76.9 | 50.5 | 100.0 | 101.0 | 65.0 | 55.9 | 100.0 | 83.9 | 53.9 | 44.9 |
| June | 100.0 | 92.7 | 73.7 | 60.7 | 100.0 | 101.3 | 85.6 | 61.2 | 100.0 | 98.3 | 64.1 | 59.3 | 100.0 | 82.7 | 65.2 | 59.9 |
| July | 100.0 | 100.7 | 80.6 | 71.3 | 100.0 | 106.6 | 88.2 | 69.8 | 100.0 | 87.5 | 74.0 | 67.4 | 100.0 | 98.1 | 74.8 | 73.3 |
| August | 100.0 | 107.9 | 85.0 | 76.3 | 100.0 | 107.9 | 92.4 | 78.7 | 100.0 | 101.0 | 73.9 | 62.9 | 100.0 | 110.1 | 80.6 | 77.4 |
| September | 100.0 | 121.6 | 110.4 | 91.4 | 100.0 | 115.5 | 114.9 | 88.4 | 100.0 | 101.3 | 88.4 | 60.1 | 100.0 | 134.0 | 112.9 | 104.8 |
| October | 100.0 | 114.1 | 104.8 | 76.7 | 100.0 | 115.6 | 121.0 | 74.0 | 100.0 | 101.4 | 79.8 | 52.2 | 100.0 | 114.7 | 98.4 | 81.1 |

month, showed increased expenses over 1916. It is true that revenues were also increased during every month, but the increase in expenses far outstripped the growth of revenues. Putting the growth of these two factors on a relative or percentage basis, we find that the first ten months of 1917 give the following results:

PER CENT. OF INCREASE, 1917 OVER 1916

| Month | Revenues per mile | Expenses per mile |
|-----------------------|-------------------|-------------------|
| January | 14.7 | 16.5 |
| February | 6.6 | 12.3 |
| March | 9.0 | 17.4 |
| April | 13.1 | 19.2 |
| May | 14.7 | 20.7 |
| June | 16.3 | 19.8 |
| July | 14.6 | 21.3 |
| August | 11.4 | 20.8 |
| September | 9.7 | 19.5 |
| October | 12.5 | 23.2 |
| Ten months to October | 11.8 | 19.3 |

The table indicates, first, that the rate of increase in expenses was greater than that of revenues, during every one of the ten months for which statistics are available at the time of writing; second, that while the rate of increase in revenues was roughly on the downward trend from June

known, and its causes are too well understood to call for extended discussion. Railway train operation in 1917 called for the consumption of approximately 150,000,000 tons of coal. If this coal cost the roads a dollar more per ton than in 1916—some of the Eastern roads testified in the Fifteen Per Cent Case that the increase was greater than a dollar—this one price-change would add \$150,000,000 to the railway expense account. In the matter of trainmen's compensation, the year 1917 is the first full year under the Adamson Eight-hour law, which became effective January first. In addition, nearly all other classes of railway labor have received wage increases and adjustments during 1917 that have contributed their force toward the upward trend of transportation costs. On top of these comes the increased cost of general supplies, which has had a telling effect on all branches of railway operation.

Passing over traffic, general and miscellaneous expenses, which in the aggregate represent only one-fifteenth of the total expenses, and in 1917 showed an increase of 11.7 per cent over 1916, we come to the significant maintenance accounts. Here, in some respects, will be found the key to the year's operations, for while transportation must be conducted in accordance with the demands of the travelling and shipping public, maintenance work on the one hand

barometers the state of the labor market and the financial vigor of the roads, while on the other hand it furnishes the physical condition of the railway plant in the interim.

The maintenance accounts—the upkeep of ways and structures and of equipment—call for two-thirds of the total outlay of the railways. As against the increase in total expenses (ten months to October) of 1917 per cent, maintenance expenses increased only about ten per cent. Maintenance of equipment which cannot be long made off traffic is to continue moving in any quantity increased 15.3 per cent, while maintenance of ways, which can be afforded to suffer more in time of stress, increased only 6.7 per cent. Maintenance expenses are composed largely of direct outlays for labor, and of such supplies as steel, iron, ballast, etc. The prices of these factors per unit—labor and supplies—probably increased faster during 1917 than their total cost to the railways as revealed on the maintenance accounts. Unskilled and mechanical labor, such as is employed in large measure on the tracks and in the shops and repair yards, secured unusually large increases.

Because of the facts just noted, the ten per cent increase in maintenance expenses does not indicate the accomplishment of ten per cent more actual maintenance work. On the contrary, measured in such physical units as rails two

hundred spring 1917, increased to 125.00 in 1918. The number of miles of track increased slightly in 1917, as shown by the increase in the "miles of track" item of the general account for that period. The fact we remember is suggested in *The War Record* that maintenance expenses, whether measured through traffic, measured in physical units, or measured in money, increased during 1917 10 to 15 per cent above last financial year, and this fact coincides with the other facts mentioned on the balance sheet and call for a study, particularly from the viewpoint looking to 1918, not only of the traffic accounts, but the general account also. The study, very important as it is, would be profitable only if it were accompanied by a study of the equipment which was needed to operate existing lines, and of the new equipment to be built for the future.

The situation of maintenance is still more to be regarded, however, in its relation to the general account for 1917, and to the general account for 1918, as shown by the fact that the total cost of maintenance, measured in physical units, increased during 1917 10 to 15 per cent above last financial year, and this fact coincides with the other facts mentioned on the balance sheet and call for a study, particularly from the viewpoint looking to 1918, not only of the traffic accounts, but the general account also. The study, very important as it is, would be profitable only if it were accompanied by a study of the equipment which was needed to operate existing lines, and of the new equipment to be built for the future.

As the year closed the outlook for the future of rail churning. With revenue falling to a level lower than ever before, the carriers are concerned for the very future of their business. The railroads of the country are in a state of financial distress, and their only hope is to be carried under government control, and then to be sold to the public. The railroads are in a state of financial distress, and their only hope is to be carried under government control, and then to be sold to the public.

Table II summarizes the operating figures for the ten months ending October 1917, as compared with the corresponding figures for 1916.

TABLE II

OPERATING REVENUE, EXPENSES AND INCOME—TEN MONTHS—JANUARY TO OCTOBER, 1917 COMPARED WITH 1916

| Item | 1917 | 1916 | % Change |
|---------------------------|-----------------|-----------------|----------|
| Aver. miles of line oper. | 21,047 | 20,000 | 5.2% |
| Total operating revenues | \$5,389,721,651 | \$4,991,462,657 | 7.8% |
| Total operating expenses | 3,341,811,622 | 3,100,271,134 | 7.8% |
| Net operating revenue | 1,300,649,029 | 1,084,411,657 | 20.0% |
| Taxes | 74,707,600 | 100,963,005 | -26.0% |
| Net railway revenue | 1,225,941,429 | 983,448,652 | 24.7% |
| Operating income | \$1,225,941,429 | \$983,448,652 | 24.7% |

and yards of ballast laid, and specific repairs made to buildings and equipment, the units of work done have probably been less in 1917 than in 1916. This would have created a sufficiently serious prospect as to the physical condition of the railway plant in the future, even for the traffic

Receiverships and Foreclosure Sales in 1917

Two Important Systems Sold Under Foreclosure With Drastic Scaling Down of Bonds and Interest

THERE were no important railroads placed in the hands of receivers in 1917, while on the other hand three important systems, which at the beginning of the year were in receivership, were reorganized, two of them through foreclosure and one through voluntary reorganization, and were returned by the courts to their securityholders.

The Kansas City, Mexico & Orient, with 964 miles of

had been paid by the new company. The court, to avoid a new receivership, ordered \$24,000,000 bonds of the original company to be deposited with it as security for the balance of the purchase price. In April, 1917, however, it was found necessary for the court to appoint W. T. Kemper as receiver.

The Wichita Falls & Northwestern is a part of the Missouri, Kansas & Texas system, but for some time after the

road, was declared bankrupt in 1917 and a receiver appointed, but as a matter of fact the road had been on the verge of bankruptcy ever since its sale under foreclosure July 6, 1914. The purchase price at that time was fixed at \$6,001,000, but up to October, 1916, only \$3,000,000 of this

bankruptcy of the rest of the system it was operated as an independent solvent property. During 1917, however, it was found desirable to have a receiver appointed.

The Denver & Salt Lake was the successor company to the Denver, Northwestern & Pacific. The Denver, Northwestern

& Pacific had been proposed from Denver to Salt Lake, crossing a line about 100 miles south of the Union Pacific, and 123 miles north of the Denver & Rio Grande. It would be farther than Craig, Colo., 256 miles. Opposed long by the Union Pacific interests and the Gravel business community, the Denver & Rio Grande is labeled and has been organized in 1913 under a plan one of the provisions of which was that the city of Denver should hold a referendum to determine whether to divide and loan it to the Denver & Salt Lake and other

the Denver & Rio Grande. The plan of reorganization was controlled by the Missouri Pacific system which included all of the St. Louis-Iron Mountain & Southern system, and the \$4,895,000 first mortgage bonds and equipment

obligations maturing June 30, 1918. The \$24,845,000 Missouri Pacific 6 per cent notes, due June 1, 1916, were paid, as were also \$3,861,000 equipment trust certificates maturing June 30, 1915, up to and including June 30, 1918. A total of \$123,169,000 bonds and notes were exchanged for securities in the new company. The cash requirements of the plan, which totaled \$41,419,792, were raised by an assessment of \$50 per share on the \$82,839,581 Missouri Pacific stock outstanding in the hands of the public. The new company issued \$91,322,442 bonds, \$76,751,635 new convertible 5 per cent preferred stock and \$82,839,585 in exchange for the stock and cash assessment of the old company and the aforementioned \$123,169,000 old securities in exchange for new. This plan was dated July 1, 1915, and became effective June 1, 1917, with some modifications.

The Pere Marquette, which had been in the hands of receivers since April, 1912, was sold under foreclosure of the consolidated mortgage, refunding mortgage, improvement and refunding general mortgage, Flint & Pere Marquette consolidated mortgage and first mortgage, Port Huron first mortgage, Grand Rapids, Belding & Saginaw first mortgage, Chicago & West Michigan first mortgage, Chicago & North Michigan first mortgage, Pere Marquette of Indiana first mortgage, and Detroit, Grand Rapids & Western first consolidated mortgage. The reorganization plan provided for wiping out all of the old mortgages on the property except \$5,870,000 undisturbed collateral trust bonds on the Canadian lines. The total amount of bonds, equipment trust certificates, notes and receiver's certificates which were wiped out by exchange into securities of the new company was \$81,142,919, calling for interest charges annually of \$3,877,540. The total interest charges, including the interest on the Canadian undisturbed bonds, was \$4,127,340. The total bonds issued under the plan of reorganization, including the undisturbed Canadian bonds, was \$36,325,000, with fixed interest charges of \$1,687,760. There is approximately \$6,000,000 cash provided for in the reorganization plan for

working capital, betterments, etc., for the new company.

The most important reorganization which took place during the year from the point of view of mileage and amount of securities is not shown in the table of foreclosures because the Chicago, Rock Island & Pacific, which at the beginning of the year was in the hands of receivers, was reorganized without a foreclosure sale. The reorganization was effected by the sale of \$29,743,889 7 per cent preferred stock (the company had outstanding approximately \$75,000,000 common stock) and the sale of \$5,000,000 6 per cent preferred stock to former directors to provide for floating debt, reorganization expenses, etc., and by the exchange of \$20,000,000 debentures for \$20,000,000 new preferred stock. The Chicago, Rock Island & Pacific operates 8,131 miles.

As shown by the first table, there is still a large mileage in the hands of receivers, the most important roads being the Boston & Maine system, the International & Great Northern, the Missouri, Kansas & Texas system, and the Texas & Pacific.

Dividend Changes

THE DIVIDEND CHANGES IN 1917 as compared with 1916 were comparatively few and unimportant, with the exception of the 10 per cent extra dividend on the Chicago, Burlington & Quincy stock. The stock, however, is held half by the Great Northern and half by the Northern Pacific, so that this extra dividend was not directly a disbursement to the public. The continuance of extra dividends on the Union Pacific, which gives stockholders 10 per cent a year, although the regular annual rate is 8 per cent, is a manifestation of the Union Pacific's ability to earn a comfortable margin over 10 per cent, even after disposal of its Southern Pacific stock.

The initial dividends noted for the Pere Marquette and Pittsburgh & West Virginia, in the table, represent the return which investors are getting on the new money which was put up for these properties in the course of very drastic reorganizations under which bond interest was scaled down to only a fraction of what it had been before:

^aAn extra dividend of 10 per cent was declared in August, 1918.

^bHocking Valley practice is to declare dividends according to rate of earnings and there is, therefore, apparently no regular annual rate.

^cIn 1917 an extra dividend of 1 per cent was declared and in 1916 the rate was changed and an extra dividend of 1 per cent was declared.

^dAn initial dividend of 1½ per cent was declared in August from the earnings of the quarter ended June 30.

^eThe dividend of 2½ per cent declared in August was the first dividend on the new consolidated stock of the P. C. C. & St. L., which was the successor company to the P. C. C. & St. L. Railway, the Vandalia; Pittsburgh, Wheeling & Kentucky; Anderson Belt, and Chicago, Indiana & Eastern. Prior to the consolidation the annual rate in 1916 on the preferred stock of the P. C. C. & St. L. was 6 per cent and the last dividend on the common was 5 per cent and on the Vandalia stock 4 per cent.

^fIn December, 1916, a 2 per cent extra dividend was declared and in 1917 extra dividends were declared quarterly of half of one per cent.

1300 MILES OF RAILROAD ABANDONED

Unprofitable lines, some in operation for a quarter of a century, at last sold for junk.

THIS IS THE FIRST YEAR since the first railroad in the United States was built, in 1825, that there has been any considerable mileage of road voluntarily abandoned by its owners or taken up and sold as junk. The *Kaiser* Age has kept a record for 55 years of new railroad construction, and in one year this amounted to over 6,000 miles and in a number of years has been over 8,000 miles, but it has never before been worth while to keep a record of the few miles of logging road or spur tracks taken up. In 1917, however, there was 451 miles of railroad actually taken up or in the process of being taken up and sold for junk. In addition there was 491 miles of road on which operation was abandoned, and 396 miles of road which the owners had asked permission from State commissions or legislatures to abandon, and, as a matter of fact, this latter figure does not represent all of the road which would be taken up and sold as junk if the owners could get permission so to do.

State commissions have in the past almost invariably refused to permit the abandonment and actual taking up of railroad mileage. It has been necessary to go to courts, and the courts have apparently definitely established the rule that owners of an unprofitable railroad may shut out the operation of it and dispose of the rails, timbers, etc., as junk.

The owners of many of the roads listed probably would ascribe their difficulties to peculiar conditions for State commissions. There is quite a work of revision and patching surrounding many of these railroad ventures which have at last proved failures. Hopes, sacrifices, grand negotiations, rebellion against the laws of government, this is the stuff of which most of these failures is made. In most cases it was bad business judgment, or some other business mistake, which caused the failure, but it is hardly surprising that the facts should be given up and when the road is abandoned in general are not manifest.

The abandonment, on a considerable scale, of railroad mileage is worthy of thoughtful study. It is startling to find that more railroad mileage was abandoned in 1917 than was abandoned than was built in 1917. The failure of the road has often been justified in the necessity of growth of population and expansion of business in the country. There has been no lessening in the need for transportation, and yet after years of hanging on, in many cases the owners of over 1,300 miles of railroad have decided to quit.

The present high price of lumber has been one of the contributing factors, but only one of several. It is a

fact that the owners of the road have decided to quit. The *Farmer* & *Home* on the property of the *Yale* with & *Wright*, that had merged with the *Freight House* Railway in 1914. The abandonment of *Farmer* had

At last 230000 feet had been used in the application to discontinue and dismantle the road.

¹At last accounts the company was only awaiting the removal of some quantity of shippers to tear up the rails.

²This electric interurban road was built as part of a project to build an electric line from New York to Chicago. This was the only part of the projected road which was ever actually built.

³Permission has been granted by the Colorado Public Utilities Commission to discontinue operation only until April 1, 1918.

⁴This is an interurban road and the application to abandon is still pending before the Public Service Commission of Indiana.

⁵Operation has been discontinued for 20 months.

⁶Operation was to have been discontinued on December 31 and presumably was discontinued.

⁷Small logging road. Mileage is not ascertainable.

⁸Application was made to the Arkansas commission to entirely discontinue the operation of 6 miles between Pine Bluff and Sheridan, and to discontinue the entire 25 miles of line as a common carrier. The first application was denied by the commission and the second is now under advisement.

⁹An application is now before the courts to have the receiver dispose of such parcels of the road as would yield the most advantageous price. If a decree is entered following the recommendation of the receiver, that part of the line between Marshall, Tex., and Esler, 73 miles, will presumably be dismantled and sold as junk.

¹⁰A petition supplemental to a petition asking for the appointment of a new receiver asks that the road be dismantled and sold. The case is now before the supreme court of the state of New Mexico.

¹¹Permission was asked the Railroad Commission of Florida to discontinue operation. Presumably the intention was to dismantle the road and sell it for junk. Permission, however, was refused by the commission.

Chesterfield counties, Virginia, during more than 25 years failed to make the Tidewater & Western a paying railroad.

Some of the roads listed were built with the money and labor of farmers. The Chicago, Anamosa & Northern and the Creston, Winterset & Des Moines, both in Iowa, were built in this way. Both of these roads were the result of a desire for transportation facilities—the farmers wanted railroad facilities and assessed themselves to pay for building the roads. In the case of the Denver, Laramie & Northern, however, the money to build the road was raised not in the territory served—Central Colorado—but from Kansas farmers' savings.

The list is pretty surely incomplete, even for all roads that have actually been abandoned; neither does it show some very important roads which the owners wish they could abandon. It is probable that many holders of Kansas City, Mexico & Orient securities would be glad to see that road torn up and sold for junk. Raising the money to

build it was one of the most remarkable feats of promotion in American railroad history. It was an example of how deeply fixed was the investor's faith in the future of American railroads.

The significance of the present abandonment of some hundreds of miles of railroad is that it shows the faith which made possible the building of the Kansas City, Mexico & Orient not shaken but actually destroyed. The abandonment of railroads in the past year marks a very important stage in the economic development of the country.

Curves of United States and Canadian Construction Mileage

is somewhat better, 61.41 miles per hour, compared with 51.21 for 1910, 52.26 for 1913, and 55.31 for 1914. It is small, however, compared with 1,063 miles of second track completed in 1913 and 1,072 miles in 1912. Of third track 35.78 miles were completed, and of fourth or more main tracks 29.42 miles. No second or multiple track construction is planned for Canada during the year.

California leads this country

[illegible][illegible]

tional tracks, yards and engine terminals are the principal items, although work is under way on large passenger terminals at Chicago, St. Paul, Minn., and one of smaller magnitude at Jacksonville, Fla. Another \$4,000,000 is also being spent on the Kansas City Terminal to provide adequate approaches to the station for certain of the railroads.

On the whole, however, most of the improvements in progress during the year have been directed toward facilitating the handling of freight. As a rule the improvements have not been of a large scale, the tendency being rather toward smaller increases in the facilities at as many points as possible. Exceptions to this rule include the Cedar Hill yard of the New Haven and the terminal improvements at Indianapolis, Ind.

Auxiliary terminal facilities have had a prominent part in this year's activities. New coal docks for the Pennsylvania Railroad and the Baltimore & Ohio have been completed at Baltimore, those of the latter being marked by a decided departure from usual practice. The Norfolk & Western has built two warehouses at Lamberts Point, at a

occupied with work of this kind at Indianapolis, the former having completed a similar project at Columbus, Ohio, during the year.

In Canada the longest piece of new line constructed is on the Edmonton, Dunvegan & British Columbia in Alberta,

cost of \$1,800,000; the Chicago & North Western has completed a large grain elevator at Chicago, and has awarded contracts for another one at Council Bluffs, Iowa, and the Pennsylvania has placed an elevator in service at Erie, Pa. The \$4,000,000 local freight terminal now being completed by the Pennsylvania Lines at Chicago, is a structure worthy of special mention. Projects of recent inception include coal piers for the Baltimore & Ohio on Staten Island and for the Central of New Jersey at Jersey City.

Grade separation work, while aggregating a smaller expenditure than in former years and involving few new projects is still occupying the attention of engineering forces. At Chicago the Baltimore & Ohio; the Chicago & Western Indiana; the Chicago, Rock Island & Pacific, and the Pennsylvania Lines are engaged on work started previous to the beginning of this year. The Cleveland, Cincinnati, Chicago & St. Louis and the Indianapolis Union Railway are

covered and the Toronto Union Station on which work is 55 per cent complete. The line through the tunnel of the Canadian Northern, Mount Royal, at Montreal, was placed in operation in April.

The comparative amounts of various classes of new tracks built and other important improvement work under way during 1917 are shown below by states.

UNITED STATES

| ALABAMA | | Miles | |
|---|-------------|-------|-------|
| Birmingham, Selma & Mobile—Nichols to Stewart..... | First Track | 4.00 | |
| Dauphin Island Railway & Dock Co.—Between Alabama Port and Cedar Point..... | | 2.30 | 6.30 |
| Second Track | | | |
| Alabama Great Southern—Not specified..... | | 32.64 | |
| Birmingham, Selma & Mobile—Nichols to Stewart..... | | 4.00 | 36.64 |

Other Important Work Under Construction

St. Louis-San Francisco—Big Warrior lift bridge at Cordova, cost \$125,000, 30 per cent completed. Strengthening bridges between Thayer, Mo., and Birmingham, Ala., cost \$300,000, 95 per cent completed.

| INDIANA | | | |
|--|--|-------|-------|
| Second Track | | Miles | Miles |
| Baltimore & Ohio & Chicago (B. & O.)—Lapaz Junction to Milford Junction | | 27.00 | |
| Chicago & Erie (Erie)—Between Boone Grove and Griffith. | | 19.00 | |
| New York, Chicago & St. Louis—Through Ft. Wayne..... | | 1.85 | 47.85 |

Other Important Work Under Construction

Chicago & Eastern Illinois—Single track bridge at Hazleton, cost \$130,000, completed.

Cincinnati, Indianapolis & Western—Track elevation at Indianapolis, cost \$100,000, 5 per cent completed. General office building and freight house and team tracks at Indianapolis, cost \$200,000, 15 per cent completed, and branch 3.50 miles track to mine, cost \$103,000, 60 per cent completed.

Cleveland, Cincinnati, Chicago & St. Louis—Grade separation through center of Indianapolis, cost \$1,025,000, 25 per cent completed. Separation of grade at Tennessee street, Indianapolis (Peoria & Eastern), cost \$161,000, 50 per cent completed.

Evansville & Indianapolis—Realignment work and reducing curvature between Worthington and Petersburg, 4.50 miles completed.

Indianapolis & Frankfort (Pa. R. R.)—Building from Frankfort to Ben Davis, 41 miles; contractors, Dunn-McCarthy Company, Chicago.

Indianapolis Union Railway—Grade separation on Union tracks division, and elevation of train shed, Indianapolis, cost \$5,000,000, 20 per cent completed.

Pennsylvania Lines, Northwest & Central Systems—Engine yard and facilities at Fort Wayne, cost \$125,000, 90 per cent completed.

Pittsburgh, Cincinnati, Chicago & St. Louis (Pa. L. W.)—Building from Philadelphia to Irvington, 9.08 miles second track; rearrangement and extension of yards and car repair facilities at Richmond, cost \$530,000, 60 per cent completed. Joint freight terminal yard east of Belt Railway at Indianapolis, cost \$1,726,000, 50 per cent completed. Grade separation Ray to Downey streets, Indianapolis, cost \$123,000 completed. New inbound freight house and tracks on Pennsylvania street, Indianapolis, cost \$1,331,000, completed. Additional tracks and grade reduction Peoria Junction to Royal Center, cost \$372,000, 30 per cent completed. New freight house at Kokomo, cost \$132,000, 5 per cent completed.

Toledo, St. Louis & Western—Rebuilding bridge over Wabash river at Silverwood, cost \$150,000, 60 per cent completed.

IOWA

Other Important Work Under Construction

Chicago & North Western—Reinforced concrete grain elevator and 6.50 miles yard tracks at Council Bluffs, cost \$1,375,000, 60 per cent completed.

Chicago, Burlington & Quincy—New shops at West Burlington, cost \$485,500, completed.

KANSAS

First Track

Anthony & Northern—Larned to north line of Pawnee county 21.50 | 21.50 |

Second Track

Atchison, Topeka & Santa Fe—Not specified 6.62 | || Union Pacific—Manhattan to Junction City | 20.50 | 27.12 |

Other Important Work Under Construction

Barton County & Santa Fe (A. T. & S. F.)—Building from Holyrood to Galatia, 32 miles.

Kansas City Southern—Reconstruction of bridge over Kansas river at Kansas City, cost \$250,000, completed.

Kansas City Terminal Railway—See Missouri.

Union Pacific—At Kansas City, 35-stall roundhouse, cost \$238,280, 51 per cent completed; power house, 12 per cent completed, and turntable, 73 per cent completed, cost of both \$122,037; at Ellis, 14-stall roundhouse, power house and cinder pit, cost \$369,700, 70 per cent completed; at Marysville, roundhouse, power house, cinder pit, turntable, trackage, water tank, cost \$270,550, completed.

KENTUCKY

First Track

Chesapeake & Ohio Northern (C. & O.)—Point near Limeville to Kentucky-Ohio state line 2.12 | || Long Fork (B. & O.)—Alpharetta to Weeksburg | 26.00 | |
| Louisville & Nashville—Benham to Lynch, 0.83 miles; North Hazard to Alois, 0.85 miles; total | 1.68 | 29.80 |

Second Track

Cincinnati, New Orleans & Texas Pacific—Not specified 13.20 | 13.20 |

Third Track

Chesapeake & Ohio—Limeville to C. & O. Northern connection 1.09 | 1.09 |

Other Important Work Under Construction

Kentucky & Indiana Terminal—Engine terminal at Louisville, total cost \$274,600, completed except cinder pits, to be finished April, 1918.

Louisville & Nashville—Building from Allair to Burlington and Whitesett, 8.01 miles; Kilday to Seagrave, 9.58 miles; Grays Knob to Turtle Creek, 2.22 miles; Blackey to Caudill branch, 3.28 miles; total 23.09 miles, and surveys under way from Homble to Staceys branch, 6.2 miles; terminal facilities at De Coursey, cost \$429,000, 95 per cent completed.

LOUISIANA

First Track

Garyville Northern—Garyville to Livingston 18.00 | || Iberia, St. Mary & Eastern—Shadyside to Patterson | 8.80 | |
| Leesville East & West—Mill Creek to Front | 2.00 | |
| Orange Northeastern—At Vinton | 1.60 | |
| Ouachita & Northwestern—Clarks to Standard | 10.60 | 39.80 |

Other Important Work Under Construction

Missouri Pacific—New yard tracks, engine house, back shop and other buildings and facilities at Monroe, cost \$215,000, 98 per cent completed.

Oakdale & Gulf—Surveys made for extension Godwin to Mamou, 18.00 miles.

Orange Northeastern—Building from Stark to Leesville, 40 miles.

MAINE

Other Important Work Under Construction

Maine Central—Lewiston station and yard, cost \$105,000, completed; grade revision and second track from Waterville tower to Clinton, cost \$766,000, 80 per cent completed.

| MARYLAND | | | |
|--|--------------------|-------|-------|
| | <i>First Track</i> | Miles | Miles |
| Pennsylvania Railroad—Odentown branch to Camp Meade, 1.66 miles; total..... | | 1.68 | 1.68 |

Second Track

New York, Philadelphia & Norfolk—F. G. block station to N. side Pocomoke river, 0.27 mile; S. side Pocomoke river to A. J. block station, 0.21 mile; total 0.48 | || Pennsylvania Railroad—Odentown branch to Camp Meade, 0.57 miles; total | .57 | | |
| Western Maryland—From a point about one mile west of Big Pool to Clearspring | 5.65 | 6.70 | |

Other Important Work Under Construction

Baltimore & Ohio—Building from Baltimore to Patapsco Creek, 5.00 miles; improvements at Baltimore, New Pier No. 6, at Locust Point, cost \$1,500,000, completed; two transfer bridges at Locust Point, cost \$196,200, 90 per cent completed; new transfer, bridge at President street, cost \$112,200, 54 per cent completed; at Curtis Bay, new export coal pier and yard, cost \$2,800,000, completed; at Cumberland, change of line at site of Kelly Springfield Tire Plant, cost \$225,000, 19 per cent completed; at Annapolis Junction, additional track facilities, cost \$100,000, 90 per cent completed.

Pennsylvania Railroad—Rebuilding the B. & P. tunnel of the Baltimore division of the P. B. & W., work completed on 1.68 miles of first track and 0.57 mile second track.

MASSACHUSETTS

Third Track

Boston & Albany—Athol Jct. to Oak street 1.21 | 1.21 |

Fourth Track

New York, New Haven & Hartford—Mansfield to East Foxboro 1.99 | 1.99 |

Other Important Work Under Construction

Boston & Maine—Additional yard facilities at Ayer, including 11 miles of new track and increasing capacity about 100 cars, cost \$244,500, completed; additional yard facilities at East Deerfield, capacity of yards has been doubled and new engine house shop being built, cost \$1,196,000, 95 per cent completed; new bridge over Connecticut river near East Deerfield, cost \$274,000, 30 per cent completed.

New York, New Haven & Hartford—Engine facilities at Southampton street, Boston, cost \$638,000, completed; engine facilities at Dover street, Boston, cost \$130,000, completed; South Boston, cut for four-track approach to Boston freight terminal, cost \$972,000, 25 per cent completed; rebuilding about 75 bridges on the system, cost \$835,000, 25 per cent completed.

MICHIGAN

First Track

Copper Range—Between Calumet Jct. and Mohawk 1.47 | || Detroit Terminal Railroad—Station 416+74 to Station 529 +25 | 2.13 | |
| East Jordan & Southern—Extensions of branches | 3.00 | |
| Rapid Railroad—Detroit to Mt. Clemens | 1.23 | 7.83 |

Second Track

Detroit Terminal Railroad—Building from Station 416+74 to Station 529+25; total 2.13 | 2.13 |

Other Important Work Under Construction

Detroit, Toledo & Ironton—Train terminal yard, 600 car capacity, cost \$250,000, 75 per cent completed; West Detroit "South yards" completed.

Grand Trunk—New car shops at Port Huron, cost \$250,000, 90 per cent completed; new classification yard at Gillett, cost \$375,000, completed.

New York Central—Engine facilities and extension of yard at River Rouge, 75 per cent completed; new freight terminal at Detroit completed and grade separation at Detroit 75 per cent completed.

MINNESOTA

First Track

Duluth & Northern Minnesota—Mile post 87½ to mile post 99½ 11.75 | 11.75 |

Second Track

Chicago, Milwaukee & St. Paul—Ortonville west 0.97 | || Duluth, Missabe & Northern—Wolf to Virginia Yard | 5.50 | |
| Northern Pacific—Rice's to Gregory, 14.67 miles; Duluth to Superior, Wis., 1 mile; total | 15.67 | 22.14 |

Other Important Work Under Construction

Great Northern Terminal (Gr. Nor.)—Freight terminal at St. Paul, cost \$400,000, 20 per cent completed.

Minneapolis & St. Louis—Terminal improvements at Minneapolis, cost \$105,000, completed.

Minneapolis Belt Line (Gr. Nor.)—Hump classification yard, engine house with terminal facilities at Northtown, cost \$250,000, completed.

St. Paul Union Depot Company—Work started on union station and terminal yard to cost \$1,000,000.

MISSISSIPPI

First Track

Jackson & Eastern—At Union 1.00 | || Kosciusko & Southeastern—Kosciusko to Zama | 16.00 | |
| Pearl River Valley—Between Nicholson and Emery | 4.80 | |
| Yazoo & Mississippi Valley—Yerger to end of track, 11.12 miles; Stout to Galloway, 6.5 miles; total | 6.62 | 22.42 |

*Relocation work takes the place of 6.73 miles of old line.

NORTH CAROLINA

| First Track | Miles | Miles |
|---|-------|-------|
| Appalachian R. way—Cherokee to Oceana Lufly..... | 3.50 | |
| Carolina & Northeastern—Jackson, to Rehoboth..... | 4.00 | |
| Goldboro Union Station Co.—At Goldboro..... | 1.35 | |
| Madison County—Laurel River Logging Company line..... | 5.00 | |
| Southern Railway—At Catawba river near Belmont..... | 3.00* | 16.85 |

*Relocation work takes the place of old line.

Second Track

| | | |
|---|------|------|
| Seaboard Air Line—Through city of Raleigh..... | 1.50 | |
| Southern Railway—At Catawba river near Belmont..... | 3.00 | 4.50 |

Other Important Work Under Construction

Appalachian Railway Surveys under way for extension Oceana Lufly to Swayney, 7.00 miles.
 Carolina & Northeastern—Building extensions, Rehoboth to Lasker, 4.00 miles, and Lasker to Ahoskie, 3.3 miles.
 Seaboard Air Line—Grade revision between Hamlet, N. C., and Charleston, S. C., cost \$350,000, completed; grade revision on portion of line between Sanford, N. C., and Hamlet, cost \$225,000, completed; additional shop and yard facilities at Hamlet, cost \$125,000, completed; double track, yard extension and shop extension work at Raleigh, cost \$225,000, completed.
 Southern Railway—Rebuilding bridges on Salisbury-Morristown line.
 Statesville Air Line—Building from Statesville to Yadkinville, 29 miles.

OHIO

First Track

| | | |
|---|-------|-------|
| Chesapeake & Ohio Northern (C. & O.) Kentucky-Ohio state line to Waverly..... | 27.19 | 27.19 |
|---|-------|-------|

Second Track

| | | |
|--|-------|-------|
| Baltimore & Ohio & Chicago (B. & O.)—Through Defiance, Cleveland, Cincinnati, Chicago & St. Louis—Between Harper and Gretna..... | 4.50 | |
| New York, Chicago & St. Louis—Through Cleveland..... | 1.18 | |
| Pennsylvania Lines, Northwest and Central Systems—At Delaware, 8.10 miles; at Sandusky, 3.10 miles; total..... | 11.20 | 18.18 |

Other Important Work Under Construction

Baltimore & Ohio & Chicago (B. & O.)—Second track through Defiance, elimination of grade crossings and improved freight and passenger facilities, cost \$675,000, 95 per cent completed.
 Baltimore & Ohio Southwestern (B. & O.)—Additional yard tracks at Brighton, cost \$103,000, completed.
 Bessemer & Lake Erie—Enlargement of yard and facilities, etc., Conneaut Harbor, 65 per cent completed.
 Chicago & Erie (Erie) Improved engine terminal facilities at Marion, 97 per cent completed.
 Cleveland & Mahoning Valley (Erie)—Separation of grades at Youngstown, 40 per cent completed.
 Cleveland, Cincinnati, Chicago & St. Louis—Building second track between Harper and Gretna, 4.5 miles; grading and masonry work for elevation of tracks in Columbus, cost \$642,700, completed; new freight house, etc., at Middletown, cost \$103,500, 50 per cent completed; rebuilding bridge No. 6 over Cuyahoga river at Cleveland, cost \$160,400, 30 per cent completed.
 Dayton Union Railway—Reconstruction of Miami river bridge at Dayton, cost \$360,300, completed.
 Hooking Valley—Grading under way for second track on about 27 miles out of 87 miles between Delaware and Le Moyne; subway to carry 7 tracks over Parsons avenue, at South Columbus, cost \$240,000, 20 per cent completed.

Lake Erie & Eastern—Extension to Gerard, 1.20 miles, including yard facilities, cost \$113,500, 25 per cent completed.
 New York Central—Classification yard and repair yard at Coalburg, 65 per cent completed; Hinrod avenue viaduct and separation of grades at Youngstown, 20 per cent completed; additional tracks in yard at Collinwood, 75 per cent completed; subway at Cleveland 60 per cent completed; new yard facilities at Rockport, 75 per cent completed; subways, new station and track elevation through Elyria, 20 per cent completed, and Camp street subway at Sandusky, 60 per cent completed.

New York, Chicago & St. Louis—Two high level freight stations at East Ninth street and Hill street, Cleveland, cost \$128,000, completed.
 New York, Pennsylvania, Ohio (Erie)—Enlarging yard at Kenmore and switch track to South Akron, 94 per cent completed; freight station and increased freight handling facilities at Akron, 70 per cent completed; improved yard facilities at Kent, 96 per cent completed.

Pennsylvania Lines, Northwest and Central Systems—Yard at Stark, cost \$793,000, 25 per cent completed; coaling station at Yankee Crossing, cost \$236,500, 10 per cent completed; yard at Austenberg, cost \$108,000, 57 per cent completed; dock No. 6 new coaling apparatus at Ashtabula, cost \$205,000, completed; avenue viaduct at Cleveland, cost \$107,000, 80 per cent completed; Kinman street yards at Cleveland, cost \$300,000, 10 per cent completed; coal handling facilities at Sandusky, cost \$629,000, completed; Bay Junction yards at Sandusky, cost \$266,000, 95 per cent completed; yard tracks at Columbus, cost \$116,500, completed; engine house and coaling station at South Akron, cost \$350,000, 75 per cent completed; building Summitville to Kinsington, 7.7 miles second track; Warren to Bristolville, 11.8 miles second track; Letonia to Alliance Junction, 13 miles third track; Alliance Junction to Alliance, 3 miles fourth track; Alliance to Stark, 12 miles third and fourth track; Canton to M. N. Tower, 6 miles third and fourth track.
 Pittsburgh & Lake Erie—Remodeling Haseltin terminal yard, cost \$1,250,000, 35 per cent completed. Struthers yard extension, cost \$775,000, 75 per cent completed.

Pittsburgh, Cincinnati, Chicago & St. Louis (P. L. W.)—New freight house and team track facilities at Newark, cost \$117,000, 10 per cent completed; improvements at power plant at shops, Columbus, cost \$133,000, completed; additions to shops, Columbus, cost \$256,000, 10 per cent completed; separation of grades at Cincinnati, cost \$519,000, completed; additional yard facilities at Bradford, cost \$351,500, 50 per cent completed; grade separation at Cincinnati, total cost \$140,000, of which railway pays \$91,000 and city \$49,000, 10 per cent completed.

Toledo & Ohio Central—Erecting shop at Bucyrus costing \$165,000, completed.
 Toledo & Cincinnati (B. & O.) Building from East Dayton to North Dayton, 2.00 miles.

were definitely signed, but the locomotives were scheduled on the shop programs ahead of many large orders for American railroads, some placed as far back as May or March. The orders even now have not been canceled; they have, however, been held in abeyance. They still remain on the shop schedules, although they will undoubtedly be set back from time to time. In other words, they have still to be reckoned with as orders, and for that reason they are here put with the 1917 figures.

These Russian orders, as a whole, have proved at once a blessing and a curse for the American railway supply field and through it for the railways. The first Russian order for locomotives placed in June, 1915, when orders were scarcer than they had been at any time for the preceding six or seven years, was received with something closely akin to joyfulness, and so were the others immediately following. The

TABLE III—CLASSIFICATION OF DOMESTIC LOCOMOTIVES ORDERED 1911-1917

last two orders, that for 500 placed last July and that for 1,500 mentioned in the preceding paragraph, have simply had to be looked upon as an unwelcome duty, as something that America as one of the opponents of Kaiserism has been properly called upon to do for one of its brother opponents. But it is still true that these Russian orders were given priority over engines urgently needed for transportation requirements at home and with all the English, French, Russian and American government engines which were placed, the American orders were pretty well down on the builders' lists.

Editorial comment on another page treats of this situation, and notice is taken that the locomotive situation is now seeing the light. The Russian order for 500 locomotives placed in July, 1917, is now almost completed, some of the locomotives having been shipped and others which were prepared for shipment are being stored until the time comes when use can be made of them by better folks than the Kaiser or the Bolsheviks. It is even announced that 200 of the locomotives will be remodeled and put in temporary service in our own country. With the other 1,500 locomotives being held in abeyance the whole situation is that the American railroads can now look forward to receiving in the near future the power they put on order six months or a year ago, and specialty manufacturers have already received notification to ship the specialties for these orders.

The situation as to the orders placed by the United States government for service with the American troops in France has had much more to commend it than the Russian orders. Deliveries on the War Department orders have been better spaced, with regard, of course, to the shipping situation. But what has counted most has been the standardization and the fact that standardization began at the first stage of the game. Railway and supply men alike, reading the accounts of the delays over the standardization of the Liberty motor, the Liberty truck, the Enfield rifle, the Browning gun, the ships, have expressed their relief that in one industry at least the War Department was represented by a man who could take an instrument of warfare, in this case, a locomotive, and have it turned out, ready for shipment and a standard for a year's future production in 20 working days. As

a result these U. S. A. Consolidation locomotives are keeping out of the way in the builders' plants and locomotives for American roads now have a clear path to completion and shipment.

Enough has been said to indicate that the situation as to domestic orders during the past year has been bad. Builders and specialty manufacturers alike have been postponing orders periodically and railway men have had to be pacified with the information that deliveries have been held up for them on account of more urgent war orders. This situation is now being remedied, so that the outlook both for deliveries and production in 1918 looks exceedingly favorable. Whether additional orders will be placed in the next few months is a question. The fact that the government has taken over the railroads is looked upon favorably, and with the easing up in prices and the improved deliveries, the supply field is confidently expecting a large buying movement. Upholding this belief is the fact that many railroads have reserved space for the coming year. The Norfolk & Western's order for the Mallet locomotives reported this week in part takes advantage of such a reservation and the New York Central has had a reservation of space for 250 locomotives with the American Locomotive Company since last September.

The tables on the following pages are detailed lists of the locomotives, freight cars and passenger cars ordered by the railways and industrial companies in the United States and Canada and also of the orders for equipment for export. A great effort has been made to make these lists as complete as possible. It will be found, however, that the orders do not add up to as great amounts as the totals given in the tables. In addition to the orders concerning which data is given, orders were also placed (as reported by the equipment builders) for 120 locomotives, concerning which it was impossible to obtain detailed information. Although, even with this, there may be some omissions of both domestic and foreign orders, it is likely that these omissions are very few and,

TABLE IV—THE LOCOMOTIVES BUILT

| 1917 | | | |
|-------------------|-------------|-------|-------------|
| Domestic | | | 2,585 |
| Foreign | | | 2,861 |
| Total | | | 5,446 |
| IN PREVIOUS YEARS | | | |
| Year | Locomotives | Year | Locomotives |
| 1899 | 2,475 | 1908* | 2,342 |

* Includes Canadian output.

* Includes Canadian output and equipment built in railroad shops.

under any condition, the results are sufficiently accurate to meet the general purpose for which these statistics are prepared, namely, to show the character and extent of the purchases of motive power this year as compared with preceding years.

The information given herewith is compiled from official sources. The *Railway Age* in answer to its inquiries has received communications from practically all of the railroads and private car lines in the United States and Canada. In the case of foreign orders and where no replies were received from purchasers in this country, the details were taken from the weekly records or from the reports of builders.

As far as the domestic orders are concerned it will be noted from Table III that there have been, even with the smaller total of orders placed, increases in the number of Mikado, Pacific and Santa Fe locomotives. The Decapod, a new development in domestic locomotive design, has increased in favor as indicated by its adoption by the Canadian Pacific

and the Pennsylvania for heavy freight service. The number of Mallet locomotives slow in the other class is decrease. There is also a considerable drop in the number of Mountain and Muhawk locomotives ordered, this being merely the result of the New York Central's not having ordered any additional engines of this type since the last two tracts for these locomotives last year. The more noticeable decrease in any one kind of locomotive was in portable locomotives; indeed the larger part of the decrease in the total is to be found in the light locomotives for industrial companies.

The most notable decrease is in the order for industrial locomotives, which is a natural consequence of the order for the New York Central's heavy freight locomotives. The order for the New York Central's heavy freight locomotives is a natural consequence of the order for the New York Central's heavy freight locomotives.

The order for the New York Central's heavy freight locomotives is a natural consequence of the order for the New York Central's heavy freight locomotives. The order for the New York Central's heavy freight locomotives is a natural consequence of the order for the New York Central's heavy freight locomotives.

Freight Car Orders in 1917 Reach Low Level

Total of 158,965 Compares With 205,368 in 1916. Domestic Orders Lowest Since the Year 1908

THE ORDERS FOR FREIGHT CARS in 1917 totaled 158,965 including 74,274 for domestic uses, 18,844 for the United States Government and 65,676 for France, Russia and other foreign countries. The total of all orders compares with 205,368 in 1916; the difference, however, is much

greater than indicated by these figures because the 1917 figures include 30,500 cars for Russia, the orders for which are now held in abeyance and which indeed may never be executed.

The passenger cars ordered total 1167, including 1124 for domestic uses; this figure being one of the smallest since the Railway Age began its compilations in 1901.

Of freight cars ordered this year about 41 per cent are for foreign delivery either for the United States Government or for its Allies. The orders for 74,274 cars ordered by the railways in this country for domestic use is the smallest number ordered since the roads began their list, with the exception of 1908 at which time 62,547 cars were ordered. Of this 79,367 there were about 1/100, or 77 per cent, ordered to be built by the railways themselves. In number this slightly exceeds those ordered to be built in company shops last year, but in percentage of total cars ordered, the ratio is about double that of last year.

of freight cars ordered this year is the smallest since 1901. As also, for the same reason, because more available during the year has all annual may have ordered.

exactly favorable either with the railways or the builders. The prices have been so high that the railways have not dared to come into the markets. As a result the builders have been operating in some cases at as low as 50 or even 25 per cent of capacity and as one manufacturer has put it, "when there were orders there was a shortage of labor and material, or when there was material, a shortage of labor." The United States Government orders for the forces in France have helped the situation considerably and it is to

Russian requirements, as was the case for locomotives, as mentioned elsewhere in this issue.

While 1917 may not have been exceedingly bright from the standpoint of freight car orders, the situation as to the immediate future is exactly the opposite. The opportunities for the railways to obtain cars were never better than at present. With the material situation much better than it was last year at this time and with a smaller number of orders on their books, the car builders are in a position to give

*Includes Canadian output.

*Includes Canadian output and equipment built in railroad shops.

the effect on the car market that the Russian locomotives orders have had. There have not been large car orders placed and there were not sufficient domestic orders to establish a conflict between deliveries on domestic and on

from three to four months' delivery, which is the condition in normal times. With a plant capacity of about 25,000 cars per month and with current orders to absorb this capacity for the next three months, one-fourth of which is for foreign delivery, the car companies could, if sufficient orders were placed, organize their forces for maximum full production and provide over 100,000 cars within the next six months. This would assist materially in relieving the car shortage. They have been handicapped throughout the year by the scarcity of labor and the delayed receipt of material. Even now if a large number of cars was ordered for immediate delivery, it might be necessary for the Government to assist in the matter of materials. A shortage of material not only delays the delivery of the cars but disrupts the shop organization and greatly increases the cost of the cars. In other words, the conditions must be stabilized if the car production is to be sufficient to meet the needs of the country for new freight cars.

And this still omits from consideration the new developments at Washington, which, as noted editorially, have been received on the whole with favor in the supply field.

There were 151,401 freight cars built during the year, of which 119,363 were for domestic use and 32,038 for foreign delivery. Of the 119,363 for domestic use, 12,273, or over 10 per cent, were of wood and over 11 per cent, or 13,488, were built by the railroads themselves. The total number built is a material increase over 1916 and 1915.

In the following tables are given lists of the orders for freight and passenger cars during the twelve months of 1917. The article on the locomotive situation on another page tells how the items were obtained. Suffice it to say here that the lists are received from official sources. Replies were received from practically every railway and car line in the country, and the reports were then further checked up by reference to lists furnished by the builders.

Position Light Signals near Hoboken, N. J.

Progress in Railroad Signaling During the Year

Length of Automatic-Block-Signaled Lines Now More Than 35,000 Miles; Marked Progress in Interlocking

A REVIEW of the statistics of fixed and interlocking signal construction during the past year and of the plants now in course of construction shows, in the United States and Canada, a total of 2,899 miles of road block signaled since January 1, 1917, or about 700 miles greater than the total increase recorded one year ago for the calendar year 1916. Exact comparisons of total increase in road worked under the space-interval system could not be made because there is a large amount of automatic signaling which takes the place of the manual block system and for which complete statistics are not available. Nearly all of this new signaling is automatic, and in the work done under construction (1,635 miles in the United States) and proposed for the year 1918 (1,240 miles) the non-automatic is almost negligible.

In interlocking as well as in block signaling the roads have made considerably more progress in 1917 than they did in 1916. The total number of plants completed, 187, compares with 98 in the previous year, and under construction, 164 plants, as compared with 113. The proposed new work for 1918, totaling 185 plants, is 15 less than the number proposed a year ago; but this is the best total figure in our summaries, because numerous important roads are not ready to tell of their plans. The work on the New York city elevated and subway lines makes up a large part of the total in this column, and thus has to be reckoned as "unplanned" some plants that were included in the summary a year ago. The Interborough, operating under contract with the city, is spending several millions of dollars on the plant work (including some block signals with space-interval operation) in the present revision, and has about 1,000 men at present employed on signal construction. The plant of the Brooklyn Rapid Transit Company, with headquarters in Manhattan as well as in Brooklyn, are doing less work than those of the Interborough.

The figures, so far as available, pointing to the new concerning work now under construction and proposed for 1918, are shown in the following tables.

| ROADS SHOWING THE TOTAL MILES OF ROAD BLOCK-SIGNALLED SINCE JANUARY 1, 1917, AND THE MILES OF ROAD NOW UNDER CONSTRUCTION AND PROPOSED FOR 1918 | | | | | | | | | |
|---|-------------|--------------------|-------------------|-------------|--------------------|-------------------|-------------|--------------------|-------------------|

* The asterisk indicates a length of more than one mile.
 73 signals. All blocks have a three-at-stops and start signal, the center approaching stations and on steep grades.

† Central of Georgia—Manual block system. This road is installing automatic block signals between Atlanta, Ga., and Charlotteville, Va., 21 miles. One third of these signals are now already equipped.

‡ C. & N. W.—Replaces manual block system.

§ C. & W. L.—Four-track replaces manual block system.

|| Chicago, M. & St. P.—Signals removed from Rock Island.

¶ N. Y., N. H. & H.—Four-track line removed from the left-hand quadrant.

¹⁸See Note 16 under Table A.

Table D, manual block signaling, compiled during the year, is even shorter than in other recent years; the figures compared with the record of automatic block systems, which illustrates the increasing appreciation among railroad managers everywhere, of the value of the automatic system and of its varied elements of superiority over any method known.

Tables E and F are still shorter. Under Table F, Manual Block Signaling Under Construction, there is reported only one item—New York, New Haven & Hartford, Boston, Conn., to Middletown, 9 miles, single-track, electric, semi-staff.

Table I, New Manual Block Signaling Proposed for 1918, is omitted entirely, there being nothing to report.

Position-Light Signals

It will be noted that on the Pennsylvania and on the New York, Philadelphia & Norfolk, position-light signals are being installed quite extensively. The use of these signals is perhaps the most notable novelty in the signaling record of the year, and pictures of some of the latest installations (on the West Jersey & Seashore) are shown at the head of this article. Reading from left to right the first of the three views illustrates a signal at an interlocking, showing the

proceed indication for low speed. The second picture shows an automatic signal indicating proceed. The marker light, some distance below the vertical row of four lights, is not energized; this light shows only when the lights at the top indicate stop (four lights in a horizontal row). The third picture shows a distant signal to an interlocking plant; it indicates that the next signal will be found to show "proceed at medium speed." If, for any reason, the top row of lights in this signal should go out, the bottom row would also be extinguished, so that there is no danger that the lower row may be mistaken for a proceed signal.

The items shown against the two roads named aggregate about 25 position-light signals installed in 1917 and 170 now under construction; and altogether there are now about 420 of these signals in service. Adding to this number those now under construction, and including also some distant switch signals, which have not appeared in any statistical review, approximately \$70 of these signals have been installed or are now under construction.

Block Signaling Proposed

The 523 signals embraced in the statement of the Brooklyn Rapid Transit Company in Table C are for the two subways now being built for operation in 1918, respectively, in both Manhattan and Brooklyn boroughs, New York city. The Fifty-ninth street line, Manhattan, is two-track, from Fifty-ninth street southward to Fort Street, where the line is four-track; from Rector street to Prospect Park, four miles, two-track. Fifteen miles of this multiple system is now being done to equip existing tracks, already signalled with

Table C: Block Signaling Proposed. This table contains multiple columns listing various railway lines and the number of signals proposed for each. The data is organized into several sections, likely corresponding to different geographical areas or types of signaling systems. Due to the complexity and repetition of the data, a full transcription of the table content is not provided here, but the structure follows the pattern of the other tables in the document.

apparatus for the operation of the automatic block system in either direction on the same track. Where the signaling is arranged for the movement of trains in either direction on the same track, the signals which, for the time being, are for movements against the current of traffic, are locked so that they cannot be moved. Automatic train stops are used throughout, and, in connection with these, time or speed con-

struction during the past two years and which are now in partial operation. A large amount of electro-pneumatic work on the Interborough is to be finished in 1918, as will be seen by the statements in Tables H and I.

New Interlocking Completed

The figures in Table G are to be taken as an exhibit, not of the precise amount in the increase in interlocking apparatus in use in the country, but rather as showing the work that has been done during the past twelve months; for a considerable proportion of the items represent, not an entirely new plant, but reconstruction of an old one, or important enlargements to provide for new tracks or rearrangement of tracks. Some duplications are included, also, the same joint plant being reported by two roads. These observations apply also to Tables H and I.

The new work done by the Brooklyn Rapid Transit Company and shown in Table G is on the subways now partly completed in both the Brooklyn and Manhattan boroughs, New York City. In Manhattan there are interlockings (electric) at 34th street; Union square, Canal street, City Hall. In Brooklyn one at Greenwood avenue, ten levers, electric. There are mechanical interlockings at Coney

² B. R. T.; includes one plant electro-pneumatic.

trol apparatus is used approaching stations and on steep grades.

Electro-Pneumatic Interlocking

The reports received indicate that electro-pneumatic interlocking has been installed during the past year on only two roads; on the Delaware, Lackawanna & Western, at the Buffalo Terminal, 23 levers, and on the Interborough Rapid Transit Company, 208 levers. The statement of the Interborough covers a large number of plants on the new subway and elevated lines in New York city—boroughs of Manhattan, Bronx, Queens and Brooklyn—which have been under

Island, Rockaway Parkway and 105th street. Light signals are used at all of these plants and automatic train stops are to be used generally. The machines have illuminated track diagrams and lever lights. All plants have approach locking and electric switch locking.

The interlocking on the New York Central at Berea, Ohio,

(Table G) has 56 working levers of which 15 are pneumatic this year. The signals and switches at the C. & O. & S. L. are controlled by an electric interlocking machine mounted on the existing mechanical machine. Electric locking has been provided for all routes. The electric machine is model 18. G. R. S.

Interlocking Under Construction

The column headed "Electric" in Table H includes three pneumatic, it contains data from five roads on which electric pneumatic interlocking plants are under construction, namely, the Delaware, Lackawanna & Western (Orange), the Innesborough Rapid Transit Company, the Pennsylvania Railroad (Philadelphia, Broad street) and the Southern Pacific (San Francisco). The work on the Interlocking is in connection with the new subway and elevated railroads now under construction in the boroughs of Manhattan, Bronx and Queens, New York City. There are 19 plants in Manhattan aggregating 226 levers; 14 plants in the Bronx, aggregating 218 levers, and 3 plants, aggregating 27 levers in Queens.

Late Building Proposed for 1918

The "Table" column in Table I shows interlocking plants proposed in 1918. One, the Boston & Maine Road, was cancelled; the Boston, Concord, the Southern New England Company, and the Transcontinental Rapid Transit Company. The work on the Boston, Concord, is for transference into an extension branch to come from the Boston to the extension at Boston. The Boston, Concord, Rapid Transit Company, Concord Extension, is now proposed at Concord, Mass. At the end of the year, interlocking proposed for the Delaware, Lackawanna & Western Company, 44 plants, and Atlantic railroads. The extension on Concord Road is to be completed by the company, which was to Concord Road, where there is a 12-mile extension, from the Concord Road, 11.5 miles. At East New York there are three plants, A, B and C, which will have, respectively, 14, 10, and 10 levers and 47 levers.

The new work to be done on the 12-mile extension at Concord Road, aggregating 276 levers.

Railroad Hearings Before The Senate Committee

Chairman Hall and Other Members of the Interstate Commerce Commission Are Questioned

HEARINGS BEFORE THE SENATE COMMITTEE on Interstate Commerce, undertaken in response to a resolution introduced by Senator Cummins on December 18 ordering an investigation and report on the recommendations made by the Interstate Commerce Commission for the unification of the railroads, were begun on December 22. The investigation had been postponed at the request of the President and further delayed by the death of Senator Newlands so that when the committee met on December 29 nothing had been done except to obtain some statistical information in response to a series of questions addressed to the commission and to the Railroads' War Board. In view of the President's proclamation taking over the railroads, the committee was undecided whether to proceed, but for the purpose of securing information having a bearing on the legislation to be asked by the President it was concluded to hear from the members of the Interstate Commerce Commission who had been called. The Republican members of the committee indicated strongly their opposition to the action of the President.

Henry C. Hall, chairman of the commission, told the committee that the action of the President might be ascribed to any failure on the part of the railroads that they have been "exceedingly diligent and have made a number and very effective effort in dealing with a weighty problem and have accomplished very great results but they have been hampered by the laws" and that much of the competition is attributable to the abuse of preferred orders by the government departments. He also declined to say that it was necessary for the President to take over the roads in order to secure their unification, pointing out that the commission had recommended another alternative. One is declared that under government control the railroads would have greater opportunity to succeed than they have had under present laws.

Senator Cummins asked him to describe the "difficulties and deficiencies in transportation" which had led the commission to make its special report. Chairman Hall said it would be difficult to single out any one cause from the many which had influenced it. "Possibly the railroads are all right," he said. "The difficulty between them is artificial, in a sense, and for technical reasons of the nature

into which and is represented by lines of ownership, but the physical facilities constitute practically a national utility. The difficulties that hinder their fullest use have not followed but result from the competitive influences between roads and from certain statutes that the states and the nation have sought to impose. When prohibited by law from passing it takes a very high spirit of patriotism to seek for a means to give its revenues depleted by sending traffic over another line. There are many ways of getting freight from one point to another and there is always one shorter line. It has become the usage to send traffic through certain gateways and when you suddenly supersede upon it such a great volume of traffic as has never been known, results from the situation unless something is done to carry freight from its accustomed routes over the new gateway naturally results.

If the railroads were all owned by one corporation it would naturally distribute freight over the line in such a way that the entire plant would be utilized on the most efficient way, and which one of various lines are utilized others would be used. You have here a great plant owned by independent companies, each doing what it can, but against the laws of the country, where loaded it is an obstacle for the "passing" of the rest of the world to be done in the most efficient way.

Railroads Hampered by Laws

When asked how the railroads should be handled, Chairman Hall said: "I have no doubt that the railroads should be handled in such a way as to be able to be handled in the most efficient way."

I have no doubt that the railroads should be handled in such a way as to be able to be handled in the most efficient way.

I have no doubt that the railroads should be handled in such a way as to be able to be handled in the most efficient way.

I have no doubt that the railroads should be handled in such a way as to be able to be handled in the most efficient way.

I have no doubt that the railroads should be handled in such a way as to be able to be handled in the most efficient way.

the per diem expense. "And they have done this cheerfully at the mere request of the Commission on Car Service. Probably the requirements have been tempered so as to equalize the expense of sending the empty cars but now the director, if he sees fit, could pick out one route to move empties out of the congested district."

In reply to a question by Senator Poindexter as to why this abnormal movement of empty cars was necessary, Mr. Hall described how currents of traffic have been changed and how the amount of freight exported through North Atlantic ports has been out of all proportion to that moved by the South Atlantic and Gulf ports.

"Was there anything to prevent the government from ordering traffic moved via the Southern ports without taking over the railroads?" asked Senator Poindexter.

Mr. Hall replied that the government control of the roads would not affect this situation, which has been caused to a considerable extent by the fact that the boat lines preferred the ports which gave them a shorter race with the submarines. He also explained that the railroads have handled a greater volume of traffic then ever before and that congestion has been increased by abuse of preference orders.

Senator Cummins asked to what extent the railroads have indicated a willingness to sacrifice selfishness and individual interests to the common good.

"I should not call it selfishness but rather a sense of duty toward their employers," said Mr. Hall, "but there have been many instances in which they have done so as far as they reasonably could. The first thing the Pittsburgh committee did was to order off the Pennsylvania Broadway Limited, although the New York Central was allowed to continue its competitive train." He also mentioned the diversion of traffic and the transfer of locomotives from the western lines to the east at a time when a locomotive is not only worth twice as much as formerly but has an earning capacity even greater.

"If the railroads could have divested themselves of their selfish interests, could they have got along without government operation," he was asked.

"Yes, that was indicated by the commission's report, but not without a repeal of the laws," replied Chairman Hall.

Senators Poindexter and Kellogg, who made it clear that they did not consider it necessary for the government to take over the roads, asked many questions as to why the President could not have remedied the abuse of preference orders under the powers he already possessed.

Preference Matter Must be Simplified

"Is there any reason to believe that the preference matter will be simplified?" asked Senator Kellogg.

"It should be immensely simplified," replied Chairman Hall. "The government has learned by experience and I understand that a change is already contemplated. There were many bureaus each undertaking to direct that their own shipments should have preference and when you try to single out cars for preference it tends to produce congestion and delay the entire movement. These orders probably didn't seem unnecessary to those that issued them but seem unnecessary to those who didn't issue them. I think now that the government appreciates the necessity for a change."

"Then the congestion is due to the fact that the President allowed various departments to issue these orders rather than to any lack of power to remedy the situation before?" said Senator Kellogg.

"I don't wish to criticise anyone. You can draw your own inferences," said Chairman Hall.

"Do you believe the government can operate railroads any more efficiently and economically than private enterprise?"

"In normal times, no; I believe under present conditions it can do so more efficiently, because the organization and men will be retained and they will have an opportunity to disre-

gard the restrictions heretofore imposed upon them. As to economy, that will depend on the men who operate them."

"Why couldn't the government direct the roads to operate as a unit?"

"That was one of our recommendations," was the reply.

Mr. Hall expressed the opinion that possibly the existing facilities and equipment will suffice for the immediate present, but that later replacements will be necessary. He thought that the necessity for capital expenditures would be "very much less than the estimates one frequently hears" and that perhaps none will be needed right away.

Chairman Hall continued his testimony on Monday and the hearing at once became involved in a maze of statistical technicalities when Chairman Hall tried to explain to Senator Cummins the exact meaning of the terms "railway operating revenue," "railway operating income" and "net income" as used in the statement of statistical information compiled by the commission in response to requests by the committee. The committee apparently desired comparable statements showing the amounts which the railroads had available for the payment of interest and dividends over a series of years and the amount of their stocks and bonds, but the questions had not been asked in such a way as to bring out just what the committee wanted. The commission's statistician, M. O. Lorenz, who was finally called in, arranged to supply the material as quickly as possible. It was explained that one of the questions asked by the committee would require the services of 150 men for three or four months to compile, but the commission had given a rough estimate instead. Senator Watson asked Chairman Hall if he would agree with the statement of the railroads that they had co-ordinated their lines in a single continental system.

"Well, I should not express it in just that way," replied Chairman Hall. "If there were but one system all purchases would have been made in common, for instance, and as long as each railroad was obliged to earn its own living it is not, to my mind, conceivable that they could have been operated as a single system under one management without the repeal of the anti-pooling law."

"Then the principal result of the new plan of government control is that it gets away from the effect of the laws," said Senator Watson. "Could the railroads not have been run as successfully under their own management if the laws had been repealed?"

"I think the commission's report speaks clearly on that point," replied Chairman Hall, "but as a war measure, control of the railroads by the President presents certain advantages."

"If it is good as a war measure, why would it not be a good thing as a general policy?" asked Senator Townsend.

"We have yet to see what the result will be," replied Chairman Hall. "I have not let my thoughts dwell on the idea of government ownership. There are a number of elements which exist in ordinary times which do not enter into the problem in war time. That would be a very different question and would require study from a different angle of approach. Many problems would be involved that are not now, such as the political problem, and I do not understand that the President would have any such powers in time of peace as he has now."

Movement of Coal

Senator Pomerene tried to bring out reasons why the Interstate Commerce Commission or some organization had not done more to promote the movement of coal. He cited a case where a plant at Alliance, O., had been closed down almost in sight of many cars of coal which had stood on the tracks for weeks because the terminals to which they were destined were blocked. Chairman Hall replied that neither the Interstate Commerce Commission nor the carriers had authority to deliver the coal to any one but the consignee to whom

Railway Employees Subscribed For \$36,000,000

Subscriptions to the Second Liberty Loan by Railroad Men
Almost Double Those to First Loan

MENTION OF THE HIGH SPOTS in railway history for 1917 must not fail to include the subscriptions by companies and employees alike to the first and second issues of the Liberty Loan. The railways themselves subscribed about \$50,000,000 to the first loan and nearly \$80,000,000 to the second. Reports just made public by the Liberty Loan Committee on Railroads, of which A. H. Smith, president of the New York Central, is chairman, show in addition that subscriptions to the second loan by railway employees totaled \$36,077,450, that amount being subscribed by 396,958 employees. As 241,280 employees subscribed \$20,027,966 to the first loan, this means that the railway companies and employees together subscribed over \$70,000,000 to the first and \$116,000,000 to the second, a total of \$186,000,000 for the two issues.

In a letter sent out by the Liberty Loan Committee on December 22 to the railway presidents who co-operated, the railway men are thanked for their efforts and the hope is expressed that the committee may anticipate "your continued co-operation in behalf of similar issues by the government." The detailed figures sent out by the committee are as follows:

| | 1st Liberty Loan | 2nd Liberty Loan |

* Second Liberty Loan Report, published with American Liberty Loan.

Canada's Victory Loan

All the honors in government awarded last year with the American railways and railway companies of Great Britain has just finished raising \$400,000,000 in new bonds at less than only \$150,000,000. The Government's success in selling its bonds in the United States was a triumph over all other nations, a splendid final result. The Government had sold more than half of the bonds, and Lord Sargent, the British Minister of Finance, had secured a figure of \$300,000,000.

The Coal Situation

THE ASSOCIATE ATTORNEY in Massachusetts in December 1901 took to the study of the situation of colored railroad travel in the State's highways. The first witness was Dr. Henry A. Girard, United States Land Administrator. He told the committee he did not believe that railroads could be relieved until the government took over control of the highways and centralized their management, and that under present conditions of railroad management the position of colored men would always lead to the violation of the railroads in handling it. He stated that in a former commission of rail and coal facilities their witnesses could be improved, but that legal obstacles have heretofore interfered with such examination. Dr. Girard also took under a letter which he had written to Judge Loring, assistant justice superior in December 24, urging a consideration of Federal Order No. 3 to give colored preference in the movement of mail, and the return of equal facilities to the colored. In view of the apparent method of the efforts these are made to relieve the colored and the of transportation and at present requirements from all sides. He thought such an order properly passed would do all residents better than

the United States Fuel Administration and authorized by the priority director in any special instance.

Dr. Garfield also said in part:

"We are now putting into effect plans which will place the entire coal industry on a war basis. These plans will be wholly effective beginning with April 1, 1918, when the present coal year will come to an end.

"In this connection, the Fuel Administration is establishing a zone system of distribution. Under this zone system the output of a given coal field will be assigned generally to a given consuming territory. It will be arranged that the producing field and its consuming territory shall be connected by the shortest possible transportation distance. This will eliminate, so far as possible and practicable, all cross-hauling.

"In order that in 1918 the whole coal output, including the coal which the mines had contracted to deliver, shall be under the direct and effective control of the Fuel Administration, an order has been issued regulating the terms of all contracts for the future delivery of coal. The order makes it plain

that all contracts for the sale of coal or coke are subject to cancellation by the President or by the Fuel Administration acting by his authority.

"The order limits contracts by providing that no contract shall call for the delivery of coal or coke over a period of longer than one year, and the order directs that the year period thus allowed shall terminate not later than 18 months from the date the contract is made. Contracts must be placed at the prices fixed by the President and the Fuel Administration, and must provide that the coal or coke affected by the order is subject at all times to requisition or diversion by the Fuel Administration.

"Contracts made under this order will not be recognized if they involve 'Railroad cross-hauling of coal, except in the case of gas coal or coal to be used for by-product purposes.' This provision will eliminate one of the transportation difficulties now confronting the Fuel Administration, and will insure the movement of coal from mine to consumer along the shortest possible transportation lines."

Accomplishments of the Railroads' War Board

Report to Senate Committee Tells Also of What It Had Hoped to Do and of Its Obstacles

WHAT THE RAILROADS' WAR BOARD has already accomplished in stimulating American railroads to greater efficiency and to cut out unnecessary competitive practices, some things it had hoped to accomplish, and the difficulties that have hampered the railroads in their efforts to secure greater transportation output were outlined in a report to the Senate Committee on Interstate Commerce, by Fairfax Harrison, chairman of the Railroads' War Board, in reply to questions asked by the committee.

The committee asked regarding the increase in traffic being handled and as to "what changes of administration have been adopted within the past year to relieve congestion of freight and increase the efficiency of the railroads, and what further changes in methods of administration would you suggest?"

The railroads had already co-ordinated their activities before their taking over by the government and for eight months have been operated as a unified continental system, said Mr. Harrison, and the increase alone in traffic handled by the railroads in 1917 as compared with that of two years ago has been over 135,000,000,000 ton miles, or substantially equal to the combined total traffic for a year of the railroads of Canada, Germany, Great Britain, Russia, France and Austria. In the first six months after we entered the war, he added, the railroads handled as much freight traffic as they did in the entire year 1906.

Some of the things the War Board had done were described in part as follows: Some of the statistics are omitted because they have been published in these columns heretofore.

Some Things the War Board Has Done

1. Formulated probably the most satisfactory car service rules which the railroads have ever had. Arranged at once to pool box cars so that they circulate as freely over the United States as bank notes, and thereafter arranged to pool coal-carrying cars to promote their equally free circulation and to transfer locomotives from one line to another to meet unusual traffic requirements.

2. Established the most cordial and co-operative relations with commercial bodies, individual shippers, state railroad commissions, manufacturers' associations, etc., through

the organization of six departments coextensive with those of the army and 33 subcommittees of the commission on car service covering the entire United States.

3. In conducting an active campaign for the conservation of facilities through intensive loading of cars, locomotives, etc.

Efficiency of the plant has been increased in every direction. The number of freight locomotives in service has been increased by greater speed in repairing in order to reduce the time in shops. The same result has been accomplished as to freight equipment. Tons handled per car and per train have increased, as have the average miles run per locomotive and per car per day. The resultant effect of all of these economies is shown in the 1,094,800 ton-miles handled per month per locomotive, an increase of 16 per cent, for the six months ending September 30, 1917, and the 14,670 ton-miles handled per freight car, in the same period—an increase of 14.2 per cent—in each case over the preceding year. In effect, this added 4,897 locomotives and 339,427 freight cars to the equipment of the carriers. Two thousand eight hundred and forty locomotives and 141,475 freight cars on the average were ordered annually between 1907 and 1916; this additional equipment, therefore, was equivalent to the immediate delivery, without cost, of one year and nine months' locomotive orders and two years and four months' car orders.

Through the acquiescence of the public and the consent of state commissions, 28,656,983 unnecessary passenger train-miles have been discontinued, resulting in saving 1,800,000 tons of coal per annum, and the release of 570 locomotives and 2,800 train and engine men for freight service.

4. Developed a policy of relocating cars by ordering their movement empty. Since May 1 orders for moving 222,027 cars have been issued, of which 188,286 have been delivered off the initial lines. This change from previous policy is the most radical and far-reaching act that the committee has ever authorized. The movement has been very expensive to the roads that moved the empties, but all orders have been cheerfully and promptly obeyed.

5. Created the co-ordinating committee on exportations, whose function is to assemble information in relation to the

adequacy of the remedy. The co-operation of the public that was there secured should be obtainable elsewhere.

4. To curtail passenger travel greatly by imposition, through the appropriate agencies, of sufficiently restrictive rates.

5. To increase the common use of terminals of one carrier by another. The common use of terminals and running tracks under trackage contracts is by no means uncommon, and under the stress of threatened congestion the principle is being urged and increasingly used.

6. To interest federal authorities in the paramount necessity of providing and conserving railroad labor, which we refer to hereafter in greater detail.

Difficulties That Have Hampered the Railroads

The report added:

We have shown what the War Board has done and what it hopes to do; it is not out of place to mention some of the obstacles in the way of securing greater transportation output.

1. The difficulties presented in handling a movement of freight exceeding by far anything ever experienced were greatly increased by the call to move over 2,000,000 troops, and thereafter to meet the demands created by their absence from home for facilities to visit their families and to permit their families to visit them. This stimulus and that of unparalleled industrial activity have steadily increased passenger traffic, which showed an increase of 23 per cent in October this year over last. The latest data available show increases of 6 per cent and 14 per cent, respectively, in mail and parcel-post traffic (years ended June 30, 1916 and 1917), and 20 per cent in express traffic (nine months of calendar years 1916 and 1917).

2. The serious congestion on eastern lines caused by the abuse of waybill preference envelopes by government agents has already been mentioned.

3. The railroads have not motive power enough. Approximately 3,400 locomotives and 33,000 cars are still under order, the delivery of which has been deferred for military reasons. The national government, recognizing its duty to its allies, determined that it was more necessary, first, that the needs of railways in France, which were to be used by our troops, for 2,331 locomotives, should be taken care of; second, that certain requirements of the British, for 296 locomotives, should be protected; and, third, and most of all, that Russia's requirements, for about 1,600, must be filled. We were told that we must take care of the transportation needs of Russia, and every energy was bent on that, and we were deprived of our locomotives and cars. Many of the 3,400 locomotives still undelivered were ordered by the eastern trunk lines now suffering so severely from congestion, for whose immediate relief 125 locomotives were drafted by the war board, not from lines that could spare them—because there are no lines in this condition today—but arbitrarily from lines outside the congested area. Our railroads, however, are determined to deal with their problems as best they can and get the largest use out of existing plant. We repeat what our executive committee has said publicly, that we believe the American railroads are getting as much service out of the existing plant as is possible by any form of management. There are, of course, more things we can yet do to increase efficiency and public service. These things we hope to do, with the assistance of our associates; we have not had a failure of co-operation by any railroad in the country. The support which we have had has been all that could be given under the most strict government control. We have had the support of shippers and receivers of freight, of commercial bodies, manufacturers' associations, and state commissions.

4. (a) By the impressment of steamships engaged in Atlantic coast traffic, of the Southern Pacific Co., Ocean Steamship Co., and Mallory and Clyde Lines, the railroads have been called upon to transport 962,000 tons of freight, in the

last half of the calendar year, which heretofore has been transported by water.

(b) The New York, New Haven & Hartford, Boston & Albany, and Boston & Maine, serving New England, have actually transported 2,817,000 tons more anthracite and bituminous coal into New England this year than last, in response to the needs of that part of our country that heretofore have been supplied by ocean carriers plying between New York, Philadelphia, Baltimore, and Hampton Roads and New England points.

(c) During the first year's operations of the Panama canal (September, 1914, to August, 1915, inclusive), 2,060,000 tons of freight were handled between Atlantic and Pacific ports of the United States. The vessels handling this traffic were attracted by bids for ocean bottoms in the trans-Atlantic trade at substantially any rate the owner might demand, and with the exception of about 70,000 tons of coal carried by United States Government in its own vessels, the 1916 traffic of the canal was negligible, and continues so; therefore the transcontinental railroads were obliged to furnish facilities to handle substantially all of the 2,060,000 tons above referred to without taking into account the large but unknown increase of traffic following the entry of the United States into the war. To move the above tonnage is equivalent to the constant monthly use during 1917 of 46,200 freight cars and 619 locomotives, or to the entire present freight traffic on about 5,000 miles of line.

5. The railroads are finding it increasingly difficult to keep their equipment, and particularly their locomotives, in proper repair and efficient condition, on account of the shortage of skilled labor. The selective draft and the attractions offered by such rates of pay in munition and government plants as most of the roads are financially unable to meet has resulted in a depletion of the shop forces of the carriers, some reporting a shortage in numbers of as much as 12½ per cent, and all reporting a much greater fall in efficiency due to the necessity of recruiting with unskilled men. The War Board has publicly called attention to these matters and has also suggested to government agencies possible measures of relief, which so far have not been granted. It should not be forgotten that the increased movement of passengers, troops, mail, parcel post, and freight has been accomplished with forces greatly depleted as to number and weakened as to efficiency.

Use of Priority Order

Regarding the extent of the use of priority orders of shipments, and its effect on traffic, the statement said:

The use of requests for priority in car supply and movement has been very general for the past six months or more on the part of the Army, the Navy, and the United States Shipping Board. The original plan contemplated that the Commission on Car Service should be furnished with copies of all such requests, but the method of handling, especially by representatives of the Army, has been lax, and it is believed that there were a great many such requests made on the railroads, direct copies of which never reached us. Furthermore, much of the movement represented by these requests extends into the future, so that it is not possible to make any figures that would fairly represent the volume of traffic that has been handled by the railroads in compliance with requests for preference. It is proper to state that the careless manner in which preference requests have been handled heretofore has now been corrected.

As stated above, however, the blanks for the purpose were used freely and the volume of traffic handled in this manner was undoubtedly large; but it is impossible to state in figures what effect this has had on the movement of other traffic.

The foregoing relates to preference shipments for the United States Government. Added to this have been shipments for the allies, amounting to many thousands of cars, which have been given a degree of preference by special order.

L. E. Johnson and N. D. Maher

PRESIDENT E. JOHNSON, after 30 years with the Norfolk & Western has retired, and N. D. McFarland, president for the last 10 years, has been elected president. When Mr. Johnson went to the Norfolk & Western general superintendent the company had come to the receivership and Henry Fink was president. In the last six months of operation the new company earned a profit of less than \$500,000 over its fixed charges. In the calendar year 1916 the company earned \$1,800,000 in pure profit over fixed charges. This is one of the really great successes.

L. E. Johnson

in the profitable development of a railroad property in the history of the United States. On the one hand there has been most remarkably conservative and successful financing of the company's needs, and on the other hand a degree of foresight in the physical development of the property that has few parallels. Ranking almost in importance with these has been the development of an operating organization that has many of the good points of the Pennsylvania's, and greater flexibility.

The credit for these results belongs to Henry Fink, I. I. Johnson and N. D. Maher, and in a broad way also to beneficent and wise control by the Peurto Rican. Henry Fink, like his older brother, Albert, was a promising student of economics and especially of railroad problems. How far ahead of most of his contemporaries and of the nation in Washington he was is rather strikingly illustrated in a paragraph in one of his annual reports. It *expresses his conviction* that such regulations *could be made effective at least as the Act to Regulate Commerce permits the prohibition or division of competitive lines and the payment of money of any balance that may become due to the weaker transportation lines.* It is hard to tell the Congress at the next session will amend the Act to Regulate Commerce so as to permit the division of competitive lines and the so-called 'pooling.' This was in 1900, the year in which Mr. Johnson came to the N. R. R. & W. Co. I am guessing under the best kind of leadership Mr. Johnson gave his broader training. He had a great deal to do with it.

After the death of F. J. Feltwell—who had been badly wounded when Mr. Fink became commander of the crowd in 1901—and the election of Mr. J. Brown to the presidency of the N. W. R. & W. Co., but with the responsibility and authority already given the company as to its present course. He traces the road, chronologically, as far as it goes. Approaching it only as first construction and the road, but it, toward their meeting, he says and refers to their course with the development as far as it goes. "There are directions the North & Western made a great general picture of the state of conditions which present some more reasonable to make a better conclusion."

[illegible]

D. C. Miller

From March 5, 1902, to September 30, 1903, he was vice-president and general manager, and from September 30, 1903, to February 1, 1904, president and general manager. On February 1, 1904, he was elected president.

N. D. Maher is the man who has built up the Norfolk & Western's operating organization. This organization is the admiration of every railroad man who has studied it. For the combination of simplicity, effectiveness and *esprit de corps* it is almost unique. Even if Mr. Maher had never been elected president of the Norfolk & Western he would have built a monument to American railroad genius that will stand out in history. Mr. Maher knows the 2,000 miles of the Norfolk & Western, its officers and employees in minutest detail; as intimately as a creator knows his masterpiece. Although he has been vice-president for the last ten years only, he has been with the road even longer than Mr. Johnson, having been made chief clerk to the general manager in 1883. Years of service is not really an adequate measure in Mr. Maher's case, because we ordinarily think of a year as about 300 working days. During the last ten years Mr. Maher has lived day and night, day after day and week after week, out on the road. The standard of supervision he set himself was 100 per cent and he more nearly attained it than would have been possible for anyone with a less rugged physique.

Nicholas D. Maher was born at Blairsville, Pa. He began railway work in 1871 as a surveyor on the Pittsburgh, Virginia & Charleston. From 1873 to 1874 he was clerk in the office of the superintendent of transportation on the Pennsylvania at Altoona, Pa., and from 1874 to June 1, 1883, he was clerk in the general superintendent's office. From June 1, 1883, to August 1, 1889, he served as chief clerk to the general manager of the Norfolk & Western; from August 1, 1889, to August 3, 1890, as trainmaster of the Flat Top division; from August 3, 1890, to June 21, 1901, as superintendent of the Pocahontas division. On June 21, 1901, he was made general superintendent of the Seaboard Air Line at Portsmouth, Va.; but on January 3, 1903, returned to the Norfolk & Western as general superintendent. On February 1, 1904, he was made general manager, and from July 1, 1907, to November, 1912, was also second vice-president. In November, 1912, he was appointed vice-president in charge of operation.

The Shepherdsville Collision

THE REAR COLLISION of passenger trains on the Louisville & Nashville, December 20, killing 47 persons, was briefly reported in our last issue, page 1185. A full copy of the statement issued by the railroad company and published in the Louisville papers has since been received and from this are taken the following details which were brought out at Superintendent W. F. Sheridan's investigation. (The local train was No. 41, not No. 9, as given in our account.)

Train No. 41 left Louisville on time at 4:35 p. m. Train No. 7, the through passenger train for Nashville, due to leave at 3 p. m., did not depart from Louisville until 4:53 p. m. No. 41 made its usual local stops and arrived at Shepherdsville six minutes late. It consumed about two minutes in discharging its passengers. It then moved forward, that is, southward, until the rear coach was about 360 feet south of the station building. It here came to a stop for the purpose of backing in upon the siding to permit No. 7 to pass, and almost at that instant No. 7 swept by the station and into the rear of train No. 41. No. 7 plowed through the rear coach and half way through the second coach of No. 41 and shoved the wreckage forward a distance of about 800 feet. The flagman and conductor of No. 41 were in one of the coaches and both were killed. The engineer and fireman on No. 7 were unhurt. * * *

When No. 41 arrived at Brooks, a station five miles north

of Shepherdsville, the conductor received information from the dispatcher that No. 7 had passed F. X. tower at 5:08 p. m. and that if he could not get to Bardstown Junction on time he had better let No. 7 pass at Shepherdsville. As he was leaving Brooks, Conductor Campbell said to his train porter, Earnest Chase, "we are to let No. 7 by at Shepherdsville." At Gap in the Knob, a station between Brooks and Shepherdsville, the train porter asked Conductor Campbell if the engineer understood that he was to head in at Shepherdsville. * * * At Shepherdsville Conductor Campbell went into the telegraph office and himself telephoned to the dispatcher at Louisville and was informed that No. 7 was close and that he had better get into the siding. Campbell came out of the office and told the train porter to inform the engineer to back into the siding for No. 7.

The porter ran forward and delivered this message to the engineer while the train was slowly moving off, and jumping upon the engine he rode it until he reached the south switch, where he alighted. He threw the switch. The effect of this was to display an additional red light to the north as soon as the train had passed the switch. The rear of No. 41 was not protected in any way by its crew as required by the rules, in that no fusee was put out or torpedoes placed between Gap in the Knob and Shepherdsville, though the train was failing to maintain schedule time; and in that no flagman with a red lantern was sent back at Shepherdsville.

After leaving Louisville train No. 7 was stopped one minute at Oak street and one minute at the Southern railway crossing and after that proceeded without any further stops until the collision. The line from Louisville to a point beyond Shepherdsville is double tracked, and trains move under standard American Railway Association rules.

In approaching Shepherdsville the track is straight for a mile and a half, except for one slight curve about half a mile north of the station, which, however, does not affect the view of the signals at the station.

Under the rules, it was the duty of the engineer of train No. 7 to approach the station with his train under control and not to pass it unless he received a "proceed" signal. This signal in the night is the changing of a red light to a green, and the approaching engineer must stop unless he actually sees this movement; that is, the change from red to green.

Upon this occasion the engineer, Wolfenberger, states that he saw the green signal in its then position when he was about 2,200 feet from the station, and that when he was about 1,800 feet from the station he sounded four short blasts, which was a request to the operator to indicate whether he must stop or proceed. The engineer states that he saw no change in the signal and admits that he knew that, not being moved in his presence, it was his duty to stop; but he thought that the signal to proceed would be given later, so he went ahead without taking any steps toward slackening the speed of his train, except that he applied the air brakes lightly. When he was within about 400 yards of the station, still observing that the signal had not been changed, he called again by sounding the four short blasts.

He says that at that time he saw the signal drop to red, and that he then applied his emergency brakes and thought that he closed or almost closed the throttle.

Upon the arrival of No. 41 at Shepherdsville, Operator Jesse Weatherford, as is customary, assisted the agent in handling the baggage, mail and express. He was working at this at about a distance of fifty-five feet from his office, and upon completing it started to return to his office when he met Conductor Campbell coming from his office and was told by him of his conversation with the train dispatcher, and informed him that he, Campbell, was going to move up and back in on the side track to let No. 7 pass. Then

General News

The shops of the Pennsylvania Railroad at Pitcairn, Pa., 15 miles east of Pittsburgh, were damaged by fire on the night of December 26; estimated loss \$35,000.

In a fire at Long Island City, N. Y., on the night of December 30, a storage and office building of the Long Island Railroad was destroyed, together with two freight cars; estimated total loss \$125,000.

The Atchison, Topeka & Santa Fe, which recently announced that it had granted a 10 per cent bonus for the six months' period just ended to unorganized employees, will pay the bonus in regular monthly installments in the coming year with the regular salaries of the men.

By the decision of arbitrators, recently appointed, the telegraphers of the Baltimore & Ohio are to have an increase in pay of 10 per cent—half the amount asked for—and they are granted the 26-day month; that is, they receive extra pay, at regular week day rates, when they work on Sundays.

Because of the importance of the local situation at Baltimore and Washington, where there has recently been a great deal of congestion, a sub-committee of the General Operating Committee of Eastern Railroads has been appointed at Baltimore with M. H. Cahill, general superintendent of the Baltimore & Ohio, as chairman. C. W. Galloway, general manager of the Baltimore & Ohio, has been appointed chairman of the Cincinnati sub-committee, succeeding W. J. Jenks.

Orders relative to providing an adequate supply of bituminous coal to the Pere Marquette, the Seaboard Air Line, the Atlantic Coast Line and the Norfolk Southern have been issued by the United States Fuel Administrator. The order recites that the present method of procuring coal under contract for these roads is causing delay in the shipment and supply of such coal, interference with commercial coal distribution and that an adequate and regular supply of coal for these roads is necessary. The order directs coal operators under contract with these roads to furnish a regular supply of coal each week, provided the mines are in operation.

The United States Civil Service Commission announces an open competitive examination for junior civil engineer, grade 1, for men only, on January 23. Vacancies in the Interstate Commerce Commission under the act providing for the valuation of the property of common carriers at salaries ranging from \$1,320 to \$1,680 a year will be filled from this examination. In addition to salaries, necessary expenses will be allowed during absences from headquarters in discharge of official duties. Competitors will be examined in the following subjects which will have the relative weights indicated: (1) Theory and practice of railway surveying and note book keeping and the mathematics used in this branch of engineering, including algebra, geometry, and trigonometry, but not including calculus, weight 50; (2) Education, training and experience, weight 50. Applicants should at once apply for Form 2039, stating the title of the examination desired, to the Civil Service Commission, Washington, D. C.

Government Steel Prices in Effect Until March 31

The President has approved the recommendation of the War Industries Board that the maximum prices heretofore fixed by the President upon ore, coke, pig iron, steel, and steel products, subject to revision on January 1, 1918, be continued in effect until March 31, 1918. New contracts calling for delivery on or after April 1, 1918, must be subject to revision by any authorized United States Government agency, so that deliveries after that date shall not exceed the maximum price then in force, although ordered or contracted for in the meantime.

Railway Regiments' Tobacco Fund

Last week was one of the best the Railway Regiments' Tobacco Fund has yet experienced, the feature of the week being the announcement that the Railway Business Association will donate \$1,000 to the Fund from the proceeds of its annual dinner. A contribution was also received during the week from the Corning Glass Works, Corning, N. Y., for \$120.

Headlight Order Modified

In view of the pressure upon the railroads for cars and engines to move war materials the Interstate Commerce Commission has postponed the effective date of its order requiring locomotives to be equipped with high power headlights from January 1 to July 1 as to all new locomotives placed in service. For locomotives in service prior to that date the changes required are to be made the first time locomotives are shopped for general or heavy repairs after July 1, 1918, and all locomotives must be so equipped before July 1, 1920.

Freight Bill Clearing Bureau in San Francisco

The three transcontinental railroads serving San Francisco have formed what is known as the San Francisco Railroad Clearing Bureau which, it is believed, will prove a source of economy in settling freight bills. All freight bills except those paid at the station on the delivery of freight will be sent daily to this clearing bureau by the local agents and be scheduled for one transmittal daily to each receiver of freight, who will make but one payment of freight charges to the bureau. G. H. Courtney has been appointed manager of the new bureau. A clearing bureau of this kind has been tried with success at Kansas City where 14 railroads are operating successfully under the plan and it is soon to be put in effect at Chicago.

Prices Fixed for Track Materials

The committee of the American Iron and Steel Institute, in charge of price establishment, has recommended maximum prices on angle bars, standard railroad track bolts, track spikes and scrap rail. The recommended base price per 100 lb. f. o. b. maker's mill for angle bars is \$3.25; for track bolts $\frac{3}{4}$ in. by $3\frac{1}{2}$ in., \$4.90; and for track spikes $9\frac{1}{2}$ in. by $4\frac{1}{2}$ in., \$3.90. The recommended price for old steel rails 56 lb. per yard or heavier and 5 ft. and over in length, suitable for re-rolling purposes is \$33 per gross ton. The recommendation carries with it a set of extras for special requirements and sizes other than those specified for the base prices. Fixed prices are also recommended for bars rolled from old steel rails at a base price of \$3 per 100 lb.

Collision at North Vernon, Ind.

In a butting collision of passenger trains on the Baltimore & Ohio, one mile east of North Vernon, Ind., on December 29, one passenger and seven trainmen were killed and 12 persons were injured. General Manager C. W. Galloway issued a statement, saying:

"The engine crews of both trains were killed and the conductor of train No. 2 (east bound) was injured to such an extent that we have not been able to interview him. Investigation clearly indicates that No. 2 held an order to wait at North Vernon for second 23 (west-bound). For some reason not yet determined this order was disregarded. The automatic signal just ahead of where the engine of No. 2 was standing, while doing station work at North Vernon, and in full view, was in the caution position, indicating that the next signal east, and lo-

3:30 p. m.; 5:08 p. m., and 9:30 p. m. In addition on Sunday night an extra sleeping car section will leave at 11:34 p. m.

The northbound trains on the Pennsylvania for New York will leave Washington as follows: 12:10 a. m. (sleepers and coaches); 12:40 a. m. (sleepers and coaches); 8 a. m.; 9 a. m.; 10 a. m.; 11 a. m.; 2:40 p. m. and 4 p. m. This schedule will eliminate from the northbound service the trains leaving Washington for New York at 12:30 p. m. and 4:27 p. m.

The train leaving Washington at 4 o'clock will replace the "Congressional Limited," and will consist of day coaches, one parlor car and one restaurant car. The "Congressional Limited," southbound, will not be replaced.

The train now leaving Philadelphia at 12:30 p. m. for Washington, will be eliminated, as will also the trains leaving Washington at 4:03 p. m., and 7 p. m. for Philadelphia. The "Federal Express," now leaving Washington at 7:30 p. m., will be changed to leave at 7 p. m., and will accept passengers for points south of New York. The "Federal Express," southbound, will arrive at Washington at 8:30 a. m.—one hour later than at the present time. The "Federal Express" will carry a restaurant car, both northbound and southbound.

In arranging for the reduction of local and commutation service the management has followed the policy of avoiding interference with trains carrying workmen to and from important industrial plants, and also has sought as far as possible, to obviate serious disarrangement of other schedules.

The reduction in the service between Philadelphia and Atlantic City will include the elimination of the bridge train leaving Broad Street station at 1:34 p. m. on week days. But this train will continue to operate on Sundays. The steam trains from Market Street Wharf, Philadelphia, at 9:20 a. m. and 4 o'clock p. m., weekdays, will be withdrawn, as will also be the weekday and Sunday electric trains leaving at 11 a. m., 3 p. m. and 8 p. m. Northbound, the bridge train leaving Atlantic City at 7:45 a. m. will be cancelled, as will also be the steam trains from Market Street Wharf leaving at 9:30 a. m. and 5:15 p. m. The northbound electric trains leaving Atlantic City at 11 a. m., 3 p. m. and 9 p. m. will be taken off. Electric train leaving at 11 p. m. will be changed to leave at 10 p. m.

Train service between New York, Long Branch, Asbury Park, Ocean Grove and Point Pleasant will be alternated between the Pennsylvania Railroad and the Central Railroad of New Jersey, the Pennsylvania Railroad eliminating two round trips under the revised schedules adopted by the two companies.

The train leaving Philadelphia at 8 p. m. for New York will be discontinued. Trains leaving Philadelphia at 8:30 a. m. and New York at 4:20 p. m. will be discontinued between Philadelphia and Trenton. Otherwise the service between those two cities will be practically unchanged, except as it is affected by the discontinuance of through trains.

Train No. 33—(the "Pan Handle Express"), from New York for the West, which now runs into Broad Street station, Philadelphia, leaving there at 4:32 p. m., will be changed to run via North Philadelphia only.

Train No. 34—(the "Seaboard Express"), from the West to New York, which now arrives at Broad Street station, Philadelphia, at 12:24 p. m., will run via North Philadelphia only, arriving at 12:48 p. m.

Changes to become effective on the Schuylkill division have already been announced, and a revised and reduced schedule between Philadelphia and Cape May is already jointly in effect by the Pennsylvania and the Philadelphia & Reading Railway.

Effective January 6, not more than one parlor car will in any case be operated on Pennsylvania trains carrying coaches. Parlor cars will be discontinued entirely on Schuylkill division trains.

In addition a number of reductions will be made in club and restaurant cars, including the discontinuance of the restaurant cars on the 1 p. m. and 7 p. m. trains between New York and Philadelphia, in each direction, and also from train No. 8—(the "Eastern Express").

On the Sunbury division, between Pottsville and Shenandoah, and Pottsville and Sunbury, via Hazleton, 12 or more trains will be withdrawn and the schedules of others revised. The purpose of this is to clear that division for the transportation of anthracite coal to Philadelphia, as the division traverses some of the most important anthracite coal-producing regions on the Pennsylvania.

A number of midday trains will be eliminated on branch lines on practically all portions of the Pennsylvania east of Pittsburgh, to facilitate the movement of coal and other freight.

Traffic News

The Cleveland, Cincinnati, Chicago & St. Louis inaugurated the sailing day plan of handling l. c. l. freight in Cincinnati, Ohio, on January 2.

The Chicago & Alton has lengthened its fast freight schedules between Chicago and Kansas City, Mo., via St. Louis, from 30 and 33 hours to 40 hours.

The final statistics on the movement of the California fruit crop show that 24,628 carloads of deciduous fruit were shipped out of the state in 1917. This is an increase over 1916 of 6,737 carloads, or 37.6 per cent. The total shipments of all the leading varieties of fruit exceeded the 1916 totals, grapes leading the way with an increase of 5,000 carloads.

The postoffice department proposes to establish a mail route by motor car between Philadelphia, Pa., and Easton, 80 miles; and already has started one between Philadelphia and Oxford, Pa., 50 miles. Contracts are being prepared also for a similar run from Pittsburgh, Pa., to Wheeling, W. Va., 60 miles; and another from Pittsburgh to Cumberland, Md., 140 miles. Similar action is contemplated in other States.

Increase in Rates on Canadian Railways

The Board of Railway Commissioners of Canada, on December 26, issued a decision providing for a general increase of 15 per cent in passenger rates throughout the Dominion, except in British Columbia, where the rate at present is three cents a mile. With a considerable number of exceptions the order allows also an increase in freight rates of 10 per cent in western Canada and 15 per cent in the east.

War Department Takes Bush Terminal

The War Department, through Acting Quartermaster General Geo. W. Goethals, has requisitioned the Bush Terminal piers and warehouses in New York City (South Brooklyn). These terminal facilities will pass immediately under the control of the War Department. Eight piers and 130 warehouses will be taken over, leaving to the Bush Terminal Company the railroad terminal and the industrial buildings. It is estimated that the net income of this property at present is more than \$1,000,000 a year. The Bush Terminals and Bush Terminal Railroad represent an investment of about \$20,000,000. The industry covers nineteen city blocks, and contains twenty-one miles of railroad tracks. Its waterfront space is more than 3,000 feet, and factories and other buildings cover nine blocks. The piers that the Government will acquire are each a quarter of a mile in length. The railroad yards can accommodate 2,000 cars, and more than 12,000 persons are employed in warehouses, railroads and manufactories.

Developments in the Coal Situation

Judge Robert S. Lovett, government priority director, has issued a supplement to Priority Order No. 5 granting priority in car supply and in movement of certain preferred commodities, to include in the third subdivision of preferences provided by that order, structural material when consigned to constructing quartermasters for account of contractors engaged in emergency construction work under the cantonment division of the quartermaster general's office. The first and second preferences under the order are given to steam railroad fuel and to livestock, perishable freight, food and feed.

The voluntary curtailment of all-rail shipments of coal to the northwestern states during the next 90 days is proposed by John F. McGee, state fuel administrator for Minnesota, after conferences held by the northwestern administrators with W. H. Grover-

Court News

Improper Packing of Freight

In an action against a carrier for damages caused by the freezing of a shipment of a bottled beverage, the Oregon Supreme Court holds that a carrier to whom barrels containing a bottled beverage were delivered and which transported them without negligence was not liable for any injury due to improper packing of the bottles in the barrels. It was not authorized to open the barrels, but was bound to ship the goods in the form in which they were delivered to it, unless they were manifestly in bad order.—*Michellod v. Oregon-Washington R. & Nav. Co. (Ore.)*, 168 Pac. 620. Decided November 13, 1917.

Removal of Rejected Ties

Cross-ties were placed on a right of way for the railroad's acceptance and use. The company duly inspected the ties, expressly rejected them as unsuited to its needs and so notified the person offering them. In an action against the railroad the Georgia Court of Appeals held that the bare fact that the ties were subsequently removed by some one, it not appearing when, how, or by whom, did not create any presumption that the ties had been accepted and used by the company, and there was no obligation on its part to pay therefor.—*Atlantic Coast Line v. Drake (Ga.)*, 94 S. E., 65. Decided October 31, 1917.

Cost of Short-Distance Passenger-Carriage

The Pennsylvania Public Service Commission dismissed a petition against a railroad company for discrimination in passenger rates. On appeal it appeared that the company charged the same rates of fare to a station 2.7 miles from its terminal as to a station 4.1 miles, and the commission found, from sufficient and competent evidence, that the business between the terminal and the first station was carried on at a considerable loss, and that there was a greater relative cost of transportation to the first station than to the second. The order of the commission was affirmed.—*Bradley v. Pennsylvania*, 66 Pa. Superior Ct. 428. Decided April 30, 1917.

Fencing—Public Roads

In an action against a railroad for killing a horse and a mule the Springfield Court of Appeals holds that the Missouri statute requiring railroads to fence their right of way does not require the fencing of roads which are in fact, though not legally, highways, and a railroad company is justified in omitting to fence, and constructing a crossing for a well-traveled road, the company not being bound to determine the legality of the road. The animals were killed at such a crossing which the public had used as a highway for 10 years. A judgment for the defendant was sustained.—*Walker v. Southwest Missouri (Mo.)*, 198 S. W., 441. Decided November 13, 1917.

Carrying Passenger Past Station—Damages Recoverable Must Not Be Remote

A woman with two little children was carried past her station some four miles because the conductor, when she paid him her fare, failed to tell her the train did not stop there. When the discovery was made that she had been carried by, she became so frightened and excited that she became seriously ill. She was subjected to no insults, inclement weather or to any of the usual causes of sickness or mental anguish, but was politely assisted from the train at the next station, taken by the company's agent to a hotel which was conducted by a woman whom she knew, and on the following morning was returned free of charge to her station, where another friend assisted her to her home. She obtained a verdict from a jury of \$1,250 on which judgment was entered. On appeal this was reversed by the Texas Court of Civil Appeals, which held that her injuries were not the proximate result of the conductor's failure to stop the train at her station, as the probability of such serious consequences could not have been anticipated; and for breach of a contract in carrying a passenger beyond his destination the damages recoverable are limited to those which are proximate and not remote or contingent.—*Gulfi, C. & S. F. v. Nichols (Tex.)*, 198 S. W., 338. Decided October 26, 1917. Rehearing denied November 14, 1917.

Supply Trade News

Frank L. Brown, president of the Ransome Concrete Machinery Company, New York, died Tuesday night in his apartment in that city, from heart disease. Mr. Brown was 57 years old.

The P. & M. Company, Chicago, has established a southwestern sales office in the Railway Exchange building, St. Louis, Mo., in charge of **W. H. Reaves**, who has been associated with this company for the past year.

The Union Supply Company, Chicago, Ill., has opened a branch office in the Call building, San Francisco, Cal., in charge of **A. A. Dawley**, western representative. Mr. Dawley was formerly purchasing agent of the Denver & Salt Lake at Denver, Colo.

E. K. Carter, representative of the Standard Asphalt & Refining Company, Chicago, Ill., has received a commission as captain in the Engineer Officers Reserve Corps and has been ordered to report for active duty at Camp Lee, Petersburg, Va., on January 5.

F. S. Wilcoxon, who for the past nine years has been mechanical representative for the Pilliod Company, New York, has resigned and has accepted a position with the Perolin

F. S. Wilcoxon

Railway Service Company as special representative. Mr. Wilcoxon commenced his mechanical career with the Pennsylvania Company at Wellsville, Ohio. He has served as locomotive fireman and engineer on the C. C. and S. Ry. (now a part of the Wheeling & Lake Erie), also as locomotive engineer and roundhouse foreman on the Alabama Great Southern Railway at Birmingham, Ala., and with the Toledo, St. Louis & Western Railway as locomotive engineer, road foreman of engines, general foreman and division master mechanic. He assumes his duties as special representative of the Perolin Railway Service Company on January 15.

I. R. Garretson, lumber agent of the Chicago & Eastern Illinois, was appointed traffic manager of the Marsh & Truman Lumber Company, Chicago, Ill., effective January 1, to succeed **A. F. Marsh** and **F. L. Bronez**, who have entered the U. S. Army service.

John Henry Goehst, president of the Federal Sign System (electric) and the Federal Electric Company of Chicago, died at his home in Chicago on January 1, at the age of 53. At the time of his death Mr. Goehst was also treasurer of the Mineral Electric Manufacturing Company and construction superintendent of the Commonwealth Edison Company of Chicago.

J. M. Hopkins, president of the Camel Company of Chicago, became chairman of the board of directors on January 1, and was succeeded as president by **P. M. Elliott**, formerly vice-president. **W. W. Darrow**, formerly general manager, is now vice-president, and **A. B. Wegener**, general manager of sales, was made secretary.

Railway Financial News Railway Officers

CHICAGO, ROCK ISLAND & PACIFIC.—The directors on December 28 declared a semi-annual dividend of 1 1/2 per cent on the \$29,743,889 of 7 per cent preferred stock and a semi-annual dividend of 3 per cent on the \$3,000,000 of 6 per cent preferred stock outstanding.

DELAWARE, LACKAWANNA & WESTERN.—The company has declared a quarterly dividend of 5 per cent, payable January 2 to stock of record January 5. Therefore it has been the policy of the directors to declare 20 per cent dividend distributions per annum in the form of four quarterly payments of 5 per cent each and a special dividend of 10 per cent. Henceforth the board will declare quarterly dividends only and omit the special dividend which has been declared once a year of 10 per cent. Thus the quarterly rate is now as high as it is 5 per cent maintaining the same per annum rate as heretofore of 20 per cent.

DENVER & RIO GRANDE.—The Equitable Trust Company of New York, which, as trustee of the old mortgage of the Western Pacific, received last June a judgment of \$32,270,343 against the Denver & Rio Grande, has obtained attachment on New York and in Chicago against certain property at the latter place.

Alvin W. Kreech, president of the Equitable Trust Company, announced on December 31, that in order that the Denver & Rio Grande might not be embarrassed in meeting the interest maturing today on the underlying bonds of the company, the trust company, acting at the instance of the Western Pacific, had offered to loan the Denver & Rio Grande \$1,500,000. This offer, however, was declined at a meeting of the directors of the Denver company. In telling of the Equitable Trust Company's offer, President Kreech said:

"The occasion for the offer arose from the fact that on December 27 the Equitable Trust Company, as trustee for the bondholders of the Western Pacific, which had been guaranteed by the Denver company, brought suit and attached various non-operating assets of the Denver Company located in New York and Chicago in order that a lien might be placed upon those assets to secure the judgment rendered by the United States Court in favor of the Equitable Trust Company as trustee. It was the view of the Western Pacific bondholders that it would be to the interest of all concerned that there should be no lapse in the ability of the Denver company to meet its fixed obligations.

"The reasons for attaching the assets of the Denver company were set forth in a statement issued by the Equitable Trust Company on December 27. Neither the Equitable Trust Company nor the Western Pacific had direct knowledge of the embarrassments of the Denver Company, and the action in bringing suit and levying at suit on December 27 was solely, under the proclamation which the government assumed possession of the railroads of the country, to protect the priority of the rights of the Western Pacific bondholders until settlement of pending suit in the United States court."

DENVER, BOULDER & WESTERN.—The Railway Labor Board Commission has forbidden this company to go into receivership and sell its properties.

ILLINOIS CENTRAL.—The directors on January 1 declared a regular quarterly dividend of 1 1/4 per cent, payable January 1 to stock of record February 1. The stock was 100,000,000 in 1917 on a 10 per cent dividend basis, but there would not be more than \$1,250,000 of 1 per cent for the fiscal year. The total dividend for 1917 was \$1,250,000. This makes this extra part of the dividend.

PENNSYLVANIA RAILROAD.—The Pennsylvania Railroad & Pottsville, having been leased to the Pennsylvania Railroad Company for 99 years from January 1, 1918, the Pennsylvania Railroad Company has designated the Southern Division.

Executive, Financial, Legal and Accounting

Theodore P. Scott has been appointed as assistant treasurer of the Chicago, Rock Island and Pacific. He was formerly assistant treasurer of the Chicago, Rock Island and Pacific.

J. M. Waller is chairman of the board of the Chicago, Rock Island and Pacific. He was formerly chairman of the board of the Chicago, Rock Island and Pacific.

of transportation with headquarters at Chicago, Ill., effective December 26. Mr. Willis was succeeded as chairman of the fuel committee by G. A. Healey, road foreman of locomotives at Galesburg, Ill.

T. M. McLaughlin, assistant division superintendent of the Maine Central with office at Waterville, Me., has been appointed superintendent of the Eastern division, with office at Bangor, vice **M. F. Dunn**, resigned.

F. B. Miller was appointed general superintendent of the Colorado, Wyoming & Eastern, with headquarters at Laramie, Wyo., succeeding **G. R. Simmons**, assigned to other duties, effective December 20.

Joseph W. Foote, superintendent of the Delaware and Jefferson divisions, of the Erie, with office at Susquehanna, Pa., has been appointed superintendent of the Wyoming division and **Edward J. Edmunds**, superintendent of the Wyoming division, with office at Dunmore, has been appointed superintendent of the Delaware and Jefferson divisions.

Arthur DeGarmo, inspector in the freight train department of the Chicago, Milwaukee & St. Paul, was appointed trainmaster of the Racine & Southwestern division with jurisdiction also over that part of the Illinois division from Ashdale to Nabant and from Savanna to Ebner, with headquarters at Savanna. The territory of **D. E. Rossiter**, trainmaster at Savanna, will be confined to the Illinois division except as above, effective January 1.

Charles Burlingame, whose appointment as superintendent of the Terminal Association of St. Louis and the St. Louis Merchants' Bridge Company of St. Louis, with the same headquarters, was mentioned in these columns December 21, was born at Wilmington, Ind., on May 31, 1871. He began his railway career in July, 1886, and from that date to September, 1890, was messenger and clerk in the offices of the agent and superintendent of the St. Louis Bridge & Tunnel Company. From September, 1890, to May, 1899, he was chief clerk to the superintendent of terminals of the Missouri Pacific; from May, 1899, to February, 1900, he was chief yard clerk with the St. Louis, Iron Mountain & Southern; from February, 1900, to August, 1902, he was assistant yardmaster with the same road; from August, 1902, to January, 1903, he was assistant chief clerk in the superintendent's office of the Terminal Association of St. Louis; from January to December, 1903, he was chief clerk to the superintendent of the Terminal Association of St. Louis; from December, 1903, to April, 1907, he was night trainmaster with the same company, and in April, 1907, he was appointed superintendent of the Wiggins Ferry Company, the St. Louis Connecting Railway, the St. Louis Transfer Railway and the Interstate Car Transfer Company, which position he held until his appointment as noted above.

W. J. Jenks, general superintendent of the western general division of the Norfolk & Western, with office at Bluefield, W. Va., has been appointed general manager, with office at Roanoke, vice **A. C. Needles**, promoted; **J. T. Carey**, superintendent of the Scioto division, with office at Portsmouth, Ohio, has been appointed general superintendent of the Western general division, with office at Bluefield, vice **Mr. Jenks**; **H. C. Weller**, superintendent of the Pocahontas division, with office at Bluefield, W. Va., succeeds **Mr. Carey**; **W. O. Franklin**, trainmaster, with office at Bluefield, succeeds **Mr. Weller**; **A. S. Payne** has been appointed assistant superintendent of the Radford division, with office at Roanoke, Va.;

J. W. Robinson, assistant trainmaster, with office at East Radford, has been appointed trainmaster of the Radford division, with office at Roanoke, vice **J. T. Goodykoontz**, transferred, as trainmaster of the Pocahontas division, with office at Bluefield, and **G. H. Gilmer** has been appointed assistant trainmaster of the Radford division, with office at East Radford, vice **Mr. Robinson**.

Traffic

G. B. Haynes, general passenger agent of the Chicago, Milwaukee & St. Paul, with office at Chicago, has assumed the duties of **F. A. Miller**, passenger traffic manager, resigned, effective December 31. Retaining the same title, **T. W. Proctor**, assistant general freight agent, with office at Minneapolis, Minn., has been transferred to Chicago in the same capacity. **A. A. Wilson**, division freight and passenger agent, with office at Des Moines, Iowa, has been appointed general agent of the freight department, with office at Minneapolis. **E. K. Garrison**, division freight and passenger agent, with office at Portland, Ore., has been appointed general agent, with office at Milwaukee, Wis., in charge of both freight and passenger traffic. **W. H. Dodsworth**, general agent, with office at Milwaukee, has been appointed assistant general agent, with headquarters at the same place. **C. E. Hilliker**, Canadian freight and passenger agent, with office at Toronto, Ont., has been appointed division freight and passenger agent, with office at Des Moines.

Engineering and Rolling Stock

R. C. Beaver has been appointed assistant mechanical engineer of the Bessemer & Lake Erie, with office at Greenville, Pa.

P. S. Winter has been appointed general car foreman of the Bessemer & Lake Erie, with supervision over the car department shops at Greenville, Pa.

Douglas Leard has been appointed right of way engineer of the Seaboard Air Line with office at Portsmouth, Va., vice **I. H. Farmer**, who has entered military service.

Charles T. Sugars has been appointed master mechanic of the Louisiana & North West with office at Homer, La., succeeding **J. S. Motherwell**, resigned to go to another company.

J. D. Esposito, assistant chief engineer of the Chicago Union Station Company at Chicago, has gone to Washington with the Emergency Fleet Corporation, and his former duties have been assumed by **A. J. Hammond**, principal assistant engineer.

J. K. Booth, general foreman of the Bessemer & Lake Erie with office at Greenville, Pa., has been appointed master mechanic, with supervision over the locomotive department shops at Greenville, and **E. F. Richardson** has been appointed assistant to the engineer of motive power.

F. M. Seifer has been appointed division engineer on the Sacramento division of the Southern Pacific with office at Sacramento, Cal., to succeed **W. H. Kirkbride**, whose appointment as assistant superintendent of the same division was announced in these columns on December 14.

Thomas Allison has been appointed road foreman of engines on the Pasco division, of the Northern Pacific, with headquarters at Pasco, Wash., vice **C. A. Wirth**, promoted, and **J. H. Weston** has been appointed road foreman of engines on the Minnesota division, with headquarters at Staples, Minn., vice **M. S. Montgomery**, resigned.

Obituary

J. S. Bartle, assistant freight traffic manager of the Atchison, Topeka & Santa Fe, died at Chicago, Ill., on December 26.

S. W. Eccles, president of the Copper River & Northwestern and Nevada Northern, and vice-president of the Bingham & Garfield Railways, died on December 30, 1917, at St. Augustine, Fla.

C. Burlingame

EDITORIAL

Trains of cars and engines labeled U. S. A., instead of with the name or initials of a railroad company, may soon become a common sight on the nation's railroads.

A new report, the other day, described the new system of government ownership of the railroad of the United States with a picture of a passenger train and a

The
U. S. A.
Railroad

a locomotive so lettered on one of the sides of the train. The train was one of the engines, of which a photograph was published in the *Railway Age* *Graphic* of August 17, 1902, and the War Department for service on our railway route at Trenton. One hundred of these have been borrowed temporarily to help some of the eastern roads clear up the congestion of freight. However, the government is apparently contemplating the purchase of additional cars and locomotives for domestic service on the lines it has taken over. The administration bill introduced January 4 to provide the train for the government's use of the railroads provides for an appropriation of \$500,000,000 to be used for "various other purposes, for the purchase of equipment and materials." President Wilson also indicated the possibility that the government would itself buy equipment when he said in his message to Congress: "It is probably too much to expect that even under the unified railway administration sufficient economies can be effected * * * to make it possible to add to their equipment and extend their operative facilities, so much as the present extraordinary demands upon their use will render desirable without resorting to the treasury for the funds." The bill also provides for advances to be made to railroads out of the "revolving fund" for needed expenditures; but cars paid for by the government would not be considered for the common use rather than the property of any one company.

The necessity of producing developed countries a pattern for the high standards of efficiency usually achieved

Railways Create Prosperity

from existing traffic, steps are taken to increase traffic. This motive actuating the policy of providing mail carriers, though selfish, has prevailed to the extent that the development of agricultural and industrial resources and, consequently, generally, has been due to the enterprising James J. Hill was one of the first railroad builders to inaugurate an extensive development policy. Under his direction thoroughbred stock and high grade land were distributed among the farmers. In the Great Northern stock farming was introduced in the early thirties and the agricultural methods were taught by agents attached to the company or loaned by a government school. In 1907 Mr. Hill saved thousands of farmers from financial disaster by extending their credit when the banks had suspended operations. Other policies have been adopted much to encourage settlement and the development of productivity. Special company fares are given to all first class passenger rates fixed to meet the needs of the traveling public.

The Economy of Investigation

President Wilson's Railroad Message

THE MESSAGE regarding government control of the railroads during the rest of the war, which President Wilson delivered to Congress on January 4, has caused much gratification to railway owners, officers and employees. It included a gracious and generous recognition of the fact that no dereliction on their part had caused government control to be adopted, and an explicit statement that no more radical changes would be made in present organizations and methods than are found necessary in accomplishing the war purposes of the government.

"It was in the true spirit of America," said the President, "that we should first try to effect the necessary unification under the voluntary action of those who were in direct charge of the great railway properties. * * * The directors of the railways responded to the need promptly and generously. The group of railway executives who were charged with the task of actual co-ordination and general direction performed their difficult duties with patriotic zeal and marked ability, and did, I believe, everything that it was possible for them to do in the circumstances." But "it had become unmistakably plain that only under government administration can the entire equipment of the several systems of transportation be fully and unreservedly thrown into a common service without injurious discrimination against particular properties." The President added: "Nothing will be altered or disturbed which it is not necessary to disturb. We are serving the public interest and safeguarding the public safety, but we are also regardful of the interest of those by whom these great properties are owned and are glad to avail ourselves of the experience and trained ability of those who have been managing them."

These words of the President are as good an answer as can be made to those who charge now, and to those who may allege in future, that private control of railroad management was superseded during the war because it was "inefficient." The managers of the railways, the President declares, did as well as they could "in the circumstances." This is a frank statement that there were circumstances in the absence of which they could have done better. What were those circumstances?

The answer as to some of them is to be found in the things which the Director General of Railroads has done since he took office. He has ordered the managements of all the railways to route traffic over the most direct open routes regardless of the effects on earnings. The Railroads' War Board did not assume the responsibility of issuing such a sweeping order, because to have handled freight regardless of the effects on the earnings of individual lines to any greater extent than was necessary to move the business would have been to do unnecessary harm to some individual lines. Such harm could have been avoided if the railways had been legally authorized to pool their earnings. Such harm cannot be done by the Director General's order, because the income of individual lines is to be guaranteed.

One of the "circumstances" which greatly embarrassed the private managers of the railways was the abuse of freight preference orders by representatives of the various government departments. One of the first acts of the Director General was to suspend all priority and preference orders. He has the legal power to do this. The Railroads' War Board did not have it.

Another of the "circumstances" which embarrassed the managers was their inability to accelerate the movement of cars by securing prompter loading and unloading. They could not increase demurrage rates without the consent of state and interstate commissions. The Director General does not have to heed laws or orders of commissions regarding demurrage. Therefore, he has ordered a general increase in demurrage rates of 50 to 100 per cent, and it is understood that still greater increases may be made. It is also

understood that the free time allowed for loading and unloading cars may be reduced. The Director General can do this without the consent of anybody. The railroad managers could not do it without the consent of the numerous regulating bodies.

Whatever may be the disadvantages of government control of management in time of war, it certainly has some advantages. But since, as the President pointed out, it can use methods which private management was not allowed to use, and since some of them are methods which even government management might not be allowed to use in time of peace the results will hardly afford any very instructive lessons as to the relative merits of government and private management in time of peace.

Proposed Legislation for War Control of Railroads

IMMEDIATELY after President Wilson delivered his message regarding railroad control to Congress on January 4, a bill embodying the Administration's views as to the financial and other arrangements which should be made during the period of control was introduced in both branches of Congress. The most interesting provisions of this bill are those relating to financial terms, and to the duration of government control.

The salient provision of the financial sections of the bill is that the President is "authorized to agree with and guarantee to any such carrier that during the period of federal control it shall receive as its just compensation an income at an annual rate equivalent as nearly as may be to its average net railway operating income for the three years ending June 30, 1917." The use of the term "net railway operating income" has caused much confusion and discussion. It has never had any place in the published statistical reports of the Interstate Commerce Commission. Probably a provision will have to be added to the bill clearly stating what it means.

We believe, however, that the intent of the measure is clear. This is to secure to each railway annually a rate of return equal to the average annual rate of the return which it earned in the three years mentioned for the payment of interest and dividends, and for other uses of benefit to its security-owners, such as investment in the property. If this be the intent of the bill its provisions fail to give it full effect. For example, between June 30, 1917, and December 31, 1917, there was an increase of the investment in road and equipment. A net return based on the results of the three years ending June 30, 1917, would apparently provide no return on this increased investment. This defect of the bill can be remedied by providing for the same rate of return on this additional investment as is to be allowed on investment made before June 30, 1917; or for the same rate of return as may be agreed upon for investment made during the period of federal control.

The real issue, so far as financial return is concerned, is as to whether the return earned in the three years ending June 30, 1917, or the return earned in some other period, shall be guaranteed by the government. Some members of Congress contend that the two years ended on June 30, 1916 and 1917, were unusually good for the railroads and that, therefore, the guarantees provided by the bill would be too large. On the other hand, spokesmen for the railroads contend that the years 1916 and 1917 taken together were not extraordinarily favorable to the railways, while the fiscal year 1915 was the most unfavorable to them for 15 years, and that, therefore, the fiscal year 1915 should be excluded and the two years ended June 30, 1917, taken as the basis.

This divergence of view is not surprising. There are some prominent members of Congress who have been largely responsible for the system of government regulation which

made a comparison of private net income of the railways during the war period 1914 and when transportation thereunder careers have promoted incomes which railway men have regarded as satisfactory. Agreement between the two was reached those of representatives of the railways was half of what was expected. There is some merit in the contention of both sides. It is true that the fiscal year 1914 was the year for the railways since the year ending following the year of 1893 and that the fiscal year 1916 was the last that the railways ever had. The year ended June 30, 1917 was not as good as 1914, but was much better than 1915. The average operating income of the three years was recorded by J. Keith Smith in his testimony before the Senate Interstate Commerce Committee at 7.6 per cent. The *Railway Age's* estimate is a little less than that, but the exact figure would be around 8.4 per cent. This is less than was earned in 1906, 1907, 1908, 1910, 1916 or 1917.

When the government fixed the prices of wheat, of iron and steel and of coal it fixed them at less, much higher than those which prevailed before the war began in Europe, and which enabled the producers to earn larger percentages of return than they were able to earn in the pre-war period. The government having taken control of the management of the railroads away from their owners, it ought to guarantee them a reasonable return, and a return less than returns earned in years of normal gross and net earnings would not be reasonable. It would hardly be contended that the years 1901 to 1910 were abnormally favorable to the railways, and yet in that period, according to the reports of the Interstate Commerce Commission, the operating income of the railways amounted to about 5.4 per cent. No basis less favorable than that recommended by the President should be adopted by Congress, nor could it be accepted by many railroads. Therefore the adoption of any less favorable basis probably would result in protracted and harmful litigation.

One of the most interesting sections of the bill is Section 13, which provides that "the federal control of transportation systems herein and heretofore provided for shall continue for and during the period of the war and until Congress shall thereafter order otherwise." (The italics are ours.) There are two fundamental objections to this provision. First, it probably is unconstitutional. The government, as a war measure, can assume control of the operation of the railways while still privately owned, but that it can constitutionally retain control of their management as long as it pleases after the war seems highly improbable. Second, the government ought not, as a matter of public policy, or in justice to the owners of the railroads to keep possession of the roads any longer than the war emergency and the subsequent necessary readjustment of the relations of the government and the companies make imperative.

Probably it will be both desirable and constitutional for the government to retain control for a brief period after the war. Some important readjustments doubtless will have to be made at that time. For example, the government may so control management that the operating income of many roads will become insufficient to pay their expenses, fixed charges and ordinary dividends. In that case, there ought to be some readjustment of passenger and freight rates before the government guarantee is withdrawn. But the length of time after the war the railways are to be retained by the government should be fixed in law. Perhaps a year will be required for readjustments, but it seems likely that six months will be enough.

It is unfortunate that a provision of this kind should have been put into a bill the sole purpose of which was supposed to be to carry out the President's program for government control as a war measure. The wording of the provision makes it read like a "joker" having a purpose quite different from that of the rest of the measure. It sounds too much as if it was intended to subject the owners of the railways to the necessity of making a fight to get their properties back.

If it is for a limited only, the statement in the President's program that "nothing will be gained or accomplished if it is not necessary to bring it."

The Wage Problem

A common contention that the government may find it difficult to control the wages of the general wage community, and the same may hold in the case of the railway community, is based on the fact that the wages of the railway community are not of the same nature as those of the general community. One of General Counsel McAdoo's last official act was to issue a plan of settlement of the demands of the thousands of railway employees for a wage increase to which he will fix their wages on the basis of a report made to him by a committee of his constituents.

There will not be an official bill administered out of the government. The purpose of this is to settle the railway employees at a time when their services are going out to the nation and when the cost of living has been increased as a result of conditions created by the war. Some Mr. McAdoo will have to deal with more demands from other railway employees whose services are also essential and most of whom can show a greater need for an increase than can the better paid train employees. There also stands to be set out for themselves the attitude of the government to its employer.

Aside from the effect of the increased cost of nearly all necessities of life, the government will find it difficult to refuse higher wages not only because it cannot afford the argument of the private employer that it cannot afford to pay them, but also because it must recognize the fact that many of these men cannot be retained in the railway business unless their compensation is made more attractive as compared with that offered in munition plants and especially by the various contractors for government work who are bidding for labor.

The railroads have already been seriously injured by the loss of thousands of mechanics and other mechanics because they could not afford to pay as much as other employers. They could not do so because their own revenues were subject to a regulation which took no account of increased expenses, but now the government can raise wages so it does not and delay the cost either from taxation or by raising the rates for freight and passenger travel.

But there comes the rail. Many of the government contractors are being paid on the basis of cost plus a percentage and within certain limits the more the cost the greater are their profits. It is even said in good authority that one of the causes of the freight congestion has been their reluctance to demurrage charges. If the government paid more as they do, and there are available men now working for the railroads, it can then position to pay the amount necessary to attract them.

The government would like to pay as much as companies making railroads and among some other private companies for the purpose of getting in new work. But the government cannot afford to do so and it is not possible to do so as long as the government and its railway employees.

Knowledge of railroads having failed, some of the public, some of the government, and some of the private have to effect the situation, but it is not possible to do so as long as the government is paying as much as the private.

C. C. Thompson, Washington correspondent of the *Washington Post*, says that the government will find it difficult to control the wages of the railway community. He says that the government will find it difficult to control the wages of the railway community. He says that the government will find it difficult to control the wages of the railway community.

fec. Just as he had congratulated himself on having performed the operation successfully his wife called to him: "John, it's twins," and hardly had the twins been properly received into the family when she called to him again. In despair John telephoned to the doctor: "Come quick, I have started something I can't stop."

Government's Fairness Calls for Loyal Response

THE GOVERNMENT is playing fair with the railways, and with their officers and employees. They should play fair, and more than fair, with it in return, and give it the most efficient service of which they are capable.

When it was announced that President Wilson intended to take control of railroad management on behalf of the Government, profound fears were felt and expressed by railway security-owners, officers and employees as to the way in which this would be done and the effects which it would produce.

It was feared that security-owners might be unjustly dealt with, and that the result would be financial disaster. The plan of compensating security-owners which President Wilson has proposed, while not generous, is not entirely unfair, and if adopted by Congress, will tend to stabilize the financial situation.

It was feared that there would be put in control of railroad management some man without railroad experience and proved administrative capacity, who would surround himself with and act upon the advice of a cabinet of transportation theorists and amateur social and economic reformers. On the contrary, the President appointed as director general of railroads a man with railroad experience who had demonstrated great administrative ability in several fields; and the director general has been getting his advice on matters of public policy chiefly from members of the Interstate Commerce Commission and on matters of railroad administration chiefly from prominent and experienced railroad managers.

It was feared that politics would influence railroad control; but politics has not yet been in evidence.

Of course, no one knows whether Congress will adopt the President's financial plan, or whether the administrative policies thus far followed by Director General McAdoo will be permanently carried out. But while railway officers opposed and dreaded the adoption of government control itself, there has not yet been anything done or officially proposed to be done under government control which has tended to justify their former apprehensions or to render it difficult for them to give unstinted loyalty and support to Mr. McAdoo.

The effects of the adoption of the fair course of the Government already are manifest. The period of greatest uncertainty and apprehension being past, railway officers, from top to bottom, are working as hard under the new form of control as they did under the old. There has been evident, recently, an impairment of official morale, the effects of which will be felt for some time; but the morale itself is being restored, and a continuance of the course which Director General McAdoo is taking will be admirably adapted to maintain it.

But something more must be done than merely maintain it. It must be improved. It must be improved because the material interests of the nation and the successful prosecution of its part in the war demand it. If the Government made a mistake in not leaving the management of the railways entirely in the hands of their own officers, then it is the duty of their officers to spare no effort to reduce the harmful effects of that mistake to a minimum. If it did not make a mistake—if the present system actually is better adapted, as a war measure, to securing good results than a system of

complete private management would have been—then it is the duty of railway officers to make the present system the most complete success possible. The demands of traffic are constantly growing; the difficulties of handling it are constantly increasing; and only by increasing the energy and efficiency with which they work can railway officers hope successfully to cope with the situation.

And in doing their work one point which it is of the greatest importance they should never for a moment forget is that, under the present system of management, every vestige of the competitive rivalries of other days must be rigorously suppressed. The one great purpose to which the Government wishes all energies directed is that of *moving the business*; and the production of evidence that railway men were using any part of their energies to hold business for the individual lines on whose payrolls they happen to be, or to get it from other lines, would do the cause of the railways great and permanent harm. So long as the present scheme of control exists all railway men must regard themselves as working for a single railroad system and do all things with the one purpose of making the operation of that single system as efficient as energy and brains and ability, and the finest co-operation and patriotism, can make it.

This is the course which the fair policy the Government is taking invites. It is the course which the selfish interests of railway men and of the railways themselves enjoin. It is the course which patriotism demands. And it is the course which, we predict, railway officers will follow from now to the end of the war with a loyalty and enthusiasm which will confound their critics, vindicate their defenders and be of inestimable value to the nation.

New Books

Railway Accounting. By Irvile Augustus May, C. P. A. vice-president, American Electric Railway Accountants' Association. Published by the Roland Press, New York. Half leather. 454 pages. Price, \$5.

This is the first authoritative and comprehensive work, so far as we know, covering street railway accounting. Mr. May, in addition to being second vice-president of the American Electric Railway Accountants' Association, is comptroller of the Connecticut Company and auditor of the Berkshire Street Railway. The sub-title of the book is really more accurately descriptive of its nature than is the title. It is more than a book on street railway accounting and is quite truly "a manual of operating practice for electric railways." Mr. May takes the system of accounts prescribed by the Interstate Commerce Commission for street railways as the basis of the various systems of street railway accounts which he touches on and then describes very clearly and in a quite remarkably interesting way the procedure required in applying the Interstate Commerce Commission's classification to actual conditions. The book is divided into three main subjects of discussion: (1) the organization of the accounting department; (2) accounting work mainly outside the comptroller's office, and (3) accounting work mainly inside the comptroller's office. There is a fourth part of the book which describes various forms which are in the nature of operating statistics. In the second part of the book there is contained a full description of methods of street railway operation. Although the main purpose of the author is to describe how the records of the company are kept, the corollary of making the operations themselves clear before the reader's mind is of almost equal importance. The book should be read by all bankers, bond buyers and salesmen who deal in public utility securities. It should be of interest also to steam railroad accounting officers and executives who are interested in street railway properties because of ownership or as a closely allied industry.

Letters to the Editor

Average Life of Ties for Valuation Purposes

TO THE EDITOR:

The statement is frequently made by writers on valuation, that on an old, well maintained railroad, where individual ties have been replaced at the end of each one's useful life, so that the present ties are a fair mixture of old, middling, and new, the average "life remaining unexpired" of all the ties in the track at any time is equal to half the average life of ties. This statement has apparently been very generally accepted as self-evident and axiomatic, and upon it is based the figure for depreciation of ties, 50 per cent, which the Division of Valuation of the I. C. C. seems to favor.

As a matter of fact, this statement is true only if every tie has the same length of life. Actually, of course, the life of individual ties varies above and below the average life. If it varies uniformly all the way from zero to twice the average, as assumed by Mr. Kruttschnitt in his letter published in your issue of December 21, the average "life remaining unexpired" is two thirds of the average life instead of one-half, and the depreciation is 33 1/3 per cent, not 50 per cent. The actual condition is somewhere between these two extremes; not all the ties will have exactly equal life, neither will their lives vary so widely as from zero to twice the average. If we assume a range of individual lives from 25 per cent to 175 per cent of the average life, then the average "life remaining unexpired" is 0.594 of the average life, and the depreciation is 40.6 per cent. If the average life of all the ties be represented by L, and the maximum and minimum lives of individual ties by L + BL and L - BL, then the general expression is:

$$\text{Average "Life Remaining Unexpired"} = \left(\frac{1}{2} - \frac{B^2}{6} \right) L$$

Values worked out from this expression for various values of B are given below:

| B | Average "Life remaining unexpired" | Depreciation per cent |
|------|------------------------------------|-----------------------|
| 0.0 | 0.5 | 50.0 |
| 0.1 | 0.5017 | 49.83 |
| 0.2 | 0.5067 | 49.33 |
| 0.3 | 0.515 | 48.5 |
| 0.4 | 0.5267 | 47.33 |
| 0.5 | 0.5417 | 45.83 |
| 0.75 | 0.6038 | 40.62 |
| 1 | 0.6667 | 33.33 |

The correction given above may be derived in several ways and is capable of rigid mathematical proof. The following demonstration avoids higher mathematics. Assume that the average life of ties is 10 years, and that the life of individual ties varies from 0 to 20 years. Consider a single tie location and suppose it filled successively by a series of ties covering the entire range from long life to short life. In the year 1900 a 20 year tie is installed, then replaced in 1920 by a 19 year tie, in 1919 by an 18 year tie, etc. The "life remaining unexpired" is in 1900, 20 years; in 1901, 19 years, etc., falling each year until 1919, rising then to 19 years, and so on. These values, if plotted at arbitrary on a base representing years elapsed, form a series of similar right triangles having altitudes decreasing regularly from 20 to 0. The average ordinate of such a series is 1/3 the maximum altitude, or 6 2/3 years. This is the average value throughout the term of the average "life remaining unexpired," and is 2/3 of the average life which checks the value given in the second paragraph and appearing in the table for B = 1. The same result may be obtained by adding up the value of average "life remaining unexpired" for each year of the term and dividing by the number of years in the term.

Another simple line of reasoning, also, shows that the statement referred to in the opening paragraph is incorrect. Imagine a track equipped with two kinds of ties in equal quantity, having lives of 5 and 15 years, respectively, averaging 10 years. Equal quantities of the two kinds are purchased for replacements. For simplicity, ties having lives between these values are ignored. It is obvious that after a few years, more of the short life ties will have been retired than of the long-life ties, and as replacements will be made with equal quantities of long-life and short-life ties, there will come to be a preponderance of long life ties in the track. As the long-life ties have an average "life remaining unexpired" of 7 1/2 years, and the short-life ties 2 1/2 years, and there are more of the former than of the latter, the grand average "life remaining unexpired" will be not 5, but more than 5 years.

The writer has no data on the actual range of the life of ties above and below the average life, but if even so limited a range as from 50 per cent to 150 per cent be agreed upon, (B = .5), so that the depreciation is changed from 50 per cent to 45.83 per cent, the aggregate valuation of the ties on the railroads in this country will be increased by about \$40,000,000.

President Wilson's Railroad Message to Congress

Asks It Ungrudgingly to Protect the Security Values and Maintain Solidity of Credit Structure

URGING THE IMPORTANCE of maintaining the unquestioned solidity of the structure of railroad credit, President Wilson in his address before a joint session of the Senate and House on January 4 asked Congress to pass "ungrudgingly" and as "promptly as circumstances permit" the legislation he had promised to recommend in his statement accompanying his proclamation taking over the railroads. The holders of stocks and bonds, he said, should receive from the government an unqualified guarantee that their properties should be maintained throughout the period of federal control in as good repair and as complete equipment as at present, and that the several roads will receive under federal management such compensation as is equitable and just alike to their owners and to the general public. As a basis he suggested the average net railway operating income of the three years ending June 30, 1917. It will probably be necessary also, he said, to resort to the national treasury for funds to add to the railway equipment and extend their operative facilities, and the Secretary of the Treasury will advise with the proper congressional committees if it becomes necessary to ask for grants of money for that purpose, but for the present he asked only the guarantees and such appropriations as are necessary at the outset of the task. The administration bill providing for an appropriation of \$500,000,000 and fixing other terms for the exercise of government control was introduced later in the day.

While he emphasized the necessity for a single and unified direction of the railroads and the common use of all facilities which he thought could be obtained only under government administration, no criticism of the railroads is either expressed or implied in the message. On the contrary, the President said that it was right first to try to effect the necessary unification by voluntary action and that the railway executives who constituted the Railroads' War Board "did everything that was possible for them to do in the circumstances." The task was taken out of their hands "not because of any dereliction or failure on their part" but "only because there were some things which the government can do and private management cannot."

Under the new regime, the President asserted "nothing will be altered or disturbed which it is not necessary to disturb" and "the interest and convenience of the private shipper will be as carefully served and safeguarded as it is possible to serve and safeguard it in the present extraordinary circumstances."

The text of the message follows:

The President's Address

Gentlemen of the Congress: I have asked the privilege of addressing you in order to report to you that on the 28th of December last, during the recess of the Congress, acting through the Secretary of War and under the authority conferred upon me by the act of Congress approved August 29, 1916, I took possession and assumed control of the railway lines of the country and the systems of water transportation under their control. This step seemed to be imperatively necessary in the interest of the public welfare, in the presence of the great tasks of war with which we are now dealing. As our own experience develops difficulties and makes it clear what they are, I have deemed it my duty to remove those difficulties wherever I have the legal power to do so. To assume control of the vast railway systems of the coun-

try is, I realize, a very great responsibility, but to fail to do so in the existing circumstances would have been a much greater. I assumed the less responsibility rather than the weightier.

I am sure that I am speaking the mind of all thoughtful Americans when I say that it is our duty as the representatives of the nation to do everything that it is necessary to do to secure the complete mobilization of the whole resources of America by as rapid and effective means as can be found. Transportation supplies all the arteries of mobilization. Unless it be under a single and unified direction, the whole process of the nation's action is embarrassed.

Railway Executives Praised

It was in the true spirit of America, and it was right, that we should first try to effect the necessary unification under the voluntary action of those who were in charge of the great railway properties; and we did try it. The directors of the railways responded to the need promptly and generously. The group of railway executives who were charged with the task of actual co-ordination and general direction performed their difficult duties with patriotic zeal and marked ability, as was to have been expected, and did, I believe, everything that it was possible for them to do in the circumstances. If I have taken the task out of their hands, it has not been because of any dereliction or failure on their part, but only because there were some things which the government can do and private management cannot. We shall continue to value most highly the advice and assistance of these gentlemen and I am sure we shall not find them withholding it.

It had become unmistakably plain that only under government administration can the entire equipment of the several systems of transportation be fully and unreservedly thrown into a common service without injurious discrimination against particular properties. Only under government administration can an absolutely unrestricted and unembarrassed common use be made of all tracks, terminals, terminal facilities and equipment of every kind. Only under that authority can new terminals be constructed and developed without regard to the requirements or limitations of particular roads. But under government administration all these things will be possible—not instantly, but as fast as practical difficulties, which cannot be merely conjured away, give way before the new management.

The common administration will be carried out with as little disturbance of the present operating organizations and personnel of the railways as possible. Nothing will be altered or disturbed which it is not necessary to disturb. We are serving the public interest and safe-guarding the public safety, but we are also regardful of the interest of those by whom these great properties are owned and glad to avail ourselves of the experience and trained ability of those who have been managing them. It is necessary that the transportation of troops and of war materials, of food and of fuel, and of everything that is necessary for the full mobilization of the energies and resources of the country should be first considered, but it is clearly in the public interest also that the ordinary activities and the normal industrial and commercial life of the country should be interfered with and dislocated as little as possible, and the public may rest assured that the interest and convenience of the private shipper will be as carefully served and safeguarded as it is pos-

sible to serve and safeguard it in the present extraordinary circumstances.

Should Receive Unqualified Guarantee

While the present authority of the executive suffices for all purposes of administration, and while of course all private interests must for the present give way to the public necessity, it is, I am sure you will agree with me, right and necessary that the owners and creditors of the railways, the holders of their stocks and bonds, should receive from the government an unqualified guarantee that their properties will be maintained throughout the period of federal control in as good repair and as complete equipment as at present, and that the several roads will receive under federal management such compensation as is equitable and just alike to their owners and to the general public. I would suggest the average net railway operating income of the three years ending June 30, 1917. I earnestly recommend that these guarantees be given by appropriate legislation, and given as promptly as circumstances permit.

I need not point out the essential justice of such guarantees and their great influence and significance as elements in the present financial and industrial situation of the country. Indeed, one of the strong arguments for assuming control of the railroads at this time is the financial argument. It is necessary that the values of railway securities should be justly and fairly protected and that the large financial operations every year necessary in connection with the maintenance, operation and development of the roads should, during the period of the war, be wisely related to the financial operations of the government. Our first duty is, of course, to conserve the common interest and the common safety and to make certain that nothing stands in the way of the successful prosecution of the great war for liberty and justice, but it is also an obligation of public conscience and of public honor that the private interests we disturb should be kept safe from unjust injury, and it is of the utmost consequence to the government itself that all great financial operations should be stabilized and co-ordinated with the financial operations of the government.

Should Preserve Values

No borrowing should run athwart the borrowings of the federal treasury, and no fundamental industrial values should anywhere be unnecessarily impaired. In the hands of many thousands of small investors in the country, as well as in national banks, in insurance companies, in savings banks, in trust companies, in financial agencies of every kind, railway securities, the sum total of which runs up to some ten or eleven thousand millions, constitute a vital part of the structure of credit, and the unquestioned solidity of that structure must be maintained.

The Secretary of War and I easily agreed that, in view of the many complex interests which must be safeguarded and harmonized, as well as because of his exceptional experience and ability in this new field of governmental action, the Hon. William G. McAdoo was the right man to assume direct administrative control of this new executive task. At our request, he consented to assume the authority and duties of organizer and director general of the new railway administration. He has assumed those duties and his work is in active progress.

It is probably too much to expect that even under the unified railway administration which will now be possible sufficient economies can be effected in the operation of the railways to make it possible to add to their equipment and extend their operative facilities as much as the present extraordinary demands upon their use will render desirable without resorting to the national treasury for the funds. If it is not possible, it will, of course, be necessary to resort to the Congress for grants of money for that purpose. The

Secretary of the Treasury will, given with your commission with regard to that very practical aspect of the matter. For the present I suggest only the broadness I have mentioned and such appropriate details as are necessary at the outset of the task. I take the liberty of expressing the hope that the Congress may arise then promptly and unhesitatingly. We are dealing with great matters and with, I am sure, deal with them greatly.

To Investigate Wage Demands

DIRECTOR GENERAL McADOO on January 4 arranged for a plan of settlement of the wage demands of the brotherhoods of train employees after two days of conferences with their executive officers and legislative representatives.

He will appoint a committee of four to investigate the question and submit to him a report as a basis for his decision. The brotherhoods were asked to suggest to him the names of possible members of the committee. Mr. McAdoo announced the plan in the following statement:

"I have had a gratifying conference with William G. Lay, president, and W. N. Doak, vice-president, Brotherhood of Railroad Trainmen, A. B. Garretton, president, and W. M. Clark, vice-president, Order of Railway Conductors, W. S. Carter, president, and P. J. McNamara, vice-president, Brotherhood of Locomotive Firemen and Engineers, and H. E. Wills, assistant grand chief, Brotherhood of Locomotive Engineers, as to the relations of the employees to the railroads while under Government control and the demands which have heretofore been presented by some of the brotherhoods to the railroad companies. I have been impressed with the spirit of co-operation and fairness shown by the brotherhood chiefs in their discussions with me, and feel confident that an adjustment fair to the men as well as to the country will be reached.

"As a result of the discussion, I have determined to appoint a committee of four representative men, whose negotiations will be a guarantee of fair dealing to all, to make a full investigation of the whole matter and report their findings and conclusions to me at the earliest possible moment. The names of the members of this committee will be announced in a few days.

"As soon as the committee makes a report the Attorney general will render a decision which will be effective as to wages from January 1, 1918. Every employee affected by this inquiry may, therefore, devote himself unreservedly and patriotically to his work with the assurance that his rights and interests will be justly dealt with.

"This is a time of great stress, and the attitude of every employee should be determined by the supreme need of the hour—duty to his country first of all. I cannot state too strongly the necessity for devoted and loyal service by every man in this emergency. Every railroad employee is now in effect a government employee and as much in duty bound to give his best service to his country as if he were in the uniform of the United States army and occupied the trenches at the front. Every unnecessary delay in a train movement vitally affects our soldiers and sailors and wounds impair our ability to defend our rights and our freedom. Every man whose neglect or indifference causes such delays must be responsible for the loss of the son of some noble American mother or father. It is as serious to the country for an employee to be slack in his work as for a man to be a laker in the army.

The present serious emergency and actual suffering for the want of coal and other supplies will be greatly increased and not be entirely remedied if every employee will do his utmost in his present task. In the name of patriotism

therefore, for the protection of our sons abroad and for the safety of the nation, I hope that every man, wherever placed, will do his level best. Let us who stay at home be ashamed not to be willing to make sacrifices equally as great as those our gallant sons are already making for us on the bloody fields of France."

While this plan applies only to the demands which have been presented by the conductors, trainmen and firemen, it would undoubtedly be applied also to any similar demands from other employees.

Mr. McAdoo has been informed by railroad executives that one of their greatest difficulties has been the shortage of labor due to the draft and enlistments and to the loss of men, especially machinists, to other industries that could afford to pay higher wages.

Parcel Post Routes by Motor Trucks to Be Extended

THE POST OFFICE DEPARTMENT announces that within, perhaps, the next three months motor truck parcel-post routes will be in operation in various parts of the country aggregating between 3,000 and 4,000 miles. One chain of motor routes will extend from Portland, Me., to New Orleans. Another will cover much of a large stretch of territory in Ohio, Indiana, Illinois, and West Virginia. On the Pacific coast routes will be established between San Francisco and Sacramento, Cal., via Stockton and Fruitdale, a distance of 125 miles, and between Redlands and Los Angeles, Cal., via Ontario and Pomona, Cal., a distance of 76 miles.

It is the belief of the Post Office Department that the operation of these routes and others to be established will materially aid in the distribution and in lowering the cost of food products.

The existing law does not provide for the employment of government-owned motor trucks on rural-delivery routes, nor does it require the rural carriers to use motor vehicles.

In the star-route service, however, where the mail is carried under contract, a recent law permits the Post Office Department to designate the sort of vehicles to be employed, and in awarding new contracts the department will specify that motor trucks shall be employed on all routes where the roads are such as to admit of their use. These contracts are advertised for bidders, and where payment asked for the service is deemed to be excessive the department is authorized to provide government-owned motor trucks and to employ drivers for the operation of these routes.

A further extension of the employment of government-owned motor vehicles by its adoption for the parcel-post service of the rural routes will be made whenever Congress enacts a law now pending for that purpose.

Operating under the law as it now stands as applied to the star-route service, motor-truck routes, some under contract and some operated with government-owned motor trucks, are in process of establishment from New York City to Port Jervis, N. Y., via Belleville, Montclair, and Dover, N. J., a distance each way of 86 miles; New York City to Hammonton, N. J., via Mount Olive, Bordentown, Trenton, Princeton, and Elizabeth, N. J., a distance each way of 114 miles; New York City to Easton, Pa., via Montclair, Morristown, and Somerville, N. J., a distance each way of 94 miles; New York City to New Milford, Conn., via Pawling, Yorktown Heights, Briar Cliff, and Yonkers, N. Y., a distance each way of 91 miles; New York City to Hartford, Conn., via White Plains, N. Y., Danbury, and Waterbury, Conn., a distance each way of 105 miles; New York City to Port Jervis, N. Y., via Goshen and Suffern,

N. Y., a distance each way of 84 miles; and from Philadelphia, Pa., to Easton, Pa., via Hallowell and Doylestown, Pa., a distance each way of 56 miles; Easton to Reading, Pa., via Bethlehem and Allentown, Pa., a distance each way of 52 miles; Pittsville, Pa., to Easton, Pa., via Orwigsburg and Danielsville, Pa.; Harrisburg, Pa., to Reading, Pa., via Lebanon and Robeson, Pennsylvania, a distance each way of 51 miles, and Harrisburg, Pennsylvania, to Hagerstown, Maryland.

Routes extend from Cincinnati to Springfield, Ohio, via Dayton and Miamisburg, a distance each way of 76 miles; Portland, Me., to Nashua, N. H., via Portsmouth and Exeter, N. H., a distance each way of 105 miles; Nashua, N. H., to Hartford, Conn., via Stafford Springs, Conn., and Worcester and East Pepperell, Mass., a distance each way of 127 miles; Hagerstown, Md., to Staunton, Va.; Staunton, Va., to Roanoke, Va.; Winston-Salem to Charlotte, N. C.; Concord to Statesville, N. C.; Charlotte to Camden, N. C., Camden, N. C., to Columbia, S. C.; Florence to Columbia, S. C., via Darlington and Lydia; Columbia, S. C., to Chapin and Lexington, a distance of 70 miles and return; Charleston, S. C., to Columbia, S. C., via Somerville and Orangeburg, S. C., a distance each way of 126 miles; Orangeburg, S. C., to Augusta, Ga., via Langley and Williston, S. C., a distance each way of 77 miles; Savannah to Statesboro, Ga., via Pooler, Bloomingdale, Mariow, and Brooklet, a distance each way of 55 miles; Augusta to Macon, Ga.; Macon to Columbus, Ga.; Columbus to Montgomery, Ala.; Greenville, S. C., to Atlanta, Ga.; Atlanta, Ga., to Montgomery, Alabama, and Birmingham to Montgomery, Alabama, via Verbera and Marbury, Alabama, a distance each way of 106 miles.

With the exception of a branch between Washington, D. C., and Richmond, Va., the course of which has not yet been decided on, a chain of routes has been adopted linking Portland, Me., with Nashua, N. H.; Nashua with Worcester, Mass.; Worcester with Hartford, Conn.; Hartford with New York City; New York City with Easton, Pa.; Easton with Philadelphia; Philadelphia with Oxford, Pa.; Oxford with Baltimore, Md.; Baltimore with Washington, D. C.; Lynchburg, Va., with Winston-Salem, N. C.; Winston-Salem with Charlotte, N. C.; Charlotte with Greenville, S. C.; Greenville with Atlanta, Ga.; Atlanta, Ga., with Birmingham or Montgomery, Ala.; Birmingham or Montgomery with Jackson, Miss. Routes will be established Jackson to New Orleans, La., and Jackson to Mobile.

These routes are now surveyed and are being advertised for bids. Where satisfactory bids are not received Government-owned trucks will be used.

The routes already in operation with Government-owned trucks are from Washington, D. C., to Leonardtown, Md., a distance each way of 54 miles; from Annapolis, Md., to Solomons, Md., a distance each way of 65 miles; from Washington, D. C., to Baltimore, Md., via Ridgeville; from Baltimore to Philadelphia, Pa., via Belair, Md., Oxford, and West Chester, Pa., a distance each way of 110 miles; and from Baltimore to Gettysburg, Pa., via Westminster, a distance each way of 53 miles.

Routes in the Middle States will form a chain from Indianapolis, Ind., to Columbus, Ohio; Columbus to Zanesville, Ohio; Zanesville, to Wheeling, W. Va.; Wheeling to Pittsburgh, Pa.; Pittsburgh to Uniontown, Pa.; Uniontown to Cumberland, Md.; Cumberland to Hagerstown, Md.; Hagerstown to Staunton, Virginia; Staunton to Lynchburg, Virginia.

Further extensions contemplated but not yet surveyed are from Charleston, W. Va., to Columbus, Ohio; Columbus to Cincinnati, Ohio; Cincinnati, Ohio, to Louisville, Ky.; Louisville to Chattanooga, Tenn.; and Chattanooga to Atlanta, Ga.

A Railway's Part in Developing Western Canada

How Canadian Pacific Attracts Settlers to Its Lands;
Its Methods of Increasing Agricultural Productivity

1. The Canadian Pacific Dam at Bassano, Alta., which irrigates 400,000 acres.

A COMPANY WHICH HAS DEVELOPED 419 "ready-made" farms, each complete with house, barn, fencing, well, and a portion of the land under cultivation; which has established 100 farms with similar improvements for veterans returning from the war; which, as a part of its loan policy for assisting settlers, has also built houses and barns on 298 farms; which has opened up as many as 60 townships in a single year, co-operating in the establishment of the necessary retail businesses and industries; which has encouraged live stock production by distributing among farmers 150 horses, 7,000 cattle, 6,900 sheep and 1,300 swine, and which in the last nine months has colonized nearly 500 bona-fide immigrant settlers upon its lands, deserves to be classed as a nation builder rather than as a transportation system alone.

The Canadian Pacific not only carries on the activities mentioned, but is the settlers' banker and teacher in agricultural science in addition. Demonstration trains, fairs, farmers' institutes and experimental farms conducted by experts all tend to keep the farmer abreast with the latest developments in agricultural methods. A loan of \$2,000 to new settlers on certain lands makes it possible for desirable farmers with limited capital to get a start on the railroad's lands. The extension of the payment for all farms over a period of 20 years also proves an attractive feature to prospective settlers of small means. In Alberta the Canadian Pacific has developed the largest irrigation project on the American continent and has also acquired what is known as the Lethbridge Irrigation District, originally developed by the Alberta Railway and Irrigation Company. Together these two tracts supply water to approximately 720,000 acres of land.

History

The history of the development of the western provinces of Canada is to a large extent a chronicle of the achievements of the Canadian Pacific. In 1871, British Columbia, then a separate British colony, joined the Dominion of Canada on the condition that a railway be built within 10 years to unite it with the eastern Canadian provinces. In 1880 the road had not been built and was not even in prospect. Finally, for a consideration of \$25,000,000 in cash and 25,000,000 acres of land in western Canada, the Canadian Pacific undertook the construction of the road which was completed in the early part of the decade. Under the terms of the agreement the railway company had the privilege

of selecting its land from the odd numbered sections within strips 10 miles wide on each side of the right of way. Subsequently it acquired other charters and subsidies with additional land. The early policy of the road was to sell land to any purchaser in any amount for prices as low as \$3 an acre, to be paid within ten years in the case of actual settlers, and within six years in the case of others. As a result considerable land passed into the hands of speculators.

Organization of Development Departments

In 1912 the Canadian Pacific organized a Department of Natural Resources for the purpose of developing the agricultural and industrial possibilities of the western provinces more intensively and scientifically. In 1916 a further organization, known as the Department of Colonization and Development, was created, and now has charge particularly of the colonization enterprises of the company. The Department of Natural Resources includes an engineering branch, which operates and maintains the irrigation tracts of the road; a townsites branch, which locates, plans and prepares townships for the market; a coal mines branch, which operates the Canadian Pacific coal mines in Alberta and Saskatchewan; an agricultural and animal industry branch, which carries on a campaign of agricultural education among the farmers, conducts demonstration farms and trains and distributes high grade live-stock and seed among settlers, in some cases on easy terms of credit; and a forestry branch, which stimulates the growth of trees on the prairies, patrols the valuable timber holdings of the company, supervises the company's lumbering operations, and plants trees along the right of way for wind breaks. The Department of Colonization and Development includes an industrial branch, which attracts manufacturers, wholesalers and retailers to the towns and cities of western Canada; a publicity branch, devoted to the dissemination of information about western Canada, particularly as to the opportunities which the cheap lands of the Canadian Pacific afford to new settlers, and an organization which aims to come into personal contact, through agents and representatives, with the prospective settler, assisting him with information and advice, and actually accompanying him to the land of his choice.

Work of the Departments

A railroad's main function is to carry passengers and freight, and likewise its revenue is dependent upon the volume of traffic it handles. Both in the United States and

Canada, railways have literally created the traffic they desired by extensive development of unsettled country. This has involved conducting propaganda to induce settlement along railways, financial and practical assistance to settlers in their pioneering days; and the creation of industries to employ surplus labor and provide a market for the farmers' products. The Department of Natural Resources and the Department of Colonization and Development on the Canadian Pacific constitute a most comprehensive organization for the achievement of these ends. For colonization purposes the road formerly had some 4,000 agents in Canada, the United States, Great Britain, Holland, Belgium and the Scandinavian countries to promote immigration to the western Canadian provinces. At the time the war commenced the influx of settlers to Canada dropped off to a marked degree and a reduction was made in the staff of agents. Despite the obstacles created by the world conflict, the work of the Department of Colonization and Development has been prosecuted vigorously, with special attention to districts where the best results can be obtained. The emigra-

cash of 10 per cent. of the list price is required of all purchasers, and settlement for the balance, with interest at 6 per cent., is extended over 19 additional years. The payments are so arranged that the settler pays no more principal until the fourth year, and if he carries out certain settlement duties, he is allowed a rebate of part of the interest for the first and second years. Those desiring to do so are permitted to repay their indebtedness or settle for the entire amount at any time before the expiration of the 20 years following the purchase. Applicants must, directly or through authorized agents, make a personal inspection of the land they propose to buy. All minerals contained in the property, including gas and petroleum, are reserved by the company.

Purchase of Land Without a Loan

Purchasers of land without a loan are required to enter into occupation within six months from the date of purchase and must undertake the construction of a house costing at least \$350, and a barn costing not less than \$200 and capable of accommodating four horses and four cows. Settlers must

Canadian Pacific Demonstration and Supply Farm, Strathmore, Alta.

tion from the United States to Canada this year has been larger in the percentage of practical farmers than ever before experienced by the Canadian Pacific.

How Land Is Sold to Settlers

The first step in a colonization campaign is to acquaint the prospective farmer with the various conditions under which he can acquire land from the railway or the provincial governments. For this purpose the Canadian Pacific issues detailed pamphlets and bulletins from time to time. The road sells most of its land in accordance with the provisions of four plans: (1) The sale of land for settlement without a loan; (2) the sale of land for settlement with a loan for improvements; (3) the sale of "ready-made" farms; and, (4) the sale of land to veterans of the war. According to the general conditions covering the disposition of land under all of these plans, no land may be bought except by bona fide settlers. Under the first plan as much as two sections, 1,280 acres, may be sold to one purchaser; when a loan is provided not more than 320 acres. An initial payment in

insure their buildings against loss from fire and must sink a suitable well, fence the land, and break and crop a portion of each quarter-section. During the entire period of occupancy each purchaser must undertake to keep at least three milch cows. Instead of cultivating the land, the purchaser may agree to maintain on the property a certain number of horses, cattle, sheep or hogs, which must be his unencumbered property.

Sale of Farm With \$2,000 Loan

The sale of land with a \$2,000 loan for improvements has recently been limited to irrigated lands in parcels not exceeding 320 acres per application. Applicants for lands under this plan must be married men having agricultural experience and must have sufficient capital to enable them to pay the first installment of 10 per cent. of the purchase price, in addition to an amount sufficient to maintain their families for one year after occupying the land. They are also required to own or purchase, free from encumbrances, sufficient horses, cattle and other live-stock, to enable them to develop their

property. Following the acceptance of an application, the company undertakes the erection of a house, a barn, the fencing of the farm and the digging of a well. Not more than \$1,000 may be expended for these improvements, including a charge for supervision of 5 per cent. of the amount expended. The amount of the loan is added to the purchase price of the land and is to be repaid in installments extended over 20 years. The character of the house and barn to be erected on the farm may be selected by the applicant from various standard plans provided by the company. A purchaser is required to occupy the land with his family within six months after the completion of improvements and must reside there continuously for five years, during which he must cultivate certain portions of each quarter section. He must also maintain during that time at least three milch cows for each quarter section and must insure the buildings against fire. Under the farm loan scheme, 298 farms have been equipped with buildings up to October, 1917.

Ready-Made Farms

In 1909, the Canadian Pacific inaugurated an improved farm policy. During that year a number of farms were

There will be only a limited number of improved farms available, but land to an almost unlimited extent can be provided under the assisted colonization scheme. Under this plan farms must be selected by the incoming colonist and then improved by him with assistance from the company in the way of advances of building and fencing material, live stock, implements and seed grain. Both plans provide easy terms of payment for land over long periods, as well as direct financial aid at fair rates of interest. It is desired in the first year of occupation. Applicants for these lands must be married men, physically fit and of good moral character, who can produce proof of having been an active soldier in the Canadian army or the British army or navy, and who have had experience either as farmers or farm laborers.

In certain districts the company still has land ready to be sold without requiring the purchaser to settle thereon. When land is sold without settlement conditions, payment is extended over a period of 10 years only.

Improvements Made by Development Branch

In addition to constructing 210 buildings on farm loan lands in 1917, the first year after the adoption of this loan

House, Barn and Well on a "Ready-Made" Farm

equipped with a house and barn, a well and a fence enclosing the property. In addition, 30 acres on each were broken and seeded to crops. In the following year a contingent of British farmers were personally conducted by the company's agents from Great Britain and located on these ready-made farms. Under this arrangement a settler may proceed to earn an income on his farm as soon as he occupies it. The farms are sold on a 20-year-payment basis under the terms of which the price of the improvements is added to the price of the land. At first this type of farm was established only in Alberta, but the policy has been extended to include Manitoba, Saskatchewan and British Columbia.

Farms for Returned Soldiers

The Canadian Pacific also has prepared plans designed to encourage returned soldiers to take up farms. The lands set aside for this purpose are of two kinds, improved farms and "assisted colonization" farms. The former are included in selected colonies with distinctive military names, which have been improved by the erection of a house, a barn and fences, the cultivation of a certain area of land, and the provision of a water supply. Each colony will contain a central control farm in charge of a superintendent, who will supervise the work of all colonists. Central control farms will be used for purposes of demonstration and as supply depots for male live-stock, and for implements to be used by the colonists in common, as follows: One drill, one mower, one binder and one rake for three farms.

farm policy—the development branch did the following work in the interests of settlers:

274 miles of fencing erected
129 wells dug, at a maximum depth of 100 ft.
many more the last 10 ft. of the water table
2,240 acres cleared
8,400 acres of virgin soil broken
6,000 acres ploughed
26,500 acres sown
13,000 acres laid out
5,800 acres seeded
2,000 acres harvested
117 houses built
117 barns, 1 pigsty, and 12 dairies erected

On company demonstration farms 11 houses, 14 barns, 12 piggeries, 11 poultry houses and 12 dairies were built, while five wells were drilled and two windmills erected.

In 1916 the development branch of the department created under its loan policy, 16 houses, eight barns, five piggeries and five chicken houses, put up 17 miles of fencing, sunk 12 wells, constructed one concrete dam and cultivated 500 acres. In addition, the following improvements were undertaken in connection with the farms being prepared for returned soldiers: 170 houses, 100 barns, 2 implement sheds, 190 miles of fencing and 25 wells. The major part of this work was completed in 1916 and the balance in 1917. Arrangements are now being made to install 100 stables on 75 of these farms, which will be supplied with grain in winter. Twenty-five of these stables have been completed.

To encourage the raising of live stock the Department of Natural Resources, under certain conditions, grants bursars

of land in the irrigated districts by advancing stock of a value not exceeding \$1,000, on a cash payment of 20 per cent. This loan is made at the discretion of the company's superintendent of agriculture and animal industry and only to settlers who have occupied their land at least one year. So far over 15,000 head of cattle, horses, hogs and sheep have been distributed in this manner.

This policy, together with a continuous campaign of education since 1904 emphasizing the importance of mixed farming, has greatly increased live-stock production in the western provinces. In 1916, the number of cattle in Manitoba and Saskatchewan was twice what it was ten years previously. Contributing to this result was the company's practice of bringing in heifers and selling them at cost as well as granting reduced rates on the transportation of heifers and thoroughbred animals of all kinds. Other factors include the furnishing of pure bred bulls free to the farmers, prize competitions in steer feeding and educational guidance through lectures on animal husbandry in demonstration trains, fairs and farmers' institutes.

For many years the Canadian Pacific has been encouraging the use and cultivation of better grades of seed. It early secured the co-operation of the Dominion and provincial governments, offering to furnish demonstration trains and free seed for the farmers if the governmental agricultural departments would supply lecturers. The Dominion government also established seed fairs throughout the Northwest. Alfalfa and timothy seed, carefully selected by the company's own experts, are sold by the Canadian Pacific on two years' credit without security other than ordinary promissory notes. Seed grain is still frequently supplied to beginners with a crop mortgage as security. The road co-operates as far as possible with government and local organizations to eradicate weed pests.

In line with its policy to extend agricultural education through the medium of exhibits at fairs and conventions and on demonstration trains the Canadian Pacific this year in-

The statistics for Alberta are as follows: Acreage of wheat, 63,391 in 1903; 1,563,700 in 1915; yield of wheat, 1,200-598 bu. in 1903; 51,355,000 bu. in 1915; acreage of oats, 51,929 in 1899; 1,912,000 in 1915; yield of oats, 2,189,441 bu. in 1899; 107,741,000 in 1915.

Live-stock production has likewise shown marked increases in the western provinces. In Manitoba the total number of horses, cattle, sheep and swine increased from 422,000 in 1899 to 886,956 in 1917. The record for Saskatchewan is even more enviable. The number of horses increased from 83,500 in 1901, to 678,965 in 1917; milch cows increased from 56,400 in 1901 to 229,142 in 1917; other cattle from 160,600 to 573,411; sheep from 73,100 to 149,418, and swine from 27,800 to 284,316. Similar results

View of "Ready-Made" Farm Buildings

have been achieved in Alberta, and there are now 590,245 horses, 193,851 milch cows, 721,067 other cattle, 262,675 sheep and 185,074 swine in that province. Since 1914, however, the number of swine in the three prairie provinces has steadily decreased from 1,038,102 to 580,162, in consequence of the heavy export demand. Because of its physical characteristics, agriculture in British Columbia has been confined largely to fruit culture, to dairying and to poultry raising.

The great increase in agricultural production which has taken place in the Canadian provinces naturally has been reflected in increased traffic for the Canadian Pacific. In fact, the motive for conducting so intensive a campaign to induce settlement and stimulate agricultural activity is to secure new business for the road.

Irrigation Tracts

The Canadian Pacific has two large irrigation tracts in Alberta, the land of which it is disposing of to settlers. The Lethbridge tract is the pioneer irrigation undertaking on a large scale in western Canada. It was started in 1900 and was acquired by the Canadian Pacific from the Alberta Railway & Irrigation Company in 1912. It draws an un-failing supply of water from the St. Mary river, which is fed by the snows and glaciers of the Rocky mountains. Canals totaling 115 miles in length serve an area of about 100,000 acres. The tract is well situated with reference to transportation. One railway line connects Lethbridge, Alta., with the international boundary and other lines traverse the center of the district and extend through the westerly portion.

The company's other irrigation tract is the largest individual project of its kind on the American continent. It contains about 3,000,000 acres served by two separate water systems, the oldest of which is in the western part of the block. Water for this section is diverted from the Bow river at a point just inside the eastern limits of the city of Calgary. Main and secondary canals and distributing ditches, totaling 1,600 miles in length, supply water to approximately 220,000 acres. Construction of this system was commenced in 1903 and completed in 1910, and the first water was used in 1907.

The eastern part of the block is served by a great dam at Bassano, Alta., which was begun in 1910 and completed in

Creamery at Demonstration and Supply Farm, Strathmore, Alta.

stalled exhibits at Calgary, Alta.; Brandon, Man.; Regina, Sask.; Toronto, Ont.; Sherbrooke, Que., and Quebec, Que.

Results of Efforts to Develop Agriculture

The statistics of grain production for the western provinces indicate what fruitful results have been achieved through the efforts of the Canadian Pacific and governmental agencies. In Manitoba, the acreage of wheat increased from 260,842 in 1883, to 3,094,573 in 1915 and the yield from 5,686,355 bu. to 62,683,000 bu. The acreage of oats increased from 215,431 to 1,314,846 and the yield from 9,478,964 bu. to 50,695,000 bu. In Saskatchewan the wheat acreage in 1899 was 328,459 and in 1915, 6,838,500, whereas the yield in 1899 was 6,083,508 bu., as compared with 195,168,000 bu. in 1915. In the same province the acreage of oats increased from 83,465 in 1899 to 2,937,000 in 1915, and the yield from 2,518,248 bu. in 1899 to 157,628,600 bu. in 1915.

1914. The dam diverts water from the Bow river into the main canal which is five miles in length and feeds 475 miles of secondary canals and over 2,000 miles of distributing ditches. The system supplies water to about 400,000 acres. Both the eastern and western sections of the block contain more or less equal proportions of irrigable and non irrigable areas. The non irrigated land has a low rainfall but is not arid. The average annual precipitation at Calgary, just west of the block, is 16 in., and at Medicine Hat 30 miles east of the eastern boundary of the block 10 in. The land, if thoroughly soaked in the fall, holds the water well, producing a crop the following year even in a dry season. The non-irrigated land furnishes excellent range for live stock and as it often lies in the same quarter section with irrigated areas, makes mixed farming profitable. All water legislation is enacted by the Dominion parliament rather than by the provincial legislatures. The water rate for all irrigated land ranges from 50 cents to \$1.25 per acre annually. The actual application of the water to the land is done by the farmer at a cost which rarely exceeds 50 cents additional.

Development of Townsites

The development of new agricultural communities carries with it the creation of cities and towns, where mercantile businesses and industries spring up to serve the wants of the farmers. The Canadian Pacific has endeavored to assist in the location of tradesmen, jobbers and manufacturers in the Canadian West without stimulating the development of city and town life beyond the needs of the rural communities. Before the war the townsites branch of the Department of Natural Resources laid out and opened up as many as 60 to 70 new townsites in a year. Since its inception in 1910, the industrial branch, the province of which is to attract urban settlers to Canada, has located some thousands of new retail businesses, and a large number of wholesale businesses, and manufacturing plants in the western provinces. The branch issues bulletins periodically indicating specifically the opportunities in the various cities and towns on the Canadian Pacific. These bulletins have been instrumental in bringing to the branch an annual average of between 3,000 and 4,000 inquiries, by letter, from prospective settlers. There was a sharp falling off in sales of townsites property in 1915, but there has been a marked revival since then. Sales in 1916 were double those of 1915, and sales in 1917 promise to be twice as large as those of 1916.

Coal and Timber Development

The forestry branch of the Department of Natural Resources stimulates the growth of trees on the prairies—conducting prize competitions to that end—patrols the timber properties of the railroad, takes measures to prevent forest fires, plants trees along the railway lines for windbreaks to replace old wooden snow fences and has charge of ornamental gardening at the railway stations. At Wolseley, Sask., it operates nurseries and at Bull River, B. C., runs the company's lumber mill, from which are obtained ties, poles, piling and other timber suitable for railway construction work.

The coal mines branch operates the company's mines, three of which are in Alberta and one in Saskatchewan. The Canadian Pacific mine at Bankhead, Alta., is the only anthracite mine being worked in the Dominion of Canada. The mines have a capacity of 4,000 tons of screened and washed coal daily.

MINERAL PRODUCTION OF ALASKA IN 1917 OVER \$41,000,000.—In 1917 Alaska produced minerals valued at \$41,760,000. These are the advance figures issued by the United States Geological Survey, Department of the Interior, and are based on estimates made by G. C. Martin. The value of the mineral output of Alaska in 1917, although about \$6,870,000 less than that in 1916, was greater than that in any other year.

Condition at Various

Terminals on January 1

THE CONDITION of the railroads as indicated by that of some of the more important western terminals at the time the government took over the roads, is indicated by the following summary of reports received by Commissioner McField of the Interstate Commerce Commission at of January 1 from inspectors assigned to that work for the information of the director general of railroads.

Pennsylvania Lines. List at Pittsburgh reports no congestion on Conemaugh division, some congestion at Union. It could handle today twice the number of cars of originating roads could take them, more than 100,000 cars, moved 2,918 up to 1,001 in December 31, on hand 12,010 cars, December 31, 2,847 cars, reduction of 1,066 on 31 January. At 6 a. m., December 31, Pennsylvania was holding the Line West 2,670 cars, an increase over Saturday of 100 cars.

The empty car situation is as follows: Conemaugh yard cars for Pittsburgh district, none. Conemaugh division, 50 per cent; Monongahela division, 10 per cent.

Pennsylvania Lines Host at Pittsburgh reports Conemaugh yard badly congested; working capacity of yard 6,000 cars; total cars on hand 6,379, of which 1,744 are bad order cars. There were despatched in 24-hour period ending midnight, 30th, eastbound, 773 cars, westbound 913 cars. The westbound movement was 1,100 cars below normal. There were received during the same period 1,466 cars. On hand for other Pennsylvania divisions, 1,960 cars; westbound cars on hand, 2,476 which is 15 per cent above normal, 825 of westbound cars were coal.

There were 32 locomotives at the terminal, none of which were O. K. for service. The coaling machine was out of service nine hours on the 30th. Other Pennsylvania divisions were holding 1,870 cars for other yards. The congestion at this point is charged by officers to lack of motive power and inefficient help.

Pittsburgh & Lake Erie advises general condition improved. Five thousand one hundred and nine cars were moved in 24 hours, which is 64 per cent of normal.

Baltimore & Ohio: Has 593 cars of slag on hand. Interchange better than day before. Eastbound freight is accumulating in yards and is being sent over the B & O.

Baltimore & Ohio, Cumberland Division. Brunswick, Cumberland and Keyser, which are the three principal yards on this division are badly congested. At 4 p. m., December 31, Brunswick had approximately 1,200 eastbound loads on hand; Cumberland, with an eastbound working capacity of 700 cars, has on hand 1,041 loads; Keyser, with an eastbound working capacity of 700 cars, has on hand 900 loads; set off between Keyser, Cumberland and Brunswick for points via Brunswick, 1,520 loads, for High Valley and Central of New Jersey railroads via Western Maryland and Cumberland Valley, 268 loads, not including 106 Cumberland Valley loads held at Cumberland and 165 at Keyser; there is also set off on Western Maryland between Hagerstown and Rutherford, 170 loads and on the Cumberland Valley line between the interchange point with the Baltimore & Ohio at Cumbo and Shippensburg, 264 loads. The Philadelphia & Reading took from the Cumberland Valley one train and from the Western Maryland two trains, a total of 120 loads on the 31st.

There is set off on line of the Baltimore & Ohio between Connellsville and Cumberland and held at the mine on the Connellsville division 1,442 loads. Forty-seven of the loads via Cumberland Valley set off east of Cumberland are for government work, 18 of them being copper for Jersey City.

About 800 of the loads set off between Keyser and Brunswick are coal. The congestion on this part of the B & O of loads via Rutherford gateway was caused by Central of New Jersey enlarging against Philadelphia & Reading on all terminal ties except fuel coal, perishable freight and Bethlehem

Steel Company's coal on December 17, and the Lehigh Valley issuing a similar embargo on December 24, and both roads embargoing against everything except live stock and perishable freight on December 28.

Philadelphia: Baltimore & Ohio at East Side from midnight until 7:25 p. m. moved west 126 loads, or five trains. The normal movement west is 18 trains each 24 hours. During the same period Philadelphia & Reading moved east three trains, a total of 58 loads. The total cars at East Side at 5 p. m. were 990. Eastbound loads, 141; west bound loads, 364, 65 of which were hard coal for Wilmington, Baltimore and Washington and west.

Seven Baltimore & Ohio and one U. S. locomotives out of service, frozen up. Fifteen additional Baltimore & Ohio locomotives out of service for repairs; the master mechanic states he will be unable to touch them for at least 15 hours on account of shortage of skilled labor.

Seranton: Erie Railroad. 375 cars moved in 24-hour period ending 5 a. m. 31st. 416 cars coal awaiting movement, due to lack of power, caused by poor housing of engines and zero weather.

Delaware, Lackawanna & Western. Moved 67 trains east and 59 trains west, handling 3,251 loads, 1,072 empties. Nothing held either for power or crews. Movement slow on account of zero weather. Seven crews tied up because of long hours.

Washington, D. C.: At 8.00 a. m., December 31, 1917, the Pennsylvania Railroad had in all yards for unloading 666 cars; was holding out 174 cars account no room; on hand, having been placed for more than 48 hours, 378 cars, of which 165 were for the Government, 143 having been placed in the Navy Yard. It had on hand for movement, in Potomac and Benning's Yards, 785 loads and 684 empties, of which 150 were empty coal cars. With respect to the coal situation, there were in the Pennsylvania Avenue Yard 13 cars of bituminous coal and 1 car of anthracite coal, consigned to local retail dealers, received as follows:

| | |
|--------------------------|-------------------|
| 12 cars bituminous coal, | December 25, 1917 |
| 1 car bituminous coal, | December 26, 1917 |
| 1 car anthracite coal, | December 26, 1917 |

The Baltimore & Ohio, at 8.00 a. m., December 31, had 207 loads placed for unloading, of which 85 were coal; 85 other loads in train yards not placed, account no power; 27 cars held up 48 hours or longer, of which 9 cars were for the government. It had on hand for movement 258 loads

and 300 empties, including 97 empty coal cars which had been on hand more than 24 hours. There was a shortage of power, in both road and switching service. On neither the Pennsylvania nor the Baltimore & Ohio were any cars for Washington proper being held out on line of road.

New York, New Haven & Hartford: On December 28 the New Haven received at interchange points 1997 cars and delivered 1934 cars. Total cars on line for transit movement all directions same date 18,688 cars, of which 9,119 moved. This movement represents what has been done for several days past, namely about 50 per cent.

December 31 at 5 p. m. there was on hand awaiting movement all directions 11,915 cars, of which 6,439 are east and 5,476 westbound. Principal points where cars are being held are Harlem River, Bridgeport, New Haven, Hartford, Waterbury, Maybrook, Providence, Midway. Worst congested points are Waterbury, Harlem River, Maybrook, Hartford and New Haven. Car movement very slow. Of 1,081 engines assigned various divisions, 303 in shop for repairs. Power badly needed; also shortage of material for repairs, as records indicate engines leaving terminals without proper repairs, causing delays en route.

At 7 a. m. 31st, there were no engines ready for service at New Haven, Westfield, Hartford, Springfield, Waterbury, Danbury, Willimantic or Worcester. Will be ready in twelve hours—New Haven 5, Westfield none, Hartford none, Springfield none, Waterbury 2, Danbury 2, Worcester none. Of 60 engines assigned road freight service Hartford division 22 are in shops. Hartford and Springfield short switching and road power, also crews. Hartford short ten road and three switching crews.

Summarizing, the worst conditions reported so far are on the New York, New Haven & Hartford, the Pennsylvania Lines West at Pittsburgh, on the Connellsville and Cumberland Divisions of the Baltimore & Ohio and on the Western Maryland and Cumberland Valley railroads. On the New Haven railroad the principal difficulty appears to be the shortage of power, due to a large number of engines in the shop and shortage of both men and material to make repairs. The congestion at Conway yard at Pittsburgh is due to shortage of power and inefficient help. The congestion on the Western Maryland & Cumberland Valley and in a measure on the Connellsville and Cumberland divisions of the B. & O. is due to embargoes, but we have not yet obtained a check of the condition of power.

Canadian Railway Troops Bolting Rails to Metal Ties in France

A Concrete Roadway System in a Shop Yard

Description of New Concrete Walks
Built by the Santa Fe in Store House
and Shops at Topeka

By Charles E. Parks
Assistant Editor, The Santa Fe Magazine, Chicago

IN ORDER TO FACILITATE the handling of material and supplies in the shop yards of the Atchison, Topeka & Santa Fe at Topeka, Kan., this company has constructed approximately two and one-half miles of concrete roadways connecting all the principal shop buildings, warehouses, storehouses, lumber yards, car sheds and unloading and storage platforms within the shop enclosure. The Topeka shops of the Santa Fe cover 120 acres of ground and are the largest on the system, containing all the principal repair shops of the company for the repairing and manufacturing of all classes of equipment and also the main storehouses and storage platforms, lumber yards, etc.

Prior to the construction of these concrete roads the trucking and hauling of all storehouse supplies to and from the storehouses and shops and the transporting of material between the different shops was done by teams under contract and by electric trucks over dirt and cinder pathways. Much hauling also was done by push-cars and switch engines. However, all of these methods were costly expedients.

The cinder roads had been built to permit the operation of power-propelled vehicles in order to displace the slow and expensive handling by ordinary hand trucks. However, they did not prove entirely successful as only a small percentage of the traction power of the electric trucks in service could be utilized, even when the roads were in good condition. At times they were impassable for the trucks, resulting in great inconvenience and delay. The hauling by switch engines of material in box cars was necessarily costly, particularly when it was necessary to handle a car three or more times, resulting in heavy switching charges, delay to cars and other expense connected with the intermittent moving and unloading.

Before the construction of concrete roadways was finally authorized an exhaustive study of hauling and trucking conditions was made. This study included a series of tests with an electric truck, the object being to determine the difference in power necessary to start and pull a loaded truck with and without trailers over earth, oiled cinders, wood, metal and concrete roadways.

The Test Conditions

The electric truck used in these tests had a capacity of 4,000 lb. and weighed 2,220 lb. It was equipped with rubber tired wheels, 15½ in. in diameter and a 3-in. tread. The battery of the truck consisted of 24 cells, Edison Type A-6, showing 31 volts at a normal discharge of 45 amperes, or about 12 volts per cell.

The trailers referred to in the table as Nos. 1, 3 and 4 weighed 385 lbs., trailer No. 2 weighed 401 lb. and differed

from the others in that it had ball bearings in the front wheel pivots and roller bearings in the rear wheels. The diameter of the front wheels of all the trailers was 36 in. with a 2½ in. tread, while the rear wheels were 48 in. in diameter with a 3½ in. tread.

The power used by the truck was indicated by volt and ammeter readings obtained by volt and ammeter placed on the truck. The pull required to move the trailer was determined by placing traction dynamometers between the truck and the different trailers. Before testing, the truck and trailers were each loaded with ten keps of bolts and nuts, making a 2,000-lb. load on each.

Test No. 1 was made with the unloaded truck and the trailer loaded with 2,000 lb. of bolts and nuts on a cinder road. To start the truck required 600 lb. of tractive force, and to keep it moving at a speed of three miles an hour required 250 lb. of tractive force. It was necessary to give some assistance to the truck in starting, the wheels slipped badly and it did not handle the load satisfactorily.

Test No. 2 was made with the unloaded truck and trailer No. 2 loaded with 2,000 lb. of bolts and nuts. This was the roller bearing trailer and it required 500 lb. of tractive force to start the truck from rest and 225 lb. to keep it moving at a speed of three miles an hour. As the truck was empty it did not handle the load satisfactorily.

Test No. 3 was made with the truck loaded with 2,000 lb. of bolts and nuts and trailer No. 1, with a similar load, on a cinder road. This road was level and the cinders oiled, the same conditions prevailing in conducting tests Nos. 1 and 2. The tractive force necessary to start the load from rest was 600 lb. and to keep it moving at a speed of three miles an hour, 250 lb. The truck handled the trailer without slipping but it tended to stall several times after starting, indicating that 4,000 lb. net weight was the maximum load which it could handle on the cinder road.

Test No. 4 was similar to No. 3, with the exception that trailer No. 2 was substituted for trailer No. 1. It required a tractive force of 500 lb. to start the load and 225 lb. to keep it moving, the difference being due to the roller bearings in the trailer.

In test No. 5 trailers Nos. 1 and 2 were attached to the front truck but it could not move the load on the cinder road.

Test No. 6 was similar to No. 5 with the exception that the truck was loaded with 2,000 lb. of bolts and nuts. However, the load could not be moved, proving that the former conclusion that 4,000 lb. was the maximum load which the truck could handle on a cinder road was correct.

Test No. 7 was conducted on a level concrete road with

the loaded truck, to which was attached the four loaded trailers. The tractive force necessary to start this load from rest was 800 lb. and to keep it moving at a speed of three miles an hour required 250 lb. The 10,000 lb. net weight was moved satisfactorily with about one-half the power used to move 4,000 lb. over the cinder roadway. The ammeter reading in this test was 103 to start and 72 to pull, volts, 22 to start and 26 to pull. In test No. 3 the ammeter readings were 220 to start and 160 to pull; volts 22 to start and 26 to pull.

Test No. 8 was conducted on a ten per cent concrete grade 40 ft. long. Trailer No. 1 was attached to the loaded truck and started up the grade but it stalled when half way up. The ammeter reading was 200 just as the motor stalled, and the volts 12.

In test No. 9 the loaded truck was started up the ten per cent concrete grade alone. It moved up satisfactorily with its 2,000 lb. load. The ampere reading was 140; volts 18.

The remaining tests were made with single trailers to determine the pull necessary for handling them. This was determined by pulling them by hand, using a spring bal-

The following table shows the power used by the truck in conducting the various tests.

| Test No. | Road | Attached loaded trailer | VOLT-AMMETER READINGS | | Volts | | Amperes | |
|----------|--------------------|-------------------------|-----------------------|-----|-------|------|---------|------|
| | | | | | Start | Pull | Start | Pull |
| | | | | | | | | |
| 3 | Cinder level | No. 1 | 22 | 26 | 220 | 160 | | |
| 4 | Cinder level | No. 2 | 22 | 26 | 220 | 160 | | |
| 7 | Concrete level | No. 1, 2, 3, 4 | 22 | 26 | 103 | 72 | | |
| 8 | Concrete 10% grade | No. 1 | .. | 12* | .. | 200* | | |
| 9 | Concrete 10% grade | None | .. | 18 | .. | 140 | | |

*Readings taken just as motor stalled.

Results

These tests indicated the great advantage of concrete over cinder roads. On the latter the small front pivoted pedestal wheels of the trailers dug into the road, requiring heavy starting effort. This was especially true when the load was turning. Even on tangents the load presses these small wheels a considerable distance into the road so that they tend to slide rather than roll, requiring more power to pull the trailers on cinders than on concrete. This difference is seen by comparing tests No. 3 and 4 with No. 7, where it took less power at the motor and also less pull at the draw-

Dynamometer Test with an Electric Truck on a Cinder Road. Dynamometer on Drawbar and Volt and Ammeter on Truck

ance to register the pull. Trailer No. 1, having common bearings, and trailer No. 2, having roller bearings, were used in the tests which were conducted on concrete, wood and metal roadways. A comparison of the tractive force necessary to start and pull these trailers is shown on the table.

The following table gives a summary of the results obtained in the tests conducted:

SUMMARY OF TRACTIVE FORCE NECESSARY TO START AND PULL TRUCK AND TRAILERS IN THE TESTS DESCRIBED IN THE TEXT

| Test No. | Road | Load on truck in lb. | Attached loaded trailers | Tractive force in pounds | |
|----------|----------|----------------------|--------------------------|--------------------------|------|
| | | | | Start | Pull |
| 1 | Cinder | | No. 1 | 600 | 250 |
| 2 | Cinder | | No. 2 | 500 | 225 |
| 3 | Cinder | | No. 1 | 600 | 250 |
| 4 | Cinder | 2,000 | No. 2 | 500 | 225 |
| 5 | Cinder | | No. 1 & 2 | Could not start load | |
| 6 | Cinder | 2,000 | No. 1 & 2 | Could not start load | |
| 7 | Concrete | 2,000 | No. 1, 2, 3 & 4 | 500 | 250 |
| 8 | Concrete | 2,000 | No. 1 | Stalled when halfway up | |
| 9 | Concrete | 2,000 | None | Pulled up satisfactorily | |
| 10 | Concrete | Hand power | No. 1 | 90 | 35 |
| 11 | Concrete | Hand power | No. 2 | 60 | 30 |
| 12 | Wood | Hand power | No. 1 | 165 | 85 |
| 13 | Wood | Hand power | No. 2 | 120 | 60 |
| 14 | Metal | Hand power | No. 1 | 95 | 45 |
| 15 | Metal | Hand power | No. 2 | 85 | 35 |

bar to move the loaded truck and four loaded trailers on concrete than it did to move the loaded truck and one trailer on the cinder road. This was shown more strikingly when it was observed that it took a steady pull of 225 to 250 lb. to handle one trailer on the cinder road and only 30 to 35 lb. to handle it on the concrete floor. Comparing trailer No. 1, which has common bearings and trailer No. 2, which has roller bearings, the data show that it takes approximately 20 per cent more power to start and pull the former than it does the latter.

The final result of these tests showed that an electric truck could handle only a small percentage of its full tonnage when used on dirt or cinder roads, even when these roads were in good condition, and clearly indicated the great advantage of concrete roads over wood, metal and especially oiled cinders, the truck handling four to five times as large a load at a smaller power output on the concrete roads than on the latter.

Concrete Highways

In view of these conclusions the Santa Fe decided that greater economy would be effected by building a system of

concrete roads on the shop and storehouse premises. Accordingly, 12,979 ft. of these roads were constructed, practically surrounding the yard and connecting all the principal buildings, storage areas and unloading platforms.

These highways vary in width from 5 to 12 ft., 10,705 sq. yd. being of 12 ft. width and 5,490 sq. yd. of 8, 6, 8 and 10 ft. widths, a total of 14,198 sq. yd. of concrete being used. In addition 89 railroad crossings—71 12 ft. wide and

to the three feet are on the average 14 ft. wide. On the main line crossings there are roads to a single track of 14 in. by 14 in. in 10 ft. sections, the bottom log resting upon the concrete blocks and the outer side against the web of the rail. The track bar is bolted to the ties by bolts driven through holes drilled in the lower ties. On side track crossings the construction is a double of concrete. After the single main for the three ways have been anchored the concrete is run to a surface even with the top of the rails. Angle irons also are imbedded in the concrete on the sides and termini of the roads at places where the concrete is liable to be injured by constant trucking to and from shop buildings.

Expansion joints are placed every 10 ft. Between these are placed two strips of tarred paper, held in place by steel plates which were removed when the concrete had been placed 10 ft. in advance of the joint. The 12-ft. roads are reinforced with 1/2-in. rods placed along each side and running the entire length of the roads and 1/4-in. bars placed crosswise every 30 ft., or at the end of each expansion joint. The roads 10 ft. or less in width are not reinforced. Standard portland cement meeting the specifications of the American Society of Testing Materials was used in the work, the fine aggregate being clear sharp sand taken from the Kaw

A Converted Ford Truck Hauling Trailers Loaded with Heavy Materials

is less than 12 ft.—were bridged. In connection with the work 300 ft. of new track was laid and 1,627 feet taken up.

In constructing the roadways, the line and grade were first established and the side forms, consisting of 2-in. by 6-in. wooden strips placed in position. As many of these roads took the same course as the cinder roads which had been in use previously, there already existed a firm subgrade which required no tamping. However, this was dressed carefully and 2,400 cu. yd. of excavation outside of the track crossings was removed, the surplus dirt being thrown out and where possible used against the shoulder. The balance was carted away.

The roads are of one-course concrete construction throughout, 6 in. in thickness at the edges, with a slight crown (about 1/2 in.) in the center which varies with the width.

Electric Truck Hauling Six Trailers Loaded with 17,500 lb. of Brass

Automobile Truck Carrying 6,000 lb. of Cement

The track crossings are constructed with 12 in. of concrete under the ties upon which is placed a sand cushion. The concrete is then paved with brick to the end of the ties. On account of the small wheels of the trucks and trailers used in hauling material at the shops it was desirable to have a small flangeway between the rails and the roadway in order to lessen as much as possible the jar incident to crossing,

river near Topeka, and the coarse aggregate consisting of clean crusher-run Garnett stone of 1 1/2-in. maximum size from which all the fine screenings had been removed. In mixing the concrete the time was 1 1/2 min., and the concrete was delivered direct from the mixing machine to the roadway and leveled.

Before the concrete set a common painter's brush was used to give the top of the road a smooth surface, or where rough spots existed, a wooden float was used to smooth it out. The finished roadway was then covered with dirt and water for curing and left covered in this manner for 21 days. The work was done entirely by company forces under the supervision of W. C. Hunt, traveling storekeeper.

These roads have been in service for several months and are giving satisfactory service. They are made use of by electric trucks and trailers, hand trucks, horse-drawn vehicles, automobile trucks and trailers and by pedestrians, and are the principal factor in the economical distribution of materials to the various shops and storage yards.

Electric Trucks

The electric trucks in use are Class A-1, manufactured by the Buda Company, Chicago, while the gasoline trucks are Ford chassis cut down to 40 in. in width and geared as low as possible. For heavy work three-ton White trucks are used.

Electric trucks are much more flexible for the handling of platform storehouse material and car work than the gasoline truck as developed thus far. The former will turn in a

shorter space, can be driven backward or forward more promptly, and can handle trailers into cars and on platforms with much greater ease, but they are not so well adapted for straight hauls of considerable length. The gasoline trucks can haul bolsters and frames, car bolts, driving boxes and similar material from the storage platform to the point of use, from one-half to two miles distant, with greater facility than the electric trucks. The White trucks are very economical in handling heavy material in carload lots and have released for service at these shops alone about three cars a day, which otherwise would have been tied up from three to six days in switching.

In operation the Ford trucks are the most economical, particularly with reference to first cost and upkeep, although the upkeep of the electric truck after two years' operation has been almost negligible. However, the ultimate expense of battery renewals, which can be avoided for a long time with careful handling, is rather heavy.

In its particular field each of the three types of trucks is making a wonderful showing in economic handling on the concrete roadways. No better means has thus far been devised for meeting the needs of the work for which each type is adapted. In addition to this service the concrete highways serve as and are instrumental in securing better fire protection as they permit of the more rapid handling of fire apparatus. In permitting of the maximum use of mechanical means of transportation facilities in the store and shop grounds they are of special interest owing to the present difficulty of securing labor.

In connection with these roads the Santa Fe also has paved a large area between the machine shops, blacksmith shop, power house and oil house over which much trucking is done. Over 6,410 sq. yd. of concrete pavement was installed here and 1,275 sq. yd. under railroad crossings. The construction here is similar to the roads. It gives ideal storage facilities, permitting proper drainage and is independent of weather conditions.

Salt Boxes to Preserve Piles

By Hermann Von Schrenk

Consulting Timber Engineer, St. Louis

IT MAY NOT BE without interest at this time to describe a simple scheme for increasing considerably the life of untreated wooden piles already in position in bridges. Without question the best method for getting the most service out of piles is to creosote them thoroughly. However, there are a great many bridges with untreated oak and pine piling which, for one reason or another, were driven in an untreated condition. Such piles will decay first of all near the ground line, and if they have any appreciable amount of sap in them, this decay will usually take place with considerable rapidity.

Some years ago the writer's attention was called by C. H. Cartledge, late bridge engineer of the Chicago, Burlington & Quincy, to a simple scheme for increasing the length of life of piles in bridges. This scheme is briefly as follows: A shallow box 3 in. to 4 in. deep is built around the head of the pile, immediately under the cap. The space between the pile and the edge of the box may vary to suit conditions, but it should be 4 in. or 5 in. at least. The bottom of the box should be so constructed that a small space is left between the boards and the pile itself: in other words, a snug fit should be avoided. The box can be built of any rough lumber and need not be particularly solid. After the boxes have been completed they are filled with ordinary rock salt. This can be done most easily by shoveling the rock salt from a push car on top of the bridge, because there

is usually enough space between the bridge ties to make this a simple matter. Every rain storm will dissolve some of this salt, and the more or less concentrated salt solution will run down on the outside of the piles and will be absorbed to a considerable degree by the outer layers of the wood.

It has been known for a great many years that common salt is an antiseptic and prevents decay. Although it is a comparatively weak antiseptic, and, because of its solubility in water, it cannot usually be employed for timber preservation. The scheme above outlined does away with the objection of solubility, because every time that any of the salt is leached out by the water a new supply is added immediately and automatically by the solution flowing from the box.

In 1913 a number of these salt boxes were installed, at the writer's suggestion, by W. S. Hanley, then chief engineer

Piles Protected by Salt Boxes

and now superintendent of the New Orleans Great Northern. The bridges in which these boxes were placed were built of yellow pine piling in 1912, and the salt boxes were fitted in 1913. These boxes have therefore been in position four years.

It is well known that pine piles having a high percentage of sap will decay in a very few years, but a recent inspection of the piles treated with these salt boxes showed that they are in absolutely perfect condition.

It should, of course, be understood that this procedure is applicable only to bridges already built of untreated piling. The writer does not believe one would be warranted in the use of untreated piles in a new bridge with the idea of protecting them by means of these salt boxes, unless it would be impossible to creosote the piles.

Director General of Railroads McAdoo on the Job

"Freight Moving Week" Ordered. Demurrage Rates Increased.

Passenger Service Curtailed. Wage Question

WASHINGTON, D. C., JANUARY 8, 1918.—Next week is "Freight Moving Week," by order of the director general of railroads, W. G. McAdoo, who on Monday issued a general appeal to public officials, shippers, railroad employees and all others concerned to make a special supreme effort to clear up existing accumulations of freight in order to get a new start. The appeal is as follows:

"The movement of fuel, food and other vital necessities is being seriously hampered by the congestion of loaded freight cars at important cities and terminals throughout the country. The congestion is particularly serious in the railroad terminals at the Port of New York. Unless freight is promptly removed by consignees from cars at terminals and from railroad stations, it will be impossible to relieve the present situation. Railroad cars cannot be used for warehouse purposes without grave injury to the American people. Railroad cars must be kept moving and they must be utilized to their maximum capacity if the demands of the people for the necessities of life and of the Army and Navy for essential munitions and supplies are to be met. It is an imperative duty of the hour for every citizen to do his utmost to move freight from cars and from railroad stations immediately upon its arrival.

"Under the new demurrage order just issued, heavy charges for detention of freight cars will go into effect on and after January 21. The whole nation should unite in a supreme effort to clear up the congestion at terminals before the demurrage order goes into effect and to keep it cleared up thereafter.

"I wish to appeal to the people of the United States to observe the week beginning January 14 and ending January 21 as 'Freight Moving Week' and I earnestly request the governors of the various states, the public utilities commissioners, the mayors of cities and towns, the state councils of national defense, the federal and state food and fuel administrators, the chambers of commerce, and other business organizations, business men and shippers generally, trucking companies and all railroad employees concerned, to organize locally and to make a supreme effort during this week to unload freight cars, to remove freight from railroad stations and to clear the decks for a more efficient operation of the railroads of the country.

"An earnest and united pull all along the line will achieve wonders in this direction. We can help ourselves and relieve an immense amount of suffering if we attack the problem vigorously and in the true spirit of co-operation."

He issued the following notice to all railroad officers and employees, with a request that it be posted by all railroads.

"The government of the United States having assumed possession and control of the railroads for the period of the present war with Germany, it becomes more than ever obligatory upon every officer and employee of the railroads to apply himself with unreserved energy and unquestioned loyalty to his work.

"The supreme interests of the nation have compelled the drafting of a great army of our best young men and sending them to the bloody fields of France to fight for the lives and liberties of those who stay at home. The sacrifices we are exacting of these noble American boys call to us who stay at home with an irresistible appeal to support them with our most unselfish labor and effort in the work we must do at home, if our armies are to save America from the serious

danger that confront her. Upon the railroads rests a grave responsibility for the success of the war. The railroads cannot be efficiently operated without the whole-hearted and loyal support of every one in the service from the highest to the lowest.

"I earnestly appeal to you to apply yourselves with new devotion and energy to your work to keep trains moving on schedule time and to meet the demands upon the transportation lines, so that our soldiers and sailors may wait for nothing which will enable them to meet the enemy on a grand still and win a glorious victory for united America.

"Every railroad officer and employee is now, as he stood, in the service of the United States and every officer and employee is just as important a factor in winning the war as the men in uniform who are fighting on the frontiers.

"I am giving careful consideration to the problems of railroad employees, and every effort will be made to deal with these problems justly and fairly and at the earliest possible moment. There should be a new incentive to every one in railroad service while under government direction to acquit himself with honor and credit to himself and to the country."

Mr. McAdoo also announced that he had asked all government departments to set a good example to other shippers by loading and unloading freight promptly.

Reports received by the director general on Monday indicated that some progress had been made in improving freight conditions, but that the worst winter conditions in years had been experienced since the new regime had been inaugurated. The moderation of the weather on Monday brought encouraging reports from railways throughout the east.

Demurrage Rates Increased

The director general of railroads illustrated one of the advantages of a central governmental control of the railroads as distinguished from regulation by the federal government and 48 states when he announced on Sunday a drastic increase in demurrage charges, as an inducement to shippers and consignees to load and unload freight promptly. The railroads have been campaigning for higher demurrage rates for years and after long negotiations had succeeded in securing the permission of the Interstate Commerce Commission and of some, but not all, of the state commissions for an increase from \$1 to a scale ranging from \$2 to \$5 a day at the time of the congestion last winter, but Mr. McAdoo was able to order an increase to a scale ranging from \$4 to \$10 per day and to cancel the "average" agreement without asking permission from anyone. This order was issued following another order which took off about 400 passenger trains on eastern roads, also without consulting a state commission.

Statement by Mr. McAdoo

Director General McAdoo made public a statement on the demurrage rules, regulations and charges, in which he announced the purpose of his action. The rules are effective January 21, and follow:

"A. 1. Forty-eight hours (two days) free time for loading or unloading of all commodities.

"2. Twenty-four hours (one day) free time for cars held for any other purpose permitted by tariff.

"B. Demurrage charges per car per day or fraction of

a day until car is released, as follows: \$3 for the first day, \$4 for the second day, and for each succeeding additional day the charges to be increased \$1 in excess of that for the preceding day until a maximum charge of \$10 per car per day shall be reached on the eighth day of detention beyond free time, the charge thereafter to be \$10 per car per day or fraction thereof.

"These charges will supersede all those named in existing tariffs applicable to domestic freight, and specifically contemplate the cancellation of all average agreement provisions of existing tariffs.

"No change is authorized hereby to be made in demurrage rules, regulations and charges applying on foreign export freight awaiting ships at export points."

Upon request of the director general the Interstate Commerce Commission has issued an order authorizing the filing of tariffs to accord with this order to become effective January 21 on one day's notice. The railroads must immediately file their tariffs with the appropriate state commissions or other state authorities.

In explaining the necessity for such a demurrage charge, Mr. McAdoo said:

"An imperative necessity exists for releasing freight cars for further service and for relieving terminals, which are now badly congested.

"These unfavorable conditions are injuriously affecting the government's conduct of the war, its aid to the allies and the supplying of fuel, food and necessities for our own people.

"On these accounts I have felt compelled to issue an order providing for heavy increase in demurrage charges unless cars are loaded and unloaded with promptness.

"In making this order I have fully considered the embarrassments of shippers and consignees on account of the scarcity of labor, the inevitable weather, the irregularity of transportation, and the consequent frequent bunching of cars.

"Nevertheless, I am convinced that the total inconvenience and hardship on these accounts will be far smaller than the inconvenience and hardship which our people as a whole are suffering on account of the undue tying up of railroad equipment, and will be very small indeed compared with the menace which the widespread tying up of equipment causes to the health and comfort of the people and the successful conduct of our war operations."

Some question has been raised as to the effectiveness of an increased demurrage rate to reach one of the conspicuous causes of congestion. For several months all government freight has been rushed forward under preference waybills regardless of whether it could be used promptly at its destination. Chairman Hall of the Interstate Commerce Commission testified before the Senate committee that some government contractors had shown an indifference to demurrage charges because they were being paid on the basis of cost plus a percentage.

A Busy Director

W. G. McAdoo and his staff of advisers and assistants have been exceedingly busy during the past week on their big task. They have stayed on the job long after the hour when it becomes necessary to explain one's business to the watchman at the door of the Interstate Commerce Commission building, where the director general and his staff are quartered. Mr. McAdoo usually sees newspaper men between five and six or seven in the evening, usually leaving some conference to do so, and then returns to hear the conclusions reached by his advisers at the conference or plunges into others.

Passenger Service Reduced

While most of the efforts of the railway administration so far have been devoted to speeding up the movement of coal,

with unusually severe weather as a handicap, Mr. McAdoo held conferences on Thursday and Friday with the brotherhood leaders and arranged for a plan for dealing with their demands.

Mr. McAdoo also held conferences with the passenger traffic officers who had been summoned to Washington to discuss the curtailment of passenger traffic and on Saturday approved a plan for a reduction of approximately 20 per cent of the through trains on the eastern railroads and a lengthening of the schedules of others. The traffic men who took part in the conference were: A. B. Smith, passenger traffic manager of the New York, New Haven & Hartford; R. E. Wright, general traffic manager, and J. P. Anderson, passenger traffic manager of the Pennsylvania; L. F. Vought, passenger traffic manager of the New York Central; and W. C. Hope, general passenger agent of the Central of New Jersey. In announcing the reduction in service Mr. McAdoo made an appeal to the public to refrain from unnecessary travel. He said:

"An important change in the passenger train service on the Eastern roads goes into effect Sunday, January 6. I have consented to this change because it is imperatively necessary that passenger travel shall be reduced as much as possible during the present serious emergency which confronts the people in the Eastern section of the country. By elimination of unnecessary passenger train service, much motive power, skilled labor, track and terminal facilities are released for the handling of coal and food and other supplies essential to the life of the people as well as to the successful prosecution of the war. Every patriotic citizen can directly help the Government in clearing up the present unsatisfactory situation on the railroads by refraining from all unnecessary travel at this time.

"The breakdown in passenger service of the various railroads in the East has not made a pleasant impression on the public, but it must be borne in mind that the railroad companies in the East are still seriously congested with an unusual amount of freight traffic, the movement of which is more vital to the country than the movement of passengers, and that the weather conditions for the past two weeks have seriously impeded railroad operations.

"A wholly erroneous impression seems to have been created in some parts of the United States, especially in California, as to the policy of the director general concerning passenger train service to the Pacific Coast. Comparatively few reductions have been made or are in contemplation in passenger train service in California or in the West. No changes have been made or will be made unless they are necessary to enable the Government to deal more effectively with war needs and war problems which are, of course, of paramount importance. Such inconveniences as may result from changes imperatively needed for the prosecution of the war to a swift and victorious conclusion must be, and will be, I am sure, cheerfully endured by the patriotic people of America. Local interests and individual interests must not be permitted to stand in the way of the supreme need of the nation, and the supreme need of the nation is to use all the facilities and resources of the country to win the war."

The plan not only covers the changes in service announced by several individual roads on their own initiative, with some modifications, but also extends to roads which had not taken action. It will gradually be extended to other parts of the country.

By Sunday night over 400 passenger trains on the eastern roads had been discontinued, including 155 on the Pennsylvania, 85 on the New Haven, 60 on the Baltimore & Ohio, 60 on the New York Central and from 5 to 25 on other lines. The number of sleeping and parlor cars was also reduced.

Development of Inland Waterways

The director general also announced his intention of taking up the development of inland waterways. He issued a statement saying:

"I am very much pleased that provision is made in the pending railroad bill for the use of the inland waterways of the United States in connection with the railroad systems now under government control. The proper use of these waterways will largely increase the transportation facilities of the country, and if the pending bill is passed giving authority to the President to expend money for the development of transportation facilities on the inland waterways every effort will be made to utilize them to the full extent of their capacity.

Mr. McAdoo received representatives of the International Association of Machinists on Saturday and discussed with them certain increases in wages and threatened strikes on some of the roads. He asked them to withhold their demands until he had further time to develop a wage policy.

Traffic Solicitors

While the doing away of competition between railroads has aroused speculation as to what is to become of the railroad traffic solicitors Mr. McAdoo has told newspaper men that there is no occasion for alarm that any policy of wholesale dismissals will be adopted. While some readjustments will undoubtedly be necessary, he said, the men affected will be given other work to perform. One of the first things done by the Southern Railway under the new regime was to call in its traffic solicitors and assign them to other work; and at a meeting of southwestern lines it was decided to abolish all uptown passenger and freight offices and eliminate passenger and freight solicitors. Mr. McAdoo has preferred to devote his first efforts to moving freight rather than toward effecting economies.

Extent of the Congestion

Mr. McAdoo has also kept the Interstate Commerce Commission unusually busy and Commissioner McChord, who was assigned to collect information as to the extent of the congestion, has submitted daily reports received from inspectors at the principal terminals in eastern territory showing the conditions of the different lines. These reports showed movement below normal in many places, a considerable shortage of power on many roads, shortage of labor and material to repair cars and locomotives, yards filled with cars beyond their working capacity, large numbers of bad order cars, delays in forwarding and receiving cars because of the congestion, shortage of cars at mines, and cars that had been on hand for a long time without being unloaded by the consignee. For example, on the Maryland division of the Pennsylvania on January 3 it was found that

coal provision on the Pennsylvania. Lines indicated serious congestion at Pittsburgh and east the report stated. Shortage of train and switching crews were reported in some cases. Some of the detailed reports giving conditions as of January 1 are given in another column.

Director General McAdoo on January 6 made public the following telegraphic report on general traffic conditions from his assistant, A. H. Smith in New York:

"Accumulation is increasing at points east of Pittsburgh and Buffalo, but this is due to the extreme cold weather. Trainmen and engineers have reported sick in large numbers, which has necessitated curtailment of train service.

"The passenger service is being reduced wherever possible, but as a great many people are returning home after the holidays considerable service is required.

"A shortage of labor at engine house terminals is preventing engines from being turned promptly and getting back into service.

"The tonnage ratings of trains has been reduced on account of cold to expedite transportation of coal and foodstuffs. Embargoes and diversions are being employed wherever necessary and possible.

"A heavy fog through the Pittsburgh district, accompanied by a low temperature, is greatly interfering with switching operations and train movements, which, with the shortage of labor, causes loss of ground there. The labor situation in the Pittsburgh district is acute.

"There is plenty of coal at Hampton Roads, but ships are slow in unloading due to the severe weather and the frozen condition of the coal. Shortage of water at Jersey City is affecting the operation of railroads in that district. Temperature in the coal region is five below zero resulting in water mains freezing and hampering operations. In Indiana and Michigan there is no serious difficulty. There is a heavy accumulation of freight at tidewater ports. Ships are available but labor for unloading them is very scarce as also is labor for coaling."

District Committees Hold Meetings

Members of the six district committees of the former Railroads' War Board, who are to continue in service at least until further orders, held meetings at their various headquarters on January 3 to discuss in detail methods of securing more complete co-ordination of the lines in their districts, such as by common use of terminals, direct routing of freight and curtailment of passenger service, as directed by General Order No. 1. The meeting of the Southeastern roads was held in Washington.

Increased Traffic to Washington

An index of the increased traffic on the railroads and an explanation of some of the delays in train service to Wash-

OPERATING REVENUES PHILADELPHIA, BALTIMORE & WASHINGTON RAILROAD ELEVEN MONTHS ENDED NOVEMBER 30, 1915, 1916 AND 1917

|-----------------------|--------------|--------------|--------------|----------------------|----------|----------------------|----------|
| Freight revenue | \$14,840,951 | \$12,047,427 | \$9,917,476 | \$2,823,544 | 28.2 | \$2,823,544 | 23.5 |
| Passenger revenue | 1,465,286 | 9,060,401 | 7,511,354 | 1,549,047 | 20.6 | 1,549,047 | 17.1 |
| Miscellaneous revenue | 461,790 | 403,116 | 407,111 | 54,679 | 13.4 | 54,679 | 13.4 |
| Express revenue | 1,222,845 | 922,818 | 792,400 | 130,418 | 16.6 | 130,418 | 16.3 |
| All other revenue | 1,108,773 | 855,323 | 768,347 | 340,426 | 44.3 | 340,426 | 39.8 |
| Total revenue | \$30,039,655 | \$23,289,085 | \$19,397,688 | \$10,641,967 | 54.9 | \$10,641,967 | 45.7 |

24 trains were ready to move with no locomotives available. There were also 58 cars of government automobiles in a yard, 50 of them in open top cars, and 120 more cars of automobiles at Glen Rock, all of which had been held for more than 60 days. The Pennsylvania had 1,156 cars for the American Ship Building Company at Hog Island, 667 of them being in the Philadelphia terminals, while there were 472 cars at Hog Island not being unloaded. The gen-

ington, as well as the difficulty in obtaining hotel accommodations, is afforded by a statement just compiled by the Philadelphia, Baltimore & Washington Railroad, showing its revenues for the 11 months ended November 30, 1917, with comparisons for the corresponding period of 1915 and 1916. This is the Pennsylvania's line into Washington which has recently been leased. Comparing 1917 with 1915, passenger revenues increased 66 per cent, freight rev-

venues 50 per cent, express revenues 56 per cent and miscellaneous revenues 57 per cent, while the mail revenues decreased 1.4 per cent. The total revenue shows an increase of 55 per cent as compared with 1915 and of 29 per cent in 1917 as compared with 1916. The decrease in mail revenue stands out in marked contrast with the other increases at a time when the passenger station platforms are so crowded with mail and parcel post that they look almost like freight stations. The government is requiring vastly more service of the railroads; yet under the new space basis of payment which went into effect on November 1, 1916, the railroads are receiving less money for it. The service is so heavy that in many cases it results in causing delays to passenger trains and the mail service itself is greatly delayed. This is particularly noticeable between New York and Washington. The statement of this road's revenues is as follows:

Further Drafts to be Made from Class I

That the operating forces of the railways will probably not be further depleted by the draft to any great extent is indicated in a report to the Secretary of War by Provost Marshal General Crowder announcing that future increments to the National Army can in all probability be met entirely from the first of the five classes into which the registrants are divided. Available figures indicate, the report says, that 1,000,000 qualified men will be found in Class I of the present registration. Class I is composed mainly of single men without dependent relatives and unskilled laborers and those in necessary employments are enrolled in the later classes. General Crowder also urges amendment of the draft law to provide that all men who reach their twenty-first birthday shall be required to register for classification.

Mr. McAdoo has indicated that the various local exemption boards will naturally take into consideration hereafter the requirements of the railroads for men and although railroad employees are not exactly government employees he will not hesitate if necessary to ask the exemption boards to exempt men necessary for railroad service.

The Provost Marshal General has announced that until further orders railroad employees will be classified under the provisions of the regulations governing claims for deferred classification on industrial grounds, and not under the provisions of the regulations governing claims as government employees.

I. C. C. Asks Information on Capital Requirements, Etc.

For the purpose of gaining information to guide the government in its plans for railroad financing, Commissioner Daniels of the Interstate Commerce Commission has sent a questionnaire to the presidents of the railroads, at the direction of Mr. McAdoo, asking them to telegraph immediately the amount of new capital required for this year and for the first six months of the year, and the purposes for which it is needed. They were also asked to furnish details as to the requirements for maturing obligations and for improvements and construction work already contracted for and partly finished, with a statement as to what portion of improvements already started can be stopped now without detriment. An approximate estimate is asked of capital necessary for new construction work and improvements and betterments, including terminals and new equipment, with a statement as to what part of the estimated requirements are not absolutely necessary for the protection of property or maintenance of earnings.

The commission also issued an order to all railroads to submit to the commission under oath by January 25 detailed statements of operating revenues and expenses, income account, profit and loss account and general balance sheet for the year ending June 30, 1917, together with the miles of

road owned and operated on June 30 and the average mileage operated during the year. The regular annual reports of the roads for 1917 are to be filed for the calendar year and this information is required to enable the commission to compute the "standard" return as provided by the administration bill as the basis of compensation to be paid by the government.

The Bureau of Car Service of the Interstate Commerce Commission on January 5 addressed to the railroads and private car lines a form calling for information as to the freight loading equipment actually available for service throughout the country and also that not available, to be submitted by January 25 for the calendar year 1917. Information is asked as to the number of cars of various classes owned, leased, in service, and in operation, and the number of bad order cars classified as to cars not to be repaired, heavy repair cars which will and will not be repaired in 30 days and light repair cars.

General Goethals in Charge of War Department Transportation

An important step in the direction of co-ordinating the transportation requirements of the government in its capacity as a shipper, which had been strongly urged by the railroads for several weeks before the taking over of the roads by the government, was taken on Monday with the announcement by Secretary of War Baker that Major General George W. Goethals, acting quartermaster general, has been appointed also director of War Department transportation and storage. This appointment centralizes functions heretofore exercised by five departmental bureaus independently. General Goethals will supervise transportation of all ordnance, engineering, signal corps, aviation service and coast artillery material, as well as quartermaster supplies and troops. The bureaus which have heretofore placed their orders for railroad transportation independently have been directed to co-ordinate their demands upon the railroads and upon storage facilities through the director of transportation, who in turn will deal with the director general of railroads, the shipping board or any other centralized agency for transportation or storage. The Railroads' War Board in its recommendations on the subject had in mind the appointment of a government traffic director to co-ordinate the transportation of the War and Navy departments and the shipping board and possibly those of the food and fuel administrations.

A Big French Railway Gun on Its Way to the Front

The Transportation of Perishable Commodities

Type of Bunker, Insulation and Floor Racks Affect Efficiency of Car; Result of Adding Salt to Ice

By Dr. M. E. Pennington

Chief Food Research Laboratory, United States Department of Agriculture, Bureau of Chemistry

THE INVESTIGATION of the transportation of perishables which is now under way in the United States Department of Agriculture has shown that the refrigerator equipment on the various lines differs widely in ability to protect against heat and cold. This variation depends to a certain extent upon the size and character of the load as well as upon the construction of the car. It is my purpose to discuss some of the results of these investigations, comparing the performance of cars of varying types when loaded with varying quantities of the commodity to be

of 2 in. by 4 in. lumber and 1 in. by 2 in. cross slats, 3/2 in. apart. These racks are fastened to the sides of the car with hinged bolts and are divided into the middle so that they can be turned up against the walls when the car is cleaned. They are absolutely necessary for the safe carrying of perishable loads. Most of the cars now on the lines are without racks. Some have permanent strips on the floors 1 in. or 1 1/2 in. in height. These strips are practically valueless. The insulation varies from a few layers of paper to 3 in. of some recognized insulator. In some cars the layers of insulation are broken by space—in others the insulation is massed. The cars in the experiments were from approximately 20 ft. between bulkheads to approximately 35 ft. All temperatures were taken by means of electrical thermometers inserted when the cars were loaded and the mechanism was such that neither the doors nor the hatches were opened to take records nor was the car modified in any way.

The car factors which determine the size of the load which can be safely carried are insulation, bunkers and floor racks. Each exercises a specific influence as indicated

Fig. 1—Box Bunker with Open Bulkhead and Insulation Broken by Air Spaces

transported. First, however, let me very briefly outline the major differences in the construction of the cars used in these experiments. In the general purpose refrigerator car we find two types of bunker—one known as the "box bunker," illustrated in Fig. 1, in which the ice rests directly against the end and sides of the car—and the other, known as the "basket bunker," in which the ice is held in a wire container 2 in. away from walls and bulkhead (Fig. 2).

The box bunker usually has an open bulkhead of wood or metal. Sometimes we find a solid wooden partition open at the top and bottom. The basket bunker commonly has a solid wooden bulkhead, open 12 in. at the bottom and 14 in. at the top, and in the new cars this bulkhead is insulated with one inch of a recognized insulator. The new cars also have a rack on the floor, 4 in. in the clear, made

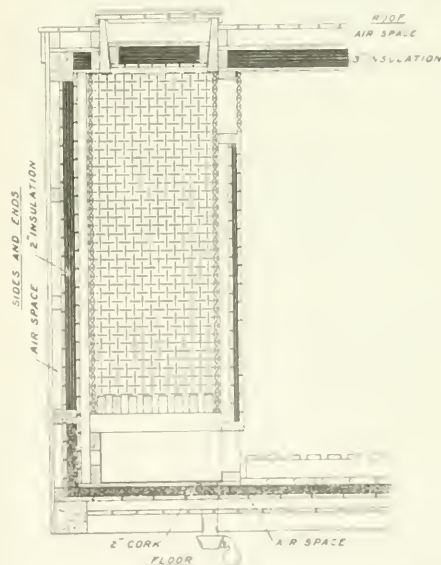

Fig. 2—Basket Bunker with Insulated Bulkhead and Massed Insulation

in Chart 1. This shows the results of an experiment conducted with things very much had seen in experiments carried for about ten months. As shown on the chart cars A and C were provided with basket bunkers and floor racks; car B had a box bunker and struts on the floor. Cars A and B had 3 in. of insulation in the roof, 2 in. in side walls and

* Figures were presented before the St. Louis Bureau, Jan. 1919.

ends and 2 in. of cork in the floor. Car C had $1\frac{1}{2}$ in. in the walls and 2 in. in the roof and floor. Each was loaded with 600 cases of eggs consolidated from pickup cars, and each received the same amount of ice accurately weighed into the bunkers. About twelve thermometers were put into each car. For our purposes the temperatures in the cases of eggs on the bottom and top of the load are especially significant, and indicate very plainly the amount of work which the car can do. For example, the temperature of the eggs on the floor of car B, between the doors, was 66.5 deg. F. on arrival; car C, in the same location, was 45.5 deg. F and car A 44.5 deg. F. The packages between the doors on the top of the load—in this case five layers high—showed for car B, 64 deg., for car C, 56.5 deg., and for car A, 55.5 deg. F.

The behavior of the packages on the floor of car B between

Manifestly, car B is not a satisfactory carrier for a heavy load of eggs. Car A, on the other hand, has done its work well, and at first sight car C, having less insulation, appears to be efficient for a load of 600 cases of eggs during hot sum-

Upper Curve (33)—Car C; Lower Curve (9)—Car A

Chart II

mer weather. Further study, however, shows that the packages around the walls of car C came into destination over 6 deg. higher than the corresponding packages in car A (Chart II), though when loaded, they were but 3 deg. apart.

Chart I

the doors is especially noteworthy. They were continuously higher in temperature than the packages on the top of the load, a condition quite contrary to the idea generally held that the coolest place in a refrigerator car is its floor. That is only true when the construction is such that the cold air from the bunkers can travel along the car floor. This experiment, and many others that we have made, show conclusively that a rack 4 in. above the floor is necessary if the goods on the bottom of the load in the two middle quarters of the car are to be refrigerated. It is of interest to note, also, that the insulation in cars A and B is unusually heavy, in fact, more than twice as much as is in most of the refrigerator cars now in service, yet because of the construction of the bunkers in car B and the absence of a rack on the floor, there was practically no refrigeration except near the bulkheads.

Chart III

Car C used about 1,000 lb. more ice than car A and, on the whole, did less satisfactory work, especially around the walls, where actual deterioration due to heat undoubtedly occurred.

It may be said that in the experiment cited car B, having the box bunker and open bulkhead, was unfairly treated in that the temperature of the entering load was distinctly higher. The facts illustrated in Chart III tend to nullify the significance of such an argument. In this experiment, the cars had 2 in. of insulation throughout, but car A was of the box bunker type, while car B had a basket bunker and its adjuncts. Here the eggs entering car A were cooled to between 50 deg. and 60 deg., while those in car B ranged between 55 deg. and 65 deg. However, car A could not even maintain the initial temperature. At destination the

cars having one foot of insulation. Car B, having $1\frac{1}{2}$ in. of insulation, is provided with a 1-ft. box bunker and a floor rack, can carry four layers. Its load, by height, we must have 3 in. in the front and 2 in. in the sides, ends and floors, and good air circulation. With more than five layers of egg cases we have not succeeded in getting good refrigeration.

This is illustrated in Chart VI showing top and bottom layer temperatures in two cars loaded six layers high, packing 700 cases to the load. Car A, of the box bunker type, was used in Chart I, where with 600 cases it did good work. With 700 cases there was practically no refrigeration except in the bottom layer. The temperature in car A, with the same insulation but having a box bunker, did not even refrigerate the lower layers. The packages on the floor, middle of the car were often warmer than the top of the load, which was only 12 in. from the ceiling. It went more than 5 deg. with the daily rise and fall of the temperature and arrived at destination showing an increase of 7 deg.

Encouraging results have been obtained in refrigerating heavy loads of fruit in the basket bunker cars by adding salt to the ice in the bunkers. On a long haul across a hot territory salt has been added to the ice at the first three long stations. By that time (the third day) the load was cooled

Chart IV

packages in the middle of the car on the floor were nearly 5 deg. warmer than when they entered the car and those in the top layer were over 2 deg. F. higher. Car B, on the contrary, brought in the load from 6 deg. to 14 deg. lower than car A. These two cars were loaded with 600 cases of eggs and, so long as the atmospheric temperatures were above 80 deg. F., refrigeration was of doubtful efficiency. The third and fourth days of the trip were unseasonably cool and also rainy, which compensated for the lack of insulation in the roof and permitted the load in car B to drop below 55 deg. before the end of the fourth day.

The performance of a poorly built car, said to contain $1\frac{1}{2}$ in. of insulation throughout, as compared with a well built car known to have $1\frac{1}{2}$ in. of insulation, is well illustrated in Charts IV and V, showing the temperature in cars in which cantaloupes were hauled for eleven days across a hot territory. The top layer in car A, loaded six wide and four high at the bunkers, was in such bad condition on arrival that claims were filed for damage in transit. Car B, on the other hand, was in good condition, although the load was seven cases wide and four cases high. In car A the combination of a lack of cold air circulation and of insulation proved disastrous, even though the load was light and open in character, and much easier to refrigerate than a load of eggs. In fact, we know that eggs can not be safely loaded more than three layers high in summer weather in

Chart V

and very frequently no more ice was needed, even though the haul continued for five to eight days. The air issuing from the bunkers is far below 32 deg., but the insulation is so rapid that there is no pecking at the bulkhead. The insulated bulkhead also protects the load so that frosting does not occur. Salting ice in a box bunker, open bulkhead, merely freezes the load next to the bulkhead. The packages in the middle of the car are not benefited because of a lack of air circulation.

We have used salt to assist in refrigerating heavy loads of eggs and with some success, but we have not succeeded in refrigerating 700 cases in a car 3 ft. between bulkheads. The records of car A, in Chart VI, bring out this fact.

Three per cent of salt was added after the load had been placed in this car and salt was again put into the bunkers at three icing stations. While the car was not able to handle so heavy a load during the very hot weather prevailing, it nevertheless did rather remarkable work and furnished valuable information on which to develop a more economical and efficient icing system. Car A, which brought the sixth layer of eggs from 85 deg. down to 66.5 deg., used 12,660 lb. of ice and 540 lb. of salt; car B, which did not refrigerate either the top or bottom of the middle part of the load, used 19,755 lb. of ice.

A great many experiments have been made with fruits and eggs, all of which confirm the foregoing; namely, that a suitable use of salt saves ice on a long haul and greatly increases the efficiency of the work done on both short and long hauls.

The experiment recorded in Chart VII adds still further to our knowledge of car construction and car performance when salt is used with the ice. In this case we had short cars, so that by comparison, the 2 in. of insulation became nearly 2.5 in. and the air circulation was more rapid because of lessened distance. Car B was of the usual box type; car A had a box bunker with an insulated bulkhead

cars A and C until the last day of the trip. An analysis of temperatures in different locations shows, further, that the floor of car B paralleled the top layer of car C. Car C did much the best work of the three. Car A, having the rack and the insulated bulkhead, but not the basket bunker, did not succeed in maintaining a sufficiently rapid air circulation to cool the top layer more than 5 deg. The packages on the floor, on the contrary, were exaggeratedly chilled because of the pocketing of the cold air. The conclusion fol-

Chart VI

and a floor rack; car C was of the standard basket type. Cars A and C received salt on the initial icing. They were neither iced nor salted in transit on an 88-hour haul. Car B was iced once. All contained from 400 to 500 cases of eggs. The three lower layers were seven cases wide, spaced for air circulation, and the upper layers were eight cases across. The average of all the thermometers in the packages in various parts of car B showed that it was far above

Chart VII

lows that even with an openly stowed load, the car must be provided with a basket bunker, an insulated bulkhead, a floor rack and ample insulation, if our present loads are to be materially increased with safety to the commodity.

Car C of the foregoing experiment was again used with a load of about 600 cases, stowed eight across (Chart VIII.) The ice was salted at the start and 40 lb. was added on the second day. Thermometers in the first, fourth, fifth and sixth layer packages give an instructive picture of the rise in temperature with the height of the load. Without salt the fourth layer would be the stopping point. The fifth layer cases around the walls of the car would suffer if the weather were hot, if salt were not used. With the salt, as this experiment shows, we can load five high with impunity, but not six, because of damage to wall cases. A study of the chart shows that the 40 lb. of salt added at the first icing station was enough to cause a drop in temperature in all except the sixth layer wall packages. Had another charge

of 40 lb. been added the next day, the rise shown in the lower layers would have been avoided and the fourth and fifth layers would have continued to cool instead of remaining practically stationary.

The investigation has convinced us that in the future ice and salt will be used for more commodities than fresh meats, poultry and fish. Indeed, it is the only way that we now see by which very perishable small fruits can be transported

latter may be further emphasized by considering a more fault with what is commonly described as "faulting." As such a car is considered to be a smaller variation from a new car but in no way is it a retroversion. Indeed, it is not provided with (see sidebar). Chart 3 shows how two temperatures on the ceiling of such a car reduce the temperature. Compare its performance with that of the power car on the same chart and I think you will agree with me that there is a decided similarity between the two.

Summary

Summing up the results of such experiments, as thus, we are led to the following conclusions:

1. A combination of basket under market bulkhead and floor rack produces a circulation of air which is not obtained in a car having a low bunker, open bulkhead and bare floor or permanent strips.
2. Such a basket bunker car approximately 14 ft between bulkheads, can refrigerate the top and bottom of the load in the two middle quarters of the car, provided it is sufficiently well insulated and not overloaded.
3. Cars which depend for insulation on rubber and oil

Chart VIII

in good condition throughout the entire car. Of course, a definite routine for its application must be worked out. The experiments of the summer just ending have yielded much information. We hope that by the end of another summer we can give specific instructions for refrigerating a number of commodities.

Such instructions must, however, be based on the type of car used. Far too many cars now on our lines would be useless no matter what treatment they received. For example, we still have cars with $\frac{1}{2}$ in. of some insulator posing as refrigerators, and we still have cars, the walls of which contain only paper and air spaces. The use of such cars to transport perishables is a wasteful practice, and should be discontinued.

The effect of poor insulation is clearly shown in Chart 1X. One of the cars represented is of the paper variety—the other well insulated. There is a variation of more than 15 deg. between the two cars. The floor of the one is often six or more degrees warmer than the ceiling of the other. The paper car follows the atmospheric temperature and the refrigerant in the bunkers is almost powerless. Yet again and again this summer eggs, fruit, vegetables and dressed poultry have been shipped in these cars and sometimes they have been loaded almost to their cubical capacity!

The relative value of the air space and paper as an insu-

Chart IX

spaces should not be used for the transportation of such perishables as fruit, dairy vegetables, poultry, eggs and fish.

- Cars having 1 1/2 in. of insulation in the side walls and 2 in. in the roof and floor will not carry eggs successfully during hot weather when loaded more than three layers high.

during hot weather when loaded more than four layers high.

Cars having 3 in. of insulation in the roof, 2 in. in the side walls and ends and 2 in. of cork in the floor will carry eggs five cases high, but not six.

The box bunker car, regardless of quantity of insulation, does not refrigerate the two middle quarters of the load when it is tightly stowed. Even with an open load the performance is unsatisfactory.

5. The use of salt with the ice in a well insulated basket

Chart X

bunker car will permit an increase in the load of from 25 to 40 per cent.

6. While each commodity must be studied separately in order to determine the maximum load, the principles of the relation between car efficiency and tonnage of eggs as indicated in this discussion can be applied to perishables in general.

IMPROVEMENTS TO PORT OF DIEPPE IN 1916.—Various improvements to the port of Dieppe, France, were made during 1916. Four steam cranes of American manufacture, of a carrying capacity of 5,000 kilos (11,000 lb.) each, were acquired. Thirteen electric capstans were installed and new railways built around some of the docks. A large shunting station was created at Rouxmesnil, 5 kilometers (3 miles) from Dieppe, and connected with the docks by a railway line. All the docks are now lighted by electricity. The unloading capacity of this port has been increased to 125,000 tons per month. In 1916 1,697 vessels of 929,004 tons entered the port of Dieppe, against 1,428 of 758,279 tons in 1915.—*Commerce Report*.

Priority and Preference Orders

JUDGE ROBERT S. LOVETT, director of priority in transportation, has issued a statement asserting that the "priority" orders issued by him are in no way responsible for the railroad congestion which has been attributed to the indiscriminate use of "preference" orders issued by various government departments. The statement is intended to clear up the confusion caused by the loose use of the word "priority" when the preference orders were meant.

Mr. Lovett's statement was as follows:

"It is being reiterated before committees and in various reports, and repeated from day to day in newspapers, that the present congestion in railroad transportation is due in large measure to numerous and unwise 'priority orders,' and it is well known and is generally published that I am in charge of priorities. The obvious inference, therefore, is that such ill-advised priority orders were issued by me. Nothing could be further from the truth.

"No one knows better than I have known all along that reckless and indiscriminate issue of priority orders would add enormously to the transportation difficulties, and that the greatest caution should be observed in issuing such orders.

"The result is that since my appointment by the President, in August last, I have issued but five orders awarding priority in transportation, to wit: Order No. 1, issued Aug. 20, directing the movement of coal to the Northwestern States via the lakes; Order No. 2, issued Oct. 27, restricting the use of open-top cars; Order No. 3, issued Nov. 2, giving preference to certain coal shipments from Utah and Wyoming mines; Order No. 4, issued Nov. 29, according priority in the shipment of certain cattle foodstuffs to the drought-stricken sections of Texas and New Mexico; and Order No. 5, issued Dec. 7, according priority to perishable freight, foodstuffs, and certain military supplies, and to coal, coke, and certain war materials.

"No railroad man or other person with knowledge of the facts has claimed or will claim that any of these orders has caused congestion or seriously hampered transportation.

"The fact is that the so-called priority orders, which are more or less responsible for traffic congestion and of which complaint is made, are the result of an agreement made by the railroads themselves and the supply departments of the Army, Navy, and Shipping Board, with which I had nothing whatever to do. This arrangement was embodied in Bulletin No. 22, issued by the so-called 'Railroad War Board' in July last, and is commonly referred to as the 'tag' system. It prescribed a form of placard or tag which, when tacked on a car entitled that car without further orders or instructions to preferred movement to destination. Large quantities of these placards were printed and distributed throughout the United States in the hands of quartermasters' agents, contractors, and others getting material for the government, and naturally one was tacked to every shipment made whether urgent or not.

"Consequently, everything bought was rushed to destination, with the inevitable result that terminals were crowded with materials before they were needed or could be unloaded. No complaint of this system was made or reported to me until late in November, and priority Order No. 5, issued by me December 7, made provision for restricting and regulating the evil.

"However indifferent one may be personally to misrepresentation, yet where the performance of public duty is involved, the facts as they are ought to be stated. Of course, I know the misrepresentation was not intentional, and the unusual circumstances were such as to make it almost unavoidable, but because of the public interest concerned, I think it should be corrected."

Thawing Out Coal at South Ambler, N. J. A Large Part of the Coal Supply for New York City Is Transported from the Mines to Barges at This Point. Copyrighted by the International Film Service, Inc.

Director General McAdoo Speeds Up Coal Movement

The Extremely Cold Weather of the Past Week Has
Seriously Complicated the Fuel Problem

THE MOVEMENT OF COAL occupied most of the attention of Director General McAdoo and his advisers during last week. On January 2 coal was moved through the New York tunnels of the Pennsylvania. Mr. McAdoo told newspaper men that he had already found railroading to be a 24-hour job and that after spending long hours at his office he had gone home to dream of pulling a 50-car train of coal with a rope around his waist. He insisted, however, that the coal was delivered on time. After all priority orders had been suspended coal was given the right of way for the time being, even over passenger traffic, with the result that passenger trains in the eastern territory were later than ever, and this resulted in some cases in a delay of milk trains.

A complete statement of the coal needs of the North Atlantic States, particularly New England, was laid before the director general of railroads by the United States Fuel Administration and Fuel Administrator Garfield has impressed upon the railway and shipping authorities the grave necessity for an immediate improvement in transportation conditions in order to relieve the needs of New England. The Fuel Administration furnished full data to the representatives of the director general as to the sources from which New England coal is moving in order that this coal might be hurried to New England along the shortest possible transportation lines.

A distribution schedule covering the North Atlantic states and eastern Ohio has also been worked out. This schedule shows the mining districts from which coal for this consuming territory is being supplied and the transportation lines along which the coal must move from the mines to the distributing centers. This information is expected to enable the railroad lines to take the amount of coal needed as directly as possible from the mines to central distributing points and thence on orders from state fuel administrators to the points of consumption.

Under this schedule the fuel administration seeks to aid the railroads in eliminating the cross-hauling of coal.

Specific coal producing districts in West Virginia and Western Pennsylvania will be set aside to supply the distributing centers in the North Atlantic states.

Fuel Administrator Garfield discussed the transportation condition as affecting the coal supply of New York, Philadelphia, Baltimore and the New England states at various conferences with the Director General.

Speedy movement of coal diverted for the immediate relief of New England was reported to the United States Fuel Administration on January 2. At noon on Monday the Fuel Administration ordered 1,250 cars of coal, tied up behind congestion at Pennsylvania points, to New Jersey tidewater ports; 750 cars of this coal were for New England distribution and 500 for the use of the United States Shipping Board. By noon on Tuesday the first trainload of this coal had reached Jersey terminals and by six o'clock January 2 6 trains, carrying 315 cars of coal, had reached Jersey points.

The Fuel Administration arranged to have the Pennsylvania Railroad carry cars of coal on car floats from Jersey terminal points through New York bay and to coal yards on the Harlem River in New York City. This plan will eliminate some of the difficulties of the transportation of coal by barge from Jersey terminals to New York City. Plans were also made to handle coal by all-rail routes to New England up the west bank of the Hudson river and across the Hudson at the Poughkeepsie bridge.

Fuel Administrator Garfield on January 4 ordered 102 mines in the eastern bituminous fields to furnish 500 additional carloads of coal effective January 8, to be shipped under consignment to J. J. Sorrow fuel administrator for New England, each day until further notice. These 500 carloads will be in addition to the usual output of these mines, and the Fuel Administration experts that the order will result in an increased production of 500 cars or 25,000 tons of bituminous coal each day while the order is in force. The order was issued because of the necessity for keeping an adequate supply of bituminous coal flowing to New Eng-

land for the use of industries essential to the conduct of the war.

In co-operation with the fuel administrator, the director general of railroads has undertaken to supply the necessary transportation facilities for making the order effective by issuing an order for the placing of the cars. The Fuel Administration finds that the present volume of shipment to New England by all rail routes is not adequate, and that the further supply is absolutely necessary for purposes connected with the war emergency.

Four mines on the Cambria & Indiana Railroad are designated in the schedule attached to the order to furnish 26 cars of coal a day. On the New York Central are 23 mines which will have to furnish 74 cars daily. On the Western Maryland there are three mines whose contribution must be 20 cars a day; on the Baltimore & Ohio are 11 mines that will furnish 50 cars a day. On the Pittsburgh, Shawmut & Northern are only three mines that will furnish 10 cars; the Buffalo, Rochester & Pittsburgh serves 25 mines that will furnish 130 cars a day; on the Pennsylvania are 28 mines that will be required to furnish 150 cars a day, and two mines on the Buffalo & Susquehanna will furnish

according to a statement by the Fuel Administration. The delivery of this coal was delayed because of the ice in the Hudson and East rivers. Yonkers was completely frozen in and the floating ice in the lower river was so thick it was necessary to use two tugs to move one float, whereas under normal conditions one tug can tow three or four floats. Coal was being moved through the Pennsylvania Railroad tunnels to the suburbs of New York on Long Island, but only small quantities can be moved to those places, and there can not be any material improvement in transportation until the weather has moderated, the statement says.

Co-operation of government departments relieved a serious coal famine in Boston on January 6, when Secretary of the Navy Daniels promptly met a request from Director General of Railroads McAdoo, to place naval coal at the disposal of the Fuel Administration for the aid of the suffering people. Telegrams from Boston authorities and representations by the Fuel Administration showed clearly that the coal shortage in Boston was an acute emergency. The director general of railroads informed the Secretary of the Navy, who responded by causing the immediate delivery of ten thousand tons of naval coal from colliers in Boston

Copyright by Underwood & Underwood, N. Y.

Barges Battle Through Harbor Ice to Bring Coal to New York

28 cars a day. Thus, from a total of 102 mines will come, by the order, 500 cars a day. The routing of the cars is to be left to the determination of the director general or to the carrier upon whose lines the mines are located.

On December 31 the Fuel Administration ordered 400 cars of coal from the Western West Virginia coal fields diverted for local distribution in Ohio by way of the Cincinnati, Hamilton & Dayton. This diversion is expected to relieve pressing conditions at Ohio points where weather of unprecedented severity is causing distress.

Three hundred cars of coal in-transit for tidewater at Hampton Roads were ordered diverted for local distribution in North Carolina. Reports to the Fuel Administration showed that weather conditions were impeding the loading of coal for water shipment at Hampton Roads, and the coal bound for that point was ordered to North Carolina.

The Fuel Administration has ordered 700 cars of bituminous coal diverted from the Kanawha district of West Virginia to points in Ohio, Michigan, and Kentucky, to meet the urgent needs of those localities, and to relieve the congestion of eastbound traffic.

Approximately 250,000 tons of anthracite coal consigned to New York City were in the cars at the New Jersey terminals of the railroads leading into that city on January 3,

harbor. This coal is now in the hands of the Fuel Administration for distribution.

The United States Fuel Administration has received assurances from the Emergency Fleet Corporation of the United States Shipping Board that 11 vessels had been assigned for service in carrying coal from tidewater to points in New England. These ships will be utilized at once to relieve the present coal shortage in the New England states and to build up a winter's coal supply in New England. The vessels assigned have an aggregate tonnage of 65,730. Some of the ships were turned over to the fuel administration at Atlantic ports on January 4. Others will be available within the next few days. Some of these ships will be available for only a single voyage, but the shipping board will undertake to replace them if they are withdrawn.

AUTOMOBILE OUTPUT 5,853,000 IN TEN YEARS.—In the past ten years, the American automobile industry has manufactured about 5,853,000 motor vehicles, of which 4,809,000 were made in the past five years. There were registered throughout the country July 1 last 4,200,000 motor cars, indicating the average life of an automobile at just under five years. It is estimated that cars in use now number 4,500,000, of which 400,000 are trucks.

The Basis of Compensation for the Railroads

An Analysis of the Provisions Which Were Suggested
by President Wilson in His Message

By Julius H. Parmelee
Statistician, Bureau of Railway Economics

IMMEDIATELY FOLLOWING the President's address to Congress on the railroad situation, last Friday, identical bills were introduced in House (H. R. 8172) and Senate (S. 5885) providing among other things a basis of compensation to railway owners while their properties are under government control. The compensation provisions are contained in sections 1, 2, 3 and 4, while sections 5, 6 and 7 bear indirectly on the financial terms according to which the roads are to be operated. Briefly summarized, the basic compensation provisions are as follows:

1. The "just compensation" guaranteed to each carrier for the use of its property shall be equivalent to the average of its "net railway operating income" for the three years ending June 30, 1917. This is denominated the "standard return."

2. This net operating income may be defined as railway operating revenues less operating expenses, taxes, uncollectible revenues if any, plus or minus the net balance from miscellaneous operations, hire of equipment, and joint facilities.

3. Taxes deductible from operating revenues under the provision just cited shall consist of all state and local taxes actually paid or charged, together with such proportion of federal taxes paid or charged as represents an amount not greater than the federal taxes assessed during the year ended June 30, 1917. This proviso as to federal taxes is designed to hold each road responsible, out of its own corporate income and entirely apart from the income guaranteed by the government, for such war taxes as were levied under the financial legislation of last October, or as may be levied from time to time until government control has terminated.

4. The proposed law guarantees adequate depreciation and maintenance charges. If expenditure of the funds derived from these charges is for any reason deferred, the President may authorize the roads to set up reserve funds on which they may draw at a later period.

5. The use of new capital invested in a carrier's property during the period of government control shall be compensated at an annual rate, determination of which is left to the President. This provision applies to capital whether invested out of carrier's surplus, obtained from the sale of securities, or borrowed direct from the government.

These comprise the direct compensation provisions of the proposed act. Decision as to the amount of the standard return rests with the Interstate Commerce Commission. No road is required to accept the decision of the commission in this matter, but has the option of two courses of action: either to submit its claim to the Court of Claims, or to submit to arbitration by a board of three auditors, whose decision is subject to review by the Court of Claims.

Sections 5 to 7 bear indirectly on the basis of compensation, in that they limit the rate of dividend payable from such compensation to the regular dividend rate of the three-year period to June 30, 1917; give the President power to order additions and improvements, to advance the carriers money at a fair rate of interest, to authorize the issue of securities, which may be purchased by the government on account or for sale in the open market; and finally, appro-

priate \$300,000,000 for carrying out the compensation and other provisions of the act.

This outline of the basis of compensation must be subjected to analysis if any understanding of the real meaning of the compensation provisions is to be reached. In making such an analysis we must consider not only the effect of the compensation provisions on the railways as a whole, considered as a single network, but also on the railways individually, and on their relative position with respect to all other roads. For example, under the provisions of a standard return all roads receive the same net operating income as before the period of government control, although some roads handle considerably more traffic than formerly while other roads may be handling considerably less. It might be argued from this that the scheme of control works to the disadvantage of some roads as compared with others, i. e., that those were doing more work for less return. However, such elements are inherent in any general scheme that must be planned without reference to the particular conditions surrounding the operations of any one company.

How will these compensation provisions, if enacted into law, affect the operations of the railways, and are they reasonably equitable as between individual railways? Reply to this query may be found in the following analysis of the various provisions, in which especial reference is had to their bearing on all the roads and on each road separately.

So far as revenues from and expenses of railway and miscellaneous transportation operations are concerned, the act bears on all roads alike. The item of uncollectible revenues is so small that it may be dismissed as negligible. The proviso as to taxes would affect only lightly roads whose federal tax payments are but slightly increased under the income tax law of October, 1917, while it will put a considerable weight on roads whose taxes will greatly increase. Hire of equipment and joint facility rentals differ from the other items mentioned above as factors in the ascertainment of net operating income, in that they consist almost wholly of inter-railway payments or settlements, whereas the other factors represent dealings with the government or with the general public. Assuming that depreciation rates on equipment are maintained at an adequate level (probably higher than normal, owing to the wear and tear of war traffic) and that repairs are made and are charged, as under normal conditions, to the operating expense accounts, there is little reason to suppose that the inclusion of the hire of equipment provision in the scheme of compensation will be a disadvantage to any road. The only possibility of harm lies in a situation involving the lease of equipment from other than railway companies or from such railways (i. e., non-operating companies) as may not come under the general provisions of the proposed act. Such a situation might work to the advantage or disadvantage of a carrier, according as it drew respectively a smaller or larger proportion of its equipment in service from the classes of companies named. Another element for harm is represented by charges in per diem rates.

So far as interchange of equipment between roads covered by the scheme of compensation is concerned, guaranteed to the government of the carriers' net operating income will make it of little moment whether the proportional use of

each other's equipment is greater or less than during the normal three-year period utilized as a yardstick. Furthermore, it is of great importance whether hire-of-equipment accounts are actually maintained between the carriers during the period of government control or not, even though for purposes of record it might be considered advisable to do so.

Equipment seems destined to be pooled on a large scale under government control, motive power as well as freight and passenger cars, and inter-company financial relations with regard to equipment contributed to the pool should therefore be of the simplest sort. However, it is absolutely essential that any road using the equipment of another road should maintain it in good order, charging the cost to its own operating expenses, while the owning road should in turn charge to its operating expense account depreciation on that equipment at a rate warranted by the wear and tear on it, regardless of whether the wear and tear occurred while in service at home or on a foreign road.

Joint facility rentals are also inter-railway payments, such as for joint use of tracks. These payments, together with the cost of operating and maintaining joint tracks, terminal facilities, etc., have been adjusted to a reasonably equitable basis in normal times, and it may be assumed that this will represent a fair basis for continuance, regardless of changed conditions of traffic routing or handling.

There are two other rental accounts not included in the scheme of compensation, namely, rents paid and received for lease of road, and miscellaneous rents paid and received. These rental payments and receipts, under the proposed act, are not to be taken into the accounts before arriving at the net operating income which the government guarantees, but shall be financed from income remaining after adjustment under the guarantee. Leased rentals are paid largely to non-operating railway companies, which seem to lie outside the scheme of government compensation. Miscellaneous rents in part represent dealings with non-railway corporations or persons. Hence these two groups of rentals stand in a somewhat different class than the two groups already discussed (hire of equipment and joint facility).

Leaving leased and miscellaneous rentals out of consideration in arriving at net operating income will affect the final result only with such roads as are forced to accept changes in rental rates after June 30, 1917, and during the period of government control. Unfortunately a number of roads are in the position of expecting increased rentals forced on them in the near future, and their guaranteed income will, therefore, be reduced by the amount of the increases. In other words, so long as these rentals are actually a fixed charge (using the word "fixed" in a dual sense, the technical accounting sense and the ordinary sense of "stable"), it makes little difference whether they are accounted for before or after arriving at net operating income; but if they take on more the character of an operating expense in that they shift quickly according to the trend of general prices, they might better be treated as an operating expense and be deducted before reaching the standard return.

There is little question about the other compensation provisions of the act. So much depends on the standards and methods adopted by the President and the Director General of Railroads, that it would be unwise to prophesy how the compensation scheme will work out. For example, much depends on what the President, or rather the person or persons to whom he delegates the task, shall regard as adequate depreciation and maintenance charges, what his attitude will be regarding issues of securities, and the like. However, the President's own emphatic phraseology, set out both in his proclamation and his address to Congress on the railway situation, assures the roads a square deal, and they certainly can neither wish nor expect anything more or less than that.

Lord Shaughnessy Comments on the Canadian Railway Situation

LORD SHAUGHNESSY, president and chairman of the Canadian Pacific, is the author of a most interesting article on the railway situation in Canada which appeared in the annual financial survey of the Toronto Globe. Extracts from this article follow:

After forty months of this great world war, the railway situation in Canada presents a very different face from that of peace times. Canada's trade balance has been converted from a heavy "minus" to a substantial "plus," the exports for eleven months of 1917 exceeding those of a similar period in 1913 by over a billion dollars. The increase in traffic-moving effort has meant not increased profit but increased anxiety for the carriers. The labor shortage is indicated by our own Honor Roll, which shows that up to December 6, 7,021 employers of the Canadian Pacific had enlisted for active service.

The satisfactory features are the efficiency with which the Canadian railways have done their part under such trying circumstances, and the remarkable absence of congestion. With fewer ports and a much less elaborate network of railways than in the United States, Canada has solved its war-export problems with infinitely less confusion. From the beginning of August, 1914, to November 30, 1917, the Canadian railways have handled for the Imperial Government over 6½ million tons of supplies, exclusive of horses and mules, most of which may be considered as supplementary to normal traffic; but so admirably has the movement been timed with the arrival and departure of steamers that not a cent has been earned by the ships as demurrage. * * *

The efficiency and absence of congestion with which our enormous war traffic has been handled might well be taken to heart by our American friends who, if I may venture the suggestion, are looking too hopefully to the centralized effort of an overworked government when they should depend more on the trained enterprise of the individual industrial units that have been so efficiently developed during times of peace. Any form of control that will have the effect of lessening the sense of keenness and responsibility on the part of these units, is sure to be disastrous in its results. If they are not too proud to profit by our experience in Canada, they should solve their traffic problem by placing under government control not the railroads but the shippers, leaving the railroads with their trained operating staffs, untrammelled by political considerations, to find out how to carry the maximum traffic to given ports at a given time, over a given route, and helping these railroads to secure on fair terms the funds for necessary maintenance and equipment.

A government controller of shipments, corresponding to our director of overseas transport, is needed, not a government controller of railroads. It is folly to send out an S. O. S. call for government control or ownership of the railroads themselves, a control which experience has shown to be fatally opposed to economy and efficiency.

The Canadian Railway Association of National Defence, with the unqualified support of the Board of Railway Commissioners, is doing efficiently, economically, and without political interference what might have been done inefficiently and expensively under government control. Our only real handicap is the difficulty of financing the operation of our railways at the old rates, when cost of labor and cost of material keep mounting up. With a reasonable increase of rates corresponding to this increased cost of production, the Canadian railways are well able to face even severer traffic problems than those which they have already so admirably solved.

The Administration Bill for Control of Railroads

Five Hundred Million Appropriation. No Dividend Increases
Without Approval. Income Guaranteed

AN APPROPRIATION from the treasury of \$500,000,000 to be used, together with the surplus earnings of any road in excess of the guaranteed net operating income, to constitute a "revolving fund" for the payment of the guarantee to other roads and to provide terminals, improvements, locomotives or equipment, is provided for in the administration bill introduced in Congress on January 4 to prescribe the terms of the government's control of the railroads in accordance with the President's recommendations. The bill was introduced in the Senate by Senator Smith, acting chairman of the Committee on Interstate Commerce, as S. 3385, and in the House by Representative Sims, chairman of the Committee on Interstate and Foreign Commerce as H. R. 8172, and it was referred to those committees.

The bill authorizes the President to make agreements with the roads and to guarantee compensation based as near as may be on the average net operating income for the three years ending June 30, 1917, which is defined as the standard return, and also provides adjustment by a board appointed by the Interstate Commerce Commission in case of a failure to agree. Under its terms dividends may not be paid in excess of the regular rates paid during the three-year period without the approval of the President.

This guards against the possibility of the government guarantee being treated by any company as a "melon" by distributing the entire amount to the security-holders without the usual appropriations for improvements or surplus and the President is authorized to make, or order a road to make, additions or improvements. Provision is made for a return on new capital invested during the period of government control at a rate to be fixed by the President.

Another important section of the bill authorizes the President to purchase for the United States securities issued by the roads and to sell them whenever in his judgment it is desirable. This is evidently intended to prevent competition of railroad securities with Liberty Bonds and to make it possible to issue securities for refunding or other necessary purposes without regard to the state of the market. The President's approval is required for all such issues.

The net operating income is defined in the bill and the Interstate Commerce Commission is to certify the amount. Federal taxes in excess of taxes assessed during the year ending June 30, 1917, are not to be charged against the revenue in computing the standard return, so that any war excess profits tax or increased income tax will be paid from the net return instead of being charged to operating expenses like other taxes. Any net operating income in excess of the standard is to be the property of the United States to constitute a part of the revolving fund.

Section 9 authorizes the President to extend the federal workmen's compensation law, which now applies to government employees, to apply to railroad employees. Section 12 provides penalties for violations of the law, or any order or regulation issued under its provisions, or for interference with railroad operation.

The lines are drawn for a possible lively contest in Congress between the advocates and opponents of government ownership by a provision in the bill that the plan of government control shall continue in effect not merely for the period of the war but until Congress shall thereafter order otherwise. It is expected that this will be strongly opposed by those who regard the action of the President as unnecessary and unwise, and this includes a large number, especial-

ly on the Republican side, who are expected to make a fight against anything that seems to contemplate a permanent possession of the roads by the government. It has been pointed out, however, that this section need not be considered to have any more significance than the necessary provision for a period of adjustment after the war.

The text of the bill is as follows:

Text of the Administration Bill

A bill to provide for the operation of transportation systems while under federal control, for the just compensation of their owners, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the President, having in a time of war taken over the possession, use, and control (called herein federal control) of certain systems of transportation (called herein carriers), is hereby authorized to agree with and to guarantee to any such carrier that during the period of such federal control it shall receive as its just compensation an income at an annual rate equivalent as nearly as may be to its average net railway operating income for the three years ending June 30, 1917, (called herein standard return); said net railway operating income for the purposes of this act shall, as to carriers making returns to the Interstate Commerce Commission, be computed from such returns, excluding, however, debits and credits arising from the accounts called in the monthly returns leased road rents and miscellaneous rents: *Provided, however,* That no federal taxes in excess of taxes assessed during the year ending June 30, 1917, shall be charged against revenue in computing such standard return. Any net railway operating income in excess of such standard return shall be the property of the United States. The amount of such standard return as accruing during said period of three years shall be determined by the Interstate Commerce Commission, and the certificate of said commission as to the amount of said net railway operating income shall, for the purpose of such agreement and guaranty, be taken as final and conclusive.

During the period of such federal control adequate depreciation and maintenance of the properties of the carriers shall be included as a part of the operating expenses or provided through a reserve fund, in accordance with such principles and rules as shall be determined by the President.

Provision for Failure to Agree on Compensation

Sec. 2. That if no such agreement is made, the President may nevertheless pay or cause to be paid to any carrier while under federal control an amount not exceeding 90 per cent of such standard return, remitting such carrier to its legal rights in the court of claims for any balance claimed; and any amount thereafter found due above the amount paid shall bear interest at the rate of six per centum per annum, and any excess amount paid hereunder shall be recoverable by the United States, with interest at the rate of six per centum per annum.

Sec. 3. That any claim for just compensation not adjusted as provided in section one shall be submitted to a board of three auditors appointed by the Interstate Commerce Commission, members of which and of the official force thereof being eligible for service as such auditors, but without additional compensation therefor. Said auditors shall give a full hearing to such carrier and to the United

States, and shall report to the President the amount due such carrier as just compensation; a sum not exceeding the amount so reported may be agreed upon by the President and such carrier. Failing such an agreement, either the United States or such carrier may file a petition in the court of claims for the purpose of final ascertainment of the amount of such just compensation, and in the proceedings in said court the report of said auditors shall be prima facie evidence of the facts therein stated. The just compensation of any carrier under federal control not making returns to the Interstate Commerce Commission shall be determined in accordance with the provisions of this section.

Sec. 4. That the return of any carrier shall be increased by an amount reckoned at a rate per centum to be fixed by the President upon the cost of any additions and improvements made while under federal control, with the approval of the President, to the property of any carrier and paid for by such carrier from its own capital or surplus, and by an amount equal to the rate accruing to the United States upon any advances made to such carrier for the cost of such additions and improvements as provided in section six hereof.

Sec. 5. That no carrier while under federal control shall, without the prior approval of the President, declare or pay any dividend in excess of its regular rate of dividends during the three years ending June 30, 1917: *Provided, however*, That such carriers as have paid no regular dividends or no dividends during said period may, with the prior approval of the President, pay dividends at such rate as the President may determine.

The Revolving Fund

Sec. 6. That the sum of \$500,000,000 is hereby appropriated, out of the public treasury from any funds not otherwise appropriated, which, together with any funds available from any excess earnings of said carriers, may be used by the President as a revolving fund for the purpose of paying the expenses of the federal control, and any deficit of any carrier below such standard or ascertained return, and to provide terminals, improvements, engines, rolling stock, and other necessary equipment, such terminals, improvements, and equipment to be used and accounted for as the President may direct and to be disposed of as Congress may hereafter by law provide.

The President may also on or in connection with the property of any carrier, make or order any carrier to make any additions and improvements necessary or desirable for war purposes or in the public interest. He may from said revolving fund advance to such carrier all or any part of the expense of such additions and improvements so ordered and constructed by such carrier or by the President, such advances to be charged against such carrier and to bear interest at such rate and be payable on such terms as may be determined by the President, to the end that the United States may be fully reimbursed for any sums so advanced.

Any loss claimed to accrue to any carrier by reason of any such additions or improvements so ordered and constructed may be determined by agreement between the President and such carrier; failing such agreement the amount of such loss shall be ascertained as provided in section three hereof.

From said revolving fund the President may expend such an amount as he may deem necessary or desirable for the purchase, construction, or utilization and operation of boats, barges, tugs, and other transportation facilities on the inland and coastwise waterways, and may in the acquisition, operation, and use of such facilities create or employ such agencies and enter into such contracts and agreements as he shall deem in the public interest.

President May Purchase Securities

Sec. 7. That for the purpose of providing funds requisite for maturing obligations or for other legal and proper

expenditures, or for reorganizing railroads in receivership, carriers may, during the period of federal control, issue such bonds, notes, equipment trust certificates, stock and other forms of securities, secured or unsecured by mortgage, as the President may approve as consistent with the public interest. The President may purchase for the United States all or any part of such securities at prices not exceeding par, and may sell such securities whenever in his judgment it is desirable at prices not less than the cost thereof; any sums available from the revolving fund provided in section six may be used for such purchases.

Sec. 8. That the President may execute any of the powers herein and heretofore granted him with relation to federal control through such agencies as he may determine, and may fix the reasonable compensation for the performance of services in connection therewith, and may utilize the personnel and facilities of the Interstate Commerce Commission and call upon members of such commission, or any of its employees, or employees of any department of the government for such services as he may deem expedient. No such federal official or employee shall receive any additional compensation for such services.

Sec. 9. That the President is hereby authorized while carriers are under federal control to direct that the federal workmen's compensation act of September, 1916, shall be extended so as to apply to carrier employees, on such terms and conditions as will give due consideration to remedies available under state compensation laws or otherwise.

Sec. 10. That nothing herein contained shall be construed as modifying or restricting the powers heretofore conferred upon the President to take possession and assume control of any or all systems of transportation; and the President in addition to the powers conferred by this act, shall have and is hereby given such other and further powers necessary or appropriate to give effect to the powers herein and heretofore conferred.

Sec. 11. That carriers while under federal control shall, in so far as is not inconsistent therewith, or with the provisions of this act, or any other act applicable to such federal control, or with any order of the President, be subject to all laws and liabilities as common carriers; and suits may be brought by and against such carriers and judgments rendered as now provided by law: *Provided, however*, That except with the written assent of the President no attachment shall be levied by mesne process or on execution on or against any of the property used by any such carrier in the performance of its duties as a common carrier.

Sec. 12. That every person or corporation, whether carrier or shipper, or any receiver, trustee, lessee, agent, or person acting for or employed by a carrier or shipper, or other person, who shall knowingly violate or fail to observe any of the provisions of this Act, or shall knowingly interfere with or impede the possession, use, operation, or control of any railroad property, railroad, or transportation system hitherto or hereafter taken over by the President, or shall violate any of the provisions of any order or regulation made in pursuance of this Act, or of any other Act concerning such possession, use, operation, or control, shall be guilty of a misdemeanor, and shall, upon conviction, be punished by a fine of not more than \$5,000, or, if a person, by imprisonment for not more than two years, or both. Each independent transaction constituting a violation of, or a failure to observe, any of the provisions of this act, or any order entered in pursuance hereof, shall constitute a separate offense. For the taking or conversion to his own use or the embezzlement of money or property derived from or used in connection with the possession, use, or operation of said railroads or transportation systems, the criminal statutes of the United States, as well as the criminal statutes of the various states where applicable, shall apply to all officers, agents, and employees engaged in said railroad and transportation service,

while the same is under federal control, to the same extent as to persons employed in the regular service of the United States. Prosecutions for violations of this act or of any order entered hereunder shall be in the district courts of the United States under the direction of the attorney general in accordance with the procedure for the collection and imposing of fines and penalties now existing in said court.

Sec. 15. That the federal control of transportation systems heretofore and heretofore provided for shall continue for and during the period of the war and until Congress shall thereafter order otherwise.

Senate and House Committees

Begin Hearings on Bill

Both the Senate and the House committees having jurisdiction over railroad legislation began their consideration of the bill on Monday, January 7. The House Committee on Interstate Commerce held a short meeting and decided to hold hearings on Tuesday, inviting Director General McAdoo to appear and explain in detail the purpose of the various provisions in the administration bill.

Before the Senate committee, Alfred P. Thom, counsel for the Railway Executives' Advisory Committee, announced it was the position of the railroads that while the provisions of the bill were generally satisfactory, the proposed compensation based on the average net operating income of the three years ending June 30, 1917, would be inadequate, and that it should be based on the earning capacity at the time the roads were taken over or reasonably near that time. He was followed by Julius Kruttschnitt, chairman of the Southern Pacific, who advocated the use of the average for 1916 and 1917.

Amendments to the bill to eliminate the provision for continuing the government possession of the roads until Congress orders otherwise have been introduced by Senators Watson and Gallinger. The former proposes that the plan shall continue for only six months after the proclamation of peace, while the latter proposes that it shall end when the war does.

The Senate Committee on Interstate Commerce on January 2 had completed the first stage of its post mortem on the action of the President in taking over the railroads, after having heard Commissioners Hall, McChord and Aitchison of the Interstate Commerce Commission. On Monday, it resumed its hearing for the purpose of hearing from railway executives, with the President's recommendations before it.

The Republican senators confined their questioning of members of the commission principally to bringing out facts to show that the government itself was chiefly responsible for creating the railroad situation which called forth the President's exercise of his war power, and that he had possessed sufficient powers to deal with the situation without taking over the roads. All of the commissioners assented to the idea that "too much priority," as Mr. McChord expressed it, was largely responsible for the congestion.

After the commissioners had been heard from, Alfred P. Thom, counsel for the Railway Executives' Advisory Committee, urged the importance of a quick settlement of the question of compensation on a basis on which there can be an agreement without the necessity of resorting to the courts, because, he said, if there is any uncertainty there will be great financial distress. Senator Underwood asked what was the object of Congress trying to fix the terms of compensation because the Supreme Court has held that it cannot fix the compensation for the taking of private property. Mr. Thom replied that while that is true, Congress may authorize the President to enter into agreements on a certain basis and establish a tribunal to adjust claims on which there is a failure to agree. The senator also asked if an agreement with the President made by the officers and

directors of a road would be binding on the stockholders. That is a very serious and legal question, Mr. Thom replied, and the only safe way is to leave the matter with the courts on the agreement.

No general rule for compensation would be universally applicable, Mr. Thom said, and every case must be dealt with specially as in the case of a real property owner, which in the last six months has greatly increased its value. The railroads wish to avoid a court case, the opportunity of an attitude of obstruction, realizing that every interest must be ready to make sacrifices necessary to the success of the war, but they are confronted with the great question of industrial transaction in history, and there is hardly a better financial institution in the land that is not forced to some extent on railroad securities. In the judgment of the railroads, he said, the basis of compensation should represent the equivalent of the property taken at the time it is taken or is near to that time as is reasonable, and should represent what the property was worth in the hands of its owner.

Senator Pomeroy remarked that the roads are still subject to regulation as to rates and asked whether the compensation should not be based on what might be considered reasonable earnings.

"The Interstate Commerce Commission has said in its annual report," replied Mr. Thom, "that the body of rates after all these years of regulation, are reasonable and should be so established by Congress for the future. To take advantage of the power of regulation to beat down the value of these properties that have been taken over would be to violate every principle of morality. It would be to say that the rates which have been declared to be reasonable are no longer reasonable in an attempt to reduce the value. Congress attempted something like that once and the Supreme Court in the Monongahela case said it could not be done."

Senator Cummins said that every lawyer would agree that the government must pay just compensation for property taken and he had supposed the railroads had been taken over, but that there was much in the bill as well as in the President's message to lead to some doubt as to whether the government had actually taken the property and was operating it or whether it had not merely exercised a greater degree of control.

"All power to control earning capacity has been taken away," replied Mr. Thom. "If the government manages well enough and the traffic is large enough any earnings in excess of the guarantee go to the government. The very substance of ownership has been taken away."

Mr. Kruttschnitt Testifies

Mr. Kruttschnitt presented statistical evidence to show that the year 1915 was exceptionally unfavorable and should not be included in the average on which to base the guarantee. There were more commercial failures in that year, he said, than in any year since 1860 and 66 per cent of the return earned by the roads on their property investment 4.09, was less than for any year since 1900. If the guarantee should be based on the three year average, all the additional money put into the properties since that time will not be allowed any return. The property now represents between 2,000 and 3,000 more miles and \$3,000,000,000 more money than in 1915. The method proposed by the President, if based on the last two years instead of three, would be satisfactory to most roads and the few special cases could be dealt with separately.

Senator Cummins asked if 1916 and 1917 were but abnormally good years, just as 1915 was abnormally bad. Mr. Kruttschnitt said that as compared with a period of years they were bad. The operating income for the three years averaged 5.26 per cent, which was less than the return for 1917, 1918, 1919, 1920, 1907 or 1908 and only slightly over that for 1910. The compensation he said should be

based as nearly as possible on the condition at the time the roads were taken.

Senator Lewis asked whether the same basis of compensation would be fair if the government were to keep the roads permanently.

"Certainly not," replied Mr. Kruttschnitt, "the directors and shareholders would submit to some loss to help win the war, but I am not prepared to say they would accept the same basis permanently."

For the Southern Pacific, he said, the three year average would produce a return of slightly over 5 per cent on the book value.

Mr. Kruttschnitt continued his testimony on Tuesday, describing the remarkable increase in railroad efficiency accomplished by the railroads under the direction of the Railroads' War Board and showing how congestion had been caused by the abuse of government preference orders and by the shortage of locomotives, caused partly by the fact that the government had ordered domestic orders for engines postponed to send engines to France and Russia.

He also told the committee that when the plan of pooling the facilities of the eastern roads was announced, although the plan had not extended to the pooling of freight or of earnings, the attorney general had become aroused by the newspaper reports and had written a letter to the board warning them not to violate the laws. Members of the committee expressed a desire to see the correspondence. "It is in the archives of the War Board, wherever they are now," said Mr. Kruttschnitt.

Before Mr. Kruttschnitt took the stand A. P. Thom, counsel for the Railway Executives' Advisory Committee, made a statement to the committee to correct an impression given by newspaper statements that "the railroads will fight to retain their profits during the period of government control." "We were not appearing," he said, "in any controversial or obstructive attitude. We are not fighting at all, we have determined merely to lay the facts before the committee."

Mr. Kruttschnitt, in reply to a question by Senator Watson, said that all railroads had implicitly obeyed all directions of the War Board. There had been some differences of opinion and some slight argument, but when the War Board insisted its directions were always complied with.

Mr. Kruttschnitt's testimony was based on the statistics included in the report filed by the War Board last week with the Senate Committee, showing an increase in traffic handled of 20 per cent in six months of 1917 as compared with 1916 and of 50 per cent as compared with the corresponding period of 1915.

"Why didn't the railroads adopt these measures of efficiency long ago?" asked Senator Cummins.

"We have been working on them for 15 years," replied Mr. Kruttschnitt, "but some roads had made more progress than others and the efforts of the War Board were largely devoted to trying to bring up the roads at the bottom of the list to the highest standards while spurring the other roads to even greater efforts."

Mr. Kruttschnitt outlined the work of the Commission on Car Service in distributing cars to the points where they were most needed, regardless of ownership, including the sending of over 222,000 empty box cars from the congested roads to the roads which needed them.

"Then didn't you have as complete control of the cars as if there had been a common ownership?" asked Senator La Follette.

"As far as box cars were concerned," replied Mr. Kruttschnitt. "The pooling of coal cars was not attempted until later."

The Railroads' War Board had also submitted to the Fuel Administration a carefully worked out plan for dividing the country into districts to be served with coal from

mines in the district to avoid the cross-hauling of coal, but, he said, the railroads had no authority to put it into effect.

He showed how congestion had been increased by the indiscriminate use of preference orders by the government departments for all government freight regardless of its importance. "On one road it was found that 85 per cent of the freight was covered by preference orders and it was obviously impossible to give everything preference," he said. "Now that Mr. McAdoo is in charge he has followed our suggestion that someone be appointed to co-ordinate the government traffic requirements and has put Edward Chambers of the Food Administration in charge."

"But the government had all the power necessary to correct the difficulty without taking over the railroads," said Senator Kellogg.

"I think so," replied the witness.

The shortage of locomotives, Mr. Kruttschnitt said, was caused in part by the fact that the government had ordered the builders to hold back American orders in order to send their output to France and Russia. Now the Russian orders are being held back and 90 to 100 of the Russian engines have been taken for use here as well as about 100 locomotives built for General Pershing's army which could be spared for a time. Also 165 locomotives have been promised for the eastern roads which had been ordered for the western lines because the western roads' need for them is less urgent.

Senator Watson asked Mr. Kruttschnitt whether he believed the roads would ever go back to their old form of management. Mr. Kruttschnitt replied that their experience during the past eight months had led railroad officers to hope that after the war some of the handicaps under which they had worked because of the laws intended to force competition would be removed. They would have been able to accomplish a great deal more, he said, if they had been allowed to do some of the things prohibited by law. In reply to a question by Senator Watson as to the present status of the railroads Mr. Kruttschnitt read a copy of a telegram he had sent to the three Southern Pacific presidents telling them to follow the usual practices except as otherwise ordered and that there was nothing yet to require the discontinuance of solicitation or the closing of offices and agencies. He said this was the conclusion reached from the President's proclamation and the orders thus far issued by the director general.

Senator Cummins asked what motive the roads now have for controlling expenses. "We have every motive," was the reply. "If we ever lose our grip on expenses it would take years to get it back. That is the hardest kind of work an executive ever undertook." Mr. Kruttschnitt then explained that it was most important that the existing organization should not be demoralized and said that as a matter of pride railroad officers would not want to have the results of their stewardship under government control compare unfavorably with the results before.

"Why should the Southern Pacific have any guarantee from the government? Why should not it be satisfied with a claim for loss by reason of any order of the director general?"

"Our experience in collecting claims from the government for loss has been unfortunate," replied Mr. Kruttschnitt, and he added that the loss of efficiency which might result from a possible demoralization of the organization or from neglect of the property would be greater than any sum of money could pay for.

Commissioner Aitchison Testifies

Clyde B. Aitchison, one of the new members of the Interstate Commerce Commission, testified on January 2. He said all the members of the commission had come to the

conclusion that railway conditions were intolerable. He had concurred in recommending the two alternatives because the first, that the roads be assisted by the government while remaining under private control, naturally suggested itself. But he, at least, felt it no longer tenable and that it was necessary to eliminate individual interests. He said the commission had intended to express no preference in stating first the alternative of allowing the roads to effect their own unification. He did not wish to criticize the work done by the Railroads' War Board, but it did not seem to him that their resolutions were being translated into action and he did not see how they could be. Many of the resolutions, he thought, were taken by the roads as recommendations rather than as positive orders.

Mr. Aitchison put into the record statistics of railway earnings and expenses, etc., for 1916, and for nine months of 1917, showing a reduction of operating income of \$50,000,000 for the roads as a whole, although the loss was entirely on the eastern roads. Senator Cummins asked if it would be safe to take that as a basis for estimating the results for the year.

"You are asking me, in effect, to decide the 15 per cent case," replied Commissioner Aitchison. He also pointed out to the Senator that while the figures showed increases in maintenance expenditures, the carriers claimed that less work was being obtained for the money and that there was a great deal of deferred maintenance.

Senator Cummins asked the commissioner to file a statement showing the principal figures arrived at by the Bureau of Valuation in its first reports.

"As these are not representative roads, they would not give us any idea of what the other roads would show, would they?" asked Senator Kellogg.

"No," answered Mr. Aitchison, "and it would require legislation to make the findings of the commission prima facie evidence in condemnation proceedings."

"But the railroads have been taken over now and there is some obligation on the part of the government to pay for their use," said Senator Kellogg.

"That is my recollection of the constitution," replied the witness.

Senator Kellogg asked the witness whether he believed that the government could operate the roads more efficiently than private enterprise and whether he believed in government ownership. "I think government ownership is now inevitable," Mr. Aitchison replied, "and that is the consensus of opinion of the state commissioners with whom I have talked. Whether I regard it as desirable or not is a different question."

Mr. Aitchison declared that in his opinion a repeal of the restrictive laws would not have been sufficient to make the railroads operate as a unit and he cited the fact that while the Southern Railway was advertising in Washington papers asking people not to travel, the Southern Pacific was advertising in the same papers asking them to go to California by the way of New Orleans. Asked whether the railroads had diverted freight to less congested lines, Mr. Aitchison mentioned the use of the Western Maryland as an auxiliary line of the Baltimore & Ohio, "but," he said, "how long it would continue to carry empties for the B. & O., I couldn't say."

Senator E. D. Smith of South Carolina, the ranking member of the Committee on Interstate Commerce, has been selected by the Senate steering committee for election as chairman of the committee to succeed the late Senator Newlands, and Senator Ollie James of Kentucky to succeed him is a member of the committee.

George P. Anderson, of the Interstate Commerce Commission, testified before the House committee on Tuesday, in place of Mr. McAdoo, who will probably testify after the railway executives have appeared. He explained in detail

the provisions of the transportation bill, which he had taken an active part in drafting. He said that any provision that increased taxes shall not be charged against the revenue in computing the carriers' income, which would reduce the government by about \$20,000,000 the amount of the increased cost of the railroad this year.

The Schenectady Ticket Office

By F. J. Lyon

THE FACILITIES of Schenectady Station, from which we derive approximately \$47,000 worth of business annually. To handle the amount of business I have working with me three clerks, two clerks on each end of the night. Each man has his own ticket desk, a small safe or a cash box containing a \$100 bank and a special compartment is provided in the safe to lock up the money when not in use.

The ticket sales are taken care of during the day at one window, and the Pullman reservations, rates, general information and telephones at the second window, the two day clerks alternating at these windows.

The local ticket case is built in beneath the window counter, extending to the right and left, and over each ticket is shown its destination and price. The two interline cases are directly behind the ticket window, one case being used for tickets with printed destinations which are alphabetically arranged, the price appearing over each ticket, the other case for blank destination tickets, which is alphabetically arranged as to terminal roads.

Tour sheets are provided with space for three tours which covers the business handled for 24 hours. All local tickets have agents' stubs attached, thus making a complete stub system, and each tour is made up from the stubs the ticket clerk has when retiring from the ticket window. The three tours are balanced against the daily report books which are closed out at 12 o'clock noon each day, all local ticket numbers being called from the case. The interline is made up from the agents' stubs.

All tariffs are filed in binders labeled "Local" and "Interline" and kept handy to the ticket window, and all circulars, etc., received from the general offices are placed on the desk for one month until everyone becomes familiar with their contents, and at the end of that time are filed in files labeled to show the class of information they contain. When circulars or supplements to tariffs are received suspending the sale of rail water fares, we face the top ticket in the case in and endorse across the back "Off sale."

For the convenience of making mileage exchanges, we have prepared a list showing all the stations on the main line and a list showing the fares to the principal cities.

Some of our "Business Getters" are to be courteous to everyone; call our patrons by name as they appear at the window, if possible; make suggestions to the uninformed traveler, keep dodgers advertising excursions prominently displayed, watch local papers for information as to people visiting and leaving the city. While we do not have much time to call on them personally, we are usually able to get in touch with them by telephone or letter and quote them fares and make suggestions as to good train service. When application is made for a foreign road time table, we ask if they are planning a trip and invite them into the office. Then we get out maps showing the country through which it would be possible for them to travel, describe such of the interesting points as we are familiar with, give them descriptive literature which would be of interest, quote the ticket and Pullman fares and try not let them escape any easier than the insurance agent does his prospective buyers.

Scientific Marketing and Transportation*

By T. C. Powell,

Vice-President, Southern Railway System, Cincinnati, Ohio.

THERE IS NO DOUBT in my mind that this country is suffering today more because of high prices than from any single cause. The high cost of living is no longer a jest! But these conditions have not been brought about by an actual shortage of food, but by a poor marketing system, and the failure of the marketing system has permitted manipulation of prices.

On October 19, the papers contained a despatch from New York stating that the Chicago packers were said to own millions of eggs in cold storage, for which there was no demand, and that wholesalers were said to be facing a loss of millions of dollars unless the Government fixed a price arbitrarily which would insure a profit. Is it probable that those consumers who had been paying 60 and 70 cents a dozen, and had been told that the price might go to \$1 a dozen, or higher, felt any sympathy?

With electricity, gasoline and steam at our command; with every device for handling commodities on land and water, we see peaches rotting on the trees in Maryland and apples on the trees in New York. We hear of a potato crop more generous than ever before in the history of the country; so generous that it is not being harvested; yet potatoes are higher than in 1915. With a shortage in some localities, we hear of food being thrown overboard and lost, and of milk being poured into the gutters, both for the purpose of keeping up the prices!

What are the real causes of the present inefficient system of marketing food products?

- (a) Lack of uniformity in packing and grading.
- (b) Dishonest packing.
- (c) Failure to plan highways so as to open up the producing and consuming territory for winter and bad weather. Summer roads are not enough and too much money is spent on roads which are not farm highways.
- (d) Failure to lay out the routes of the electric traction line so as to open up the country which cannot be reached by steam railroads.
- (e) Lack of co-ordination among the different forms of transportation.
- (f) Failure to appreciate that it is more important, and leads to more comfort, to market what is produced, rather than to excite a desire for what is scarce.

Co-ordination of Transportation Agencies

And yet we have more miles of good highways than ever before, and in addition to the motor trucks available for use on those highways, we have the electric traction line, the steam railroad, and the river steamers. Why is it not possible to combine these facilities into a co-ordinating piece of transportation machinery?

So far as river improvement is concerned, the army engineers have reported on those plans which are feasible and those which are not. Let us drop the ones that cannot be undertaken with a fair chance of profit, and concentrate on those which will justify the expenditure.

One such is the Ohio, from Pittsburgh to Cairo. Had the system of locks and dams recommended by the United States engineers been prosecuted vigorously and simultaneously by Congress, and slack water provided throughout the year, so that coal fleets might be operated at all seasons, the communities in Ohio would not have felt forced to confiscate coal during the last month. Such confiscation is a dangerous doctrine. It is opposed to all precedents of law and order, and the situation becomes one of "First come, first served, and the devil take the hindmost." It would certainly be far better permanently to improve the marketing facilities!

Decline of River Transportation

When first built into the Northwest, the railroads broke down the monopoly of the river steamboats. It used to be said of some of the boats on the upper Mississippi, before the advent of the railroads, that they were compelled to tow an extra barge to hold the money taken in by the purser! And if this was an exaggeration, it could truly be said, that many and many a boat paid her first cost out of the profits of one trip, and if it took more than three trips to do so, there was thought to be something the matter with the captain!

Notwithstanding this lead, river transportation has declined in this country because the organization has not kept pace with the demands of commerce. Each boat has been handled as a separate transaction and as if the public demanded to know the name of the boat, the name of the captain and other details of no interest whatever.

The steamboat companies should erect warehouses for the reception and delivery of freight, in locations convenient to the public, just as the railroads have done; and having taken charge of the freight, the river boat companies should despatch it to destination on a regular schedule, giving insured bill of lading and taking full responsibility for the safe delivery.

In other words, they should provide facilities for marketing the transportation they have to sell. When this is done, the river steamboats and the steam railroads will supplement each other.

As you doubtless know, the Government is now trying to demonstrate the practicality of river service by turning over to private parties and corporations the floating equipment of the War Department to haul barges of coal, ore and other commodities on some of the western rivers.

Reasons Interurban Electric Lines Fail

The interurban electric lines in this country have been failures in many cases because the projectors in frequent instances have tried to compete with the steam railroads, and the promoters have found that their support sometimes came from those who were merely antagonistic to the railroads, and whose judgment was, therefore, biased. Few interurbans have been intelligently located so as to open up new territory, and as a consequence, have simply shared in the traffic already existing, with only its normal increase.

Years ago a writer in England said that it would be far better to cover the country with a network of railroads capable of handling traffic and persons at moderate speed, rather than to spend all the money on a few high speed and expensive lines, which could serve only a few communities while the rest of the country remained inaccessible.

Why not plan the electric traction lines as adjuncts to the steam roads, and build them *into* the country instead of on the borders, and then again supplement these with highways, so that every farm and village will have access to the commercial centers in winter as well as summer?

Motor Truck Lines in Transportation Plan

It is proposed, in a bill which has been submitted to Congress, to give the Post Office Department power to establish a special motor truck collection system which will develop a direct delivery of foodstuffs to the consumer. This is what is termed "community marketing," which has been in vogue along the lines of the Southern Railway system for several years. The agents of the Southern Railway system development service collect the data, publish a "For Sale" bulletin, and encourage the use of any facility—parcel post, express, or freight train, and even advocate driving across country, if this seems the best plan in certain cases. I do not mean to do away with the broker or middleman. Within certain limits and under proper regulations, I recog-

*Abstract of an address before the Traffic Club of New York, on October 30.

mize the value of the middleman in establishing markets and providing part of the machinery of distribution, but the problem of scientific marketing goes beyond the scope of the intermediate handler.

I want to impress you with the magnitude of this problem, which includes a scheme of transportation so complete that from the factory, the farm and the fisherman's net, there shall be an unbroken channel to the ultimate consumer, and to do that I would require that every dollar of public money devoted to the improvement of our rivers and our highways, should be spent only in accordance with well conceived and closely co-ordinated plans.

An English Journalist's Views of the English Railway System*

WHEN war broke out it soon became clear that the transport of troops and munitions would involve the treasury in a huge liability to the companies, and it was therefore arranged that all the systems should be operated by one committee of managers. This control was afterwards extended to the tubes and the underground railroads of London, and a scheme for unifying control of surface cars on the streets of all the cities, some of them owned by companies and others by municipalities, is now under consideration.

Railroads in the United Kingdom are capitalized approximately at six billion dollars, and if so large an amount of government paper were added during the war to other government loans there might be a tendency to sell which would embarrass our sinking fund provision. . . . The shareholders have had no reason to complain; the only grievance arises in the case of certain companies that, like the Great Central, have long routes, recently opened up, the value of which will only develop as years go on. . . . Competing express trains were eliminated. Even long distance travelers have had to stand for hours in corridors. High speeds were relaxed. Hundreds of engines were exported to France and even Egypt (to connect up with Palestine). Passenger travel had to be cut down. Our standard fare is two cents a mile, third class, and this was raised to three cents. But all over the country we had cheaper week-end tickets and thousands of excursion trains at holiday seasons to race meetings, to football and cricket matches and to pleasure resorts. All these concessions have been cancelled. Only 100 pounds of baggage may now be carried by travelers, unless they are about to embark on the ocean, and even then they have to pay excess on weight above 100 pounds.

Before the war the net revenue of British railroads available for dividends of all kinds was, in round figures, £50,000,000. The companies paid very low wages. About 100,000 out of the 600,000 employees received under £1 a week, and while many of these were porters, who made good on tips, the record was not wholly creditable to our industrial reputation. The practice of the companies was to recruit their workers in the villages, where agricultural labor earned only, say, 16 to 18 shillings a week, and this reservoir of cheap man-power depressed wage rates throughout the entire transport system. When war broke out labor rose to a premium and wage increases have been granted which, up to a few weeks ago, must have involved the companies—that is the state, which guarantees the companies—in an annual charge of £25,000,000, or half the available fund for dividends. These increases are partly in the shape of war bonuses, but it is easier to concede a war bonus than to bring it to an end. And the boon to labor, however costly, may

be regarded as permanent. And it is said by Germans further wage increases, involving greater taxation, are now certain.

The effect must be either more intensive travel for the public after the war or a vast outflow of railroad capital. Moreover, when the time comes for reconstructing a damaged civilization immense masses of railroad stock must be renewed. All manner of repairs have been postponed. Hundreds on hundreds of miles of track have been shipped off to France and elsewhere. All this will have to be put right.

But some at least of the gains of the socialist have been actually sacrificed by state control. Wages may be higher but hours are very long. The substitution of women for men at booking offices, and as ticket collectors and train conductors is not precisely what the labor union would have asked for. But we shall never go back to private management. For so small a country as ours there was obviously no room, except for one railroad system. Yet no such monopoly could come about, except under state limitation of profits.

Some Train-Order Technicalities

By W. E. Watts

THE TRAIN ORDER BLANKS in use on most railroads are too small. This was mentioned by a recent writer in the *Railway Age*. Some roads have given careful thought to this matter and have provided a blank upon which that need be asked for. Others still continue to use the old size prescribed by the standard code many years ago. There should be at least three lines for the address, covering the whole width of the blank, five lines would be preferable. The prefix "C. & E." should be printed at the beginning of each line, instead of leaving the operators to write it in.

The space for the body of the order should be the same size on both Form 19 and Form 31. A short line should be printed in the bottom of this space for the initials of the signature of the person by whom the order is signed. Allow five lines for signatures on Form 31. The word "Complete" might be printed in the place provided for that purpose, leaving a blank space for the time. The word is, of course, of no effect until the time is added. A place should be provided for the name of the person receiving the order. Quite often one operator takes an order, and a different one delivers it. There could be no question as to the handling if this information were shown. The space for the body of the order should be at least six inches up and down; the word is fairly satisfactory already, but it would be better if a little wider.

Printed schedule blanks should be approved and encouraged. Names of stations should be printed, with space opposite each station for the "time" in figures only. Words, duplicated in figures, are confusing. A separate blank for each direction should be provided, as eastward and westward; northward and southward; the initial terminal in each direction being at the top of the blank, with following stations in order. Such printed schedules may be quite conveniently used for putting late trains on "waits," or for running extra, under old example 3, Form G, with right over certain other trains. If the train falls behind those figures a new string of waits can be put out for an entire district in a very few minutes; or, better still, such train may be given an order to "run late on order No. . . ." specifying, for example, from A to G, if desired. They are an especially desirable form of order for putting several delayed trains on one schedule when they are bunching. In such a case each train may be run late separately on that order if occasion requires.

When both forms 19 and 31 are used two colors are, of course, desired. Preferably, yellow should be used for 31 and

*From an article in the New York Tribune by P. W. Wilson, of the London Daily News.

green or white for 19. If only one of these forms is used yellow should be the color. Carbon impressions show up on yellow much better than on white or green. Yellow orders are easier read by engineers at night than either of the other two colors, and do not smut up so easily.

The use of typewriters should be authorized for copying train orders, but the machines ought to have larger type than the ordinary pica. A record ribbon is much better than copying ribbon; for the hard copy made by a copying ribbon has a tendency to "run" if it should get wet. Typewriters have been authorized and used on some railways for several years, and are liked on account of the orders being so much more legible than ordinary handwriting.

The quality of paper provided should allow of making eleven to thirteen copies with a stylus writing over a fly sheet. The paper used for train order blanks seems to have deteriorated somewhat during the past year or two, perhaps owing to the war. The best quality of double-sided train order carbons should be supplied. A brand formerly on the market, known as "Carter's" was as good as any the writer has come across. Price-cutting purchasing agents seem to give very little attention to such details. A good carbon is absolutely necessary for making more than three copies of an order. Thick carbons are practically useless for more than 5 copies. Operators frequently need to make from 10 to 13, or even 15, copies at one writing.

Good agate-pointed styluses should also be provided. Agate is much better than steel. Indelible pencils should not be used. Hard copy "runs" the same as with the copying-ribbon of the typewriter. Old specifications required paper capable of making seven copies with a No. 4 Faber pencil. This grade of pencil is too hard for practical train order use, as it tears the paper quite easily unless used with blunt point. The "Smith" steel stylus is next best to a good agate stylus.

Clearance Cards.—More space should be provided in the blanks for showing the numbers of the train orders delivered. The space generally allowed is insufficient. Trains are frequently cleared with as many as 15 or 20 train orders, including slow orders, annulments, etc., and operators have to write all over the blank, wherever they can find room. Clearance cards might well be printed on manifold paper, a little thicker than train order manifold, but thinner than the stock most generally used now. If used with double-sided carbons and a stylus the writing would show up much better than now.

Conservation of Material*

By J. P. Murphy,

General Storekeeper, New York Central, Cleveland, O.

AS CITIZENS and railroad men we have faced during the past few months what seemed to be, for the moment, insurmountable obstacles; yet means have been found whereby the difficulties, to a great extent, have been worked out. The conditions with which we are daily contending have, to a greater or less extent, affected our individual lives and we are beginning to feel that we not only must conserve our energy, apply it with the greatest efficiency in our daily occupation, but we must conserve in other directions. We are urged by our government that it behooves us to save, that our country and our freedom depend upon our effort in this direction and the support of our men in the field.

We are reclaiming eatables by converting the portions that are not used at one meal into some form appealing to the appetite at another meal. We are not preparing as large a portion for each individual as we formerly did, thus insuring to a greater extent against waste.

The food commission has wisely taken steps to discourage

the hoarding of supplies, prohibiting the storage of large quantities of sugar, canned goods, etc. The housewife favors this plan because she knows if she opens a hundred pound bag of sugar before the hired girl that it will be used much more freely than if there is a small quantity available. She knows if those preparing the dinner have access to a large quantity of potatoes, the tendency will be to use the fresh ones instead of reworking those left over after the last meal. The housewife is giving more personal attention to these things than she ever did before.

Many of our railroads saw fit, recently, to contract for large quantities of material; taking advantage of market conditions, and to a great degree, regulating delivery. In some instances our railroads have large quantities of material on hand. Some materials are exceptionally difficult to obtain. Prices have jumped from 60 cents each to \$3.00, and from 4 cents per pound to 10 and 12 cents. Items of stationery, which frequently do not receive due credit, such as pencils, inks, etc., have jumped 200, 300 and 400 per cent.

The tendency is, as we all know, where large quantities of material are available, to use the new article in preference to anything else. Conservation in the use of such available material is not a general matter. It is an individual proposition. We must realize that this material piled up on our railroads has an equivalent in dollars and cents; that it deteriorates while going through the reclamation period; that while it is sent on its way to the scrap dock other dollars and cents are put in its place.

The value of unapplied material on most railroads has doubled and trebled during the last two or three years and a large percentage of this amount or increase is due to increased prices. The same man-power that two or three years ago was using a pound of nuts that cost two cents is using, in the same manner today, a pound of the same article costing from four to six cents. This same principle applies to other items representing dollars instead of cents.

As the housewife has taken to the education of the members of her family and her assistants, so must the man in charge of the shop apply these same principles to the work he has in hand. Why should we conserve the use of sugar in our households and then go out to our work and permit the open keg of nuts, the monkey wrenches and thousand-and-one other items we have control over, to be wasted?

A striking object lesson which recently came to the writer's notice, is worth relating. In a railroad office employing 25 clerks, five or six of whom are stenographers or typists, the chief clerk was told at about four o'clock one afternoon to stop work, clear off the desks and ask each clerk to empty his waste basket on his desk and straighten out the contents so that the chief clerk might look them over. One of the crumpled bunches of papers taken from one of the baskets contained six new sheets of carbon paper and six sheets of onion skin with about two lines written by the typewriter across the sheet. Apparently, it was found by the stenographer that one of the carbons had been inverted when placing the sheets in the typewriter and instead of removing the carbon and correcting it, the entire bunch was taken from the machine and thrown into the waste basket. While six sheets of carbon paper and six sheets of onion skin may seem a trivial matter, it is typical of the detail waste that is continually going on, particularly in railroad service, where the material is bought and paid for by the other fellow.

While we are occupied with our personal contributions to the government, physically, mentally and financially, we may have been distracted from consideration of our vocation. We may have seen fit to forego the customary woollens for the coming winter in order to contribute more liberally to the Liberty Loan. Are we applying like principles to the properties entrusted to us, or are we permitting the company's material, representing dollars and cents, to go to waste?

*Abstract of a paper presented before the Central Railway Club.

General News

Employment of the Alaskan Engineering Commission, which is constructing a railroad in Alaska, sublet for \$120,000 at the second lowest bid.

The Northern Pacific and the Northern Express Company have granted an increase of 10 per cent in the pay of all unorganizational employees, the first January 1. This advance makes the present pay the same in the aggregate as was paid during 1917, but the money will now be paid monthly instead of partly by bonus at the end of each six months.

The Clayton Law, which Section 101 requires competitive bids on certain classes of purchases made by railroad, and which was to have come into effect on Tuesday of this week, has been suspended by this feature by a joint resolution of both houses of Congress which declares the provision inoperative for one year longer.

At Toronto, Ont., December 28, Justice Riddell, acting on the request of the general superintendent of the road, exempted from the draft 116 firemen and trammies of the Canadian Pacific. Local draft boards had refused exemption on behalf of the railroad; it was stated that the Ontario division was short 250 trammies.

The Chicago & Eastern Illinois has granted a 26-day working month and an advance of \$10 a month to its 424 telegraphers, effective January 1. The Chicago & North Western has granted a 13 per cent advance in pay to approximately 2,100 station agents, operators and workmen, effective December 1. Revised rules applying to these men were made effective January 1.

The Comptroller of the Currency in his call for a report of the condition of banks at the close of business on December 31, in addition to the usual information, asks for an itemized statement of the deposits carried by all railroads, street or electric railways and steamboat companies. This will furnish information to the government railroad administration in its plan for railroad financing.

Ten thousand soldiers are being sent into the woods of the Northwest as the Spruce Production Division of the Signal Corps. Their duties are to get out spruce and fir for airplane stock. These men are volunteering from Western National army camps and from civil life and from other services to counteract the trouble caused by I. W. W. agitation in Western lumber camps.

The Canadian Railway War Board has stationed an agent at the Niagara frontier to supervise the movement of coal and other traffic; with authority to send cars by the best route regardless of the original billing. The aim is to make sure of using all railroads to their full capacity. The traffic by ferry between Windsor and Detroit is to be pooled, with a view to saving fuel. The Board will call for the backing of the Canadian government in its efforts to get cars back from the United States, the excess on this side of the line being now about 22,000 cars.

The Shepherdsville Collision

The State Railroad Commission of Kentucky has announced that an investigation of the rear collision of passenger trains at Shepherdsville, Ky., on the Louisville & Nashville, December 20, killing 47 persons, will be begun at Louisville this week.

The Bullitt county grand jury has indicted three officers of the railroad company on charges connected with their responsibility for this collision, as developed in a hearing lasting five days. These officers are B. M. Starks, general manager; W. F. Sheridan, division superintendent, and F. J. Fishback, master of trains. These three, and the railroad company are indicted for "creating

and maintaining a common nuisance." Similarly, the manager of the Louisville & Nashville is accused of being guilty of involuntary manslaughter. All the charges are of gross negligence and will be negligence. As to the charges of manslaughter they could not stand, and would be dismissed.

Fifty Coaches Destroyed

At a fire in the depot at the Union in Milford, Mass., on Sunday last 50 passenger coaches were burned, with different cars and their contents were destroyed, together with the North Station coach plant. The estimated loss is \$300,000.

High-Power Locomotive Headlight Law

The Interstate Commerce Commission has announced the effective date for the application of high-power locomotive headlights (rules 20 and 31) from January 1, 1918 to July 1, 1918. As these rules now state existing locomotives are to be equipped with headlights to meet the requirements of the Interstate Commerce Commission the first time they are brought to the shop for general or heavy repairs after July 1, 1918 and all locomotives constructed after that date shall be so equipped. All locomotives must be equipped before July 1, 1920.

Buy Thrift Stamps with Liberty Bond Interest

"Apply the interest from your Liberty Bonds to the purchase of Government Thrift stamps." This suggestion has been advanced by President William Sprague to all officers and employees of the Southern Pacific's Pacific System. The suggestion came in the form of a circular which is to be widely distributed. Announcement is made that the Company will offer the security of its own vaults to all employees who desire to protect their Liberty Bonds and will collect in their behalf the interest as it accrues and either remit same or invest it in Government savings stamps as the owner desires.

New York City Subways

The Broadway subway, Manhattan, New York City, is now in partial operation from Vesey street northward to Fort-second street, about three miles. This line, operated by the New York Municipal Railway Corporation, controlled by the Brooklyn Rapid Transit Company, will when finished extend from the Battery northward through Church street, Vesey street, Broadway and Seventh avenue to Fifty-ninth street, thence eastward under Fifty-ninth street and the East river to a connection with new rapid transit lines in Queens borough. On the south, the line is to be extended eastwardly under the East river to Brooklyn.

North Western Employees Asked to Increase Efficiency Under Government Control

R. H. Ashton, president of the Chicago & North Western has sent circulars to every officer and employee of the Chicago & North Western containing a copy of the proclamation of the President assuming control of the transportation system of the country and copies of telegrams exchanged between Messrs. Ashton and McAdoo. In commenting on the appointment of Mr. McAdoo as the new head of the American railroad system, Mr. Ashton has this to say:

"Intelligent and redoubtable efforts in every employable officer of this company is requested to make the efficiency in the movement of traffic along the lines tributary to the message from the director general of railroads and also in

line with the suggestions for increased efficiency that have been pointed out to the employees and officers of this company from time to time, and particularly since the declaration of war. All employees and officers are earnestly solicited to make recommendations to their superior officers for increased efficiency and economy in handling traffic, and where necessary such recommendations will be transmitted for the general manager's consideration. All concerned are especially requested to see that there is no failure to continue this company's policy of courtesy and efficiency in their dealings with patrons and the public in general."

Massacre of Passengers in Sonora

Press despatches of January 2 report that the regular south-bound passenger train of the Southern Pacific was stopped by Yaqui Indians at a point 32 miles south of Empalme, Sonora, and from 20 to 30 passengers killed, some of the passengers being from Tucson, Ariz. The conductor and the express messenger were also killed. There was on the train a military escort of about 75 soldiers, but these were greatly outnumbered. The Indians had stopped the train by tearing up the track. After looting the baggage and express cars, the Indians rode away.

Railway Regiments' Tobacco Fund

During the week ending Tuesday noon, January 8, the following contributions to the Railway Regiments' Tobacco Fund have been received:

Robert H. Blackall, Pittsburgh, Pa., \$10 a month for 12 months.
Bridgeford Machine Tool Company, Rochester, N. Y., \$10 a month for 12 months.

Railroad Water & Coal Handling Company, Chicago, \$5 a month for 12 months.

Standard Safety Nut Corporation, New York, \$25 to cover 6 months.

Preparations are now being made to forward the second shipment of tobacco about January 15.

Machinery in the Mail Room

The Southern Pacific has installed an 8-ft. revolving sorting table in its mail room at 65 Market street, San Francisco, Cal. Priority orders, war tax regulations, war board circulars and other matters incident to the increased activity of the railroads have swelled the volume of mail to such an extent that the installation of the sorting table was considered necessary. The table revolves three times a minute and when sheets of mail matter are to be assembled into sets, as in the case of tariff sheets, etc., clerks gather around it and assemble the sheets as they pass. An average of 30,000 pieces of mail matter are assembled in this way daily.

Railway Revenues and Expenses for October

The net operating income of the railways of the United States for October, 1917, was less than October, 1916, by \$64 per mile, or 12.8 per cent, according to the monthly bulletin of the Bureau of Railway Economics.

Total operating revenues, \$380,951,970, exceeded those for October, 1916, by \$42,285,740. Operating expenses, \$259,017,248, were greater by \$48,721,407. Net operating revenue, \$121,934,722, decreased \$6,435,657. Taxes \$21,910,588 increased by \$8,011,910. Net operating income was \$99,926,889, which is a decrease of \$14,504,608.

If spread over the mileage represented, operating revenues averaged \$1,648 per mile, an increase over October, 1916, of 12.3 per cent; operating expenses per mile, \$1,121, were greater by 23.0 per cent; net operating revenue per mile, \$527, shows a decrease of 5.2 per cent; while net operating income per mile, \$432, decreased 12.8 per cent. Taxes per mile rose 57.4 per cent. This summary covers 231,183 miles of operated line, or about 50 per cent of the steam railway mileage of the United States.

For the Eastern railways, operating revenues per mile were greater than those for October, 1916, by 13.9 per cent; operating expenses rose 25.5 per cent; net operating revenue decreased 10.0 per cent; taxes increased 35.1 per cent; operating income per mile decreased 15.8 per cent.

For the railways of the Southern District, operating revenues

d Decrease. * Less than one dollar.

per mile exceeded those for October 1916. In 1910 per cent operating expenses rose 26.7 per cent, net operating revenue increased 1.1 per cent, taxes increased 48.8 per cent. Operating income per mile decreased 1.6 per cent.

For the Western railways, operating revenues per mile exceeded those for October 1916 by 8.7 per cent, operating expenses rose 18.6 per cent, net operating revenue decreased 4.5 per cent, taxes increased 73.1 per cent. Operating income per mile decreased 1.135 per cent.

The 10 months of the calendar year 1917 (compared with the corresponding period of the preceding year) show changes per mile of line as follows: Operating revenues increased 11.8 per cent, operating expenses increased 19.2 per cent, net operating revenue decreased 2.3 per cent, taxes increased 23.3 per cent, while operating income decreased 7.4 per cent.

Operating income per mile decreased 15.7 per cent in the East, increased 11.1 per cent in the South, and decreased 1.4 per cent in the West.

October net operating income per mile was 12.8 per cent less in 1917 than in 1916, 5.1 per cent less than in 1915, 2.9 per cent greater than in 1914, and 5.8 per cent greater than in 1913.

American Short Line Railroad Association

The Short Line Railroad Association of the South has recently changed its name to the American Short Line Railroad Association and amended its articles of organization so as to admit members from any part of the United States. There was such a demand for membership in the association that it was decided to extend its scope. The association will have the same officers as before: President, Bird M. Robinson; vice-president, B. S. Barker; secretary, T. F. Whitteley (Washington, D. C.) and the following officers have been added to the staff of its Washington office, 709 Union Trust Building, S. S. Ashbaugh, general counsel, and M. M. Ashbaugh, assistant secretary.

Corrections for Statistical Number

Despite all the efforts of the editors of the *Railway Age* to make the annual statistical number absolutely accurate, two errors were made which were not found until it was too late for correction.

On page 65 in the article entitled "Freight Car Orders in 1917 Reach Low Level" the figures given in the first three lines were incorrect and did not agree with the figures given elsewhere in the issue and particularly in tables I, III and A of the article in question. The totals in these tables were the correct ones.

A total of 979 miles of new railroad was completed in the United States during 1917. This mileage was incorrectly reported in the opening paragraph of the article on Construction Activities During the Year on page 51. The figures in the table are correct.

National Safety Council

The Steam Railroad Section of the National Safety Council now has 83 members, representing 117,056 miles of railroads. Chairman Harry J. Bell has issued a circular calling on all members to co-operate in the safety work.

"Send to Frank A. Wightman, chairman, Springfield, Mo., at least one photograph and description from which a bulletin may be worked up. Or, better still, get up a bulletin all ready to print and send it to him. Criticisms about the bulletin service of the Section should be sent to Mr. Wightman. Send to George L. Wright (C. St. P., M. & O.) St. Paul, Minn., suggestions as to subjects which it is desired to have discussed at the next annual meeting. Members are reminded of their duty to answer questionnaires. To secure the full benefit of this service there must be a general response, so that at least a majority opinion will be given in the analysis which is prepared by the secretary from answers received. Members are asked to send to R. S. Jarnagin (N. Y. C.) New York City, all information concerning safety at grade crossings and in connection with dangers to trespassers. Whenever a bill is introduced in a legislature or a law passed, or any decision is issued by a state railroad commission, Mr. Jarnagin should have the benefit of the information promptly."

Electric Roads Economize

During the month of October of this year, thirty-four million tons of coal were consumed in the United States, according to the United States Bureau of Commerce, which also reports that the consumption of coal and oil in the same month of the preceding year was 34,000,000 tons. The increase was caused by the consumption of fuel in the home sector, according to the conservation of fuel. J. Edgar Adams, director of the American Electric Railway Association's War Board at Washington, pointed out the facts that reflect on a large degree will be a "warfare" next year. "The production of fuel in this country is a fairly adequate estimate," he said. "Yet the consumption of fuel is at least 30,000,000 tons to our present estimate. The way in which we can prove that it is not by production but by consumption. The street railways of this country are now usually consuming about 16,000,000 tons of coal and they are being asked to save one million. The fuel (see rules adopted by the street railway companies at the city of Washington) and which will result in saving much coal. These measures include the 'kip or stagger stop,' every other car omitting every other stop, distribution of car mileage, reduction of heating in the cars, a gradual reduction of the normal hours of employees in large shops and stores, and the operation of two traction systems by means of one power plant. Suggestions were adopted requesting the Public Service Commission to take action looking to the carrying out of these changes, especially the staggering of hours of labor in industrial plants, the employees of which are patron of electric railroads. Under the present arrangement of working hours of these men it is in most cases impossible for the companies to furnish a reasonably adequate service during 'rush hours'."

Switch Indicators as Safeguards

The Interstate Commerce Commission report on the collision at Larnard, Va., October 21 (*Railway Age*, December 29, page 1171), shows the most prominent element in the cause of the collision to have been the failure in the men in charge of Train No. 10 to wait on the side track after getting the switch to go out to the main line, for the space of two minutes as required by the rule. If they had waited they would have seen or heard the train approaching on the main track and the collision would have been avoided.

In the investigation, W. J. Eek, signal engineer of the road, was questioned about the use of indicator switches, and the report summarizes his views as follows:

"I considered that the rule requiring a train to wait two minutes after the switch was opened before going out on the main line provided ample protection under all operating conditions, as at all times-point switches are located within 500 ft. of the point of the switch, and, of course, tracks being approximately 5,000 ft. long, the results in the worst case of the passing track being not over 5,500 ft. from the signal in any case. He considered such a rule safer than the use of switch indicators, for the reasons that the switch indicator is a small, delicate instrument, liable to get out of order and subject to neglect by the maintainer; it is installed where only the train brakeman, who is usually the most experienced man in the crew, observes it, and there is no practical method of checking his observation of an indicator; whereas everybody on the train can check compliance with the two-minute rule; furthermore, to save expense, indicators are ordinarily installed to show red so long as the block is occupied. Although a train may have passed the switch protected, and that introduces an element of uncertainty in the minds of trainmen as to the status of the block. Mr. Eek said that there was no rule in effect on the Southern Railway requiring a train after stopping in a block to proceed under control of the member of the train crew through the block, although verbal instructions have been issued to that effect."

The question, certainly, does not fully arrest Mr. Eek's claim that a switch indicator is not more than 550 ft. from the block signal, a distance of two minutes is sufficient, for he says that under many operating conditions the two-minute period prescribed by the rule is practically not enough to provide necessary protection for a train in the frame of mind in which it is particularly in the absence of a red indicator a train which stops or slows down to proceed under control through the block. "The main reason for the rule is to give a train a moment's opportunity to observe the status of the block before proceeding. It is not a rule to be applied to a train which is already in the block, but to a train which is approaching the block."

Sproule on Government Control

In a recent public statement William Sproule, president of the Southern Pacific Company, made the following comments on government control of railroads:

"The President's proclamation, taking control of the railroads, states the method and purpose as clearly as it can be done, in my estimation. There can be no question that the highest motives actuate the President. Let us not forget that the center of the target at which the nation is aiming is war. If we will keep our minds fixed upon that as the center we will have a better measure of what is taking place. This is well stated in Section 80 of the 'Selective Service Regulations' issued by the Secretary of War, to govern the selection and organization of the army. This section says in part:

"Two things are to be accompanied to raise armies, to maintain industries and agriculture . . . It is self-evident that the problem is not absolutely to prevent interference with industry, for that is impossible; it is to reduce interference to a minimum. A balance must be struck and maintained between the military and industrial needs of the nation . . . The success of the nation's military operations is the dominant object, to which the conservation of certain industries is related as one means to that end. . . . The military necessity, being paramount, the task is to foster all necessary industries equally, to the maximum, consistent with the military necessities."

"This quotation omits portions of the section not material to the moment, but the observation quoted will remain true throughout the period of the war. Hence the public can rely upon it that in the operation of the railroads interference with the normal business of the country will be kept to the lowest point consistent with the purposes of the government in the winning of the war. The fact is that in emergency the government can do, without any question, things in the public interest that it would be unlawful for private ownership to attempt. As to the financial aspects, the financing suggested for the roads needing it leads inevitably to the Secretary of the Treasury, such financing must be done under his auspices and approval, which can be accomplished directly when it is the Secretary of the Treasury himself who has his hand upon the operation and conduct of the railroad systems of the country.

"The Railroads' War Board has given an impulse to unity of aim and purpose on the part of the railroads which is hard to overestimate. Reliance can be placed upon the continuing desire of the railroads to do their part toward the winning of the war, whatever may be the duration of this deplorable struggle for human rights so ardently championed by the President, behind whom we all stand."

"Safety First" on the M. K. & T.

The Missouri, Kansas & Texas distributes a leaflet 4 in. by 6 in. to foremen and others, to be handled to trespassers. These notices are made as small and as attractive as possible, so that foreman can carry them in their pockets and hand them out as occasion demands. The warning reads:

The M. K. & T. is distributing to new employees in the locomotive and car department a booklet, bound in paper covers, entitled "Ten Seconds for Safety." It contains fifteen National Safety Council bulletins cut down to 8 in. by 9 in. These bulletins contain illustrations of injuries and their results, and speak better than words.

Traffic News

The Pere Marquette, the Baltimore & Ohio and the Southern now run a daily train between Detroit, Mich., and Jacksonville, Fla.

The Intercolonial is now running passenger trains regularly to and from Quebec over the new bridge across the St. Lawrence river.

E. N. Hurley, chairman of the Federal Shipping Board, has been appointed chairman of the War Port Board at New York City, succeeding Secretary McAdoo.

Dr. H. A. Garfield, fuel administrator, announced on Monday of this week that henceforth no coal may be exported from the United States, except to Canada, until a license has been obtained. It is the intention to allow none exported except for purposes connected with the winning of the war.

William J. Jackson, receiver of the Chicago & Eastern Illinois, has been named by the Illinois railway presidents to advise the United States Fuel Administration in matters of fuel transportation and diversion in Illinois. This nomination was made at the request of the Fuel Administration, which, since it has been given power of diverting coal for domestic purposes, feels the need of the advice of an expert railroad operating officer.

At Huntingdon, Pa., January 7, the county fuel administrator seized for local needs 12 cars of bituminous coal, destined to New England and standing on the tracks of the Huntingdon & Broad Top Mountain Railroad. This road is now holding more than 1,000 cars of coal consigned to Philadelphia, to New England cities and other eastern destinations, which the Pennsylvania Railroad is unable to take.

Army Motors Detroit to Seaboard

As the result of the recent successful trial run of motor trucks, with freight, the quartermaster's department has decided to start similar trains from Detroit for the Atlantic seaboard every day for six weeks, beginning January 10.

The 46 motor trucks which were started from Buffalo, N. Y., by the War Department, on January 1, for New York City, 440 miles, made the journey in a little less than eight days. Severe weather prevailed throughout nearly the whole of the journey, the temperature being below zero a good deal of the time. This convoy was in charge of Captain J. K. De Loach and 101 men.

Coal Production

According to the weekly report of the Geological Survey, a preliminary estimate places the estimated production of bituminous coal at 42,050,000 tons, the lowest recorded for months since April, 1917. On this basis the entire 1917 production should be approximately 54,142,000 tons, representing an increase over 1916 of 8.3 per cent. Anthracite shipments were reported as 29,228 cars. Reports from almost every district indicate some improvement over the extraordinary depression of the week of December 15. For the country as a whole, losses during the week ended December 22 due to all causes amounted to 31.9 per cent of the full time capacity. Improvement was reported in car supply, losses due to that factor declining from 30.8 to 24.8 per cent. Losses attributed to labor shortage and to mine disability returned to normal.

Zone System of Handling Embargoes

A zone system of handling embargoes will be introduced on January 21 for the purpose of simplifying for all concerned the problem of routing freight to conform with existing traffic restrictions. Heretofore each railroad has issued any necessary embargoes and has notified connecting lines; and these in turn have notified their connections, and so on until all lines have been advised. Under the new plan about 20 embargo zones will be established in the country in each of which one of the present sub-

committees of the Commission on Car Service will act as an enlarged committee. New enlargements must be made only once every 24 hours and each modification of an enlargement must include a full statement of the original order. Each rail will notify its immediate connections as heretofore, and the enlarging committee will advise other roads in the same case sending notice also to the Commission on Car Service at Washington and to enlarging committees. In this manner practically all carriers in the country will receive simultaneous information concerning each restriction from the day

Freight by Motor-Truck

Motor trucks are carrying freight between Philadelphia, Baltimore, Washington and Baltimore. Two trains each 20 feet long, containing approximately 12 tons, were hauled by motor trucks from Chester to Reading, Pa. Five tons of supplies for the Red Cross were hauled from Philadelphia to Boston for export 320 miles in less than two days. Large quantities of yarn and textile material have been hauled from Philadelphia to New York and reshipped to New England points. A fleet of 22 motor trucks has been running on daily schedule between Philadelphia and New York since July 1, making trips also to Washington, Baltimore, Wilmington, Hartford, New Haven, Springfield, Providence, Harrisburg, Reading, Bethlehem, Trenton and other cities. Single motor-truck loads of freight recently have been insured for \$50,000. Recently 14,000 pounds of united leather were carried from Philadelphia to New York for export and 18 trucks carried 90 tons of musical instrument records to New York in a single day. Motion picture films are carried regularly between New York and Philadelphia.—*N. E. and Atlantic Coast Bulletin*.

Lake Vessels on the Ocean

During the last six months a strange procession has been moving through the Great Lakes to the Sea.

The twenty-five locks of the Welland Canal can admit boats of 3,500 tons with 250 feet length and 44 feet beam. Thirty ships not exceeding these dimensions have already passed out to sea, while sixteen more have been cut in sections and so transported through the canal, to be assembled at Montreal. The larger passenger steamers must remain with the fresh water fleet, since their great width precludes the passage of the locks, even in sections. This process of cutting boats in two costs about as much as new construction, but effects a great saving in time and in materials. The process may be completed in about 100 days, one-third the time required to build a new boat. During the winter months, when lake navigation is closed, the use of this tonnage on the Atlantic is so much clear gain. Before spring, new construction on the Great Lakes will have replaced the loss.—*American Express Company's Transit Bulletin*.

Sending Box Cars West

A. H. Smith, assistant director of railroads, on Monday of this week ordered all roads to make special efforts to deliver box cars to lines west of Chicago and St. Louis, the cars being needed there to move grain from country stations to primary elevators. The grain waiting at New York now for shipment to Europe amounts to between five and six millions of bushels, and Mr. Smith calls for the embargo of shipments in box cars eastward except three classes of freight: (a) foodstuffs for human consumption; (b) export shipments approved by the New York committee; (c) government freight covered by section 3 of priority No. 5. The grain actually on hand at New York terminals at the date of the report was located, as follows:

| Railroads, | Bushels | Cars on Hand. | Cars in Transit |
|----------------------|-------------|---------------|-----------------|
| | or in Boats | | |
| N. Y. Central, | 1,898,180 | 27 | 42 |
| Lehigh Valley, | 704,000 | 61 | 455 |
| Pennsylvania, | 35,973 | 0 | 9 |
| Erie, | 423,059 | 65 | 29 |
| Lackawanna, | 1,500,000 | 180 | 448 |
| Totals, | 4,561,218 | 333 | 983 |

Stimulation of Water Transportation

The president's Commission on the subject of food supply to stimulate production of foodstuffs has recommended a number of measures. The first point is to encourage the shipping of foodstuffs. The commission's recommendation is that the government should be authorized to purchase foodstuffs for export and to ship them to the foreign countries. The commission also recommends that the government should be authorized to purchase foodstuffs for export and to ship them to the foreign countries. The commission also recommends that the government should be authorized to purchase foodstuffs for export and to ship them to the foreign countries.

There seems to be little or nothing to report except from the Mississippi river and a few states. The commission has also authorized the government to purchase foodstuffs for export and to ship them to the foreign countries. The commission also recommends that the government should be authorized to purchase foodstuffs for export and to ship them to the foreign countries. The commission also recommends that the government should be authorized to purchase foodstuffs for export and to ship them to the foreign countries.

Reductions in Passenger Service

The Boston & Maine will discontinue a large number of passenger trains on Sunday, January 20. The poster announcing these changes is a sheet 20 in. by 35 in. and it contains 150 or more items. Some of these include changes in not suspensions, and many refer to trains running only on Sunday; but the discontinuance of the train running at least six days in the week number 75 or more.

The Long Island Railroad has taken off 13 passenger trains and has taken off all parlor cars.

The New York Central has taken off through passenger trains No. 29 and No. 80 between New York and Buffalo.

In Montreal it is announced that all of the lines have agreed to discontinue Sunday passenger trains to New York to Boston and to Portland, Me.

The Grand Trunk has discontinued its passenger train leaving Chicago for Buffalo at 12:10 p. m. and the train leaving Buffalo for Chicago at 11:30 p. m.

Among the 85 trains taken off the New York, New Haven & Hartford at the beginning of this week were the Bay State Limited between New York and Boston; the new train to and from Pittsburgh over the Hell Gate bridge, and the State of Maine Express.

The Railroad Commission of Louisiana, in orders recently issued, has authorized the Texas & Pacific to discontinue three trains between Addis and Terras, 62 miles; two trains between Alexandria and Shreveport, 132 miles; two trains between Melville and Crowley, 57 miles; two trains between Eunice and Melville, 84 miles, and two trains between Addis and New Orleans, 89 miles. In an order issued on December 19, 1917, the commission imposed a penalty of \$400 on the Texas & Pacific for discontinuing certain trains on November 22 without its consent.

The Lehigh Valley has taken off trains which will reduce the passenger train mileage of the road about 75,000 miles a month, and expects to save 7,500 tons of coal a month. The most important trains taken off are Nos. 3 and 15 westward and 2 and 12 eastward, both night trains. To other through trains, one in each direction will henceforth be run only over that portion of the line east of Wilkes-Barre. There will be left in service two through trains each way, the Black Diamond in the daytime and the Lehigh Limited at night. The rearrangement of local trains has been carried out in connection with a careful study of the possibilities of pooled railroads, the Central & New Jersey in Pennsylvania and the New York Central in central New York so as to give the public the best arrangements with the Texas trains.

Commission and Court News

State Commissions

In the case of Green Brothers Lumber Company versus the Vicksburg, Shreveport & Pacific, recently decided by the Railroad Commission of Louisiana, it was held that when circumstances entirely beyond the control of a shipper prevent him from shipping his finished product within the time required to benefit by rates stipulated in transit arrangements, he shall not be required to pay full tariff rates. In the petition it was stated that from June 2, 1915, to August 10, 1915, 70 cars of logs were shipped into the Green Brothers mill over the V., S. & P. on which full tariff rates were paid. These logs were to be made into lumber and the lumber reshipped over the same road within 12 months, after which the petitioner was entitled to a refund of \$378. On account of the acute car shortage, embargoes and an exceedingly depressed condition of the lumber market caused by the European war it was not possible to ship out the lumber within the allotted 12 months' time. The commission declare the petitioner entitled to a refund equivalent to what was paid above the rate specified in the stop-over arrangement, in so far as intrastate shipments were involved; in other words, the time-limit is held unreasonable.—Green Brothers Lumber Co. v. V., S. & P. Decided December 18, 1917.

Court News

Unloading Oil Tank Cars

A tank car was unloaded by removing a tap on a pipe in the bottom and connecting a pipe, and then opening a valve from the top of the tank. When the tap was removed the flow of oil from the tank could be controlled by means of the valve. When the tap was removed at destination the valve was open when it should have been closed and oil was wasted before the pipe could be connected or the valve closed. The Texas Court of Appeals holds that the tank having been filled by the plaintiff shipper before starting, the railroad was not liable for the loss of oil, and judgment for the plaintiff was reversed.—Houston & T. C. v. Oriental Oil Co. (Tex.), 198 S. W., 601. Decided November 1, 1917.

Hours of Service Act

A train crew was released from duty at a division terminal for an hour and a half while refrigerator cars were being iced, but the release was not absolute, and the men were required to hold themselves in readiness to respond to a call, if needed. The Circuit Court of Appeals, Ninth Circuit, holds that the release did not break the continuity of the service. It also holds that the fact that rainfalls a few days previous had softened the track so that trains were subjected to delay did not excuse excessive hours of service; this was not an unavoidable accident, nor could it be excused, under the law, as an "act of God."—United States v. Southern Pacific, 245 Fed., 722. Decided October 22, 1917.

Grant of Right of Way

An owner made an absolute and unqualified sale of a tract of land to a railroad without reserving a roadway reserved in a former deed of an adjoining tract. In an action by the owner against the railroad for the obstruction of the road way it appeared that the second tract of land was bought for the purpose of double-tracking the railroad. Owing to landslides, it was necessary to make a difference in the grade of the two tracks. This difference in grade made the crossing practically impassable. Thereafter the company constructed another roadway for the plaintiff, several hundred feet longer, which the plaintiff claimed was not safe and practicable. The Kentucky Court of Appeals holds that there could be no implied reservation of the existing roadway in the second deed, but only of a way that was absolutely necessary to give the plaintiff an outlet to the public road, in view of the rule that a grant is taken more strongly against the grantor, and that, if he intends to reserve any right over the

land granted, it is his duty to reserve it expressly in the grant; and that the roadway substituted by the railroad was as safe and practicable as the circumstances would permit.—McGurn v. Louisville & Nashville (Ky.), 198 S. W., 222. Decided November 23, 1917.

Surrender of Bill of Lading

A manufacturer shipped an automobile to its sales agent under a bill of lading to be surrendered. The sales agent secured the car without surrendering the bill of lading and sold it to an innocent purchaser. In an action by the railroad to recover possession of the automobile the Iowa Supreme Court held that the sales agent could not by such sale transfer good title as against the manufacturer or against the carrier who had paid the value of the car to the manufacturer. The carrier may waive a provision of a bill of lading requiring its surrender before delivery of the property, but the presumption that it did so cannot be indulged.—Chicago, R. I. & P. v. McElhany (Iowa), 165 N. W., 67. Decided November 17, 1917.

Exchange of "Off Line" Service Contracts

In an action by a railroad company against a telegraph company to compel the latter to comply with a contract, dated prior to 1906, for 99 years, for the exchange of services, the question was: Under the laws as they exist today, can a carrier or telegraph company render "off-line" service to the other at a rate other than that published in the regular schedules and different from the rate charged the general public? The Federal District Court for the Northern District of Illinois holds that such a contract, though valid when made, is prohibited by the act of 1906 amending the Commerce Act, and is not authorized by the amendment of 1910.—C. G. W. v. Postal Telegraph-Cable Co., 245 Fed., 592. Decided August 14, 1917.

Crossing Accident—Contributory Negligence

In an action for injuries by a train to the driver of a taxicab at a crossing, where, from the physical facts established, the plaintiff, had he looked and listened, must have observed the approach of a train, the California Court of Appeal held that the fact that he testified that he looked for the train and did not see it until he was on the track did not absolve him of contributory negligence. The mere fact that telegraph poles obscured his vision at one point did not absolve the plaintiff of contributory negligence when for 30 feet immediately before he drove on the track his vision was unobscured, since a traveler must look for a train where such looking would be effective.—Jones v. Southern Pacific (Cal.), 168 Pac., 586. Decided September 14, 1917.

Insufficient Evidence of Negligence

A freight conductor was killed by the explosion of torpedoes put on the track by some unknown person. The evidence showed that the torpedoes were the same kind as those kept by the railroad company in its locked storeroom not far away. The window of the storeroom was not always securely fastened. The key to the storeroom was accessible to the company's employees. In an action for the death, the plaintiff rested her case on the establishment of these facts, it being her theory that it was sufficient for her to show that the torpedoes were thus negligently kept where some thief might have stolen them and set them on the track, where by explosion they killed the employee. The Kansas Supreme Court held that a demurrer to the evidence was properly sustained.—Norman v. Atchison, T. & S. F. (Kan.), 168 Pac., 830. Decided November 10, 1917.

Railroad and Pullman Company Exonerated

A passenger sued for injuries caused by slipping on the sill or threshold of a Pullman car while entering, alleging negligence on the part of the railroad and the Pullman company in allowing the threshold to be uncovered and to become coated with ice. The car was of the latest and most improved type of construction, in perfect repair, and the film of ice, if any, which caused the fall was so imperceptible that it could not be discovered without getting down on the floor and scraping the sill with a knife.

The United Supreme Court held that in such an instance the doctrine of *res ipsa loquatur* did not apply. It also held that the railroad and the Pullman company were required to exercise only reasonable care for the safety of a passenger in acquiring a knowledge of the presence of ice on the sill of a car, and if the ice could not be seen by an ordinarily reasonable inspection they were not liable to a passenger who slipped and fell. Judgment for the defendants was affirmed. *Connell v. O. S. L. (Mich.)*, 168 Pac., 337. Decided November 9, 1917.

Passengers' Baggage—Property of Another

The Oklahoma Supreme Court in an action for damages for the loss of a traveling salesman's sample trunk which had been checked by him in the baggage room and was destroyed by fire therein holds that as the railroad had no knowledge of the relation between the passenger and his employers, the plaintiffs, the owners of the property, it was not liable to the plaintiffs in the absence of gross negligence or willful misconduct. The court stated the well settled general rule to be as follows: The carriage of baggage is a mere incident of the carriage of the owner as a passenger; and where a passenger procures the property or another to be carried as baggage, the carrier, if without knowledge of the true ownership, is a gratuitous bailee thereof, and liable to the owner only for loss or damage caused by gross negligence or willful misconduct. Judgment for the plaintiff was reversed.—*Lusk v. Bloch (Okla.)*, 168 Pac., 430. Decided May 22, 1917. Rehearing denied, November 6, 1917.

Taxation of Land Used for Railroad Purposes

In an action against a local board of commissioners to enjoin the sale for delinquent taxes of a piece of land on which tracks had been laid, the Kansas Supreme Court holds that when property, however acquired or previously held, is incorporated into the right of way or yards of a railroad, or is otherwise devoted to the use and operation of a railroad, it becomes taxable by the tax commission, and cannot be assessed or taxed by local authorities. When tracks were laid over the land in question, and it was used as part of the yards of the railroad, it became the duty of the company's officers to include it in its returns made to the tax commission in the following March. A single failure to make such return would have made the company liable to a penalty of not less than \$1,000 under the Kansas statute. The fact that the land had been assessed by the local authorities the year before, upon a valuation which under the law was to be effective for a two-year period, did not prevent the property from passing within the jurisdiction of the tax commission. The railroad was held entitled to injunction.—*Atchison, T. & S. F. v. Board (Kan.)*, 168 Pac., 687. Decided November 10, 1917.

Intrastate Rate-Fixing Proceeding

Appeal was taken from an order of the Pennsylvania Public Service Commission, holding that the rates for carrying milk and cream into Pittsburgh and its suburban towns were excessive and unreasonable, and fixing new rates. The Pennsylvania Superior Court holds that where a railroad company has filed a new tariff of freight rates and no complaint is made within thirty days against such tariff, the proposed rates become effective rates, and if any shipper thereafter complains to the commission that such rates are unreasonable, the burden of proof is upon him to establish that fact. In such a case the railroad is not required to produce any evidence until the complainant has, *prima facie* at least, offered proof which if unanswered would warrant an order in his favor.

The commission found "that the rates complained of are an increase of practically one hundred per cent." It was held on appeal that this finding was not sustained by an inspection and comparison of the old tariff with the new tariff, and the record did not show that the commission had found facts which would enable the court to determine whether or not the conclusion of the commission was reasonable and lawful. The order of the commission was reversed, and the record remitted to the commission with directions to reconsider the order, and make such further report as would be warranted by the law and the evidence. *B. & O. v. Commission*, 66 Pa. Superior Ct. 403. Decided April 15, 1917.

Equipment and Supplies

Locomotives

THE OKLAHOMA & GREAT WESTERN is requiring for 25 Mikado locomotives.

THE DELAWARE, LEBANON & POTOMAC is in the market for 15 Mikado locomotives.

THE CALUMET & ABERDEEN MINING COMPANY is requiring for one Consolidation locomotive.

THE GREEN BAY & WESTERN has ordered 2 Mikado type locomotives from the American Locomotive Company.

ARTHUR ALLEN CAMPBELL, Port of Spain, Trinidad, B. W. I., who styles himself a manufacturer, agent and tropical rubber specialist dealing in the West Indies, British Guiana and Dutch Guiana and in Venezuela, writes under date of December 13 last follows:

I am in the market now for two locomotives of a particular specification and have been informed that there may be a possibility to get them if not to exact specification, at least very near, among those built for Russian orders and not shipped to destination owing to present conditions in Russia.

SPECIFICATION OF TWO LOCOMOTIVES REQUIRED

TYPE—4-4-2
GAUGE—4 ft. 8½ in.
DRIVING WHEELS—51 in.
BOILER PRESSURE—160 lb. to 200 lb.
WEIGHT—30-32 tons of 2,500 lb.
CYLINDERS—14 in. 16 in. by 26 in. 24 in.
FIRE—extra large grate
1 BL—BRASS
TYPE OF BUTTER—Link & Pin
SUPERHEATED WITH OIL BURNER FOR FUEL OIL

State of New York, to be sent to J. L. New York and state of New York.

Anyway, I want two locomotives more or less in the type specified for early delivery and will be very pleased if you could put me in the way to get them.

With satisfaction to the authorities I have supplanted other foreign manufactures with goods of American manufacture on the same railroad for which I require these locomotives and consequently have good business relations with them.

By careful handling I have built up a pretty decent trade between them and U. S. Manufacturers and have their assurance of permanent custom after the war for at least one of the men which I supply exclusively to them.

I may mention that if these locomotives be obtained and of satisfaction, there is an assurance of at least one repeat order.

ARTHUR A. CAMPBELL

Freight Cars

THE ILLINOIS CENTRAL is requiring for 25 caboose car bodies and frames.

THE UNION PACIFIC has recalled a recently ordered order for 200 tank cars.

DIXON & HILDEBRANT, Tulsa, Okla., are requiring for 50 8,000-gal tank cars.

THE PITTSBURGH, ALLEGHENY & McKees Rocks is asking prices on 10 steel hopper cars.

THE ATLANTIC COAST LINE is in the market for 1,000 40-ton steel underframe vent-louver box cars.

THE BAYVIEW & OMAHA has issued inquiries for 1,000 50-ton steel underframe box cars, 1,000 50-ton flat bottom gondola cars and 1,000 50-ton hopper cars.

THE PITTSBURGH & ALLEGHENY COMPANY, 1420 Chestnut Street, Philadelphia, is in the market for 50 steel 40-ton tank cars and 50 steel 40-ton hopper cars.

ITALIAN GOVERNMENT RAILWAYS.—The order for 9,000 freight cars for the Italian Government, which has been in contemplation since November, is about to be placed. Reports have it that the American Car & Foundry Company and the Standard Steel Car Company will get the major part of the order.

Passenger Cars

THE DULUTH & IRON RANGE, noted in the *Railway Age Gazette* of November 16 as inquiring for 5 passenger cars, has ordered 5 coaches from the Pullman Company.

Miscellaneous

THE UNITED STATES GOVERNMENT has ordered a large number of gasoline motor cars for the use of the army on track work in France.

THE UNION STOCKYARDS COMPANY, Omaha, Neb., has placed an order with the Roberts & Schaefer Company for a 150-ton automatic electric coaling plant for South Omaha, Neb.

THE NEW SOUTH WALES GOVERNMENT RAILWAYS, Sydney, Australia, have ordered from the Roberts & Schaefer Company the entire machinery for an automatic electric locomotive plant.

THE LOUISVILLE & NASHVILLE has placed an order with the Roberts & Schaefer Company for coal-handling machinery for a coaling plant at Nashville, Tenn., and a 400-ton concrete coaling plant at Guthrie, Ky.

THE HOCKING VALLEY has ordered from the Roberts & Schaefer Company a complete installation of Robertson cinder equipment for a 300-ton concrete coaling plant which Roberts & Schaefer is now building at Nelsonville, Ohio.

THE BESSEMER & LAKE ERIE has placed an order with the Roberts & Schaefer Company for the equipment of a coaling plant of 400-ton capacity using four RandS measuring coal loaders, electrically operated, at North Bessemer, Pa.

THE NASHVILLE, CHATTANOOGA & ST. LOUIS has ordered from the Roberts & Schaefer Company two 300-ton capacity frame-constructed coaling plants, for installation at Nashville, Tenn., and at Chattanooga, each to be equipped with two RandS measuring coal loaders.

THE PENNSYLVANIA RAILROAD has given a contract to the Roberts & Schaefer Company, Chicago, for the design and construction of a 300-ton reinforced concrete, automatic, electric, locomotive coaling plant and a gravity sand plant for installation at West Brownsville Junction, Pa.; a 200-ton concrete, automatic, electric coaling plant and a gravity sand plant at Blairsville, Pa.; and a 100-ton automatic electric coaling plant which is now being built at Rochester, N. Y.

Signaling

THE WASHINGTON, BALTIMORE & ANNAPOLIS is installing two blocks of automatic signals, one at Shipleys and the other at Ardmore, Maryland, with three-color light signals having a range of from 1,500 to 2,000 ft., under bright sunlight conditions. The material is furnished by the Union Switch & Signal Company.

THE RICHMOND (VA.) TERMINAL COMPANY will install an electro-pneumatic interlocking plant at the Richmond Terminal. The 51-lever frame will include 22 switch levers and 15 signal levers. The 32 track circuits within the locking limits will be equipped with two-position, Model 15 A. C. vane type relays. The Union Switch & Signal Company has the contract for this work.

NEW ROLLING STOCK FOR CHILEAN RAILWAY.—By proclamation dated September 26, 1917, the President of Chile has set aside for the use of the Arica-La Paz Railway the sum of 1,200,000 pesos (\$440,000). This fund is to be employed in the purchase of 100 steel freight cars of 25-ton capacity, and 3 Mallet locomotives. Persons interested in this matter may secure further detailed information from the Ministry of Railways, Santiago, Chile.—*Commerce Report*.

Supply Trade News

Shelby S. Roberts announces the dissolution of the firm of Berry & Roberts and his continuance of the business in the general practice of civil engineering, with office in the Transportation building, Chicago.

P. W. Page, formerly representative for the B. F. Goodrich Rubber Company, Akron, Ohio, in western Massachusetts and southern Vermont and more recently an ensign in the United States Navy, was drowned recently off the coast of England when his seaplane became unmanageable and plunged into the sea.

Peter Leidenger, western sales manager of The Dayton Manufacturing Company, Dayton, Ohio, died suddenly of pneumonia at the Buckingham Hotel, St. Louis, Mo., on December 28. Mr. Leidenger was born at Ironton, Ohio, in 1862, and had been with the Dayton Manufacturing Company for the past 30 years.

Russell T. Gray, formerly advertising manager of the Haynes Automobile Company and more recently secretary of the Shuman Advertising Company, Chicago, has opened an office in the First National Bank building, Chicago, as an advertising engineer. Among his clients are the Chicago Malleable Castings Company and the Interstate Iron & Steel Company, both of Chicago.

D. Gleisen has been appointed manager of the industrial bearings division of the Hyatt Roller Bearing Company, Newark, N. J. Mr. Gleisen is a mechanical engineer, a graduate of Stevens Institute, and has been connected with the Hyatt Roller Bearing Company for the past six years. He was formerly assistant manager of the Hyatt Company in charge of the bushings sales.

Ralph C. Davison, for the past six years associated with the American Mason Safety Tread Company, New York, in a selling and engineering capacity, has resigned his position and directorship with the above company to engage in a broader and more active field with the American Abrasive Metals Company, makers of Feralun Safety Treads and Anti-Slip surfaces. Mr. Davison, through his connection with the Concrete Association of America, has a large acquaintance among architects and contractors. He was also at one time an associate editor of the Railroad Gazette.

Frank W. Hall has been appointed commercial manager of the Sprague Electric Works of the General Electric Company. With the exception of a short period, Mr. Hall has been connected with the Sprague Works continuously for 22 years in various engineering and sales capacities, and for the three years prior to his present appointment occupied the position of sales manager. **D. C. Durland**, former executive head of the Sprague Electric Works, has resigned to accept the presidency of the Mitchell Motors Company, Inc.

Charles V. Eades, who recently resigned as sales manager and engineer of the asphalt product department of the Standard Asphalt & Rubber Company, Chicago, announces the establishment of the Mineral Rubber Products Company, with offices at 280 Madison avenue, New York City. The company will handle materials and will contract for floors, waterproofing, insulation, expansion specialties, protective coatings, etc., as well as represent other well-known manufacturers. One of the special products which this company has put on the market is a moisture-proof concrete block, designed by Mr. Eades.

LESS HEAT IN SWISS TRAINS.—As a fuel-saving measure passenger coaches on the Swiss Federal Railways will not be heated to the usual standard this winter, reports Consul Lewis W. Haskell, of Geneva. The use of traveling rugs, to offset this lack of heat, is suggested.

Financial and Construction

ATLANTA, S. L. & SANTA L. E.—Attachments to the charter of four subsidiaries of the Atlanta, L. & S. Co. have been filed in the secretary of state's office at Atlanta, Ga. The Canal Belt has increased its capital stock from \$100,000 to \$300,000. The South Plains & Santa L. E. has increased its capital stock from \$50,000 to \$75,000. The Paulville & Santa L. E. has increased its capital stock from \$60,000 to \$350,000 and the Plains & North Texas has increased its capital stock from \$70,000 to \$350,000.

DENVER & RIO GRANDE.—The United States Circuit Court of Appeals has affirmed the decision of the Lower Court against the Denver & Rio Grande in the suit brought on behalf of the bondholders of the former Western Pacific by the Equitable Trust Company. The amount involved is \$32,272,274, which with interest accrued brings the total judgment up above \$38,000,000.

Horace Payne, counsel for the Director General of Railroads, had a conference at Washington on January 8 with representatives of the Denver & Rio Grande, Western Pacific and Missouri Pacific railways with regard to the financial situation of those roads. At its conclusion Mr. Payne said:

"The Equitable Trust Company has obtained a judgment in New York and another in Denver based on that in New York, for about \$38,000,000 against the roads. Attachments had been levied on approximately \$2,000,000 of cash in New York and Chicago. It was feared that an interruption in the operation of the roads would result because of a failure to meet payrolls and other pressing obligations. Counsel representing these interests had been here and I invited them all to come here together today for this conference. Counsel representing the Equitable Trust Company indicated they were willing to release enough of the funds levied upon them to give the roads a sufficient working capital, but wanted a lien upon about \$3,000,000 of free assets in the treasury of the company in Denver, consisting of Liberty bonds and other assets, and also expressed the desire that the interest maturing January 1, partly paid, be fully paid, and that the interest on bonds and interest maturing February 1 should be paid. They insisted that money advanced for improvements, or, indeed, any substantial sums of money if not secured by the free assets should be secured by receivers' certificates or other arrangements ahead of the bonds except the underlying issue.

"It was plain that this could be done only by a receivership. After much discussion, the parties indicated a willingness to come together on some arrangement, the effect of which would probably be to make an immediate application for a receiver unnecessary, but failing in this, a receivership would be arranged for and application made to the Director-General for his consent to the appointment of a receiver with his approval and his approval of the person to be named as receiver."

MISSOURI PACIFIC.—The Missouri Pacific Railroad Company, a Missouri corporation, has filed a petition with the Illinois Public Utilities Commission asking for authority to purchase the line of the Missouri Pacific Railroad Company, a Delaware corporation, and has asked for a certificate of convenience and necessity to operate the road in Illinois and for permission to extend a lien of first refunding mortgage bonds of the Missouri Pacific Railroad Company, a Missouri corporation over the Delaware corporation.

WESTERN PACIFIC.—See Denver & Rio Grande.

Railway Construction

TAMPA SOUTHERN.—Contracts have been given to E. W. Parker, Tampa, Fla., and to Baxter Morrison, Inverness, to build from Tampa, south to Palmetto. The line is projected further south via Manatee to Sarasota, a total of about 57 miles. D. C. Gillett, president, Tampa; J. E. Willoughby, chief engineer, Wilmington, N. C. (May 4, p. 976)

Railway Officers

Executive, Financial, Legal and Accounting

E. T. Hatter has been appointed assistant manager of the Central & Elkhart with office at Hammond, Ind., succeeding **R. T. Criswell** resigned.

J. J. Cogan formerly manager of the Colorado Midland and the Cripple Creek & Colorado Springs, with office at Colorado Springs, Colo., has been elected vice-president.

F. R. Bolles, general manager of the Central & Elkhart, with headquarters at Hammond, Ind., has been elected vice president and general manager, with headquarters over the operating and traffic departments.

G. B. Wall, assistant to president of the Chesapeake & Ohio, with headquarters at Richmond, Va., has been appointed a vice-president, and will continue in charge of the real estate, industrial and tax departments and perform such other duties as may be assigned to him.

A. W. Towsley, formerly vice-president and general manager of the Ann Arbor with office at Toledo, Ohio, and more recently special representative in the vice-president's office of the Chicago, Rock Island & Pacific at Chicago, Ill., was appointed assistant to the vice-president in charge of construction and will give special attention to transportation matters, effective January 1.

The authority of **George M. Shriver**, vice-president of the Baltimore & Ohio in charge of accounting, treasury, loan and relief departments, with headquarters at Baltimore, Md., has been extended over the purchasing department and the authority of **Arthur W. Thompson**, vice-president in charge of traffic and commercial development, with headquarters at Baltimore, has been extended over the operating and engineering departments, effective January 1.

Operating

O. H. McCarty has been appointed superintendent of the Western division of the Western Maryland with office at Cumberland, Md.

W. E. Miller, has been appointed general manager of the Colorado Midland and the Cripple Creek & Colorado Springs, with office at Colorado Springs, Colo., succeeding **J. J. Cogan**, promoted.

D. E. Wilcox, trainmaster of the Denver & Rio Grande, Colorado lines, at Pueblo, Colo., has been appointed assistant superintendent of the Green river division with headquarters at Helper, Utah, effective January 1.

J. A. Campbell, supervisor of bridges and buildings of the Northern Pacific, with office at Tacoma, Wash., has been appointed trainmaster of the Tacoma division with headquarters at Tacoma, vice **C. W. Fee**, who has been transferred to general service.

F. S. Gibbons, who has been employed in the same position and on the staff of the vice-president of construction and is a general manager of the Illinois Central at Chicago, Ill., was promoted assistant to the general manager with office at headquarters effective January 1. Mr. Gibbons entered the service of the Illinois Central 20 years ago and has been continuously employed since that time at various increasing responsibilities of the road. He has been in the present office of the vice-president of operation and the general manager of Chicago since 1906.

R. C. Ten Eyck, superintendent of the Denver & Rio Grande Utah lines, with headquarters at Helper, Idaho, has been transferred to the same capacity to the Transcontinental Colorado lines, with headquarters at Avondale, Ariz., succeeding **B. T. McGraw**, who has been transferred to the same capacity to the First National bank with office at Pueblo, Colo., succeeding **W. J. Miller**, resigned. **J. L. Brown**, trainmaster of the Colorado lines with headquarters at Washington, Colo., has been transferred to the same position to the Trans-

and Second district, First division with headquarters at Pueblo, succeeding D. E. Wilcox, promoted. James Flynn, assistant superintendent of the Second division, Colorado lines, with headquarters at Salida, Colo., has been appointed trainmaster at Walsenburg, succeeding Mr. Brown.

Traffic

C. W. Meador has been appointed assistant general freight agent of the Arizona Eastern, with headquarters at Tucson, Ariz.

W. F. Conner, southwestern passenger agent of the Wabash at Dallas, Tex., has been relieved at his own request, after 42 years of active service.

F. A. Markley, commercial freight agent of the Baltimore & Ohio at Buffalo, N. Y., has been transferred to Pittsburgh, Pa., for special duties. The office at Buffalo has been abolished.

N. W. Hoke, commercial agent of the New York Central at Baltimore, Md., has been appointed general agent of the Michigan Central at Detroit, Mich., succeeding S. W. Secor, resigned.

E. L. Gamble, general agent of the traffic and transportation departments of the Western Pacific with headquarters at Stockton, Cal., has also been appointed to the same position on the Tidewater Southern.

J. A. McCoy, traveling freight agent of the Louisiana & Arkansas, with headquarters at Shreveport, La., has been appointed general agent at Alexandria, La., succeeding H. R. Whiting, who has enlisted in the army.

Laurence Dwen, commercial agent of the Missouri & North Arkansas at Kansas City, Mo., was appointed general agent with the same headquarters, effective December 15. G. C. Murray, commercial agent at Atlanta, Ga., has been transferred to Kansas City in the same capacity to succeed Mr. Dwen.

F. G. Hamblen, traffic manager of the Kansas City & Memphis, with office at Rogers, Ark., having resigned to accept service with the American Red Cross the position of traffic manager has been abolished. All matters pertaining to traffic will in future be handled by R. C. Hobbs, general manager, at Rogers.

H. A. Fidler, general freight agent of the Detroit, Toledo & Ironton at Detroit, Mich., was appointed traffic manager with the same headquarters, effective December 15. His former position as general freight agent has been abolished. C. E. Hockstedler was appointed chief of the traffic bureau with office at Detroit, Mich., effective on the same date.

Engineering and Rolling Stock

J. B. Conerly has been appointed master car builder of the Missouri, Kansas & Texas with headquarters at Denison, Tex., effective January 1.

S. W. Law, electrical signal engineer of the Northern Pacific with headquarters at St. Paul, Minn., has been promoted to assistant signal engineer with the same headquarters, effective January 4.

J. S. Motherwell, master mechanic of the Louisiana & North West, with office at Horner, La., has been appointed master mechanic of the Oklahoma, New Mexico & Pacific, with office at Ardmore, Okla.

T. C. Hanson has been appointed supervisor of signals, of the Northern Pacific with headquarters at St. Paul, Minn., vice E. A. Cuthbertson, who has been transferred as supervisor of signals, to Tacoma, Wash., vice A. H. Barnes resigned.

Thomas J. Cole, master mechanic of the Erie at Meadville, Pa., has been appointed shop superintendent, with headquarters at Meadville; Timothy F. Gorman, general foreman at Brier Hill, Youngstown, Ohio, has been appointed master mechanic of the Meadville division with office at Meadville; Lee R. Laizure, master mechanic with office at Hornell, N. Y., has been appointed shop superintendent at Hornell and Albert J. Davis, general foreman at Hornell, N. Y. has been appointed

master mechanic of the Allegheny and Bradford division, with headquarters at Hornell.

The organization of the maintenance of equipment department of the Bessemer & Lake Erie was sub-divided on January 1 as follows: locomotive department, under the supervision of the engineer of motive power; car department, under the supervision of the master car builder; office, accounting and stores departments, under the supervision of the assistant to the superintendent of motive power; engineering department, under the supervision of the mechanical engineer, and the following appointments have been made: H. D. Webster, engineer of motive power; F. W. Dickinson, as master car builder; C. C. Richardson, assistant to superintendent of motive power; C. L. Tuttle, mechanical engineer; all with headquarters at Greenville, Pa.

Purchasing

N. B. Coggins has been appointed division storekeeper of the Alabama Great Southern with office at Birmingham, Ala., vice D. A. Hickman, resigned to enter service of the United States army.

James E. Garnett, division storekeeper of the Southern Railway at Memphis, Tenn., has been appointed division storekeeper, with office at Sheffield, Ala., vice H. H. Delony, resigned to accept service elsewhere.

F. W. Taylor, whose appointment as purchasing agent of the Southern Pacific, with headquarters at San Francisco, Cal., was announced in these columns, December 14, was born at Campo Bello, New Brunswick, on August 5, 1867. He entered the service of the Union Pacific in December, 1885, as clerk in the store department at Laramie, Wyo., where he remained until July, 1889, when he was transferred in the same capacity to Pocatello, Idaho, with the division store keeper of the Union Pacific, the Oregon Short Line and the Southern Pacific lines east of Sparks, Nev., remaining until January, 1911, when he was appointed general purchasing agent of the Pacific Electric, the Peninsula, Stockholm Electric, the Fresno Traction and the Visalia Electric at Los Angeles, Cal., which position he held until the time of his appointment, as noted above, effective December 1.

Obituary

John T. Long, president of the Ozark Valley Railway, died on January 6, at St. Louis, Mo.

Daniel W. Sanborn, who was general superintendent of the Boston & Maine from February, 1892, to September, 1906, died on January 7, in Somerville, Mass., at the age of 87.

Joseph Hobson, consulting engineer of the Grand Trunk with office at Montreal, Que., died at Hamilton, Ont., on December 19 at the age of 84 years. He was born at Guelph, Ont., in March, 1834, and entered the service of the Grand Trunk as assistant engineer on construction work west of Toronto in March, 1858, and virtually had a continuous record of service with the system from that date until his death. He served as assistant engineer on various lines in Nova Scotia, Ontario and Michigan for several years; from June, 1869, to April, 1870, he was engineer of construction of the Wellington, Grey & Bruce; from that time to November, 1873, he was resident engineer on the International Bridge near Buffalo, N. Y. He then became chief assistant engineer of the Great Western, which position he held until June, 1875, when he was promoted to chief engineer of the same road, now the Great Western division of the Grand Trunk System. On February, 1896, he was made chief engineer of the Grand Trunk System, which position he held until July 4, 1907, when he was appointed consulting engineer. He was also chief engineer and builder of the St. Clair tunnel and the Victoria bridge over the St. Lawrence river.

RIVER SERVICE BETWEEN BOLIVIA AND URUGUAY.—The Belgian-South American Company has established a line of river steamers between the Bolivian river port of Puerto Suarez and the city of Montevideo. The Inca, the first steamer placed on this run by the company, flies the flag of Bolivia.—*Commerce Report*.

Rules for Loading Lumber

An article on the loading of lumber in open top cars will be found on another page of this issue which merits the attention of all railroad men interested in increasing the efficiency of the transportation system. The present methods of loading lumber result in serious losses on account of the frequent shifting of lading in transit. The expense involved, though very large, is widely distributed and for that reason few people realize the magnitude of the waste. Some of the roads which handle a great amount of lumber in open top cars have taken measures to correct these conditions. By bulkheading cars with lumber the shifting and consequent delays in transit have been greatly reduced. That a large saving can be effected by this method is beyond question and the universal adoption of the practice is highly desirable. The majority of lumber shippers will not bulkhead their cars unless they are required to do so, for while bulkheading might prove advantageous to the shipper by insuring earlier delivery, it is more expensive than the standard method of loading. The shippers do not seem to object to the plan on account of the greater amount of lumber which must be used in the bulkhead, but their principal contention has been that the present dunnage allowance is too small to cover the weight of lumber required for the bulkhead and stakes. Since there is no question that the railroads would be benefited by the universal adoption of the practice of bulkheading open top cars loaded with lumber, and slight concessions would be sufficient to overcome the objection of the shippers, it would seem that the logical thing to do to secure the advantages of this method is to modify the M. C. B. loading rules to make the bulkheading of open top cars loaded with lumber mandatory, and to increase the dunnage allowance on cars so loaded to compensate the shippers for the extra expense which this practice involves.

The Future of the Railways

THE future of our railways, has been made more uncertain than ever by the adoption of government control. The utterances of President Wilson regarding their taking over and most of the provisions of the Administration's bill for their control and financing seem to contemplate their return to their present owners at the end of the war. Furthermore, while government control suspends the operation of the Sherman anti-trust law and the anti-pooling law, there has been no proposal made that they be repealed. If they remain on the statute books competition must be resumed as soon as the railways are returned to their owners.

There are, however, several important reasons for doubting whether either the old system of regulation or the old system of management will be revived. While the repeal of the Sherman anti-trust law and the anti-pooling law is not at present being discussed, a revolution apparently has occurred in the attitude of public men and the public generally, toward railroad competition. The sentiment for competition seems suddenly to have given way to a sentiment for "co-operation" and "co-ordination." Again, Section 13 of the Administration's bill provides that federal control "shall continue for and during the period of the war and until

Congress shall otherwise order otherwise." It was also drafted the bill went to have received the old government continuation of control with the idea that some federal management in railroad ownership as well as management might be desirable after the war and that the government should hold the properties while there were better considerations.

There clearly is a growing belief among both railway men and public men that it is undesirable that either the old system of regulation or the old system of management shall be restored. For many years the railways had been trying to eliminate wasteful competition by pools, traffic agreements and by mergers. For over thirty years regulation defeated every effort of this kind. The result was that in every territory there were "weak" and "strong" railways operating side by side. The competition in service between the railways in each region was severe and caused many discriminations and wastes. Furthermore, it was impracticable for the regulating authorities to adopt any scale of rates which would be fair and satisfactory to both the "weak" and "strong" roads, or which would not be either regarded by part of the public as too low because it made the poor railways poorer or be regarded by another part of the public as too high because it made the rich railways richer. Probably in the natural course of events combinations between parallel railways would have wiped out the distinction between weak and strong lines; but natural tendencies were constantly defeated by laws to enforce competition.

While most railway men, regulating officers, business men and statesmen would agree that the old system was unsatisfactory, they would disagree widely as to what system should be adopted in its place after the war. Probably a majority of them would say that government ownership and management should be avoided if possible, but many would also say it is at least as likely that government ownership will be adopted as that we shall return to the old system of regulation and management.

Never in its history was this country confronted by an economic and political problem more important than the railway problem as it now presents itself. Few wish to return after the war to the old system and no more really want to see the adoption of government ownership. In order that we may escape both there must be worked out some plan which will apply to the public or something most of the advantages both of the old system of regulation and management and of government ownership and management, while being free from the disadvantages and dangers of both. It is not so much constructive statesmanship in this country to work out and to secure the adoption of some such plan.

The Administration believes that some of the fundamental principles on which the plan that will solve the problem must be based, already are existing. First, it would seem, such a plan must provide in some way for the elimination of unnecessary competition, and this can be best accomplished by the consolidation of the railways under regional lines. Second, such a plan must include private ownership with government supervision of rates and operations. Only through private ownership can the political evils and the difficulties of management of government ownership be avoided, but there must be safeguards in the return because experience has indicated that in the absence of such safeguards it will be impossible to get managing bodies to follow plan-

quate net returns. Third, if there are to be government guarantees the government must have a direct voice in the management. This could be given it by empowering it to appoint part of the directors of the regional railroad companies. Fourth, there must be pooling of facilities in so far as such pooling will promote efficiency. The pooling of tracks, terminals, etc., as far as was advantageous, would be secured by reorganizing the railways along regional lines; and the pooling of equipment as far as was desirable could be secured by the organization of an equipment company, the stock of which should be owned by the regional companies and which should distribute equipment over the lines of all the railways in proportion to their needs.

Any plan for the reorganization of the railroads which may be offered now will, of course, be subject to important modifications as discussion may disclose its weaknesses from the railroad or the public point of view. It is, however, the duty of railway men, public men and the public to recognize the fact that the railways are now drifting toward some unknown goal. Unless with wisdom and patriotism they are taken in hand and steered in the direction it is desirable for them to go, they may arrive at some port where few want them to arrive and where it will be destructive of the interests of their owners, their employees and the public for them to arrive.

There has been manifested a deplorable want of constructive statesmanship in the handling of the railway problem in the past. This want has been manifested both by railway officers and by public men. If it continues to be manifested the economic and political consequences will be most serious.

Lord Shaughnessy's Warning

LORD SHAUGHNESSY, chairman and president of the Canadian Pacific, deprecates government control of railroads in the United States. Extracts from a statement recently made public by him were published in the *Railway Age* for January 11, page 128. He says that the people of the United States are "looking too hopefully to the centralized effort of an overworked government when they should depend more on the trained enterprise of the individual industrial units that have been so efficiently developed during times of peace. Any form of control that will lessen the sense of keenness and responsibility on the part of these units is sure to be disastrous in its results."

Government control in the United States is now an established fact. But it is not too late to take to heart Lord Shaughnessy's warning about the danger of excessive centralization. The warning comes from the head of a railway system having the largest mileage, and operating over the largest area, of any system on the North American continent. In view of his long experience in managing such an immense system, he might be expected to speak of the advantages of operating a large mileage as a single system. It is significant that it is to the dangers rather than the advantages of such operation that he directs attention.

The railways of the United States have twenty times as much mileage as the Canadian Pacific. Therefore, the consequences of excessive centralization of control of management on our railways would be something like twenty times as serious as the consequence of excessive centralization of control of management on the Canadian Pacific. The central authority can and should indicate the *general* principles on which the railways are to be managed; it can and should indicate the *general* methods by which these principles are to be carried out; and it can check up the managements of the various large units into which the system is divided and make such changes in their organizations as may be necessary to see that its instructions regarding general principles

and methods are carried out. But the day on which the controlling authority begins to try to do more than this, on that day the managements of all the large units inevitably and necessarily will begin to look to it for detailed instructions and to delay issuing important instructions to their subordinates until they get their instructions from above. When that comes, centralized control will slow down everything instead of speeding up everything; and the increases of efficiency gained by eliminating competition will become small compared with the losses of efficiency caused by impairing the initiative and "lessening the sense of keenness and responsibility on the part of the units."

It should hardly be necessary to say that the foregoing is not intended as a description of what already has occurred on the railways of the United States. It is intended only as a description of what inevitably will occur under any system of centralized control which does not leave large autonomy and great freedom of action to the managements of the various groups of railways and of individual railways.

With reference to the problem that would be presented by consolidation of all the railways of this country under government ownership, it recently was said elsewhere, before the present government control was adopted:

"The problem of developing and working an organization which would centralize authority enough to co-ordinate all parts of this vast system, and which would at the same time decentralize authority sufficiently to enable each part to cope with local conditions and needs, would be the biggest and hardest industrial problem ever presented to the genius and energy of man. Therefore, even though the best judgment and ability of the country were enlisted and allowed to carry on the business without any political or other vitiating form of interference, it is questionable if the advantages which would be gained by consolidation would not be outweighed by disadvantages arising from the unwieldy magnitude of the undertaking."⁽¹⁾

The problem stated in this quotation is the one Director General McAdoo and his advisers are now actually wrestling with. They are grappling with it under conditions far more favorable to its solution than would exist under government ownership because they actually are doing so—thus far at least—without any political or other "vitiating form of interference," and because some of "the best judgment and ability of the country" are enlisted.

It will be most interesting and instructive to observe what success they will have in securing needed co-ordination of the operation of the railways while avoiding excessive centralization of direction, with its paralyzing effects.

The Trespassing Evil

THOSE RAILROAD and public service commissioners who, at the Washington convention (see *Railway Age Gazette*, October 19, page 695, and November 2, page 804), voted down the proposal of the Walker committee to have a federal law to punish trespassers on railroad tracks, acted, no doubt, under a sense of public duty: but that discussion and vote marked no progress, and the problem still presses; and the honorable commissioners have a pressing duty, at home, to put forth some vigorous efforts for the enactment of adequate state laws on this subject. One can readily understand the feeling of local pride, or jealousy, or laudable support of States' Rights, which may impel a commissioner to object to federal encroachment on his prerogatives; but such negative action as that at Washington does more harm than good. The crying need is for positive action. State commissioners have a peculiar

⁽¹⁾ Yale Review, January, 1918, article on "Railways in Peace and War," page 371.

and solemn duty in this matter. Most of the legislators who ought to bear themselves and draft suitable statutes to cure the evil are too much engaged in other matters to do anything effectively while the commissioners are, or should be, specially qualified to advise, enlighten, and even push, the legislatures. The commissioners are where they can survey the situation throughout the whole country all of the time, and they must be aware of the seriousness of the problem. There is no glory in this work, for the whole public seems to be satisfied to let careless pedestrians go on killing themselves on the tracks at the rate of five thousand a year; but that is all the more reason why a truly devoted public servant should take up the task, other and more spectacular reforms will find promoters easily among people not informed concerning this one.

The commissioners' committee characterizes the conditions as disgraceful; and everybody acquainted with the facts knows that this is true. Only one-fourth of the states have laws designed to suppress trespassing, and those few do not enforce them, at least, they have nothing encouraging to report concerning enforcement. Surveying the country as a whole, the committee says that there is a lack of respect for railroad premises and property, and that this is a deep-seated feeling of many years' standing; and along with this there are people everywhere who seem to believe that anti-trespassing laws have been framed to favor the railroad, rather than to protect careless pedestrians; a belief rooted, no doubt, in the old suspicion that "capital" is always abusing the poor. The final conclusion of the committee's rehearsal of facts is that the outlook is discouraging—which no one can deny.

The cheerful aspect of the situation is that a considerable amount of good work has been done in spite of the discouragements. Many of the larger railroads keep up a vigorous fight, in spite of municipal indifference. With any sort of co-operation on the part of sheriffs and police these railroad activities would soon show tangible results. If the railroads continue to aid and instruct, and *enrich*, the farmers as they have been doing for the past few years, it may be that after a while people will begin to credit railway officers now and then with a modicum of public spirit. The New York Central by its vigorous prosecutions of tramps a year or two ago, reduced the annual average number of accidents to trespassers 19 per cent. Other roads in the more thickly settled parts of the country have also done good work. It is real work, however; costly and difficult. The Central's officers spent a prodigious amount of time, energy and patience in arousing the local magistrates. The lethargy or ignorance of these officers is one of the greatest obstacles everywhere. New York State, at last, has simplified its law so that the punishment of trespassers will be greatly facilitated; and the Central may be expected to do still greater things. Depending, as we have to, on railroad enterprise instead of state enterprise, it may be said that the Central now has before it the task of extending to the six other states traversed by its lines the profitable gospel of safety which it has been spreading in New York.

The Walker committee made one recommendation that was ignored by the convention; that the campaign of publicity, designed to convince thoughtless persons of the dangers of trespassing, be continued. That is good as far as it goes—but the publicity that will be most likely to count is that which can be engineered by well-informed public service commissioners, addressing themselves to the men who are primarily responsible—the legislators. The committee said that commissioners should "lose no opportunity to point out" the merits of anti-trespassing laws; and it is among legislators that the most useful opportunities can be found. This is a progressive movement which, unlike many others just now, need not be seriously retarded because of the pressure of war-time problems.

The Freight Car Situation

THE condition of existing freight cars is one of the most serious ones confronting the railroad. During 1916 and the early months of 1917, the roads were loaded to making a material increase in production of food and other goods. There has been little change in the situation since April, 1917, however. The movement of cars is slow or uncertain, they are returned probably at intervals of from 45 to 60 per cent of the total, although the roads have been making great efforts to keep cars in satisfactory condition.

This failure to reduce the percentage of cars on hand to even 50 per cent. The railroad get out quickly and the knowledge handled per loaded car have been seriously reduced during the past two years. The shortage of the cars secured from equipment manufacturers has been not faster than usual and more than the ordinary amount of repairs are needed to keep the equipment in good condition.

The repairing of cars is made unusually difficult under present conditions. Few new freight cars have been received during the past two years, and all the old equipment which the roads owned has been put into service even though it is of obsolete construction and under modern operating conditions requires frequent overhauling. Furthermore the percentage of foreign cars which the roads have been handling has increased, thus making it necessary for the car repairers to do a larger share of their work on cars with whose construction they are not familiar. As might be expected under these conditions, the number of foreign bad order cars in recent months has been much greater than for the corresponding month of the previous year, the increase in some cases is as great as 20 per cent.

The only way to meet the demand for cars is to keep the available equipment in serviceable condition. This is no easy task. There is a very strong temptation to put by the minor defects when cars are on the repair track in order to increase the number of cars turned out. Inspectors and inspectors, who are best qualified to judge the situation, agree that the general condition of cars at this time is far below the average. The condition of cars which have been on the home road for some time is in many cases extremely bad.

With labor and material both hard to get it is natural that the foremen in charge of the shops should not pay much attention to the repairing of foreign cars. The cars on the home road are given preference, and no wonder the American car receives just enough repairs to get it back on the main line of some distant road. After it has made a few hundred miles it is again ready for the repair track.

In routing cars under present conditions, probably you would find that over half of the cars to be repaired. This will result in a greater percentage of foreign cars on all roads. Unless these cars are handled promptly when they need repairs, the number of bad orders is bound to increase. Consideration of profit or loss should not come into the question of making repairs. The immediate matter is keeping the car in service. Whenever possible, repairs can be made with material on hand, it should be supplied, even though it is not standard in size. That is, possibly, in nearly every case to repair cars without waiting on the owner to furnish material is down to the road or workshop which repaired 12, 30 or 40 cars and material material from the owners for only 11.

Roads that are following the practice of shifting repairs to foreign cars should realize that such a procedure will inevitably result in rapid deterioration of equipment. The surest way to keep the cost of maintenance down is to make light repairs as soon as they are needed. If this is not done,

the car is certain to require an abnormally large amount of work when it is shopped.

A reduction in the percentage of bad order cars cannot be secured by any system that attempts to shift the burden to some other road. Two things are needed to improve the car situation. First, a disregard of the petty considerations that delay repairs to foreign cars, and second, good, thorough repairing applied as soon as the car develops defects. The object of the repair track foreman should not be merely to get the cars back into service, but to put them in condition to handle traffic and stay off the repair track.

New Books

Seasoning of Wood. By Joseph B. Wagner. 274 pages, illustrated, 6 in. by 9 in. Bound in cloth. Published by D. Van Nostrand Co., 25 Park Place, New York. Price, \$3.

The book considers seasoning both in air and in kilns. The first two-fifths of it is devoted to a general treatment of the subject of timber, including two brief chapters on general characteristics and some 70 pages in cataloguing the various species. Wood destroying insects, which work on wood in the air, either in the tree or in the structure, are also given some space. In the treatment of seasoning, proper attention is devoted to the relation of the properties of wood, moisture, content, the influence of evaporation or manner of drying and to a discussion of the advantages of seasoning.

The construction, arrangement and operation of kilns of various kinds and various devices and forms of apparatus used in kiln drying are given detailed treatment.

Business Law for Engineers. By C. Frank Allen, formerly professor of railroad engineering, Massachusetts Institute of Technology. 6 in. by 9 in., 457 pages. Bound in cloth. Published by McGraw-Hill Book Company, Inc., 230 West Thirty-ninth St., New York. Price, \$3.

The book is divided into two parts, one entitled "Elements of Law for Engineers" and the second called "Contract Letting." The first part may be compared favorably with the familiar texts on commercial law, designed for the use of the layman, except that the material is arranged in this case for the special benefit of the engineer rather than the business man. Otherwise the arrangement is much the same with chapters covering the familiar subjects of torts, equity, real property, agency, etc. As illustrating the supplementary material for engineers the chapter on real property covers the acquirement of land for engineering projects, eminent domain, the law of land surveying, etc. There are also two chapters of special significance to engineers and railway men, namely, "Railroads" and "Engineer's Relations with Others."

The first of these touches on the legal phases of railway location, maintenance and operation and deals briefly with the legal status of the common carrier. The up-to-date character of the book is indicated by the fact that mention is made of the Adamson law. The second part of this book covers the same general ground as previous texts on engineering and construction contracts. The subject is treated largely through the presentation of specimen forms for all phases of contracts, such forms including the uniform general contract of the American Railway Engineering Association, and the Standard Form of the American Institute of Architects. As the author states in his preface, the book is not intended to make every man his own lawyer, but it will be a valuable addition to the library of any engineer.

Letters to the Editor

A Correction

WASHINGTON, D. C.

TO THE EDITOR:

May I call your attention to two typographical errors in the article appearing in your current number from my pen entitled, "The Basis of Compensation for the Railways"?

The last sentence in the last paragraph on page 127, as printed, read "Another element for harm is represented by charges in per diem rates." The word "charges" should have been "changes." I was referring to the fact that changes in per diem rates during the three-year test period or at any future time during the period of government control would tend to throw out the relation of road with road in the scheme of government compensation.

The other error appears at the top of page 128, in the first sentence reading "Furthermore, it is of great importance whether hire-of-equipment accounts are actually maintained between the carriers during the period of government control or not, even though for purposes of record it might be considered advisable to do so." The word "not" is left out of the sentence after the word "is." The sentence should have read, "Furthermore, it is *not* of great importance," etc. My thought there was that the keeping of hire of equipment accounts between the carriers would, under government control, be largely a matter of policy and expediency rather than of necessity.

JULIUS H. PARMELEE.

The Problem of Depreciation

UNIVERSITY OF CHICAGO.

TO THE EDITOR:

G. C. Hand's article on depreciation in your issue of December 7 is ingenious, but I fear it makes more for confusion than for clearness on the fundamental issues involved. His argument is deductive and his conclusion is contained in his assumptions as to the meaning of value. When Mr. Hand takes up the *a priori* logic which is the favorite weapon of the closet theorist, he must remember that the structure is no stronger than its foundation assumptions and that his foundation is itself unsupported. He also gives the theorist a chance to turn the tables on the practical man by remarking that his logic does not touch the practical needs of the case. This chance is too good to be missed; so let me say, as a specialist in *a priori* closet theory, that the final logic of this case is pragmatic, not *a priori*, and that the system that will work and be equitable cannot be deduced from definitions of terms.

Mr. Hand assumes that "depreciation is the subsidence of value," that: "The value of a railroad is the present worth of the . . . net revenue . . . funded at the prevailing rate of commercial profit," and that: "Value is unique." These three propositions contain his entire case against physical valuation and against the calculation of depreciation accrued but not matured. The answer is: If value is unique, and means what Mr. Hand proposes, then "valuations" for accounting and regulation are not and cannot be, strictly speaking, value, but something else. Hence we get nowhere by first assuming that they ought to be value and then criticising them because they are not. If valuations for accounting, regulation, condemnation, etc., are all "values," then value is not unique.

Each in turn is in a sense responsible for the whole value of the going concern. It follows that the sum of the parts thus calculated would be many times greater than the whole. This goes to show that regulation cannot be based on the actual values of the *parts* of the property of a company any more than on the actual value (as Mr. Hand uses the term) of the whole taken together. For this service Mr. Hand deserves the thanks of those interested in clear thinking on these matters.

To sum up: the basis of regulation and the basis of accounting are not "value" in the commercial sense, as he assumes, and his main thesis falls with this assumption on which it is based. If such questions as these could have been thrashed out earlier and a reasonably simple outcome arrived at, the present valuation of railways might have been made less expensive. The whole problem of "fair value," however, can never be simple.

J. M. CLERK,
Associate Professor of Economics.

Curses and Courtesy

CHICAGO.

TO THE EDITOR:

Ever since the inception of the "courtesy movement" on railroads, the periodicals of the country have been replete with articles on that subject, each one, perforce, meritorious because it constitutes an agitation toward a worthy end, if for no other reason. One and all of those that have come under my perusal have discoursed on the soft spoken word for the public, leaving the inference that the mask of courtesy may be donned or doffed at will.

With all due respect to the compelling power of the conscious mind and its facility for facing trying environment, we must award the palm to the subconscious mind for power of impulse—which actuates by far the most of our activities. Auto-suggestion, by means of conscious courteous effort, has a certain power, but the effort must be perfunctory as a general thing, if it springs from the will rather than from impulse.

A discussion of impulse carries us into the subject of heredity and its strongest ally or, mayhap, its strongest enemy, environment. We may run the entire gamut of human character and find all the tones of temperament due to heredity; tones that come with our entrance upon life's stage and for whose presence we are not responsible. Reflection reveals to us that these proclivities assert themselves most unexpectedly and our task is to aline and sometimes repress them. It is not necessary to descend far down the classification of organisms until we come to those which are absolutely helpless before their inborn tendencies; their reflex actions are always and inexorably the same under a given set of circumstances and this is true no matter how painful is each experience. We are told by scientists, and we know *a fortiori* of its truth, that the continued existence and progress of any organism depend upon its power of adaptability toward its environment. Further, we see that man embodies the highest type of adaptability found in any organism. His power to act upon and set the scenery of his environment places him upon a pedestal far above the beasts of the field and the fowls of the air over which he was given dominion. Then, as the apostle Paul says, "Let us acquit ourselves like men."

We are born into the narrow room of heredity, but adaptability is the key that unlocks the door and permits an exit into a world of character progress.

But what has all this to do with the acquirement of a courteous manner, you may ask. Just this. Our powers of adaptability must be bent upon setting the stage for a continuous performance, a consistent environment, an aura of

gentility. A courtesy to the public is not the beginning of such an environment, it is more truly the end; for as surely as law is law, so sure is it true that the beginnings of our courtesy must be among ourselves. Can a justifiable rebuke, degenerated into a tirade of curses administered by a superintendent, for instance, to an engineer, be so dissolved that the superintendent can turn in the same hour and give an address before a commercial club with a courtesy and gentility which is convincing in its sincerity? Not often. The man who fell into the slough of curses is the selfsame man who speaks in the club room.

We railroad men, in practically every department of the business, must plead guilty to all too much of this brand of conduct. The conductor curses the engineer and fireman, is cursed in return, then turns to his ticket collecting and puts on a courteous attitude as "prescribed by the rules."

The agent curses at the way-freight crew for knocking an empty car "off spot" and in the same breath turns to sell a lengthy coupon ticket to a prospective purchaser, who from the window has heard his altercation with the train crew. How incongruous it must sound then to hear the agent dilate upon his road's being "the only way" or as providing the best of everything. Yet another scene: The train dispatcher's office, a snow blockade, trains hours late; numerous ones of the public stray into the office to inquire about relatives or friends on snowbound trains which have no diner attached and no way to warm the cars; the dispatcher's ability and patience are strained to the breaking point; enter a trainmaster, or an assistant superintendent and, seeing what he deems to be poor judgment being exercised in some detail of despatching, breaks forth into a stream of sarcasm, abuse and curses, within hearing or beyond—it is little difference—of the inquiring public. Do the words of such a man inspire the inquirers with confidence in him, respect for his business or satisfaction for the safety of the snow-bound passengers? Plainly now, can a man be a Doctor Jekyll and Mr. Hyde and make a success of both? Man's inability to serve two masters was asserted by a wise teacher 1917 years ago. Have we not yet learned its import? He also said, "Woe unto you, vipers, hypocrites, for you cleanse the outside of the cup, but the inside is filled with all uncleanness." Let's all think of that when we turn from our notorious, mutual cursing and endeavor to put on our courtesy mask for public inspection.

NEMESIS.

Not a Consolation Prize in This Case!

NEW YORK CITY.

TO THE EDITOR:

May I say a word in commendation of the lowered price for the upper berth?

Years before the price was lowered I learned to use the upper berth because, for a girl traveling alone, it seemed a distinct advantage to be up and out of the way, and safe for the night. And now—well, I take peculiar pleasure in getting the thing I prefer at the preferable price!

S. D. W.

TUNNEL TO BE BUILT UNDER JAPANESE STRAIT.—The Japan Chronicle reports that influential citizens of Fukuoka, Kiushu, have undertaken a plan for the establishment of a company with \$7,228,250 capital for the purpose of making a railway tunnel under the Mogi Straits. The tunnel will start at Shimonoseki and end at Dairi, Fukuoka Prefecture, and it will be connected with the railway trunk line of Kiushu. The total length is put at 17,700 feet, of which 4,000 feet will be beneath the sea. Five years will be required to complete the whole project.

Director General McAdoo with the Members of Freight Moving Week Board and its staffs.

Running the Railroads Under the New Regime

Freight Moving Week. Status of the I. C. C. and the State Commissions. Wage Question. Mail Service

By GEORGE D. COLE

THE PRINCIPAL WORK of the railway administration during the past week in the direction of improving transportation conditions was that directed from New York by A. H. Smith, Mr. McAdoo's assistant in charge of transportation on the eastern lines, who also came to Washington on Thursday and spent several hours in conference, reporting on conditions at the congested New York terminals and on the efforts to increase the movement of coal.

Freight Movement Week, officially designated by Director-General McAdoo, started on Monday throughout the country with many different agencies co-operating in an effort to make it a success, but bad climatic conditions threatening to seriously interfere with the work.

Reports from the middle west on Monday night were to the effect that the storm which has paralyzed that section for several days had begun to break, but there was no indication that even the normal movements of cars could begin for several days. Both snow and cold were interfering with the movement of traffic as far east as Pittsburgh. The snow did not reach beyond that point, but cold weather was being experienced east as far as the Atlantic Seaboard. Reports from New York, however, said that the temperature was moderat-

ing, and it was thought that traffic could be speeded up considerably early in the week.

Under the direction of the director-general, very little had been made to increase the movement of traffic. Some plans were being used throughout the middle western section where snow drifts were interfering with train movements, and on the roads were cleared railway companies were making the greatest possible speed to get their trains to their destinations. The general order that went out from the director-general was that every possible means should be used to return traffic conditions to their normal state as quickly as possible.

Despite the snow and cold it was believed that a great deal of good would be accomplished during Freight Moving Week. Virtually every business organization and member of the United States indicated his desire to co-operate with the director-general in clearing up the situation, promising particularly to endeavor to keep new freight on the rails during the shipments now on hand ready for distribution. Various governmental agencies outside of the director-general's office also are lending a helping hand. The Fuel and Fuel Administrations have sent out urgent pleas through all their agencies to keep new shipments off the road this week. So ready have been the responses to the director-general's widespread appeal for co-operation, that it was felt much of the congestion could be relieved if the weather moderated to any extent during the course of the week.

Thousands of telegrams have been received at the office of the director-general from mayors of cities, business organ-

* The Freight Moving Week Board, organized by the Interstate Commerce Commission, consists of the following members: Director-General McAdoo, chairman; A. H. Smith, assistant director-general; H. W. Walters, assistant director-general; W. G. McAdoo, standing; H. H. Smith, assistant Chicago, Portland & Quincy; Edward C. Calkins, vice president Atlantic, Pacific & Santa Fe; Walker D. Harris, treasurer, Atlantic, Pacific & Santa Fe; John Martin Payne, legal adviser; and Oliver S. Price, secretary to the director-general.

izations, state governors and other leaders, promising full support for freight moving week. On the first day of next week the new increased demurrage rates will go into effect, and the clearance movement preceding is expected to save many thousands of dollars to shippers as well as assist the railroads in handling their big load.

To A. H. Smith, his assistant in charge of eastern lines, and R. H. Aishton, president of the Chicago & North Western, Director General McAdoo telegraphed on Sunday:

"I am very much distressed at the inconvenience and suffering the blizzard has brought to the people in the West and central West. The paralysis of railroad service is inevitable, but I should like you to use every possible means to overcome the situation and restore railroad service at the earliest possible moment."

Mr. Aishton's report read:

"Every means within our power is being used to restore normal railroad service, and particularly in the movement of coal. The greatest difficulty was experienced in Chicago and in a radius of about 250 miles, with Chicago as its center, where the severity of the storm of Friday last, following the very heavy snow and strong wind the previous Sunday, created a condition that has not been equalled in the history of this territory for over twenty years.

"All employees stuck to their tasks of keeping transportation moving as long as it was humanly possible to do so. Every available man was employed in the moving of snow, and very good progress was made yesterday and last night.

"Through passenger service and coal movement was resumed to a limited extent last night. Suburban service in the Chicago district was resumed with nearly normal operations in Chicago this morning. The greatest efforts are being directed to resume normal movement of coal. Very good success was obtained last night in placing coal in Chicago territory. Every man that can be spared from any other class of work is being used to remove snow from tracks in yards so that all transportation may be resumed at the earliest possible hour. You may feel assured nothing is being left undone by officers and employees to restore full normal transportation."

A. H. Smith telegraphed Director-General McAdoo on Monday as follows:

"Between Pittsburgh, Buffalo, Chicago and St. Louis there has been practically no freight movement for 24 hours. Practically the only passenger movements have been those incident to getting stalled passenger trains into terminals.

"Snow has drifted very heavily, packing in cars on side tracks and in yards, and it will take considerable time and much effort to get them loose. Temperature this morning at Pittsburgh and Buffalo still zero with extremely high winds. West of there weather has moderated. It has likewise moderated in New York and at other points east.

"The very low temperature with snow and high winds has produced a combination which is said to be worse than anything in the history of the railroads in the central west.

"Little freight, if any freight eastbound from Chicago and St. Louis today on account of conditions in yards. Efforts are being made to place coal to relieve fuel situation in central western cities. Everything being done with the help and power available to restore service at the earliest possible moment.

"In answer to your telegram you may be assured of the utmost efforts in this direction on the part of all concerned.

"Believe we should devote our attention to keeping people warm, moving food and coaling ships in the harbor, even if manufacturing industries close down for a few days until the effect of this storm can be cleared away and working room afforded.

"There are 118 ships in the harbor this morning awaiting coaling and 21 bunkered last 24 hours."

Later, Mr. McAdoo gave out the following statement:

"The director-general is in receipt of advice from A. H. Smith, assistant to the director-general at New York, that the weather conditions, which are more severe than experienced in 50 years, have crippled railroad transportation to such an extent that it is imperative to give preference at New York and vicinity to certain vitally essential commodities. He recommends that this order of preference be:

"First—Coal for domestic use and vital public utilities.

"Second—Food.

"Third—Coal for bunkering the ships now in New York harbor which are loaded for our armies abroad and for the Allies.

"The director-general has approved the recommendation with the expectation that the plan will be temporary only; that improving weather conditions will soon obviate its necessity, and that it will not materially affect industrial activity.

"This appears to be the shortest cut to a restoration of normal conditions. It is hoped, therefore, that everybody will co-operate by submitting as cheerfully as possible to the temporary inconveniences the plan may occasion, in order that it may be made in the highest degree effective and that prompt relief may be brought about."

Mr. McAdoo has announced that he expects to appoint other assistants in charge of various districts, just as Mr. Smith is in charge of transportation on the eastern roads. B. F. Bush, president of the Missouri Pacific, has been advising him on conditions at St. Louis. Mr. McAdoo has announced, however, that he will *not* appoint state directors of transportation.

Acting on a report from Hale Holden, assigned to make a special study of freight conditions in the District of Columbia, Mr. McAdoo sent a letter to A. W. Thompson, vice-president of the Washington Terminal Company, requesting him to arrange for the common use of the rail facilities in the district, in which he said:

"I inclose copy of letter which I have today written to Louis Brownlow relating to the local freight congestion in the district. It is of importance that these facilities be kept in efficient operation, and while the present situation appears to exist chiefly because consignees are unable or do not take away their freight as rapidly as should be, there are doubtless measures which can be taken to increase capacity by the railroads.

"I therefore request that you undertake at once to arrange for the common use of the rail facilities in the district, as far as may be wise, to increase efficiency in the use of them and see to it that sufficient switching power is maintained here at all times. The forces at the freight houses and in the administration of the facilities generally should be kept at all times adequate to serve the public and generally measures should be taken from time to time as necessary to keep the service abreast with the requirements of the public here. I shall be glad if you will report to me on the subject from time to time."

In another letter to one of the district commissioners Mr. McAdoo approved of a plan for a pooling of the use of drayage and trucking facilities in the district recommended by Mr. Holden, and pointed out that the main cause of the local congestion has been the delay on the part of consignees in removing freight from freight houses and team tracks.

On Tuesday Mr. McAdoo announced that he had relieved A. W. Thompson, vice-president of the Baltimore & Ohio, from his duties as vice-president of the Washington Terminal Company, in order that he might devote his attention to his own road, and appointed in his place G. R. Loyall, assistant vice-president of the Southern, whose office is in Washington and who is therefore in a better position to give attention to the local situation.

The Navy Department on request of Director General McAdoo sent a battleship to Baltimore to break the ice in

the harbor and to open the channel. Mylar was received in the afternoon that the harbor had been opened and the battleship was proceeding down the bay with 18 loaded ships and barges which it released at Baltimore. There was three feet thick ice in the Baltimore harbor.

Thus far Mr. McAdoo has not reached a conclusion as to whether the express companies should be taken over by the Government. He has asked the Interstate Commerce Commission and his advisers for an opinion on the subject but has felt that an immediate decision was not necessary because of his jurisdiction over the trains in which express cars are carried. A delegation of officers of the principal express companies called on Mr. McAdoo on January 10 and it is understood practically asked him to take over their business, which is to a very large extent intertwined with that of the railroads.

The Interstate Commerce Commission

While there has been much discussion of the effect on the Interstate Commerce Commission of the President's

various parts of the capture, Commissioner Daniels is maintaining information on which to make up a budget of railroad improvements and equipment. It is to be expected that the Bureau of Civil Service is taking a census of the number and availability of the freight car equipment. Commissioner Anderson, after having been the principal author of the administration bill provided for the transfer of the express to Government control, has been busy for a week preparing to advise Senate and House committees and Congressmen. Harlan has been in New York helping to make the express transfer.

Mr. McAdoo and the members of the War Board heard occur a large part of one hour of the Interstate Commerce Commission, including the Committee on Civil Service of the American Railway Association, and the War Board, as the function of the railroad, the function of the former railroad. War Board, which had a building of its own, have been taken over under the direction of Harlan, president of the Chicago, Burlington & Quincy.

The Interstate Commerce Commission on Saturday cleared the way for railroads to haul freight over the routes

(Photo from Transportation Magazine)

Reasons Enough Why This Train Arrived Late at Chicago

action in taking over the railroads and placing them under the direction of Mr. McAdoo, and it has become entirely evident that the Commission has lost much of its supreme authority because that of the director general of railroads has been made paramount, the Commission has by no means been side-tracked.

Its office building in Washington has now become the headquarters of the U. S. A. R. R., and to all outward appearances it is a busier place than ever before. While the rate problems with which the commissioners and their subordinates formerly wrestled have been diminished both in number and in importance, a large number of new tasks have been imposed upon the commission by the director general in accordance with his announced intention of making use of his organization to the full. Commissioner McChord is securing information regarding transportation conditions in

routes and establish new receiving or delivery plants by issuing an order allowing the necessary tariff changes to be made on one day's notice, and allowing relief from the provisions of the long and short haul laws in the case of new rates made to open new routes.

The State Commissions Just After the Cyclone Passed

At this important period in the history of transportation the railroads find themselves the more often at a point of sympathy with, if not from, the state railway commissions which are concerned as to the effect of the new regime on their status.

The President's proclamation gave the railroads a full and explicit so far as said through the state of new in emergency. In general, the railroads are not in a position to transport the state railway commissions, and the railroads are not in a position to transport the state railway commissions, and the railroads are not in a position to transport the state railway commissions.

and orders of regulating commissions of the various states in which said systems or any part thereof shall be situated. But any orders, general or special, hereafter made by said director shall have paramount authority and shall be obeyed as such."

Charles E. Elmquist, secretary of the Special War Committee of the National Association of Railway and Utilities Commissioners, has addressed to the state commissions a bulletin on the subject of Government operation of railroads. After quoting the above and other extracts from the President's proclamation and message, he says (italics his): "Examination of the foregoing makes it appear that the railroads were taken over as a war measure, should be operated as a war measure, and that none of the functions exercised by the Interstate Commerce Commission or state commissions or common law or statutory rights of shippers and passengers, should be curtailed unless it is necessary to do so as a war measure. Exigencies of war should not require the director general to set aside statutes or orders of state or federal commissions, or to abolish the wise practice of submitting all rate questions to regulating tribunals, with the right of the public to be heard. *The right of the director general to supersede by an order the constitutional rights heretofore exercised by the states is a debatable question. Instead of considering the distinction between state and federal authority at this moment of extreme peril to the Nation, we regard it as important to establish a fair, just and workable basis of co-operation between the state and federal governments, so that all regulating officials and employees may work together in the common cause of helping the country win the war. Team work should be the watchword.* For the purpose of establishing a correct understanding between the states and the government the Hon. Clyde B. Aitchison has been designated as the person to confer with Mr. Charles E. Elmquist, secretary of your Special War Committee, and it is expected that a working basis may soon be reached. It is to be expected that questions for discussion will frequently arise and the Interstate Commerce Commission felt that this plan establishes a helpful point of contact between the states, federal government and the director general. Your committee will give much thought to these matters and invites suggestions from the commissions. *It is to be expected that the railroads will ask the director to interfere with pending actions before, or orders made by, the commissions.* It will be of service to the states if the special War Committee is furnished with copies of orders that are issued by the states, which affect revenues, labor or material, and also a statement of pending formal cases, and what is involved in them. *The state commissions should retain jurisdiction over all matters conferred by statute until otherwise ordered by the director or court, at which time appropriate action may be taken.* The exercise of these functions, however, should have due regard to the conditions imposed by the war. *The underlying purpose should be to help the government operate the railroads in such a way as to make them a vigorous auxiliary of our war machinery.* This can be done by helping to curtail unnecessary and luxurious passenger service, save fuel and motive power, eliminate circuitous routing, police the yards and terminals for the purpose of expediting delivery by the carriers and prompt release of equipment, encourage heavy loading and prevent the bunching of cars, use conservatism in treating demands for improved station facilities and reduction of grade crossings and other improvements which cost money and absorb labor and material, constantly remind the public that we are in a state of war and that normal service can not be expected, and be careful to find out if the carriers, their employees and agents are freely and unreservedly responding to the unusual demands for service which are brought on by the war.

"Your committee takes pleasure in announcing that the President in his proclamation honored our request that the

state commissions be recognized and shippers be given the right to sue railroads in local courts. The legal effect of that part of the proclamation is a moot question.

"I am sending to your office one copy of the administration bill introduced in Congress. Examine this carefully and decide if amendments are necessary to preserve the useful powers of the Interstate Commerce Commission to regulate interstate commerce and complete the valuation of railroad property, and secure the right of the states to regulate intrastate rates and service, and of the shipper to be heard upon questions affecting charges for transporting persons or property, and to sue railroad companies for damages to person or property, in local courts. Send your recommendations to your Congressional delegation and furnish me with a copy. It will also be well to have special attention given to the existing status of state commissions and the right of the director general to set aside state statutes or orders made by commissioners."

This bulletin expresses a commendable desire to co-operate, and if it displays a keen interest in the preservation of the constitutional rights of state commissions it may be well to recall that the President has not yet recommended any guarantee to state commissions.

Wages

Mr. McAdoo has already begun to hear from the classes of employees other than the members of the brotherhoods who want their wages increased. On January 9 S. E. Heberling, president of the Switchmen's Union of North America, which is a rival of the Brotherhood of Railroad Trainmen and the Order of Railway Conductors in its efforts to represent yard employees, called on Mr. McAdoo to discuss demands already presented to the roads which have contracts with the switchmen's organization. The organization of the maintenance of way employees has asked the United States Board of Mediation and Conciliation to call the attention of the director general to their interests. A movement has also been started among train dispatchers to bring their claims for increased wages before Mr. McAdoo. How great strength this movement represents has not been made clear, but copies of a petition have been circulated among the dispatchers of different roads with a request to them to sign it and forward it to the director general. The petition contains a review of the working conditions of dispatchers and asks for one day off per week, or in lieu thereof double time for Sundays and holidays; a monthly salary of \$235 for chief dispatchers, \$225 for assistant chief dispatchers, and \$215 for trick dispatchers, to be made effective as of January 1, 1918; also foreign line and Pullman transportation. The Order of Railway Telegraphers has been following its usual plan of presenting demands separately to individual railroads, but its president, H. B. Perham, has been in Washington recently.

Burleson Finds Mail Trains Late

Comes now A. S. Burleson, Postmaster General, to take a last crack at the "inefficiency" of the railway mail service while the cracking is still good, because hereafter cabinet courtesy, if not the well known admiration of the Postmaster General for government management, will probably preclude such statements as the one he has just issued in answer to many criticisms of delay in the mail service.

"During the month of November," says the Postmaster General, "mail trains failed to make scheduled connections 86,712 times. One of the important trains, carrying mail from Washington, Baltimore, Philadelphia and points west, failed 70 per cent of the time during the last four months; and the principal train between New York and Chicago failed 71 times in its Southwest connection during three months, and 57 times in its Northwest connection.

"Delay in the transmission of mail," says the Postmaster General, "is due to congestion of the railroad system. Re-

port, secondary operations of the railway mail service, the postoffice and city delivery show that the mail, though presented in greater volume than before in the history of the country, is being handled more expeditiously by the postal employe than in previous years. That there has been a delay in some of the services is a matter of public knowledge not disputed by the department."

The Postmaster General, however, unlike most people who have to explain delays or shortages these days, does not make any complaint on the score of increased expenses. He says:

"There is no indication of whereby more liberal, lawful expenditure of money in any branch of the service under the control of the department the delivery of mail could be facilitated. The Post Office Department is no more responsible for delay in the delivery of a letter than it is for the delay in the delivery of coal and sugar, and were additional sum expended much in excess of the surplus of the past ten years the mail could in no wise be expedited."

"Reports show that notwithstanding an increase of more than 25 per cent in first-class matter and approximately 40 per cent in parcel post there was a marked improvement in the service during 1917 as compared with that of other years."

"The reports of the holiday season show that the only point where congestion occurred in a post office was in Washington, and this congestion was due to failure by the railroads to furnish sufficient cars, the mail through this office having increased at least 10 times the normal amount by reason of the city being the gateway to army cantonments and mobilization camps."

The Postmaster General takes his critics to task on complaints that he has saved from \$5,000,000 to \$9,000,000 for the government, believing that this curtailment has injured the service. Mr. Burleson contends that the service has been bettered, not hindered, and challenges any one to show where "by the restoration of a system of prodigality of expenditure" the delivery of mail could have been made more prompt.

These are some of the things he says. Some of the things he does not say are that most of the \$5,000,000 to \$9,000,000 he has saved has been saved at the expense of the railroads, by reducing their pay for carrying the mails. "Poor pay, poor preacher." Either of the sums named would have bought a few mail cars.

The 25 to 40 per cent in raise in mail service finds no response in the bulletins on railway revenues published by the Interstate Commerce Commission. For the 10 months ending October 21, published in the commission's latest report, while total railway operating revenues per mile increased 11.8 per cent as compared with the corresponding period of 1916, and freight revenues increased 10.7 per cent, passenger revenue 15.1 per cent, and express revenues 12.5 per cent, the revenues received for transporting the mails show a decrease of 1.7 per cent.

Purchasing Departments Undisturbed

There is no apparent intention on the part of the government railway administration, for the present at least, to interfere with the functions of the railroad purchasing departments. Mr. McAdoo and his staff are concentrating most of their attention upon the immediate pressing problem of moving the freight and clearing up congestion and until he has fit to act the railroads will continue to purchase their own supplies in the usual way, just as they continue to operate their lines. The administration bill provides for an appropriation of \$50,000,000 to be used with any excess earnings above the guarantees, in the purchase of engines, rolling stock and other necessary equipment and for terminal improvements. Probably orders placed with this money would be expedited under the direct supervision of the government, but so far as road matters are concerned the railroad officers

will follow their usual course, as provided in the following paragraph from the President's proclamation:

"Said directors have authority to make and impose upon them no law and to make and impose no law which exceeds the limits of the laws, orders, decrees, orders and regulations of said system of transportation. They and except to the extent directed shall have full power to make by general or special orders and regulations, the business of said system, to accept, accept and conduct the same, and to make and impose upon them no law and to make and impose no law which exceeds the limits of the laws, orders, decrees, orders and regulations of said system of transportation."

(See also the bill for "protection" created. *Railroad Law*, *Railroads Under the New Power*, *The Railway*.)

Train Accidents in December

THE FOLLOWING TABLE SETS OUT THE INCREASE IN TRAIN ACCIDENTS THAT OCCURRED ON THE RAILWAYS OF THE UNITED STATES IN THE MONTH OF DECEMBER, 1917.

| Accidents | | Killed | | Injured | |
|-----------|--------|--------|-------|---------|-------|
| Date | State | Number | Train | Number | Train |
| 1 | Ala. | 1 | 1 | 1 | 1 |
| 2 | Ariz. | 1 | 1 | 1 | 1 |
| 3 | Calif. | 1 | 1 | 1 | 1 |

The trains in collision at Belling, Ark., on the first of the month, northbound passenger No. 1 and northbound freight No. 6580, the passenger running into the rear of the freight. The fireman of the passenger train was killed and the engineer injured. The collision was due to disregard of block signal by train No. 1, and the train in charge of No. 6580 are charged with neglect of the protection.

The trains in collision at Shippensburg, Pa., at 1:47 a. m., on the 6th were eastbound passenger No. 48 and a switching engine moving westward, pulling a freight train. Both trains were on the northbound track, the eastbound track having been closed by a derailment. Both locomotives were wrecked and their conductors were killed. A caboose next to the switching engine was burned up, together with the bodies of two trainmen who were in it, and were killed. The engineer of the passenger train was killed and the fireman was killed. One other employee was killed and two were injured.

The trains in collision near Waco, Ky., on the morning of the 11th, were eastbound passenger No. 1 and northbound freight No. 1744. The freight

had been brought to a stop and the passenger was running at low speed. There was a blinding snow storm at the time. One engineman and one fireman were injured.

The trains in collision near Weleetka, Okla., on the night of the eighth were through freight. Both locomotives were wrecked and three employees were killed.

The trains in collision at Dickson, Tenn., on the tenth were a through freight of the main line and a local freight of Centreville branch. Two employees were fatally injured.

The trains in collision at Cobleskill, N. Y., on the 16th were eastbound freight No. 864, running into the rear of No. 791. Two engines and 11 loaded cars were wrecked. The engineman on No. 864 was killed. Train 864 ran into the passing siding already occupied by the preceding train at excessive speed, and No. 791 was not properly protected.

The trains in collision at Shepherdsville, Ky., on the evening of the 20th were southbound passenger No. 41, a local train, and southbound passenger No. 7, a through express. The express ran into the rear of the local, wrecking the two rear cars and killing 45 passengers and two trainmen. About 40 passengers were injured. There appear to have been neither space-interval nor time-interval regulations, but the engineman of the express disregarded a train-order signal, the observance of which would have given him sufficient space within which to stop his train before striking No. 41. This collision was reported in our issues of December 28 (p. 1185), January 4 (p. 88) and January 11 (p. 137).

The trains in collision near New Haven, Conn., on the 22d were a northbound passenger and a switching engine, the collision occurring within yard limits. The fireman of the passenger train was killed and three other employees were injured. The baggage car was overturned.

The trains in collision at Ludlow, N. J., on the 23d were westbound through freights. One trainman was killed and two others were injured. The engineman of the second train fell asleep and awoke too late to stop before running into the other train. He had been on duty 6³⁴ hours.

The trains in collision at Keough, Me., on the 24th were an eastbound freight and a following locomotive without a train. The empty engine ran over a misplaced switch and into the rear of the freight, wrecking the caboose. The conductor and a trackman, in the caboose, were killed.

The trains in collision on the Baltimore & Ohio at North Vernon, Ind., on the 29th of December, were eastbound passenger No. 2 and westbound passenger No. 23, second section. Eight persons were killed; one passenger, the engineman, fireman and baggageman of the westbound train, and the engineman, fireman, baggageman and one brakeman of the eastbound. About 20 persons were injured. The eastbound train had run past distant and home automatic block signals set against it. This collision was reported in the *Railway Age* of January 4.

The train derailed at Edwardsville, Ill., on the 2d was westbound passenger No. 3. No serious injuries to persons were reported. The derailment was due to the failure of an arch bar of one truck of the tender. A broken part fell to the ground and tore out a frog.

The train derailed near Granger, Ill., on the 2nd was a westbound special passenger carrying soldiers returning from a two-day holiday at Chicago. Two of the 13 cars of the train were overturned, and 25 passengers and one employee were injured. The derailment was caused by the failure of a brake rod connection on one of the trucks of the tender which fell to the track and caught in a switch.

The train derailed near Corry, Pa., on the morning of the 3rd, at about 2 o'clock, was a southbound passenger. The engine was overturned and the engineman and fireman were fatally scalded. The derailment was caused by a defective brake rigging which fell to the ground and caught in a plank crossing.

The train derailed at Butts, Va., on the night of the 6th was southbound freight No. 63. The engine was derailed at a misplaced switch, and, with four cars, was overturned and wrecked. The fireman was killed and two other trainmen were injured. The switch had been tampered with.

The train derailed near Camp Shelby, Miss., on the 6th was a westbound passenger. The fireman and three passengers were injured, the fireman fatally. The cause of the derailment was not determined; supposed to be defective truck.

The train derailed on the Chesapeake & Ohio at Sharon, Ky., on the night of the 8th was eastbound passenger No. 24. Both of the two engines drawing the train were overturned and fell against the caboose of a freight train standing on a side track. One trainman in the caboose, and three other employees were killed, and three employees and one mail clerk were injured. The leading engine had been thrown off the track by ice at a street crossing about three miles back, and had run on the ties the whole distance to a switch, near the standing freight train, where the engines headed across the side track.

The train derailed near Tower, Minn., on the 17th was a local passenger. Three coaches fell down a bank and were overturned. Fifty-four passengers and 2 trainmen were injured.

The train derailed near Dale's Station, Utah, on the 21st, about 5 a. m., was a westbound freight. The train became uncontrollable on a steep descending grade and was thrown off the track at a curve. One trainman was killed and three others were injured, one of them fatally.

The train derailed near Valdosta, Ga., on the 24th was southbound passenger train No. 95. The locomotive and tender remained on the rails, the four coaches being derailed but not turning over. Three passengers and one porter were slightly bruised. The derailment was caused by a piped rail breaking under the train.

The train derailed near Roxbury, Conn., on the 25th was a southbound passenger. Twelve passengers were injured. The cause of the derailment was a broken rail.

The train derailed at Ludlow, Ky., on the 26th was a northbound freight. The train became uncontrollable on a steep descending grade near Erlanger, seven miles from Ludlow and ran at high speed to a switch in Ludlow yard, where the engine and 25 cars were ditched.

The train derailed near Security, Md., on the 30th was a westbound freight, No. 914. The train became uncontrollable on a steep descending grade near Edgemont and ran at a high speed to Security, about 10 miles. Several cars were thrown off the track at a curve near Cavetown.

The train involved in the accident near Derry, Pa., on the 3rd was eastbound passenger No. 32. While passing, at full speed, a freight train, standing on the adjacent main track, a freight car projected so as to foul the side of the passenger train, and many coach windows were broken. Twenty-six passengers and one employee were injured.

Electric Car Accidents.—Six serious accidents to electric cars were reported in the newspapers as occurring in the United States in the month of December; the worst one, a runaway at Pittsburgh, Pa., on the 24th, causing the death of 20 passengers and the injury of about four times as many. This accident was reported in our issue of December 28, page 1189. At Houston, Tex., on the 15th, a locomotive ran into a street car, killing three persons and injuring five. Other accidents—causing one death and a number of injuries each—occurred at Weehawken, N. J., on the 14th; Baltimore, Md., on the 19th; Fair Hope, Ohio, on the 26th, and Vandalia, N. Y., on the 26th.

Canada.—In a collision on the Canadian Pacific, near Tilsonburg, Ont., on the 17th, one employee was killed, and in another on the Grand Trunk at Stoney Creek, Ont., on the 18th, two were killed and three were injured.

How Will the Railroad Securities Be Affected?

Progress of the Country Can No Longer Be Counted Upon as a
Favorable Factor in Railroad Stock Values

ON THE THURSDAY MORNING after the announcement of the President in regard to the government operation of railways and guarantee of net income, there was a quite sharp rise on the New York Stock Exchange in the price of most of the so-called standard railroad stocks. By the following Saturday a reaction had set in in many railroad stock prices.

Of all the many things that are reflected in price changes

Closing Prices Dec. 26 to Jan. 11 of Missouri Pacific, Pittsburg & West Virginia, Pere Marquette, Western Maryland and St. Louis-San Francisco

on the stock exchange it is possible to distinguish two principal groups: one group has to do with nerves, the other with brains or judgment. The sudden upward trend of prices on Thursday and its continuation in some cases on Friday may be principally attributed to those causes in the group that has to do with nerves. It reflected the sudden cessation of nervous dread which had been cumulative in the past few days and weeks. The charts show the closing price of each of 20 railroad stocks on each stock exchange day from Wednesday, December 26, the day before the President's proclamation, to Friday, January 11. The course of prices, after the first sudden rise of Friday, may in general be said to reflect the judgment of the market, modified, of course, by specific supply and demand conditions.

After the relief due to the removal of uncertainties had worn off a little, one of the first things that struck an investor in railroad stocks when he studied the administration's bill was that whereas nearly all investment in stocks and the great bulk of investment in bonds has been predicated upon the assumption that gross business will steadily increase at an average annual rate of about 8 per cent, and that a considerable part of the increase in gross will go one way or the other to enhance the return on the investment or the equity behind it, now suddenly that whole attitude of mind has to be changed. Not only is there no hope for an increased return on the investment and no longer can progress and growth of the country be a factor to count upon, but even the best that we have done before is not taken as a standard for the future—it is averaged down by the inclusion of 1915.

There are only a few American railroad stocks that are

properly classed as investments, the difference being greater or less extent according to the speculative as to due to the conservative investor. To the speculative investor and to the stock of recently organized companies the administration's future plan is most important. The charts showing the prices of Missouri Pacific, Pittsburg & West Virginia, Pere Marquette, Western Maryland, and St. Louis-San Francisco show this in quite a striking way. These roads have all been through reorganization. All of them have had 100 shares written off, very considerable losses charged out to security holders, and the par value of the outstanding securities at least three out of five is much lower than the actual cash investment in the properties.

It is, of course, impossible accurately to figure out just what "other income," "fixed charge" and "rentals" will be

Closing Prices Dec. 26 to Jan. 11 of New York, New Haven & Hartford, Chicago, Rock Island & Pacific, Erie and Denver & Rio Grande

in the next two or three years, but based on the actual figures for the last year (either based on 1914 or 1915, whichever is available) it would appear that the Missouri Pacific road charges, rentals, etc., would be between one and two million dollars. The sum which the directors will have under the "standard return" plan will be \$14,445,111. There is here a little margin, but the reorganization plan was predicated on the assumption that the new stockholders who had paid

a heavy assessment would in the near future begin to receive some dividends; without the President's specific permission they cannot now receive dividends.

The Pittsburgh & West Virginia will receive only \$298,704 under the government guarantee, but its stockholders were former bondholders and the par value of the stock is less than the actual cash investment in the property.

to the government's guarantee, but even this will not leave them anything like an adequate margin.

Turning now to the railroads that have had fairly good

Closing Prices Dec. 26 to Jan. 11 of the Union Pacific, Norfolk & Western, Illinois Central and Atchafalaya, Topeka & Santa Fe

The Western Maryland will receive \$3,090,247; its fixed charges are between two and three million and its cumulative dividend requirements nearly \$1,200,000.

The Pere Marquette will receive \$3,750,963, while its fixed charges are over one and a half million and its cumulative dividend requirements nearly \$1,200,000.

The St. Louis-San Francisco will receive \$13,453,378, while its fixed charges are over fourteen million dollars.

All of these roads will have some "other income" to add

Closing Prices Dec. 26 to Jan. 11 of the Chesapeake & Ohio and the Chicago, Milwaukee & St. Paul

earnings in the past three years, but about which there had been considerable doubt and uncertainty. In this class are the Chicago, Milwaukee & St. Paul, New York Central, New York, New Haven & Hartford, and Chicago, Rock Island &

Closing Prices Dec. 26 to Jan. 11 of Reading and Canadian Pacific

Pacific. At first thought it would seem that the government's plan would be of great market value to these companies' stocks. The stocks had been selling down and down because of the fear that the future would not be as good to them as

the past had been. Now they are to be guaranteed on the basis of the past. It is quite evident from the charts that the stock markets took this point of view, at least on Thursday. But further consideration proved to be not so optimistic, especially in the case of the Rock Island and the New Haven.

Closing Prices Dec. 26 to Jan. 11 of New York Central

The Rock Island will receive \$15,074,252; its fixed charges, after deducting other income, will be apparently nearly \$14,000,000.

The Chicago, Milwaukee & St. Paul will receive \$27,848,808 and its fixed charges, after deducting other in-

Closing Prices Dec. 26 to Jan. 11 of Delaware & Hudson and Pennsylvania

come will be between fourteen and fifteen million dollars, leaving between twelve and thirteen million dollars for dividends and surplus, while 7 per cent on the preferred and 4 on the common will call for nearly \$13,000,000.

The New York Central is in a quite different situation. It will receive \$55,972,807, with net fixed charges, etc., amount-

ing to a little over one hundred and a half millions, leaving in the neighborhood of thirty-eight millions dollars, with dividend requirements at the present rate of double less than twelve and a half million dollars.

The Chicago & Ohio presents an interesting and complicated case. It will receive \$17,420,000 and will have left, after paying fixed charges, etc., something over five million dollars. It has only recently resumed paying dividends and without special permission could not supposedly increase the 3 per cent rate left the market took a decidedly favorable view of it.

The Delaware & Hudson stands in a class by itself. It will receive \$7,729,294 and will have left, after deducting increased income from the new heating department, nearly \$4,000,000, while it is one cent dividend requirements call for a little over \$3,800,000. The Delaware & Hudson had the largest rise in price on any of the charts. The fact was, however, that the stock was selling at considerable discount price due to a per cent and long drawn out road case in the stock market accompanied by rumors without any foundation in fact.

Turning now to what may be properly considered high class investment stocks. We have the Union Pacific, which will receive \$38,267,000 with net charges of \$1,000,000 and dividend requirements of 8 per cent on the common and 4 on the preferred, or a little over \$17,000,000, leaving a surplus of nearly fifteen million.

The Norfolk & Western will receive \$9,918,800 and have left over \$19,000,000, with dividend requirements of about \$8,000,000.

The Illinois Central will receive \$16,549,000 and have left between eleven and twelve million dollars with dividend requirements of about \$6,500,000.

The Atchafalaya & Santa Fe will receive \$4,000,000 and have left over \$3,000,000, with dividend requirements of only a little over \$1,000,000.

The stocks of these roads had a large rise and fairly well maintained their new levels but apparently there is uncertainty as to just how the surplus above the "standard return" not required for dividends will be dealt with. If Congress and the Interstate Commerce Commission merely live up to the commission's theories of the distribution of surplus capital expenditures and expenses this surplus can be invested as new capital and the standard return will be increased by an amount equal to interest thereon. If this interpretation is placed on the law there will be certainly a chance for roads like the Santa Fe, Norfolk & Western and Illinois Central to appreciate in value and for a steadily increasing equity back of the stocks. The same is true of the Pennsylvania, although, because of the consolidation of the Pennsylvania Company with the lines east, an accurate forecast cannot be made of how great the surplus would be above the standard return.

Canadian Pacific, which was not affected by the President's proclamation, except through its ownership of Soo stock, had as great a rise as many stocks that were directly affected. The explanation of this is probably a technical one. J. P. Morgan & Co. have presumably been liquidating a heavy sale of securities which included a very large block of Canadian Pacific in anticipation of paying off a British loan with matures at about this time. There had therefore been heavy selling pressure on Canadian Pacific and when this pressure ceased as it did before December 26, an excess rally was needed for a considerable rise.

It would appear that if the government passes and interprets the new law so as to make it less of a hardship on the new incorporated roads and plays fairly and squarely with roads like the Santa Fe and Illinois Central, there is a real chance that standard American railroad stocks will again become acceptable investments for the first time in more than a decade.

Tests of Manganese Steel Rails

THE SERVICE which has been secured from manganese steel rails on seven railroads is given in a report prepared by M. H. Wickhorst, engineer of tests of the rail committee of the American Railway Engineering Association, Chicago, and published in bulletin No. 199 of that association. These seven roads submitted reports to the committee giving in considerable detail the curvature and grades and the approximate density of traffic to which the test rails were subjected. Two of the seven reports submitted to the committee are abstracted below with the conclusions based on the seven reports.

Tests on Lackawanna

In the fall of 1912, 500 tons of 101-lb. rolled manganese rail was secured, for use on some of the sharp curves of the eastbound track of the Delaware, Lackawanna & Western on a $1\frac{1}{2}$ per cent grade down the Pocono mountain. After the manganese rail had been in service for about two years, the low rail on some of the sharpest curves showed signs of flowing. This flowing was not by the formation of a lip, as is usually the case with Bessemer or open-hearth rail, but the head of the low rail dished slightly and the entire head seemed to move both ways from the center. With a view of getting the full life out of this rail, we decided to remove the low rail from the curves in question and lay it on the high side of other curves, laying frictionless rail on the low side.

For convenient study, the results of the several tests showing the abrasion of the high rail per million tons of traffic are given below:

| HIGH RAILS | | | Sq. in. abrasion per million tons |
|------------|-------------------------|-------|--------------------------------------|
| Curve | Kind | | |
| 6° | Beth. O. H. | | .0230 |
| 6° | Lack. Bess. F. T. | | .0283 |
| 6° | Lack. O. H. Spec. Prem. | | .0274 |
| 6° | Beth. O. H. Spec. Prem. | | .0260 |
| 6° | Ill. Manganese | | .0035 |
| 6° | Ill. Manganese | | .0035 |
| 6° | Lack. O. H. Spec. Prem. | | .0034 |
| 6° | Ill. Manganese | | .0222 |
| 7° | Lack. Bess. | | .0718 |
| 7° | Lack. O. H. | | .0583 |
| 7° | Passaic Manganese | | .0115 |
| 7° | Beth. O. H. | | .0275 |

Tests on Pennsylvania

In April, 1912, about 41 tons (0.27 track miles) of 100-lb. P. S. Manard rails were laid in the eastward freight track on the Horseshoe curve, and open-hearth rail was laid simultaneously, adjoining it, for comparison. The Manard rail cost \$94 per ton. In September, 1912, the open-hearth was replaced with new open-hearth, this latter rail remaining in track until January 7, 1913. The open-hearth rail was again renewed on June 20, 1913, and both open-hearth and Manard were removed October 15, 1913, the life of the Manard being $17\frac{1}{2}$ months, or four times that of the open-hearth.

The figures below give the average abrasion of each kind of rail:

| Date of measurement | Manard | | Open-Hearth | |
|---------------------|---------------|--------------------------|---------------|--------------------------|
| | Square inches | Per cent of head abraded | Square inches | Per cent of head abraded |
| October, 1912..... | 0.08 | 1.9 | 0.52 | 12.4 |
| February, 1913..... | 0.47 | 11.2 | 1.25 | 29.8 |
| June, 1913..... | 0.63 | 15.0 | 2.11 | 50.1 |
| October, 1913..... | 0.81 | 19.2 | 3.11 | 74.0 |

There were three failures of the Manard rail out of a total of 84 rails laid, two consisting of transverse fractures through the head and about two-thirds of the web and one by split head.

On January 26, 1914, about 0.27 track miles of Manard rail was laid in the eastward freight track on the Horseshoe curve in comparison with ordinary open-hearth rail. It was removed November 9, 1915, the abrasion being as follows:

| | Abrasion | Manard | Open-Hearth |
|--------------------------------------|----------|--------|-------------|
| Total area sq. in. | | 0.74 | 4.13 |
| Per year of service..... | | 0.42 | 2.35 |
| Per ten million tons of traffic..... | | 0.07 | 0.41 |

On the Middle division, in 1914, 0.40 track miles of Manard rail was laid, as follows:

| Date | Miles | Track | Location | Curve |
|---------|-------|-------------------|--------------------|-------|
| Jan. 14 | 0.16 | Ewd. Pass. | W. of Barree | 6° |
| Jan. 26 | 0.19 | Ewd. Pass. & Frt. | E. of Tyrone Forge | 6° |
| May 1 | 0.05 | Ewd. Pass. & Frt. | W. of Shoenberger | 6° |

This rail is still in track and the stretches west of Barree and east of Tyrone Forge now show wear as follows:

| Location | Deg. of curve | Per cent of head abraded | Service to date | Life of ordinary rail |
|--------------------|---------------|--------------------------|-----------------|-----------------------|
| Barree | 6° | 8.44 | 33 mo. | 14 mo. |
| Tyrone Forge | 6° | 10.39 | 33 mo. | 18 mo. |

Of the 0.94 track miles of Manard rail in track there have been 40 failures, of which 28 were transverse fractures through the head and a portion of the web, 6 were split head and 6 split web. In no case was the rail broken through. Forty failures in 0.94 track miles in average life of $3\frac{1}{2}$ years amounts to 1,216 failures per year per 100 miles of track, as compared with an average of 27 failures for all rail on the Pennsylvania on the same basis.

A comparison of failures per 100 track miles of Manard rail with those of ordinary open-hearth, 1913 100-lb. P. S. rails shows the following:

| | Failures per 100 track miles | | | | Position in ingot | | | |
|---------------------|------------------------------|-----|------|--------|-------------------|------|-----|--------|
| | Head | Web | Base | Broken | A | P | L/3 | *Total |
| Manard | 639 | 639 | .. | 2977 | 2127 | 1488 | 74 | 4255 |
| Ordinary O. H. | 31 | 27 | 2 | 28 | 23 | 16 | 12 | 88 |

*Failures in lower positions divided by 3 to show approximate number in each position.

The annual cost per ton of open-hearth rail at \$30, lasting one year, is \$28, and Manard at \$94, lasting four years, is \$27. It would therefore be economical to use Manard rail on sharp curves under heavy traffic where ordinary open-hearth rail lasts one year or less, but not elsewhere. In this comparison failures are not taken into account. If they are considered, the cost of the Manard rail per ton per year would be increased about \$3, and with such a failure rate it would be economical only at locations where ordinary open-hearth wears out in 8 months.

Conclusions

The following are probably the conclusions that may be drawn from the various tests:

1. Manganese steel rails abrade much slower than Bessemer or open-hearth steel rails on sharp curves. On curves of 8 or 9 deg. the abrasion of the high rail per million tons of traffic, may be taken very roughly as follows: Manganese, 0.004 sq. in.; open-hearth, 0.012 sq. in.; Bessemer, 0.20 sq. in. In other words, the abrasion of open-hearth rails is about three times that of the manganese rails, and the abrasion of the Bessemer rails is about five times. The results, however, vary considerably and are probably dependent upon the nature of the rolling equipment as well as the tonnage. We also have no information as to relation between the abrasion and degree of curvature.

2. Manganese steel rails become distorted by spreading and drooping of the head more easily than open-hearth rails, and apparently, also, than Bessemer rails, explained presumably by the low elastic limit of manganese steel.

3. The failures or breakages of manganese rail were extremely high and seemed to consist mostly of transverse cracks in the head, starting from the surface, resulting finally in pieces of the head breaking out. The manufacturers explain these failures as due to faulty manipulation in the early manufacture of manganese rails, which has since been remedied. Immediately after rolling, while still very hot, it is necessary to quench the rails in water, which operation was not at first handled in an entirely satisfactory manner.

Methods of Loading Lumber in Open Top Cars

Failure to Prevent Shifting of Lading Results in a
Serious Waste of Equipment and Labor

THE UNPRECEDENTED MEASURES restricting the use of open cars which have been taken by Judge Lovett, director of priority, show the importance of securing the maximum service from this class of equipment. The tonnage of coal that will have to be moved this winter will break all records and the demand for cars will be greater than

some coast cities have shipped in long strings of cars continuously between the falling and had more than all are kept year-round. If this shipping no electric power may be placed connecting between each layer of different lengths. These cars were found in effect for many years. The equipment which have been made from time to time have been of a better character.

It will be noted that the roller mounting the loading of lumber in open cars are loaded on two assemblies that friction will be sufficient to prevent lateral shifting of the load. The selection of heavy or medium power and the treatment in the length of train in road cars has increased the average

Good Judgment or Good Luck in Making Up the Train

the supply. Gondola cars will, therefore, be urgently needed for carrying coal. On the back haul to the coal mining regions gondolas are used for many commodities, one of the most important being lumber. It is the purpose of this article to show how greater service can be secured from open

Damaged Equipment Contributes to the High Cost of Transporting Lumber

The Transfer Track Is a Busy Place

cars by better methods of loading lumber, when transported in that class of equipment.

The loading rules of the M. C. B. Association, in brief, provide that lumber loaded in open top cars must not extend beyond the end sill of the car unless protected by an idler, nor within 6 in. of the brake wheel. If the load extends above the side of the car, stakes must be provided to hold the lading at the side. The number and size of the stakes depend on the height of the car side, the height of the load, the number of piles making up the load and the method of loading. The tops of opposite stakes must be fastened together with boards or with wire. Lumber of equal thick-

ness must either be loaded in long strings joined continuously between the falling and had more than all are kept year-round. If this shipping no electric power may be placed connecting between each layer of different lengths. These cars were found in effect for many years. The equipment which have been made from time to time have been of a better character.

A Load That Will Probably Check Short at Its Destination

ness of the lumber which has not been so taken out of the train and the roller mounted to combine with the loading rules (which is provided in the association). The loading of lumber should be done in long strings of large and small sections in this manner and the use of lumber in a cross-section of the train. Some of the trouble encountered in such

ing lumber in open top cars can be gained by examining the illustrations which accompany this article. All the photographs of shifted loads which are shown were taken at one yard in a single week.

The Illinois Central a short time ago conducted a special investigation in order to determine the loss of service from cars due to the reshaping of loads which had shifted in transit. During a period of three months this road handled 7,926 cars loaded with dressed lumber. The total car days' delay on these shipments amounted to 17,778, an average

dressed, which causes trouble by shifting. Open cars are used to handle probably 25 per cent of the dressed lumber shipped, or 26,000,000 tons. Assuming an average load of 50 tons per car this amounts to 520,000 carloads. As each shipment would require under normal conditions about 18 days from origin to destination, the average number of open cars used in the lumber traffic is 25,600. If an average saving of two days per trip could be secured by bulkheading the cars the number required to handle the traffic could be reduced to 22,800, thus effecting a saving of 2,800 cars.

In addition to the saving in equipment there would be fur-

Bulkheads on Lumber Cars Keep the Load Where It Belongs

of 2.24 days per car. Had it been possible for the Illinois Central to avoid the delays to cars loaded with dressed lumber during the three months referred to above, the road would have had 194 more cars available for service. It is estimated that it would have secured increased revenues amounting to about \$85,000. In addition to this there would have been a considerable saving due to the elimination of the expense of switching cars and adjusting loads, and claims for damage to lading. The cost of switching was probably about 50 cents a car and the cost of reshaping the load considerably greater. In the month of May alone the cost of transferring and reshaping loads of lumber at Memphis amounted to

Type of Bulkhead Used on the Illinois Central

ther economies due to the reduction of charges for switching and reshaping of loads and also to the elimination of claims for damage to lading.

While the Illinois Central was investigating the delays due to the shifting of loads, a special messenger accompanied one shipment of 50 cars of lumber from a single company.

Shifting Is Not Confined to the Smaller Sizes of Lumber

\$39,308. Probably one half of this expense was chargeable to loads on open cars.

While accurate data concerning the amount of dressed lumber shipped in open cars on the railroads of this country are not available, an estimate of the saving of cars that would be effected if the practice of bulkheading was generally adopted will show the importance of the subject. The total lumber traffic of the country in the year 1917 was probably about 160,000,000 tons. Of this amount about 65 per cent or 104,000,000 tons consisted of lumber wholly or partly

Of these 50 cars 22 were delayed three or four days on account of the necessity of reshaping the load. The railroad had experimented with bulkheads placed in the ends of the cars to keep the lumber in place and had found the results of this practice very satisfactory. It was so evident in this case that the delay was due to improper loading that the company from which the shipment in question was received was persuaded to bulkhead their cars. They have continued to follow this practice and delivery of shipments from this company are now made without the delay formerly experi-

enced. Trains of 50 or have been brought to their destination without having a single car removed or undetracked for reshaping.

The method of bulkheading which has been in use on the Illinois Central for loads on gondolas or flat cars is shown in the illustration. The end is made up of three upright posts 4 in. by 4 in., to which are fastened 2 in. by 1 in. boards. The corner post is fastened to the third side post by diagonal strips of 1 in. by 6 in. lumber and similar bracing connects the tops of the posts. In case the bulkhead is used on flat cars, a 4 in. by 4 in. timber is placed crosswise at the end of the car to hold the lower end of the posts in place.

That shippers are willing to co-operate with the railroads in this matter of bulkheading cars is shown by the fact that one large producer of lumber has adopted the practice while the Southern Pine Association has urged its members to consider the advisability of bulkheading their shipments. The

value and if additional damage is reported the allowance provided in the tariff should be increased.

It seems probable that both the shipping and the railroad would benefit by the adoption of the practice of bulkheading open cars loaded with lumber. The saving that would be effected over under-packed conditions would justify the expense. At the present time the expense of damage and cost of insurance is a pressing and important factor in making any effective statement of the cost of shipping.

Tests of Slag Concrete

A series of tests for the purpose of comparing slag (blast-furnace) and stone in the concrete aggregate for concrete in contact with sea water has been made by the Pennsylvania Testing Laboratory, Philadelphia, Pa. It being the intention to construct

Typical Examples of Shifted Loads

main obstacle to the adoption of the practice is the fact that the shippers object to using so much lumber to secure the load unless the roads make a corresponding increase in the damage allowance. The present rules of the three principal freight classifications provide that an allowance not to exceed 500 lb. will be made for temporary stakes, dunnage or supports when required to protect and make secure for shipment

the tests over a period of five years. All the tests made up to the end of the first six months have now been made public and while these are by no means conclusive, they indicate the trend of the results.

The tests were undertaken to secure information relative to (1) a comparison of the crushing strengths of air-cured blast-furnace slag, crushed stone and gravel when used as

Loads of Lumber Going Out "Over the Top"

property on flat or gondola cars upon which carload rates are applied. It has been urged by the shippers that the practice of bulkheading be made mandatory and the dunnage allowance increased to 1,000 or 1,500 lb. The carriers claim that the lumber used in bulkheading has some commercial value and that the shippers should be able to sell it to the consignee. The shippers on the other hand contend that the lumber used for securing loads has no market

value and if additional damage is reported the allowance provided in the tariff should be increased. (2) Determination of the compressive strength of the material as secured, together with other physical characteristics. (3) A determination of the corrosive tendency of sulphur in slag. (4) The effect of sulphur and other elements on the durability of concrete up to the age of five years. (5) The relative strength and durability of

concrete made of high magnesia low lime slag and low magnesia high lime slag.

The cement used in the tests is Alpha portland, from Manheim, West Va., selected by lot from a list of several standard brands. The fine aggregate is sand from the Ohio river, while the coarse aggregates cover nine varieties of slag gathered from plants in various parts of the country, two kinds of gravel, two kinds of limestone, a trap rock and a crushed granite.

The proportions were determined by establishing the leanest mixture which would produce a dense concrete when using the coarse aggregate having the highest percentage of voids, and then using this mixture for all the materials. This led to the use of proportions of one part cement, two parts sand and four parts of the coarse aggregate.

The specimens were made in steel molds to produce cylinders 8 in. in diameter by 16 in. high. A quantity of material sufficient to make 10 cylinders was mixed at one time. Water was added as needed until a "quaking consistency" was obtained, so that the same consistency was secured in each case, regardless of the amount of water used. For this reason, it was not possible to use a mechanical mixer. The specimens were kept in the molds for 48 hrs. and were then stored in damp sand for 35 days. At the end of this time, all specimens were removed and stored in air. Four short pieces of reinforcing steel were embedded in each of two cylinders from every batch for the determination of corrosive tendencies. The results of the compression tests on the cylinders at the ages of 14 days, 30 days, 60 days and 180 days are shown in the table.

RESULTS OF COMPRESSION TESTS ON 8-IN. BY 16-IN. CYLINDERS.

| Character of Coarse Aggregate Used. | Compressive Strength in Pounds Per Square Inch. | | | |
|-------------------------------------|---|----------|----------|-----------|
| | 14 days. | 30 days. | 60 days. | 180 days. |
| Gravel | 2093 | 1792 | 1921 | 2608 |
| Lime Stone | 1840 | 1720 | 1758 | 2442 |
| Trap Rock | 2109 | 2026 | 2063 | 2454 |
| Granite | 2208 | 1980 | 2122 | 2334 |
| Slag No. 1 | 2594 | 2380 | 2484 | 3127 |
| Slag No. 2 | 1998 | 1897 | 1941 | 2770 |

Note.—The tests for each age covered the same number of specimens. For each age there were six gravel cylinders, six of lime stone, three of trap rock, three of granite, three of slag No. 1 and three of slag No. 2. Nine varieties of slag were used, of which slag No. 1 gave the greatest strength and slag No. 2 the lowest.

Average Net Operating Income for Years 1915, 1916 and 1917

THE ACCOMPANYING TABLES, showing the net operating income and property investment of railroads operating 86 per cent of the railroad mileage of the country, for the years 1915, 1916 and 1917, were introduced in evidence before the Senate Committee on Interstate Commerce last week by Frank Trumbull, chairman of the Railway Executives' Advisory Committee, and are here reproduced for the purpose of showing the amount and percentage of the guarantee proposed to be paid to the roads by the government while the properties are under its control during the war.

The average net operating income for the three years is proposed as the "standard return" to be used as the basis for agreements to be made by the roads with the President. For special cases where an agreement cannot be reached on this basis the bill now pending in Congress provides a method of adjudication by a board of auditors to be appointed by the Interstate Commerce Commission or by the Court of Claims. The net operating income as stated in the tables is computed as that term is used in the Interstate Commerce

SOUTHERN DISTRICT

NET OPERATING INCOME AND RATE OF RETURN ON INVESTMENT FOR THE YEARS ENDING JUNE 30, 1915, 1916 AND 1917; ALSO THREE-YEAR AVERAGE (Net Operating Income = Operating Revenues Less Operating Expenses, Taxes and Net Balances of Equipment, Joint Facilities and Miscellaneous Rents)

| Road | Mileage | | | | Net Operating Income June 30, | | | | Property Investment as of June 30, | | | | Rate of Return - Per Cent | | | | Road |

(Net Operating Income) Operating Revenues Less Operating Expenses, Taxes and Net Income of Equipment for 1915, 1916 and 1917, At Terminal and Rapid River, in Statement for the Year Ended June 30, 1915, 1916 and 1917, At Terminal and Rapid River

Abstract

cessful operation of the railways during the war is to give praise where it is not due. But in any case the present control cannot be continued indefinitely. The Act of 1871 sanctions it only when "emergency has arisen," and the Secretary of State's warrant for possession has to be renewed every week. Nor, fortunately, can the railways pass into the possession of the state without the sanction of Parliament. Many hold the mistaken view that the Gladstone Act of 1844 gives the Government power to take over the railways. All that that act sanctioned was the purchase of any railway thereafter authorized. Railways made or authorized prior to that session were excluded, and whilst the terms of purchase were laid down in the act they were only definite in the case of those companies whose "clear annual profits divisible upon the subscribed and paid-up capital stock of the said railway, upon the average of the three then last preceding years, shall equal or exceed the rate of ten pounds for every hundred pounds of such paid-up capital stock." Those companies which have paid less than 10 per cent—which means all of them—may take their claim to arbitration. Finally, it is distinctly laid down in section 4 of the act that Parliament must again consider this question, as the necessary funds must first be provided. On the abstract principle of government ownership, there has been no change in public opinion; on the contrary, the high authorities who inquired quite recently into the future of the Canadian railways, said "Our personal belief is strong that, in normal circumstances, railway enterprise is a matter best left in private hands, subject to proper regulation by the Government. Were we asked to advise in the case of the railways of the United Kingdom or the United States, which have been constructed by private companies, with money found by private investors, we should give effect to this belief." It must not be forgotten also that practically every witness in any way associated with commerce who appeared before the Royal Commission of 1913-14, presided over by Lord Loreburn, which inquired into the relations between the railways and the state, was emphatically opposed to the state ownership of railways.

Where the idea has gained ground is in the labor party and, without doubting the sincerity of that party's opinions, it is fair to assume that the success which has attained its applications for increased pay has suggested that, with the state instead of private companies to deal with, the condition of labor would be better. The Railway Review—the organ of the National Union of Railwaymen—said in its issue of November 16: "If it is not intended to work the British railway system in the future as a single entity in the possession of the state, it will be the business of the National Union of Railwaymen to declare that railway workers object to the railways and railway owners returning to the pre-war status. A return to pre-war conditions of railway control and management will not be to the advantage of railway workers and will be detrimental to the national welfare."

Unfortunately, it is no longer a question as to whether or not the country would be the better by state ownership. The war has brought other conditions to bear on the subject, and it is now the question whether the companies could revert to their former conditions. A few brief remarks will soon put our readers in a position to judge as to this possibility. The main point to remember is that in the year 1913 the railway companies had a net income, including the balance brought forward and a small appropriation—£28,000—from reserve, of £53,268,000. After paying the interest on loans and debenture stock, miscellaneous other first charges and appropriations to reserve, there were paid £17,239,000 in interest on guaranteed and preference stocks and £17,705,000 on ordinary stock, leaving £1,159,000 to be carried forward. As roughly two millions of this sum belonged to the Irish railways which, in this matter, are outside the question, it may be taken that the divisible

profits of British railways, under pre-war conditions, were thirty-five million pounds.

If, and when, the railways revert to private ownership, one question to consider—if not already disposed of—is the payment of the increase in wages. In August last it was stated that this increase cost twenty-five millions a year. The five shillings a week since granted to the enginemmen by the Committee on Production, and the same amount given by the government to the other men, will bring it up to thirty-three millions, a sum which, alone, would swallow up all the profits. But that is not all. There is the higher cost of material. How much it will be we cannot even estimate, but allowing for an increase of 5s. per ton in coal alone, three-and-a-half million pounds a year would be required to meet the increase. Again, to cope with the increased trade that may reasonably be hoped for, considerable capital expenditure will be necessary. If the credit of the railways be impaired, where is the high rate of interest—supposing the money could be borrowed—to come from?

It is very easy to talk about raising the rates and fares to meet the increased expenditure. To raise fares would, considering the services rendered, be quite justifiable, and would appear to be called for. But to raise rates is to cripple trade, which has other burdens sufficiently heavy to bear. British railway rates are, on the whole, higher than those elsewhere. The necessarily short haul and the numerous companies—each of whom is entitled, in the case of traffic passing over its line, to charge as though the traffic initiated on its line—are partly responsible for this fact, but the main reason is the senseless competition of former, but yet comparatively recent, days. No increase in the existing rates could be obtained without a struggle. Some rates could be raised to the maximum, but even they would certainly be challenged before the Railway and Canal Commission. The government might promise legislation, as at the railway strike of 1911, for an all-round advance, but the experience gained on that occasion would prevent such a step being taken. When it is remembered that the bill sanctioning what is now known as the 4 per cent increase, was determinedly opposed by the government's own supporters, and that it was only secured by Mr. Asquith saying that the government could not go back on its word, it is safe to say that the chances of the railways passing into the hands of the state is more likely than an increase in rates.

The whole problem is amongst the most difficult conceivable, and it is further complicated by the possible addition to the thirty-three million pounds for wages by another large sum as a consequence of the demand for an eight-hour day. It must not be assumed that because this demand was much in evidence in August, that it relates to enginemmen alone; the National Union wants eight hours for its 350,000 or so members. Then there are the questions of arrears of maintenance and renewal of track, locomotives, rolling stock, etc.; the rehabilitation of the workshops to their normal condition for railway work; the return or replacement of locomotives, wagons and track sent overseas; the re-employment of railway servants who have been crippled; the reopening of stations and branch lines now temporarily closed, which, although not earning a profit, could not be kept shut without laying the railway company open to a charge of withdrawing facilities; the future of privately owned wagons, etc. The government has, therefore, done wisely in calling in the aid of authorities in the different spheres to advise them on these problems. These gentlemen, as we understand Sir Albert Stanley's answer in the House on the 14th inst., do not constitute a formal committee. The different aspects of the whole question are each to be considered by the two or three experts on that particular subject. The result of their labors is, Sir Albert added, to come before the House before any final arrangements are made.

Senate and House Committee Railroad Hearings

Roads Ask Standard Rate of Return Computed on Basis of Property When Taken. Want Time Limit

WASHINGTON, D. C.

BOTH THE HOUSE AND SENATE committees on Interstate Commerce devoted all of last week and part of this week to hearings on the administration bill prescribing the conditions governing the government's control of the railroads during the war.

A majority of the members of both committees who indicated their attitude by their questions evinced a desire to treat the roads fairly. Many of them, however, showed a reluctance to accept the reasoning of the railroad witnesses that the compensation should be based on the year 1917, or the average of 1917 and 1916, as representing the earning capacity of the roads at the time they were taken, rather than the average of the three years 1915, 1916 and 1917, which is reduced by the inclusion of such an unfavorable year as 1915. Many of the committee members seemed inclined to feel that 1916 and 1917 were abnormally good years, at least sufficiently so to offset one lean year, and that the three-year average represented both the ups and downs of the fortunes of war.

Senator Cummins, in his usual suave manner, appeared the most hostile to the plan proposed by the President and asked most of his questions for the purpose of trying to tear down the arguments made by the witnesses. He was clearly opposed to guaranteeing the average net operating income and indicated a preference for what he might consider a "reasonable" return on a "fair" valuation of the property, or on the market value of the securities. While the railroad men stated the net operating income in comparison with the property investment, he insisted on having it compared with the capitalization and even made some efforts to drag in an inference from the tentative valuations made by the Bureau of Valuation of the properties of six small roads.

Many of both senators and representatives appeared to agree with the contention of the railroads that Section 13 of the bill should be amended to provide a definite time limit for the continuation of government control after the war instead of leaving it in effect until Congress shall order otherwise.

The railroad witnesses had pointed out that the property investment at the time of the taking over of the roads was about \$240,000,000 greater than on June 30, 1917, and much greater than that of the plant which had produced the three-year average of net operating income. They also expressed the opinion that most roads would be able to reach a speedy agreement on whatever basis is selected, and that only a comparatively few roads in special circumstances would have to take their claims to court. Whenever the proposed guarantee was suggested as a possible basis of compensation in the event of government ownership, however, they promptly insisted that what might be considered a fair rental basis in war time would not be a satisfactory measure of the purchase price.

Commissioner Anderson Before Senate Committee

The Senate committee heard railroad witnesses first. The opening testimony of Julius Kruttschnitt, chairman of the Southern Pacific, was reported last week. The House committee began by hearing George W. Anderson, of the Interstate Commerce Commission, who was the principal author of the bill, and who explained in detail the purpose of its various provisions. On Friday, Mr. Anderson repeated his testimony before the Senate committee and Mr. Kruttschnitt and Alfred P. Thern, counsel for the Railway Executives'

Advisory Committee, transferred their testimony to the House committee.

Mr. Anderson said that the average net operating income of the three years ending June 30, 1917, had been selected as representing a fair and practical basis of compensation for the majority of the roads, taking everything into consideration, and that a method had been provided for negotiating special cases. He said the average of a five-year period had been considered and discarded because it was regarded as being too low to give a fair return on the fair market value of the securities. He had considered the plan of tying compensation on the market value of the securities, but found that it led into a blind alley and dropped it.

Asked by a representative if the plan proposed would not lead to a rise in the market quotations of bonds, Mr. Anderson said he certainly hoped so. When he qualified as a member of the Interstate Commerce Commission recently he had been obliged to dispose of his holdings of railroad securities, and had taken a loss of about 30 per cent, and he thought something ought to be done to put the market price somewhere near the real worth of the securities. Estimating from the actual figures of Class 1 roads, Mr. Anderson placed the three-year average of net railway operating income at \$935,000,000 for all carriers, including switching and terminal companies, and excluding the Pullman company, express companies and private car lines. This is 5.31 per cent on an average investment of \$16,873,832,797. The percentage for the three years he gave as 4.14 for 1915, 5.84 for 1916 and 5.91 for 1917. The property investment for 1917 was estimated at \$17,250,000,000. From the \$935,000,000 estimated guarantee, he said, would be deducted the war taxes, estimated by the railroads as between \$50,000,000 and \$90,000,000, because it was felt that the railroad security owners should bear their share of the war taxes instead of charging them to expenses. He opposed placing any definite time limit on the period of government control, saying that a period of readjustment would be necessary, that Congress could not bind future Congresses, and that although he was not an advocate of government ownership, certainly the former status could never be re-established.

Asked by members of the committee whether he considered the book value a fair measure of the cost of railroad property, he said that it must be treated with caution, but could be used safely for purposes of comparison. For some roads it probably represented an understatement and for others an overstatement of the actual cost.

He referred to the proposed guarantee as a rental which must be paid on the basis of the actual earnings in spite of the lack of uniformity in between different roads, but said he proposed to submit an amendment to prevent paying a premium to a road that has increased its net earnings by selling its property by installment liquidation and depreciation allowances and by preventing a road that has made a large investment. He also said that the bill was intended to provide for a reasonable reserve, and it is impossible to fix the property investment as a road security.

Several senators agreed vigorously with Mr. Anderson on the question raised by Senator L.

"The government could not, in the wake of the justice which it makes the contract," Senator Kellie declared, "but Mr. Anderson could not agree with him."

If we think that that we must give them some way to be able to make it right now and put it in the bill," said

Senator Underwood. "If we don't, we should set a definite period. Some of these railroads will have their compensation fixed in the courts and if a court construes the taking as for an indefinite period it may fix the compensation on that basis."

Mr. Anderson asked if he thought a court would fix a higher rate of compensation in one case than in the other. "As Section 13 is drawn now," replied Senator Underwood, "it is an absolutely indefinite taking of property and a railroad could enter suit for the value of its property, and the court would probably fix the compensation on that basis, but if a definite period were specified the court would probably hold that the rental value would be just compensation."

Both Senator Underwood and Senator Townsend contended that the provision "until Congress shall thereafter order otherwise" in Section 13 means nothing more than is implied in every bill and leaves the period of government control entirely indefinite.

"The purpose of this plan is to get better railroad service, is it not?" asked Senator Watson.

"That and to stabilize market conditions," said Mr. Anderson.

"Will Section 13 enable us to get any better service?"

"I can't say that it will have any effect either way in that respect," replied Mr. Anderson. "The only thing I claim for Section 13 is that it offers less opportunity for difficulty and danger than any other plan." He added that he had yet to hear any railroad lawyer say he wanted government control to be terminated immediately after the war and that to set any definite time after the end of the war would be to "hold a stop watch on Congress." He said that railroad men agree that legislation will be necessary after the war to deal with the new conditions which will have been created by the government's possession of the roads, such as the financial readjustment, the changed status as to competition, the results of pooling traffic during the war, the effect on the traffic department organization, and the disposition of government rolling stock.

Senator Cummins thought there ought to be a time limit but for another reason, that the President should not be allowed to retain after the war such great powers over the commerce of the country as he will have during the war, and that when peace is restored the question of what shall be done with the railroads should be turned over to some proper tribunal.

"Congress might not be able to agree on a plan for ten years," he said.

In reply to a question by Senator Pomerene Mr. Anderson said he thought Congress would be better able to decide what ought to be done two years from now than it is today.

Senator Cummins said that the bill provides for paying to the railroad owners not only the amount of their dividends and interest but also any surplus they had earned during the last three years, and provides for the payment of a return on any of that surplus that may be invested in the property. "The Interstate Commerce Commission has been on both sides of that question and is now on neither side," he said, "but why have you attempted to settle it in the bill that the railroads may collect rates to pay a return on invested surplus?"

"I was not of the opinion that the bill would prejudice that question in any way," replied the commissioner. "If I thought it would I would never stand for it."

Senator Cummins suggested that the guaranteed return might be reduced by any excess over "adequate" dividends and interest and the surplus devoted to improvements with a provision that rates should not be based on that investment. He promised to draft a proposed amendment along that line.

Mr. Anderson's testimony was concluded on Monday but he said he wished to redraft the bill in some particulars and may be recalled later. The President is understood to have

let it be known that he desires early action on the bill but it is predicted that a long contest is to be expected.

Mr. Kruttschnitt Before Senate Committee

"The railroad officers of the United States have made up their minds to be good soldiers whatever happens and to support the President's policies as to the management of the railroads to the best of their ability," declared Julius Kruttschnitt, chairman of the Southern Pacific Company, before the Senate committee.

Senator Smith had asked the witness if, assuming that the present organizations of the roads may be maintained, government control will not result better in meeting the exigencies of the situation than private control.

"We have felt that the railroads could have done a great deal more under their own organization," replied Mr. Kruttschnitt, "if they had had greater support and assistance from the government, but we realize as a practical matter that there was certain assistance that probably couldn't have been given to the roads under private ownership. Therefore, we have no criticism to make and we accept what has been done because it was the opinion of the Commander-in-Chief that it was necessary and we will work as loyally under government control as in the past. We feel that the President must have had good reasons for what he did and we intend to support his policies to the best of our ability."

"Personally, I think what has been done was done for the best and we propose to do our level best to make the existing conditions successful. I have exhorted our officers to work as hard under the new conditions as they did for the shareholders, and I haven't the slightest doubt that they will do it."

Small Roads Handling Increased Business

Alton C. Dustin, of Cleveland, president of the Portsmouth & Western Railroad, who described himself as "not a practical railroad man, but a lawyer who in an unguarded moment financed a railroad," testified to call the attention of the committee to the effect of the compensation provisions of the bill as applied to small roads that are now handling an increased business. His road in the year ending June 30, 1915, had earned net \$53,000; in 1916, \$62,000, and in 1917, \$147,000, an average of \$87,000, but in the calendar year 1917 it had earned \$244,000. The road is in receiver's hands and cannot borrow money, but it is now meeting an important demand for freight service, and is using the increased earnings to put the road in shape to handle the business. Under the three-year average guarantee it would receive only \$87,000, while it would have to wait for years to get through the Court of Claims money that it needs now to keep in operation. Mr. Dustin suggested an amendment to authorize the President in special cases to authorize additional compensation not exceeding the current net operating income.

Three-Year Average Unfair to Eastern Roads

George M. Shriver, vice-president of the Baltimore & Ohio, testified on behalf of the eastern railroads to show how the average net operating income for the three years ending June 30, 1917, was reduced by the inclusion of the year 1915. In 1915, he said, the net operating income produced a return on the property investment, for the 38 eastern roads, of 4.34 per cent. In 1916 the return was 6.53 per cent and in 1917, 5.71 per cent, making the three-year average 5.54 per cent. However, the investment in property had meanwhile been increased so that, based on the investment on June 30, 1917, the three-year average of net operating income produced a return of only 5.41 per cent, and based on the investment as of December 31, 1917, a return of only 5.33 per cent, which was less than the net operating income of the eastern railroads in 1913, which was 5.36 per cent, to which the Interstate Commerce Commission said in the 5 per cent case was "smaller

than is demanded in the interest both of the public and of the railroads."

The average property investment for the three years for the 38 eastern railroads was \$6,250,411,492. On June 30 it was \$7,116,424,444, and on December 31 it was estimated at \$7,226,000,000, approximately \$110,000,000 having been added during the last six months.

"Nineteen sixteen was the first really good year the eastern railroads had since 1910," said Mr. Shriver, whereas 1915 was, with one exception, 1914, the worst year the eastern

other year and the railroads are still looking compensation based on what they actually did earn at the time the properties were taken over.

Mr. Trumbull on Three Year Average

Frank Trumbull, chairman of the Railway Executive Advisory Commission, submitted before the Senate committee on January 10, estimated that the average net operating income for the three years ending June 30, 1917, is reduced by the inclusion of the 38 eastern railroads, 1914, by a great margin their earning capacity at the time they were taken over. He pointed out that during the war the government took over the roads, it had estimated the net income at the time before the war. Which was the best year the railroads made profit. He also pointed out that the three year average would be unduly able to read that the 38 had carrying their revenues and whose earning capacity was less during the whole part of the period than at the time they were taken by the government.

To illustrate the point Mr. Trumbull presented a table showing the income and property investment by roads in companies operating 80 per cent of the railroads of the country. In 1915 the net operating income of those roads was \$500,000,000.

Eliza Crossing the Ice

railroads had had in the last 18 years. The net operating income in that year was less for the eastern roads than it was for 1906, 1907, 1909, 1910, 1911, 1912 or 1913, notwithstanding an increase in the investment of over \$1,700,000,000."

When Senator Cummins questioned the accuracy of the book value of the railroads, Mr. Shriver explained that the book value was used only as a basis for purposes of comparison to show the relative rate of return on that basis in the different years, and to show how the average was reduced by the inclusion of the year 1915. He said the railroads were not asking a definite rate of return, but only a compensation based on their earning capacity at the time the properties were taken over.

"In other words," said Senator Underwood, "you ask to have as a basis for the compensation to be adjusted by agreement with the President the same basis you would expect to receive if you were obliged to go into the courts and sue for compensation."

"Why should not the government pay the same rate of return on all properties?" asked Senator Cummins.

"It would be a good thing for the railroads if that were done," replied Mr. Shriver, "but a dollar invested in one place is often more profitable than a dollar invested in an-

Over the Government's Follies

Parents Have a Way of Worrying About Such Things

27.74, or 4.05 per cent on the property investment. In 1914 it was \$95,270,117, or 5.75 per cent. In 1917 it was \$280,788,002, or 5.78 per cent, making the average for the three years was \$340,214,886, or 5.24 per cent.

In other years the three year average was \$114,000,000 less than the net operating income for 1917 and \$88,000,000 less than for 1915, while the net for 1915 was \$200,000,000 less than the average.

Mr. Trumbull presented his statement by saying, "We are not here in an objective attitude, but we think we should be careful by our duty to the interest of those roads."

and to you if we did not present the facts as they appear to us."

Senator Poindexter asked: "What is the attitude of your committee toward permanent government operation or ownership?"

"We have not taken any attitude on that," was the reply.

"What is the general opinion in railroad circles?"

"I think as a whole the railroad officers think it would be an undesirable step for the country to take," said Mr. Trumbull.

"What about the interest of the owners of the roads?" asked Senator Poindexter.

"That would depend on the price they would get," replied the witness. "Many of them would be glad to sell to anybody if they could get their price."

Explaining the statistics, Mr. Trumbull pointed out the inequality in the effect of the three-year average on different roads. "For example," he said, "the three-year average for the Chicago & Eastern Illinois, which is in receivers' hands, would be \$3,000,000 less than the net for 1917, for the Atlantic Coast Line it would be \$2,500,000 less, for the Chesapeake & Ohio \$2,300,000 less, for the Illinois Central \$5,300,000 less, for the Atchison, Topeka & Santa Fe \$6,600,000 less, for the Missouri, Kansas & Texas, which is in receivers' hands, \$800,000 less. A most glaring example is presented by the International & Great Northern, which is also in receivers' hands; the three-year average would cut the 1917 earnings in two. Many roads, such as those which have recently been reorganized and those which are in receivership and are yet to be reorganized, would be underpaid by the three-year average."

"The action of the government in taking over the railroads was made inevitable in 1910, when Congress passed the law giving the Interstate Commerce Commission power to suspend any increase in rates," said Mr. Trumbull. "At that time the railroad managers lost their control of their earnings and were rendered unable to increase their rates to meet increased expenses, as any other kind of business does. No one could run a business successfully under such conditions. When that law was passed it became inevitable that some time the government would have to guarantee them." He explained that he was giving his personal views.

Government Regulation Has Broken Down

"Are you in favor of government ownership?" asked Senator Townsend.

"No, we should preserve the benefits of private initiative with possibly some form of government guarantee and some plan by which the government would share in the profits."

Section 13 of the bill, he said, seems to leave the railroad problem in the air indefinitely, and the period of government control should be limited to some definite time after the expiration of the war.

"I believe that before the period of government control expires we will be able to work out some better scheme than we have had in the past. Later on we will want to consider some permanent relation between the government and the railroads."

"Then you think that government regulation of private ownership had broken down," said Senator LaFollette.

"I think the system of regulation had broken down," replied Mr. Trumbull.

Additional Investments Should Be Considered

In discussing the terms of the bill, Mr. Trumbull said that the railroad plant taken over by the government on December 31 was not the same plant that had earned the average net operating income of the three years 1915-1917. It represented \$240,000,000 more on December 31 than

on June 30 and \$934,000,000 more than on June 30, 1915.

"We feel that this bill should make provision, no matter what years are selected, for allowing a return on the additional plant which was turned over to the government. The average net operating income for the three years represents only 5.04 per cent on the investment as of December 31."

The bill should also provide for an adequate tribunal to deal with the questions presented by the roads in special circumstances, he said, such as certain roads that had a deficit for the three years, and that are wondering what their guarantee will be. It is important that Congress shall establish a standard to serve as a basis for agreements with as many roads as possible, but there will be certain roads that will have to resort to a separate adjudication.

Alfred P. Thom Testifies

Alfred P. Thom, counsel for the Railway Executives' Advisory Committee, made a preliminary statement before the House committee, saying that the railways realize fully that the President has been actuated by a purpose to do justice in what he has recommended, and that nothing they shall do or say should be interpreted as an indication of an obstructive attitude or critical spirit. "We believe," he said, "that the principle which the President has recommended as the basis for compensation is the correct principle, and that it recognizes that the rental which the government should pay should represent the equivalent of the value of the use which the owners of the railroad property were able to make of it at the time of the taking by the government—in other words, its earning capacity."

In order to represent the earning capacity of the plant whose use has been taken, Mr. Thom said the compensation should be related as closely as possible to the earnings on the date when the roads were taken.

"In England," he said, "they took the year before the war, undeterred by the fact that that was the best year in the history of the English roads. Our view is that to take the last year would be to go back far enough from the time of the actual taking, and that two years would certainly be enough, but that if you go back three years, to 1915, the result is inadequate, both because that year was an abnormal one and because the plant as it existed on December 31 represented a much greater investment than that of June 30, 1915."

Congress should fix a time limit for the expiration of the period of government control of the railroads after the war, in order to provide for any necessary readjustment, and should authorize the President to terminate the plan sooner, Mr. Thom contended.

Section 13 of the law should be determined before the compensation is determined, he said, because just compensation for a temporary taking would be very different from the compensation for a permanent taking. "I regard Section 13 as meaning government ownership," he said, "and that question should be decided on its merits. If the government is to buy the railroads it should pay the full value of their property, not the mere value of their use."

"Under Section 13 as it stands," he said, "all you've got to do, if you think you've got a good bargain and want to keep these properties after the war, is to do nothing."

"Can't you trust the patriotism of future Congresses?" asked Chairman Sims.

"You would rather rely on the patriotism of the present Congress, would you not?" asked another member of the committee.

"Yes."

"In other words, you prefer to fix the terms of the bargain now."

"We appeal to Congress to fix the tenure," said Mr. Thom. "No one rents a house and leaves the term of the lease to

the will of the tenant, and you should at least be as definite in dealing with one-seventh of the property in the United States. Congress can fix a limit and provide that the President may terminate the contract before that time."

1915 An Abnormally Bad Year

Julius Kruttschnitt, chairman, of the Southern Pacific, testified on January 11 before the House Committee that the three-year average was reduced by the inclusion of the abnormally bad year of 1915, and that the average of 1916 and 1917 would be fairer. He denied that the earnings in those years could be considered abnormally high. To show that 1915 was abnormal he showed that in the fall of that year over 40,000 miles of railroad, or one-sixth of the total railway mileage of the country, were in the hands of receivers.

"Would it not be more fair to take a period of years when more normal conditions prevailed instead of war years?" asked Representative Parker.

"That depends on the time when you take the properties," replied Mr. Kruttschnitt. "If you had taken them in peace times then the return in peace times should be considered, but you should pay the owners the return they were getting at the time you took them."

Mr. Kruttschnitt also emphasized the importance of keeping the railroad organizations intact, with the idea that the properties will be restored to their owners, saying that efficiency will be greatly impaired if anything is done to impair the spirit of emulation between different roads, which he said had been largely responsible for the degree of efficiency they have obtained. While no one should be retained in a position where he cannot perform useful service, he said, he thought that the popular idea as to the possibilities of economics as a result of unification is considerably exaggerated, and he understood that present practices are to be continued except as the director general shall order otherwise.

In reply to questions by Representative Esch, Mr. Kruttschnitt said that if wages are increased during the war it will be extremely difficult to reduce them afterward, and he assumed that the government "will use its influence with the Interstate Commerce Commission to raise rates so as to make the people who use the railroads pay the government guarantee, instead of making all the people pay it by taxation."

"It would leave the roads bankrupt," said Mr. Thom, "if wages should be increased without reference to the earnings."

Railway Employees in Government Service

R. M. Little, chairman of the United States Employees' Compensation Commission, told the House committee that his board had already taken over the railway employees into the government service, by passing a resolution that they are federal employees, but Glen E. Plumb, counsel for the railway brotherhoods, informed the committee that if Congress desired to extend the provisions of the federal workmen's compensation act to the railway employees it would be safer to do so by legislation than to take Mr. Little's word for it. The bill provides for extending the act to cover railway employees, but the War Department has ruled that they are not federal employees.

L. E. Wentling, statistician for the western railroads, testified before the House Committee on Monday, basing his statement principally on the statistics prepared by the Bureau of Railway Economics which had been used by Mr. Trumbull before the Senate Committee.

He was followed by Bird M. Robinson, President of the American Short Line Railroad Association, and other representatives of the short lines, who explained how the bill would affect the smaller railroads, many of whom had deficits in place of a net operating income for the three years ending June 30, 1917. The short line representatives

also appeared before the Senate Committee on Tuesday.

John Bertin Payne, Director General, M. A. A. A. head adviser, testified before the House Committee that those short lines would not be taken over by the government because they were not essential. Thus, Mr. Robinson said, would be "virtual assumption" of roads left out. All the roads had already received notice that they had been taken over. Commissioner Anderson proposed to draft an amendment to safeguard the interests of the short lines.

Following a meeting of railway executives in New York on Sunday the Railway Economics' Advisory Committee forwarded to Washington a resolution urging an amendment of the administration bill to provide that government control shall terminate one year after the close of the war or earlier in the discretion of the President.

A Question of Authority

Representative Lenroot, of Wisconsin, in a speech in the House on Monday, attacked the right of the President to assert in his proclamation or to delegate to the director general of railroads power to set aside orders of the state and interstate commissions and to regulate stations. He said he was merely opposing the method taken and that if the President desired to exert such power he should obtain specific authority from Congress.

"This is a declaration upon the part of the President," Mr. Lenroot said, "that during the time the railroads of the United States shall be in his possession in behalf of the government all statutes of the United States, all orders of the Interstate Commerce Commission, and all statutes of the various states and orders of state commissions relating to railroads may be suspended by him, acting through the director general whom he has appointed. I confidently assert that no such power has been delegated to him and none can exist unless expressly delegated by Congress. If this power does exist the Interstate Commerce Commission may be deprived of all its functions by the director general except the drawing of their salaries."

"There is no language in this act from which any implication can be drawn that the President is given power to set aside or suspend any existing statutes relating to railroads. I think I am safe in asserting that when this act was passed no member of Congress ever dreamed that under it a power to set aside the laws enacted by Congress would be asserted. While there are certain statutes affecting railroads that will not affect them while in possession of the government, it is not because of any power of the President to suspend them, but only because under the now existing conditions they are no longer applicable."

"It may be claimed that the power to employ the resources of the government to carry on the war carries with it the power to suspend the statutes of the United States if he shall deem it necessary to carry on the war. No such power can be implied from the language used."

It has also been argued that the words "existing statutes and orders" in the proclamation have in effect only such orders as had already been issued and would not in effect any further orders except with the approval of the director general.

William F. Fiske, governor of New Jersey and president of the Council of States in Taxation, has sent a telegram to the Vice President, saying: "I respectfully draw your attention to the fact that any governmental action in any form of national control does not interfere with existing contracts of railroads of individual states and local units of trust in the railroads, property or interests, at the present time. This, in many states, constitutes a large portion of state revenues, and to suspend in any form would greatly increase the financial strain, necessitating the levying of taxation, which in this time could be most burdensome and unfair to the people."

Solidification as a Factor in Railway Valuation

A Method Is Suggested for Determining the Appreciation in the Roadbed Due to Seasoning

By H. M. Taylor

Chief Engineer, Ferrocarriles del Norte de Cuba (Cuba Northern Railways Co.), Moron, Cuba.

IN THE *Railway Age Gazette* of October 5 (page 599). Director Prouty of the Valuation Board states that appreciation by solidification cannot be determined. I regard the article of the Director as highly fair as a whole, but disagree with him in this statement. Anything worth knowing can be determined if it is approached with an open mind and patience enough to get at the facts. There are railway systems which have been engaged in railway construction for half a century that know very closely how much more it costs to maintain new track than it does to maintain seasoned track. Unfortunately, our railways and our public have not yet arrived at the position where the Director could accept the statements of these railways, however certain he might be of their correctness, because the public would not regard such information as impartial.

This matter was brought home to me a number of years ago by reading an estimate of the cost of a line, published by one of our most important Western systems in which the officer making the estimate used the phrase "hardening down" and gave a sum that surprised me as the cost. I had had no such experience as the man mentioned, but had been on construction a considerable part of my life and most of the balance of the time I had been engaged on maintenance. The term struck me as good, expressing a condition which I had observed and which had caused me some uneasy nights as well as anxious days. As I was shortly afterward placed in charge of the construction of an important line for the National of Mexico, where another and far more experienced engineer had made the estimate, I looked for his allowance for "Hardening down" and did not find it.

This work was the standard gaging of the National line from Corpus Christi, Texas, via Laredo and the construction of a new line from a place we afterward named Gonzalez to Mexico City. The whole distance was 1,000 miles and the new line was 196 miles long. My work was the building of this new line.

We had been operating the narrow gage line since 1888. I had been with the company since 1890. Our track, though narrow gage, was good; our men remained in the service and there had been few changes among our officers in a number of years. Our vice-president and general manager was E. N. Brown, afterward president, an experienced engineer and a careful, close figuring operating officer, who made us think and plan carefully.

Our standard of maintenance was high, and details of the cost to maintain a given number of kilometers in a given district had been well determined. Sections from Saltillo to San Miguel Allende were 15 kilometers (9.315 miles) long. Six men and a foreman comprised the gang required to maintain and better the line for that distance and they did it. The line from San Miguel to Mexico City, with lighter rail and inferior road bed material, had sections of 12 kilometers (7.45 miles), with the same number of men. This latter line was nearly 20 per cent curved, had 1, 2, 3.85 and 4 per cent grades and crossed a summit a little over 10,000 ft. in elevation and this was the cause of the new line. Our survey gave us a 1 per cent grade south bound and 1.5 per cent north bound, shortened the line about 40

miles and crossed a summit 1,000 ft. lower than the old line. All of us had staked our reputations on what we could do with the standard gage line, the amounts we could save in the fuel bill, in wages and in maintenance as compared with the old line. My report was we would save nothing on maintenance and it was not popularly received.

The line was placed in operation in October, 1903. The track was in good line and surface, and well raised with good slopes from the ends of the ties to insure drainage. We started with twenty-one 15-kilometer sections, with two supervisors, and one road master and one foreman with 8 men to each section. The foremen were all picked men, known to me. The labor was unusually good, even for Mexico, where the most faithful track labor I have yet worked is to be had. The supervisors and the road master were capable. Within one month after we turned the road over to operation with 70-lb. rail, 8 ft. ties spaced 22 in. on centers, E. 40 locomotives and 80,000-lb. capacity cars, the track condition became alarming. Several derailments occurred, and the sand and "tepetate," or volcanic burned clay ballast, which we had put down to cover about 100 kilometers of gumbo, had become insufficient. The one man to 1.164 miles of line could not maintain it, neither could 8 men instead of 6 men to the section. In December we increased the forces to 12 men to the section and put on one extra gang to get out more "tepetate" ballast and put it in. A second extra gang of 40 men with a foreman and an assistant were put on with a regular work train in January, 1904, and continued throughout the year.

January 1, 1905, one of the extra gangs was taken off and in April of the same year the other gang came off for financial reasons. After we had gotten by the fiscal year on July 1, one of the gangs was put back on under the better foreman. This gang was increased to 60 men and they stayed on until April, 1906, when the gang was taken off, and the section gangs reduced to 8 men, for financial reasons. This held until the end of 1906.

In January, 1907, two extra gangs of 20 men and foremen were put on to clear cuts and widen certain of the large fills and lift them back to grade where the settlement had been sufficient to affect the tonnage rating of the engines. Ballasting with broken stone was well under way. This work was charged to betterments and had nothing to do with "Hardening down," the cost of which was still charged to operating expenses. These men continued on the hardening throughout that year, and again in 1908 throughout the year, cleaning slopes, increasing them in many cases, widening fills, and bringing them up to grade ahead of ballasting. This was charged to operating.

Finally in May, 1909, with the track fully ballasted and after 5½ years of operation, the gangs got down to the old standard of the narrow gage line, 1 foreman and 6 men to the section, with no extra gangs. None of these men were engaged at any time in work on stations, on water tanks, wells, etc., for the line started with all stone culverts, stone and steel bridges, steel tanks, and stone stations. Repairs to these, which were almost nothing, were confined largely to additional bridges and painting, and were properly distributed in the accounting. E. 46 locomotives and 100,000

16 years had been added. The rail had been changed to 85 lb., and the number of ties had been increased to 2,000 per kilometer or 20 to a 35 ft., or 10 meter rail. Due to consolidation with the Mexican Central and the diversion of much tonnage to the lighter grade line, the tonnage had doubled. The passenger trains remained the same as in 1904.

In sex estimation all the men employed beyond these 6 men and the foreman between 1903 and 1909 were a proper charge to the *lost of property*, or 'Hardened' down. It takes more men to maintain stone ballasted track than seasoned well drained, hardened earth track. I was not with the line from March 1904, to June 1907, but was with the same system, and kept notes and watch of this piece of line.

For easy calculation suppose the labor received for this period \$1 per day. The cost which should be added would be

This money was charged against earnings out of I believe, a proper charge to capital for interest on the money so used until the "Hardening down" is finished.

The work in question was unusually heavy and at the end of 1909 there were still some signs of settling but the average seemed solid and permanent. The \$1 per day was not the rate paid our men nor are the figures for foreign correct as given in this article though they are not far wrong.

If the commission would appoint one expert engineer to investigate the large companies which have lines long in service and lines newly built, I believe it would be a real matter to arrive at a factor for determining closely the appreciation due to solidification.

Locomotive Feedwater Heating

THE SYSTEM DEVELOPED by the Locomotive Cold Water Heater Company, New York, for preheating the water before it is admitted to the boiler of a locomotive, uses the exhaust steam taken directly from the steam chest or the exhaust passage in the cylinder saddle, as shown in the illus-

General Arrangement of An Exhaust Steam System of Feedwater Heating

near the cylinders in order to reduce the length of passages between the cylinders and the heater. In the particular case illustrated, it is located directly in front of the cylinders.

water heating equipment applied to a locomotive well illustrates the system. The pump draws the water from the tank through a $3\frac{1}{2}$ -in. suction pipe and delivers it to the heater

Section Through the Locomotive Feedwater Heater

Pipes extend from each steam chest to the inlet connections of the heater. With this system the injector is replaced by an entirely new water pump, which was developed for this

through a 2-in. pipe. From the heater the water passes through a 2-in. pipe with a check valve to the boiler check. A $\frac{3}{4}$ -in. connection is made in the pump discharge pipe for

Application of Feedwater Heater and Steam Pump to a Locomotive

particular work by the Westinghouse Air Brake Company. It may be located on either side of the locomotive, being applied similar to the application of an air compressor.

The diagrammatic view of the arrangement of the feed-

the squirt hose, thus providing cold water for that purpose. The pump takes steam from the cab turret and the speed of the pump is regulated by a valve at that point. The exhaust steam from the pump passes into the heater to

give up its waste heat to the feed water. The exhaust steam condensed in the heater passes through an opening in the bottom of the heater to a drain pipe that carries it to a point near the ash pan where it is drained to the track.

The pump was modeled after a Westinghouse compressor. The steam end is that used on a standard 9½ in. compressor. The water cylinder is 6½ in. in diameter and is double acting. When running at 80 strokes a minute the pump will deliver 6500 gals. an hour. There are ten valves, five suction and five discharge, located in the chambers on each side of the pump. Each set of five valves is included in a valve deck which may be easily removed. Tests made with this pump have shown that 50 lb. of water and over are pumped per pound of steam used for operating the pump.

A sectional view of the heater is shown among the illustrations. As indicated by the notations, the exhaust steam from the steam chest is admitted at the top, allowed to circulate around the tubes which contain the feed water, and passes out through the drain at the bottom. The water from the pump passes through the heater four times before it is delivered to the boiler. This is accomplished by means of walls in the headers at the ends of the heater. The header at the right has three chambers formed by a wall extending horizontally across the header at the center and a vertical wall extending up from this wall. The header at the left has one vertical wall dividing it into two parts. The water enters the header at the right in the upper right hand

corner. It passes through the tubes in quadrant A to the header at the left. From there it comes through the tubes marked B, then back through the tubes marked C, to the header at the left, passing through tubes D to the water outlet. By thus passing the water through the heater four times an equivalent length of pipe of 15 ft. is obtained from which the water will almost boil.

One of the most important features of this heater is the jacket containing its shell, in the tubes of the heater. These are closed in the top row of tubes in the heater illustrated. They consist of a thin brass-removable and spiraled strip of metal and teeth designed to so rotate the water as it passes through the tubes that every portion of it will come in contact with the hot tubes and absorb all the heat possible from the exhaust steam on the outside of the tubes. This rotation also serves to keep the tubes clean and free from scale. The higher the velocity of the cold water passing through the tubes the more violent the agitation and the greater the amount of heat absorbed by the water.

Two types of heater bodies are being used, one iron and the other steel plate. When a cast iron body is used the difference in expansion of brass and iron is taken up by a copper expansion joint forming one end of the body. When steel plate is used the difference is taken up by a flexible form of joint formed at either end of the body where it connects to the tube sheet.

The Germans Make Efficient Use of the Light Railway in Transporting Wounded

General News

A walkout of 1,500 shopmen from the shops of the Atlantic Coast Line at Waycross, Ga., was reported on January 8, the grievance being that a non-union pipefitter had been employed; but the matter was settled the next day.

The long bridge over Albemarle Sound, on the Norfolk & Southern, was badly damaged by ice in the storm of January 11 for a length of about 1,000 ft., and the operation of trains had to be suspended to allow the bridge to be repaired.

The governor of Pennsylvania has received an offer from a committee of business men and public officers of Susquehanna, Lackawanna and Luzerne counties, to give to the state for a state highway, the right of way which has been abandoned by the Delaware, Lackawanna & Western Railroad from Clark's Summit to Milford, 33 miles.

A grievance of engineers on the New York, New Haven & Hartford is reported as having been settled by arbitrators under the Federal law; and the decision was filed in the United States District Court at New York City on January 15. The controversy was submitted to the arbitrators on October 30 last. It is said that in the main the railroad company is sustained.

The freight house and office building of the Union Pacific at Fifteenth and Nicholas Streets, Omaha, Neb., was destroyed by fire on December 28, together with 9 loaded cars. Ten other cars with contents were damaged. The fire is believed to have originated from a small stove used by water service men for thawing out frozen pipes. The total damage to the building and cars is estimated at \$50,000.

A fine of \$1,000 was imposed, in the county court at Jersey City, N. J., on Monday of this week, on the Lehigh Valley Railroad Company because of its responsibility for the death of a policeman at the fire which resulted from the great explosion at "Black Tom," New York harbor, July 30, 1916, in the yards of the Lehigh Valley. The indictment against the railroad company was for the crime of manslaughter.

Differences between the Chicago & Alton and its telegraphers were settled through the mediation of G. W. W. Hangar, of the United States Board of Mediation and Conciliation on January 11. Under the terms of the agreement the telegraphers will receive overtime pay for Sunday work, a reduction of the working day by one hour, giving them an eight hour day, and an increase of about \$9.75 a month. About 400 men are affected by the settlement which is the first made since Secretary McAdoo was appointed director general of railroads.

The coal carried off by mobs of men, women and children who raided the railroad yards in Philadelphia during the first week of January, when thousands of people were suffering from the cold weather, is said to have amounted to several hundred tons; and the retail dealers, whose coal was taken from the cars, are preparing to sue the city for the amount of their losses. It is said that the tracks of the Pennsylvania Railroad, along Washington Avenue, were visited by crowds of a thousand persons at one time, and whole carloads were carried off. The police made few arrests and most of those who were taken to the courts were leniently dealt with.

Disturbance of state revenue from railroad taxes, as a possible undesirable result of Federal control of railroads, is the subject of a telegram which Governor Walter E. Edge, of New Jersey, has written to the leaders of Congress and to the governors of a number of states. Governor Edge is president of the Congress of States on Taxation, which recently held a conference at Atlanta, Ga., and his efforts to arouse interest in this subject are addressed to governors and other state

officers who took part in the conference. The state of New Jersey collects from the railroads in taxes about \$8,000,000 annually, the largest single source of revenue in the state. The governor deems it wise to present the matter to Congress without delay, and before any action is taken, with special regard to the interests of those states where the railroad taxes are based on the receipts from traffic.

A Government Traffic Director

H. M. Adams, vice-president and traffic manager of the Missouri Pacific, has been appointed Director of Inland Transportation of the War Department to supervise all Government traffic, under Major-General George W. Goethals, acting Quartermaster General. Mr. Adams will have his office in Washington.

Western Railway Club Meeting

The January meeting of the Western Railway Club, will be held at the Hotel Sherman, Chicago, on January 22. A. R. Ayres, superintendent of motive power of the New York, Chicago & St. Louis, will present a paper on Organization Maintenance and P. S. Eustis, passenger traffic manager of the Chicago, Burlington & Quincy, will speak informally on The Passenger Traffic Problem Today.

Mr. Willard Resigns from Industries Board

Daniel Willard, president of the Baltimore & Ohio, has resigned as chairman of the War Industries Board; and it is understood that the resignation will be accepted as soon as a successor is found. Mr. Willard gave as his reason that the railroad required his entire attention. He has had the step under consideration some time. He was confronted with the alternative of resigning the presidency of the Baltimore & Ohio if he remained as chairman of the War Industries Board.

Fuel Administration Officers

Appointed to Co-operate with Railroads

In compliance with a request from Director General of Railroads McAdoo, United States Fuel Administrator H. A. Garfield has designated Fuel Administration officers to co-operate with the railroads in clearing up emergency traffic congestion. G. N. Snider, of the Fuel Administration, is to act with the Pennsylvania and the Philadelphia & Reading. The Commissioner of the Tidewater Coal Exchange at Norfolk, Va., is to co-operate with the railroads at Hampton Roads in clearing up congestion at that point. Another representative has been located at New York City. These designated officers of the Fuel Administration will have authority to divert shipments of coal from the original consignee whenever an emergency renders such action necessary to relieve traffic conditions.

Progress in Valuation Work

In a statement prepared by H. C. Phillips, general secretary of the Presidents' Conference Committee for the Federal Valuation of the Railroads, dated December 31, 1917, information is presented to the effect that the government has spent about \$9,000,000 and the carriers \$16,600,000 on the valuation work from the passage of the valuation act on March 1, 1913, to June 30, 1917. The government roadway and track parties have covered over 150,000 miles of main lines up to January 1, 1918. Tentative valuations up to the present time have been served on six carriers with a total mileage of 2,120 miles. The field and track inspection is now complete on 153 roads with a total mileage of 61,333

F, Port Arthur, Tex. Most recent reports make the number of officers of the El Paso & Southwestern who have received commissions, two; the number of employees who have received commissions, 10; the number who have enlisted or who have been drafted in the army, 185; and those in the navy, 26; making a total now with the colors of 233.

The Baltimore & Ohio reports the following additions to its list of employees who have received commissions: J. G. Stevenson, bridge inspector, captain quartermaster's department, Camp Merritt, N. J.; W. B. Blanchford, machinist, captain, regular army; H. R. Holljes, inspector, first lieutenant Marine corps, France; E. J. Clopton, chairman, lieutenant field artillery; A. N. Peters, chief dispatcher, lieutenant, railway regiment; A. M. Dinsmore, brakeman, second lieutenant, machine gun corps, Fort Riley, Kan.; C. R. Preston, inspector, second lieutenant in infantry, Camp Lee, Va.; J. J. Chisolm, inspector, second lieutenant assistant paymaster in the navy; J. M. Beverly, brakeman, second lieutenant in the navy.

The statistics of enlistments in the army for the Tennessee Central were inadvertently omitted from the article in the *Railway Age* of January 4. The number of employees of this road, however, who entered government service was included in the grand total of railway men under arms therein mentioned. Two Tennessee Central employees received commissions, i.e., C. H. Fitzgerald, yardmaster, a majorship, and F. J. Ready, Jr., secretary and chief clerk in the legal department, a first lieutenant in the aviation section of the signal corps. Seventy-one other employees either volunteered or were drafted.

Gratitude for Tobacco Funds

Brigadier-General W. W. Atterbury, Director General of Transportation, American Expeditionary Forces in France, has congratulated the employees of the Pennsylvania Railroad upon the liberality with which they have contributed to the fund for supplying tobacco to their former comrades, now in the field. In a letter to J. C. Johnson, Superintendent of Telegraph of the Pennsylvania Railroad, he says:—

"I was very much gratified to learn that the Pennsylvania Railroad employees had contributed a fund of \$35,000 for the purchase of tobacco for Pennsylvania Railroad boys serving with the American Expeditionary Forces. As to the best method of sending the tobacco, I shall want from the general manager's office a list of the employees, upon receipt of which we will make the necessary arrangements and advise how to forward the tobacco.

"I want to congratulate the employees of the Pennsylvania Railroad who are doing their bit at home to help us here in France, for the splendid way they have responded in this very laudable undertaking. American tobacco is very scarce over here and is in great demand, and I know that all of our employees with the American Expeditionary Forces will be very glad to receive such a substantial reminder from their friends and fellow-workers at home.

"Needless to say, we are very busy, for the job they have given us is going to tax all our energy and ingenuity. However, that is what we are here for."

Contributors to the Railway Regiments' Tobacco Fund will be interested in a letter from Fred A. Preston, secretary and treasurer of the P. & M. Company, Chicago, now a captain in the regular army in France. He was in a hospital for a month with the measles, and after he came out he wrote a letter to Fred A. Poor, president of the P. & M. Company, in which he said:

"I had occasion while at the hospital to see what sending tobacco to the soldiers means. There were sixty privates with the measles quarantined in a separate building and they were the most cheerless lot of men I ever saw, with no clothes of their own and nothing to smoke. They were actually sick, not from measles but from pure loneliness. After they had been there six days the Y. M. C. A. brought around about 500 bags of Bull Durham and the whole character of the place changed in a flash. I have never seen anything which gave so much pleasure and those boys were well in an hour, and left the hospital the next day!

"There is nothing so welcome as Bull Durham with plenty of papers and matches. The latter are especially scarce. Send the tobacco in the large size bags. Before long I shall have

the chance to see some of the soldiers who are receiving your tobacco. I will write you what they say; but I know now what it will be."

Contributions to the Railway Regiments' Tobacco Fund for the week ending Tuesday noon, January 15, are:

Detroit Graphite Company, Detroit, Mich., \$3 a month for 12 months.

Mt. Vernon Bridge Company, Mt. Vernon, Ohio, \$10 a month for 12 months.

Record Snow Storms Paralyze

Transportation in Central West

Two of the severest snow storms in history have swept over the Central West within a week paralyzing transportation for from 24 to 48 hours each time. The first storm was accompanied by a snow fall of nearly 15 i. hes, which constitutes a record for Chicago and tributary territory, and was confined largely to a zone within about 100 miles of that city. It started west of the Mississippi river late in the evening of Saturday, January 5, and at Chicago the velocity of the wind was about 55 miles an hour. The railroads were forced to annul most of the passenger trains scheduled to leave Chicago on Sunday, and all incoming trains were late.

Hardly were the rails and yards cleared of snow when a second storm passed over the same section of the country. It began Friday evening, the 11th. The snow fall was not so heavy, a maximum of about eight inches and in many localities not exceeding three inches, but the gale was as bad or worse, and of longer duration. Passenger trains throughout the storm area were stalled, and passengers were forced to billet in warehouses, country stations and small rural hotels. The less fortunate had to remain in their trains, in some cases after the car-heating facilities gave out. Many important trains could not be moved for from 24 to 48 hours. Some which left Chicago Friday evening were recalled when it became apparent that they could not proceed, but the return trip in some instances took all day Saturday and Sunday.

Thousands of men were hired and others were drafted from all railroad departments, which could spare men, to clear the tracks. The Chicago, Burlington & Quincy employed all its freight handlers, freight clerks, and draftsmen to shovel on January 14. Other roads took similar measures. Because of the difficulty of obtaining men for this work some Chicago roads paid as high as \$1 an hour for common labor. Rotary snow plows were put at work, but, as long as the storm lasted, these progressed with difficulty. On Sunday morning, January 13, a plow and a locomotive were derailed near Corliss, Wis., on the Chicago-Milwaukee line of the Chicago, Milwaukee & St. Paul.

Practically no trains were run on the 12th and 13th, but passenger service was resumed on something approaching normal schedules on January 14. Chicago suburban trains, which attempted to fight the storm Friday night, were stalled in snow drifts, forcing commuters to spend the night in the cars except when rescued by farmers who broke through the drifts with sleighs and bobsleds. Chicago offices, stores and factories were operated with depleted forces on January 12 because of the failure of all suburban trains, electric interurbans and street railways.

The first break in Chicago's isolation from the east came when the Twentieth Century Limited on the New York Central arrived at 10 a. m., Sunday, a little over 24 hours late. The New York-Chicago Limited of the Baltimore & Ohio, due at 9 a. m. on Sunday the 13th, did not arrive until 1:30 p. m. on Monday. The Manhattan Limited and the Mercantile Express of the Pennsylvania, due in Chicago on Saturday afternoon arrived Monday. These trains were held at Mansfield, Ohio.

No freight service, except the movement of coal and perishables, was attempted until Monday, January 14. The Illinois Central delivered coal at team tracks in Chicago on Sunday, although hardly a wheel of a passenger train moved. A small amount of milk in cans reached the city over the Chicago & North Western Monday morning, the first to come in over that road since Friday. Milk deliveries in the city on the 14th were confined to families with babies, and even some of those had to do without. Coal movements were greatly impeded everywhere. The Illinois State Fuel Administration has com-

Traffic News

The Navy Department has taken two steamers of the Central Vermont Railway, which have been lying at New London unused, for the past three years—the Narragansett and the Manhattan.

The Traffic Club of Jacksonville, Fla., held its annual meeting on January 5. John C. Burrowes, superintendent of the Pullman Company, was elected president for the ensuing year.

In Philadelphia, this week, eight large freight stations of the Pennsylvania Railroad have been kept open until 10 o'clock in the evening, with the hope that consignees would be able to more rapidly clear away the accumulation of freight.

James A. Farrell, president of the United States Steel Corporation, who was recently appointed assistant to A. H. Smith, assistant director-general of the railroads, has appointed a committee of eight traffic managers of steel companies to gather information and submit reports to Mr. Smith.

The United States Food Administration's recent instructions that shippers must load to safe carrying capacity have produced results on the Southern Pacific. A shipper at Hubbard, Ore., on November 15, loaded 104,500 lb. of potatoes into a Southern Pacific 40-ft. box car. At 60 pounds to the bushel this means 1742 bushels. The car was loaded nine sacks high, and was delivered at Colma, Cal., on November 22, without complaint as to the condition of its contents.

The special committee of the National Industrial Traffic League, recently appointed, with Guy M. Freer, president of the league, as chairman, has gone to Washington to give Director General McAdoo the viewpoint of shippers at large concerning the important measures he has taken since assuming control of the railroads, including particularly the new demurrage rates, the routing of freight without reference to company lines, etc. The committee will also ask for a league representative on Mr. McAdoo's advisory board.

Railroads in the territory of the Western Passenger Association have discontinued the delivery of railroad, sleeping-car and parlor-car tickets either by railroad employees or by paid messengers. Similar action was taken some time ago by railroads in the territory of the Central Passenger Association. Member lines of the Western Passenger Association have also agreed to discontinue free telegraph and telephone service in connection with sleeping-car reservations, subject to the concurrence of the Southwestern and Transcontinental Passenger Associations. According to this arrangement, if it becomes effective, no sleeping-car or parlor-car reservations for passengers on foreign lines or at other points on the same line will be made by telegraph or telephone except at the expense of the passenger. This rule will not apply to reservations on sleeping-cars or parlor-cars which pass through the station where passengers call for space, but merely applies when passengers desire to reserve berths or parlor-car chairs on a train with which they intend to connect.

Illinois Manufacturers Protest

Increased Demurrage Charges

The traffic committee of the Illinois Manufacturers' Association has passed a resolution declaring that any change, through government control, or agitation by the carriers in connection with trap and ferry cars, increase in carload minimum weights, storage, track storage, or other matters, without consultation and agreement with shippers, is ill advised and inconsistent with the spirit of co-operation. "These subjects have been handled through negotiation between the carriers and shippers with very satisfactory results, and we respectfully suggest that such relations continue." A telegram was sent to W. G. McAdoo, director-general of railroads, criticising his order making radical changes in demurrage charges and eliminating the average agreement.

It said: "We are in entire accord and sympathy with you in your efforts to facilitate prompt movement, but . . . we can demonstrate that the enforcement of your order will not accomplish the results desired. . . . We therefore respectfully request opportunity to be heard prior to the taking effect of the order January 21."

To managers of Chicago railroads a message was sent deploring the abolishing of commercial railroad freight offices long established out of necessity. Such a radical change, it is declared, deprives the shipping and traveling public of the only prompt means of obtaining necessary information which is absolutely essential.

Curtailement of Passenger Train Service

The New York Central made further extensive reductions in passenger train service on Monday of this week, particularly in suburban trains to and from New York City.

The Chicago, Milwaukee & St. Paul, to conserve coal, has issued orders cancelling 54 passenger trains.

The Cleveland, Cincinnati, Chicago & St. Louis has discontinued its night trains between Chicago and Louisville.

The Louisville & Nashville has taken off a number of Sunday trains.

South American Traffic

Steamship lines to South America and to Trans-pacific ports report more passenger traffic than last year. The rapid development of new trade enterprises under the stimulus of war conditions has created a volume of commercial travel heretofore unknown. New trade relations now established mean new freight, and permanent benefit to the carriers of both freight and passengers. The new United States and Pacific Line, plying between New York and the west coast of South America, through the Panama Canal, announces the departure of the first of its four new steamers the last of January.—*American Express Co.'s Travel Bulletin.*

Discontinuance of Solicitation of Traffic

Reductions of the forces of city passenger and freight agents have been under consideration during the past three weeks by many railroads at many cities; and action has already been taken in a number of cases, including the complete closing of some offices; but there seems to be no very well-defined policy, and each road apparently finds itself compelled to consider numerous local obstacles. The Baltimore & Ohio has closed its office at 196 Washington street, Boston, and the New England passenger agent has been sent to Philadelphia. Among the 30 railroad offices on the principal business streets of Boston, a considerable number reduced their staffs on or about January 1; but it is said that some of the roads have reconsidered the matter and may not withdraw so many men as at first was intended. From Toronto, Ont., it is reported that the Chicago, Milwaukee & St. Paul, the Minneapolis, St. Paul & Sault Ste. Marie, and the Pennsylvania have closed their offices. The passenger and freight agent of the Missouri Pacific at Nashville, Tenn., has called in his traveling agents. The Chesapeake & Ohio, the Erie and the Southern have signified their intention of close their offices in Philadelphia. The Georgia Railroad has closed its office in Macon. A number of offices have been closed in Atlanta, Ga. At Chicago mercantile interests protested against the closing of city freight offices.

Railroads in the territory west of Chicago have practically discontinued the solicitation of freight traffic, but their soliciting forces have been utilized in other ways. The Missouri Pacific recalled approximately 200 freight solicitors and put them at work in the operating department. On most of the larger roads the solicitors are employed to expedite the movement of freight and to keep shippers advised as to how and by what routes freight is being moved. The Texas & Pacific, the Southern, the St. Louis Southwestern, the International & Great Northern and the Missouri, Oklahoma & Gulf have closed their offices at Chicago. The Chicago, St. Paul, Minneapolis & Omaha has closed its agency at Kansas City, and the Baltimore & Ohio closed its office at Buffalo, N. Y.

Commission and Court News

Interstate Commerce Commission

The Kentucky Real Estate Commission has approved for "free without terms" listing Water Conservation No. 6, stating that it has been accepted by all real estate members of buyers and that the shared system is the result of the Uniform Classification Committee that brings a new grade of uniformity in practice.

State Commissions

The Public Service Commission on Motor Vehicles has authorized the Baltimore & Ohio and the Chesapeake & Ohio to raise their passenger fares in that the former 2 cents a mile to 2½ cents a mile, the new rate to take effect February 1. The commission says that although the increase and decrease may be due at a later date, it is not.

Demurrage Rates Advanced

The United States Commission on the Mississippi River has selected the intrastate trade as a favored field for increasing tonnage revenues from Washington and on down to shippers of the state, as well as for the conservation of this important economy. The attention to shippers is all the more the extensive navigable waters of Louisiana, and it is known that shippers have not properly appreciated these channels of transportation. The circular names a half dozen steamboat lines which are available, and the commission proposes to hold an owners of boats who will attend water service to place new looking it.

The railroad commissions of a number of other states have adopted or approved the demurrage rates presented by Director General McAlloy, among which are those of Georgia, Maryland, Pennsylvania and Tennessee.

The Public Service Commission of New York State, second district, announces the receipt of notices from most of the principal railroads of the state that enlarges have been placed on all shipments of freight on railroads, which the shippers desire to have stopped or held for reconsignment or diversion. These enlarges have been placed by direction of the assistant to the director general of railroads.

New York Annual Report

The Public Service Commission of New York City first district (New York City) has sent to the legislature its 11th annual report. The most important subject dealt with is the construction of rapid transit lines in New York City. Ten of these lines, or sections of lines, have been put in operation during 1917, and a lot as many more will be finished in 1918. The report characterizes the new dual system of rapid transit in New York as the world's first great engineering undertaking, costing in the neighborhood of \$400,000,000, or more than the construction of the Panama Canal. Its hundreds of miles of track in city and country, wheel lines will effect approximately an increase of more than 100 per cent in the city's transit facilities as they existed in 1910. Hundreds of acres of territory now largely settled in the outlying districts will soon be both as regards population and as regards new lines, which together will constitute the greatest metropolitan rail system in the world.

Township is bisected by the Craig Mountain corridor which will take us from Lexington Avenue Station and the Sixth Street station to our operation. The Lexington Avenue always is a factor in our work with the first subway, the City of Forty-two Street, entering there northward toward the Bronx, Park Avenue, crossing at 135th Street into East Harlem and extending westward to Pelham Bay Park and then further north westerly to Woodlawn Road.

The Streetcar Avenue subway runs along the shoreway at Times Square and extends south, forking at Port Place into two two-

Construction of Live Stock Contract

[illegible]

Interstate Shipments—Time of Bringing Suit

held insufficient to contradict the written admissions in the contract. Judgment for the plaintiffs was reversed and judgment entered for the railroad.—*Illinois Central v. Rogers* (Miss.), 76 So. 686. Decided November 19, 1917.

Computation of C. L. Charges—Storage and Demurrage

Action was brought against a shipper to recover for freight, demurrage and storage on a stone-working lathe and equipment shipped from Columbia, Me., to St. Cloud, Minn., which the consignee refused to receive, but not on account of any fault of the carriers. The freight charges were lawful, and on 24,000 lb. the minimum c. l. rate. The actual weight of the goods was 17,000 lb., and the question was raised whether the goods shipped reasonably amounted to a carload. The Maine Supreme Court justified the carload rate; and also held that the terminal carrier did not act imprudently in taking the lathe and equipment to a warehouse at an additional freight charge, although it might have unloaded it on its right of way; but its action, after it knew that the shipper was unlikely to give any orders for the disposition of the shipment, in keeping the goods on the car at a demurrage charge of \$1 a day for 86 days was held unreasonable and unnecessary, and it should have unloaded the freight and released the car after a demurrage charge of not over 26 days.—*Northern Pacific v. Pleasant River Granite Co.* (Me.), 102 Atl. 298. Decided November 24, 1917.

Free Passes to Employees—

After Termination of Service

A railroad sent its agent to Union Springs, Ala., and there employed several persons to work for it on its lines in North Carolina and Tennessee. Their contracts included free transportation to their place of work and free transportation to their homes in Alabama every two weeks. The latter was never furnished, but the men continued at work until their job was finished in North Carolina and they were transported to Johnston City to work. At this point they declined to work any further and were discharged. They then demanded their free transportation to their homes, which was refused and they brought suit. The railroad's defense was that it was not permitted, under the law, to contract to furnish free transportation; that it could only furnish transportation to such persons as were in its employ, and that, at all events, after the plaintiffs were discharged, it was unlawful for the railroad to furnish such transportation. The Tennessee Supreme Court held that the plaintiffs not being servants of the railroad at the time the free transportation was refused at Johnston City, the railroad could not furnish it without being liable in the penalty provided in the federal law. There is no exception for such a case in the act itself and the court can make none. The court followed the rulings of the Supreme Court of the United States, which has construed the act very strictly in furtherance of the policy of Congress to root out the practice of furnishing free passes by interstate carriers, except in the cases reserved by the act. Such a contract was therefore held not binding.—*Northern v. Linear* (Tenn.), 198 S. W., 887. Decided November 20, 1917.

United States Supreme Court

Texas Train-Schedule Law Void

The United States Supreme Court, on Monday of this week, in the case of the Missouri, Kansas & Texas, of Texas, against the state of Texas, dismissed a suit by the state to collect penalties for alleged violation of an order of the state railroad commission in failure to adhere to passenger train schedules. The Court held that the order was an interference with interstate commerce.

Interstate Commerce Commission Sustained

The Supreme Court of the United States has upheld the order of the Interstate Commerce Commission which (after several revisions) merely denied to the Louisville & Nashville authority to continue on certain traffic through Bowling Green to Louisville and to Nashville lower rates than were contemporaneously in effect to Bowling Green. (Bowling Green Business Men's Association v. Louisville & Nashville, 24 I. C. C. 228). The railroad assailed the validity of the

order in the federal district court for the Western District of Kentucky. The district court refused to grant a temporary injunction and dismissed the company's bill. This is now affirmed by the Supreme Court. The railroad company had filed a long assignment of errors. The Supreme Court says that "many of the assignments of error are not now insisted upon, none deserves detailed discussion, all are unsound." *L. & N., v. United States*. Decided, January 7, 1918.

Railroads Lose Illinois Passenger Fare Case

The Illinois railroads have lost their fight to set aside the Illinois two-cent fare law. The United States Supreme Court on Monday of this week in a decision by Justice Van Devanter, sustained the decision of Judge Landis of the district court for the northern district of Illinois, which held that the Interstate Commerce Commission had exceeded its authority in its order in the Business Men's League case. The commission ordered the railroads to remove the discrimination against interstate traffic resulting from the higher rate for interstate traffic than the rate charged for intrastate passengers, and it specifically approved the 24-cent interstate rate as being reasonable. The railroads asked an injunction to restrain the enforcement of the two-cent rate in Illinois, but Judge Landis dismissed the proceedings. Both the railroads and the state authorities appealed from the decision, which is now upheld. Another federal court at St. Louis enjoined the railroads from violating the commission's decision and during the litigation the higher rates have been charged, rebate coupons being given to the passengers. The court sustained the contention of the state authorities that the order of the Interstate Commerce Commission was not sufficiently definite and precise to be enforced as against a state law.

Assumption of Risk Under

Federal Employers' Liability Act

A freight train was being made up in a yard, and an experienced conductor, while between cars contrary to the rules, and assisting in an effort to adjust a faulty coupler, was killed. The coupler was at the south end of a string of cars standing on a grade; another string moving down from the north hit the standing cars and drove them against the deceased and across a space of twenty feet. Suing under the federal Employers' Liability Act the administratrix maintained that the brakeman in control negligently permitted the moving cars to strike with too great violence; also that the company negligently failed to promulgate and enforce adequate rules to safeguard the deceased while at work; and some evidence tended to support both claims. The Circuit Court of Appeals, Second Circuit, affirmed a judgment for the defendant after the trial court had denied motion for new trial based solely on its refusal to give the charge specially requested by the plaintiff (218 Fed. 367). The requested charge was that "the risk the employee now assumes since the passage of the federal Employers' Liability Act, is the ordinary dangers incident to the employment, which does not now include the assumption of risk incident to the negligence of defendant's officers, agents or employees." Denying the request the court said: "Under the Employers' Liability Act the employee simply assumes the risk of his employment. Section 4 reads, 'Such employee shall not be held to have assumed the risk of his employment in any case where a violation by such common carrier of any statute enacted for the safety of employees contributed to the injury or death of such employee.' I decline to charge as requested, because this is not an action of the kind specified in Section 4."

The Supreme Court of the United States, in affirming judgment for the defendant, said that the request quoted did not accurately state any applicable rule of law and was properly refused. Already the jury had been told that the deceased assumed the ordinary risks of his employment, a statement more favorable than the plaintiff could properly demand. If the negligence of all officers, agents or employees of the company should be excluded in actions under the Employers' Liability Act "it is difficult to see what practical application could be given to the established doctrine concerning assumption of risk." *Boldt v. Pennsylvania*. Decided January 7, 1918.

Equipment and Supplies

Locomotives

THE WESTERN PACIFIC is inquiring for 4 Mikado locomotives.

The CHICAGO, MILWAUKEE & ST. PAUL is contemplating the purchase of 50 steam locomotives.

The DELAWARE, LAKEWARE & WESTERN reported in last week's issue as asking prices on 15 Mikado locomotives, has ordered these locomotives from the American Locomotive Company.

THE RHODE ISLAND RAILWAY have ordered 9 mountain type locomotives from the American Locomotive Company. These locomotives will have 22 by 24 in. cylinders, a total weight in working order of 172,000 lb. and will be equipped with superheaters.

THE CHILEAN STATE RAILWAYS recently ordered 20 Mikado locomotives from the American Locomotive Company. These locomotives will have 22 by 28 in. cylinders, a total weight in working order of 195,000 lb. and will be superheated. The purchase of the locomotives has been supervised by Justino Sotomayor, vice-general manager and vice-minister of public works of Chile, who is now staying at the Hotel McAlpin, New York.

Freight Cars

EARL PETTY, Eldorado, Kan., is inquiring for 20 sulphuric acid tank cars.

THE ST. LOUIS-SAN FRANCISCO is inquiring for 170 steel underframes.

THE BALTIMORE & OHIO has withdrawn its recent inquiry for 3,000 freight cars.

SAMUEL BAER, Nashville, Tenn., is inquiring for 10 8,000-gal. capacity tank cars.

W. D. JENKINS, New Orleans, La., is inquiring for 10 8,000-gal. capacity tank cars.

THE CANADIAN GOVERNMENT RAILWAYS have issued inquiries for 250 drop bottom gondola cars.

THE WESTERN CONTRACTING COMPANY, Kansas City, Mo., is inquiring for 25 8,000-gal. tank cars.

LOWELL R. GAIDRI, New Orleans, La., is inquiring for 10 50-ton, 8,000- to 10,000-gal. capacity tank cars.

THE REPUBLIC IRON & STEEL COMPANY has ordered 200 coke cars from the Pressell Steel Car Company.

THE EQUALITY REFINING COMPANY, Oklahoma City, Okla., is inquiring for 30 8,000-gal. capacity tank cars.

THE SOUTHERN OIL CORPORATION, Tulsa, Okla., is inquiring for 25 8,000- to 10,000-gal. capacity tank cars.

THE JAREKI CHEMICAL COMPANY, Cincinnati, Ohio, is inquiring for 6 50-ton, 7,000-gal. capacity tank cars.

THE UNITED STATES NAVY has ordered 60-ton steel underframe box cars from the American Car & Foundry Company.

THE COLUMBIAN NORTHERN has ordered 10 15-ton wooden gondola cars from the American Car & Foundry Company.

THE UNITED STATES WAR DEPARTMENT is about to place orders for quantities of spare parts and accessories for freight cars.

THE BRIDG HILL IRON & COAL COMPANY, Yellowtown, Ohio, is inquiring for 10 70-ton gondola, 40 70-ton coal and 25 50-ton general service cars.

Passenger Cars

THE COLUMBIAN NORTHERN has ordered 2 third-class passenger coaches from the American Car & Foundry Company.

Supply Trade News

Peter L. Maher, assistant manager of the Eastern Car Co., 111, 113, 115 Broadway, New York, has resigned his position and is returning to his home in Ireland.

The Concrete Mixing & Placing Company has moved its offices from 125 West Madison Street, Chicago, to the First National Bank Building in the same city.

S. D. Winger, formerly associated with the Traction Line Locomotive Co. in its railroad work, has been appointed general manager of the locomotive and engine department of the Chicago Railway Division, Company, with office at Chicago, Ill.

P. C. Gunter has been named secretary-treasurer of the National Locomotive Association, 111, 113, 115 Broadway, New York. Mr. Gunter has been in the same department of the Hyatt Company for two years. Just previous to his recent appointment he was manager of the Pittsburgh office.

The American Sheet & Tin Plate Company, 111, 113, 115 Broadway, New York, has a record of 1417 steel or tin-coated tin plates in the military service of the United States. To mark occasion to this fact the company printed in its latest issue a sticker made up like a service file containing the name of the company, a star and the figures, 1417.

A. C. Miller, promoter of the Caltrans, New York Air Line, part of which was finally absorbed in the City & Suburban Traction System, of which he was formerly the head and more recently the inventor and promoter of a rail train control device, died on January 4 at Aurora, Ill., aged 66 years. Although of the same name he was not associated with the Miller Train Control Corporation, Danville, Ill.

Recent promotions in the Federal Steel Car Company's organization in the Pittsburgh District include J. H. Hackenburg, purchasing agent, succeeded the late H. J. Gearhart. Mr. Hackenburg was formerly the assistant purchasing agent. H. B. Fisher and C. C. Clark have been assigned assistant purchasing agents of the company. W. C. Howe, formerly in charge of the Allegheny plant, has been assigned to the vice president. J. C. Ritchey has been appointed assistant engineer.

R. A. Van Houten, with the name of the Southern Manufacturing Company, Chicago, has been appointed vice president and general manager with the same headquarters. George M. Hogan, sales agent, has also been appointed assistant secretary and W. H. Seigmund, formerly, has been appointed assistant treasurer. E. M. Kerwin, formerly treasurer, has been promoted to head of the order delivery service, having been a confidential assistant to the executive department and stationed at Washington, D. C.

Milton Rupert, vice president, succeeded vice-president and assistant treasurer of the D. D. HARMON COMPANY of Philadelphia, Pa., in the duties of assistant secretary and treasurer. Mr. Rupert has been with the National Company since March 4, 1912, holding various positions. In 1913 he was promoted to the general sales office, directly in touch with all sales matters and also manufacturing operations. During the latter part of this period Mr. Rupert was assistant to president and general manager. In his new position Mr. Rupert will have charge of sales and manufacturing operations.

Forl, Bacon & Davis, Pittsburgh, announced the formation of the Ford, Bacon & Davis Corporation, organized by the purpose of conducting a general contracting business with particular reference to industrial plants, including power plants, heating and power plants, building structures and railway construction, including industrial buildings, hydroelectric and irrigation projects. All other lines within the construction or engineering field of contracting work which operations has been handled by the firm since. The corporation's headquarters are at 114 Broadway, New York and its local office at 114 Broadway, Pittsburgh.

Trade Publications

SMOOTH-ON SPECIALTIES.—A new edition of the instruction book published by the Smooth-On Manufacturing Company, Jersey City, N. J., has recently been issued for free distribution. In addition to information regarding the use of Smooth-On iron cement, the booklet contains a list of the standard sizes of Smooth-On coated corrugated gaskets for flanged pipes of sizes from 2 in. to 26 in.

METHODS OF LOADING RADIATORS AND BOILERS.—The American Radiator Company has issued an excellent booklet, describing and illustrating the standard methods of loading and bracing shipments of radiators and boilers, which have been adopted by this company to reduce the liability of damage to a minimum. The instructions contained in the booklet will be of value to agents who frequently handle such shipments.

HYDRATED LIME.—The Hydrated Lime Bureau of the National Lime Manufacturers' Association, Pittsburgh, Pa., has issued a 24-page pamphlet entitled "Watertight Concrete" which is devoted to the discussion of the properties of hydrated lime in making concrete impermeable to water. The pamphlet contains a large amount of information regarding this material and its uses and is illustrated with photographs of structures in which hydrated lime has been used.

PRESSED STEEL TRUCKS.—The Pressed Steel Truck Company of Pittsburgh, Pa., has recently issued folders describing the Atlas two-wheel and four-wheel trucks. These folders are well illustrated and show in some detail the interesting features of construction and describe the various uses to which these trucks may be put. They are constructed with a one-piece frame, without bolts or rivets. They weigh less than wooden trucks and have greater strength. The axles are supported on flexible hardened steel bearings.

AN EXPORT ORDER AND ALLIED TOPICS.—The Foreign Trade Department of the National Association of Manufacturers has recently issued a very interesting 48-page booklet in which it follows with illustrations of letters, invoices, bills of lading, etc., the progress of an export order from paint to a company in New York from a purchaser in Montevideo from the inquiry for information to the shipment and invoicing of the goods. The accompanying story explains each step in the order, and emphasizes such essentials as courtesy in the correspondence, the securing of proper credit data, the translation of letters into the language of the prospect, and the proper methods of securing shipping permits and orders, insurance, drafts, etc. In addition to that information is given concerning the trade mark laws and the consular requirements of foreign countries. Several pages, finally, are devoted to the facilities of the Foreign Trade Department of the Association. The Department, says the booklet, furnishes special reports on trade prospects to individual manufacturers, lists of foreign business houses, translations, credit reports. It also prepares reports on foreign inquiries for American goods and in trade conditions. The offices of the department are at 30 Church Street, New York. Views are shown of these offices and a map in the form of an insert shows the location of the department's foreign correspondents in all countries of the world.

MORE DESTROYERS THAN THERE ARE NOW IN THE WORLD.—E. G. Grace, president of the Bethlehem Steel Corporation, told the 500 guests of the Allentown, Pa., Chamber of Commerce at its banquet on December 20, that the submarine destroyers which the Bethlehem Shipbuilding Corporation will build for the Government are more than all of the destroyers now in the world. Mr. Grace said he regarded the rapid construction of destroyers as the solution of the submarine menace. Mr. Grace said that of the entire ship construction of the United States, war vessels and merchantmen included, the companies of the Bethlehem Steel Corporation are bearing more than half of the burden. The Bethlehem plants now employ 30,000 men as compared with 9,000 five years ago. Charles M. Schwab, who also spoke, said that the payroll of the Bethlehem plants is now \$100,000,000 a year.—*Iron Age.*

Financial and Construction

Railway Financial News

BALTIMORE & OHIO.—The board of directors at a meeting last Wednesday declared semi-annual dividends of 2 per cent on the preferred stock and 2½ per cent on the common stock.

BOSTON & MAINE.—The Minority Stockholders' Protective Association has sent a protest to President Wilson against the enactment of any legislation under which the disbursement to railroad security holders of compensation for the use of railroad property by the federal government would be left optional with the directorates. The resolution in which the protest is embodied also urges the enactment of legislation to provide specifically for a guarantee of direct compensation payment to security holders during the period of federal control.

CANADIAN NORTHERN.—The \$1,250,000 6 per cent one-year gold notes, originally issued by William A. Read & Co., were paid at maturity, January 10, by the Central Trust Company, New York. During the last year the Canadian Northern has reduced its outstanding obligations by \$6,000,000. The Canadian government now owns practically all of its \$100,000,000 capital stock.

MICHIGAN EAST & WEST.—This road, operating between Manistee, Mich., and Marion, has been placed in the hands of Eugene Ford, receiver.

PENNSYLVANIA RAILROAD.—The railroad lines heretofore operated by the Pennsylvania company, embracing the northwest and central systems of the Pennsylvania Lines West of Pittsburgh, having been taken over by the Pennsylvania Railroad Company, will be operated under the title of the Pennsylvania Railroad Company, Western Lines.

PITTSBURGH & WEST VIRGINIA.—The Pittsburgh Terminal Railroad & Coal Company, a subsidiary of the Pittsburgh & West Virginia recently declared two dividends of 3 per cent each on its \$14,000,000 of stock. All of the stock is owned by the railway company. The first dividend, an initial distribution, was paid December 31, 1917. The second dividend is payable next June. The total cash involved in these two dividends amounts to \$840,000, equivalent to the full 6 per cent on the \$9,000,000 Pittsburgh & West Virginia preferred stock and an additional 1 per cent on the \$30,000,000 common. Since the railway company earns sufficient to pay the full 6 per cent on the preferred this distribution of \$840,000 may be said to apply entirely to the common stock. On this basis it is equivalent to \$2.80 per share on the common.

ST. JOSEPH VALLEY.—H. E. Bucklin, president, has been appointed receiver of this line, which extends from Elkhorn, Ind., to Columbia, 70 miles.

Railway Construction

ILLINOIS CENTRAL.—This company is considering the construction of an inbound freight house at East St. Louis, Ill.

MOBILE & OHIO.—This company proposes to repair and remodel the grain elevator at Mobile, Ala., and the wharf adjacent thereto, involving a total expenditure of about \$125,000. The grain elevator, with a capacity of 250,000 bushels, is to be connected to the wharf by a conveyor having a capacity of 15,000 bushels per hour. This building is 56 ft. wide by 106 ft. long and 130 ft. high to the eaves. The machinery to be installed will be entirely electrically driven and of the latest type. A contract has been given to the R. C. Stone Engineering Company at St. Louis, Mo., for the installation of the machinery, and the remodeling of the building will be done by the railroad company. It is expected to have the elevator in operation within six months.

Traffic

J. H. Gregory has been appointed commercial agent of the Chicago, Burlington & Quincy with office at St. Joseph, Mo.

George J. Allen has been appointed commercial agent of the Georgia & Florida and the Augusta Southern, with office at Nashville, Tenn.

E. M. Hess, has been appointed commercial agent of the New York Central, with office at Baltimore, Md., vice **N. D. Hoke** promoted.

C. J. Piper, has been appointed commercial agent of the Canadian Northern, with office at Minneapolis, Minn., vice **J. T. Whitlaw** resigned.

J. W. Brown, traveling freight agent of the Baltimore & Ohio with headquarters at Dayton, Ohio, has been appointed general agent at Camp Sherman, Ohio.

R. R. Williams has been appointed Canadian agent, passenger and freight, of the Buffalo, Rochester & Pittsburgh, with headquarters at Toronto, Ont., vice **P. A. Bolopue**.

W. T. Grier, general traffic manager of the Lehigh Valley, with headquarters at New York, having resigned to enter other business, the position of general traffic manager has been abolished.

H. A. Cochran, general coal freight agent of the Baltimore & Ohio, with office at Baltimore, Md., has been granted a temporary leave of absence in order that he may assist the United States Fuel Administration at Washington.

F. K. Woodruff, manager of mail traffic of the Kansas City Southern, with office at Kansas City, Mo., has been appointed director of development, with the same headquarters, in charge of the industrial, immigration and agricultural departments. The position of manager of mail traffic has been abolished and the duties of that position have been assumed by **F. D. Downie**, general baggage agent, Kansas City, Mo., effective January 1.

Engineering and Rolling Stock

B. J. Peasley has been appointed mechanical superintendent of the St. Louis-Southwestern of Texas with office at Tyler, Tex.

A. H. Hackfield has been appointed master mechanic and roadmaster, of the Southwestern Railway with office at Archer City, Texas.

H. T. Nowell, assistant superintendent of the Billerica (Mass.) shops of the Boston & Maine, has resigned to engage in other business.

Ernest S. Draper, has been appointed engineer of structures of the Boston & Albany, with office at Boston, Mass., vice **A. D. Case**, who has resigned to become structural engineer, in charge of the structural division of the American International Shipbuilding Corporation.

M. F. Smith, division master mechanic on the La Crosse and Wisconsin Valley division of the Chicago, Milwaukee & St. Paul, with office at Milwaukee shops, was promoted to district master mechanic, with the same headquarters; **William Joost**, roundhouse foreman at Milwaukee shops, was promoted to master mechanic of the Milwaukee terminal and the Chicago and Milwaukee division, with office at Milwaukee shops, Wis., effective January 10; **A. J. Klumb**, assistant district master mechanic, with office at Milwaukee shops, has been appointed division master mechanic on the Prairie du Chien and Mineral Point division, with office at Madison, Wis.; **W. H. Hart**, assistant district master mechanic on the Superior division, with office at Green Bay, Wis., was promoted to division master mechanic with the same headquarters; **J. E. Bjorkholm**, traveling engineer, with headquarters at Milwaukee, Wis., was appointed division master mechanic of the Chicago terminal, with office at Chicago, Ill.; **J. H. Phillips**, traveling engineer, was appointed division master mechanic on the Northern division, with office at Ilwaco, Wis.; **John Turney**, assistant district master mechanic of the Twin City terminals, with office at Minneapolis, Minn., was appointed division master mechanic of the same division; **H. G. Dimmitt**, district master mechanic of the River and Iowa & Minnesota divisions, was

appointed division master mechanic of the same divisions; **P. L. Mullen**, roundhouse foreman at Sioux City, Iowa, was appointed division master mechanic of the Southern Minnesota division, with office at Austin, Minn.; **G. P. Hodges**, general car and locomotive foreman, with headquarters at Mason City, Iowa, was appointed division master mechanic of the Iowa and Dakota division, with the same headquarters; **Joseph Bodenberger**, traveling engineer, with headquarters at Aberdeen, S. D., was appointed division master mechanic of the Hastings and Dakota division, with the same headquarters; **G. P. Kempf**, district master mechanic on the Dubuque division, with office at Dubuque, Iowa, was appointed division master mechanic of the same division; **E. W. Harvey** was appointed division master mechanic of the Illinois and Racine & Southwestern division and the Rochelle & Southern line, with office at Savanna, Ill.; **F. P. Miller**, general car and locomotive foreman at Marion, Iowa, was appointed division master mechanic of the Iowa division, with the same headquarters; **S. J. O'Gar**, general car and locomotive foreman, with headquarters at Ottumwa Junction, Iowa, was appointed division master mechanic of the Kansas City division, with the same headquarters; **G. J. Messer**, general car and locomotive foreman, with headquarters at Minneapolis, Minn., was appointed division master mechanic of the Sioux City and Dakota division, with headquarters at Sioux City, Iowa; **T. S. Manchester**, general foreman, with headquarters at Aberdeen, S. D., was appointed traveling engineer, with the same headquarters, and **Joseph Opia**, general foreman, with headquarters at Austin, Minn., was appointed general inspector, with the same headquarters.

Railway Officers in Military Service

F. G. Robbins, general superintendent of the Erie at Chicago and recently commissioned major in the Engineer Officers Reserve Corps, has been called into active service and has been assigned to Washington, D. C.

James T. Phillips, auditor of disbursements of the Oahu Railway & Land Company, with headquarters at Honolulu, T. H., has been called to active military service with the rank of captain in the quartermaster department, and assigned to duty as assistant to the department quartermaster in Honolulu. Mr. Phillips went to Honolulu in March, 1916, to take charge of the disbursements and store department of the Oahu Railway; he previously had served for about 15 years in the operating and accounting departments of the Rock Island, the Chicago, Burlington & Quincy, the Atchison, Topeka & Santa Fe and the Southern Pacific.

Obituary

M. L. Crowell, formerly treasurer of the Toledo, St. Louis & Western, with office at Toledo, Ohio, died on January 7, at the age of 73.

Archibald J. Wykes, treasurer of the Illinois Central, with headquarters at New York, died on January 14, at his home in Glen Ridge, N. J., at the age of 46. Mr. Wykes entered the service of the Illinois Central in March, 1897, as a clerk in the executive office, at New York. In February, 1913, he was appointed assistant treasurer and the following May was promoted to treasurer.

Lee Howell, general freight agent of the St. Louis and Henderson divisions of the Louisville & Nashville, with headquarters at Evansville, Ind., died recently. He was born on May 18, 1844, and began railway work in 1872, as a contracting agent on the Louisville & Nashville. He subsequently served as general agent at Evansville, Ind., then as division freight agent of the Henderson division and since November 1882 was general freight agent of the same road. From July 1 to December, 1883, in addition to the duties of general freight agent he served as superintendent of the St. Louis division.

THE TOTAL EXPORTS TO U. S. FROM ENGLAND IN 1917 had an aggregate value of \$262,891,937, against \$305,414,269 in 1916, according to a cable from the American Consul General at London under date of January 2.

EDITORIAL

The War Savings Stamps have now been on sale for some thing over two months. The admirable campaign of publicity

War Savings Stamps

that has been put behind them and the splendid cooperation from agents of all kinds for their sale have spread their use most extensively. However, the stamps and certificates are not yet

in as general use as they should be in view of the merits of the plan. Anyone who has studied the method of inducing a man to save money by means of these War Savings Stamps or who has bought some of the stamps himself, has been surprised at the remarkably easy plan they present to save money and to be thrifty. The plan has been advertised so extensively that it is not necessary to repeat its essentials here. But it may be worth while to bear in mind that a mere quarter starts an account, mere quarters carry it on, and compound interest at 4 per cent begins, not at the end of a year, or after a certain interest date, but as soon as \$4.12 worth of War Savings Stamps have been exchanged for a \$5 War Savings Certificate. The readers of this paper no doubt understand the value of these Thrift Stamps, but we wonder if they are doing all that they can to bring their value to the attention of the men under them. Railwaymen have taken it upon themselves to leave no stone unturned to serve their country in this war. This time the opportunity in question relates to Thrift Stamps. Railwaymen can do considerable in encouraging their sale and they will certainly agree that thrift among their own men is very desirable. Railwaymen and employers generally can encourage the sale of Thrift Stamps (1) by buying stamps and certificates themselves, (2) by recommending their sale at railway ticket offices and at the pay car, (3) by recommending their sale and availability at stores, (4) by telling their friends and employees how easy it is to obtain stamps and save money by them, and (5) by backing the organization of War Savings societies among their forces. It should not be hard to encourage a man to be patriotic and save money at 4 per cent compound interest. It is merely a matter of readily available supplies of stamps and publicity to explain the plan and its advantages.

Railway officers are unusually fortunate these days in both their enemies and their friends. W. G. Lee, president of

Some Friends and Enemies of Railway Officers

the Brotherhood of Railway Trainmen, announces that railway employees had noticed for months before government control was adopted, that railway officers

were permitting unnecessary delays and congestions of traffic. They were doing this to discredit government regulation, he says, and they unintentionally let the situation get beyond their control. W. R. Hearst also has been shadowing the railway officers, and has got something on them. His artistic and veracious newspapers assert that railway officers are "lying down" in order to discredit government control. He advises that the chief malefactors be discharged and that the rest have their "fancy" salaries cut—seemingly forgetting that he once found it profitable to pay one of his editors \$75,000 a year. Lee is one of the four labor brotherhood heads who showed their in-

terest in railway officers and the nation of the United States by calling a strike on all the railways last spring when the country was right on the verge of war with Germany. Later after we were in the war, the Brotherhood actually called a strike in Chicago in an attempt to throw the terminals there. Calumnies from a man who has shown his interest in railroad efficiency and his patriotism in other ways should be very offensive. As for Hearst—that why discuss anybody so well known and perfectly understood by the American people as Hearst? The President of the United States said recently in a message to Congress referring to the way the railway officers who had general charge of railroad operation before government control was adopted, that they "performed their difficult duties with patriotism and marked ability," and "did, I believe, everything that it was possible for them to do in the circumstances." The Director General of Railroads has not hesitated to rely on railway officers, high and low for advice and assistance. The public probably will have no great difficulty in deciding whether W. G. Lee and W. R. Hearst, or President Wilson and Secretary McAdoo, are more likely to judge the efficiency and loyalty of railway officers intelligently, disinterestedly and fairly.

Once more the railroads have failed in their efforts to defeat a state two-cent passenger fare law on the ground of dis-

Illinois Passenger Fare Case

crimination against interstate commerce. They have had little difficulty in showing that the two-cent fare is a cause, such a discrimination and in the Illinois passenger fare case it was in-

deed that a sufficiently definite issue had been presented to secure a clear-cut decision, which would be lawfully applicable to other states. The Supreme Court, however, in a decision rendered last week, of which an abstract is published in this issue, holds that the issue of the Interstate Commerce Commission or which they had relied is not sufficiently definite in its description of the rates to which it applies to be used to set aside a state law. The Commission had held that 2.4 cents a mile was a reasonable rate for passenger service between Chicago, St. Louis and Missouri and Iowa and that the corresponding maintenance between points in Illinois of lower rates than the interstate rates constituted an illegal discrimination against the interstate commerce. It also went so far as to issue a supplemental order from which the inference might easily be drawn that its direct purpose was to bring about an advance in the state fares, but the Commission was actually restricted by the terms presented to it in the complaint and possibly it was actually misled as to the Illinois law. The court holds the principle that there is no Shreveport case, that Congress has ample power to prevent railroads from being held as their interstate operations in such a manner as to effect injurious results which it sustains, that Congress, not the state, is entitled to prescribe the dominant rule, and that Congress may provide for the abolition of the power through the Interstate Commerce Commission and has done so in the well-regulated commerce. It also repeats its finding that where the Commission not only finds that a dis-

parity in the two classes of rates is resulting in unjust discrimination against interstate commerce but also determines what are reasonable rates for the interstate traffic and then directs the removal of the discrimination, the carrier not only is entitled to put in force the interstate rates found reasonable but is free to remove the forbidden discrimination by bringing the intrastate rates up to the same level." There is no doubt that the Commission intended that its order should fit the above specifications, but the court says, "while the order shows that it is not intended to require or authorize a readjustment of all the intrastate rates, the description of those to which it applies is left indefinite." It therefore concludes that the uncertainty in the order is such as to render it inoperative and of no effect as to the intrastate rates. A similar case instituted by the express companies to set aside an order of the South Dakota commission came to a similar conclusion. The court's various decisions in cases of this kind leave no room for doubt as to the power of the Interstate Commerce Commission to prevent discriminations resulting from low state rates but "straight is the gate and narrow is the way" of the course to be followed in doing so.

The Report on Columns

THE FINAL REPORT of the special committee of the American Society of Civil Engineers on steel columns and struts, which was published recently, harks back to the first Quebec bridge failure, because the discussion of the grave disclosures made in the investigation of this disaster culminated in the organization of this body of American bridge engineers.

The committee carried on its work for nearly eight years and, with the aid of the United States Bureau of Standards, conducted a comprehensive series of tests on columns of various sections.

"To report upon the design, ultimate strength and safe working values" were the instructions given the committee and the report covers admirably all phases of its problem except the first, design. The tests disclosed little upon which to base discrimination between the several forms of sections tested. As regards stresses, on the other hand, the results are positive and, might be considered to be, disappointing or even alarming if they had not been anticipated by the progress reports of the committee and the reports of contemporaneous tests carried on under other auspices.

The unwelcome fact is that the ultimate unit strength of a column is materially less than the drop-of-the-beam yield point as determined by the mill specimen tests of the material used. Of even more concern is it that this condition is more pronounced in columns composed of heavy material—such as would be more commonly used in actual construction—than in the light columns of the test. In other words, the ultimate unit strength of the columns composed of thicker material was materially lower, although this fact was not indicated in a comparison of the ultimate strengths and yield points as determined in the mill tests of the material.

The steel used in the tests was of the ordinary structural grade with a specified ultimate tensile strength of 60,000 lb. per sq. in. and a yield point of 38,000 lb. per sq. in. Studies of the ultimate unit strengths of the columns and of their "Useful Limit Points" (a practical elastic limit) disclosed that the former varied from 38,000 lb. per sq. in. to 32,600 lb. and the latter from 35,000 to 19,000 lb. per sq. in., for columns having a ratio of slenderness of 50 to 85. Based upon these facts the committee "regards it as unwise to assume a higher working stress than 12,000 lb. per sq. in. for columns in which the ordinary grade of structural steel is specified and in which the ratio of slenderness is 80 or less.

As this is materially lower than the American Railway Engineering Association column formula, $16,000 - 70 \frac{1}{r}$

with its maximum value of 14,000 lb. per sq. in., the question as to a substitute formula is answered by the committee with the statement that the wide limits covered by the strength values obtained in the tests (28 per cent) precluded the writing of a rational formula at this time.

This wide variation in strength values deserves serious thought, particularly because the workmanship of the test columns and the care with which they were prepared for testing involved much more refinement than is obtained in usual structural steel practice, while the specifications for the material were more rigid than the usual structural specifications in so far as they concerned an effort to secure material of uniform strength. Although definite as to the limitations of column strength, particularly with columns composed of the thicker material, the report is not conclusive as to the cause of the weakness of this thick material and as to the reason why this fault has not been disclosed by the mill tests. More complete information on these vital matters is extremely desirable.

Make It Solely a War Measure

GOVERNMENT CONTROL of railroad management was adopted as a war measure. If it is to be efficient as a war measure it must be carried out as a war measure.

The sole purpose of war measures should be to win the war as quickly and completely as possible. Many of our people have not awakened to the fact that the United States is engaged in a life-and-death struggle with the greatest military power that ever existed and that there is a strong chance that the United States may lose. These people persist in thinking a great deal more about the effects war measures will have on our affairs at home than about the effects they will have on the battlefields of Europe. Many of them are constantly engaged in trying to frame and use such measures not mainly to defeat Germany, but mainly to work an economic and social revolution in the United States.

This tendency has been strongly manifested by certain politicians and labor leaders in dealing with the question of railroad control. In the hearings before the Senate committee Senator Cummins has hardly asked anything as to how railroad control may be so shaped as to make it most effective in helping win the war. All his questions about the proposed financial guarantees to the railways have been directed toward whittling the guarantees of the stronger lines down as much as possible. Does he think this would help win the war? If so, he has not said so, nor told why he thinks so. He has asked the director general of railroads to furnish him a list of the salaries paid to most of the higher officers of the railways. He evidently wants to see these salaries reduced. Does he think that wholesale reductions in their salaries would cause railway officers to give more loyal, patriotic and energetic support to the government and thereby contribute toward winning the war?

He might answer that the money saved the public by reducing the guarantees of the companies and the salaries of their officers could be usefully employed elsewhere, and that the companies and their officers should be willing to make the sacrifice. But why not use a little common sense about such matters? Railway owners and officers assume exactly the same attitude toward questions of this kind that other people do. They are perfectly willing to make their *proportionate share* of the sacrifices necessary to winning the war. But if the government, as a pretended war measure, arbitrarily reduces their return from their properties and their

salaries, while not interfering in similar manner with the returns of other classes of business concerns and with the salaries of the officers of other large corporations, railroad owners and officers naturally will feel that they have been discriminated against without just cause or any cause except dirty politics, and they will resent it. Wouldn't any other class of people feel the same way? And if they do feel that way, could the effects upon the efficiency of the railroads be anything but unfavorable?

It is the first duty of every citizen, whatever his position in life, to give unstinted support to the government in this crisis. It is also the first duty of every public man to do everything he can to infuse into all classes of the people a loyal, enthusiastic, fighting spirit. There are many people, high and low, who talk much about the need of willingness to "sacrifice." This war isn't going to be won by sacrifice. No war ever was, none ever will be, however necessary sacrifice may be. It is going to be won, if it is won, by hard, determined, enthusiastic fighting on the battlefield and in every line of industry at home. The fighting spirit needs to be raised to a much higher pitch in all classes of our people than it has been. It needs to be raised and maintained to the very highest pitch among railway officers if the railroads are to be operated with the greatest efficiency, and is it not plain that it would be lowered, not raised, by arbitrary action on the part of the government which would be regarded by railway officers as demagogic, discriminatory and unjust?

President Wilson in his railroad control message to Congress said, "Nothing will be altered or disturbed which it is not necessary to disturb." That is the only sound policy to follow in carrying out railroad control as a war measure. Director General of Railroads McAdoo showed in his testimony before the Senate Committee on Interstate Commerce that it is the policy he desires to carry out. We can do all the economic and social revolutionizing necessary after we have won the war. Any man who tries to turn government control into an agency for giving effect to his pet economic or socialistic theories instead of an agency for helping win the war is a better friend of Germany than he is of America.

The Railway Wage Commission

REGARDLESS of their opinions as to the advisability, necessity or probable success of the plan of government control under which the railroads are now being operated, all railway officers who have had to deal with the wage question, and that includes most of them, have occasion to feel greatly relieved that it has been taken out of their hands, for the time being at least. Moreover, they now have reason to believe that before it is ever restored to them to deal with, an important step will have been taken toward simplifying it for them in the future.

One of Mr. McAdoo's first acts as Director General of Railroads was to appoint a railway wage commission which was charged with the duty of investigating and assembling for decision the facts bearing on the entire question of railway wages, their relation to wages in other industries and to the cost of living and the relation between the wages of various classes of railway labor.

This has been accomplished at one step what the railroads have long advocated, that wages should be determined by some authority that fixes the rates out of which they must be paid. The railroads have heretofore urged that wage questions be referred to the Interstate Commerce Commission, because the commission has heretofore been the most potent rate-regulating body. Now, while it retains its jurisdiction in ordinary rate matters, the authority of the Director General is paramount and if he advances wages to a point which

requires no advance payment by the railroad, the same or the railroad is bound to honor the advance. This is an important principle which the railroads did not hope.

The new wage commission will therefore report its recommendations without consideration for anything but the facts at hand and time. It is probable it will be able to warrant the belief that its recommendations will be so given justice to all concerned but it is also equally true from past experience that the railroads that have demanded an adequate adjustment of wage problems have failed. It is understood that the brotherhoods of train service employees are to receive first consideration in all such matters, but that time it is nearly known they were the first to present their demands. The government now has no more reason to be afraid by them than by the other employees where the railroad managers have had. The brotherhoods are organized and the majority of railroad employees are not, but even if political considerations are to count for anything the unorganized employees have more votes. In theory at least, the brotherhoods still have the power to call a strike. It is unlikely that they should be allowed to do so, but at any rate the other employees are now on more even terms with them because if they are not sufficiently under the discipline of a union to be able to strike successfully under present conditions, they at least can quit if they are not satisfied and easily find other jobs, which many of them are proving every day.

The railroads, although they may have preferred to increase the wages of many of their lesser paid men, have been unable to do so to the extent which would have been desirable and which has now become almost a necessity, because the strongly organized employees have always got to the trough first and there were limits to the ability of the railroads to pay. In consequence the disparity between the wages of the organized and the less strongly organized or unorganized employees has steadily widened while the railroads were practically powerless to remedy the situation.

It has often been glibly asserted that the American people were willing to pay whatever rates were necessary to enable the railroads to pay fair wages. Perhaps this is true, but while the American railroads have paid the highest wages of any railway system in the world, the fact remains that the American people have not thus far paid rates that would warrant the wages that those who receive the wages consider fair, nor have the railroads ever had any assurance that if they raised the wages they would be allowed sufficient rates. On the other hand, they have frequently had the contrary experience of increasing wages only to be denied corresponding increases in rates on the ground that their earnings would probably increase enough in the next few months to make higher rates unnecessary.

Certainly Mr. McAdoo and his wage commission have no lack of power to deal adequately and fairly with the entire wage situation. If they have not unlimited funds at their disposal they certainly have command of all the money that the American people as a whole can afford to pay for railroad wages. If the wages are placed too high the shippers who pay for most of them in the first place will naturally complain, but they cannot fairly object to any reasonable element in the necessary cost of transportation and the only difficulty lies in the complicated problem of ascertaining the facts and stating them in such a way that they will be convincing.

The wage commission is faced with a delicate problem of adjustment as between the claims of the men, owners on the one hand and the requirements of the public, and as between the various classes of employees. It will also have to consider the relation between railway wages and wages in other kinds of employment. The usual substitution of human nature will certainly be found on all sides. However, it will not be confronted with the financial difficulties that have heretofore presented an ideal solution of the problem, and it

ought to be able to reach a solution of the intricate problem before it which will commend itself to all concerned. It has neither the prejudices of the employer nor those of the employee. It ought to be just as much concerned with the interests of the rate-paying public as with those of the wage earning public, and with the condition of one class of railway employees as with that of another.

If it finds that railway wages ought to be so increased that the present rates will not produce sufficient revenue to pay them and the other necessary expenses of transportation, then the rates ought to be increased also. Otherwise the wages will not be paid by those who use the railroads in proportion to their use but by the entire public in the form of taxation, and the railways will be left in an impossible condition after the government guarantee has expired.

"Lest We Forget."

ALMOST EXACTLY twelve years ago one of the wisest and farthest-seeing Americans that ever lived made a prediction. The prophet was James J. Hill. The prophecy was that continuance of the policy of railroad regulation then being adopted by the state and national governments would bring national disaster.

The policy was continued. The prophecy has been fulfilled. The disaster has come. It has come in the midst of the nation's participation in the greatest of all wars. The government last week ordered the industries of the busiest and most populous part of the United States shut down for five days. It has made each Monday in the same territory an enforced holiday for ten weeks.

Those responsible for the order say it was necessary because the railways could not haul all the coal that the mines could produce and other industries could consume—that this was the only way to relieve the transportation congestion and increase the movement of fuel.

This is but a partial explanation. Last summer the government created a fuel administration and put at its head a college professor, who knows little about fuel and less about administration. The great need of the country as regards fuel was a vast increase in production. No possible amount of conservation would make the supply sufficient. To get the needed increase of production the prompt adoption of large constructive measures was essential. Prices must be so fixed as to encourage the operation of mines which, under ordinary conditions, would be unprofitable. Production must be raised and kept to the very maximum possible during the summer and fall months when transportation conditions were favorable. It was desirable to divide the country into zones as was long ago done in England, so that coal would be consumed near where it was produced, and cross-hauling and waste of transportation be eliminated.

The large constructive measures needed were not adopted. Instead of co-operating with the railways as was necessary, the fuel administration spent its energies in "passing the buck" to them. With a fuel administration which knew anything about the fuel business there would have been a larger amount of coal produced and transported.

The rest of the explanation of the existing situation is that James J. Hill's prediction has been fulfilled. For twelve years the state and national governments have followed a policy of regulation intended to compel unrestricted competition between railroads and to reduce their net return to the lowest basis which the courts would not hold confiscatory. In consequence, while the productive capacity of our industries has been rapidly increasing, the expansion of the facilities of our railways has been rapidly decreasing. The final outcome was clear to every intelligent and sane railroad man or business man. It was as certain that under this policy

the railways in time would become unable to handle all the country's commerce as that the law of gravitation would continue to operate or the sun to rise in the morning and set in the evening. The fulfillment of Mr. Hill's prophecy has been precipitated by the war, but it was bound to come whenever from any cause there came a great increase of industrial activity.

Who have been chiefly responsible for the policy of regulation, which led to such results? Those responsible are Senator La Follette, Senator Cummins and other politicians of the radical class, who have succeeded in getting the states and the nation to adopt and persist in a punitive, repressive policy in dealing with the railways regardless of its effects on the railways, and on commerce and industry.

When the present transportation condition has been predicted, La Follette, Cummins and others of their class have replied that the railways were over-capitalized, and were earning too much, and that predictions of disaster were mere "calamity-howling." And what do they say now, when these predictions are being fulfilled? They say that the railways have "broken down"; blame the managers for the "break-down," and talk about government ownership as the remedy! The government under a new system of war control, and with the patriotic support of railway officers, is trying to retrieve the mistakes of the past; and certain of the radicals in and out of Congress are trying to reduce the compensation the administration proposes to pay the railways, to slash railway officers' salaries and to otherwise emasculate the administration's plan in ways that would undermine its effectiveness as a war measure.

The country is at the parting of the ways in respect to its railroad policy. It must choose whether it will follow in future those responsible for the policy which has paralyzed transportation and industry and who are now advocating government ownership, or those who have opposed the past policy of regulation, who have foreseen and predicted its results and tried to get it reformed and who are now opposing government ownership because they believe it would make conditions still worse, if possible.

Which class of leaders will the public follow in future? The answer to this question may exert as much influence on the economic and political future of the United States as the outcome of the great war.

New Books

Proceedings of the International Railway Fuel Association.

416 pages, illustrated, 6 in. by 9 in. Published by the association, J. G. Crawford, secretary, 702 East Fifty-first street, Chicago, Ill. Price, leather bound, \$1.50, paper bound, \$1.00.

This is the official proceedings of the ninth annual convention of the Railway Fuel Association which was held in Chicago, May 14 to 17, 1917. It contains papers with complete discussions on the following subjects: Powdered Coal; Storage Coal; Locomotive Feedwater Heating; Front Ends, Grates and Ash Pans; Car Shortage and Coal Shortage; Conservation Appeal; Council of National Defense; Fuel Economy in Relation to Reducing the Cost of Kindling Fires in Locomotives; Fuel for Small Furnaces; Graphical Daily Records of Performances of Enginemen and Locomotives; Soot, Tests of Six Grades of Coal from a Franklin County (Illinois) Mine; and Theory, Practice and Results of Fuel Economy. Of particular interest are the papers and discussion on locomotive feedwater heating and the tests made by the University of Illinois for the association, on Illinois coal. This book is a material addition to the information put forth by this progressive association, and contains suggestions which will to a very large extent assist in the conservation of fuel on railways.

The New Pennsylvania Entrance Into Indianapolis

A 41-Mile Line Between Ben Davis and Frankfort
Gives a Line to Chicago Over Its Own Rails

AT A COST OF MORE THAN \$1,500,000 OR EXACT \$10,000,000 per mile, the Pennsylvania Lines are now completing a new railroad in Indiana which will give the system a complete line between Indianapolis and Chicago. The new line is being built by a separate corporation, the Indianapolis & Frankfort Railroad, and is 41 miles in length. It extends north from a connection with the St. Louis division at Ben Davis, Ind., about six miles west of Indianapolis, to Frankfort on the Michigan division. These divisions are both parts of the St. Louis system of the Pennsylvania Lines which, until recently, was the Vandavia Railroad, and which is now a part of the new consolidated company, the Pittsburgh, Cincinnati, Chicago & St. Louis Railroad. The new line is being built under the direct jurisdiction of officers of the St. Louis system. At Lebanon, 27 miles north of Ben Davis, this line crosses the Central Indiana, which is controlled jointly by the Pennsylvania and the Big Four.

On the completion of this road the traffic of the Panhandle between Chicago and Indianapolis and the south, which is now handled over the Logansport and Richmond divisions, from Chicago, through Logansport to Kokomo, Ind., and then over the Lake Erie & Western to Indianapolis, will be diverted to the new route at Logansport, and will go over the Michigan division to Frankfort, and then over the new line to Ben Davis and Indianapolis. While no distance is saved by the new route for passenger traffic, it will be about six miles shorter for most freight movements. The grades are much lower and the traffic facilities will be much improved.

Under the present arrangements the east and west traffic of the Pennsylvania lines through Indianapolis is handled over the Indianapolis and St. Louis divisions. Divisions from Vincennes and Louisville also enter the city from the south and the freight is handled between the different lines by means of the belt line of the Indianapolis Union Railway. These divisions furnish the facilities for the east, west and south traffic. The existing Pennsylvania lines leading to the north of Indianapolis intersect the east and west lines at Terre Haute, 72 miles west of the city, and at Richmond, 68 miles east, meeting at Logansport.

The Pennsylvania has seven lines radiating from Logansport. The traffic originating at Indianapolis and on the divisions to the south, a large amount of which is coal from the southern Indiana fields on the Vincennes division, des-

and by the location of certain parts of the line to avoid slow speed movement through curves as by the construction of a new line. The same plan was suggested as a remedy of the situation showed that, with the traffic then being handled by the Pennsylvania, the advantages outlined justified the investment necessary for its construction.

In deciding on a new line opportunity was also taken to improve operating conditions at Indianapolis. The use of the Lake Erie & Western track north from Indianapolis

Relation of the New Line to Other Pennsylvania Lines

required the turning of all passenger trains on a curve at that point. The old arrangement also made it necessary for all of the coal trains to use the tracks of the Indianapolis Belt for about 11 miles and the congestion on this line led to excessive delays. Both of these conditions will be eliminated on the new line.

Surveys for the new line were first made in 1911. The maximum grades of the new line were established at 0.2 per cent northbound and 0.5 per cent southbound as compared

Map of the New Line

wood to points in the "gas belt" and in northern Indiana and to Chicago is handled north out of Indianapolis over the line of the Lake Erie & Western for a distance of 55 miles under a trackage agreement. This arrangement is unsatisfactory in several ways. Relief could be had either by increasing the facilities of the Lake Erie & Western, by the reduction of grades and the construction of second track

with 1 per cent grades in both directions on the old route. There are few curves on the new line and the sharpest are 1 deg. except for one curve at the Ben Davis connection. While for the present only a single track will be built right-of-way has been provided and the masonry has been built for a double track line.

The new line is also a part of the proposed future im-

provements including a connecting line from Ben Davis to Mooresville on the Vincennes line. By means of this proposed connection the traffic from the Vincennes division for points north of Indianapolis will be diverted from the present route through the city to this new connection, saving about 11 miles in distance and to an extent relieving the yards at Indianapolis and the St. Louis and Vincennes divisions near Indianapolis, where both divisions have ruling grades against the coal movement. The construction of the Indianapolis to Frankfort line provides a 0.3 per cent grade from the St. Louis division connection to Chicago, and a

A Standard Construction Trestle

0.3 per cent line can be had from the coal fields and from Louisville without prohibitive cost.

Grade Crossings Eliminated on New Line

As mentioned previously, the new line is 41 miles in length. Sufficient property was acquired for a double track line, the right-of-way being 100 ft. wide for the entire distance and wider where necessary. The country traversed is mainly flat and for much of the distance the tracks are carried on embankments, making frequent borrow pits necessary.

Passing tracks 4,500 ft. long are provided at intervals of about six miles. These sidings are so located that controlling grades are not encountered in leaving. The grades are separated at all highway crossings on these sidings.

The width of roadway at sub-grade is 24 ft. for single track and all slopes are $1\frac{1}{2}$ to 1. The tracks will be laid with gravel ballast, 85-lb. rail and untreated oak ties. Cast iron pipe is used for small drains up to 48 in. in diameter and reinforced concrete culverts for the larger openings, farm crossings and cattle passes.

There will be no crossings at grade with steam or electric railways, the new line in all cases being carried overhead. Twenty-four highways are carried under the track through subways and two cross overhead. These 26 crossings include most of the main roads so that the highways that cross the line at grade are generally unimportant. Where possible, at points where the line crosses highways near their intersection, marginal roads parallel to the right-of-way enable two crossings to be consolidated into one or allow part of the traffic to avoid crossing entirely.

Lebanon is the only town of any importance reached by the new railroad. Here the line passes through the outskirts of the city and is elevated, all streets being carried under the tracks through subways. A modern station will be provided at the street level and passengers will reach the platform at the track level by subways and stairs. An electric elevator will also be provided for handling milk and baggage. At the track level the layout will be built for double track. The passenger platform will be located between tracks and will extend across two streets and an electric line. The platforms over the bridges have already been built as a part of the bridges.

Property has been acquired near the business center of the city as a site for a local freight house and team tracks. This property will be reached over the Central Indiana tracks and the interchange track between the two railroads. Interchange tracks will be provided here.

In order to lessen the grading on the new line at the crossing over the Cincinnati, Indianapolis & Western it was necessary to depress the main track and a passing siding on that line. The maximum depression was about 6 ft. which necessitated a cut with a total length of 4,000 ft. The lowering of these tracks was done by the Indianapolis & Frankfort contractors.

Water stations will be provided at White Lick (mile 13), Lebanon and Frankfort. At the latter point the water facilities will consist of one 50,000 gal. and one 100,000 gal. tank, connected with a water softening plant.

Embankments Made from Four Borrow Pits

As previously mentioned, the new line is carried on embankments for much of its length, requiring a large amount of borrow. The grading consists of about 2,700,000 cu. yd. of filling and 230,000 cu. yd. of excavation exclusive of borrow pits. While the lighter fills have been made from side borrow, the general plan has been to secure the material from four large borrow pits located at intervals along the line, pit No. 1 being at mile 3, pit No. 2 at mile 9, pit No. 3 at mile 28 and pit No. 4 at mile 33. Between pits 2 and 3 the grading was light and most of the excess filling material was secured by the side borrow.

The heaviest grading on the line was on the first five miles north of Ben Davis. Through this district the line is entirely on embankments that exceed 26 ft. in height in places. The fill necessary in this section aggregates more than 1,700,000 cu. yd. which was all secured from pit No. 1. In the $4\frac{1}{2}$ miles north of this section where light cuts aggregating approximately 2 miles in length were made, several large fills were necessary which were made from material secured from pit No. 2.

Pit No. 1 is the one from which the most dirt was taken. It covers an area of about 75 acres. It is located $1\frac{1}{2}$ miles east of the new line, making the construction of a connecting line necessary. This line was double tracked for the entire distance. To permit the flexible operation of the material trains both north and south of the pit the tracks of the line leading to the pit were spread into a wye at the connection

A Typical Flat Slab Bridge for County Highways

with the new line. A double track crossover was provided just east of the point of convergence on the connection line, this arrangement permitting the trains on either of the connection tracks to reach the new line over either of the wye tracks.

The material in the pit is chiefly clay and existing springs together with the great amount of rain which fell during the season made it necessary to provide an outlet for the water by means of 18-in. tile drains leading to existing drainage ditches east of the pit. The high ground near the center of the pit was utilized for the location of water supply facilities.

ties for the shovels and engines, the water being pumped to the tank from a creek in the vicinity.

Two shovels were cut in on opposite sides of the pit, each working toward the high ground in the center. As a shovel progressed with a cut a track was laid close behind it over which it moved back before starting the next cut. After moving back, this track was utilized as a loading track. Working ten hours a day, the two shovels maintained an average output of 3,500 cu. yd. of material per day. The filling material was moved to the embankments in standard gage equipment the trains consisting of from 12 to 15 12-yd. cars.

The fills were made from trestles, consisting of four pile

Building the Double-Arch Bridge and Approaches at Prairie Creek

ents capped with logs and braced with three lines of girts. The stringers were 10 in. by 16 in. by 28 ft. long which were salvaged after the completion of the fills. Jordan spreaders were used in spreading the material after unloading from the cars.

The other pits were located adjacent to the new line. Standard gage equipment was used at pits 3 and 4 and narrow gage equipment at pit 2. At pit 1, 3 and 4 the grading outfits were brought in by rail, the connecting tracks also being used as construction tracks. At pit 2 it was impossible to secure such a connection and the equipment was brought in over a highway from Clermont, a station on the Big Four, 1½ miles distant. This was done by laying a standard gage track on a road in sections about 800 ft. long over which the shovel was moved. After the passage of the shovel the rails were moved in for the narrow gage engines and cars. The additional equipment for use in the pit was brought in by wagon.

The Bridges

Approximately 68,000 cu. yd. of concrete was used in the construction of the bridges and culverts. At highway crossings two designs were followed. Where the headroom permitted, reinforced arches with spans ranging from 30 to 50 ft. were built, and where the headroom was limited flat slabs of reinforced concrete or I-beams protected with concrete and with center columns were substituted. In cities the flat slabs were built in three spans with the supporting columns at the curb lines. At drainage ditches the bridges consist of 30-ft. deck girder spans and concrete abutments, this design being followed to permit the spans being removed for the passage of dredges as required by law.

Both stone and gravel were used in the concrete and in all reinforced concrete ten per cent by weight of hydrated lime was added to the cement. Abutments and wing walls were painted on the back with one coat of tar paint and the arches and flat tops were covered with Barret, Minwax or Lewis waterproofing. The formation encountered at the bridges was mainly clay which in some cases was soft. The foundation piles were timber, 20 ft. piles being used in most cases, driven from 14 to 18 ft.

With the exception of the labor shortage which has handicapped the contractor throughout the entire work, the construction of the bridges presented no special difficulty. While

timber stringers for the trestles were delivered to the site on flat trucks hauled along the right-of-way from connections with the railroad, trestle, it was necessary, at places to use teams and wagons. The construction plant consisted of 1 yd. mixer, 60 ft. towers and chutes for placing the concrete in the forms.

A portable plant was used at Lebanon where several bridges were built within a short distance. This plant consisted of a flat car with a tower and elevator at the forward end and a 30-yd. mixer. A trolley line with a capacity for 24 cu. ft. of material was pulled behind the mixer. The floor of the bin was sloped toward the mixer so that the materials might pass by gravity from the bin to the charging hopper. The hoisting engine and the ladder for the mixer were located at the rear end of the car. A locomotive crane hauled the material from the stock pile to the storage bin.

The largest bridge of arch design was built at Sugar Creek. It consists of three 65 ft. elliptical arches. No foundation piles were necessary at this point. Cofferdams of timber sheet piling were used in making the foundation excavation. The water was controlled during the excavation by centrifugal pumps and in order to obviate the possibility of trouble from high water, the work up to the springing line was built as a unit.

The concrete materials were brought in from Frankfort over the new line and unloaded into bins placed beneath the deck of the dumping trestle. The materials dropped by chutes from these bins into small push cars which ran on dinky tracks. The cars were pushed to the mixing plant by hand. The plant was located near the center of the bridge and consisted of a mixer, a tower and chutes. The arches were poured in three sections parallel to the track, each section being completed in a continuous run. Expansion joints filled with felt and asphalt were provided between sections.

The centering for the arches, which was jacked on the ground, was supported on falsework made up of two rows of bents with the necessary bracing and wedges. As mentioned, the arches were built in sections. Two rows of piles were driven about 6 ft. apart for each section, the rows being parallel to the bridge. These piles were capped with

Carrying New Line Over the St. Louis Division of the Big Four

12-in. by 17-in. timbers placed at right angles to the bridge. With these timbers of solid frame bents were built consisting of posts for uprights and 12-in. by 12-in. timbers for cross. These three bents were thoroughly braced to each other by means of poles. The second story of the falsework consisted of two rows supported on 12-in. by 12-in. piles laid transversely on the sides of the first story bents. Using these bents as supports the arch forms were held in place by pole braces and by ropes placed between them and the forms in front of which the adjustments were made.

and the forms were released after the concrete had set.

This line was incorporated early in 1916 and a contract for its construction was awarded about April 1 of that year. The masonry and grading work is now practically complete and the track laying and the ballasting will soon be finished. It is expected that the line will be turned over

to operation for freight traffic during the present winter.

The studies leading to the construction of the new line and the plans for the work were developed under the direction of F. T. Hatch, chief engineer of the Indianapolis & Frankfort Railroad. The contractor for the work was the Dunn-McCarthy Company of Chicago.

Five Coal-less Days and Ten Heatless Holidays

Fuel Administration Orders Curtailment of Coal Burning and a Suspension of Industries

WASHINGTON, D. C.

WITH THE EXCEPTION of plants engaged on work deemed particularly essential to the prosecution of the war or the production of food, the manufacturing industry of the eastern part of the United States came to a standstill on January 18 for five days as the result of an order issued on January 17 by United States Fuel Administrator Garfield, adding to the series of "meatless" and "wheatless" days with which the country has already become familiar a period of "coalless" days to be followed by nine "heatless" Mondays on which the use of fuel except by consumers classed as absolutely necessary is prohibited. The shutdown became less complete after the first day because the order was followed by a long list of exemptions, many of which did not become known until after the plants to which they applied had complied with the original order.

Advance notice of the order to cease operations was given out on the evening of January 16 and the order itself was signed on January 17, with the full approval of the President and such members of his cabinet as were consulted but without the advice and consent of the Senate, which only a few minutes after the signing of the order had adopted by a vote of 50 to 19 a resolution requesting its postponement for five days.

The order provided that on January 18, 19, 20, 21 and 22 preference and priority in the use of coal should be given only to a designated list of consumers, in which railroads were first named, whose consumption of coal is absolutely necessary; that during those five days no manufacturing industry, with a few exceptions, should be allowed to operate even if it had its coal supply on hand, and that the use of fuel except by consumers classed as absolutely necessary should be prohibited on Monday of each week from January 21 to March 25.

The exemptions made public on January 18 included a list of about 1,000 plants compiled on information furnished by the Secretary of War and the Secretary of the Navy and heads of other government departments, so that concerns supplying materials under contract to the government which are immediately needed and could be delivered without adding to the transportation congestion might not be forced to cease their production. Various special exemptions were also made. The list included the manufacturers of locomotives for the United States government and American railroads and also manufacturers of gas masks, explosives, rifles, pistols, machine guns and small arms ammunition, important forgings, war essentials needed immediately, Liberty Bond paper, chrome green, linseed oil, destroyers, forgings and boilers for destroyers, seamless tubes less than 1½ in. in diameter, condenser tubes for destroyers, aircraft and signal corps products, emergency navy contracts, products for the shipping board, emergency fleet orders and emergency government work. The further special exemptions included manufacturers of uniforms, optical glass and tents and equipment. The exemptions applied, however, only to the

manufacture of the materials specified and not to other products that might be made in the same plants. There were no general exemptions of industry.

The order aroused a storm of protest on the day following its announcement and on the first day of its effect, but after the exemptions had been announced, and the President had endorsed it, there was less opposition.

The Order and the Railroads

Whether the order was primarily intended for the conservation of coal or whether its chief object was to serve as a partial embargo on new freight offerings to the overburdened railroads, has been a point of lively controversy in Washington and particularly in Congress, which devoted most of its sessions to the discussion of the subject on January 17 and 18. Mr. McAdoo was asked the direct question during the testimony before the Senate Committee on Interstate Commerce on Monday, as to whether it was a coal order or a transportation order and replied that it was both. He said he had nothing to do with formulating it but had agreed to it and thought it would be beneficial and that an immense improvement had already resulted.

Interest in the administration railroad control bill was temporarily suspended for a time while Congress joined with the rest of the country in criticising the Fuel Administration's embargo on manufacturing. It soon became apparent, however, that while Fuel Administrator Garfield took full responsibility for the order, the authority of the entire administration was back of him. While the railroad administration at first took the position that its interest in the question was rather incidental, its attitude toward the effect of a virtual embargo on most kinds of new freight for five days, which would enable it to catch up on its coal movement and clear up congested terminals, was plainly one of more than equanimity. Freight Moving Week having turned out inauspiciously, as the result of the unprecedentedly severe weather, which the still unco-ordinated government weather administration had been unable to deal with successfully, a series of days during which coal could not be used for the manufacture of additional demands upon cars and locomotives while the director general was completing his organization, was obviously a source of considerable relief. Mr. McAdoo said he did not care whether it was called an aid to the director general or not, provided its result was beneficial.

Dr. Garfield was somewhat more outspoken in his announcements of his efforts to co-operate with the railroad administration. "The movement of coal in transportation," he said, "must be so directed as to aid the director general of railroads in dealing with the railroad emergency created by the recent blizzard conditions."

While Dr. Garfield also emphasized the desire to keep domestic consumers of coal warm he laid the greatest stress, both in his testimony before the Senate Committee on Man-

ufactures, which called on him to explain the order, and in his prepared statements to the public, on the effect it would have on transportation conditions.

In a statement accompanying the order, describing the conditions which he considered made it necessary, Dr. Garfield said:

Statement by Dr. Garfield

"The most urgent thing to be done is to send to the American forces abroad and to the Allies the food and war supplies which they vitally need. War munitions, food, manufactured articles of every description, lie at our Atlantic ports in tens of thousands of tons, while literally hundreds of ships, waiting loaded with war goods for our men and the Allies can not take the seas because their bunkers are empty of coal. The coal to send them on their way is waiting behind the congested freight that has jammed all terminals.

"It is worse than useless to bend our energies to more manufacturing when what we have already manufactured lies at tidewater congesting terminal facilities, jamming the railroad yards and sidetracks for long distances back into the country. No power on earth can move this freight into the war zone where it is needed until we supply the ships with fuel.

"Once the docks are cleared of the valuable freight for which our men and associates in the war now wait in vain, then again our energies and power may be turned to manufacturing, more efficient than ever, so that a steady and uninterrupted stream of vital supplies may be this nation's answer to the Allies' cry for help!

"It has been excess of production, in our war-time speeding up, that has done so much to cause congestion on our railroads; that has filled the freight yards to overflowing; that has cluttered the docks of our Atlantic ports with goods waiting to go abroad. At tidewater the flood of freight has stopped. The ships were unable to complete the journey from our factories to the war-depots behind the firing-line.

"Added to this has been the difficulty of transporting coal for our own domestic needs. On top of these difficulties has come one of the most terribly severe winters we have known in years.

"The wheels were choked and stopped; zero weather and snow-blocked trains; terminals congested; harbors with shipping frozen in; rivers and canals impassable—it was useless to continue manufacture and pile confusion on top of confusion.

"A clear line from the manufacturing establishments to the seaboard and beyond; that was the imperative need. It was like soldiers marching to the front. The men in the foremost ranks must have room to move.

"More than a shock was needed to make a way through that congestion at the terminals and on the docks so that the aid so vitally needed by the Allies could get through.

"The incidental effect of this transportation situation on coal production has been disastrous. There is and always has been plenty of fuel, but it cannot be moved to those places where it is so badly needed while railroad lines and terminals are choked. Throughout the coal fields scores, even hundreds, of mines are lying idle because of railroad inability to supply the cars to carry away their product. Coal mines cannot operate without cars. Cars cannot be supplied while the railroads are crippled by the present freight congestion, which keeps idle cars lying useless in the freight yards.

In the past week the production of coal has been disastrously reduced. Reports in some cases have shown 90 per cent of the mines in certain fields closed completely for lack of cars.

"This is war. Whatever the cost we must pay it so that in the face of the enemy there can never be the reproach

that we held back from doing our full share. If our ships, laden with our supplies of food for men and food for guns, must have fuel and coal to sail!

Order Endorsed by President Wilson

President Wilson also issued a statement saying that he had been consulted by Dr. Garfield before the order was issued and fully agreed with him that it was necessary.

"It is absolutely necessary to get the ships away," he said. "It is absolutely necessary to relieve the congestion at the ports and upon the railroads. It is absolutely necessary to move great quantities of food and it is absolutely necessary that our people should be relieved in their homes, if not where else, and half way measures would not have accomplished the desired ends.

"If action such as this had not been taken, we should have limped along from day to day with a slowly improving condition of affairs with regard to the shipment of food and coal, but without such prompt relief we had become absolutely necessary because of the congestion of traffic which have been piling up for the last few months.

In a later statement apparently intended as an answer to those who had advocated cutting off the coal supply of non-essential industries rather than a general temporary curtailment, Dr. Garfield said in part:

"Industry is in an unbalanced condition. We lack many essentials—food, clothing, fuel. We have piled up enormous stores of things not essential to life but very essential to war. We have piled them so high on our docks and in our storehouses that the ships available cannot carry them away as fast as they pile up.

"The food supply is threatened to an even greater degree than the fuel supply. This condition is in large part due to the congestion that at many points holds the loaded cars in its grip.

"To single out industries not engaged to some extent in war manufacture is to select industries which in the aggregate will bring relief only if suspended indefinitely. To require all industries except a comparatively small part to cease for a few days quickly accomplishes the desired result and permanently injures none.

"The order as it stands puts all industry on an equal footing, favoring none and avoiding unfair competition, but this reason alone is not sufficient. This reason, plus the fact that the order will put coal in the empty cars of the people, will save coal, will aid in breaking up congestion of traffic and in furnishing an adequate supply of coal to the people who need it and to the ships which cannot wait without us—these are sufficient reasons and justify the order.

"Only those industries producing necessary war material that can be promptly delivered are permitted to operate during the suspension period. To permit industries with a coal supply on hand to operate would allow many of the most essential to continue while those of the most essential would be compelled to stop.

"Moreover, to use these famous words to produce a coal glut to continue would result in giving to the producers and shippers who also are concerned at a time of such dire need the means to continue production of coal would be result. To have allowed the application of the order would only have added to the congestion. If we are under a condition of military necessity such would have served to the answer to increase the supply of coal and other war essential during the suspension of the operation of the order."

A report was published to the effect that the fuel order would be frustrated by coal-brokers from the former general of the coal fields, planning an embargo against the transportation of non-essential goods, that it was authoritatively stated that neither the Board nor considered by Mr. McAlister. The objection strongly considered such a move unnecessary because the fuel order would give the railroads a "running

spell, and, while he considered Dr. Garfield's order in the light of a necessary surgical operation, he thought its results would be beneficial in the end. He hoped that with an improvement in weather conditions such as was reported east of the Allegheny mountains on Friday, the more effective use of freight cars resulting from the increased demurrage charges, which Mr. McAdoo believes will increase freight car efficiency 25 per cent, and with the assistance afforded by the delivery of 700 additional locomotives to the eastern roads, the roads will be enabled to handle all the freight offered without embargoes, while essential freight will be given preference. Mr. McAdoo has made it plain that he does not intend to cut off non-essentials unless the necessity for it should become more apparent than it has so far.

Mr. McAdoo sent the following telegram on January 18 to the presidents of all railways in eastern and southern territories:

"In view of the order of the Fuel Administrator for a five-day cessation of industrial activity in this territory for the purpose of accumulating and distributing an ample fuel supply, I urge and direct that every possible effort be made by the railroads to move coal and to co-operate to the limit with the Fuel Administration for the accomplishment of the desired end.

"I hope that the officers and employees of the railroads will do their part so effectively that there may be no further occasion for interruption of the industrial and normal activities of the nation."

On Saturday the fuel administrator, at the request of A. H. Smith, assistant director general of railroads, made arrangements looking to the pooling of facilities for bunkering ships at the port of New York. The assistant director general, in a telegram to the fuel administrator, set forth that some piers which were supplied with coal had no barges to transport the coal to vessels in the stream, and that other piers having no coal were well supplied with barges. After a consultation with Chairman Hurley, of the United States Shipping Board, the fuel administrator advised the assistant director general that a personal representative of the Shipping Board would be sent at once to New York to take charge of the proposed pooling arrangement. J. W. Searles, personal representative of Fuel Administrator Garfield at New York, was directed to extend his full co-operation in perfecting the plan.

General compliance and almost complete co-operation in the enforcement of the fuel administration regulation curtailing industrial use of fuel were reported to the United States Fuel Administration on Saturday. Railroad officials reported generally improved transportation conditions in the eastern part of the country. The reports indicated that the way was rapidly being cleared for the movement of coal for the bunkering of the ships now held up at Atlantic ports and for keeping the country warm. Improvement was also noted in the central west, despite the continued zero weather, which has been impeding railroad operations.

Reports from the Baltimore & Ohio showed a car supply of 1805 cars available for coal mines in West Virginia. This was an increase of 400 over the number available the day before. On the first day the restrictive regulation was effective the Baltimore & Ohio moved 1100 loaded coal cars consigned in accordance with the order out of the West Virginia coal fields. This was the best movement of coal that this railroad company has shown in that district in 60 days.

From Philadelphia it was reported that rail conditions generally on the lines operating between Altoona and Philadelphia, which have been badly congested, were much improved.

Reports direct to the fuel administration showed that coal in transit consigned to or already arrived at tidewater

points for the bunkering of ships destined to the American forces in Europe and to the nations associated with the United States in the war were more than sufficient to bunker the ships now in port and supplies sufficient to insure the prompt bunkering of vessels for some time to come were en route. Upwards of 300,000 tons of coal was in cars for bunkering and is on the way to South Atlantic ports. Approximately 150,000 tons is in cars en route for northern Atlantic ports. With the improved rail conditions this coal should rapidly fill the requirements of the vessels now awaiting bunkers.

At the request of the United States Fuel Administrator, the director general of railroads placed an embargo on the use of open-top coal cars for the shipment of products other than fuel.

The fuel administration was notified that 3,000 cars of coal were moving on one railroad to the east; 1,000 was consigned to tide-water for bunkering ships and 2,000 was on the way to domestic consumers.

On Sunday reports from the mine fields indicated that snow and zero weather were interfering with railroad movement of coal, but that empty coal cars were moving promptly back to the mines. Weather conditions in the middle west, particularly, were reported as interfering with general railroad operation. Deep snow and as low as 20 degrees below zero in some parts of the country combined to make train movements difficult.

The improvement in the weather did not continue, however, and on Monday Dr. Garfield announced that while more fuel had been made available for domestic consumers and bunker coal was moving to tidewater in sufficient volume to supply transatlantic shipping, the third aim to be accomplished, the clearing of railroad congestion, had not yet been attained because of adverse weather conditions.

The Pennsylvania Railroad declined to accept any general freight for shipment and other roads placed local embargoes but Mr. McAdoo declined to order a general embargo.

Disappointed with the results of the five days' suspension of industry, Fuel Administrator Garfield has recommended to Director General McAdoo that an embargo be placed for a few days on general freight except fuel and food. Mr. McAdoo was not inclined to favor it and a committee has been appointed consisting of Howard Elliott and A. G. Gutheim, representing the railway administration, to work with two representatives of the fuel administration in developing a plan for eliminating the cross hauling of coal by restricting the shipments to the zones of production.

The geological survey reports that the 1917 production of bituminous coal was 544,000,000 tons, or an increase of 8.3 per cent over 1916.

On Tuesday the total number of ships coaled at the New York harbor was 24, and all of the most important ships had been supplied and were sent on their way. The number of ships waiting on Wednesday morning to be coaled was 80; not all of these, however, were scheduled to sail at once.

W. B. Pollock, marine superintendent for the railroads' committee at New York, said on Tuesday that the loading of 353 empty lighters had been seriously hampered at the loading points by the desertion of large numbers of laborers, practically all of whom are Italians and Poles. On Tuesday, when a light snow was falling nearly all day, 1,060 men refused to work on the ship bunkering barges. In addition hundreds of men quit work for the day, at least, at the docks in New Jersey.

The men engaged in bunkering steamers could earn \$200 a month by working full time. But they are paid on the hourly basis, and they lie off whenever the weather is bad. The pay is 55 cents an hour for day work, 80 cents an hour for night work, and \$1.05 an hour on Sundays.

McAdoo Appoints Three Regional Directors

Railway Wage Commission to Investigate Labor Questions.
Weather Interferes with Transportation

THE DIRECTOR GENERAL OF RAILROADS, W. G. McAdoo, on January 18, issued General Order No. 4 announcing that for purposes of operation the railroads of the United States will be classified as Eastern, Southern and Western Railroads, defined as follows:

Eastern Railroads.—The railroads in that portion of the United States north of the Ohio and Potomac rivers and east of Lake Michigan and the Indiana-Illinois state line; also those railroads in Illinois extending into that state from points east of the Indiana-Illinois state line; also the Chesapeake & Ohio, the Norfolk & Western and the Virginian railways.

Southern Railroads.—All railroads in that portion of the United States south of the Ohio and Potomac rivers and east of the Mississippi river, except the Chesapeake & Ohio, Norfolk & Western and the Virginian railways; and also those railroads in Illinois and Indiana extending into those states from points south of the Ohio river.

Western Railroads.—All railroads not included in the above definitions and, broadly speaking, all railroads in the territory west of Lake Michigan and of the Indiana-Illinois state line to the Ohio river and west of the Mississippi river from the Ohio river to the gulf of Mexico, excepting those railroads in Illinois included in Eastern Territory, and those railroads in Illinois and Indiana included in Southern Territory, as above stated.

A. H. Smith, president of the New York Central, is appointed regional director, with office at New York, in charge of the operation of Eastern railroads.

C. H. Markham, president of the Illinois Central, is appointed regional director, with office at Atlanta, in charge of the operation of Southern railroads.

R. H. Ashton, president of the Chicago & North Western, is appointed regional director, with office at Chicago, in charge of the operation of Western railroads.

Orders issued by the gentlemen named in their capacity as regional directors will be issued by authority of the director general and will be respected accordingly.

Railroad Wage Commission Appointed

Director General of Railroads McAdoo has announced the appointment of a Railroad Wage Commission to make a general investigation of the subject of railroad wages in the United States. The director general named as members of

the commission Franklin K. Lane, Secretary of the Interior, Charles C. McChord, member of the Interstate Commerce Commission, J. Harry Covington, chief justice of the supreme court of the district of Columbia, and William R. Willcox of New York. The members of this commission are all men who have had experience in dealing with problems like that referred to it.

The commission held its first meeting at Washington on January 21 and organized by electing Secretary Lane as chairman. W. A. Ryan was appointed secretary of the commission. It was decided to appoint a board of four examiners and a statistical board of three members. Public hearings will be held at Washington and it was stated that some results could be expected in about 60 days.

Secretary Lane was for eight years a member of the Interstate Commerce Commission, and was also the chairman of the board, consisting of himself, the Secretary of Labor, Daniel Willard and Samuel Gompers, which brought about the wage agreement between the railroads and the four railroad brotherhoods last year pending the adjournment of the Adamson law.

Commissioner McChord was formerly chairman of the Kentucky Railroad Commission. During his eight years of service as a member of the Interstate Commerce Commission he has been largely concerned with those regulatory laws which directly affect railroad employers, and during 1916 had charge of the investigation of car shortage problem.

Judge Covington, prior to his appointment as a federal judge in 1914 was a member of Congress, serving on the Committee on Interstate and Foreign Commerce, the committee which considers all railway legislation in the House of Representatives. He was the President's personal representative last summer on a mission to the Pacific Coast states in connection with labor trouble existing there.

Mr. Willcox was chairman of the Republican National Committee last summer, after receiving the new appointment. After serving as comptroller of New York City, he was subsequently Governor Hughes' chairman of the New York Public Service Commission for the Fuel District and served upon that body for six years.

The commission has been appointed with a view to determining the causes of the railroad claims of labor upon the railroads, and to see not only the train service but also the ferry, passenger service, steamships and the other claims.

many of which had presented demands to individual railroads. It will begin its work at once, and will report to the director general, giving its recommendations in general terms as to changes that should be made. Upon this report the director general will make a decision.

In dealing with such a complex problem as railroad wages, the powers of the commission must be very broad if it is to report a satisfactory result. It is therefore authorized to make a general investigation of the whole field of railroad labor—the compensation of persons in the service of the railroads, the relation of railroad wages to wages in other industries, the conditions in different parts of the country, the special emergency respecting wages which exists at this time owing to war conditions and the high cost of living, and the relation between different classes of railroad labor.

The creation of this commission is the culmination of a large number of complaints and demands of employees which have been pending before the railroad managers for some time past. These complaints and demands were brought to the attention of the director general shortly after the assumption of the operation of the railroads by the government. They came in all forms, from various classes of railroad labor organizations and from various groups of unorganized employees of the railroads.

President Wilson sent the following letter to each member of the commission:

"May I not assure you of my appreciation of your acceptance of the invitation extended to you by the director general of railroads to serve as a member of the important commission he has appointed to inquire into the question of wages of railroad employees in the United States?"

"This is one of the most important problems of the moment and is worthy of the unselfish and disinterested service you have so patriotically undertaken to render."

In the case of the brotherhoods an agreement was reached at a recent conference between their representatives and Mr. McAdoo that whatever decision was made would become effective as of January 1, 1918.

Shippers Confer with Director General

A special committee of the National Industrial Traffic League called on Mr. McAdoo on January 17 to offer their co-operation and to discuss the relations between shippers and the railroad administration. They made a suggestion that a representative of the shipping public be appointed to the director general's Advisory Board, but Mr. McAdoo told them that the board represented the entire public. They also suggested a change in the new scale of demurrage rates which went into effect on January 21, proposing instead of the progressive scale ranging from \$3 to \$10 a rate of \$5 for the first few days and \$10 thereafter, to obviate the difficulties caused when cars on which demurrage has accrued are switched without reference to the number of days they have been detained. The shipper or consignee would naturally prefer to have the most expensive car moved first but it is difficult to handle the cars in that order. The National Industrial Traffic League proposed a similar change last year after the scale of \$1, \$2, \$3, \$4 and \$5 had been in effect for a time and the railroads agreed to substitute the flat rate of \$2 for the first three days, increasing to \$5 thereafter. The shippers also objected to the abolition of the average agreement and the bunching rule. The suggestions were referred to Edward Chambers, Mr. McAdoo's traffic advisor.

State Commissions Reassured

The authority of state railroad commissioners is not impaired by the federal control of the railroads, Mr. McAdoo told a delegation of representatives of state commissions at a conference in Washington on January 16. The delegation was headed by E. C. Niles, of New Hampshire, presi-

dent of the National Association of Railway and Utilities Commissioners, and they expressed to Mr. McAdoo their fears that it might be the intention to nullify their authority, as the President's proclamation declared that the railroads shall remain subject to all *existing* statutes and orders. They also said that in some instances railroads had already refused to obey their orders; but they were assured that unless and until the director general chose to exercise his paramount authority their status remained unchanged. Mr. McAdoo advised them, however, not to impose requirements involving capital expenditure except in cases of absolute necessity and the commissioners promised their co-operation in every way.

Cars Wanted for Corn Loading

Representative Medill McCormick of Illinois has placed before Mr. McAdoo a letter from Food Administrator Hoover on the need for sending box cars west for loading with corn. It was stated that the country elevators are filled and that corn is rotting in the fields because so many cars of western roads are in the east. Mr. McCormick suggested the appointment of an experienced railroad executive to devote his attention to the corn movement. Mr. Hoover's letter said in part:

"It does not appear to me that the movement of this most critical and essential foodstuff necessarily conflicts with the movement of coal. Grain moves in box cars and coal in open top cars. I am informed that a large number of box cars are daily loaded with pianos, furniture, graphophones, beer, whisky, etc., which are not so essential at the moment as grains. It is estimated that the eastern roads have anywhere from 20,000 to 40,000 box cars belonging to the grain roads and unless these can be returned and put into their proper employment there is little solution of the problem."

New Locomotives Ordered Diverted to Eastern Lines

For the purpose of increasing the supply of locomotives on the eastern roads, many of which are conspicuously short of power, Mr. McAdoo has ordered the locomotive builders to deliver all locomotives turned out in January, February and March, on orders from the railroads, about 700 in all, to be turned over to specified eastern lines, regardless of the road that ordered them. About 150 are to be delivered in January, about 250 in February and 250 in March.

Mr. McAdoo has been in conference with officers of the locomotive companies in the effort to secure early delivery of engines which have been ordered and in making arrangements for obtaining the use of locomotives ordered by the Russian government. As one of the great sources of difficulty has been the shortage of labor for repairing locomotives, efforts have been made to transfer men from the western and southern lines to the eastern lines.

Blizzards Interfere with Freight Moving Week

Weather conditions throughout the eastern district have continued to interfere with the efforts of the railway managers and the director general to clear up congestion. The efforts to make last week a general freight moving week were rendered almost fruitless by the continuance of blizzards in the middle west and below zero weather in the east, and while the five-day shut-down of manufacturing plants resulted in some improvement and certainly prevented congestion from increasing as it otherwise might have done, its results were far less than had been expected. On Monday night Mr. McAdoo received the following report from A. H. Smith:

"Very severe weather over entire Eastern District. 9 below in New England. 31 below in Pennsylvania. 20 below in Northern New York State, and snowing and blowing. 15 below Ohio. 5 below West Virginia.

"There was severe shortage of labor at engine terminals

and many men failed to report to work. Many of those who did report went home on account of severity of the weather, interfering with train operations and slowing up things very much.

There is much ice in the yards which is interfering with switching. So far as possible we are getting labor to pick it out.

At 10:30 o'clock this morning weather clearing and moderating and situation is improving.

We are concentrating on getting empty to the mines and movement of coal out, also movement of food-stuffs east of Chicago, which must be kept up.

Anthracite producing regions still affected by the freezing, and improvement can only come with higher temperatures.

Accumulation of freight held out for New York continues to show reduction.

Harbor conditions improving.

Steamers bunkered 14, with total of 10,320 tons."

On account of the extremely severe weather, which has particularly affected operations of railroads crossing the Allegheny mountains, Director General McAdoo on Wednesday, upon recommendation of Regional Director Smith, authorized him to place an embargo on all freight, except food, fuel and such war munitions and war supplies as are specifically approved by the War Department, upon the Pennsylvania Lines East of Pittsburgh, Baltimore & Ohio east of Ohio river, and Philadelphia & Reading for the purpose of enabling these lines, which are the heaviest bituminous coal carriers, to continue specializing upon coal for the double purpose of relieving the acute conditions in New England and the Harbor of New York and elsewhere, and to provide empty cars for the mines and coke ovens. This embargo is a temporary one. It should last but a few days if the weather moderates.

Metropolis Bridge Now in Service

THE PHOTOGRAPHS SHOW TWO VIEWS of the recently completed Ohio river bridge which connects the Chicago, Burlington & Quincy and the Nashville, Chattanooga & St. Louis at Metropolis, Ill. This structure was

View of the Bridge from the Kentucky Side, the Long Span in the Foreground

recently opened to service and affords a new all rail route for traffic from the northwest to the southeast. The bridge is notable primarily as containing the longest simple truss

span in the world, 720 ft. between end supports. Various phases of the progress in this structure were covered in the *Railway Age* numbers of July 2, 1915, page 109, May 12, 1916, page 114, and September 8, 1916, page 109.

In addition to the use of the long truss span, a time of construction selected because of the inaccessibility of securing river transportation, attention must be made of another distinctive feature of the bridge, the use of concrete steel for the main compression members. The great truss members from the falsework on December 12, 1915, commenced on being followed during 1917 by that of the falsework main spans, each 255 ft. long, but of the same general type of construction as the main span. The north approach 1,290 ft. long and the south approach 600 ft. were completed previously. The erection of the record span on falsework revealed unusual

The Portal of the 720-ft. Span

problems requiring the use of more unusual equipment and methods, such as a 150-ton locomotive crane having a maximum boom length of 185 ft. and the 50-ton hydraulic jacks used in lowering the span free from the falsework.

The substructure also involved noteworthy features that were brought about primarily through the necessity for a large spread of the footings because of the low bearing pressure permissible on the available foundation material. Structural steel and reinforced concrete worked largely into the design of the caissons and large timber piers were used to float the caissons into place.

The work on this structure was started in the early part of 1915. The substructure was built by the Union Bridge & Construction Company of Kansas City, and the superstructure was fabricated and erected by the American Bridge Company. The bridge was designed and its construction started under the direction of C. H. Critchfield, late chief engineer of the Chicago & Eastern Illinois Railroad and bridge engineer of the Chicago, Burlington & Quincy. Ralph Modjeski, Chicago, Ill., was consulting engineer on the project and took over the execution of the work following the death of Mr. Critchfield.

The Baghdad Railway and Its Part in the War

The Mesopotamia Campaign Has Hindered the Completion of This Threat Against Egypt and India

THE BRITISH CAMPAIGNS in Palestine and Mesopotamia, which occupy a prominent place in the news of the day, may be observed in a new light when it is considered that one of the urgent reasons for them is the forestalling of the completion of the Baghdad Railway and its being put into effective military use as a route towards the Suez Canal and towards India. This fact was clearly brought out by H. Charles Wood in an illustrated lecture on the Baghdad Railway in the war, delivered before the American Geographical Society in New York on January 8. Mr. Woods is a fellow of the Royal Geographical Society

follow a line which would necessitate the shortest sea passage. The other, and from political and military points of view, far more important reason for the change of plan was that German influence in Turkey was entirely directed toward the construction of a Baghdad Railway which would not be easily attacked by a group of powers possessed of the command of the sea.

Indeed, the Germans have always realized the importance of the fact that Constantinople, the Bosphorus and the Dardanelles were and are interdependent and that in the defense of the straits and the construction of railways there existed

The Baghdad Railway*

and an author of several books on the Near East. An abstract of his paper follows:

In opening his lecture Mr. Woods briefly referred to the earlier schemes for the construction of a railway from the Mediterranean to the Persian Gulf—schemes which were more or less dropped in 1876 when the British purchased shares to the value of \$20,000,000 in the Suez canal. From that time onward two reasons gradually led to the connecting not of the Mediterranean, but the Bosphorus with the Persian Gulf. The first of these was that from the moment of the opening of a through railway to Constantinople in 1888, the overland route to the Persian Gulf was naturally destined to start from the Turkish capital and therefore to

a sort of set-off to British sea power. Thus while a line starting from the Mediterranean would have been valueless to Turkey or Germany as a means of through communication between East and West or vice versa, a railway only broken at Constantinople gives to the enemy an iron road, the value of which is one of his principle assets in the war. In short, so long as the forts of the straits remain intact the Sultan and his allies enjoy the advantage of naval supremacy in a limited area—the Bosphorus, the Sea of Marmora and in the Dardanelles—without the possession of a fleet.

Counteracting British Sea Power

That this question of counteracting British sea power has never been forgotten by the Germans is also clearly demonstrated by the fact that they objected to a modification in

*Map adapted from a similar map in the National Geographic Magazine. Opportunity was lacking to compare it with the map shown by Mr. Woods at the lecture.

the original route to be followed by the Baghdad Railway, a modification destined to have taken the main line through Alexandretta and Aleppo instead of by the more northerly route through Baghche. This modification, which was strongly advocated in many quarters after the Young Turkish Revolution of 1908, would have had the dual advantage of placing Alexandretta and Aleppo on the main line, and also of taking the railway, not through the heart of the Amanus mountains, but by a more southerly route which would have minimized the course of construction. But had it been accepted, such a change would have meant that instead of the railway going within about ten miles of the coast, it would have run for a good many miles actually along the sea shore. In case of war, therefore, there would have been a much greater menace to the Turkish and German communication from the sea, for while the section of the railway in the neighborhood of the Gulf of Alexandretta is still the most easy of attack, that attack would now constitute a far larger undertaking than were the line to have run close to the water's edge.

The Route

Before entering into a detailed account of the history, geography and construction of the Baghdad Railway, Mr. Woods went on to give a general account of the present facilities provided by that line. Starting from Scutari opposite Constantinople, since the recent opening of the Taurus and Amanus tunnels through communication has been established as far as a junction located about ten miles to the north of Aleppo. From here the northern prong, or Baghdad Railway proper, continues in an easterly direction, certainly as far as Heli and probably at least to Nisibin—thus making about 1100 miles of line in working order. At the other, or Baghdad end, the railway has been completed in a northerly direction for 75 miles, and as far as Samarra. This means that out of the total distance of approximately 1,500 miles from Constantinople to Baghdad, nearly 1,200 miles can be accomplished by train. Moreover of the remaining 300 miles not more than about 150 have to be covered by road, for the rest can be accomplished in boats and rafts docketed or sailed down the River Tigris from Mosul. In addition, as the railway now crosses the Euphrates at Jeraheles, there is an alternative means of communication with Mesopotamia by way of that river as far as Feludjah, now connected by a light railway with Baghdad. The military advantages which have and are to accrue to Turkey in her Mesopotamian campaign are therefore obvious. But, in addition, the Baghdad Railway now also provides the easiest and quickest means of communication between Constantinople and northeastern Asia-Minor, for the distances to be covered by road from its present terminus, near Nisibin, are less than those which otherwise have had to be traversed from Angora—formerly the nearest point in railway connection with Constantinople.

From Aleppo the great southern prong which is not part of the Baghdad system proper runs through Damascus to Persia. From there two roads proceed southwards. The first is the Hedjaz line which nominally goes as far as Medina. The second bends in an easterly direction towards Haifa, but before reaching that point turns south near Nazareth, ultimately extending as far as El Ajja a few miles to the southwest of Beersheva. Although there is at least one break of gauge at Kayak, not at Aleppo, as is sometimes stated, the strategic importance of these lines, some of which have only been built since the beginning of the war, is enormous. They rendered possible the formerly threatened attack upon Egypt, and they enabled the Turco-Germans to bring up the reinforcements with which they so strongly opposed the British advance at southern Palestine. That this advance has now been successfully accomplished, is a matter of enormous political and military importance. In

addition to giving the British a lead in the north and in the desert, the occupation of Jerusalem and of its neighbourhood provided them with a good example of play for future operations.

The History of the Project

In 1858 the only iron railway existing in Asia Minor was completely, or at least practically, in the hands of the British capitalists. Thus, London, to the greatest detriment of German influence in the Near East, had won one of these lines had passed out of British control as the result of the war, and the Germans dominated the communication in the Asiatic dominion of the Silesians.

In 1875 they obtained power to proceed the railway from Esaki-Shehr to Konia, thereby establishing communication with the railway from Smyrna to Arian-Karahissar. This connection was of considerable value in the Dardanelles campaign, for it was by way of this line and by its branch to Panderna on the Sea of Marmara, that the Turks were able to convey many of their reinforcements to the eastern neighborhood of the southern shores of the Straits. This resulted in the substitution of a very short sea trip for a longer voyage from Constantinople to the Peninsula of Gallipoli—a longer voyage which was dangerous owing to the presence of allied submarines in the Marmara.

From the time of the opening of the railway to Konia in 1896 the German plans became more definite and positive. A verbal promise having been given in 1878, the final concession for the Baghdad line was secured in 1890. It was not only the right of the construction of a line from Konia to Basra, but it also authorized the building of several branches and the construction of ports at Basra, Hama, and at some point on the Persian Gulf. It laid down the financial arrangement to be entered into by the government and the company, which included a kilometer-guarantee of \$7,100 per kilometer.

The completion of the first section of the line from Konia to Panguhlu was followed by a projected delay. This was due partly to the fact that the second or Persian section was the most costly of construction of the whole line and partly to the international complications which arose in rescheduling the necessary guarantees and to the possibility of international cooperation in the scheme. Even after the signature of the necessary documents in June, 1900, there was a further delay owing to the revolution created by the Young Turkish Revolution of the following month.

After carefully describing the difficulties and because of the Turkish section and showing that the railway followed not the ancient route to west of the Cilician Gates, but a more easterly line by way of the valley of the Chabur-Su, Mr. Woods took up the enormous importance of the concession granted to the Germans in 1911 for the construction of a branch to the port of Alexandretta. This concession finally disposed of the issue of a second section in the original route—a concession which would have taken the main line of the road through Alexandretta to Aleppo instead of to the present more northerly line through the Amanus. Moreover, the railway there requires really consideration as a line of the type of Alexandretta and Bagdad arrangement should to be carried on that branch proposed by the Germans to Kani-Ghis. Consequently, however, the importance of the part of Alexandretta was of great importance. (The) journal also stated of importance for the Baghdad Railway in its own right.

In addition, the railway route to be found in Alexandretta, the new concession, made between the Ottoman Government and the Germans in 1911 made a provision for the building of a line from Bagdad to Bagdad. At the same time the concession was also intended to be right in the construction of the section from Bagdad to the Persian Gulf. But since it was then not yet possible to find a definite and definite

with many of the more important results which preceded and followed the signing of this agreement, those events might be possessed of political consequence, the significance of which it would be impossible to exaggerate. It came almost directly after the meeting of the Czar with the Emperor at Potsdam in November, 1910, a meeting during which the relations existing between Russia and Germany were temporarily adjusted. Though the exact nature of that agreement was not known until afterwards, it was certain that Russia agreed no longer to oppose the construction of the Baghdad Railway, and either herself to build or to allow the Germans to build a line from Khanikin—the terminus of a branch already agreed upon between Turkey and the Baghdad Company—to Teheran. As compensation for this the Russian position in northern Persia was recognized by Germany. It remained then for Berlin to negotiate with England and France for agreements concerning future developments in their respective spheres.

The Tripoli War of 1911 and the Balkan War of 1912 were not, however, favorable periods for negotiation, and it was thus only in 1913 that Turkey in agreement with Germany dispatched to London the ex-Grand Vizier—Hakki Pasha—to try to bring about agreements to be drawn up between the foreign office, the German Embassy and the Ottoman Embassy—agreements to settle the outstanding differences as regards the Baghdad-Persian Gulf section and other cognate matters of river transport in these regions. This agreement peaceably presupposed a continuance of friendly and peaceful relation between Turkey, Germany and Great Britain, and it is believed that it was practically already concluded when in August, 1914, Great Britain found herself compelled to declare war on Germany, Turkey subsequently throwing in her lot with the enemies of this country.

The Service Called For

Turning to the actual facilities which the railway provides or which it might provide for travel, Mr. Woods said that the agreement with the company stipulated for the provision of a fortnightly express train between Constantinople and the Persian Gulf, and vice versa. This train was to run at an average speed of about 28 miles an hour, including stops, for the first five years from the opening to traffic of the whole of the main line, that speed subsequently to be increased to 37 miles an hour including stops. This meant that were the express train to run at its lower speed the journey from Constantinople to Baghdad would be accomplished in about 54 hours, and from the Turkish capital to Basra in about 66 hours. Taking the pre-war time necessary for the journey from London to Constantinople by the "Orient Express," and allowing for a very short delay at the latter place, theoretically it would be possible to travel from London to Basra in about six days. From Basra to Bombay the distance is just over 1900 miles—a distance which at say 20 knots could be accomplished in about 84 hours. Thus taking all the conditions at their most favorable value and allowing only a margin of five hours in Basra, travelers and mail could be conveyed from London to Bombay by that route in just under ten days instead of as before the war in between 13 and 14 days. But against these advantages must be set the facts that the journey by way of Brindisi and the Suez Canal could be speeded up and that on the great cross-country journey from Constantinople to the Gulf there would be bound to be considerable delays and irregularities in the running of the railroad trains.

Influence on Allied Military Plans

Mr. Woods went on to point out that knowledge of the coming improvements upon the Baghdad and Syrian Railways must have had a prominent influence upon the Allied

plan of operations. In November, 1914, when the Ottoman Government threw in its lot with the Central Powers there was a gap of 30 miles in the Taurus, the Amanus tunnels were not complete, the Jerabelus bridge across the Euphrates was not in position, and the terminus of the railway was at Tel-el-Abiad, only about 60 miles to the east of the river. This meant not only that the Turkish reinforcements and material destined for Mesopotamia had to be detrained at least twice, but that the enemy was unable to derive the full benefits provided by the Euphrates route for water transport. Under these circumstances it was obvious that it was necessary to forestall the Turks and to inaugurate a Mesopotamian campaign before the improvement and completion of the Baghdad Railway. Moreover, the fact that the enemy was compelled to utilize the finished parts of the line for military purposes prevented these sections from being available for the transportation of railway material to be utilized for the extension of the line. Equally in regard to the Syrian campaign, had the British delayed taking the proper precaution on the Egyptian frontier until the opening of the Taurus and Amanus tunnels and until the completion of the new railway on the west of the Jordan, the magnitude of their task and the dangers of the situation would have been enormously increased.

The Future Prospects

It is difficult, if not undesirable, to make a detailed forecast as to the future of the Baghdad Railway and of the other lines in Asiatic Turkey. The only alternative was, therefore, to say that two things seemed certain—firstly, sooner or later the Baghdad or some other line from the Bosphorus to the Persian Gulf would be completed—and secondly, its ownership and control would depend not so much upon any agreement already made as upon the results of the war and particularly upon the fate of Turkey. For years the Germans have turned their attention towards the development of an influence which, so to speak, pivoted upon the Baghdad Railway. It is for this reason that whatever concession might be offered to them nearer at home the Allies must leave no stone unturned to prevent the conclusion of a peace which will leave the enemy still possessed of the predominating control in an undertaking, which, once it were robbed of its political significance could easily be established upon an international basis and controlled as a result of some scheme of internationalization.

TRANSPORTING TROOPS TO THE ITALIAN FRONT.—A British authority, Major Redway, has contributed to the London Globe some interesting calculations relative to the movement of troops by rail, with special reference to the Italian front. A British division up to war strength requires, he says, a total of 85 trains, made up as follows: Two specials for headquarters, 27 trains for three brigades, one for a cavalry squadron, 45 for artillery, two for engineers, two for the supply units, and six for field ambulances. Italian conditions may differ somewhat, but under normal conditions the average speed would be something under 20 miles an hour, and it would take at least 24 hours to unload a dozen battalions from one platform. As regards the Italian campaign, two Franco-Italian routes are available, the Marseilles-Nice-Genoa coast line, and that from Calais to Rome, via Modane. The enemy can bring troops from Bavaria only via the Adige Valley and Trieste to Verona, and from Vienna to Venice there is but one through line, via Udine, and the coastal line from Trieste to Venice, via Monfalcone. "With all the talk about the mechanism of war," no belligerent has found the strategical concentration of a modern army by rail, utilizing the ordinary resources of a passenger and freight line, anything but a sore tribulation, from the first marshalling of the rolling-stock to the detrainment of the last S. A. A. cart.

The New Haven Saves a Million Dollars in Fuel

Marked Economies Are Effected by Supervision of Locomotives on the Road and at the Terminals

THE NEW YORK, NEW HAVEN & HARTFORD estimates a yearly fuel saving amounting to more than a million and a third dollars, based on comparison of actual performance of its locomotive in December, 1917, as against December, 1916.

Care of Fires at Engine Terminals

The necessary use of locomotives on short runs to an unusual extent because of the characteristics of traffic on the New Haven causes a relatively large detention under steam at terminals, so that the proportion of coal consumed while the locomotives are standing is large. This feature of the problem being of prime importance, much attention has been given to it during the past six months with gratifying results. Fuel supervisors follow up the subject with those in charge of locomotives, and have established fairly stable values for coal burned per hour for the several classes of power when the fires are banked, when covering the full grate area, and when dumped and then rebuilt as needed.

Master mechanics are encouraged to prepare estimates of savings based on such unit consumption rates applied to locomotives held at terminals, versus what the consumption would have been had the locomotives been permitted to stand with the full grate area covered, as formerly.

Recent reports of master mechanics to the general fuel supervisor containing estimates of savings for one week follow:

| Division | Pounds of fuel saved |
|------------|------------------------|
| New York | 36,455 |
| New Haven | 170,137 |
| Hartford | 235,300 |
| Hartford | 46,400 |
| Providence | 81,076 |
| Old Colony | 46,588 |
| New London | 34,839 |
| N. E. Ry. | 74,953 |
| Total | 1,084,325 = 541.5 tons |

It is endeavored to have the terminal forces bank the fires of locomotives which are not to be used within a short time. When locomotives are to be held three to four hours the grate area covered is reduced by 60 per cent. In the case of locomotives to be held 24 hours or more, the fires to be dumped.

The men at terminals have also been drilled as to the necessity of careful and economical handling of coal in the work of cleaning and banking the fires. Ashpit men are taught, so far as changing forces permit, to minimize the amount of coal placed in the firebox after the fire is cleaned and also to be particularly careful in cleaning the fires that good coal is not wasted. This has, undoubtedly, resulted in considerable saving.

Education of Firemen

Frequent changes in the personnel of firemen in service make education much less complete than is desirable or possible in more stable times, but continued effort is made to instill into the engineers and firemen the seriousness of the coal shortage and the tremendous burden which the present high prices place on the road, and the entire nation. When the men are told of the current prices of coal to the company they usually express surprise, as, generally, they have not realized that the extraordinary prices of the present affect the railroad to the same extent as they are affected in their personal living expenses. Almost without exception the men agree to co-operate in fuel saving.

Attention has been called to what the savings of one barrel of coal per mile amounts to, having been better supplied for the year ended June 30, 1917, as to just what had done and what could have been done if one (supposed) of coal per mile was saved. This story has been phrased and shows them what they can do if they practice rigid economy in the use of fuel. Good results are being produced, as is shown in current report.

Regulation of Nozzle Sizes

It is desirable to standardize, as far as practicable, the sizes of exhaust nozzles, using, of course, the largest size consistent with free steaming. Variations in the quality of coal available make this no simple matter, but constant supervision is productive of better results than permitting the matter to drift along lines of least resistance. Fuel supervisors render good service in this respect by constant checking of locomotives, and co-operation with engine house forces.

A concrete example of the benefits was the trial of switching power with larger nozzles than formerly, the result indicating roughly that there was a reduction of coal used amounting to 128 lb. per hour. That would mean over 50,000 tons per year on the New Haven.

Constant effort to strengthen the interest and co-operation of engine and terminal men to assist, and to feel themselves partners in the work, is made, largely through the use of such figures as mentioned above.

Individual Performance Data

Of prime importance is the use of figures for individual road locomotives, showing consumption of coal in pounds per 1,000 gross ton miles, both in passenger and freight service. This data is prepared by an accounting force and the records of the various locomotives are examined and memoranda made covering cases of locomotives whose consumption is running out of line with good practice, that of power and service being considered. Fuel supervisors then ride the locomotives and make report of defective boilers, machinery, draft rigging, grates, plunger, etc., to the master mechanics. Also, if necessary, the crews are instructed in proper handling in times, or the terminal men be checked with regard to coal used during lay-overs.

Superheating Smaller Power

Modernizing older locomotives by applying new valve gear and superheaters results in a saving on the New Haven of over 20 per cent in the coal used per 1,000 gross ton miles. Superheating is absolutely necessary in order to obtain the lowest unit coal consumption and the greatest power output from the locomotive.

Miscellaneous Coal Losses

The supervision of fuel naturally checks losses by overloading tenders; by waste around cooling stations; by failure to remove all coal from coal cars; by theft; by loss through holes in the decks of locomotives, etc.

Fuel supervisors report the need for picking up coal dropped along the right of way so that it can be utilized at section houses and for section roads and the switch stands, etc.

Train Operation

The general fuel supervisor tries to the motive of the higher speed out of a train at means of power, resulting in fuel waste, as for example, unnecessary double-heading.

*From a report by George W. Wilden, general manager of the New York, New Haven & Hartford, to the Bureau of Mines.

light mileage, excessively large locomotives on small trains, etc.

Superintendents endeavor to lessen the delay in transit of all trains, and particularly heavy freight trains. Attention is given to the fact that the stopping of freight trains entails a serious loss of fuel from which no returns are had, and care is exercised by despatchers to avoid, if possible, the stopping of trains at the foot of steep grades, from which points it is difficult and expensive to start.

Proper Engine Loading

Proper loading of trains with respect to locomotive capacity is of the greatest importance in obtaining a low unit consumption. An overloaded locomotive is wasteful of fuel. An underloaded locomotive is equally so, measured in "gross ton miles per unit of coal used." A locomotive with two-thirds its rating will burn nearly as much coal per train mile as it will with full rating, and the ton-mile cost is correspondingly high.

It is particularly important to have locomotives properly loaded to get the greatest benefit from superheaters. A corps of fuel supervisors cannot gain headway on a gross-ton-mile-consumption basis against any considerable decrease in the loading of engines.

Saving from Fuel Supervision

In a word, the saving of fuel has the constant attention of practically all employees in the operating department, beginning with the superintendents and ending with the men who clean the fires on the ashpit. Their attention is constantly directed to the savings produced by careful thought and action and to the losses resulting from inattention and neglect.

The foregoing gives information as to the principal methods followed on the New Haven to conserve locomotive fuel. In order to determine the net results on a broader scale than by such estimates as have gone before, figures from actual operation of all locomotives in freight and passenger service, both yard and road, are appended to show that the varied efforts have produced a considerable reduction in coal consumption, and consequent large money saving.

Comparison is made between the performance in September of 1917 and 1916; the results of which are typical of those for broader periods. The statistics of coal used are those covering all issues to locomotives as charged under the primary accounts, Interstate Commerce Commission classification.

| | ROAD | FREIGHT | STEAM | LOCOMOTIVE | SERVICE |
|-----------------|-----------------------------------|------------------------------|---------------------------------|------------|--------------------------|
| | Pounds of coal per 1,000 G. T. M. | | Pounds of coal per engine mile. | | G. T. M. per engine mile |
| September, 1916 | 227.44 | 166.76 | 796 | | |
| September, 1917 | 199.74 | 163.24 | 945 | | |
| | 27.70—11.9 per cent (Decrease) | 3.52—1.8 per cent (Decrease) | 149—18.7 per cent (Increase) | | |

There were 632,287,097 gross ton miles handled in September, 1917, which, if the 1916 consumption rate had prevailed per 1,000 G. T. M., would have required 8,757 more tons of coal than were actually burned. Since the cost of coal on tenders averaged \$5.09 per ton, the saving was \$41,573 for the month, or at rate of \$534.876 per year.

It is gratifying to note that with an increase of 149 gross ton-miles per locomotive mile, or 18.7 per cent, there was a decrease of 3.5 lb. of coal per locomotive mile, or 1.8 per cent. Greater locomotive loading naturally has benefited the gross ton-mile consumption, but the coal used per locomotive mile would have also increased if the supervision had not been effective.

| | FREIGHT YARD LOCOMOTIVES | |
|-----------------|---------------------------------|--------------------------------|
| | Pounds of coal per car received | Pounds of coal per engine mile |
| September, 1916 | 111.19 | 116.25 |
| September, 1917 | 99.31 | 97.78 |
| | 11.88—9.9 per cent (Decrease) | 18.47—15.5 per cent (Decrease) |

There were 383,413 freight switch locomotive miles in September, 1917. Therefore, the coal saved on a locomotive mile basis was 3,540.5 tons for the month. At the rate of \$5.09 per ton, the saving was \$18,021 during the month, or at rate of \$216,252 per year.

| | ROAD | PASSENGER | STEAM | LOCOMOTIVE | SERVICE |
|-----------------|-----------------------------------|------------------------------|--------------------------------|------------|--------------------------|
| | Pounds of coal per 1,000 G. T. M. | | Pounds of coal per engine mile | | G. T. M. per engine mile |
| September, 1916 | 426.68 | 111.16 | 261 | | |
| September, 1917 | 364.65 | 109.07 | 299 | | |
| | 62.03—14.5 per cent (Decrease) | 2.09—1.8 per cent (Decrease) | 38—14.5 per cent (Increase) | | |

There were 313,713,362 gross ton-miles handled in September, 1917, which, if the 1916 consumption rate had prevailed this year per 1,000 gross ton-miles, would have required 9,729.5 more tons of coal than were actually burned. Since the cost of coal on tenders averaged \$5.09 per ton, the saving was \$49,523 for the month, or \$594,276 at the yearly rate.

It is gratifying to note that with an increase of 38 gross ton-miles per locomotive mile, or 14.5 per cent, there was a decrease of 2 lb. of coal per locomotive mile, or 1.8 per cent.

PASSENGER YARD LOCOMOTIVES

| | Pounds of coal per locomotive mile |
|-----------------|------------------------------------|
| September, 1916 | 112.09 |
| September, 1917 | 95.17 |
| Decrease | 16.92—15.1 per cent |

There were 65,568 passenger switch miles in September, 1917. Therefore, the coal saved on a locomotive mile basis was 554.5 tons. At the rate of \$5.09 per ton, the saving was \$2,822 during the month, or at an annual rate of \$33,864.

SUMMARY OF ESTIMATED FUEL SAVINGS BASED ON COMPARISON OF ACTUAL PERFORMANCE SEPTEMBER, 1917, VERSUS SEPTEMBER, 1916

| | Per month | Per year |
|------------------------------|-----------|-------------|
| Passenger service: | | |
| Road | \$49,523 | \$594,276 |
| Yard | 2,822 | 33,864 |
| Total | \$52,345 | \$628,140 |
| Freight service: | | |
| Road | \$44,573 | \$534,876 |
| Yard | 18,021 | 216,252 |
| Total | \$62,594 | \$751,128 |
| Recapitulation | | |
| | Per month | Per year |
| Savings in passenger service | \$52,345 | \$628,140 |
| Savings in freight service | 62,594 | 751,128 |
| Grand total savings | \$114,939 | \$1,379,268 |

OBSERVING MILITARY TRAFFIC FROM THE AIR.—Hardly a train moves within five miles back of the German trenches, or a squadron of men come up for relief, or digging begins on a new series of emplacements but a pair of keen eyes, steadily watching from great observation balloons just behind the Allied front takes notice of it, says a letter from a captain in the U. S. Aviation Corps to the St. Louis Republic. Every movement, every activity, is registered until a schedule of the usual enemy routine is built up and the average amount of motion known. Any departure from this schedule is suspicious. A train running late or with more cars than usual, men in the trenches being relieved too frequently, new roads or emplacements being built too earnestly, give the first hint that "Fritz," across the line, is up to something. A keen balloonist notes any of these changes and at once telephones down to the ground, "An extra train of six cars passed — at 10:40." Half a mile farther down the line another pair of eyes reports, "Large convoy moving up to front, range so-and-so." Still a little farther down another suspicious circumstance is noted, until the general staff down below, assembling all these straws, foresees the beginning of a big offensive across the line. Counter measures are taken, batteries directed, convoys and trenches are smashed up, and the enemy's plans thrown askew.

Mikado Type Locomotive for the Santa Fe System

Developed from Earlier Class of Same Type; Greater Horsepower Capacity, No Change in Adhesion

THE SANTA FE SYSTEM is now receiving from the Baldwin Locomotive Works a consignment of heavy Mikado type of locomotives, which are intended for freight service on the Eastern Lines. These engines are coal burners and were developed from lighter Mikado type locomotives built in 1916. The new design was worked out conjointly by the railway company and the builders, and existing Santa Fe standards were used generally throughout the construction. A comparison of the leading dimensions of the new locomotives with those of the previous engines is as follows:

| Date built | Cylinders, dia and stroke, in | Diater drivers, in | Steam per sq. in. | Grafe area, sq. ft. | Water heat ng surf., sq. ft. | Superheating surf., sq. ft. | Weight on drivers, lb. | Weight total engine, lb. | Effort, lb. tractive |
|------------|-------------------------------|--------------------|-------------------|---------------------|------------------------------|-----------------------------|------------------------|--------------------------|----------------------|
| 1916 | 25 by 32 | 57 | 60 | 58.5 | 4,111 | 880 | 100,000 | 14,500 | 5,600 |
| 1917 | 27 by 33 | 63 | 63 | 58.5 | 4,414 | 900 | 104,000 | 14,500 | 5,900 |

Wheel load limitations prohibited a material increase in the weight on drivers, as compared with the design of 1916; and while the new engines are heavier, the additional weight is carried on the front and rear trucks. The principal advantage derived from this greater weight is the increased steaming capacity of the enlarged boiler. With this additional steam supply the larger cylinder horse-power incident to the use of driving-wheels of greater diameter can be developed. For an increase in total weight of not quite eight per cent there has been an increase in water heating surface of over 11 per cent. The starting tractive efforts, with steam pressures giving approximately the same ratio of adhesion, are practically the same for both locomotives, but the larger cylinders, wheels and boilers of the new engines give them greater horse-power capacity. This additional power will be utilized in maintaining higher speeds with the same or possibly a little greater tonnage.

The boiler is of the extended water-tube type designed for a pressure of 225 lb. per sq. in., but is rated for carrying 190 lb. It contains a 45 element superheater, and the air box is equipped with a brick arch supported on four tubes. An auxiliary dome, mounted over an opening in the shell of sufficient size for inspection purposes, is placed back of the main dome and on the same center with it. A single liner is placed under both domes; it also covers the longitudinal

steam, which is placed on the right hand side of the center line.

The boiler accessories include a power-operated fire-door and grate shaker. The minimum air opening specified for the ash-pan is 15 per cent of the grate area. The turntable valve is fitted with an auxiliary drifting valve.

The cylinders are designed with direct exhaust passages of ample area, free from abrupt bends. Gaps from a seal for the cylinder and steam chest leading to piston and valve rod and packing rings, and cross-head shoes. The piston rods are of rolled steel, and the cross-head shoes of 40 carbon cast steel of the Laird design. Special steels are used for the piston rods, valve stems, piston and side rods and main crank pins. The Baker valve motion is applied and is controlled by the type "B" Riggs power reverse gear. Fifty per cent of the weight of the reciprocating parts is balanced.

The frames are of substantial design, the main members having a width of 5 1/2 in., while the depth over the main driving pedestals is 8 1/2 in., and over the rear end pedestals 7 1/2 in. The top and bottom rails are bolted together between adjacent pairs of pedestals by strong vertical cross-I sections. These rails carry the top and bottom main pins, which are fitted into reinforced end bearings. Transverse braces are applied at both ends of driving pedestals. Three of these braces span at the second end of pedestal and one at the fourth pedestal only, leaving the pedestals through their own shape. They are also braced by high line braces at the pedestals. They support, respectively, the guide rollers, the cross motion rod, and a lower motion rod.

The steam and water connections at each end, and the driving pedestals of the main pedestals, are bolted into frame. Long main motion rods are used. The frames are all drilled and dimensionally applied to the leading frames.

The leading cross-rod of the E locomotive consists of two main rods bolted into the front of the Holmes type. Each end is supported with two rods of driving motion. The arrangement is of cross motion rods, frequently called by the name, consisting of two transverse beams connected by a central vertical link to assist in guiding the rear drivers and reducing track.

The use of power will make steam pressure ample deck main. Special attention has been paid to the location of the oil tank, according to place all heavy valves, etc., with-

in east track of the row, and to locate the steam air and water gauges where they can easily be read.

The tender is carried on two six wheeled trucks, which are equipped with clip brakes and Standard rolled steel wheels. The tender frame is of cast steel, in one piece.

The link between the engine and tender is of the radial type. A coal pusher is applied.

These locomotives, in accordance with Santa Fe practice, are fitted with steam heat equipment so that they can, in cases of emergency, be used on passenger trains. Their leading dimensions are given in the table:

| | |
|---|---------------|
| Overall length | 41 ft. 10 in. |
| Overall height | 11 ft. 6 in. |
| Tractive effort | 11,000 lb. |
| Weight in running order | 111,000 lb. |
| Weight on drivers | 70,000 lb. |
| Weight on trailing truck | 41,000 lb. |
| Weight on trailing truck | 45,000 lb. |
| Weight of coal and fuel tank in working order | 10,000 lb. |
| Wheel base, engine | 16 ft. 6 in. |
| Wheel base, tender | 25 ft. 1 in. |
| Wheel base, engine and tender | 41 ft. 10 in. |

| | |
|--|-------|
| Weight in drivers in full load effect | 3.8 |
| Traction weight in full load effect | 6.1 |
| Tractive effort in full load effect | 603.4 |
| Equivalent heating surface* in sq. ft. | 93.7 |
| Flue heating surface in sq. ft. | 4.1 |
| Weight of boiler in running order | 30.7 |
| Traction weight in full load effect | 50.4 |
| Weight of boiler in full load effect | 1.6 |
| Weight of boiler in full load effect | 3.0 |

| | |
|---|---------------|
| Overall length | 41 ft. 10 in. |
| Overall height | 11 ft. 6 in. |
| Tractive effort | 11,000 lb. |
| Weight in running order | 111,000 lb. |
| Weight on drivers | 70,000 lb. |
| Weight on trailing truck | 41,000 lb. |
| Weight on trailing truck | 45,000 lb. |
| Weight of coal and fuel tank in working order | 10,000 lb. |
| Wheel base, engine | 16 ft. 6 in. |
| Wheel base, tender | 25 ft. 1 in. |
| Wheel base, engine and tender | 41 ft. 10 in. |
| Weight in drivers in full load effect | 3.8 |
| Traction weight in full load effect | 6.1 |
| Tractive effort in full load effect | 603.4 |
| Equivalent heating surface* in sq. ft. | 93.7 |
| Flue heating surface in sq. ft. | 4.1 |
| Weight of boiler in running order | 30.7 |
| Traction weight in full load effect | 50.4 |
| Weight of boiler in full load effect | 1.6 |
| Weight of boiler in full load effect | 3.0 |

*Equivalent heating surface is based on standard heating surface of 15 sq. ft. for each square foot of boiler.

Senate and House Committee Railroad Hearings

Necessity for Stabilizing Credit. Controversy Over Short Lines. Cummins Asks Salary List

W. G. McAdoo, director general of railroads, testified on Saturday before the Senate committee on Interstate Commerce which is considering the administration bill for federal control of railroads. He did not discuss at length the details of the bill, which had been dealt with exhaustively by Commissioner Anderson, but confined his testimony principally to answering questions by members of the committee. Before he had concluded he was asked by Senator Cummins to furnish a list of all directors, presidents, vice-presidents, general managers, secretaries, treasurers and counsel of the railroads under government control, with their salaries. He promised to do so as soon as it could be compiled.

Mr. McAdoo urged the early passage of the bill, saying it would be a great advantage to have the question settled promptly because both the railroads and the government have to face the question of what improvements and additions to equipment are to be made this year and no expenditures can be made until the appropriation is available.

Purpose of the Appropriation

The appropriation of \$500,000,000 proposed is "about the smallest amount that the government could get along with," he said. "It may be necessary to meet any deficiency in earnings to pay the guarantees, and while he hoped it will not be necessary to make good any deficiency he could offer only a hope and an expectation based on general knowledge and what some railroad officers have told him that some economies will be possible. On the other hand, he said, any economies resulting from unification may be offset by increases in wages and in other items of expense that cannot be avoided.

A fund is also necessary for equipment and additions and

improvements and some roads may need assistance in financing. He thought that the companies themselves, once their status is settled, can take care of refunding their maturing obligations, which, according to a statement he had prepared, would amount to \$222,000,000 in 1918, \$28,000,000 in 1919, and \$215,000,000 in 1920. These figures include equipment obligations. It may be necessary to give final financial assistance to roads now in receivers' hands.

In reply to a question, Mr. McAdoo said he thought the basis of compensation proposed in the bill is on the whole a fair one and he thought it wise to arrive at a fair basis which would be generally accepted as such in order that a settlement could be promptly made.

The necessity of stabilizing market conditions, which had been underlined to an extent that seriously threatened the financial structure of the country in the breakdown of railroad securities, was one of the important reasons for the enactment of government control of the railroads, Mr. McAdoo said.

The Serious Condition of Railroad Credit

Who was federal control necessary? Asked Senator Frank Johnson:

"I think that was covered in the President's statement," replied Mr. McAdoo. "It was necessary to stabilize the competitive system, it was impossible to get the reconstruction which was necessary to the efficient conduct of the war, but it was also necessary to make a credit situation which was giving the whole basis of credit and was attempted to make that condition at once. There was something over \$11,000,000,000 worth of railroad bonds outstanding which were held not only by individuals but by banks and other institutions, and which formed an essential part of the credit structure."

ture of the country. The values of these securities had shrunk very much under the uncertainties of the situation and the railroads were experiencing great difficulty in selling new securities to finance the new equipment and facilities needed to meet the unusual demands upon them. Something had to be done to stabilize the railroad financial condition. The shrinkage in the value of the assets of savings banks and other institutions and in the credit power of firms and individuals, was threatening a very serious situation."

Senator Smith asked whether the difficulty in the transportation situation was due to lack of facilities or to the failure to secure their full use.

"It was due to both," replied Mr. McAdoo. "Every railroad man naturally felt an obligation to the owners of the property to get all the business he could for his road. That was his duty, but when some took more than they could carry congestion resulted. When I took charge I found a terrible congestion on the eastern lines caused not only by insufficient facilities of all kinds but particularly by the shortage of motive power and the fact that a large percentage of the freight cars were being used for warehouses. The equipment might have been sufficient if it had been possible to get the full use of it. We hope to be able to remedy that by the higher demurrage rates." He also said that it was hoped that the situation would be improved by the order to the locomotive builders to deliver all locomotives turned out during January, February and March, to the eastern roads. That could not have been done under private management, he said.

In reply to Senator Poindexter as to what other things he had been able to accomplish, Mr. McAdoo said a great deal had been done in diverting cars from the overloaded lines by distributing the traffic via the lines that can handle it the best regardless of the shippers' orders.

Little Improvement Yet

"Has there been any clearing up in the situation?" he was asked.

"Through the East I don't think there has been much improvement," Mr. McAdoo replied. "The railroad men were left on the job and in addition were given the benefit of the power of the federal government, but there was a serious congestion when the government took hold, and while I do not believe in excuses the railroad men tell me that the weather has been unprecedented. Blizzards have come so fast that it was impossible to dig out of one before another came."

In discussing the causes for the congestion Mr. McAdoo said that no one condition could be singled out but that one of the most serious causes was that consignees have held cars for an unreasonable length of time because it was easier to pay demurrage than to unload them. Other causes were the shortage of power and the scarcity of labor to repair locomotives. He thought that in a short time, with the aid of the government, it would be possible to get more efficient operation.

"Government control didn't have any effect on the weather," remarked Senator Poindexter.

Causes of Congestion

Mr. McAdoo also referred to the undue congestion of export traffic at New York which should have been distributed to other ports. He said the railroads were not wholly to blame for this situation because they did not control the shipping but he thought lines terminating at New York had preferred to take freight to that port and that under government control it would be possible to distribute it more equitably.

"Had not the Railroads' War Board taken steps to do so?" asked Senator Watson.

Mr. McAdoo said it may have done so; that he was familiar only in a general way with what it had done but

he thought that while it had done good work it had tried to accomplish by agreement some things the government could order.

Senator Kellogg asked if the principal reason for the congestion was not the enormous increase in traffic and the inability of the railroads to secure additional cars and locomotives because of the prior demands of the government for materials and for cars and engines for France and Russia. He also asked if the War Board had not been able to draft 100 locomotives from western roads without the assistance of the government and if the railroads had not been hampered by letters from the attorney general warning them not to violate the laws.

Mr. McAdoo said he had only a general knowledge of these things.

"But how has government control benefited the situation?" asked Senator Kellogg.

"I haven't said it has benefited it yet," replied the director general.

He said that the statistics show that during the last two or three years the railroads had expended for new equipment much less than in former years and while he was not prepared to say just why this was so it might have been because the railroads had found themselves confronted with the great increase in cost and hesitated to buy as much as they should. "However," he said, "the fact that they did not makes it very obvious that when the enormous increase in traffic came, they found themselves in a very awkward situation."

Senator Cummins asked whether the present organizations, officers and employees of the railroads will be retained.

"As long as they prove satisfactory and efficient, and I hope they will," said Mr. McAdoo.

Officers' Salaries

"What provision ought to be made with regard to the compensation of officers and high-priced employees? What are you going to do with these big salaries that are charged to operating expenses?"

"I haven't had time to give any study to that question," replied Mr. McAdoo. "We are not going to carry any one in the government account that is not necessary but it is necessary that the integrity of the railroad organizations be preserved until the railroads are restored to their owners or at least until Congress determines what shall be their status, and we must pay whatever it costs to get the right kind of talent. The railroads ought to keep up their organizations to the extent that they are serviceable and efficient." He added that the government would not be assuming directly the expense of railroad salaries because they are already charged to operating expenses. The corporations are operating the railroads for government account, and he had not assumed that their employees were government employees.

Senator Cummins then asked for the list of officers and their salaries which Mr. McAdoo promised to furnish as soon as possible.

Mr. McAdoo also conferred with the committee in executive session.

Not in Favor of Government Ownership

Mr. McAdoo continued his testimony before the Senate committee on Monday, laying special emphasis on the importance of an early passage of the bill and upon the necessity of allowing for a period of readjustment after the war without fixing any time limit for the return of the roads to their owners. In reply to a question by Senator Watson Mr. McAdoo said that personally he was not in favor of government ownership of railroads, but he thought it would be impossible to return to the same status that existed before the war, because fundamental conditions will have been so altered, if the period of government control is a long one.

that new legislation will be required to fix the new status and Congress should have a free hand in dealing with the new conditions. The entire method of routing traffic will have changed, he said, and a sudden taking away of the government control would leave both traffic conditions and the position of the security owners in a chaotic condition. Moreover, he said, the expiration of the period might come during a recess of Congress or a filibuster might prevent action within the time limit.

If the plan of government control proves beneficial, Mr. McAdoo said, the people will not be satisfied to go back to the competitive system, and a larger measure of government control than has prevailed would be the result. He suggested the possibility of a plan somewhat along the lines of the present plan, by which the government would not actually take title to the roads but which would free them from the complications resulting from the conflicting jurisdictions of 48 states and the federal government.

"We are dealing with absolutely uncertain conditions," he said, "and if the control should last for three years conditions will be more changed than if it lasted only six months. The longer it lasts the greater will be the government's investment in these properties; if it should last three years the investment might be \$1,500,000,000, and time would be required to effect the liquidation. It is in the interest of the security owners to have the status preserved until intelligent action is taken to settle what it shall be. My view is that it is wiser for Congress to keep this under control, so that it may be free to deal with conditions as they exist at the end of the war."

Senator Kellogg asked if he thought it wise to give the President absolute power over rate-making.

"I think it would be extremely unwise to hamper him in any way," replied Director McAdoo, who explained that there was no purpose to interfere with the exercise of the power of the interstate or the state commissions in ordinary matters, but that it was considered essential that the President should have paramount power to act when the public interest requires it without consulting all the various commissions. He cited as examples his action in ordering coal shipped through the Pennsylvania tunnels to save the people of Long Island from freezing, although it was contrary to a franchise provision, and also his action in prescribing new demurrage rates and rules. It would have been impossible to take prompt action, he said, if he had had to apply for permission to every state commission and some legislatures that had prescribed demurrage rates by statute. The President has a great many powers he does not exercise, Mr. McAdoo said, and while ordinary procedure will continue to be observed in ordinary cases it is necessary for him to have power over rates to prevent the possible action of a state to reduce the revenues on which the government depends to meet its guarantees.

That means that until Congress sees fit to order otherwise one man is going to fix all the rates and their relations," said Senator Kellogg.

"It does not mean that," replied Mr. McAdoo. "It merely means that he has the power to act when it is necessary for the purposes of the war."

If Congress shall fail to legislate to terminate the period of government control, Mr. McAdoo said, the courts could be appealed to to terminate it. If there is any fear of government ownership in the desire to fix a definite time limit, he said, Congress cannot prevent the consideration of that question hereafter by anything it may do now. "Why should we allow the specter of government ownership to influence action that it is wise to take now?" he asked. "The reason we haven't ships now is the fact that Congress in 1914 refused to pass the shipping bill for fear of government ownership, and now we are again confronted with the same specter if we try to do something that is needed to be done."

Senator La Follette protested against the use of the word "specter." "It is a reality," he said, "and we will have to meet it some time anyway."

It has no terrors for me," remarked Senator Cummins.

Mr. McAdoo said he thought the proposed basis of compensation is eminently fair and reasonable, and that a basis that will be accepted as such will aid the government immensely in carrying on its own financial operations. When a member of the committee pointed out that the roads which would receive a liberal guarantee would probably make an agreement with the government while the roads whose earnings in the three-year period had been low would not for more, Mr. McAdoo replied, "Well, what is the remedy for that? We cannot be less than fair to any one. The government cannot stand for doing a double standard to anyone. We can only establish a fair principle as the basis of a settlement." He added that the amount of the guarantee to be paid by the government might be more than the outlay for this reason.

Senator Cummins was more worried about the danger that the President should continue to exercise absolute power over the transportation system after the war than he was about the effect of a sudden removal of the guarantee upon security owners, and asked if Congress should not provide against the possibility of leaving the entire transportation system of the country in the hands of one man.

"I am inclined to feel that the people have more confidence in the President than in anyone else," replied Mr. McAdoo, "and as an American citizen I would be more confident with the railroads in the hands of the President, no matter who he might be, than in the hands of any board or commission. I think he would handle them better and with greater responsibility to the people."

The step taken by the President was necessary, Mr. McAdoo said, not only to secure the necessary coordination of transportation facilities but to give the necessary stability to financial conditions, and that this purpose would not be accomplished unless the basis of compensation is made such as to give assurance of fair treatment to the railroad security owners.

Permanent Acquisition Not Intended

"This step was was not intended to be a permanent acquisition of the railroads," he said. "The government acted to meet an emergency and the compensation should be on an emergency basis. It cannot be put on the same basis as if the assumption of control were to be permanent. The proposed guarantee is about \$100,000,000 less than the income of 1917, and it will be reduced still further by the deletion of war taxes. If that is not a fair trade for the government I don't know what would be fair."

Discussing the order of the Fuel Administration curtailing the use of coal, Mr. McAdoo said that "attaining a reasonable quality of weather," he hoped that conditions would soon improve to such an extent that the order would not have to go as far as is now contemplated, and that "an immense improvement" has resulted already.

Attitude of Congress

Although President Wilson has made several moves to urge Congress to expedite its consideration of the railroad federal control legislation, no prospects for early action are yet apparent, and no one so far is venturing even an opinion as to when the bill will go out of the committee that have been holding it since continuous hearings for over two weeks.

Communications Administrator Anderson, the leader of the Administration bill, which has already come to be known as the "Anderson bill," instead of in the name of the transportation bill introduced by the committee, announced last week that it had already received reports of several hundred and some thousand instances of various types of interference

the committees as to various provisions of the bill that a considerable length of time will be taken in agreeing upon the reports. After the bill gets on to the floor of Congress a protracted debate is likely to ensue.

The most sharply defined issue is presented by Section 13 of the bill, which is being bitterly contested by those who, rightly or not, see in it a "joker" for the purpose of keeping the roads in the possession of the government, including a large number of Republicans and also some Democrats who do not believe in government ownership. Another point of controversy has been aroused by the announcement that Mr. McAdoo does not propose to conduct an eleemosynary institution for orphan railroads and will relinquish control of any of the short lines that he does not consider essential. A great many congressmen who are very little concerned about the things that worry the officers and owners of the big railroads are showing not only sympathy for the little roads but are interesting themselves in their local institutions.

Very little opposition is heard to the general plan of the bill for compensating the railroad owners for the use of their property, although some of the radicals and those who are constitutionally anti-railroad will object to it as being too liberal. On the other hand, the ranks of those who may be considered friendly to the railroads—and these are more numerous than they were two or three years ago—are likely to be considerably augmented by those who regard the action of the government in taking over the roads as absolutely unnecessary and unwarranted. The situation was not made more harmonious by the drastic order of the Fuel Administration, which many Republicans chose to interpret as an indirect method adopted for easing the strain on the Democratic railroad administration. One representative called the order "nothing more than a camouflage for the real railroad situation."

The hearings before the Senate committee were continued throughout all of last week. After the representatives of the short line roads had been heard Luther M. Walter, a traffic attorney representing numerous shippers, but who appeared at the request of the committee, suggested some changes in the bill. He was particularly desirous of protecting the powers of the Interstate Commerce Commission and of the station commissions in rate-making and he urged that the three-year average net operating income be based on the period ending December 31, instead of that ending June 30, 1917. He asked that the act to regulate commerce be not interfered with except as to the right of the shipper to route his freight and he thought the shipper should be allowed to designate the delivering carrier. He also urged that a representative of the shippers should be included in the staff of the director-general. The period of government control should terminate 30 or 60 days after the war. In the case of new roads or roads whose traffic has recently been greatly increased, he said, provision should be made for a guarantee representing a reasonable earning capacity.

Joseph L. Bristow, chairman of the Kansas Public Utilities Commission and of the legislative committee of the National Association of Railway Commissioners, began his testimony by asking whether the standard rate of return was meant to be a percentage rate and if so whether it was to be computed on the book value or the capitalization. He was promptly assured by Mr. Anderson that the return was to be a sum of money without reference to any value. Mr. Anderson, to avoid any possibility of confusion, offered to strike out the words "annual rate," but Alfred P. Thom, counsel for the Railway Executives' Advisory Committee, said that that would give the roads only one year's net income for the entire period of federal control. He also said that at the proper time the railroads would ask that provision be made for payment of the guarantee at certain periods, perhaps quarterly, in order that they might meet their obligations. Mr. Bristow and Mr. Walter both asked that the guarantee

of adequate maintenance and depreciation should be made more specific. Mr. Bristow said it would be difficult to define the exact condition of the roads at the time they were taken over and at the time they were restored—"if they ever are restored"—and he feared that there might be many claims for inadequate maintenance.

Mr. Bristow said that, stating the proposed guarantee in terms of the percentage, of the book value made it look smaller than it really was, and he proposed that a definite rate of return based on the market value of the securities, or that the actual dividends be guaranteed. He based his attack on the book value on some of the results obtained in the tentative valuations made by the Bureau of Valuation, but when one of the senators suggested calling Director Prouty to testify, Commissioner Anderson said he had asked him, and that the director said he had as yet no information that would be worth anything as a basis for the compensation of the roads. Chairman Smith said Mr. Prouty had told him the same thing.

Mr. Bristow objected to the proposed guarantee on the ground that it would give some roads 25 per cent on their common stock and bankrupt others. He read a list of 25 roads with the percentages which the three-year average net operating income would represent in the common stock, but Commissioner Anderson said he had omitted to deduct for war taxes, and that if the committee thought the figures material he would like to have them checked by the commission's statistical department.

Senator Kellogg pointed out that under the bill the owners of the stock could not collect their large percentages anyway, because dividends are limited, and Senator Underwood pointed out that the government is confronted by a condition, not a theory, in that it has taken the roads and must pay a fair compensation no matter how painful it may be to do so because the railroads will hardly accept less than they can get from the courts.

The Short Line Railroads

One of the most complicated phases of the problem created by the taking over of the railroads is that affecting the status of the short line railroads, many of which had earned an inadequate return or a deficit in place of a net operating income during the three years ending June 30, 1917, but many of which are now handling a considerable traffic and most of which had very high hopes for the immediate future. But Bird M. Robinson, president of the American Short Line Railroad Association, had not completed his argument for a provision in the bill to give special consideration to their peculiar conditions when John Barton Payne, Mr. McAdoo's legal advisor, announced that there was no intention on the part of the government of taking over a large number of the short roads which had been unprofitable and which were not considered essential and that, therefore, they need not worry about their guarantee.

This announcement fell like a bomb-shell among the representatives of the short lines, who showed copies of the notices received from the director general that they had been taken over, and of the various requests for information sent out by the Interstate Commerce Commission. It also produced some surprise among members of the Senate and House committees. The representatives of the short lines said that while they would be forced into bankruptcy if they were taken over without an adequate guarantee they would be "assassinated" if left out of the government system. Mr. Payne could not say what roads would be left out but, he said that Mr. McAdoo does not think that the proclamation by the President or the notices sent to all railroads in the country constitute taking over all the lines and that he does not think the railroads not necessary for war purposes should be taken.

"The smaller roads cannot live if this interpretation is

trial," said Mr. Robinson. "They will get no freight or cars from the larger line and in addition will be forced to pay the higher wage scale which the government will allow."

"You might as well try to run a rural free delivery route in opposition to the government as to try to run one of these roads in opposition to the government system," said B. B. Dean, of the Gainsville & Northwestern, testifying before the Senate committee. "If the government is going to take any it should take all."

Most of the testimony on behalf of the short lines was in regard to the necessity of providing for a guarantee in the discretion of the President or of some board of a return commensurate with the present carrying capacity of the road. The three year average, it was said, would not pay the bond interest on many roads which are now able to pay their interest, particularly in the case of roads which have recently built new lines, or which have recently been reorganized. "You wouldn't fix the rental of a lot which had been vacant on the basis of what it had earned from a peanut stand on it," said Mr. Dean. He thought the "Anderson bill" would be a good bill with a few amendments. Commissioner Anderson said he would not object to a provision giving the President discretion to agree on a basis which would cover interest charges, on valid outstanding obligations and proposed a re-draft of section 3 which appeared satisfactory to the representatives of the short lines. This provides that all claims not adjusted shall be submitted to boards of referees appointed by the Interstate Commerce Commission. Mr. Anderson said that section 7 of the bill provides for any necessary financing of a road taken over by advances from the government.

A telegram was received by the Senate committee from the Western Association of Short Line Railroads protesting against any arbitrary basis of compensation. The committee decided that the association might file a brief.

Commissioner Woolley and Mr. Payne are understood to be compiling a list of the railroads and information on which to base a decision as to which lines shall be taken over. The decision will be based on the usefulness of the roads to the government.

Mr. McAdoo was questioned at length by the Senate committee regarding his attitude toward the short line railroads, which he said would not be taken over unless upon investigation they are found to be useful and necessary to the national purpose. "They are hollering before they are hit," he said in reference to their claim that they would be injured if left out of the government system, "and if they are damaged in any way which imposes a liability on the government they have a remedy in the courts." He said that traffic would not be diverted from them except as a war necessity and that there would be no disposition to treat them unfairly. Any non-essential railroad that has been taken over may be relinquished, he said, and a road found useful could be taken at any time, just as canals and other inland waterways could be taken over if desired.

Before the House Committee on Interstate and Foreign Commerce on Saturday, A. De Bernardi, general manager of the Kansas City, Mexico & Orient, said his road had not earned expenses for three years and thought it ought to be guaranteed operating expenses and enough to pay interest charges.

Clifford Thorne, representing several organizations of shippers, urged the incorporation of a specific provision to prevent the Interstate Commerce Commission "being forced into oblivion" by the usurpation of its jurisdiction over rates.

Mr. Thorne also testified before the Senate committee on Tuesday, objecting to the proposed basis of compensation as too high and urging an amendment to provide for the reduction of the guarantee in the case of roads that had failed to maintain their properties adequately.

Before the House committee Glenn E. Plumb, representing

the railroad interests, reported that arguments he had heard in the various times following that the railroads do not own their property but are limited by their charter governing to the right of way over it. He proposed an amendment providing that the Interstate Commerce Commission shall determine the amount on which each company is entitled to a return, and that the return shall be a percentage on this amount. Pending the determination of the amount, he would allow the roads to be paid their present net operating income until provided for a refund of any excess.

Nathan L. Ayer, of Boston also testified. He would have objected to complicate these figures, he said.

Concrete Highway Crossings

ESTIMATES WITH THE aid of concrete highway crossings statute for under a crossing, partly have been in progress on several railroads in the south, and the various periods up to two years, and have demonstrated the merits of this material. A recent study of these small sections by the engineers of the Universal Portland Cement Company has led to the preparation of a new design that is to be used at the various points of railway tracks and highways in the plant of this company at Birmingham, Ala. The drawings and photographs illustrate the manner in which the crossings have been worked out on several cases.

This concrete construction has taken two general different forms. On the Chicago, Burlington & Quincy, where the installation at Homestead, Mo., at La Grange, Ill., and at Dowers Grove, the design is an exact copy of the present of the usual wooden plank and ties. The concrete plank is 4 in. thick, 8 ft. wide and 8 ft. long, except that the

Typical Designs of Concrete Crossings

end plates, is 4 ft. long to permit turning the beams. The reinforcement consists of American Steel & Wire Company No. 27 steel rods, made and fastened by the same company. As the planks are not in direct contact with the concrete, they are supported on 2-in. by 4-in. wooden strips laid on top of the ties.

On the Chicago, Milwaukee & St. Paul road the Gates Rapids & Iron Ore (Huron) and Great Rapids, Iowa, and in the north of the Eastern Steel Company, at South Chicago, concrete crossings have been installed, in which cut to make of concrete slabs that have considerably more than the standard. These features the rails of the track are at least a width that is a problem of concrete supports. The slabs at Gates Rapids are only 8 ft. long so that two are used to make a 16-ft. crossing, while those at South Chicago are 7 ft. 6 in. long. In some places there are 16-ft. slabs, however. The slabs at both places have a compound joint to the head of the road

so that they rest directly on the ties without the use of filler blocks or strips. It has been the idea in all of the concrete crossings to make the top surface level with the rail, except that in the case of the new design for the Universal Portland Cement Company, the slabs are crowned $\frac{1}{2}$ in. on the center line of the track and depressed $\frac{1}{2}$ in. on the center line between tracks.

The formation of the flangeway on the gage side of the rails is an important detail and was provided for in nearly all of the cases mentioned by some form of all-metal flangeway such as that obtained by a rail laid on its side with the head bearing against the web of the running rail, or with the use of an angle iron, supported on a wooden strip to give

A Concrete Slab Crossing Installed by the Burlington at Downers Grove, Ill., in May, 1917

the desired elevation. With a flangeway formed in some such manner, no special detailing of the concrete slabs is necessary, although it is desirable to protect the edge of the slab adjacent to the flangeway by means of a metal guard. In the Universal Portland Cement Company's design a Kahn curb bar is used. One of the drawings shows a Burlington design in which the slab is notched out to fit under the rail and provide an adequate flangeway without the use of an extra rail or an angle bar.

Some question has been raised as to the need of fastening the units of the concrete crossing in place, and the use of

A Crossing Installed at Cedar Rapids, Ia.

lag screws driven through holes cast in the slabs has been suggested, but in none of the installations recorded has it been considered necessary to take this precaution. In the concrete plank design used by the Burlington there has been some tendency for the row of planks next to the rail to creep but this has been overcome by driving a stake at one or both ends of the row.

A detail that is of far greater importance is the provision of a ramp at the ends of the crossing to insure that dragging

brake beams or other parts of cars will be carried safely over the top of the crossing, instead of catching on or underneath the ends. At South Chicago, a ramp of this kind has been built up of wooden planks, while on the Burlington a steel plate is used for this purpose.

Construction

It is generally found of advantage to build units for use in installations of this kind at concrete plants where other unit construction work is carried on. The work in the field is then restricted to the preparation of the foundation and the lifting of the units into place. On the Burlington the slabs placed in the space between tracks were founded on a sand cushion tamped by means of a 25-lb. tamper and carefully leveled off. The slabs were placed $\frac{1}{2}$ in. below the top of rail, but after two or three days' service some of them worked up flush with the top of rail. The joints between the slabs were also filled with sand. At the Illinois Steel Company crossing at South Chicago, granulated slag was used for the foundation bed and filling material.

Service

The two crossings at Cedar Rapids have been in use for nearly two years and the crossing on the Burlington at Hannibal, Mo., has passed through one winter, while those at the other two locations on that road have been in service since early in the spring. The conclusions based on an examination of these crossings after this service indicate that the concrete crossing planks afford a serviceable permanent construction. The units are readily kept in place, and with a grade of material and workmanship suited to the purpose, the concrete will stand up well under the vehicle traffic. The principal advantage of this form of construction is that it affords a roadway surface that compares favorably with that of any pavement that may be in service on either side of the tracks while retaining the ready removal feature so necessary for the proper maintenance of track.

MATERIALS NECESSARY FOR A SINGLE AIRPLANE.—The following figures, according to the Official Bulletin, have been received from the Signal Corps, Aviation Section, of the materials necessary for a single airplane of the more simple type, and exclusive of all the materials necessary for the engine:

| | |
|-----------------------|---------------------|
| Nails | 4,326 |
| Screws | 3,377 |
| Steel stampings | 921 |
| Forgings | 798 |
| Turnbuckles | 276 |
| Veneer | square feet 57 |
| Wire | feet 3,262 |
| Varnish | gallons 11 |
| Dope | gallons 59 |
| Aluminum | pounds 65 |
| Rubber | feet 34 |
| Linen | square yards 201 |
| Spruce | feet 244 |
| Pine | feet 58 |

GAGES IN WARFARE.—Most military lines constructed within the past three years have been either on the standard gage or on the 3-ft. and meter gages, but 2-ft. lines have also been of considerable use. Speaking generally the standard gage carries men, material and food to within some miles of the trenches, railroad going forward in each fresh advance, while the meter gage lines, the so-called "trench railways," run thence to points well within the zone of fire. These narrow gage lines also serve as connecting links in the main system in much the same way as the Belgian light railways feed and tap the main lines in normal times, and we believe that in certain districts mixed gage lines have been laid as well. Results prove our frequent contentions as to the traffic handling capacities of narrow gage railways, subject to the proviso that the very heaviest artillery requires standard gage tracks for its transportation.—*Railway Gazette, London.*

Pennsylvania Lines Specialize in Car Conservation

Excellent Results Are Achieved by Promoting the Intensive Utilization of Car Space

A SAVING IN CAR SPACE equivalent to 4,000 cars is the enviable result achieved by the Pennsylvania Lines West of Pittsburgh in November, 1917, in its campaign for heavier loading of l. c. l. freight. This record represents the decrease in the number of cars required to handle the l. c. l. business of the lines in November, 1917, the last month for which statistics are available, as compared with the number used in July, 1912, the first month in which special attention was directed to intensive loading. The saving in cars was made possible by an increase in the average lading per car from 10,849 lb. in July, 1912, to 19,076 lb. in November, 1917, or 76 per cent. By conserving cars used for l. c. l. freight, more equipment has been made available for the movement of c. l. business. However, the road is not concentrating its attention on l. c. l. traffic exclusively, but is also directing its efforts to increase the average lading of c. l. freight.

Beginning with March, 1917, the road extended its intensive loading campaign, prior to that month applicable to l. c. l. freight only, to include c. l. business. The results achieved subsequently have been encouraging. A large number of commodities for which records have been kept since that time show increases in carload weights for September, 1917, averaging about eight per cent above March. The details of the work of stimulating the greater utilization of cars both in handling l. c. l. and c. l. traffic are carried on under the direction of J. W. Roberts, superintendent of freight transportation of the Pennsylvania Lines West, and under the immediate supervision of W. T. Wolff, superintendent of freight station service.

Heavier Loading of Less-Than-Carload Freight

Previous to July, 1912, l. c. l. freight on the Pennsylvania Lines was handled without reference to the conservation of car space. When the intensive loading campaign was inaugurated there was considerable opposition to the plan on the ground that the delay incident to holding cars for capacity loading would result in a loss of traffic and that heavier loading would lead to an increase of damage claims. Neither objection has proved tenable. The holding of cars for heavier loading has actually expedited the delivery of l. c. l. freight, inasmuch as it has facilitated the movement of traffic to destination or the nearest transfer point, thereby opening the way for extensive consolidation of loading classifications, with a resultant saving in cars.

Damage claims are no more attributable to heavy loading than to light loading. Damage results from improper loading, not intensive loading. In fact, a well-stowed car loaded to capacity is less liable to damage than a car only partially filled.

To reduce loss and damage claims to the minimum the Pennsylvania Lines has issued a booklet of detailed instructions for the stowing and bracing of l. c. l. freight, and has taken special pains to employ experienced stowmen or stewdores to stow and brace freight in cars. In the first few years following the inauguration of intensive loading of l. c. l. freight, Mr. Wolff, as the special representative of the superintendent of freight transportation, spent considerable time on the road keeping in personal touch with the freight agents at the large stations of the system. Each agent was required to prepare a daily report of cars loaded at his station from which monthly statements were drawn showing the average pounds per car of l. c. l. freight forwarded from each

station showing a decrease of one per cent in the average for each division at a time.

Establishment of Rule Prescribing Minimum Carloads

In August, 1912, an order was issued requiring agents to hold cars until they contained 10,000 lb. or more of freight if destined to a station on another division or 4,000 lb. or more if consigned to a station on the same division. This practice of holding cars for loads is equivalent to the sailing day plan, with the exception that it is more flexible, i. e., no particular days of the week are designated as shipping days but cars are merely held until they contain at least minimum loading.

The records kept by the freight agents enable the superintendent of freight station service to improve on agent or division superintendent if cars are forwarded lightly loaded. The following form letter is one which has been used to require why lightly loaded cars have been forwarded contrary to the rule:

PENNSYLVANIA LINES WEST OF PITTSBURGH
Office of the Superintendent of Freight Station Service

Pittsburgh, Pa., _____

Mr. _____
Supt. _____ Div. _____
On _____ 191 _____ Station loaded and
forwarded _____ Cords to _____
with only _____ lb. of freight. Please advise
as to this light loading. See Rule 2, General Notice 91.
W. T. WOLFF,
Supt. of Frt. Station Service.

The fixing of minimum carload weights for l. c. l. freight, was merely a starting point in the intensive loading campaign. Subsequently, instructions were issued providing that all cars used for the movement of l. c. l. business must be loaded to cubical capacity.

Monthly Bulletins Show Improvement or Decline in Loading

On about the seventh day of each month the superintendent of freight station service issues a bulletin showing the average pounds per car of l. c. l. freight handled on each division and at each station forwarding 15 or more cars per month. The monthly standing of a station or division is a source of pride and interest to each division superintendent and freight agent. It is thoroughly understood, of course, that differences in local conditions may make it difficult for one agent or superintendent to compete with another, but nevertheless an improvement on the part of any station or division proves a source of satisfaction to the efforts responsive to. One of the sources of strength of the intensive loading campaign has been the fact that personal letters of commendation are often sent to freight agents and division superintendents when they direct increases in the average pounds per car forwarded from their station or division.

Prior to October, 1917, but due to the loading of l. c. l. freight included with those stations forwarding five cars or more per month and beginning with October, 1917, the stations were further restricted to stations which forwarded 15 cars or more per month. This new rule was put into effect at the request of the Pennsylvania Lines West, but in accordance with rules of the Commission on Car Service of

the American Railway Association, applying to all member railroads in the country.

Comparative Statistics of L. C. L. Loading

In November, 1917, the average lading per car of l. c. l. freight was 17,860 lb. for the Central system and 19,521 lb. for the Southwest system of the Pennsylvania Lines West, or the highest averages ever attained for these two systems. The increases in loading over July, 1912, for the Lines West as a whole and its three constituent systems are as follows:

| | Average lading L. C. L. freight in pounds | | Increase in pounds | Per cent increase |
|------------------------------|--|---------------|-----------------------|----------------------|
| | November, 1917 | July, 1912 | | |
| Pennsylvania Lines West..... | 19,076 | 10,849 | 8,227 | 75.83 |
| Southwest system..... | 19,521 | 10,655 | 8,866 | 83.20 |
| Central system..... | 17,860 | 9,029 | 8,831 | 97.80 |
| Northwest system..... | 18,819 | 11,463 | 7,356 | 64.17 |

Each system also showed increases in the average lading per car of l. c. l. freight forwarded in November, 1917, over November, 1916. The increase for the entire road was 1,459 lb. per car, or 8.28 per cent; for the Northwest system, 408 lb., or 2.21 per cent; for the Central system, 3,036 lb., or 20.48 per cent; and for the Southwest system, 1,988 lb., or 11.33 per cent. Although the total l. c. l. traffic handled in November, 1917, was considerably below that of the same month of 1916 and somewhat smaller than that of July, 1912, this decrease was not due to the loading methods of the road, but to chronic embargoes and to the fact that, as previously stated, effective October, 1917, the monthly statistics include only stations forwarding 15 or more cars per month instead of five or more cars per month. The records for March, 1917, show conclusively that heavier loading has not led to a loss of business. The volume of l. c. l. traffic forwarded in that month surpassed all previous records and was moved with 29,000 fewer cars than the total l. c. l. business of July, 1912.

Of the 118 stations on the Pennsylvania Lines West for which statistics were prepared in November, 1917, 22 achieved the highest loading records ever made at those stations. The station at Economy, Pa., which stood forty-first in rank of loading in November, 1916, was third in rank in the same month of 1917; Allegheny, Pa., rose from thirty-eighth in rank to fourth in the same period, and Chicago (Dairy Station) from twenty-seventh to sixth. Other stations showed like improvement. The comparative loading

year. These factors have affected some stations more seriously than others, and in some instances account for the less favorable showing of stations which made good records a year ago. In spite of these difficulties, it is quite well established, on the Pennsylvania Lines at least, that the holding of cars for two or three days to secure full lading does not work a hardship on shippers, because it permits a longer haul without interruption at transfer or intermediate points, thereby eliminating costly delay.

How Heavier Loading of C. L. Freight Has Been Accomplished

Intensive loading of c. l. freight is more difficult to effect than intensive loading of l. c. l. freight because its success rests almost entirely with the shippers; the railroads are able only to assist by suggestion and by furnishing the shippers with statistics indicating whether or not their efforts have produced good results. The Pennsylvania Lines West keeps monthly records of all cars loaded with the heavier commodities, giving the average lading for each commodity and for each individual shipper. In the case of some commodities of low specific gravity arbitrary maximum carload weights were established which were found, through experience, to be within the bounds of physical possibility. These bases were established, instead of following the policy of asking that all cars be loaded to 110 per cent of the stenciled capacity, a plan which in many cases would serve only to antagonize the shipper. Under this scheme the standard lading for earthenware was placed at 28,000 lb. per car regardless of stenciled capacity, that of oats at 65,000 lb., that of flour, corn, wheat and barley at 96,000 lb. if loaded on cars stenciled 100,000 lb. capacity, and if loaded on cars stenciled under 100,000 lb., at marked capacity plus 10 per cent. The standard lading for tinplate, steel shapes, nails, cement, stone, salt, brick, lime, tinplate bars, steel and soda ash (dense), ballast, gravel, sand, limestone, pig iron, structural steel, sheet steel, bar steel and flux was placed at 10 per cent above the stenciled capacity, as all of these commodities are of high specific gravity.

Each report prepared by the railroad shows the percentage of capacity utilized for the current month and the preceding month, indicating to the shipper whether or not he is making any improvement. The accompanying table is a sample of a monthly report showing carload averages for a number of typical commodities. On the basis of a maximum stand-

STATEMENT SHOWING LOADING OF CARLOAD FREIGHT IN JULY, 1917

| Commodity | No. of cars checked | Total weight of commodity loaded | Average pounds per car loaded | Total capacity (lbs.) | Average capacity (lbs.) per car | Percentage of capacity utilized | | Per cent increase | Per cent decrease |
|-----------------------|---------------------------|--|--|--------------------------|--|------------------------------------|------------|----------------------|----------------------|
| | | | | | | July, 1917 | June, 1917 | | |
| Tin plate..... | 373 | 31,380,212 | 84,129 | 33,569,000 | 90,801 | 92 | 83 | 0 | .. |

verages, percentage increases, and standings of the three stations mentioned are given below:

| Station | Station average lading in pounds | | Increase in per cent | Rank among stations | |
|------------------------------|----------------------------------|------------|----------------------------|------------------------|------------|
| | Nov., 1917 | Nov., 1916 | | Nov., 1917 | Nov., 1916 |
| Economy, Pa..... | 31,216 | 19,206 | 62.53 | 3 | 41 |
| Allegheny, Pa..... | 30,317 | 19,391 | 36.30 | 4 | 38 |
| Chicago (Dairy Station)..... | 28,438 | 21,188 | 34.21 | 6 | 27 |

In general, the continuous loss of experienced labor to other industries offering higher wages, has intensified the difficulties which the ever-changing multiplicity of embargoes has placed in the way of heavier loading during the past

and carload for each commodity the loading record for 28 of the most important commodities was 92 per cent in July, 1917, as compared with 85 per cent for the preceding month.

Considerable improvement has been effected in the loading of coal. In general, coal is now loaded to 100 per cent of cubical capacity, or about 5 per cent above the average lading for May, 1913.

On October 1, 1917, the Commission on Car Service of the American Railway Association issued an order directing that all carloading records be based on 110 per cent of the stenciled capacity of the car. While commodities of low specific gravity make a poor showing under this plan as com-

pared with those of higher specific gravity, this order has the advantage of establishing a universal basis from which intelligent comparisons can be made between different railroads. If, under this scheme, freight of low specific gravity registers but 33,000 lb. when loaded to the cubical limits of a car of 100,000 lb. capacity, it will be unloaded by the shipper and the railroad alike, that a load of 30 per cent of the stenciled capacity of the car, plus 10 per cent, constitutes the best that can be done with that commodity. On the other hand, in comparing the records of one road with another, the line handling commodities of low specific gravity will, under this plan, show up at a disadvantage with lines handling heavy commodities.

Comparison of Monthly Records of Commodity Loading

The Pennsylvania Lines' records for October and succeeding months have been prepared in accordance with the order of the Commission on Car Service. As a result, the average loading percentages for commodities of low specific gravity have fallen considerably. For instance, the loading of earthenware which averaged 103 per cent of what the railroad considered a maximum lading in September, fell to 33 per cent in October. Likewise, enamelware fell from 91 per cent to 25 per cent, stoneware from 95 per cent to 36 per cent and flour from 73 per cent to 69 per cent. In spite of these decreases on account of the new method of calculation, the lading of 33 commodities for October averaged 91.5 per cent of 110 per cent of stenciled car capacity, as compared with an average of 92 per cent for September on the old basis of arbitrary maximums for different commodities. The holding up of the average is accounted for by the fact that substantial increases in average carload weights were effected for commodities of high specific gravity. The following statement indicates the percentage of capacity utilized in loading various commodities of c. l. freight both on the new basis, for the month of October, and on the old basis, for preceding months:

TABLE 1.—PERCENTAGE OF CAPACITY UTILIZED IN LOADING VARIOUS COMMODITIES OF C. L. FREIGHT, AS ASCERTAINED BY A MONTHLY CHECK.

| Commodity | May | June | July | Aug. | Sept. | Oct. |
|-------------|-----|------|------|------|-------|------|
| Flour | 73 | 88 | 94 | 93 | 90 | 96 |
| Enamelware | 91 | 87 | 87 | 87 | 98 | 25 |
| Earthenware | 103 | 87 | 87 | 103 | 103 | 33 |
| Enamelware | 91 | 87 | 87 | 87 | 98 | 25 |
| Flour | 73 | 88 | 94 | 93 | 90 | 96 |
| Stoneware | 95 | 87 | 87 | 87 | 98 | 36 |
| Flour | 73 | 88 | 94 | 93 | 90 | 96 |
| Stoneware | 95 | 87 | 87 | 87 | 98 | 36 |
| Flour | 73 | 88 | 94 | 93 | 90 | 96 |
| Stoneware | 95 | 87 | 87 | 87 | 98 | 36 |

One of the greatest obstacles in the way of the more intensive loading of c. l. freight is the trade unit basis of doing business in various industries. Trade units date back to the time when cars were smaller, and are based on what were then considered well-filled carloads. The Pennsylvania Lines West, in common with other railroads, is doing all it possibly can to induce shippers' and manufacturers' associations to discontinue this method of doing business, and to base all orders on a modern c. l. basis, i. e., the loading of cars to full cubical or stenciled capacity. They have been assisted materially by the National Industrial Traffic League and its various car service committees throughout the country, which have brought home to the individual shippers the great importance of this change in methods. Some shippers have gone so far as to refuse orders which do not permit heavy carloading.

Intensive Loading Important Both in War and Peace Times

In the intensive loading of l. c. l. freight the Pennsylvania Lines West was a pioneer among American railroads. The persistent campaign which it has carried on in this direction has resulted in an increase of over 75 per cent above the

average loading per car when l. c. l. freight was handled without reference to car capacity. That saving in car space is reflected as a decrease of about 25,000 cars per month in the equipment required to handle the total l. c. l. business of the line.

However, loading of l. c. l. freight has been into progressively only recently because it is a matter almost entirely under the control of the shipper. The great volume of traffic, which has been pressing for shipment during the past two years, and the prior importance of coast-to-coast transportation from the entrance of the United States in the war has forced shippers and carmen to conserve railroad equipment by releasing cars more quickly and by utilizing available car space more fully. The Pennsylvania Lines West has been able to stimulate heavier loading of c. l. freight since last spring because shippers have been in the frame of mind to give consideration to the savings of the road.

The loading of heavy commodities has been increased appreciably through the cooperative efforts of the railroad and shippers. Cement which was loaded to 91 per cent of car capacity in March, 1917, showed a percentage of 79 in October; the loading of nails increased from 60 per cent to 72 per cent in the same period, stone from 80 per cent to 88 per cent. The more important commodities (exclusive of coal) were loaded 7.5 per cent heavier in October than in March, 1917, despite the fact that the computation of loading percentages on the basis of stenciled car capacity, introduced in October, resulted in marked drops in percentage for some commodities. Car conservation, whether applied to l. c. l. or c. l. traffic, is particularly important in war times and is likely to receive even more attention if the freight traffic of the country continues to increase in volume. Of paramount consequence in war times, it is a practice worthy of continuance after the return of peace.

A Substitute for the Frog

FROGS IN TURNOUTS ARE A COELEFT SOURCE OF WEAR AND TEAR to rolling stock and track and on lines of heavy traffic frog maintenance and frog renewals become very burdensome. For this reason any device of practical application that will replace the frog and diminish the damage

A Well Proven Switch Operated from a Switch Stand

may be done by the use of a well-proven switch mechanism. The use of a well-proven switch mechanism is a well-proven method of reducing the wear and tear on the rails and the frog. The use of a well-proven switch mechanism is a well-proven method of reducing the wear and tear on the rails and the frog.

into line with the running rails of either track. The movement is accomplished by a system of rods and levers actuated from a switch stand or interlocking plant. A suitable locking device is provided to secure the rail in line for either track, the arrangement being such that the switch stand lever cannot be locked unless the locking bolts of the swing rail have been fully driven home. When connected with an interlocking plant it conforms to the usual locking requirements.

All parts of this device exposed to the traffic are mounted on a steel plate which is spiked to the ties. The four rail ends are fastened to this plate by means of bolts and suitable cast steel blocks bolted to both the plate and the rail so that there is no opportunity for the rails to run under the effect of traffic and temperature. The swing rail is supported for its entire length by two cast steel bars, having the general shape of two supporting rail-joint bars except that each one of them is provided with bolts which lock the rails into position by passing into holes in the cast steel blocks supporting the ends of the running rails.

In the earlier designs, illustrated in the photograph, the swing rail was moved by rods attached near its end, and

was locked by means of rods driven end-wise between the stock rails. In the improved design, the working mechanism is contained in a cast iron drum located directly under the pivot and the operating rods entering this drum are below the top of the ties. The operating mechanism consists of two concentric shafts, one to swing the rail and the other to lock and unlock it.

The photograph shows one of these frogless switches in service in the eastbound freight track of the Atchison, Topeka & Santa Fe, at Argentine (Kansas City), Kan. This installation is operated from a switch stand and has been in service for over four years. The anchoring of the ends of the running-rails to a plate makes it possible to reduce the clearance between the abutting ends of the rails to a very small amount. In consequence wheels pass over this joint with but little jar. The device requires much less metal than the usual frog and obviates the need for guard rails. All parts of the device subjected to wear from traffic can be renewed readily and in a short time.

The device is manufactured by the Walls Frogless Switch & Manufacturing Company, Kansas City, Mo.

Supreme Court Decisions Affecting Railroads

Interstate Commerce and the Relations Between State and Federal Regulating Authorities

THE UNITED STATES SUPREME COURT on January 14 rendered two important decisions in cases involving the relations between state and federal authority in matters affecting interstate commerce. In one case the order of the Texas railroad commission imposing penalties for failure to run passenger trains within 30 minutes of the advertised schedules was held to be an unlawful interference with interstate commerce. In the other the court sustained the dismissal of suits brought by the Illinois railroads in the effort to have set aside the Illinois two-cent fare law on the ground of the Interstate Commerce Commission's order requiring the removal of the discrimination against interstate commerce. While the court repeated the principles of its decision in the Shreveport case, that the federal power is ample to remove discriminations arising from the relation of state and interstate rates, it held that the uncertainty of the commission's order was such that it could not be used to nullify the effect of the state law. The Illinois case came before the court on cross appeals by the Illinois railroads and the state authorities from a decision by Judge Landis of the district court for the northern district of Illinois. An abstract of the decision is as follows:

The Illinois Case

These cross appeals present a controversy over the validity, scope and effect of an order of the Interstate Commerce Commission dealing with discrimination found to result from a disparity in interstate and intrastate passenger rates. For some years prior to December 1, 1914, interstate passenger rates between St. Louis and Keokuk on the one hand and points in Illinois on the other were on a substantial parity with intrastate rates between East St. Louis and Hamilton, respectively, and points in Illinois. All were on a basis of 2 cents per mile, save that the rates to and from St. Louis and Keokuk included a bridge toll over the river. All other rates between points in Illinois were also on the same basis, any intrastate rate in excess of 2 cents per mile being prohibited by a statute of that State. On December 1, 1914, the rates between St. Louis and Keokuk, respectively, and

points in Illinois were increased by the carriers to $2\frac{1}{2}$ cents per mile, plus bridge tolls, the parity theretofore existing being thereby broken. Following this increase the Business Men's League of St. Louis filed with the Interstate Commerce Commission a petition charging that the rates between St. Louis and points in Illinois were unreasonable in themselves, and, in connection with the lower intrastate rates, worked an unreasonable discrimination against St. Louis and in favor of Illinois cities, particularly East St. Louis and Chicago, and a like discrimination against interstate passenger traffic to and from St. Louis and in favor of intrastate passenger traffic to and from East St. Louis and Chicago. An association representing interests in Keokuk, Iowa, intervened and urged that any relief granted with respect to St. Louis be extended to Keokuk. The state of Illinois, the Public Utilities Commission of that state, an association representing interests in Chicago and another association representing interests in East St. Louis, also intervened and opposed any action contemplating or requiring an increase in intrastate rates. After a hearing the Interstate Commerce Commission filed a report finding that the existing bridge tolls at St. Louis and Keokuk were unobjectionable, that rates between either of those cities and points in Illinois were reasonable when not in excess of 2.4 cents per mile, plus bridge tolls, and that the service, equipment and accommodations provided for intrastate passengers to and from East St. Louis, Hamilton, and Chicago, were the same as those provided for interstate passengers to and from St. Louis and Keokuk. In that report the commission also found that the contemporaneous maintenance between East St. Louis and Hamilton, respectively, and other points in Illinois, of rates on a lower basis than those maintained via the same routes between St. Louis and Keokuk, respectively, and the same points in Illinois, bridge tolls excepted, gave an undue preference to East St. Louis and Hamilton and to intrastate passenger traffic to and from the latter points, and subjected St. Louis and Keokuk and interstate passenger traffic to and from those cities to an unreasonable disadvantage; that the existing disparity in interstate and intrastate rates worked an

unjust discrimination against St. Louis and in favor of Chicago in so far as the rates between St. Louis and points in Illinois approximately equal, start from those cities, exceeded by more than the difference in the rates between Chicago and the same points, that the disparity worked a like discrimination against Keokuk and in favor of Chicago, and that the existence of the reasonably direct lines of the carriers in the territory between Chicago on the one hand and St. Louis and Keokuk on the other of intrastate rates on a lower basis per mile than the rates between that territory and St. Louis and Keokuk, bridge tolls excepted, operated to subject interstate traffic to an unreasonable disadvantage.

The commission then made an order intended to result in the installation of rates not exceeding 2.4 cents per mile between St. Louis and Keokuk, respectively, and points in Illinois and to remove the discrimination shown in the report, but shortly thereafter the commission recalled that order and filed a supplemental report indicating that lawful interstate rates between St. Louis and Keokuk on the one hand and Illinois points on the other could be defeated by the use of two tickets, one purchased at the interstate rate for a part of the journey and the other at the lower intrastate rate for the remainder, and therefore that the order should be so framed as to cover the rates between the intermediate points. In this connection it was said that the discrimination against interstate traffic resulting from the lower intrastate rates "would not be removed merely by an increase in the intrastate fares to and from the east bank points," and that "any contemporaneous adjustments of fares between St. Louis or Keokuk and points in Illinois, and generally within Illinois, which would permit the defeat of the St. Louis, Keokuk, East St. Louis, or any other east side city fares by methods such as described above, and which would thereby permit the continuance of the undue prejudice which we have found is suffered by St. Louis and Keokuk, and continue to burden interstate commerce," would not comply with the order.

In obedience to that order the carriers—of whom there were 29—took the requisite steps to establish and put in force interstate rates on a basis of 2.4 cents per mile between St. Louis and Keokuk, respectively, and points in Illinois, and those rates became effective. Then, believing the order required all intrastate rates in Illinois to be on a level with those interstate rates, bridge tolls excepted, the carriers proceeded to establish and put in force new rates between all points in that state on a basis of 2.4 cents per mile. This met with opposition on the part of the state authorities and the carriers severally brought suits against them, in the district court for the northern district of Illinois, to enjoin them from interfering, by civil or criminal proceedings, or otherwise, with the establishment and maintenance of such intrastate rates under the commission's order. The suits were consolidated and the present appeals are from decrees dismissing the bills for want of equity and dismissing cross bills of the state authorities for want of jurisdiction.

Mr. Justice Van Devanter, after making the foregoing statement, delivered the opinion of the court.

After discussing questions of jurisdiction the opinion holds that the district court had rightly disposed of the jurisdictional questions by entertaining the principal suits and declining to entertain the cross bills. The opinion continues:

Whether the suits by the carriers were rightly dismissed on the merits is the principal question, and its solution turns on the power of the commission to deal with discrimination arising out of a disparity in interstate and intrastate rates, and on the scope and effect of the order made.

In their answers the state authorities took the position that in so far as the order purports to authorize or require a removal of the discrimination found to exist by a change in intrastate rates it is in excess of any power that has been or can be conferred on the commission, and therefore neither relieves the carriers from full compliance with the state rate

laws nor prevents them from being freely enforced against them. If the carriers were bound the existing situation would break for a time, the commission would be order which it has no power to make, the order is corrective, and not merely punitive. But that the power to be asked is vested by the Interstate Commerce Act, 1906, 34 Stat. 1, 1911, 36 Stat. 160, 1913, 38 Stat. 1000, 1915, 39 Stat. 1000, 1917, 40 Stat. 1000, 1918, 41 Stat. 1000, 1919, 42 Stat. 1000, 1920, 43 Stat. 1000, 1921, 44 Stat. 1000, 1922, 45 Stat. 1000, 1923, 46 Stat. 1000, 1924, 47 Stat. 1000, 1925, 48 Stat. 1000, 1926, 49 Stat. 1000, 1927, 50 Stat. 1000, 1928, 51 Stat. findings. And had it intended to require or authorize a state-wide readjustment of the intrastate rates it doubtless would have given direct expression to that purpose, which easily could have been done in a few lines. But neither in any part nor as a whole does the order plainly manifest such a purpose. In harmony with the reports it deals with the intrastate rates in so far only as they result in discrimination against interstate traffic to and from St. Louis and Keokuk. Its most comprehensive paragraph—the next to the last—declares that the carriers must “abstain from the undue preferences and the undue and unreasonable prejudices and disadvantages found in said report to result from the contemporaneous maintenance between Illinois points of passenger fares, which fares, in combination with other fares required or permitted by this order, would produce the discrimination against interstate commerce and the undue preference in favor of intrastate commerce condemned in the report of the commission.” But even here the general terms are so far restrained by the reference to the reports as to show that nothing more is intended than to command the removal of the discrimination to which the traffic to and from St. Louis and Keokuk is subjected. Besides, this paragraph evidently proceeds upon the theory that some of the intrastate rates are not affected by the other paragraphs, and ought not to be disturbed save where their use in connection with rates sanctioned by the order will be productive of the discrimination which it is intended to correct.

But while the order shows that it is not intended to require or authorize a readjustment of all the intrastate rates, the description of those to which it applies is at best indefinite.

There may be less uncertainty in some parts of the order than in others, but when each is read in the light of the rest and all in the light of the reports it is apparent that none has a certain or definite field of operation. The uncertainty arises out of a failure to designate with appropriate precision the territory or points to and from which the intrastate rates must or may be readjusted, and this omission accords with the absence from the reports of any finding showing definitely the territory or points where those rates operate prejudicially against the interstate traffic which the order is intended to protect.

To be effective in respect of intrastate rates established and maintained under state authority an order of the commission of the kind now under consideration must have a definite field of operation and not leave the territory or points to which it applies uncertain.

In construing federal statutes enacted under the power conferred by the commerce clause of the Constitution the rule is that it should never be held that Congress intends to supersede or suspend the exercise of the reserved powers of a state, even where that may be done, unless, and except so far as, its purpose to do so is clearly manifested. This being true of an act of Congress, it is obvious that an order of a subordinate agency, such as the commission, should not be given precedence over a state rate statute otherwise valid, unless, and except so far as, it conforms to a high standard of certainty.

We conclude that the uncertainty in this order is such as to render it inoperative and of no effect as to the intrastate rates, established and maintained under a law of the state, and therefore that the suits by the carriers were rightly dismissed on the merits.

The Texas Case

In the Texas case the court reversed the judgment of the lower court in a suit brought by the state of Texas to recover penalties for violation of an order of the State Railroad Commission. This order required passenger trains in Texas to start from their point of origin and from stations on the line in accordance with advertised schedule, allowing them

not exceeding 30 minutes at origin or points of junction with other lines to make connection with trains on such other lines, and not exceeding 10 minutes more if at the end of the 30 minutes the connecting trains were in sight. There were some other qualifications not necessary to be stated.

The defendant's passenger trains concerned were numbers 9 and 209, and were parts of a train, also numbered 9, of the Missouri, Kansas & Texas Railway, a different corporation, taken charge of by the defendant at Denison, Texas, about five miles south of the Texas and Oklahoma state line, under a contract with the Missouri, Kansas & Texas. In pursuance of this contract they were forwarded via Dallas and Fort Worth to Hillsboro, thence as one train to Granger and there again divided, the two parts going respectively to Galveston and San Antonio. There were similar arrangements for trains to the north. The cars received by the defendant came from St. Louis and Kansas City, Missouri, uniting at Parsons, Kansas, and thence proceeding south to Denison. The court of civil appeals at first held that the movement must be regarded as a continuous one from Kansas City and St. Louis, and that the order did not apply to the train; but on a rehearing decided that as the defendant took control at Denison with new crews and engines, and as the defendant could not go beyond the state line, the movement so far as the defendant was concerned was wholly within the state. Breaches of the order having been proved, it affirmed a judgment imposing a fine. A writ of error was refused by the supreme court of the state.

Justice Holmes in the decision said:

The supreme court gave up the manifestly untenable ground taken by the court of civil appeals and recognized that the defendant's trains were instruments of commerce among the states, but it construed the order as applying to them none the less and held it valid as so applied. The only question with which we have to deal is whether the state commission could intermeddle in this way, especially when there was sufficient accommodation for local traffic independent of the through trains. The defendant in error attempts to open this last matter, because the opinion of the court of civil appeals in which the fact was stated was reversed by it for a different reason, and that of the court of first instance was the other way. But we regard the decision of the intermediate and the supreme court as proceeding upon the assumption that we have stated and that we see no reason to disturb. Again, the question is not what the state commission might require of a road deriving its powers from the state, with regard to local business, *Missouri Pacific Ry. Co. v. Kansas*, 216 U. S. 262, 283, but whether the order if applied to this case would not unlawfully interfere with commerce among the states.

On its face the order as applied was an interference with such commerce. It undertook to fix the time allowed for stops in the course of interstate transit. It was a serious interference, for it made the defendant liable for an interstate train not starting on schedule time, when the train did not come into the defendant's hands, from another company in another state, until late. This, as we understand the facts, was the train to which the advertised schedule applied, and if so, the mere statement of the result is enough to show that the burden imposed not only was serious but was unwarranted as well as unjust. The suggestion that compliance with the order could have been secured by having an extra train ready to run if the regular one was not on time hardly is practical, and is not an adequate answer, even in form. For the defendant advertised, or at least had the right to advertise, the interstate train, and, if it did so, would not free itself from liability for a delay on the part of that train by offering another. We think it plain that this order was applied in a way that was beyond the power of the commission and courts of the state.

Report of Commission on Adamson Eight-Hour Law

The report of the commission of three appointed in 1916 to observe the operation and effects of the Adamson Eight-Hour law has been transmitted to the President and to Congress. It is signed by General George W. Goethals, chairman, E. E. Clark and George Rublee. The report contains, among other things, findings of the commission with regard to the effects of the institution of the eight-hour standard work day upon wages and hours. It shows an increase in cost to the railroads, increase in wages in each occupation and class of service, increases in wages as affecting individual employees, amount of overtime payments and additional allowances, typical wages by occupations in relation to services performed, and average hours of service.

The eight-hour day, says the report, as a measure of a day's work for the purpose of reckoning compensation of certain classes of railroad employees, has become as accomplished fact, and it is not understood that the roads have any intention of further contesting the establishment of the eight-hour day for the employees concerned. The employees recognized by roads as entitled to the eight-hour basis under law are: Engineers, firemen, conductors, assistant conductors, baggagemen, brakemen and flagmen in road and yard service, and generally also hostlers. The average number of employees in these classes in the calendar year 1916 was about 17 per cent of the total number of railroad employees. The law does not limit the actual duration of work to eight hours per day.

As actually applied in practice, the eight-hour standard which is being observed in road service is the so-called speed basis of $12\frac{1}{2}$ miles per hour. On a run of 100 miles or less, however, overtime begins after eight hours. Notwithstanding the permission of overtime the law has had some effect in reducing the actual hours of work. This is true

chiefly in yard service. Between March and October, 1917, over 11,000 yard crew were placed on eight-hour duty.

In road service the reduction in hours has been slight. Where hours have not been reduced the law has had the effect of increasing wages. Detailed reports for the month of January, 1917, indicate that the law caused the addition of over \$61,000,000 annually to railroad operating expenses. To what extent economies may be introduced to offset this increase in expense cannot be stated. Except in short turn around and suburban service passenger service is but little affected by the law. In road freight service the increase in wages averages about 15 per cent and about 25 per cent in yard service. Where there has been an actual reduction in hours the total pay of the individual is not necessarily increased by the eight-hour law, and his pay may actually be less than it was in the year 1916 before the law became effective.

A detailed study of the payrolls indicates that 10 per cent of the employees in the classes named received no increase in pay in January, 1917. Under the eight-hour law 30.2 per cent received less than \$10 per month increase, 22.6 per cent received from \$10 to \$20 a month increase, and 34.5 per cent received \$20 or more per month increase. The figures are subject to modification to the extent that the hours of work have subsequently been reduced.

Concerning hours of labor, the report says that in the Eastern district in slow freight service the actual time during which engineers are on duty is from 12 to 13 hours per run. In the Southern and Western districts the corresponding figures are considerably smaller. In local freight service men work from 11 to 12 hours per run in all districts.

Among the subjects which receive special treatment are speed and delays of freight trains, railway wage schedules and agreements, employment conditions in road and yard service, and practicability of an actual eight-hour day in railroad train service. The report itself is a book of about five hundred pages. Only a press summary was given out for general publication.

Light Railway with Gasoline Engine Being Used for Transportation of Wounded Soldiers

New Night Lights for Pullman Cars

THE PULLMAN COMPANY has been experimenting for some time with various lighting arrangements designed to provide suitable illumination for the aisles of sleeping cars after the passengers have retired. A satisfactory installation has recently been developed and is now being applied to all new cars built and also to cars which pass through the shops for repairs.

It may be of interest to give a few details of the numerous installations which were tried before a method of lighting was evolved that would fulfill all the requirements. In one of the experiments a light was placed at the bulkheads at the ends of the aisles and shaded with an amber glass, with a view to providing a non-glaring light to illuminate the aisle at night. This was found to be unsatisfactory as it lighted the end sections to some extent. An attempt to secure the

main switchboard, separate switches being used for the lights on the right and left sides of the car.

The fixture, which is attached to the aisle seat end and the seat rail, is pressed out of sheet steel. The base carries a small switch of the push button type which makes it possible to control each light individually. The lamp is placed in the fixture in a horizontal position, being held in place by a plain Edison type socket secured by a spring clip. The casing around the light, like the base, is of pressed steel.

Location of Aisle Light Under Seat End

In one side it carries a green glass which throws a subdued light over the floor. The connections are dust tight and with the exception of the green glass, which can readily be reached from the aisle, the parts will require cleaning at infrequent intervals. As will be seen from the illustrations all parts of the fixtures are easily accessible when the seats are removed and in case it becomes necessary to replace a lamp or any other part it can be done with little difficulty.

The Pullman Company is now planning to install fixtures

Sleeping Car Aisle Illuminated by Lights Under Seats

same results by dimming the ceiling lights also proved a failure. An installation with lights under the seat ends was tried, but the light was found to be annoying to the occupants of the lower berths opposite the fixtures. This objection has now been overcome by shading the light with a green glass.

The lighting arrangement which has been adopted for illuminating the aisles consists of 15 watt, 32 volt, type S tungsten lamps in receptacles placed under the ends of alternate seats. As the ends of the aisle are illuminated by the lights at the bulkheads it is not necessary to provide lights under the single seats in the end sections. Every second seat end on each side of the car carries one of the lighting fixtures, which are placed alternately on opposite sides of the car. Thus a 12 compartment car has 5 aisle lights and a 16 compartment car has 7. The lights are controlled at the

Lighting Fixture with Case Removed

similar to those used on the berths at the steps, to provide illumination for the treads. Clear glass, instead of green glass, will be used in these fixtures. Applications have been made by the Pullman Company for patents to cover the principal features of this system of lighting.

AUSTRIAN FARES INCREASED 50 PER CENT.—Austrian railway fares have been increased by 50 per cent since December 1.

General News Department

George Hodges, chairman of the Committee on Relations Between Railroads of the American Railway Association, and its related committees, has been re-elected for a term of two years.

Edwin F. Wendt, member of the engineering board of the Interstate Commerce Commission, and past president of the American Railway Engineering Association, has been elected president of the Washington Society of Engineers.

Repeal of the Valuation Act, under which the Interstate Commerce Commission is making a valuation of railway property, is the object of a bill which has been introduced in Congress by Senator King of Utah. It is Senate bill No. 3530.

All freight must be unloaded within seven days, if Congress should pass a bill, introduced by Senator Nelson of Minnesota on January 18. The Senator believes that this would be more effective than demurrage charges, to prevent cars from being used as storehouses.

The shopmen of 29 roads west of Chicago have laid before the director-general of railroads a request for better pay and for an eight-hour day; also for overtime rates for work done on Sundays and holidays. They want a maximum rate of \$6 a day and a minimum of \$3.50 for all shopmen, except carmen. The carmen want a maximum of \$5 a day.

The steel manufacturers of Canada, following conferences with the War Committee of the cabinet, have announced that the production of steel in the Dominion, this year, will be made 20 per cent more than last year, provided there is no failure of raw materials. Since the beginning of the war the railroads have suffered seriously from lack of rails because of the preferences given to makers of munitions.

Commanding officers on troop trains are forbidden to interfere with the schedules of the trains. This is an order from the War Department issued as a result of repeated protests from railroads. The railroads complained that officers on trains, ignoring carefully arranged schedules, have in some instances followed their own opinions as to where and when the trains should stop for resting or exercising the men, or for feeding and watering animals.

Surprise tests on the Pacific system of the Southern Pacific Company in the month of December numbered about 3,000. Among the most common tests are the removal of markers, extinguishment of lights, and the display of wrong numbers on caboose and engine indicators. In every test of this kind the trainmen detected the false condition and reported the error. The per cent of efficiency was 99.77. The few failures noted were mostly of a technical character, not involving the immediate element of risk.

Western Society of Engineers Elect Officers

The Western Society of Engineers, Chicago, has elected Charles E. Burdick, consulting hydraulic engineer, Chicago, president; James N. Hatch, consulting mechanical engineer, first vice-president; Kempster B. Miller, consulting electrical engineer, second vice-president; A. S. Baldwin, chief engineer, Illinois Central, third vice-president and C. R. Dart, bridge engineer, Sanitary District of Chicago, treasurer.

Railway Regiments' Tobacco Fund

The Machinery Club, New York, has voted to set aside one-third of the net profits of the cigar department for a tobacco fund for troops abroad and is dividing this third equally between

Railway Regiments' Tobacco Fund and the New York Sun Tobacco Fund. A check for \$295.94 has been received from F. A. Sullivan, acting chairman of the House Committee of the Machinery Club, as the Railway Regiments' Tobacco Fund proportion of this distribution for the month of December.

Another War Bonus in England

The English Government has granted another war bonus to railway workers, the fifth since the beginning of the war. The new bonus amounts to six shillings a week, bringing the total increase since February, 1915, to 21 shillings a week. The average pre-war wage was 30 shillings. The bonus to boys is increased to 10s. 6d. a week, while women and girls receive 8s. 6d. and 4s. 9d. extra a week, respectively.

Report on Telegraph-Wire Disturbances

The California State Railroad Commission, summarizing the results of an investigation extending over five years, has compiled a large mass of material on questions connected with inductive interference with the operation of telegraph and telephone wires by parallel power circuits, and persons interested in the subject and desiring information may apply to Richard Sachse, chief engineer of the commission, 813 Market Street, San Francisco. The full report is not yet available.

This investigation has been made, at an expense of \$100,000, by the commission jointly with power companies and utilities interested in the subject.

Freight Moving Week in New York

The "Clean-up Week" ordered by the director-general of railroads was badly neutralized by the severe cold and snow, but the freight stations in New York City reported considerable success, in spite of the obstacles. Substantially all of them report hearty co-operation on the part of the consignees and the steamships. The Lehigh Valley reported 1,418 loaded cars on hand on the 21st, as compared with 1,747 on the 14th, a decrease of 329. The New York Central reported a similar decrease of from 9,176 to 8,758.

The coal situation in New York City has been increasingly critical, not so much because of railroad congestion as from difficulty in getting boats across the river from New Jersey. More than half of the available tugs in the harbor were temporarily disabled by broken propellers or other damage caused by ice; and floating ice greatly reduced the speed of all water movements. Many barges were sunk while being towed through ice fields. Receipts of coal in the city have been from 20,000 to 25,000 tons daily when the normal needs aggregate 40,000 tons.

Western Lines Move Large Quantities of Coal

Following the severe storm of January 11, 12 and 13, a protracted period of severely cold weather greatly handicapped railway operation in the Central West. As a result the Chicago terminal district and other transportation centers in the Middle West are congested at the time of writing, and interchanges of cars between roads are slower than under normal conditions. The danger of a coal famine, which caused the United States Coal Administration to stop the wheels of commerce for five days, January 18-22, led western lines to devote most of their attention to the movement of coal when train operation was resumed after the storm. It was not until the 19th, however, that the railroads were able to move anywhere near the coal traffic they are capable of handling. In the 48 hours ending with midnight, January 20, fuel movements into the Chicago Terminal district by all roads with the exception of the Elgin, Joliet & Eastern, reached the high figure of 2,501 cars, of which 327 contained anthracite, 2,000 bituminous coal and 114 coke. During the same period 16 cars were delivered to industries, 413 cars were placed at room tracks and 93 at coal yards, while 2,226 cars in the district remained unplaced. Of the cars delivered 558 remained unloaded at the termination of the two-day period. Whether this rate of movement will be maintained depends upon whether the milder weather which made its appearance in the early part of the week continues.

Tank Car Tests and Safety Appliances

The executive committee of the Master Car Builders' Association has issued a circular regarding the hydrostatic tests of tanks of tank cars, stating: "That part of section 23 of the standard specifications for tank cars, classes I, II, III and IV, which requires that the tanks be retested hydraulically at stated intervals, is hereby suspended as to tanks for which such tests shall become due prior to January 1, 1920, except when the cars are shopped for repairs. The requirements of section 23 of each of the specifications named, that new tanks shall be tested before being put into service, and that tanks damaged to the extent of requiring patching or renewal of one or more sheets, or extensive riveting or recalking of seams, shall be retested before being returned to service, are not suspended."

A circular was also issued regarding safety appliances, stating: "The date effective of rule 3, paragraph m, of the rules of interchange, regarding the interchange of cars not equipped with United States safety appliances or United States safety appliances, standard, is hereby extended from January 1, 1918, to March 1, 1918.

The Dilution of Labor

As an illustration of the difficulties experienced by the railroads since and prior to the entrance of this country in the European War, the following comparative figures for one of the large railroads are of interest, as showing the number of men employed during the year 1917, such as firemen, brakemen and telegraphers, as compared with the normal force:

| | Normal force | Employed | Men employed per man required |
|-----------------|--------------|----------|-------------------------------|
| Firemen | 3,000 | 5,491 | 1.83 |
| Brakemen | 5,560 | 8,531 | 1.6 |
| Operators | 1,300 | 585 | .45 |
| Total | 9,860 | 14,607 | 1.5 |

On one division located in the iron and steel district it was necessary to employ four firemen, 2½ brakemen and 1½ telegraphers to maintain the normal force. The figures reflect not only the enlisting and drafting of men into the government service, but also the widespread shifting of employees, during the present abnormal conditions, because of offers of improved pay or conditions.

Mr. Willard Returns to B. & O.

The resignation of Daniel Willard as chairman of the War Industries Board of the Council of National Defense was reported in last week's issue. The White House has given out the text of his letter to President Wilson tendering his resignation, which says, in part: "The taking over of the railroads by the government has naturally raised many unforeseen and intricate questions, and it seems clear to me that I ought now to give my whole time to the affairs of the Baltimore & Ohio. In common with all other American railroads its operating organization has been considerably weakened during the last year because of the large number of officers and skilled employees who have gone to France and Russia."

In an interview at Baltimore Mr. Willard is quoted as saying that President Wilson left him free to take whatever steps would enable him to render the most useful service. "If I thought that I could be of greater service to my country by running a locomotive attached to freight trains over the Baltimore & Ohio than by doing what I am doing today, I would assume the new task without hesitancy. I was an engineer long before I became President of the Baltimore & Ohio. It is my desire to follow the line of activity that will produce the best results for my country in the midst of the supreme struggle in which it is now engaged. . . . Over 2,000 of our men have joined the colors, and it was right that they should do so. Of course, this left us short of men. Our officers have been working night and day. They are overworked; some of them have been ill. Facing such conditions, I could not help feeling that it was my duty to come back and devote my whole time to the railroad property. Our men in the trenches in France are depending on us for munitions and supplies. I have a boy at the front in France. I do not know what is going to happen to that boy before this war is over. But I do want to say that if all I am called upon to experience while my son and the sons of other parents are at the battlefield is a

little inconvenience to myself that might arise through compliance with some government order, I shall be delighted. This is no time for thinking of ourselves and slight interferences with our daily lives."

American Railway Engineering Association Convention

The American Railway Engineering Association is proceeding with its plans for its annual convention which will be held at Chicago on March 19 to 21 inclusive. Reports will be presented from the standing and special committees. In addition a large part of the session on Wednesday will be devoted to the consideration of the problems with which the maintenance of way department is now confronted in the handling of labor. It is expected that the report of the Committee on Economics of Railway Labor, discussing methods of securing men and of feeding and housing them, will be presented on that day. Letters have been sent out to a selected list of about 100 members of the Association asking them to prepare and submit descriptions of devices and methods for the conservation of labor which have come to their attention.

The annual dinner will be held as usual on Wednesday evening and will be in the nature of a war dinner. It is expected that two prominent railway men will speak on the railway situation at that time.

Pere Marquette Inspection Awards

Announcement has been made of the results of the 1917 track inspection on the Pere Marquette, based on a trip made in October, conducted by Frank H. Alfred, president of the road. A prize of \$100 was given to William Meier, roadmaster of the Detroit division, Benton Harbor, Mich., for the district receiving the highest grade and a prize of equal amount was given to H. Morris, roadmaster on the Canadian division at Walkerville, Ont., for the district showing the greatest improvement during the year. Prizes of \$25 were awarded to 12 foremen receiving the highest grade on each roadmaster's district and to 11 foremen making the greatest improvement as compared with 1916.

In addition to the examination of the track the inspection trip covered a consideration of signals and an inspection of station grounds and shops, shop grounds, repair tracks and engine houses, three additional inspection committees being appointed to grade these special features. Based on these gradings a prize of \$50 was awarded to E. Smith, the signal supervisor receiving the highest grade for the condition of interlocking and automatic signals. A prize of \$100 was given to Charles Montgomery, division master mechanic at St. Thomas, Ont., whose shop grounds and buildings received the highest awards, and \$25 to the station agent on each superintendent's division for the highest grade on station grounds.

The various prizes were awarded on the basis of grading made by committees assigned to consider the various phases of track maintenance, as well as signals, shop grounds, stations, etc.

Government to Mobilize Labor

The United States Department of Labor has recently reorganized its employment service for the purpose of conducting a campaign for the mobilization of labor. This is to meet the greatly increased demand of war industries and one of the announced objects is to furnish 250,000 men for transportation service. The employment office formerly under the jurisdiction of the commissioner-general of immigration has been turned over to the United States employment service under the direction of John B. Densmore; and the Secretary of Labor has appointed a special advisory council, including representatives both of employers and of employees, with John Lind, former governor of Minnesota, as chairman. This advisory council is to direct the campaign for co-ordinating the supply and the demand. Secretary Wilson intends later to increase the advisory council by the appointment of representatives from the War and Navy departments and the Department of Agriculture and the shipping board.

"The labor administrator and his advisory council," says Mr. Wilson, "will at once take in hand the questions of standardization of labor policies; will consider labor dilution and

training, priority demands, the adjustment of disputes and the safeguarding of employment. The advisory council will study all phases of the problem, make recommendation and plan for additional machinery and supervise their execution."

Arrangements are being made for the early transportation of 50,000 common laborers to the United States from Porto Rico. As soon as vessels are available 60,000 others will be brought from Porto Rico and the Virgin Islands, sufficient, it is hoped to take care of the shortage of the domestic supply of railroad and agricultural workers. Director-General McAdoo has asked the employment service to assist in supplying the railroads with labor for maintenance of way and for shop work.

Embargo Zone System Now in Effect

The new system of handling embargoes briefly outlined in the *Railway Age* of January 11, page 140, became effective on January 21. The railroads of the United States and Canada have been divided into 26 zones for this purpose. Hereafter all railroads will transmit their embargo notices, modifications, extensions and cancellations to all zone chairmen concerned and at the same time to all their agents at non-subscriber connections. No road may transmit its embargoes to any of its direct subscriber connections except as may be specifically arranged and agreed upon with the zone chairman. Embargoes received by zone chairmen are transmitted immediately upon receipt to roads listed under their jurisdiction according to their discretion, both as to whether a road may be affected in any particular by the embargo, or whether the method of transmission should be by wire, mail or messenger. When embargoes are placed because of congestion, accumulation, or threatened conditions at a particular gateway, or against shippers at stations where more than one railroad may be involved, the zone chairman will be responsible for any embargo action necessary to prevent accumulations or congestions on other lines entering the gateway or serving the shippers in question. Embargoes must be transmitted by wire to the zone chairman and become effective 24 hours after 11:59 p. m. of the date issued. The 26 zone headquarters and zone chairmen follow:

| Zone Headquarters | Name of Embargo Chairman |
|---------------------|---|
| Atlanta, Ga. | I. I. McCullum. |
| Birmingham, Ala. | H. F. Hutchens, Southern Ry. Western N. D. C. |
| Boston, Mass. | A. G. Thomason. |
| Chicago | D. J. F. esyth (vice-chairman) |
| Columbus, Ohio | I. W. Geer, Pennsylvania Lines |
| Denver, Colo. | E. L. Brown, Denver & Rio Grande |
| Detroit, Mich. | F. M. Nowell, Wabash. |
| Galveston, Tex. | I. H. Keefe, G. C. & Santa Fe |
| Indianapolis, Ind. | J. W. Conney. |
| Kansas City, Mo. | C. O. Hill, Kansas City Terminal |
| Louisville, Ky. | W. R. Hensley |
| Memphis, Tenn. | W. H. Fran, Y. & M. V. |
| Minneapolis, Minn. | A. T. Slade, Northern Pacific |
| Montreal, Que. | W. M. Neal (secretary). |
| Nashville, Tenn. | M. Wrenne, N. C. & St. L. |
| New Orleans, La. | I. I. Bailey |
| New York, N. Y. | E. E. Williams |
| Omaha, Neb. | H. T. Peterson, C. B. & Q. |
| Philadelphia, Pa. | O. O'Donnell, Penna. R. R. |
| Pittsburgh, Pa. | H. T. Crawford, Penn. Lines West |
| Richmond, Va. | W. H. Luke, R. Fred. & Pot. |
| San Francisco, Cal. | K. M. Nicols, West Pac. |
| Seattle, Wash. | I. H. O'Neill, Great Northern |
| St. Louis, Mo. | W. F. M. Garry. |
| Wilmington, N. C. | J. T. King, Atlantic Coast Line |
| Winnipeg, Minn. | Grant Hall, Canadian Pacific |

Additions to Railway Honor Roll

Data received from the Standard Air Line and the Florida East Coast indicate that 443 employees of those lines are now with the colors. Information received from these roads, together with additional statistics published in the *Railway Age* of January 18, page 181, increase the number of railroad employees and officers in the nation's service reported in the *Railway Age* of January 4, page 22, to 55,302 men. Up to date returns have been received from 126 roads representing 209,463 operated miles. The number of railway officers and employees of these lines now holding commissions in the army or navy number 1,482. The following statistics show the number of men in army or navy service and the names of officers and employees who have re-

ceived commissions for the Standard Air Line and the Florida East Coast respectively.

| STANDARD AIR LINE | | | |
|------------------------------------|-------------------|---------------|-------------------|
| Employees Who Received Commissions | | | |
| Name | Railroad Position | Military Rank | Branch of Service |
| Hugh H. Hays | Gen. Foreman | 1st Lt. | Inf. |
| I. S. Waters | Chief Eng. | 1st Lt. | Inf. |
| W. W. R. Hays | Int. Sec. | 1st Lt. | Inf. |
| J. H. Farmer | Rtd. Way Eng. | 1st Lt. | Inf. |
| C. M. Haucourt | Chief Eng. | 1st Lt. | Inf. |
| W. P. Briggs | Stenographer | Lieutenant | Inf. |
| Raymond Booth | Int. Sec. | Lieutenant | Inf. |
| I. D. Hightower | Asst. Int. Sec. | Lieutenant | Inf. |
| D. R. Wyatt | Clerk | Lieutenant | Inf. |
| Charles Pickett | Stenographer | Lieutenant | Inf. |
| G. E. Vanehart | Stenographer | Lieutenant | Inf. |
| Robert Ould | Clerk | Lieutenant | Inf. |
| H. N. Morris | Div. Clerk | Lieutenant | Inf. |
| J. W. Cooper | Clerk | Lieutenant | Inf. |
| J. L. Gresham | Draftsman | Lieutenant | Inf. |

Employees who received commissions: 1
Number of employees volunteering or drafted: 1
Total number of employees in government service: 1

| FLORIDA EAST COAST | | | |
|------------------------------------|-------------------|---------------|-------------------|
| Employees Who Received Commissions | | | |
| Name | Railroad Position | Military Rank | Branch of Service |
| C. S. Goel | Engr. M. of W. | Major | 1st Engr. (Ry.) |

Employees who received commissions: 1
Number of employees volunteering or drafted: 6
Total number of employees in government service: 1

American Society of Civil Engineers Elects Officers

The American Society of Civil Engineers has elected the following officers for the ensuing year: President, Arthur N. Talbot, professor of engineering, University of Illinois, Urbana, Ill.; vice-presidents, John F. Coleman, J. F. Coleman Engineering Company, New Orleans, La.; Nelson P. Lewis, chief engineer, Board of Estimate and Apportionment, New York. Among the directors elected are George W. Goethals, Samuel Thomas Wagner, chief engineer, Philadelphia & Reading, Philadelphia, Pa.; Milo Smith Ketchum, Dean, College of Engineering, University of Colorado, Boulder, Colo.; C. A. Morse, chief engineer, Chicago, Rock Island & Pacific, Chicago; and C. F. Johnston, general manager, Kansas City Southern were among those elected members of the Nominating Committee.

Professor Talbot is the author of several engineering texts including "The Railway Transition Spiral" extensively used by railway engineers. He is also chairman of the Joint Committee on Stresses in Track of the American Railway Engineering Association and the American Society of Civil Engineers which is now engaged in exhaustive experimental studies on the stress which railway track sustains under traffic. He has also been active in other engineering associations including the American Society for Testing Materials, of which he was president last year.

Air Brake Association

The executive committee of the Air Brake Association at a recent meeting decided to hold the 1918 annual convention, the announcement stating that "Executive committee has unanimously believed by your executive committee to be a reasonable time to hold a convention." The meeting will be held at Cleveland on May 7 to 10.

Railway Business Association Dinner Postponed

The annual meeting and dinner of the Railway Business Association scheduled for January 25 has been postponed. The local administration says "President Gen. A. L. Smith in the telegram to the members, 'Seriousness of the situation with such a serious situation existing, the thought of attending all concerned that this postponement was almost imperative.'"

Traffic News

The Public Service Commission of Oregon has abolished the average agreement provision in the demurrage rules of that state.

J. F. Holden, vice-president in charge of traffic of the Kansas City Southern, has been appointed supervisor of transportation and traffic of the United States Shipping Board, with office at Washington, D. C.

The Hartford & New York Transportation Company, which usually suspends business during the winter, will continue to run one steamer three trips a week between New York and Saybrook, Conn., at the mouth of the Connecticut River, 44 miles south of Hartford.

The Railway Commission of Canada, granting the requests of western grain shippers, has postponed until June 1, next, the date on which rates for the transportation of wheat shall be increased. The increases which have been approved went into effect on all other commodities on February 1.

The new demurrage rules recently announced by William G. McAdoo, director-general of railroads, have been adopted for application to intrastate traffic by the state commissions of Alabama, Illinois, Indiana, Kentucky, Mississippi, Ohio, Tennessee, and practically all of the states west of the Mississippi river.

The New York, Chicago & St. Louis has discontinued through trains Numbers 3 and 4. No. 3 left Buffalo at 6:40 a. m. and No. 4 left Chicago at 2:30 p. m. Train No. 2, Chicago to New York heretofore leaving at 10:35 a. m. now leaves at 8:30 a. m. The Pittsburgh & Lake Erie has discontinued the daily train leaving Pittsburgh for Cleveland at 11 p. m.

The recent order of the Fuel Administration closing certain industries for a period of five days, beginning on January 18, and stopping practically all business except transportation and government work on the ten Mondays beginning with January 21, led to considerable uncertainty on the part of both shippers and railroads as to whether these coalless holidays should be omitted in the computation of demurrage charges. A telegraphic inquiry sent to Washington authorities on these days just as on any ordinary week-day and that the order of the Fuel Administration prohibiting the operation of most industries did not prevent the loading or ties from Chicago brought the reply that demurrage would unloading of cars at those industries.

Cars Unloaded Even After 26 Days

On the tracks of the Bush Terminal Railroad, New York City, the inspectors of the Port Committee found, on January 10, nearly 100 loaded cars which had been there 26 days or more (out of a total of 443 cars that were waiting to be unloaded); and the committee proposes to take measures to punish any railroad officer or consignee who is responsible for these unreasonable delays. This committee consists of James S. Harlan, member of the Interstate Commerce Commission; Ralph W. E. Donges, of the New Jersey Public Utilities Commission and Travis H. Whitney of the New York State Public Service Commission. Their report says that 29 of the cars referred to as unreasonably delayed had been there since November, and no less than 273 had been on hand more than 10 days. The committee says also that the records of the Bush Terminal Railroad are not well kept, and that the inspectors had found difficulty in getting at the actual facts. The committee also makes public the case of a car containing 90 drums of caustic soda which had been standing in one of the yards of the New York Central for three weeks (with over \$70 demurrage accumulated) which had been reconsigned three times and still was waiting to be unloaded.

Freight Solicitors on Their Jobs

One of the first interpretations of the President's proclamation taking over the railroads was that competition was abolished, thereby eliminating the need for freight solicitation. Accordingly, many of the roads of the country called in their freight solicitors and employed them at other work. But solicitors are valuable in non-competitive work and most of the lines west of Chicago have put these men back at their posts. They handle claims, trace freight, quote rates, aid in routing cars to avoid congestion, and work to encourage heavy loading and the prompt release of cars by consignees. Operating officers and freight agents in many cases are so busy with operating matters that the solicitors in reality afford the only point of contact between the shippers and the railroads. They are more necessary now, to expedite the movement of the immense traffic of the country than ever before.

Illinois Roads Prepare to Refund Excess Fare

The legal committee of the Illinois railroads, composed of S. H. Strawn, general solicitor of the Chicago & Alton, R. B. Scott, general solicitor of the Chicago, Burlington & Quincy, and A. P. Humburg, commerce attorney of the Illinois Central, conferred with Edward J. Brundage, attorney-general of the state of Illinois, on January 21 to work out the details of refunding to the public the excess fares collected in the state since January, 1917, above the two cents a mile provided by state statute. This action was necessitated by the recent decision of the United States Supreme Court declaring that the order of the Interstate Commerce Commission in the case of the Business Men's League of St. Louis versus the Atchison, Topeka & Santa Fe et al. was not sufficiently specific to justify the application of the 2.4 cents interstate rate to intrastate passenger business throughout Illinois. According to the agreement reached at the conference, the railroads will receive for redemption the coupons evidencing the payment of excess fare, commencing at midnight January 26. These coupons may be presented at any ticket office of the issuing railroad and will be transmitted by the agent to headquarters where checks will be made out promptly and sent to those asking refunds. It is the intention of the railroads to ask the Interstate Commerce Commission to revise its order in that case so that the points in Illinois between which the 2.4 cents fare will apply will be specifically defined.

Government Appeals to Southern Farmers

W. G. McAdoo, secretary of the treasury and director-general of railroads, has issued a statement urging the farmers of the southern states to raise enough food for their own section. Reminding them that one of the great tasks of the day is to make the railroads more efficient, he tells them that the people of the South, especially the farmers, are in the habit of using the transportation system of the country to a degree that is highly uneconomic and unnecessary; that is, for the purpose of transporting food and feed from other parts of the United States, because they do not produce enough for themselves.

"Do everything possible during the next year to relieve the strain on the railroad agencies of the Nation by producing your own food and feed crops. The best farmers of the South recognize the fact that it pays as a matter of good farming to produce on each farm the hay and grain for the live stock, all the garden products, fruit, and poultry products which are needed by the farm, and if possible a surplus for sale in the immediate vicinity.

"The growing of cotton is not to be discouraged. Every Southern farmer should raise all the cotton that he can well cultivate, but he should grow the hay and grain to feed his draft animals. He should produce his own milk, butter, eggs, poultry, fruit, and vegetables, and every city and town of the South ought to be supplied with these commodities by the farmers of the South. If the South can feed itself it will release from unnecessary service in the South a vast number of freight cars and engines and will help win the war."

THE AMERICAN WAR TRUCK—There are, approximately, 7,500 parts in the American war truck, which weighs complete just over four tons, and is propelled by a 58 horse-power engine, running at 1,350 revolutions per minute.

Commission and Court News

Interstate Commerce Commission

The commission has approved without hearing the filing of tariffs by E. Morris and R. H. Countiss providing for increased demurrage and storage charges and new regulations on export traffic to North Pacific coast ports.

Personnel of Commissions

Oscar S. Straus, chairman of the New York State Public Service Commission, first district, has been reappointed, his present term expiring on February 1. Mr. Straus has told the governor that he expects to be allowed to resign as soon as the extensive new subway construction work has been brought near enough to completion to allow a new man to take up the chairmanship without detriment to the public interest.

Court News

Liability of Initial Carrier

The Iowa Supreme Court holds that where a shipper consigned wood to itself at St. Louis, and the wood was later consigned to the shipper at Philadelphia, the shipper's claim for conversion by the final carrier at Philadelphia waived any right based on conversion at St. Louis by the reconignment, and ratified the reconignment. *Adams Seed Co. v. Chicago Great Western (Iowa)* 165 N. W. 367. Decided December 10, 1917.

Failure to Stop at Flag Station

Unless it was a passenger train, the North Carolina Supreme Court holds that recovery cannot be had for failure to stop at a flag station on signal of one desiring to take passage; and if it was a passenger train nothing more than actual damages can be recovered, unless the engineer actually saw the signal or with reasonable care ought to have seen it. After the failure of a train to stop at a flag station on the signal of a woman, she, instead of waiting for another train or proceeding by a highway, needlessly attempted to walk to her destination on the track and fell into a cattle guard. It was held that the failure to stop at the station was not the proximate cause of her injuries and she could not recover therefor. *Brown v. Linville River (N. Car.)* 94 S. E. 431. Decided December 5, 1917.

Change in Demurrage Tariff

The Circuit Court of Appeals, Fourth Circuit, holds that a local tariff of demurrage charges applies after it has gone into effect, by notice for the required time, to all cars, including those accepted for transportation before the tariff was issued; and the optional allowance at destination is wholly disconnected with the service of transportation. A railroad, therefore, may lawfully apply a new tariff to cars transported before the old tariff was canceled. The court said that the opposing view, to say nothing else, overlooks the essential difference between the service of transportation, which must be furnished and paid for, and the accommodation of storage, which may or may not be provided. Broadly speaking, the former is a right which the carrier cannot deny or abridge, the latter a privilege which it is at liberty to accord or refuse. One is obligatory, the other optional. The court also holds that in the absence of anything in a demurrage tariff, or the statute, requiring the carrier to give notice of arrival of cars, absence of such notice does not affect the time when the demurrage charges commence, notwithstanding notices are usually given on the day of arrival as matter of courtesy or custom. *Chesapeake etc. Coke Co. v. Toledo & Ohio Central*, 245 Fed. 917. Decided July 5, 1917.

Local and State Taxation of Railroad Property

Part of a lot of cross-ties which were being treated at a railroad's creosoting plant were intended for use outside the state of New Jersey and part within the state. The local assessors attempted to impose a tax on the whole lot. The New Jersey Court of Errors and Appeals held that this was in violation of the state's right to tax the property for state uses under the Railroad Tax Act, §1, providing that the property of railroad corporations used for railroad purposes within the state is not taxable by the local taxing district, but by the state board of taxes and assessments for state uses. What the local assessors should have done was to have ascertained what proportion of these ties was intended to be used outside of New Jersey and what proportion within the state and to levy the local tax accordingly. The fact that that might have been difficult to do was no justification for their action. *P. & R. v. Woodbridge (N. J.)* 102 Atl. 92. Decided November 21, 1917.

Act of God and Delay in Transportation

The Indiana Appellate Court holds that where a piano was shipped to a point 163 miles distant, and 15 days later, when standing in a yard, it was damaged by the Dayton flood, the proximate cause was the act of God, and not the carrier's delay, and the carrier was not liable. The court thus stated its view on the much debated question as to whether an act of God exonerates a carrier for delay. Two conflicting rules have been established in different jurisdictions. (1) In several states it is held that the act of God completely exonerates the carrier, even though there has been negligent delay in transportation, and these cases rest on the proposition that the delay is not the proximate cause of the loss. (2) In some other states it is held that the act of God does not exonerate the carrier where there has been negligent delay in transportation, and these cases rest on the proposition that the delay is a contributing cause, or a concurring cause, or a proximate cause, or a concurring proximate cause. The first rule has been consistently followed by the federal courts. The Indiana court holds that that rule is sound. The law holds men responsible for the effects of their acts and omissions within the sphere of human control only. An act of God is the manifestation of a superhuman power which breaks the chain of causation in the realm of human activity. It upsets the best-laid plans of men and spoils all their calculations. Because its coming is beyond the scope of man's provision and its power beyond his strength to resist, he is relieved from the consequence thereof. In the case at bar the flood was held the sole cause of the loss of the piano. As between the delay and the damage the relation of cause and effect did not exist. So far as the court was aware, the question had not been previously decided in Indiana.—*Chicago & Erie v. Schaff (Ind.)*, 117 N. E. 869. Decided December 4, 1917.

Recent Decisions Under the

Federal Employers' Liability Act

The federal district court for the Western District of New York holds that a railroad employee pumping water into a tank for the use of locomotives engaged in interstate commerce is engaged in such commerce where such use is not dependent on remote possibilities.—*Collins v. Erie*, 245 Fed. 811.

The New York Court of Appeals holds that work contributing to the safety and integrity of an interstate railroad is a part of such railroad's interstate commerce; and no recovery could be had under the State Workmen's Compensation Act for the death of an employee killed while mowing weeds along the right of way to prevent spread of fire and slippery rail.—*Plaza v. Central New England (N. Y.)*, 117 N. E. 952.

The New York Appellate Division holds that a plumber engaged in the maintenance of a department of an interstate carrier, who was engaged in repairing a pipe on a station and was killed by a train while crossing tracks in the course of his employment was entitled to no compensation under the Workmen's Compensation Act, since he was employed in interstate commerce.—*Vollmer v. New York Central*, 167 N. Y. Supp. 426.

The New Jersey Supreme Court holds that a crossing flagman employed by a railroad company engaged in interstate and intra-

state commerce who was struck and killed by the engine of a train was engaged in interstate commerce.

The California Supreme Court holds that the interstate transportation of mail by a railroad under a contract with the federal government is "interstate commerce." Proceedings under the California Workmen's Compensation Act sought an award for the death of an employee of the Atchison, Topeka & Santa Fe who, while delivering pouches of mail from the station at Riverhead to a train, was run down by another train. It is held no recovery could be had under the state law.—*Zenz v. Commission (Cal.)*, 168 Pac., 364.

The West Virginia Supreme Court of Appeals holds employees in the machine shops of a railroad company are not engaged in interstate commerce when pushing a carload of lumber about the shops to the place where it is to be unloaded, the car having been loaded at a point in the state and hauled to the shops (its point of destination, likewise in the state), although the lumber was intended for use in building and repairing cars thereafter to be used, in part, in carrying interstate traffic.—*Barnett v. Coal & Coke Ry. Co. (W. Va.)*, 94 S. E., 150.

United States Supreme Court

Texas Train-Regulation Void

The decision of the Supreme Court annulling, as applied to interstate traffic, the Texas law requiring trains to be run regardless of late connections, was noticed briefly last week, page 186. This suit was brought by the State of Texas against the Missouri, Kansas & Texas of Texas to recover penalties for the violation of an order of the State Railroad Commission. This order required passenger trains in Texas to start and to run on time, or not over thirty minutes late, and not exceeding ten minutes more (at a junction) if at the end of the thirty minutes a connecting train were in sight. The trains concerned were numbers 9 and 209, received by the defendant at Denison, about five miles south of the Oklahoma state line. The Texas Court of Civil Appeals at first held that the movement must be regarded as a continuous one from Kansas City and St. Louis, and that the order did not apply to the train; but on a rehearing decided that as the defendant took control at Denison with new crews and engines, and could not go beyond the state line, the movement so far as the defendant was concerned was wholly intrastate. Breaches of the order having been proved, it affirmed a judgment imposing a fine. A writ of error was refused by the State Supreme Court. That court recognized that the trains were interstate, but it construed the order as applying to them none the less. The case then came before the Supreme Court of the United States.

The Supreme Court held that the only question with which it had to deal was whether the State Commission could intermeddle in this way, especially when there was sufficient accommodation for local passengers independent of the through trains. The question was not what the State Commission might require of a road deriving its powers from the State, with regard to local business, but whether the order, if applied to this case, would not unlawfully interfere with interstate commerce. On its face the order was an interference with such commerce. It undertook to fix the time allowed for stops in the course of interstate transit. It was a serious interference, for it made the defendant liable for an interstate train not starting on schedule time, when the train did not come into the defendant's hands from another company in another state, until too late. This, as the court understood the facts, was the train to which the advertised schedule applied; and if so, the mere statement of the result was enough to show that the burden imposed not only was serious but was unwarranted as well as unjust. The suggestion that compliance with the order could have been secured by having an extra train ready to run if the regular one was not on time was "hardly practical," and was not an adequate answer, even in form. For the defendant advertised, or at least had the right to advertise, the interstate train, and if it did so, would not free itself from liability for a delay on the part of that train by offering another. The court thought it plain that the order was applied in a way that was beyond the power of the Commission and courts of the State, and the judgment was reversed.—*M. K. & T. of Texas v. State*. Decided January 14, 1918.

Equipment and Supplies

Locomotives

THE PHILADELPHIA & READING will build 15 locomotives in its own shops.

THE CHESAPEAKE & OHIO is inquiring for a number of ten-wheel switching locomotives.

THE ILLINOIS CENTRAL, which was reported in the *Railway Age Gazette* of November 30 as having ordered 25 switching locomotives from the American Locomotive Company, has also ordered 4 Santa Fe locomotives from the same company. The switching locomotives are superheated six-wheel locomotives and weigh 169,000 lb. The Santa Fe locomotives are also superheated and will weigh 367,000 lb.

NORFOLK & WESTERN.—This company's order for 20 Mallet type locomotives reported this week as having been given to the American Locomotive Company was placed in December. Full details concerning it and an order for 20 Mallet locomotives given to the Baldwin Locomotive Works at the same time were given in the list of locomotives ordered during 1917 which appeared in the Annual Statistical Number of the *Railway Age*.

Freight Cars

THE UNITED STATES ORDNANCE DEPARTMENT is asking prices on 150 ammunition cars.

THE AMERICAN SHEET & TIN PLATE COMPANY, Pittsburgh, Pa., is inquiring for 10 50-ton, 7,000-gal. capacity tank cars.

THE UNITED STATES WAR DEPARTMENT has issued inquiries for 400, 15-ton, 150, 30-ton and 75 20-ton flat cars for service in France.

THE VULCAN STEEL PRODUCTS CO., New York, is in the market for 40 box, 19 cattle, 27 flat and 13 gondola cars, all of 28-tons capacity and for export to Brazil.

THE UNITED STATES NAVY has issued inquiries for 10 to 40 flat cars. The Navy has ordered 6 underframes for 30-ton box cars, this item having been incorrectly reported in last week's issue.

Passenger Cars

THE VULCAN STEEL PRODUCTS CO., New York, is in the market for 5 first-class passenger cars, 6 second-class passenger cars and 4 combination mail and express cars for Brazil.

THE UNITED RAILWAYS OF YUCATAN have ordered from the Railway Storage Battery Car Company, New York, three 55-ft. all-steel storage-battery passenger cars, and two 27-ft. baggage and express trailers for service between Progreso and Merida.

Miscellaneous

PERU. The January 17 issue of Commerce Reports published by the Bureau of Foreign and Domestic Commerce contains the following notice: A cablegram from Commercial Attaché William F. Montavon, at Lima, Peru, states that he has immediate use for catalogues of railway equipment and construction material, and requests that they be forwarded to his office at once.

Signaling

THE CENTRAL OF GEORGIA has contracted with the General Railway Signal Company for an electric interlocking plant at Macon Junction to replace one recently destroyed by fire. The machine will have 97 working levers and 15 spare spaces. All switch levers will be provided with lever lights, and an illuminated diagram with 23 lights will also be provided. All track circuits will be changed from direct to alternating-current, and there will be approach, route and section locking on all through passenger routes.

Supply Trade News

R. J. Morgan, formerly supervisor of sales for the American Steel Export Company, Woolworth building, New York, has been appointed assistant general manager of sales.

H. M. Aubrey, who has served in various capacities with the Quaker City Rubber Company and the H. W. Johns-Manville Company, has been appointed special packing representative of the Union Supply Company with headquarters at Chicago.

Frank Bartholomew, who has been erecting engineer for the Shaw Electric Crane Company for the past 20 years and who resigned his position with that company in December, 1917, has become associated with N. B. Payne in the Havemeyer building, 25 Church Street, New York, specialist in electric cranes.

R. A. Van Houten, whose appointment as vice-president and general manager of the Sellers Manufacturing Company with office at Chicago, Ill., was announced in these columns

on January 18, entered railway service in March, 1887, with the Erie, serving consecutively as chairman and rodman on the New York division for two years; rodman for the chief engineer for two years; assistant engineer on the New York division for seven and one-half years and division engineer on the Delaware division for eight and one-half years. In June, 1908, he became division engineer of the New Jersey & Lehigh division of the Lehigh Valley, which position he held until October 15, 1912,

when he was appointed eastern sales agent for the Sellers Manufacturing Company with office at New York. After seven months in New York, he was transferred to the sales department at Chicago, as sales agent and on April 1, 1917, he was appointed works manager of the plant at Mayfair, (Chicago), which position he held until January 1, 1918, on which date his appointment, as noted above, became effective.

Edward M. Hagar, president of the American International Steel Corporation, a subsidiary of the American International Corporation, and former head of the Martin-Wright Aeroplane Company and the Universal Portland Cement Company, died January 18, from pneumonia at his home in New York. Mr. Hagar was born in Salem, Mass., 45 years ago. He was educated at the Massachusetts Institute of Technology and at Cornell. Going to Chicago, he became president of the Portland Cement Company, serving 15 years in that capacity, and resigned to become president of the Wright-Martin Company. He became president of the American International Steel Corporation last June.

Bertrand H. Wait has entered the employ of the Portland Cement Association, and on February 1 will take up his duties with the association as district engineer in charge of the Portland Cement Association, New York office, 101 Park avenue. Mr. Wait graduated from Cornell University in 1902 with the degree of civil engineer. In 1903 he was appointed assistant engineer with the Rapid Transit Subway Commission, New York, and remained on this work until 1907, when he was transferred to the Board of Water Supply, city of New York. In 1911 he was transferred to the City Aqueduct Department as assistant division engineer of the Bronx Division, and in

August of that year was made district engineer. In 1914 he resigned to accept the appointment as Division Engineer, New York State Highway Department in charge of Division No. 1, which consisted of ten counties adjoining New York city. During the past year Mr. Wait has also served as Consulting Engineer for the U. S. Government on certain road construction.

Frank J. Foley, formerly manager of the mining department of the Westinghouse Electric & Manufacturing Company, on January 1, became connected with the Edison Storage Battery Company, Orange, N. J., as manager of the mining and traction department, with headquarters at the main office in Orange. During the two years Mr. Foley was connected with the New York City service department of the Westinghouse Electric & Manufacturing Company, he helped install the original multiple unit control on the Brooklyn Rapid Transit system, helped install the switchboards and turbines in the Kent Avenue power station of the Brooklyn Rapid Transit, and the turbo generator unit at the Waterside Station of the Consolidated Gas Company, New York. He then became connected with the East Pittsburgh plant of the Westinghouse Electric & Manufacturing Company, and after attending that company's engineering sales school for a year, was associated with the industrial sales department going into the mining section in 1910, in which position he had occasion to handle electrical equipment for mines, including storage battery and trolley locomotives. In 1915 Mr. Foley was promoted to manager of the mining section.

Guy E. Tripp Made Ordnance Executive

Guy E. Tripp, of New York, heretofore chairman of the Westinghouse Electric & Manufacturing Company, has been appointed by the War Department, with the rank of colonel, as chief of the production division of the ordnance department, entrusted with the task of supervising and stimulating the production of all ordnance supplies.

The appointment of Mr. Tripp is one of the important steps in the reorganization of the ordnance bureau, announced recently by its chief, General Crozier.

Mr. Tripp was selected because of his experience in the manufacture of munitions of all kinds, the Westinghouse company having obtained large contracts from the British and Russian governments immediately on

the outbreak of the European war. Mr. Tripp is credited with bringing to the department the highest obtainable type of experience and ability to insure speedy and careful production of munitions. The board of directors of the Westinghouse company has given him a leave of absence for the duration of the war.

Trade Publications

REINFORCING IRON—The Camilla Steel Company, Philadelphia, has issued a 24-page illustrated booklet describing the Camilla Slick concrete reinforcing bar. This booklet contains detailed information concerning the properties of this bar and data of value in designing structures in which it is to be used.

LOSING CAR TOLL DEPUTE—It was announced in London on December 21 that the railway companies have decided not to enforce for the present the toll of one penny for each cab entering the London stations for hire. This settles a dispute of six months' standing causing considerable inconvenience to arriving passengers.

R. A. Van Houten

Guy E. Tripp

Financial and Construction

Railway Financial News

BALTIMORE & OHIO.—This company has applied to the Ohio Public Utilities Commission for permission to issue \$10,284,384 of refunding and general mortgage bonds.

BOSTON & MAINE.—Attorney General Henry C. Atwill in his annual report to the Massachusetts Legislature recommends the state purchase of the Boston & Maine as a means of protecting its investment in the Fitchburg Railroad bonds. "The Commonwealth holds \$5,000,000 of bonds of the railroad acquired in 1900 at the time of the lease of the Fitchburg Railroad to the Boston & Maine in exchange for 50,000 shares of the common stock of the Fitchburg Railroad. Upon these bonds there is now due accrued interest amounting to about \$225,000. These bonds are unsecured. In order to insure that these bonds and interest will be paid upon any sale of the road, a price necessarily must be realized sufficient to pay at least all outstanding bonds with accrued interest, together with the floating indebtedness.

"There are at present outstanding bonds of the Boston & Maine amounting to \$43,338,000. The floating indebtedness amounts to \$13,306,060. That a sale of the road might not realize an amount sufficient to pay these obligations in full, under the present financial conditions of the country, is by no means improbable. There is no assurance of the payment of the Commonwealth's claim in full unless some method is provided by which the Commonwealth can appear as a competitor for the purchase of the property of the railroad in the event of a proposed sale by the receiver."

CHESAPEAKE & OHIO NORTHERN.—Articles of incorporation increasing this company's capital stock from \$3,500,000 to \$4,200,000 were filed recently at Maysville, Ky.

DENVER & RIO GRANDE.—Stay of execution of judgments for \$36,515,000 granted against the Denver & Rio Grande by the Federal courts of the Southern District of New York and of Colorado and appointment of a receiver for that road were asked in a petition filed January 18 in the Federal District Court at Denver. The petitioner is the Elliot Frog & Switch Company, of East St. Louis, Ill., which asserts about \$18,000 is due it. The hearing on the application for a receiver has been set for January 24.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company is preparing plans for terminal improvements at Tulsa, Okla., to cost approximately \$800,000.

ILLINOIS CENTRAL.—This company has purchased 83 acres of land east of its right of way and south of One Hundred and Seventy-first street, Chicago, which will be used for new classification yards.

PHILADELPHIA & READING.—A contract has been given to the William Steele & Sons Company, Philadelphia, Pa., for building a steel and concrete engine house at Philadelphia, part circular and to contain 10 stalls 90 ft. long and 6 stalls 110 ft. long, also to build a machine shop of irregular shape. The latter will be 130 ft. wide at one end and 156 ft. 6 in. at the other by 216 ft. 7 in. long. The cost of the work will be about \$326,183.

SOUTH MOUNTAIN & HANCEVILLE.—This company is building a line between Hanceville, Ala., and Stouts Mountain, six miles. P. A. Kearny, president, and C. F. Wheelock, secretary, and chief engineer, American Trust building, Birmingham.

SOUTHERN PACIFIC.—This company plans to remodel its timber preserving plant at West Oakland, Cal., at an estimated expenditure of \$350,000. The improvement includes the reconstruction of the track layout, the filling of a portion of the bay to provide room for expansion and the new installation of modern timber treating equipment.

Railway Officers

Executive, Financial, Legal and Accounting

Clyde West has been appointed paymaster of the Missouri, Kansas & Texas of Texas with office at Dallas, Tex., succeeding E. E. Deisher.

C. B. Zabriskie, secretary and treasurer of the Tonopah & Tidewater, has been elected also first vice-president with headquarters at New York City.

John T. Reid, cashier of the Atlantic Coast Line, at Norfolk, Va., has been elected treasurer with headquarters at Wilmington, N. C., succeeding James F. Post, deceased.

W. G. Davison, treasurer of the Spokane, Portland & Seattle with office at Portland, Ore., in addition to his duties as treasurer, will act as tax agent. **J. C. Daries**, right of way and tax agent, will be relieved of his duties as tax agent but will perform, in addition to his duties as right of way agent, those of sales manager of the Ruth Realty Company with office at Portland, Ore., as before.

A. W. Johnston, assistant to the president of the New York, Chicago & St. Louis at Cleveland, Ohio, retired from active service on January 1. Mr. Johnston had been in the service of the Nickel Plate continuously since April, 1, 1884. He was born at Boston, Mass., on March 4, 1853, and is a graduate of the Massachusetts Institute of Technology. He entered railway service in July, 1875, as a clerk in the office of the general superintendent of the Pittsburgh, Cincinnati & St. Louis. He was later assistant engineer on that road, following which he was superintendent of an industrial corporation in Arizona, chief engineer of the Toledo, Delphos & Burlington and superintendent of the Leavenworth, Topeka & Southwestern. On the Nickel Plate he was successively division engineer, division superintendent, general superintendent, general manager and assistant to the president. He was president of the American Railway Engineering Association for the year 1907-8.

Operating

C. P. Shaughnessy has been appointed trainmaster on the Kent division of the Erie, with headquarters at Mansfield, O.

J. A. Pierson has been appointed trainmaster of the Denver & Salt Lake with office at Denver, Colo., succeeding F. B. Miller.

W. A. Couch has been appointed superintendent of the Memphis, Dallas & Gulf with office at Arkadelphia, Ark., succeeding J. A. Couch.

M. M. Sisson, trainmaster of the Detroit, Toledo & Ironton at Springfield, Ohio, has been promoted to superintendent of car service with the same headquarters.

John M. Condon, assistant superintendent of the Mahoning division of the Erie, with office at Youngstown, Ohio, has been appointed superintendent of terminals, with headquarters at Jersey City, N. J., vice Frank J. Moser assigned to other duties.

J. H. Johnson, trainmaster of the Northern Pacific, with office at Minneapolis, Minn., has been appointed assistant to the general superintendent of the Eastern district, with headquarters at St. Paul, vice O. F. Ohlson, granted leave of absence.

R. C. Morgan, superintendent of the Winnipeg terminal division of the Canadian Pacific, has been appointed acting general superintendent of the Manitoba district with office at Winnipeg, Man., succeeding C. Murphy who has been assigned to special duties.

F. G. Archer, general yardmaster of the Atchison, Topeka & Santa Fe at Clovis, N. M., has been appointed assistant superintendent of the Third district, Middle division, of the

St. Louis Southwestern of Texas with headquarters at Texarkana, Tex., effective January 12.

A. E. Wallace, superintendent of the Chicago, Rock Island & Pacific, with office at Manly, Iowa, has been appointed general superintendent of the Chicago and Marion divisions of the Erie, with headquarters at Chicago, succeeding Franklin G. Robbins, who has entered military service.

William J. Jenks, whose appointment as general manager of the Norfolk & Western with headquarters at Roanoke, Va., has already been announced in these columns was born

near Raleigh, N. C., and was educated in public and private schools. He began railway work in November, 1886, and served as telegraph operator and agent at various places consecutively on the Raleigh & Augusta Air Line, now a part of the Seaboard Air Line, the Richmond & Danville, now a part of the Southern and the Norfolk & Western. From January, 1889, to September, 1901, he was successively train despatcher, chief despatcher, and car distributor on the Norfolk & Western and then to December, 1901, was chief despatcher, on the Seaboard Air Line, at Savannah, Ga. In December, 1901, he was promoted to trainmaster, and from January, 1904, to March, 1908, served as superintendent on various divisions of the same road. From March, 1908, to May, 1912, he was chairman of the Car Allotment Commission, of the Norfolk & Western, and then to December, 1912, was superintendent of the Pocahontas division of the same road. In December, 1912, he was promoted to general superintendent, of the western general division with headquarters at Bluefield, W. Va., which position he held until his recent appointment as general manager of the same road as above noted.

W. J. Jenks

From March, 1908, to May, 1912, he was chairman of the Car Allotment Commission, of the Norfolk & Western, and then to December, 1912, was superintendent of the Pocahontas division of the same road. In December, 1912, he was promoted to general superintendent, of the western general division with headquarters at Bluefield, W. Va., which position he held until his recent appointment as general manager of the same road as above noted.

E. A. O'Donnell, whose appointment as superintendent of terminals of the Southern Pacific at Houston, Tex., was mentioned in these columns on December 28, was born at

Navan, Ont., on August 6, 1884. He attended the Collegiate Institute at Ottawa, Ont., from 1898 to 1900 and business college at Ottawa during 1900. He entered the service of the Great Northern on July 10, 1901, and remained in its employ until September 1, 1905, serving as clerk, stenographer and telegraph operator in the office of the trainmaster, chief despatcher and superintendent at Havre, Mont. From October 1, 1905, to September 15, 1906, he was clerk in the traffic department of the Southern Pacific at Los

E. A. O'Donnell

Angeles, Cal. In the subsequent four months he was a clerk with the Cananea Consolidated Copper Company at Cananea and Senora, Mexico. From January 2, 1907, to August 1, 1917, he was with the Southern Pacific consecutively as secretary to the superintendent and to the general superintendent, yard clerk, switchman, yardmaster, trainmaster and inspector

of transportation in California, Louisiana and Texas. On August 1, 1917, he was promoted to assistant superintendent with headquarters at El Paso, Tex., which position he held until his appointment as noted above, effective December 1.

R. J. Barry, division superintendent of the Southern Pacific Texas line, with headquarters at Austin, Tex., has been transferred to the Galveston branch at the Galveston, Harrisburg & San Antonio and the Texas & New Orleans, with office at Houston, Tex., succeeding W. L. Cox. L. H. Cecil, general superintendent of the Louisiana & Pacific and superintendent of the Lake Charles & Northern with headquarters at De Ritter, La., has been appointed superintendent of the second division of the Houston & Texas Central with office at Austin, Tex., succeeding Mr. Barry.

F. B. Miller, whose appointment as general superintendent of the Colorado, Wyoming & Eastern with headquarters at Laramie, Wyo., was announced in these columns on January 4, was born at Galesburg, Ill., on September 28, 1866. He began his railway career as a rodman and brakeman on the Peoria & Farmington, in June 1884. In 1887, he entered the service of the St. Louis Southwestern, serving as train baggage man and freight conductor. From 1886 to 1907, he was employed as brakeman, conductor, trainmaster, general yardmaster and superintendent on the Chicago, Burlington & Quincy; from 1907 to 1912 he was superintendent on the Colorado Midland, and from that date to 1913 he was superintendent on the Denver & Salt Lake, resigning in the latter year to engage in farming. From 1915 to 1916 he was assistant superintendent of the Moffat Coal Company and in 1917 returned to the Denver & Salt Lake as trainmaster serving in that capacity until his appointment as noted above.

C. O. Bradshaw, whose appointment as superintendent of the Illinois and the Racine & Southwestern divisions of the Chicago, Milwaukee & St. Paul with headquarters at Savanna,

Ill., was announced in these columns on January 18, was born at Grand River, Iowa, on November 11, 1884. His railway career began on June 1, 1900, when he was employed by the Chicago, Burlington & Quincy as a water boy with the bridge and building department. While in that position he learned telegraphy and on July 1, 1901, he was promoted to agent and operator, which position he held until July 14, 1902, when he resigned to enter the service of the Great Northern. He remained with that road until

C. O. Bradshaw

August 1, 1917, serving successively as operator, despatcher, assistant chief despatcher, chief despatcher and trainmaster. He was appointed transportation inspector by the Special Committee on National Defense at Washington, D. C., on August 1, 1917, in which capacity he remained until November 5, 1917, when he was appointed inspector of transportation at the Chicago, Milwaukee & St. Paul with headquarters at Chicago, Ill., which position he held until January 15, 1918, on which date his appointment as noted above, became effective. He succeeded G. R. Morrison, who has been assigned to duties with the traffic department of the St. Paul.

Traffic

W. J. Doyle was appointed general agent in the general freight department of the St. Louis Southwestern of Texas at Dallas, Tex., effective December 1.

H. H. Hunkins, district manager north of the Chicago, Milwaukee & St. Paul at General Office has been transferred to Chicago, Ill., as city passenger agent.

E. C. Newman, city passenger agent of the Illinois Central at Memphis, Tenn., was appointed district passenger agent with the same headquarters, effective December 1.

S. C. Frost, passenger and freight agent of the Los Angeles & Salt Lake at Ocean Park, Cal., has been appointed commercial agent at Santa Ana, Cal., succeeding **W. H. Lee**.

J. B. Payne, assistant freight traffic manager of the Texas & Pacific, with headquarters at Dallas, Tex., has been appointed traffic assistant to the receivers, effective February 1.

Ralph H. Wallace, general passenger agent of the Erie, with headquarters at New York, in addition to his present duties will in future have direction of the suburban passenger traffic.

C. E. Norris, traveling agent of the Chicago & Alton at Cincinnati, Ohio, has been appointed division freight and passenger agent at Mexico, Mo., succeeding **J. E. Fish**, who was appointed local agent at Peoria, Ill., effective January 16.

J. S. Talbot, general traffic manager of the Evansville & Indianapolis with headquarters at Terre Haute, Ind., resigned and the office was abolished, effective December 1. **E. P. Lowery** has been appointed general freight and passenger agent with office at Terre Haute, Ind.

J. F. Osborne, commercial agent of the Missouri, Kansas & Texas at Denison, Tex., has been transferred to Dallas, Tex., succeeding **L. T. Fowler**. **D. Allen**, travelling freight agent with headquarters at Chicago, Ill., has been appointed commercial agent at Denison to succeed Mr. Osborne.

Neal M. Leach, general traffic manager of the Texas & Pacific, with headquarters at New Orleans, La., will retire from that position on February 1, to become vice-president of the J. H. W. Steele Company, engaged in freight forwarding, steamship chartering, etc., with offices at New Orleans; also at New York and at other places. Mr. Leach was born on September 14, 1869, and was educated at Kentucky University, Lexington, Ky. He began railway work in 1886, with an engineering corps of the Chesapeake & Ohio, and from 1887 to 1894 he was consecutively clerk in the purchasing and commissary departments of the Queen & Crescent Route. From 1895 to 1897 he served as chief of the commissary department and paymaster of the Q. & C. R., and then to 1901 as commercial agent of the New Orleans & North-eastern, the Alabama & Vicksburg, and the Vicksburg, Shreveport & Pacific, at New Orleans, La. From 1901 to March, 1905, he was general agent of the Mobile & Ohio, at the same place, and in March, 1905, was promoted to assistant general freight agent. On February 1, 1908, he was appointed general freight agent of the International & Great Northern at Palestine, Tex., and from May to August, 1911, he was traffic manager of the International & Great Northern, and Texas & Pacific, with office at San Antonio, Tex. From August, 1911, to September, 1913, he served as assistant to the president of the International & Great Northern and as traffic manager of the Texas & Pacific, with office at New Orleans, and since September, 1913, as general traffic manager of the Texas & Pacific.

The authority of **Robert C. Wright**, traffic manager of the Pennsylvania Railroad, with headquarters at Philadelphia, Pa., has been extended over the New York, Philadelphia & Norfolk; **R. B. Cooke**, traffic manager of the New York, Philadelphia & Norfolk with office at Norfolk, Va., has been appointed assistant to the traffic manager of the Pennsylvania Railroad and of the New York, Philadelphia & Norfolk, with

headquarters at Norfolk. and **Randolph B. Cooke**, freight solicitor of the New York, Philadelphia & Norfolk, has been appointed division freight and passenger agent of the New York, Philadelphia & Norfolk, with headquarters at Norfolk.

Engineering and Rolling Stock

L. F. Couch has been appointed master mechanic of the Memphis, Dallas & Gulf with office at Nashville, Ark., succeeding **F. J. Sears**.

W. O. Galbreath has been appointed chief engineer of the Missouri, Oklahoma & Gulf with office at Muskogee, Okla., succeeding **N. C. Van Natta**.

Daniel Sinclair, road foreman of engines of the Northern Pacific, with office at Glendive, Mont., has been appointed fuel supervisor, with headquarters at Glendive.

J. M. Roeschlaub, resident engineer on the Denver & Salt Lake with headquarters at Denver, Colo., has been appointed chief engineer with the same headquarters.

F. T. Mumma, electrical engineer in charge of the electric sub-stations of the Chicago, Milwaukee & St. Paul main line, has been appointed superintendent of the telegraph and telephone department on the Anchorage division, of the Alaska Railways, succeeding **Herbert Gaytes**, resigned.

Major Frederick Mears for the past three years member of the Alaskan Engineering Commission, operating the government railroad in Alaska, has been recalled from Alaska by the War Department to engage in railroad work in France. **William Gerig** consulting engineer for the past two years of the Alaskan Engineering Commission has been appointed engineer in charge of the Anchorage division of the Alaska Railways.

Purchasing

A. Gerrard has been appointed material agent and assistant purchasing agent of the Missouri, Oklahoma & Gulf with office at Muskogee, Okla.

Obituary

Joseph Hunter Garahty died at his home in Chicago on January 15. Mr. Garahty was the purchasing agent of the old Columbus, Hocking Valley & Toledo and later of the Cleveland, Cincinnati, Chicago & St. Louis. A number of years ago for some time after leaving railroad service he was associated with the Griffin Wheel Company, Chicago, following which he engaged in the development of large bituminous coal mines in the Middle West. About 10 years ago he sold his coal interests and retired from active business.

James F. Post, treasurer of the Atlantic Coast Line, with headquarters at Wilmington, N. C., died on January 5, at his home in that city. He was born in February 1851, at Wilmington and began railway work in August 1871, as a freight clerk on the Wilmington & Weldon. In 1886 he was appointed assistant treasurer of the same road, the Wilmington, Columbia & Augusta, and the Central Railroads and from 1887 to 1900, served as secretary of the same roads, all of which now form part of the Atlantic Coast Line. From April, 1900, to November, 1902, he was secretary and treasurer of all the roads in the Atlantic Coast Line System, and since the latter date was treasurer of the same system.

F. M. Luce, treasurer of the Association of Transportation and Car Accounting officers from 1904 to December, 1916, and formerly auditor of car accounts on the Chicago & North Western and since connected in an advisory capacity with the transportation department of that road, died at Chicago on January 22, at the age of 72. From 1872 to 1899 he was general car accountant of the Chicago & North Western and later became auditor of car accounts. He was the originator of the "Luce System of Car Accounts" now in use on many railroads. At the time of his death he was superintendent of car service of the Menasha Wooden Ware Company and the Two Rivers Wooden Ware Company; and was treasurer of the Central & Western Association of Car Service Officers.

Who Shall Fix Railway Rates?

It has been assumed that under the new policy of government control, the director general of railroads would have the same authority over railway regulation as over railway management. Some are contending, however, that the Interstate Commerce Commission should be allowed to continue to fix railway rates as in the past. This raises the interesting and important question whether any government official or body except the director general should be allowed to control railway earnings. For the power to regulate rates is the power to control earnings; and the power to control earnings would be, while the government guaranteed the companies' return, the power to create a railway deficit which the government would have to pay from the public treasury. It would seem that the same government official who is charged with responsibility for the financial and operating management of the railroads should also be given authority over the fixing of their rates. An independent official or commission possessing the rate-making authority would be able to embarrass and hamper the director-general in many ways. On the other hand, if the director-general is given power to fix rates it doubtless will be desirable for him to exercise it on the advice of the Interstate Commerce Commission. The commission is the country's most important railway regulating body; and while the director-general should control the general level of rates, the commission's views as to the way in which they should be adjusted in relation to each other should carry very great weight.

Who ever a man on a new job had worse luck than Director General McAdoo, we have never heard about him. The railroads have now been operated under Mr. McAdoo's direction a little over a month. There is always likely to be at least a temporary decline in morale and efficiency in any business following a change of management. If, therefore, there had been some loss of efficiency immediately after Mr. McAdoo took charge it would not have been surprising. But the director-general has had something worse than some loss of morale to struggle against. Never in the history of this country, we suppose, has there been a January throughout which weather conditions were more unfavorable to satisfactory railroad operation than they were during the month which ended yesterday. Even if there had been merely a normal traffic to handle, the railways would have had difficulty in handling it, and the traffic was abnormal in both size and complexity. Those who during this trying period have visited Mr. McAdoo's office regularly know that he and his assistants have worked as hard as men can work; and they have received as loyal and energetic support as railway officers and employees could give them, in the circumstances; but no loyalty, energy and skill can do more than minimize the effects of a succession of terrible northern blizzards. Mr. McAdoo hasn't had a square deal from the weather man. The weather man also is a government official. We suggest that the best solution of the problem of railroad operation during February might be for President Wilson to direct the weather man to get his orders during that month from the director general of railroads. The secretary of the treasury was appointed director

general partly to co-ordinate the treasury department and the railroads. The most important need that for however has been more co-ordination between the weather department and the railroads.

It legibly written, a train order is likely to be correctly read; and mistakes in reading have usually occurred in connection with poor penmanship or faint or dimmed or blurred type—though how men who are competent to run a train can ever take the risk of accepting anything but the clearest wording must always remain a puzzle. When not legibly written an order brings trouble, if not danger, and those first three words—"if legibly written," constitute an important if in the recommendation, printed on another page, for the universal delivery of train orders without requiring the conductor to sign a receipt. The arguments for the use of Form 19 which have been published during the past few years have a convincing sound, yet many roads continue to ignore them; can it be that this extreme cautiousness is due to a feeling that a good many operators ought to be required to reform their chirography before they can safely be trusted to impress an order on a conductor's mind without reading it to him aloud? To throw some light on this subject the *Railway Age* would like to print fac-similes of some well-written train orders, and this is an invitation to any reader to send to the Editor, at New York, any original orders, dated prior to February 1, which would illustrate good and satisfactory practice. Orders copied by a slowly hand have often been exhibited; it will be encouraging if some of the opposite kind can be shown. Also, let us have some typewritten orders. To what extent are typewriters used at stations for writing train orders?

Train-Order Form 19

The drastic action of the United States fuel administrator in prohibiting the industrial use of coal for five days, except in those industries absolutely essential to the continuance of our national life, has brought home the seriousness of the fuel situation to every citizen. The present situation is a lesson in the need for conservation which should not go unheeded, and any plan which offers the possibility of a material saving in the use of fuel should be given the most thoughtful consideration. In a paper presented by David Moffat Myers before the last annual meeting of the American Society of Mechanical Engineers, an abstract of which will be found on another page of this issue, the amount of fuel wasted in the production of steam which may practically be prevented by a campaign of education, is estimated to be 1,000,000 car loads a year. The relief that such a reduction in the coal requirements of the country would offer to the railroads in the present congestion and shortage of railroad facilities is clearly indicated by the author in his statement that it is nearly equal to the annual coal carrying capacity of the Pennsylvania Railroad. Of course such a plan would be of very little value as a means of remedying the acute shortage of fuel existing at the present time. Another winter is coming, however, and there is no reason

Industrial Fuel Conservation

to believe, with many of the activities essential to the conduct of our share of the world war just getting well started, that a reduction of 1,000,000 cars in the coal consumption of the country would leave any of our transportation facilities idle. The number of cars and locomotives which can be added to the resources of the railroads during the coming year will not be sufficient to provide a reserve large enough to insure that under adverse weather conditions, congestion and shortage may not again be encountered.

The report of the Railroad Committee of the Investment Bankers' Association, a part of which is printed elsewhere

For the Protection of Bondholders

in this issue, was made before the appointment of Mr. McAdoo as director general of railroads, but it is worthy of study and discussion. The idea on which the report is based is that the association should favor the formation of a bondholders' protective committee at the time that an issue and sale of bonds is made, this committee to employ an expert to continuously keep tab on the management of the railroad selling the bonds. The association referred the report back to the committee for further study. Government control in any case would have made a restudy of these suggestions necessary. It is interesting, however, to note that some of the tendencies of thought in regard to railroad financing which are indicated in this report have been quite clearly expressed in the discussions at Washington which have taken place following the President's proclamation announcing government control. Mr. McAdoo has made it perfectly clear that he recognizes and respects the huge stake which the creditors of the railroads have in their proper management and maintenance. It is hardly conceivable that when the railroads are turned back to their owners (the stockholders), many of the old theories of the rights of the controlling interests among the stockholders to manage and finance the road primarily or solely in their own interests, will have survived. Happily, even before government control the call of patriotism had gone far toward making this type of management unfashionable. It would seem highly probable that in the readjustments which take place after the war, bondholders' (the railroads' creditors') interests will receive very full recognition. The Investment Bankers' Association's committee report, therefore, may very profitably be studied both by railroad men and bankers and the committee should, and presumably will, welcome suggestions, especially from practical railroad men.

After all the commotion caused during most of the year 1916 and the early part of 1917, in the public press, in Congress, and elsewhere, by the demands of the four brotherhoods of railroad train service employees for an eight-hour day and their threats to strike if they didn't get it, it seems

Report of the Eight-Hour Commission

rather strange that practically no attention has been paid to the report of the Goethals commission appointed by the President under the Adamson law to observe its operation and effects. The report was submitted to Congress and the President last week but the newspapers carried but a few lines on it and many failed entirely to notice it. Most of those who believed the impassioned statements of brotherhood leaders that they were seeking a reduction in hours rather than higher wages, or of those who believed the statements of the railroads that the eight-hour day in train service would be impracticable and that the Adamson law would merely increase the wages of the highest-paid railroad employees, while decreasing by that much the ability of the roads to pay a more adequate compensation to some of their

men who had a much greater need for the increase, probably will never know what the Eight-Hour Commission has found out about those disputed questions after an exhaustive investigation of the subject. But those who will have an opportunity to see the report, an abstract of which is published elsewhere in this issue, will be interested to note that most of the claims made by the railroads during the long controversy have been sustained, while most of those made by the other side have been refuted. The report says that the eight-hour day, as a measure of a day's work *for the purpose of reckoning compensation* for certain classes of railroad employees, has become an established fact, and that while the law has had some effect in reducing the actual hours of work, chiefly in yard service, in road service the reduction in hours has been slight and the principal effect has been to raise wages. The commission also estimates that the increase in expenses caused by the law amounts to over \$61,000,000 annually, which is about the same as the estimate made by the railroads in advance. To what extent economies may be introduced to offset this increase in expense, the report says, cannot be stated. While the report is by no means conclusive, and the commission itself states that it was not possible to make authoritative findings as to the ultimate effects of the eight-hour standard work day because conditions during the period of its study were in many respects abnormal, it contains a wealth of valuable information on many disputed questions as to wages and conditions of employment. If it be claimed that the results predicted for the law were not fulfilled only because of the stubbornness of the railroads it may be remarked that the brotherhoods in their latest demands, presented to the railroads and now under consideration by the Railroad Wage Commission, have not asked for a real eight-hour day but a still further increase in wages.

A Great Opportunity for Public Service

THE OFFICERS AND EMPLOYEES of the railways of the United States have at this time the most splendid opportunity to render a great public service that they ever had. Furthermore, the conditions are such that they should be more disposed than they usually would be to work cordially together in rendering it.

There has been in the past much friction between the managements and certain classes of employees. This has been mainly due to controversies over wages and conditions of employment. All wage questions having now been referred to a government commission, the main cause of friction has been removed for the period of the war.

When in the past the operating officers have tried to increase efficiency, many employees have been luke-warm because, whether with good ground or not, they have felt that increased efficiency would mean fewer jobs for employees and more profits for the company. No employee can now have any such reason for refusing to co-operate in all efforts to increase efficiency. No company now can get as many men as it needs. No increase in efficiency will now add to the profits of any company, for under the guarantee plan, no matter what a railway's net earnings are, its owners will get the same amount of money. Every increase in efficiency will benefit the public, and it alone. It will benefit the public by causing more freight and passengers to be hauled for commercial and military purposes. It will also benefit the public either by reducing the deficit or increasing the surplus the government will have after paying the companies the amounts guaranteed them.

There never was in the past—and let us hope there never will be again—a time when the government and the people of the United States needed the very most efficient service which railway officers and employees could render as much

present owners of the teams and other facilities can agree to consolidate their energies and their capital, under conservative management, no better thing could be desired. It is understood that a sufficient number of the truckmen of the city are already favoring the plan to assure a successful start. There are more than a hundred of them, not counting the multitude of smaller establishments, and the task of arousing the co-operative spirit is by no means a simple one; but the Merchants' Association and those working with it have done much already. The term "pool" is used only in its theoretical sense; the more exact definition would be, division of traffic. The proposal contemplates zones of railroad stations and zones of stores and factories, each zone to be assigned to a single trucking concern. Actual payments of surplus earnings by one concern to another would not, probably, be necessary; satisfactory benefits should accrue to all interests without carrying the scheme that far.

As to rates to be charged for trucking, there will have to be a comprehensive and stable tariff, of course, and the director-general will have to prescribe it. The state and federal commissions, stopping to listen to a swarm of objectors, would take half a year just to make up their minds—assuming that they felt legally authorized to act—and relief is needed without any unnecessary delay. Moreover, the tariffs, at first, would have to rest on a rather arbitrary basis, for the calculation of the costs of the different kinds of wagon-service might require a good deal of experimental work.

For the protection of the monopoly (as well as for the maintenance of rates) dependence would have to be placed on the iron hand of the director-general. Trucks not subject to rigid discipline would have to be kept out of the freight-station piers. Consignees would have to accept freight sometimes at the cost of a little inconvenience, in order not to clog the delivering machinery. Everybody would have to do his best to promote the scheme for the general good, even if at his own loss.

Now, when we have a transportation dictator, and when everybody is disposed to do his best to hold up the hands of a dictator, would seem to be the right time to try this experiment. The single objective, to save one day's time on thousands of shipments, is alone well worth all the expenditure necessary to effect this reform. Because of the magnitude of the problem and the varied and conflicting interests involved, such a bold venture, in ordinary times, would require not only a genius but a prodigious expenditure of time and labor, and would involve no one knows how much delay; but when people are anxious about their daily bread, and are in danger of freezing, bulls are being taken by the horns every day; and are vanquished. The federal and state authorities (represented by Messrs. Harlan, Whitney and Donges) have already been interested; and Mr. McAdoo knows how to listen to a thing of this kind intelligently. And, finally, the immediate arrangements are in the hands of a veteran railroad officer, J. C. Lincoln, manager of the Merchants' Association's traffic bureau.

New Books

Selected Bibliography on Ports and Harbors. Compiled by W. J. Barney. 144 pages, 6 in. x 9 in. Bound in paper. Published by the American Association of Port Authorities, 110 West Fortieth street, New York City. Price \$1.

This book contains a fairly complete list of articles and books, published during the past ten years, concerning ports and harbors; and it deals with prints in the English, French, German, Italian, Spanish and Portuguese languages. The researches of the compiler have covered administration, laws, finance, equipment and engineering.

Letters to the Editor

Green Firemen—One Out of Three

NEW YORK CITY.

TO THE EDITOR:

For many of the positions in the operating department of the railroads of the country it is necessary, under the present stress, to employ a new man every ten weeks, or five times a year; a condition which would be startling if we stopped to realize it in its full meaning. This high percentage of resignations is, no doubt, familiar to readers of the *Railway Age*; it was published in the issue of January 4, page 89. And this dilution of the quality of the personnel is not to be put aside (as a matter that rightfully may be neglected) on the ground that the figures represent only an average; or because the totals include trackmen and freight-house men whose work, for the most part, can be performed with some degree of efficiency even by a green man. The conditions are deplorable in important branches of work directly affecting the prosecution of the war.

On one of the trunk lines, no less than *thirty-two per cent* of the locomotive firemen now in the service went to work, absolutely without experience, within the last four months. Of about fifteen hundred employees in one large locomotive and car repair shop, forty-three per cent have been employed within the last three months.

As has been said in connection with our five-day suspension of business to see if a little coal can be accumulated, the American people can adjust themselves to *anything*. Some local freight agents in and near large cities have learned how to get cars loaded, with a tolerable degree of efficiency, by gangs of men containing many individuals who have had only one day's experience and others whom it is safe to bid good-by, on the certain assumption that at the end of the day they will ask to be paid off. All things are possible.

But the lesson is there, just the same. Mr. Basford and others have told of the virtues of systematic education and the value of a general apprentice system; but here we go on in apparent utter obliviousness to his teaching. The editorial columns of your paper have rung with warnings against the danger of running trains without two first-class men in the cab of the locomotive; yet here we see evidence that hundreds of locomotives have only one man competent to deal with the varied emergencies that are liable at any time to arise in train operation. As I have said, we can adjust ourselves to anything. It is true, without doubt, that our best conductors and enginemen can get a train over the road, when they set themselves resolutely to accomplish the task, with crews whose ignorance is mountainous. All credit to such skillful operating men. Emergencies arise where, but for their ingenuity and fidelity, our transportation machine would break down. Within the last month there have been great numbers of such emergencies. But what I am driving at is that we have no right to tolerate this condition a single day beyond the time necessary to cure it.

To have competent men it is essential not only to pay adequate wages but also to train beginners as long as may be necessary. To have first-class firemen today men had to begin their course of education two years ago. We cannot set the calendar back two years, or even two days; but there remains the duty to begin. War-time pressure does not excuse neglect of this duty. To begin two years behind time is humiliating, but it is the only way out. It is better to begin two years too late than two years and one day too late.

L. D. W.

Senate and House Committee Railroad Hearing

Commissioner Anderson Has Prepared a New Draft of Administration Railroad Control Bill

WASHINGTON, Dec. 31.

THE ADMINISTRATION BILL providing the terms under which the government is to exercise its control of the railroads during the war and providing the basis for agreements with their owners as to the compensation to be guaranteed for their use, is now being considered in executive sessions of the Senate Committee on Interstate Commerce and the House Committee on Interstate and Foreign Commerce. Although it is uncertain when the bill will be reported, Chairman Smoot of the House Committee has stated that only a short time will be required. In the Senate Committee it is possible that more time will be required to reach a vote on the amendments to be proposed by Senator Cummins, who feels that the proposed basis of compensation is altogether too liberal and who has not yet been brought around to the idea that the restrictive ideas that he and others have advocated in the past are largely responsible for the emergency with which the government is now trying to deal.

Undoubtedly some time will be required also to consider the amendments proposed to provide that the government control shall terminate after a definite period after the end of the war, but the general prediction is made in Washington that the bill will pass in substantially its present form.

A new draft of the bill prepared by G. W. Anderson of the Interstate Commerce Commission as a result of the points brought out in three weeks' discussion of the bill in the hearings before the two committees was laid before the members last Thursday and after hearing arguments the Senate Committee concluded its hearings on Saturday and the House Committee on Tuesday. Mr. Anderson spent Friday in explaining the provisions of the redrafted bill to the Senate Committee.

The redrafted bill has been introduced in the Senate by Senator Smith as S. 3632 and in the House by Representative Smoot as H. R. 8172. The Senate Committee on Tuesday voted 7 to 6 to amend the bill to provide that the government shall relinquish control over the railroads within one year after the end of the war. Those supporting the amendment were Chairman Smith, and Senators Pomerene, Underwood, Watson, Townsend, McLean and Kellogg.

Redraft of the Railroad Control Bill

Sections 1, 2, 3, 4, 9 and 11 of the bill have been entirely rewritten, a new section 13 has been inserted and the former section 13, which has thus far been the principal storm center in the bill, has been changed to section 14. The bill now provides that the federal control shall continue during the period of the war and until Congress shall thereupon order otherwise and the following has been added: "But this act is expressly declared to be emergency legislation enacted to meet conditions growing out of war; and nothing herein is to be construed as expressing or prejudicing the future policy of the federal government concerning the ownership, control, or regulation of carriers or the method or basis of the capitalization thereof."

Mr. McAdoo and Commissioner Anderson have insisted that it would be extremely unwise to include in the bill a definite time for the termination of the government control, on the ground that its continuance will be necessary to protect the interests of the security owners as well as those of the government during the period of readjustment and that to set a time limit for action by Congress would be dangerous.

The new section 1 of the bill is as follows:

That the President having in full of war taken over the possession, use, control, and operation (called herein federal control) of certain systems of transportation (called herein carriers), is hereby authorized to agree with and to guarantee to any such carrier making returns to the Interstate Commerce Commission that during the period of such federal control it shall receive as just compensation an annual sum (herein called standard return), payable in reasonable installments, for each year and pro rata for any fractional year of such federal control, at a rate equivalent as nearly as may be to its average annual railway operating income (including therein such income of lines acquired by, leased to, or consolidated with such carrier between July 1, 1914 and December 31, 1917), for the three years ended June 30, 1917, and in addition thereto an annual sum payable likewise in reasonable installments reckoned at a rate per centum to be fixed by the President upon the cost of any additions or improvements, less retirements, made during the six months ended December 31, 1917. In the computation of such income, debits and credits arising from the accounts called in the monthly reports to the Interstate Commerce Commission, equipment rents and joint facility rents shall be included. The standard return and the cost of such additions and improvements are to be ascertained by the Commission from the reports, books, and other pertinent data of such carrier and certified by it to the President. No certificate shall, for the purpose of such agreement, be taken as conclusive of the amount of such average annual railway operating income and of such cost.

Every such agreement shall provide that any federal tax under the act of October 3, 1917, or acts in addition thereto or in amendment thereof, commonly called war taxes, assessed for the period of federal control beginning January 1, 1918, or any part of such period, shall be paid by the carrier out of its own funds, or shall be charged against or deducted from the standard return; that other taxes assessed under federal or any other governmental authority for the period of federal control or any part thereof, either on the property used under such federal control or on the right to operate as a carrier, or on the revenues or any part thereof derived from operation (not including, however, assessments for public improvements or taxes assessed on property under construction and chargeable under the classification of the Interstate Commerce Commission to investment in road and equipment), shall be paid out of revenues derived from railway operations while under federal control, that all taxes assessed under federal or any other governmental authority for the period prior to January 1, 1918, whenever levied or payable, shall be paid by the carrier out of its own funds or shall be charged against or deducted from the standard return.

The President is further authorized by such agreement to make all reasonable provisions for the maintenance, repairs and renewals of the property, and for the cost of removing funds therefrom and for the depreciation thereof, and that at the termination of such federal control either the property shall be returned to the carrier in substantially as good repair and in as good title as at the beginning of such federal control or that just payment shall be made therefor.

The President is further authorized in such agreement to make all other reasonable provisions, not inconsistent with

the provisions of this act or of the act of August 29, 1916, that he may deem necessary or proper for such federal control or for the determination of the mutual rights and obligations of the parties to the agreement, arising from or out of such federal control.

If the President shall find that the condition of any carrier was during all or a substantial portion of the period of three years ended June 30, 1917, because of non-operation, receivership, or other undeveloped or abnormal conditions, so exceptional as to make the basis of earnings, hereinabove provided for, plainly inequitable as a fair measure of just compensation, then the President may make with the carrier such agreement for such amount as just compensation as under the circumstances of the particular case he shall find just.

The principal change is in the addition of a provision for a return on the capital invested during the last half of 1917, estimated at \$240,000,000, and in the definition of the "standard return" to avoid the use of the term "net operating income" which is not well understood because it has not been used in most of the reports of the Interstate Commerce Commission, although it was recently inserted in the monthly report forms. A change was also made in the provision in the second paragraph, for the purpose of clarifying the provision that war taxes shall be paid out of the guarantee and not charged to operating expenses, and in the provision authorizing the President to make agreements in the case of roads in exceptional conditions.

The new sections 2, 3 and 4 are as follows:

Sec. 2. That if no such agreement is made, the President may nevertheless pay to any carrier while under federal control, an annual amount, payable in reasonable installments, not exceeding ninety per centum of the estimated annual amount of just compensation, remitting such carrier to its legal rights for any balance claimed to the remedies provided in section three thereof. Any amount thereafter found due such carrier above the amount paid shall bear interest at the rate of six per centum per annum; and any excess amount paid hereunder shall be recoverable by the United States with interest at the same rate.

Sec. 3. All claims for just compensation not adjusted as provided in section one shall, on the application of the President or of any carrier, be submitted to boards, each consisting of three referees to be appointed by the Interstate Commerce Commission, members of which and the official force thereof being eligible for service on such boards without additional compensation. Such boards of referees are hereby authorized to summon witnesses, require the production of papers, view properties, administer oaths, and may hold hearings in Washington and elsewhere, as their duties and the convenience of the parties may require. Such cases may be heard separately or together or by classes, as the Interstate Commerce Commission or any board of referees to which any such cases shall be referred may determine. Said boards shall give full hearings to such carriers and to the United States; shall consider all the facts and circumstances; and shall report as soon as practicable in each case to the President the just compensation, calculated on an annual basis and otherwise in such form as to be convenient and available for such agreement as is authorized in section one. The President is authorized to enter into an agreement with such carrier for just compensation upon a basis not in excess of that reported by such board, and may include therein provisions similar to those authorized under section one. Failing such agreement, either the United States or such carrier may file a petition in the Court of Claims for the purpose of final ascertainment of the amount of such just compensation, and in the proceedings in said court the report of said referees shall be prima facie evidence of the amount of just compensation and of the facts therein stated.

Sec. 4. The just compensation that may be determined as hereinbefore provided by agreement or that may be adjudicated by the Court of Claims shall be increased by an amount reckoned at a reasonable rate per centum to be fixed by the President upon the cost of any additions and improvements, less retirements, to the property of such carrier made by such carrier with the approval of or by the President while such property is under federal control.

Section 3 provides more specifically for the handling of claims for just compensation which are not adjusted by agreement. No change is made in section 5 and only slight changes in section 6. This now provides that the appropriation of \$500,000,000, together with any funds available from any operating income of the carriers, may be used as a revolving fund for the purpose of paying the expenses of the federal control and, so far as necessary, the amount of just compensation, as well as to provide for terminals, improvements, etc., as provided in the original bill. It is also provided that the President may expend such an amount as he may deem necessary or desirable for the purchase, construction or utilization and operation of canals, as well as other water transportation facilities mentioned in the original bill.

In place of section 9, authorizing the President to direct that the federal workmen's compensation act shall be extended to apply to carrier employees, a new section is inserted as follows:

Sec. 9. The President may prescribe a reasonable system and schedule of compensation for the disability or death resulting from an injury occurring, or that may have occurred at any time after the beginning of such federal control, and sustained in the course of his employment by a person employed, either directly by the United States, or indirectly through such carrier, in connection with such federal control and operation; and may likewise prescribe the means and method for the administration of such system and the determination and adjustment of any claim for such compensation and the payment thereof, as well as the expenses of the administration thereof, out of the operating revenues derived from the federal operation of the carrier, or out of any reserve fund or funds created therefrom. The President may, from time to time, revise and modify such system, schedule, means, and method. He may, in his discretion, transfer the administration thereof to the United States Employees Compensation Commission. The rights and remedies so provided shall exclude all other rights and remedies of the person injured, his personal representatives, dependents, or next of kin, either at common law or by statute, whether federal or state, against either the carrier or the United States on account of such injury or on account of the disability or death resulting therefrom.

The President may further prescribe that a reserve fund or funds shall be created, to be charged to operating expenses, for the commuted value of any or all claims for compensation allowed or accrued during such federal control.

To section 10 is added the following: "The provision of this act shall also apply to any carriers to which federal control may be hereafter extended." The new section 11 is as follows:

Sec. 11. That carriers while under federal control shall, in so far as is not inconsistent therewith, or with the provisions of this act, or any other act applicable to such federal control, or with any order of the President, be subject to all laws and liabilities as common carriers, whether arising under statutes or at common law; and suits may be brought by and against such carriers and judgments rendered as now provided by law. But no process, mesne or final, shall be levied against any property under such federal control. The President shall prescribe the means and methods for the payment, out of the operating revenues derived from such federal control, of any judgments and the

increase in wages to the trainmen, which were made effective as of January 1, into the February expenses, "but in a perfectly open and aboveboard way" and that they had not stated to the commission that the February returns were not representative or "indicative of tendencies." He said that if an advance in wages is granted that should not be made an excuse for higher rates but should be paid for by the government as a war expense and while he had no objection to the President's raising rates on war materials, where the government is the shipper, he did object to any advance in commercial rates.

Frank J. Warne, a statistician who has often represented the brotherhoods, testified before the Senate Committee on January 24, giving statistics to show the extent of intercorporate holdings of railway securities. He said that over 30 per cent of the outstanding stock is held by railroads for purposes of control while only 16 per cent of the bonds is held by railroads. He described the practice of acquiring the stock of subsidiary companies and issuing bonds against the property, saying that the result has been to practically convert stock into bonds and to make fluid capital subject to rigid interest requirements, and that this practice has exposed the railroads to financial crises in times of depression and has prejudiced the interests of the employees. "Our railway structure," he said, "rests on a financial structure of sand, a house of cards threatened by the slightest wind." He did not oppose the plan of guarantee proposed, saying that it is better to give the railroads too much than too little and that it would be impossible to measure the value of the service performed by the transportation system, but his apparent purpose was to show the committee that most of the money would go to a comparatively few large holders of securities.

Arguments on the Bill

Alfred P. Thom, counsel for the Railway Executives' Advisory Committee, presented a legal argument before the Senate committee on January 26 on the attitude of the carriers toward the administration bill.

Mr. Thom emphasized the fact that the basis of compensating the railroads proposed in the bill is not intended to fix the compensation directly but outlines a basis for an agreement between each company and the government and he declared that it is in the public interest that there shall be agreements in as many cases as possible.

It is not in the public interest, he declared, for a railroad to accept for its security holders less than an adequate return, for these securities lie at the base of the credit of the financial institutions of this country and constitute the foundation and support of those that have financial strength. It would not be an act of patriotism or in the public interest to agree to a reduction of these values. No mere sacrifice of these holdings which would weaken the financial structure of the country would be in the public interest.

"There should be paid to the owners of these properties what the Constitution requires," Mr. Thom said, "and that is the fair equivalent of the value of the use of that which is taken. You have but one precedent of a similar case to guide you. England is the only great nation that has done what this country has done and in that case the railroads were paid the demonstrated value of their use in the hands of their owners. You have also the recommendation of the President and of the secretary of the treasury to justify that basis."

Senator Cummins asked if he would contend for the basis of the actual earnings if the Interstate Commerce Commission had reduced the rates 15 per cent on December 29.

"Can you justify the crippling of a horse in order to buy him?" asked Mr. Thom. "The value cannot be affected any more by the possibility of the exercise of the legislative power to reduce rates than by the possibility of an increase

in rates. There is greater prospect of an increase in rates than of a decrease, but the carriers should not be entitled to the benefit of it. The compensation should be determined on the basis of the value as of the time of the taking and we must look at the conditions and circumstances as they existed at that time."

"If a railroad had been operating at a loss could we take it without paying anything?" asked Senator Cummins.

Mr. Thom replied that the fairly demonstrated earning power was the minimum which could not be reduced without confiscation and that where there was no fairly demonstrated earning capacity some other principle must be taken as a basis. He cited the case of two warehouses, one which had earned a profit and the other one similar but new and without demonstrated earning capacity, saying that the new warehouse could not be taken without compensation.

He also pointed out that the earning capacity of the roads at the time they were taken was based on rates which had long been subject to regulation and which during the past 10 years had been practically fixed by the Interstate Commerce Commission and, therefore, must be presumed to be reasonable. "If one railroad earned more than another from reasonable rates," he said, "it was because it performed a larger measure of public service. Congress, through its deputy, the Interstate Commerce Commission, cannot fix rates as reasonable and then reduce them on the ground that the earnings are too high."

Mr. Thom also urged that provision be made in the bill for returning the roads to their owners within a year after the expiration of the war or at the discretion of the President. He repeated his argument before the House committee on Monday.

Brief arguments were also made before the Senate committee by S. H. Cowan, representing Texas shippers; Glenn E. Plumb, representing the brotherhoods; Clifford Thorne and Commissioner Anderson.

Mr. Cowan argued that the roads were not entitled to be guaranteed any surplus and suggested that the advantages of competition be retained by allowing the roads part of the surplus if they could earn it, the rest to go to the government. "You ought to give the roads all they are entitled to and a little bit more," he said. "Whether they have bought the property, whether it was given to them, or whether they stole it, they are entitled to a reasonable return on it if their consciences will let them take it, but after you have guaranteed interest and dividends, that is all that is required. Let the government use part of the surplus to help the weaker roads and furnish a stimulus to the managers by giving them a chance to earn a little more than the guarantee. Mr. Thom talks about crippling a horse in order to buy him, but the plan proposed here is to take a crippled horse and doctor him up and then pay as much for him as for a good horse."

Mr. Plumb argued that railroad property is irrevocably devoted to public use and under the charter limitations is not private property. He said that if the carriers insist on their right to the "pound of flesh," an examination of the "bond" will show that they are not entitled to a drop of blood and they can be prevented from taking it because under their state charters they have no right to do a dollar's worth of interstate business.

Mr. Thorne argued particularly against letting the President, or Mr. McAdoo for him, fix rates. He said the railroads want the rates placed as high as possible, both for the effect on the value they may claim if the government buys the roads, and also so that they will be on a high basis if the roads are restored to their owners, and that the government will have a temptation "to milk the shippers of the country for money to carry on the war by an indirect tax in place of a bond issue."

Senator Cummins asked if the men surrounding Mr.

McAdoo are not those who in the past have consistently advocated higher rates. Mr. Thorne replied that they were and that whereas formerly the Interstate Commerce Commission building was all cluttered up with railroad men who crowded the elevators and halls and offices "swamping the commission" with their efforts to put forth their views as to higher rates, now they are permanently lodged there by the government and frequently a shipper cannot get to Mr. McAdoo except through a railroad man.

This aroused the indignation of Commissioner Anderson who asked if it was not just as much the duty of a Commissioner to hear a railroad man as to hear Thorne or other representatives of the shippers.

Mr. Thorne replied that that was, of course, the case, but that the shipper is entitled to a hearing and that the National Industrial Traffic League had been denied a hearing in the demurrage rates, while the "other fellows could discuss the matter in an ex parte way in Mr. McAdoo's private office." "If you turn this power over to a one-man tribunal," he said, "it will work disaster to many industries."

"If Congress wants to avoid litigation," he said, "it will have to accept the proposition made by the carriers," meaning presumably the proposition made by the President. He urged, however, that the guarantee be confined to fixed charges, reasonable dividends and a share of the surplus. He read resolutions adopted at a convention of the Iowa Grain Dealers' Association on January 24, advocating that the Interstate Commerce Commission should retain its present authority over rates and saying that "to substitute the snap judgment of one man would be a calamity to American industry."

Commissioner Anderson said that he had been working night and day on the bill and on methods for dealing with the situation since November 18. This is about the time the Railroads' War Board sent for the vice-presidents of the eastern roads to take what were considered at that time drastic measures for the relief of the congestion. The President's proclamation, which was given out on December 26, he said was completed on December 24. The essence of the plan he originally worked out has stood the fire of criticism better than he had hoped it would and while he had no idea that the bill is perfect, he said that practically no proposition has been presented that is not now represented in the redraft of the bill which has not been excluded "as an impossible proposition."

The plans proposed by Messrs. Cowan and Thorne for guaranteeing interest, dividends, and part of the surplus, he said, "would be destructive of the very purpose of federal control, which is to co-ordinate the railroads into one system and to make railroad men feel that they are working for the nation instead of for individual companies." "If you reject that," he added, "there is practically nothing before you attacking the proposed basis as the foundation for an agreement. These plans all have the same inherent vice—they won't work."

To show the views as to the right of a carrier to earn a return on invested surplus, which he holds "when not dealing with war emergency conditions," Mr. Anderson read from an article he had written, advocating that the return to be allowed should be based on the "amount of cash capital actually invested honestly and with prudence," but, he said, "we are now dealing with a war emergency and a condition, not a theory, confronts us. This is no time for Senator Cummins, with whom I thoroughly agree, and myself or Mr. Plumb or Mr. Thorne, to indulge our pet theories. If though we are right, Mr. Thorne is somewhat radical and Mr. Thom is all wrong."

Mr. Anderson said he had very reluctantly come to the view that it was necessary to leave the absolute power of rate making in the hands of the President, although it ought not to use it except in emergencies and ought to

employ the machinery of the emergency. He had suggested that a statute be drafted which would retain in the Interstate Commerce Commission all of its power not inconsistent with the necessary war power of the President but had found no one who can draw a statute that will work although he thought that the President had made it clear in his proclamation that he would not interfere except in special cases. He said that if Mr. Plumb had had to draft a bill that would meet all his criticisms, instead of merely presenting an oration about them, he would not have had time to read "The Merchant of Venice" recently.

As to the rate question he said: "If the railroads are not self supporting it will be the duty of the President to raise the rates."

To meet an objection that under the wording of the revised bill a railroad once taken over by the government would have to remain under government control until Congress orders otherwise, Mr. Anderson suggested an amendment to Section 14 providing that the President may at any time relinquish control of all or any part of any system of transportation which it was not needful or desirable to retain.

As to the proposal to set a time limit Mr. Anderson said that most thinking people who have studied the question are coming to the conclusion that there should be no time limit. Mr. Thom had referred to the possibility of a political campaign on the question of government ownership. This would be even more dangerous, Mr. Anderson said, if Congress were required to decide the question by a certain date. "That is a question you have got to face," he said. "We can't do anything now that will head it off."

New Form of Application for Priority Certificates

THE PRIORITIES DIVISION of the War Industries Board has issued a new form of application for priority certificate which will be put in effect immediately for all future applications for priority in war orders. Since September 21 the division has been issuing two kinds of certificates—principal and subsidiary priority certificates. From now on, only one kind of certificate will be issued, to be known as a "priority certificate." There will be no change whatever in the status of the principal and subsidiary certificates now outstanding, but the new form will be used alike in the future for all who have been accustomed in the past to apply for principal certificates as well as those who have been applying for subsidiary certificates.

The new form of application differs from the previous forms chiefly in that it is much more complete and calls for all of the facts which the division must have in order to consider the request intelligently; and in the second place, each application must be verified by an affidavit of the applicant, except the applications which are made by representatives of the American or allied governments.

The division will continue in the future, as in the past, to issue certificates only on special orders for materials, commodities or work. No industrial plant, material, or commodity will be given blanket certificates. A new priority circular, to be known as Priority Circular No. 7, with additional general information about the priority system will be issued within a few days.

The new priority certificate application contains 10 questions which must be filled out as described by the applicant. The questions are as follows:

1. Insert here name and address of person who is to supply the material, etc., or perform the work described in certificate (2 copies). This is the person in whom certificate is placed.

2. Insert here name and address of applicant.

3. State here number and date of order placed with person named in paragraph 1, above, for which priority is desired and date delivery is promised and desired, respectively.

4. If order was placed by other than the applicant named in paragraph 2, above, insert here name and address of person who did place the order.

5. Insert here particulars of order on which priority is desired, viz.: Quantity and description of material; or amount and description of work.

6. List here the numbers, ratings, and subject matters of priority certificates, if any, under which the applicant is working, and for which the material, etc., described in paragraph 5, is needed.

7. If material or work described in paragraph 5 is ultimately destined to fill one or more government or original orders, insert name of government department or of original contractor and number and date of orders.

8. State fully why priority is desired and what effort, if any, has been made to secure delivery without priority assistance. The above must include a statement that no part of the material, etc., for which priority is asked, has been shipped.

9. (a) Has applicant the plant and equipment necessary and now available to execute all orders upon which he is now engaged? (b) What per cent of applicant's plant output is now devoted to government orders?

10. If applicant has not the plant and equipment adequate to execute all orders upon which he is now engaged, what plant extensions or additional equipment are necessary?

Train Despatching*

THE PROMPT MOVEMENT of trains affects the earnings of the road quite as much as the successful operation of any other department. The train despatcher's office is the clearing house; all departments come in contact with, and do business through, this office. The despatcher's work depends more upon the co-operation of all than that of any other employee, and a great measure of his success is due

to help accorded him by train and engine men, yardmasters, and operators. Despatchers should be given the opportunity to go out over the road at frequent intervals, without loss of sleep or pay. This is profitable to the company, for there is no question but many an unwise move is made on the despatcher's checker board, which would not be made were he thoroughly familiar with the situation. Tell the despatcher as far ahead as possible when a train expects to move, where to, and nature of work. Tell him of any expected delay. If you are on a special train and you are authorized to run at a certain speed, whether fast or slow, tell the despatcher, so he may plan accordingly. How much ahead would you be if you ran 45 miles an hour when he was figuring on 30 or 35, and he stuck you 15 or 20 minutes?

It is a mistaken idea that because a despatcher is not sending orders continually, he is not working. Let no one attempt to estimate the amount of his work by the number of orders. Unlike other officers, who do the thinking and tell some one else to do the work, he does both. Care should be taken that the trick despatcher shall not be burdened with detail work and that his office be kept private. To make the despatcher responsible for all transportation matters in addition to the handling of trains has proved that a man cannot do a half dozen things at one time; something must be slighted; and this is false economy.

The operator is the eyes and ears of the despatcher. Good, prompt, efficient operators are worth their weight in gold to the despatcher, while the slack, inattentive ones are not worth their salt. I sometimes imagine that this department does not receive equal attention with others, considering its importance.

In your daily work and complaints, "have a heart." We are all striving toward the same end, to move the company's business. It has been said that the life of a train despatcher's nervous system is about 15 years, under present conditions; and I sincerely believe that the time is not far off when the despatcher is going to be allowed his one day off a week, the same as other workers.

We are gradually, year by year, striving more, co-operating more, and more intelligently realizing the importance of each other's work. This is the day of trained experts. Put the best you have into your job, and your future is assured.

*From a paper by S. F. Spurbeck, despatcher, Duluth, Missabe & Northern, Proctor, Minn.; read before the Missabe Railway Club of Proctor.

A Machine Gunner and Big Boulders Will Help Block the Progress of the Austrians Along This Italian Railway Line

Hopper Bottom Gondola Cars for C. M. & St. P.

Composite Construction With Heavy Steel Center Sill for
Equipment Built in Company's Shops

The Chicago, Milwaukee & St. Paul is now building at its shops at Milwaukee and Tacoma 1,500 50-ton gondola cars. A composite design has been adopted for this equipment, principally on account of the difficulty of securing prompt deliveries of steel at this time. Although heavy

end sills are 42 in. deep, the maximum width 10 ft. 11 in., and the maximum height from the top of the rail 8 ft. 6 in. The body of the car is 10 ft. 11 in. long, 8 ft. 7 in. wide

Hopper Car for the C. M. & St. P.

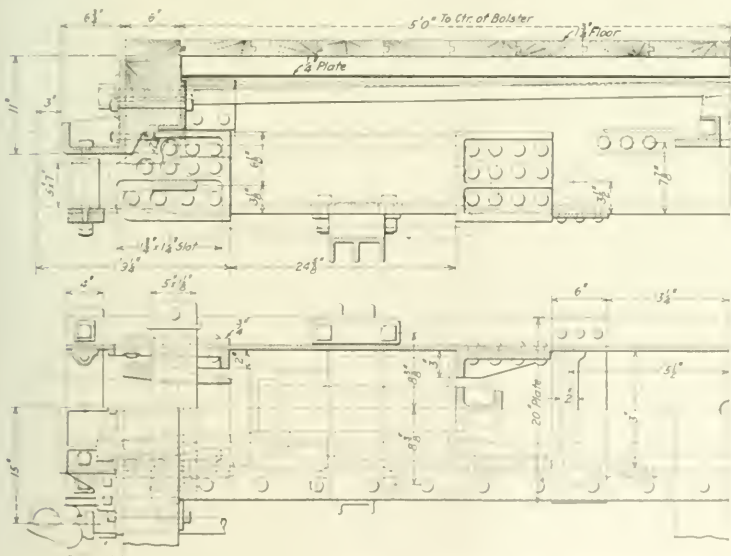

Cross Section of Car at Hopper

sills are used, the ratio of light weight to capacity has been kept reasonably low, the average light weight being 42,100 lb. The ratio of the revenue load to the maximum total weight is therefore 72.5 per cent.

In the design of the car the principal aim was to use wood as extensively as possible and yet provide a car that would give good service and insure economy from the standpoint of

and 4 ft. 3.38 in. deep. The cubical capacity, with the load heaped 2 ft. above the sides, is 2,000 cu. ft.

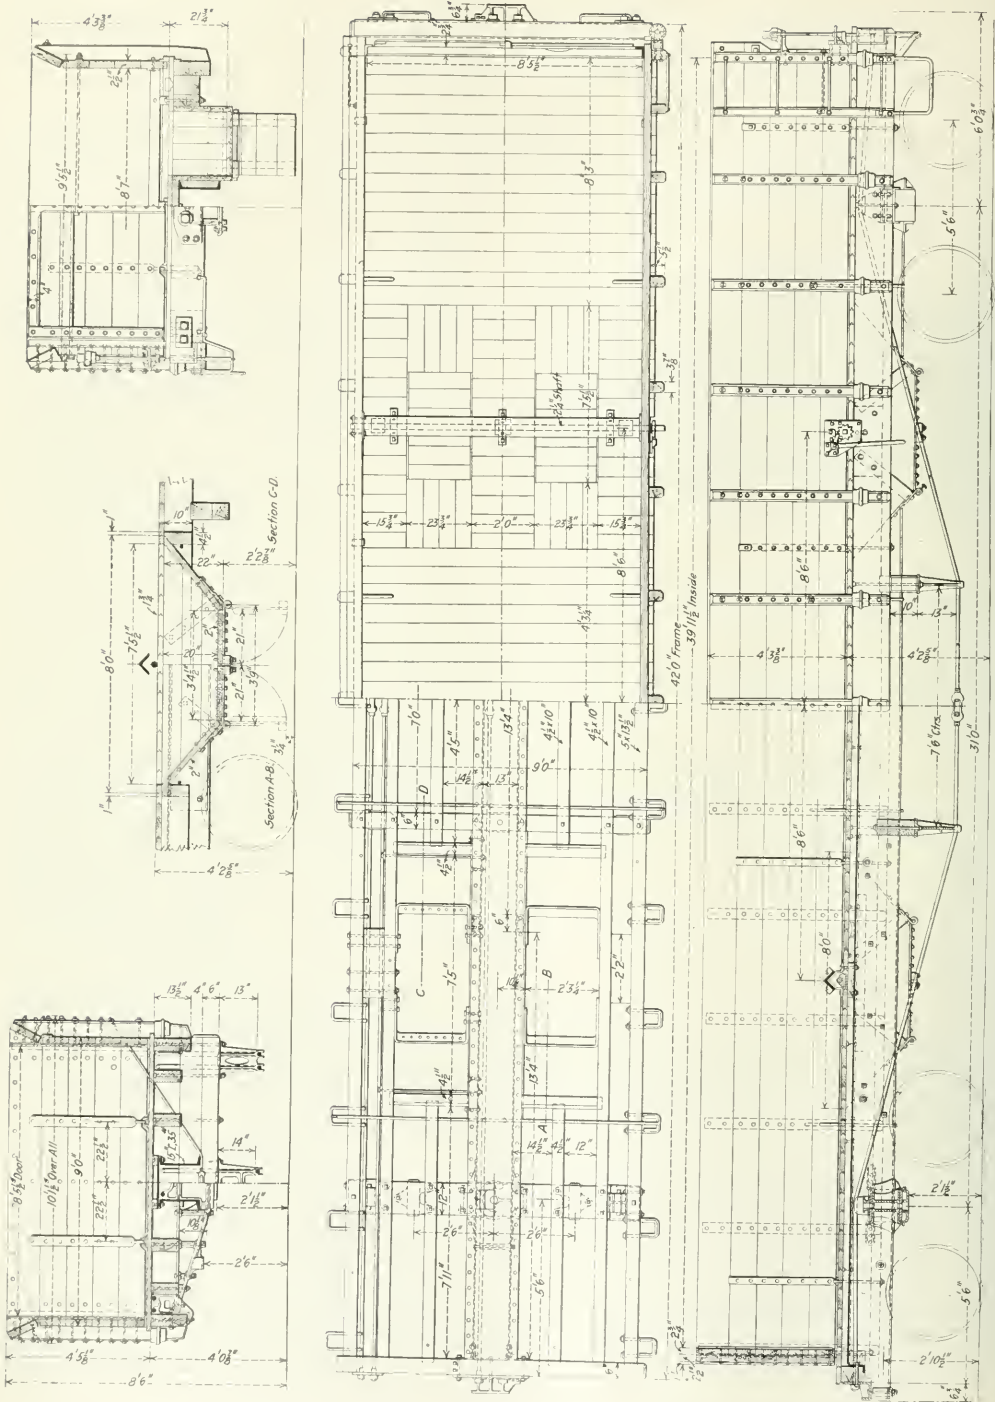

In the construction of the car body the metal parts have been confined almost wholly to the center sill members. Two channels, of 15-in., 57-lb. section, extend from end to end

Details of Center Sills and Draft Attachments

maintenance. With this thought in view, a heavy steel center sill has been provided to take care of the buffing and pulling stresses, while the weight of the body and lading is carried on wooden sills and truss rods. The length of the car over the

of the car and are reinforced for the entire length by 1 1/2 in. by 20 in. cover plate. Under the center sills two truss rods, 1 1/2 in. in diameter with 1 1/2 in. upset ends are provided to carry the weight of the lading. The body bolsters are built

General Arrangement of the C. M. & St. P. 42-Ft., 100,000-Lb. Capacity Gondola Car

up of rolled sections and tiler casting. The tension member which passes through the neutral axis of the center sills is 11 in. by 12 in., while the compression member is 11 in. by 12 in. The sides of the car body are supported by two wooden sills the outer 8 in. by 15 in. the inner 4 in. by 10 in. These sills are also reinforced with two 1 1/2 in. truss rods.

The four hoppers, 28 1/4 in. wide and 8 ft. long are placed between the center sills and side sills, the centers being 1 ft. 3 in. from the ends of the car. Short intermediate sills extend from the ends of the car to the hoppers and between the hoppers, being supported by the end sills, body bolsters and needle beams. The side stakes are 3 3/8 in. by 5 1/2 in. Every third pair of stakes is tied together with a 1 1/4 in. rod extending under the center sill. The sides of the car body are 2 1/2 in. thick and the floor is 1 in. thick.

The hoppers are supported on the side and the ends by metal struts fitted on two inner side to the center sill, barrel end on the center side to the two side sills. The drawing mechanism consists of 2 1/2 in. shaft extending across the car above the deck with chains to raise the hopper doors. A 3 in. by 1/2 in. angle iron is placed over each shaft to protect it from the lading. The details of construction of the hoppers are shown in one of the illustrations.

On account of the difficulty of securing clearance between the brake wheel and the end of the car, special types of ratchet brakes have been applied. Among the other specialties used on these cars are Bettendorf truck side frames, Bettendorf and Buckeye cast steel truck bolsters, Barber General rollers, Ajax brake beams, Ajax couplers with Buckeye cast steel yokes and Miller traction draft gear.

The Zone System for the Distribution of Coal

The Committee Appointed Jointly by Mr. McAdoo and the Fuel Administration Begins Work

AS BRIEFLY NOTED in last week's issue, Director General of Railroads McAdoo and the Fuel Administrator have appointed a joint committee to work out a plan for eliminating the cross-hauling of coal by dividing the country into districts or zones of production and distribution to the end that coal produced in each district will be consumed in that district or in defined districts of destination. The plan is to limit the shipment of coal to certain restricted consuming districts, which will prevent long and circuitous hauls, cross-routings and congestion.

The committee consists of Howard Elliott, of the New York, New Haven & Hartford, and A. G. Guthrie, of the Bureau of Car Service of the Interstate Commerce Commission, appointed by Mr. McAdoo; G. N. Snider, traffic manager of the Fuel Administration and formerly coal traffic manager of the New York Central, and S. A. Taylor, a Pittsburgh mining engineer, named by Dr. Garfield, and C. E. Leshar, chief statistician of the Bureau of Mines. Some preliminary details of the zone plan were announced by the Fuel Administration on January 25.

The adoption of such a plan was repeatedly urged upon the Fuel Administration by the Railroads' War Board last fall but the railroads had no power to put it into effect. The Fuel Administration did not display marked enthusiasm toward it when its adoption might have made unnecessary the expedient of declaring an embargo on manufacturing and a series of Monday holidays. The War Board, however, continued to recommend the zone system and on December 19 submitted to the Fuel Administration a completely worked out plan in which the producing and consuming districts for the entire United States were defined in detail. This plan was later described in testimony before the Senate committee conducting an investigation into the causes of the shortage of coal, by F. S. Peabody, a practical coal man, who worked out the details with the railroad committee. Dr. Garfield also outlined a plan before the Senate committee on December 26. Mr. Peabody, who was chairman of the Committee on Coal Production of the Council of National Defense before the policy of coal production was supplanted by the policy of coal conservation, testified that the plan would result in a saving of 20 per cent in the use of coal cars and a corresponding reduction in the cost of coal at destination.

In a letter of December 19, submitting the plan to the Fuel Administration, Fairfax Harrison, chairman of the

Railroads' War Board, said: "We again urge upon you the paramount necessity of adopting the principle of limitation of cross-hauling of coal upon which this plan is based. The power to do this comprehensively lies with the Fuel Administration and, as we understand it, with no one else."

The Railroads' War Board's plan has been printed in pamphlet form, with a series of maps showing the various producing districts in red and the consuming territory to be served from each in yellow. The producing districts are all carefully defined and a destination index shows the producing districts from which each territory is to be served. It is understood that it was used to a considerable extent as the basis of the new plan.

The Fuel Administration's statement outlining the new plan is as follows:

"The plan contemplates a system of coal distribution that will insure the speediest possible movement of coal from the mine to the consumer, and the immediate return from consuming centers to the mines of empty coal cars. It will eliminate so far as possible cross-hauling of coal by providing for the movement of coal from the mine to the consumer along the shortest possible transportation lines.

"Under the plan each state will be allotted its quota of the estimated output of bituminous coal. This allotment will be supplied from the output of certain definite producing districts. Coal for each state must move from the producing districts in which the state's allotment is located and from no others.

"The producing fields of the country have been divided into some 20 districts and a district representative will be named in each of these. Each district representative will equitably allot all orders and requests for fuel from the Fuel Administration among the various shippers and mines within his district. They will be responsible for the prompt filling of coal orders and the prompt movement of coal out of the producing fields. They will see to it that each state receives only its authorized quota from the producing districts. All requests and orders for emergency coal, either by the federal fuel administration or by state fuel administrators, will go through these district representatives.

"The whole system of coal distribution and apportionment will be under the general direction of J. D. A. Morrow, manager of apportionment and distribution, working directly under U. S. Fuel Administrator Harry A. Garfield. The new distribution plan, which was conceived by the

Fuel Administration soon after its organization, called for an enormous amount of detail work in the establishment of temporary quotas in the coal budget for each state. This work has been progressing for two months under tremendous pressure. Hundreds of statistical experts, under the direction of experienced coal men and transportation executives, have been at work on this problem, in co-operation with the Geological Survey. It is expected that within a short time a definite announcement of the temporary quotas of the consuming states and of the producing sources from which each shall secure its supply may be made.

"Representatives of the Fuel Administration and representatives of the railroads named by Director General McAdoo are now at work developing the phases of the plan which concern transportation, in order that the best results, both for the movement of coal and for transportation generally, may be secured."

The operation of the plan, so far as it has now been inaugurated, was explained to federal fuel administrators in the various states in a letter from Dr. Garfield. The letter said in part:

"As soon as district representatives are appointed, all state administrators who may call upon them will be notified. Individual shippers and mines within those districts for which district representatives have been appointed will be notified to refer any orders or requests for shipment of coal made upon them by any member of the U. S. Fuel Administration to the proper district representative. No emergency requests should be made directly to Washington by state administrators unless the proper district representative has been unable to supply the necessary coal.

"In order that the bituminous coal supply of the country may be apportioned equitably among the different states, and among the various consumers in each state according to the relative importance of their needs, it is necessary that the work of the Fuel Administration in regard to the apportionment and distribution of bituminous coal be not limited to the relieving of emergency shortages. Accordingly, the available coal production of the country is to be apportioned among the various states, based upon previous consumption and the changes resulting from the entrance of the United States into the war. In order that cross hauling may be reduced to a minimum and that each state may receive coals adapted to its needs, the particular fields from which each state shall draw its supply will be designated, (by-product and gas coal excepted). When this budget is complete, the

consumers of each state will be notified through the press that their coal must be obtained from certain specified fields. Producers will then be allowed to ship only to consumers in the states designated, and jobbers will be required to observe the same rules. In other respects the normal distribution of coal will go on without interference.

"State administrators, as soon as the tentative apportionment is complete, will be informed as to the particular fields upon which they may call for coal, and the quantities they may secure from each. When a state is currently receiving its full allotment of coal, all further needs must be met by reducing the quantity supplied to other consumers in that state. District representatives will be instructed to comply with any requests for coal made by designated state administrators up to the amount allotted to their respective states. Should any state have a demand for coal in excess of its allotment, this excess will have to be taken care of by a curtailment of consumption, or a temporary or permanent readjustment of the allotment be made by Washington.

"The foregoing is a part of the new plan, details of which are being worked out as rapidly as possible and will be announced as soon as they can be perfected."

Under the regulations of the United States Fuel Administrator Garfield of January 17, fuel will still be shipped to the list of preferred consumers contained in the order before industry generally receives its supply. After this preferred list has been cared for, the Fuel Administration in each locality throughout the country will endeavor to supply those concerns whose operations have been listed by the departments of the government as most necessary to the conduct of the war. Section 1 of the order of January 17 provided:

"Until further order of the United States Fuel Administrator, all persons selling fuel in whatever capacity shall, in filling their contracts or orders now on hand, give preference to necessary current requirements of: railroads, domestic consumers, hospitals, charitable institutions; Army and Navy cantonments, public utilities, by-product coke plants supplying gas for household use, telephone and telegraph plants, shipping for bunker purposes, the United States for strictly governmental purposes (not including factories or plants working on contracts for the United States), manufacturers of perishable food or of food for necessary immediate consumption, and municipal, county, or state governments for necessary public uses. Any tonnage remaining after the foregoing preferred shipments have been made may be applied in filling any other contracts or orders."

Armored French Train in Action in the Vosges Mountains

Left to right are: J. Edgar Hoover, director of the Federal Bureau of Investigation; William F. Winterrowd, director of the Bureau of Labor Statistics; Charles P. Neill, manager of the Bureau of Information of the Southeastern Railroads; E. A. Burgess, assistant grand chief of the Brotherhood of Locomotive Engineers; and A. O. Wharton, president of the American Federation of Labor. Seated at the far end of the table is the Director General of the Railroad Wage Commission, Frank K. Lane.

Railroad Wage Commission Begins Hearings

Makes Statement as to Its Duty and Hears the President of the Railroad Telegraphers

THE RAILROAD WAGE COMMISSION, appointed by Director General of Railroads McAdoo to make a general investigation of railroad wages as the basis for a recommendation to him, began a series of public hearings at Washington on Monday, January 29, and was confronted at the outset by a request from H. B. Perham, president of the Order of Railroad Telegraphers, for a 40 per cent increase in wages for the members of the organization and others of the same class of employees. This request, he said, had not been made to the railroads, although requests for a revision of schedules had been presented on 24 railroads before the government took them over, but his members had "become excited" when they heard that the government was going to raise wages and he had received thousands of letters urging him to present the request.

The wage commission has established itself in offices in the Department of the Interior building. T. W. Lehmann has been appointed general counsel and a board of statisticians has been appointed consisting of Charles P. Neill, manager of the Bureau of Information of the Southeastern Railroads and formerly United States Commissioner of Labor; E. A. Burgess, assistant grand chief of the Brotherhood of Locomotive Engineers; and A. O. Wharton, president of the Railroad Department of the American Federation of Labor.

A tentative program of hearings has been outlined, at which the following labor leaders will be heard: T. H. Garvey, representing maintenance of way employees; E. H. Norton, representing the Order of Railway Station Agents; W. G. Lee, president of the Brotherhood of Railroad Trainmen; A. B. Garretson, president of the Order of Railway Conductors; S. E. Heberling, president of the Switchmen;

Union W. S. Carter, representing the Brotherhood of Locomotive Firemen and Engineers; and A. O. Wharton representing the mechanical employees, helpers and apprentices and railway clerks. It is understood that railroad officers will also be heard.

Statement of Commission

Franklin K. Lane, Secretary of the Interior and Chairman of the commission, read an opening statement regarding the scope of the investigation. The commission is acting under the authority of General Order No. 7 issued by the Director General, which provides that:

"The commission shall make a general investigation of the compensation of persons in the national service, the relation of railroad wages to wages in other industries, the conditions of service in the various parts of the country, the special emergency resulting from the conditions at this time owing to war conditions and the depletion of labor, as well as the relation of railroad labor to the national interest."

The commission shall make its report to me and make recommendations to the Director General, giving its recommendations in general terms, with the reasons therefor, and such recommendations as it may deem proper."

"Efficient, capable and competent of the country are required to furnish the Railroad Wage Commission with respect all information it may require in the course of its investigations."

In the statement Secretary Lane said:

"The commission understands that its duty is to make an impartial study of wages in different industries and to determine the interests of both the employer and the employee. The government has taken over the control of the railroads for the period of the

war and to meet war needs. It is a matter of necessity that we secure from the roads their fullest usefulness. They must be made to play their part to the limit in the making of war, the carriage of goods and men. To this end it is fundamental that the employees shall feel that a spirit of justice animates the government. We should seek to give not what may be forced by contest, struggle, intimidation and coercion, but what is fair, all things considered. This is our attitude. We look at the problem before us as not, 'what does organized labor or unorganized labor demand,' but what with war upon us and living costs as they are, should be the compensation given for the services rendered. We seek for no counsel of perfection. The status of labor for all time is not to be determined by our studies. We shall not expect to give all that under pressure the workman might compel any more than we shall ask him to accept the wage that our soldiers receive for their unequalled sacrifice. But a working basis must be arrived at between the government and those who are employed on the roads by which good feeling shall be maintained and the fullest service obtained, for this is the prime need of the hour that each man's hand and brains shall serve the nation now as never before. We wish, in short, to stimulate production by doing what is just.

"This being a government inquiry we shall hear those who wish to contribute anything that is helpful, but it is mandatory that we shall reach a quick conclusion. Therefore the greater part of the data upon which we must act will be gathered for ourselves. There are 1,800,000 employees on our railroads. Some are organized and have great power for self-help. The great majority, more than two-thirds, are, however, not organized. We shall consider both classes, and upon an equal footing, so far as that may be practicable.

"This very statement of the number employed makes evident the unparalleled size of the task that is before us. If with this fact is considered the extent of the territory covered and the significance of the different conditions obtaining in the varying sections of the country it will at once be realized that no such hearing as this has been held before, nor one that carries such possibilities in affecting for good or ill the mass of our workers in all industries and the part they will play in carrying on the pressing duty of making war with characteristic American energy, enthusiasm and masterfulness. We wish first of all to know what present conditions are. What data have already been gathered as to the number of employees, their classification in groups according to their duties, their compensation in money and that compensation converted into terms of support for themselves and their families. This leads into a study of the present cost of living as contrasted with the cost at other periods. The various governmental agencies, the railroads themselves, the larger organizations of labor and individual studies will doubtless prove to have already gathered the greater part of these facts. Wherever there is a shortage this must be supplemented, and to this end we shall feel free to call upon railroads and employees, the government departments and other agencies for such facts as they can furnish.

"We shall also seek from foreign governments and from the industries of the country for the presentation of methods by which conditions such as we must meet have been met. In a word, we shall make this inquiry upon the broadest possible lines consistent with an early closing of our research, and the great body of the material we shall gather will, we trust, come to us in compact written or printed form rather than by oral statement. Each one who appears in person or otherwise shall be regarded as being animated by the same purpose that animates the government itself. No selfish or narrow ends are to be served by this hearing. We are looking to the greater welfare of the nation, and through service to the nation we seek the welfare of mankind. Our

end is not to justify a theory or to reach or approximate an ideal, but rather as practical men to deal with a situation present in a spirit of fair-mindedness."

Telegraph Operators Ask Increase

Mr. Perham said he was appearing on behalf of telegraph operators, dispatchers, station agents, telephone operators, levermen and similar classes of employees, of which there are 84,233. Of these about 50,000 are members of his organization. Secretary Lane brought out the fact that the organization is making a broader request of the government than when it was presented to the roads. Mr. Perham said that he had always followed the plan of dealing with railroads individually and that while the 40 per cent request was never presented to the roads committees are now negotiating with 20 roads, 3 mediation proceedings are under way and 1 arbitration proceeding. Seven roads had denied the petitions since the wage commission was created.

The employees he represents have never been adequately compensated, Mr. Perham said, but have always accepted compromises rather than go on a strike, although their wages are below those of other classes of labor. He read from the statistics of the Interstate Commerce Commission showing the average daily compensation of station agents, increasing from \$1.73 in 1896 to \$2.31 in 1913, and of telegraph operators and dispatchers ranging from \$1.93 in 1896 to \$2.52 in 1913. In later years, he said the method of compiling the statistics has been changed and he read from the report of the Eight-Hour Commission showing the average compensation per hour in 1916 of train dispatchers and directors, 55.6 cents; telegraph, telephone and block signal operators, 28.2 cents; telegraphers and station agents, 23.03 cents; telegrapher clerks, 25.04 cents; non-telegrapher levermen, 22 cents.

He said it had never been feasible to adopt a standard wage for telegraph operators and agents because of varying local conditions and varying degrees of responsibility, that station agents receive from \$40 to \$105 per month and that in some cases men receive higher pay than others for the same work.

Asked by members of the committee whether he considered the present relation of wages as between the various classes a proper one Mr. Perham said that if they could have their way they would like to have an increase amounting to 40 per cent and distribute it as circumstances seem to call for because some men ought to have more of an increase than others. He said it is usual for a road to agree to pay an increase amounting to a certain sum to be divided among the various divisions and among the individual men according to the circumstances of each case, and he believed this has resulted in a fair adjustment in general.

Mr. Perham said he assumed to represent all the employees in the classes represented by his order whether they are organized or not, and that the lowest wages are paid on the organized roads, although he said the Pennsylvania advances wages to keep men out of the organization.

He said that hundreds of agents and operators are working for as little as \$38 a month, but when he was asked to file a list of such cases he thought he could not show so many because he was unable to get the exact figures for the unorganized roads. Chairman Lane asked him to file a statement showing the number of men in the various classes of employees receiving less than \$50 a month, from \$50 to \$60, and so on by \$10 stages. Mr. Perham suggested that these statistics be obtained from the I. C. C.

Representatives of the train dispatchers appeared before the commission on Tuesday and of the maintenance of way employees on Wednesday.

The Board of Examiners will include Lathrop Brown, special assistant to the Secretary of the Interior; E. J. Barculo of Buffalo, and Riley Redpath of Kansas City.

The Activities of the Railroad Administration

Economy of Expenditure of Operating Revenues Ordered.

Federal Anti-Pass Law Applied to States.

WASHINGTON, D. C.

DIRECTOR GENERAL OF RAILROADS McADOO on January 28 issued his first order looking toward economy in the expenditure of railroad operating revenues during the period of the war. This was General Order No. 6, issued to officers and directors of railroad companies, as follows:

"During the period of possession, operation, and government control of railroads, it is necessary that officers, directors, and agents of railroad companies be very careful in the handling of moneys and in the dealing with transportation matters. Without attempting at this time to give general directions, there are a few matters involving the expenditure of moneys for purposes having no direct relation to transportation, which should receive immediate attention, as well as the issuance of free transportation.

"It is therefore ordered that the carriers' operating revenues shall not be expended:

"1. For the payment of agents or other persons who are employed in any way to affect legislation.

"2. For the employment of attorneys who are not actually engaged in the performance of necessary legal work for the company.

"3. For the payment of the expenses of persons or agencies constituting associations of carriers unless such association is approved in advance by the Director General.

"4. For any political purpose or to directly or indirectly influence the election of any person or an election affecting any public measure.

"No passes or free transportation shall be issued by any carrier under federal control or any official of such carrier unless the issuance of such free transportation is expressly authorized by the Act of Congress entitled 'An Act to Regulate Commerce, approved February 4, 1887, and Amendments thereto' and any such passes or free transportation heretofore issued not in conformity with said act must be recalled.

"This order applies to all carriers under federal control, whether inter-state or intra-state."

The order as it applies to passes simply extends the provisions of the federal law to cover intra-state as well as inter-state transportation. Some states have no anti-pass laws and the laws in many states are more liberal than the federal law, many of them allowing or even requiring railroads to give free transportation to public officials.

General Order No. 5, which preceded this order, was the formal appointment of the Railroad Wage Commission.

Blizzards Handicap Railroads

The Director General of Railroads and his staff have continued to draw most of their attention to problems created by the weather and the succession of blizzards and low temperatures has made it impossible to raise the embargo against general freight ordered on January 23 on the Pennsylvania, Baltimore & Ohio and Philadelphia & Reading, which it was expected would be in force but a few days. While one of the most serious hindrances, the inability of ships to enter because of the delay in obtaining bunker coal, has been removed, many of the eastern roads have, and unable to handle much new freight except food, fuel and necessary government freight for several days and most of the reports received at Mr. McAdoo's office have been discouraging while the daily reports of the Interstate Commerce Commission's inspectors from various terminal points received

by Commissioner McChord continue to show conditions approaching a paralysis of transportation at many points due to weather conditions, congestion in yards, shortage of crews, and engine and cars in bad order with a shortage of labor to repair them.

A. H. Smith, regional director in charge of the eastern lines, reported on January 26 that it had been necessary to suspend operations in Northern New York on account of a heavy snow storm and that on account of a very severe snow storm at Chicago all belt roads had discontinued accepting cars. Assurances that an adequate supply of cars will be furnished for the transportation of food supplies for export to the allies was given by Director General McAdoo at a conference with commissioners representing the British, French and Italian governments on Saturday and some discussion was given to the question of diverting more export freight to gulf ports.

Director General McAdoo has instructed in the matter of embargo on the Pennsylvania Lines east of Pittsburgh, Baltimore & Ohio east of the Ohio River, and Philadelphia & Reading, that the following exceptions be made:

(a) Food for animals.

(b) Material used in the operation and upkeep of coal mines.

To provide for the rail movement of food and supplies consigned to the French, British and Italian governments for ports on the North Atlantic seaboard, already accepted or under permit, arrangements have been made to consolidate these shipments and move them in solid trains or groups of cars, east from Chicago, St. Louis and intermediate terminals.

Congestion on Pennsylvania

In addition to the daily reports from various terminal points Commissioner McChord, on January 29, issued the following statement, summarizing reports of the Interstate Commerce Commission's inspectors, relative to the congestion of freight traffic on the Pennsylvania Railroad and calling attention to the lack of any marked relief from the congestion on that line.

"A condition of serious congestion exists on the Pennsylvania Railroad in the Philadelphia district and in the Pittsburgh district and the line between is practically blocked with cars destined for those two points and beyond.

In the Philadelphia yards the normal daily movement of cars is 925. The reports covering the period from January 14 to January 25 inclusive, except for January 19 on which no report was furnished, show that the maximum daily movement was 2,213 cars and the average was less than 2,000. And on those same days there were from 54 to 61 trains left over in the Philadelphia yards ready for movement but for which no movement could be made. The number of cars left in the yards varied from 1,875 to 5,745. During this entire period there were from 1,400 to 2,200 empty dead cars in the yard for movement, and the number actually forwarded averaged varied from 115 to 487 per day.

On the Atlantic seaboard, for movement in both directions, cars were approximately 1500 cars left over per day. While it is stated the facilities accepted by the Philadelphia and the Pittsburgh districts are restricted, the traffic has been kept moving by payment for permitting disbursements frequently.

Looking at 16 or 17 per cent of the normal business, the Pennsylvania started the average number of trains

for which no locomotives were available in Pitcairn and Conway yards was more than 100 trains daily, and there were approximately 10,000 cars left over in those two yards each day.

"For four days on which the information was furnished, coal mines in the Pitcairn district were supplied with a very small percentage of empties required, in one instance 324 cars being required and only 24 furnished on account of no other empties being available.

"The principal cause assigned for the serious congestion on this railroad is shortage of motive power, but it is clearly apparent that the real cause is the impaired condition of motive power available, as well as the lack of adequate facilities for properly maintaining it, and excessive terminal delays. For example, the inspector reports that the facilities for maintaining the 149 locomotives assigned to Pitcairn are entirely inadequate, and only such repairs as are absolutely required are made, the demand for power being so great that minor repairs and other work which would greatly increase efficiency of locomotives are left undone; further, that even if more locomotives were assigned there, it is doubtful if they could be properly maintained or promptly handled. And at Altoona, on January 23, the report for that date being typical, all of the 50 stalls of the engine-house were occupied by locomotives undergoing repairs, 190 of the 230 locomotives despatched were repaired on inspection pit and storage tracks where there was no shelter or protection from snow and weather. Under such conditions, and in the crowded and unheated enginehouses existing at many points, some of which are too small to accommodate the large locomotives in use today, it is not reasonable to expect that necessary work can be promptly and efficiently performed. Vigorous action must be taken to improve the condition of motive power before relief can be expected."

Russian Locomotives

Former President Roosevelt, in an address before the National Press Club at Washington on January 25, criticised the administration for delay in obtaining the use of 200 locomotives built in this country for the Russian government, which have not been delivered to Russia because of the political situation.

"You all know the fuel shortage," he said. "You know it has been due largely to an insufficiency in the number of locomotives, and you know that ships needed to carry food to our troops in France have been at the docks for some weeks, because they could not load on account of the failure in locomotives. There are here 200 locomotives built for the Russian Government, and the Russian minister here, as I am informed, (and if necessary, if the question is queried, I will give my informants' names,) assented to our taking them. The Russian minister assented two months ago, and for eight weeks we have been leisurely discussing as to whether we could, under the circumstances, take these 200 locomotives and use them. I understand that the discussion is inching along to a favorable conclusion, and that in a few days, or a week or two, we will have the locomotives. But it will be two months after we ought to have had them. What I think, of course, in my views of the proper governmental policy, should have been done, was to take the 200 locomotives and then discuss."

It was announced some time ago that arrangements had been made for the use of the Russian locomotives by eastern railroads, but there has been some delay. Mr. McAdoo has stated, however, that they will be made available. It was planned that they should be used on the basis of a rental of \$50 a day, which is the same basis on which locomotives will be used by the eastern railroads which will be delivered under orders from Mr. McAdoo for temporary use on those lines, regardless of who ordered them. The title to the locomotives will remain with the road that ordered them and it will receive the rental for the time until conditions

are such that the locomotives can be delivered to the owning road.

Judge Payne Appointed General Counsel

Director General McAdoo announced on January 26 that Judge John Barton Payne, who has been acting as his legal advisor, has permanently retired from the firm of Winston, Payne, Strawn & Shaw, of Chicago, and has accepted appointment as general counsel to the director general of railroads. He has also severed all connection with railroad or other transportation corporations.

John Barton Payne was born at Pruntytown, Fauquier county, Va., January 26, 1855. He was educated in the private schools of Orleans, Va. At the age of 15 he became

John Barton Payne

a clerk in a country store and studied law with the county clerk at Kingwood, Preston County, W. Va., being admitted to the bar there in 1876. In 1877, he was chairman of the Democratic committee of Preston County, and in 1880 was appointed a special judge of the circuit court of Tucker County, W. Va. In 1882 he was elected mayor of Kingwood. The following year he removed to Chicago, where he practiced law until 1893, in which

year he was elected judge of the superior court of Cook County, Ill. He resigned from the bench in 1898, and shortly afterward became a member of the firm of Winston, Payne, Strawn & Shaw, which has represented the Chicago & Alton, Chicago Great Western and other roads. Judge Payne was for some years president of the Board of South Park Commissioners of Chicago and has devoted much of his time and means to the artistic betterment of that city.

Judge Payne is the only member of Mr. McAdoo's permanent staff, aside from the three regional directors, whose appointment has yet been announced. It is understood, however, that announcement will be made shortly of the permanent organization and that it will include Edward Chambers, Vice-president of the Atchison, Topeka & Santa Fe, in charge of traffic; John Skelton Williams, Controller of the Currency, in charge of financial matters; C. A. Prouty, Director of the Bureau of Valuation of the Interstate Commerce Commission, in charge of public service and accounts; W. S. Carter, President of the Brotherhood of Locomotive Firemen and Enginemen, in charge of labor matters, and Mr. Payne, in charge of legal matters.

Carl R. Gray, President of the Western Maryland, has been acting in charge of transportation matters for almost two weeks in the absence of Mr. Holden, and it is rumored that he will be permanently appointed. Another appointment is to be made in the maintenance and construction department. W. T. Tyler, assistant to the vice-president of the Northern Pacific, is acting as assistant to Mr. Gray. G. W. Kirtley, who has been assistant to Judge R. S. Lovett in his office as Director of Priority in Transportation, is acting as an assistant to Mr. Chambers, as the office of Priority Director is now practically obsolete.

The offices of the Railway Administration in the Interstate Commerce Building have displaced the Bureau of Valuation, which has been transferred to the building formerly occupied by Railroads War Board.

After conferring with Traffic Agents at Chicago, who had expected certain features of the demurrage rules prescribed in general order No. 1, the Director General on Wednesday issued general order No. 7, making a number of modifications in the rules. The provision for using the average agreement is now limited not only for use in connection with cars held for unloading. It will not apply in the case of empty cars piled for loading. The number of days for which accrued demurrage will be considered will be four, instead of five as formerly. The regular demurrage rate, instead of increasing \$1 each day, will be \$1 a day for the first four days, the same rate for the five time, \$6 a day for the next three days, and \$10 a day thereafter. The bunching rule will be restored, but with some modification.

The demurrage rules apply to railroad freight except empty coal and coke cars piled for loading, or under load, export freight awaiting ships, coal for transshipment at tidewater or lake ports, and empty private cars stored.

Legislation in congress to the favor of New Orleans and officers of the New Orleans municipally-owned Public Belt Railroad have been very busy trying to find out whether the road has been or would be taken over by the govern-

ment. Mr. McAtee recently referred the question to C. H. Macklow, railroad attorney for the Southern Railway, which transportation is at Atlanta, Ga., and showed that it was not needed by the government.

Mr. McAtee on January 14, next, delivered a memorandum to the railroad department of the American Federation of Labor, the International of Maritime Seamen, and the organization of Long Island Central Seamen, about 2000 workers and numerous blacksmiths and mechanics. Their request for increased wages have been referred to the Railroad Wage Commission.

It was stated last week's issue that L. L. Hodges, vice-president in charge of traffic at the Kansas City Southern, has been appointed supervisor of transportation and traffic of the Central States Shipping Board. This nomination was slightly in error. Mr. Hodges has been appointed by Director General McAtee as his assistant to Edward C. Chamberlain, traffic adviser, and he will have general supervision over the transportation of the supplies and materials for the Shipping Board and refer one between the railroads and the Shipping Board, but not a member of Mr. McAtee's staff, rather than of that of the board.

Passenger Traffic and Labor Supervision Discussed

Western Railway Club Has Paper on Organization Maintenance and Address on Traffic Problems

THE MONTHLY MEETING of the Western Railway Club was held at the Hotel Sherman on January 21. A. R. Ayres, superintendent of motive power of the New York, Chicago & St. Louis, read a paper on Organization Maintenance, and P. S. Eustis, passenger traffic manager of the Chicago, Burlington & Quincy, gave an informal talk on the Passenger Traffic Problem of Today.

Mr. Eustis' Address

Mr. Eustis spoke in part as follows: "If we would find the causes of the present trouble on the railroads we must look back. When the European war broke out, the roads were unprepared. They had no surplus facilities because they had had no surplus earnings to put into the properties and could not get capital from other sources to take care of the needed expansion. The main trouble was too much regulation and lack of confidence. Manufacturers too were not prepared for the enormous orders that came, and the ships and docks and mines were unable to take care of the demands made upon them. The industries of this country have always lived from hand to mouth. They keep stocks of fuel and supplies to last but a very short time. The mines did not work at full capacity during the summer, and the country had come to think that strikes of miners during that period were of no consequence. This has been largely responsible for the shortage of fuel we are now experiencing."

"The amount of work done since the war started is wonderful, considering how poorly prepared this nation was. The railroads operating under the direction of the War Board were still hampered by the restrictions of State and Federal laws. Yet in 1917 they moved 27 per cent more freight per car than ever before. At the same time there was a great increase in passenger traffic, varying on individual roads from 10 to 70 per cent. The passenger traffic of the entire country is probably 25 per cent greater than at any previous time. A great deal of this increased traffic has been in one section, and it is not to be wondered at that there is congestion in the east.

"One of the greatest mistakes the railroad men could

make would be a failure to back Mr. McAtee in his railroad directorship. If Mr. McAtee doesn't manage to work out some plan that will make government direction a success, then look out that officials don't charge you with having obstructed his work.

"One of the difficulties that will be met in unifying the roads is due to the fact that the carriers, because of competition, have furnished better service for less money in this country than anywhere else in the world. If we try to do away with part of this service there will be strong opposition. Nevertheless, we should save coal by running only the passenger trains that are needed."

Organization Maintenance

By A. R. Ayres,

Superintendent Motive Power, N. Y. C. & St. L. Ry.,
Cleveland, Ohio.

One of the greatest problems before the railroads, as a result of the present intense industrial activity, is that of keeping up their organizations to a point which will accomplish the necessary results. One of the factors which make this problem difficult is the constantly changing personnel of the organizations, brought about by officers and foremen as well as workers leaving railroad service for industry or industrial organizations. The main reason railroads have been hampered by lack of long experience in that particular work, the workers as well as those in supervisory positions were considerably unfamiliar with the layout and property handling now attention is a matter of routine and with very little mental strain. This trouble about a situation, when an engine handling of a given task will frequently get up to the workers to whom it was assigned with practically no mental strain, then the men who received the work, the foreman was supposed to know his business.

Foremen have changed in recent months, and all over the railroad we are doing the work with men who in many

cases, have had no previous railroad experience; this applies to the road work as well as shop work. This condition makes a heavy burden on supervision and it is necessary for supervision to change its methods materially; the work can no longer be put up to the man without instruction. When a man lacks previous experience, or perhaps lacks initiative, it is necessary to instruct him in detail concerning the work which he is to do, and in many cases even supervising officers and foremen, who may be new in their present positions, do not understand very definitely just what is expected of them.

Difficulty in getting results is sometimes ascribed to indifference on the part of the men, and while this may be so in many cases, it is also true that much of the difficulty is due to lack of experience of the men, and lack of proper supervision and instructions. There are many conditions existing in shops and engine houses which were not very strongly objected to by the old timers, who were used to them, but which contribute quite largely to indifference and inefficiency on the part of the new and inexperienced employees. Some of these conditions are, poor light, lack of sufficient heat, poor floors, lack of proper small tools and worn out machinery. Men who are used to working with labor saving devices do not take kindly to places where they have to do the same work by main strength and awkwardness.

There is no question that a much heavier burden has been placed on our supervision, on account of the necessity of giving detailed instructions to new men, which were not required with the older men, and where this has been recognized, and where the supervising force has been organized to meet the conditions, excellent results may be obtained which will more than repay the additional expense.

The continual changing of the working force, requiring the constant educating of new men, requires more than usual courage, resourcefulness, cheerfulness and enthusiasm on the part of the foremen, as well as ability in their particular kind of work. Nothing is more important at this time than to inspire these qualities in the men who are close to the firing line.

In the present emergency, I am prompted to quote from the address of J. F. Deems, when he was president of the American Railway Master Mechanics Association in 1907: "We may work in brass and steel and leave the most perfect

mechanism; we may develop and improve and evolve methods and practices until nothing more can be desired; we may reach perfection in all these, in mechanism, structure and method, and yet our bequest be a failure and itself a burden unless we provide that which is paramount, which is over and above the sum total of all this, and for which, even today, events throughout the world are crying aloud—the man. A man prepared, experienced, earnest; hopeful and happy; consecrated to his work and ready to the hand of the future." There are many such men in our organizations; some of them we know, others we have not yet discovered, and it is up to us to know that our working conditions in shops and on the road are the best that can be afforded, that our supervision is ample and capable, so that men will understand their duties and will be happy, contented and enthusiastic in the performance of them, in order that nothing may be left undone to give our last ounce of energy in supporting this Government and those who are fighting for us to win this war.

Discussion

The consensus of opinion was that there is need for an increased number of foremen at this time. Less supervision is required where the piece work system is in effect than where the men are on day work. Some stated that it was impossible to get men to stay on the work long enough to train them. A. R. Kipp (Soo Line) brought out the fact that the workers at this time have not the same spirit as formerly and it will take a different kind of supervision to secure results. As there is a spirit of carelessness and indifference in the workers, the foremen must put in a personal touch to give them inspiration and incentive. T. H. Goodnow (C. & N. W.) expressed the opinion that the seniority rule makes it very difficult to secure foremen and often makes it impossible to get the best men who could be chosen in supervisory positions. The organization and rules of the unions have removed the ambition which workers formerly had. Another difficulty is due to the fact that the majority of men now doing the work in some departments are foreigners. With the shortage of labor and the attitude of the labor organizations it is difficult for the foremen to secure results. The men in the higher positions should uphold the foremen in order that they may secure the support of the men in the ranks.

Showing How the Railway and Motor Truck Are Co-ordinated Behind the British Lines

Report of the Eight-Hour Day Commission

Wage Increase Resulting from Adamson Law Estimated at
\$61,000,000. Some Reductions in Hours

W.

A BRIEF SUMMARY was published in last week's issue of the report submitted to the President and Congress by the Eight-Hour Commission, General George W. Goethals, Edgar E. Clark and George Rublee, appointed by the President under the terms of the Adamson Law. The following is an abstract of the text of the report, which is accompanied by nearly 500 pages of appendices, including statistical exhibits, and the reports of the commission's special agents on topics connected with the investigation.

This commission is directed by law to observe the operation and effects of the institution of the eight-hour standard work day established for certain railroad employees during a period of not less than six months nor more than nine months, in its discretion, and to report its findings to the President and Congress within 90 days thereafter. The law does not state when the period of observation shall begin. It this period was intended to begin with the legally effective date of the eight-hour standard day, January 1, 1917, the report would have been due not later than October 31, 1917. By reason of occurrences beyond the control of this commission, it was not possible to make a satisfactory report by October 31, 1917. We had to decide whether, in pursuance of a strict construction of the statutory direction, we should, on that date, make a report which, for lack of information, could have little, if any, value, or whether we should wait until we could obtain a sufficient body of the statistics to give weight to our findings and enable our report, in some measure at least, to fulfill the purposes which Congress had in contemplation. After careful consideration it seemed to us that we were justified in taking such additional time as would be necessary to complete a reasonably informative report. Early in October, however, it seemed probable that the relations between the brotherhoods and the railroads would again come prominently into public notice before the close of the year. Under these circumstances we concluded that it would be best to transmit our report in December, even though it would be in many respects incomplete.

A brief statement of the events leading to the enactment of the law creating the commission is here inserted to make clear the nature and extent of its duties.

Scope of the Duties of the Commission

The commission is directed to report the operation and effects of the institution of the eight-hour standard workday and the facts and conditions affecting the relations between common carriers and employees. This language is broad enough to authorize an encyclopedia on railroad labor, but it seemed to the commission that it could reasonably be expected to deal only with topics connected with the proposal to insert an eight-hour basic day in the wage schedules as the time measure of a day's work, and with topics connected with the proposal of the roads. This indicated that there should be shown the increase in wages resulting from the law, as well as the actual hours and wages paid, by classes of service and occupations; the relation of "straight" time and overtime payments and arbitrary allowances; a description of the leading features of the wage schedules; the conditions of train operation which result in overtime, and the possibility of eliminating those conditions; and, finally, a description of the conditions under which train and engine crews work. This view eliminates the question of the reasonableness of the present wages, as well as the question of the financial condition of carriers as bearing upon their

ability to pay an increase. These related questions it did not seem possible to deal with adequately. To determine whether the increases made as a result of the eight-hour law were justified would be to decide again a question already settled by negotiation, and to attempt to determine whether further increases would be reasonable in advance of a demand for them would be futile.

Consideration was given to the advisability of including in this report a study of the trend of wages of train and engine crews in relation to changes in ton-miles, car-miles, and train miles. A beginning on such a study was made, but it appeared that an adequate treatment would require such a comprehensive investigation of railroad operations and of the financial conditions of carriers over a series of years that the project was abandoned on the ground that no thorough and conclusive showing could be made, and also on the ground that this matter had to do with the reasonableness of increases in wages. After it is conclusively shown whether wages per locomotive-mile or per ton-mile have increased or decreased, it still remains to be decided what is the significance of the showing. How much increase in the wages per locomotive mile are required to compensate for the increased fatigue or hazard of operating the larger locomotives? If the tonnage of a train is doubled, in what proportion should the wages of the crew be increased? An answer to such questions we think is outside of the province of this commission.

Plan and Progress of Commission's Work

The President appointed the members of this commission on October 11, 1916. At a conference held on November 23, 1916, the railroad executives present agreed to give all necessary information, and at a conference held on November 28, 1916, the chief executives of the brotherhoods also expressed a willingness to co-operate. At the request of the latter, the headquarters of the commission were transferred from New York City to Washington, D. C., as the men whom they expected to appoint as their representatives to assist in checking the returns of the companies could not leave Washington. The railways have been represented before the commission by a sub-committee of the National Conference Committee of the Railways, A. S. Gregg, C. P. Neill, J. G. Walker, and J. W. Higgins. The brotherhoods appointed W. J. Lauck and F. J. Warne as their representatives, with authority to go over the work of the commission from month to month and approve it. These representatives met from time to time during December, January and February in conference with the secretary of the commission, and a series of forms to be filled out by the railways were agreed upon.

It was impossible for carriers to fill out these forms until after the provisions of the eight-hour law, which, in general, in its terms, had been made definite by judicial interpretation or by agreement of the parties.

The railroads in November and December, 1916, instituted many suits to enjoin the enforcement of the law. By a stipulation between the attorney general of the United States and counsel for the railroads, a consent order was entered continuing all of these cases except one, which was made a test case. The final determination of this case was to be expedited as much as possible. The roads agreed to keep their books and accounts in such a manner that if the constitutionality of the act was upheld the same could be paid

from January 1, 1917, in accordance with the terms of the law. This meant, in practice, merely that the roads kept the time slips showing the service performed by each man. The calculations of the pay on both the old and new bases could not be made currently, because the very general terms of the law could not, without interpretation, be applied to individual schedules.

The case was argued before the Supreme Court of the United States on January 8, 1917. Before the case was decided, the brotherhoods again threatened to strike if a settlement was not effected at once without waiting for the decision of the Supreme Court. The strike was to begin on March 17 at 7 p. m. The President of the United States appointed a committee, representing the Council of National Defense, and consisting of Hon. Franklin K. Lane, secretary of the interior; Hon. William B. Wilson, secretary of labor; Daniel Willard, president of the Baltimore & Ohio Railroad; and Samuel Gompers, president of the American Federation of Labor, to effect a settlement of the controversy through mediation. At the request of that committee, the date of the strike was postponed until March 19. Early on the 19th a settlement was effected in harmony with the eight-hour law, but defining somewhat more specifically the application of the eight-hour basis to existing schedules and practices. On the same day, March 19, the decision of the Supreme Court of the United States upholding the constitutionality of the law was handed down. The award above mentioned provided for a "Commission of Eight," four members representing the brotherhoods and four the railroads, to decide disputed questions arising thereunder. This body found it necessary practically to rewrite the schedules for the entire country. Negotiations were continued during the summer, the decisions of the Commission of Eight not being completed until September 23, 1917. The eight-hour day as the measure of a day's work for the purpose of reckoning compensation of certain classes of railroad employees has thus become an accomplished fact. We do not understand that the roads have any intention of further contesting the establishment of the eight-hour day for the employees concerned in the negotiations.

During the months of deliberation by the Commission of Eight, the work of filling out the blanks agreed upon was retarded. Some of the returns included in this report were received as late as November 10.

In addition to the information to be entered on the blank forms agreed upon, the commission proceeded to collect information through three special agents on the following topics: (1) Railway wage schedules and agreements; (2) employment conditions in road and yard service; and (3) the practicability of an actual eight-hour day in railroad train service. These topics were assigned respectively to William Z. Ripley, Victor S. Clark, and Charles P. Howard. Their reports are described in subsequent sections, and are printed in full in appendixes. Although the commission exercised care in selecting men of impartiality and of scientific standing for these special reports, and made suggestions as to their plan and scope, the reports themselves should be taken as representing the individual views of their authors.

Railroads and Classes of Employees Affected

It is not possible for this commission to make authoritative findings as to the ultimate effects of the eight-hour standard workday. In the first nine months of 1917 traffic conditions were in many respects abnormal. Furthermore, it takes some time for railroads to adjust themselves to these new conditions. It will require further study by others in the future to make anything like a final showing. Nevertheless, we believe that certain truths regarding the operation of the eight-hour law are now apparent, and the presentation of such facts as have been collected will be of some service.

(1) *The roads included:* The law applies to all common

carriers by railroad subject to the act to regulate commerce with the exception of railroads independently owned and operated not exceeding 100 miles in length, electric street railroads and electric interurban railroads, such exceptions, however, not applying to certain terminal and transfer roads. "One hundred miles in length" presumably means first track mileage operated under any form of ownership or contract, so long as the ownership and operation are independent. "Independently" here probably means independently of some parent or controlling company. The roads excluded from the above exception and thus subject to the law are those whose principal business is leasing or furnishing terminal or transfer facilities to other railroads; or which are themselves engaged in transfer of freight between railroads or between railroads and industrial plants. This, taken strictly, would leave very few if any steam roads excluded, since probably nearly all roads make interchanges of freight between other roads. The exact determination of this matter must be left to the courts. In order not to increase the extent of the commission's correspondence uselessly, it was decided to address only the roads which reported to the Interstate Commerce Commission and which were 100 miles or more in length, or were classed as switching and terminal companies, as well as roads less than 100 miles in length if known to be parts of larger systems.

(2) *The employees included:* Neither the eight-hour law nor the decision of the Supreme Court makes an enumeration of the classes of employees affected. The terms of the law are general. It applies to persons actually engaged in any capacity in the operation of trains used for the transportation of persons or property. The restrictions to trains transporting persons or property is of no practical importance, since it is customary to pay engineers, for example, at the same rate whether their engines run light or loaded.

In a broad sense, nearly all employees of railroads are engaged in the operation of trains, that being the business of a railroad; in a more restricted sense, the language of the law might apply to all persons connected with the movement of trains, directly or indirectly, including not merely the enginemen and trainmen, but also the telegraphers who send messages controlling the movement of trains. In a still narrower sense, the law might be understood to apply only to those physically on moving trains and having something to do with their operation. The narrowest view might exclude yard employees as engaged in making and breaking up trains but not in operating them, and it might also exclude hostlers.

The railroads have taken the view that the act does not apply to employees other than those who were represented by the brotherhoods in the negotiations which led to the passage of the law, and in fact only the latter classes are recognized by the roads as entitled to its benefits.

It is a fact, however, that the demands of the brotherhoods related to freight service only, while in its actual application, the eight-hour law has affected the passenger service also. It clearly applies to that service. We must look to the language of the law as well as to the negotiations between brotherhoods and railroads to find out what the law means in detail, the classes of employees threatening to strike at a particular time affording the general basis for classification, and, as the Supreme Court has ruled, an adequate basis. In other words, Congress, although moved to legislate because of a crisis affecting certain employees, may be assumed to have made a logical classification in framing the act. The proper interpretation of the words, "actually engaged in any capacity in the operation of trains," must be left to the courts.

This commission has received inquiries whether such employees as switch tenders and car inspectors are entitled to the eight-hour basis, but no definite answer could be given in advance of interpretation by the courts.

We find that the roads in actual practice have applied the eight hour day as a basis for reckoning the compensation of the following classes of employees: Engineers, firemen, con-

switching performed by crews of freight trains. The following is an illustration of the performance on one of the divisions where helpers were discontinued and double-headers operated:

| Trains | Time consumed per train. | | | | |
|-------------|--------------------------|-------|-------------|--------|--|
| | Initial yard. | Road. | Final yard. | Total. | |
| July, 1916. | 37 | 9 06 | 24 | 10 07 | |
| July, 1917. | 35 | 7 12 | 21 | 8 08 | |

The Increase in Wages in Each Occupation and Class of Service

The foregoing discussion is based upon aggregates of the wage increases in passenger, freight, and yard services. It is important to show also the increases in the various occupations in each sub-class of service. Illustrative results are shown in the following table:

PER CENT OF INCREASE IN COMPENSATION UNDER EIGHT-HOUR LAW IN EFFECT JAN. 1, 1917, AS COMPARED WITH COMPENSATION PAID UNDER 1916 SCHEDULES, FOR SELECTED ROADS: MONTH OF JANUARY, 1917.

| Class of service and occupation. | Eastern district. | | | | | | Southern district. | | | | | | Western district. | | | | | |

* Syracuse, Rochester, and Buffalo divisions only.

a No increase or decrease.

b Less than one-tenth of 1 per cent increase.

c Decrease.

d Less than one-tenth of 1 per cent decrease

It will be seen that here again the heaviest increase appears for eastern roads. In the main the increase in through passenger service is slight, but in the short turn-around service it is substantial. Short turn-around or suburban service was intended to include those turn-around passenger runs on which the distance in either direction does not exceed 80 miles, although one road reports that it drew the line at 50 miles. In slow freight and local freight services the increase is decidedly heavier than in fast freight service. Fast freight service was defined to include trains actually operated with reduced tonnage to make possible a rate of speed higher than that of ordinary slow freight for the purpose of making required deliveries or connections with other trains, regardless of whether designated as fast freights, symbol trains, red ball, or other special designations. The increase shown for yard service is subject to the qualifications noted.

In order to determine whether the percentages for January were representative, carriers were asked to give data for engineers only for the months of March and May. Such returns as have been received indicate that the percentages of increase are similar from month to month for the same road in the same sub-class of service, except where they reflect the change to the eight-hour shifts in yards, beginning on some roads in May. In this connection it should be explained that the increase in compensation shown in these tables is merely a computation of the difference between the amounts due under two sets of wage schedules for the service performed in a given period in 1917. No account is taken of the actual service and compensation for the corresponding period in 1916. Consequently, where there has been a reduction in the hours of labor per man per day, these percentages may indicate neither the change in the total labor cost to the carrier nor the change in the total wages received by the individual employee.

Increases in Wages as Affecting Individual Employees

The average increase in compensation in each occupation is by no means applicable to each individual in that occupation. Many employees received no increase whatever, while others received remarkably large increases.

Out of a total of 69,202 employees in 13 occupations on 64 roads included in a special study on this point, it was found that 12.6 per cent received no increase in January as a result of the law, and 30.2 per cent received an increase of less than \$10 per month, as appears from the following table:

| Amount of Increase per Month | Number of persons receiving increase | Per cent of total |
|------------------------------|--------------------------------------|-------------------|
| No increase | 8,700 | 12.6 |
| Under \$10 | 21,300 | 30.2 |
| \$10 and under \$25 | 17,100 | 24.7 |
| \$25 and under \$50 | 10,700 | 15.5 |
| \$50 and under \$75 | 5,100 | 7.4 |
| \$75 and under \$100 | 2,800 | 4.1 |
| \$100 and over | 1,500 | 2.2 |
| Total | 69,202 | 100.0 |

Overtime Payments and Additional Allowances

In the statistics requested of the carriers, a distinction is drawn between overtime compensation and the amount paid for "straight" mileage or "straight" time. In road service, the straight mileage is all mileage paid for at the mileage rate, and in yard service, or in other purely time service, straight time means the minimum hours which constitute a day. Overtime is the time paid for in addition to the straight time or mileage payments. But not including the allowances under special rules, which are paid in addition to the compensation for the mileage or time of the entire service.

The eight-hour standard which is being observed in road service is the so-called speed basis of 12.5 miles per hour. This simply means that overtime is considered as beginning after the expiration of the number of hours indicated by the

fractional distance by dividing the number of miles run by 12.5. For example, if the miles are 100, the minutes that overtime begins after 8 hours have elapsed. Based under this rule, are considered the miles or length for purposes of compensation. For runs longer than 100 miles, overtime does not necessarily begin after the expiration of 8 hours. On a run of 125 miles, for example, overtime will begin at the expiration of 10 hours, 10 being two-thirds of 12.5, divided by 12.5.

This arrangement may seem to be a violation of the statute, which says nothing about increase after 8 hours, making it merely the measure of a day's work. But at the hearings and discussions preceding the enactment of the statute it was understood, the 12.5 miles per hour basis is not an unreasonable interpretation of its meaning. The Supreme Court of the United States has referred to the demand of the employees as being for a "permanent agreement of to wages for which the period should be shortened in which the fixed mileage then previously existing should be performed." The court also said that the statute "permanently applied an eight-hour standard for work and wages which existed and had been in practice in about 1 per cent of the roads."

The effect of the law as applied is normally to turn the compensation for straight mileage or straight time unchanged. The same payment to be made for 1 minimum day of 8 hours as was formerly made for a minimum day of 10 hours. The mileage rate remains unchanged, while the rate per hour is increased. The increase in pay tends to the character of the law brings to the employees in effect in the form of payment for more hours of overtime at an increased rate per hour.

The following two cases will serve to illustrate these distinctions further, and will also show what extreme conditions are possible under the law as interpreted. In the first case a passenger conductor on the Southern Railway received an increase of \$124.70 per month, or 88.7 per cent of his former pay.

The details of his service and pay are as follows:

He ran 126 miles in short turn-around passenger service each day for 31 days, or a total of 3,906 miles. His constant time, counted continuously from the beginning to the end of the day's work, averaged 16 hours and 35 minutes a day, but his actual time averaged 6 hours and 8 minutes a day. Under schedules in effect in 1916, his mileage paid for all straight mileage was 155 per day, which was the maximum mileage in that service constituting a day according to the Southern Railway schedules, at a rate of 2.9 cents per mile, making \$4.50 per day, or \$139.50 for 31 days. On one day he received 2 hours' initial terminal allowance at 58 cents per hour, or \$1.16, or a total pay of \$140.66.

Under the eight-hour day settlement, overtime in short turn-around and suburban passenger service is all paid not more than when there is more than 8 hours of continuous service within any 10 hours, but overtime is also allowed for all time in excess of 10 hours, taking the entire span of the day's work as a whole. In this case the conductor ran 16 hours and 35 minutes each day, counted as 7 hours. Accordingly, his earnings received the former day's pay of \$4.50 per day for 31 days, or \$139.50, and in addition 7 hours overtime each day at 58 cents per hour, or \$13.86, making a total payment of \$153.36, hence an increase of \$124.70, or 88.7 per cent.

On the same railroad a case was found where the pay of a passenger conductor had been according to the agreement made the road from 1911 until after the expiration of 10 hours in 1916. He made 9 round trips in the month of January, and the pay received was arranged that the second as well as the second time was usually 10 hours per day. This means that overtime was being made on every day, month long, by the old basis \$1.16 2/3. On one of the days, he ran 100 miles and 8 hours and 25 minutes and 8 hours and 75 minutes, respectively. On the old basis, overtime began

after 7 hours and 36 minutes (152÷20), making the overtime over one-half hour (8 hours 25 minutes—7 hours 36 minutes), which was counted as 1 hour. On the new basis the overtime began at 8 hours, and was thus less than one-half hour, which was not counted. Two such instances in the month at 58 cents per hour, made the total pay \$1.16 less under the new basis.

For 29,608 employees on the Pennsylvania Railroad in January the "straight" payments, for miles, hours, or trips, aggregated \$2,624,078 under the 1916 schedules, and \$2,622,267 under the eight-hour law, or substantially the same. The increase in compensation appears in the overtime payment, being for this road \$321,420 under 1916 schedules and \$857,661 under the eight-hour law, an increase of \$536,241, or 166.8 per cent. The allowances under special rules amounted to \$40,119 under the 1916 schedules and \$45,117 under the present standard, being in both cases less than 2 per cent of the total compensation.

While the allowances under special rules are relatively unimportant in the aggregate, they do affect a large propor-

occupations. Similar information for additional occupations is given in an appendix. Attention is first directed to the number of persons receiving specified amounts of wages per month.

NUMBER OF PERSONS RECEIVING SPECIFIED WAGES FOR THE MONTH OF JANUARY, 1917.

(Covers 26 eastern, 17 southern, and 21 western roads, in whole or in part.)

tion of the men. The count of 69,202 individual cases to which reference has been made above, shows that 29,321, or 42.4 per cent, had received allowances under special rules. Overtime was made by 59,849, or 86.5 per cent of the individuals.

There is a wide variation in the relative importance of overtime to total pay in the various subclasses of service, as is shown in the above illustrative table.

Typical Wages by Occupations in

Relation to Service Performed

In addition to the report of the aggregate compensation under the old and new basis of pay, carriers were asked to give the names of the individuals to whom this compensation was paid, so far as they were employed in any one class of service during the month, and to show what was the service rendered by each individual as expressed in days, runs, miles and hours. This report concerning individuals was intended to serve partly as a check upon the accuracy of the general report, and partly as a basis for a study of the range of pay and hours in each occupation.

This study has been made for only 69,202 employees, as the tabulation had to be confined to those reports which were received promptly. For each of these individuals a card was punched in the office of the commission showing his compensation for the month of January, 1917, under the eight-hour law settlement and the number of days, miles and hours of service for the month, as well as other data. The cards were then classified and the items counted with the cooperation of the Bureau of the Census.

In the following tables certain results are shown for two

The advantage of such a statement over that of a simple average is apparent. The typical earning of an eastern freight engineer, for example, was around \$180 a month, and that of the eastern freight brakemen \$100 a month, but there were many who received more and many who received less. It is not enough, however, to show how many persons received the specified earnings. It is desirable to know also the amount of service rendered in each of these classes. The tables in Appendix III will show by occupations an analysis of the days, miles and hours for each of the wage classes shown in the preceding table. It may be noted here that the very low earnings indicate that work was performed for only a fraction of the month and the high earnings imply large mileage or long hours.

Average Hours of Service

The following table shows the average hours per run, in the case of road service, and the average hours per day, in the case of yard service, for engineers on representative roads, as reported for the months of January, March, and May, 1917. These averages are on the basis of actual time for each of the subclasses of service except short turn-around and suburban passenger service, for which both elapsed time and actual time are shown.

It will be observed that the hours are shortest in through passenger service. This fact should be considered in connection with the number of miles run in this service. Data concerning the miles run by employees in various occupations and services will be found in Appendix II and Appendix III to this report. The foregoing table shows further that on the eastern roads in slow-freight service the actual time during which engineers are on duty is from 12 to 13 hours per run. In the southern and western districts, the corresponding figures are considerably smaller. In local freight

service, men work from 11 to 12 hours per run in all districts.

In road service the average hours shown in the table are nearly the same from month to month. In yard service the effect of the introduction of eight-hour shifts on certain roads in the month of May is apparent.

COMPARATIVE STATEMENT OF ACTUAL TIME ON DUTY PER RUN OR PER DAY, AS INDICATED, FOR ENGINEERS IN VARIOUS SECTIONS OF SELECTED ROADS MONTHS OF JANUARY, MARCH AND MAY, 1917

* Represents hours per day, runs being incompletely reported.
* No service reported.

The statistics concerning the average hours on duty per run have been supplemented by a study of the total hours of service of individual employees for the month of January. The reports for 2,256 freight engineers in both slow and fast freight services, in the eastern district, show that 1,040, or 45.5 per cent, were on duty for periods aggregating less than 200 hours, the equivalent of 10 hours per day for 20 days, and 1,240, or 54.5 per cent, were on duty 200 hours or longer during the month. Those working 340 hours or longer, the equivalent of 11 hours a day for 31 days, were 255 in number, or 10.2 per cent of the total number considered. In the southern and western districts, the percentages corresponding to the one last given are respectively 4.7 per cent and 6.7 per cent.

The Speed and Delays of Freight Trains

The blank forms drawn up in conference with representatives of the Brotherhoods and of the railways included in dealing with train operation from the standpoint of speed, tonnage and delays. This form provided for a statement of all freight trains in the two weeks' period ending March 17, 1917, classified as fast freight or slow freight, on certain selected roads agreed upon as representative. Such data as the following were requested to be shown separately for each train: Miles run by the train, the loaded and empty car mileage, the gross ton mileage, the delay at initial and final terminals, the delays en route, the time actually running, the miles assisted by helper and pusher engines, as well as the wages paid the crew on both the old and new basis. This last requirement delayed the filling out of this form because of the uncertainty of what would be the

method of accounting under the new law. Replies were received a time or two by return train, but in general no full or in part. The general purpose kept in mind in summarizing the information was to throw light upon the conditions existing in the freight service, that the increasing size of freight trains has been the direct cause of lengthening the haul per run. The replies have indicated that the reason of slow average train movement is the congestion of traffic, rather than the size of the train. The statistical showing will not demonstrate that there is a slow freight. It is generally a heavy train that within certain limits is made to run as fast as a lighter one. It is sufficiently in control power to make, but taking the situation as we find it with the congestion of locomotives actually made by the rails, it is true that the statistics indicate a somewhat slower running time for the heavier trains. There is no clear statistical showing as to the relation between the size of train and the amount of delay per train, but probably this is not to be expected, since an accident to one train may cause delay to a number of others of a different class. There is the further difficulty that heavy freight trains and loads of traffic usually go together, so that it is difficult to distinguish the one cause from the other, and the picture is also blurred by variations in grades, weather conditions, and character of traffic, and the inadequacy of power and other facilities.

A very general survey of the results is shown in the following table:

ANALYSIS OF SPEED AND DELAYS OF TRAINS IN SLOW FREIGHT SERVICE ON REPRESENTATIVE ROADS, TWO WEEKS ENDING, MAR. 17, 1917

| Road. | Number of slow freight trains on divisions reported. | Per cent having speed, including delays, faster than 12 miles per hour. | Per cent having less than 40% delay. | Per cent having less than 15 miles per hour actually running. | Trans-shipment per mile of main track. |

* Includes both freight and passenger. Column e is calculated from the annual reports of operating earnings to the Interstate Commerce Commission for the year ending June 30, 1916.

* Includes all divisions.

* The New York Central & Hudson River.

* 42 divisions.

* 17 divisions in the line of the Pittsburgh & Cincinnati (Chicago & St. Louis).

* 42 divisions.

* 10 divisions.

* 10 divisions.

* Huntington & North Carolina.

It will be observed that the percentages of the trains in the slow freight service, showing a 12% delay per mile, are 75.3 per cent, or 75.3 per cent. Generally speaking, the slow

having heavy train loads and many trains per mile of main track are near the bottom of the list, and those of less density and lighter loads near the top. Whether the variations from the rule support one side or the other of the controversy above mentioned is a question that can not be decided except upon a study far more comprehensive than it has been possible for us to make. Incidentally, it may be noted that the percentages for the Baltimore & Ohio and Pennsylvania Railroad shown in columns (b) and (c) are the same. This is a curious coincidence and not an error.

For a smaller number of trains a study was made of those having fewer than 50 cars as compared with those having 50 cars or more per train. It was necessary to take the number of cars as a basis for classification rather than the gross weight, as not all roads could give data as to gross ton-miles. The general result was as follows:

COMPARISON OF THE SPEED AND DELAYS OF LONG AND SHORT TRAINS IN SLOW FREIGHT SERVICE ON REPRESENTATIVE DIVISIONS FOR THE TWO WEEKS ENDED MAR. 17, 1917.

| Item. | Trains having fewer than 50 cars per train. | Trains having 50 or more cars per train. |
|---|---|--|
| Number of trains included in this table..... | 11,050 | 4,467 |
| Average number of cars per train: | | |
| Loaded..... | 24.29 | 35.54 |
| Empty..... | 8.30 | 28.03 |
| Total..... | 32.59 | 63.57 |
| Average number of miles run per train..... | 106.75 | 103.78 |
| Average delay per train..... hours and minutes.. | 5 32 | 5 41 |
| Average actual running time..... miles per hour.. | 15.91 | 13.59 |
| Average speed including delays..... do..... | 8.71 | 7.92 |

The selection of the operating divisions in these tables was determined by the order in which reports were received from carriers and the degree of completeness of the work of compilation, as many as possible being included.

It should be noted that trains having more than 50 cars are not always heavier than those having fewer than 50 cars, since the former may include relatively more empties. As a general rule, however, the long trains are the heavier. On roads reporting gross ton-miles it appeared that for 6,520 trains having fewer than 50 cars and 2,552 trains having more than 50 cars the average gross weight per train was 936 tons for the short trains and 1,289 tons for the long trains.

The difference in speed between 8.71 and 7.92 miles per hour for a 100-mile run means a difference of 1 hour and 9 minutes per run in favor of the shorter train. But this cannot be set down as a universal rule. In the following table the results are given for each of the roads represented in the total figures above mentioned. In a number of cases, no appreciable difference is shown.

Certain theoretical aspects of train speed are presented in the special report by C. P. Howard.

Railway Wage Schedules and Agreements

The eight-hour day act has effected a considerable change in the wage agreements under which men in train and engine service work. In simple language, it provides that eight hours shall, in contracts for labor and service, be deemed a day's work and the measure or standard of a day's work for the purpose of reckoning the compensation for services of employees engaged in the operation of trains; but the task of revising the very numerous and complex schedules or agreements with the different classes of employees so as to comply with the law has involved a difficulty like that which would be met with in changing the size of one wheel in a clock and then making the clock keep time. A presentation of the development and nature of these agreements or schedules governing wages and hours, together with a record of the

changes resulting from the eight-hour law, is properly a part of this report. A detailed examination of this subject was made for the Commission by Prof. William Z. Ripley, of Harvard University.

DELAYS AND RUNNING TIME OF TRAINS IN SLOW-FREIGHT SERVICE BY ROADS.

| Total..... | 11,050 | 4,467 | 5 32 | 5 41 | 15.91 | 13.99 |

^a Fewer than 50 cars.

^b Fifty cars or more.

^c The fact that this figure is the same as the corresponding one in the preceding column is a coincidence and not an error.

In describing the schedules concerning the work of train operatives, this report by Prof. Ripley necessarily deals with the same subject matter which underlies the report of Dr. Clark on employment conditions, but the point of view is distinct. The one is a study of the development of the employment contract, while the other is a record of field observations.

As a result of his investigations, Prof. Ripley is led to make certain recommendations regarding the organization of a permanent wage board. These should not be taken as recommendations of this commission, as they lie beyond the scope of its work.

Employment Conditions in Road and Yard Service

The commission is directed among other things to observe the facts and conditions affecting the relations between carriers and their employees. As previously indicated, we have not considered it our duty to study the adequacy or inadequacy of the wages in relation to the cost of living. Consideration was given to undertaking a study of occupational fatigue, it being frequently asserted that a reduction of hours would reduce fatigue and prevent accidents. But no practical plan of procedure that could be carried out within a few months at small cost was suggested. It is possible that an amplification of the monthly accident reports required by the Interstate Commerce Commission, so as to show the number of hours on duty and hours of rest preceding accidents for which individual employees are responsible, might in the course of years yield definite results. The whole matter of accidents to train employees was set aside in order not to duplicate the work of other departments of the government. The statistics of the Interstate Commerce Commission amply demonstrate the hazardous character of the work of train operation.

The task of investigating and writing a description of the working conditions in train and yard service was assigned to Dr. Victor S. Clark. Dr. Clark traveled extensively in the summer of 1917, interviewing the men who work in train and yard service and the officials of the road who come in contact with the men. His special report will be found in Appendix VII. He describes the entrance requirements,

the promotion and this plan, seniority rights, and the regularity of employment in the occupations affected by the eight-hour law. Similar facts with respect to the hours of labor and of the living conditions of train operatives at home and on the road are presented. The Clark report may be characterized as a careful summary of the views of employees and officials whom he interviewed in the course of his investigation.

Practicability of an Actual Eight-Hour Day in Train Service

Although the distinction is elsewhere noted in this report, it is well to emphasize the fact that while the law requires eight hours to be the measure or standard of a day's work for the purpose of reckoning the compensation for services of train employees, it does not limit the actual working time to eight hours. As explained above, overtime does not begin at the expiration of eight hours if the run is more than 100 miles and is made at the rate of 12½ miles per hour or better. For runs at 100 miles, the actual eight-hour day as ordinarily understood is the same as the speed basis of 12½ miles per hour. Very generally in the freight service this average speed is not attained. The engine and train crews as shown in other sections of this report average considerably more than eight hours per day, or less than 12½ miles per hour. In the discussion preceding the enactment of the law it was contended for the railroads that they could not, to any large extent, eliminate this overtime by increasing the average speed of trains to the 12½ mile per hour basis without exorbitant cost.

In response to the question whether the railroads would run their trains any faster if they had to pay time and a half for overtime Elsie Lee, speaking for the roads, said:

We formed a committee subordinate to the national conference committee, or what we called the "Studies committee." I think there are about 12 or 15 men in the East and 4 or 4 from the West and 3 or 4 from the South—the three territories—to study the proposition and see in what manner the operation could be changed to meet this burden if it was imposed upon us.

The witness further stated that the conclusion they all came to after making these studies of different portions of the road was that the most economical thing to do was to operate in the same way as they are operating to-day and pay for the overtime. S. Doc. 549, 64th Cong., 1st sess., p. 30.

On the other hand, it was contended for the brotherhoods that "if you touch the pocketbooks of these operators, these operating officers, they will so regulate their business that the law will not make the long hours that we are making now." Statement of W. G. Lee, id., p. 68.

As a result of the law, even with pro rata overtime, there have been numerous instances of changes in operation of trains in road service shortening the time of runs, as shown in a previous section, but generally speaking, no marked change in operation in road service is observable. As elsewhere explained this is not true of yard service, in which an actual eight-hour day has been generally introduced. To what extent it would be practicable ultimately to limit the hours of road train employees to eight per day it is impossible to say.

The commission was urged by representatives of both the brotherhoods and of the railroads to make some study of this matter. It was noted that an exhaustive field study of representative operating divisions would be an undertaking far beyond our time and appropriation. It was thought, however, that some light could be thrown on the question at issue by a critical examination of available material. Charles P. Howard, an experienced engineer in the Bureau of Valuation of the Interstate Commerce Commission, was

employed to make this examination and to secure a general report which would be found in part in Appendix VIII. The data thus given at the preliminary gathering consists of speed and time as well as other points of the technical consideration attending the problem.

The railroad representatives, headed by Mr. Hayward, also paid his attending session, and in general. In the general review of these studies he gave considerable attention to the various points of interest, and in his operating time and contrasted with the requirement of time and a half for overtime at home.

1. Pay one time and a half while running outside of operation.

2. Cut the overtime and increase the speed.

3. Cut the overtime and increase both the speed and track facilities.

4. Increase the standard by means of having engines without increasing the speed.

5. Increase the speed by expenditure for additional facilities.

6. Shorten the time on duty by reducing train loads, the engines going through.

7. Plan No. 7 applies to good hostlers and head freight service and contemplate rearrangement of forces or rates.

All of these plans were not studied on every division. Generally speaking, in spite of many errors and inconsistencies found in the studies, plan No. 1 is shown to be the cheapest in road freight service. Mr. Hayward contended that the roads cannot speed up all of the freight trains to 12½ miles per hour, including delays by any universal action. But a close attention to the problem of reorganizing and with sufficient incentive, conditions as to type of road and road train service can be improved to varying degrees and by varying methods according to local conditions.

The commission expresses its appreciation of the report which it has received from its secretary, Dr. M. O. Lawrence.

ENGLISH RAILWAYMEN VISIT THE UNITED STATES.—The National Union of Railwaymen has accepted the government's invitation to send a delegation of railwaymen to the Western front. The delegation will comprise 35 members including the executive, elected delegates to the annual general meeting, general officers, and four representatives from among the 60 union groups. Each representative will travel at his personal risk. The executive committee of the Society of Locomotive Engineers and Firemen has declined the government's invitation that 35 of the members go to the front. This is the first refusal from the various labor bodies' delegations of which have recently visited the front lines. A resolution adopted by the committee says that owing to the long hours of duty in force and the absence of money from home work it would be unfair to the others to accept the invitation.

ZONE SYSTEM FOR SPANISH FRUITS.—The great increase in the cost of sea freight between Spanish ports has resulted in throwing upon the railroads an accumulation of freight that they are unable to cope with. In order to relieve the congestion, the cost of Spain has been divided into three zones, and a special tariff reserved for merchandise loaded in different parts of each zone. The rate governing each half metric ton is decided and not be accepted by the railroads from port to port, with the exception of an extra from fruit, fruit and vegetables. Railroads are permitted as to the kinds of freight to be transported by the national trade in the various zones taking into consideration the products of each zone and sea shipping available. The water zones are connected with inland zones and the merchandise of these zones may only be shipped from the ports at which the railroads connect, particularly those mentioned. —Commerce Report.

The Trans-Continental Railway of Australia*

Water Supply the First and Last Thought of the Builders of This 1,053-Mile Standard Gage Line

IN THE SPARING words of its engineer-in-chief: "The construction of the Port Augusta-Kalgoorlie Railway was a work of great magnitude and beset with unusual difficulties." The world has many transcontinental railroads. Some of them are longer than this first project of communications undertaken by the federal government of Australia. Many of them have involved greater engineering problems. The piercing of the Rockies; the traversing of the Andes; the penetration of the primeval forests of Central Africa alike have called for the daring and ingenuity of the surveyor and the engineer. But in none of them were there to be faced the same difficulties as those which had to be surmounted in throwing a single track from east to west across the heart of the Australian continent. The line was part of the federal

toral country with fresh water in wells for 200 miles. There are copper outcrops in plenty. Gold has been, and is being, successfully mined on the range at Tarcoola, 262 miles west of Port Augusta. From Tarcoola westward, the country becomes gently undulating, somewhat sandy, developing at about 380 miles west into a region of parallel sand ridges, as many as five to a mile, covered with "black oak," "mulga" and "mallee scrub," which, although there is no surface water, gives to the eye sweeping views of tossing greenness, and nullifies the careless term of "desert." At 428 miles from Augusta the route debouches suddenly on to the famous "Nullarbor," an absolutely level and treeless plain—a plain as big as France, averaging 600 ft. above the sea-level. It is of limestone formation, covered with a good red soil, growing luxuriantly the salt-bush and blue-bush, most valuable food for stock. For 330 miles on the "Nullarbor" the line runs without a curve—the longest tangent in the world. There is no surface water, but extensive boring is producing fresh water in large quantities. The Western Australian border is reached at about 592 miles west in latitude 30 deg. 45 min. south. At 850 miles from Augusta the plain ceases as suddenly as it began, and lightly timbered country accompanies the line right into Kalgoorlie. The greatest elevation reached on the route is 1,354 ft. This is at a point 107 miles from Kalgoorlie, which itself stands at a height of 1,240 ft. above sea-level.

On the whole route there are no steep ranges to be tunneled. There are few defiles necessitating deviation. The grades are therefore simple. In the Eastern Division (*i. e.*, that portion of the line within South Australia) the ruling curve is 1 ft. in 88 ft., compensated for curvature, with a maximum curvature of 4 deg. 20 min. The ruling grade in the Western Division (in Western Australia) is 1 ft. in 80 ft., compensated for curvature. This grade occurs only in the first 105 miles, after which there is no steeper gradient than 1 ft. in 100 ft. The maximum curve of 4 deg. 20 min. occurs only twice, and that within the town area of Kalgoorlie. At 400 miles west from Port Augusta the dreaded Sandhill Country, with its persistent swelling ridges, slightly transverse to the line of route, necessitated heavy earth works and considerable banking, when access from one valley to another had to be negotiated.

Organization for Construction

Let it be admitted, therefore, that the proposition was not an excessive one from the point of view of the surveyor. But let it also be remembered that in the "inside" of the Australian continent "life" is spelt with more letters than in Europe. For life needs water, and of natural surface water there was none in the whole stretch of 1,050 miles. Given water on the route, and this description would have been written decades since: Water—and the soil, rich alike in minerals and fertility, would today be supporting a close population. But when construction commenced, at least 800 miles of the route was entirely uninhabited. Over the whole route there was no local population from which labor might be utilized, or food produced for man or beast. Organization was therefore necessary of a kind quite unusual in ordinary railroad enterprise. It was less like an engineering job than the organization of a campaign. The Commonwealth government built it as a direct government enterprise. What few contracts there were were subsidiary. Labor—practically all white—had to be brought hundreds, sometimes thousands of miles, and maintained per-

The Railways of Australia and the New Transcontinental

compact under which Western Australia entered the Australian Commonwealth. It was to connect the Eastern railway system, ending at Port Augusta, in South Australia, with the Western system, whose "furthest east" was Kalgoorlie, flanking the famed Golden Mile of Boulder City. It was to be a line of high standard; the federal government set its face against any perpetuation of the tragic system of "broken" gages by which the various state railways are divided into traffic-tight compartments. It decided to have neither the 3-ft. 6-in. narrow gage of Western Australia nor the 5-ft. 3-in. widest gage of Victoria, but to adhere to the 4 ft. 8½-in. world's standard, and to use its influence, and that of the Transcontinental, to convert the 3-ft. 6-in. trunks of Queensland and Western Australia, and the 5-ft. 3-in. of Victoria and South Australia, to the desired standard.

The Terrain

The whole distance to be covered was 1,053 miles, not a great distance in a continent larger than the United States. The terrain varied considerably. Starting from Port Augusta the line crosses the head of Spencer's Gulf at Yorkeys Crossing. It then contours the rising ground to the westward, running through sand rises and gypsum banks, until a sparsely-timbered plateau gives occupied pas-

* From Engineering, London. This will supplement the article in the *Railway Age Gazette* of December 28, telling of the recent completion of the line.

manently on the line. Construction had to embrace not only a highly developed system of transportation of material, water, and other supplies, the government had to provide stores and personal necessities for the working men and their families, boarding houses, huts and food rations for the housing of employees, postal, telegraph and banking traffic.

Wirrappa Reservoir, South Australia

ties; medical and field hospital units, libraries and other necessities which, in other countries and under ordinary circumstances, are the care of private enterprise or other intermediaries.

Water and Food Supply

Water was the first and last thought of the engineers. Over the greater part of the route there are no watercourses of any size; an indication that the streams carrying off the rainfall are so little concentrated that opportunities of holding up volumes of water by the construction of dams was reduced to a minimum. The annual rainfall over the whole area does not average more than probably 7 in. There are occasionally intervals of years during which rainfalls are too scanty for collection. At Port Augusta an indifferent town supply existed at the outset. Another scheme had therefore to be added to the engineering programme. To the uninhabited, a more hopeless place in which to seek a water catchment never existed than the dry lands of Spencer Gulf. The surveyors and the well-borers of the overland line deserve well of their country. With their camel teams and petrol engines they have punched holes in the most arid proposition to be found in Australia. The camel is bred in thousands in South Australia, and was used on the line for everything—hulage, riding, water carrying; he was, in short, "General Utility." For the Eastern Division, at 26 miles from Port Augusta, they laid toll to the one possible supply. An intake weir of 75,000 gal capacity was constructed at Depot Creek. Five catchment reservoirs of a total capacity of 50,000, 000 gal were constructed at intervals for 250 miles west from Port Augusta. Wirrappa, with its massive concrete revetments, its asphalt-lined tanks of 5,000,000 gal. capacity, was one of the pioneers. In the Western Division the line possessed the advantage of the Murrumbidgee river supply at Kalbarri. The water had already made a journey of over 500 miles before it reached the Golden City. It had now to be carried by rail farther west for the maintenance of the construction gangs. The Western Division is off the artesian belt. In the quest for water the boring parties went forward for hundreds of miles into the Nullarbor Plain. With the miracle and the Willy (i.e., a fast traveling spiral steel whirl) for company, aided by the ever present sun, chilled with the wood of night winds across the waste, they wrestled with the living rock, dragged from its depths water which often reached the surface warm. The bores reached a maximum depth of 1,500 ft. The flow

flow varied from 7,000 gal to 70,000 gal. The engineers thus provided adequate water supplies, not merely for construction, but permanently for their own towns. But an immense amount of haulage for construction trains was nevertheless. During the first six weeks the mileage amounted to 795,108 miles, and vehicle mileage to 2,745,000.

Next to water supply came the problem of food. For with over 2,000 employees scattered over an area 200 miles in length, the question of nourishment was serious. Added to which the men were of 1 race accustomed to no variations to live well. They demanded food necessities. The government opened provision and general stores for their needs. The stores had to be self-supporting. Bread and meat supplies were organized by the department on October 1, 1915. The authorities did their utmost to prevent the sale of animals. In the Western Division part clubs, "bush" "restaurants" (i.e., restaurants) were set up, run directly by government, moving always with the gangs, and furnishing them with substantial food at cost prices.

New Construction Methods

The construction work was commenced in 1907, 1912, by Henry Deane Commonwealth government consulting engineer. In April, 1914 Colonel Norris had been appointed engineer in chief. He drove the last dovetail spike in October of last year. The line was built from both ends. It is of the standard 4 ft. 8 1/2 in. gauge, 80-lb. rails were utilized. They are flat-bottomed, as is the custom in Australia, dovetailed directly to ties. The preliminary supplies were imported from America and England; the latter half from the local steel mills of New South Wales. The ties were of course obtained in Australia. Two and a half million tons were utilized. Even engineers would have been immediately struck with their extreme length. For Australia "has timber to burn" and it was argued that the larger ties ensured a good road bed, even before ballasting could be completed.

Again one had to note that the material of Southern

The American Track Layer at Work

timber culture. The American countries followed the construction of the transcontinental lines of 1905. In the space of about one hundred miles, from first of course, to the western coast of America. In that time, however, the open spaces had not been filled in for more sophisticated methods. Mechanical methods were applied, for example. On the basis of the experience, some mechanical devices were developed which made 100 ft. of track, running on the 100 ft. verge and on the machine. With horses and men and going faster, the machine was quickly moved. A "Cochran" machine was utilized for setting the Eastern Division completed section and finished the track of the Western Division. In the Western Division, however, the construction team had to go to the United States for "timber" from America. The

track layer was to become the "tank" of the overland route. It was rather a labor-aider than a labor-saver. Its swinging derricks operated by steam power from the locomotive, waved like the antennae of a giant lobster over the prepared road-bed. From alternate flat-topped bogie wagons, ties and rails were delivered into trough conveyors hung to each side of the construction train, mechanically operated rollers passing them forward, to be gripped by the derricks, swung out in front to where a rushing gang of navvies slammed them down, to be hastily linked and dog-spiked into position on the earth cushion. It was arranged that the derricks on one side should be longer than the other. The ties were conveyed on the longer side, having to be delivered ahead of the rails. Every few minutes the train moved forward on the new-laid track; every few minutes the converging railheads in

line of 3-ft. 6-in. gage, so that sidings of combined gages had to be constructed to carry the alternative wagons; while at Port Augusta the material was received from ships' slings, after a long sea haulage up the narrowing waters of Spencer Gulf.

The government took every possible step to safeguard the health of the men engaged on the line. The utmost care was taken to ensure good food. Hospital cars with proper dispensary and operating accommodation were provided in both sections. Medical attention and hospital accommodation were provided by the government for all employees, who contributed a general sum of 6d. (12 cents) each per week. The total number of accidents on the whole work was well under 1,000, causing a total loss of life of about 20.

Rolling Stock and Equipment

It was the aim of the Commonwealth government to build a line capable of carrying traffic at high speeds. The line is of the best workmanship, and, so far as passenger accommodation is concerned, the engineers of the Commonwealth have been scouring the world for the latest ideas in traveling luxury.

Huge day-and-night coaches, of a size undreamed of in England, saddled with its legacies of tunnels and bridges of a past railway age, will leave no device unexplored that will minister to the enjoyment of passengers. The Australians are inveterate travelers. They do not mind being in the train for a week, but they demand comfort. Ice in the hot weather, heating in the winter, and baths whenever possible. It is safe to say that they will make their great "through" expresses *trains de luxe*. Most of the construction rolling-stock, practically all of the locomotives and coaches for the new line, will have been built by Australians in Australia.

Results Achieved

Such, briefly, is the history of a great undertaking. It has been accomplished at a cost of millions of national money, provided out of a consolidated revenue by the Australian taxpayer. It renders possible one of the longest railway runs in the world. From tropical Townsville, sheltered behind the Barrier Reef, the traveler may soon run by way of Brisbane, Sydney, Melbourne and Adelaide, to Perth, on the surf-beaten shores of the Indian Ocean—a run of 4,000 miles. He may do this in the running time of 150 hours. Every foot of the track is owned by the State. The line joins the Eastern system of 15,000 miles to its isolated daughter system of 3,000 miles in the west. It is a visible pledge of federation. It is the pioneer of many great similar projects which are aimed at the internal development of a continent. It provides for the military defence of the country on interior lines. The voyage from west to east of the continent has been halved in point of time. And the tenacity of Australian engineers has tamed the wilderness. Out in the former "unknown" settlements have already sprung up along the line. The optimism of their population is expressed in names like that of "Golden Ridge," but it is an optimism that has subdued deserts, and is making the Australian Nation.

THRIFT, THE INDISPENSABLE PREREQUISITE OF VICTORY.

It is the duty of every man, woman and child in the United States to produce more and consume less, and then to pass over to Uncle Sam through the purchase of Liberty bonds the savings which he has effected in this two-fold manner. The next sale of Liberty bonds can be of no value to the government unless those savings of goods and labor are now being made for which the money which the government borrows can be exchanged. In a war which is taxing the capacity of every nation engaged thrift becomes the indispensable prerequisite of victory.

A Wayside Station and Inspection Train

east and west moved closer together. Behind the track layers the line was pulled in, packed, and otherwise completed, by the fetting gangs and the *olla podrida* of a railroad camp. A temporary station was formed at each railhead, including a loop, and two "dead-ends."

Base Organizations

A fair rate of progress of a mile a day was the object of the engineers, though it can hardly be said to have been attained. Yet every day the railheads moved forward inexorably in obedience to the capabilities of communication in the rear. Every 20 days there was something like an exodus. For the hutments and workshops of a thousand employees, the camp trains of the engineering and surveying staffs, the hospital cars of the medical section, recreation rooms, churches, cooks, camels, the miscellaneous paraphernalia of the railhead, moved also onwards to the new front. And in the Nullarbor, they said, a man might go to sleep on the morning of such a trek, wake on the site of the new encampment, and never know, from his surroundings, that the location of his camp had been moved.

With railhead and construction camps totally dependent upon the line for daily existence, both Eastern and Western Divisions had necessarily to be progressively complete and self-contained. What bridging work had to be done—for the most part the negotiating of dry, though sometimes wide, dongas—could never be allowed to hold up through communication. At such places, by means of slight deviations, the rails were led down into the bed of these depressions. The concrete piers and bridge girders were constructed later, and the line subsequently pulled into permanent position. Nor could conventional methods be followed even at the great base depots at Port Augusta and Kalgoorlie, whence were distributed the hundreds of thousands of tons of rails and fishplates, and the millions of ties required for construction. For to Kalgoorlie the material was dragged over a

Form to Be Taken By New Railroad Financing

Recommended That a Bondholders' Committee Be Established While Company Is Solvent

THE REPORT OF COMMITTEE on railroad securities of the Investment Bankers' Association was divided into three parts, the first part dealing with the causes of the decline in railroad credit was published in a recent issue of the *Kansas City Gazette*. The second part of the report is given below.

As many of the mortgages formerly available for railroad financing are virtually exhausted in usefulness, or actually used, resort must be had to the issuance of new general refunding mortgages covering all of the property of the railroad, and so drawn as to provide means for financing requirements through the sale of bonds issued under these mortgages as long as the credit of the road warrants. One of the chief financial problems of the railroad companies and their bankers today is that of raising money through the sale of bonds issued under such mortgages. It is undoubtedly true that such bonds have not recently been popular with the investor. If any suggestion which we make should lead to the adoption of means by which these issues can be made more attractive, we feel that the financial position of the railroads will be immeasurably bettered.

We recommend that general refunding mortgages should provide that bonds issued thereunder be in series, in such form as may be determined by the board of directors, each series to have such special features in reference to date of maturity, rate of interest, place of payment, redemption, convertibility, sinking fund, registration and exchange as may be determined as necessary at the time of issue; that all series should be equally secured by the mortgage, and the rate of interest should be fixed at the time of issue of any series without any maximum limitation. There should be no fixed limit as to the amount of bonds which can be issued under a general refunding mortgage. The provision of the New York state savings bank law to the effect that the maturity of refunding bonds must extend beyond that of any bonds to be refunded appears to us unwise, and we believe steps should be taken to modify this provision to the end that failure to comply with it will not have the effect of eliminating the railroad bonds so issued as legal investments.

There is another provision of the New York state savings bank law that we think should also be repealed, namely: that which pertains to the limitation that the authorized amount of bonds to be issued under a refunding mortgage shall never exceed three times the out-standing stock. This provision in our opinion is unwise and if, as seems likely, stocks should in the future be issued without par value, it would lead to great confusion. We recommend that the only provision in the mortgage should be one similar to that in many public utility and industrial mortgages, providing that additional bonds may only be issued—either then for the refunding of underlying bonds, or the acquisition of securities—for a certain percentage of the cost of new construction, betterment, etc., and for a certain percentage of the cost of new equipment, but only provided that the net income for the preceding twelve months (after deducting taxes) exceeds one and a half (or two) times the total fixed charges, including rentals, hire of equipment and other prior charges and interest on the bonds to be issued.

The issuance of bonds for the acquisition of stocks or bonds to be deposited under the mortgage should be limited to a comparatively small proportion of the total bonds outstanding at any one time.

One of the weak features of railroad mortgages brought to light by recent experience is that the bondholders had no redress until there was a default under the mortgage and the property goes into the hands of a receiver. We do not believe it is practicable to attempt to remedy this weakness by giving the trustee more authority. Experience, owing to the exigencies of the situation, has shown how to deal competently for the business world on emergency to organize the indenture, therewithal before starting on the road, and the small payment it receives for its interest does not warrant it in taking much responsibility.

To remedy this situation we suggest two suggestions which we believe are worthy of careful consideration. We do not here present them in detail, as we desire to have an expression of opinion only on the principle recommended by these suggestions.

A Bondholders' Protective Committee

The first suggestion is that provision be made for the election by the bondholders of a permanent bondholders' committee, composed of men who are not officers of the railroad; this committee to have power to call meetings of the bondholders for the consideration of their interests whenever it sees fit to employ an expert who would or of course keep in touch with the property and whenever necessary call the attention of the committee to any evils which he considers should be remedied. A provision should be placed in the mortgage providing for annual meetings of the bondholders, at which meetings they would have the right to make changes in the permanent committee through election; to consent to something not provided for in the mortgage, or to waive default and to delegate powers to the committee as their representative sufficient to enable such committee to take any action that might in its judgment be calculated to preserve the interests of the bondholders.

The second suggestion is to split up the functions which the trust company is now supposed to perform, but in the course of which it generally avoids any action requiring the exercise of discretion and consequently fails to perform into two sets of powers. The first set of powers would be the real functions of the trustee, namely, taking notice of defaults and enforcing the right of bondholders, dealing with release of property and securities and redemption of securities, and calling the bondholders together in a meeting whenever common law vote of a stipulated amount of the bonds is rendered necessary or desirable by reason of something out of the ordinary. The second set of powers would relate to the custody of securities and money and the perfection of bonds. The first set of powers is one which only involve the exercise of discretion and a certain measure of interested supervision, and should be vested in preferably as trustee, the second set of powers involves no discretion, but simple mere attendance to the wants of the company, and should be vested in a trust company or trustee, because the bondholders desire a responsible financial organization as the representative of such matters.

To exercise the permanent bondholders' committee of the railroad and trustee, appointed to represent the bondholders during the term of the mortgage contract. They might be allowed to be present among their number, subject to the right of the bondholders to elect someone else as a substitute (or substitutes) for that purpose. Their compensation would be

penses, and those of the expert would be determined as part of the original bargain of the railroad.

Trustees Are Not a Protective Committee

The present unsatisfactory situation is due to the fact that the trust companies are now supposed to exercise supervisory and discretionary power, although they are not compensated sufficiently to warrant them in taking any risk. Individuals who really represent the bondholders would exercise the kind of supervision and discretion that the bondholder considers that he has a right to expect from those whose special function would be that of guarding the integrity of his security.

In the event of either of these suggestions being adopted, it would seem desirable that mortgages should provide the machinery for calling meetings of bondholders and for the authorization or ratification of acts which the trustees recommend, by a vote of a stipulated proportion of the bonds, which vote shall be binding upon the minority. Most of the existing mortgages create difficulties by reason of the existence of provisions in them which stipulate that the unanimous consent of the bondholders is required for any departure from their strict terms, yet all of us know of things which it would have been very desirable to do, both in the interests of the railroad company and of the bondholders, and also know of foreclosures and expenses of reorganizations which might have been avoided if there had been any machinery by which a given proportion of the bonds could bind the minority in consenting to something not provided for in the mortgage, or in waiving some default.

No Equipment Trust Certificates

The committee on railroad securities, in its report to the fifth annual convention recommended that all equipment purchased or already owned should be placed under the general refunding mortgage, and that the present method of issuing serial bonds, payable in one to ten years, secured by equipment alone, be discontinued as rapidly as practicable. We heartily agree in this recommendation. In the event of a receivership it is always well for the bondholder to own the equipment as well as the track or line of road, otherwise he is in the position of a workman without tools.

Where general refunding bonds are issued for the purchase of new equipment, we recommend that carefully drawn restrictions or safeguards be placed in the mortgage. In connection with rolling stock and floating equipment pledged under the mortgage and owned by the railroad company at the date of the creation of the mortgage, the mortgage itself should specifically enumerate the total number and capacity of the locomotives, passenger-train cars, freight-train cars, floating and other equipment, and the net book value of the same (after deducting accrued depreciation and outstanding equipment trust obligations, if any) and the aggregate capacity of every class of equipment should always be maintained. Bonds reserved under the mortgage for the construction or acquisition by the railroad company of new rolling stock or floating equipment for use upon or in connection with any of its lines of railroads at any time subject to indenture, should not be issued for more than 90 per cent of the cash cost of such equipment, and no bonds should be issued in respect of equipment acquired subject to or through any equipment trust or other lien. The face amount of all bonds issued for new equipment, or cash paid for the acquisition of new equipment, should be added to the net book value of the equipment specified, as mentioned above, in the granting clause of the mortgage for the purpose of fixing the value of the equipment to be maintained by the railroad company or replaced when destroyed. The railroad company should be required, either annually or semi-annually, to furnish a report to the trustee showing the total number and capacity of each class of equipment, to-

gether with the net book value of all the equipment after deducting accrued depreciation, etc.

The previous committee on railroad securities recommended the issue under the general refunding mortgage of a special series of bonds to cover new equipment purchased, which series should be paid off serially in from one to twenty years. We have found strong objections to this issue on the part of the railroad managers, as they feel that such series would command a better price and would tend to make the sale of other series under the same mortgage difficult because of their longer maturity. Certain recent mortgages contain new provisions in regard to bonds reserved for the purchase of new equipment; we recommend that these provisions be embodied in all new general refunding mortgages, especially in view of the fact that the previous committee on railroad securities has gone on record that the railroads should make ample provision for adequate charges on account of the depreciation on equipment.

One of these provisions is that the company will maintain in good order, and when destroyed replace by other equipment of equal value, all equipment under the mortgage, and that in each case where bonds are issued against new equipment or additions and betterments to old equipment, the railroad shall pay to the trustee at or before the end of each year for a period of 25 years from and after the authorization or delivery of the bonds, a sum in cash equal to the difference, if any, between five per cent of the principal amount of bonds so issued and the actual amount which the company shall in such year have charged to operating expenses, to cover the depreciation of the equipment, for the purchase of which or for additions and betterments thereto the bonds have been issued; that is, if the railroad company should charge into operating expenses, say, three per cent of the cost of equipment or of betterments thereto in any one year against which bonds have been issued, the company must pay in cash to the trustee the difference between three per cent and five per cent, or two per cent, in that year, and so on for 25 years. All moneys received by the trustee under this covenant must be held by the trustee for improvements and betterments, acquisition of new equipment or the purchase of new securities, etc.

Railroads generally prefer to purchase equipment through equipment trusts, on account of the lower interest rates required. Another trouble is that underlying closed mortgages generally attach, by virtue of their "after-acquired-property" clauses, equipment purchased by bonds under refunding mortgages. A further trouble is that underlying mortgages which are not closed generally do not permit the issue of bonds for the purchase of equipment, although their "after-acquired-property" clauses automatically cover all equipment bought with bonds of junior issues. Only in comparatively recent general refunding mortgages are adequate provisions made for the issuance of bonds to buy equipment. Thus the situation is that on the one hand the railroad cannot buy equipment with the underlying bonds which command the best price, but must use a junior bond commanding an inferior price, and on the other hand the junior mortgage, which buys the equipment, cannot get an exclusive purchase money lien upon it. Therefore, if it is impossible to persuade the railroad companies to purchase equipment through the issue of general refunding mortgages containing such adequate provisions as have been recited above, and they insist upon issuing equipment trust obligations, there should be a provision in the general refunding mortgage that no bonds shall be issued on account of equipment acquired subject to any equipment trust. In this way, as the equipment trust obligations mature, the equipment comes under the general refunding mortgage or some prior mortgage.

There is no question on which there is a greater difference of opinion than the desirability of sinking funds in railroad bond mortgages, and while the conditions under which such mortgages are issued vary greatly, there is no doubt that the general principle of amortization of debts is a sound one, and today is more popular than ever among investors. The Interstate Commerce Commission requires the railroads to include in their operating expenses an annual charge for depreciation of equipment, but does not specify what its application is proper nor does it require the railroads to depreciate any other class of property. Only a few of the strongest roads depreciate any class of property other than equipment, and many of them charge off ridiculously low rates of depreciation, even on equipment.

Sinking Funds

There are some classes of railroad property, such as passenger terminal stations, subject to continuous depreciation which cannot be taken care of even by the full physical maintenance of the property. This depreciation is due chiefly to the normal growth of traffic, which, sooner or later, results in almost any terminal, however well designed, becoming inadequate and obsolete. Even though the building remains in as good physical condition as when constructed, its usefulness disappears, and by the time this occurs the debt issued to provide the cost of the property should be retired, except in so far as the value of the unimproved real estate is concerned. This same criticism applies to a certain extent to bridges, and also to branches or lines serving mines or other industries, the traffic from which is not permanent. Bonds issued against property of this nature should be protected by an adequate sinking fund provision sufficient to retire the bonds during the estimated life of the property or industry.

A large number of long-term railroad bonds are secured to some extent by lien on railroad equipment. The usual provisions for replacement and repair are not adequate to preserve the security, as it is not reasonable to suppose that equipment purchased today will be adequate to perform the service which will be required twenty years later, even though such equipment has been maintained at 100 per cent of its original condition. Railroad property of this kind becomes obsolete, and when this occurs its use by the road becomes wasteful. Bonds issued for the purchase of such property should be completely retired during the probable usefulness of such property.

Good management, proper maintenance and adequate depreciation charged to operating expenses unfortunately cannot always be relied upon. It is therefore necessary to adopt some method of safe-guarding bond issues—by which is meant providing annually out of income for their payment, in whole or in large part, at maturity. This is probably best accomplished by creating a small annual sinking fund. An annual payment of one-half of 1 per cent of the amount of bonds outstanding, compounded annually at 4 per cent, will provide for the entire issue in about 57 years and, if compounded at 5 per cent, in about 50 years. Such an annual payment is so small as to be almost negligible.

Strong objection is made to sinking funds on bonds secured by a mortgage on main track, exclusive of equipment or terminals. This objection, which is based on the necessity of the maintenance of such property and its freedom to a large extent from obsolescence, is valid and could not be answered were it not for certain other factors which are not always considered. In the first place, property of this character is not always maintained as it should be; therefore, sinking funds on bonds issued seem to be the only sure way of providing against a gradual deterioration of the property. We admit that this applies only to a limited percentage of railroad properties, but the fact remains that

investors have lost large sums of money through inadequate maintenance. In most cases if the extra money that would have been spent on maintenance of the property had been applied to dividend payments, a forced sinking fund, while not increasing the net income of the property at full value at least reduces, eventually, the loss thereon and acts as a deterrent against the payment of dividends at the expense of the property.

One of the objections raised against an sinking fund by the railroads is that they are retaining funds out of earnings through the operation of sinking funds, even at the same time they are issuing other bonds probably against the same mortgage at a lower price for necessary additional capital. In this connection it has been suggested that the idea of a sinking fund might be varied by having it applied to the making of improvements instead of the retirement of bonds.

This method would probably be more advantageous from the standpoint of the railroad, and, if properly carried out would maintain the equity behind the bonds. It would, however, result in losing one of the points in favor of sinking funds which is not sufficiently considered by the railroads; namely, the favorable effect on the market price of bonds on account of purchases for the sinking fund. It not only inures to the benefit of the bondholder, but enables the railroad to obtain better prices for subsequent issues.

Preventable Waste of Coal*

By David Moffat Myers

AS A MEANS of far-reaching economy the Government of the United States should at this time apply intelligent and direct acting efforts to the conservation of fuel at the industrial plants which are responsible for its greatest consumption. Coal is wasted in vast quantities in the boiler furnaces of our plants, to feed which it is mined and distributed at a high and ever-increasing cost of labor and material.

The mining and distribution of the coal have been placed under the supervision of the War Coal Board in order more nearly to meet the crying needs in these directions, to use the railroad facilities more efficiently so that the present car shortage may be minimized to the greatest possible extent and to apportion the coal in quantity and to uses deemed most expedient. While this organized effort to bring about efficiency in the production and distribution of coal is being made, no parallel measures have been adopted to bring about a normal and practicable efficiency in its use. The hundreds of large plants which are consuming fuel wastefully, in many cases more wastefully and carelessly than ever before, are directly and needlessly causing a large fraction of the existing car shortage. They are overloading the already strained capacity of the railroads; they are rendering slower and more difficult the transportation of food and other vital commodities, and in short they are simply counteracting the measures of efficiency in production and distribution which have elsewhere been established.

Preventable Waste of Fuel

The preventable waste of fuel in the boiler furnace of one steel mill which I investigated amounted to 4,000 tons per year, which at \$5 a ton would cost \$20,000. This was a comparatively modern plant. The efficiency of boilers and furnaces in a 14-day test was 55 per cent. The load factor was unusually favorable to high efficiency and could readily be raised to 70 per cent or over. This is only one example and there are many more extreme cases. In one

*Published by permission of the War Coal Board, U. S. Department of the Interior.

hand-fired plant the evaporation was raised from 6 to 9 lb. in a few days of instruction and continuously kept close to this higher mark with the help of coal and water measurements which were inaugurated. The saving was due exclusively to instruction and consequent better operation.

The saving or wasting of one-fourth of the coal consumption of any industrial plant, depends entirely upon the efficiency of its operating management. Let me emphasize that this fraction of the consumption relates exclusively to the boiler plants, i.e., the production of steam; and does not include the large economies possible in connection with its distribution and use.

Under present conditions a plant which carelessly operates at an efficiency of 40 to 50 per cent, receives from the government the same consideration in the delivery of coal as the one whose efficiency is 70 to 75 per cent. This obviously is unfair and wasteful. The government hands over, say, 200,000 tons of coal a year to a plant owner, but asks for no accounting as regards its consumption, nor any questions as to the amount of steam it is made to produce. There is nevertheless an equivalent amount of steam this fuel is capable of generating and it can and should be made to produce that quantity.

There is no doubt that very important economies in the use of food have already been effected by the educational campaign with which we are familiar. These economies are largely the result of educating the ultimate consumer. The requisite propaganda spreads practical information concerning the efficient use of foods and their respective values and methods of preparation in such simple and convincing manner as to be understood and practiced by the women all over the United States. It places this information where it will be applied.

Conservation Methods

In general, there are, I think, two plans of operation worthy at least of consideration. The one might be termed the autocratic method. This would involve the use of authority to compel coal consumers to execute such measures of economy as the proper authorities might prescribe for any given case, limits to be set as to expense to the user. Such limits might be in terms of a percentage of his present yearly coal bill. Alterations should be directed chiefly, as previously implied, to purely operating improvements. Many objections would probably be made by consumers against this plan, but once in effect the majority would no doubt realize its pecuniary advantage to themselves. But its tendency may be too strongly opposed to democratic principles.

The other plan would be largely an educational one, in which patriotism and efficiency would furnish the motive forces required. The teaching must be accomplished with the utmost simplicity and directness. Above all, it must be in such form as to be readily comprehended and applied.

The United States Bureau of Mines has for a number of years engaged in obtaining and disseminating scientific information regarding the mining and consumption of coal, and the results of the work have been of great value to technical engineers who are able to use and apply it. It is evident that we now require an extension of the idea of education, but in such form as directly to affect the men who run the boiler plants of our country, for in their hands is the saving or wasting of one-fourth of the fuel which they consume.

Save One Million Tons of Coal

Six hundred million tons of coal were mined in the United States in 1916. It is predicted that 700,000,000 tons will be mined in 1917, and the production in 1918 will likely be still greater. Of this quantity approximately 67 per cent, or 469,000,000 tons, will be burned for steam-making purposes on land, assuming the same percentage consumption

for the steam production as existed in the year 1915.

The saving or wasting of one-quarter of this coal, that is, over 117,000,000 tons, depends upon the efficiency with which we operate our boiler furnaces. If we actually saved by proper methods only 50,000,000 tons per year, this economy would result in freeing for other important service the use of 1,000,000 fifty-ton freight cars during the year. The significance of such an economy may be realized when it is stated that the number of cars thus released for other service would be equivalent to 15 per cent more than the combined yearly coal-carrying capacity* of the Baltimore & Ohio and Southern Railway systems; approximately equal to that of the Pennsylvania Railroad system on lines east of Pittsburgh, or $1\frac{2}{3}$ times the number of coal cars hauled by the Norfolk & Western. The direct saving to our industries would be \$250,000,000 worth of coal per year, if figured at \$5 per ton.

This saving would be 10.65 per cent of the coal now burned for steam production. It is impossible to state the present average efficiency of boilers and furnaces, but I have personally spent sixteen years of concentrated study in the investigation and improvement of steam and fuel conditions in factory power plants, and I have never visited a plant of this class where a saving in coal of at least 10 to 12 per cent could not easily be made. The poorer the conditions found the easier it is to make an attractive saving in fuel.

If we do not limit our field of action to coal used merely for steam generation, but extend it to include a consideration of the economy with which the steam itself is utilized and applied, there is no doubt in my mind that the above-predicted saving could be doubled, so that we might save 2,000,000 fifty-ton carloads of coal per year. There is, for instance, widespread ignorance to a surprising degree in regard to the value of exhaust steam in heating and process work. No account has thus far been taken of other primary uses of coal such as coke production, which consumes about 14 per cent of the output of our mines, and coal-gas manufacture, domestic purposes and miscellaneous. Additional economies could undoubtedly be effected in these applications.

Our steam plants are under the immediate management of chief operating engineers. The examination requirements for licenses in this profession call for practically no knowledge of steam and fuel economics. These examinations deal chiefly with matters of safety, repair and maintenance of equipment and neglect almost entirely the subject of coal economy. This is a very serious defect in our present system and is directly responsible for a large preventable waste of fuel.

The mining and distribution of our coal supply, the regulation of prices and the adjustment of financial and labor problems have already been placed under official administrative attention. But no parallel measures have been adopted looking toward reduction of waste in connection with the utilization of this coal. The work involved in a general program such as I have very briefly suggested will undoubtedly be undertaken. Its success or failure will depend chiefly upon the kind of men who may be selected for its planning and execution.

INCREASED OPERATING COSTS IN NEW SOUTH WALES.—During the year ended June 30 last, the awards of wage boards on the New South Wales Railways led to an additional outlay of £297,536 (\$1,446,125), while the higher price of fuel cost an additional sum of £57,534 (\$279,615), and of materials other than coal £89,388 (\$434,426). The transportation of troops and of military stores at reduced rates, and the transfer of starving cattle cost £104,647 (\$508,584).

*Based on statistics for the year 1916.

Passenger power locomotive (Baldwin-Westinghouse) being built at Chicago

Most Powerful Electric Passenger Locomotives

New Power of 112,000 lb. Tractive Effort and 3,200 H.P.
for the Chicago, Milwaukee & St. Paul

THE CONTINUATION of the Chicago, Milwaukee & St. Paul's electrification program to the Cascade Range includes the electrification of a new section from Othello, Washington, east of the mountains to Seattle and Tacoma. With this completed there will be 611 miles of trans-continental electrified railroad in operation. The original 440 miles of electrification will eventually have all the passenger trains hauled by Baldwin-Westinghouse electric locomotives. These locomotives embody many novel features.

The complete locomotive with a total length over couplings of 90 ft., weighs, ready for service, 266 tons, and has an adhesive weight of 330,000 lb. These new locomotives will be single-cab units, although the horsepower capacity is much greater than for any double-cab electric locomotive now in service. There are two main running gears, each having a four-wheel guiding truck, three driving axles with a 16-ft. 9-in. rigid wheel base, and a two-wheel trailing truck. It thus corresponds to two Pacific type running gears coupled with a link and having two-wheel trucks on the adjacent ends.

The cab is supported on center pins located midway between the first and second driving axles of each running gear. On one running gear the center pin is designed to restrain the cab both longitudinally and laterally, while on the other running gear the center pin restrains the cab only laterally, permitting free longitudinal movement. This arrangement of riding and floating pins relieves the cab of all pulling and buffing strains due to train load, as these strains are taken directly through the running gear side frames and bumpers. The driving wheels are 68 in. in diameter, and carry 55,000 lb. per axle. Guiding trucks have 36 in. wheels. The two-wheel trucks each have a load of 38,500 lb. at the rail, with approximately 62,000 lb. distributed on each of the four-wheel trucks.

On any single driving wheel, the non-spring supported weight is that of wheels, axles and driving boxes only.

With the flexible type of quill drive used the motors are located well above the railhead and the axle with its wheels is free to follow the rail independently. This drive secures all the advantages of a flexible gear in cushioning the torque and avoids the shock to the rail that is obtained with the common flexible gear construction and mounting.

Each main running gear has three-point equalization with a single point toward the end of the locomotive, in accordance with accepted steam locomotive practice. The four-wheel guiding truck center pin and cross-equalized leading pair of driving wheels are equalized together on the longitudinal center line of the locomotive. This arrangement

combines all the advantages of the standard construction of the American and Consolidation types of steam locomotives. The two remaining pairs of driving wheels and the two trailing wheels of the main running gear are equalized in accordance with accepted steam locomotive practice.

The center of gravity of the main running gear including motors, is 41 in. above the rail, and the height of the center of gravity of the complete locomotive is 61 1/2 ft. above the rail.

Among the novel features which will be found on these locomotives are: Large capacity in single-cab unit, flexibility of running speeds with small rheostatic losses, trim motor design with quill drive; low-voltage auxiliary simplifying inspection, maintenance and operation; simple and effective regeneration; improved equalization to minimize weight transfer in trucks, and auxiliary train heating plant.

Capacity.—These will be the most powerful locomotives running in passenger service. A single unit is able to haul a 950-ton train (12 coaches) over the entire mountain section at the same speeds as called for by the present schedules. The one-hour rating for one of these locomotives is 3,000 hp. and its continuous rating is 1,200 hp. with a starting tractive effort of 112,000 lb. The normal speed on level track is 60 m.p.h.; on a 2 per cent grade about 45 m.p.h.

Flexibility.—One of the noteworthy characteristics of these units, which is very desirable in passenger service, but which has not heretofore been attained with this type of electric locomotive, except at the expense of heavy rheostatic losses, is the flexibility of running speeds. There are nine running positions without rheostatic loss. This is accomplished by the use of six 1,500 volt four-pole motors on the locomotive, arranged for three-speed construction as follows:

- Position No. 1. 1 set 6 motors in series
- Position No. 2. 2 sets 3 motors in series
- Position No. 3. 3 sets 2 motors in series

During the change from one speed construction to another, tractive effort is maintained.

Two additional running speeds are obtained on each speed combination by means of trimmable shunters in the motor fields, which permit in outdoor places current to be as well as save rheostatic losses, and enabling the power obtained over the varying profile to be kept more nearly constant. The speed range is from 8 to 50 m.p.h., dependent on the load.

Main Motor.—The use of 100 rectangular design quill drive is not only perfect, the most effective and of the type between the driving wheels, but enables the use of two armatures only instead of 750 volt motor current and secured to

the same quill. This also makes possible the advantage of better commutating characteristics inherent in the lower voltage motors.

Auxiliaries.—Low voltage auxiliaries considerably reduce the complication and hazard of high voltage on these locomotives. The only high voltage apparatus among the auxiliaries is the motor of the small motor-generator which is used for train lighting and charging the storage battery. The resultant simplification secured by the use of low voltage appliances decreases the complication of installation, maintenance and operation. Ordinary inspection can be carried on, including the functioning of switches and auxiliaries, with the complete absence of 3,000-volt power on the locomotive.

Regeneration.—The type of regenerative control for holding trains on descending grades used in these locomotives is of particular interest. Special arrangements have been perfected to secure positive operation of this feature over widely varying speeds. The same main motor combinations for "motoring" are used for "regenerating" except that the fields of the main motors are separately excited over a wide range by axle-driven generators. These are so connected with balancing resistance that inherent stability in the motor characteristics during regeneration is assured, irrespective of whether the changes in line voltage are sudden or gradual.

While the regenerative braking of trains lessens the duty on the air-brake equipment, further safety in braking with electric locomotives is introduced with the axle-driven generators. These machines are mounted on the pony trucks of the locomotive, and in addition to exciting the motors during regeneration, furnish the power for operating the air compressors and blower motors when the locomotive is hauling. This method insures a current supply to the air compressor motors irrespective of the overhead trolley supply, and provides that compressed air will always be available for use of the air brakes.

Weight Transfer.—In electric locomotives without connected wheels, weight transfer due to tractive effort, is an important point of interest. This is caused by the drawbar pull being exerted at the coupler height, which with the reaction at the rail, tends to lift the leading end and depress the trailing end. This changes the weight distribution and increases the tendency of the wheels to slip. The method of equalization described above reduces the weight variation on the driving wheels to only 6 per cent from normal when pulling at 30 per cent adhesion.

Train Heating.—The question of passenger train heating is of vital importance due to extreme weather conditions encountered in that section of the country. Heat must be assured under all conditions of failure of equipment, and delays of trains. The heating plant, therefore, must be entirely independent of the electrification. Each locomotive is equipped with an oil fired steam boiler, designed to burn ordinary fuel oil used by the railway company. Provision is made for a storage of 7,500 gal. of water and 750 gal. of oil in each engine.

The careful attention given to improve the details of design and operation insures that these new locomotives will mark an epoch in the development of the electric locomotive for steam railroad passenger service.

SELECTED ROUTES FOR BRITISH FREIGHT.—The Railway Executive Committee of England has given notice that on and after December 1, 1917, traffic for conveyance by freight train between England and Scotland, and Wales and Scotland, will only be accepted and conveyed by selected railway routes. Information as to the route by which traffic for places served by more than one railway should be forwarded, can be had an application to the railway companies' agents.

Store-Door Delivery

Proposed in New York

THE DIRECTORS of the Merchants' Association of New York City have published a plan, prepared by J. C. Lincoln, manager of the association's traffic bureau, providing for store-door delivery of freight in New York City, combined with pick-up service; and the plan has been referred to the committee of commissioners who are investigating traffic conditions in New York City—Messrs. J. S. Harlan, of the Interstate Commerce Commission; T. H. Whitney, of the New York State Public Service Commission, and W. E. Donges, of the Public Utilities Commission of New Jersey. This committee has it now under consideration and is expected soon to recommend it to Mr. McAdoo. The plan involves some radical changes which, in ordinary times, could not be carried out without new legislation; and therefore the Merchants' Association seeks the approval not only of this committee, but also of the director-general of railroads. In the absence of legislation the plenary powers of the director-general would be needed to set the scheme in operation.

The report opens with a brief description of the extreme and unusual conditions in New York, especially on Manhattan Island; very inadequate team tracks and consequently large quantities of carload freight to be moved through the freight stations on the piers, and the enormous volume of business of all kinds, resulting in blockades of trucks loaded with outgoing freight very frequently even in normal times. Consignees, as a rule, call for freight only after they have received notice of arrival, and for the great bulk of the merchandise received in the city, this means a delay of at least 24 hours.

Store-door delivery—the trucking of freight away from stations as soon as practicable after its arrival, instead of awaiting the decisions of hundreds or thousands of consignees—is, of course, the ideal arrangement. The present report considers the question of getting each railroad to form a trucking company, and also another proposal that all of the roads should combine to form a company; but recommends, finally, the pooling of present equipment, which is owned by several hundred concerns.

With facilities consolidated the trucking company could have lined up on the pier batteries of trucks serving particular zones in the early hours of the morning and the delivery of freight would begin with the opening of business hours. The same method could be continued during the day. The pier station would thereby be kept free of incoming freight and more adequate facilities would be provided for out-bound business. By this method deliveries would be made before the consignee, under present methods, receives notice of arrival.

Continuing, the report says:

"The same trucks should also be employed in picking up freight for outbound shipments. By proper co-operation on the part of shippers, a more even delivery of freight to the pier stations throughout the day could be accomplished and the frightful line-up and delays to trucks which take place in the late afternoon would be avoided. Trucks would be substantially assured of full loading in one direction and probably in both.

"At first the agreement, as a regulation, to be confined to the handling of less than carload merchandise.

"Carload receivers usually maintain their own trucks or have an arrangement with a trucking company to do their hauling; carload consignments could be kept intact and assigned a space on the pier floor where it would be accessible to the consignee. With the removal of the large number of trucks now handling less than carload freight from the

pier, the carload receiver could remove his freight more expeditiously.

The following regulations would have to be prescribed and made enforceable:

No trucks for the handling of less than carload merchandise other than the trucks of the company formed for the purpose of effecting store-door delivery to be allowed on the pier.

Tender of the property to the consignee at his store door or usual place for the receipt of his property to be a legal tender of such freight, and upon such tender the consignee to pay freight and cartage charges before delivery. (Unless by prior arrangement he shall have arranged for credit.)

If the property is refused by the consignee or payment is refused, then such freight may be placed in public warehouse.

When delivery of merchandise is desired by consignee at other than his usual place of business, instructions shall be placed with the cartage company prior to the arrival of the goods.

Schedules of reasonable cartage charges to be prescribed, which charges shall be strictly adhered to.

Arrangements should also be made for the arrangement of reasonable and non-discriminatory storage and handling charges for merchandise placed in public storage.

Method of Procedure

In order to relieve congestion at stations and to delay to trucks the carrier should be required to make delivery of the property transported subject to a reasonable charge for the additional service rendered. (The duty of the carrier being increased the authority of the district general on the premises should be unimpaired.)

The trucking service to be accomplished under government authority and direction trucking companies and operations to be permitted to pool their equipment, so as to operate as one company for the handling of freight to and from railroad piers and stations. The city to be divided by zones as to piers and places of business to be served—and trucking equipment to be so regulated as to serve these particular zones. The trucking company to have priority rights on the pier.

Where consignee desires to perform trucking, such truck to be permitted on the pier in such restricted hours as will not interfere with the operation of the general plan. * * *

Wood Preserver's Association Studies War Conditions

The Shortages of Material and Labor Important Topics at the Fourteenth Annual Convention

THE CONVENTION of the American Wood Preservers' Association was held at the Hotel Sherman, Chicago, on January 22 to 24, inclusive. Although some doubt was expressed regarding the attendance previous to the meeting, the number present compared favorably with that of previous years. Approximately 75 members were in the hall at the opening session on Thursday morning.

The officers of this association for the past year were: John Foley, president, forester Pennsylvania Railroad, Philadelphia, Pa.; M. K. Trumbull, first vice-president, vice-president National Lumber and Creosoting Company, Kansas City, Mo.; J. B. Card, second vice-president, president Central Creosoting Co., Chicago, and F. J. Angier, secretary-treasurer, superintendent timber preservation, Baltimore & Ohio, Baltimore, Md.

The convention was called to order by President Foley at 10 o'clock on Tuesday morning, and was opened with prayer by J. H. Waterman, a past president. The report of the secretary-treasurer showed a balance of \$149.77 in the treasury. The membership on December 31, 1917, was 291, including 75 members from 36 railways. Fifteen members were reported in the military or naval service of the United States government.

In his opening address President Foley referred to the unusual problems of the past year arising from shortages in oil, fuel, labor and lumber which are requiring extensive readjustment in the wood preserving industry. He referred to the recognition of this condition in the program for the meeting and urged the members to participate in the discussion of these problems in order that the wood preserving industry might do its full part in helping our government to win the war. He described the great inroads which are now being made on European forests, particularly those of the belligerent nations and referred to the large contribution which this country has made to the lumber demands of its allies. Owing to the depletion of the forests of Europe, the United States, Canada and Russia will be called upon to

supply the timber needs of the world. President Foley also referred to the fact that 5,000 American foresters and lumbermen are already in France and emphasized the effect which this will have on the conservation of American timber resources after the war when these men return from Europe.

The War's Effect on Labor Supply

E. T. Howson, engineering editor of the *Railway Age* spoke on the effect of the war on the labor supply. Although the labor problem is universal at the present time, no definite statistics are available showing the extent of the shortage of men. Such data as are available however, indicate that the shortage is indeed serious. The causes of the situation are the increase in the demand for labor and the decrease in the available supply. The army draft increased the number of men who had already been withdrawn from industries through voluntary enlistments and the rapid growth of war industries also proved a heavy drain on the labor supply. On the other hand, the flow of alien labor into the country through immigration has almost ceased. Whereas in the 10 years previous to the war an average of 1,012,000 men available as unskilled laborers migrated from other lands to the United States every year, now hardly 250,000 enter the country annually and this number is nearly equalled by the exodus of alien reservists to fight in the armies of Europe. The two largest classes of immigrants are unskilled laborers and agricultural workers. Of the former class, 90,000 entered the country last year and 101,000 left.

Considerable attention has been directed to the Mexican labor supply, particularly in the Southwest. It is generally believed, however, that much of this supply is unimportant as it is now being used in the Southwest. More than 20,000 Mexicans migrated to this country and across the border in the first three days of May 1, 1917, almost a negligible number have entered. The only other source of labor is Asiatic and although thousands upon thousands of Oriental workers have passed through Canada en route to France to take over the unskilled

labor of that country, the United States Department of Labor has consistently opposed letting down the bars to permit the influx of that class of labor into this country, and not a single bill has so far been introduced into Congress to that end. The Department of Labor has, however, arranged to import 110,000 Porto Ricans for employment in this country. The big problem in this connection is to secure boats to transport these laborers. Up to date, bottoms have been supplied for about 50,000, who will be placed in the South, where climatic conditions are similar to those in their native land.

The Department of Labor has recently been given wide powers, among which is the authority to give certain industries, considered most essential to the prosecution of the war, priority in bidding for labor. Under present conditions some companies making large profits have not only outbid others for labor, but have followed the policy of keeping a surplus of labor on hand to provide for maximum needs, with the result that, from the standpoint of the country at large, there has been a considerable waste of man power. The Department also operates 100 labor agencies throughout the country which co-operate closely with 134 state agencies and give particular attention to the prevention of unnecessary movements of labor from place to place, and particularly, the transportation of men for long distances.

The employment of women is not a solution of the labor problem from the standpoint of the wood preserver, except in so far as they can be used in office work. Much more can be done, however, in utilizing the service of boys for light labor.

A remaining remedy for the labor situation is the further use of labor-saving equipment. Considerable success has been experienced in the use of locomotive cranes for the handling of ties. The further development of other labor-saving devices in this field is highly desirable at the present time.

Not only is it difficult to secure laborers at the present time, but it is hard to keep them. Commercial timber men have been able to bid higher than railroads for labor with the result that there has been a demoralization of the market. The degree in which the keen competition for labor has raised the standard wage of unskilled workers is indicated by the fact that in the recent storm in Chicago one or two railroads were forced to pay as much as \$1 an hour to snow shovelers.

There is one way of keeping labor without further increasing wages and that is further attention to the comforts of the men. Comfortable quarters, sanitation and good food at labor camps are strong inducements for the men to stick to their jobs. In considering the labor problem it should be remembered that the present labor shortage may continue indefinitely after the war and that improvements introduced now may justify themselves as permanent qualities.

Discussion

C. M. Taylor (P. & R.) discussed the possibilities of the Hilke tie stacker, stating that lack of capital had hindered the development of this stacker. The Delaware, Lackawanna & Western, he said, had one of these machines in its yards which had not been perfected sufficiently to do satisfactory work. With reference to the labor situation, Mr. Taylor stated that the speaker had omitted mention of one source of supply, namely, the Portuguese, Spanish and Finnish sailors who spend considerable time at our ports waiting for their ships to sail. He said his labor was largely made up of these transient aliens. With reference to the negro supply of labor, he stated that the importation of blacks to the North should be discouraged as opposed to the economic and social welfare of that section of the country.

J. H. Waterman (C. B. & Q.) disagreed with Mr. Taylor's views on negro labor, asserting that under present conditions

any one who could handle a tie was in demand and that the South should not have a monopoly on the negro supply of labor. On the subject of labor-saving devices, he said that while locomotive cranes were invaluable in a tie yard and he found them capable of loading from eight to nine stock cars a day through the side door, the price of cranes had risen from about \$8,000 to \$20,000 since the beginning of the war. In other words, both the cost of labor and machinery is high.

William A. Fisher (Michigan Wood Preserving Co.) described the operation of a monorail crane used by his company which is capable of handling a trainload of ties every two or three minutes. George E. Rex (A. T. & S. F.) said that he was using five cranes at the present time and wished he had five more. Cranes, he said, cut the cost of handling ties in two; in fact, without them he would not be operating today. A. L. Kuehn (American Creosoting Company) stated that his company had found that the cost of handling black ties could not be reduced materially by the use of locomotive cranes. Ties are received by his firm in closed top equipment, necessitating the use of practically the same number of men to move the ties from the interior of the car to the door and to arrange them in piles in the yards, as when cranes are not used. The only advantage of the crane rests in doing the heavy lifting work, thereby enabling the company to make use of a somewhat lower class of labor than when all the heavy work must be done by the men.

A. R. Joyce (Joyce-Watkins Company) related experiences of his company on tie operations where organizers from outside unionized the laborers with the result that the companies were compelled to recognize the union and raise wages. While he felt that the raise in pay was entirely justifiable the unions had produced unfavorable results in other ways. There was evidence of indolence and carelessness on the part of the men resulting in an increase in the number of accidents. President Foley called attention to the urgent need of the nationalization of any foreign workmen employed. He outlined the efforts made to teach new men the principles and ideals of our government, which led to the suggestion by M. K. Trumbull (National Lumber and Creosoting Company) that material assistance could be obtained by those concerned with this problem through co-operation with the American Committee on Nationalization, New York.

Bonus systems as a means of holding men were also discussed, especially the tendency for the men to leave as soon as the bonus was paid. Mr. Howson suggested that this could be overcome by paying the men a small increase in rates after a certain period rather than a lump sum bonus.

Conditions in the Tie Market

A general review of the tie situation was presented by M. T. Shanessy, general tie inspector, New York Central. He was followed by P. R. Walsh (Walsh-Griffith Tie and Timber Company), who gave an account of the conditions imposed upon the tie producer under the current shortage of labor and the high prices of all materials used. The shortage of ties is increased through a demand for lumber of small sizes for which tie timber is entirely suitable. As a consequence the portable saw mills are now being used largely in the production of this lumber.

W. H. Clifton (B. & O.) said that there were not enough ties in the east to meet the requirements and that he was now compelled to cover a much wider area in order to secure the necessary ties. F. S. Pooler (C. M. & St. P.) said that the railroads could help the tie situation materially by reducing their requirements and cited his own road which had reduced the tie renewals for 1917 by 450,000 from the estimates originally made. A. R. Joyce (Joyce-Watkins Company) said that the tie production in upper Michigan, Wisconsin and Minnesota, was less than 50 per cent of

northern and that practically all of the ties produced in this region are now being consumed by the railroad passing through it and as a result roads outside of the territory cannot get them.

Fire Insurance at Creosoting Plants

J. G. Harrell, manager, National Inspection Company, gave an account of the measures which can be taken to prevent fires. Oil-rickness and oiliness were especially emphasized. Vents must be kept free from all rubbish, chips, etc. The lumber must be kept well piled and, where not storm-proofed from the standpoint of seasoning, should be piled well.

Attention was directed to the fact that creosote was highly inflammable when heated and that the same was true of creosoted wood under a like condition. For this reason it is paramount to prevent accumulations of the oil on the floor around machinery, etc., and also to provide thorough ventilation to prevent accumulation of volatile gases. The boiler room requires special treatment. Sufficient head room must be provided over the tops of the boilers and special care is required where refuse is burned. The stacks should be screened and enough space be kept clear in front of the fire doors to do away with any danger of fires from that source. Machinery and shaft bearings must be kept clean. Many fires have been caused by the ignition of refuse in contact with heated bearings. Where artificial heat is necessary steam heat is far superior to any other from the standpoint of the fire risk, but even with steam heat precautions are necessary. Refuse must be kept away from the steam pipes and the racks on which the pipes are placed should be made of iron and not wood.

The last part of the talk was devoted to apparatus for fighting fires, including the water works system, pipes, hydrants, hose, etc. In the case of a creosoting plant a pile of sand should be kept convenient to the operating buildings for fighting oil fires.

In the discussion of this paper J. H. Waterman (C. B. & Q.) described the measures taken at the Burlington plant at Galesburg, Ill., to decrease the fire hazard and where, with the existing conditions the insurance company fixed a rate of \$118, after the improvements and rearrangements had been made, a rate of 50 cents was obtained. Dr. Hermann Von Schrenk (consulting timber engineer) called attention to the important bearing of the moral hazard, stating as his opinion that carelessness, indifference and ignorance had far more to do with fires at creosoting plants than the materials.

The Creosote Situation

R. L. Lee (Barrett Company) gave a short talk on the available supply of creosote. Insofar as the domestic supply is concerned the chief difficulty at the present time is that the coal sooting has resulted in the extensive use of coke-oven tar as a fuel, it being estimated that 1,250,000 gal. per annum are being consumed at the present time in connection with steel manufacture, so that refiners are unable to obtain an adequate supply. Three or four years ago it was the custom of those connected with the coal tar products industry that the great volume of the supply of this material would be a serious problem to the producer and manufacturer because of the difficulty of securing an adequate market. The present conditions present an absolute reverse of this situation. The shortage is acute, as a fact it was believed that the production of creosote for 1918 would be less than 1917.

E. E. Fulk (American Tar Products Company) confirmed Mr. Lee's statement in that the best to be expected was a production in 1918 practically equalling that of 1917.

with the difference that with the beginning of this year a surplus of 12,000,000 to 15,000,000 gal. of creosote was on hand whereas there is hardly a supply at the present time.

G. A. Linschke (American Tar Refining Company) gave the preliminary concerning the supply of creosote material. Aside from the water consumed by the heating processes in the separation of the material, and for use now being used for a fuel in England there is the possibility of a large quantity being taken off. Considering the close of the war a large supply of creosote should be available from England and it is probable that the creosote shortage problem, owing to the supply of shipping which took the creosote.

Cause and Prevention of Failures in Creosoted Wood Block Factory Floors

By L. T. Ericson,

Contracting Engineer, The Insulated Wall Company, Chicago.

This paper touched on the points with which these floors have been used in all manner of industries, but stated that occasional failures are encountered and that the problem confronting this industry at the present time is to study these occasional failures with a view to a discontinuation of the practices which are found to cause them. The principal problem arises from the need of providing for both expansion and contraction, the former causing a floor to buckle and the latter to make it rough and uneven in finish. Adequate expansion joints are required around the edges of the floor and also between the individual blocks through the use of fillers. Special attention was called to the necessity for differentiation in the treatment of blocks as found in time on the job and in laying the floor, to prevent adaptation for the great difference in the behavior of blocks laid in dry surroundings and those subjected to wet or humid conditions.

Air seasoned lumber, stable foundations and a wooden filler were named as the primary reasons for success in any case. For the foundation, reference to the fact and the practice of providing a level or uniform surface was recommended as doing away with the possibility for the cushion which serves no other purpose than to provide a level surface for the placing of the blocks. A cushion is not required to take up vibration. The most serious job of all is the placing of the filler. Good workmanship and adequate supervision are necessary. A correct result is to be secured.

Discussion

Walter Boehle (Barrett Company) emphasized still further the necessity for a distinction between marine wood block floors subjected to constant loads of impact and that the blocks be as hard as dry timbers, must be treated entirely different from those which will be placed to receive or hold loads after being laid.

Other Reports

Dr. A. S. Linschke called first on the effect of the war on the supply of timber of various kinds. Between July and September the consumption of wood in this country was almost as great as in Germany itself. The construction of the war-scarred country is building, reconstructing and shipping at a rate of most extraordinary speed and while this war continued it is a considerable amount with excellent records of January, January, January, the situation was not so serious as it was produced by the war-scarred activities which caused the use of all available timber and wood.

Because of the need for a large amount of material of various other industries have been placed on the different

of yellow pine and fir in the larger sizes for other purposes than ship building. However, in any case where the use of material for special purposes can be shown as a definite need, it has been found possible to secure the release of the necessary material by application to the special branch of the Council of National Defense, or through the lumber associations.

The annual report of the committee on service tests was presented by P. R. Hicks (Forest Products Laboratory). This consisted of a statement of the progress being made in the selection, compilation and tabulation of data on the life of untreated ties and those treated according to various processes.

The condition of creosoted wood block pavements in Mobile, Ala., Shreveport, La., and a number of Texas cities was the subject of a paper presented by C. H. Teesdale (Forest Products Laboratory) who had been commissioned to investigate certain failures of pavements in these cities. His conclusion is that poor workmanship, particularly as to laying and application of fillers, was primarily responsible.

Volume Temperature Correction for Creosote Oil Measurements, a paper by S. R. Church (Barrett Company) and J. M. Weiss was presented by the former. The report of the Committee on Terminology was presented by the secretary and consisted of a glossary of the technical terms used in the wood preserving industry. It was suggested that criticisms or additions to this glossary be submitted to the chairman of the committee.

Other Business

At the closing session on Thursday, the following officers were elected for the ensuing year: President, M. K. Trumbull, vice-president, National Lumber & Creosoting Company, Kansas City, Mo.; first vice-president, J. B. Card, president, Central Creosoting Company, Chicago; second vice-president, A. R. Joyce, Joyce-Watkins Company, Chicago; secretary-treasurer, F. J. Angier, superintendent of timber preservation, Baltimore & Ohio, Baltimore, Md.; members of the executive committee, E. B. Fulks, vice-president, American Tar Products Company, Chicago, and E. T. Howson, engineering editor, *Railway Age*, Chicago. It was voted to hold the next annual convention at St. Louis. The annual dinner was held on Wednesday evening.

BRITISH WAGE DISPUTE SETTLED.—The delegate meeting of the National Union of Railwaymen of England on November 29 agreed to accept a revised offer of the Railway Executive for a flat rate advance of 6s. (\$1.44) per week to men and 3s. (\$0.72) a week to women and youths under 18.

INTERNATIONAL TRADE OF 1917 will show a larger total than in any earlier year, says a bulletin of the National City Bank of New York. In the case of the United States the total trade of the year is estimated at approximately nine billion dollars, against less than four billions in 1913.

TANKS TRAVEL BY TRAIN.—Some interesting details regarding the "railification" of the British front in France were recently given by a special correspondent of the London World. Some of the existing lines, he writes, have been double-tracked and others quadrupled, and "in places the sidings remind one of the big railway junctions in England, as they would look were all the permanent buildings removed and only the lines left." The British Army has added to and improved the rolling stock, and British locomotives from all lines, all painted black, are to be seen everywhere. The trains are described as "interminably long," traveling at a very slow pace, due to the innumerable stops, and the number of mixed consignments handled. The writer adds, "How many people are aware that tanks travel to the front by train?"

Increased Efficiency by Use of Train-Order Form Nineteen

By T. H. Meeks

General Agent of the The American Railway Association, Camp Logan, Texas

NOTWITHSTANDING the wonderful progress that has been made towards more efficient and economical operation of the railroads since the beginning of the world war, the volume of traffic has increased so rapidly and to such extent that innumerable difficulties are still being met in handling it with the degree of promptness and regularity necessary to the successful conduct of the war; and every road must therefore be organized and systematized so as to develop the maximum of efficiency; this in order that it may be utilized to the limit of its possible usefulness. The increase in efficiency that has been accomplished thus far is principally the result of better utilization of motive power, reduction of delays to cars, and better car-loading. The railroads and the people have responded willingly and promptly to this emergency. But a much greater concentration of effort in this direction is necessary to help make the available supply of cars and engines carry the present increased traffic; no road can secure new rolling stock in sufficient quantities to meet the demand.

The greatest item of unnecessary expense, and hindrance to traffic on a busy railroad (I say busy railroad because the loss is more noticeable on trunk lines where the traffic is dense) that apparently has not been dealt with in any far-reaching way is the stopping of trains for dispatchers' orders. This expense and delay could be greatly reduced by curtailing or eliminating the use of train order form 31 (which requires the stopping of trains for the signature of the conductor). The only time it is necessary, from a point of safety, to stop a train for an order is *when execution is required at or in the vicinity of the station at which it is issued.*

The majority of railroads, particularly single track lines, continue the use of form 31 for restricting the superiority of trains. The reason usually advanced is that it is safer than form 19 (which does not require the stopping of trains for the signature of the conductor), although the unrestricted use of form 19 is authorized in the standard code of train rules of The American Railway Association. Its use has proved successful on several railroads which are using it almost exclusively; furthermore, the railroads that are using form 19 for restricting purposes consider it superior to form 31 for the reason that it obviates the following undesirable features in the movement of trains by train order:

- (1) Need of protecting the rear end when trains are stopped (see rule 99);
- (2) Delay in stopping and starting;
- (3) Cost of fuel and water in starting;
- (4) Wear and tear to equipment by stopping and starting;
- (5) The inferior requirements with respect to the delivery of form 31.

Not only is form 31 undesirable in the five particulars just enumerated, but it also causes serious delay to inferior trains at meeting points with superior trains on account of dispatchers (on many railroads) not being permitted to stop through passenger or freight trains, when only a few minutes late, to deliver a 31 order, whereas, a 19 order could be delivered to a superior train without stopping it, and the delay to the inferior train thereby reduced. Reducing delay at meeting points would, in a great many cases, prevent trains from freezing in cold weather, and it would prevent numerous sixteen-hour-law tie-ups which are extremely expensive. Dispatchers have frequently been known to violate

the rules under which they were working, and use form 19 for restricting the superiority of trains, or they would instruct operators to sign the conductor's name to orders (which amounts to the same thing), to avoid excessive delays. Division officers wink at these practices. All of this is conclusive evidence that the procedure under form 19 is preferable for general use.

It is doubtful if a correct calculation of the unnecessary expense and delay incurred through the use of form 31 could be made, but it is obviously enormous, and the needed step should be directed to its elimination.

Issuance of Train Orders

The principal features in the issuance of a train order are the correct receipt and repetition by the operator, and correct check by the dispatcher while it is being repeated to him. In these respects there is no difference between form 19 and form 31.

Delivery of Train Orders

The principal features in the delivery of train orders are

- (1) The proper display of the train order signal.
- (2) Recognition of the signal by trainmen and engine-men.
- (3) Receipt of the order by trainmen and engine-men.

As to point 1 there is no difference between form 19 and form 31. As to the second there is this difference; the operator, in the case of form 31, remains in his office, leaving the recognition of the signal entirely to the men on the train; he is not required to do anything but wait until the conductor reports; while in the case of form 19, he is out on the platform to make personal delivery of the order. He is required to have with him hand signals for the purpose of signaling the approaching train in case the train-order signal should fail or not be properly observed. As to point 3, the operator is an active agent in the delivery of the 19 order and, therefore, there is a greater assurance of delivery. If the order is legibly written and if delivery is made, it is as certain of execution under one form as under the other.

In making delivery of a restricting order to a train at a non-train-order station, or train-order station at which the operator is not on duty, in care of another train, either of the following methods could be adopted for taking receipt for orders thus delivered:

- (1) Form 31 could be used for this purpose.
- (2) A receipt could be taken on the face of form 19 without this form being modified.

(3) A universal form of order could be adopted to take the place of forms 19 and 31 for all purposes, the procedure in making delivery to be the same as with present form 19 except to provide a space for the signature of the conductor or engine-man of trains receiving restricting orders at places other than open train-order stations.

Under the second or third method only one form would be required where two are now required. This would make a saving in stationery and would simplify the handling of trains by train order. Under any of the three methods, the receipt would be turned in at the next train-order office for transmission to the dispatcher, so that the order could be delivered to the inferior train or trains affected.

Where it is not desirable to revise the rules and revolutionize the train order system, form 31 could be used in cases where execution is required at or in the vicinity of the station at which the order is issued, also for orders sent to a train at a non-train-order station (or train-order station at which the operator is not on duty) in care of another train which restricts its superiority or otherwise imposes an obligation.

Where form 19 is used, the clearance card is indispensable. At the beginning of the use of a form that required the signature of the conductor and engine-man (which was later

modified to require only the signature of the conductor) so as to eliminate part of the delay, the clearance card was not used, nor was it necessary, as the signature on the order was sufficient evidence of delivery. When form 19 was promulgated it was then necessary to provide evidence of delivery, hence the clearance card; the conductor and engine-man were required to check the number of the order received against the number shown on the clearance card to ascertain if all had been received.

Relation of Clearance Card to the 19 Order

Some railroads are under a form of clearance card that requires the dispatcher's O. K. before being issued to a train. The operator when asking permission to place a train, is required to report to the dispatcher the nature of the order on the clearance card, and the dispatcher is required to check the number given by the operator against the orders outstanding at that office to insure that none have been omitted; after which he gives the O. K. and the operator then clears the train in the usual manner. It would provide an additional element of safety if clearance cards were numbered by dispatchers, the same as train orders, thereby making it impossible for an operator to properly clear a train without the dispatcher's permission.

This method of handling clearance cards places the responsibility for delivery of orders on both the dispatcher and the operator instead of on the operator only, and deserves careful consideration. If frequent surprise tests were made to keep dispatchers and operators on the alert, the chances for failure to make delivery would be even more remote.

Mexican Railroad Properties in a Ruinous Condition

THAT THE RAILROADS in Mexico are going to rack and ruin is the opinion of an observer sent by the New York Sun into Mexico from Vera Cruz. The first special dispatch sent by this observer from Havana, printed and copyrighted by the Sun in its issue of Tuesday last, paints a picture of Mexico that is thus summarized in the leading paragraph: "Mexico is starving and bleeding to exhaustion. There seems no present hope for its recovery, is she with the idea encouraged by treacherous German propagandists, that the United States is her natural enemy, her negligible because Germany is sure to win the war and will thereafter be Mexico's great and good friend."

The Sun's observer discusses the situation in Mexico from all angles. Concerning the railroads he writes:

"The railroads are in bad shape. None of the rolling stock has been painted since the revolution started, and from the looks of the cars no repairs have been made in years. The Vera Cruz & Pacific is not a question of time, but the railroad of Tehuacan, once now to be taken from Vera Cruz to Puerto Mexico."

"The International American Railroad, which should have been running and no one knows in what way from the line to The Mexican Central line from San Luis to Tampico has been abandoned, it being impossible to get even a military train over it. From Mexico City to Queretaro the Mexican Central is so completely the Mexican National Railway has ceased to exist—nothing remaining but railways and the right of way, the good rails have entirely disappeared."

"From Vera Cruz to Cordoba on the 'Queen of the South' line, the engines are in bad shape, wrecked and burned cars. They operate this line in daylight only, the territory from Vera Cruz to Oquiza being subject to the attacks of raiding bands. The passenger train is piloted by a pilot train of

three box cars and an engine, with 150 soldiers. The train itself carries three more cars of soldiers and there are small garrison posts along the line some fifteen miles apart. In spite of these precautions the train is raided about every ten days.

"The passenger train from Mexico to Laredo carries three box cars of military escort. At Queretaro, in which Gen. Coss and Gen. Luis Gutierrez, with his brother, Gen. Eulalio Gutierrez, one time President of Mexico, recently set up their own revolutionary standard, they add a pilot train with soldiers. At San Luis Potosi they increase the escort and attach an armored train to the rear of the passenger. Thus the train proceeds in to Monterey. That is it does with any kind of luck and if no one has taken up the rails. At present writing some three kilometers of rails have been removed by the revolutionists beyond Saltillo.

"The line from Monterey to Tampico is kept open most of the time. Over this line the fuel oil for the Central Railways is hauled. It is subject to raids by Gen. Juan Andrew Alminiz between Linares and Victoria. Trains run heavily guarded, but the right of way is strewn with wrecked and burned car bodies.

"The railroad shops in Monterey have a small force of men working, but the yards are filled with rusting locomotives, while on sidings in the freight yards stand the gaunt frames of over 800 cars all burned at one time by one of the revolutionary generals.

"There are one or two commission houses and a mining company that have been carrying on business by owning their own trains, locomotives and cars and employing their own crews. In this manner they have succeeded in bringing in supplies over roads on which the national government could not operate trains.

"Early in December one of these privately owned trains was held up near Queretaro by an independent band of bandits. While going through their regular performance of looting the train the bandits came to one car which was securely locked. One of them with an automatic pistol fired into the lock. The car had contained forty tons of dynamite. When the smoke and dust cleared away and things ceased falling the train and some 120 bandits had gone away from there, only a large hole indicating where they had been.

"In spite of such casual losses as this the firms operating their own trains are said to be making money and the bandits continue to flourish."

Work of the Railway Engineers

IN HIS TESTIMONY before the Senate Committee on Military Affairs on Monday, January 28, Secretary of War Baker described in a general way the work of the railway engineering regiments now in France. Secretary Baker said in part:

"In a very short time we had organized engineering regiments of railroad men and sent them over there and were rebuilding railroads which were being carried forward with their advance; reconstructing their broken engines and cars, building new railroads, both back of the French and British lines, and those regiments were of such quality that at the Cambrai assault, carried on by General Byng, when the Germans made their counter attack, our engineer regiments threw down their picks and spades and carried their rifles into the battle and distinguished themselves by gallant action in the war itself.

"It was suggested that further groups of mechanics might be needed. We began to see that we were going to be over there in large force, and the question that then had to be answered was, How will we maintain an army in France? Special studies had to be made of that problem, and this is what they showed: They showed that the railroads and the

facilities of France had during this war been kept in an excellent condition; far better than any supposed possible under war conditions; and yet that those railroads were used to the maximum to take care of the needs of the French and the British themselves, and that when our army became a great army it would be necessary for us to build back of our own line an independent line of communication.

"For instance, the French had naturally reserved the best ports in France for their own supply. The Channel ports have been reserved for the British. When we came in it was necessary for us to have independent ports of entry in order that there might not be confusion and admixture of our supplies, going through these ports of disembarkation with those of other nations. We were given several ports. As you perhaps recall, the ports of France are tidal ports, ports with deep water and tidal basins at high tides, with insufficient water for landing at the docks when the tide is out.

"As a consequence, the construction of docks and wharves in ports of that kind is very much more difficult than where you have a deep sea harbor, and all you need to do is to erect a pile wharf. We have had to build docks, we have had to fabricate in this country and send over dock handling machinery; we have had to send from this country even the piles to build the docks. We have had to have gantry cranes, manufactured in this country, sent over to be erected on those docks; we have had to erect over there warehouses at the ports of disembarkation in order that these vast accumulations of stores and supplies which go over, can be properly housed and cared for, until they can be distributed into the interior.

"We have had to take over and are in process of rebuilding and amplifying a railroad 600 miles long in order to carry our products from our ports of disembarkation to our general bases of operation. And all of that has to be done, not only studied out, as a necessary thing to do, but when so studied out and reported here, the manufactories for those things have to be carried on in this country and the things shipped over there—nails, crossties, spikes, fishplates, engines, cars, buildings.

"That great staff under General Pershing's direction, containing so many men from the American army enriched by captains of industry and masters of technical performance in this country, all of these large industrial operations under general direction, such as the railroad and dock buildings, under a former vice-president and now a vice-president perhaps of the Pennsylvania Railroad. Atterbury and men of that quality and experience, summoned in to aid him—those are the men who are carrying forward these operations, which are quite as expensive as those which are carried on over here, and of far greater difficulty, because it means getting material by cable as to sizes and specifications, having it fabricated here and sent across through those infested 3,000 miles of ocean and then set up on that side."

WHERE U. S. COAL WENT IN 1917.—Of the 52 million tons of coal passing out of the United States in the fiscal year 1917, over 17 millions went to Canada, while another 8 millions passed into the bunkers of vessels engaged in foreign trade. This 17½ millions exported to Canada is the largest in the history of our trade with that country, and is valued at \$58,000,000, about one-fourth of the quantity being anthracite. Italy ranks second in the list of countries to which we export, the total to Italy in 1916 being nearly 3 million tons. Cuba ranks third, the exports to that island being about 1½ million tons in 1917; Panama about one-half million tons, most of which, however, is for the coaling station at that point; Argentina and Brazil about three-fourths of a million tons each, and Uruguay 100 thousand tons.—*Bulletin of the National City Bank of New York.*

General News Department

Serious Results of Storms in New York
Pennsylvania, West Virginia and Elsewhere

The Pennsylvania Turnpike, by Monday, the 2nd, was almost shut in the most difficult matter of the morning, more than 100,000 things in any way since the time cars were taken the riding of traffic was only a fraction of what it is today. Thousands of trains were stalled all along the line between Philadelphia and Pittsburgh; and near Galveston, Tex., over 1,000 cars were in the straitened of its origin. Even at the Frankfort, Ky., bridge, Philadelphia, train movements were virtually hampered by the impossibility of securing enough men to keep the trains in the moving order. On Monday afternoon all through the morning from Philadelphia were stalled. On Tuesday evening the road issued a statement which said:

"A force of 1,000 men was kept on duty in clearing the running tracks, sidings and yards at the main yard till on Monday. About 2,500 of the extra force of men showed up were extra men hired for the day. The contractor employed track laborers, carpenters, plumbers and electricians and other employees pressed into emergency duty. Several hundred supervisors, assistant supervisors, foremen and yard men formed out as extra force. They take charge of the men clearing gates

REVENUES AND EXPENSES OF RAILWAYS

ELEVEN MONTHS CALENDAR YEAR 1917

The Winter Is Half Through

F. D. Underwood, president of the Erie Railroad Company, last week issued an appeal to officers and employees, in which he said:

"Weather and other conditions on the Erie Railroad have resulted in conditions that inflict hardships on officers and employees of every grade. By comparison, however, the hardest lot of any man on the railroad is light compared with that of your fellows in the army abroad. We are less than manly when we grumble at conditions here. Let us anew apply ourselves to the work before us, regardless of any personal discomfort. The winter is half through. Do not lie down for a minute. Conditions must be better in a short time.

"Especially guard against the error that has found voice that, now that the Government has taken over the railroads, a lesser effort on the part of employees will go. The direction of railroads remains in the hands of its officers, and they have the right to demand from every loyal employee full support. Your responsibilities to them and to the Erie Railroad are in no way lessened.

"If we allow the work to lag we are not only unworthy American citizens, but are doing a direct injury to our brothers abroad. * * *

Inductive Interference by Parallel Power Circuits

This is a subject on which very little exact data is available, but which is of considerable importance to men who have to lay out power circuits which parallel communication circuits, and conversely to men who have to lay out communication circuits which parallel power circuits.

Since December, 1912, the California Railroad Commission, through the joint committee on Inductive Interference, has carried on an exhaustive investigation of the problem of inductive interference to communication circuits by parallel power circuits; and after five years' work the joint committee has completed its task at a cost of over \$100,000, this expenditure having been borne jointly by the commission and the interested power and communication utilities. The subject is of particular interest to the signal, telephone and telegraph departments of railroads. There have been many requests for copies of the report, and the commission is considering the publication in book form of the most important data. It will go ahead with the work if a sufficient number of subscriptions can be obtained in advance to warrant the necessary outlay. Information can be obtained from Richard Sachse, chief engineer, California Railroad Commission, 833 Market street, San Francisco, Cal.

Railway Business Association

The dinner of the Railway Business Association, which was to have been held on January 25, and the postponement of which has already been announced, has been definitely cancelled by the General Executive Committee and subscriptions have been refunded. It was decided to hold a business convention, without public dinner, on a date yet to be fixed.

Engineering Institute of Canada

This is now the name of the former Canadian Society of Civil Engineers, the change having been made at the annual meeting in Montreal, January 24. The president for the ensuing year is H. H. Vaughan, vice president and managing director of the Dominion Bridge Company.

Meetings and Conventions

The following gives names of secretaries, dates of next or regular meetings and places. Meetings of these associations which will meet during the next three months.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next annual meeting, March 20-22, 1918, Chicago.

NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, 149 Peoples Gas Bldg., Chicago. Annual exhibition, March 18-21, 1918, Coliseum and Annex, Chicago.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next meeting, March 18, Chicago.

Traffic News

J. A. Middleton, formerly freight traffic manager of the Missouri Pacific, has been appointed in charge of the oil traffic of the United States Food Administration.

The enlarged Erie Canal is expected to be open for traffic from Lake Erie to the Hudson river on May 15, next. Frank M. Williams, state engineer of New York, in his annual report, says that it is urgently necessary that the government take action looking to the construction of barges for use on the canal. A large amount of work still remains to be done on the canal in the vicinity of Rochester.

To induce farm settlement in the Dakotas and Montana and thereby increase agricultural production next season, the St. Paul will make low homeseekers' rates to those states, beginning in March and continuing until November. These fares will be in effect every Tuesday. In past years the homeseekers' rates have been in effect only on the first and third Tuesdays of each month, and last year did not become effective before May.

The Interstate Commerce Commission Wednesday announced its decision in the Transcontinental Commodity Rate cases, allowing increases in rates to Pacific Coast terminals. Because of the temporary absence of water competition the order issued is substitute for the order of June 30 last year, which was suspended pending investigation of tariffs filed by railroads, which are now approved in some particulars, but ordered modified in others.

The volume of parcel post business in the month of December was greater than in the same month of 1916 by 1,173,000 sacks. The Post Office Department reports that in order to relieve the railroads, parcels are being sent from New York to Norfolk, Va., by steamer. The time is 19½ hours, but, it is said, this time, under present conditions, is faster than by railroad. Throughout the United States the parcel post traffic has been greatly increased because of delays to freight by embargoes and by adverse weather conditions.

The Pennsylvania Railroad reports that the reductions in passenger train service put into effect on its lines on January 6,—104 trains week days and 51 on Sundays—amount to an aggregate of 2,708,212 train miles annually. The number of enginemen thus released equals 55 men each day, and of firemen the same; and a corresponding number of conductors and brakemen. Of the 29 locomotives released, only a part are available for use in the freight service as some of the company's passenger engines were urgently in need of repairs. Thirty-five lines of parlor and sleeping cars were discontinued.

In an article in this column on January 18 regarding the discontinuance of freight solicitation, it was stated that the Texas & Pacific, the International & Great Northern and the St. Louis Southwestern closed their traffic offices in Chicago. As a matter of fact, these roads did not close their offices but merely discontinued solicitation for a short time. Their agents are again "doing business as usual." The Buffalo, Rochester & Pittsburgh announces that its freight agencies at Cincinnati, Ohio, and Detroit, Mich., have been closed. The Missouri & North Arkansas has closed its traffic offices at Joplin, Mo., Helena, Ark., and Wichita, Kan., New Orleans, La., and Chicago.

An Appeal to Work on Mondays

In order to encourage the loading and unloading of freight cars in the Chicago terminal district on the coalless holidays the following advertisement was published in Chicago newspapers on January 27:

"Shippers and receivers of freight in the Chicago district and adjacent towns can assist railroad transportation by using every man who can be employed to unload and free freight cars on next Monday and on following Monday holidays. This in accordance with the wishes of the Fuel Administration. If these

ments must necessarily be considered in making the assessment, other benefits resulting to the company or its property because of the improved conditions of land adjacent to the district or because of any other resulting advantages which it enjoys in common with the general public are too remote and intangible to be made a basis of levying assessments.—*C. & N. W. v. Board of Supervisors (Iowa)* 165 N. W. 390. Decided December 18, 1917.

Switchman's Assumption of Risk at Curves

A foreman switchman sued for injuries received while moving a car on a spur track. The track ran alongside a coal bin and was some four feet away from it, though at one point there was a 30-degree curve, where the middle part of the car swung much closer to it. The plaintiff was standing at such a spot that, in spite of the efforts of the trainmen when they saw his danger, he was caught between the car and the bin. The Missouri Supreme Court held that as there was nothing in the evidence to indicate that the railroad did not do its best consistently with successful operation in the location and construction of the spur track in question, it would be presumed that it did. A railroad is not required so to construct a track in relation to the physical features of the industry served that switching would be absolutely safe even to careless employees. A switchman of 19 years' experience would be held to know that, in a case like this, the body of a car moves towards the inside of a curve. The plaintiff was held negligent in assuming the position of danger and unnecessarily remaining after his reason for taking it had ceased; he owed the railroad the duty to suggest a change in the track if one was necessary, and if he did not he assumed the risk.—*Morris v. Pryor (Mo.)*, 198 S. W., 817. Decided November 17, 1917. Rehearing denied December 1, 1917.

Contracts as to Fencing and Cattle Guards

The deed of a right of way to a railroad provided that the grantor should erect and maintain all necessary fencing and the railroad should make proper crossings and cow gaps. Under the Kentucky statute the landowner would have had to construct and maintain the fence on one-half of the division line, and cattle guards were required to be maintained by the railroad company "at all terminal points of fences constructed along the lines," except that where there was a private passage across the right of way, the landowner should bear one-half of the expense. The Kentucky Court of Appeals holds that the fencing required to be constructed under the contract was such as both parties would have been required to construct and maintain by statute, except for the contract, and the cattle guards which the railroad obligated itself to maintain were such as the statute put on it the duty to provide. The company was under no duty to construct or maintain cattle guards until the landowner had constructed a fence on each side of the right of way. The construction and maintenance of fences and cattle guards went together.—*Louisville & Nashville v. Durbin (Ky.)*, 198 S. W., 908. Decided December 11, 1917.

Validity of Leases by Railroads

A lease from a railroad company of a portion of land to be used for storing ties provided as part of the consideration that the lessee released all claim for damages on account of fire caused by the operation of the railroad on or near the premises, whether the damage occurred on the premises leased or on premises adjacent thereto. A spark from a locomotive on a spur track closely adjacent to the track extending into the leased land set fire to and destroyed certain ties. The Illinois Supreme Court holds that the lease was not invalid as against public policy; the use of the land leased for storage purposes not being a public utility. A "public utility" must be such a use as is common and has the same terms, however few the number who avail themselves of it, though it may be limited to the inhabitants of a small locality. And the act of a railroad company in leasing land used as part of its right of way cannot be attacked as ultra vires on the ground that the land cannot be held by it for such purpose by any party except the state, whether the real estate has been acquired for the authorized uses or not. Judgment for defendant was affirmed.—*Bartee Tie Co. v.*

Jackson (C. & E. I.) 117 N. E. 1007. Decided December 19, 1917.

Carrying State Officers Free

In an action involving consideration of the constitutionality of a New Jersey statute of 1915, requiring railroad companies to carry certain state officers and employees free, the New Jersey Court of Errors and Appeals holds that even though the state, in the railroad's charter reserved the right to amend, alter, or repeal the charter, it cannot by virtue of such right impose on the railroad company the burden of carrying free of charge state officers; for that works a deprivation of the railroad's property without due process of law.—*Napier v. D. L. & W. (N. J.)* 102 Atl. 444. Decided November 19, 1917.

Warning of Low Bridge

In an action for the death of a freight brakeman, there was evidence to show that he was found dead on the coal heap of the engine, and it was alleged his head had been crushed by an overhead bridge, five of which the train had passed under. The first four bridges were eliminated on account of their height, and it was a question for the jury whether the last bridge struck the deceased. It appeared that the middle span of the last bridge was considerably lower than the two side spans, and because of its blackened condition, that fact could not be seen until an observer was very close. It was held that an instruction that if the brakeman was struck and killed by the bridge, then the question for determination was whether he was warned by the company of his danger, and that the warning did not have to be in writing, or any formal warning by this or that officer, it being sufficient if he was given all the knowledge that the company could give him, properly submitted the question of warning to the jury. It was also held that though the company had provided telltales, it could not as a matter of law be declared that such safeguards were in themselves sufficient notice and warning.—*Marland v. P. & R.* 246 Fed., 91. Decided November 7, 1917.

Reparation for Unreasonable Freight Rates

In consolidated actions by a shipper of live stock against several railroads to recover from each of them the amount awarded the plaintiff by an order of reparation made by the Interstate Commerce Commission awarding damages for exaction of unreasonable freight rates, the Circuit Court of Appeals, Eighth Circuit, in reversing a judgment for the plaintiff in the Federal District Court for the Western District of Missouri, made the following rulings:

While the commission in making investigations should not be too narrowly constrained by the technical rules as to the admissibility of proof, nor hampered by those narrow rules which prevail in trials at common law, yet, by reason of the liberality of practice in admitting testimony, it is more imperative to preserve the essential rules of evidence by which rights are asserted or defended, and the commissions cannot act on their own information, but the parties must be fully apprised of the evidence submitted and be given an opportunity to cross-examine witnesses, inspect documents, and offer evidence in explanation. Administrative orders, quasi judicial in character, are void if hearing was denied, if that granted was inadequate or manifestly unfair; if the finding was contrary to the indisputable character of the evidence or if the facts do not support the order. An order of the commission based on a finding unsupported by evidence is contrary to law and must be set aside by a court of competent jurisdiction. An order of reparation, awarding damages for unreasonable rates, requires a finding disclosing the relation of the parties as shipper and carrier, the character and amount of traffic out of which the claims arose, the rates paid, whether they were unreasonable, and whether the shipper was injured, and if so the amount of his damage. Testimony that the witness had obtained from commission houses to which cattle had been consigned and from individuals not shown to be the owners of cattle is the worst kind of hearsay.

Under section 15, it is held improper for the commission, having ordered reduced rates for a period of two years, to order reparation solely on account of the previous exaction of higher

Supply Trade News

P. M. Wagstaff has been appointed railroad representative for the Onondaga Steel Company, Inc., Syracuse, N. Y.

Charles S. Bilyeu, who recently became associated with the Gulick-Henderson Company, New York, has been appointed assistant to the president.

F. A. Driver, for many years a director of the Driver-Harris Wire Company and identified with the company since its inception, died January 21 at the age of 82 years.

R. P. Lamont, president of the American Steel Foundries, with office at Chicago, Ill., has been commissioned a lieutenant-colonel by the War Department and appointed assistant chief of the procurement division of the ordnance department and has reported to Washington for duty.

Ralph F. Tillman has been elected vice-president of the Wine Railway Appliance Company, Toledo, Ohio, in charge of western sales with headquarters in Chicago, effective February 1. **W. F. Creman** has been appointed assistant to the president of the company in charge of eastern sales with headquarters in Wilkes-Barre, Pa., also effective February 1.

At the meeting of the board of directors of the Union Steel Casting Company, Pittsburgh, Pa., **C. C. Smith**, formerly president of the company, was elected chairman of the board of directors. **J. P. Allen**, formerly vice-president, was elected president. The remaining officers of the company were re-elected as follows: **S. H. Church**, vice-president; **G. W. Eisenbeis**, treasurer; **W. C. Eichenlaub**, secretary, and **J. B. Henry**, general superintendent.

Charles D. Jenks, who has been the active business executive of Edwin S. Woods & Co., Chicago, has severed his connection with that concern, effective January 31, having been elected president and a director of the Damascus Brake Beam Company, with headquarters in Cleveland, Ohio. He was formerly in the operating and sales department of the Pressed Steel Car Company at Pittsburgh, Pa., and Chicago, and western sales manager for the Standard Coupler Company, leaving the latter concern in 1912 to go with Edwin S. Woods & Co. In his new position as president of the Damascus Brake Beam Company he will assume the active management of the operation and sales department.

C. D. Jenks

Cameron C. Smith, chairman of the board of the Union Steel Casting Company, Pittsburgh, was on January 15 appointed Major Ordnance Reserve Corps, and has been assigned to the Production Department, Carriage Division of the Ordnance Department of the U. S. Army, with headquarters in Washington. Mr. Smith was born in Clinton Township, Butler County, Pa., April 2, 1861. His first position was as stenographer in the office of Wilson Walker & Co., iron and steel manufacturers of Pittsburgh, Pa. He was with them ten years, during which time it was merged into the Carnegie, Phipps & Co., and then into the Carnegie Steel Company. He left the employ of the Carnegie Steel Company in 1893, and accepted a position with the Reliance Steel Casting Co., of Pittsburgh, being with them six years, when in 1899 he withdrew to organize the Union Steel Casting

Company, of Pittsburgh, Pa. He was secretary and general manager during the first year of the existence of the Union Steel Casting Company, and in 1900 was elected president, which position he has held until January 26, 1918, when he was elected chairman of the board of directors.

W. H. Lovekin has been appointed assistant to the president of the Locomotive Feed Water Heater Company, effective January 1, 1918. Mr. Lovekin has been with the company since June, 1916. He was born in Philadelphia, Pa., and received his education in the public schools of that place, Haverford Preparatory School and Princeton University. He started his business career in the banking house of the Logan Trust Company, of Philadelphia. Later he accepted a position on the staff of the Bureau of Municipal Research of Philadelphia. On leaving the Bureau of Municipal Research he entered the sales department of R. J. Crozier & Co., of Philadelphia, where because of special qualifications he was shortly assigned to the railroad field. This position as sales representative in the railroad field brought him into intimate contact with railroad men. On June 1, 1916, he entered the service of the Locomotive Feed Water Heater Company as special representative. In this capacity he was intimately connected with the development of feed water heaters for locomotives and ships. In April of this year he was made assistant to vice president from which position he is now promoted.

W. H. Lovekin

Waldo H. Marshall to Assist Colonel

Tripp in Ordnance Department

Waldo H. Marshall, formerly president of the American Locomotive Company, and now associated with J. P. Morgan & Co., has been appointed assistant chief of the Division of Production of the Ordnance Department.

Colonel Guy E. Tripp, chief of that department, in announcing the appointment Tuesday, said:

"Mr. Marshall's wide experience in manufacturing and recognized ability to solve various production problems will be, it is felt, of great advantage to that division. His appointment marks another step forward in the recently adopted policy of appointing civilians to important posts in the War Department."

Mr. Marshall was on the staff of Edward R. Stettinius (now Surveyor General of Supplies in the War Department) in the munitions department of J. P. Morgan & Co. Born in 1864, Mr. Marshall began his business life as a railroad man. He became assistant superintendent of motive power for the Chicago & North Western in 1897; was appointed superintendent of motive power for the Lake Shore & Michigan Southern in 1899; was made general superintendent of that road in 1902, and general manager in 1903, his jurisdiction extending also over the Lake Erie & Western and the Indiana, Illinois and Iowa. In 1906, he was elected president of the American Locomotive Company.

U. S. FOREIGN TRADE RECORD OF 1917.—In foreign commerce the year 1917, says a bulletin of the National City Bank of New York, far exceeds in value of merchandise imported or exported that of any earlier year. Total imports for the full calendar year 1917, according to the bank's statement, are 60 per cent greater in value than in 1913 and exports of domestic products 150 per cent, greater in value than those of 1913. The total foreign trade of the country is estimated in very round terms at 9 billion dollars in 1917 against 4¼ billion dollars in 1913, the total of imports and exports combined being thus more than double in 1917 that of 1913.

catine, Burlington & Southern with office at Muscatine, Iowa, and was later made president and general manager, which position he resigned to take the position noted above.

E. L. Bock, superintendent of the Huntington division of the Chesapeake & Ohio, with office at Huntington, W. Va., has been appointed assistant general superintendent of the Western general division and the C. & O. Northern, with headquarters at Huntington; **F. L. Fletcher**, superintendent of terminals at Louisville, Ky., has been appointed superintendent of the Huntington division, with office at Huntington, W. Va., vice Mr. Bock; **H. T. Brown**, trainmaster at Huntington, has been appointed assistant superintendent of the Cincinnati division and the C. & O. Northern, with headquarters at Russell, Ky. **C. A. Pennington**, assistant superintendent, with office at Huntington, W. Va., has been appointed superintendent of the Louisville & Jeffersonville Bridge & Railroad Company, with office at Louisville, Ky., vice **F. L. Fletcher**, and the office of assistant superintendent of the Huntington division has been discontinued.

J. A. Shepherd, whose appointment as superintendent of the Green river division of the Denver & Rio Grande with headquarters at Helper, Utah, was announced in these columns on January 18, was born at Homer, Ill., on April 21, 1874. He entered railway service in August, 1893, with the Wabash, serving as operator, despatcher and chief despatcher until December, 1901. From January, 1902, until March, 1904, he was superintendent on the Western Maryland at Hagerstown, Md.; and from March, 1904, to January, 1905, assistant superintendent of the Terminal Railroad Association at St. Louis, Mo. On the latter date he was appointed superintendent on the Western Maryland at Baltimore, Md., and in April, 1911, he was promoted to general manager, in which capacity he remained until January, 1913, when he became superintendent of terminals on the Missouri Pacific at Kansas City, Mo. In November, 1916, he went to New Orleans, La., to become general manager of the Trans-Mississippi Terminal. In November, 1917, he entered the service of the Denver & Rio Grande as assistant superintendent at Helper, Utah, which position he held until January 1, when his appointment as noted above became effective.

Austin Edward Wallace, Jr., who has been appointed general superintendent of the Chicago and Marion divisions of the Erie, with headquarters at Chicago, as has already been announced in these columns, was born March 3, 1879, at Nashua, N. H., and was educated at Harvard University. He began railway work in November, 1902, and served consecutively as clerk and timekeeper on the Great Northern at Larimore, N. D., until January, 1904, when he became yard clerk on the Chicago, Rock Island & Pacific, and subsequently served first as timekeeper and then as chief clerk to superintendent at Cedar Rapids, Iowa, on the same road. In January, 1907, he went to the Chicago, Burlington & Quincy as special inspector at Alliance, Neb., and from September, 1909, to February, 1911, he served successively as assistant extra gang foreman, foreman, assistant roadmaster, assistant trainmaster and trainmaster. From February to September, 1911, he was special inspector, with headquarters at Chicago. He then served on the staff of the second vice-president at Chicago, and later as assistant superintendent, with office at St. Paul, Minn., on the same road. In July, 1912, he returned to the service of the Chicago, Rock Island & Pacific as superintendent, with office at Cedar Rapids, Iowa, and in February, 1913, he was transferred in the same capacity to Manly, Iowa, which position he held until his recent appointment as general superintendent of the Chicago and Marion divisions of the Erie as above noted.

Traffic

J. J. Lane, local freight agent of the Delaware, Lackawanna & Western at Newark, N. J., has been appointed division freight agent, with headquarters at Newark.

R. L. Gohmert has been appointed assistant general freight agent of the San Antonio, Uvalde & Gulf with office at San Antonio, Texas, vice **J. L. McDonald**, resigned.

Edward T. Campbell, general traffic manager of the Erie, with office at Chicago, has been assigned to special duty, reporting to the president, with headquarters at New York.

J. F. Gavin was appointed general freight and passenger agent of the Kansas City Northwestern with headquarters at Kansas City, Kan., succeeding **E. H. Campbell**, promoted, effective January 24.

W. H. Ward, chief of Tariff Bureau of the Indiana Harbor Belt at Chicago has been promoted to general freight agent, succeeding **J. W. Bingham**, resigned to become traffic manager of the Corn Products Refining Company, Chicago, with headquarters at Chicago.

Engineering and Rolling Stock

C. U. Irvine has been appointed division engineer of the Southern Railway in Mississippi, with headquarters at Columbus, Miss., vice, **W. F. McDade**, resigned.

L. B. Allen, general superintendent of the Chesapeake & Ohio, at Huntington, W. Va., has been appointed superintendent maintenance of way, with office at Huntington.

H. Stringfellow, assistant engineer of the Southern Railway, with office at Eutaw, Ala., has been promoted to district engineer, with headquarters at Lexington, Ky., succeeding **H. P. Mehler**, assigned to other duties.

William Snell, district general car foreman of the Chicago, Milwaukee & St. Paul, with headquarters at Minneapolis, Minn., has been transferred to the newly created position of the same rank at the Chicago terminal, effective February 1.

W. E. Burkhalter has been appointed acting division engineer of the St. Louis division of the Mobile & Ohio, with headquarters at Murphysboro, Ill., Vice, **J. L. Cummings** who has been appointed acting bridge engineer with office at Mobile, Ala., vice **H. Austill** furloughed to enter military service and **S. F. Ryan** has been appointed acting assistant engineer with office at Mobile, vice **L. P. O. Exley** assigned to other duties.

L. K. Sillcox, mechanical engineer of the Illinois Central in charge of car work, has been appointed master car builder of the Chicago, Milwaukee & St. Paul, with headquarters at Milwaukee, Wis., effective February 1. He was born at Germantown, Pa., on April 30, 1886, and was educated at Trinity School, New York, and the Mechanical & Electrical Institute of Brussels. He entered railway service in 1903 as an apprentice in the High Bridge shops of the New York Central, leaving there in 1906 to go with the McSherry Manufacturing Company at Middletown, Ohio. He resigned from that company as assistant shop superintendent in 1909 to become shop engineer of the Canadian Car & Foundry Company at Montreal. He left his position with the latter company in 1912 to become mechanical engineer of the Canadian Northern. In 1916 he was appointed to a similar position with the Illinois Central in charge of car work, from which he resigned to accept the appointment as noted above.

Railway Officers in Military Service

W. H. Wharton, commercial agent of the Nashville, Chattanooga & St. Louis at Chicago, has been commissioned first lieutenant in the ordnance department of the United States army for transportation work.

Obituary

W. A. Newell, commercial agent of the St. Louis Southwestern at Chicago, Ill., died in that city on January 23.

Carlton Hillyer, formerly from 1870 to 1914, auditor of the Georgia Railroad, died at Augusta, Ga., on January 17, at the age of 74.

C. A. McLeod, vice-dean of the faculty of applied science of McGill University at Montreal, Que., died in that city on December 26. He was professor of geodesy and surveying and had charge of McGill Observatory. He was born at Strathorn, Cape Breton, N. B., in 1851, and his first engineering work was done while in charge of section construction on the Intercolonial, following which he was resident engineer on construction of the Prince Edward Island. He was charter member of the Canadian Society of Civil Engineers and served as secretary for twenty-five years, holding that position at the time of his death.

EDITORIAL

Railway Age

By way of expressing their disappointment that the Railroad Wage Commission apparently does not intend to consider their "request" or "demand" or "proposition" for increased wages entirely as an ex parte proceeding, W. G. Lee, president of the Brotherhood of Railroad Trainmen, and A. B. Garretson, president of the Order of Railway Conductors, at the hearing Tuesday charged railroad officers with "laying down" and deliberate inefficiency in an effort to make a failure of government control of railroads and to increase the overtime payments to discredit the Adamson eight hour law. It is easy to make such general charges unsubstantiated by any facts and they would not be taken seriously for a moment if it were not for the effect they may have on those who are as uninformed about the railway situation as they are about the character of the men who make such charges. If they were intended as a barrage fire to protect the charge being made by the brotherhoods on the Government's treasury they had an effect. They kept most of the newspapers from reporting the fact that Mr. Lee and Mr. Garretson are showing their patriotic desire to co-operate with the government by increasing the demands they had previously presented to the railroads by a new demand for time and one-half for overtime, just as it was predicted they would do when they withdrew a similar demand at the request of the President at the time of the eight-hour controversy. Without attributing to railroad officers any more than their fair share of patriotism it is perfectly evident that any effort on their part to discredit government control by any failure to do their best would be the most short-sighted kind of policy, sure to react on railroads themselves, and the Adamson law is not now an issue. Mr. Garretson said that employees are "not engaged in giving a demonstration of what a failure government operation is," but some of their leaders are giving demonstrations that loyal employees ought to resent and they doubtless will do so until the charges are either proved or retracted.

The opportunities of the railroads for getting good deliveries on new freight cars was called attention to in the January 4 issue of the *Railway Age*. During the past month no cars have been ordered by the railroads and of inquiries for about 2,500 cars only 1,125 have come from railroads. While at present every railroad man's attention is taken up with the severe congestion due to a lack of sufficient motive power, thought must be given to the car situation eight or ten months hence. There are about 2,600,000 freight cars in service on the railroads today. Assuming 15 years to be the average life of a car, there will be required about 173,000 cars for replacements alone, to say nothing of increased business requirements. During the past 17 years, over which period records have been kept, the number of cars ordered amounted to 2,784,662 or 163,803 cars per year. During the past five years the average number ordered amounted to 117,242 or 46,561 less than the average. This shows that our railways have for five years been short of new cars. Something must be done, and be done quickly, to make up this deficit. The car builders were never in a better condition to supply equipment than at the present. At the first of the year there

were about 40,000 cars on order for completion. Working at maximum capacity, this number should be completed within the next two or three weeks. Under ordinary conditions it takes about three months before deliveries are made after the order is placed. At present it might take longer, so that cars ordered now probably cannot be delivered before the early summer. If they are not ordered now and all road delay taking action until summer the demands will be greater than the car builders can meet. It is far better from a purely economic standpoint—and the economic situation is vital to the country at the present time—to place the orders now, so that the builders will be permitted to regulate their output and systematize their forces so that an even, efficient production can be made. The matter cannot safely be overlooked. The power situation bids fair to improve materially within the next three months because of new locomotives being received. If the railroads are not careful, a car shortage will be as serious next fall and winter as the locomotive shortage is today. Order the cars now and do not let it be said nine months hence that a lack of foresight precipitated a great car shortage.

A note in the *Railway Age* of January 4 announced that four Spanish railways, the Northern, The Madrid, Saragosa & Alicante; the Andalusian, and the Madrid-Caceres had joined in a venture to make locomotives. There is more behind this announcement than was at first apparent. These four companies will help raise about \$5,000,000 for the extension of a large machine shop in Barcelona, "La Maquinista Terrestre y Maritima" to enable it to build locomotives now very badly needed in Spain. The Spanish railway situation is exceedingly bad. The locomotives and cars of many of the roads, and particularly those of the Northern Railway, were considerably damaged in the two recent severe strikes and ill-usage has further added to their deterioration. Material for repairs are next to impossible to obtain, it has become exceedingly difficult to get good coal, and to cap the climax there is a much greater traffic to handle than usual. The last is the result of the withdrawal of coastwise shipping for other purposes and an increased traffic in Spanish mined coal. The difficulty of obtaining coal from England has made it necessary to rely on the inferior Spanish coal, but even that has not been sufficient, and there is now a severe coal shortage. None of the railways has a month's supply on hand, and shipping rates are so high that coal is to be obtained from England only at a price in Spain of no less than \$85 a ton. The Madrid, Saragosa & Alicante, which owns its own mines, is unable to produce a sufficient supply and its average price for coal in 1917 approached \$25 a ton. Naturally, passenger service has been reduced wherever possible, but that has not been sufficient. The new plant mentioned above is expected to be able to supply the entire demands of the Spanish railways. Some years ago the same interests embarked on a similar project but had completed only 15 locomotives—the only locomotives ever produced in Spain—when German competition put an end to further progress. In fact, the Northern and the Madrid, Saragosa & Alicante alone imported 915 German engines from 1910 to 1913 and German locomotives held control over the market. The progress of this new locomotive building venture

Order Cars Now for the Future

will be watched with interest in America. We, too, have essayed to sell locomotives in Spain and have received orders for 87 since the beginning of the war, the principal orders including 25 twelve-wheel locomotives for the Madrid, Saragossa & Alicante in 1915; 15 Mikados for the Northern Railway in 1916 and 40 Mikados also for the latter road in 1917. Spain has about 2,500 locomotives and 50,000 freight cars. American railway supply houses can undoubtedly look forward to doing a business in this market in the future, but they will not be able to make the most of their opportunities there until the shipping situation improves.

The Screw Spike Situation

THE PUBLICATIONS of the American Railway Engineering Association contain two very interesting and instructive articles on the use of screw spikes in track construction. In bulletin No. 175, dated March, 1915, G. J. Ray, chief engineer of the Delaware, Lackawanna & Western, described the experience of that road with screw spikes after observing the results with over 12,000,000 screw spikes in service for periods up to five years, and stated that "as a whole, the screw spike installation has proved very satisfactory, and no conditions have developed such as to cause any doubt about the ultimate success of the undertaking." In bulletin No. 200, dated October, 1917, and issued within the last month, W. C. Cushing, chief engineer maintenance of way of the Southwest System, Pennsylvania Lines, outlined the results of experiments which have been conducted by the Pennsylvania under the direction of a committee of the chief engineers of the constituent lines of the system. In this bulletin the committee reports that "screw spikes have no advantage over nail spikes."

This marked conflict in ideas regarding as important an item of track construction as screw spikes deserves careful consideration. In the first report the conclusions were drawn after extensive service with large numbers of spikes in tracks carrying a heavy traffic. The more recent report of the Pennsylvania is based on studies of limited installations, but it carries much weight because of the long established reputation of this road for the thoroughness of its tests.

Before undertaking to discuss the conflict in these conclusions, it is well to note the results which are being secured on the roads which are using screw spikes in the largest numbers. The Lackawanna is the largest user of screw spikes, having employed them exclusively on new construction as well as on maintenance work for several years and now has approximately 17,000,000 of them in service in connection with about 7,000,000 flat bottom tieplates. With three years additional service since the original report was written, no defects have come to light which would lead the officers of that road to change in any way the conclusions published in 1915. The New York, New Haven & Hartford started with an experimental mile of screw spike track in 1907, and has since extended the use of this fastening on the four and six-track main line between New York and New Haven until over 300 track miles are now laid with this form of construction, with tieplates and creosoted ties. A report from this road states that "so far the screw spikes have been entirely satisfactory." The Atchison, Topeka & Santa Fe is another road which has had an extensive mileage of screw spike track in service for periods up to ten years, and while the officers of this road do not feel that their use has progressed far enough to warrant a final conclusion, it is stated that up to the present time none of this track has developed the results shown by the Pennsylvania. The experience of these three roads, which have used screw spikes in the largest numbers, does not therefore bear out the conclusions reached by the Pennsylvania in its tests.

Railway engineers have had two objects in mind in considering screw spikes—their service as track fastenings, and

their effect in reducing the destruction of the ties. While their function as track fastenings is of primary importance, their economy comes about primarily because of their protection of the ties from the destructive action of the ordinary cut or nail spikes. The Pennsylvania appears not to have considered this advantage of the screw spike as it confined its report almost entirely to the service secured as a track fastening in spite of the fact that it is the other object which has led to the introduction of the screw spike in most instances. The Santa Fe has been a pioneer in the use of screw spikes and in the treatment of ties in this country, and has a larger number of treated ties in the track than any other road. It has likewise given more careful study to the causes leading to the destruction of ties. In common with other roads it soon found that ties can be treated against decay to give them a life far beyond their ordinary mechanical life, which is limited by the deterioration about the rail seat caused by nail spikes and the cutting of the rail. The screw spike and the flat bottom tie plate of ample dimensions have been developed to arrest this deterioration and to give to the tie a mechanical life equal to its resistance to decay. By ignoring this condition, which led to the original introduction of the screw spike, it is not surprising that the Pennsylvania arrived at the conclusion presented in the recent report. In fact, it is doubtful if the screw spike would ever have received serious attention on any road if its efficiency as a track fastening was the only consideration involved.

We hold no brief for the screw spike, but we do not believe that it should be discarded on the strength of the tests made on the Pennsylvania which, while conducted with care, were limited in scope as compared with the extensive service which the screw spike has rendered on other roads. The continually increasing cost of ties makes necessary the adoption of all practical means for increasing their life, because of the reduction which can be effected in the outlay for ties, the duty of the railways to assist in conserving the supply of timber, and the saving in labor which results from less frequent tie renewals. The screw spike requires a more expensive form of track construction than the cut spike. For this reason, its use is probably limited at present to those lines of heavy traffic where the destruction of the track is the greatest and the cost of maintenance correspondingly heavy. It is entirely possible that the further development of track construction may lead to important modifications of the screw spike, or to its entire replacement with some more suitable device. At the present time, however, it possesses certain advantages which warrant serious consideration by railroads of the class just mentioned.

Making a Revolution While You Wait

DID ANY MAN ever completely change, his mental attitude and the habits of a life-time on a day's notice? Books dealing with religious experience tell us of such cases. But they are very rare. Converts often revert to their original condition of weakness and sin, simply because habit in most adult folks is so strong that it is almost impossible to overcome it.

All the officers of all the railways of these United States are now being asked to do this thing which most people find impossible. They have been taught and forced throughout their business lives to compete. They have been taught to compete by those who have trained them and directed their work, and forced to do it by the laws and the courts of the land. They have had to struggle hour after hour, day after day, year after year, to hold business for their own companies and to get it away from their companies' competitors. Getting business has been the sure road to promotion; losing it, the sure road to separation from the pay-roll.

Wearied of the struggle, they have sometimes tried to mitigate the fury of competition by agreements and combina-

tions, and then they have been stirred to renewed energy in the competitive struggle by the threat of fines, jail sentences and other pleasant things. Competition in consequence, has become with railway men a point of view, a mental attitude, an ingrained habit. They have competed in making showings of efficiency in the operation of the various lines, competed in soliciting business, competed in rendering service, competed at all hours of the day, and often into the hours of the night, competed by taking thought until finally most of them got so they competed automatically.

And now suddenly all is changed. They are told by superior authority that they must utterly desist from competing. They are no longer working for individual companies, but for a single consolidated railway system. Their duty now is not to hold or get business, but to direct it over the lines and through the gateways most able to handle it. They must forget entirely that they are on the payroll of some individual road, and by the utmost "co-operation" and "coordination" move the largest possible volume of traffic over all the railways of the United States.

It is not only desirable, but absolutely necessary, that railway men should be asked and required to make this sudden revolution in their mental attitude and habits. The demands upon railway service, especially in Eastern territory, have become so vast that, even with the most efficient management and operation of the railways the supply of transportation cannot be made sufficient. In order to make it as near sufficient as possible it is necessary to operate the railroads as a single system. Only in this way can all lines and facilities be utilized to their utmost capacity. The old time competition is absolutely inconsistent with the operation of all railways as a single system.

Can the railway officers of the country accomplish the feat of changing their mental attitude and breaking the habits of a life time on such short notice? Can they cease trying to make good showings for their individual lines, and suddenly devote themselves exclusively to making the best possible showing for the railways of the United States, regardless of the effect on their individual lines? This they must do if the present plan of operating all the railways as a single system is to be a success. If it is not an entire success railway officers, whether justly or not, will get most of the blame. Their own welfare, the future welfare of the railways, the future welfare of the nation, demand that they shall break with all their business predilections, prejudices and habits and do all they can to make it a success, and a great success.

A good many years ago a very young man asked a very wise man: "What is the chief qualification of a man for practical success in life?" The wise man replied, "Adaptability." There are a lot of other qualities that are important; but there is none which it is more important for railway officers to show in the present crisis in railway and national affairs. They are confronted by new conditions of unprecedented complexity and difficulty. Also, they have a new boss. He is the Director-General of Railroads, and he represents the government of the United States. He is a boss with a tremendous power. But he has not shown any disposition to abuse it. He has shown a disposition to treat everybody decently, to give everybody a fair chance, and to avail himself of all the energy, experience and brains in the railroad business. But he has some very decided opinions as to how the railroads should be run while he is in charge. He has not got his experience in the hard school of railroad competition, and he thinks of the railroads as a single system and expects others to thus think of them and act accordingly. As applied to the present crisis the fundamental idea of the new boss is sound; and he should receive unstinted support in carrying it out.

Meantime, the new boss and the public should be patient. They are asking a great deal of railway officers when they ask them to change the mental attitude, the habits, the

practice of a lifetime. If there has been too much competition in the railroad business the public, with its Sherman law and anti-trust law, has been mainly to blame. No other class of men is more sincerely anxious to serve the government in this crisis than railway officers. But they are being asked to revolutionize their business habits and methods under conditions of the greatest pressure, stress and turmoil. They will accomplish the revolution just as quickly as any other class of men could. But if they don't accomplish it in a few days or even a few weeks, people shouldn't find fault.

Some charge that railway officers are selfish. "Look down," if that they are not trying to make the present government control a success. Those who are such things either haven't tried to ascertain the facts, or they deliberately lie. Railway officers are as patriotic as any class of American citizens; and every patriotic citizen recognizes that any man who, under present conditions, could even hope that government control would be a failure, ought to be in East Loam, worth. But it isn't easy for a whole class of men suddenly to change business habits and methods which have become almost as natural to them as breathing and eating.

Making of Rates Under Government Control

THERE HAS BEEN a good deal of discussion lately in the congressional committees at Washington as to whether under government control rates should be regulated by the Interstate Commerce Commission or by the President through his deputy, the Director General of Railroads.

Who shall fix the rates is not so important as how they shall be fixed. Some witnesses who have appeared before the committees have contended that rates should not be increased to cover advances made in the wages of employees to offset increases in the cost of living due to the war. This raises a very important question of public policy. It is possible that the present freight and passenger rates will prove high enough to enable the railways during the war to earn enough to pay their operating expenses and taxes and the government guarantees to the railway owners. But this does not seem probable.

The advances in wages asked by the various classes of employees would run into hundreds of millions of dollars. Furthermore, the current high prices of railway equipment and supplies will have a greater and greater effect on operating expenses as equipment and supplies bought at the old prices are replaced to a larger and larger extent by those bought at the present high prices. It is not probable that government control will be able to effect sufficient increases to offset the increases in expenses which will result from these causes. Therefore, unless passenger or freight rates be high as advanced while the government is in control, the earnings may not be sufficient to pay operating expenses, taxes and the guarantees of the government.

If present rates do prove insufficient to cover expenses, taxes and other costs, should they be raised, or should they be allowed to be increased at market value, which would have to be borne by the transportation public? The latter argument which has been advanced by some would raise both credits to prevent a default, and the possibility of increase in rates will result in lower freight rates and that the traveling and shipping public should not be required to pay expenses incurred in carrying on the war.

If the government cannot be relied on to regulate the business with thought it is not to be used in reference to other businesses. We have learned from experience the need of operating the firms. On the theory under consideration, instead of the prices of farm products being increased in order to offset the high cost of farm implements, the prices of farm products should

be held down and the farmers should be reimbursed for their increased expenses through taxes levied upon the public. Similarly, there have been large increases in the cost of mining coal and of producing iron and steel. On the theory under consideration instead of the coal operators and the iron and steel manufacturers being allowed to charge higher prices than before the war to offset their increased expenses, they should be required to reduce their prices to the pre-war basis and then the public should be taxed to reimburse them for their increased expenses.

Everyone would say at once that it was absurd to suggest that instead of prices in the various industries of the country being raised to offset increased expenses the public should be taxed to reimburse concerns of all kinds for these increased expenses. But if it would be absurd to propose that the public should be taxed rather than that prices should be raised to offset increases in the cost of production in other lines of business, why is it not absurd to contend that the public should be taxed rather than that rates should be raised to offset the increased cost of producing transportation?

Either those who would have to pay increases in rates to offset increases in railway expenses are the same persons who would have to pay taxes levied for the same purpose, or they are not the same persons. If they are the same persons, then it would make no difference whether rates or taxes were increased. If, on the other hand, the ratepayers and the taxpayers would be different persons, the argument in favor of raising rates rather than taxes is conclusive. If the rates were raised those who use the service of the railways would pay the increased expenses in proportion to the amount and value of the services which they receive. On the other hand, if taxes were increased there would be no equitable relationship between the amount and value of the railway service rendered to individuals and concerns and the increased taxes they would have to pay because of the increased cost of rendering the service.

As a practical matter, it is equally desirable from the standpoint of the railways and of the government that during the period of government control rates shall be made high enough to cover all operating expenses, taxes and fixed charges. The difficulty of solving the railroad problem after the war will be far greater if there is a wide difference at that time between earnings, on the one hand, and expenses, taxes and fixed charges, on the other, than if there is no such difference. If the railways are to be returned to the management of their owners, the problem of readjustment after the war will be much simpler if income and outgo are practically the same than if there is a wide difference between them. If government ownership should be adopted, government management would be undertaken under much more favorable auspices if it began with earnings which were adequate than if it began with a deficit to face. Even though there were surplus earnings when government ownership and actual government management commenced, there would be grave danger that the surplus would speedily be converted into a deficit; and if government ownership and management should begin with a deficit, the chances are that there would always continue to be a deficit for taxpayers to pay.

The only sound policy to adopt either now or later, whether under government control or government ownership, will be that of making the rates and earnings sufficient to cover all expenses and fixed charges. Under existing law, however, the Interstate Commerce Commission is not required to regulate rates on this principle. All it is required to do is to fix "maximum reasonable rates." This requirement is susceptible of different interpretations. If the power of rate regulation is to be reserved to the commission it should be allowed to fix the relations between different rates as it deems fair, but at the same time it should be required to make rates as a whole high enough to cover all expenses, taxes paid from earnings and guarantees to the companies.

The Executive Versus the Judiciary

IT IS A NICE QUESTION as to what portions of the assets of the Denver & Rio Grande are actually in the hands of receivers. Judge Sanborn on January 26 appointed A. R. Baldwin, vice-president of the Western Pacific, and E. L. Brown, president of the Denver & Rio Grande, receivers, but he in substance left it up to the director-general of railroads' office to say what they were receivers of. The President's proclamation of December 26 contains the following:

"Except with the prior written assent of said director, no attachment by mesne process or on execution shall be levied on or against any of the property used by any of said transportation systems in the conduct of their business as common carriers, but suits may be brought by and against said carriers and judgments rendered as hitherto until and except so far as said director may, by general or special orders, otherwise determine."

The Equitable Trust Company as trustee for the first mortgage of the Western Pacific, which is guaranteed principal and interest by the Denver & Rio Grande and on which interest is in default, having brought suit against the Denver & Rio Grande as provided in the mortgage, asked for the appointment of a receiver. When the case came before Judge Sanborn in Denver last week the director-general of railroads' office sent a telegram which was read in court, which said in substance that in view of the President's proclamation, the director-general's office thought it was not necessary to be represented before Judge Sanborn, assuming that the only attachment granted would be on such assets as were not used in the business of transportation and that the attachment would not cover revenue or income received since January 1. Obviously this left an opening for the court to define what assets were covered and what were not covered by the President's proclamation, but whether or not the director-general's office hoped that this burden would be assumed by the court it is impossible to say. Whatever the hopes may have been, however, the court promptly passed the question back to the director-general's office in accordance with the well established traditions of American courts. Judge Sanborn made a comprehensive order differing in some respects from the usual order made when a railroad is placed in the hands of receivers, but in the main much like the usual order which if it had not contained a final proviso would have apparently placed an attachment on the whole property. This final clause in substance said that the above order applied to such property as the director-general's authority did not prevent an attachment from applying to. And there you are, as the saying is.

Time and again in this country the legislative branch of the government has tried to pass some law or other in such form as to shift to the shoulders of the Supreme Court the responsibility for making effective the intentions of one or other of two contending factors, neither of which was willing to take the responsibility of drawing a bill which would make their intention unmistakably clear. The commodities clause of the act to regulate commerce was such a law. The Supreme Court in cases like these has nearly always refused to assume the responsibility which belongs to the legislature. Judge Sanborn's receivership order similarly refuses to assume responsibility which apparently he believed attaches to an executive order. There is a touch of humor to the whole thing, serious and delicate as are the questions involved.

The Denver & Rio Grande-Western Pacific tangle is just about as complicated a legal and financial situation as could be found, or in fact as has occurred in the history of American railroads. It seems just a bit tough on the director-general's new organization to throw that kind of a situation at it; still we have learned to accept the fact that courts deal in justice, not mercy.

Letters to the Editor

Reducing Loss in the Transportation of Perishable Freight

CINCINNATI, Ohio.

TO THE EDITOR:

There is much said relative to the agricultural end of perishable freight—farming methods, the centralization of packing houses, loading, marketing, etc.—but little recognition is given to the important factor of refrigeration and ventilation of perishables when shipped. The wastage in food products in transportation is attributable to three causes:

1. The failure of originating shippers to give definite instructions concerning icing, non-icing, ventilation, etc., which properly would protect the shipments.

2. Delay caused by reconsignment and the failure of the shipper to advise what protective service is to be given beyond the reconsigning points and during the time the car is held.

3. Failure of the carriers to furnish protection in accordance with specific instructions, or to furnish sufficient protection when shippers do not request definite service.

To offset these various causes which result in wastage, it is necessary to have transportation specialists who are thoroughly familiar with the fundamental principles of protective service. To attain the maximum results each employee concerned must be trained and recognized as an expert in his particular line, and able to perform such accessory protective service as directed through the main office. Every trainmaster, agent, yard clerk and trainman must be a student of the principles of protective service, as all share in the responsibility for the safe movement of food products. On the Cleveland, Cincinnati, Chicago & St. Louis, such employees receive instruction at periodical terminal meetings and classes, written bulletins being issued from time to time, defining their respective duties. Our efforts in the prevention of perishable freight wastage have been confined largely to the application of an analysis of the following factors governing damage to food products in transit:

- (a) Inherent depreciation
- (b) Refrigeration
- (c) Ventilation
- (d) Heating
- (e) Movement
- (f) Loading, stowing and unloading

An absolute record is taken at all terminals and junction points of every car of perishable freight passing over Big Four rails, showing full information as to refrigeration and ventilation, etc., and what accessory service is given. Such records are checked through at the central headquarters to take the necessary action to eliminate negligence and errors. Our results so far have been very gratifying. Proof of the elimination of wastage is indicated by the fact that freight claims for damaged perishable freight on account of improper refrigeration and ventilation alone were 53 per cent less in 1917 than they were in 1916. We are enabled through these methods to handle long distance shipments and place them on markets in first class salable condition.

Constant changes in operating forces of railroads, especially under the present stress of circumstances, paves the way for increasing failures, but what we have accomplished through united efforts, for economic reasons, we shall make every effort to continue for the all-important reason of patriotism.

C. W. HICKS,

Superintendent, Refrigeration Service,
Cleveland, Cincinnati, Chicago & St. Louis

Standardization of Buildings

TO THE EDITOR:

LAKE CHARLES, Mo.

Does the standard building unit offer a solution for speeding up railroad building construction? Small railroad buildings, and to some extent more recently fire ones, have been standardized. The object is to standardize the construction as it applies to essential details, leaving the question of arrangement to be decided for each building. For instance, such a plan permits preconstruction of the steel roof trusses, girders, columns and lights. The doors and sashes may be bought on an annual contract, and the lumber and roofing may be held in stock. Such a plan also permits enclosing a building in the minimum time after which almost any interior arrangement and finish may be installed to suit the local conditions.

The larger railroads have highly organized building departments competent to design their structures, but unfortunately these departments operate on the same basis as a consulting engineer or an architect, and endeavor to design and construct a building to suit the department that is to use it. After all, building design for shop or warehouse purposes is largely a question of floor space and daylight lighting. How the result is obtained is non-essential as long as the cost is within practical limits and the type of construction and workmanship give long life at low maintenance. A standardized design based on the best practice will, of course, produce that result just as well as a special design.

Several standard building units will undoubtedly be necessary for railroad purposes but when they are adopted the principal part of the designing is done and the essential materials may be ordered immediately. On the other hand, if a special building is used the designing department must finish its part before the plans can be approved and the material ordered. This requires time and costs money, both of which are saved with a standard building unit. Special designs also entail construction delays, higher priced materials, and waste, all of which add to the building cost. The railroad building problem would be greatly simplified if the engineering department could submit several standard building units from which one might be selected. The finished structure could be visualized quickly and frequently in concrete form, where structures of the kind in question had been built.

An investigation of a large number of railroad buildings designed for different services shows that with a few notable exceptions, their width and type could be standardized. For instance, outboard freight houses are almost uniformly 30 ft. wide inside. Combined inboard and outboard houses are for the most part 50 ft. wide. This is also the width generally used for storehouses and a number of other buildings. In connection with any of these buildings there does not seem to be any objection to a 20 ft. column spacing. With these factors fixed, the roof trusses and framing can be standardized. The question of load room can be decided at the time a building is decided upon as fabricating the columns is relatively simple and one that can be done quickly.

The roof construction is important but a standard can readily be adopted which will give the best service for the money paid for it. To a certain extent the type of roof used will depend on the character, length of the trusses. Sashes and doors should be of standard sizes, and of either wood or steel as desired. They should be standard or can be purchased under an annual contract. Floor and platform construction need not be fixed but the building operation is simplified if a standard is adopted. Platforms and canopy roofs and clearances should be left entirely up to each width. They will save the building of certain amounts of flexibility in

overall width in meeting track and driveway clearances. In other words, a foot or two in the platform width will affect the building cost but little, and may mean much in track clearances. Floor and platform heights above rail and driveways vary with localities but this should not affect the standard. The design of the foundations must necessarily vary with soil bearing power conditions.

So much for a standard freight house unit and its essential details. These, it appears, can be standardized and used in most locations. With a standard design the usual benefits follow, such as a standard bill of material, much of which can be stocked where the annual building program is sufficiently large to warrant such a policy. Standard design also permits improvements in the workmanship without sacrificing speed in the various operations. When mechanics are familiar with building details, supervision is simplified and the work of the man in charge may be confined largely to inspection. In other words all building operations may be standardized. With the design and specifications prepared in advance this time and cost is saved. Contractors familiar with the standards are prepared to furnish bids on short notice, and if competition is keen, a low price will be obtained, because the prices can be based on actual experience. Similarly, if a structural shop has its shop details prepared in advance it is in a position to make a close figure. This, in turn, means scheduling the job in the shop when it has been placed, rather than awaiting such time as may be necessary to prepare a design as is frequently required, and later working out the shop details.

In scheduling a building operation alone, the standard building unit is a great asset. With the material and labor quantities pre-determined and the contingencies provided for, the building can be definitely scheduled and finished on or ahead of time. This means much to a railroad and everything to a reputable contractor. In expediting the movement of materials to the building site, every one who has anything to do with it is on a railroad basis, where time is the essence of the operation. Literally thousands of details take care of themselves automatically, or may be left to the subordinates.

A 50-ft. building unit undoubtedly could be substituted for a number of smaller shop buildings. In the latter, however, a change in the column height would be necessary, and in many instances, provision would have to be made for traveling cranes. In general, other shop buildings, such as wood mill, wheel, machine, forge and boiler shop buildings vary in width from 60 ft. to 80 ft. In some cases clear spans are adopted and in others a row of columns is not found objectionable. Frequently the objections are theoretical rather than practical and the increased cost of a clear span over a line of columns is not warranted. An erecting shop, or a locomotive repair shop presents a different problem which must be treated in a special way. Even in these, much time and money can be saved by using standard material sizes in the design. Waste is reduced to a minimum and much labor saved in assembling and erecting.

In the final analysis, the present railroad building problem is one of speeding up production. Railway organizations have been depleted so that the time is fast arriving when their entire attention must be directed toward keeping the railroad in operation. Traffic, transportation and mechanical facilities must be expanded to cope with the emergency situation. Construction must be speeded up, and standardized building designs and operations will afford one means of accomplishing that result. Another is to contract both the design and construction to specialists who are able to shift their forces from one railroad to another, thus using the labor available for building operations, most economically and efficiently.

E. M. HAAS,

Sales Engineer, The Austin Company

The Valuation of Ties

NEW YORK CITY.

TO THE EDITOR:

The docility of figures, caught young and skilfully broken, has been often noted, but in the letter on "Average Life of Ties" published in your issue of January 11, we must admire more the ingenious illustrations that such figures are brought to support. Take the last example: two kinds of ties, having lives of 5 years and 15 years, respectively. Assume that 15 ties of each kind are placed in track. At the end of 5 years the first set, having furnished 75 tie-years, must be replaced, and in 15 years the second set, with 225 tie-years to their credit, go likewise. Thus the 30 ties yielded 300 tie-years, or an average of 10 years per tie—the average total service age being, as might be expected, the same as the average of the lives at first assumed.

As a railroad man the writer believes that in railroad valuation we should press our valid claims and avoid hypotheses that cannot be justified or demonstrated. We should strive for a fair and adequate allowance for overhead costs. We should also by all means uphold the truth that if a property is maintained in good operating condition capable of affording proper service to its patrons its value as a basis for rate making cannot be diminished on the plea that there is some accrued loss of service life in its elements. Its value for this purpose must in justice always remain the full value of the investment the concededly fair measure of which is the reproduction cost new. This cannot be decreased or impaired on account of the natural physical changes in such a property.

It is a strange mental aberration of many courts and commissions, and I regret to say also of some engineers, that because the wearing life of ties in a piece of track will, after a time, average 50 per cent of the original life, and will continue so indefinitely with proper maintenance, therefore a fund or its equivalent equal to the 50 per cent of expired life, which fund could never be used on the ties, should have been provided, or that 50 per cent of the investment in the ties should be struck off, in arriving at a value for rate making. The only justification for the creation of a reserve fund or its equivalent for renewals, in the case of an indefinitely continuing property, is where it is necessary to equalize the annual expenditures for maintenance and renewals. If earnings in the past were sufficient to have provided a fund equal to this 50 per cent. value, but such earnings were paid out in dividends, which was a perfectly sound economic and legal thing to do, it is not just or fair to penalize present security holders for the benefit of present rate payers because other rate payers in the past possibly paid too much.

It is encouraging to note that at least one state commission (Massachusetts Public Service) has seen the light and come out squarely for the right, and also that some of the courts are waking up and refusing to follow the vicious precedent of the Knoxville Water Case. We may confidently expect that ultimately the U. S. Supreme Court will reverse itself on this subject as it has reversed itself on some other matters.

J. W. BURKE.

SIAMSE STATE RAILWAY RETURNS.—According to a recently issued report of the operations of the southern line of the Siamese Government Railways for the fiscal twelve-month ended March 31, 1917, there was an addition of 178 miles to the length of the main line and of 33 miles in sidings, completing a total length of 642 miles of railway open to traffic at the end of this period, with through connection from Bangkok to Trang, Nakawn, Sritamarat and Singora. During the period under review the gross earnings amounted to \$770,908, or \$206,129 more than in 1915-16, yielding a dividend of 1.51 per cent, against 1.27 for the previous year. The total number of passengers carried was 1,661,111, an increase of 310,872.—*Commerce Report.*

Activities of the Railroad Administration

A Traffic Investigation Committee Appointed; the Congestion Continues; Other Developments

ON FEBRUARY 10, Director General McAdoe appointed a traffic investigation committee consisting of H. F. Winchell, traffic director of the Union Pacific; G. F. Randolph, commissioner of the lines in official classification territory; and T. C. Powell, vice president of the Southern Railway. This committee is to make a study of the great traffic currents of the country with a view to seeing what steps can profitably be taken in order to shift the traffic from the most seriously congested gateways to less congested gateways and from more congested ports to less congested ports.

The director general has explained to the committee that the reason of government possession and control the situation should be viewed from the standpoint of a national railway system consisting of all railroads, instead of as heretofore from separate standpoints of separate railroad companies. The committee is to deal with the larger questions affecting movements of traffic between the three regions and will not interfere with similar studies which will be conducted under each of three regional directors with reference to traffic moving within his part of the country. The members of the committee have been in conference with Edward Chambers, Mr. McAdoe's traffic adviser.

Severe Weather Conditions Hamper Railroads

The railroad administration and the railroads still continue to struggle with unprecedented winter weather conditions which have made it difficult to bring about much improvement in the eastern district, although the western and southern lines have generally reported conditions better than normal.

For the purpose of assisting to clear up congestion on the Pennsylvania east of Pittsburgh, the eastern roads have been ordered to contribute pro rata 34 locomotives to the Pennsylvania for a time.

The conditions in the eastern district during the latest cold wave are described in an article on another page.

Owing to the shortage and crippled condition of lighters and tugs and the physical condition in New York harbor, and for the purpose of speeding up the loading of ships, Director General McAdoe has ordered certain roads to assign their piers for the loading of ships. Details are given in our article on "Export Freight in Trunkline" in this issue.

R. H. Ashton, regional director for the western lines, reported on February 4 from Chicago: "Extremely cold weather last night which continues to day, has very seriously interfered with movement of both passenger and freight traffic. While there was no new snow, a very strong wind buried all this full of snow and stalled a number of freight trains during night. Conditions in a part of territory had been so severe that it was necessary to suspend passenger service where it could be done without great inconvenience to traffic, and this will continue for a period of three or four days, at which time it will be resumed to the regular schedules. This is certainly necessary to take care of the great coal movement. Western business is being taken in very fair shape by western lines and extra efforts being made to move all emergency traffic being received here from another territory. Generally fair and warmer weather is predicted for Tuesday and Wednesday over a greater part of this fourth district. 743 cars are scheduled for loading and 741 cars are loaded Saturday."

Mr. Ashton also forwarded a report as to operations of the Pacific Coast from William S. Stetson, president of the

Southern Pacific, covering the movement of heavy loads in all directions and without interruption. There are some congestions on the Southern Pacific for loaded trains.

Coal Production Curtailed

The National Coal Association on January 11 issued a statement declaring that "our shortage and emergency conditions during virtually the entire month of January had curtailed production of bituminous coal throughout the country to an extent unequalled in many years, and that this serious condition emphasizes the need of the emergency standards laid by the railroads to insure better movement of fuel and coal." Unless conditions improve, it was stated, it may be necessary to have an extension of these emergency standards. A decline in the statement the last production for the month was estimated at not less than 16,000,000 tons.

Grain and Corn Situation

A delegation of grain dealers and elevator owners called on Director General McAdoe to discuss methods of moving the western grain crop to the seaboard. They told him that there is no danger of a shortage in grain but that there are millions of bushels of wheat, corn and oats ready for shipment to the Atlantic seaboard if transportation can be provided and that if the wheat and oats now stored in elevators and warehouses along the western railroads could be moved out the soft corn, now in danger, could be put into the elevators. Mr. McAdoe told them that if the way were cleared for acceptance at the seaboard the railroads could move at least a million and a quarter bushels of wheat daily. He suggested the issuance of a priority order for soft corn but that was not what the grain dealers wanted.

Railroad Executives Not "Laying Down"

Mr. McAdoe has not failed to make mention in his reports such as those made by W. G. Lee of the Brotherhood of Railroad Trainmen, that railroad executives are "laying down" in an effort to discredit government control of the railroads. He not only repudiates the unfounded conclusion which the roads are confronted with but he has his own way of ascertaining what is going on and he knows that it would be the most shortsighted kind of policy on the part of a railroad president to attempt to place his hand over the head of discrediting the government. Success of such a move would result in the national bankruptcy. Mr. McAdoe, acting in this capacity, is making a personal control of railroad executives, and appointing committees on the railroads and he has repeatedly told newspaper men that with increased power and confidence are shown the railroads of the country. He has ordered executive railroads to submit to the government all their business, and he is making it his business to make sure that the railroads are doing their best to keep the country out of bankruptcy.

Order No. 6 Not Clear

The second executive order under the government control of the railroads, "Order No. 6," has been issued. It is a very long and complicated document, and it is not clear what it means. It is a very long and complicated document, and it is not clear what it means. It is a very long and complicated document, and it is not clear what it means.

assumed that the traffic associations at least would have to be continued and these and various others have filed formal requests for permission with the director general which have been under consideration by his assistants.

The Director General's Organization

More or less uncertainty has also been caused by the delay in the announcement of Mr. McAdoo's permanent organization. Since the government took over the roads an increasing number of complaints and requests for cars or relief from embargoes, etc., have been sent to congressmen, who have had difficulty in finding out whom to see about them. Many requests and complaints of this kind that formerly went to the Railroads' Commission on Car Service or the Bureau of Car Service of the Interstate Commerce Commission are now sent to Mr. McAdoo, although the commission and the bureau have been merged and are working together much as they did when they were separate bodies co-operating with each other.

New members of Mr. McAdoo's staff have arrived almost daily and have gone to work, while the announcement of their appointment has been withheld until the organization was completed. Edward Chambers, Mr. McAdoo's traffic adviser, has been working out a plan for having an assistant for co-operation with each government department so that the traffic needs of the government may be co-ordinated. H. M. Adams, director of inland traffic for the quartermaster's department, was appointed by General Goethals, but J. F. Holden, is an assistant to Mr. Chambers in charge of relations with the Shipping Board. C. B. Buxton, who was Mr. Chambers' assistant in the traffic department of the Food Administration, is working with him in his new office. Gerrit Fort, passenger traffic manager of the Union Pacific System, is in charge of passenger traffic matters and R. C. Wright, traffic manager of the Pennsylvania, is also assisting Mr. Chambers.

H. T. Bentley, general superintendent of motive power of the Chicago & North Western, is assistant to C. R. Gray in charge of mechanical matters and an engineering assistant is also to be appointed.

Deposit Balances and Salaries

At the request of the director general the Interstate Commerce Commission has requested the roads to furnish promptly information as to the deposit balances to the credit of each company and of all subsidiary companies, and also as to cash on hand. Railroads have been asked also to file information as to the salaries of their officers, which Mr. McAdoo promised to furnish the Senate committee at the request of Senator Cummins.

Traffic to the Seaboard in January

IN THE FIRST MONTH OF OPERATION of railroads by the government the number of carloads of freight waiting at North Atlantic ports for export has been reduced by 7,508; or from 41,101 on January 1, to 33,593 on February 1. This and other interesting facts are found in a report prepared for A. H. Smith, regional director of railroads for the Eastern States, by the Freight Traffic Committee for North Atlantic ports, George D. Ogden, chairman, New York City. The report covers the six ports named in the table below:

The reduction in the accumulation of supplies for the Allies at the North Atlantic ports is due to two factors—first, the improvement in the coaling of ships and their consequent faster despatch; and second, the smaller arrivals by rail, because of adverse weather conditions and embargoes.

Railroad yard and pier congestion have been relieved and the ships have released more than 4,000 cars for active use.

The following table shows the number of carloads waiting on January 1 and February 1:

| Ports | Jan. 1 | Feb. 1 | Dec. | P. C. |
|--------------|--------|--------|-------|-------|
| Boston | 1,190 | 998 | 192 | 16.14 |
| New York | 24,971 | 19,723 | 5,248 | 24.02 |
| Philadelphia | 3,531 | 3,307 | 224 | 6.34 |
| Baltimore | 7,164 | 5,878 | 1,286 | 17.95 |
| Newport News | 1,653 | 1,284 | 369 | 22.32 |
| Norfolk | 2,592 | 2,403 | 189 | 7.29 |
| All ports | 41,101 | 33,593 | 7,508 | 18.27 |

The consignees of this export freight are classified as follows:

| | Jan. 1 | Feb. 1 |
|--------------------------|--------|--------|
| United States Government | 3,369 | 3,329 |
| British Government | 4,682 | 3,270 |
| French Government | 13,615 | 11,750 |
| Russian Government | 4,823 | 4,864 |
| Italian Government | 4,093 | 3,090 |
| Commercial | 10,519 | 7,290 |

More than half the freight held at the ports was lying on the ground, as shown below (February 1):

| Consignee | In Cars | On Piers | On Ground | Total |
|--------------------------|---------|----------|-----------|--------|
| United States Government | 1,387 | 495 | 1,247 | 3,329 |
| British Government | 1,504 | 1,168 | 598 | 3,270 |
| French Government | 857 | 916 | 9,977 | 11,750 |
| Russian Government | 56 | 263 | 4,545 | 4,864 |
| Italian Government | 619 | 557 | 1,914 | 3,090 |
| Commercial | 2,292 | 3,477 | 1,521 | 7,290 |
| Total | 6,915 | 6,876 | 19,802 | 33,593 |

The 9,977 carloads of freight on hand February 1 for the French Government listed as on the ground included munitions of war, which became out of date by the progress of modern warfare before they could be carried across the ocean. Permits have been issued for about 30,000 carloads of freight for the Allies to be brought forward to the seaboard as soon as room can be found for it.

One of the Oldest Relics of the War

This engine was about to start for France late in August, 1914, with a number of cars, when a German shell broke one of the wheels. The cars could be taken through a side track, but the engine had to be abandoned. It has remained so for three years and a half standing near No Man's Land at the entrance of what used to be Nieuport Gare. Note the camouflage curtain.

Hearings Before Railroad Wage Commission

Nearly All Classes of Employees Ask Higher Pay.
Forty Per Cent a Popular Figure

REPRESENTATIVE of practically all classes of railway employees have either presented requests for higher wages to the Railroad Wage Commission or have asked for a hearing for that purpose. In some cases they have referred to the commission the demands previously made on the railroads but in some they have asked from the government more than they had asked of the roads, while representatives of employees that had not asked the roads for an increase have appeared before the commission to present their case. In many cases the increase asked varies according to the requests made by individual groups of employees and there is no general request, while in some no definite request is made except for higher pay and shorter hours. Where a percentage increase is asked for 40 per cent seems to be a popular figure.

A. B. Garretson, president of the Order of Railway Conductors, and W. G. Lee, president of the Brotherhood of Railroad Trainmen, testified before the commission on February 5 on the joint demand of the two organizations for increased wages which was presented to the railroads on December 1, and which has now been referred to the commission. The hearing was set for Monday but Mr. Lee was delayed by a late train and Mr. Garretson said that as it was a joint movement he did not feel justified in proceeding alone.

The hearing soon brought out the fact that the trainmen, like the telegraphers, are already considering the possibility that the government would be a more benevolent paymaster than the railroads, when it was announced that the request to the government includes a proposition for time and a half for overtime which was not included in the demands presented to the roads. Mr. Lee said that because of the previous attitude of the railroad managers it had been considered useless to do so.

The joint request provides for increases ranging from 20 to 40 per cent. The desired rates are stated in what is known as proposition No. 65 as minimum rates per mile, per day or per month for the various classes of service. The proposed rates were published in the *Railroad Age Gazette* of December 7.

Objects to Presence of Railroad Men

The controversial atmosphere which has usually surrounded wage negotiations in the past became evident at the outset, when Mr. Garretson remarked on the presence of numerous railroad officers who have taken an active part in wage negotiations in the past, including J. W. Higgins, chairman of the Association of Western Railways, and J. G. Walber, of the Bureau of Information of the Eastern Railroads. He said he had understood from the President and

the Director General that the Brotherhood was to deal only with the government and that there was to be no "other side." We do not intend to take the position of demanding this question with our former employers," he said.

He was informed by Chairman Lee of the commission that he had not understood that an *ex parte* proceeding was contemplated and that the railroad men had been invited to be present and to give such information as they could. Mr.

Garretson objected to information being presented by the railroad without an opportunity to question it and Mr. Lee said that after the administration had asked for their co-operation and had recognized in principle the increased cost of living as a justification for higher wages they had abandoned their efforts to compile data as for an arbitration proceeding and had thought that government statistics showing the increased cost of living would be sufficient. Judge Covington said that the railroad officers had not been invited to appear as a committee or to antagonize anyone but to supplement the information presented and that if the brotherhoods find anything in the record to correct they will have an opportunity to do so. Mr. Lee asked the commission to excuse him for being suspicious but that he had been dealing with railroad officers for half a century and he charged that many of them are "laying down" and deliberately trying to make a failure of government control. He mentioned particu-

larly the New York Central Railroad and the Pennsylvania Railroad.

Trainmen Are Piece Workers

Mr. Lee read a prepared statement regarding the wages and conditions of employment in train service, saying the men have never been paid what they were worth but only the least they could be got to work for. He read comparative statistics of wages in other industries, principally the steel industry, and apologized for the conservatism of his organization as compared with that of trade unions, saying that so much machinery was required to obtain an expression of the wishes of the men that they often spent a year in discussing a proposition before acting. He emphasized the extra living expenses which trainmen pay because they are away from home and read some letters from men earning \$80 to \$100 a month giving their living expenses, with comparisons of 1917 with 1914. There has been no increase in wages since that time, he asserted, except in a few instances, and he discussed the American Railway Union's request for laying off one-third of the men to increase overtime payments during a year of unusually heavy traffic. A man of \$107 a day for a fireman in 1917, he said, was

An Atrocious Charge

Eighteen months ago four social bandits, at the head of four railway men's organizations, threatened to paralyze the whole industrial life of the country by calling a general strike of railway men. It was a hold-up of a nation, by promising what President Wilson characterized as "an unspeakable calamity."

Yesterday one of these four men, Warren G. Lee, president of the Brotherhood of Trainmen, made the charge before the Railroad Wage Commission that in this hour of a nation's deep need four bankers of New York had ordered engines to be left to freeze while millions suffered for lack of coal.

The hiss of loyal labor, millions strong, should follow the exit from Washington and from public notice of this vile traducer, this poisoner of more ignorant minds.—New York Tribune.

only equivalent in real purchasing power to \$1.39 in 1913.

In urging the time and one-half for overtime Mr. Lee said it was necessary to prevent unreasonable hours of work and he paid his respects to the practice of running long trains.

Chairman Lane and Judge Covington of the commission interrupted a discussion of the complicated wage schedules to ask how the men would consider abandonment of the mileage system of payment and the substitution of payment by the day.

"You could do nothing that would stir up such a hornet's nest," replied Mr. Lee. "You can't afford even to consider it if you want to promote harmony and the co-operation of the men. That would upset the whole plate of beans."

"I understand that to be your attitude," said Chairman Lane, "but, why should that be so, if you are assured adequate wages?"

"If the men got a substantial increase would they be captious about the method?" asked Judge Covington.

Mr. Lee replied that they would, that the mileage basis was the foundation of the schedules, and that as the railroads are paid by the mile for their service the men were entitled to the same principle. The roads might try to run a man 200 or 300 miles in a day, he said, or might even try to make a man work a full eight hour day in case he completed his run earlier.

"I am merely suggesting it," said Judge Covington. "I don't know that it would be wise at this time to try to interfere with your highly complicated schedules, but why isn't in the public interest to make as many miles as possible provided you get adequate pay on the time basis?"

"We are piece-workers," said Mr. Lee, "and you would find the men in the munitions plants if you ever tried it."

Station Agents and Station Employees

E. H. Norton, representing the Order of Railway Station Agents, asked for a basic eight-hour day with time and a half for overtime and increases in wages. He described the conditions of work of a station agent, saying that 50,000 of them are practically strangers to their families because they have to work such long hours. He said a station agent has to be a business man, a diplomat and an expert accountant and that he should be considered on a par with the postmaster in his town, who, he said, usually has a much larger force than the station agent, works only eight hours a day and receives higher pay. The station agent devotes one-third more time to the business of earning a living than the average business man or government employee, he said.

P. J. Coyle, grand president of the Brotherhood of Railway Station Employees, representing baggagemen, station cleaners, freight handlers, checkers, etc., asked for a general 40 per cent increase and a higher percentage for the lower paid men. He said that at one station employing 90 to 110 men the "turnover" was so great, caused by the men leaving for other work, that in two months 1,400 men had been on the payrolls.

D. W. Holt, grand chief of the Brotherhood of Railroad Signalmen, spoke on behalf of the men who install, maintain and repair signal apparatus, reading letters from men in various parts of the country outlining their conditions. He presented the requests that had been filed with various roads.

Train Dispatchers

On January 29, G. S. Sandlin, of the Southern Railway, appeared on behalf of train dispatchers and asked for the increases named in a petition to Director General McAdoo which has recently been circulated among the various roads. The petition asked a monthly salary of \$235 for chief dispatchers, \$225 for assistant chief dispatchers, and \$215 for trick dispatchers.

A. J. Tatlow, of the Independent Order of Railway Employees, appeared on behalf of station agents, telegraphers, clerks and other employees.

Maintenance of Way Employees

T. J. Garvey, president, and E. S. Begg, general secretary of the Maintenance of Way Employees' Association, testified on January 30. Mr. Begg told the commission that the trackmen perform the hardest and most disagreeable work on a railroad and that they have very little chance for promotion. He said a track laborer can get higher wages as a common laborer than he could get as a section foreman after five to seven years of experience. Section foremen, he said, receive \$50 to \$95 a month and are subject to call 24 hours a day. The average track laborer, he said, is paid \$1.15 a day. "Why doesn't he go and get a better job?" asked Chairman Lane. Mr. Begg replied that there is a fascination about track work and railroad work of all kinds that seems to hold them until they are worn out, and he introduced a man who had been engaged in track work for 52 years. Few stay long enough to become foremen, he said. Out of a membership of 23,000 in the organization, over 3,000 have enlisted in the army or navy.

How the Investigation Is Being Conducted

In most cases the organizations presenting requests seek to represent all employees in their classes of employment and it is understood that the commission is prepared to accept this plan in general, but among many classes of employees that are not well organized there are overlaps, as where the employees in one section of the country belong to an organization of their own but those of the same class in another section belong to an organization that represents various classes. Many of the station agents, for example, are members of the Order of Railway Telegraphers, while some are members of the Order of Railway Station Agents, and others are not members of any union.

The investigation is being conducted along entirely different lines from an arbitration proceeding and the commission is by no means depending upon the facts laid before it by witnesses at the hearings. Its boards of statisticians and examiners are studying all the available statistics that have already been compiled by government and other agencies, both with a view to reaching a conclusion as speedily as practicable, and for the purpose of studying the relations between wages in various classes. This will offset to some extent the disadvantage of the unorganized employees who have not the means for presenting their case in a forceful way that have been employed by the brotherhoods, with their lawyers and statisticians.

Other Hearings

Thomas McNeill, representing car repairers, was to testify on February 8; W. S. Stone, grand chief of the Brotherhood of Locomotive Engineers, W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, and A. O. Wharton, representing mechanical department employees, on February 11; J. B. Parsons, representing construction, maintenance of way employees, and E. T. Thompson, representing colored employees, on February 12.

THE PRINCIPAL COAL EXPORTS OF THE WORLD IN 1913, including that used for bunker purposes, were Great Britain, 93 million tons; Germany, 40 millions; United States, 29 millions; Austria-Hungary, 9 millions; Belgium and Canada, about 5½ millions each; Netherlands, slightly less than 5 millions; Japan, nearly 4 millions; British South Africa, 2½ millions, and Australia, 2 millions. A compilation by the National City Bank of New York shows that the United States now holds second rank as a coal exporter.

The Car Conservation Problem Solved in China

"Free-time" of Only 12 Hours, High Storage Rates and Charges
Based on Capacity of Car Secure Results

By John Earl Baker,

Adviser to the Chinese Ministry of Communications

EVERY MAN FROM AMERICA brings some story of a desperate car shortage. From a shortage of cars there's a shortage of coal. From a shortage of coal there's a shortage of steel. From a shortage of steel there's a shortage of ship and shells. And from a shortage of these the war may be lost, "all for the want of a horseshoe nail." Under such conditions it may not be considered impertinent to call the attention of the foremost railway nation of the world to the car performance in China.—China one of the newest countries in point of railway history, a land considered backward in everything that pertains to efficiency.

So far China has no car mileage statistics. But on the Government Railways, the equipment and its capacity have been inventoried, and tonnage statistics of goods handled are compiled according to uniform rules prescribed by the Ministry of Communications. Thus there may be computed the number of tons carried per ton of carrying capacity. In 1915 each ton of carrying capacity transported on the average 69 tons of goods. Compared with this, American cars in 1913 (the latest figures available here) transported some 33 tons of freight per ton of carrying capacity. What would it not be worth to tell the carrying record of American freight cars?

But the comparison must not be allowed to stand just as it is. While the Chinese car carried three tons to the American car's one, it did not carry them so far. The average haul per car in the United States was about 145 miles; in China, it was only 89 miles, — 56 miles less. There are two ways of looking at this comparison. One way is to consider that the American haul is 63 per cent longer than the Chinese haul and consider the discrepancy in tons carried accounted for by that much. The other way is to remember that after a car is loaded and on its way it does not take long to run an additional 56 miles. Even if the American car encountered a

terminal in the course of that additional 56 miles a delay of more than one day to a loaded car is something to be explained. The Chinese car gets a fresh full load about every five days. The American car requires a cut 15 days to accomplish this feat. Something more than 56 miles of haul and a terminal delay must be used to account for this difference of ten days.

Chinese Cars Keep in Motion

There are other factors, partly statistical which render the full validity of the comparison just given, but they may be disregarded for the sake of more important facts. Freight cars are classed among "rolling stock," but every car distributor in America knows that his car stands still a great deal longer than it rolls. Freight cars are assigned to carry goods, but when they do roll they are absolutely empty about one-third of the time, and even the average nearly full empty much of the loaded time. There are no figures of empty car mileage, or of tons per loaded car on Chinese railways, but the facts that Chinese cars are out of motion for a practically equal time and when they are in motion they are nearly loaded, — that is, that they keep rolling, — tell the story.

On the Peking-Mudan line, for example, the longest direct stretch in the Chinese system, heavy loading is made every day, the rail most freight trains are composed, according to the capacity of the rail, not on the actual number of the train, but on the tonnage. Two thousand freight cars are constantly unrolled in loading, all but 400 are empty, while there are 1600 or 1800 empty cars on the same American system. The exception of the railroad must therefore be kept in mind in passing comparisons unless there are enormous full loads. This is undoubtedly a great economy. In the case of heavy shipments the rail car is a loaded car in 100 per cent. So shipments will not cost more. Loaded or not, the car carries the load

as a protection against the weather, and are articles of commerce at destination. The load limit is fixed by a loading gage, placed on the lead to the loading tracks, and under which the car must pass. In the case of heavy commodities, frequent weighings of suspected cars detect loads in excess of 110 per cent. of marked capacity, while a penalty of triple rates for excess loads supplies the deterrent.

Heavy Demurrage Rules

No matter how important heavy loading may be, it is equally important to get the car under its *next* load promptly. Car records, reports, and supervision are all important factors in promoting that result, but there are handicaps suffered by the American car which must be removed before it can aspire to the Chinese record. The Chinese car is aided immensely by the demurrage rules. The prevailing "free-time" allowed is 12 hours of daylight. Contrast this with the American "48 hours after the first 7.00 a. m., etc.," and it is apparent how the Chinese car saves from four to five days right there. On one line, the Shanghai-Nanking, free time allowed is only six hours. But if unloading has not been commenced within four hours after placement, the car is "shunted" (switched) to the "go-down" (warehouse) and unloaded by station forces, costs being added to freight charges. Right is reserved to add, still, a storage charge of 5 cents per ton per day on these goods in the "go-down." This may seem like heroic treatment, but it frees the cars.

The demurrage charge perhaps is secondary in importance to the brevity of "free-time allowance." However, when it is contrasted with the cost of labor, it appears much higher than when mere rates are named. The rate varies among the several lines, and is based as a rule on the capacity of the car. The rate per ton per day ranges from 15 cents (Mex.) per ton capacity to 50 cents. Thus at the lowest rate, a 40-ton car would take a penalty of \$6,—enough to

of the scandals, little and big, local and international, grow out of this condition. But, nevertheless, this shortage helps produce a great record of car performance. It carries the freight offered at a minimum of investment cost. But how much does it repress commerce? That's another question.

To the American shipper under peace conditions these rules of the Chinese railways would seem intolerable. But the Chinese merchant has known no different, and he contrives to get along very well. It is true, of course, that the

Press Illustrating Service, Inc.

A Troop Train at Tien-Tsin

wants of Chinese villagers are still so elementary that most localities come very close to being self-sustaining. This fact favors carload business—not more than two per cent of the total tonnage being less than carload. So also does it leave a large proportion of the total tonnage to such goods as coal, salt, bricks and grain—heavy commodities. Of the total tonnage handled in 1915, 45 per cent was mineral

Photograph, Underwood & Underwood, N. Y.

A Chinese Railway Shop

hire ten coolies all day,—and on the Peking-Mukden it is \$20 per day. It is customary to make some allowance for particularly bad weather, but, in spite of devoted missionary effort these many years, commercial China knows little about Sunday. It is evident therefore that Chinese cars are not likely to be used for warehouses.

No Surplus Equipment

It should not be overlooked also, that the car supply of Chinese railroads has not been designed to meet "peak load" conditions. Hence the average performance is not dragged down by an extravagant surplus of idle cars during long slack seasons. In fact there is a car shortage in China. It attracts little attention for it is the normal condition. Many

products. However, this is a lower percentage than in the United States. But the Chinese shipper has developed great capacity for co-operation so as to make up a full car-load. A common method is for the innkeeper at a shipping point to consolidate several small shipments and consign them to the innkeeper at destination, who in turn acts as distributor according to instructions sent him. On some of the lines regular forwarding and receiving companies have developed to perform this service.

Then, too, there has been a concession to the small shipper in the form of a four-wheel truck of 10, 12, or 15 tons capacity. It has draft gear equal in strength to that of larger cars. Its dead weight is about five and a half tons,—not much more in proportion to capacity than in the case of

cars whose capacity is 20 tons. Cars of 30 and 40 ton capacity, however, weigh but little more than the 20-ton cars, and so the use of four-ton trucks instead of one 40-ton capacity car would involve the hauling of considerable extra dead weight—but certainly no more than in the case of the large American cars hauled on the average with only about half a load. The ten-ton car helps the average result.

America Can Profit from Chinese Experience

Undoubtedly circumstances and Chinese railroads to obtain high car performance records, but the principal aid is the Chinese shipper. It should be evident to American shippers that the number of cars on American railroads cannot be increased much during the war. The alternative

Photograph from "Illustration & Newswood, N. Y."

A Scene at Hankow on the Pekin-Hankow Railroad

is to get maximum service from the supply at hand. Chinese experience shows that greater service can be obtained. The methods are not inapplicable to American conditions if shippers will make up their minds to it. To change will involve some hardship, but all will share alike. It would appear that American shippers are now suffering hardships. They have merely a choice of them. Leisurely free-time, low demurrage rates, and minimum loads have brought a crippling car shortage. Free-time limited to one working day, prohibitive demurrage rates and charges based on maximum loads, will increase the present car effectiveness 50 per cent, and perhaps more. It's up to the shippers. Which will they take?

And if the new rules should make more labor necessary for loading and unloading—well, China can furnish that

PARAGUAYAN RAILWAY CONCESSION.—In January, 1916, a concession was granted to the Azucarera Paraguaya Co., with sugar factories at Ioliquiry, 120 kilometers (75 miles) from Asuncion, for the construction of a branch railway 22 kilometers (14 miles) in length, with a gauge of one meter. The first section of 13 kilometers (9 miles) must be completed within two years and the remainder within six years. For a period of 25 years no taxes are to be levied on this concession and all materials, including machinery, tools and spare parts required for the construction and maintenance of the line are to be free from customs duties. In event of sale the government has the option of taking over the railway by paying 20 per cent more than the cost of construction.—*Commerce Report.*

Who Wastes the Fuel?

By Master Mechanic

When the locomotive is the subject of talk. Judging from articles in technical journals, the reports of conventions and even from the remarks of a large number of mechanical experts, the engine crew are almost wholly responsible. But are they?

When the locomotive and train have been subjected to save coal and cautioned and criticized and sometimes even threatened with discipline if they do not it is sometimes felt that a disagreeable duty has been performed, and the result should be shown by a great improvement in the fuel record.

I do not wish to relieve the engine crew from their responsibility, no one will deny that the proper interest in, and the study of fuel economy on their part will result in enormous savings when put into practice. But the failure to note the shortcomings of others and continually placing all of the responsibility on these men is not only wrong but it is decidedly detrimental to the service.

Enginemakers, firemen and mechanics, in the majority of cases today, are as well read, intelligent and keen, as the officers under whom they serve, and to criticize them because of the amount of fuel burned when they have an engine that should be in the shop, or they have been delayed on the road five or six hours on account of poor meeting points, is not likely to be productive of very good results.

There is hardly anyone in the employ of the railroad, from the president to the water boy, who is not responsible for waste of fuel, and for good measure we might also add a few patrons of the road. How about the higher officers? There is probably no single thing more responsible for the unnecessary consumption of fuel than lack of adequate locomotive terminal facilities. At the present time it may be impossible to procure the necessary money to provide them, but how much thought has been given to this matter in the past, when money was used for less essential purposes? What investment would pay better dividends in northern climates? One only needs to note the number of engines kept fired up outside in zero weather on account of lack of stall room to be convinced of the magnitude of the loss thus sustained, not only in waste of fuel but also in the condition of the power. If officers gave more thought to this matter possibly repairs and improvements would be made in seasonable weather and the applying of new roofs on round-houses, installation of new turntables, etc., would be done at some other time than between November and April, when in the northern parts of the country the temperature is anywhere from zero to 35 deg. below.

Good water is a great factor in fuel consumption and every additional one-sixteenth inch of scale on the heating surfaces makes its effect felt very quickly on the fuel pile. How often is the quality of the water supply given adequate consideration along with the question of availability?

Does the superintendent always see that the running time of trains is equalized as much as possible in time cards so that the day complaint that "we have to go as fast as we can turn a wheel from A to B and the time from B to C is so slow that you are afraid of getting lost going on the wheels" is not justified? Sometimes there is a good excuse for this variation in time but not always. High speed means increased fuel consumption.

On the majority of the roads, the supervision of engine crews and the reduction of fuel consumption rests with the road terminal or station. Any time is actually one where there should be some or from not little thought is usually given to the possibility of having him to attend to this work, when he is engaged to ride in an official train or for some other

job outside of his regular duty. Fuel economy will not be a great success when left to itself.

Superintendents do not consider enough the proper distribution of power to obtain the maximum fuel economy consistent with good service. Where coal is under the supervision of the superintendent he does not always take sufficient interest in seeing that it is picked up around coal chutes and yards; or that the coal burned in way cars, flag houses, etc., is charged to proper accounts. While this may not save fuel it at least gives the locomotive some credit.

While not as large a factor as some others, the division engineer can help out in fuel economy by giving proper thought to it when locating side tracks, etc. The reduction of curves and grades is an important factor, and the removal of slow flags as soon as consistent also means the saving of coal. Sawing by on account of short side tracks wastes fuel and every time an engine or train is stopped or slowed down the coal pile is decreased.

Fuel economy propaganda cannot be presented to engineers very successfully when the master mechanic fails to keep his engines in such condition that they will perform their work successfully and economically. Lame engines, blowing valves and pistons, leaking steam pipes, etc., not only in themselves do not tend to fuel economy but they destroy what little interest in the subject the crew may have felt.

No one person wastes as much coal as the train dispatcher, more especially in a single track district. How many dispatchers make a study of the profile of the road and are thoroughly acquainted with the grades and curvature at important points on the line? Many a ton of coal has been burned and many a drawbar has been pulled out in doubling out of stations at the bottom of sags, after stopping for orders or to answer messages that could just as well have been delivered or answered at stations where grade conditions were favorable. Frequently messages are sent to trains at unimportant stations, requiring immediate explanation of the cause of a few minutes' delay to a passenger train, when more time is lost in answering than in the original delay. To make up the time thus lost costs fuel. Such messages should either be held for delivery at the terminal or sent to a station where the work to be done will allow sufficient time to answer the message without additional delay to the train.

How much attention does the dispatcher give to fuel economy when he knows that a train has a large enough engine to make up any time that may be lost? The train is laid out on any pretext, and then messages sent requiring an explanation of the delay. This refers particularly to single track districts.

Trainmasters can save coal by insisting upon co-operation between engine and train crews, in reporting improper train dispatching and in seeing that proper switching is done at terminals so that cars are placed in trains in station order as far as consistent. Every time an unnecessary engine movement or switch is made fuel is being wasted.

Next to the engineer and fireman the road foreman of engines is usually considered the person most responsible for the economical use of fuel, where there is no organized fuel department, and if allowed the necessary time properly to supervise the work of the crews, he should be able to obtain results. To do this he must be able personally to demonstrate the truth of his teachings and be possessed of such a personality that he may secure the good will and co-operation of the men.

The roundhouse foreman's part in fuel conservation is almost second to none and the care and supervision given by him to see that repairs to engines are properly made, that superheater and other flues are cleaned every trip, boilers washed, flues expanded, grates cleaned, and engines fired up at the proper time, will not only save many tons of coal but avoid engine failures. Roundhouse foremen, especially

the night foremen, should be given every possible help and encouragement and no unnecessary criticism.

The list could be continued to show that the mechanic who does an improper job, the agent who causes an unnecessary switch, the switching crew that works on a switch and must make a reverse movement every time a switch is made, the track force who leaves out an unnecessary slow flag and the car repairer that allows a car to go out with dragging brakes or an improperly packed journal box is guilty of fuel waste as well as the fireman who shovels coal into the firebox unnecessarily.

What can be done to better these conditions? The following suggestions will help, if complied with.

Every effort should be made to get the best water available. This will not only save fuel but the boilers as well. Money spent in this manner is like "bread cast upon the waters" but instead of waiting many days the returns will begin to accrue at once.

If a large amount of coal is to be stored, proper measures should be taken to prevent its deterioration either by submergence or other means. Coal records will suffer when coal is used that has been allowed to lie out of doors and deteriorate for two years or more.

Adequate locomotive terminal facilities should be provided and construction of buildings or their repair should not be undertaken in extremely cold weather.

More attention should be given to train movements, the time equalized as much as possible, and unnecessary stops eliminated. The cross-hauling of cars should be checked.

Power should be given repairs when needed and sufficient roundhouse forces provided to keep it in the best serviceable condition.

Enough supervision should be provided properly to check the use of coal by engine crews and to instruct them in the principles of combustion.

The distribution of fuel should be closely checked and coal burned in other ways than by the locomotive should be charged to the service in which it is used.

Coal should be checked both for quality and weight. While possibly there may be no such thing as poor coal, yet no one will deny that some coal is better than other coal.

All concerned in the waste of fuel should be held as responsible as the men actually using and handling it. The work of train dispatchers, roundhouse forces, yard and station men and even of car repairers should be checked as closely as that of enginemen.

Tying up power at outside points where there are no housing facilities should be discontinued, especially during cold weather. This practice wastes coal and usually ends in an engine failure the next trip, due to the dirty fire.

Regular engines should be maintained where it can be done consistently.

Cars and engine tanks should not be overloaded. A pound of coal burned in the firebox will do more work than 10 pounds spilled on the right of way.

Passing tracks should be of sufficient length to accommodate the greatest length of train which is run in the district and grades reduced where possible to do so.

The actual weight of the coal placed on engine tanks should be given. It is hard to convince an engineman that he has burned an unreasonable amount of coal when there is only a guess made as to the amount of coal delivered.

Trains should be given thorough inspection for air leaks and dragging brakes, and the packing in journal boxes given attention.

A periodical check made by some disinterested officer or outsider with no bias either for or against any department or class of labor should be beneficial.

Parties held responsible for the economical use of fuel should be given the necessary authority, as authority and responsibility cannot be separated.

Pennsylvania System Rejects Screw Spikes

Action Taken After Exhaustive Experiments at Two Points for a Period of Eight Years

THE PENNSYLVANIA SYSTEM has been conducting an exhaustive series of tests of screw spikes and tie plates under heavy traffic for the past eight years. The details of these experiments and the conclusions which have been reached have been made public in a report prepared by W. C. Cushing, chief engineer maintenance of way, Southwest System, Pennsylvania Lines, published in bulletin No. 200 of the American Railway Engineering Association from which the following data have been abstracted. These experiments were made under the direction of a committee of engineers from the various lines of the Pennsylvania System.

The committee, at its first meeting, June 16, 1908, decided that, in view of the fact that the screw spike experiments must be made on curves where tie plates are used and also on softwood ties requiring tie plates, it would be desirable to experiment with the various forms of tie plates in conducting the screw spike test.

The locations selected for the experimental track were in No. 1 eastward passenger and freight track east and west of Birmingham, Pa., on the Middle division of the Pennsylvania Railroad, and in No. 1 westward passenger and freight

the test for the screw spikes, using steel ties, to make their portions homogeneous. The ties were bored one inch deeper than the previous one in the other section. In only one the diameter of the hole for the screw spike at the end of the case of the screw spike was increased from 2 1/2 in. to 3 in. one inch that at the center. A tie board was provided for the seat for the tie plate in that time used. These tie plates, which were used in the tie for screw spikes independent of those engaging the rail, were absolutely fastened to the tie with the outside screw spike and washers. The other screw spikes or clips were then treated as different separately at was most desirable. No same was made for the standard cut spikes. Screw spikes were not supposed to be driven into the ties but it was required that they be placed in the use of the proper wrench.

Performance of Each Type at Birmingham

Type 1A—Standard track with standard 7 in. by 9 in. by 7 1/16 in. tie plates and standard rail spikes and ties.

No deterioration of any kind was evident for one year and eight months, when the ties began to show galling under

Tie Plate, Screw Spikes and Clips for 100-lb. P. S. Rail

track east of Wooster, Ohio, on the Eastern division, of the Northwest System, Pennsylvania Lines West.

After a very thorough investigation of the experience of foreign railroads with screw spikes, plans were prepared for seven types of rail fastenings, four of which were to be used on oak and pine ties, and two (without tie plates) to be used on oak ties only. One type was eliminated. All ties were to be cross-tied, and one-half of each section was to be laid with cow-hair pads. Detailed instructions for the installation and inspection of the experimental track, and blanks for reports were also prepared.

During November and December, 1909, and January, 1910, the track at the adopted location east and west of Birmingham, Pa., was prepared by putting in fresh ballast, preparing for thorough drainage, etc., and 10 sections of experimental track each 1,000 ft. long, were installed. During the last eight months of 1910 the same was done east of Wooster, Ohio. In less than a month after installation the cow-hair pads began to be squeezed out from under the tie plates in the Birmingham track and in six months they were nearly all out.

Previous to installing the test sections holes were bored in

the outer edge of the tie plates on the inner side of curves. This cutting continued for one year, being found necessary in some places to clear the ties under the base rail. On 52 of the ties the plates were cut that they extended to the outer edge of the tie plates after 2 years and 7 months. In the case of the ties at Birmingham, after 2 years and 7 months, the ties were found to be in good condition, and the ties were found to be in good condition, and the ties were found to be in good condition. On 52 of the ties the plates were cut that they extended to the outer edge of the tie plates after 2 years and 7 months. In the case of the ties at Birmingham, after 2 years and 7 months, the ties were found to be in good condition, and the ties were found to be in good condition. On 52 of the ties the plates were cut that they extended to the outer edge of the tie plates after 2 years and 7 months. In the case of the ties at Birmingham, after 2 years and 7 months, the ties were found to be in good condition, and the ties were found to be in good condition.

After six months' service, the plates began showing considerable deterioration, indicating that the 7 in. by 9 in. tie plates were too small for softwood ties and, in cutting, was producing considerable wear on the outer edge of the tie plates. It was decided that the tie plates should have been half longer than the ties. Accordingly the increased ties in relation to the three ties was obtained in January, 1911, increasing the length by 6 in. at the outer end. A similar change

had previously been made on the Lines West, the increase being $\frac{1}{2}$ in. It was apparent that a 7 in. by 9 in. tie plate was utterly inadequate for pine ties or even for oak ties under the heavy traffic at this point and that pine ties would not be suitable for such locations, even with very large tie plates. After a service of 2 years and 11 months 232 of the ties (about 40 per cent) were cut $\frac{3}{8}$ in. or more, and in 3 years and 7 months, 267 ties were cut this amount. After four years' and three months' service nearly all the ties on the curve had been adzed under the low rail, 175 had been removed on account of wear and 196 others were cut $\frac{3}{8}$ in. or more. After 5 years and 5 months 359 ties were cut that amount. In May, 1915, 92 ties were renewed on account of being cut by plates, making a total of 267 renewed for this cause; 48 other ties were renewed in June, 1912, on account of damage from derailed equipment, at which time 257 other ties were cut. Otherwise the track continued in good condition until the conclusion of the experiment, July 31, 1915.

TYPE 2—Standard track, standard nail spikes, no tie plates; oak ties.

After five months the cutting of the ties by the rail was noticeable, but the penetration was only about $\frac{3}{16}$ in. after 1 year and 7 months' service, and $\frac{1}{4}$ in. to $\frac{3}{8}$ in. after 2 years and 4 months. After 2 years and 10 months, 72 ties were cut $\frac{1}{2}$ in. or more, and 161 ties were cut $\frac{3}{8}$ in. to $\frac{1}{2}$ in. after a service of 3 years and 4 months, when (April, 1913) this section was eliminated from the experiment owing to the failure of Type 3 with which it was being compared. The canting of the rail was slight, the gage widening only $\frac{3}{16}$ in.

TYPE 3—Screw spikes with rolled clips; no tie plates; oak ties.

The rail cut into the ties in the same manner, but not quite as fast as in the case of Type 2. After one year about a dozen of the clips were loose. In two years and four months 29 ties were cut $\frac{1}{4}$ in. to $\frac{5}{16}$ in., 293 clips and 41 spikes were loose, and after 3 years 4 months 451 clips and 114 spikes were loose. At this time (April, 1913) the rail had penetrated the ties a distance equal to the thickness of the base of the rail at its edge, which permitted the rail to slip under the clips, thus widening the gage. This type was therefore eliminated from the experiment.

TYPE 4A—Screw spikes, rolled clips, standard 7 in. by 9 in. by $\frac{7}{16}$ in. tie plates; oak ties.

During the first three months of service 132 of the clips became loose, and in spite of frequent tightening of the spikes, the loosening of the clips increased, and their rattling was quite perceptible in riding over this section of track. After one year the cutting of the tie plates into the ties at the outer edge was noted. After one year and seven months 500 clips and 30 of the screw spikes were loose and could not be tightened. In October, 1911, this type was eliminated, there being 993 loose clips and 60 loose spikes at that time. The tie plates cut into the ties at the outer edge on the inner side of the curve to a slight extent, there being no noticeable difference in this respect between this type and Type 1a.

TYPE 4B—Screw spikes, rolled clips, standard 7 in. by 9 in. by $\frac{7}{16}$ in. tie plates; pine ties.

The behavior of this type was precisely similar to that of Type 4a except that the plates cut more rapidly into the ties and the screw spikes loosened more quickly. This type was eliminated at the same time as Type 4a (October, 1911), there being 986 loose clips and 181 loose spikes at that time and 185 of the ties being cut by plates $\frac{3}{8}$ in. or more.

In July, 1911, photos were taken of ties taken from Birmingham experimental track types 4a and 4b, and split at the spike holes. These photos showed that while the holes had been bored one inch below the bottom of the spike, the screw threads in the wood were entirely destroyed, there being no appreciable difference between the oak and pine ties.

TYPE 6A—Screw spikes with malleable iron tie plate chairs 7 in. by 13 in. by 2 in.; bolts and clips; oak ties.

After 3 months' service 35 of the screw spikes were found

to be slightly loose, and after 18 months the cutting of the plates into the ties became perceptible at the outer edge of the plates under the inner rail on curves. This type of track shows a higher cost for lining than the others because the bolts must be loosened and retightened after the track is thrown to line. It was noted that the feet of the rail anchors bore against these tie plates and it was thought that special rail anchors should be designed for types 6a and 6b that will bear against the tie. After a service of 2 years and 3 months 20 ties were cut about $\frac{1}{4}$ in. on the outer edge of tie plates under the low rail, and 32 of the screw spikes were loose. In 3 years and 5 months 166 ties were cut $\frac{3}{8}$ in. or more and 416 spikes and 24 clips were loose. In February, 1914 (4 years and 1 month service), the cutting of the ties at the outer edge of the plates and the resultant canting of the rail was found to have widened the gage to 4 ft. $\frac{9}{16}$ in. at some points with full section rail. It was evident that this particular design was not properly balanced to resist the overturning forces which caused the canting of the rail and cutting of the outer edge of the tie plates into the ties and it was thought that nothing could be gained by further experiment with it on sharp curves and that a new tie plate of similar style or type, with more bearing area outside of the rail than inside, should be designed. It was accordingly decided that where the rail was canted sufficiently to make the gage 4 ft. $\frac{9}{16}$ in. with full section rail these tie plates should be replaced with standard tie plates, which was done on 200 ties; 965 of the spikes and 64 of the clips were loose at this time (February, 1914). The whole section was eliminated in May, 1914.

TYPE 6B—Screw spikes, with malleable iron tie plate chairs 7 in. by 13 in. by 2 in.; bolts and clips; pine ties.

The same conditions of cutting of ties and canting of rail as noted under Type 6a prevailed on this section except that the cutting was more rapid into the pine ties of this type of track. After a service of 2 years and 3 months 135 of the ties were cut $\frac{1}{4}$ in. or more, and a few as much as $\frac{1}{2}$ in., and 11 spikes were slightly loose. In 3 years and 5 months 301 ties were cut $\frac{3}{8}$ in. or more and 89 spikes and 28 clips were loose, and in 4 years and 1 month 374 ties were cut $\frac{3}{8}$ in. or more and 423 spikes and 96 clips were loose. The same comment applies as under Type 6a regarding the higher cost of lining and rail anchors bearing against tie plates. This section was eliminated from the experiment at the same time as the other (May, 1914). Another effect of the widening of the gage was that the rail wore out about twice as fast on the 6 deg. curves with Types 6a and 6b, as on the 6 deg. curves on Types 1a and 1b (standard tie plates). When this excessive rapidity of wear was observed, samples of the rail were analyzed and found to be of normal composition, hence the excessive wear was evidently due to wide gage. A total of 423 spikes and 96 clips were loose on Type 6b in February, 1914.

TYPE 7A—Screw spikes with rolled steel tie plates 7 in. by $1\frac{1}{2}$ in. by $\frac{5}{8}$ in.; oak ties.

After eight months' service a few of the screw spikes (both plate spikes and rail spikes) were found to be loose, and after 2 years and 4 months the tie plates were observed to be cutting into the ties, eight ties being cut about $\frac{1}{4}$ in. Nineteen of the spikes were loose at that time. Six months later (October, 1912) 36 of the spikes were slightly loose and 19 ties were cut $\frac{1}{4}$ in. to $\frac{1}{2}$ in. but, as on Type 7b (pine ties) some of the spikes were so loose that they could be extracted with the fingers, the committee decided to try the Lakhovsky split lining. The application of these linings cost 9 cents each in oak ties and 7 cents each in pine ties. A total of 459 of these devices were applied on Section 7a and 207 on Section 7b during 1913; but they did not prove effective, and the spikes equipped with them soon became loose again. After a service of 4 years and 2 months 139 of these ties were cut $\frac{3}{8}$ in. or more and 430 spikes were loose (including 12 of the 459 that had been equipped with

Lakhovsky linings.) It was noted that the cutting of the outer edges of the plates into the ties was canting the rail and widening the gage in the same manner, though not to the same extent, as on Type 6a, owing to the lesser thickness of the tie-plate ($\frac{1}{8}$ in. as against 1 15/16 in.), but as this form of track can be repaired without difficulty it was decided to continue it, adding the ties when necessary. All the ties on the curve were added under the low rail in September, 1914. It was not found necessary to do any adding under the high rail. At this time 22 of the 459 spikes which had been equipped with Lakhovsky linings were again found loose and there were 275 other loose spikes. Seven months later, after 5 years and 4 months' service (April, 1915) 281 ties were cut $\frac{1}{8}$ in. or more and 482 spikes were loose, including a number with Lakhovsky linings, and in June, 1915, 281 ties were cut and 492 spikes were loose.

In June, 1915, the wooden plug method of re-setting spikes which is extensively used abroad was tried. Locust plugs 1 in. by 1 3/16 in. at the top, $\frac{1}{8}$ in. by 1 in. at the bottom, and 5 in. long were used for the rail spike holes and smaller plugs $\frac{1}{4}$ in. by $\frac{7}{8}$ in. at the top, $\frac{1}{8}$ in. by 1 1/16 in. at the bottom and 3 1/2 in. long, for the plate spike holes, these dimensions bearing the same relation to those of the spikes as the measurements of the wooden plugs used in France bear to the spikes in connection with which they are used. These plugs were driven into the spike holes in ten ties where the spikes had come loose, the holes were re-bored and the spikes re-set. The spikes soon became loose again and a laboratory test was made which showed that the resistance to extraction offered by the screw-spike in the plugged hole was not greater than that of an ordinary nail spike. This type of track was accordingly eliminated in August, 1915, at which time there were 358 loose spikes and 264 ties cut by plates. The ties on the curve were added under the low rail in September, 1914, to restore the canted rail to its normal perpendicular position. Seven ties were renewed on this section, four of them on account of original defect and three on account of wear.

Type 7n—Screw spikes with rolled steel tie plates 7 in. by 1 1/2 in. by $\frac{5}{8}$ in.; pine ties.

The service afforded by this type was similar to that of Type 7a except that the softer ties naturally offered less resistance to cutting by plates and loosening of spikes. After a service of 2 years and 4 months 17 of the ties were cut $\frac{1}{4}$ in. or more and 16 of the spikes were loose. After 2 years and 10 months 63 ties were cut from $\frac{1}{8}$ in. to $\frac{5}{8}$ in. and 49 spikes were loose, several of the latter, particularly at the joints, being so loose that they could be extracted with the fingers.

At this time the committee considered several methods of resetting the loose spikes, as follows: (1) The square plug was discarded at this time for the reason that it could afford only temporary relief, as the same forces which loosened the spike in the tie would loosen it in the plug. (2) The Thillier helical lining was not adopted because it cannot be applied to track in service. (3) The Collect trial possessed the same objection as the square plug, though it might hold the spike somewhat longer, but it has the additional objection that it has a very large diameter and would therefore inflict too much injury on the tie. (4) The Lakhovsky split lining was adopted and 207 spikes were equipped, but in February, 1914, 15 of them were again found loose. At that time 198 ties were cut $\frac{1}{4}$ in. or more. In April, 1915, there were 450 ties and 582 loose spikes, and in June 541 cut ties and 475 loose spikes. In August, 1915, this type was eliminated. At that time there were 685 loose spikes and 451 ties cut by plates. Five ties were renewed on this section on account of wear.

In the Spring of 1911 the rail on the 6 d.c. curves on Types 1a, 1b, 4a, 4b, 6a and 6b was raised, when the gage returned precisely to that first reported for the track was installed, thus proving that there had been absolutely

no lateral movement of the tie plates under normal use.

During the first 20 months there were 114 joint bar failures on the Birmingham track, of which one was Kevette insulated, five were standard No. 30 bars, seven had semi-circular bars for screw spikes and 103 ties remained intact for clips. As this showed conclusively that the deep rectangular slotting for the clips was conducive to the fracture of the bar, the design of clips for Types 3, 4 and 6 was revised to permit the slot to be semi-circular.

In view of the fact that the removal of the nailheads from the plates (Type 6) necessitated the cutting of 75 ties on Section 6a and 45 on 6b about 1 1/2 in. longer than the other ties, and as these ties were scattered throughout the portions of these sections remaining in track, giving the track a very ragged appearance, and also that all the curved portions of these sections were eliminated from the experiment in February, 1914, on account of the widening of the gage, the remainder of the two sections (Types 6a and 6b) were eliminated from the experiment in May, 1914.

Wooster Service Tests

Type 1a—Standard track with standard 7 in. by 9 in. by $\frac{1}{4}$ in. Goldie tie plates and standard nail spikes, oak ties.

After a service of 2 years and 11 months, the cutting of the tie-plates at the outer edge was quite marked, 10 of the ties being cut $\frac{1}{8}$ in. One year and 5 months later 46 ties were cut $\frac{1}{8}$ in. or more and in November, 1914, when this type was eliminated on account of the elimination of the corresponding type at Birmingham 52 ties had been cut $\frac{1}{4}$ in. or more.

Type 1b—Standard track with standard 7 in. by 9 in. by $\frac{5}{8}$ in. Goldie tie plates and standard nail spikes, pine ties.

After a service of 2 years and 5 months, the cutting of tie-plates, at outer edge, into the ties was quite marked, 15 of the ties being cut from $\frac{1}{2}$ in. to $\frac{5}{8}$ in. Six months later 210 of the ties were cut $\frac{1}{4}$ in. or more, and after 4 years' service 355 of the ties were cut $\frac{1}{4}$ in. or more and two spikes were found broken. In August 1915, when the experiment was concluded, 440 of the ties were cut $\frac{1}{4}$ in. or more and 4 spikes were loose.

Type 2—Standard track, standard nail spikes, no tie plates; oak ties.

After 1 year and 9 months' service the cutting of the rail into the ties became perceptible, but none of them were cut as much as $\frac{1}{4}$ in. At two points it was noted at this time, that the rail had pushed the spikes back a little, apparently due to irregularity of surface. The cutting of the rails into the ties continued, but the gage was not seriously affected, the maximum being 4 ft. 8 11/16 in. after a service of 2 years and 3 months. In April, 1915, when this type was eliminated after a service of 2 years and 9 months on account of the failure of Type 3 in the experimental track at Birmingham, the track was in good condition, none of the ties being cut as much as $\frac{1}{4}$ in. and only one spike found standing above the base of rail.

Type 3—Screw spikes with rolled steel tie plates, oak ties.

After one year's service four of the ties were found loose, and 9 months later there were 350 ties and 47 loose spikes. After a service of 1 year and 4 months there were 174 loose clips and 67 loose spikes, and in April, 1914, 16 months later, when this type was eliminated on account of the failure of the corresponding type at Birmingham, there were 421 loose clips and 82 loose spikes. None of the rails were cut as much as $\frac{1}{4}$ in. at this time.

Type 4a—Standard 7 in. by 9 in. by $\frac{1}{4}$ in. Goldie tie plates, standard nail spikes, pine ties.

This track was installed a year later than the corresponding type at Birmingham, during which time the members of the clip and loose spike mechanism and a clip of different design having a shoulder to fit outside the base of the rail was used. After 7 months' service 50 clips were found loose,

and 3 months later there were 365 loose clips and 28 loose spikes; no cut ties. At this time this type was eliminated on account of the failure of Type 4a at Birmingham.

TYPE 4B—Standard 7 in. by 9 in. by $\frac{5}{8}$ in. Goldie tie plates, screw spikes and clips; pine ties.

After 7 months' service 175 clips and 7 spikes were found loose. The improved clip was used on this type as well as on Type 4a. After 10 months' service there were 405 loose clips and 35 loose spikes but no cut ties. This type was then (October, 1911) eliminated on account of elimination of corresponding type at Birmingham.

TYPE 6A—Screw spikes; malleable iron tie plate chairs 7 in. by 13 in. by 2 in. bolts and clips; oak ties.

After a service of 1 year 11 months the tie-plates were observed to be cutting slightly into the ties and 4 screw spikes were found loose. Six months later there were 16

cluded, 208 of the ties were cut $\frac{3}{8}$ in. or more and 124 of the spikes were loose.

The table below shows that both the annual cost and the cost per million tons traffic are less for the nail spike than for the screw spike. In comparing the costs of Types 2 and 3 with the others, it must be remembered that these two types are on straight track and oak ties and would not be suitable for curves or softwood ties.

Conclusions

1. Screw spikes have no advantage over nail spikes. When used with clips without tie plates, the cutting of the rail into the tie permits the rail to slip under the clip, thus widening the gage.

2. No satisfactory device is known for resetting screw spikes after the thread in the wood has been destroyed. When some of the screw spikes in the Birmingham experi-

| Type | First Cost | | | Annual Cost | | | Cost per million tons traffic | | |

*Interest at 6 per cent and taxes at 1 per cent (both on first cost in track), plus cost of maintenance, plus annuity, which, at 6 per cent compound interest will amount at end of life to first cost in track less salvage.

†Including installation and maintenance.

loose spikes and 8 loose clips. After a service of 3 years and 1 month 14 of the ties were cut $\frac{3}{8}$ in. or more and 195 spikes and 40 clips were loose. In May, 1914, when this type, after 4 years' service was eliminated on account of the failure of corresponding type at Birmingham there were 161 loose spikes and 31 cut ties.

TYPE 6B—Screw spikes, malleable iron tie plate chairs 7 in. by 13 in. by 2 in.; bolts and clips; pine ties.

After a service of 1 year and 5 months the cutting of the tie plates into the ties was noted, but although considerably more than on Type 6a (which had been in service 7 months longer) it was not over $\frac{1}{4}$ in. Six months later 7 spikes and one clip were loose. After a service of 2 years and 7 months 89 ties were cut $\frac{3}{8}$ in. or more and 168 spikes and 20 clips were loose. In May, 1914, when, after 4 years' service, this type was eliminated, on account of the failure of the corresponding type at Birmingham, there were 32 loose spikes and 240 cut ties.

TYPE 7A—Screw spikes; rolled steel tie plates 7 in. by 13½ in. by $\frac{5}{8}$ in.; oak ties.

After a service of 1 year and 10 months the cutting of the tie-plates, at outer edge, into the ties was noted and 5 spikes were loose. Six months later 19 spikes were found loose. After a service of 3 years only one tie was cut as much as $\frac{3}{8}$ in. At this time 182 spikes were loose. After 4 years' service there were 16 ties cut $\frac{3}{8}$ in. or more and 75 spikes were loose. In August, 1915, when the experiment was concluded, 21 of the ties were cut $\frac{3}{8}$ in. or more and 203 spikes were loose.

TYPE 7B—Screw spikes; rolled steel tie plates 7 in. by 13½ in. by $\frac{5}{8}$ in.; oak ties.

After a service of 1 year 5 months the cutting of the tie plates, at the outer edge, into the ties was noted and 8 spikes were found loose. Six months later 7 of the ties were cut over $\frac{1}{4}$ in. and 8 spikes were found loose. After a service of 2 years and 7 months 52 of the ties were cut $\frac{3}{8}$ in. or more and 50 spikes were loose, and 1 year and 1 month later 149 of the ties were cut $\frac{3}{8}$ in. or more and 37 spikes were loose. In August, 1915, when the experiment was con-

cluded, 208 of the ties were cut $\frac{3}{8}$ in. or more and 124 of the spikes were loose.

It became so loose that they could be extracted with the fingers, the committee, after considering the several devices for securing screw spikes, selected the Lakhovsky split lining and 666 of these devices were applied to loose screw spikes, at a cost of 6.82c. each for material and 9c. for labor in oak ties or 7c. in pine ties. This device did not prove effective, as the spikes soon became loose again by turning back. It seems evident that there is not sufficient friction between the metal surfaces of the screw and the lining to prevent the spike from turning. The hardwood plug method, which is extensively used abroad, was next tried, using locust plugs of the same shape and size with relation to spike as the wooden plugs used in France. This method was also unsuccessful, the spikes soon becoming loose again. A laboratory test of 32 screw spikes in plugged holes, and 12 standard nail spikes driven in oak ties in the ordinary way, showed that the average resistance to extraction was the same for the screw spikes as for the nail spikes, viz., 5,000 lb. At least a part of the plug was always extracted with the spike. The Collet trenail, which consists of a large hardwood plug threaded on the outside and screwed into the tie, was not considered advisable on account of the injury to the tie by boring holes of such large diameter as is necessary. The Tenax lining was discarded as it is similar to the Lakhovsky and has the same objections. The Thiollier helical lining was considered but not adopted for the reason that it cannot be applied to track in service. It was also thought to have the same objection as the Lakhovsky, viz., that the metal surfaces would not possess sufficient friction to prevent the screw from turning back.

3. The first cost and the maintenance cost of track equipped with screw-spikes are both considerably in excess of those of track equipped with nail-spikes, as shown in detail in statement of annual cost of maintenance of Birmingham and Wooster experiments. The average first cost, at Birmingham and Wooster, of ties and rail fastenings for 1,000 ft. of track with tie plates and nail spikes was \$1,044, while that of similar track with screw-spikes was \$1,782, or an increase of 71 per cent. The universally admitted higher

first cost of screw-spike track can only be justified by a corresponding decrease in the cost of maintenance. Such a decrease was not effected in this experiment; on the contrary, the average annual maintenance cost of the nail-spike track was \$598, and that of the screw-spike track \$892, or an increase of 72 per cent. Where tie plates were not used, which in heavy service tracks is of course practicable only on straight track on account of the rapid cutting of the rail into the ties on curves) the same relation obtained, though in lesser ratio, the first cost of the nail-spike track being \$847 and that of the screw-spike track \$1,087, an increase of 28 per cent; the maintenance of the former \$109 and that of the latter \$306, an increase of 180 per cent. While derails and accidents have not at any time during the experiment damaged the track sufficiently to throw it out of service, thereby necessitating quick repairs, our record of installation of the screw-spike track indicates that in such a case the time required to repair screw-spike track would be more than 60 per cent greater than would be required for nail-spike track, with the same number of spikes and tie plates of similar pattern, even if ties already buried for the screw-spikes were at hand. In the event of an accident destroying any considerable stretch of track, the avoidance of the delay to traffic which would be occasioned by the excess time required to make repairs with screw spikes would justify the use of nail-spikes for temporary repairs, and the subsequent application of screw fastenings, with the waste of material involved, would greatly increase the cost of repairing track after wrecks.

4. Cow-hair pads as applied in this test have no value as a protection for the tie, as they were quickly squeezed out from under the tie plates where the traffic was heavy.

5. The 7 in. by 9 in. by 7-16 in. plate is inadequate for pine ties, or even for oak ties, under the heaviest traffic on the Pennsylvania Railroad, and loblolly or sap pine ties are not suitable for such traffic even with very large tie-plates. The maximum load sustained by a tie plate under 100-lb. rail is about 45 per cent of the load imposed by the wheel and under our heaviest equipment (including dynamic tugment and impact), is about 26,000 lb. on tangents and the outer rail of curves, and 36,000 lb. on the inner rail of sharp curves.

6. While the 7 in. by 9 in. by 7/16 in. tie plates were found too small under heavy traffic, it is not determined whether the 7 in. by 13 1/2 in. by 5/8 in. tie plates or the specially designed wrought- and cast-iron tie plates of greater area and thickness, for the more uniform distribution of the load, will prove economical and save enough in the less cutting of the tie to pay for the additional cost. The cost of maintenance with screw spike fastenings and 7 in. by 13 1/2 in. by 5/8 in. tie-plates is greater than with nail fastenings and 7 in. by 9 in. by 7/16 in. tie-plates.

7. The plates when flat and symmetrical cut more rapidly into the tie at the outer edge, thus canting the rail. They therefore should be so designed as to bring the line of contact as near the center of the plate as practicable.

8. When necessary to slot joint bars to permit the use of clips the slots should be semi-circular in shape, as large rectangular slots weaken the joint bars causing breakage.

When the committee inspected the screw spike track on the Delaware, Lackawanna & Western and the New York, New Haven & Hartford, the maintenance of road officers of these roads stated that screw spikes were giving no satisfaction. It had been adopted as standard. It should be born in mind, however, that new screw spike track was compared with ordinary nail spike track, and it is probable that if a section of the latter had been laid new at the time of the installation of the screw spike track, its performance would have been as satisfactory as, and its maintenance cost less than, that of the screw spike track, as was the case at Birmingham and Wooster.

We also advise that the flies from our two screw-pike truck on the December 1 experiment and Western are about 71,000 tons and on the New York, New Haven and Hartford about 8,000 tons. The traffic on the experimental truck at Birmingham averaged 14,100 tons per day, and at Worcester 21,000 tons per day. As the average at Birmingham is about twice that on the Massachusetts and New Haven roads, it is probable that when the volume on the latter roads reaches the total carried on the Birmingham experimental truck, they would not be in any great measure increased due to the screw-pike.

The screw pile made at Greenacre (Long, New York, New Haven & Hartford, is now in almost the same condition as when inspected by the committee in November, 1914, except that the cutting at the toe of the screw pile has increased slightly. The penetration of the screw pile into the bottom of the toes show evidence of being driven up from a distance of at least three years additional service. Most of the screw piles are standing up from a distance of about the rail and a few are tipped in such a position as not indicate any superiority of the screw over the pile. No cases were found where the screw failed in less than being destroyed.

The Delaware, Lackawanna & Western is now experimenting with a new fastening in which the tie plate is secured by bolts extending through the tie and a metal plate underneath the tie. This would seem to indicate that screw spikes have not proved altogether satisfactory.

In conclusion, it may be said that throughout the experiment as elsewhere, it has been evident that there is no cause for traffic from failure of ordinary rail spikes either by bearing or extraction, and the question of securing greater holding power by the use of screw spikes is solely a matter of economy, so that in order to justify its use, the new spike must accomplish a reduction in cost of track maintenance sufficient to offset its higher first cost. This need has not been accomplished; in fact, the screw spike has not only been more costly to maintain, but also less reliable than the nail spike, and while it holds better at first, owing to its greater initial resistance to extraction, it becomes quickly loose under continued raising by the wheeling action of the rail. The nail spike, on the other hand, once set, still retains a very considerable portion of its holding power.

A "Solemn Rite of Circumlocution"

WITH A Congress that recognizes that we will do, not only to a joint study, the Senate Committee on Interstate Commerce has introduced the Administration Railroad bill to secure the President of the power of rate-making. Giving the rate to the Interstate Commerce Commission and the state railroad commissioners. And the pretense to regulate it.

Transcontinental Rates to Be Increased

THE INTERSTATE COMMERCE COMMISSION on January 30 issued its opinion and order in the Transcontinental Commodity Rate Cases, approving in part and denying in part the applications filed by the carriers for permission to increase rates to the Pacific Coast terminals on account of the commission's decision of June 30, 1917, that water competition does not now justify lower rates to the coast terminals than to intermediate points.

In *Transcontinental Rates*, 46 I. C. C., 236, the commission found that existing water competition between the east and west coasts of the United States did not justify the maintenance by the rail carriers or water-and-rail carriers of lower rates on commodities from eastern defined territories to Pacific coast points than were contemporaneously maintained on like traffic to intermediate points.

It also found that the maintenance of lower rates via rail-and-water routes through Galveston on barley, beans, canned goods, asphaltum, dried fruits, and wine from California-Pacific coast ports to the Atlantic seaboard than on like traffic from or to intermediate points was not justified. Orders were entered requiring the carriers on or before October 15, 1917, to realign the commodity rates from eastern defined territories to Pacific coast and intermediate points, and the rates via rail-and-water routes through Galveston on the commodities above named from California ports to the Atlantic seaboard to accord with the long-and-short-haul rule of the fourth section of the act.

By amendment to section 15 of the act approved August 9, 1917, it is provided that until January 1, 1920, it shall be unlawful to file increased interstate rates without having first secured from the commission approval thereof.

Under this requirement, the carriers filed on September 21, 1917, Fifteenth Section Application No. 324, and on October 22, 1917, Fifteenth Section Application No. 1399, requesting authority to file certain increased commodity rates from eastern defined territories to the Pacific coast, and, in some instances, to intermediate points. On November 16, 1917, Fifteenth Section Application No. 1822 was filed asking authority to file increased rates on barley, beans, canned goods, asphaltum, dried fruits, and wine from California ports to the Atlantic seaboard via rail-and-water routes through Galveston. By Fifteenth Section Applications Nos. 1077 and 1083, filed October 8, 1917, authority is sought to file increased export rates from various points in the United States to Pacific coast ports on traffic destined to points in Australia, New Zealand, Japan, China, the Philippine and Fiji Islands and in specific instances to Central and South American and Mexican points. By fifteenth Section Application No. 1084, filed October 8, 1917, authority is sought to file increased rates from Pacific coast ports to points in the United States and Canada applicable on traffic originating in Asia, Australia, and, in specific instances, in Central and South America, Mexico, and the Hawaiian Islands.

Hearings respecting the propriety of the proposed increases have been held at New York, N. Y., Chicago, Ill., Portland, Oreg., and Washington, D. C.

The commission does not discuss its reasons, but after considering the evidence offered, both of a general and of a specific character, its conclusion is given as follows:

1. The carriers should be authorized to file the increased rates proposed by the all-rail lines on all the carload commodities embraced in applications Nos. 324 and 1399.

2. The water-and-rail lines via Galveston should be authorized to file the increased carload rates proposed on articles as to which through all-rail rates are not published from group A to the Pacific coast and intermediate points.

3. The Southern Pacific Company should be denied authority to file rates on the 24 items mentioned in the re-

port which are lower than the rates proposed by the all-rail lines, unless corresponding rates are published by that company on all commodities which are adapted to water transportation.

4. The authority sought by the all-rail lines to cancel all of the less-than-carload commodity rates from eastern defined territories to the Pacific coast and intermediate points should be denied, but they should be authorized to file increased rates on less-than-carload commodities to Pacific coast points not higher than the present rates on such commodities to the highest rated intermediate points.

5. The carriers should be authorized to file the increased export rates proposed in their applications Nos. 1077 and 1083 from eastern defined territories to the Pacific coast.

6. The carriers should be authorized to file increased import rates as described in application No. 1084 from Pacific coast ports to eastern defined territories.

7. The water-and-rail lines through Galveston should be authorized to establish commodity rates on barley, beans, canned goods, asphaltum, dried fruits, and wine from all California ports to the Atlantic seaboard not higher than the present all-rail rates.

8. The all-rail lines and the water-and-rail lines through Norfolk seeking authority to depart from the provisions of the fourth section in order to meet the competition of the Southern Pacific Company via its water-and-rail route through Galveston have not shown that they are at such disadvantage in respect to this traffic as to justify fourth section relief and these applications should be denied.

Commissioner Aitchison, dissenting in part, said:

The order of the commission entered June 30, 1917, which denied authority to maintain rates on commodities from eastern defined territory to Pacific coast ports lower than the rates contemporaneously in effect on like traffic, to intermediate points, could manifestly have been met by the filing of tariffs reducing the rates to intermediate points to the Pacific coast port level as well as by increasing the coast terminal rates. The carriers have followed the latter course. I am unable to agree with the majority of the commission in the interpretation it placed upon the amended fourth section of the act in *Transcontinental Rates*, 46 I. C. C., 236, 252, which followed its decision *Reopening Fourth Section Applications*, 40 I. C. C., 35. The adjustment proposed in the tariffs now before the commission can be justified only by ignoring the last paragraph of the amended fourth section, and this in my judgment can not lawfully be done.

I can not find that as to the commodity rates proposed in schedules B and C, where advances are made either to the intermountain country or to the Pacific coast ports, the carriers have justified the advanced rates as reasonable. In cases before the commission in which certain rates were prescribed as reasonable in and of themselves to various intermountain points, the whole traffic of this section was not before the commission as is now the case, and it by no means follows that rates which might then have been prescribed as reasonable would have been made if the whole Pacific slope traffic instead of a limited portion thereof had been under consideration.

THE AMERICAN MERCHANT MARINE on January 1, 1917, comprised 37,894 vessels of five tons net register or over and had a total gross tonnage of 12,250,000 tons, according to a report of the Census Bureau. The geographical distribution of this gross tonnage was as follows: Atlantic Coast and Gulf of Mexico, 6,509,000; Mississippi River and its tributaries, 1,621,000; Pacific Coast, including Alaska, 1,186,000; Great Lakes and St. Lawrence River, 2,738,000; canals and other inland waters, 196,000. The distribution according to method of propulsion was as follows: Steam and other power, 6,098,000; sail, 1,089,000; unrigged, 5,063,000.

Norfolk & Western Hopper Car of 100 Tons Capacity

The Maximum Revenue Load Is 77 Per Cent of Gross Weight;
Single Member H-Section Center Sills

By B. W. Kadel

THE Norfolk & Western recently built at its Roanoke shops and put into service a 100-ton self-cleaning hopper car, of all-steel construction, using six-wheel trucks. This car, known as the Class HR, has been built as a sample from which the advisability of providing larger quantities of this type of car may be determined.

The design of the car follows previous designs of Norfolk

and the center sill of the car is composed of a Bethlehem 12-in., 841-lb. H-section and extends slightly beyond the bolsters at each end of the car, where it is milled off to exact length and a true surface. Pressed-steel draft sills are spliced to the center sill by means of a steel back stop casting and top and bottom cover plates. The draft gear stops against this casting in buffering and the back stop casting is

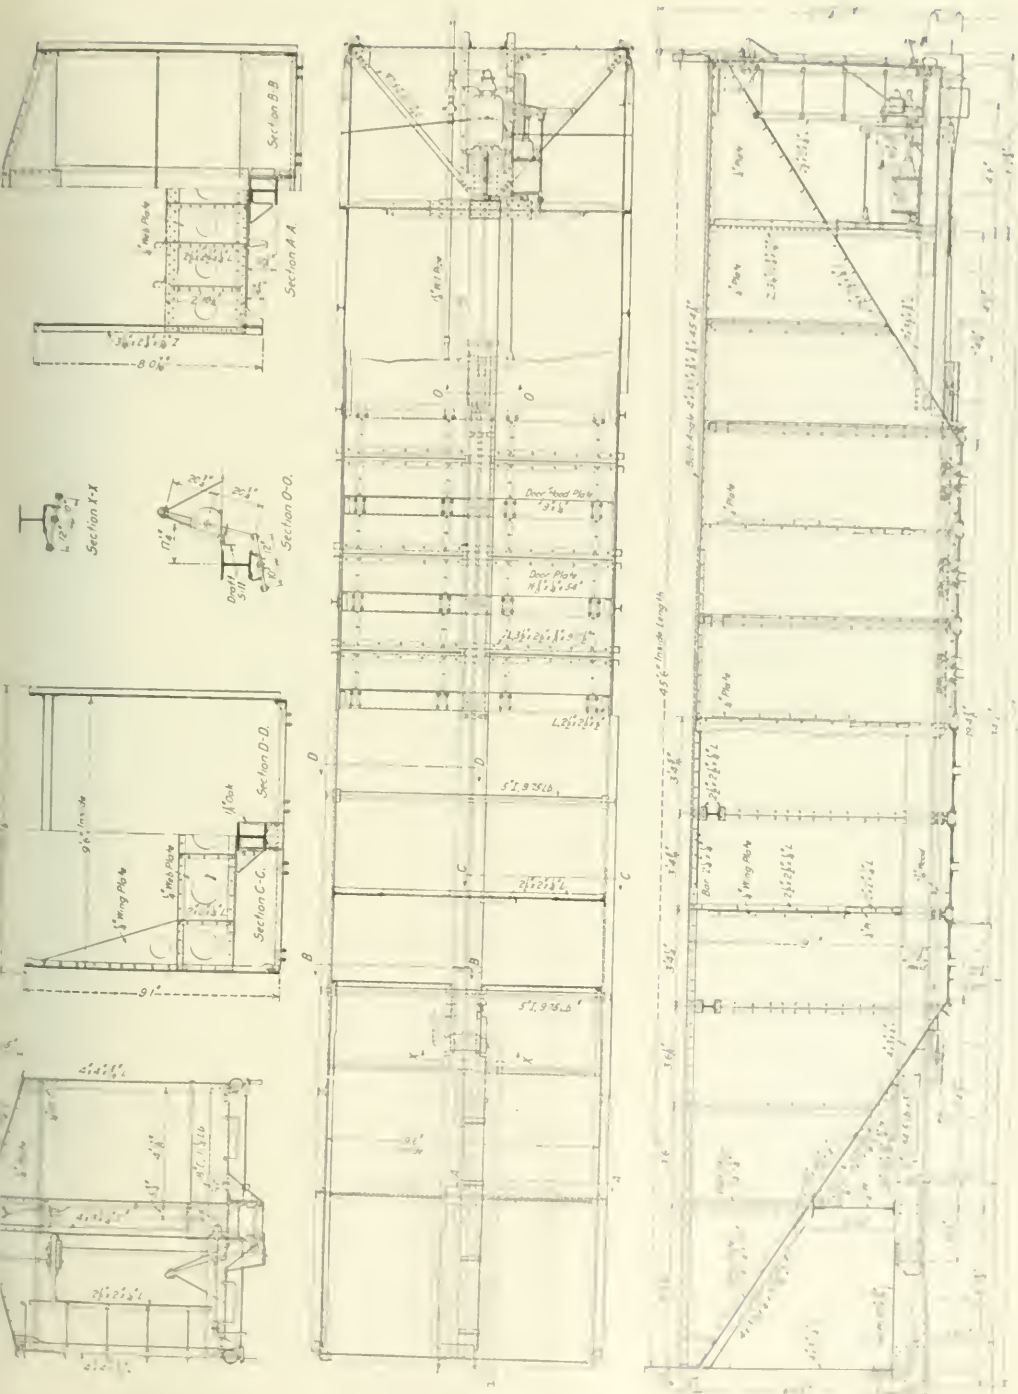

Details of the Draft Gear and Draft Sill Construction

& Western hopper-bottom cars in that the drop doors are arranged in pairs extending across the car from side to side. Six pairs of doors are used, giving a door opening approximately 19 ft. 6 in. long. Each pair of doors may be dropped independently of the others.

arranged so that they can be raised and lowered by the H-section so that all the loading and unloading is done by the center sill without depending on any other part of the car.

The draft gear is made of 7/16-in. steel plates, flanges and a steel casting. The draft gear is made of 7/16-in. steel plates, flanges and a steel casting.

Attitude of Security Owners

S. DAVIES WARFIELD, president of the National Association of Owners of Railroad Securities, recently sent a circular to members of the association regarding their attitude toward the action of the government in taking control of the railroads, in which he said in part:

The action of the government in taking over the operation of the railroads of the United States is the most far reaching recorded in our industrial history.

This association has followed the developments leading to this action and in reply to many inquiries now calls to the attention of its members the conditions under which their properties have been taken. The questions involved are of vital concern to every bondholder and every stockholder of all the railroads, and their adjustment should not be left to their operating executives. Indeed the results of any mistake here may not be confined to the holders of railroad securities—so large a part of the basis of all credit—but may be fraught with serious influence upon all enterprise for a generation to come.

The great question of permanent operation or ownership by the government, we will not discuss at this time. Its discussion involves questions of great moment, not alone to the fifty million people of the country who own, directly or indirectly, the securities of the railroads, but to all the people as a whole. It is an economic question which should be settled in time of peace; it has no place in these times of war and when there is to be discussed and determined the immediate necessities of the moment. Nor will we now discuss the details of the methods to be adopted by the government for the temporary use of the properties and for their return to their lawful owners after the war.

The exigencies of war and the conditions under which the railroads of the country were being operated made it imperative that their operation during the period of war should have the backing of the government.

We are, therefore, to assume that the bill is distinctly a measure of war, to give the necessary power to the President, and to protect the owners of the securities of the railroads during their operation by the government "at this time"—for the war period—and that such operation is for that period only.

May not the owners of the railroads, therefore, very properly make the request that the bill be framed to carry out the declared intention of taking the railroads for war purposes only and not for indefinite and continuous operation after the war, or for experimental purposes in connection with their operation or control. It should not be a requirement of the bill that the owners of the railroads, whose properties have been taken as a measure of war, must appeal to Congress to restore them at the expiration of the period for which they were taken. We may well ask that their restoration shall automatically take place at a fixed period at the close of the war.

It is not sufficient to say that we do not know under what conditions the railroads shall be returned to their owners—under what form of governmental control or regulation—or what may be the requirements for their future operation under plans of greater centralization of railroad control and for greater co-operation in operating methods, which may take place. Such reasons do not alter the fact that the government's tenancy is for the purposes explicitly stated by the President, and, therefore, can only be temporary.

Our purpose in addressing you at this time is that you may be informed as to the effect of the most important sections of the bill now before Congress and which greatly concern the owners of the securities of the properties. Provisions of less importance and certain ambiguities in the bill we need not discuss herein. As largely representing

such owners we should give co-operation to the government; we have assured them of such and we should gladly accept such rental for our properties as may be just. In fact, there are no security owners, we assume, who are not willing to make sacrifices as their patriotic duty and in their desire to help win the war. But, on the other hand, we should expect that the government will act when the rental shall cease and will operate and conduct our properties during their tenancy, forced upon them and upon us through the exigencies of war, with as little disturbance to the organizations of the several properties, which have cost millions in their development, as the demands of war conditions justify,—"nothing will be altered or disturbed which it is not necessary to disturb," the President has stated. We assume it is in this spirit that the railroads have been taken over and will be operated; in any other spirit, war conditions would be utilized as an expediency for depriving the owners of these properties of their lawful as well as moral rights. A great moral question is involved here and we are confident we can leave its settlement in the hands of our President who was specific in his reasons and purposes in taking over the temporary operation of the railroads.

This association has now the greatest responsibility of its existence, because during the period of governmental operation, and when the war closes, the position of the owners of the railroads should be clearly defined, and questions vital to such owners will arise.

Whether the great areas of unoccupied millions of acres of land of our country can be successfully and intensively developed by means better than through individual initiative and railroad operation, with the advantages incident to the full play of individual human endeavor; whether the full development of the industrial life of the nation can be accomplished better than through the competition involved in the building of railroads by private capital and the competitive system for securing and for the establishment of industries thereon, and through the proper and efficient operation of privately owned railroads under government control and regulation, wisely conducted; whether shippers in competition with other shippers, and whether the public, can secure better service than through the service they have been accustomed in times of peace to have offered them under the stimulus of individually operated enterprise; and whether employees can be given through other means the latitude for the enjoyment of personal liberty free from political restraint—all these are questions which are not at issue at this time, and should not be made an issue by an indefinite provision of an act of Congress permitting that to be done in a serious situation outside of and beyond what the President very pointedly stated was his purpose in the premises. As previously pointed out these are economic questions too vital to the country to bring up at a period other than during the time of the peaceful pursuits of the people and the conduct of our government in times of peace.

Nevertheless, if there is the intention to permit a situation to be created the result of which will make it impossible for you to get back your properties with the value attached to them at the time they are taken as going concerns, and which will fasten permanent government railroad operation on the nation, without adjusting the terms of payment for the principal of the properties, it is essential to the protection of your securities and only fair to you that such intention should be made known now.

THE QUANTITY OF COAL EXPORTED from the United States in 1917 was larger in both quantity and value than in any earlier year in the trade, the total quantity being about 32 million tons, including bunker coal, and the total value \$113,000,000.—*Bulletin of the National City Bank of New York.*

British Ambulance Train for American Wounded

The Midland Railway of England Has Built a Sixteen-Car Train for Our Forces in France

IF THERE WERE ANY DOUBTS as to whether wounded American soldiers would be properly taken care of on their journeys by rail to the hospitals behind the lines in France, they have all been dispelled by the announcement made by Surgeon General Bradley with the American Army in France on January 6 that 15 complete hospital trains have been ordered in England and two in France for this purpose.

Sick Officers' Day Saloon

The announcement followed the placing of the orders some time, for on December 29 the American ambassador, a number of United States Army and Navy officers and prominent Americans and Englishmen were able to inspect at the St Pancras station in London, the first of the completed trains—one built in the car shops of the Midland Railway of England. In the Patriotic War Number of the *Railway & Locomotive Gazette* there appeared a description of one of the ambulance trains built for the British Government by the Great Eastern Railway, and emphasis was placed on the extreme care that the British have taken to make the railway journeys for their wounded as pleasant and restful as possible under the circumstances. The American train, illustrations of which are given herewith, likewise shows evidence of this British skill and care.

The complete train consists of 16 cars with accommodations for about 450 persons, there being 300 seats for wounded and facilities for the staff and personnel. Each car is 51 ft long, mounted on four-wheeled bogie trucks, and equipped with Westinghouse brakes. The couplings, draw hooks, steam connections and side chains are to the international standard. The total length of the train, without engine and tender, is 915 ft and its weight (unloaded) 455 tons.

Each car is built of well-seasoned timber and painted khaki color, with two large red crosses on a white ground on either side. For identification purposes, the number of each car and the distinguishing letter are conspicuous on each side, and the train number with the distinguishing letters U. S. A. T. is painted on the extreme ends of the train.

The train is vestibuled, and fitted throughout with electric lights and fans. The roofs are semi-elliptical, with high and airy ceilings. Every care has been taken to admit of the interior of the cars being kept clean with the least effort. The floors are covered with linoleum or hard, and have rounded corners. The gangways between the cots are wide enough to pass the army stretcher. An abundant supply of

American Officers Inspecting the Accommodations

water (285 gal per car) is carried in tanks built in the roof.

In addition to the accommodations for patients, the train has steam from the engine, the staff car, the personnel car (labeled with a telephone symbol) and the personnel car (labeled with a telephone symbol) and the personnel car (labeled with a telephone symbol).

The order of cars in the train is as follows:
A—Engine and tender
B—Staff car
C—Personnel car (labeled with a telephone symbol)
D—Personnel car (labeled with a telephone symbol)
E—Personnel car (labeled with a telephone symbol)
F—Personnel car (labeled with a telephone symbol)

A-5, A-6, A-7, A-8, A-9—Ward cars (five).

D-2—Kitchen car (with N. C. O's and men's compartment).

C—Personnel car.

E—Brake and stores car.

The brake and lying infectious ward car (A-10) contains four wards, each fitted with six beds, an attendant's com-

partment with lavatory and toilet accommodation, and a guard's compartment with bed, folding table and seat, lavatory, etc., in addition to the usual brake equipment.

Staff car B contains dining room and sleeping compartments for the medical officers and nurses and lavatory and toilet accommodation, including side sprays. This car is also furnished with wardrobes, cabinets and book racks, and is finished and panelled throughout in polished mahogany.

Kitchen car D-1 contains an officers' pantry and cook's room is also provided in this car, containing a 4 ft., 6 in. bath, which is fitted with hot and cold water and shower bath.

The nine ward cars are open throughout, with a lavatory compartment at one end. Each car contains 36 folding cots, in three tiers, the cots in the middle tier being so arranged that they can be folded down to form backs for sitting cases on the lower tier. An ample supply of drinking water and conveniences such as paper racks, ash trays, etc., is provided for each patient. The sides and roofs of these cars are painted in glossy white enamel.

Pharmacy car F comprises a dispensary, and treatment medical officer's office, linen room, and a pantry for medical comforts, and an emergency compartment. The corridor on this car is wide enough to pass a stretcher into the treatment room. The dispensary is fitted with cupboards and racks for bottles, surgical dressings, etc. Part of this car is partitioned off and provided with eight berths, in which bad cases can be treated.

Kitchen and men's mess car D-2 contains a large kit store, wash basin, and kitchen similar to that on car D-1, a mess room, with folding table for the men, and a smaller mess for the non-commissioned officers, the latter having two

beds, so that the senior N. C. O's may sleep there if desired.

Personnel car C is arranged similarly to the ward cars, except that the mattresses of the beds are covered with American cloth, so that the beds can be used as seats by the staff during the day. Kit racks are provided, and also small lockers under the beds.

Brake and store car E contains a large linen store and a compartment provided with shelves for carrying the general provisions required on the train, a kit store and compartment for perishables and a meat safe. A brake compartment similar to that on car A-10 completes the car.

JAPANESE IMPORTS OF RAILWAY EQUIPMENT.—Among the principal imports into Japan during 1915 and 1916 were railway cars and parts valued at \$308,312 in 1915 and at \$149,039 in 1916; locomotives and tenders valued at \$113,710 in 1915 and at \$60,091 in 1916.

STEAM LOCOMOTIVES EXPORTED from the port of New York during December, 1917, were valued at \$873,377. Steel rails exported in that month were valued at \$680,127. The total exports for the month of December, says a recently issued bulletin of the National City Bank of New York, amounted to \$86,304,580.

New Priority Regulations

THE PRIORITIES DIVISION of the War Industries Board on February 4 made public Priority Circular No. 3 defining the regulations which the Priorities Division now has in effect for determining precedence in orders and work and describing the methods of administering them. The regulations are subscribed to by the Secretary of War, Secretary of the Navy, the chairman of the Shipping Board and the president of the Emergency Fleet Corporation, and the chairman of the Council of National Defense. The circular discloses a much wider field of operations than that defined in the first circular issued in September of last year. The priority regulations apply to all individuals, firms, associations and corporations engaged in the production of copper, iron and steel and in the manufacture of their products; of chemicals, cotton duck and woolen cloth, and all such other raw materials and manufactured products as the committee may deem necessary from time to time.

Under the new regulations, all orders and work are divided into four general classes instead of three as heretofore: Class AA, Class A, Class B, and Class C, with such subdivisions as AA-1, Class AA-2, etc., Class A-1, Class B-1, etc. Class AA comprises only emergency war work of a special or urgent nature. Class A comprises all other war work; that is to say, orders and work necessary to carry on the war such as arms, ammunition, destroyers, submarines, airplanes, locomotives, etc., and the materials or commodities required in their production or manufacture. Class B comprises orders and work which, while not primarily designed for the prosecution of the war, yet are of public interest and essential to the national welfare or otherwise of special importance. Class C comprises all orders and work not embraced in the other three classifications and no certificate will be issued therefor. All orders, work or materials not covered by priority certificates will fall within Class C. The new regulations in no way change or modify any priority orders previously issued. The rule of procedure from now on is that orders and work in Class AA shall take precedence of those in all other classes; orders and work in Class A preceding those in Class B and those, in turn, orders and work in Class C, irrespective of the dates the orders were placed.

"The classification of an order," the circular states, "simply means that it shall be given such precedence over orders of a lower classification as may be necessary (and only such as may be necessary) to insure delivery on the date specified in the order. It does not mean that work should cease on orders of a lower classification or that the order should be completed and delivery made in advance of orders taking a lower classification if this is not necessary to effect delivery within the date specified. The one to whom a priority certificate is directed should make his own production plans so as to get the maximum of efficiency out of his operations, making all deliveries at the times contracted for, if possible, and where this is not possible, giving precedence to those orders which take the highest classification."

As a general rule, where an application for priority certificate is necessary, it should be made by the one placing the order on which the application is based, in the name of the department or official for whose account the order has been placed, whether of the United States government or one of the allied governments. In the latter case, the application must be made through and with the written approval of the war mission, which is representing that particular government in this country. Government contractors or subcontractors, however, may make application for priority direct to the committee if their need is urgent.

The committee does not administer priority on coal and

coke, or foods and feed, which are handled by the Fuel and Food Administrations. The committee will, however, consider applications for priority assistance to procure tools, equipment, or supplies for the production of these commodities. The committee's work does not cover transportation and it does not attempt to expedite transportation.

No industry, plant, material, or commodity will be classified as such. Only specific orders for materials, commodities, or work are classified according to their importance in war preparation or in work necessary to the public interest and essential to the national welfare, or otherwise of exceptional importance.

"The paramount purpose of priorities," the circular says, "is the selective mobilization of the products of the soil, the mines, and the factories for direct and indirect war needs in such a way as will most effectually contribute toward winning the war. In requesting priority the petitioner should join with the committee in applying the test: To What Extent, if at All, Will the Granting of this Application Contribute, Directly or Indirectly, Toward Winning the War; and if at All, How Urgent Is the Need?"

Questionnaire on New Equipment, Additions and Betterments

DIRECTOR GENERAL OF RAILROADS McADOO has addressed a circular letter to the railroads under date of February 2, calling for complete information on accompanying blank forms as to new equipment, additions, betterments, extensions, etc., already contracted for or which are considered necessary for 1918. The roads are asked to send one copy of the answers with all possible despatch to the Regional Directors to whose jurisdiction they are subject and the other to the Interstate Commerce Commission.

In determining what additions and betterments, including equipment, and what road extensions should be treated as necessary, and what work already entered upon should be suspended, the roads are asked to be guided by the following general principles:

"From the financial standpoint it is highly important to avoid the necessity for raising any new capital which is not absolutely necessary for the protection and development of the required transportation facilities to meet the present and prospective needs of the country's business under war conditions. From the standpoint of the available supply of labor and material, it is likewise highly important that this supply shall not be absorbed except for the necessary purposes mentioned in the preceding sentence.

"Please also bear in mind that it may frequently happen that projects which might be regarded as highly meritorious and necessary when viewed from the separate standpoint of a particular company, may not be equally meritorious or necessary under existing conditions when the government has possession and control of railroads generally and therefore when facilities heretofore subject to the exclusive control of the separate companies are now available for common use whenever such common use will promote the movement of traffic.

"While the questions and blanks group together additions and betterments designed to improve capacity, efficiency and economy, this is done because of the difficulty of drawing sharp lines between these objects. It is important to emphasize, however, that under existing conditions the primary thing to accomplish is increased capacity to handle the traffic of the country.

"Please send as soon as possible the information called for in parts I and II of the questions and send the information called for in part III as soon as the accounts for December,

1917, shall be completed to the point where it is possible to send the information." The questions are as follows:

I.

Submit statement of equipment authorized or contracted for, or the contracting for which during the calendar year 1918 is believed by the management to be necessary for the proper conduct of the business.

Show the number of units, listing separately locomotives, cars, and other equipment in accordance with the descriptions relating to type and design carried on the blank form; where and by whom constructed; probable time of delivery; estimated probable cost of each unit; and estimated probable cost of aggregate.

Show in corresponding detail units of equipment which it is anticipated will be retired from service during the calendar year 1918, with the ledger value thereof, and approximately the way in which such ledger value will be disposed of in the accounts.

II.

Show additions and betterments (exclusive of equipment) and road extensions authorized or contracted for since December 27, 1917, or which in the judgment of the management it is necessary should be authorized or contracted for during the calendar year 1918, as follows:

(1) Total cost of additions and betterments (excluding road extensions) to existing roadway and structures which are primarily and principally calculated to increase the carrier's capacity, efficiency, or economy in respect of traffic which it expects will be offered and which could not be expeditiously and efficiently handled without such additions and betterments. In dealing with this class of expenditures, bear in mind that under existing conditions railroad facilities can and ought to be used in common so far as such common use will increase capacity, efficiency or economy. Hence, even if an expenditure would be calculated to promote these objects as to a particular railroad if viewed as a separate proposition, it would not be included under this heading where under existing conditions approximately the same objects could be accomplished by the greater common use of existing facilities of other railroads, or where the desired result could be better obtained by some joint expenditure for common use.

Give brief description of character and location of each project grouped under this heading where the cost charged to investment account aggregates \$50,000 or more, and show in addition cost chargeable to operating expenses. As to each project of \$50,000 or more thus separately listed, show probable time the addition or betterment will be completed and put into operation. As to each such project of \$50,000 or more give explanation of benefit anticipated through enlargement of capacity or increase of efficiency or economy, giving as far as possible estimate in figures of annual amount of anticipated increase in net revenue from railway operations likely to result therefrom.

(2) Additions and betterments (excluding road extensions) to existing roadway and structures, which the management thinks should be made during the present calendar year, even though not primarily and principally for the objects stated in No. 1. Describe separately each such project involving an investment cost of \$25,000 or more; show also amount chargeable to operating expenses, and give reasons why such projects should be entered upon at this time, bearing in mind the consideration stated in the next succeeding paragraph in opposition to entering at this time upon any expenditures which are not absolutely necessary. As to each such item of \$25,000 or more, state benefit anticipated therefrom and give where possible estimate in figures of anticipated annual increase in net revenue from railway operations likely to result therefrom.

(3) Extensions of existing lines (i. e., additional road

mileage), construction of new branches or new lines. Show mileage and estimated cost. Describe each extension. Say whether the construction is designed to serve a territory or locality which is already served by some other transportation system, naming such system, or is designed exclusively to develop territory not now served in a practicable way by some transportation line. Give fully the reasons why such construction should be entered upon at this time when it is of the highest importance to conserve capital, material and labor for the undertakings which are absolutely necessary and which cannot be postponed. Where practicable give an estimate in figures of annual net revenue from railway operations to be derived from such new construction.

Indicate the probable time required for completion and putting into operation.

III.

As to additions and betterments (exclusive of equipment) and road extensions which were inaugurated prior to December 28, 1917, and which have not been completed:

(1) Show amount authorized and amount already expended, showing separately (a) amounts chargeable to operating expenses, and (b) amounts chargeable to investment account. (See 5 below.)

(2) Show what part of this work in the judgment of the management, without detriment to the carrier's capacity, efficiency and economy, can and will be suspended in order to carry out the general policy herein outlined of postponing expenditures which could be avoided by joint use of facilities of other carriers and which ought to be postponed so as to conserve capital, material and labor.

(3) As to projects which the management believes should not be suspended, (a) as to each project whose investment cost is \$50,000 or more, falling in the class described in paragraph 1 of II and (b) as to each project whose investment cost is \$25,000 or more and falling in class described in paragraph 2 of II, give description and show separately investment cost and amount chargeable to operating expenses, and percentage of completion. As to projects falling in class described in paragraph 2 of II, i. e., those which are not primarily and principally to increase efficiency, economy or capacity, give the reasons why the management believes the work should be completed.

(4) As to all extensions of existing lines, and construction of new branches or new lines, show same information as is called for in paragraph 3 of II above and show also percentage completed. Show which of these projects can and ought to be suspended in order to avoid unnecessary expenditure of capital, material and labor at present.

(5) As to all items under III show the information as of December 31, 1917.

SCOTTISH RAILWAY STOCKHOLDERS' PROTECTION.—At a meeting of shareholders of Scottish railways held on December 19 in Glasgow, the following resolution was passed: "That an association to be called 'The Scottish Railway Stockholders' Protection Association' be and is hereby constituted, its objects being to take all necessary steps to safeguard and protect the interests of Scottish railway stockholders at the conclusion of the war, and that an executive committee consisting of 20 stockholders, with power to add to their numbers, be appointed, five to be a quorum, with full powers to carry into effect the formation of the association, to fix its constitution, and to take all such necessary steps and measures and incur such expense as may be deemed necessary by the executive committee to carry out the objects of the association and manage its business." Thereafter the meeting elected 20 representative stockholders to act as an executive committee, with powers to add to their number. A circular is shortly to be sent out to all stockholders of the Scottish railways inviting them to join the association.

The Relation of the Railroad to the Farmer*

Inauguration and Development of Farm Bureaus in New York State Has Had Far Reaching Results

By George A. Cullen

Passenger Traffic Manager, Delaware, Lackawanna & Western

IN AMERICA ALONE, broadly speaking, was the policy adopted from the start of pushing the railroads out ahead of the population, not only into the far and middle West, but also into unsettled sections of the East. In all these cases the railroad projectors built upon hope and with a vision and a financial courage unequalled probably in all the history of mankind.

Coupled with the marvelous achievements in securing the capital, solving the engineering problems and marshalling and directing the forces of men and material, there was another phase of this pioneer work that some of us not yet in middle life can well remember as boys. I refer, of course, to the gigantic colonization agencies of the Union Pacific, the Burlington, the Santa Fe, the Rock Island, the Missouri Pacific, the Northern Pacific and other great systems of the West, which, not content with posting quarter sheet cards on every telegraph pole, fence and barn in staid New England, sent its emissaries by the thousands across the sea and there preached the gospel of prosperity and happiness in the land of freedom to the daring or the disappointed of Europe. We know how whole states such as Kansas, Nebraska, Minnesota, and the Dakotas were peopled thus.

We often forget, however, that the government did not do this and that the people of the United States as a whole did not do it, but that we owe this, which has probably been one of the most important factors in our present national greatness almost, if not quite wholly, to our railroads.

The activities of the different railroads in contributing to the agricultural development of the territory served by their lines vary not only with the different sections and localities and with the character of the products raised, but also in a marked degree, with the individual judgments, opinions or preferences of the different railroad managements concerned. This is but natural when you realize that the work is done by railroad men who do not claim to be farmers, but who are obliged to select from the many plans put forth by agricultural experts those best suited to their conditions and to the degree of effort, personal and financial, they feel they can profitably expend upon it.

About the year 1910, W. H. Truesdale, the president of the Delaware, Lackawanna & Western, himself a western man and before coming east the general manager of one of the largest of the western granger roads, became impressed with the way in which our national food production was being overtaken by domestic consumption, so that not only was the margin for export rapidly reaching the vanishing point, but the unprecedented condition apparently approaching when America would not produce enough foodstuffs for her growing population.

It was manifest that the printed bulletins of the agricultural department fell far short of accomplishing their theoretical purpose, by reason of the inability of the average man in any line of business to interest himself in the printed page without accompanying demonstration and personal contact.

The advice of the United States Department of Agriculture was sought, and Professor W. J. Spillman, chief of the division of farm management of the U. S. department, and

the creator of the idea of the county agency, proved most enthusiastic in laying before us the principles which had already crystallized in his mind, and upon which the County Farm Bureau of today is founded. Professor Spillman's experience with county agents in the South, where they had originally been sent to exterminate the boll weevil and had gradually developed into general agricultural advisers and had led to the introduction in that section of diversified farming, inspired him with the thought that the ideal unit of scientific, agricultural instruction was the county. He saw that the opportunities which an agricultural expert had in working in a restricted area, gave him an advantage over any other possible method, by reason of the fact that it enabled him to get into personal relationships with each farmer and to add to the mere cold, hard, scientific instruction, the persuasive power of personal contact, and by persistent application upon the individual farmer induce him to try the methods which science had proved were good and practicable.

Professor Spillman welcomed the opportunity to experiment in a section such as that of the southern tier of New York, where he believed the conditions ideal to demonstrate the practicability of his plan, and when he found the Lackawanna ready to contribute the funds necessary for at least one half of the support of the bureau the first year, and the Binghamton Chamber of Commerce one fourth, he found funds available in the U. S. department for the remainder, and in March, 1911, the Broome County Farm Bureau was organized.

The first year of the Broome County Farm Bureau was a very trying one, owing to a variety of causes, such as the unfamiliarity of the farmers in that particular region with scientific methods, skepticism as to the practicability of anything particularly new or progressive, and we must admit, a certain hesitancy to accept anything so freely offered by a railroad corporation and a chamber of commerce. The work did not become really successful until an association of farmers was with some little difficulty formed and financial support obtained therefrom. I never saw a better illustration of the fact that where your treasure is, there will your heart be also, than in this work, and I am now a firmer believer than ever in the fact that if you want to get a man's interest, you had better first get his capital.

This was soon followed by a contribution from the county itself through its board of supervisors, so that today these two agencies, the Farm Bureau Association and the board of supervisors, contribute over two thirds of the total expense. Of course, with the development of the farm bureau throughout the nation, and under the provisions of the Smith Lever act, the United States government and the state governments contribute to such farm bureaus, I think, \$500 each per annum for their support, in addition to furnishing through the state colleges all of the assistance and direction necessary to make the county agent successful.

Following the Broome County Bureau and, in 1912, the formation of the Farm Bureau of Cortland County was brought about by the Lackawanna on lines similar to those already described. Shortly following that came Chemung county and then others in rapid succession.

I have just received a letter from Hon Raymond A. Pearson, assistant secretary of agriculture at Washington,

*Extract from an address before the Massachusetts State Board of Agriculture, Worcester, Mass., January 9, 1918.

in which he says: "This work must have been well done, because it has stood the test of six or seven years, and it has been followed by the location of county agents in a very large number of counties. Of the 2850 rural counties in this country, 1900 now have county agents and about 1200 of these have women demonstration agents, an outgrowth, by the way, of the farm bureau plan. I always thought that the interest of your road in this matter came from a genuine appreciation of the fact that the railroad business and the farmer's business, to a large extent, depend upon each other. In the present emergency, the importance of these great industries in their intimate relations are being emphasized as never before."

The county farm bureau under competent management is, in our opinion, unquestionably the best medium not only for disseminating scientific information, but for bringing about among the farmers co-operative action along many lines where until recently they have been suffering seriously from too great a degree of individualism. This feature manifests itself in a variety of ways. On the one hand, we find farmers through the farm bureaus purchasing their supplies, agricultural implements, fertilizers and what not, at very much more favorable terms than would otherwise be possible and with a much better prospect of prompt delivery by reason of the quantity of the shipments. On the other hand, they are in many cases making possible the sale and shipment of farm products under much more favorable terms than heretofore, the farm bureau agent being located generally in one of the principal cities of the county and in contact with the general consuming public, either directly or through the agency of some railroad, and thus finding markets of superior attractiveness and securing improved treatment at the hands of the distributors in those markets. The possibilities along the latter line are very great, and we look to see counties acting as units of distribution with very promising results, both to the farmer and to the consumer.

In several other respects, the farm bureaus have, particularly during the past year, proved of a high degree of usefulness. An interesting illustration of this is had in the meeting called by the Lackawanna at Binghamton, N. Y., on April 7, 1917, at which the farm bureau managers of 13 counties were present, accompanied each by four of his Farm Bureau Association directors. These 65 representative authorities on farm needs and opportunities were gathered together with some 40 of the leading business men and bankers of Binghamton, Cortland, Norwich and Elmira and one or two other cities, and an entire day was spent in the discussion of ways and means to increase the production of the counties represented to meet the demand for foodstuffs growing out of the entrance of this country into war.

The effects of that meeting have been continuous throughout the subsequent period, and have resulted in a number of important, and, in some cases, original movements. Through the impetus flowing from this meeting and by the instrumentality of the railroad company, over 30 car loads of seed potatoes, which apparently could not otherwise have been obtained, were brought into the section involved. The use of tractors for plowing has been successfully experimented with, and will undoubtedly be largely increased in the coming season. Perhaps the most notable of all has been the response to the request of the farmers for labor. In this matter the farm bureau agents have acted as a medium for the temporary transfer of employees of manufacturers in Binghamton, Cortland, Norwich and Elmira to the farms of Broome, Cortland, Chenango and Chemung counties. This has been made possible by the unprecedented action of the large employers of labor in those cities, in releasing a considerable number of their men for periods of from one to four weeks in the planting and harvesting seasons for general farm labor, to which also the railroad company has contributed a number of its section men for such rough work

as plowing. In all cases, the city employers have paid their employees the difference between the ruling price of farm labor and the wages which they were receiving in the city. Several hundred men have worked on the farms under this arrangement, and all reports are that it has been of real value to the farmers in the emergency existing, and has contributed materially to the increase of acreage under cultivation. All of this would have been entirely impossible, but for the agency of the farm bureau.

The possibilities of these farm bureaus, aided by the ever willing service of the railroad company, in the matter of improved methods for securing labor, the introduction of farm machinery, and particularly, in the yet undeveloped field of better marketing conditions, are, in our opinion, most attractive, and, in fact, hold the promise of greater usefulness than anything yet accomplished.

Carbocoal—A New Fuel

A NEW COMMERCIAL PROCESS for converting bituminous coal into a fuel which is smokeless and has the characteristics of anthracite coal, has been invented and perfected by C. H. Smith, who has been working on this new process for some time in conjunction with Blair & Company, of New York. The bituminous coal is taken in its raw state and subjected to a distillation process at relatively low temperatures which distills off vapors and permanent gases, leaving what is called Carbocoal to be made into briquettes. An important feature is that valuable by-products are obtained from the gases, the revenue from the sale of which largely compensates for the cost of the process.

The residue from the distillation is pressed into hard and durable briquettes. These briquettes are practically pure carbon, having only one to four per cent volatile matter. They provide an intense fire and are adaptable for use on locomotives where high steaming rates are required. The adaptability of this fuel for locomotive use has been determined by actual locomotive tests, at which high rates of combustion were obtained with practically no smoke. It has been found particularly suitable for use where limited grate area is obtained and restricted boiler capacity requires an efficient fuel. It is easily handled; the briquettes do not readily disintegrate.

The accompany table shows the products obtained from the raw bituminous coal by the distillation process. The

| |
|---|
| Raw Bituminous Coal—2,000 lb. |
| Carbocoal Briquettes—1,440 lb. |
| Gases and Vapors—560 lb. |
| Vapors—360 lb. |
| Tar Oils—Benzol, Toluol, Naphthas, Motor Spirit, Cresote, Oils, Tar Acids, Lubricating and Fuel Oils, Anthracene, Pitch and other tar oil products. |
| Ammonical Liquor—Ammonia (Concentrated), Sulphate of Ammonia, Cyanogen, Pyridene bases and other nitrogen compounds. |
| Permanent Gases—200 lb. |
| These are used to provide heat for the distillation process, or may be used for commercial purposes. |

coal tar products are recovered in their primary stage, there being available some 20 gallons of tar oils for the market as compared with four or five gallons from the same grades of coal in the ordinary carbonization process. Many of the by-products which are obtained by this process are in great demand for use in the manufacture of explosives.

Such a fuel will find a field on railroads, for domestic use, in stationary and marine plants where smokeless operation is desired, and for kilns and gas producers. This process is being handled by the International Coal Products Corporation, of which Mr. Smith, the inventor of the process, is president. An experimental plant has been in operation at Irvington, N. J., and plans are now under way for the construction of new plants.

The Railroad Control Bill Is Reported

Committee Amendments Provide for Termination of Government Control After Fixed Period

WITH AMENDMENTS providing for the termination of the government's control of the railroads at a fixed period after the close of the war, and restricting the President's authority to fix rates by a provision for a review by the Interstate Commerce Commission on appeal, the administration railroad control bill was reported by the Senate committee on Monday and is expected to be reported by the House committee later in the week. In the Senate bill the period of government control is limited to 18 months after the close of the war with discretion in the President to terminate it sooner. In the House bill a two-year period is provided. No change was made in the provision for the compensation of the roads based on their net operating income for the three years ending June 30, 1917, but the Senate committee inserted an amendment to prevent any increase in compensation based on earnings or surplus accruing and invested in the property during the period of federal control.

Because of the nature of the changes the bill was introduced in the Senate as a new bill S. 3713, and on Tuesday it was reintroduced as S. 3752 on account of an omission. It was referred back to the committee for a report later in the week. Chairman Smith said he would ask for its early consideration. Senators La Follette and Cummins will file minority reports.

The expressed wish of the administration that the period of government control should be left indefinite, in order that Congress might not be circumscribed as to time in reaching its determination as to the future status of the roads after the war, was disregarded by a considerable majority in both committees. Although most of the Democrats voted to leave the period indefinite and most of the Republicans voted for a time limit, the votes were not entirely controlled by party considerations and the well-known advocates of government ownership, such as Senators Cummins and La Follette and Representative Sims, were against any limitation.

The House Committee on Interstate and Foreign Commerce on Saturday adopted an amendment providing for a two-year period after the war by a vote of 15 to 6. All of the Republicans voted for it and also Representatives Rayburn, Montague, Coady, Dewalt, Snook and Sanders from among the Democrats. The amendment was proposed by Representative Montague, who had originally held out for a one-year limit. Amendments proposing a 3-year limitation offered by Representative Barkley, an 18-months limitation offered by Representative Parker, and a one-year limit offered by Representative Esch were defeated. The amendments voted by the House committee include one to provide that the proposed guarantee shall be "not in excess" of the three-year average. Another provides that a report shall be made on January 1 of each year of the expenditures from the \$500,000,000 appropriation.

The House committee on Tuesday agreed by a vote of ten to eight to give the President unrestricted control over rates. The Senate provision regarding rates provides that whenever in his opinion public interest requires, the President may initiate rates by filing same with the Commission. The rates shall be fair, reasonable and just and shall take effect at such time and upon such notice as he may direct, but the Commission shall upon complaint enter upon hearing and consider all facts and circumstances. After full hearing it may make such findings and orders as are authorized by the commerce law.

The Senate committee held executive sessions on the bill

throughout last week. The first result of its deliberations was a test vote of 7 to 6 for an amendment limiting the period of government control to one year after the close of the war. On the following day the committee also voted 7 to 6, but by a different amendment, against allowing the President unlimited authority to fix rates. Those who voted for Presidential rate making were Senators Smith, Myers, Robinson, Thompson, James and Poindexter, while those who favored retaining full power in the hands of the Interstate Commerce Commission were Pomerene, Gore, Underwood, Cummins, Townsend, McLean and Kellogg.

An effort to reconsider the votes was also defeated 7 to 6. The test votes were taken without the specific language of the amendments having been drafted. After a conference by members of the committee with President Wilson a compromise on a limitation of 18 months after the war and giving the President power to control rates subject to the right of the commission to review his action was adopted by a vote of 11 to 4, those opposing being Senators Gore, Cummins, Poindexter and La Follette. Senator Cummins proposed an amendment providing that during the period of readjustment after the war until Congress determines on the future status of the roads they should be controlled by a board of five consisting of an engineer, a financier, a representative of shippers, a railroad man and a lawyer.

He also offered an amendment providing for a reduction of the proposed guarantee. In specifying the period for the termination of government control after the war the Senate committee authorized the President to relinquish control over all roads before that time. It also inserted a provision for the benefit of the short lines giving the President discretion to determine, up to July 1, 1918, what roads are to be included in the plan, but providing that control of a railroad may not be relinquished after that time and before the relinquishment of control of all roads except by its consent.

Instead of passing on petitions of railroads for general increases in rates, as in the past, the Interstate Commerce Commission may have imposed upon it in the near future the interesting function of passing upon the application of the President of the United States for permission to advance rates to offset rising costs of operation and higher wages, if the bill becomes a law in the form it was reported by the Senate committee. This, of course, does not mean that Woodrow Wilson would appear personally before the commission in the way that the railroad executives have appeared with indifferent success on numerous occasions, to explain why the last partial increase had proved insufficient or to be told to cheer up and wait to see if the increased traffic of the next few months would not suffice to keep him out of the bankruptcy court. Nor does it mean that he would be subjected to cross-examination by Clifford Thorne and others as to the details of maintenance charges or the "thousand million" surplus which has re-echoed through Washington since the word billion became commonplace. What would happen in most cases in which the President desired an increased rate may probably be described by the formula used by the Interstate Commerce Commission in announcing the latest change in demurrage rates: "The Director General of Railroads having requested the commission's approval for filing of tariffs by the following-named carriers, viz.: It is ordered, that the rules, regulations and charges above specified be, and they are hereby, approved for filing by said

carriers, without formal hearing, which approval shall not affect any subsequent proceeding relative thereto. It is further ordered that said tariffs may be filed, effective on upon not less than one (1) day's notice. * * * In the case of ordinary changes in rates in which the President and the Director General are not particularly interested doubtless the carriers would file fifteenth section applications in the usual manner, which would be approved or denied as in the past.

But, assuming that the wages of railway employees are increased by several hundred million dollars, and that other expenses continue to increase as they have during the past year or even remain stationary, it is conceivable that the President or Mr. McAdoo, or both, having in mind their responsibility for a "thousand million" dollar guarantee, to use round figures again, might propose that the expenses of the railroads be borne directly by those who use the railroads, rather than that a part of them should be defrayed by those who pay taxes. In other words, the President or Mr. McAdoo, or both, might find themselves in the position of a railroad president faced with increasing expenses on the one hand and fixed interest charges and a dividend rate that cannot be reduced without serious consequences on the other, and might attempt to remedy the situation in the same way that the railroad presidents have tried.

Quite likely other remedies would occur to other people, just as they have on similar occasions in the past, but it is at least within the domain of not too violent assumption that the President or Director General of the Unified Scrambled Railroad under such circumstances might follow the precedent so often set by the president of the X. Y. Z. Railroad and ask for a general increase in freight rates. Under the terms of the bill it is not strictly accurate to say that he would "ask" for the increase, or that he would even "demand" it. He would initiate it and the Interstate Commerce Commission would guide it to its ultimate destination. Mr. McAdoo, in his testimony before the House committee, indicated that such a possibility had occurred to him and that in an event of such importance he would naturally suppose that the commission would hold hearings in the usual way and make a recommendation. He made that assertion under his assumption that the Interstate Commerce Commission could not regulate the President of the United States. If Congress changes that assumption by declaring that it can delegate legislative power to a commission by giving it explicit instructions that all rates shall be "just and reasonable," but that such power cannot, or at least will not, be delegated to the President, Mr. McAdoo's proposed method would be reversed and he or the President or both would recommend and the Interstate Commerce Commission would have the ultimate decision.

A general advance in freight rates might be no more popular with shippers if initiated by the President, or by the Director General, than if initiated by railroad officers, but it might be less popular and quite probably it would be less effective to say so. If increased wages should threaten to create a deficit after payment of the guarantee to the railroad companies an administration which already has found some difficulty in picking out new sources of taxation might naturally prefer to make the railroads pay as they go, rather than to make up a deficit by taxation afterward.

BRITISH RAILWAYMEN'S WAR RECORD.—One hundred thousand members of the National Union of Railwaymen of England are serving with the forces. Over 3,500 have been killed.

IMPORTS OF MACHINERY INTO HANKOW.—The value of railway machinery imported into Hankow, China, in 1914, amounted to \$46,551; in 1915, \$34,091, and in 1916, \$34,166.

Rulings on Excess Profits Tax

REGULATIONS for the interpretation of the excess profits law, drafted by a board of experts in the treasury department with the aid of an advisory committee of business men, economists and accountants, have been approved by the Secretary of the Treasury and are now in the press. A statement giving a digest of the regulations has been issued by the Bureau of Internal Revenue.

The provisions which are of most general interest are those which deal with the definition of invested capital of corporations and partnerships and with the treatment under Section 210 of cases in which the capital cannot be satisfactorily determined and under Section 209 of cases of nominal capital.

The provisions of Section 210, which permit the deduction to be computed by reference to the deductions as determined in the ordinary way in the case of representative concerns engaged in the same trade or business, are held to apply to a number of classes of exceptional cases, among which are the following:

(1) Where on account of defective accounting it is impossible to accurately compute the invested capital.

(2) In the case of a foreign taxpayer, where the Secretary finds upon application that the expense of securing the necessary data is unreasonable in view of the amount of tax involved or that it is impracticable to determine either the entire invested capital or the entire net income.

(3) Long-established business concerns which by reason of conservative accounting or the form and manner of their organization would, through the operation of Section 207, be placed at a disadvantage in competition with representative concerns doing a similar business.

(4) Where the invested capital is seriously disproportionate to the taxable income, as for example because of the realization in one year of the earnings of capital unproductively invested through a period of years, or of the fruits of activities antedating the taxable year, or because of inability to recognize or properly allow for amortization, obsolescence, or exceptional depreciation due to the present war.

The provision which is probably of the greatest general interest is that which lays down the rule for the computation of the invested capital of corporations and partnerships. The law provides that the invested capital shall consist of the actual capital paid in and of the paid in or earned surplus and undivided profits, exclusive of the undivided profits of the taxable year. The law also prescribes certain limitations upon the valuation of assets and other items. The regulations provide that the total of the capital, surplus and undivided profits as shown on the books, adjusted as required by the limitations just referred to and as permitted by certain other provisions of the regulations, shall constitute the invested capital. In the few cases, however, where this total exceeds the adjusted value of the admissible assets (the law expressly excludes assets the income from which is tax free), the invested capital must be reduced so as not to exceed the total value of the admissible assets. If there has been any change in the invested capital during the taxable year, the monthly average shall be taken.

In addition to the express provisions of the law relating to invested capital, several of the provisions of the regulations supplementing those of the law are of the greatest importance. If, because of failure to provide for depletion, depreciation, obsolescence, or other expenses of losses, the books of the corporation or partnership do not show its true surplus or undivided profits, the necessary corrections must be made. But on the other hand, amounts which have been expended in the past for plant, equipment, or other tangible property still owned and in active use by the corpora-

tion or partnership, and which have been charged as current expense, may, unless such expense has been claimed as a deduction under the income tax acts of 1913 or 1916, be added to the surplus account, proper allowance being made for depletion or obsolescence. Amounts so expended for good will, trade-marks, trade-brands, franchises, and other like in tangible assets may be added only if bona fide payment was made therefor specifically as such in cash or tangible property. No readjustment can be allowed, however, for expenditures made for the general development of intangible assets, but such cases may, to some extent, be provided for under Section 210, to which reference has already been made. Another important provision relating to the invested capital of a corporation or partnership is that, when it can be shown by satisfactory evidence that tangible property has been conveyed to it by gift or at a value clearly and substantially in excess of the cash or par value of the stock exchanged therefor, then the amount of the excess shall be included as paid-in surplus.

One other important provision relating to corporations is that every corporation must describe in its return all its relation with other affiliated corporations, and that in certain cases the Commissioner of Internal Revenue may require such affiliated corporations to make a consolidated return of net income and invested capital. Further provision is also made for the assessment of the tax on the basis of such consolidated returns in certain cases.

Unparalleled Delays by Storms

THE RAILROADS IN "EASTERN TERRITORY," which term now covers all the States east of Chicago and St. Louis and north of the Potomac and Ohio rivers, were just getting freight traffic to moving with some approach to normal conditions on Sunday last, when the fifth spell of zero and below-zero temperatures, accompanied by high winds, put a stop to the movement of heavy trains—and at many places stalled all trains—more serious than at any previous time. Severe weather has now hampered railroad operation in central and northern New York for sixty days, and the same is true in a less degree of northern Ohio, Indiana and Illinois.
