The benefit to be derived from this was quite noticeable on one of the railway lines on which data was collected, where the soap suds test system was inaugurated on repair tracks about the time we began collecting data. It was found that while the percentage of porous hose ran very high at the beginning, it gradually lessened until within two

months it was reduced to such a point that only two per cent of the hose tested were found porous. It was also noticed that out-bound terminal air brake delays decreased.

While the cost of removing hose at the expiration of 28 or 30 months means the expenditure of a large sum, we believe that the additional cost will be offset many times by the decreased out-bound terminal air brake delay and by the increased flexibility of train control, the greater train safety and less damage to the equipment due to air brake manipulation. In order to lengthen the life of air brake hose,

the railroads must do one of three things: either put into effect a rule which will cause the hose to be parted by hand, buy a guaranteed hose from the manufacturer, or take up the use of properly constructed braided hose.

Abstracts of the remainder of the papers and committee reports will be given in next week's issue.

A list of the companies having exhibits at the convention together with a brief statement as to the character of the exhibit, and the names of their representatives present will be found in the General News Section of this issue.

Welding Cast Iron With the Electric Arc

Work Done By New York Central Methods Indicates
That No Break Is Too Complicated for Repair

GREAT ECONOMIES are being effected in railroad repair shops because it is now possible successfully to repair iron castings damaged from various causes. Heretofore, expensive castings were scrapped because it was not possible to patch them up in a satisfactory manner. Probably the most important phase of this work as applied to steam locomotives is the welding of cylinders. These castings cost in the neighborhood of \$1,000 and in the past it was often necessary to hold an engine in the shop for months

filled up by the metal electrode process, and additional metal is laid over the top of the joint, covering the upper and lower row of studs. This additional metal is known as the "pad."

If the weld does not require strength, it is necessary only to "V" out the sections to be welded, and fill in with the metal electrode until the surfaces are flush. The tensile strength of a section in which steel is applied to a cast iron surface, is, however, only about 5,000 lb. per square in. Usually it is desirable to have the ultimate strength of the weld as much or more than that of the original casting. For this reason, the studs are used, as mentioned in the preceding paragraph.

The required size of these studs, and the manner of placing them, is a subject which has caused a large amount of discussion. Until the welder has become experienced, however, a good method to follow is the one shown in Fig. 1.

Fig. 1—Section to Be Welded Is "V'd" Out with an Air Chisel and Studs Are Placed in Staggered Rows

while the old casting was taken out and a new one obtained and substituted. Now a broken cylinder can be patched satisfactorily by the electric arc, the work costing from \$50 to \$100, and the locomotive can be released in a few days. Thousands of dollars are saved annually in large locomotive shops, as it is possible with the electric arc to repair castings in place.

The experience of shop men on the New York Central who are interested in welding, proves that it is possible to weld satisfactorily any cast iron material over $\frac{1}{4}$ in. in thickness and that no break is too complicated for repair. There are, of course, breaks which are too complicated to weld economically, but there are few such breaks and it is possible to repair any of them. Furthermore, if the proper method be used and proper care be taken in the work, the strength of the weld will be greater than that of the original material.

Preparation of Material for Weld

The material adjoining the fracture is "V'd" out with an air chisel at an angle of about 45 deg. as shown in Fig. 1. Where strength is required, steel studs are placed in the material to be welded in staggered formation as shown in the same illustration. The space which is "V'd" out is then

Fig. 2—Triangular Section Replaced in Cylinder by Metal Electrode Process

using studs of such a size, and with such a spacing that the strength of the metal in the studs alone will be equal to, or greater than the ultimate tensile strength of the casting.

Best practice in studding, as used by the New York Central, is shown in Fig. 6. It will be noticed that the studs in the "V" are smaller than those outside. An example of the practice used is to place $\frac{1}{2}$ in. studs in the "V" of a fracture with 1 in. thickness and $\frac{1}{4}$ in. studs outside of the "V" in the pad of the weld.

A comparative simple cylinder repair is shown in Fig. 7.

In this illustration the section 4-2-5 was broken out of a cylinder. Most of the broken section was in small pieces, but the flange 4-5 was intact. The first part of the operation was to replace this flange, and weld it into position. This left a triangular hole, 1-2-3. A piece of wrought iron was cut and rolled to fit this triangle. The outer edges of the wrought iron were beveled, and the inner edges of the hole in the cylinder were beveled and studded with mild steel studs. The wrought iron patch was then clamped in place temporarily, while the weld was "tacked" at several points. The clamps were removed, and the weld completed. The reasons for using wrought iron for the patch are that wrought

piece of wrought iron was cut out to approximately fit this hole and welded into position, in exactly the same way as the wrought iron was welded into the first cylinder described.

A unique application of welding is shown in Figs. 4 and 5. Fractures developed in the valve ports at about mid

Fig. 3—A Badly Broken Casting Which Taxed the Ingenuity of the Welder

iron is easily cut and shaped to fit such a break, and that it is not necessary to place studs in the wrought iron in order to make a perfect weld. The thickness of metal in the wrought iron patch is equal to the thickness of the original casting. A much more complicated cylinder fracture is shown

Fig. 4—Hole Cut in Valve Chest with the Oxy-Acetylene Torch. Metal Surrounding the Hole Has Been Drilled and Tapped for Studs, and Metal Shown Under the Hole Has Been Repaired with the Electric Arc

in Fig. 3. The parts broken out were the section 1-2-3-4-5-6. The flange 1-6 was found intact, and was "V'd" out and welded into position. A straight piece 4-9 was made, and secured to the body of cylinder and valve casting with long studs. The section 1-2-3-4-9 was then built up by the metal electrode process. This left the triangular hole 5-7-8. A

Fig. 5—The Hole Shown in Fig. 4 Has Been Closed With a Piece of Wrought Iron Welded in Place with the Electric Arc

position in the valve. It was impossible to reach the fracture through the head of the valve cylinder, so a circular piece was cut out of the side of the valve chamber with an oxy-acetylene torch as shown in Fig. 4. This made it a comparatively simple matter to get at the broken parts and repair them with the arc. A piece of wrought iron with beveled edges was cut to approximately fill the hole, the

Fig. 6—The Four Sides of This Cylinder Saddle Were Cut Out to Permit the Repair of the Exhaust Passage. One and One-Quarter-Inch Boiler Plate and the Electric Arc Made the Saddle as Good as New

sides of the hole were beveled and studded, and the wrought iron plate welded into position with the metal electrode as shown in Fig. 5.

One locomotive was brought into the shop with the exhaust passage broken inside the cylinder saddle. In order to repair the break, it was necessary to get at it from all four sides. Accordingly, a large opening was cut in each of the four sides of the saddle with an oxy-acetylene cutting torch. The crack in the exhaust passage was "V'd" out and studded, and the edges of the holes cut in the side of the cylinder saddle were beveled and studded, as shown in Fig.

6. The operator then welded the break in the passage by working through the holes cut in the saddle. After the break had been repaired, the holes in the saddle were closed and welded. Pieces of $1\frac{1}{4}$ in. boiler plate were used to replace the metal taken out on the four sides of the saddle. This operation supplies conclusive evidence to show that the possibilities of electric arc welding, in connection with the welding of cast iron, are practically unlimited.

General Foreman McAllister, of the West Albany shops, has made a special study of cast iron welding, and his capability in this respect has been recognized, as he was one of the committee appointed by former Collector Malone to report on the method of handling repairs on the interned German ships. It is now a well-known fact that the use of the electric arc in repairing these ships greatly facilitated getting them into service quickly at a minimum cost. Work which ordinarily would have taken over a year was finished in two or three months. In connection with the work at West Albany, Mr. McAllister says that even though the cost of materials has increased over 100 per cent and labor has made an advance of from 50 to 100 per cent during the past two or three years, the cost per locomotive mile for repairs has remained approximately constant. This is due altogether to shop economies, the most important of which is the use of electric arc welding.

Safety-First and the Golden Rule

ON THE DETROIT DIVISION of the Pere Marquette, the Safety-First Committee consists of the trainmasters, the division engineer, the master mechanic, the road foreman of engines, the chief dispatcher, the general yardmasters, the agents at Detroit and Lansing and foremen, clerks and others to the number of 19 in all; and each one of these men is required to constitute himself chairman of another committee consisting, besides himself, as chairman, of employees who have broken some rule. Once on this committee, a member is required to explain how the violation of the rule happened to occur, and to consider what the consequences might have been. Membership in the committee lasts until such time as a new violation of the rules occurs, when the oldest member retires, making way for the new man. In this way, the committee becomes a sort of endless chain. This creates a rivalry among the men and has the effect of putting them on their guard against infractions of the rules, to the end that they may escape the duties and obligations of the committee work.

J. J. Corcoran, superintendent of this division, issues educational bulletins whenever a suitable occasion offers, not waiting until some bad accident occurs. Bulletin No. 39, dated December 31 and reprinted in the Pere Marquette Magazine for February, takes for its text the butting collision of passenger trains at North Vernon, Indiana, on December 29. It says, in part:

"It is indeed unfortunate that this bulletin is on the same subject as the preceding number, but it is fortunate that the affair is not credited to our railroad. The cause is said to be the east-bound train disregarding orders. Now, let us draw a parallel with our division, and then ask ourselves a few questions. . . . I am just wondering what respect was given the automatic signals. Were the train orders handled as they should have been? We have known of cases where the rules were not followed, in so far as properly reading the orders is prescribed. Was the intermediate preventive overlooked in this case; that is, the conductor with the air signal notifying the engineer that they had a meeting point at the next stop? How were the automatic signals respected? Perhaps if any one of the three points mentioned had been literally lived up to, this accident could have been avoided."

And the bulletin goes on to give, says the Pere Marquette Magazine, some "Golden Rule admonitions" to conductors, engineers and others to ponder lessons of this kind without waiting for a disaster to occur on their own division. The magazine gives quotations from other bulletins embodying the Christian doctrine of the golden rule. Some of these are—

No. 1, to trainmasters:

"It is exasperating to read the numerous reports which have been received covering damaged switch points, stands and connecting rods on account of switches being run through. We must take action to have this kind of work discontinued. Speedy investigations should be conducted. It is not necessary that they be long drawn out affairs, taking up a lot of your time. Hustle each one of the cases to a conclusion and mete out the discipline you think is warranted.

"Cold weather is now on and naturally the men are bundled up in heavy wearing apparel and engineers should understand that men handling switches cannot be as active as when free from burdensome clothing. . . .

No. 2:—"Of course, all of you gentlemen are familiar with the very bad accident which happened on a railroad other than the Pere Marquette, between a steam railway movement and a street car. Several months ago we had several cases where a number of street cars at crossings were not handled just as they should have been. Each of you will, of course, continue your vigilant observation and research into the conduct of all employees located there. . . .

The division engineer will please have his supervisor and section foreman report anything which in their judgment is irregular. The signal engineer, the trainmaster and road foremen will handle this with train and engineers and yardmasters. . . . I personally canvassed each point myself and find that they are being handled properly at the present time; eternal vigilance, without question, keeps us out of irregularities better than anything else."

No. 3:—"I understand that on some divisions where electric blocks are in operation it has been the practice where one train followed another closely instead of remaining back until the blocks cleared and permitted them to go, they put a flagman on the preceding train.

"I would like to know if anything like this could be happening on this division. We cannot be too severe on these fellows who wilfully disregard such rules. Do not hesitate to take decisive and severe action with anyone you find violating these rules."

No. 4:—"I cannot resist from appealing to all that we should have uniform railroading. We seem to be satisfied with semi-annual house cleaning periods—spring and fall. During each of those two periods a thorough renovation is made and the untidy housekeeper just thinks there is nothing further to be done until the next regular house cleaning period, but it is in the interim that her troubles accumulate.

"It is so with railroads. The supervision gets lax and a lot of accidents occur and then everybody starts house-cleaning. They get on their toes and harp about compliance with the rules; and finally straighten out and go along as they should for a short time; but we gradually forget what has gone before and matters get back into the old rut and we let a lot of little troubles accumulate without any action being taken until finally we run into another epidemic of accidents and then comes another house-cleaning.

"But what I am hinting at is to keep cleaning all the time; and I mean vigilance and observance of the rules. Frankly I think we are keeping our house pretty clean, but let us continue to do so."

"What is your answer to this?"

Further, says the editor of the magazine, Mr. Corcoran has successfully handled the training problems of the Detroit division with practically the same set of employees that surrounded his less successful predecessors.

General News Department

A free school for instruction in telegraphy has been opened by the Boston & Albany at Springfield, Mass.

The wheel and axle warehouse of the Louisville & Nashville, at Louisville, Ky., was destroyed by fire on May 2; estimated loss, \$125,000.

The freight house of the Baltimore & Ohio at Braddock, Pa., together with a storehouse containing unclaimed freight, was destroyed by fire on May 1; estimated loss on real estate, \$35,000, and on merchandise, \$75,000; total, \$110,000.

The Texas Short Line railroads have sent a deputation, accompanied by the chairman of the State Railroad Commission, to the railroad administration at Washington, asking special consideration of the Texas short line railroad situation.

On the dining cars of the Erie Railroad the prices of meals are now fixed, and a la carte rates have been discontinued. The price for a dinner is \$1 and for a breakfast or luncheon 75 cents. To members of the military and naval forces, in uniform, the rate is 75 cents uniformly, morning, noon and night.

The Ozark Valley Railway, a 35-mile line extending from Williamsville, Mo., northward to Cascade, has been sold for junk to the Bender Iron & Supply Company, Shreveport, La., subject to the confirmation of the United States district court, under which the road has been operated by G. A. Long, receiver.

The Atchison, Topeka & Santa Fe has applied to the Kansas Public Utilities Commission for authority to take up the track of its line between Wellington and Caldwell, a distance of about 20 miles. This line has not been used for several years, trains being run over the parallel line of the Chicago, Rock Island & Pacific.

The annual meeting of the Western Railway Club will be held at the Hotel Sherman, May 20, the informal banquet being held in the Italian room at 6:30 p. m. and meeting in the Louis XVI room at 8 p. m. The principal speaker of the evening will be professor H. G. Moulton, of the department of political economy, University of Chicago, who will speak on "The Business Side of the War." The Memorial Committee will present resolutions on the death of Joseph Taylor, the late secretary of the club. There will be the usual annual meeting and election of officers.

The Division of Valuation of the Interstate Commerce Commission wants senior electrical engineers, grade 2; junior civil engineers, grade 1; and junior engineers in the same grade for the electrical, mechanical, signal, structural, telegraph and telephone departments; also junior architects. Candidates for senior electrical engineer will have their applications considered on June 18, while those for the other offices named will be taken up at any time, regardless of date. The salaries for the first named office will range from \$1,800 to \$2,700; and for the other places, from \$1,320 to \$1,680.

The Chicago council committee on track elevation went to Washington this week to confer with the director general of railroads on the subject of railroad track elevation work in Chicago during the war. The committee wishes to determine whether the prosecution of the war demands the total or partial discontinuance of elevation work in the city. The committee carried with it statistics prepared by the coroner showing the number of persons killed and injured at grade crossings in the city in 1916 and 1917. Solon Gold, engineer of track elevation for the city, accompanied the committee to Washington.

The stationary storehouse of the New York, New Haven & Hartford, at New Haven, Conn., was destroyed by fire on May 9; estimated loss, including contents of building and freight and passenger cars, \$80,000. On the day before,

Wednesday, the passenger station of this road at New Haven was gutted by fire and practically ruined. This building was used mostly for offices, as some months previously a temporary wooden station was put in use preparatory to the construction of a new passenger station a short distance west of the present location. The burned station was of brick, three stories high, built in about 1871 and rebuilt in 1891 after the fire of that year.

M. C. B. and M. M. Associations

The Executive Committees of the Master Car Builders' and the Master Mechanics' Association, at a joint meeting held in Chicago on May 13, elected V. R. Hawthorne secretary of both associations, to fill temporarily the vacancy caused by the death of Joseph W. Taylor. Mr. Hawthorne was formerly in the service of the Pennsylvania Railroad, but for the past year has been engaged in work for the American Railway Association.

Vestibuled Cabs

The New York legislature has passed a law requiring all new locomotives which shall be put in service after this year (1918) and all taken into the shop after January 1, next, for general repairs, to be equipped with "vestibuled" cabs, so constructed as "to attach to the sides of and inclose all openings between the engine cab and the tender." The New York law requiring power-operated fire-box doors on locomotives goes into effect on the same date on all new locomotives placed in service after January 1, next, and locomotives now in service must be equipped with vestibules the next time they are withdrawn for "generally heavy repairs," after the act becomes effective next January.

Fuel Consumption by Railroads in 1917

The Geological Survey reports that the immense increase in railroad traffic has increased correspondingly the quantity of petroleum consumed as locomotive fuel in 1917, despite the mounting cost and growing scarcity. Statistics compiled from reports submitted by all railroad companies that operated oil-burning locomotives in the United States show that the quantity of fuel oil consumed by them in 1917 was 45,707,082 barrels, or 8.5 per cent over 1916 and a larger consumption than in any other year.

The total distance covered by oil-burning engines in 1917 was 146,997,144 miles, and the average distance covered per barrel of fuel consumed was 3.2 miles. Oil-burning locomotives were run on 32,431 miles of road in 21 States.

Western Roads Will Use Government

Employment Agencies

Railroads under the authority of the Western regional director have agreed to discontinue the use of employment agencies conducted for profit and to obtain their track labor exclusively through the United States employment service. The carriers' own free labor agencies are to be continued as branches of the United States free employment service. The employees of these agencies will be appointed examiners in the Federal service at one dollar a year, and will continue to receive their regular compensation from the railroads. Those agencies operating labor camps under contracts with railroads have similarly been taken over by the United States employment service. Although private labor agencies will no longer be used by the roads, the United States employment service is taking over many of the best operatives of these organizations. In Chicago alone 20 employees of labor agencies have joined the United States employment service and in Omaha four have been employed.

The plan for recruiting track labor under the new arrangement has been worked out by Dr. P. L. Prentis, superintendent of District 7 of the United States employment service, with head-

quarters at Chicago, and W. G. Bierd, chairman of the Chicago Railroad Presidents' Committee, who is the representative of R. H. Ashton, regional director. Several railroad officers with practical experience in employing laborers have assisted them in this work. Dr. Prentiss and the superintendents of the other districts of the United States employment service in the western railroad region will supervise the recruiting of track labor in their respective territories, in co-operation with the existing organizations maintained by the railroads. Each superintendent will aim to supply the labor demand in his own territory and in case he secures an excess will turn over the surplus to adjoining districts in need of men.

Railroad men with experience in handling laborers believe that this plan of distributing men is practicable only within certain limits. They point out that the hobo class of labor is of a roving disposition and accustomed to making long trips from points where they have wintered before they are willing to settle down and do any work. It is also pointed out that the maximum wage of \$2.75 for terminal points and \$2.50 a day for points on the line, recently established by the Railroad Administration for western lines, is not sufficient to attract men. The recent recommendations of the Railway Wage Commission are based upon conditions in December, 1915, when track laborers received from \$1.65 to \$1.75 a day, so that the 43 per cent increase recommended will only raise the track laborer's wage to from \$2.35 to \$2.50 a day, or less than the maximum wage recently established for railroads in western territory. While it is probable that wages will have to be increased above this maximum, it is pointed out that it is not necessary to raise the compensation for track labor to the standards obtaining in war industries, as there is an attraction about track work which induces men who have had experience on railroads to work at less pay than is offered in other industries, provided the pay is sufficient to supply them with the necessities and the pleasures which they are used to.

The Overman Bill

The Overman bill, authorizing the President to reorganize the executive departments of the government, was passed by the House of Representatives on Tuesday of this week, and has been sent to the President. The amendment to except the Interstate Commerce Commission from this law was rejected in the House by a vote of 213 to 7. In the debate on the bill, Chairman Webb, of the Judiciary Committee, said that President Wilson had told him that he had no intention of taking away the functions of the Interstate Commerce Commission, especially such functions as the power of the commission to review freight and passenger rates, as conferred by the railroad control bill; but the President said that he could make use of many employees and experts of the Interstate Commerce Commission in other departments of government work.

Inefficiency of the Post Office Department

The Merchants' Association of New York city, acting on a voluminous report made by a committee, after five months' investigation, has presented to Congress a memorial calling for the appointment of a joint committee to make a comprehensive investigation of the present methods of the Post Office Department. These methods have resulted in serious delays throughout the country. The investigating committee finds that about 44 per cent of the railroad lines formerly served by railway postal cars, have been wholly or partly deprived of the advantages of that service, and that economizing space in cars, to reduce the cost of transportation, is constantly causing unreasonable delays. The investigating committee finds that mails are not despatched with former frequency; that they are not fully worked in transit; and that train delays are not a principal cause of slowness in the mails.

Society for Testing Materials

The twenty-first annual meeting of the American Society for Testing Materials will be held at the Hotel Traymore, Atlantic City, N. J., on June 25, 26, 27 and 28. Wednesday afternoon, the 26th, will be devoted to topical discussions on Co-operation in Industrial Research, while the evening session on Thursday will be a joint meeting with the American Concrete Institute. The annual golf tournament will be held on Thursday afternoon.

Bugs Stop Train

A freight train in the Chicago Burlington & Quincy was stalled on May 7 near Stockholm, Wis., when it ran into an immense cloud of shad flies. The crushed bodies of the insects lubricated the tracks to such an extent that the driving wheels slipped. It was necessary to clean the rails before the locomotive could make headway.

Miss Phœbe's Finish?

Should McAdoo
Miss Snow Taboo
And veil her face from human view,
In Memory's light
She'd still shine bright
Along the Road of Anthracite

—J. B. G., in *Verse for the Future*

Wooden Passenger Cars Passing Out of Service

In order to ascertain the progress of the building of steel and steel underframe passenger train cars and to develop the cost of reconstruction in steel of the present wooden equipment of the country the Special Committee on Relations of Railroad Operation to Legislation sent certain requests to the carriers on January 2, 1918. Replies were received from 434 roads operating 246,224 miles in the United States and 64,816 passenger train vehicles, and with 966 under construction on January 1. Replies were also received from eight companies operating 33,269 miles in Canada, with 5,422 passenger train vehicles, and with 35 under construction on the same date. Estimates and percentages in the tables apply only to cars operated by roads in the United States.

It will be noted that there were but five wooden passenger train cars constructed in 1917 and that but 27 such wooden cars were under construction on January 1, 1918, indicating that the building of wooden passenger train cars has practically ceased.

ANNUAL ADDITIONS OF PASSENGER EQUIPMENT

| Acquired in | Total number | Percentage | | |
|---|--------------|------------|------------|------|
| | | Steel | Underframe | Wood |
| 1909..... | 1,880 | 26.0 | 22.6 | 51.4 |
| 1910..... | 3,638 | 55.4 | 14.8 | 29.8 |
| 1911..... | 3,756 | 59.0 | 20.3 | 20.7 |
| 1912..... | 2,660 | 68.7 | 26.8 | 4.4 |
| 1913..... | 3,350 | 63.0 | 30.4 | 6.6 |
| 1914..... | 4,495 | 74.6 | 29.9 | 4.5 |
| 1915..... | 1,696 | 73.7 | 20.1 | 6.2 |
| 1916..... | 1,445 | 97.5 | 2.8 | 0.7 |
| 1917..... | 2,780 | 62.5 | 37.3 | 0.2 |
| January 1, 1918 (under construction)..... | 966 | 90.8 | 6.4 | 2.8 |

*This figure includes wooden cars reconstructed with steel underframe.

The rapid increase in steel and steel underframe cars is shown below:

| Approximately in service | Steel | Underframe |
|------------------------------|---------|------------|
| January 1, 1909..... | 6,211 | 6,753 |
| January 1, 1910..... | 11,177 | 1,008 |
| January 1, 1911..... | 33,111 | 6,611 |
| January 1, 1912..... | 53,347 | 2,306 |
| January 1, 1913..... | 72,271 | 1,206 |
| January 1, 1914..... | 94,487 | 4,608 |
| January 1, 1915..... | 126,961 | 5,200 |
| January 1, 1916..... | 142,306 | 6,000 |
| January 1, 1917..... | 157,764 | 6,136 |
| January 1, 1918..... | 172,601 | 8,210 |
| Increase 1918 over 1909..... | 166,390 | 7,664 |
| Increase 1918 over 1910..... | 161,424 | 1,152 |
| Increase 1918 over 1917..... | 14,837 | 2,074 |

The number of wooden cars in service on January 1, 1912, was 48,126. There are now in service approximately 38,876, indicating the retirement from service of 9,250 cars in six years.

APPROXIMATE COST OF REPLACEMENT WOODEN CARS WITH STEEL

| | Number | Average cost* | Amount |
|---|--------|---------------|---------------|
| Postal..... | 13 | \$1,500 | \$19,500 |
| Mail and baggage..... | 37 | 17,500 | 647,500 |
| Mail baggage and passenger..... | 78 | 17,500 | 1,365,000 |
| Baggage and passenger..... | 1,341 | 17,500 | 23,467,500 |
| Freight or express..... | 6,008 | 17,500 | 105,140,000 |
| Passenger..... | 20,718 | 17,500 | 362,565,000 |
| Parlor, sleeping..... | 3,978 | 17,500 | 69,615,000 |
| Business..... | 721 | 17,500 | 12,617,500 |
| Motor..... | 276 | 17,500 | 4,830,000 |
| Total..... | 28,876 | | \$584,440,000 |
| Annual interest charge at 5 per cent..... | | | \$29,222,000 |

*This estimate is based on a 12-year life.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF FEBRUARY, 1918

| Name of road | Average mileage operated during period | Operating revenues (in millions) | | | | Maintenance of | | | Operating expenses | | Net operating income | Railway tax | Increase (or decrease) |
|-------------------------------|--|----------------------------------|------------|------------------|------------|-----------------|-------------|-------------|--------------------|-------------|----------------------|-------------|------------------------|
| | | Freight | Passenger | Mail and express | Total | Way and station | Equip- | Trans- | Traffic | General | | | |

MONTH OF MARCH, 1918. CONTINUED.

Program of Convention of Fuel Association

The tenth annual convention of the International Railway Fuel Association will be held at the Hotel Sherman, Chicago, on Thursday and Friday, May 23 and 24, under the auspices of the United States Railroad Administration and the United States Fuel Administration. The convention will open on the first day at 10 a. m. and on the second day at 9:30 a. m. The program is as follows:

Thursday

Introductory Address by E. W. Pratt, President, International Railway Fuel Association.
 "The Railroads and Their Relation to the Fuel Problem," by C. R. Gray, Director, Division of Transportation, United States Railroad Administration.
 "What Can Be Done for Our Northern Ally," by Sir George Bury, Chairman, Canadian Railways War Board.
 "What the Men on the Locomotives Can Do," by W. S. Stone, Grand Chief, Brotherhood of Locomotive Engineers.
 "The Motive Power Department and Fuel Economy," by R. Quayle, General Superintendent, Motive Power and Car Department Chicago & North Western.
 "The Railroad Industrial Army," by W. S. Carter, Director, Division of Labor, U. S. Railroad Administration.
 "Relation of Locomotive Maintenance to Fuel Economy," by Frank McManamy, Director, Division of Locomotive Maintenance, U. S. Railroad Administration.
 "The Transportation Department and Fuel Economy," by E. H. De Groot, Jr., Assistant Manager, Car Service Section, Division of Transportation, U. S. Railroad Administration.

Friday

"The Fuel Problem and the War," by H. A. Garfield, U. S. Fuel Administrator.
 "The Need for Fuel Conservation," by P. B. Noyes, Director, Conservation Division, U. S. Fuel Administration.
 "The Supply and Distribution of Fuel," by J. D. A. Morrow, Director, Distribution Division, U. S. Fuel Administration.
 "The Coal Operator and His Responsibilities," by Edwin Ludlow, Vice-President, Lehigh Coal & Navigation Company, Lansford, Pa.
 "What the Coal Miner Can Do," by John P. White, Labor Advisor, U. S. Fuel Administration.
 "What the Coal Operator Can Do," by H. N. Taylor, Vice-President, Central Coal & Coke Company, Kansas City.
 "Individual Effort Toward Fuel Savings," by Eugene McLaughlin, Manager, Fuel Conservation Section, U. S. Railroad Administration.

Exhibitors at the Air Brake Convention

The companies exhibiting devices at the Air Brake Association Convention, which was held at the Hotel Winton, Cleveland, Ohio, May 7 to 10, together with a list of their representatives is given below:

Ashton Valve Company, Boston, Mass.—Gages, gage testers and safety valves. Represented by H. O. Feitinger.
 Barco Manufacturing Company, Chicago, Ill.—Engine-tender air connections at air reservoir joint connections. Metallic car steam heat connections. Represented by F. N. Bard and C. L. Mellor.
 Detroit Lubricator Company, Detroit, Mich.—Lubricators and flange oiler. Represented by A. G. Machesney.
 Dielmere Valve Company, Tacoma, Washington.—Automatic drain and relief valve for single or compound air pump, and Vincent grease plug for side rods on locomotives. Represented by W. P. McLaren.
 Dixon Crucible Company, Joseph, Jersey City, N. J.—Graphite and graphite products for railroad service. Represented by L. H. Snyder, F. R. Brandon and William Ernst.
 Garlock Packing Company, Palmyra, N. Y.—Air brake gaskets, air pump and spiral packing. Represented by C. F. Flood.
 Goff Electro-Pneumatic Brake, Collingswood, N. J.—Represented by Frank Goff.
 Gould Coupler Company, New York.—Gould universal automatic brake slack adjuster. Represented by W. F. Richards, Geo. R. Berger, W. Garstang and W. H. Sauvage.
 Johns-Manville Company, H. W. New York.—Airbrake throttle and brake cylinder packing, expansion rings and slack adjuster. Represented by F. E. Meek, C. E. Murphy, Fred Horne, L. C. Sprague and G. Christenson.
 Leslie Company, The, Lyndhurst, N. J.—Steam heat regulators and removable injector coupling nuts. Represented by S. J. Leslie and J. J. Cizek.
 New York Air Brake Company, New York.—Air pump strainer, Type J slide valve, feed valve. Represented by N. A. Campbell, L. W. Sawyer, B. Hyman, Wm. Owens and B. Pratt.
 New York and New Jersey Lubricant Company, New York.—Non-fluid-oil brake cylinder lubricant and N. F. O. triple valve lubricant. Represented by J. H. Bemis and W. W. Orvis.
 New York Belting and Packing Company, New York.—Represented by L. F. Purill.
 Perfection Adjustable Hand Reamer Company, Cleveland, Ohio.—Reamers for valve and governor bushings. Represented by C. Feagler.
 Simmons-Boardman Publishing Co., New York.—Railway Age, Railway Mechanical Engineer and Railway Electrical Engineer. Represented by H. H. Marsh and A. F. Stuebing.
 United States Rubber Company, New York.—Mechanical goods division, air brake hose, pneumatic tool hose, gaskets and packings. Represented by C. S. Prosser, W. B. Wise and T. P. Dunham.
 Westinghouse Air Brake Company, Pittsburgh, Pa.—Slack adjuster, hose mounting and clamping devices. Represented by Walter V. Turner, A. W. Dudley, J. B. Wright, F. H. Parke, T. W. Newburn, A. L. Berghine, C. B. Thorne, C. M. Noll, E. H. Dewson, H. H. Burns, J. C. Rohmert, R. Johnson, F. H. Whitney, J. S. V. Fralich, H. Weaver, T. H. Thomas, B. E. Key, G. A. Stenson, A. L. Houston, R. E. Miller, L. J. Gwynne, E. Richards, W. M. Sleet.

Traffic News

Waiving the customary thirty-day period after the publication of a tariff schedule, the State Public Utilities Commission of Illinois on May 8 permitted attorneys representing railroads in Illinois to file a petition for the reclassification of commodities. The commission will open a hearing on the matter at Springfield, Ill., on May 15 and after a week in that city it will continue the hearing at Chicago. A request by shipping interests for a thirty-day postponement of the hearing was not granted.

Freight, in carload lots, destined for Baltimore or Philadelphia, is now received by the trunk lines for shipment to either of those cities only on a special permit for each shipment; which permit must be procured from the local committee, which will issue it only after having been assured that the consignee of the freight will unload it promptly. The committee consists of Presidents Rhea, of the Pennsylvania, and Dice of the Reading, and Vice-President Thompson of the Baltimore & Ohio.

The Erie Canal was opened for business on May 15. The government manager, G. A. Tomlinson, announced in New York last week that the government had bought 30 tugs and had taken 165 of the barges heretofore in use on the canal, this in order to begin taking freight without waiting for the construction of new barges. Of the new and larger barges there will be 75, some of them steel and some concrete. None of these will be self-propelling; it was found that the construction of boats with engines would require a much longer time. The new barges will be 150 ft. long, 21 ft. beam, and 12 ft. moulded depth.

Shipments of anthracite in April, as reported by the Anthracite News office, amounted to 6,368,372 tons, an increase of about 14 per cent over those of the corresponding month of last year. It is anticipated that with the working energy now in force, this year's total output may reach 80,000,000 tons, a gain of 3,000,000 tons over 1917. A satisfactory supply of cars is available to move all anthracite as currently produced. The order prohibiting shipments to 19 states south and west, except on special permits, affects, relatively, a limited tonnage. New England shipments have been limited somewhat by embargoes which have been intermittent on the New Haven and quite steady on the Boston & Albany for two weeks past.

Coal Movement

During the month of April the railroads transported coal at a rate which, if continued throughout the year, will make up the amount which the Fuel Administration estimates will be required, according to statistics compiled by the Railroad Administration. During the four weeks ending April 27 the bituminous coal loaded into cars amounted to 895,318 carloads, an increase of 73,978 cars as compared with the corresponding period of 1917.

The Geological Survey reports that bituminous output declined slightly during the week ended May 4, after three successive weeks of rising production. The total production of soft coal (including lignite and coal made into coke) is estimated on the basis of railway shipments at 11,559,000 net tons as compared with 11,803,000 net tons during the preceding week, or a decrease of 2 per cent. Production per working day is estimated at 1,927,000 net tons, considerably in excess of 1,829,000 net tons, the average during the month of May, 1917.

Losses attributed to transportation conditions declined during the week ended April 27 from 16.2 per cent of potential capacity during the preceding week to 14.4 per cent; losses due to labor conditions from 4.8 per cent to 4.4 per cent; those due to mine disability from 3.3 per cent to 2.8 per cent and to market losses from 1.8 per cent to 1.2 per cent.

Anthracite shipments during the week ended May 4 rose to 40,570 cars, the largest since the week of March 30.

Commission and Court News

Interstate Commerce Commission

The commission has announced a series of hearings, before Commissioner Atchison, in various cities, for the purpose of giving all interested parties an opportunity to express their views as to the exact definition of the five zones of standard time, which the commission was authorized to establish in the "day-light saving" law.

The Interstate Commerce Commission has announced a hearing at Washington on May 27 for the consideration of a set of suggested amendments proposed by the Bureau for the Safe Transportation of Explosives and Other Dangerous Articles, after exhaustive conference with shippers and carriers, to the commission's regulations on this subject. By reason of new information and altered conditions certain modifications are desirable. Unless objections are presented and sustained, the proposed amendments will be adopted. Therefore, the commission says, attendance upon the hearings seems not to be important except for the purpose of presenting objections.

Private Car Line Report

The Interstate Commerce Commission has made public the tentative report of Attorney-Examiner G. N. Brown on the commission's investigation of private cars. An important part of the interstate commerce of the country is transported in privately owned cars and, says the report, it is to the interest of the owners, the carriers and the public that their operations should be continued under such rules and regulations as will insure their efficient handling without discrimination. Different phases in connection with the use of privately owned cars are considered in detail in the report and recommendations are made with respect to their use for the future. In conclusion, the report recommends: That shippers may continue to lease cars independently for the transportation of their shipments; that carriers require statements of car line charges made by car owners against shippers, for publication in their tariffs; that a charge in addition to freight rates should not be made for furnishing to shippers refrigerator, tank or other special types of cars unless the freight rates are predicated on transportation in another type of cars less expensive and less difficult to operate; that the basis for the compensation to be paid owners of private cars should not be on the cost of cars and shops, etc., depreciation, taxes, cost of operation and maintenance and interest on investment, but that payments should be made by the carriers on the basis of loaded and empty mileage; and that the mileage should be computed on the basis of distance tables without the elimination of mileage movements through the switching districts.

It is recommended that there be no increase in the present payment for the use of refrigerator cars and so-called meat cars east of El Paso, Albuquerque, Salt Lake City and Ogden, but that the present rate of three-quarters of a cent per mile on the loaded and empty movement of tank cars be increased to one cent and that an increased allowance should be paid on live poultry cars, palace stock, heater and other privately owned cars which are used, operated and controlled by shippers, where the payment is now less than one cent a mile. It is recommended that there should be no increase on stock, coke, coal, rack, flat, box or pocket cars, although privately owned. The examiner also recommends that the master carbuilders' rules be not filed as tariffs.

The report estimates that on January 1, 1918, there were in the United States 200,000 private cars. This includes 135,000 tank and refrigerator cars, and the remaining 65,000 is made up of stock cars, coal cars, palace stock cars, heater cars, etc. It is estimated that these 200,000 cars represent an investment of \$250,000,000, and in addition to this the owners of the cars have large investments in repair shops, etc.

Equipment and Supplies

The Mechanical and Purchasing Committees of the Railroad Administration have been holding joint meetings to consider the specialties for cars and locomotives ordered which have been recommended by the Mechanical Committee in the light of bids submitted by manufacturers. Various representatives of manufacturers have been called in to discuss the proposed orders for their devices, while some have been told tentatively that they will be given orders. No announcement of the specialties selected is expected for several days.

Freight Cars

THE VIRGINIAN is inquiring for 15 caboose cars.

THE BALTIMORE & OHIO is inquiring for 100 steel underframes for caboose cars.

THE CUBAN AMERICAN SUGAR COMPANY is inquiring for five 6,500-gal. tank cars.

THE TRUMBULL STEEL COMPANY, Warren, O., is inquiring for ten 50-ton steel gondola cars.

THE PINE POOL GASOLINE COMPANY, Okmulgee, Okla., is inquiring for 40 8,000-gal. insulated tank cars.

THE CABLE CHEMICAL COMPANY, Charleston, S. C., is inquiring for 25 50-ton, 7,000-gal. sulphuric acid tank cars.

THE COLORADO & WYOMING has ordered ten 50-ton gondola cars from the Western Steel Car & Foundry Company.

THE CHIMO COPPER COMPANY, Salt Lake, Utah, has ordered 24 underframes from the Pressed Steel Car Company.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, is in the market for a number of ore cars, not over 25 ft. long.

THE WITTAKER GLESSNER COMPANY, Portsmouth, Ohio, has ordered four 50-ton gondola and seven 50-ton hopper cars from the Pressed Steel Car Company.

Passenger Cars

THE PACIFIC ELECTRIC is inquiring for 25 motor cars.

THE BOSTON ELEVATED is inquiring for prices on 200 motor cars and 100 trailers.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, is in the market for a number of passenger cars.

Miscellaneous

THE ST. LOUIS SOUTHWESTERN has ordered from the Roberts & Schaefer Company, Chicago, two automatic electric coaling plants, to be of reinforced concrete and of 200-ton capacity each. These will be duplicates of the plant that was recently built for the same road at Valley Junction, Ill. The new plants are to be built at Commerce, Tex., and Jonesboro, Ark.

BUILDING LOCOMOTIVES IN DENMARK—Commerce reports, under date of March 28, says that building of locomotives is progressing in Denmark. The firm of Frische & Co., Aarhus, has recently booked an order from the Government for 20 new locomotives.

JAPAN BUYS LIGHT RAILWAY—The Government has decided to purchase the Ishinomaki Light Railway which runs from Kogota to Ishinomaki, in Miyagi prefecture. The decision was made in consequence of the recent completion of the Trans-Ou Railway, with Kogota as the eastern terminus. *The Far Eastern Review*.

Supply Trade News

The H. W. Johns-Manville Company announces that after July 1, 1918, its Houston office will be located at 424-426 Washington avenue, Houston, Tex.

John A. Diener, formerly assistant examiner of the United States Patent Office, and for the past four years associated with Brown, Hanson & Boettcher, Chicago, in the practice of patent and trademark law, has become a member of that firm.

H. D. Wright, manager of the San Francisco office of the Brown Hoisting Machinery Company, has been appointed Pacific coast representative succeeding the Colby Engineering Company in the northwest territory. Mr. Wright's offices are in the Monadnock building.

H. S. Patterson has been appointed manager of the railroad department of the Walworth Manufacturing Company, with headquarters in Boston. H. T. Goodwin has been appointed assistant manager of the railroad department, with headquarters in New York. Both Mr. Patterson and Mr. Goodwin obtained their training with the National Tube Company by taking the specialty course at the Kewanee works of the National Tube Company, now the Walworth Manufacturing Company.

C. Z. Moore, supervisor division No. 4 of the Philadelphia division of the Pennsylvania Railroad, with headquarters at Middletown, Pa., tendered his resignation, effective May 1, to associate himself with John Lundie, consulting engineer, 52 Broadway, New York, inventor and producer of the Lundie tie plate. Mr. Moore entered the service of the Pennsylvania Railroad, October 1, 1894 in the division engineers' office at Harrisburg, Pa. One year later he was transferred to the construction department where he assisted for several years in heavy construction work. Later he returned to the maintenance of way department and served as transitman, assistant supervisor and supervisor at various points on the system. For the past few years he has been most successful in work as a track engineer, having taken in competition the general manager's prize for five consecutive years, the awards being made for the greatest improvement and the best track on the system and superintendent's division. Mr. Moore will represent Dr. Lundie with office in the Finance building, Philadelphia, Pa.

C. Z. Moore

The Austin Company, Cleveland, O., announces that G. E. Lemmerich has joined the engineering staff of that company, to devote his entire attention to the design of railway terminal buildings, having specialized in this work with the various railroads in the United States for a number of years. Mr. Lemmerich began his railway career in 1881 as axeman for the Pennsylvania, and has been doing railway layout work for over 20 years. In 1898 he was with the Central Railroad of New Jersey on engine terminals, freight terminals, and on special work in connection with the Elizabethport shops. In 1902 he was employed by the Delaware, Lackawanna & Western on the construction of freight car repair shops, at Scranton, and in 1903 at Jersey City on the proposed terminals for the Erie. In 1904 Mr. Lemmerich was employed with the Northern Pacific working on layouts for division

terminals. During the past eight years he has been associated with the design of freight terminals on the Illinois Central and the Chicago & Western Indiana, and with the design of engine terminals on the Western Maryland. The Austin Company, which has specialized in the construction of standard buildings erected in 30 to 90 days, is now designing engine terminal, shop and other railway buildings for similar rapid construction.

Edward Buker has been appointed western representative of Rome Iron Mills, Inc., with office in the McCormick building, Chicago. Mr. Buker was born in Chicago in 1885. He received his education in the public schools at that city and at the University of Illinois, from which institution he received the degree of Mechanical Engineer. While at college his summer vacations were spent in South Chicago rolling mills. Immediately upon graduation from college Mr. Buker entered the service of the Pullman Company as apprentice in that company's car shops in Chicago. After serving his time he went as special apprentice in the locomotive shops of the Illinois Central. Two years later he accepted a position as inspector on the Chicago, Rock Island & Pacific and was later appointed general foreman on the same road. Leaving the Rock Island he went with the Missouri, Kansas & Texas as master mechanic. During the past two years he has been with the Galena-Signal Oil Company as mechanical expert, which position he held up to the time of his recent appointment.

E. Buker

Trade Publications

SWITCH STANDS.—The Ramapo Iron Works, Hillburn, N. Y., has just issued its Pamphlet No. 17, descriptive of the Ramapo automatic safety switch stands. This is a 16-page book with illustrations and shows in detail the character of construction and the manner of operation of this type of switch stands.

MOTIVE POWER PROBLEM.—The Baldwin Locomotive Works in Record No. 90 has issued in booklet form the address of its president, Alba B. Johnson, before the annual convention of the Chamber of Commerce of the United States, at Chicago, April 11, entitled "The Problem of Motive Power Under the National Administration of Railroads." Mr. Johnson's paper was published in the *Railway Age* of April 12, page 965.

RAILWAY CONSTRUCTION IN DOMINICAN REPUBLIC.—There are two railroads in the Puerto Plata consular district, viz., the Dominican Central, owned by the Dominican Government, and the Samana & Santiago, owned by Scotch capitalists. The Dominican Central connects Puerto Plata with Santiago, a distance of 42 miles, with a further extension of 17 miles to Moca. Traffic on this road was suspended the first half of 1916, but operations were resumed in July of that year. The service has improved gradually, and the railroad has been reconstructed throughout, 700 tons of new 60-lb. rails and 50,000 new ties being laid. The telephone system has been placed in good condition, and new apparatus have been installed. All bridges, stations and other buildings have been painted and repaired. Work was commenced on a cut-off between Barrabas and La Sabana, which will reduce the grade from 9½ to 3 per cent and reduce the maximum curvature to 32 degrees. The Samana & Santiago made considerable progress with its seven-mile branch between Moca and Salcedo. When completed, this branch line will link the Samana & Santiago with the Dominican Central, thus connecting the ports of Sanchez and Puerto Plata by rail.—*Commerce Reports*.

Financial and Construction

Railway Financial News

DENVER & RIO GRANDE.—An agreement has been reached between the Denver & Rio Grande and Western Pacific interests and Government officials whereby the Denver & Rio Grande will secure funds to pay off its interest and other obligations up to and including June 1, with the exception of the judgment for approximately \$38,000,000 held by the Western Pacific against the Denver. This agreement plans for the wiping out of approximately \$4,500,000 indebtedness, which includes \$2,400,000 bond interest, unpaid or due June 1. The Railroad Administration will advance \$1,500,000, on account of the Denver rental, and the Equitable Trust Company will advance \$1,800,000 and will purchase certain Treasury securities, Liberty bonds, etc., while \$625,000 in cash in the Denver's treasury now under attachment will be released by order of the court. By agreement also \$900,000 on deposit with trustees for Denver bonds will be available.

DES MOINES & FORT DODGE.—See Minneapolis & St. Louis.

MINNEAPOLIS & ST. LOUIS.—Judge Charles M. Hough in the Federal Court at New York has dismissed the suit of William Mitchell and others as temporary administrators of the estate of Amos F. Eno against the Des Moines & Fort Dodge and the Minneapolis & St. Louis railroads. The plaintiffs sought to prevent the consolidation of the roads and to compel the payments of dividends on stock in their possession.

MISSOURI PACIFIC.—Bertram Cutler has been elected a director to succeed Carl Gray.

NEW YORK CENTRAL.—This company has obtained \$6,000,000 for six months at six per cent from the Central Trust Company of New York through the efforts of Director General McAdoo. See "Doings of the United States Railroad Administration" on another page of this issue.

ST. LOUIS-SAN FRANCISCO.—James N. Wallace has been elected a director to succeed E. D. Levy, resigned.

WASHINGTON, BRANDYWINE & POINT LOOKOUT.—See Washington, Potomac & Chesapeake.

WASHINGTON, POTOMAC & CHESAPEAKE.—A new corporation, the Washington, Brandywine & Point Lookout Railroad has been formed to operate this road which last December was sold for junk to Joseph Bros. & Co. for \$2,500. The purchasers had begun to dismantle the railroad when proceedings were begun by prominent citizens which stopped the dismantling. A new charter was procured and stock was subscribed for. After \$75,000 had been raised and the Government had loaned \$50,000 on first mortgage, a contract for the purchase of the road from Joseph Bros. & Co. for \$125,000 was signed on May 6 in the office of Judge John B. Payne, general counsel for the director general of railroads.

Railway Construction

ILLINOIS CENTRAL.—This company has completed plans for the construction of a 12-stall roundhouse, a turntable and a machine shop at Carbondale, Ill., to cost about \$200,000. It is also planning to enlarge its mechanical facilities at Champaign, Ill. The work, in the main, will consist of the construction of new roundhouse stalls and will cost about \$150,000. At Centralia, Ill., the company proposes to construct additional tracks in both its north and southbound yards at a cost of about \$150,000. At Paducah, Ky., it is planning mechanical facilities, including a new roundhouse containing 32 stalls, which will cost approximately \$200,000. Plans are also being prepared for a hospital building at Paducah, the construction of which the company expects to start in about six weeks. The road expects to complete plans for its fifty-third street (Hyde Park) station, Chicago, in about two months.

Railway Officers

Executive, Financial, Legal and Accounting

J. B. Myers has been appointed auditor of the Montana, Wyoming & Southern, with office at Belfry, Mont., succeeding **A. R. Clement**, resigned to enter other business.

W. J. Jackson, receiver of the Chicago & Eastern Illinois, with headquarters at Chicago, has resigned and has been placed in charge of the operation of the road with the title of president. **Thomas D. Heed**, of Chicago, succeeds Mr. Jackson as receiver.

A. E. Warmington has been appointed assistant to the president of the California Southern, with headquarters at Los Angeles, Cal. **J. C. Odell** has been elected treasurer, with headquarters at Los Angeles, Cal., succeeding **J. R. Grant**, who continues as secretary.

J. E. Conklin, assistant to the president of the Anthony & Northern, has been elected vice-president, with office at Hutchinson, Kans., and **T. A. Fry** has been elected secretary, with headquarters at Hutchinson, Kans., succeeding **E. M. Vetter**. Mr. Fry continues the duties of treasurer and purchasing agent.

Winfield S. Cooper, whose appointment as assistant to the vice-president in charge of operation of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, was announced in the *Railway*

W. S. Cooper

Age on May 3, was born at Polk, Ohio, on February 15, 1862. Mr. Cooper's railway work began in May, 1877, when he became a telegraph operator on the New York, Pennsylvania & Ohio, which has since become part of the Erie. Subsequently he was consecutively operator and train dispatcher on the Louisville & Nashville, train dispatcher on the New York, Pennsylvania & Ohio, train dispatcher on the Canadian Pacific, and from 1886 to 1895 train dispatcher and chief despatcher on the Chicago, Milwaukee & St. Paul. In 1895 he was appointed trainmaster, and in February, 1903, he was promoted to superintendent. Three years later he was again promoted, this time to assistant general superintendent, with headquarters at Chicago. He continued in that position for six years, following which on February 1, 1912, he became general superintendent of the southern district, with the same headquarters, holding this position until his recent appointment as assistant to the vice-president, as mentioned above.

Operating

J. D. Feeney has been appointed acting superintendent of the Anthony & Northern, with office at Pratt, Kans., succeeding **C. F. Jeff**.

F. O. Bamforth, treasurer of the Cincinnati, Findlay & Ft. Wayne, which road is operated by the New York, Chicago & St. Louis, has also been appointed superintendent.

A. Ross, superintendent of the Lehigh Valley at Easton, Pa., has been appointed superintendent of New York division, vice **S. S. Stone**, resigned; **M. A. Mulligan**, superintendent at Hazleton, has been appointed superintendent of the New Jersey & Lehigh division, vice Mr. Ross, and **P. T. Reilly**, general yard inspector at Bethlehem, has been ap-

pointed superintendent of the Mahanoy & Hazleton division, vice Mr. Mulligan, transferred.

W. M. Bacon, assistant superintendent of the St. Louis Southwestern, with headquarters at Mt. Pleasant, Tex., has been appointed assistant superintendent of the Denver & Salt Lake, with headquarters at Denver, Colo., succeeding **G. W. Barr**. **A. R. Stith** has been appointed superintendent of car service, with headquarters at Denver, Colo., succeeding **W. T. Bruning**.

J. B. Blair, who has been appointed superintendent of the Canadian Pacific with headquarters at Farnham, Que., as has already been announced in these columns, was born on November 17, 1876, at Whitby, Ont., and was educated at Dufferin school, Toronto, and at the Toronto Normal school. He began railway work in May, 1894, with the New York, Ontario & Western, at Norwich, N. Y., and subsequently served consecutively on the New York, New Haven & Hartford, the Chicago & North Western, the Chicago, Milwaukee & St. Paul, and the Southern Railway, in various capacities in train service. From June, 1914, to January, 1916, he was general yardmaster of the Canadian Pacific at Windsor, Ont., and then to the following month was assistant superintendent at London. In February, 1916, he was appointed assistant superintendent of terminals at Montreal, Que., which position he held at the time of his recent appointment as superintendent of the same road as above noted.

A. J. Miller, whose appointment as superintendent of car service of the Delaware, Lackawanna & Western, with headquarters at Scranton, Pa., has already been announced in these columns, was born on October 3, 1877 at Dunmore, Pa., and was educated in the high schools and at business college. He began railway work in March, 1902, with the Delaware, Lackawanna & Western as a clerk in the car service department. He subsequently held different positions in this department and in October, 1912, was promoted to traveling car agent, remaining in that position until July, 1916, when he left that road to become chief clerk to the superintendent of car service of the Central of New Jersey, at Jersey City, N. J. In November, 1916, he returned to the service of the Delaware, Lackawanna & Western, as general chief clerk to the superintendent of car service, which position he held at the time of his recent appointment as superintendent of car service of the same road, as above noted.

A. J. Miller

W. M. Weidenhamer, whose appointment as general superintendent of the southern district, of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, was announced in the *Railway Age* on May 3, was born in Schuyler County, Ill., on June 23, 1863. He entered the service of the Chicago, Burlington & Quincy on January 2, 1880, as a brakeman and was promoted to conductor on February 12, 1885. On May 4, 1904, he was assigned to special duties by the operating vice-president. On November 1, 1904, he was appointed trainmaster of the Galesburg division, with headquarters at Galesburg, Ill., and on October 15, 1905, he was transferred in the same capacity to the McCook division, with headquarters at McCook, Nebr. He was promoted to superintendent of the Sterling division on December 15, 1908, with headquarters at Sterling, Colo., and on December 1, 1909, was transferred to the Alliance division, with headquarters at Alliance, Nebr. He left the Burlington in December, 1917, to become inspector of transportation of the Chicago, Milwaukee & St. Paul, which position he held until his recent promotion to general superintendent of the southern district, as mentioned above.

Martin J. Larson, whose appointment as superintendent of the Southern Minnesota Division, of the Chicago, Milwaukee & St. Paul, with headquarters at La Crosse, Wis., was announced in the *Railway Age* on May 3, was born in Norway, on April 19, 1866. He began railway work as a messenger in the passenger department of the Chicago, Milwaukee & St. Paul, at Milwaukee, Wis., on September 15, 1882. The following year he was employed as a clerk in the purchasing department at Milwaukee; then in March, 1884 as a clerk in the general superintendent's office at Milwaukee. In June, 1889, he was appointed chief clerk to the division superintendent at Sioux City, Iowa. In July, 1903, he was transferred to the general manager's office at Chicago, and on May 1, 1907 he was promoted to trainmaster at Sioux City, Iowa. In July, 1912, he was appointed assistant to the assistant general manager at Chicago, where he remained until his recent appointment as superintendent of the Southern Minnesota division.

Hugh Wilson, assistant division superintendent of the Baltimore & Ohio at Grafton, W. Va., has been appointed superintendent of the Monongah division, with headquarters at Grafton, vice **J. W. Deneen**, promoted; **P. C. Allen** has been appointed superintendent of the Baltimore division, with headquarters at Baltimore, Md., vice **C. B. Gorsuch**, granted leave of absence; **B. Z. Holverstott**, trainmaster at Fairmont, W. Va., has been appointed assistant superintendent of the Monongah division with headquarters at Grafton, vice Mr. Wilson; **J. K. Flaherty**, road foreman of engines on the Monongah division, has been appointed assistant superintendent, with office at Cumberland. **J. N. Niland**, general yardmaster at Cumberland has been appointed trainmaster with office at Grafton, succeeding **J. McClung**, transferred to Clarksburg. **P. E. Marsh**, road foreman of engines, with office at Weston, has been appointed trainmaster with office at Clarksburg to succeed **E. Bartlett**, who has been transferred as trainmaster to Fairmont, succeeding Mr. Holverstott.

Traffic

F. J. Toner has been appointed acting general freight and passenger agent of the Denver & Salt Lake, with headquarters at Denver, Colo., succeeding **W. H. Paul**.

H. A. Fletcher, commercial agent of the Central of Georgia, with office at Chicago, has resigned to accept service with the Illinois Central, and the agency at Chicago has been closed.

G. A. Westcott, general freight and passenger agent of the Copper Range, has been appointed traffic manager, with office at Houghton, Mich. The office of general freight and passenger agent has been abolished.

F. G. Abbey, assistant general freight agent of the Missouri, Kansas & Texas, of Texas, with headquarters at Dallas, Tex., has resigned to become Washington representative of the Southern Products Company.

William M. Mortimer, general freight and passenger agent of the Coal & Coke, with office at Charleston, W. Va., having resigned to accept other service, the position of general freight and passenger agent has been abolished.

J. H. Webster, general agent of the passenger department of the Erie, has been appointed division passenger agent, with headquarters at Elmira, N. Y., and **F. Ralph** has been appointed division passenger agent, with office at New York.

William Owens, northern passenger agent of the Chicago & Alton, at Milwaukee, has been appointed passenger agent at the Union Station at Chicago, succeeding **H. E. Thomas**, who has resigned to enter the army. The position held by Mr. Owens at Milwaukee has been abolished.

C. McD. Davis, general freight agent of the Atlantic Coast Line, with office at Wilmington, N. C., has been temporarily detached from his duties with the Atlantic Coast Line for service with the Southern Freight Rate Committee at Atlanta, Ga. Until further advised, the duties of the general freight agent will be performed by **J. W. Perrin**, assistant freight traffic manager at Wilmington; **S. H. Dare**, general western freight agent at Chicago, has been appointed division freight agent, with office at Montgomery, Ala.

Engineering and Rolling Stock

S. W. Heckathorne has been appointed master mechanic of the Anthony and Northern, with headquarters at Pratt, Kan., succeeding **S. C. Reep**.

J. B. McClain, assistant bridge engineer of the Seaboard Air Line, with office at Norfolk, Va., has been appointed bridge engineer, vice **Guy Pinner**, resigned to accept service elsewhere, and **W. C. Binford** has been appointed assistant bridge engineer, vice Mr. McClain.

C. Gribbin, master mechanic of the Canadian Pacific at North Bay, Ont., has been appointed master mechanic of the New Brunswick district, with office at St. John, N. B., succeeding **C. Kyle**, transferred; **T. Hambley** has been appointed master mechanic, with headquarters at North Bay, vice Mr. Gribbin; and **J. S. Allen** has been appointed general foreman, locomotive erecting shop, at North Bay.

A. B. Enbody, assistant master mechanic of the Central of New Jersey, with office at Mauch Chunk, Pa., has been appointed master mechanic of the Lehigh and Susquehanna division in charge of locomotive and car departments, and assignment of power, with office at Ashley, and **C. W. Culver**, general foreman at Mauch Chunk, has been appointed assistant master mechanic of the Lehigh and Susquehanna division, with office at Mauch Chunk.

H. S. Wall, whose appointment as mechanical superintendent, of the Atchison, Topeka & Santa Fe, with headquarters at Los Angeles, Cal., was announced in the *Railway Age* on April 12, has been in the employ of the Atchison, Topeka & Santa Fe for a period of nearly 19 years. On October 5, 1899, Mr. Wall entered the services of that company as a machinist at Albuquerque, N. M., and on April 1, 1900, he was appointed roundhouse foreman at Needles, Cal. On July 1 of the same year he was promoted to general foreman at the same place, and on August 15, 1900, he was promoted to division foreman at Barstow, Cal. He remained there until May 1, 1906, when he was promoted to master mechanic at Winslow, Ariz., being transferred on October 21 of the same year to Needles, Cal. On July 1, 1909, he was promoted to shop superintendent at San Bernardino, Cal., which position he held until his recent appointment as mechanical superintendent of the coast lines as mentioned above.

H. S. Wall

Purchasing

The New York, New Haven & Hartford announces that on May 7, the purchasing department and stores department were consolidated, with headquarters at New Haven, Conn., and both departments are now known as the "supply department," under the supervision and management of **George G. Yeomans**, general purchasing agent, and **G. W. Hayden**, assistant purchasing agent. The supply agents, Lines East and West, will co-operate and rank with maintenance engineers and mechanical superintendents. The division supply agents will co-operate and rank with division master mechanics and division engineers.

Railway Officers in Government Service

F. R. Hanlin has been appointed export agent for the regional director of western railroads, with headquarters at Seattle, Wash.

W. W. Walker, vice-president and general manager of the Duluth, South Shore & Atlantic, has been appointed

chairman of the terminal committee in charge of abroad operations at Duluth effective May 7.

William Sproule, president of the Southern Pacific, has been appointed chairman of the western department of the western railroad region, with headquarters at San Francisco, Cal., and will assist the regional director of western lines in supervising the operation of the roads in California and adjacent states.

W. B. Scott, president of the Southern Pacific, Texas and Louisiana lines, has been appointed chairman of the southern department of the western railroad region with headquarters at Houston, Tex., and will assist the regional director of western roads in directing the operation of the railways in that section of the western territory.

H. J. Bell, safety inspector of the Chicago & North Western has been appointed safety supervisor of the railroads under the jurisdiction of the western regional director. Mr. Bell is in Washington at present, where he is familiarizing himself with his new work under the supervision of H. W. Belnap, manager of the Safety Section of the United States Railroad Administration. He expects to assume his new duties with headquarters at Chicago in about a month.

Joseph W. James, assistant to the general manager of the Buffalo, Rochester & Pittsburgh, has been appointed special representative under J. M. Herbert, chairman Inter-regional

J. W. James

committee, in charge of railway operation, at St. Louis and East St. Louis. Mr. James was born at Cooper's Plains, Steuben county, New York, on August 10, 1879. He began his railway work in 1894, with the Delaware, Lackawanna & Western as telegraph operator. Subsequently he held various positions, such as telegraph operator, agent, yardmaster, train dispatcher, general yardmaster, chief train dispatcher and trainmaster, on various roads including the Great Northern, the Union Pacific, the Southern Pacific, the

Louisville & Nashville, the Atlantic Coast Line, the Illinois Central, the Cleveland, Cincinnati, Chicago & St. Louis, the Pennsylvania, the Missouri, Kansas & Texas, and the St. Louis & San Francisco. Mr. James has made an exhaustive study of train despatching, handling train orders and train rules. He was recently instrumental in revising the operating rules of the Buffalo, Rochester & Pittsburgh, where he was also the founder and editor of the employees' magazine. He originated and superintended the installation of the so-called "sailing day" plan for movements of package freight on the Buffalo, Rochester & Pittsburgh. Among other matters assigned to Mr. James in connection with his duties as special representative is the inauguration of a plan similar to the "sailing day" plan for the southwestern railroads under the jurisdiction of the committee in charge of operation in that section.

Obituary

A. S. Weinsheimer, secretary of the Pullman Company at Chicago, died on May 11, at the age of 72 years. Mr. Weinsheimer was born at Allegheny, Pa., on May 12, 1846, and entered railway service in 1860 with the Lehigh Valley, with which he was consecutively telegraph operator, train clerk and ticket agent. From 1864 until the termination of the Civil War he was connected with the U. S. Army Quartermaster's department at various points in the Baltimore & Ohio. In 1865 he again entered the service of the Lehigh Valley in the coal department. He severed his connections

with that company in 1871 to go with the Pullman Palace Car Company, at Chicago, and served it and its successor, the Pullman Company, until his death. He was cashier from September 1, 1875, to September 13, 1878, and from the latter date until his demise was secretary.

William Mahl

William Mahl, formerly vice-president and controller of the Southern Pacific Company, at New York, who retired on April 7, 1913, under the pension rules of the company, after 53 years' continuous railroad service, 31 of which were in the service of the Southern Pacific Company, died at Atlantic City, N. J., on May 13. Mr. Mahl was born in Carlsruhe, Baden, on December 19, 1843, and came to America with his parents in 1852. In 1860 he was entered as an apprentice in the shops of the Louisville & Nashville. In four years he became successively a machinist, a draftsman and chief clerk in the mechanical department. From 1864 to 1872 he was auditor and purchasing agent of the Louisville, Cincinnati & Lexington, now a part of the Louisville & Nashville. For a few years he served under Colonel Thomas A. Scott, on the Texas & Pacific, as auditor, purchasing agent and financial agent. Soon after the panic of 1873 he returned to the Louisville, Cincinnati & Lexington, and was appointed general superintendent. In February, 1882, Collis P. Huntington called him to New York, where he served successively as general agent, controller and assistant to the president of the Chesapeake & Ohio and the Southern Pacific, and the various collateral railways, steamship lines and other large interests of Mr. Huntington. After Mr. Huntington's death, E. H. Harriman continued and extended Mr. Mahl's functions so as to cover the entire Union Pacific and Southern Pacific systems. Mr. Mahl was vice-president and controller of both systems from October, 1909, until the Union Pacific and the Southern Pacific were separated under the order of the Supreme Court; and on February 6, 1913, he resigned from the Union Pacific.

William Mahl belongs to the older generation of railroad men, of whom there are now only one or two still active in business life. He represented in a remarkable way the ideals of the great age of American railroad development; ideals of great achievement, of personal initiative, of arbitrary exercise of great powers, the ideals of a railroad system strictly under private ownership and private management.

When Mr. Mahl went to the Louisville & Nashville in 1864, Albert Fink was chief engineer, and shortly afterwards became general superintendent. Mahl's early training was, therefore, under one of the greatest of the older generation of railroad men, and one of the first students of scientific railroad operation.

In 1873, when William Mahl was auditor of the Texas & Pacific, Thomas A. Scott, later president of the Pennsylvania Railroad, was president; General Grenville M. Dodge, later chief engineer of the Union Pacific, and later chairman of the board of the Colorado & Southern, was chief engineer, and W. H. Newman, later president of the New York Central & Hudson River, and now chairman of the board, was general freight and passenger agent.

From 1882 on, Mr. Mahl was an assistant, with one title or another, to Collis P. Huntington. Whatever his title happened to be on the various roads which Mr. Huntington was interested in, his functions were actually those of watch-dog of the treasury. Collis P. Huntington was a man, generous to a degree, and the loyal co-operation and service of a man like Mr. Mahl, to whom waste was an abomination, was in-

valuable. The present generation of railroad men hardly realize how great a share C. P. Huntington had in the development of the railroads of the United States. In the early eighties he was president of the Chesapeake & Ohio, and was connected with the development of the roads now known as the Texas Lines of the Southern Pacific, and with numerous other railroad enterprises which were later linked up with the larger railroad systems of the country. Mr. Huntington's genius lay in the conception of the rapid development of great railroad projects. Mr. Mahl's contribution to the success of these projects was of very real importance. His was the analytical mind which permitted of the carrying out of the dreams of Mr. Huntington in an economical and scientific way.

Until the time of his death, Mr. Mahl was engaged in writing an autobiography of his long and remarkably interesting life. It is to be hoped that these memoirs were near enough completion so that they may be put in shape for publication by Mr. Mahl's heirs. Curiously enough, in a man whose life work dealt with a vast multiplicity of detailed figures, Mr. Mahl wrote not only clear, concise English, but could be, when interested in his subject, vividly interesting.

Mr. Mahl was not of the cost accounting school of the present day followers of the Interstate Commerce Commission's theories. In his work of preparing accounting figures and statistics for Mr. Huntington and his railroad officers, the fundamental principle was to so construct the accounts as to call the attention of the executive to a fluctuation in costs, and, where possible, to provide the figures for an explanation of this fluctuation. Starting in, as he did, as a machinist, Mr. Mahl was always particularly interested in the accounting of the mechanical department, and his contrast of his own desires and those of the Interstate Commerce Commission in maintenance of equipment expenses is illuminating as to his attitude toward railroad accounting in general. The Interstate Commerce Commission's chief desire is to allocate to each piece of work the cost of doing this piece of work. Mr. Mahl's fundamental principle was to make it apparent at a glance if a particular shop force were added to even to the extent of a single man.

Exactness from his subordinates the utmost precision, he, nevertheless, had a thorough contempt for bookkeeping as bookkeeping. No poet could have expressed more scorn than could Mr. Mahl in pronouncing the phrase "That is a mere matter of bookkeeping." As a matter of fact, Mr. Mahl was, in his use of figures in his annual reports, akin to a great artist in the use of colors, or a great author in the use of phrases and of the connotation of words to produce a particular effect. If one will study Mr. Mahl's reports of the Southern Pacific under Collis P. Huntington, this fact will be amply apparent. When a sale of bonds was impending, Mr. Mahl's annual report would be a picture of the assets of the Southern Pacific that was remarkably convincing. From the first set of tables to the last, touch after touch to this picture would be given until the facts which, under a man of less genius, would have been a compilation of figures and nothing more, stood out as vividly as a physical picture of the resources, the plowed in profits, and the equities behind the Southern Pacific stock and bonds.

Mr. Mahl's standard of honesty in accounting work, as in everything in his life, was absolutely uncompromising. It was 100 per cent.

When the late E. H. Harriman bought the Southern Pacific, he asked Mr. Mahl to become the controller of the Harriman lines and made him vice-president, promising authority similar to that which Mr. Mahl had had on the Southern Pacific under Collis P. Huntington. Probably this promise, made in perfect good faith, was impossible of accomplishment. Mr. Harriman himself had so intimate a grasp of detail that his own mind performed the functions which Mr. Mahl had supplied to Mr. Huntington's mind. But Mr. Harriman depended on Mr. Mahl as he did on few of his associates. When the Harriman lines were dissolved and the accounting problems, involved in the dissolution of the Southern Pacific and Union Pacific, had to be worked out with the restrictions on the one side of Mr. Harriman's dominating personality and inflexible purposes to carry out certain policies and, on the other, the restrictions of the decree of dissolution of the courts, Mr. Mahl felt that it was a task better fitted for younger men, and he retired from all active railroad work.

W. Mahl

EDITORIAL

Railway Age

EDITORIAL

The *Railway Age* showed in an editorial last week that the operating income of 114 railways was \$90,000,000, or 60

Railway Earnings and Expenses

per cent, less in the first three months of the present year than it was in the first three months of last year. Returns from 191 roads which have now been made public by the Interstate Commerce Commission make a better showing, although not much better. In the three months these roads had an increase in operating revenues of \$57,400,000. The increase in their operating expenses was \$162,000,000 and the increase in their taxes and uncollectible revenues was about \$3,490,000. In consequence, their operating income declined from \$189,900,000 to \$81,600,000, making a loss in operating income compared with last year of \$108,000,000, or 57 per cent. The encouraging feature of the returns is that those for March are much better than those for the entire three months. The decline in the operating income of these roads in March was only from \$73,787,000 to \$67,352,000, or about 9 per cent. If the results for the three months should be taken as an indication of what the earnings and expenses will be during the entire year the outlook would have to be regarded as very bad. On the other hand, if results in March may be taken as an indication of those which will be gained during the rest of the year, the outlook is very much better. In any event, however, the indications are that the tendency of operating expenses would continue to be strongly upward and that of operating income strongly downward, even if a very large advance of wages was not impending. It seems highly desirable and necessary, therefore, that steps should be taken as rapidly as possible toward an increase in rates in order to save the government from suffering a large deficit from railway operations this year.

The director of the Division of Capital Expenditures of the Railroad Administration, Judge Robert S. Lovett, has au-

Large Capital Expenditures Authorized

thorized capital expenditures by 182 railways amounting to about \$938,000,000. As was to be expected from a department headed by a man of such great experience and executive ability and wisely as was practicable in the circumstances. The newspapers have called attention to the fact that the expenditures authorized are about three times as great as those made in any of the last three years. Measured merely in terms of money this is true. Measured in terms of what money will buy, it is far from true. In the fiscal year 1915 capital expenditures were \$310,500,000. The average railway wage this year will be at least 40 per cent higher than it was then, the prices of equipment will be at least 100 per cent higher and the prices of materials will average at least 50 per cent higher. The additions and betterments made and the equipment bought in 1915 for \$310,000,000 would have, on the basis of present wages and prices cost about \$550,000,000. Or to state the matter in another way, the facilities which can be provided now for \$938,000,000 would have cost on the basis of the prices and wages of 1915, about \$500,000,000. In the three years ending with 1915 the increase in investment in road

and equipment averaged \$457,500,000 annually and in the three years ending with 1912 it averaged \$755,000,000. Making allowances for differences in wages and prices, the authorizations for this year do not provide for as great increases in facilities as those made on the average annually from 1909 to 1915, inclusive. On the other hand, they probably provide for all and more than all the increases in facilities which it will be possible to get labor, money and materials to make.

A more careful analysis of the report of the Railroad Wage Commission discloses the fact that there are many cases

The Wage Increase and the Shop Mechanics

where the railway shop craftsmen and foremen will not participate in the increases recommended. During the past two years the railroads have been forced by dire necessity to periodically increase the rates of pay to this class of men in order to keep the shops fully manned. The demand for mechanics has been so great in the manufacture of war materials and ship building and the wages paid so high that many of the men have been drawn away from the railroads. Since the government has taken control of the roads, however, the immigration of the mechanics has been checked somewhat by the more or less tacit understanding that the men in the shops would be taken care of properly in the readjustment of wages. It is not to be wondered at, therefore, that expressions of dissatisfaction are heard from that quarter. The commission said: "It (the proposed scale) has its foundation in principle and not in the compelling force of any unusual competitive conditions." This, of course, is not practical, when there is such a large discrepancy between the awards made by the commission and what is being paid by industrial concerns. The ship building industry pays anywhere from 65 to 85 cents per hour for its mechanics and common laborers receive 40 cents. Munition plants pay 70 cents for machinists. Even the locomotive builders pay the craftsmen as high as 65 and 75 cents per hour. This compared with wages in the neighborhood of 50 cents an hour for mechanics and 25 cents for labor on the railroad indicates the difficulties that will be encountered as the demand of the war industries grow, unless a modification is made in the present schedule. Without doubt, the director general has observed this deficiency in the commission's report and will correct it. The fact, however, that the original report has received such wide publicity requires that prompt action be taken.

The terminal problem has been receiving considerable attention of late because it is well known that a large part of the car time is consumed in railway

Pooling Introduced with Success in the West

yards and that episodes of congestion can generally be traced to inadequate terminal and interchange facilities. Under the stress of necessity the regional director of Western railroads recently introduced a plan for handling certain commodities in solid train lots, described elsewhere in this issue, which has the advantage of eliminating terminal switching and avoiding the delays incident thereto. The plan which was first applied to export

grain, has reduced by one-half the transit time on that traffic between the Western primary markets and the Atlantic seaboard. The innovation constitutes a pooling of traffic among initial lines and the assignment to each of all shipments on certain designated days. This method of dividing business enables a railway to assemble sufficient cars of the same commodity consigned to the same destination to handle them in solid trains. These are operated through to the point of final delivery, according to routings arranged for by the Railroad Administration in such a manner that connections alternate in participating in the movement. The plan prevents the duplication of switching by initial lines, eliminates delays in switching at junction delivery points and gives all lines involved a fair share of the business handled. Up to date the scheme has been applied to the movement of both export and domestic foodstuffs, oil originating in the "Mid-Continental field," packinghouse products, north Pacific coast lumber consigned to the government, California perishables and coast-to-coast shipments of hemp, wool and sugar. While the western regional director and his staff are to be commended for the success of the train-lot plan, this method of handling traffic is nothing more or less than pooling which was prohibited by law under the private operation of railroads. It would, therefore, be decidedly unfair to seize upon this development under federal control as an argument for government ownership. It is rather an added proof of the short-sightedness of repressive regulation, and an indication of the need for an altered policy by federal and state governments when the railways are returned to their owners.

Increasing Track Capacity on Lines Already Signaled

CONGESTION FREQUENTLY OCCURS on certain more or less limited sections of track on a division already signaled owing to a number of trains endeavoring to move over such sections at approximately the same time. It may be inadvisable or impossible to rearrange train schedules to relieve such a situation. When one or more tracks are badly congested with traffic moving in the one direction at a time when the other track or tracks used for traffic in the opposing direction are idle, or nearly so, a decided loss in capacity results and the most efficient use is not being made of all the facilities at hand.

This condition can be and is oftentimes relieved by running some trains on other tracks against the current of traffic by the issuance of train orders. Instead of lightening the burden of the train dispatcher such practices add to his work, which is heavy enough under the most favorable circumstances. A study of the train sheets will indicate the time as well as the points on a division (if not already known) where the greatest congestion occurs.

The possibilities of using all tracks to capacity was early recognized by some roads. The Chicago, Burlington & Quincy has for a number of years made very good use of existing facilities by operating trains in the same direction on two tracks during certain periods when the conditions warranted, as outlined above. This practice was followed when the lines were operated under the telegraph block system. With the installation of automatic block signals, the tracks, where necessary, have been so signaled as to provide for operation in either direction on each track. Such a method not only provides for the most efficient use of existing facilities but more nearly approaches the ideal operating conditions, as trains may be run on any available track without the use of train orders or the throwing of additional work on the dispatcher. Such a method of operation is recognized by the American Railway Association and is fully provided for in the standard code.

It would appear advisable for operating officers to make a careful study of their lines and where conditions exist such as outlined above their tracks might well be signaled for operation in both directions. Considering the advantages to be derived, the changing of the present signal installations for such operation would appear to offer a solution of some of the difficulties experienced at the present time. When it is considered that the first cost and the cost of maintenance of such an installation are small compared with the cost of other means of obtaining the same results the plan is deserving of careful consideration, as any increase in the capacity of existing lines means ability to move additional traffic, which is so vital at the present time.

A Large Construction Program

THE NOTE OF PESSIMISM which has pervaded most discussions of railway betterment programs for the current year should be completely dissipated by the recent announcement of capital expenditures authorized by the Railway Administration, which aggregate \$937,961,318, of which \$440,071,013, or nearly one-half, will be spent for additions and betterments. It has been known for some time that the division of capital expenditures had recommended extensive improvements and that some of the roads have had very large budgets approved, but it was not until now that the real magnitude of the total sum has been apparent.

The actual size of the expenditures approved on the different roads vary widely, beginning with the New York Central with a maximum appropriation of \$70,000,000. There is also a wide variation in the relation of the sum authorized to the total amount of the budget submitted by the railroads, from the cases where the budget was accepted in full to the instances where nearly all of the items were eliminated. However, the same rule has been applied in all cases—the bearing of the items in question on the effectiveness of the railways as a war machine. Roundhouse and shop facilities have received primary consideration. Next in importance are increases in facilities for the movement of traffic, such as additional main tracks and yard improvements. The latter are primarily in the nature of extensions from which benefits will be secured in the shortest time. Nevertheless, the authorizations include projects for yards of unusual proportion, such as the Markham yard of the Illinois Central near Chicago. Other work has been approved where direct connection with the "winning of the war" has not been so obvious, although fundamentally just as pertinent. Among these may be mentioned the completion of grade separation projects in which the present stage of the work constitutes an obstacle to traffic. It is not surprising that extensions have been limited to \$18,203,000, divided among 38 out of the total of 182 roads that are included in the budget figures quoted above.

The time required to pass upon this heavy expenditure to ascertain whether the proposed work complied with the spirit of the policy adopted by the Railway Administration has, of course, been considerable, and is one of the causes for delay in undertaking work. Another obstacle has been a lack of funds on the part of the railroads. The large decrease in net revenues has effected some reduction in the amount of cash on hand; the government has been slow in making payments on its transportation bills and only limited disbursements have been made as yet on the income guarantees under government control. However, any misapprehension on this score should be allayed by Circular No. 14, issued by Director General McAdoo with regard to the progress being made on addition and betterment work. This order indicates that the interest of the Railway Administration in these projects does not cease with an examination and

authorization of the expenditure, but that the government, in placing its stamp of approval not only sanctions the work, but definitely directs its active prosecution. Of particular importance is the director general's inquiry as to delays to work through a lack of necessary funds, with instructions for immediate reports on any financial needs for an expeditious prosecution of such work. The Railway Administration, having passed on these improvement programs, is in the possession of valuable information regarding the needs of the various roads, and the advantages to accrue in improved transportation facilities through their completion. It is to be expected, therefore, that the government will not rest with mere authorization but will give the roads ample co-operation in the supply of both men and materials necessary for successful completion.

Amalgamation of Railway Associations

THE PROGRESS IN EFFICIENCY of the railways of the United States along technical and operating lines has been very largely due to work which has been done by their associations. The most prominent among these have been the American Railway Association, the Master Mechanics' Association, the American Railway Engineering Association, the Master Car Builders' Association, the Railway Signal Association, and the Association of Railway Accounting Officers.

They have furthered progress in two general ways. First, they have handled investigations and negotiations which have had to be made in order to enable any of the railways to make progress in certain directions. Second, they have had meetings and discussions, furnished information regarding the work being done on individual railways, and adopted recommendations as to standard practice, which have enabled all the railways to benefit by all the improvements made by any of them in operating methods or physical plant.

It has been truly said of the railway associations:

"It is a point often overlooked in discussions of Government ownership that economies of the kind attributed to consolidation under Government ownership in Prussia are made in the United States under private ownership by co-operation between the various railways. This co-operation is carried on largely through numerous national associations, composed of the railways themselves or of their officers. Some of the most important associations are international, including Canadian and other roads. The way their members, although competitors, place the results of their investigations and experience at one another's disposal without reserve and without price affords perhaps the best example of commercial tri-e-masonry in the world. By the investigations and reports of their committees, the free and full discussions at their meetings, the recommended practice which they adopt, and their very substantial success in getting the railways to follow the practice recommended, these organizations exert a potent influence for efficiency."

There has been, however, for some years an opinion among many railway officers that the various associations did not accomplish as much as they would if, first, they were co-ordinated under the hegemony of the American Railway Association, and second, their recommendations regarding standard practice were given some kind of backing which would cause them to be more generally carried out.

Some strong objections have been urged against either subjecting the control of other associations to the American Railway Association or attempting to force individual lines to comply with the recommendations of either this or other associations. It has been objected to the plan of putting other associations under the control of the American Railway Association that the latter has been less progressive and aggressive than some of the less pretentious organizations, that it is composed chiefly of executive officers, most of whom are not technical men, and that subjection to it would be likely to hamper rather than to further the work of the technical associations. Furthermore, there has been no power directly connected with railroad management which could exercise any coercion over the individual lines. Gov-

ernment control has given to one central authority, the director general of railroads, the power of forcing the individual lines to adopt standards recommended by the associations; and the movement for subjecting the other associations to the control of the American Railway Association has been renewed. It is even proposed to amalgamate all the more important associations.

The *Railway Age* believes there should be more co-ordination between the activities of the various associations. It also believes that there has been too much diversity in the practice of the railways of the United States, and that when recommendations for standardizing practice which it is desirable should be uniform, have been adopted by a large preponderance of the membership of important railway associations, there is no good reason why the various lines should not be required to adopt these practices. At the same time, however, this paper strongly questions the desirability of actually amalgamating all the large associations; and it seems clear that there might be more harm done by enforcing too much standardization of practice, than has been done in the past by failure voluntarily to adopt enough of it.

The constant development of better and better practice requires much experimenting and experience; and before any practice is adopted as standard for all the railways all the different varieties of practice should be carefully studied and fully discussed. In the mechanical field this investigation and discussion can best be done by an organization of mechanical officers; in the engineering field, by an organization of engineering officers; in the signal field, by an organization of signal officers. But the organizations in the several fields cannot do their work intelligently and thoroughly unless they are allowed a large measure of autonomy. They might be able to do it well if they were changed into divisions of the American Railway Association, which met and deliberated separately, and they reported the results of their deliberations to the American Railway Association; but if they were reduced to the status of mere committees of the American Railway Association, the number of technical officers who were given an opportunity to participate in their work would be greatly curtailed, and the amount of intelligence and the breadth of experience brought to bear on the various problems to be solved would be almost proportionately reduced.

If it were desirable that practice in regard to all operating and engineering matters on all railways should be the same, the case for having all such matters handled by a single association whose recommendations would be enforced by governmental authority would be stronger. And there are numerous matters regarding which practical uniformity is desirable. It is desirable regarding such matters as train rules, safety appliances on cars, and signaling indications. Train employees constantly are shifting from one railway to another, and diversity regarding such matters as those mentioned are elements of danger. There are many kinds of practice, however, diversity in which is desirable, not as a thing good in itself, perhaps, but as a means to an end which is good, this end being progress. Manifestly, it would be desirable to have the government require all roads to conform to the best practice in everything, provided we were sure, first, what was the best practice, and second, that the government's enforced standardization of a certain kind of practice would not prevent the introduction of still better practice. If, however, it were left to a single association to adopt recommended practice along all lines for all the railways of the United States, and if the government were to require the adoption by all railways of the exact practice recommended, there would be great danger that progress in the technical development of the railways, and in their operation would be hindered rather than promoted.

While it probably is desirable for closer co-ordination

ments. A total of \$5,819,000 was spent for betterments, of which \$1,327,000 was for improvement and additions to roadway and \$2,315,000 for additions (net) to equipment.

While it is probable that when all of the annual reports for western and southwestern roads have been published it will be found that roads in that part of the country did not suffer as severely in 1917 as the trunk lines and New England roads, nevertheless, the Missouri Pacific is in a rather unique position. While the road was still being operated under B. F. Bush as receiver, a very large force of employees was built up because of the need of taking up a great deal of delayed maintenance work and, in general, of feeding up the patient which had been, prior to the receivership, pretty badly starved. When, therefore, Mr. Bush was made president of the new company the management had a well rounded out organization with which to work. Traffic was on the increase, but under the receivership adequate facilities had been provided to meet an increase in traffic, so that while the Missouri Pacific, like all the other roads, had to pay greatly increased wage rates, the management had adequate forces both for train operation, maintenance of equipment and maintenance of way at their disposal.

Total operating revenues amounted to \$78,320,000 for 1917, an increase compared with 1916 of 11.93 per cent. Total operating expenses amounted to \$53,248,000, an increase of 3.71 per cent. Transportation expenses amounted to \$26,326,000, an increase of 21.18 per cent, which in the face of the rise in the rate of wages and the larger traffic handled, is a good showing. Maintenance of way cost \$10,946,000, a decrease of 10.81 per cent, and maintenance of equipment \$12,449,000, a decrease of 11.15 per cent. The explanation is, of course, that under the receivership in 1916, maintenance included very large expenditures for deferred maintenance. The Missouri Pacific management would probably say that notwithstanding the acute labor shortage it was in a position to do and actually did all of the maintenance work in 1917 that was necessary to keep the property up to the new and much higher standard which has been set for it.

The following table shows the ratio of each class of expenses to total operating revenues:

| | 1917 | 1916 |
|--|-------|-------|
| Maintenance of way and structures..... | 13.98 | 17.53 |
| Maintenance of equipment | 15.90 | 20.02 |
| Traffic | 2.16 | 2.48 |
| Transportation | 33.61 | 31.05 |
| General | 2.18 | 2.26 |
| Other | 0.16 | 0.03 |
| Total | 67.99 | 73.37 |

In 1915 8.64 per cent of the main line tracks of the Missouri Pacific was unballasted and 46.90 per cent of branch line tracks was unballasted. At the end of 1917 4.27 per cent only of main line tracks and 35.26 per cent of branch line tracks were unballasted. These figures, however, by no means give an adequate picture of the amount of rehabilitation work which has been done. Just what part of the track which was carried on the books as ballasted in 1915 had had so little renewal of ballast applied to it as to make it ballasted in theory rather than practice, it is hard to say, but there was a very considerable mileage of this kind of track. Renewal of ballast is a charge to maintenance of way expenses and a part of the very heavy maintenance expenses in 1916 was on account of work that, while technically renewal, actually cost almost as much as if there had been no ballast under the track before.

A great part of the increase in traffic which was handled by the Missouri Pacific in 1917 resulted from a much larger tonnage of bituminous coal and a larger tonnage of manufactures. The tonnage of bituminous coal carried in 1917 was 6,824,000, or 15.38 per cent more than in 1916. The tonnage of all manufactures totaled 5,352,000 tons in 1917, an increase of 20.55 per cent over the previous year. The average haul per ton in 1917 was 252 miles, in 1916 243.

There was a notable gain in train loading, the average train load in 1917 being 530 tons as against 463 tons in 1916. The average loading per loaded car was 21.55 tons in 1917, as against 19.35 tons in 1916.

The number of passengers carried one mile totaled 648,000,000 in 1917, an increase of 20.58 per cent. The mileage made by passenger trains, however, actually showed a decrease, totaling (including mixed train-miles) 12,370,000, or 1.74 per cent less than in 1916.

The table shows the figures for operation in 1917 and 1916:

| | 1917 | 1916 |
|------------------------------------|--------------|--------------|
| Average mileage operated | 7,325 | 7,437 |
| Freight revenue | \$57,504,651 | \$55,681,444 |
| Passenger revenue | 14,912,673 | 12,031,982 |
| Total operating revenues | 78,320,313 | 69,972,813 |
| Maint. of way and structures | 10,945,534 | 12,271,479 |
| Maintenance of equipment | 12,448,601 | 14,010,096 |
| Traffic | 1,691,349 | 1,734,745 |
| Transportation | 26,326,277 | 21,755,162 |
| General | 1,708,652 | 1,578,953 |
| Total operating expenses | 53,248,038 | 51,342,197 |
| Taxes | 4,220,700 | 3,068,800 |
| Operating income | 20,858,963 | 15,526,653 |
| Gross income | 24,999,877 | 16,970,535 |
| Net income | 8,965,104* | 959,008† |

*The deductions from gross income include interest on funded debt of the old company for the five months ended May 31, 1917.

†Deductions from gross income include the interest on the entire funded debt of the old company, although part of this interest was not paid, but was defaulted.

New Books

Proceedings of the American Railway Bridge & Building Association. 300 pages. Illustrated. 6 in. by 9 in. Bound in paper and cloth. Published by the Association. C. A. Lichty, Secretary, 319 North Waller avenue, Chicago. Price, \$1.

This volume contains the proceedings of the twenty-seventh annual convention which was held in Chicago on October 16-18, 1917. The reports and papers which were presented at this meeting were prepared with particular reference to present day problems in the bridge and building department and with the discussions will be found to be of more than usual value to railway men confronted with the problems incident to the maintenance of bridges and other structures. Committee reports were presented on the following subjects: The Erection of Plate Girder Spans with the Least Interruption of Traffic; Repairing and Strengthening Old Masonry; Paint and Its Application to Railway Structures; The Economical Delivery of Water to Locomotives, and Fire-proofing Roofs of Wooden Buildings. Individual papers were also presented on the following subjects: Concrete Casing for the Protection of Steel Structures, by E. E. R. Tratman, western editor, *Engineering News-Record*, Chicago; The Organization and Operation of Bridge and Building Material Yards, by H. C. Pearce, general purchasing agent, Seaboard Air Line; The Organization and Operation of a Bridge and Building Supply Yard, by Geo. T. Richards, superintendent bridge and building shop, Chicago, Milwaukee & St. Paul, Tomah, Wis.; Shipping Company Material Economically, by J. R. Pickering, superintendent of car service, Chicago, Rock Island & Pacific, Chicago; Housing and Feeding Bridge and Building Maintenance of Way Crews, by F. E. Weise, chief clerk, engineering department, Chicago, Milwaukee & St. Paul, Chicago; Snowsheds, by Geo. W. Rear, general bridge inspector, Southern Pacific, San Francisco, Cal.; Uniform Versus Differential Rates for Bridge and Building Department Employees, by E. T. Howson, western editor, *Railway Age*, Chicago; How to Secure and Hold Bridge and Building Men, by J. P. Wood, supervisor of bridges and buildings, Pere Marquette, Saginaw, Mich.; The Material Problem, by Albert Reichman, division engineer, American Bridge Company, Chicago; and Intelligent Reclamation of Material, by C. A. Lichty, Chicago & North Western Chicago.

Letters to the Editor

The Report of the Railroad Wage Commission

TO THE EDITOR:

NEW YORK.

This document, dated April 30, 1918, and released to the press May 9, 1918, is an able one, and the investigation was made with a view to its comprehensiveness and appears to have been thorough. It has, however, the defects of its origin. It is a political document and is carefully built within the four walls of political expediency.

The trouble with the politician is that he always looks at the problem of industrial organization from the "one man, one vote" standpoint. He never visualizes the industrial organization in its functioning—an activity in which one man as a manager may easily equal in potency one thousand men as workers, in which \$1,000 of capital in dynamic plant energy may easily equal in potency many times that value in human dynamic energy. In passing upon the rewards of these three contributing efforts, the views expressed are not especially illuminating.

The entire argument rests on the cost of living. The commission takes cognizance of two things:

(1) That the cost of living has increased disproportionately among those of small incomes, and

(2) That there is a point up to which it is essential that the full increased cost shall be allowed as a wage increase, while from this point on the increase may be gradually diminished . . . because the opportunity for substitution and other methods of thrift decline almost to the vanishing point.

In view of the emphasis placed upon this point, the findings of the investigators, Hathaway and Bowen, are interesting; that is, they find the increase in the cost of living as applied to men receiving incomes up to \$600 per year has been 43 per cent, to men receiving up to \$2,000 40 per cent; in other words, that the compressibility of the expenses of the \$2,000 man as compared with that of the \$600 man shows an advantage of only 3 per cent. This can hardly be the common experience.

No changes are recommended in wages above \$250 per month and no hint is given of the real decrease in wages and salaries above that amount through the incidents of the income tax, the sur-tax, the excess profits tax, etc.

The commission criticizes the slowness of the railroads in yielding to increase in wages, but it does not call attention to the reason therefor, which was the strangulation to which the roads were subjected through their rates being held inflexible by the commissions. Attention is called to the fact that such advances as were made were not in any way uniform, but the report does not dwell particularly upon the activities of the brotherhoods and not at all upon the activities of the President and the Congress in the passage of the Adamson law.

One noticeable feature of the report is that it applies to all employees and goes back for its foundation to the conditions existing on December 31, 1915. Thus, at one stroke, the government wipes out everything for which the unions fought: that is, their separatist advantages. This as to the future does not seek wholly to rectify the inequalities of the past, not even going so far as to suggest that having laid down the rule that the wage goes with the place and having fixed a wage for the place, that if the present incumbent was receiving a wage in excess of the standard and if, in

indulgence, he were allowed to continue in his position, his successor in taking the place should do so at the standard wage.

Such compensations, these commissioners suggest, "have been attained by the most compact and complete organizations, handled with a full appreciation of all strategic values." Had their statisticians reviewed the history of wages in the last forty years they would have seen how valueless have been these organized efforts as against the law of supply and demand. The fact is that unorganized common labor has fared equally well if the wages of today are compared with those of, say, 1880.

"Reductions in hours are not to be regarded as increases in pay." So much in apology for the history of the past! The basic eight-hour day, with its increase of 37½ per cent in wages (where the hours worked are maintained, but the basic day and its overtime are applied) has attractions that are well understood by all that are in direct contact with the situation.

The political aspects of the matter are further accentuated by the entire failure to report or condemn uneconomic practices—the maintenance of parasitic labor, as in the full crew requirements, too many men in freight and passenger pools, the limitation of output, as in the prohibition of operating double-headed trains in territory west of the Mississippi river, limitations in the number of apprentices, and many other similar examples of the false philosophy of labor unionism.

It is not unexpected that in contrast with this silence they should markedly call attention to the salaries of officials, some of which they say "may well be abolished altogether, others greatly reduced."

"Our system of railroads (they say) and our method of railroading are regarded as the model for the world, excelling all other public or private systems elsewhere. For our needs and for our pride this standard of superiority must be maintained." But no words of recognition of the great names of the past nor of the ability and the devotion of the names now on the official roster are found in this report. Here the report descends to demagoguery.

A FRIEND OF THE YOUNGER RAILROAD OFFICER.

"Curses and Courtesy"

CHICAGO.

TO THE EDITOR:

I have noted in your issue of January 18 the article signed "Nemesis."

I wondered what the idea was. Is any individual who happens to be able to write, to be allowed to accuse railway men of customarily transacting their business by cursing? There does not seem to be, on analysis, anything but imagination in what is said in the article, but it is run as a statement of facts.

F. H. RUTHERFORD,
Superintendent Terminals, Chicago & Eastern Illinois.

[The letter entitled "Curses and Courtesy," which appeared in our issue for January 18 and to which Mr. Rutherford refers, was published because it was written by a railway officer who perhaps meant to describe only how business is conducted in his immediate environment. If his letter was meant as a description of the way in which railway operation generally is conducted it was, according to our observation, inaccurate and unjust. There is a great deal of profanity spilled in the operation of the railways of the United States, but it is no greater in proportion than the amount spilled in running any other line of business. It would be entirely unjust to imply that railway men, as a class, are peculiarly addicted to profanity.—EDITOR.]

A Billion Dollars for Capital Improvements

Railroad Administration Announces Railroad Budgets That Have Been Tentatively Approved

WASH., D. C.

BUDGETS made up by the railroads for improvements and extensions during 1918 aggregating a capital expenditure of \$937,961,318 have been approved by the Railroad Administration, through the division of Capital Expenditures. The total includes \$440,071,013 for additions and betterments, \$479,686,531 for equipment, and \$18,203,774 for extensions. Proposed expenditures aggregating \$349,247,828 were eliminated in the revision of the budgets by the regional directors and the division of Capital Expenditures.

A list of the expenditures approved by roads divided between additions and betterments, equipment and extensions, together with the amounts eliminated, is given in the accompanying table given out on May 18. The list was accompanied by an explanatory statement as follows:

"The attached budgets were made up by the carriers in response to a letter of instructions issued by Director General McAdoo, which contained the following:

"In determining what additions and betterments, including equipment, and what road extensions, should be treated as necessary, and what work already entered upon should be suspended, please be guided by the following general principles:

"From the financial standpoint it is highly important to avoid the necessity for raising any new capital which is not absolutely necessary for the protection and development of the required transportation facilities to meet the present and prospective needs of the country's business under war conditions. From the standpoint of the available supply of labor and material, it is likewise highly important that this supply shall not be absorbed except for the necessary purpose mentioned in the preceding sentence.

"Please also bear in mind that it may frequently happen that projects which might be regarded as highly meritorious and necessary when viewed from the separate standpoint of a particular company, may not be equally meritorious or necessary under existing conditions when the government has possession and control of railroads generally and therefore when facilities heretofore subject to the exclusive control of the separate companies are now available for common use whenever such common use will promote the movement of traffic."

"If these instructions were followed, the estimates should be conservative. Nevertheless they were carefully revised and further reduced, as shown by this statement.

"The approval of these budgets is necessarily tentative. It was necessary to ascertain as speedily as possible what improvements were required and the probable cost, and grant authority to proceed with those most urgent, so that the work could be done promptly and before next winter. The subject is still under careful study, with a view to postponing or canceling any work which can reasonably be deferred; and the financial condition of the carriers and their ability to repay the money borrowed will require curtailment in many cases. On the other hand, it is certain that there will be considerable additions from time to time to the amounts required for particular improvements, which were not foreseen when the budgets were prepared. But on the whole, the figures given in the statement are as definite and accurate as it is possible for any estimates for such vast and varied work to be."

The total of \$479,000,000 for equipment includes the estimates of the various companies as to their requirements

for the year, as revised, including equipment contracted for but not yet delivered or paid for. If the roads are supplied from the cars and locomotives ordered by the government the cost will be charged against the authorized expenditure, so the total for equipment is not to be added to the expenditure of the government for equipment. As new cars and locomotives are charged to capital account while the cost of cars or locomotives which may be retired are written off the accounts, the figure \$479,000,000 represents the estimated expenditure for new equipment, regardless of any amount that may be written off for retirement. In the case of additions and betterments in the case of a facility that is retired, the figures given in the table represent the increase in the cost of the new facility over the cost or estimated value of the facility retired. In a circular addressed to the roads giving instructions as to the preparations of their reports it was stated that the information desired was as to the new money required in connection with the improvement rather than the manner in which the transactions are dealt with on the carriers' books.

Because the authorizations are more or less tentative, a further subdivision showing the detailed expenditures to be made is not yet available.

The asterisks in the table opposite the names of certain roads indicates that these budgets are still subject to revision, but the figures in general indicate an intention on the part of the Railroad Administration to allow the roads to make capital expenditures approximately three times as great as the average of the amounts so expended in the last three years, although the figures cannot be exactly compared with the increases in property investment as reported by the Interstate Commerce Commission.

The figures also indicate that the Railroad Administration is not encouraging many extensions of lines except for the completion of projects already under construction. The total for extensions, over \$18,000,000, is apportioned among 38 roads and in only eleven cases has more than \$500,000 for any road been approved. Of the total nearly \$7,000,000 is for the Pennsylvania System. The greater part of the additions and betterments approved are on the eastern lines where the heaviest traffic is being concentrated.

The cases in which the greatest eliminations were made were those of the Chicago Union Station Company, whose estimate was reduced by \$19,043,480 to \$1,655,293; the Norfolk & Western, whose figures were reduced by \$20,755,200; the Pennsylvania Western Lines, reduced \$22,356,128, and the Southern Railway, reduced \$46,916,950.

Rules to be observed with respect to all railroad work involving charges to capital account were prescribed in General Order No. 12 issued by Director General McAdoo on March 21, which authorized the director of the Division of Capital Expenditures, R. S. Lovett, to issue such regulations and instructions and to prescribe such forms and require such reports as might be necessary to carry out the order. The reports which Judge Lovett's department asked were sent to the regional directors for their recommendations and to Judge Lovett's office for final approval. After most of the budgets had been passed upon Circular No. 25 was addressed to the roads directing them to report at once to the regional directors and to the Division of Capital Expenditures as to whether they were proceeding with all practicable expedition to construct and put into operation all additions and betterments approved, with the reasons why

in case the work was not being vigorously prosecuted.

In case the carrier did not have on hand or had not arranged for the necessary funds, and if it anticipated that this condition was likely to delay any of the work, the carrier was directed to make a report at once to the director of the Division of Finance, stating its financial needs to complete all approved work expeditiously. Wherever possible, it is expected that railroads will finance their own work but if necessary the government may purchase the securities issued therefor. It may also make advances to the roads from its revolving fund, which consists of an appropriation

of \$500,000,000 and any surplus earnings of the carriers, or advances may be made through banks or directly by the War Finance Corporation.

The New York Central's Budget

The New York Central's total of \$70,672,087 allowed for capital expenditures, is the largest for any road and the total for the entire New York Central system, approximately \$163,000,000, exceeds the total for any other system. From its budget as submitted to the Railroad Administration, the New York Central proper had only \$41,000 eliminated and

BUDGETS FOR 1918.

*Total (1912)

*Subject to change.

the total eliminations for the entire system figure up only to less than \$5,000,000, of which \$3,115,288 was taken off the total for the Cleveland, Cincinnati, Chicago & St. Louis.

In view of these facts it is interesting to see how the total for the New York Central Railroad proper was divided:

| | Chargeable to investment account | Chargeable to operating expenses | Total |
|---|----------------------------------|----------------------------------|--------------|
| I. Equipment: | | | |
| Locomotives— | | | |
| Contracted for | \$8,731,800 | | \$8,731,800 |
| Not authorized but necessary in 1918 | 9,340,400 | | 9,340,400 |
| Freight cars— | | | |
| Contracted for | 265,634 | | 265,634 |
| Not authorized but necessary in 1918 | 8,600,000 | | 8,600,000 |
| Passenger cars— | | | |
| Contracted for | 3,112,808 | | 3,112,808 |
| Not authorized but necessary in 1918 | 2,274,000 | | 2,274,000 |
| Betterments to equipment— | | | |
| Locomotives | \$21,239 | \$273,290 | 794,529 |
| Freight cars | 1,844,734 | 3,225,007 | 5,069,741 |
| Passenger cars | 228,579 | 142,388 | 370,967 |
| Total equipment | \$38,168,394 | \$3,640,685 | \$41,809,079 |
| II-1. Additions and betterments necessary for efficiency: | | | |
| (1) Contracted for | \$1,243,046 | \$104,254 | \$1,347,300 |
| (2) Authorized but not contracted for | 703,185 | 1,445,734 | 2,148,919 |
| (3) Not authorized but necessary in 1918 | 13,950,650 | 2,508,757 | 16,459,407 |
| II-2. Additions and betterments necessary, but not primarily for efficiency, etc.: | | | |
| (1) Contracted for | | | |
| (2) Authorized but not contracted for | 821 | 29 | 850 |
| (3) Not authorized but necessary in 1918 | 99,500 | 14,000 | 113,500 |
| II-3. Necessary road extensions: | | | |
| | \$15,997,202 | \$4,072,774 | \$20,069,976 |
| III-a. Additions and betterments (exclusive of equipment) inaugurated prior to December 28, 1917, which have not been completed, and which are necessary to increase carriers' efficiency economy or capacity: | | | |
| | \$14,247,871 | \$5,902,135 | \$20,150,006 |
| III-b. Same—which are not primarily calculated to increase efficiency, etc. | | | |
| | 2,224,620 | 265,030 | 2,489,650 |
| III-c. Road extensions and new branches and lines inaugurated prior to December 28, 1917: | | | |
| | 75,000 | | 75,000 |
| | \$70,713,087 | \$13,880,624 | \$84,593,711 |
| Less part that can and will be suspended | 41,000 | | 41,000 |
| | \$70,672,087 | \$13,880,624 | \$84,552,711 |

Of the total of \$70,672,087 which may be charged to investment account \$61,015,887 is for the lines east of Buffalo. All of the equipment is charged to the lines east, no separate return for the equipment for the lines west having been included.

Equipment.—In the budget of over \$38,000,000 for equipment it is noted that the road now has on order 226 locomotives costing \$8,731,800, delivery on which is expected at various times throughout the year, even as late as December. Additional locomotives to the number of 171 costing \$9,340,000 are required this year.

The road has only 263 freight cars costing \$265,634 on order, but the budget as approved allows it to place additional orders for 1,000 box and 2,000 coal cars costing \$3,000,000 and \$5,600,000, respectively.

The passenger cars on order total 173, costing \$3,112,808. The budget allows the placing of additional orders for 50 coaches, 50 baggage and 10 milk cars, a total of 120, at a cost of \$2,274,000.

Other equipment now on order totals only 4 units, costing but \$22,200. The budget approves the placing of orders for 626 additional units costing \$3,227,000, including among other things 300 coal and ballast cars costing \$1,500,000; a ferryboat costing \$450,000; three tugs worth \$450,000, and 20 covered barges worth \$360,000, etc.

Among the additions and betterments for the lines east of Buffalo classified under II as necessary for efficiency, are

the following, the items quoted here being chosen from a list of several hundred as being among the more important.

Syracuse.—A 30-stall engine house, costing \$900,000, including \$540,000 chargeable to investment account and \$360,000 to operating expenses.

East Buffalo.—Shop improvements, \$550,000.

Depew.—Gardenville branch connection, \$500,000.

Watertown.—A 30-stall engine house, coal trestle, etc., \$900,000.

Avis.—Boilers for generating plant, shop extensions, etc., \$855,000.

Under the head of track work at various points on the road appears the sum of \$638,150, all but \$67,000 of which is to be charged to investment account.

Buildings will call for an expenditure of \$512,500.

An item of \$216,000 appears for coaling plants.

Signals will call for a total expenditure of \$1,337,400, of which \$997,900 will be chargeable to investment account and \$340,500 to operating expenses. The several items are as follows:

Automatic signals, Little Falls to Fonda, \$321,000, and Buffalo Belt Line, \$72,000.

Interlocking, Syracuse Junction, \$282,000; two towers at Rochester, one \$222,000, the other \$127,500.

Miscellaneous automatic signal and interlocking work, \$312,900.

Under the head of III-a—projects already under way, the completion of which is necessary for the carrier's efficiency, etc.—appear the following important items chosen also from a list of several hundred.

Belle Isle Engine Terminal.—Now 40 per cent completed; \$600,000 required for 1918.

Gardenville Engine Terminal.—Also 40 per cent completed; \$1,400,000 required.

Tonawanda, realignment, etc., made necessary by Barge Canal construction.—20 per cent completed. Required in 1918, \$1,437,000.

Rail.—The 1918 program calls for 62,190 tons costing \$2,576,600, nearly all chargeable to operating expenses.

Grand Central Terminal.—For this project there are a large number of comparatively small items which it is desired to carry out in 1918, some in the way of improvements which will increase the rentals of stores, etc., at the terminal, some required for the convenience of the public, some by city requirements, etc. For these purposes \$695,750 is permitted under III-a (necessary for the carrier's efficiency, economy and capacity) and \$1,262,750 under III-b (not primarily necessary for efficiency).

The only amount for new extensions either asked for or allowed in the entire budget is under III-c—projects inaugurated prior to December 28, 1917, and is for only \$75,000. It covers the expenses for 1918 for the Beach Creek Extension Railroad which the New York Central is planning to build along the south side of the Susquehanna River from Keating, Pa., to Browns, a line which will eventually be 47 miles long, will cost from \$6,000,000 to \$8,000,000 and will be an important link in the road's soft coal traffic. Between the points in question the New York Central is now using the Pennsylvania Railroad under trackage rights.

Lines West of Buffalo.—Several important projects are called for on the lines west at Buffalo.

Under II-1.—Improvements at Collinwood, \$615,000.

At Cleveland, \$267,000.

A new yard at Minerva, \$500,000.

Extension of yards at Elkhart, \$279,000.

Machine tools for various shops, \$480,000.

Under III-a.—New yard at Dock Junction to handle increased traffic at Erie. Now 30 per cent completed, \$432,000 required in 1918.

Improvements in freight facilities at Cleveland now 80 per cent completed, \$2,000,000 required.

Under the head of track materials for the lines west appears the total of \$2,644,000, of which \$1,713,000 is chargeable to operating expenses. The lines west ordered 30,000 tons of rails in 1917 but obtained only 24,000. The 6,000 tons is added to the 1918 program, making 36,000.

In reference to ballast the budget for the lines west states:

"Our program for 1918 is considerably below normal and represents the minimum amount necessary to keep our main tracks in safe operating condition."

Railroads To Be Operated By Federal Managers

This Step Taken by Director General McAdoo in Belief That
No Man Can Serve Two Masters

DIRECTOR GENERAL McADOO has announced a plan for placing the operation of each railroad in the hands of a federal manager to be appointed by and to be directly responsible to the Railroad Administration, reporting to the regional directors and displacing so far as authority for operation is concerned the presidents of the roads except as some of them may be appointed federal managers. The appointments of federal managers, except in one instance, have not yet been made. They will be chosen as far as practicable from operating officers of the particular properties involved and in most instances will probably be operating vice-presidents. The presidents who are displaced will thus be left free to represent the corporations with responsibility to stockholders and directors and their compensation will be charged to corporate funds, rather than to operating expenses. The plan as announced also includes further subdivision of the eastern region into districts and the creation of two additional regions, and a similar plan is expected to be adopted in other parts of the country.

Announcement of the plan which has been under contemplation for some time was made by the director general in a statement issued Tuesday night as follows:

"In view of the direct responsibility for the operation of the railroads of the country placed upon Director General McAdoo by the act of Congress and by the proclamations of the President, he has been unable to escape the conclusion that it will be advisable to place in direct charge of each property for operating purposes a representative, to be known as the Federal Manager, who will report to the Regional Director. As far as practicable, this Federal Manager will be chosen from the operating officers of the particular property, who are therefore entirely familiar with its employees and with its conditions.

"Except so far as may be necessary to meet the emergency conditions which compel the government to take control of the railroads, the Federal Manager of each railroad will endeavor to avail himself to the fullest extent of the advantages incident to the operation of the particular railroad as a unit and the preservation of its identity. This is believed to be of essential importance, not only to secure the best results during the period of government control, but also to give the greatest degree of reassurance to the officers and employees that the railroad careers upon which they have entered will not be narrowed, but, if anything, will be broadened, and to give the greatest possible reassurance to the stockholders that their just interests in the properties will be respected and that nothing will be needlessly done to have even the appearance of impairing their just rights.

"While in this way the responsibility for the operation of the property will be directly to the Regional Directors, and not to the boards of directors, it is the purpose of the Director General to accord to the boards of directors and their representatives the fullest opportunity to keep advised as to the operation and improvement of the properties and to maintain with the Director General and the Regional Directors the

fullest interchange of views as to what is in the best interest of the government and of the stockholders.

"In the development of this policy the Regional Directors, and also the Federal Managers, will be required to sever their official relations with the particular companies and to become exclusive representatives of the United States Railroad Administration.

"The first moves in the inauguration of this policy will be through the creation of two new regions, to be known as the 'Allegheny region' and the 'Pocahontas region.'

"The Allegheny region will consist, broadly, of the Pennsylvania lines east of and including Pittsburgh and Erie; Baltimore & Ohio, east of Pittsburgh and the Ohio river, including Pittsburgh terminals, Bessemer & Lake Erie Railroad, Cumberland Valley Railroad, Central Railroad of New Jersey, Coal & Coke Railroad, Philadelphia & Reading Railway, Western Maryland Railway, Cumberland & Pennsylvania, and Pittsburgh & Lake Erie. This region will be placed in charge of C. H. Markham as Regional Director (who has resigned his connections with the Illinois Central and other companies), who will have offices in Philadelphia.

"The Pocahontas region will consist of the Chesapeake & Ohio Railway east of Columbus, Cincinnati, and Louisville; the Norfolk & Western Railway, and the Virginian Railway, including the terminals of all lines at Hampton Roads. With the exception of the Allegheny and the Pocahontas regions, the Eastern region will remain as originally defined, with A. H. Smith as Regional Director, and district directors under Regional Director Smith will be appointed for New England and for that portion of the Eastern region west of Pittsburgh and the Ohio river and south of the Erie main line. The selection of the Regional Directors for the Pocahontas region and for the Southern region, succeeding Mr. Markham, as well as of the two new district directors under Regional Director Smith, will be announced later.

"The same policy will be applied from time to time, as rapidly as may be convenient, in other parts of the country, always with the greatest possible regard for all the interests affected and with a view to preserving intact, as far as reasonably practicable, the operating organizations of the companies."

Railroad President Displaced

The announcement followed the making public of the fact that C. W. Huntington, president of the Virginian Railway, was retired as the chief operating officer of the company and that Joseph H. Young, president of the Norfolk Southern, was appointed federal manager of the road in charge of its operations by telegraphic orders from Mr. McAdoo on Monday, effective at 12:01 a. m. on Tuesday. The Railroad Administration had ordered some improvements on the Virginian Railway in accordance with its policy of developing the coal carrying roads to handle a greater tonnage of coal to the Hampton Roads district and it is stated that Mr. Huntington did not act with sufficient

promptness in carrying out the orders but delayed work pending a discussion of such matters as the amount of interest to be paid on the necessary capital.

Mr. Huntington has issued the following statement:

"President Huntington, when seen at the office of the Virginian Railway Company, said that he had been 'retired as the chief operating officer' of the Virginian Railway Company by a telegram sent from Washington at 9.55 p. m. Saturday, May 18, and received by his secretary Sunday morning, which read as follows:

C. W. Huntington, president. Virginian R. R. Co., 60 Wall street, New York.

It is hereby ordered, effective at 12.01 A. M., Tuesday, May 21, 1918, that C. W. Huntington, president of the Virginian Railway Company, be retired as the chief operating officer of the railroad of that company, and that thereafter his compensation be paid by the corporation so long as the corporation desires to utilize his services, and that Joseph H. Young be and he is hereby appointed federal manager of the Virginian Railway and placed in charge of operations thereof, with office at the Norfolk Terminal Station building, Norfolk, Va., with full power to do and perform any and all acts which may be necessary or appropriate in the efficient operation of said railroad, and in the making of all improvements and betterments which may be necessary or appropriate to enable said railroad adequately to serve the public needs.

All officials, agents, and employees of said road are required to obey orders issued by or under the authority of said federal manager.

W. G. McAdoo.

Director General of Railroads.

"Mr. Huntington said that no reason had been assigned for the action of the director general and that he had no information on the subject except a news report that his retirement as chief operating officer of the Virginian Railway was because of his failure to obey an order of the Director General to make certain improvements on the railway. He added that the statement about failure to make ordered improvements was false, as no such order had ever been issued."

Published statements as to amount of the salaries to be paid to federal managers and members of the staff of the Railroad Administration are not confirmed, but no effort is made at the Washington office to deny the impression that officers' salaries to be paid by government will be limited to less than amounts paid under private management. The regional directors are expected to come to Washington shortly to discuss the appointments of the federal managers.

Eastern Liberty Loan Details

F. D. UNDERWOOD, chairman of the Third Liberty Loan committee, Eastern Railroads, has issued a statement giving complete details of the subscriptions by 691-521, employees of the Eastern Railroads for \$45,829,500 Third Liberty bonds.

The total number of men employed by the 95 railroads and subsidiaries in the Eastern district is 876,886, showing that 78.9 per cent of the employees subscribed to the loan.

An Example of Modern Coaling Station Construction

The Lehigh Valley Has Completed a Large New Plant
Which Embodies Some Original Features

A NEW REINFORCED concrete coaling station has recently been completed on the Lehigh Valley at Manchester, N. Y., which is notable not only because of the volume of storage space and capacity of the

structure while one passes along each end. The elevating towers are separated from the bin structure by a distance of 39 ft., the coal being transferred from the tower to the bin by means of two bridges spanning the intervening distance

General Plan

Elevation of Towers

Ground Plan Showing Track Arrangement and an Elevation of the Towers

receiving and discharge facilities, but also because of a number of innovations incorporated in its construction. Duplicate receiving and hoisting facilities, an arrangement

and forming a part of the superstructure covering the top of the bin.

This coaling station was designed and built by Roberts & Schaefer Company, Chicago, Ill., and the coal handling equipment is similar to that furnished in other plants built by that company, except as it has been modified to suit the particular requirements at this point. The elevating equip-

Arrangement of Chutes Over the Coal Pockets

for mixing the various kinds of coal as received, and an unusual compactness and convenience in the installation are among the special features that deserve notice.

The reinforced concrete storage bin is 70 ft. by 52 ft., and is elevated on concrete columns so as to serve locomotives standing on six tracks, four of which pass under the

One of the Coal Trams Receiving Coal

ment is in duplicate. Each elevating tower receives coal from a separate track hopper 20 ft. long from which it is fed automatically into the elevating bucket by means of a

Schraeder measuring coal feeder of $2\frac{1}{2}$ tons capacity, this feeder being actuated by the ascent and descent of the elevating bucket. The bucket in turn is raised and lowered by an independent electric hoist, having a capacity of 75 tons per hour. Since there are two elevators, 150 tons of coal can be received from cars and distributed in the bins each hour. One of the prime advantages of this duplicate equipment is that the plant may be served by either of the hoists alone in case the other is out of service.

At the top of each tower the elevating bucket dumps coal into a "RandS" horizontal tram car, which is shown in one of the photographs, the tram car for each elevator traveling back and forth on its own track across the bridge and over the top of the bin. Each tram car is timed to make its excursion over the coal pocket horizontally, as the bucket makes its excursion vertically.

The operation of both the hoisting and distributing equipment is automatic, being under the control of a Cutler-Hammer automatic controller, so that the operation is continuous without the attention of the operator. However, the operation may be stopped or started at will by means of electric push buttons at two locations, one in the hoist on the ground level and one over the bin.

The 1,200-ton bin is divided into a number of pockets, equipped at the top with chutes for receiving coal at various points in the travel of the tram cars across the top of the bin. It will be seen from one of the photographs showing a view over the top of the bin that the two interior rows of pockets can receive coal from either or both of the tram cars. This arrangement has been made useful in a unique way. At the present time this plant is delivering to engines either buckwheat or run of mine, bituminous coal or a mixture of 30 per cent buckwheat with 70 per cent crushed stoker coal; or a mixture of 50 per cent of buckwheat with 50 per cent of lump run of mine bituminous coal. One kind of coal in any proportion can be elevated in one elevating

bucket, and another kind of coal in any proportion can be elevated in the other elevating bucket, discharging into the two tram cars at the same time and through the concrete

The Pockets Are Equipped with Measuring Coal Loaders

chutes so as to bring this coal together at the delivery point into the storage pocket. Thus the coal in the pockets may be mixed in any desired proportions.

The coal bin is equipped with 14 electrically operated

The Station Will Coal Six Locomotives at One Time

"RandS" measuring coal loaders, for issuing and recording the amount of coal placed on locomotives at the rate of five tons per minute. The bin is arranged with steel walkways and pipe hand railings under the structure, and an operator is kept continuously on these walkways to issue all coal to locomotives, the loaders being operated by two horsepower electric motors with hand control.

In addition to the handling of coal, this plant is equipped with a reinforced concrete "RandS" gravity sand plant located between the bucket towers. The green sand is dumped in the track hoppers in the same manner as the coal, elevated in the elevating buckets, and discharged into a 120-ton capacity concrete wet sand pocket. Located directly under this are two Beamers steam sand dryers, which receive the sand through a rack and pinion gate. All of the dry sand passing through the dryers, which run continuously night and day without the attention of the operator, falls on a large steel hopper, over which the dry sand is screened, while the pebbles and foreign matter pass to the outside of the structure. The dry sand passing through

the screen falls into an automatic Tyrone sand drum, and by the use of two air valves, the dry sand is blown by compressed air to the 20 ton capacity dry sand tank located over the bin. The bin is equipped with six moisture proof undercut sand valves and telescoping spouts for supplying sand by gravity to locomotives on the six tracks. By the use of the "RandS" gravity sand plant, the sand is not touched with hand or shovel from the time it is dumped in the track hopper until it is placed in the domes of the locomotives.

The force required to tend this plant during operation includes one operator in charge of the mechanical equipment for elevating and distributing, one operator to coal the locomotives by the use of the measuring loaders and three laborers who dump the coal over the track hoppers. The installation of the plant has been under the direction of E. B. Ashby, formerly chief engineer, now consulting engineer of the Lehigh Valley, and G. T. Hand, now chief engineer. All work in connection with this structure was executed by the forces of Roberts & Schaefer Company.

Train-Lot Plan of Moving Freight in West

Regional Director Achieves Marked Operating Economies
by New Method of Handling Traffic

ON FEBRUARY 25 there were approximately 12,000,000 bu. of grain in the primary markets west of Chicago waiting for movement to seaboard for export. Despite the urgent need for foodstuffs abroad, the acute operating difficulties of the railroads resulting from exceptionally severe weather had slowed up transportation so considerably that export grain was reaching the Atlantic ports irregularly and often too late for transfer to the vessels in which shipping space was reserved. Likewise, some ports became congested with this freight because of the absence of a well-worked out plan for the distribution of export traffic among the various coast terminals.

This condition demanded a prompt and effective remedy. Accordingly, R. H. Aishton, regional director of western railroads, and M. J. Gormley, his operating assistant, put into practice the train-lot system of handling freight. That the scheme is a success is evident from the record for the first two-and-one-half months' experience. Between March 1 and May 15, 7,348 cars of foodstuffs were handled in train-lot movements, most of which contained grain and flour for export. Under the new plan a continuous stream of export freight is moving uninterruptedly from interior markets to Atlantic and Gulf ports where bottoms, arranged for in advance, are waiting.

To illustrate the speed with which this traffic is now being handled, a trainload of oats recently made the trip from St. Paul to Baltimore in seven days. This instance is not an exception but merely indicative of what can be done when the time consumed in crowded yards switching cars from one line to another is eliminated. It is not exaggeration to say that the time of moving cars from western markets to seaboard has been cut in half by the new arrangement. Cars leaving St. Paul, for example, did well under former conditions if they reached Baltimore in 12 or 14 days.

How Train-Lot Plan Is Operated

Under the train-lot plan the regional director of western railroads receives daily reports from the Food Administration and the British Ministry of Shipping through which he is advised of all purchases of grain, flour and other food-

stuffs at various primary markets. The regional director in turn telegraphs a "train-movement notice" to his terminal chairmen at the market centers, which contains all necessary directions concerning the furnishing of cars, time of departure and routing. Copies of these notices are also forwarded to all parties interested in any way in the handling of this traffic from the loading point to the destination of the freight.

It is incumbent upon the terminal chairmen to secure cars for the freight to be moved and to assemble these into trains. As soon as a train has been despatched over the designated road the chairman is required to telegraph the first connecting line and the regional director giving notice of departure indicating therein the probable time of arrival at the terminal or junction delivery point. The other lines involved in the movement likewise give telegraphic advice to their connections of the probable time of delivery, thus keeping all concerned fully informed and insuring continuous movement with minimum terminal delay. The road making final delivery at destination also advises the regional director's office by wire of the time of arrival. The following forms are used in telegraphing advice of the progress and arrival of a train-lot movement.

| | |
|--|------------------------------|
| PROCESS REPORT | |
| To Connecting Line and Regional Director | |
| Train movement Notice No. _____ | Train No. _____ left _____ |
| at (time) _____ (date) _____ | with _____ cars of _____ |
| _____ (weight) _____ | gross tons Will arrive _____ |
| (delivery point), at (time) _____ | |
| ARRIVAL REPORT | |
| To Regional Director | |
| T. M. N. No. _____ Train No. _____ | arrived at _____ |
| at _____ (time) _____ | with _____ |
| cars of _____ | |

The train movement notices are exceedingly simple, thereby facilitating prompt action on their receipt. Train Movement Notice No. 18, which is reproduced in part below, is typical:

MARCH 13, 1918
To: Chicago, St. Paul, Minneapolis, St. Louis, Kansas City, New Orleans, via routes and in dates named. These

trains are to be handled intact and given continuous movement. All cars in any one train to be destined to one port:

| Train No. | Date | Initial line | From | To | Routing |
|-----------|----------|--------------|-------------|-------------|--|
| 1 | March 14 | Mo. Pac. | Kansas City | New Orleans | Mo. Pac. (through) destination. |
| 2 | March 15 | K. C. S. | Kansas City | New Orleans | K. C. S.-Shreveport-T. & P.-destination. |
| 3 | March 16 | St. L.-S. F. | Kansas City | New Orleans | St. L.-S. F.-Memphis-Ill. Cent.-destination. |

O. T. Hill, chairman, car service committee, will arrange details with D. F. Piazek, zone agent, United States Food Administrator, and car pooling necessary. Kansas City lines are to make delivery of empty equipment as directed by Mr. Hill for this movement, and this to be done regardless of their other necessities.

Oil Movements Accelerated 100 Per Cent

The train-lot plan proved so successful in connection with the movement of export grain and flour that its application has been rapidly extended to other commodities. The second commodity to be handled according to the train-lot plan was oil in the so-called "mid-continental" field. This was necessitated by a reduction in the number of tank steamers available for oil movements from southern ports to the Atlantic seaboard, the increased demands for oil for governmental and industrial use and the impossibility of making any immediate additions to the available tank car equipment.

Following a conference of the Fuel Administration, the Railroad Administration and the oil industry, arrangements were made for the handling of oil traffic in train-lots. In order to facilitate the execution of the plan, the Oil section of the Fuel Administration appointed H. M. Conley, the oil interests appointed W. E. MacEwen and the Railroad Administration designated B. L. Swearingen as members of a committee on oil traffic, with headquarters at Kansas City. The plan provides for the consolidation of oil traffic from various refineries in train-lots at specified concentration points. When a train is made up the originating line designates it by a number and gives advance information to its connections of the point and time of delivery, together with the consist of the train. Similar information is passed on by each intermediate line, thereby insuring continuous and prompt service through to destination. The return movements of empty cars are effected by assembling cars at important terminals or concentration points and despatching them to points of origin as soon as trains are made up. Empty cars arriving at concentration or terminal points after one train has started are held for similar train-lot service on the following day, thus insuring a uniform and uninterrupted movement of empties and providing for an available supply of tank cars in refineries for loading.

In the first month of operation under the plan 6,562 cars were handled according to the train-lot method. The success of the scheme is indicated by the fact that the car mileage per day of oil equipment has been raised from 57 to 117 miles per day. A recent train consigned to one company in Pittsburgh made the trip from Tulsa, Okla., and return in 11 days. The new plan has not only insured an adequate supply of cars and eliminated delays in switching at terminals but has relieved the oil shippers of the necessity of employing a large corps of car tracers to locate delayed shipments. In fact, one of the most important advantages of the plan is that it dispenses with the services of those who demoralized yard forces through their efforts to secure special attention to the movement of oil shipments.

Plan Expedites Movement of Government Lumber

The application of the train-lot plan to the movement of government lumber from North Pacific coast points has been an unqualified success. Previously the government employed soldiers as train riders in order to secure the prompt and uninterrupted movement of shipments required for shipbuilding and aeroplane construction. Because of the un-

satisfactory results under this plan, the regional director of western roads introduced train-lot service to take care of the traffic.

Under the practice inaugurated, shipments from various mills are consolidated at designated originating train movement terminals, from which trains are despatched as soon as 15 or more cars have been assembled. The regional director, the government, connecting lines and all others concerned are provided with telegraphic reports of the consist of the train, the time of departure, the probable time of delivery at junction points and passing times at division terminals. The plan enables the government and the regional directors to follow the train from point of origin to destination and, if so desired, to divert certain cars to different plants at designated diversion points. Inasmuch as reconsignment is limited to a few terminals it is possible in most instances for the terminal chairmen at those points to hold the diverted cars until they can be consolidated with other cars for the same destination, thereby making a new train-lot movement possible.

For example, at Billings, Mont., shipments originating over the Great Northern and Northern Pacific are consolidated into one train over the Chicago, Burlington & Quincy which takes a new train-lot identity and is handled in the same manner as previously, to destination. At Minnesota Transfer shipments arriving over the Northern Pacific or Great Northern are consolidated into one train and given to one specific line for movement beyond. Likewise, they are given a train identity, whereas formerly cars originating at that point were scattered over all the Twin City-Chicago roads. Operating economy is further effected by the provision in the plan permitting the filling out of lumber trains with other commodities to full freight tonnage rating. Experience under the train-lot plan of handling shipments shows a saving in time between coasts of from four to ten days.

The Plan as Applied to Packing House Products

Under the old system of operation all of the roads serving the packinghouse centers of South Omaha, Sioux City, South St. Paul and Kansas City sent switching crews to the packing houses daily to assemble cars routed over their lines. Each line likewise attempted to maintain schedules averaging from 28 to 30 hours between those points and Chicago. They were, however, rarely able to reach destination on time with the result that the cars generally required re-icing before arrival. The absence of any definite provision for re-icing under the old plan of operation resulted in considerable losses through the deterioration of meat.

Under the plan introduced by the regional director, the schedules have been lengthened and re-icing has been specifically provided for at the expiration of each 24 hours of the run. The plan further definitely assigns all shipments from each of these terminals to certain roads on certain days, thereby insuring sufficient tonnage for train-lot service by the handling line and eliminating the duplication of switching service with the unavoidable interference of one line with another in the yards of the packing plants. A marked advantage of the new practice is that each line knows definitely what traffic it will be called upon to handle and is in a position to perfect arrangements for its movement in advance.

California Perishable Traffic Pooled

The train-lot plan has also been applied to the California fruit and vegetable traffic. Under former conditions each line participated in this business and attempted to operate under schedules which they were rarely able to maintain. Under the new plan the traffic has been divided up among the different roads in a manner similar to that under which the meat traffic is handled and trains are moved only

when a minimum of 25 cars has been accumulated, whereas formerly the roads started trains containing as few as ten cars of perishable freight. In addition, the schedules have been lengthened to provide for arrival in Chicago in time for morning team track placements, including delivery to auction houses and to eastern connections. Under the old system the schedules also provided for morning delivery but trains frequently arrived late. Inasmuch as there was no advantage in delivery unless it could be made early in the morning, the Railroad Administration decided to add a day to the schedule in order to insure arrival at destination on time. Thirty hours, for instance, has been added to the schedule between Roseville, Cal., and Chicago, but this addition in time makes delivery in Chicago sure on the morning of the ninth day from point of shipment.

Another merit of the new practice is that each train has a specific routing from the loading point to destination. Under the former plan of operation a separate routing would be specified for each car with the result that trains would be divided among connecting lines at junction points. At Omaha, for instance, a receiving road might or might not, secure sufficient cars to make up a fruit train for Chicago. It is obvious, therefore, that the old method of handling perishable traffic was not conducive to economy.

Summary of Merits of Train-Lot Plan

The train lot plan which has proved so successful in the movement of the commodities mentioned, is being rapidly extended to govern the transportation of other supplies including wool, sugar and hemp which have been moved in solid trains from the Pacific coast to the Atlantic seaboard.

The merits of the train-lot scheme may be summarized as follows:

- (1) Through the pooling of equipment by all lines at loading points an adequate supply of cars is insured.
- (2) Continuous movement of traffic is effected through the advance information furnished connecting lines concerning each train.
- (3) Economy of operation is made possible by the elimination of switching at terminals.
- (4) Fast schedules are not essential under the new plan, because continuous movement and minimum terminal delays enable trains to reach destination on time.
- (5) The designation of certain roads to handle specific commodities on certain days insures maximum tonnage to the handling lines in contrast with the former method of dividing traffic and running several trains on different lines operating under the same schedules.

Doings of the United States Railroad Administration

Railroads Will Carry Own Insurance—Merger of Express Companies—Wage Increases Not Satisfactory

THE railroads of the United States now having been unified into a single system, the combined system is considered big enough to carry its own insurance, thereby saving that part of the amount of the insurance premiums which goes to make up the profits of the insurance companies.

On April 30 a telegram was sent to carriers, instructing them not to renew any expiring fire insurance policies on property in federal control, and not to take out any new fire insurance policies upon such property. It was provided that carriers might call attention to cases calling for exceptional treatment. A letter was sent to the carriers confirming this telegram, and the letter suggested care for fire prevention in terms similar to the last paragraph of this order.

The Director General has now issued General Order No. 24, in which he says:

"It is desired to extend the instructions to other insurance than fire insurance, excepting only bonds or policies insuring fidelity of employees in handling funds.

"Carriers, therefore, are now instructed not to renew any expiring insurance of any character, covering property in federal control, or any liability in connection with the operation or use of any such property, or liability for property transported or stored by carriers under federal control, and not to take out any new policies, or place any additional or new risks under existing policies, of such insurance, except that this order shall not relate to bonds or policies insuring the fidelity of employees in handling funds. Such fidelity bonds or policies shall be continued, and proper provision made for any necessary changes, as heretofore. Carriers may present to the director general any special circumstances which they believe call for exceptional treatment."

If the termination of insurance in accordance with this order results, as to any particular property, in the discontinuance by the insurance company of inspection or other measures for prevention of loss, it will be desirable to adopt proper substitute therefor, and the carrier must make rea-

sonable and proper temporary provision for such inspection or other preventive measures, reporting its action to the director general.

The idea, of course, is that, the railroads being under a single control, a loss on one road can be made up by the saving in premium payments on other roads.

Many railroads now carry their own insurance and have accumulated considerable funds for the purpose. One of the points in controversy in connection with the negotiations with the government on the compensation contract involves the question as to whether such funds, accumulated by charges to operating expenses, belong to the companies or whether they have been transferred to the government.

C. A. Prouty, director of the Division of Public Service and Accounting, is taking steps to bring about uniformity in accounting for additions and betterments. In circular No. 3 he says:

"From advices received, there appears to be a lack of uniformity among accounting officers of steam railroad carriers in accounting for expenditures for additions and betterments incurred in connection with property (excluding land and equipment) retired and replaced.

"Uniformity in accounting for expenditures for additions and betterments must be attained, and to that end accounting officers of steam railroad carriers are hereby instructed to take such steps as will result in accounting for these expenditures in accordance with the accounting rules of the Interstate Commerce Commission.

"The attention of all concerned is directed to the general instructions of the commission's classification of investment in road and equipment, and particularly Sections 7 and 12 thereof.

"A copy of all inquiries addressed to the Interstate Commerce Commission requesting an interpretation of the rules referred to, should be forwarded to A. H. Plant, chairman of the Accounting Committee."

Freight Control Committees

Two additional committees for the control of freight traffic have been organized as subsidiaries of the North Atlantic Ports Freight Traffic Committee, which reports to the regional director for the eastern district. The two committees are located at Baltimore and at Philadelphia and are to control the movement of domestic freight into those ports. The Philadelphia domestic division consists of R. R. Blydenburgh, chairman, W. D. Corfield and W. F. Richardson. The Baltimore domestic division consists of E. S. King, chairman, S. T. Stackpole and W. A. Shropshire.

Railroad Offices in New York

No operating office in New York City of a railroad which does not reach New York City will be allowed to be charged to operating expenses under government control. This is a decision reached by Director General McAdoo after the entire subject of the expenses of corporate and operating offices of the railroads in New York City has been under consideration for some time. The director general has decided that he will not allow to be charged to operating expenses any of the expenses incident to the corporate existence of the corporations, which means that New York financial and corporate offices, if maintained, will have to be charged to the compensation which railroads receive from the government; and that of the New York offices, only those actually used for the operation of railroads reaching New York may be charged to operating expenses.

Proposed Merger of Express Companies

The contract between the Railroad Administration and the proposed Federal Express Company, which provides for a merger of the principal express companies of the United States into one company on the basis of an exchange of capital stock for physical assets, and for a contract with the Railroad Administration for the carriage of express traffic, has been practically completed and is now before Director General McAdoo for his approval. The contract provides for a division of the earnings of express traffic on the basis of slightly over 50 per cent to the government, this figure having been reached by taking the average of the amounts paid by express companies to railroads during the last ten years. The proposed combination thus far does not include three express companies owned by railroads, the Great Northern Express, subsidiary of the Great Northern Railway, the Northern Express, subsidiary of the Northern Pacific, and the Western Express, subsidiary of the Denver & Rio Grande and Western Pacific. These companies did not wish to be included because the railroads take the position that their earnings from express should be included in the compensation to be guaranteed them by the government, while the government has taken the position that it will make a contract with but one express company. The railroad-owned express companies, therefore, have been told that the government will not make a contract with them individually, but that they will be given an opportunity to join the proposed combination of the express companies on such terms as they can make, and the disposition of the matter is still unsettled.

Drop Letters Instead of Postcards

A. H. Smith, regional director for the eastern railroads, has sent a circular to the roads in his territory suggesting that drop letters at first-class postage rates be used instead of postal cards for communication with consignees regarding their freight shipments because under the new postal rates drop letters for delivery in the same community may be sent for two cents, the same price as a postal card, and they may be used to give more complete information. It is also understood that the drop letters sometimes receive better postal service than cards.

Consolidated Ticket Office in Chicago

Director General McAdoo has approved the selection of the ground floor of the Insurance Exchange building, located on Jackson Boulevard, with a frontage running from Sherman to Wells streets for the consolidated ticket office in Chicago. There will be two large rooms, the eastern half being occupied by the Eastern and Southern lines and the western half by the Western lines. There are at present 37 railroad ticket offices in Chicago which will be supplanted by the two consolidated offices. The annual saving in rental will be \$198,725. The work of equipping the new offices will proceed as rapidly as possible.

It is estimated that the aggregate business transacted in the consolidated offices will exceed \$16,000,000 a year.

Walker D. Hines

In Circular No. 26 the director general announces that Walker D. Hines, heretofore assistant to the director general, has been appointed assistant director general of railroads.

Compensation Contract

Negotiations between the representatives of the Railroad Administration and the committee representing the railways headed by Alfred P. Thom, regarding the form of contract for the compensation to be paid the railroads by the government are rather far from a conclusion and conferences are still being held. It is understood that the railroad committee and the government had approached an agreement when at the conference held on May 16 a committee representing the National Association of Owners of Railroad Securities, with Samuel Untermeyer as counsel, appeared and interjected some new points of controversy into the discussions which may serve to prolong the negotiations.

Proposed Wage Increase Not Entirely Satisfactory

It is becoming apparent that if the director general expects to keep railroad employees satisfied with their wages sufficiently to prevent them from leaving the railroad service for other employment it will become necessary for him to revise upward some of the recommendations of the Railroad Wage Commission, which would increase the railroad payroll by approximately \$300,000,000 a year. Mr. McAdoo still has the report under advisement but meanwhile large numbers of railway employees are protesting that the recommended increases in wages as compared with those of December 31, 1915, will give them little or no increase at this time, because they have already received increases from the railroad companies which equal or in some cases even exceed the advances recommended, but which they do not consider sufficient. This condition applies with greater force on some roads than on others. The shop employees particularly have received increases by various settlements and arbitration proceedings of such an amount that the figures proposed by the commission would not benefit them greatly. The brotherhoods, although the increases in their earnings which resulted in many instances from the Adamson law are not counted against them, are also understood to have asked for more.

SINGLE-PHASE 1,200 H. P. FREIGHT LOCOMOTIVES.—On the Magdeburg-Halle-Leipzig railway, one of the busiest lines of Central Germany, three 1,200-h.p. locomotives were recently introduced for dealing with the freight traffic. Since then 27 new locomotives have been ordered. The engines are built by the Allgemeine Elektrizitäts-Gesellschaft and are worked by single-phase currents of 13,500 volts and 16⅔ periods per second. Each engine carries two motors; the speed is 50 km., about 30 miles, per hour. —*Engineering, London.*

An Italian Military Supply Train

Italian Railways Under Government Management

The Value of Unified Direction Exemplified as a War Measure During Three Years of War

By Our Special European Correspondent

(Continued from page 1119, May 3.)

THE railway history of Italy is not pleasant reading, certainly. There have never been the huge financial rewards for railroad builders as in a richer country, and as a general rule the government has been called upon to throw good money after bad in order to meet the national necessity of obtaining railroads. There has always been in Italy a good deal of railroad graft, ranging from the knocking down of fares to high finance, but for all that the building has gone along steadily, and the results are felt to have justified the expenditures.

Why Italy Took to Government Control

Government control because of military necessity hardly seems to have entered the minds of anybody in Italy during the long and heated controversies beginning in 1903 and ending in 1905 with the government taking over and running its railroads. In the light of present events, no stranger fact can be found in this connection than the failure of all the bright minds of Italy, in and out of the Senate and the Chamber of Deputies to see the inevitable necessity of taking over the railroads because of their military importance. In war time one might as well think of having the army and the navy run by a group of business men as of having the railroads run on the same basis as in peace times. I have read many of the public documents of those years regarding government ownership in Italy and hardly anywhere has this phase of railroad management been discussed.

The underlying reason was simply that socialism in those days was taking its first great stranglehold on Italy, including other countries of the world, and one of the truisms of socialistic doctrine is government ownership and the elimination as much as possible of private ownership or management of so-called public utilities and public service concerns.

A royal commission appointed by parliament to study the matter reported against government ownership, and the private railroad owners were against it, as were the majority of the commercial bodies of the country. The railroad em-

ployees and workmen in general and the political parties representing them were in favor and carried the measure.

The facts in the case were reviewed among others by Deputy Rubini before parliament June 30, 1904. Italy's railroads had always been controlled in some fashion by the government. Previous to 1885 it had let out certain lines and had then been under the necessity of taking them back or of putting up money to pay their losses; but in 1885 and thence until 1905 it had leased its lines to three large companies for a term of 20 years with the possible privilege of renewal for two other periods of 20 years each, the government guaranteeing interest to be paid on the company capital. For the two years preceding 1905 a popular campaign was begun to prevent the renewal of the leases for the second period of 20 years.

Having tried both systems of ownership Italy ought to furnish one of the best models of any country for studying both sides of the question. But from a money point of view there doesn't ever seem to have been much made out of the Italian roads. The private companies did show dividends of 4 to 6 per cent in the prosperous years of Europe around 1900, and those who remember their service claim it was much better than that which the state has ever been able to give since.

Those favoring state control, however, claimed the private companies had been able to show dividends because of the help given by the state. Deputy Rubini, who made the fairest, most exact and comprehensive review of the railroad situation that perhaps has ever been made here, stated that in the fiscal year 1904-5 the only correct interpretation of railroad accounts showed receipts to be 165,000,000 lire (one lira—19.3 cents) with expenditures \$67,000,000 lire, with a virtual loss therefore of 144,000,000 lire. This loss he claimed had to come out of the pockets of the nation that had guaranteed the operation of the roads, so after all it didn't matter whether the roads were under private or state control; the loss existed and had to be paid even by those who stayed at home and benefited only indirectly by railroads. He pointed out that in 1885 the state had leased

its roads together with rolling stock and that after 20 years, with 9,000 kilometers of railway in operation representing a valuation of 5 billion lire, the state would owe July 1, 1905, about half a billion lire.

Rubini made careful comparisons of Italy's railroads with those of other European countries and gave some of the reasons why it was difficult to operate railroads in Italy and make them pay over a large territory.

Most of these reasons, I think, exist in 1918 as they did in 1900 or earlier. If one will take a map and look at the whole of Italy it will be seen that the country is traversed by the straggling chain of mountains the whole of which is called the Apennines. The only really level and rich country is that in the north, the city centers of which are Turin, Milan, Bologna and Venice. The next richest soil in fairly level country is that in central Italy, between the cities of Florence and Perugia, with a third bit of rich soil in the wheat country to the south of Foggia near the Adriatic straits.

The railroading problem in the north of Italy save for the grades reaching upward to the Alps and over the frontiers, has always been comparatively easy, with a level country and a rich agricultural soil and a large manufacturing population to draw from. But elsewhere, with a not very

length, and expensive shorter tunnels counted by the hundred. Grades are another railroad curse to Italy. Trains are always going up or down mountains. The climb from Genoa to the French frontier at Modane, over a distance of 165 miles, is 3,120 feet. The central cities of Rome, Florence and Bologna are practically the same distance above the sea level, about 100 feet, but to get from Rome to Florence, a distance of 188 miles, there is a gradual climb of 600 feet over two-thirds of the distance. From Florence to Bologna, a distance of 80 miles, there is a midway climb of 1,800 feet. To cross Italy, in the south, from the flat wheat lands of Foggia to Naples, a distance of 118 miles, with Foggia 192 feet above sea level and Naples 36 feet, elevations of 1,652 feet must be overcome. To cross from the Adriatic Sea to Rome, on the opposite side of Italy, on the Castellamare-Adriatic-Rome branch of railway, a distance of 144 miles, beginning at an elevation of 15 feet and ending at one of 174 feet, a series of grades must be overcome the worst of which reached 2,700 feet above sea level. The prosperity of the country along this line is indicated by the statement that midway of the line is located the earthquake section where in 1915, near Avezzano, many thousands of people were killed or made homeless. One of the branches of this line, from Sulmona to

An Italian Military Supply Station

rich soil and with mountains to climb, mountains bare on their faces and with no stores of mineral wealth underneath, the problem has always been a staggering one. South of Bologna a central line runs to Florence, thence to Rome, and Naples, with two parallel lines following each coast of the peninsula. These three lines are not fed by many cross lines because of the mountains and also because of the lack of industrial centers. The two seashore lines are in level but poor country.

Consider the line that runs down from Genoa to Pisa and thence to Rome. In 1905, in the short distance of 55 miles south from Genoa to the port of Spezia, there were no less than 81 tunnels, with the rest of the line to Rome going, after passing the port of Leghorn, through a dreary, swampy waste of land, with no profitable traffic except the little freight that could be picked up at the iron mines of the Isle of Elba. Even under the Romans, with thousands of slave workmen at their disposal, this region, kept open by the Aurelian road, constituted a problem. Only in the past dozen years, thanks to quinine and drainage, have its fevers been controlled and its land tilled.

There are about 50 miles of long tunnels in various sections of the railways, including 20, averaging $1\frac{1}{2}$ miles in

Cainello, a distance of 104 miles, enjoys a grade of 3,345 feet, possibly the highest south of the Alps country.

These are a few samples of grades which indicate railroading conditions in Italy and might explain why, on the whole, the lines do not pay. Rubini pointed out that despite a large population (35,000,000), the ratio of travelers to 100 kilometers of line was but 396,560, as compared with 1,153,000 in France and as compared with 3,016,086 in Belgium.

Political Conception that Railroads Need Not Earn Money

But whether Italy's railroads had or had not earned money under private management, I believe they would have gone under government control just the same, given the political trend of thought in the country. We must remember that the Government of the United States was founded for the very purpose of obtaining relief from the petty vexations and restraints of Europe, this old Europe which for so many centuries has been nurtured on the idea that the government is all-powerful. When we in our happy slang say, "Let George do it," we express Europe from the ground up. Loving private initiative, born to individually and personally

do for ourselves, we cannot learn to lean on a government as they do here in Europe, and when I say Europe I mean continental Europe, for England, too, is one of the homes of personal endeavor. We have always had privately owned railroads for much the same generic reason that Europe has had the other kind.

It must be remembered that here in Italy is the 2,000-year-old example of a centralized government. The great

Italy Has Hundreds of Such Tunnels

United States is but a child among nations, as compared to the thousand years of greatness enjoyed by the Romans. This old example of central authority is ever before these people, influences them today, and always will influence them. It is the secret dream of modern Italy, to establish once more a great world-encompassing government. Then, too, there is the more recent example of Napoleon who for a brief 15 years or so established a centralized government

of which it that the state should control every large-scale activity.

For instance, Germany, like Italy, has not been given by nature a rich soil like that of France or of Russia but by government organization and help she has increased her agricultural wealth until she imported, in the year just before the war, but 5 per cent of her foodstuffs to feed her population. "Let us do the same with Italy," argued Luzzatti, one of Italy's statesmen who helped pull up her finances. "Let us have rich farming districts and then our railroads will have more freight to carry. Why should Italy's railroads have to depend on passenger traffic for one-third to one-half of their revenues? But in order to enrich our farming districts we must build better railroads. Private companies cannot afford to spend the money to reach out into districts where at present there is no freight. Therefore the government must do this."

So gradually the view regarding railroads in Italy has come to be that they should not be expected to make money, primarily. If some time in the distant future they do earn money, it will be only as incidental to national prosperity.

The same arguments that have been only very recently brought up in the United States are very old in Italy, namely, that by state ownership the evils of private competition are eliminated, as in the case of running empty trains to the same points by different lines, the making of unfair tariffs to obtain long distance hauls; also, the employment of personnel for life instead of for a few months or years and thereby running the risk of losing efficient men and of at the same time injuring individuals by too frequent discharges; further, the danger of harming one section of a country by building up another section through unequal transportation favors. Government ownership, too, in a great measure has destroyed the speculation in railroad stocks, often to the injury of the public, since railroad shares are guaranteed by the government.

There are certain evils inherent in either private or public

For Country and King

with a machinery more perfect, if possible than that of the Romans. It is commonly stated that thanks to his system France has been held together ever since. There, authority more than law is the dominant force. Italy is modeled on the French lines, with the Napoleonic code as the basis of its government. The men governing Italy some 15 years ago had, too, been educated in the centralization organization of Germany. Many of them had attended German universities as students; and right here in Italy, too, there were a large number of German traders, bankers, salesmen, all of whom brought their educational ideas, the basis

ownership, and in a future article I shall discuss these in relation to Italy's experiences so that American statesmanship may perhaps apply this experience to obtaining the best of both for ourselves.

PAPER CLOTHING FOR HUNGARIAN RAILWAY EMPLOYEES.—It is announced in the Bohemian press that experiments made with "paper cloth" have been so successful that the Hungarian State railways are to furnish their employees with summer clothing of this fabric.—*Commerce Reports*

miles show a decrease of 7.9 per cent, but the tonnage per train shows a decrease of .7 per cent, and the tonnage per loaded car increased 10.3 per cent. Both the average miles

per locomotive per day and the average miles per car per day show large decreases. The table gives the figures in detail and by districts.

* The returns included in the monthly statement represent about 97 per cent of the total operating mileage of the roads of Class I and about 99 per cent of their total traffic.

* Less than one-tenth of one per cent.

Compiled for the Association by Bureau of Railway Economics, Washington, D. C., May 23, 1918.

Railroad Men's Mountain Home Association

THE PROJECT FOR A Railroad Men's Mountain Home in Colorado, mentioned in the *Railway Age* of March 22, has aroused much interest among the railroad men, who are now lending their support to such an extent that a sufficient sum of money has already been guaranteed to enable the board of directors to start work on their plans to provide a recuperation camp for returning soldiers who enlisted from the ranks of the railroad and express service. It is believed that within the next 30 days two buildings will be ready for occupancy and will accommodate approximately 25 men. As funds are received through the generous assistance of various railroads the accommodation will be rapidly enlarged, and eventually the complete plan will be in successful operation, so that railroad men in need of such assistance, regardless of whether they have been actively engaged in military service, will be afforded the opportunity to regain health and strength under ideal conditions.

The plan has the approval of a number of important railroads. The Chicago & Alton, St. Louis Southwestern, Oregon Short Line, Denver & Rio Grande, Colorado & Southern and Oregon-Washington Railroad & Navigation Company, as well as several smaller lines, have brought the matter to the attention of their officers, agents and employees with request that contributions be sent to the treasurer of the company, who, in turn, will remit to the First National Bank, Denver, Colo., which is acting as treasurer for the Mountain Home Association. The Rock Island, Baltimore & Ohio, Southern Pacific, Oregon-Washington Railroad & Navigation Company, and several others have made appeals to their men through their employees' magazines with gratifying results.

Railroad men are also being solicited by letter, to send 25 cents or a thrift stamp or two to the bank in Denver for the support of the home, as the stamps can be very easily remitted. The Association of Transportation and Car Accounting Officers has officially endorsed the plan and is circularizing its officers and others, bringing to their attention the "Thrift Card" plan for raising funds. Employees of the Southern Pacific shops at San Jose, Cal., have collected and remitted to the treasurer of the association a total of \$127.50 for the purpose of equipping a San Jose section in the home.

Apparently an erroneous impression prevails in some quarters, that the plan has been established in connection with the government plans for the rehabilitation of wounded and disabled soldiers. The association will not undertake any work of this kind, but its activities will be almost wholly confined to affording the opportunity for convalescent and weary railroad men to recuperate under ideal conditions. No attempt will be made to conduct a hospital or take care of surgical cases.

A circular letter addressed to railroad men explains the plan in part as follows:

"The *Railway Age* of January 4 says the American railroad fraternity was represented in the army on that date by about 70,000 men. You probably have, or will have, relatives and friends facing the bullets in France; and, in the natural course of events many of them will return disabled or afflicted. Therefore, it is essential that means be provided to care for them on their return.

"Seven railroad men and citizens of Denver have incorporated, under the non-profit sharing statute of Colorado, and have accepted 40 acres of mountain ranch, donated by a railroad man, 30 miles southwest of that place on the side of a mountain, ideally located, where accommodations will

be provided so our railroad soldiers may find rest among the pine trees and pure mountain air.

"A fund is being provided for carrying out this undertaking, buying additional property if necessary, building cottages, making improvements, etc. Your assistance is requested. The board of trustees is giving its time toward the furtherance of this laudable enterprise. They will pass on the eligibility of applicants desiring to go to the home, and furnish all information regarding the plan, as it will be maintained at as low a cost as possible on the co-operative principle. No compensation of any kind is to be received by any one other than the actual employees. It is hoped to have a few cottages ready for early summer; and, by the

Location of the Railroad Man's Mountain Home

end of the year, to increase the capacity to accommodate at least 1,000.

"If you are in sympathy with this movement kindly send 25 cents or more, or a government thrift stamp or two, to the cashier of the First National Bank, Denver, and write at least five copies of this letter to other railroad or express company men and women. The writer of this has the assurance of a friend from whom it was received that it is a very worthy cause. This assurance can be handed down the line to the railroad people of the United States, who can verify it by inquiring of any railroad man in Denver, as the newspapers have given it publicity."

TWO HUNDRED AND SIXTY-FIVE TRAINS OF HUN WOUNDED.—Two hundred and sixty-five trains full of wounded soldiers returning to Germany from the battle fronts of Picardy and Flanders, says the newspaper *Les Nouvelles de The Hague*, were counted in the daytime on April 9, April 11 and April 12, on the Namur-Liege Railway. The transports were so crowded that the Germans were even using open coal cars to carry the wounded.

Durability of Untreated Piling Above Mean Low Tide

Report of an Investigation of the Protection Afforded by Saturation Above the Water Level.

By C. H. Teasdale and Mabel E. Thorne
Forest Products Laboratory, Madison, Wis.

IT HAS LONG been recognized that wood constantly immersed in water is not subject to decay. Instances are on record of wood being preserved in this way for centuries. Timber structures in fresh water or in water free from the various forms of marine wood-borers remain sound indefinitely, unless affected by some destructive agent other than decay.

In tidal water, where marine borers are not active, portions of piles that are completely immersed at each high tide may be exposed at other times without danger of decay, for though completely immersed only part of the time, they may be practically saturated all the time. The extent of this saturation, and therefore permanent preservation against decay, is an item of considerable interest and importance in designing pile construction. The difficulties of cutting off piling at low water, as well as the extra cost and weight of the superstructure when joints are made at low tide level, may well be avoided wherever immunity from decay exists for any distance above this level.

Because there is so little available data as to the extent of this immunity zone, the Forest Products Laboratory has recently been conducting a study of the subject by the questionnaire method. Replies to the questionnaire are given in this report. They show careful thought, and several of them contain records of actual investigations made after the questionnaire was received.

Effect of Setting in Earth

A few of the replies make note of the fact that piles set in an earth wharf are free from decay to a greater distance above mean low tide than those set alone. For example, Edwin Lord, harbor master at Bangor, Me., writes that "where the wharfing and piling have been covered with earth and saturated at high water the timber remains sound. I have seen the wharfing uncovered and the logs apparently in perfect condition where they have lain for nearly 70 years."

Raymond F. Bennett, president, Bennett Contracting Corporation, Portland, Me., states that "for piles driven in a solid earth wharf, the height of no decay would be higher than for piles standing alone, and this height would also increase with the distance of the pile from the edge of the fill. A Boston engineer who designed a structure to be built on a solid fill wharf in this harbor, stipulated that the piles near the edge of the fill should be cut off 5 ft. above mean low tide; and that piles say, 20 ft. and further from the edge of the fill, should be cut off at 7 ft. I think probably this is good practice."

The United States Engineer Office, Galveston, Texas, writes as follows: "A pile and brush dike was built about 1902 on the north side of Galveston channel, the piles being green with the bark on and their tops being about 4½ ft. above mean low tide. This dike was partially covered by material excavated from the channel, but some of the material has since washed away, so that the piles which remain now stand on ground which is possibly one foot above mean low tide. In other words, they stand in water part of the time. Those of the piles which have not been touched by the teredo are still sound although the bark is gone." (Mean tide level is 0.3 ft. above mean low tide in Galveston harbor.)

The Commission on Waterways and Public Lands of Massachusetts reports: "A great deal of solid clay filling has been done in Boston, and piles driven into it have been found solid up to 13 ft. above low water 30 years after they were driven. Above that level they were practically all decayed, the filling above the clay being gravel." (Mean tide level here is 4.5 ft. above mean low tide.)

One particularly interesting case was reported from Galveston. Under the direction of the U. S. Engineer Office, an examination was made of piles set in a salt marsh or meadow, so enclosed that they were protected from teredo and yet were subject to frequent immersion in salt water. The nominal range of tide at Galveston is less than a foot but the harbor is subject to storms which force the water up onto the shores of the bay to much greater depths. The following is quoted from the letter describing the results observed:

"The piles in an old trestle built about 1892 across a salt marsh on the east end of Galveston island were examined. The piles are pine. In order to make an examination the dirt was removed from around them to a depth of about 18 in. The results of the examination are tabulated thus, all elevations being referred to mean low tide

| Pile No. | Diam. at top inches | Elev. of top of pile | Elev. of ground surface | Condition and remarks |
|----------|---------------------|----------------------|-------------------------|---|
| No. 1 | 14 | plus 4.8 | plus 4.4 | The full exposed part of the pile except the heart is decayed. |
| No. 2 | 12 | plus 5.6 | plus 4.1 | Decayed, except heart. |
| No. 3 | 18 | plus 4.9 | plus 3.3 | Sound. |
| No. 4 | 12 | plus 4.0 | plus 3.0 | Sound. |
| No. 5 | 16 | plus 4.8 | plus 2.7 | Sound. |
| No. 6 | 12 | plus 4.9 | plus 2.6 | Sound. |
| No. 7 | 12 | plus 4.7 | minus 0.6 | Sound. Contains a few small teredo holes, but no live teredo was found. |

"Remarks: Piles 1 and 2 are on level ground covered with marsh grass. Pile 3 is located at the head of a small swale or depression leading to tide-water, and the remainder of the piles follow down this depression consecutively, as numbered. Piles 3 to 7 were saturated with water so that driving a hatchet into them brought water to the surface. The wood was bright and clean as if newly cut from the forest."

H. E. Manvel, vice-president, Rhodes & Manvel, Inc., states that: "We have also found that on foundation piles driven in salt meadow which is permanently wet to high water line, that capillary action saturates the piling for a distance of 12 to 18 in. above the high water mark, and it is very seldom that the piling will rot below that point, so we can broadly state from our experience that timber and piles will be saturated on an average from 1 to 2½ ft. above the permanent water level."

The extent above mean low tide to which these piles remain sound may be explained by the fact that salt has certain preservative properties.

Protection from Weather

Protection from the action of the weather is also an important factor in the durability of piles. The following replies mention this point:

T. A. Scott, harbor master, New London, Conn.: "Piles or timber extending above mean low water (New England coast), which are saturated every high water will stand preserved for at least 50 years and longer if that part of the timber exposed to the atmosphere all the time is under some protection from the weather."

S. R. Alexander, acting harbor engineer, Baltimore, Md.:

"I also noted that timbers buried in earth filling behind bulkheads were in much better condition than those exposed to the air even though the latter were in many cases lower than the former."

Richard A. Monks, vice-president, John Monks & Sons, New York, N. Y.: "As foundation piles are not exposed to any drying factors, such as sun-light, etc., they should retain their life indefinitely, if cut about half tide or below this level."

Commission on Waterways and Public Lands, Massachusetts: "Many piles have been observed in old wharves where the outer portion of the timber is sound up to about the high water mark, while the center portion has been decayed—the decay extending to half tide or below. Piles cut off just below mean high water and having their tops protected from rain water will undoubtedly last indefinitely, excepting for the action of worms and ice, and especially so when they are not exposed to the sun."

Relation of Durability to Mean Tide Level

Replies received from 25 different sources were summarized and divided into two classes, those which state that for permanent foundation work piles can be safely cut off at mean tide level or above and those which state that the zone of safety does not extend to mean tide level. It was noticeable that the grouping of these replies according to their character is a geographical grouping as well. The climate of the northern states is more favorable to the long life of piling than that of the southern states. From the data at hand, it would seem that the line of demarcation between the harbors in which it is safe to cut off piling at mean tide level or above and the harbors in which it is not safe lies somewhere between New York and Baltimore.

The rate at which a pile dries is largely dependent on temperature and relative humidity. The relative humidity varies only slightly from Maine to Florida, while the temperature variation is considerable. This means that, a few hours after high tide, piles in southern waters will have a much lower percentage of moisture than those in northern waters, which, combined with the encouragement to the growth of fungi furnished by the higher temperatures, probably accounts for the variation in the extent of the zone of safety.

Orders of Western Regional Director

DURING the past week R. H. Ashton, regional director of western railroads, has issued the following circulars:

Purchases

In supplement No. 1 to R. P. C. Circular No. 7, dated May 15, the western regional purchasing committee says:

The central advisory purchasing committee at Washington has now decided as follows: The proposed plan for turning over to the purchasing agents of producing lines for handling, inspecting and shipping from one road to another unfilled contracts or orders placed prior to government action on March 13, 1918, as outlined in R. P. C. Circulars 1 and 7, cannot be made effective in time to avoid delay in delivery for this season's requirements. Therefore the following will be observed:

1. All contracts or orders for cross-ties placed prior to government action March 13, 1918, must be handled on their merits. Roads having such contracts or orders unfilled should immediately take up with the contractors the questions of completing shipment if possible by June 15.

2. There may be old contracts made at low prices that should be revised. In such cases the committee will consider such recommendations as roads submit. In the event of any question as to adjustment of price, the matter should

be taken up direct with the contractor and if an increase is warranted, the recommendation of the road interested should be submitted for approval to the regional purchasing committee with full explanation.

3. The receiving roads will continue to take up and inspect the ties same as heretofore. It is hoped that all such contracts or orders as are not completed by June 15, should be given special consideration at that time as to the best means of handling and completing them.

4. All embargoes on ties to be shipped from one road to another should be lifted and the ties moved as soon as possible.

5. The road on which ties are produced will give every assistance possible to secure prompt completion of such orders and contracts.

6. If there is any shortage of cars for moving ties, the matter should be brought to attention of regional director.

Track Labor—Season 1918

Supplement No. 3 to Circular No. 63 issued by the western regional director reads as follows: In order to avoid any misunderstanding, and the possibility of laborers transferring from one line to another, please discontinue at once the payment of time and a half for Sunday work to section and extra gang track laborers, regardless of whether the practice was in effect prior to the issuance of Circular No. 63 or not.

Cars for Grain Loading

In a communication to grain-carrying roads, dated May 17, the western regional director gives the following instructions:

Special efforts must be made, in anticipation of heavy grain movement, to have all available box cars fit for grain loading in proper repair. It must be realized that with the large percentage of foreign cars on the various roads this year special attention will have to be given to these cars that they may be made fit for this service. Specialize on repairs to box cars and pay particular attention to those repairs relating to the subject of this circular.

Engines Available

In Circular No. 105, dated May 16, the western regional director asks western lines to send him a report of all engines now tied up *awaiting service* giving information as called for below:

| Engine Nos. | Where Located | Type of Loco. | Kind of fuel used | Tractive Power | Size Drivers | Size Cyls. | When will they be required for service | Remarks |
|-------------|---------------|---------------|-------------------|----------------|--------------|------------|--|---------|
|-------------|---------------|---------------|-------------------|----------------|--------------|------------|--|---------|

He also asks for additional reports whenever the engines referred to are put in service or additional engines are tied up awaiting service. This refers to passenger engines of 25,000 tractive power or over and other engines of 33,000 tractive power or over.

Equipment—Wagon Coal Mines

Supplement No. 1 to Circular 51, issued by the western regional director on May 16, reads as follows: The object of restricting wagon coal mines to the use of box cars is to conserve the open-car supply for mines loading coal from tipplers. In order that the situation may be taken care of as fairly as possible it is further provided:

1. When open-car equipment available is sufficient to provide full car supply to mines loading coal from tipplers, open cars may, when requested, be furnished to wagon coal mines.

2. Where wagon coal mines dump coal into cars from elevated platforms under physical conditions such as to make the loading of box cars impracticable, open cars may be distributed on the same basis as to tipple mines.

3. Any special condition in connection with wagon mines on your line that seems to warrant further deviation from the letter of this rule may be reported for consideration.

Annual Convention of Railway Fuel Association

Under Auspices of United States Railroad Administration and
United States Fuel Administration

"SAVE COAL, OR LACK IT," was the keynote of the opening session of the tenth annual convention of the International Railway Fuel Association. This convention, which is being held with the co-operation of the United States Fuel Administration and the United States Railroad Administration, opened on Thursday, May 23, at Chicago. The first meeting was held in Cohan's Grand Opera House.

Several changes were made in the list of speakers for the first day's session as originally announced. C. R. Gray, director of the Division of Transportation, United States Railroad Administration, was unable to be present, and R. H. Ashton, director Western Regional District, United States Railroad Administration, addressing the meeting in his stead. Sir George Bury, chairman of the Canadian Railway War Board, was also unable to attend but was represented by Thomas Britt, general fuel agent of the Canadian Pacific Railway.

Practically every railroad company in the country designated representatives to attend the convention and there were also present a large number of coal operators and other representatives of the mining industry.

The convention was opened with an introductory address by the president of the association, E. W. Pratt, assistant superintendent motive power and machinery, Chicago & Northwestern. Mr. Pratt spoke in part as follows:

President's Address

E. W. Pratt, president of the association, spoke in part as follows: "Subsequent to our last convention the executive committee of the association made offer of itself, our individual membership and the entire machinery of the organization to the United States Railroad Administration and to the United States Fuel Administration. The offers were accepted and representatives from each department were assigned to co-operate with us. We want you to leave this convention so imbued with the patriotic spirit that when you go home you will carry on the movement for more and better coal and its economical use. As individuals we take a back seat for no one when it comes to patriotism, but it has been my experience and observation that we know not always wherein our individual duty lies nor can we sense its importance in the big game. We are wont to say, 'What's the use of the extra exertion to save a shovelful of coal when another can save a ton?' 'What's the use of unloading a car of coal a day earlier when we see trains of coal remaining unmoved daily?' 'What's the use of firing a locomotive with care when the train dispatcher holds us an hour on a siding?'—a delay which seems to you avoidable. 'Why repair a car today by extra effort when there will be 'just as many' tomorrow?'

"Some of us can do more than others, but all of us have it in our power to a greater or less degree to help win the war by doing our best. It is not expected that the miner will do as much as the operator, but both can do wonders in the improvement of the quality of fuel coal if their heart be in it. The stationary fireman can do less toward fuel economy than the manager of the plant who can provide efficient devices. Neither can the locomotive fireman save as much coal on his one engine as can the train dispatcher with dozens of trains on a single track road, but each can do and must do his part.

"There is no time for any of us to count his performance with respect to what the other fellow is doing. If the other man fails that is no reason for letting up on our own efforts.

"The largest single item of railroad expenditure, other than labor, is for fuel, and yet we know that much fuel is wasted on every railroad. The railroads of the United States use over one-quarter of all the coal mined, and being such extensive users of this commodity, valuable in time of war far beyond dollars and cents, it devolves upon those of us who are laboring for the railroads to exert ourselves to secure the utmost economy. Ask the average locomotive fireman if he can, by close attention to his work, save a shovelful of coal a mile and he will say, 'Sure I can.' Suppose he were firing a locomotive over in France on the United States military railroad with coal costing anywhere up to \$150 per ton, and he would surely tell you he could save still more.

"It is stated that in the year 1917 fifty millions tons more coal was mined in this country than in the year before we entered the war. That sounds good, but let us consider the facts: Experts calculate that there was enough slate, bone and dirt in 650 million tons of coal mined in 1917 to nearly offset the apparent increase of 50 million tons. It means that it took one million more coal cars to haul this 50 million tons of slate and rock from the mines to the users, a tremendous loss in economical firing due to ashes and clinkers, and another million cars (or its equivalent in wagons, barges, etc.) to haul them away. The miner might say that it would give him less earnings during the year to pick the coal well, and the operator might say it would give him less sales for the year, but I contend that this is not true. The output of both miners and the mines will without doubt this year be limited by the car supply at the mines, as has been the case for the last few years, and it should be borne in mind that the railroads are not responsible for this condition, but the public policy toward them for the past decade.

"There are three items in this tremendous fuel problem—production, transportation and consumption—and the railroads of this country are largely responsible for all three of them. For production in so far as concerns the delivery of machinery and supplies to the mines and a car supply for the coal produced; but the miners and operators both can do much in this particular. How often have the mines dropped empty cars by the shaft for some trivial reason? If there be refuse in the cars, a hole in the floor or sides, a brake chain broken, how little effort on their part would avoid this loss of use of one or more cars for a whole day? I venture to say that this trivial item amounts to several thousand of coal cars each day.

"The next item is transportation, largely by rail, some by water. Railroad men are a hardy and earnest lot and not easily discouraged, working every day in the year including Sundays and holidays, that their task may be accomplished with credit to themselves, their employers and to their country. But when last winter, after weeks of continued and unprecedented snow and cold, their locomotives were compelled to operate with added disadvantages of poor and dirty coal it was perhaps the greatest obstacle of all and many a locomotive died and its train was abandoned for this reason. I have yet to see a miner or operator who would defer to the railroad man in the matter of patriotism or loyalty to country, and I believe if the proposition is put squarely up to the men that there will be no Sundays or holidays in either

the mine, on the railroad or in the coal yard when it concerns the output and distribution of coal, any more than there is Sunday or holiday in the trenches with the Hun facing our boys and the Kaiser menacing our free institutions.

"Were the railroad problem purely one of handling coal, it would indeed be simple and easy, but with vast quantities of foods and materials to move it is greatly complicated.

"The zoning system inaugurated by the United States Fuel Administration will save thousands of coal cars per month. This must needs be, yet it will be only a drop in the bucket compared with what we can accomplish by all pulling together. It is calculated that the average car in coal trade only makes a round trip from the mines to the coal shed once a month. Reduce this time at the mines, on the repair tracks, on the road and at the coal sheds; this we must do to help solve the problem.

"The 27 per cent of the coal produced which is used by the railroads is so large that we hope by care and close attention to details not only as to firing but in better repair of locomotives, more care in despatching and moving trains,

through the shop should be continued as far as possible, considering the scarcity of materials and skilled labor to apply them. The locomotive feed-water heater also offers an attractive field for economy and efficiency and well warrants careful and continued experimentation.

"There is every indication of a greater shortage of coal next winter than we had last unless production is increased and great conservation is practiced and let it not be possible for anyone to point the finger at you or me and say with any degree of justice—there is a slacker."

The Railroad Industrial Army

By W. S. Carter,

Director, Division of Labor, U. S. Railroad Administration

Mr. Carter was unable to attend and the address prepared by him was read by Eugene McAuliffe, manager of the Fuel Conservation Section, United States Fuel Administration. Mr. Carter's address was in part as follows:

E. W. Pratt, President, Railway Fuel Association

Frank McManamy
Director, Division of Locomotive Maintenance, U. S. Railroad Administration

Robert Quayle
General Superintendent, Motive Power and Car Department, C. & N. W.

E. N. De Groot, Jr.
Assistant Manager, Car Service Section, Division of Transportation, U. S. Railroad Administration

W. S. Carter
Director, Division of Labor, U. S. Railroad Administration

and better operation on the part of the engineer, to save millions of tons of coal and millions of gallons of fuel oil. Superheating has been proven practicable and each locomotive so equipped saves hundreds of tons of fuel per year besides rendering faster and better service; hence, the present practice of superheating the larger locomotives passing

We are told by those who know that it requires four tons of shipping to maintain one American soldier in France. We are told by those who are determined to win the war that by the spring campaign of 1919 we will have more than two millions of our boys "over there," and as the war progresses more and more ships will be required to trans-

port across the sea food and munitions with which to maintain our fighting force. Not only the winning of the war depends upon this ceaseless flow from our farms and our factories to the battle front but without it the men we send to France in freedom's cause will be sacrificed.

When we talk of this stupendous movement of war supplies we seem to think only of ships but little thought is given to the fact that upon our railroads these ships must depend for cargoes and bunker coal. The reason that we have not more fully recognized this fact is because heretofore the capacity of our railroads has exceeded that of our ships. We read from day to day of the splendid developments of the ship building industry, and the day is not distant when our ports will be crowded with ships in readiness to perform their part in this great transportation problem. When that day comes we railroad men will have a rude awakening. No longer may we conduct our business affairs and maintain our conditions of labor as in the days of peace.

Without yielding their laudable purpose to limit a day's work to eight hours when this war is over the American working people must now work as long each day as the war's necessities demand, compatible with their physical well being. So long as brothers and sons of American working people are dying in France for our liberty none of us will hesitate short of our greatest effort. Business men must no longer profit out of our country's misfortunes. Great wealth accumulated during this war will not be the product of patriotism. With millions of men now under arms in France, with thousands of ships ready for cargoes and bunker coal, railroad men will soon realize that truly they are a component part of the American expeditionary forces. In fact they are now a great industrial army. Their failure to maintain an efficient line of transportation will cause ships to lie idle in our harbors and deprive our battle line of munitions and food.

A breakdown in the efficiency of our railroads here when the crisis comes will be no less disastrous than a rout of one of our armies in the great battles that must be fought before the war is won. I shall not attempt to tell each railroad man what he should do to avert the possible collapse of our transportation system when it is put to a crucial test. Each and every railroad man's conscience will tell him that.

I know that the railroad employees of this country will not be lacking in the performance of their duty to the nation and to those who go across the sea to win or die. My confidence in and my knowledge of railroad men assures me they will do their part. If the railroads fail when they should be most efficient I cannot believe that the fault will lie with those men whose uniforms are overalls. When our children's children read the stories of the part played by America in the great war for liberty they must find there also recorded that the railroad men of America realizing that upon them had fallen the burden of transporting troops, munitions and food far beyond their normal capacity worked as no men had ever worked before and thereby maintained an uninterrupted medium of transportation without which the war could not have been won.

Relation of Locomotive

Maintenance to Fuel Economy

By Frank McManamy,

Manager Locomotive Section United States Railroad Administration

Fuel economy and locomotive maintenance in practically everything that relates to efficient locomotive performance, are synonymous terms. Within recent years the increasing cost and scarcity of fuel have made fuel economy a question

of major importance to the designer of locomotives as well as to the officials in charge of locomotive maintenance. The inventor has also turned his talents in that direction, with the result that the superheater, the brick arch combustion chamber firebox, and other fuel saving devices, are today parts of the equipment of every modern locomotive. The influence of these devices in effecting real fuel economy is tremendous, and their application to many existing locomotives will result in a marked reduction in fuel consumption.

The largest possible measure of performance can be obtained from a locomotive only by giving constant and careful attention to locomotive maintenance. Locomotive maintenance is not only related to fuel economy, it is fuel economy. What is meant by a locomotive in good condition? It means a boiler which generates steam economically but freely, proper steam distribution to the cylinders and efficient mechanism for transmitting the power developed in the cylinders to the only place where the power of the locomotive can be measured—the drawbar at the rear of the tender.

The boiler, to promote economy of fuel, must be properly designed, with ample grate and heating surface. It must be clean, the grates level and easily shaken and in good condition, the ash pan and grates must have ample air openings to aid combustion, the firedoor should operate easily, and the fire tools should be in good condition. The flues must be clean, the flues and firebox free from leaks, smokebox must be air tight, the smoke stack and nozzle in line, and the draft appliances in good condition and properly adjusted.

Too much stress can not be laid on the necessity for keeping boilers clean, because in addition to effecting a material saving in fuel, it increases the efficiency of the locomotive and materially prolongs the life of the flues and firebox sheets. Frequent and thorough boiler washing is the foundation of proper boiler maintenance. Authorities differ somewhat as to the exact loss due to scale on boiler sheets but a comparison of tests made indicate pretty conclusively that 1/16 in. of scale will increase the fuel cost approximately 15 per cent and that 1/4 in. of scale will increase the fuel cost approximately 60 per cent.

It is not an exaggeration to say that on an average 40 per cent of the locomotive boilers in service have scale 1/16 in. thick or to say it differently, that due to poor boiler washing all of them have 1/16 in. scale 40 per cent of the time, and that many have scale from 1/8 in. to 1/4 in. in thickness. In fact in some districts it is not unusual to find 1/2 in. of scale on boiler sheets. Let us see what this means in actual figures. In 1918 it is estimated that the railroads will require 166,000,000 tons of coal at an average cost of \$8.50 per ton, which will be a total of \$581,000,000. If we add to this 48,000,000 barrels of fuel oil it will make the total fuel cost over \$650,000,000. We will pay, therefore, during the year of 1918 more than \$50,000,000 for fuel on account of the scale in locomotive boilers that many men do not consider of sufficient importance to warrant its removal.

But even a boiler that is clean and in the best of condition can do no more than generate steam; proper steam distribution to and from the cylinders must be had and the steam made to do effective work. If the valves are out of square or blowing or the valve gear badly worn; if valve chambers or cylinders are badly worn or out of round; if the cylinder packing is worn or leaking; if leaking piston rod packing or leaks about the steam chests or cylinders, less than the steam that should be used is made to do work. We can expect no improvement in our fuel performance.

Assuming, however, that the boiler is in good condition, that the steam itself is in good condition and that there is no waste of steam through steam leaks, it remains to deliver this power at the firebricks, and this can not be done until we economically done through the medium of perfect machinery. Rods in

bad condition, boxes loose on journals, wedges which require adjusting, and tires badly worn which will cause excessive slipping, are poor mediums through which to transmit energy.

Some of the repairs which will do the most towards reducing the fuel consumption and improving locomotive performance arranged in what is believed to be the relative order of their importance, are, setting the valves properly and maintaining the valve motion, washing the boilers, keeping the flues clean, eliminating steam leaks about cylinders and steam chests and maintaining the driving boxes and rods.

Each locomotive represents a certain definite investment on which a return must be made. This can be done only by maintaining it in a condition to accomplish maximum results in the way of locomotive performance. If it were possible to calculate the aggregate loss in operating efficiency for the total number of locomotives that due to lack of maintenance are operating at less than their maximum efficiency, the result would be staggering, and when we add to this enormous loss of operating efficiency, from 10 to 20 per cent of the railroad fuel bill which for the past year was \$329,000,000, and for the current year is estimated to be \$581,000,000 for bituminous coal alone, we begin to realize the price we have been paying for the privilege of operating defective locomotives and delaying traffic thereby. This being true, the question that must inevitably follow is, what is being done by the U. S. Railroad Administration to remedy the conditions which have been described.

The first step before taking action to bring about an improvement in the condition of locomotives was to make a survey of the field. The next step was to speed up locomotive repairs to provide motive power to meet the immediate needs and this was done by increasing the shop hours about 16 per cent for over 200,000 men, and by nationalizing locomotive repairs so that a locomotive in need of repairs would be sent to the nearest available repair shop, thus utilizing to the fullest extent the total shop capacity of all railroads. The result of this soon became apparent in the increased number of locomotives turned out of the various shops which for the four months ended April 30, increased 6,849 over the corresponding period for last year. This not only means more locomotives but it means better locomotives, which both increases operating efficiency and decreases fuel consumption.

For the future the work that has been started will be continued and a higher standard of condition of locomotives required. A regular schedule for the application of superheaters and other fuel saving appliances to locomotives not new equipped, is being prepared and will be adopted subject only to labor and material being available.

Next to wages the fuel bill of American railroads constitutes their largest single item of expense. Locomotive maintenance is the only method of conserving fuel that will of itself show a net profit, in addition to the fuel saved. Every item of maintenance that makes for fuel economy also promotes operating efficiency and increases the life of the locomotive. Therefore, the good effects of maintaining locomotives are cumulative, and the bad effects of failing to maintain them, increase in the same ratio.

Today, with the increased demands for fuel by reason of the war and the necessity for furnishing fuel to our allies; with the increased use of fuel in industries whose output is essential to the successful conduct of the war, the saving of fuel by better locomotive maintenance and the increased operating efficiency which will result therefrom, means more than can be expressed in terms of tons, gallons, or dollars. It means the saving of America, the saving of Democracy, the winning of the war.

In the conservation of fuel by better locomotive maintenance, as in all other matters relating to transportation, the United States Railroad Administration, and the railroad men

of the country who are solidly behind it, can rightfully adopt as their motto, "We will deliver the goods."

The Motive Power Department and Fuel Economy

By Robert Quayle,

General Superintendent Motive Power and Car Department,
Chicago & North Western

In 1917 the railroads of this country consumed approximately 175,000,000 tons of coal. This, at an average price of \$2.50 a ton, would give us a cost of \$437,500,000. Now, I maintain that if every individual in the operating end of the railway organization of this country were to work together as one man, each helping the other to the one end of saving fuel, we could easily save 10 per cent, which would be 17,500,000 tons equivalent to \$43,750,000.

I want, first, to call attention to the master mechanic's part in this game of saving fuel. It is your duty to know what is going on on the division or the divisions that you represent. You should be in touch with your division superintendent and train despatchers in such a way as to make them feel and really know that you are interested in them personally, that you are interested in their welfare. Men can always do their best work when they do it cheerfully. It is the master mechanic's duty to be so in touch with his shop man and engineers and firemen that they will have confidence in him, and he should have the happy faculty of having the men constantly feel kindly toward him. This would enable him at once to get the best from the men that can be had. Kindly treatment always begets bigger and better results than the opposite sort of treatment.

You should fix the machines that the men are going to handle, so that the men will have the least amount of discouragement in their work, and there will be the least amount of effort on their part necessary to get the best results. To this end you should have your men trained to make proper reports of necessary work to be done. You will find that occasional meetings with your roundhouse foremen, particularly calling attention to these things, and insisting upon their having the work done that is reported, will bring about good results, and your engineers encouraged by that method will take much more interest in making the detailed reports than they would if their reports were not given proper attention. Give every encouragement you can to all your men. By so doing you make them grow bigger and better, and the results increase as the men grow.

My next thought is the traveling engineer. His real importance on a big job, such as his is, is not often placed in the class wherein it belongs. What are his duties? To make inspection of locomotives; see that they are in proper condition to do the best work. He should know the condition of every engine in his charge. He should know what they are capable of doing. He should see to it, at the roundhouse end, that the engines leave fully capable of making the trip successfully and economically. He should always have in mind that his job is one of helpfulness and instruction, rather than one of fault finding and improper criticism. The result will be that every man then will measure up to what is properly required of him, and will do his part to the very best of his ability.

The roundhouse foreman, as a rule, is the most abused man on a railway. He is up against all kinds of conditions, all kinds of cares and troubles, all kinds of problems to work out, in order that everything may move smoothly, keep every man one at peace with the other, and get every locomotive repaired and put in condition for its trip. His duties are multitudinous, not only in so far as the mechanical end of it is concerned, but in so far as the personal end of

it is concerned. We require a good deal of the roundhouse foreman, and to be a successful roundhouse foreman, to get the very best out of his job, he should be gracious; he must needs be a philosopher, he must be a student of human nature and he must smile even when everything goes "dead wrong."

Locomotive engineers and firemen, what a magnificent opportunity you men have to show your patriotism by your work! Study every day: "What can I do to help Uncle Sam out in this crisis?" Coal is scarce. I need not tell you what people had to do last winter to get coal to keep themselves warm. Industries were restricted in the amount of fuel that they had formerly used, because of conditions generally existing in this country at that time. On the basis of your loyalty and faithfulness I am asking you to redouble your efforts; increase your intelligence not only for yourselves, but strongly urge every other fellow not only to do his bit, but to do his all, that fuel will be conserved and utilized, not wastefully, but with the highest economy and efficiency, that our nation and our allies might not suffer for the want of fuel. Fuel is now playing and will play a most important part in our warfare.

Work your engine most economically, consistent with the work that you have to do. Keep your eye on the coal pile in your tank. Watch your firemen. Do not flood your engine one time and have your crown sheet almost bare another time. Do not climb your hills 100 miles an hour and put your brakes on going down the other side. I know, of course, that very few men do these things in the extreme, but it is the careless, indifferent man that must be brought up to the standard of the best men.

The firemen can do much on their job to save fuel, and they will do much, if we put it to them right. When a piece of coal is in the gangway, instead of kicking it off, if you would do like our best men do, put it where it belongs. Don't keep the fire door open, and shovel ten or fifteen scoops of coal in at a time, without closing the door and then get up on your seat and let the black smoke roll out, and think you are doing fine. You all know that the fellow on that engine is a slacker and not a good soldier. When you find a man like that, do your bit and call his attention to it and tell him we are at war, and if he does not know it tell him coal is scarce and the demand is greater than the supply. Knowing that, I believe that he, too, will join the ranks for economy; that he, too, will go out and talk and work, and, if need be, fight, that every pound of coal will be saved.

You will observe that what I have said can be summed up in a word, co-operation, and I am sure when we of the motive power department will have done our part that the men at the other end of the operating department will say to us, "You have done well." Then we are in a position not only to solicit, but practically to command, their co-operation, and they, too, will help us get better results, because human nature is the same the world over. We all respond to success, and when one department has shown a great improvement the other fellows will not only follow in the wake, but they will try to beat them out in the end if they can.

Co-operation means, on a railway, every man of us in every department helping every other man in his own, as well as in every other department, to the end that they as a railway might be bigger and better, more useful and more serviceable to the country in which we live than any other railway.

My appeal in closing this address is that every railroad man here will take another hitch in his belt, roll up his sleeves a little higher, think more deeply, more earnestly, work a little harder, fight a little better for the conservation of fuel and for the Government by which we are employed, and for Old Glory, which stands for bigger and better things than any other flag in the universe.

The Transportation Department and Fuel Economy

By E. H. DeGroot, Jr.,

Chief, Bureau of Car Service, Interstate Commerce Commission, and Assistant Manager, Car Service Section, United States Railroad Administration

Fuel is absolutely necessary to the production of raw materials. It is essential to the manufacture of those materials into products and without it there would be no transportation as we now understand the term. Coal and more coal, then, must be our slogan.

That Nation which lags in its coal supply must lag in its fighting! We must win the war! What will it profit us, though we send our boys to the battle fields by the million, if we at home waste the coal needed to support them adequately with supplies and munitions or upon which our gallant allies are dependent to enable them to hold out?

And what can we of the transportation department do to help in this? What ladder iron can we grab that we may get a foot in the sill-step and climb to the deck of opportunity in this crisis? Well, the locomotive is in the hands of the transportation department from the time it leaves the turntable at the initial point until it is turned in over the ender pit at the terminal, and during this period it offers splendid opportunities for patriotic railroad men to co-operate to the end that the work which it performs may be done with a minimum of coal consumed.

Steam saved is coal conserved. The air compressor on the modern locomotive is a powerful engine. It performs wonders which are little enough appreciated by most of us but it has a frightful appetite for steam—and steam means coal. Its cylinders are large, necessarily so because of the exacting nature of its work, and as its load increases directly with the progress of the piston, the steam cannot be used expansively but must be admitted to the very end of the stroke, there to be exhausted and a fresh draft made upon the boiler. Under these circumstances, air leaks constitute a direct drain upon the boiler and so reach their greedy fingers back through the firebox into the precious coal pile. There is no way in which the trainman can contribute so much toward the good cause of saving coal as by stopping the train-line leaks before starting on the trip. With porous hose, worn gaskets, pipe and other leaks, what the pump has to overcome needs no description among practical men.

Leaks are crimes when coal is a military necessity! To stop leaks then is of the greatest importance and this should be done carefully and conscientiously. Surely, any man who does less than he can, does less than he ought in this. The practice of carrying a hose gasket or two in the pocket as some trainmen do for this purpose is an excellent one. Rainy weather offers an opportunity to locate hose which are porous to a serious extent and by changing them when opportunity offers much fuel may be saved which would otherwise be wasted.

But all of the leaks are not discoverable while the train is at rest, particularly in cold weather, and new ones develop during the trip. These should all receive first-aid treatment as soon as found. Then, too, the leaks may result in sticking brakes and this condition is like compounding a felony. It not only takes much coal to pump against the leaks but much more coal at the same time to pull against the brakes.

Nothing has been said about the share which the engineer and fireman may have in this good work for the reason that other speakers will cover these points, but in passing it should be noted that the opportunities for co-operation between engineers and trainmen are many and that advantage should be taken of all of them. One way to co-operate to good advantage is by being ready to leave the house promptly at

the hour for which called, thus affording maximum time in which to pump up the train, look for and repair leaks and properly test the brakes.

So much for trainmen. Now how about the superintendent? Well, with him individual interest is indispensable! If he does not take an active interest in fuel conservation it follows as the night the day that the value of the transportation department as a factor in saving coal on *that* division will be very small. On the other hand, when the superintendent manifests keen sympathy with the movement, the men for whom he is responsible will contribute no small share toward the success of the movement. In short, the other transportation officers and the employees on the division will form their estimate of the importance of the movement very largely from his point of view. Fuel costs form the largest single item of transportation expense, and fuel economy should interest every superintendent as a fundamental of successful operation, but I want to place it on a higher plane than this, meritorious though it be,—the plane of patriotism!

Our boys are laying their lives on the altar—making the supreme sacrifice cheerfully and unafraid, as Americans have always done in the testing time. It is no longer a question whether the sons of a decadent age are worthy of their sires, but a burning question whether we fathers of America are worthy of our noble sons! And these sons will judge us—those who come back. How shall we meet them if we have betrayed them in the matter of the fullest support—or like Peter, followed afar off?

Experience on different roads has demonstrated that one of the very best ways to develop interest in fuel economy is through the agency of employees' meetings held at convenient times and places and attended by the superintendent, the road foreman and, as may be practicable, by the trainmaster, dispatchers, stationmen and any others interested—as well as by enginememen, yardmen and trainmen. Attendance upon these meetings should be purely voluntary and the discussion of all subjects, including that of saving coal, frank and friendly.

Where the attendance is general, that is, not restricted to any particular class or classes of employees, there is insured a wide-spread appreciation of the importance of the subject and its place in the great war program of the nation, which is very helpful indeed. Some roads report that at meetings of this description they regularly have a hundred men or more in attendance.

The trainmaster has a fine chance to make a substantial contribution to the cause as he goes about the division, through his contact with the men and the resultant opportunities for educating and enthusing them, as well as by his ability to correct conditions which result in waste of fuel, or to have them corrected. With the yardmasters he is in position to have trains so made up at terminals as to minimize switching en route, remembering that to keep trains moving kills two birds with one stone; reduces over-time and *saves fuel*. In short, his active co-operation is of great value in this important work of fuel saving and his responsibility correspondingly great. By ordering trains for a time by which they can be made up by yard crews and at which they can get out without being delayed by other road movements as well as with a view to expediting their passage over busy stretches of track where other trains might interfere if the call is made without sufficient forethought, chief train dispatchers and yardmasters can render no little assistance.

Long delays to freight trains on sidings often result in bad fires and leaky flues, both of which increase the amount of coal which must be burned in order to overcome the handicaps which they present. Train dispatchers and trainmen by close co-operation can avoid many of these detentions and with a knowledge of how vital to the nation the

conservation of coal is at this time, should do their best to avoid such detentions.

Telegraph operators also can help by keeping dispatchers advised as to conditions affecting the movement of trains and their location so that orders may be issued advantageously and the despatching done in such a manner as to involve a minimum of delay.

In fact, fuel economy is like a Liberty Loan, everybody on the division from superintendent to call-boy should glory in having a share therein.

What has gone before pertains to the saving of coal after it has been mined and distributed. Now just a word about a big opportunity which comes to transportation men actually to make possible an increased production of coal by the miner. I refer to the chance to get cars to the mines and place them in time to save a day in their loading. Every man who in any way expedites the movement of a coal car, loaded or empty, helps in this and should realize that he is making a contribution of service which is of great importance even though he may not see the result. Men composing mine crews, however, have a fine chance not only to play the game but also to see the result by making every possible effort to place the cars for loading by the time and in the numbers that they are required under agreements between mine operators and miners, co-operating heartily with both in an endeavor to make possible the loading of a maximum number of cars each day. They can further hit the Huns by pulling the loads promptly and switching them for movement as early as possible, thus expediting the movement outbound.

Careful handling of coal loading equipment both in mining territory and elsewhere is another way in which an increased supply of cars for the movement of fuel may be secured, while careless handling, on the other hand, resulting in damage as it frequently does, means the withdrawal of instrumentalities from service which can ill be spared at this time.

The addresses of R. H. Aishton, Thomas Britt, W. S. Stone and the addresses given at the closing session on May 24 will be published in next week's issue.

INCREASED RAILWAY RATES IN EGYPT.—An Exchange telegram from Cairo states that the fares on the state railways of Egypt have been increased 50 per cent, being 100 per cent increase on the pre-war rates. Freight rates have also been increased from 50 to 150 per cent.—*Railway Gazette, London.*

RAILWAY BETWEEN THE MALAY STATES AND SIAM.—Advices received by the Malay States Information Agency are to the effect that the railway connecting British Malaya with Siam was nearing completion, and that it was expected that through passenger traffic between Singapore, Kuala Lumpur, Penang and Bangkok would begin on April 1. As a matter of fact, trains conveying officials of both countries had already been run over the line between Kuala Lumpur and Bangkok, and it was only the difficulty of obtaining certain ironwork that has prevented an earlier opening of the line to general traffic. One big bridge on the Siamese side had not been completed. The substructure had been built, however, and efforts were being made to get the metal work fixed up as soon as possible. The completion of the through railway is expected to have an appreciable effect on the Federated Malay States food problems, as the Siamese authorities are anxious to send through as much rice and other foodstuffs as possible when once the railway is open. Owing to circumstances due to the war, the through service will at first be of a modified nature, and it is not likely that there will be more than one passenger train daily each way till the war is over.

The Air Brake Association Convention

THE PROCEEDINGS OF THE FIRST DAY'S session of the Air Brake Association convention appeared in last week's issue on page 1245. A brief abstract of the later proceedings follows:

Preparing Air Brakes at Terminals

Installation.—The brake cylinder and auxiliary reservoir should be bolted to the most rigid portion of the underframe and all points of fastening should be equally rigid to avoid twisting or cramping under stresses of brake applications. All air brake piping should be securely clamped to prevent shifting when cars are subjected to shocks. This will avoid many broken or distorted cross-over pipes, loose pipe joints and other causes that produce excessive leakage.

Maintenance.—If the man in charge is to be successful in supervising air brake work, his knowledge should cover the following points: He should know when a triple valve is applied to a car that has been properly repaired, cleaned and tested and is suitable for service. A brake that is tested by making a service application, the reduction of brake pipe pressure being made at the proper rate, will often fail to apply or remain applied, while if it was tested by making the reduction at an excessive rate, which may still be less than required to produce an emergency application, the brake will apply and remain applied. Hence, the importance of testing brakes with a service reduction at the proper rate, this to insure the condition of the brake being such that it will apply and remain applied when placed in the train.

The application of levers of improper dimensions and proportions causes brake-rigging failures, slid flat wheels, improper and unequal braking power and a detrimental influence on train handling. Changing brake shoes without readjusting to between seven and eight inches standing piston travel is often the direct cause of slid flat wheels, break-in-twos and train shocks. Permitting cars to leave shop or repair tracks without hammering and blowing out the brake pipe is not treating the triple valve on the car or other cars in the train in a manner conducive to good operation. Applying triple valves to cars without first seeing that branch pipe strainers are inserted and in good condition and failure to clean out dirt collectors at proper intervals, deprives the triple valves of the protection they are entitled to and causes numerous triple valve troubles.

Inspection Tests.—In making initial inspection tests and retaining valve and brake cylinder tests the committee emphasized the need of giving especial attention to the condition of all piping at points where wear or corrosion is apt to take place. It should be determined that all pipe clamps and nuts on bolts holding cylinders and reservoirs are securely in place. A 90-deg. bent nipple with each leg approximately six inches long, instead of an elbow, should be installed at the triple valve end of the retaining pipe and the pipe should be clamped not closer than six feet from the triple valve to provide flexibility and should be clamped about every six feet from this point to the retaining valve. But one union should be used in the retaining pipe, located at the end of a 90-deg. bent nipple 12 or 14 in. from the triple valve.

Triple valves that do not apply with a service reduction; that apply quick action with a service reduction, and those that have leaks at the exhaust ports should be removed and replaced with others which have been cleaned and tested in accordance with M. C. B. practice. Brake cylinders that have leaky packing rings, and the brakes that have not been cleaned for eight months on system cars or 12 months on foreign cars should be cleaned, repaired, tested and stenciled in accordance with M. C. B. standard practice.

No train should be permitted to leave a terminal without a terminal test. In testing incoming freight trains at terminals the air brake and the general inspection must not be combined. On both leaving and arriving trains inspectors should rapidly examine the train for piston travel, brakes that fail to apply, brakes that have leaked off and brake pipe leaks. To insure inspectors ascertaining the condition of the brakes on arriving trains, switchmen, carmen and others must not discharge any air from the auxiliary reservoirs or brake pipes of cars that have not been inspected.

Brake Pipe Leakage.—Excessive brake pipe leakage is one of the most liberal contributors to train shocks and break-in-twos. It wastes air, takes away from the engine-man the ability to control the amount of brake applications, contributes to brakes sticking, causes overheating of the air compressor and even prevents the maintenance of standard brake pipe pressure. The maximum leakage should not exceed seven pounds per minute, as determined by standard test. This test consists of making a reduction of ten pounds from standard pressure, lapping the brake valve and then noting the leakage during the following minute after the service exhaust ends. By observing the caboose gauge during brake applications train men can often note the existence of excessive leakage.

The most common cause for brake pipe leakage is poorly clamped piping that will permit shifting in switch movements, or shocks that occur along the road. Allowing train and yard men to pull hose apart instead of separating them by hand, produces spread couplings jaws, destroys gaskets and creates porous hose.

Brake pipe is not the only leakage to be considered in our effort to eliminate shocks and break-in-twos. Brake cylinder and auxiliary leakage are just as productive of damage to trains as is brake pipe leakage. If a triple valve performs its duty and permits the desired pressure to pass from the auxiliary reservoir to the brake cylinder when the reduction is made and then, due to a bad leather in the cylinder or a defective gasket under the pressure head, the pressure is permitted to leak to the atmosphere, the effectiveness of that brake is either partially or wholly lost. On the other hand, if the brake cylinder and brake pipe are comparatively tight and we have a leaky auxiliary, either from a carelessly applied drain plug, a poorly fitting exhaust valve or a slide valve leaking, then after the application is made the auxiliary pressure leaks down two or three pounds below the brake pipe pressure, the brake will release and its efficiency is lost. Other factors that assist in producing leakage are brake pipes applied out of proper height and distance from the face of the coupler; nipple ends broken off and new threads cut on old nipples, shortening the brake pipe; angle cocks applied and not given the proper angle toward the center of the track.

Defective Triple Valves.—Any number of cases have come under the observation of the writer, when with the brake pipe and auxiliary fully charged the trainman in separating the train would close only the angle cock on the portion of train to be moved, leaving the other one open, and then pull the hose apart, setting all the brakes in emergency on the standing portion of the train, regardless of its length. Repeatedly applying brakes in emergency in this manner is frequently the cause of bent emergency piston stems.

Undesired Quick Action.—Undesired quick action can be caused by permitting triple valves to become dirty and gummy to the extent that the piston sticks to the bushing so that a high differential must be brought about to cause it to move. It can also be caused, especially with long trains, by a very light brake application or a very slow reduction, produced by lapping the brake valve and allow-

ing brakes to leak on, where it would be avoided by braking according to proper methods.

How Train Shocks May Be Eliminated.—To prevent, as far as possible, damaging shocks in long trains due to brake applications, it is necessary that the percentage of braking power be as near uniform as possible on all cars, and that loaded and empty cars be so distributed that the greater part of each will not be at the head end or rear end of long trains. This provides a means of distributing the braking power so that reasonably good handling of the train can be expected.

Long piston travel is preferable to short piston travel. A seven-inch standing travel will provide much better handling trains than a five-inch standing travel with the same brake pipe reduction, because in the former case the cylinder pressure will be built up more slowly and consequently any movement of slack in the train will take place proportionately slower, with a reduction in the velocity difference between cars and the stresses thereby set up. While there will be a considerable difference in the cylinder pressure between a five-inch and seven-inch travel at the beginning of a brake application, the pressures will be nearly equal when the brake is fully applied. If the piston travel is short, say five inches, it is possible to develop a high brake cylinder pressure at the head end with a 10-lb. reduction before the beginning of brake application at the rear. This causes the slack to run in from the rear, sometimes with very damaging results if the speed is low. If the piston travel is long, say eight or nine inches standing travel, it is possible to make the same reduction and produce only 20 to 25 lb. cylinder pressure, less than one-half the pressure produced with the short piston travel. This reduces the rate of retardation set up on the head end of the train, and consequently the severity of any slack action due to a run-in of the slack. Lighter brake pipe reduction still further reduces the cylinder pressure developed, until the train can be controlled without any noticeable slack action.

Excessive Draw Bar Slack.—Another liberal contributor to train shocks and break-in-tuos is excessive drawbar slack. The inspector should be instructed to watch this closely and make every effort to have cars with undue draw bar slack sent to the repair tracks for correction. With no slack and good draft rigging, trains could not be broken in two. The same can be said with slack either all in or all out and held so. The damage arises from its sudden change. How heavy the shock will be depends mainly on the difference in speed that must instantly be made uniform and on the weight that must suddenly be altered in speed. Weight is important, but change in speed is more so, as a sudden change of three

miles an hour will cause nine times the shock caused by a similar quick change of one mile an hour.

DISCUSSION

The members discussed measures that might be taken to keep the air brakes on freight cars in condition to render effective service. The necessity of setting brakes on incoming trains and stretching trains before starting from terminals was emphasized, and the practice of inspecting and cleaning brake cylinders and triple valves on team and house tracks, which is now followed by some roads, was endorsed as a means of saving much time to outbound trains and keeping cars in the train to destination. Higher standards of maintenance were urged by a speaker who told that inspection on one road showed that of cars off the tracks of the owning line 25.3 per cent were found to have ineffective brakes. It was moved to recommend to the M. C. B. Association that Rule 6 be supplemented by a provision permitting all roads to clean brake cylinders and triple valves on foreign cars sent to the repair tracks for other defects nine months after the previous cleaning.

Other Business

Reports were also submitted on the maintenance of $8\frac{1}{4}$ in. cross compound compressors, on the maintenance and operation of the feed valve, on M. C. B. freight brake stencilling and on proposed changes in the recommended practice of the association. The conservation of material and supplies was discussed at Wednesday's session and the topic was assigned as the subject of a report to be presented at the next convention.

In addition to addresses by C. H. Weaver and D. R. McBain, short addresses were given at the opening session by W. O. Thompson of the New York Central Lines, Martin Beman, director of public welfare of the city of Cleveland and W. S. Stone of the Brotherhood of Locomotive Engineers. On Wednesday evening Walter V. Turner gave a lecture on freak inventions.

The treasurer reported the largest balance that the Association has ever had in its treasury, and the executive committee voted to invest \$1,000 in war saving certificates. The secretary advised that the association's membership was now over 1,000.

The officers elected were as follows: president, F. J. Barry, New York, Ontario & Western; first vice-president, T. F. Lyons, New York Central; second vice-president, L. P. Streeter, Illinois Central; secretary, F. M. Nellis, Westinghouse Air Brake Company; treasurer, Otto Best, Nathan Manufacturing Company.

Relation Between Train Handling and the Caution Signal

By F. H. Nicholson,

Assistant Engineer, Signal Department, N. Y., N. H. & H. R. R., New Haven, Conn.

IT IS NATURAL ENOUGH to assume, in considering a signal stop, that the train is run at high speed to the caution signal, or to some point beyond it, where the engineman makes a carefully measured brake application and brings his train to rest just under the line at the stop signal. Not many signal stops are made in this apparently simple manner.

In the first place, to make such a stop with the necessary assurance requires a quality of judgment in speed, distance and braking power that is rarely if ever possessed by the most experienced engineman. No engineman can so closely estimate speed, distance, grade and braking qualities of his train that he can run at high speed to a certain point, make a full service brake application, and know that his train will stop at a definite and predetermined point in advance. If an engineman, basing his estimate of speed, distance and braking qualities upon normal conditions, runs at high speed to a certain point, makes a full service reduction, and stops

and the engineman's intention is not to stop his train anywhere within the caution block, but quite close to the stop signal. It is only by stopping quite close to this signal that the most efficient use is made of the signal system; therefore, the first stop, in which the train is stopped a considerable distance from the desired point, and in which the factor of safety appears as an inaccuracy, is plainly not good practice.

If the factor of safety appears as a lighter brake application, there may be no factor of safety available when most needed. Through misjudgment of distance or speed the engineman may so encroach upon minimum braking dis-

Fig. 1

Fig. 2

Fig. 3

Factor of Safety Appears As Inaccurate Stop, Fig. 1; As a Partial Service Brake Application, Fig. 2; As a Free Running Period Between Two Braking Periods, Fig. 3

his train with the pilot of his engine just opposite the stop signal, he has realized his expectations, but he has nothing left for an error in judgment. The factor of safety is nil. To obtain a factor of safety, braking must be begun earlier, that is, at a greater distance from the stop signal. With the average train the factor of safety would then appear as a stop short of the signal; as a lighter brake application with probably more accurate handling of the train; as a combination of short stop and lighter brake application, or as a free running period in a two-application stop, which is probably the most accurate stop of all.

Accuracy, of course, is a valuable quality in train handling,

Fig. 4

Fig. 5

Fig. 6

Full Service Stop from 60 M. P. H. with 12-Car Passenger Train, Fig. 4; From 30 Miles Per Hour, Fig. 5; Two Application Stop from 60 M. P. H., Fig. 6

tance, that to avoid overrunning the stop signal he may finally find it necessary to put to work all the braking power available, and make what he would call a "parachute" stop; or he may even overrun the signal through inability to produce sufficient braking power when needed. The stop in which the factor of safety appears wholly as a lighter brake application is liable then to be an unsafe stop, and it is therefore not good practice.

If the train is stopped by the two application method of braking, the factor of safety appears as a free running period between two braking periods. The first brake application is made at a point and of a degree such that if maintained the train will be stopped a considerable distance from the desired point. The intention of the engineman is to stop at the signal, and since the first application if held will stop the train short of the desired point, the brakes are released after the train has been brought to an intermediate, or so-called controlled speed, and the train is allowed to drift for a certain distance. The engineman "proceeds with caution," and a well judged second application brings the train to rest with smoothness and accuracy at the stop signal.

The following records of train handling illustrate the three methods of braking, and the three forms in which the factor of safety may appear. Fig. 1 shows a stop in which the factor of safety appears as the distance between the signal and the point at which the train stops, in other words, the factor of safety appears as an inaccurate stop. Fig. 2 illustrates a stop in which the factor of safety is consumed in a lighter brake application, and this curve shows also that all the braking power available had to be used to avoid overrunning the stop signal. Fig. 3 is an example of a two-application stop, in which the factor of safety appears as a free running period between two braking periods. This record shows the smoothest and most accurate handling of the train, and represents best practice in train handling.

Since the two-application stop is made up of two braking periods and an intermediate free running period, the distance

required may be determined by constructing the complete speed distance curve to represent the handling of the train. The first section of the complete curve would show the deceleration following the first brake application, and it would be obtained from the 60 m. p. h. full service braking curve. This braking curve, representing a stop from 60 m.p.h. with a twelve-car train, is shown by Fig. 4. This and the following assumed braking curves are for level and tangent track only.

Records of train handling show that the first application is usually held until the speed has been brought to approximately 35 m.p.h. In other words, most engineers consider 35 m.p.h. a convenient speed at which to release and recharge the brake system. After a release of the brakes the speed may taper off to about 30 m.p.h. in a distance of from 200 to 300 feet. Then follows a free running period. The second brake application made from 30 m.p.h., brings the train to a stop according to the braking curve shown by Fig. 5. The complete speed distance curve may now be constructed.

If this speed distance curve, shown by Fig. 6, be applied to a 3,500-ft. block, and we assume that the braking is begun as the train passes the caution signal, and that the train is brought to rest as the pilot appears opposite the stop signal, the factor of safety in the handling of the train is represented by the distance of 900 feet. The nominal per cent factor

of safety is $\frac{900}{1700 + 300 + 600}$, or 34.6 per cent, which

seems to be a large enough factor of safety to care for the variable braking conditions found in passenger train service. With average conditions in train braking, a margin would also be left for a braking effort somewhat less than full service. It may be noted that the true factor of safety is greater than 34.6 per cent, since the shortest possible stop is a one-application full service stop, as shown by Fig. 4, in

with best practice in making the signal stop. The interpretation, "approach next signal prepared to stop," leaves to the engineman the fixing of the point at which braking shall begin, and there is a temptation to run for a distance into the block at high speed, and to delay braking until the stop cannot be made without overrunning the signal, except by a heavy single brake application and a "parachute" stop. The factor of safety may be completely consumed in the distance covered at high speed, and if through some unknown defect there is less than normal braking power available, it may be impossible to stop without overrunning the signal.

Several of the curves are records of actual signal stops made in accordance with the first interpretation of the caution indication. They are typical of the results to be obtained where the caution signal means "reduce speed at once and proceed with caution." It is apparent that where signals are spaced with due regard to braking distance, the interpretation of the caution signal, "reduce speed at once and proceed with caution," brings into real agreement the language of the caution signal and the normal action of the engineman in making a safe and accurate stop, and insures that the designated factor of safety for each block will become an actual factor of safety in the handling of the train.

RESTRICT LONDON TRAVEL.—Sir Albert Stanley, President of the British Board of Trade, announced in the House of Commons on May 8 the decision of the government to place great restrictions on travel in London and vicinity, which will be extended later throughout the country. Passenger train service, he said, would be reduced by 40 per cent, and it will be necessary for every one to show that his proposed trip has an adequate reason.

FRENCH LOCOMOTIVES AND ROLLING-STOCK.—In an article given in its issue for March, *La Technique Moderne*

Fig. 7—Signal Stop from 50 M. P. H.

Fig. 10—Signal Stops from 40 M. P. H.

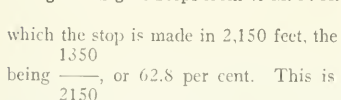

Fig. 8—Signal Stop from 60 M. P. H.

Fig. 11—Signal Stops from 55 M. P. H.

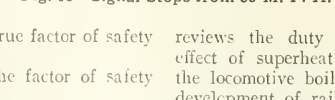

Fig. 9—Signal Stops from 56 M. P. H.

Fig. 12—Signal Slow Down

which the stop is made in 2,150 feet, the true factor of safety being $\frac{1350}{2150}$, or 62.8 per cent. This is the factor of safety

for a one-application stop, but, as pointed out above, it is a factor of safety unavailable in its entirety unless the braking is begun at the caution signal, and if made available by early braking, the result with the average train is an inaccurate stop and an inefficient use made of the signal system.

The two-application stop, therefore, really makes available the nominal factor of safety in block length, and as a manner of braking it is the most accurate method of making the signal stop. It is evident, therefore, that where signals are spaced 3,500 feet to 5,000 feet—or even more, the spacing depending upon grade and curvature—and the speed is properly limited, the interpretation of the caution signal, "reduce speed at once and proceed with caution," conforms exactly

reviews the duty required of the steam locomotive, the effect of superheat and compounding and the working of the locomotive boiler, and states that the reorganizing and development of railway transport in France are among the most urgent problems to be solved not only after the war, but even at the present time. It will be necessary shortly to renew the country's rolling-stock, which has been overworked during the last four years. A considerable increase in railway freight traffic is also to be faced. These conditions imply the construction of powerful traction units capable of hauling as heavy loads as possible at a speed closely approximating to the speed of passenger trains. Further, owing to the high cost of fuel, particular importance will attach to arrangements destined to reduce fuel consumption, by improving the utilization of the steam in the cylinders, or by improving the steam raising power of the boiler.

General News Department

President Wilson, on May 20, signed the Overman bill, authorizing him to reorganize executive departments and agencies, under which he is expected to transfer some of the forces of the Inter-state Commerce Commission to the Railroad Administration or other agencies.

Employees of the Pennsylvania Railroad System in the military and naval service on April 1, last numbered 12,548; and 8,415 of the names of these men are printed in a statement, filling 42 pages, of the Mutual Magazine, published by the employees of the Pennsylvania Railroad. This number of the magazine (May) has for its frontispiece a full length portrait of Brigadier-General W. W. Atterbury.

The committee on track elevation of the Chicago city council, which conferred with the Railroad Administration at Washington last week to determine the latter's attitude towards a continuation of the track elevation program in Chicago, was referred to the regional director. If Mr. Aish-ton finds that any or all of the improvements which have been projected are vitally necessary, and so recommends to the director general, the completion of the work may be permitted.

Carrying workmen to industrial plants now requires, on the Pennsylvania Railroad, 370 passenger cars above normal passenger requirements on that road, these cars are mostly used between cities and nearby shipyards, munition factories, and other industries which have been established on account of the war; and the daily movement in each direction is from 31,000 to 32,500 passengers. Most of these industries are situated between New York and Baltimore. Every Saturday the Pennsylvania carries about 10,000 soldiers on furlough from Camp Dix, and Camp Meade to their homes, and carries them back to the camps on Sunday.

New union ticket offices are being established in many places. Locations in New York City, at 66 Broadway and at 280 Broadway, have already been announced. That for the "mid-town" district will be at 31 West Thirty-second street. A lease for this property has been taken for six years. The new union office at Louisville, Ky., has been opened in the Todd building, Fourth and Market streets. The agent is Frank L. Alexander, heretofore ticket agent of the Louisville & Nashville at the Tenth street station. The saving in rents at Louisville is estimated at \$22,000. Nine roads participate in the use of this office. Arrangements for an office in Chicago are noted in another column.

H. P. Salter, freight agent of the Louisville & Nashville at Nashville, Tenn., has relieved the congestion in his freight houses on numerous occasions, recently, by employing squads of young men from the colleges. A group of 20 young men from George Peabody college for teachers, helped out recently by working Saturday afternoon and on Sunday, and similar assistance has been rendered by students from Vanderbilt University. The work of these helpers is reported as highly satisfactory. Thirty students of the University of Chicago have signed contracts to work as track laborers for the Chicago, Burlington & Quincy in Wyoming during the coming summer.

The Pennsylvania bridge over the Ohio at Louisville, Ky., the entrance of the Southwest System to the city of Louisville, was seriously damaged by fire on May 6. The bridge is undergoing reconstruction and the fire occurred in the timber falsework and the counterweight forms in the south tower of the vertical lift span, which is over the Government canal on the Kentucky side of the river. Owing to the location of the initial blaze high up on the tower, difficulty was experienced in fighting the fire, which was not extinguished for several hours and did serious damage to the steel work of the tower. The amount of damage and the extent of the delay in completing the structure will not be known until a careful survey is made. The cause of the fire is not definitely

known but is assumed to be a spark from a passing locomotive.

Great oaks from little acorns grow, and great losses from little causes flow, and the general manager of the Coast Lines of the Atchison, Topeka & Santa Fe uses a picture of an oak tree, issued in the shape of a circular printed in red white and blue, to impress on the employees of the road, the causes which have led up to the payment by the company of \$1,234,965 for losses of and damages to freight during the year 1917. The largest single item in the list of losses appears to be that for live stock, \$138,359; and the next is lumber, \$113,143. Among the big limbs of the tree lettered to show important causes of losses, are wrecks; improper refrigeration and ventilation; delays, dirty and defective cars, and concealed losses.

Labor difficulties in connection with the construction of the new Pennsylvania freight terminal at Chicago, were summarily terminated this week by the federal government. Several weeks ago, when the Quartermaster's Department of the Army reserved space in the new building it was found that the electricians who were putting in the wiring for the elevators were on a strike and that some other unions had gone out in sympathy. Despite the efforts of the government to induce the men to return to work the electricians remained obdurate. Finally, on Monday last, the government hired electricians belonging to an opposition union. United States troops have been placed on guard and it is expected that the wiring will now be completed in about six weeks.

The lines of pneumatic tubes in New York city, used for conveying letters underground between the central and the branch post offices aggregate in length about 27 miles, and the number of carriers transmitted through them daily is about 80,000. Each carrier has a capacity for about 450 ordinary letters, or 250 large letters. Each tube line consists of two tubes, each 8 in. in diameter. In the busy hours carriers are despatched every ten or fifteen seconds. These and other facts have been brought out in connection with the strenuous contest which has been made before committees of Congress in support of the clause in the annual appropriation bill providing for the maintenance of the tubes for the ensuing fiscal year. The postmaster general has persistently urged Congress to discontinue the use of the tubes and to have all letters carried by automobile trucks in the cities now using tubes—Boston, New York, Philadelphia, Chicago and St. Louis.

More State Railroading

The Massachusetts legislature has passed a bill providing for state control of the Boston Elevated Railway, which operates elevated, subway and surface lines in Boston and its suburbs. This law puts the management of the property, for a period of ten years, in the hands of five trustees to be named by the governor, provides for a guaranteed dividend of 6 per cent, and leaves the question of fares to be determined by the condition of the reserve fund.

Commercial Bribery

The Federal Trade Commission on May 16 sent to both branches of Congress a communication urging the enactment of a sufficient law striking at the unjustifiable and vicious practices of commercial bribery. The report says that the commission has found commercial bribery to be general throughout many branches of industry, and scores of complaints have been issued by it on that account. Fourteen states have laws prohibiting such practices, but they fail to reach the root of the evil. The commission can only deal with commercial bribery as an unfair method of competition, having no criminal jurisdiction.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF MARCH, 1918, CONTINUED

* Began operations June 1, 1917.

Western Railway Club

At the annual meeting of the Western Railway Club held at the Hotel Sherman, Chicago, on May 20, the following officers were elected: President, A. LaMar, master mechanic, Pennsylvania Lines; first vice-presidents, G. S. Goodwin, mechanical engineer, Chicago, Rock Island & Pacific; second vice-president, W. Alexander, superintendent of motive power, Chicago, Milwaukee & St. Paul; treasurer, C. H. Bilty, mechanical engineer, Chicago, Milwaukee & St. Paul.

Manganese Track Society Elects Officers

The Manganese Track Society met at the Hotel Blackstone, Chicago, on May 16, and elected officers for the coming year. Knox Taylor, president of the Taylor-Wharton Iron & Steel Company, Easton, Pa., was elected chairman, succeeding A. H. Mulliken, president of the Pettibone-Mulliken Company, Chicago. O. de G. Vanderbilt, president of the Weir Frog Company, Cincinnati, Ohio, was elected vice-chairman in place of R. W. Gillespie, of the Bethlehem Steel Company, South Bethlehem, Pa., and Henry Elliot, president of the Elliot Frog and Switch Company, East St. Louis, Ill., becomes treasurer in place of R. J. Davidson, treasurer of the Ramapo Iron Works, Hillburn, N. Y. B. M. Fosgate, Chicago, continues as secretary.

Convention of American Association of Engineers

At the national convention of the American Association of Engineers at Chicago on May 14, the following officers were elected for the coming year: President, W. H. Finley, chief engineer, Chicago & North Western, Chicago; first vice-president, W. H. Clausen, assistant city engineer of Chicago; second vice-president, L. K. Sherman, president of the L. K. Sherman Engineering Company, Chicago; national directors to serve two years; Harold Almet, consulting engineer, Chicago; F. K. Bennett, principal assistant engineer, Minneapolis & St. Louis, Minneapolis, Minn.; T. M. Chapman, civil engineer, Central of Georgia, Atlanta, Ga.; J. N. Hatch, consulting engineer, Chicago; Alexander Potter, consulting engineer, New York; J. H. Prior, consulting engineer, Chicago.

The Airplane Mail Service

The airplanes of the Post Office Department, carrying letters between New York and Washington, have finished their first week with a checkered record. On the first day, Wednesday, May 15, the northbound flyer broke down at a point in Maryland about 25 miles from Washington, and his letters, at first reported as having been transferred to railroad cars, were brought to New York by airplane on the next day. The southbound trip on Wednesday, with 350 lb. of mail, was made substantially according to the schedule.

On Thursday the northbound trip was made successfully, leaving Washington at 11:30 A. M., and reaching the landing ground at New York at 2:58 P. M. On this trip the amount of mail was 118 lb., only 5 lb. of which was mailed at Philadelphia. The southbound aviator on Thursday lost his way and landed at Bridgeton, N. J. He reached Philadelphia by automobile at 5:15 P. M. The Philadelphia-Washington machine then started for Washington, but went only 25 miles before something failed. A new start was made, however, and the mail finally reached Washington at 8:45 P. M.

On Friday a start was made from Washington at 11 A. M., but it was necessary to make stops for repairs, and Philadelphia was not reached until 7:25 P. M. The mail was taken to New York by train. The flyer who was waiting at Philadelphia, seems to have started for New York on time and arrived at 3:48 with 47½ lb. of mail. The southbound trip on Friday was made on time.

On Saturday, the fourth day, both northbound and southbound trips were successful, the time from Philadelphia to New York being 67 minutes, and from New York to Philadelphia 65 minutes. On Monday, the fifth day, the records appear to have been all right in both directions, the amount of mail leaving New York being 125 lb., and that arriving in New York 35 lb. From Philadelphia to Washington the trip of 135 miles was made in 89 minutes, favorable winds having helped the motor. On Tuesday, the sixth day, an electrical storm appears to have prevented the flyer from starting from Philadelphia for New

York. Southbound on Tuesday the flyer left New York on time, but soon encountered an electrical storm and returned; and the mail was sent by railroad. From Philadelphia to Washington the flyer also encountered an electrical storm—at a height of about two miles—but he kept on, and reached Washington in 154 minutes from Philadelphia.

The Government Railroad in Alaska

William C. Edes, chairman of the Alaskan Engineering Commission, says that this line will not be finished before 1921, or considerably later than the date calculated when the work of building the road was begun. The line is now 65 per cent completed, but more time may be required to build the unfinished third than was required for the completed two-thirds. About 6,000 men were employed in the field last year, but the chairman expects that not more than 3,000 men can be obtained this year. The Commission will direct its chief efforts to completing the main line between Seward and Anchorage and to laying steel toward Fairbanks. It is hoped to open the line from Mile 215 to Mile 265. For the transportation of supplies from the States to Seward and Anchorage, dependence must be placed, this season, on the commercial steamship lines. The amount of these supplies for this season is estimated at 5,000 tons, which will tax the capacities of the vessels. The government has spent thus far on this railroad an aggregate of \$23,670,000. The original estimate of the cost of the road was \$35,000,000, but, on account of the increased cost of labor and materials, the present estimate is \$40,000,000.

In the Anchorage district last year a large crop of potatoes was raised, and the coal fields yielded 54,000 tons of coal.

Accident Bulletin No. 63

The Interstate Commerce Commission has issued Accident Bulletin No. 63, giving statistics of railroad accidents occurring in the United States during the three months ending with March, 1917. This bulletin appears to have been made up in November, 1917, about seven months after the close of the period for which it gives returns; but it reached this office on May 17, 1918, or about 13 months late. (The last bulletin, No. 62, was reported in the *Railway Age* of September 14, 1917, page 462.)

The present bulletin is printed on sheets 9 in. x 11 in., and its form and style are changed throughout; and it contains much less detail than has been given heretofore. At the end of the year, however, it is proposed to give more detail, rather than less; this quarterly bulletin is being issued in abbreviated form so as to present "certain accident figures of immediate interest and usefulness." The electric railway statistics are left out; casualties to trespassers are given for each state in the Union separately; train accidents are shown in a table (giving the statement for each month by itself), in which the number of accidents is compared with the number of millions of locomotive miles; and the number of casualties to shopmen and other workmen is shown compared with the number of hours worked by the men, in each class, during the months reported. An appendix of 19 pages gives the circumstances and causes of train accidents which were investigated by the Bureau of Safety, of the commission, during the three months under review.

The total number of persons killed and injured on the railroads of the United States during the quarter here reviewed was 51,426; that is to say, 2,346 killed, and 49,080 injured. The condensed totals of the tables of casualties are as follows:

Casualties on Steam Railroads, Three Months Ending with March, 1917

| | Passengers | | Employees | | Other persons | |
|-------------------------------|------------|---------|-----------|---------|---------------|---------|
| | Killed | Injured | Killed | Injured | Killed | Injured |
| In train accidents..... | 38 | 840 | 114 | 1,187 | 47 | 181 |
| In train service accidents 43 | 866 | 614 | 12,563 | 1,357 | 1,888 | |
| In industrial accidents. . . | ... | ... | 114 | 30,992 | 19 | 561 |
| Totals | 81 | 1,706 | 842 | 44,744 | 1,423 | 2,630 |

The number of "other persons" killed in train accidents (47) is swelled by including, under the head of train accidents, cases where a train strikes an automobile, or other vehicle at a public highway crossing. There were 38 accidents of this kind, in which 25 non-trespassers were killed, and 143 injured. The damage to railway property in these 38 accidents is given as \$16,790

The number of collisions per million locomotive miles in three months was 3.48, and of derailments 5.05. The total damage to railway property in all train accidents was \$3,078,370. The man-hours of shopmen reported by all the roads in class 1, were, for the quarter, 317,760,570, and the number of casualties per million man-hours, in and around shops, was 50.68. In this statement of ratio the killed, 34, and the injured, 17,714, are lumped in a single item. Similar statements of ratios are given for station men, trackmen, bridge and building men, and "other employees." The total number of casualties under the head of industrial accidents, as shown in the table above, was 31,686.

In our table the column headed "Other Persons," includes both trespassers and non-trespassers; and included in the trespassers are 39 employees killed and 63 employees injured. Besides these items there are included under the head of "Employees," 35 killed and 137 injured, who were not on duty.

Serious Delays to Trains by Heavy Mails

The report which has been sent to Congress and the President by the Merchants' Association of New York City concerning inefficient mail service, which report was briefly noticed last week, cites a great number and variety of statements showing how the movement of important postal trains has been seriously delayed by the conditions imposed by the Post Office Department as to the loading and unloading of mail at important stations. In the case of one of the heaviest mail routes the average train delay due to mails, during a period of thirty days, was 50.36 per cent of the total train delays. For 462 trains operating on 26 lines during the same period the general average of delay due to mails was 13.89 per cent. The Post Office Department explained the delays as due to the congestion of the railroad system, quoting the record of November, 1917, when there were 86,712 failures of mail trains to make their scheduled connections. The Merchants' Association calls attention to the omission of essential facts which, when shown, destroy the implication that delayed train movement is the sole, or even the principal factor in causing mail delays. By far the larger part of the mail trains operated in the month of November were substantially on time. Of all those not on time, a material part of the delay was caused by the conditions under which the railroads were required by the department to handle the mails. The number of train failures, 86,712, as stated by the department, is equivalent to only 18 per cent of the number of mail trains running. As each delayed train represents several missed connections, the number of such misses is obviously greater than the number of delayed trains causing them. The obligation rests with the Post Office Department to explain the major cause for the serious delays to the mails which, in number and duration of time, far exceed any possible delays that can result from railroad operation. Delays of one to four days were found to be not only common, but usual, in the case of mails moving not over 150 miles, by direct routes requiring no change to other lines, and upon lines having frequent train service. It is impossible convincingly to explain such delays by attributing them to delayed trains.

Trains Nos. 45 and 11, operating between New York and Pittsburgh, are among the main channels for the movement of west and eastbound mails. The record of delays to these trains caused by mails is as follows:

No. 45, October, 37.81 per cent November, 42.80 per cent
No. 11, October, 45.48 per cent November, 38.78 per cent
An examination of the daily records of these trains makes clear the fact that the delays due to the mails are in many cases sufficient to cause the train to miss its connections, and thereby prevent prompt despatch over connecting lines.

On the New York Central train No. 35, leaving New York at 8:40 p. m., is a solid mail train, carrying mails to make close connection with the Burlington at Chicago for far western points. A mail train from Boston connects with train No. 35 at Albany. The Boston train carries storage cars usually filled to capacity with mails. Under former practice these storage cars were switched into Train 35 at Albany and no delay in train movement was caused. Under the prevailing space system the cars coming from Boston end their run at Albany, and the mail contained in them is handled across the platform and loaded into Train 35. This process usually consumes considerable time. In one instance it required twenty-eight minutes in excess of the scheduled stop at Albany to transfer these Boston mails. Similar delays occur at other points, particularly at Cleveland, where heavy mails from Pennsylvania require to be transferred. Atretary J. H. Leonard New York

Toledo a large quantity of mail for Detroit must be unloaded.

The Boston mail taken up at Albany is not concentrated in a particular car upon Train 35. Every car upon that train is frequently so filled with mail originating at New York that there is not sufficient space in any one car to take the Boston mails, consequently the latter are distributed at Albany throughout several cars, and it is impracticable for the clerks upon the train to so assemble that mail as to permit its being properly worked before arrival at Chicago. Moreover, the postal crews, immediately after leaving Albany, are compelled to devote a large part of their time to readjusting the contents of the several cars, upon which a load of Boston mail has been dumped, in such manner as to enable them to get at the various mails which must be worked for points beyond Albany. This delay consumes the time of the crew, at least as far as Utica, so that much mail destined for intermediate points is carried by, because it has been made inaccessible by the overloading of the cars with the Boston mail.

Joint Meeting of Master Car Builders' and Master Mechanics' Association at Chicago, June 19-20

The Master Car Builders' Association and the American Railway Master Mechanics' Association have issued a joint circular postponing the annual conventions of the associations another year, and calling a meeting to dispose of the accumulated work of committees and to pass on other matters requiring action. All representative members, the chairmen of all committees, the executive committees of both associations, and the arbitration committee of the Master Car Builders' Association are invited to attend the meeting, which will be held in the Florentine Room of the Congress Hotel, Chicago, on June 19 and 20, 1918.

The Master Car Builders' Association will receive reports from the committees on the following subjects: Arbitration; standards and recommended practice; brake shoe and brake beam equipment; couplers; loading rules; car wheels; specifications and tests for materials; train lighting and equipment; tank cars, and welding truck side frames, bolsters and archbars.

Committees of the Master Mechanics' Association will present reports on the following subjects: Standards and recommended practice; mechanical stokers; fuel economy and smoke prevention; specifications and tests for materials; train resistance and tonnage rating; springs (shop manufacture and repair).

The reports of the committees will not be sent out to the members in advance of the meeting but copies will be distributed to those attending. Members will be free to discuss the papers as was customary at the annual conventions. The associations will maintain headquarters during the meeting at the Congress Hotel. There will be no exhibit of appliances in connection with the meeting.

A Smoke Kit for Every Rock Island Soldier

The Rock Island Lines plan to send a "smoke kit" to each of the 2,074 Rock Island men now in army and navy service. Ever since last summer money has been coming in for Company B, of the Thirtieth Engineers (Railways), which has been in France since early last fall. So far about \$2,200 worth of "smokes" and other articles of comfort have been sent to the men in this company and, in addition, \$2,275 has been cabled to the company as a mess fund. It is now proposed to send a kit containing tobacco, candy and other comforts to all other Rock Island men now with the colors. The May shipment to Company B cost \$461 and consisted of 12,000 Fatima cigarettes, 720 packages of Tuxedo tobacco, 864 packages of Prince Albert, 100 books of cigarette paper, 1,440 pieces of chewing tobacco, 10 dozen packages of pipe cleaners, 3,132 cigars, 180 lb. candy, 6,000 envelopes and 18,000 sheets of letter paper.

Terminal Engineers

The Society of Terminal Engineers at its annual meeting held in New York on May 21 elected as president for the ensuing year Gen. William H. Pils, U. S. A., St. Louis, Mo. There were also elected five vice-presidents: Francis Lee Stuart, New York; R. E. Cresson, Jr., New York; John Meigs, Philadelphia, Pa.; Calvin Tomkins, New York, and Charles Whiting Baker, New York. The treasurer is W. Joshua Barney and the sec-

Traffic News

The safe transportation of eggs is the subject of a report, entitled "Bulletin No. 664," which has been issued by the Department of Agriculture, giving the results of an investigation of the conditions surrounding the transportation of 147 shipments of eggs, all of them full carloads, and also less complete examinations of many other shipments. The report fills 31 pages, and goes into extreme detail, millions of eggs having been inspected individually. The average haul was over 1,200 miles, and the observers visited 32 packing houses, the stations of 32 railroads, and the establishments of 33 consignees. The conclusions are summarized in the statement that when eggs are shipped in carload lots, packed in good, well-made, standard cases, with new medium or heavier fillers and flats, with properly placed and suitable cushions at top and bottom, with cases tightly stowed and efficiently braced in the car, and the car handled in accordance with good railroad practice, especially when switching, the total damage referable to transit was less than 2 per cent. When loads are buffed properly with straw at the ends of the car, the eggs are damaged near the center of the car more than at the ends. The load of eggs must be a solid unit in the car, fitting without play. Straw buffing at the ends too near the bottom, or the use of too much buffing, will waste half the refrigeration.

Coal Production

The continuation of favorable operating conditions, both of transportation and mining, during the week of May 11, are reflected in the production of coal, which gained 2.2 per cent over the week of May 4, and exceeded slightly the record week of April 27, according to the weekly report of the Geological Survey. The total production for the week is estimated at 11,896,000 net tons, an average per day of 1,968,000 tons, compared with 1,926,000 tons the first week of May and 1,829,000 tons in May, 1917. Anthracite shipments declined from 40,570 carloads during the week ended May 4 to 38,314 carloads during the week of May 11. The percentage of full time output lost during the week ended May 4 on account of car shortage was 13.1.

Centralized Ticket Offices at Chicago

A central ticket office for all railroads entering Chicago will be established in the Insurance Exchange building, on Jackson Boulevard, between Sherman and Wells streets. The entire first floor of the building, embracing 20,000 sq. ft., has been leased for this purpose by the regional director of railroads, according to P. S. Eustis, chairman of the passenger traffic committee of western railroads. This consolidation will mean a saving to the Railroad Administration of approximately \$200,000 a year in rents and salaries. Comparatively few men will be thrown out of employment as most roads are now operating with restricted clerical staffs. The space will be divided into two sections, one on the east side of the building for the 14 eastern and southern roads and the other on the west side for the eight western lines. The arrangement of the booths to be occupied by the individual lines within the two sections has not yet been determined. The present tenants have been notified to vacate at once. Extensive alterations are to be made and the new ticket office will not be opened for several weeks. The quarters now occupied by railroad ticket offices will be sub-leased by E. A. Howard, vice-president of the Chicago, Burlington & Quincy.

PENNSYLVANIA OFFERS FRANCE TREES.—The Pennsylvania Department of Forestry, through Governor Brumbaugh, has offered to the French Government a gift of 4,000,000 forest tree seedlings from the State forest nurseries to be used in reforesting the shell-torn woods in the battle-grounds of eastern France. The tender will be made by Colonel Henry S. Graves, who organized the work of the forest regiments in France.

Commission and Court News

Interstate Commerce Commission

Collection of Undercharges

The commission has issued a revised interpretation of conference ruling 314. The commission held it to be the duty of common carriers to exhaust their legal remedies to collect undercharges; but carriers are advised that this ruling does not require the filing of a suit where the party liable for the undercharge cannot be located, or service cannot be made, or where upon investigation by the carrier in good faith it is found that legal process would be futile and ineffectual.

Court News

Railroad's Agreement with Customs Broker

The Michigan Supreme Court holds that an agreement between a railroad and its chief clerk, at a point on the Canadian line, that the clerk should remit to the railroad whatever fees he received as customs broker for the United States, was not *ultra vires* of the railroad.—*Duluth S. S. & A. (Mich.)*, 167 N. W., 55. Decided March 27, 1918.

Removal of Station

In a hearing before the Oklahoma Corporation Commission, involving the removal of a station from one location to another, which it was alleged would be more convenient for the inhabitants of a nearby village, the probable cost to the company of removing the station and the facilities connected therewith came into question. Qualified witnesses on behalf of the railroad testified that the removal would cost in the neighborhood of \$24,000. Without any witnesses testifying to the contrary, the commission found that, "from viewing the grounds and general knowledge of the right of way and structure," the estimate of the railroad was about twice the actual cost. The Oklahoma Supreme Court holds that this finding was not supported by the evidence. The order directing the removal was held unreasonable and unjust and was set aside. The present location of the station is about half a mile from the principal street of Red Rock, a town of about 600 inhabitants, and the petitioners wished it moved nearer the town.—*Atchison, T. & S. F. v. Wolverton (Okla.)*, 171 Pac. 722. Decided March 12, 1918.

War Exigencies Must Be Proved

In the case of the Norfolk & Western against the Public Service Commission of West Virginia, in which the railroad appealed from an order of the commission requiring shipping facilities to be furnished for the Trace Coal Company, the Supreme Court of that state holds:

1. The Act of Congress conferring upon the Interstate Commerce Commission authority to require railroads to provide shipping facilities for shippers tendering interstate shipments sufficient to justify the construction and maintenance of the same, does not deprive the Public Service Commission of jurisdiction to require such a railroad to provide such facilities to a shipper offering intrastate commerce, even though the facilities, when provided, may be used in the shipment of interstate as well as intrastate commerce.

2. Findings of fact by the Public Service Commission based upon evidence to support them will not be reviewed by this court.

3. A common carrier will not be excused from its duty of furnishing shipping facilities to one offering commerce to it, upon the ground that all of its energies are required to meet government needs, brought about by the present state of war, where it does not appear that the granting of such facilities would divert any of the carrier's energies, or require of it service which would make it less able to perform its public duty.

Equipment and Supplies

The Government Locomotive and Car Orders

The mechanical committee and the purchasing committee of the Railroad Administration completed their joint meetings to discuss the question of specialties for the government cars and locomotives last Thursday. Since then long lines of representatives of specialty manufacturers have waited outside the doors of the purchasing committee and they have been called in for conferences from time to time. It is understood that most of the locomotive specialties have been determined, and some of the car specialties, but no announcements have yet been made.

Locomotives

THE BUNHAM & GARFIELD has ordered one 0-8-8-0 Mallet type locomotive.

THE FRENCH STATE RAILWAYS, and the Paris-Orleans Railway, it is reported, are inquiring in this country for locomotives.

THE CHINESE GOVERNMENT RAILWAYS, and the Yunnan Railway of China, it is reported, are inquiring in this country for locomotives.

Freight Cars

THE GUANTANAMO & WESTERN is inquiring for 25 box cars.

GIORGIO ANSALDO & Co., Genoa, Italy, is inquiring for 10 40-ton general service cars.

THE UNITED STATES GOVERNMENT, ORDNANCE DEPARTMENT, has ordered 150 ammunition cars from the American Car & Foundry Company.

Passenger Cars

THE GUANTANAMO & WESTERN is inquiring for 3 to 5 passenger cars.

THE RAILWAY EXECUTIVE COMMITTEE OF ENGLAND recently issued a notice ordering that all cars containing coal consigned to stations and sidings adjoining docks and canals must be unloaded at the place to which they are consigned, and that they must not be re-labelled and consigned elsewhere.—*The Engineer, London*

AERIAL SERVICE IN NORWAY.—The Tidens Tegn of Christiania states that a large number of prominent business men from all parts of Norway have decided to issue a prospectus relative to the organization and promotion of a company to be known as A. S. Norsk Luftfartrederi. The purpose of the new company is to be that of maintaining regular aerial routes, partly between points in Norway, and partly between Norwegian and foreign points. The organizers held a meeting at Christiania on March 1, 1918, and the prospectus probably will be ready for distribution within a short time.—*Commerce Reports*.

GERMANY SELLS LOCOMOTIVES.—Despite the alleged deficiencies of the German railways in respect to rolling stock, Germany still finds it possible to manufacture locomotives for export according to an Associated Press Correspondent at Stockholm in a report dated March 25, and quoted in the New York Times. Two of an order of twenty for the Swedish State railways were received the first week in March, and the other eighteen were promised before April 1. The scarcity of brass and copper in Germany is evidenced by the fact that nearly all locomotive parts usually made of these metals are made of iron or steel in the locomotives already received. The Swedish State railways have also closed a contract with the German steel trust for 80,000 tons of rails, with plates and bolts. One-third of the order is to be delivered this year, a third in 1919, and the rest in 1920.

Supply Trade News

The Burden Sales Company, Inc., New York, announces the removal of its office from 30 Church street to the forty-second street building, 30 East 42nd street.

Patrick T. Kilgarraff, chief clerk to T. C. Powell, vice-president of the Southern Railway system, Cincinnati, Ohio, has been elected vice-president of the Certes Supply Company, St. Louis, Mo.

Thomas Finigan was elected a vice-president of the American Brake Shoe & Foundry Company, with headquarters at Chicago, at a meeting of the board of directors of that company on May 20.

William F. Cutler has been elected president of the Southern Wheel Company, with headquarters at St. Louis, succeeding W. G. Pearce who now becomes chairman of the board of directors, and Frank C. Turner was elected vice-president in charge of sales with office at St. Louis.

Holmes Forsyth, second vice president, secretary and general manager of the Curtin Supply Company, Chicago, was elected president at a meeting of the directors on April 30.

Mr. Forsyth has been actively connected with the Curtin Supply Company since its organization in 1899, having at that time been elected second vice-president and secretary of the company, which offices he continued to hold until his recent election as president, succeeding Edward T. Burrowes, who died on March 19, at his home in Portland, Me.

Mr. Burrowes had been the president of the company since its organization on May 19, 1899, at which time the F. T. Burrowes Company, the Adams &

H. Forsyth

Westlake Company, and the Forsyth Bros. Company, sold out their curtain departments to the new concern which was designated the Curtin Supply Company. Mr. Burrowes was therefore connected with the car curtain industry from its very beginning, being president of the first company that ever put on the market an American car window curtain.

The Q & C Company announces that it has taken over the manufacture and sale of packing and lubricating under the Thomas Smith patents, formerly controlled by B. M. Jones & Co., of Boston. These devices will be hereafter known as the Q & C packing and Q & C lubricating.

R. G. Stutsman, for a number of years superintendent of the frog and switch shop of the Chicago, Milwaukee & St. Paul at Tomah, Wis., and more recently master mechanic of the Four Lakes Ordnance Company, Madison, Wis., has been appointed sales representative of Manning, Maxwell & Moore at Milwaukee, Wis.

Randolph S. Reynolds, assistant to the general manager, was elected secretary at a meeting of the directors, succeeding Holmes Forsyth. Mr. Reynolds has been with the Curtin Supply Company since 1912. Prior to that date he was with the Western Steel Car & Foundry Company, at Alliston, Ala., and with the Pressed Steel Car Company of Pittsburgh, Pa., having been connected with their purchasing department from 1905 to 1912, at which time he resigned to go with the Curtin Supply Company.

The Driver-Harris Company, Harrison, N. J., announces the election of the following officers: Frank L. Driver, president; Arlington Bensel, first vice president; Leon O. Hart, second vice president; Frank L. Driver, Jr., third vice president; Percival E. Reeves, treasurer; Stanley M. Tracy, assistant treasurer, and M. C. Harris, secretary. Wilbur B. Driver, formerly vice president has retired from active participation in the business.

The Curtain Supply Company, owing to the growth of business and the need of increased space, has leased almost the entire building at 350-356 West Ontario St., Chicago, and will be located there after June 1. The new quarters of the company will be about 50 per cent larger than the old. The building is new and in addition to being equipped with greater and more efficient manufacturing facilities, will have a private track for shipping and receiving freight. For about 19 years this company has been located at 320 West Ohio street, Chicago.

Lieut. Colonel W. R. Roberts

Lieut. Colonel W. R. Roberts, the announcement of whose promotion from Major to Lieut. Colonel in the Construction Division of the United States Army has been previously made, is president of Roberts & Schaefer Company, Chicago. Colonel Roberts has been in engineering construction work for 30 years, and about 20 years ago organized the Roberts & Schaefer Company, which specializes in coal mining plants, coal washeries, coal docks, etc. He is still president of this company, although he has been giving all of his service to the government since last October. The Construction Division of the Army, with which Colonel Roberts is connected, is the outgrowth of the old Cantonment Division which was organized for the purpose of building the 16 National Army camps and the 16 National Guard camps. The variety and character of the work of the Construction Division are much greater than were those of the old Cantonment Division. While the Construction Division is still building some cantonments for the Signal Corps and the Engineer Corps and making extensive additions to all the original cantonments, its most important work at present is the building of large ordnance plants, powder manufacturing plants, Quartermaster Corps terminals, Quartermaster interior depots, many large hospitals, etc. Indeed, this division does all the construction work for the United States and its possessions, for all divisions or bureaus of the Army, and it now has a construction program on hand which amounts to about \$650,000,000. It is divided into six branches, engineering, construction, materials and transportation, contract and administration. Colonel Roberts is executive officer in charge of the construction branch, which is the largest and most important branch and which now employs about 200,000 men. Colonel Roberts was a graduate of the University of Illinois. His success in his business, as well as in his new work, has been due not only to his skill as an engineer, but to his ability as a business organizer.

Col. W. R. Roberts

Trade Publications

Tools.—The Warren Tool & Forge Company, Warren, O., has issued a 32-page catalog illustrating and indexing the special line of hand tools manufactured by that company. These consist of picks, crow bars, lining bars, various heavy hammers, axes, rail and tie tongs, wrenches, chisels, etc. Many different forms of each tool are illustrated.

Financial and Construction

Railway Financial News

ATLANTIC COAST LINE.—Frank K. Borden has been elected a director to succeed his father, E. B. Borden, deceased.

CHICAGO, MILWAUKEE & ST. PAUL.—Edward S. Harkness has been elected a member of the executive committee to succeed John D. Ryan, resigned.

KANSAS CITY SOUTHERN.—John F. Harris has been elected a director to succeed Herman Siecklen, deceased.

LEAVENWORTH & TOPEKA.—This 47-mile line, operating between Leavenworth, Kan., and Topeka, which was recently ordered sold for junk by the Federal Court, was purchased at a receivers' sale at Leavenworth, Kan., on May 10, by residents along the road. The sale price was \$80,000, of which \$25,000 was paid down, the balance to be paid at the confirmation of the sale by the Federal Court.

MISSOURI PACIFIC.—See editorial comments elsewhere in this issue.

NEW YORK CENTRAL.—See improvement budget in another column.

PENNSYLVANIA RAILROAD.—Clement B. Newbold has been elected a director to succeed William H. Barnes, deceased.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company has been authorized by the Railroad Administration to resume the construction of the Osage & Santa Fe from Caney, Okla., to Pawhuska. The director general had previously ordered the Santa Fe to discontinue this work.

CHICAGO, BURLINGTON & QUINCY.—This company has awarded a contract to E. Otto of Downers Grove, Ill., for the construction of a 10-stall brick roundhouse at Bridgeport, Neb.

CHICAGO & NORTH WESTERN.—This company has completed plans for the north approach of the Orleans Street bridge over the Chicago river, Chicago. The bridge will be built by the city, but the north approach which crosses the North Western tracks will be constructed by the railroad. The North Western has also awarded contracts to the Widell Company, Mankato, Minn.; Gaffin & Gehri, Fond du Lac, Wis., and Adolph Green, Green Bay, Wis., for concrete work in connection with the construction of 35 bridges on various divisions of the road.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—This company has been granted a permit to build a two-story brick extension to the office building in Nashville, Tenn. The estimated cost of the work is \$16,500.

QUEBEC & SAGUENAY.—A contract has been given to O'Brien & Doheny, Quebec, Que., to build a line through St. Francois Xavier, Que., Baie St. Paul, Eboulements, St. Irene and Murray Bay. The work will be difficult and calls for building a number of temporary trestles, to be later replaced with steel bridges. Track has already been laid on 26 miles.

ENGLISH RAILWAY INVITES SUGGESTIONS.—The London & North-Western Railway has issued a notice in its Crewe works that the company will welcome suggestions for the improvement in methods of manufacture or carrying out work which occur to any of its staff, and in the event of any such suggestion being made use of by the company, and found beneficial, a suitable acknowledgment will be made, and, if desirable, assistance will be rendered towards the patenting of the same, under the usual conditions appertaining to patents taken out by employees of the London & North-Western. In conformity with the notice the directors have recently granted a reward of £5 (\$25) to a man in Crewe works for suggesting an improvement to the machine on which he was engaged.—*The Engineer, London.*

ANNUAL REPORT

First Annual Report of Missouri Pacific Railroad Company, Year Ended December 31, 1917

St. Louis, Mo., April 15, 1918.

TO THE STOCKHOLDERS

The Board of Directors herewith submits report of the operations and affairs of the Missouri Pacific Railroad Company, to December 31, 1917.

A summary of results from operations for the year divided between the periods prior and subsequent to June 1, 1917, compared with the year 1916, is as follows:

| | January to May, 1917. | June to December, 1917. | Year 1917 | Year 1916. | Increase or Decrease | Per Cent |
|---|--------------------------|----------------------------|-----------------|-----------------|-------------------------|-------------|
| Railway Operating Revenues | \$31,126,903.51 | \$47,193,409.95 | \$78,320,313.46 | \$69,972,812.50 | \$8,347,500.96 | 11.9% |
| Railway Operating Expenses | 21,536,977.47 | 31,711,060.67 | 53,248,038.14 | 51,342,397.05 | 1,905,641.09 | 3.7% |
| Net Revenue Railway Operations | \$9,589,926.04 | \$15,482,349.28 | \$25,072,275.32 | \$18,630,415.45 | \$6,441,859.87 | 34.5% |
| Railway Taxes and Uncollectible Railway Revenue | 1,471,243.76 | 2,772,068.46 | 4,243,312.22 | 3,103,762.38 | 1,139,549.84 | 36.7% |
| Total Operating Income | \$8,118,682.28 | \$12,710,280.82 | \$20,828,963.10 | \$15,526,653.07 | \$5,302,310.03 | 34.1% |
| Non Operating Income | 568,672.97 | 902,241.34 | 1,470,914.31 | 1,443,872.04 | 27,042.27 | 1.8% |
| Gross Income | \$8,687,355.25 | \$13,612,522.16 | \$22,299,877.41 | \$16,970,525.11 | \$5,329,352.30 | 31.4% |
| Deductions from Gross Income | 76,340,433.08 | 6,994,140.57 | 113,334,773.65 | 116,011,517.31 | \$2,676,743.66 | *16.7% |
| Net Income | \$2,346,922.17 | \$6,618,381.59 | \$8,965,103.76 | \$5,957,007.80 | \$3,008,095.96 | 50.3% |

* Decrease

† Included in the interest on funded debt for five months ended May 31, 1917, and for the calendar year 1916, is the interest on bonds in default, amounting to \$1,736,601.51 and \$4,917,930.00 respectively.

Applying the interest for twelve months of 1917 to the reduced debt basis under the reorganization plan, the net income would have been \$10,218,336.94.

Missouri Pacific Railroad Company was incorporated under the laws of the State of Missouri, March 5, 1917, and, with its subsidiary companies, has acquired substantially all of the lines of railroad, franchises and property formerly of The Missouri Pacific Railway Company and the St. Louis, Iron Mountain & Southern Railway Company, which latter Companies were in receivership continuously from August 19, 1915, until June 1, 1917. Missouri Pacific Railroad Company took over the properties for operation June 1, 1917, at which time there were issued the following securities:

| | |
|--|------------------|
| Common Stock | \$82,839,500.00 |
| Preferred Stock (5% Cumulative after July 1, 1918) | 71,800,100.00 |
| Total Stock | \$154,639,600.00 |
| First and Refunding Mortgage, 5% Bonds | \$46,923,000.00 |
| General Mortgage, 4% Bonds | \$1,350,000.00 |
| Total Bonds | \$48,273,000.00 |
| Total | \$202,912,600.00 |

These securities were in addition to \$125,461,620.00 outstanding underlying bonds and \$3,683,000.00 equipment obligations.

CAPITAL STOCK.

No change has been made in the outstanding Capital Stock since June 1, 1917.

FUNDED DEBT.

Equipment Obligations to the amount of \$351,000.00 have been retired since June 1, 1917, and in addition, \$12,000.00 General Consolidated Railway and Land Grant Bonds have been retired with land grant funds, resulting in a reduction of \$363,000.00 in the Funded Debt. Statement on page 17 shows the detail of these reductions. Funded Debt outstanding shown on pages 18 and 19, and brief descriptions of the various mortgages are given on pages 23 to 29, inclusive.

NEW LINES

A new line from Dalhousie, Ark., to Camp Pike, Ark., a distance of 4.05 miles was constructed for the purpose of transporting material for the construction of the National Army Cantonment at that point and to afford facilities for the movement of troops and supplies. Minor changes, due to remeasurements and reclassification, increased the mileage 0.94 miles.

The details of charges to Road and Equipment as shown on page 22, summarize as follows:

| | |
|-------------------------------|---------------|
| For Construction of New Lines | \$ 176,865.41 |
|-------------------------------|---------------|

ROAD AND EQUIPMENT

The following new equipment has been acquired and taken into the accounts since June 1, 1917, at a cost of \$1,873,617.29:
 5 Combination Steel Coach and Mail Cars
 6 Dining Cars
 26 Stock Cars
 1500 Coal Cars
 13 Work Cars.

| | |
|--|----------------|
| For Improvements and Additions to Roadway | 1,326,923.71 |
| For Improvements and Additions to Equipment | \$2,569,156.48 |
| Less Credits account of Equipment Retired | 254,140.60 |
| Total Charge to Investment in Road and Equipment | \$3,818,855.59 |

OPERATIONS.

Total Operating Revenues for the year were \$78,320,313.46, an increase of \$8,347,500.96, or 11.9%. Applied to the average mileage operated, the revenues amounted to \$10,691.58 per mile of road, against \$9,408.41 the previous year. Freight revenue increased \$4,882,206.85, largely due to an increase of 13.11% in the tonnage from Products of Mines, of 55% in the tonnage of Manufactures, 6.08% increase in the tonnage of Merchandise (less carload freight), and 21.22% in the tonnage of Miscellaneous Commodities. The total tonnage handled increased 9.72% (details of which are shown on page 43).

The average haul per ton of revenue freight was 252.42 miles, as compared with 243.26 miles last year. The traffic statistics on page 41 show material increases in loading per train and per car mile.

Passenger revenue increased \$2,880,600.26, or 23.94%; the total amounted to \$14,912,672.69, or 19.04% of all Operating Revenues and without any material increase in the average rate per passenger mile. The number of passengers carried increased 13.77%, while the number of passenger miles increased 20.58%.

The total Operating Expenses shown in detail on pages 34 and 35 were \$53,248,038.14, an increase of 3.71% notwithstanding large increases in employees' wages and in cost of material. Maintenance of Way expenses equalled nearly \$1,500.00 per mile of operated road, and, combined with Maintenance of Equipment expenses, absorbed 29.88% of total operating revenues.

Transportation Expenses show an increase of \$4,601,114.37, or 2.18%, with an increase in gross revenue of \$8,347,500.96, or 11.93%.

PENSIONS.

To provide for employees who, after long years of faithful service, have reached an age when they are unable to further perform their duties, a pension system was made effective July 1, 1917. At the close of the year there had been placed in the pension rolls the names of forty-four beneficiaries.

The productive capacity of the property, now highly improved as a transportation plant, is fully evidenced by the average operating revenues for the last three calendar years, which exceeded the record of the previous three-year period by \$10,000,000.00.

IRVING

President

Under a proclamation by the President of the United States the properties were taken over for operation by the Government on December 31, 1917.

GENERAL BALANCE SHEET

DECEMBER 31, 1917, COMPARED WITH JUNE 1, 1917

| ASSETS | | | LIABILITIES | | |

Belgian Civilians Working on Belgian Railroad Under German Guard

Railway Officers

Executive, Financial, Legal and Accounting

William J. Moody, chief clerk in the treasurer's office of the Erie, at New York, has been appointed an assistant treasurer.

Hale Holden, president of the Chicago, Burlington & Quincy, has also been elected president of the Ft. Worth & Denver City and the Wichita Valley, with headquarters at Chicago.

T. B. Coppage, vice president and general manager of the Fort Worth & Rio Grande has been appointed terminal chairman at Fort Worth, Texas, under the regional director

Operating

W. Tansley has been appointed car service agent of the Canadian Pacific at St. John, N. B., succeeding **W. B. Brown**, transferred.

J. F. Blattenburg has been appointed division examiner on the Colorado division of the Union Pacific, with headquarters at Denver, Colo., vice **P. Groome**, promoted.

F. N. Melius, hitherto acting superintendent, has been appointed superintendent of the Hudson division of the New York Central, with headquarters at Grand Central Terminal, New York.

J. J. Donnelly, trainmaster on the Gulf, Colorado & Santa Fe, with headquarters at Temple, Tex., has been transferred to Galveston, Tex., succeeding **E. W. Nettleton**, who goes to Brownwood, Tex., succeeding **W. M. Knowd**, who has been transferred to Temple, Tex., succeeding Mr. Donnelly.

J. T. Slattery, superintendent of the Denver & Rio Grande, Colorado lines, second district, with headquarters at Salida, Colo., has been transferred to the Salt Lake division of the Utah lines, with headquarters at Salt Lake City, Utah, succeeding **E. W. Duell**, transferred to the Colorado lines.

C. W. Huntington, president of the Virginian Railway, by order of Director General McVoo, has been retired as chief operating officer of the road, and **Joseph H. Young**, president of the Norfolk Southern, has been appointed federal manager in charge of the operation of the Virginian, effective on May 21, with office at Norfolk, Va.

G. J. Ross, superintendent of car service of the New York Central, lines east of Buffalo, with office at New York, has been appointed superintendent of freight transportation, with headquarters at New York, vice **G. H. Alexander**, and **D. A. Day** has been appointed superintendent of car service, with headquarters at New York, vice Mr. Ross.

M. M. McLearn, chief dispatcher of the Canadian Government Railways at Truro, N. S., who was recently appointed assistant superintendent of District No. 2, Eastern Lines, with headquarters at Fredericton, has decided to return to his former position; and **R. Z. Walker**, station agent at Fredericton, has been appointed assistant superintendent, vice Mr. McLearn.

H. R. Saunders, superintendent of the Kansas City terminal division of the Chicago, Rock Island & Pacific has been transferred to Amarillo, Tex., succeeding **J. G. Bloom**, appointed division engineer at Herington, Kan. **G. W. Rourke**, formerly assistant general manager of the Chicago, Rock Island & Pacific, second district, with headquarters at El Reno, Okla., has been appointed division superintendent of the Kansas City terminal division, succeeding **H. R. Saunders**.

A. H. Moll, has been appointed assistant superintendent of the Chickasha subdivision of the Fort Worth & Rio Grande, with office at Oklahoma City, succeeding **J. A. Johnston** transferred to the Oklahoma subdivision with the same headquarters, succeeding **F. C. Glow**. Mr. Glow has been appointed trainmaster of terminals, with headquarters at Tulsa, Okla., in place of **J. C. McGlothlin**, resigned. **George E. Dornblaser** has been appointed assistant super-

intendent of the Cherokee subdivision of the same road. **D. P. Edmundson**, transferred.

W. L. Jarvis has been appointed assistant trainmaster of the Long Island Railroad. **H. A. Golder** has been appointed assistant passenger trainmaster, freight transportation of train service, etc., of the Far Rockaway division and Rockaway Beach division, and **W. B. Hautsch**, general passenger agent at Bay Ridge, has been appointed assistant freight trainmaster, all with office at Jamaica, N. Y.

F. E. Williamson has been appointed general superintendent of the New York Terminal District, New York Central, with headquarters at the Grand Central Terminal, New York. The New York Terminal District will operate that portion of the Hudson division from Sackett Harbor, (New York city) southward to St. John's Park, including freight stations in Manhattan and at Wallabout Basin, Brooklyn, also that portion of the River West State Division from Little Ferry drawbridge, southward to the junction of the Pennsylvania Railroad south of Weehawken. Mr. Williamson was formerly superintendent of the Hudson division, but for the past year has been acting as general agent at New York city, for the American Railway Association.

James H. Brennan, assistant superintendent of telegraph, of the St. Louis-San Francisco, has been promoted superintendent of telegraph, succeeding **H. D. Teed**, whose death was announced in the *Railway Age* on May 19. Mr. Brennan was born at Marysville, Kan., on September 3, 1873. He began his railway career, on October 1, 1887, in the telegraph department of the St. Joseph & Grand Island at Marysville, Kan., and subsequently entered the service of the Western Union Telegraph Company as telegraph operator at Lincoln, Neb., later going to Kansas City as telegraph operator for the Western Union Telegraph Company and the Postal Telegraph-Cable Company. He afterwards became manager for the Western Union at Las Vegas, N. Mex., and then wire chief at Santa Fe, N. M., Cleburne, Tex., and La Junta, Colo. On December 1, 1906 he was appointed assistant superintendent of telegraph of the St. Louis-San Francisco, which position he held until his recent promotion as mentioned above.

Traffic

G. O. Herbert is appointed demurrage manager of the Missouri Pacific, with headquarters at St. Louis, Mo., effective June 1.

Samuel E. Aliender has been appointed chief special agent of the St. Louis-San Francisco, with headquarters at St. Louis, succeeding **James H. Smith**, resigned.

F. B. Townsend, vice-president of the Minneapolis & St. Louis has been appointed to the staff of **J. G. Woodworth**, traffic assistant to the regional director at Chicago.

W. B. Cornell, district passenger agent of the Chicago & Alton, at Cincinnati, Ohio, has been appointed passenger agent at Springfield, Ill. This former position has been abolished.

Rodney MacDonough has been appointed division passenger agent of the Pennsylvania Railroad and the West Jersey & Sea Shore, with office at Philadelphia, Pa., succeeding **F. B. Barnitz**, who has been granted a furlough.

S. B. Wade, connected with the traffic department of the Chicago & Alton, at Little Rock, Ark., has been appointed traffic agent of the Jacksonville division, with headquarters at Bloomington, Ill. The position he held at Little Rock has been abolished.

E. B. Robb, acting division freight agent of the Canadian Government Railways, with office at Cochrane, Ont., has been appointed division freight and district passenger agent for the Transcontinental Division—O'Brien, Que. to Graham, Ont., inclusive, with office at Cochrane.

Gordon M. Craig, assistant general passenger agent of the Erie with office at New York, in addition to his present duties, will in future have the direction of the suburban passenger traffic, vice **Ralph H. Wallace**, general passenger agent who has been furloughed for service on the passenger train committed to the Railroad Administration for eastern routes.

Charles M. Burt, general passenger agent of the Boston & Maine and subsidiary companies, with office at Boston, Mass., having been assigned by the regional director, eastern territory, of the United States Railroad Administration, to duty on the passenger traffic committee, **Frederick T. Grant** has been appointed acting general passenger agent, of the Boston & Maine and subsidiary companies, with office at Boston.

J. L. Hayes, commercial freight agent of the Baltimore & Ohio, with office at Baltimore, Md., has been appointed division freight agent, with office at Cumberland, and authority over the Cumberland division, Martinsburg to Grafton, both exclusive, including branches. **P. H. Lantz** has been appointed commercial freight agent, with office at Baltimore, vice Mr. Hayes, and **W. F. Geisert**, traveling passenger and freight agent at Denver, Colo., has been appointed general agent, with office at Camp Sherman, Ohio.

H. P. Cornick, whose appointment as general freight agent of the Louisville & Nashville, with headquarters at Evansville, Ind., has already been announced in these columns, graduated from the high school at Evansville, and began railway work on October 13, 1884 with the Louisville & Nashville as stenographer to the general freight agent of the St. Louis & Henderson divisions. In November, 1892, he was promoted to chief clerk in the same office. On December 1, 1892, he was appointed assistant general freight agent of the St. Louis and Henderson divisions and branches, which position he held at the time of his recent appointment as general freight agent of the same road as above noted.

On May 1, the Atchison, Topeka & Santa Fe, in compliance with orders of the Railroad Administration, closed its off-line freight and passenger soliciting offices. The order caused considerable rearrangement of official positions and in some cases the men affected sought employment elsewhere. **E. F. Lalk**, general freight agent at Pittsburgh, Pa., was appointed assistant manager of the division of transportation of the United States Shipping Board, at Pittsburgh. **S. W. Manning**, general New England agent, at Boston, Mass., received a similar appointment from the Shipping Board at Boston. **R. C. Smith**, general freight agent at Philadelphia has been assigned to government work at Washington. **E. W. Demarest**, general freight agent at Buffalo, has gone to San Francisco, Cal., to engage in the automobile and tire business. **E. C. Kitching**, general freight agent, at Joplin, Mo., is now engaged in the automobile business in that city. **Sam Larimer**, general agent for the passenger department at Des Moines, Ia., has been appointed passenger agent at Wi hita, Kas. **W. J. Curtis**, general freight and passenger agent at Salt Lake City, Utah, is now a passenger agent in the general office at Topeka, Kas. **W. S. Farnsworth**, general freight agent at Mexico City, has become identified with the United States Food Administration, in Cuba, in connection with the handling of sugar. **E. H. Dallas**, general passenger agent at Atlanta, Ga., is now located in the traffic manager's office at Chicago.

Engineering and Rolling Stock

G. H. Berry has been appointed assistant master mechanic of South Louisville (Ky.) shops of the Louisville & Nashville, vice **B. E. Dupont**, transferred.

W. Wells, district master mechanic of the Canadian Pacific, with office at Schreiber, Ont., has been transferred in the same capacity to the Farnham division of the Quebec district.

L. G. Curtis, district engineer of the Baltimore & Ohio, with office at Chicago, has been appointed assistant chief engineer in charge of construction, with headquarters at Baltimore, Md.

J. G. Bloom, superintendent of the Chicago, Rock Island & Pacific, with headquarters at Amarillo, Tex., has been appointed division engineer, with headquarters at Herington, Kan., succeeding **S. L. McClanahan**, who has resigned to enter the army, having received a commission as first lieutenant with the 25th Engineers (Railways.)

W. S. Jackson, master mechanic of the Erie at Marion, Ohio, has been appointed mechanical superintendent, with headquarters at New York, to succeed **F. S. Fitzsimmons**, resigned, **R. V. Blocker**, general foreman at Huntington, Ind., has been appointed master mechanic with office at Marion, to succeed Mr. Jackson.

C. E. Smith, consulting engineer at St. Louis and formerly bridge engineer of the Missouri Pacific, has received a commission as major in the engineering branch of the quartermaster's corps. He is now stationed at Washington, D. C.

The Chicago, Rock Island & Pacific mechanical department, in a rearrangement of territories assigned to supervisors of fuel economy, has made the following changes and additional appointments, effective May 15: **J. Benzie**, supervisor of fuel economy of the Chicago terminal, Illinois and Missouri divisions, with headquarters at Rock Island, Ill., will now have charge of the Chicago terminal and the Illinois divisions, with the same headquarters. **P. Smith**, supervisor of fuel economy of the Cedar Rapids, Minnesota, Dakota and Des Moines divisions, with headquarters at Cedar Rapids, Iowa, will now have charge of the Dakota and Des Moines Valley divisions, with headquarters at Valley Junction, Iowa. **F. Meredith**, supervisor of fuel economy of the Iowa, Nebraska and Colorado divisions, with headquarters at Fairbury, Neb., will now have charge of the West Iowa, Nebraska and Colorado divisions, with the same headquarters. **F. Connolly**, supervisor of fuel economy of the St. Louis, Kansas City terminal, Kansas and El Paso divisions, with headquarters at Herington, Kan., will now have charge of the Kansas and El Paso divisions, with the same headquarters. **B. J. Bonner**, road foreman of equipment, with headquarters at Herington, Kan., has been appointed supervisor of fuel economy of the East Iowa, Cedar Rapids and Minnesota divisions, with headquarters at Cedar Rapids, Iowa. **C. W. Reed**, road foreman of equipment has been appointed supervisor of fuel economy of the Missouri, Kansas City terminal and St. Louis divisions, with headquarters at Trenton, Mo.

V. R. Hawthorne, whose election as acting secretary of the Master Car Builders' Association and the Master Mechanics' Association, was announced in the *Railway Age* of

V. R. Hawthorne

May 17, has been serving as temporary secretary of the associations since the death of J. W. Taylor. Mr. Hawthorne was born at Oleona, Pa., on November 27, 1886. He entered the service of the Pennsylvania Railroad as a car repairman at the Elmira, N. Y. shops in June, 1905. He was transferred to the shops at Baltimore, Md., in November of the same year, at which place he was employed during the summer months repairing passenger cars and during the winter as a clerk. Here he gained his first experience in M. C. B. billing. In June, 1910, he was transferred to Williamsport, Pa., as M. C. B. clerk in the office of J. T. Wallis, remaining there until June, 1914, at which time he was transferred to Altoona, Pa., as a gang leader in the M. C. B. clearing house. While there he was appointed on the M. C. B. special committee making time studies. Early in 1917 he was appointed special master car building inspector, reporting to J. T. Wallis, general superintendent of motive power of the Pennsylvania Railroad. He was assigned on special M. C. B. committee work of the American Railway Association in April, 1917.

Purchasing

C. C. Keeble, recently storekeeper of the Gulf, Colorado & Santa Fe, at Galveston, Tex., has received a commission as first lieutenant in the quartermaster's corps, at Washington.

Railway Officers in Government Service

H. S. Ray, assistant general passenger agent of the Chicago, Rock Island & Pacific at Des Moines, Iowa, has been commissioned a major in the army and assigned to duty as assistant director of inland transportation, war department.

EDITORIAL

Railway Age

EDITORIAL

Announcement is made elsewhere in this issue of the appointment of W. J. Cunningham, the James J. Hill professor

Standard Operating Statistics

of transportation of Harvard University, to take charge of statistics for the government Railroad Administration. Professor Cunningham has worked for a number of years on just the kind of

problem that he will have to solve under the Railroad Administration. His practical work, of course, has not been on as large a scale as it will be now, but his study of operating statistics has been comprehensive for the entire country. Some years ago he devoted a considerable part of his time to working out a system of statistics to be used by the Union Pacific, and the Union Pacific's operating statistics are today among the simplest and most useful of any system in use in the United States. For the last few years, Professor Cunningham has been acting in an advisory capacity to James H. Hustis in his operation of the Boston & Maine. The system of statistics for the Boston & Maine had to be built pretty well from the ground up and the practical experience which Professor Cunningham had on the Boston & Maine should stand him in good stead now. At the same time that he was having this practical experience he was making a study of the system of statistics in use on all the roads of the country. He possesses that rare combination of the student and the practical man, which is so vitally needed if the operating statistics of all of the railroads which are under the jurisdiction of the director general are to be harmonized and yet kept in such shape as to meet the particular needs of each property and each organization. It is essential that a new manner of reporting statistics, no matter how good it is theoretically, shall not be adopted on any road before it is so well understood by the organization that the figures of the old system in use could be interpreted and carried on by the new system. Professor Cunningham's work on the Boston & Maine is of special value in this connection.

Much uncertainty has attended all construction during the past two years. While this has been due primarily to the

Building Construction and Second Hand Material

unsettled labor situation still the difficulty of securing the necessary materials for carrying on the work has been of hardly less importance. Before that time conditions were such that engineers when making plans for improvements could estimate closely the cost of work and the time necessary for doing it, basing their estimates on past experience. Contractors if invited to present bids on the projects also based their figures on past experience. Under the present conditions past performances have lost much of their value as measures of what may be expected in future operations. This is particularly true in building construction where materials of varied character are required. Such work calls for large quantities of cement, brick, steel and specialties. With the exception of cement and possibly brick, the demand for building materials exceeds the supply, and even if the materials can be purchased shipments are subject to embargoes, and consequently deliveries are uncertain. All this renders labor inefficient through the time lost in waiting for

deliveries, and the constant changes necessary in the organization to take advantage of available supplies at the expense of a predetermined plan of operation. In the construction of the new car repair shops at Port Huron, Mich., described elsewhere in this issue, the Grand Trunk minimized the delays due to the material situation by utilizing large quantities of second hand materials of varied character salvaged from buildings wrecked in connection with the preparation of the site. This resulted in a considerable saving in expenditure which was, however, secondary in importance to the saving in time effected. While it is true that the conditions surrounding this project were more or less favorable the results obtained would suggest the importance of close studies of conditions when attempting building construction in order that the most may be made of already existing conditions.

One of the most interesting of the kaleidoscopic developments of the regime of federal railroad control is the announcement of the plan for the ap-

Federal Managers for the Railroads

pointment of federal managers to take charge of the operation of the railroads reporting exclusively to the Railroad Administration and with no connections with the owners of the properties. It is entirely natural, perhaps, that Mr. McAdoo should desire to have an organization responsible to him alone rather than one consisting of men with a dual allegiance and many close observers of the trend of recent events in the railroad world have foreseen the necessity of drawing a sharp line of distinction between the officers of the government and the officers of the corporations. This necessity first became evident in the case of members of the director general's staff at Washington who were required to sever their corporate relations and the issues drawn between the railroad owners and the administration in connection with the negotiation of the compensation contract have demonstrated some strong reasons why there should be a similar separation in the case of operating officers. Comment on certain phases of the policy should perhaps be withheld until more is known of the administration selections for the positions of federal managers. The newspapers have been allowed to give forth the impression that the railroad presidents already have been summarily ousted, whereas the only definite statement on the subject has been an announcement that the men to be placed in charge of each property must be exclusive representatives of the Railroad Administration. It would be exceedingly unfortunate if the director general should find it necessary or advisable to dispense with the services of any large proportion of the best brains in the railroad business and it is understood that many presidents will be appointed federal managers, leaving the chairman or other officer as the representative of the corporation, while in case the president is a man who has been more closely identified with the financial and corporate policies of the company than with its operation he will be allowed to remain with the corporation and an operating officer will be appointed federal manager, in most cases the operating vice-president. This is on the theory that many of the functions formerly performed

by the chief executive officer of a railroad have now been taken over by the Railroad Administration.

The Advance in Rates

THE *Railway Age* has probably printed more material on the reasons why railroad freight and passenger rates should be advanced than any other publication. Some of its editors, as well as scores of its contributors, by long practice have acquired a facility and a fluency in dealing with the subject which some of our good natured critics have occasionally characterized as the manifestations of a deep-seated habit.

But before the latest opportunity to indulge in a discussion of this familiar topic we find ourselves strangely at a loss. An increase in rates amounting to something like a billion dollars a year seems an appropriate subject for discussion, but we approach it with something like awe. Not at the magnitude of the sum, although a billion dollars is still big in the railroad business, because we have been accustomed to observing the operating expense accounts and are becoming inured to large figures. But we confess ourselves somewhat embarrassed by the magnitude of the proposition. We can hardly be expected to object to an increase in rates. Our views on that subject are well known. But we have been used to discussing reasons why rates should be advanced, proposals to advance rates, and occasionally a qualified permission to advance rates. An order to advance rates is rather novel.

Moreover, Mr. McAdoo's General Order No. 28 contains so many points of interest that we hardly know where to begin and the time allowed for discussion before it takes effect is so short. We have usually been allowed at least a year or two to develop the reasons why freight rates in a part of the United States should be advanced 5 per cent, 10 per cent or 15 per cent, and have then been allowed additional years in which to complain because only a part of the increase was allowed. Here we have a 25 per cent increase in freight rates, an increase of passenger fares to 3 cents a mile, an additional passage charge for parlor and sleeping car passengers, state rates supplanted by interstate rates and then raised, and the elimination of special reduced rates induced by competition, all rolled into one order, to become effective in less than three weeks in the case of passenger fares and in a month in the case of freight rates. We have not time even to warm up by urging the Interstate Commerce Commission not to suspend the tariffs. Before we could get a good start the thing will have been accomplished.

There is a finality about the order that is rather appalling to those who have kept in touch with rate advance proceedings in the past. Mr. McAdoo returns to his office after an absence of two months, including two or three weeks when he was confined to his home by illness, signs an order which is telegraphed to all parts of the United States on the same day, and turns to another large problem, or a problem which formerly would have been considered large, with every assurance that his order will take effect on the date set. Even the element of controversy which has enlivened the history of rate cases is to a large extent lacking. Undoubtedly there will be opposition and protests but their apparent futility creates some lack of interest. While protests are being made before the Interstate Commerce Commission the rates will be in effect, in the states even as in the nation.

It is all so easy that Mr. McAdoo does not hesitate to advance wages for the morning papers and rates for afternoon release and to precede them both by an order that soldiers and sailors may ride for one cent a mile. He knows in advance where the money is coming from. In this he

has a great advantage over railroad executives who are sometimes accused of being lacking in vision. Many of them have known long in advance what ought to be done but they have not been able to pass so readily from the state of volition to that of action. One of the reasons why capital is timid is that capital usually has to pay the bill.

It seems unnecessary for the *Railway Age* to express its opinions of the director general's order. In the first place, what's the use? In the second place, we are already on record. For 10 or 12 years we have been pointing out the need for higher freight rates, why the passenger business should be placed on a self-sustaining basis and why the conflicts between state and interstate rate-making should be removed. It is coming about in a manner somewhat different from that which we had anticipated but we may at least congratulate Mr. McAdoo on his determination to place the railroads on a self-sustaining basis rather than yield to the suggestions that have been made from some quarters that any operating deficit be met indirectly by taxation.

Is the Amalgamation of Railway Associations Advisable?

THERE IS A LARGE NUMBER of railway associations. There are without question some which should be combined for the good of all concerned. However, with these exceptions, each of the organizations now existing fills a definite need, providing the channel through which the men in the particular department can exchange ideas and work together to improve methods and materials used in the service in which they are employed. In nearly all cases these societies are supported by railway men in their individual capacities, who join on their own initiative, pay their own dues and work in the associations largely on their own time. While some roads pay the annual dues of their men in these organizations and a large number pay their expenses to attend conventions, in the aggregate the money so spent by the roads is small in proportion to the benefits derived.

Before changing the present methods of organization of these societies, it is well to consider what they have accomplished under present methods in order to determine the effect which any change in these methods will have on the amount and character of the work done. In order to be specific, reference will be made to the American Railway Engineering Association for purpose of illustration as it is typical of the stronger and more efficient railway associations. This society was organized 20 years ago and now enrolls about 1,400 members, nearly all of whom are directly in railway service in the United States and Canada. No distinction is made between residents of the two countries, the president of the Association last year being J. G. Sullivan, chief engineer of the Western Lines of the Canadian Pacific and a resident of Winnipeg, Man. Membership is individual and voluntary without official designation from the roads. Work is done through committees which meet at frequent intervals and whose recommendations are subject to review and spirited discussion on the floor of the annual convention before acceptance by the Association. The reports and discussions are published in the annual proceedings which have become the standard book of reference in the libraries of railway officers concerned with engineering and maintenance of way problems. The recommended practices and standards of the association are also published in a manual, which is revised annually, to keep pace with the developments in practice and is in use throughout the English-speaking world. The Railroad Administration has already indicated its appreciation of the value of

the work done by this association by ordering a large number of copies of this manual. It is difficult to pick out specific work of any association for special mention. However, one of the most valuable lines of work has been with reference to the rail problem. As a result of the work of this committee changes have been made in specifications and mill practice which have played no small part in the improvement in the quality of the rails during the last few years. The committee on Stresses in Track is now engaged in an extensive study which bids fair to be of even greater value to the roads in determining the relations which exist between wheel loads and the different units of the track structure.

Work such as this can be done to best advantage only when men are working voluntarily because of their professional interest in the subject. The fundamental reason for the high grade of work done in most of these voluntary associations is the opportunity offered for individual initiative. It is for this reason that any amalgamation of these associations whereby they will lose their individual identities will do irreparable harm. When an organization becomes official in character, individual initiative in speech and action is checked while the incentive and loyalty to the individual organizations are removed.

The logical outcome of the consolidation of these associations will be that the members, particularly in the technical departments, will transfer their activities to other societies such as the American Society of Mechanical Engineers, the American Society of Civil Engineers, and the Western Society of Engineers, over which neither the railways or the director general have any control. This will be a return to the condition existing years ago before the formation of the railway organizations.

It has been stated that the director general has proposed the amalgamation of these associations in order that (1) he may have one central body to which he can turn to secure advice from the best talent in the railway industry, (2) he may limit participation in the preparation of principles and standards of recommended practice to those actually in the employ of the roads of the United States and (3) by giving this association an official character, he may have the means of making its recommendations binding on the roads. Referring to the first objective, it is not necessary to destroy the individual organizations to secure concerted action, for this can be accomplished by the co-ordination of activities through some central committee or board composed of representatives of these societies. The elimination of Canadian railway men and those in consulting practice, university professors, etc., would only deprive the societies of the benefits of the service and advice of these members with no positive gain. Likewise while the standard of design and practice prepared by the different organizations have been adopted wholly or in part by many but not all roads, and while the deviation from these standards on other roads has increased manufacturing costs, we do not believe that the enforced universal adoption of these standards is advisable, for it will tend to arrest, if not entirely stop, future development. The rapidity with which this development is occurring, largely as a result of united co-operative association work, is indicated by the fact that the American Railway Engineering Association revises its manual of standard practice yearly to keep it up to date.

The railway associations are willing and desirous of doing everything in their power to assist in the winning of the war. They have offered their services to the government in whatever way our country can use them. The railways are essential to our military activities. The railway associations have had much to do with the development of efficient practices. They should, therefore, be able to assist the government in the solution of the transporta-

tion problems now confronting it. We believe that this can be done best by co-ordinating the work of the associations in such way that there may be a minimum overlapping of work while at the same time providing for the freest play of initiative and individual incentive. The loss of interest and restriction of action which will necessarily follow the amalgamation of the organizations will far outweigh the disadvantages which now exist and most, if not all, of which can be eliminated by intelligent co-ordination.

New Books

The Elements of Railroad Engineering, by William G. Raymond, dean of the College of Applied Science State University of Iowa, 512 in. in. bound in cloth, 453 pages, illustrated. Published by John Wiley & Sons, Inc., New York. Price, \$4.

This is a revised third edition of the original volume published in 1908. The order and arrangement is the same as in the previous edition, the book being divided as before into three parts: "Permanent Way" which may be said to partake of the nature of a critical description of the roadway, track, structures, signals, etc.; "The Locomotive and Its Work" covering the principles of economic railway operation and its influence on railway location; and "Railroad Location, Construction and Betterment Surveys," which is an account of the methods of conducting the work rather than a mathematical treatment. The appendix on the location of the Knoxville, La Follette & Jellicoe Railroad by W. D. Taylor, covering 70 pages appears as in the original edition. The section on the locomotive has been largely revised and Chapter 10 on "Signaling" has been entirely rewritten. Chapter 23 on "Valuation," covering 22 pages, is an addition which has no counterpart in the original work, and which presents a review of the various problems involved and a statement of the opposing views presented in their solution.

A Bibliography of Municipal Utility Regulation and Municipal Ownership, By Don L. Parsons, 410 pages, cloth, 9 in. bound in cloth. Published by Harvard University Press, Cambridge, Mass. Price \$4.

Although this book does not cover strictly railroad regulation, the student of railway matters will find it of considerable value, for there are many things in public utility regulation that follow along the same lines as railroad regulation. The book has been compiled primarily for the business man with a view, of course, to its use by the student or general reader, and is arranged with that in mind. Each publication noticed has been read by the author of the book and his very brief notations concerning the character of the articles should prove of considerable assistance in the selection of material. The names quoted are taken primarily from articles in public utility, technical and other periodicals and the bibliography is completed to January 1, 1917. "It is believed," says the author in his preface, "that little of value on the subjects treated has been overlooked."

The bibliography covers works on gas, electric water and traction utilities, but works in languages other than English are not included. Among the references are a number of articles which have appeared in the *Railway Age*. The bibliography is classified under the following heads: General Works; History of Utilities and of Regulation; Franchises; Public Service Commissions; Valuation; Rates; Taxation; Holding Companies and Municipal Ownership. A 50-page index also helps in finding articles. Like all the publications of the Harvard University Press, the book is attractively gotten up, printed in a legible type and well arranged typographically.

Letters to the Editor

The Trespassing Evil

TO THE EDITOR:

CHICAGO.

Allow me to add a word to your interesting discussions in recent issues dealing with the trespassing evil. The appeal to legislators is pat and timely. Whether the patient efforts of railroad officers, in this direction, will bear much good, remains to be seen; but if teaching by example will do any good the railroads certainly ought to begin before long to penetrate the hides of the indifferent.

You speak of one prominent road on which the trespassing record was reduced by 19 per cent, and you refer to the lethargy and ignorance of local magistrates. It occurred to me to call your attention to the Chicago & North Western, which also has made a new record. It is on the North Western, you know, that the "father" of safety-first on the railroads, R. C. Richards, has carried out safety ideas with a vigorous hand for a number of years past. The record of the

judges who are an exception to the general statement which you have made. In a circular printed in four languages, all in large type and arranged with good taste, he appeals to heads of families to "STOP, LOOK AND LISTEN"! This circular, distributed broadcast among the householders of Milwaukee, is reproduced below, reduced about one-half in width and height:

Mr. Richards, to whom I have referred, is, as your readers know, one of the leaders in the National Safety Council, and he is to be credited with many of the good ideas which are spread throughout the country in the bulletins issued by the

LOOK and LISTEN

TO THE HEAD OF THE FAMILY:—

Read this — Then read it to your family — Then read it again.

Make sure YOU remember it. — Make sure THEY remember it.

IGNORANCE OF THE LAW EXCUSES NO MAN.

Did you know that? You know it now, anyway. Every time you trespass, or any member of your family trespasses, upon a railroad track you break the Law.

Every time that anyone — Man, Woman or Child — walks upon a railroad track that person is taking a dangerous risk. A risk of imprisonment: a risk of being maimed for life: a risk of being killed! The plea that you didn't know you were breaking the law will not keep you out of prison if you are arrested for trespass; it will not ease your pain if you get hurt; it will not mend a broken leg; it will not comfort your family if you get killed!

Don't let your children go on to the track to look for coal or kindling. Besides the danger to life and limb it paves the way to crime — to stealing from depots and waiting rooms; to breaking into freight cars and storage sheds.

If they go to prison for it YOU are to blame!

If they go to a hospital with a smashed limb YOU are the cause of it.

If you are sent for to identify the poor, maimed little body at the morgue YOU are responsible. Keep them away from the tracks!

REMEMBER:—If you or any of your family is, after this, brought before a judge for trespassing upon the tracks it will not help you any to say you "Didn't know."

You DO know — See that you keep it in mind.

During the twenty-seven years ending June 30th, 1916, there were:

123,501 Persons killed,

135,168 Persons injured, trespassing on the railroad tracks in this country.

In Milwaukee, in 1916,

84 Boys and Girls were killed and injured trespassing on railroad tracks.

During the same year

612 Boys and Girls were brought into Juvenile Court for misdemeanors on railroad tracks and thefts from freight cars.

John C. Karel
Judge of Juvenile Court.

Bulletins Are Read by 4,500,000 Workmen Each Week
NATIONAL SAFETY COUNCIL, CHICAGO, ILL.

JUST AS LONELY AS HE LOOKS

The Boy Who Flipped Trains

This picture tells its own story. The crippled boy is just as lonely as he looks. He is not getting that exercise which might make him a strong, robust man, and next summer when the boys are playing ball he will be standing over on the sidewalk, just as lonely as you see him in this picture. What happened to him, or something worse, has happened to THIRTY-SEVEN THOUSAND SEVEN HUNDRED AND FOURTEEN other boys and girls under eighteen years of age who were walking on the tracks or flipping on the trains in this country during the last twenty-eight years—SO, KEEP OFF THE TRACKS!

Remember! It Is Better to Be Safe Than Crippled!

number of trespassers killed on the North Western in the year 1917 was 89 killed and 120 injured, as compared with 146 killed and 223 injured in the same length of time four years previously (1913).

This statement concerning the North Western only tends, of course, to strengthen what you have said about the good work done in the east. The other point that I wish to make is, in a way, a contradiction of what you say about the inefficiency of local magistrates; but a contradiction which everybody will be glad to hear of. Hon. John C. Karel, judge of the Juvenile Court in Milwaukee, Wis., is one of those

secretary of the Council. One of the latest bulletins issued in this campaign is devoted to the "boy who flipped trains." A copy of this circular is shown herewith; it tells a vivid story. The original is on a sheet 8½ in. by 11 in., and the three lines which are shown in the largest type are printed in red ink. This bulletin is issued by the Steam Railroad Section of the Council, headquarters, 208 So. La Salle Street, Chicago, and copies are furnished at cost price.

CHINORWEST.

VICTORIAN RAILWAYS DIAMOND JUBILEE.—The railways of Victoria are now in their diamond jubilee year; the first rule book was dated January 1, 1858, and the official opening of the first railway was on January 7, 1859.

PHILIPPINES HAVE 755 MILES OF RAILROAD.—According to the annual report of the Philippine public utility commissioner, the islands now have 755 miles of railroad under operation. Of this mileage, the Manila Railroad has 623.8 miles in operation and 5.3 miles under construction. A line 93.2 miles long is being projected from Calauag on the main line south to Baoo, the terminal of the Legaspi-Naga line. The Philippine Railway company has 131.7 miles of main line under operation.

Distribution of Additions and Betterments

An Analysis of Expenditures to Be Made on Improvements for Forty-nine Principal Lines

IN ORDER that a comprehensive idea might be obtained of the nature of the improvement work approved by the Railroad Administration, a compilation has been made from the budgets of 49 roads, having an aggregate mileage of 150,810 miles, showing the approved expenditures for several important items. These are shown by roads in the tables and the amounts are the sums of the expenditures chargeable to both capital and operating accounts.

A study of the distribution of the expenditures shows that the Railroad Administration has been particularly liberal in approving requests for items that will make possible an increase in the capacity of the railways. Of particular interest is the \$81,385,935 which will be spent for increasing the yard tracks, sidings, etc., of the 49 roads in question and the \$64,297,478 which will be spent for shop buildings, enginehouses, etc. In the latter item is included the cost of the shop machinery and tools which will be required to equip the new shops. Most of the \$9,248,249 shown under the heading "shop machinery and tools" is for additions and betterments to existing shops. A generous amount (\$32,708,392) has been granted 39 of these roads for improvements to existing rolling stock. This will increase materially the power and capacity of locomotives and permit of improving the freight cars.

The guiding principle in the consideration of all budgets has been to grant those expenditures which are necessary to help win the war. Approvals for projects which might be considered unessential to winning the war have been limited and made to cover, particularly on work that has already been started, amounts necessary to permit a cessation of the work without loss to the company. For instance, the Chicago Union Station Company was given \$1,655,293 to bring the work that was in actual process of construction to a close without loss. Another case is that of the St. Paul electrification between Othello, Wash., and Seattle. In this case \$5,417,000 was granted, as the work had progressed to such an extent that the railroad would suffer a severe loss if the work was summarily stopped. Ballasting is another item which has been held to a minimum, as it was believed that most of this could be left undone until after the war. The expenditures for bridges have been limited to the maintenance or renewal of present structures, rather than to new work. The item "freight and passenger stations" includes almost entirely expenditures for improvements in the handling of freight. Practically no money was permitted for passenger stations, except where it was inexpedient to discontinue new work on stations under construction.

The last column of one of the tables gives amounts for additions and betterments chargeable to operating expenses. These amounts added to those given in last week's issue on pages 1268-69, for the respective roads gives the sum total that will be spent for additions and betterments.

Important Projects Authorized

Of particular interest in the budget of the Baltimore & Ohio is the expenditure to be made for shop buildings, enginehouses, etc. The largest single item in this account is the shop and enginehouse at Glenwood, Pa., just outside of Pittsburgh. This shop will have a capacity of 40 to 50 locomotives per month. Over \$1,300,000 has been appropriated for the shop and enginehouse at Cumberland, Md., and a new shop and enginehouse will be built at Youngstown, Ohio, at a cost of \$740,000, an extension will be built

to the shop and enginehouse at Washington, Ind., for \$272,750, an enginehouse will be built at Gratton, W. Va., at a cost of \$528,080 and the shop and enginehouse at Dayton, Ohio, will be rebuilt at a cost of \$225,000. The bridge across the Allegheny river at Pittsburgh will be renewed at a total cost of \$2,568,000, of which \$500,000 will be required this year.

The Boston & Albany has received \$750,000 for additional yard facilities, of which \$200,000 will be spent at West Springfield, Mass., and \$300,000 for a freight handling yard at Boston. A third track will be built between Athol Junction, Mass., and Springfield at a cost of \$60,000.

A particularly large amount, \$3,407,221, has been given the Boston & Maine for shop buildings, enginehouses, etc. This includes an enginehouse at Concord, N. H., costing \$800,000; one at East Deerfield, Mass., costing \$770,000; one at Lowell, Mass., costing \$750,000; one at Dover, N. H., costing \$275,000, and one at East Cambridge, Mass., costing \$143,500.

The Chesapeake & Ohio will spend \$470,000 for third track from Big Sandy Junction to Russell, Ky., and will also reduce grades from St. Albans, W. Va., to Ferrill at a cost of \$403,596.

The Chicago & Eastern Illinois will build a new yard at Terre Haute, Ind., at a cost of \$425,000, and additional yard facilities will be provided at Yard Center, Ill., and Clinton, Ind. Second track will be built from Salen Yards, Ill., to Brubaker at a cost of \$124,000, and from Pana, Ill., to Dolville, at a cost of \$192,000.

In addition to the amounts shown in the tables the Chicago, Burlington & Quincy has been granted \$250,000 for improvements at the Hawthorne (Ill.) yard and an engine terminal costing \$155,000 will be built at Eola, Ill.

The Chicago, Milwaukee & St. Paul was allowed \$5,417,000 for the completion of the electrification between Othello, Wash., and Seattle. This was granted because a considerable loss would be entailed if the work were not completed. An expenditure of \$680,000 was granted for the engine terminal at Savanna, Ill.; \$601,870 for an engine terminal at Ottumwa Junction, Iowa, and \$236,000 for a freight and engine terminal at Atkins. In addition to this \$334,000 will be spent for the yard at Godfrey and \$107,000 for the freight yard at Davenport, Iowa.

The Rock Island was granted nearly \$1,000,000 for shop buildings, enginehouses, etc., which includes improvements at Herington, Kan.; Amarillo, Texas; Manley, Iowa, and Burr Oak, Ill. Over \$1,000,000 will be spent for second track on this road.

The Cincinnati, New Orleans & Texas Pacific has been granted an expenditure of \$5,960,000 for double track from Lexington, Ky., to St. John. Of this amount \$2,800,000 is appropriated for 1918. This road will also build a new terminal yard at Danville, Ky., at a cost of \$900,000.

The Cleveland, Cincinnati, Chicago & St. Louis has received \$4,409,874 for additional main track, of which \$2,000,000 will be spent for second track work on the Cleveland-Indianapolis division. Second track, 26 miles long, will also be built on the Chicago division at a cost of \$1,658,000. A second track on the Columbus line will be built at a cost of \$475,000. A yard will be built at Sharonville, Ohio, at a cost of \$500,000. The expenditure of \$710,419 for "shop buildings" includes engine terminals at Galion, Ohio, Sheffield, Ind., and additions at various points.

The largest expenditure for the Erie is for shop buildings, enginehouses, etc., \$2,382,156. This expenditure includes a 31-stall enginehouse and engine terminal facilities at Meadville, Pa., at an estimated cost of \$411,191. New engine terminals will be built at Girard, Ohio, for \$400,000, and at Avoca, East Buffalo and Dayton, N. Y. This road will reduce grades and construct second tracks between Steamburg, N. Y., and Falconer, a distance of 14 miles, at an estimated cost of \$510,000 and between Jamestown, N. Y., and Lakewood at a cost of \$135,000. Second track will also be laid in Akron, Ohio, at an estimated cost of \$150,000, and between Sharon, Pa., and West Middlesex, a distance of eight miles, at an estimated cost of \$375,000. This will give the Erie double track from Jersey City to Chicago. An expenditure of \$351,000 will be made for grade reductions and elimination of grade crossings in Union City, Pa.,

the Creek, Charlotte, and Lansing, Mich. The information regarding the Grand Trunk expenditures was not available for last week's issue. The total capital expense for additions and betterments amounts to \$4,696,536, and capital expense for equipment is \$5,876,842.

A large amount of second tracking will be done on the Great Northern, consisting mainly of \$284,000 for second track between Long Lake, Minn., and Delano; \$212,000 from Kandiyohi, Minn., to Renock; \$309,000 from Camp Barrow to Breckenridge, Minn., and \$121,000 from Surrey, N. D., to Minot. In addition to the amount shown in the table the Great Northern has been granted \$300,000 for improvement to the coach yard and \$270,000 for the freight terminal at St. Paul, and \$650,000 has been allowed for a dock at Seattle, Wash.

The Hocking Valley will complete 27.9 miles of second

CLASSIFICATION OF EXPENDITURES FOR ADDITIONS AND BETTERMENTS

| Road | Ballasting | Rails and other track material | Bridges, trestles and culverts | Additional main track | Additional yard tracks sidings, etc. | Signals and interlocking plants | Road machinery and tools | Freight and passenger stations, etc. |

and a modern car dumper will be built at Buffalo at an expenditure of \$406,000. A scrap reclaiming plant will be built at Meadville at a cost of \$95,000.

The Grand Trunk has an appropriation of \$1,648,105 for yard improvements, which includes new classification yards at Port Huron, Mich., for \$400,000; at Nichols, Mich., for \$203,000, and at Thornton Junction, Ill., for \$450,000. The \$1,058,609 for shop buildings, enginehouses, etc., includes a 15-stall roundhouse at Pontiac, Mich., and improvements at West Bethel, Me., Battie Creek, Mich., and Fort Gratiot. A substantial expenditure is made for signals which includes new automatic block signals in Maine; from Granger, Ind., to Port Huron, Mich., and from Detroit to Durand, Mich. New interlocking work will be done at Bat-

main track between Delaware, Ohio, and Cummings, at a cost of \$1,260,000, and additional yard tracks will be built at Wallbridge, Ohio, for \$303,000, and at Parsons, Ohio, for \$120,000. The mechanical facilities at various points throughout the system will be improved, \$409,296 being appropriated for this purpose.

The Illinois Central was given \$2,345,170 for shop buildings, enginehouses, etc., which will be used to improve the mechanical facilities at Kankakee, Ill.; Clinton, Ill.; Mattoon, Ill.; Freeport, Ill.; Waterloo, Iowa; Jackson, Tenn.; McComb, Miss.; Champaign, Ill.; DuQuoin, Ill.; Benton, Ill.; Carbondale, Ill.; Mounds, Ill.; Amboy, Ill.; Fulton, Ky.; Paducah, Ky., and Central City, Ill. Over \$500,000 is to be expended for signals, which includes the equipping of

44 miles of single track and 15 miles of double track, and an interlocking plant to be built at Ramsey, Ill. In addition to this \$1,000,000 has been allowed for a new yard and terminal at Markham, Ill. This amount is not included in the tables.

The Lake Erie & Western has been given over \$800,000 for shop buildings and enginehouses, of which \$500,000 will be for a locomotive repair shop at Tipton, Ind.; \$158,200 for rebuilding the enginehouse at Lima, Ohio, and \$79,200 for rebuilding the enginehouse at Peru, Ind.

The largest item of expense in the budget of the Lehigh Valley is for \$2,514,114 to be spent for shop buildings, enginehouses, etc. A new engine terminal is to be built at Hazleton, Pa., at an estimated cost of \$1,000,000 and a new engine terminal will be built at Jersey City at a total cost of \$1,400,000, of which \$900,000 has been appropriated for

gun City, Ind. Additional shop facilities will be provided at a cost of \$355,000, and a new steel car repair shop will be built at West Detroit at a cost of \$210,000. The drawbridge over River Rouge, Detroit, will be renewed at a cost of \$200,000.

One of the largest individual items for the New York Central is \$7,707,600 for shop buildings, enginehouses, etc. This includes a car repair shop at Avis, Pa., for \$746,000; new engine terminal facilities at Watertown, N. Y., for \$700,000; a new enginehouse at Syracuse, N. Y., for \$540,000; additions to the car repair shops at East Buffalo for \$520,000; an addition to the erecting shop at Collinwood, Ohio, for \$345,000; a new enginehouse at Genesee, N. Y., for \$200,000; a car repair shop at New Durham, N. J., for \$198,000; a new enginehouse at DeWitt, N. Y., and additions to the enginehouses at Norwood, N. Y., Clearfield, Pa.,

* Amounts for all items were not available.

1918. A new classification yard will be built at East Waverly, N. Y., which will eventually cost \$2,000,000, and of which \$350,000 has been appropriated for this year. A new freight terminal will be built at Greenville, Jersey City, consisting of a warehouse, steamship terminal, 10 piers, yard facilities, storage space, grain elevators, etc., at a total cost of \$15,000,000, of which \$200,000 has been appropriated this year. An amount of \$75,000 has also been approved in addition to that shown in the table for the building of a large canal terminal.

The Michigan Central will make an expenditure of \$2,231,080 for shop buildings, enginehouses, etc., which includes new engine terminals at Jackson, Mich., and Michi-

gan City, Ind. Change of grade and alignment will be made at Tonawanda, N. Y., incident to the large canal, at an expense of \$1,242,500, the work now being under way. A new yard will be built at Depew, N. Y., at a cost of \$484,000. Additional tracks into the Syracuse yard will be laid at \$340,000. Extensions will be made to the yard at Elkhart, Ind., at a cost of \$224,000, storage and repair tracks will be built at Harmon, N. Y., and a yard at White Plains, N. Y., at a cost of \$241,000. An extensive program has been submitted for signals, \$2,079,125 will be spent. This includes renewal of the interlocking plant at Rochester, N. Y., at a cost of \$271,200, renewal of the signal system between Little Falls, N. Y., and Londa at a cost of \$261,000

and a new interlocking plant at Syracuse Junction at a cost of \$224,000. In addition to the amount shown in the table \$1,918,400 has been approved for the Grand Central Terminal and \$2,000,000 has been approved for new terminal facilities at Cleveland, Ohio.

Particularly Liberal with New Haven

The Railroad Administration has been particularly liberal with the New York, New Haven & Hartford, that being one of the roads that needs a large number of improvements. The shops and enginehouses will be improved generally for handling heavy power, particularly the Santa Fe type locomotives which that road has received. Fifteen stalls will be added to the enginehouse at East Hartford, 10 stalls to the Medway enginehouse on the New London division and seven stalls to the Waterbury (Conn.) enginehouse. Automatic block signals will be installed between Hopewell Junction, N. Y., and West Pawling, N. Y., and interlocking and track changes will be made for the junction with the New York Connecting Railway at Port Morris, N. Y.

The Norfolk & Western will spend \$879,000 for the Roanoke (Va.) yards; \$590,000 for the Hagerstown (Md.) yards and \$565,000 for improvements in the Bristol (Va.) yards. In addition to this an additional new shop building will be constructed at Roanoke at a cost of \$575,000 and \$222,634 has been appropriated for the shop building at Shenandoah, Va., which is under way.

The principal feature of the Northern Pacific budget is a new car and locomotive shop at Mandan, N. D., towards which \$500,000 has been appropriated. A new car repair shop will be built in the Como yards near St. Paul at a cost of \$250,000. Seven and a half miles of second main track will be constructed between Laurel, Mont., and Park City at a cost of \$137,231, and between Livingston, Mont., and Mission, 5½ miles, at a cost of \$112,184.

With about \$700,000 for shops the St. Louis & San Francisco will improve mechanical facilities at a large number of its repair points.

The expenditure of \$4,609,108 for shop buildings, enginehouses, etc., on the Philadelphia & Reading will include new engine terminal facilities at Reading, Pa., costing \$355,000; a new addition to the enginehouse at St. Clair, Pa., costing \$92,000; a new extension to the shops at Reading, costing \$255,000; a new engine terminal at Tamaqua, Pa., costing \$200,000; new engine facilities at Chester, Pa., \$140,000; new engine facilities at Coatesville, Pa., costing \$440,000; a new enginehouse and machine shop at Rutherford, Pa., costing \$145,000, and \$157,172 for engine facilities at Reading, which are 49 per cent completed.

\$6,000,000 for Union Pacific Terminals

The Union Pacific will spend over \$6,000,000 on terminal improvements, divided as follows: Cheyenne, Wyo., \$1,689,425; Council Bluffs, Iowa, \$1,647,351; Junction City, Kans., \$1,175,007; Green River, Wyo., \$919,674; Omaha, Neb., \$535,026; Sidney, Neb., \$158,935; Grand Island, Neb., \$43,100; North Platte, Neb., \$25,200; Ellis, Kans., \$9,000. At Cheyenne a machine shop will be built costing \$1,276,500. At Council Bluffs \$440,000 will be expended for a 40-stall enginehouse, \$293,000 for a power house, \$235,000 for a machine, boiler and blacksmith shop and \$175,000 for a 600-ton coaling station. At Junction City a machine, boiler and smith shop will be built at a cost of \$270,000, a 20-stall enginehouse at a cost of \$240,000 and a 400-ton coaling station at a cost of \$110,000. The improvements at Green River include a 28-stall enginehouse costing \$280,000, a machine, boiler and smith shop costing \$235,000, a car repair shop costing \$85,000 and a storehouse costing \$68,000. At Omaha, Neb., an extension to the machine shop will be built at a cost of \$245,000. Over \$800,000 will be spent for machine tools for the various shops in this program.

Conservation in Use of Locomotive Supplies*

By W. J. Tollerton

General Mechanical Superintendent, Rock Island Lines

THE COST OF LOCOMOTIVE SUPPLIES has increased greatly during the past several years. A few years ago 25 cents per 1,000 locomotive miles was considered a fair average cost for this item of operating expenses, whereas during the fiscal year ended December 31, 1917, the average cost per 1,000 locomotive miles was \$1.80, an increase of 620 per cent.

Locomotive supplies include, among other items, scoops, torches, brooms, chisels, globes, lanterns, hammers, wrenches, oil cans, oilers, coal picks, buckets, ropes, chains, signal lamps, flags and torpedoes.

During 1917 we issued, as an average, 9 oil cans per locomotive owned, over 1 tank bucket, 6 straight and long spout oilers, 2 dope pails, 2 torches, 1 water cooler, 2 tallow pots and 3 cups and dippers. With proper care, the life of all of these and many other items of locomotive supplies should be indefinite. Therefore, the quantity used during 1917 was excessive and would indicate these supplies are not receiving careful handling.

In addition to being difficult to obtain from the manufacturers, the cost of locomotive supplies is constantly increasing. Cotton duck has increased 220 per cent in price, brooms 140 per cent, files 125 per cent, air hose 50 per cent, lanterns 35 per cent, scoops 88 per cent, torpedoes 55 per cent and tinware 35 per cent, with practically no increase in freight and passenger rates. Therefore, inasmuch as transportation is the only commodity which the railroad company has for sale, the strictest possible economy must be practiced.

Care should be exercised to insure obtaining the maximum life out of each item of locomotive supplies and no new supplies should be drawn until absolutely necessary. When new tools or supplies are drawn from the storeroom, the old material should be turned in. A little soldering may reclaim an oil can, oiler, lantern or torch, a new handle may reclaim a scoop. To illustrate the extreme importance of conserving in the use of locomotive supplies, each item saved is equivalent to the gross revenue earned by the company for transporting a ton of freight the following distance:

| | |
|-----------------------|-----------|
| ½-gal. oil can..... | 30 miles |
| Tallow pot..... | 34 miles |
| 1-gal. oil can..... | 40 miles |
| Torch..... | 50 miles |
| Tank bucket..... | 60 miles |
| Long spout oiler..... | 64 miles |
| 2-gal. oil can..... | 73 miles |
| 3-gal. oil can..... | 83 miles |
| 5-gal. oil can..... | 120 miles |
| Scoop..... | 143 miles |
| Water cooler..... | 636 miles |

With the hearty co-operation and support of all concerned, there is no question but that a noticeable reduction can be effected in the cost of locomotive supplies, and it is with that end in view that the assistance of all employees is earnestly solicited.

MECHANICAL LABOR-SAVERS ON FRENCH RAILWAY.—Le Genie Civil says that the Orleans Railway, feeling the shortage of labor, has successfully adopted mechanical cleaning devices both for railway cars and hired cabs, in addition to vacuum cleaners. Various forms of revolving brushes driven at a speed of from 500 to 800 r. p. m., through flexible shafts by electric motors of ½ to ½ h. p., are employed, the apparatus as a whole being slung, according to requirements, from various kinds of portable attachments, with the aid of springs and counterweights.

Two Tractor Driven Grading Outfits at Work.

Building a Seven-Mile Railroad in 32 Days' Time

Unusually Large Force Is Employed to Complete a Short
Spur in Time for Important Government Service

TEAM WORK BY A LOYAL organization in which each man knew what was expected of him and did his part to the best of his ability, was the most important factor in the construction of 7.1 miles of railroad in 32 days. This record was made by the construction forces of the Nashville, Chattanooga & St. Louis and the Mason & Hanger Contracting Company to provide rail communication for the Old Hickory powder plant now under construction in Hadley's bend of the Cumberland river, some 12 miles from Nashville, Tenn. The railroad's permanent force, which was gathered from other work in progress on that road, was enlarged many times by men picked up

organization ready to do the work and because John Howe Peyton, president of the Nashville, Chattanooga & St. Louis, realized the opportunity for the road to do the country a real service and tendered the good offices of his company to that purpose. Following negotiations during January, the road was authorized on January 31 to prepare surveys, and seven days later, on February 6, the government's representative authorized the work and expressed a desire to see it completed in 30 days.

The location of this work is of interest. The Lebanon branch of the Nashville, Chattanooga & St. Louis and the Tennessee Central occupy approximately parallel locations in a direction almost due east from Nashville, the former to the south of the latter. The Cumberland river lies just to the north of these railroads, but winds its way westward through a succession of horseshoe curves which form large peninsulas projecting alternately to the north and to the south. The new powder plant occupies a large tract of land at the north end of one of these peninsulas on the south side of the river in what is known as Hadley's bend. The distance from the yard at the plant to a connection with the two railroads is roughly seven miles.

The intervening country is rolling, entailing considerable earthwork and no small amount of skill in locating either the most economical line or the one capable of the quickest construction. The character of the line was governed to a large extent by the nature of the traffic which has already attained a movement of 450 cars per day in construction materials and supplies. The maximum traffic which will exceed this figure will be reached about the middle of September when supplies must be handled for both the initial production operations and the final construction activities. At present the traffic is practically all inbound, but even after the operating traffic has replaced the movement of construction materials, the bulk of the tonnage will be inbound, i. e., raw materials for the manufacture of explosives—sodium nitrate, cotton, sulphur, and also about 2,600 tons of coal daily.

In view of this, it was deemed desirable to have a 0.5 per cent maximum grade against inbound traffic, whereas short reaches of 1.5 per cent grades were considered satisfactory for the outbound movement, so for the sake of speed in construction it was decided first to build a line having a maximum of 1.5 per cent grades in both directions, this to be used later as an outbound line when a second track could be finished having not more than 0.5 per cent grades against inbound movements.

Unfortunately the first 1.5 miles of this line was by far the most difficult involving a trestle 2,000 ft long and a

A View of a Part of the Completed Line

by the railroad and by the contractor, wherever they could be found, but the success of this feat depended not only on the effectiveness in which the rapidly built organization was directed, but also on the rapidity with which materials and equipment were collected from various parts of the system and despatched to the scene of activity.

This line is not a part of the Nashville, Chattanooga & St. Louis, but is the property of the United States Government and is being finished and double tracked by Mason & Hanger, general contractors for the powder plant. The railroad's unique position in the role of a railroad contractor is accounted for by the proximity of its Lebanon branch to the plant in question, by the fact that it had an

rock cut of 23,000 cu. yd. close to the main line connection, so after building 700 ft. of this trestle it was concluded that better progress could be made by building a temporary detour line on a 2-per cent grade as far as station 82, this line to be abandoned after a double track line with 0.5-per cent grades could be built from station 0.0 to station 82 on the final location.

Prosecution of the Work

The government representatives estimated that a day's delay in the completion of the line represented a loss of \$50,000. As a result, speed in construction progress overbalanced any other consideration. For this reason some of the methods resorted to in pushing the work to the utmost would be considered wasteful under almost any other conditions. Although the burden of pushing the work through was largely on the railroad, the work was more or less divided between the road and Mason & Hanger, the contractors. The railroad completed all the grading and trestle work from the connection with his track to the government property line, $4\frac{1}{2}$ miles, while the contractor did equivalent work north of that point, but the railroad completed all of the track lying on the first main line with its own forces for the entire 7.1 miles to the throat of the powder plant yard.

The initiation of emergency work such as this entails the employment of a great many men and before the project was completed the railroad was employing 3,000 men on

when it was moved out over the track already laid to station 150, then across a field to station 162 into a small rock cut. A Bucyrus pile driver, locomotive crane, six steam drills and a boiler were also brought in at the same time. The extra gangs were used very largely on the track work and the carpenter gangs on the construction of the pile trestles.

The contractor used more power equipment which was moved in on the work from time to time as it proceeded. This equipment included two tractor-drawn graders and two Bucyrus caterpillar shovels with $\frac{3}{8}$ -cu. yd. dippers and 400 teams. They were used largely in a 60,000-cu. yd. fill near the far end of the line, made principally from barrow.

Materials Rapidly Gathered

The accumulation of the necessary materials was a large problem in itself. The temporary line was laid with 57-lb. relayer rail while all the remaining main line rail was 80 lb. In the yard at the plant the contractor laid 57-lb. Russian rail. The problem of supplies involved not only those needed for the initial seven miles of main line but materials had to be hauled in simultaneously for the second track and the yard tracks at the plant. For instance, the railroad company furnished 20,000 ties out of stock for use in the first line, but while this material was being supplied the company's purchasing organization was busy gathering 175,000 standard ties, 135,000 narrow-gage ties, and 160 sets of switch ties for the use of the plant contractor.

Lumber and piles were also required for the trestles, one

An 800-foot Trestle with Piles from Four States Completed in Five Days

the $4\frac{1}{2}$ miles of line. Fortunately plenty of men were available, largely because the extremely cold weather had delayed spring work on the farms. The close proximity of Nashville was also of an advantage since a large part of the force was recruited there, although labor agents at Paducah, Ky., and Memphis, Tenn., supplied large numbers. The nearness of the large city was also of advantage in another way since it obviated the necessity for feeding and housing the men on the work. With the exception of the regular construction forces of the railroad these men were all hauled to and from their work each day in special trains, two on the Nashville, Chattanooga & St. Louis and one on the Tennessee Central.

The men were supplied quicker than the materials and equipment, so resort was had largely to the pick and shovel. The cuts were wasted and the fills were borrowed by gangs of men working almost shoulder to shoulder. As the days passed by more modern methods of construction were instituted. Men and equipment of the construction department of the railroad employed in building an extension of the Tracy City branch in the Cumberland mountains were sent to the work. This embodied six extra gangs and five bridge gangs with their camp equipment and a type 70 C. Bucyrus shovel, the latter arriving on the work on February 12,

of 700 ft. and another 100 ft. which were needed at once. Additional trestle material being required for the second track. The piles for the big trestles were brought from the various divisions of the road, in Tennessee. The first piles driven were telephone poles which the railroad had purchased for the construction of a telephone line, while the majority of the piles were cut from the woods and brought to the work.

To facilitate the handling of supplies one of the first steps taken in the work was to build a material yard with adequate trackage just north of the connection with the Tennessee Central. Until a considerable portion of the track was built, practically all of the material was despatched from this yard to points on the line by motor trucks. At the end of 32 days the track was ready to carry traffic into the plant and the railroad's part of the work was over. The railroad's work was handled by the engineering department of the Nashville, Chattanooga & St. Louis, of which Hunter McDonald is chief engineer. Direct responsibility for the progress of the work fell upon Leigh Taliaferro, construction superintendent, while the gathering and despatching of materials to the work was carried on by various members of the organization, including C. M. McDaniel, tie and timber agent.

Higher Freight and Passenger Rates Ordered

Freight Increase 25 Per Cent. Passenger Basis Three Cents
Per Mile. State Rates Leveled Up

GENERAL ADVANCES IN FREIGHT RATES and passenger fares, to apply both to interstate and intrastate traffic were ordered by Director General McAdoo in General Order No. 28, which was telegraphed to the railroads from his office late Saturday night, May 25. The increases are declared to be necessary to meet extraordinary increases in operating expenses, estimated at from \$830,000,000 to \$860,000,000 for the year 1918, including the \$300,000,000 increase in wages, and the director general promises appropriate reductions later if they turn out to be greater than necessary.

Freight rates are to be increased by 25 per cent or by specific amounts in the case of certain commodities, effective on June 25.

Passenger fares are to be advanced to a minimum of three cents per mile, effective on June 10, with an extra passage charge of 8 1/3 per cent to 10 2/3 per cent for passengers traveling in sleeping and parlor cars. Commutation fares will be increased 10 per cent and reduced mileage and excursion rates, with some exceptions, will be discontinued.

The proposed rates have been worked out by the various rate committees of the railroads, under the direction of the division of traffic. In the case of the passenger fares nearly 200 rate clerks have been at work in Washington for several weeks under the direction of a committee headed by E. L. Bevington, formerly chairman of the Transcontinental Passenger Association and composed of one representative of each of the territorial passenger associations. Various bases for the increase have been suggested for the consideration of the director general and he signed the order on his return to the office after an absence of nearly two months, including his Liberty Loan tour and a period of illness, during which, however, he has been in constant touch with both railroad and treasury affairs.

A particularly interesting feature of the plan is that all intra-state rates are to be cancelled where there are interstate rates published between the same points and the interstate rates as increased will apply.

Passenger fares to be made on a mileage basis, so that a higher fare will be charged for a longer route between two points except that the order provides that where public convenience will be served thereby fares determined by the short line may be applied over longer routes. It is understood that this means that a uniform rate will be applied between large cities reached by several routes of approximately the same length.

Director General McAdoo's Statement

In explanation of the necessity for the increases in rates Director General McAdoo made the following statement:

"The United States has taken over the railroads as a war emergency measure. They must be operated efficiently if the war is to be carried to a successful conclusion and they must be operated under the high cost conditions the war has created. These conditions are strikingly illustrated by the steady increase in the cost of railroad coal, as indicated by the following table:

| | | | |
|------|------------------|--------|---------------|
| 1915 | 125,000,000 tons | \$1.17 | \$143,860,000 |
| 1917 | 127,000,000 tons | 1.35 | 171,450,000 |
| 1917 | 134,570,000 tons | 1.25 | 168,212,500 |
| 1918 | 166,000,000 tons | 2.95 | 489,700,000 |

"The increases in the cost of fuel oil consumed by the railroads and in the cost of other railroad materials and supplies have likewise been enormous.

"These increases have contributed inevitably to the increased cost of living, which in turn has created a demand for increased wages for railroad employees. This subject was exhaustively considered recently by the Railroad Wage Commission, consisting of Messrs. Franklin K. Lane, Charles C. McChord, J. Harry Covington and William R. Willcox, who have unanimously recommended increases in wages which they estimated will add to railroad operating costs not less than \$300,000,000 in the year 1918. The director general has put the recommendation of the Wage Commission into effect, making at the same time certain additional increases for some classes of employees in order to meet practical necessities which cannot be escaped or postponed.

"On account of these extraordinary increases in operating costs, which have come about as a consequence of the war it is estimated that for the same aggregate business as last year, and under the same conditions except as to prices and wages, the operating expenses for the calendar year 1918 will be from \$830,000,000 to \$860,000,000 more than for the calendar year 1917.

"While these increased operating costs will be subject to readjustments and may be somewhat diminished, yet on the other hand, because of the abnormal methods by which business must be conducted to serve the needs of the war, they may be substantially increased. It seems clear that the railroads should be made self-sustaining and that sufficient revenues should be provided to prevent them from becoming a burden on the federal treasury. The immediate practical necessity is that, without delay, increases in rates should be made to provide for these increased costs of operation. At best, practically half of the year 1918 must elapse before such increases in rates can be made effective, although increases in operating expenses have been steadily effective since January 1, 1918.

"Therefore, by virtue of the power, during federal control of the railroads, which the act of Congress has conferred upon the President to initiate rates whenever the public interest requires, which power, as provided in that act, the President by proclamation has devolved upon the director general, the latter has been compelled for the reasons stated, to initiate substantial increases in freight and passenger rates for practically all transportation services performed by the railroads under federal control, including, of course, transportation services within the several states as well as transportation service across state lines. These increases are made with the approval of the President and are explained in detail in the copy of order accompanying this announcement.

"The increases in passenger rates will become effective on the 10th day of June, 1918, and the increases in freight rates will become effective on the 25th day of June, 1918.

"In making the advance effective on the dates specified a simple form of tariff authorized by the Interstate Commerce Commission must be used and this will lead to the temporary disregard, to some extent, of established groupings and differentials. But it is the intention to observe such groupings and differentials as far as practicable, and hereafter, with as much despatch as possible, restore any important relationships which may be for the time being disturbed, and concurrently therewith endeavor to remove any existing discrimination and bring about uniformity of rate adjustment throughout sections where conditions are similar.

"The act of Congress provides that the reasonableness and justness of such rates may be dealt with by the Interstate

Commerce Commission, so that no interests affected will be deprived of the opportunity for full hearing and consideration. The act of Congress provides that the commission, in passing upon these questions, shall take into consideration the President's finding and certificate that in order to defray the expenses of federal control and operation it is necessary to increase the railway operating revenues. In this connection it is important to make clear that no part of the increase in rates now initiated is on account of the making of additions and betterments or the purchase of new equipment or other expenditures chargeable to investment account. The increases initiated are solely on account of increased burdens tending to diminish railway operating income.

"In the nature of things no such far-reaching step can accomplish ideal equalization as between the numerous interests necessarily affected and doubtless the commission will find it proper to make readjustments to attain a nearer approach to such equalization. While as far as practicable, the rates as initiated are designed to avoid unnecessary disturbance of relative rate bases, the director general will co-operate heartily with the commission in any readjustments needed to accomplish still further the object of avoiding undue preferences which, nevertheless, may develop upon detailed consideration by the commission.

"It is earnestly hoped that all citizens affected directly or indirectly by this increase of rates will support the general principle of such increase as an unavoidable war measure and accept the additional burden in the same spirit of self-sacrifice in which they have accepted other inconveniences and burdens and the grievous personal losses which are parts of the price that the nation is patriotically paying for world liberty.

"In considering these increases, one vital distinction which makes them fundamentally different from any rate increases ever proposed or allowed when the railroads were under private control should be understood. This distinction is that there is no way in which the present increases will inure to private profit. If they turn out to be more than are needed to meet the grave public exigency, they will promptly be readjusted so as to prevent any unnecessary burden upon the public; but pending such readjustment the excess, if any, will be for the benefit of the people of the United States as a whole and not for the benefit of the private railroad owners or any of them.

"To the extent that savings can be effected and to the extent that reduced prices for the things the railroads must buy can be realized, it will be the purpose of the director general to make from time to time appropriate reductions."

The order is as follows:

General Order No. 28

Whereas, it has been found and is hereby certified to the Interstate Commerce Commission that in order to defray the expenses of federal control and operation fairly chargeable to railway operating expenses, and also to pay railway tax accruals other than war taxes, net rents for joint facilities and equipment, and compensation to the carriers, operating as a unit, it is necessary to increase the railway operating revenues, and

Whereas, the public interest requires that a general advance in all freight rates, passenger fares and baggage charges on all traffic carried by all railroad and steamship lines taken under federal control under an act of Congress approved August 29, 1916, entitled An Act making appropriations for the support of the army for the fiscal year ending June thirtieth, nineteen hundred and seventeen, and for other purposes, shall be made by initiating the necessary rates, fares, charges, classifications, regulations, and practices by filing the same with the Interstate Commerce Commission under authority of an Act of Congress approved March 21, 1918, entitled An Act to provide for the operation of

transportation systems while under federal control, for the just compensation of their owners, and for other purposes—

Now, therefore, under and by virtue of the provisions of the said act of March 21, 1918, it is ordered that all existing freight rates, passenger fares and baggage charges, including changes heretofore published but not yet effective, on all traffic carried by all said railroad and steamship lines under federal control, whether the same be carried entirely by railroad, entirely by water, or partly by railroad and partly by water, except traffic carried entirely by water to and from foreign countries, be increased or modified, effective June 25, 1918, as to freight rates and effective June 10, 1918, as to passenger fares and baggage charges, to the extent and in the manner indicated and set forth in the "Exhibit" hereto attached and made part hereof, by filing schedules with the Interstate Commerce Commission effective on not less than one day's notice.

Given under my hand this twenty-fifth day of May, 1918.

W. G. McAadoo,
Director General of Railroads.

The exhibit referred to describes the increases to be made as follows:

FREIGHT RATES

Section 1. Class Rates (Domestic)

- (a) All interstate class rates shall be increased 25 per cent.
- (b) All intra-state class rates shall be increased 25 per cent where there are no interstate class rates published between the same points, and shall be governed by the classification, viz: Official Classification, Southern Classification or Western Classification, exceptions thereto and minimum weights which generally govern the interstate rates in the same territory, except that the Illinois Classification will be used between points in the state of Illinois.
- (c) All intra-state class rates shall be canceled where there are interstate class rates published between the same points and the interstate rates as increased by paragraph (a) shall apply.
- (d) After such increase of 25 per cent no rates shall be applied on any traffic moving under class rates lower than the amounts in cents per 100 lb. for the respective classes as shown below for the several classifications. Any article, on which exceptions to any Classification provides a different rating than as shown in the classification to which it is an exception, will be subject to the minimum as provided below for the class provided therefor in the classification proper.

| Official Classification | | | | | | | | | | | | |
|-------------------------|----|-----|-----|----|-----|-----|---|----|----|----|--|--|
| Classes | 1 | 2 | 3 | 4 | 5 | 6 | | | | | | |
| Rates | 25 | 21½ | 17 | 14 | 12½ | 9 | | | | | | |
| Southern Classification | | | | | | | | | | | | |
| Classes | 1 | 2 | 3 | 4 | 5 | 6 | A | B | C | D | | |
| Rates | 25 | 21½ | 19 | 16 | 13 | 11 | 9 | 10 | 7½ | 6½ | | |
| Western Classification | | | | | | | | | | | | |
| Classes | 1 | 2 | 3 | 4 | 5 | A | B | C | D | E | | |
| Rates | 25 | 21 | 17½ | 15 | 11 | 12½ | 9 | 7½ | 6½ | 5 | | |
| Illinois Classification | | | | | | | | | | | | |
| Classes | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | | |
| Rates | 25 | 21 | 17½ | 15 | 11 | 12½ | 9 | 7½ | 6½ | 5 | | |

Section 2. Commodity Rates (Domestic)

- (a) Interstate commodity rates on the following articles in carloads shall be increased by the amounts set opposite each:

| Commodities | Increases |
|--|-----------|
| Coal—Where rate is 0 to 49 cents per ton... *15 cents per net ton of 2,000 lb. | |
| Where rate is 50 to 99 cents per ton... *20 cents per net ton of 2,000 lb. | |
| Where rate is \$1.00 to \$1.99 per ton... *30 cents per net ton of 2,000 lb. | |
| Where rate is 2.00 to 2.99 per ton... *40 cents per net ton of 2,000 lb. | |
| Where rate is \$3.00 or higher per ton... *50 cents per net ton of 2,000 lb. | |

*Where rates have not been increased since June 1, 1917, the increase to be made now shall be determined by first adding to the present rate 15 cents per ton, net or gross as rated, or if an increase of less than 15 cents per ton, net or gross as rated, has been made since that date, then by first adding to the present rate the difference between the amount of that increase and 15 cents per ton, net or gross as rated; and to the rates so constructed the above increases shall now be added.

Where rates from producing points or to destinations have been based on fixed differentials in cents per ton, such differentials to be maintained, the increase to be figured on the highest rated point or group.

| | |
|--|--|
| Coke—Where rate is 0 to 49 cents per ton... *15 cents per net ton of 2,000 lb. | |
| Where rate is 50 to 99 cents per ton... *25 cents per net ton of 2,000 lb. | |
| Where rate is \$1.00 to \$1.99 per ton... *40 cents per net ton of 2,000 lb. | |
| Where rate is 2.00 to 2.99 per ton... *60 cents per net ton of 2,000 lb. | |
| Where rate is 3.00 or higher per ton... *75 cents per net ton of 2,000 lb. | |

*Where rates have not been increased since June 1, 1917, the increase to be made now shall be determined by first adding to the present rate 15 cents per ton, net or gross as rated, or if an increase of less than 15 cents per ton, net or gross as rated, has been made since that date, then by first adding to the present rate the difference between the amount of that increase and 15 cents per ton, net or gross as rated; and to the rates so constructed the above increases shall now be added.

Where rates from producing points or to destinations have been based

In local differentials in rates for the same commodities to be maintained, the increase or decrease in the local differential shall be equal to that of the general increase or decrease.

Over 20 cents per 100 lb. for 100 lb. If cargo that no increase shall be made in rates on ex-lake cars to the pond, the increased rate before reaching lake vessel.

Stone, artificial and natural, building and monumental except carved, lettered, polished or traced, two cents per 100 lb.

Stone broken, crushed and ground, one cent per 100 lb.

Sand and gravel, one cent per 100 lb.

Brick, except enameled or glazed, two cents per 100 lb.

Cement, cement plasters and plaster, two cents per 100 lb.

Lime, one and one-half cents per 100 lbs.

Lumber and articles taking same rates or arbitrates over lumber rates; also other forest products, rates on which are not higher than on lumber, 25 per cent, but not exceeding an increase of five cents per 100 lb.

Grain, wheat, 25 per cent, but not exceeding an increase of six cents per 100 lb.

Other grain, new wheat rates.

Flour and other mill products, 25 per cent, but not exceeding an increase of 6 cents per 100 lb., and increase shall not be less than new rates on wheat.

Cotton, 15 cents per 100 lb.

Cotton linters, new cotton rates.

Live stock, 25 per cent, but not exceeding an increase of 7 cents per 100 lb., where rates are published per 100 lb., or \$15 per standard 36-ft. car where rates are published per car.

Packing house products and fresh meats, 25 per cent, except that the rates from all Missouri river points to Mississippi river territory and east thereof shall be the same as the new rates from St. Joseph, Mo.

Bullion, base (copper or lead), pig or slab and other smelter products, 25 per cent, except that rates from producing points in the states of Arizona, California, Idaho, Montana, Nevada, New Mexico, Oregon, Utah and Washington, to New York, N. Y., shall be \$16.50 per net ton with established differentials to other Atlantic seaboard points and

2. Rates from points in Colorado and El Paso, Texas, to Atlantic seaboard points shall be increased \$6.50 per net ton.

Separately established rates used as factors in making through rates to the Atlantic seaboard shall be increased in amounts sufficient to protect the through rates as above increased.

Sugar, including syrup and molasses where sugar rates apply thereon, 25 per cent, except

(1) Where the Official Classification applies, 5th class rates as increased will apply.

(2) From points east of the Indiana-Illinois state line to points west of the Mississippi river, rates will continue to be made on combination of local rates or of proportional rates if published, to and from the Mississippi river; except that from points on the Atlantic seaboard to the Missouri river, Kansas City, Mo., to Sioux City, Iowa inclusive, established differentials over the increased rates from New Orleans, La., shall be maintained.

(3) From points in the states south of the Ohio river and east of the Mississippi river, also from points in the states of Louisiana and Texas, rates shall be increased; to Chicago, Ill., 22 cents per 100 lb.; to St. Louis, Mo., 17½ cents per 100 lb.; to points west of the Indiana-Illinois state line and west of the Mississippi river, except points in Arkansas, Louisiana and Texas, 22 cents per 100 lb. to points on and north of the Ohio river and east of the Indiana-Illinois state line rates shall be increased to maintain the former established relation to the rates to such points from producing points on the Atlantic seaboard.

(4) From Missouri points in Colorado, Wyoming, Montana, Kansas and Nebraska to Missouri river territory and points in Arkansas, Oklahoma, Louisiana and Texas and points east thereof, 22 cents per 100 lb.

(5) From points in Idaho and Utah to points named in paragraph (3) rates shall be 15 cents above the rates from eastern Colorado.

(6) From points in California to points taking Missouri river rates and points related thereto under the Commission's Fourth Section Orders, and to points east of the Missouri river, 22 cents per 100 lb.

(7) Interstate commodity rates not included in the foregoing list shall be increased 25 per cent.

(c) Intrastate commodity rates shall be increased as shown in paragraphs (a) and (b) of this section where there are no interstate commodity rates published on substantially the same commodities between the same points, and shall be subject to the minimum weights applicable on interstate traffic in the same territory.

(d) Intra-state commodity rates shall be canceled where interstate commodity rates are published on substantially the same commodities between the same points, and the interstate rates as increased by paragraphs (a) and (b) of this section shall apply.

(e) In applying the increases prescribed in this section the increased class rates applicable to like commodity descriptions and minimum weights between the same points are not to be exceeded, except that the increases in rates on sugar in carloads shall be made as expressly provided in paragraph (a) of this section.

Section 3. Export and Import Rates

All export and import rates shall be cancelled and domestic rates applied to and from the ports.

Section 4. Filing Intra-State Tariffs with Interstate Commerce Commission

(a) All intra-state rates for transportation by water, which are to be increased under this order, if not now on file, except rates cancelled under paragraph (c) of Section 1 and paragraph (d) of Section 2, shall be immediately filed with the Interstate Commerce Commission.

(b) All items which are confined in their application to intra-state traffic, but are now carried in tariffs on file with the Interstate Commerce Commission, if not cancelled under paragraph (c) of Section 1 and paragraph (d) of Section 2, shall be made applicable to all traffic.

Section 5. Minimum Charges

(a) The minimum charge on less than carload shipments shall be as provided in the classification governing, but in no case shall the charge on a single shipment be less than fifty cents.

(b) The minimum charge for carload shipments shall be \$5 per car. Does not apply to charges for switching service.

Section 6. Disposition of Fractions

In applying rates fractions shall be rounded off as follows:

(a) Rates exceeding ten cents per cent shall be rounded off to the next higher cent.

(b) Fractions of one-half cent or less shall be rounded off to the next lower cent.

(c) Fractions of one-half cent or less shall be rounded off to the next lower cent, but shall be shown as one-half cent.

(d) Fractions of one-half cent or less shall be rounded off to the next whole cent.

(e) Rates per ton

Amounts of less than five cents to be omitted.

Amounts of five cents or greater, but less than ten cents, to be increased to ten cents.

(f) Rate per car

Amounts of less than 10 cents to be omitted.

Amounts of 10 cents or greater, but less than 25 cents to be shown as 25 cents.

Amounts of 25 cents or greater, but less than one dollar to be increased to one dollar.

Section 7. Observation of Differentials

In establishing the freight rates herein ordered, while established rate groupings and fixed differentials are not required to be used, their use is desirable if found practicable, even though certain rates may result which are lower or higher than would otherwise obtain.

PASSENGER FARES AND BAGGAGE CHARGES

Section 8

This order shall apply to all the passenger fares, both interstate and intra-state, of the railroads under federal control. No existing fare equal to or in excess of three cents per mile shall be reduced. All fares now constructed on a lower basis than three cents per mile shall be advanced to the basis of three cents per mile. All fares which are on a lower basis than the said existing or advanced fares, as the case may be, such as mileage or excursion tickets shall be discontinued. These requirements are subject to the following exceptions:

(a) The provisions of Section 1 and 22 of the Act to Regulate Commerce, which authorize free or reduced fares or transportation may be observed, except:

First: That no mileage ticket shall be issued at a rate that will afford a lower fare than the regular one-way tariff fare, and except;

Second: That excursion tickets may be issued only to the extent and on the terms set forth in paragraphs (b) and (c) below.

(b) Round trip tourist fares shall be established on a just and reasonable basis bearing proper relation to the one-way fares authorized by this order, and tariffs governing same shall be filed as promptly as possible with the Interstate Commerce Commission.

(c) For the National Encampment of the Grand Army of the Republic and auxiliary and allied organizations at Portland, Ore., in 1918, and for the United Confederate Veterans' Reunion, auxiliary and allied organizations at Tulsa, Okla., in 1918, a rate of one cent per mile in each direction via direct routes shall be authorized and confined by certificate of identification to the membership of these organizations and members of their immediate families. For the various state meetings of these organizations held during the year 1918, fares shall be authorized under like conditions on basis of two cents per mile in each direction and confined to limits of the state in which the meeting is held.

(d) Where public convenience will be served thereby subject to the approval of the director general, fares determined by the short line may be applied over longer practicable routes.

(e) Officers, enlisted men and nurses of the United States Army, Navy and Marine Corps, when traveling in uniform at own expense, shall be granted the privilege of purchasing passage tickets at one-third the regular one-way fare, via route of ticket, applicable in coach, parlor or sleeping car, as the case may be, when on furlough or official leave of absence, except that this reduced fare shall not be granted on short term passes from camps or when on liberty from ships or stations to nearby cities.

Applicants for such tickets shall be required to submit for inspection of ticket agent, military furlough or other official form of leave of absence and to surrender to ticket agent a furlough fare certificate signed by a commanding officer.

(f) Children under five years of age, when accompanied by parent or guardian, shall be carried free; children five years and under twelve of age shall be charged half fare.

Section 9

Commutation fares shall be advanced ten per cent. Commutation fares shall be required to include all forms of transportation, including for suburban travel and for the use of those who have daily or frequent occasion to travel between their homes and places of employment or educational institutions.

Section 10

Passengers traveling in standard sleeping cars and parlors shall be required to pay an additional passage charge of sixteen and two-thirds per cent of the normal one-way fare, and passengers traveling in tourist sleeping cars an additional passage charge of eight and one-third per cent of the normal one-way fare. The foregoing charges are in addition to those required for the occupancy of berths in sleeping cars or seats in parlor cars.

Section 11

The following minimum number of tickets of the class good for passage in sleeping or parlor cars shall be required for occupancy of drawing rooms, compartments or sections in parlor or sleeping cars:

Two adult tickets for a drawing room in a sleeping car.

Two adult tickets for a compartment.

One and one-half adult tickets for a section.

Five adult tickets for exclusive occupancy in sleeping car or parlor car.

Section 12

Passenger fares on fares for transportation and transportation of passengers entirely by rail, or partly by water and partly by rail, shall be increased proportionately with fares and charges for the transportation of passengers via rail.

Section 13

The rates for carrying baggage for express baggage transported under

lawfully effective tariffs shall be sixteen; and two-thirds per cent of the normal one-way passenger fare, with minimum of fifteen cents per 100 lb. and minimum collection of twenty-five cents per shipment.

Section 14

Tickets purchased prior to June 10, 1918, will not be honored for passage on and after that date, except:

(a) Passengers en route on June 10, 1918, on one-way tickets will be carried to destination by continuous passage without additional charge.

(b) Round trip tickets, portions of which have been used prior to June 10, 1918, or held by passengers en route on June 10, 1918, shall be honored in accordance with original tariff conditions under which sold without additional payment except that they shall be subject to the same requirements as one-way tickets in respect of additional payment for passage in sleeping or parlor cars as prescribed in Section 10.

Tickets made invalid for passage by this order will be redeemed from original purchasers as follows:

Unused tickets will be redeemed at amount paid therefor.

Partially used one-way tickets will be redeemed by charging tariff fare at time of journey for portion used and refunding difference between such amount and fare at which sold.

In redemption of mileage, scrip or credential forms the purchaser shall be given the benefit, for the distance traveled of a net basis proportionate to that which would have applied had the entire book been used according to its contract.

Section 15

All passenger fares, lower than those hereinbefore prescribed, such as mileage, party, second-class, immigrant, convention, excursion and tourist fares shall be discontinued until further notice, except that tourist fares shall be re-established as prescribed in Section 8, paragraph (b) hereof.

Section 16

Tariff provisions intended to assure the long haul to carriers, and which prevent the free interchange of traffic shall be eliminated.

Section 17

Stop-overs on one-way tickets, side trips at free or reduced fares, discounts by use of excess baggage permits or excess money coupon books, and the sale of one-way tickets having limit in excess of time necessary to make trip by continuous passage, shall be discontinued.

Section 18

Optional routes may be used only when specified in tariffs.

Section 19

In publishing fares and charges under this order, tariffs may be used which increase the present fares by fixed percentage to bring them to the bases authorized herein, even though the actual fares so constructed may be fractionally more or less than three cents per mile.

GENERAL

Section 20

Where the Interstate Commerce Commission prior to the date hereof has authorized or prescribed rates, fares and charges, which have not been published at the date of this order, the rates, fares or charges initially established hereunder by applying the increases herein prescribed to the existing or published rates, fares or charges may be subsequently revised by applying the increases prescribed herein to the rates, fares and charges so authorized or prescribed by the Interstate Commerce Commission.

Section 21

All schedules, viz: tariffs and supplements, published under the provisions of this order shall bear on the title page the following, in bold face type:

THE "RATES MADE EFFECTIVE BY THIS SCHEDULE ARE INITIATED BY THE PRESIDENT OF THE UNITED STATES THROUGH THE DIRECTOR GENERAL, UNITED STATES RAILROAD ADMINISTRATION AND APPLY TO BOTH INTERSTATE AND INTRA-STATE TRAFFIC. THIS SCHEDULE IS PUBLISHED AND FILED ON ONE DAY'S NOTICE WITH THE INTERSTATE COMMERCE COMMISSION UNDER GENERAL ORDER NO. 28 OF THE DIRECTOR GENERAL, UNITED STATES RAILROAD ADMINISTRATION, DATED MAY 25, 1918.

*On passenger tariffs use word "fares." On baggage tariffs use word "charges."

The increases are estimated to produce an increase of revenue amounting to something over \$900,000,000 a year.

McAdoo Explains to State Commissioners

Director General McAdoo on May 27 sent the following telegram to the chairmen of all state railroad commissions:

"Apparent increases in operating expenses aggregating \$830,000,000 to \$960,000,000 for the calendar year 1918, as compared with the calendar year 1917, and consisting principally of increases in wages and cost of coal, fuel oil and other materials and supplies, leave no escape from the conclusion that the public interest requires immediate and substantial increases in the rates for practically all services, passenger and freight, now performed by the railroads under federal control, and therefore in effect performed by the United States government itself, and that there is no other reasonable way to defray the expenses of federal control and operation since it is clear that those additional burdens should not be forced upon the federal treasury at this time when it is already so heavily taxed by the needs of our own govern-

ment for war purposes and the essential demands for credit of the gallant nations associated with us in this great struggle for liberty. In these circumstances, it seems clear that the duty which rests upon me by virtue of the act of Congress of March 21, 1918, and by virtue of the President's proclamation, should be performed by the initiation without delay of increased rates to meet the situation.

"In dealing with this supremely important subject, I have given much thought to the question as to the practical way of availing myself of the knowledge and co-operation which at all times have been so cordially put at my disposal by the state commissions. The act of Congress gives me no opportunity to share with the state commissions the responsibility which rests upon the United States Railroad Administration for the financial results to the United States Government of the operation of the railroads. In fact the government of the United States has assumed control of the railroads and the undivided responsibility for their operation, and that entire responsibility has been placed upon me. I have also felt that the exigencies of the situation are so serious as not to admit of postponement of action until full opportunity could be extended to the commissions in all the states to discuss the important problems involved and to advise me, in advance of official action, as to how my responsibility could best be discharged.

"In these circumstances, it has seemed clear that the responsibility should be promptly met in the manner contemplated by the act of Congress, and then, in the inevitable readjustments which always must come in a matter of such far-reaching character, to obtain the advice and suggestions of the state commissions and to take advantage of their views in order that in the final consideration of the subject by the Interstate Commerce Commission, that body may have the benefit of the most intelligent and equitable suggestions as to the readjustments needed to accomplish the largest measure of relative justice while at the same time obtaining the additional operating revenues which the United States government must have in order to discharge the responsibilities which it has assumed for railroad operation.

"Acting upon this view, I am initiating substantial increases in practically all rates, passenger and freight, and am arranging to have delivered to you at once a copy of the announcement on this subject. I earnestly hope that the procedure thus adopted and which is unavoidable, will have your support, and that you will give the government your full co-operation in perfecting the rates thus initiated. I also bespeak your patriotic co-operation in getting the public to support in a patriotic spirit and as a war measure these substantial rate increases which are the outgrowth of war conditions and which in principle and in substance are indispensable to enable the federal government to discharge the transportation functions which are essential to the successful conduct of the war."

Interstate Commerce Commission Issues Necessary Orders

The Interstate Commerce Commission on Monday issued a fifteenth section order that the presently effective joint rates, fares, charges and classifications applicable to the joint transportation of freight and passengers between points on the lines of carriers under federal control on one hand, and points on lines of carriers not under federal control on the other hand, may be increased to the bases set forth in General Order No. 28, and approving for filing the joint rates without formal hearings, "which approval shall not affect any subsequent proceeding relative thereto." It is further ordered that the rates may become effective on not less than one day's notice. In a general order the commission says that certain of the present freight rates, passenger fares and baggage charges of the carriers are fixed for the future by outstanding orders of the commission which were made

naturally have meant an exceptionally large expenditure of money.

This territory, as well as that between Cowan and Rockledge, has since 1911 been protected by the semi-automatic controlled manual block system. The revised track arrangement necessitated a change and an addition to the signals, as all movements were then and are still being made by signal indications without train orders or caution cards. These signal indications supersede time table rights as stated above. A small electro-mechanical interlocking plant was formerly located at Rockledge, which is on the summit of the mountain. This plant handled the north end switch of the passing track and the signals were power operated. The switches at the south end were operated by hand but the signals at this point were of the power type. At the south end of the passing track is located a runaway track which made a crossover movement necessary to get on the main line. The switches of the crossover were boltlocked with each other, so that it was necessary for a train entering the passing track at the north end to stop at the south end before proceeding out on the main line. If a train was unable to stop due to the failure of brakes or from other causes, it was diverted to the runaway track which was built on an ascending grade to stop such a train by gravity.

The revised track arrangement consisted in lengthening the passing track at both ends, and retaining the runaway track with the exception that it was located on the opposite side of the main track, and the passing track was used as a second main track. This track rearrangement placed the switch which was formerly operated mechanically at too great a distance to be handled in such a manner. The switch at the south end was still more remote from the tower. The track to the south is on a 2 per cent descending grade. In order to facilitate train movements and to make them as safe as possible between Rockledge and Sherwood, it was decided that all switches in this territory should be controlled and operated electrically.

Low voltage switch machines were decided on for this

Switch at End of Double Track at Tantallon

purpose, and five Model 13 machines were ordered from the Union Switch & Signal Company, four of which were used at Rockledge. The two machines to the north of the tower are approximately 1,500 ft. distant, while those to the south are located approximately 2,700 ft. from the point of control. The original mechanical interlocking machine, which is a National of 12 levers and was manufactured at the Nashville, Chattanooga & St. Louis Railroad shops, is still in use.

The switch and facing point lock levers formerly operating the north switch were removed and two electric units

were installed in their place. These units were made by the Union Switch & Signal Company and through these units the two sets of crossovers are operated and indicated. These electric units have mechanical connections with the mechanical lockings and in this manner are properly interlocked with all other levers in the machine, through which the power signals are operated. The power signals are controlled through rotary circuit controllers which are operated by the tail levers of the machine.

At Tantallon, a point approximately four miles down the mountain from Rockledge, other track changes were made. Double track starts at this point and extends to Sherwood, two miles further south, or a distance of six miles from Rockledge. The fifth low voltage switch machine purchased

Electro-Mechanical Interlocking Machine at Rockledge

was used on the end of the double track switch at Tantallon. This point is located at the foot of the grade and consequently is a very important one from the standpoint of safe and uninterrupted operation. This switch at the end of double track at Tantallon is two miles from the interlocking tower at Sherwood, from which point it is controlled and operated. This I believe to be the record distance for low voltage switch operation.

The switch is controlled through an electric unit of an electro-mechanical machine of the S-7 type as furnished by the Union Switch & Signal Company. All the low voltage switch machines in service operate in from 28 to 30 seconds and require approximately three amperes of current with 20 volts impressed across the motor. Except for a few days after installation, they have given no trouble whatever and we consider them practical, safe and efficient.

Another important installation was made at Bridgeport, Alabama, in 1917. A low voltage switch machine was installed here to operate the end of a double track switch, located across the river south of the tower which is located on the north bank of the river, the switch being approximately one mile from the tower. In this installation a draw bridge intervenes between the tower and the switch. The balance of the switches at this point are in the vicinity of the tower and are mechanically operated. All signals are power operated. The whole layout is operated by an electro-mechanical machine of the S-7 type.

The source of power for the operation of these machines is derived from 32 cells of Type 72 high voltage battery furnished by the National Carbon Company, and this battery is housed in concrete battery wells of the Massey type. The wells are large enough to house additional cells for other purposes.

McAdoo Puts Wage Increase Into Effect

Recommendations of Wage Commission Increased in Some Instances. Eight Hour Basic Day Recognized

WASHINGTON, D. C.

DIRECTOR GENERAL McADOO on May 25 issued General Order No. 27 putting into effect with some modifications the increases in wages for all railway employees receiving less than \$250 a month on December 31, 1915, recommended by the Railroad Wage Commission.

Numerous protests that the increases recommended by the commission would add little or nothing to the wage increases made by the railroads during the last two years, and the practical necessity of greater advances to prevent a general exodus of railroad men to other employments have apparently been taken into consideration by the director general in the case of common labor and shop employees in passing upon the commission's report but, although the order makes certain additional increases for some classes of employees, no change is made in the estimate of the commission that the addition to the railroad payroll will approximate \$300,000,000 per annum.

On this basis the back payments to employees due on June 1 will amount to somewhere near \$125,000,000.

The order applies to the employees of 164 railroads named in the order, and in addition to "all terminal, union station and switching companies, all or a majority of whose stock is owned by railroads named." The order states further that such other railroads as may be retained in federal control on July 1, 1918, will be added to the list, and that "the Pullman Company, whose status is now being considered, will also be added if decision shall be reached to retain the Pullman Company under federal control."

The rates named in the order do not substantially vary from those recommended by the Railroad Wage Commission, but certain modifications are made which grant to common labor an increase of two and one-half cents per hour in excess of the wages paid on December 31, 1917, when the increase recommended by the Wage Commission is less than that amount, and which establish a minimum rate of 55 cents per hour for such shop trades as machinists, boiler makers, blacksmiths and other mechanics who receive the same basis of rates.

The original recommendation of the Wage Commission, which has been substantially adopted in the director general's order, was based upon the "average monthly earnings" for each class of service for the month of December, 1915. In the tabular statement of monthly rates recommended by the Railroad Wage Commission, the percentages of increase are as high as 43 per cent for employees receiving under \$46 per month, the percentage gradually decreasing in what appears to be a constant ratio, leaving no increase to employees whose wages were \$250 in December, 1915.

While this ratio of percentages appears to be uniform, the actual increases are shown to extend from \$20 per month to the lowest paid men up to \$33.60 for those who were receiving \$82 in December, 1915, and then gradually decreasing to no increase for those who received \$250.

The order is made effective as of January, 1918, and back payments will be made to employees as promptly as possible, separate from the current wage payment and for each month as rapidly as the computations are made for such months.

Colored firemen, trainmen and switchmen, in addition to securing the increase recommended by the Wage Commission, will have their wages advanced to the same as white men employed on the same roads and for the same work on June 1, 1918, but back payments will not apply to this increase, which is made effective as of June 1, 1918.

A marked deviation from the recommendation of the Railroad Wage Commission is found in Article 5, Rules Governing Conditions of Employment, wherein the basic eight-hour day is established. This deviation, however, does not reduce the hours of employment as at present worked, nor does it increase the total compensation fixed in the order for the number of hours now worked in excess of eight hours, but it does establish the basic eight-hour day upon which further wage adjustment will be based.

The order also creates an advisory Board of Railroad Wages and Working Conditions and appoints as members of such Board J. J. Dermody, F. F. Gaines, C. E. Lindsey, W. E. Morse, G. H. Sines and A. O. Wharton.

An abstract of the report of the Railroad Wage Commission was published in the *Railway Age* of May 17. The order of the director general begins with the following preamble:

Preamble

In promulgating this order I wish to acknowledge the patriotic service so unselfishly rendered by the Railroad Wage Commission, consisting of Messrs. Franklin K. Lane, Charles C. McChord, J. Harry Covington, and William R. Willcox, in connection with the important question of wages and hours of service of railroad employees which I referred to them by my General Order No. 5, dated January 18, 1918.

This commission took hold of the task with great energy and devotion and has dealt with the entire subject in a thoroughly sympathetic spirit.

Manifestly in a matter of such magnitude and complexity it is impossible to find any general basis or formula which would correct every inequality and give satisfaction to every interest involved. But the commission has made an earnest effort to do justice to all concerned. I have felt obliged, however, to depart from its recommendations in some particulars.

With respect to hours of service the commission says: "Manifestly, therefore, at this time, when men must be constantly taken from the railroads, as from all other industries, to fill the growing needs of the Nation's army, hours of labor can not be shortened and thereby a greater number of men be required for railroad work. . . . While the commission is strongly disposed to a standard day, in so far as the nature of the service will permit it, its firm judgment consequently is that the existing hours of service in effect on the railroads should be maintained for the period of the war."

The commission also reached the conclusion that as to overtime "the existing rules and conditions of payment should not be disturbed during the period of the war." The commission has pointed out that this is not the time for any experiments which might lessen the tons of freight hauled and the number of passengers carried when the urgent and serious necessities of the war compel sacrifices from all, and that the adoption of any plan which would prevent the government from working its men as long as they have been in the habit of working under private employers would be to take advantage of the grave war necessities of the government and to embarrass it in carrying forward essential operations of the war at a time when the need of service was never greater and the ability to call on outside men is seriously impaired.

There has never been a time when the public interest

demanding more urgently the devotion and unselfish service of all classes of railroad employees. I agree with the commission that it is not practicable at this time, when the war is calling upon every class of loyal citizens for service and sacrifices, to reduce the actual hours of labor to eight in every line of railroad work.

Nevertheless I am convinced that no further inquiry is needed to demonstrate that the principle of the basic eight-hour day is reasonable and just and that all further contentions about it should be set at rest by a recognition of that principle as a part of this decision.

Recognition of the principle of the basic eight-hour day in railroad service is, therefore, hereby made.

The question arises as to what further steps can and ought justly to be taken to strengthen the application of that principle, and when. This question must be solved in the light of the varied conditions of railroad employment and will have to be studied in detail by the Board of Railroad Wages and Working Conditions herein and hereby created and in the light of what is reasonably practicable under war conditions.

No problem so vast and intricate as that of doing practical justice to the 2,000,000 railroad employees of the country can be regarded as completely settled and disposed of by any one decision or order; therefore the Board of Railroad Wages and Working Conditions is hereby established and will take up as presented any phases of the general problem relating to any class of employees or any part of a class of employees which may justly call for further consideration.

It is my earnest hope that railroad officials and railroad employees will realize that their relations under Federal control are not based upon the old conditions of private management. Dissensions and disappointments should be forgotten and all should now remember that they are not only serving their country in the operation of the railroads, but that upon the character, quality, and loyalty of that service depends in large measure our success in this war.

It is an inspiring task—this task of putting upon a more just and equitable basis the wages and working conditions of loyal workers in railroad service—and I confidently expect the patriotic support and assistance of every railroad official and every railroad employee in performing that task with credit to each other and with honor to their country.

Rates of Wages

Then follows the order, which, in Article I names the railroads involved and in Article II, Section A, establishes the increases in wages recommended by the commission in the scale of monthly rates as of December 31, 1915, with the amounts and percentages of increase to make up the new rates, which was published on page 1239 of our issue of May 17. The only modification in this table is an exception in the case of employees under 18 years of age receiving less than \$46 per month, whose increases are provided for in another part of the report.

The remainder of the report, which gives the directions and illustrations as to the methods of applying the increases to hourly, daily, piecework and mileage rates, changed somewhat from the examples given in the Wage Commission's report because of the modifications made by the director general, is as follows:

Method of Applying Increases to Monthly Rates

(1) The employee who holds the same position today that he did the last day of December, 1915, and who then received \$75 a month and has received no increase since, will receive an additional wage of \$30.75 per month. If he has received an increase in these two years of \$10 per month, the recommended increase of his wage will be cut down by that much, making his net advance \$20.75.

(2) Employee "A" occupied the same position in 1915 and in 1918: Salary, 1915, \$150 per month; 1918, \$175 per month.

Basis of increase on salaries of \$150 per month is 16.17 per cent, or \$24.25 per month. New salary, \$174.25; present salary, \$175. Present salary undisturbed.

(3) Employee "B" in 1915 received \$100, and on the same desk in 1918 received \$112.50 per month. Basis of increase on \$100, 31.75 per cent, or \$31.75. New salary, \$131.75. Present salary, \$112.50. Employee "B" is entitled to receive back pay from January 1, at the rate of \$19.25 (the difference between \$131.75 and \$112.50), and to receive monthly, hereafter, \$131.75 instead of \$112.50. Back pay due January 1 to May 31, \$96.25.

(4) Employee in December, 1915, received \$100 per month, entitles him, with this increase, to \$131.75. His salary had been raised for same position on January 1, 1918, to \$135. He is not, therefore, entitled to any advance or back pay. Present salary undisturbed.

Method of Applying Increases to Daily Rates

(1) Employee, December, 1915, \$3.00:

Increased to new rate of \$4.23 per day..... \$109.98
January 1, 1918, his pay was raised for same work to \$3.50 day,
equal per month to..... 91.00

Difference in pay:

1 month..... \$18.98

5 months..... \$94.90

At 8-hour 26-day month both years..... 52.9c \$32.80

Worked 62 hours overtime, at new 1918 rate..... 37.5c 23.25

Was paid 62 hours overtime at..... 9.55

Total back pay due January 1 to May 31, 1918..... \$104.45

SECTION B.—RATES OF WAGES OF RAILROAD EMPLOYEES PAID UPON DAILY BASIS

| Old rate per day | New rate per day | Old rate per day | New rate per day | Old rate per day | New rate per day | Old rate per day | New rate per day |
|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|
| \$0.75 | \$1.52 | \$2.50 | \$3.53 | \$4.25 | \$5.40 | \$5.95 | \$6.85 |
| .80 | 1.57 | 2.55 | 3.60 | 4.30 | 5.45 | 6.00 | 6.90 |
| .85 | 1.62 | 2.60 | 3.67 | 4.35 | 5.50 | 6.05 | 6.94 |
| .90 | 1.67 | 2.65 | 3.74 | 4.40 | 5.55 | 6.10 | 6.98 |
| .95 | 1.72 | 2.70 | 3.81 | 4.45 | 5.58 | 6.15 | 7.02 |
| 1.00 | 1.77 | 2.75 | 3.88 | 4.50 | 5.62 | 6.20 | 7.06 |
| 1.05 | 1.82 | 2.80 | 3.95 | 4.55 | 5.66 | 6.25 | 7.11 |
| 1.10 | 1.87 | 2.85 | 4.02 | 4.60 | 5.71 | 6.30 | 7.15 |
| 1.15 | 1.92 | 2.90 | 4.09 | 4.65 | 5.75 | 6.35 | 7.19 |
| 1.20 | 1.97 | 2.95 | 4.16 | 4.70 | 5.79 | 6.40 | 7.23 |
| 1.25 | 2.02 | 3.00 | 4.23 | 4.75 | 5.83 | 6.45 | 7.28 |
| 1.30 | 2.07 | 3.05 | 4.30 | 4.80 | 5.88 | 6.50 | 7.32 |
| 1.35 | 2.12 | 3.10 | 4.36 | 4.85 | 5.92 | 6.55 | 7.36 |
| 1.40 | 2.17 | 3.15 | 4.41 | 4.90 | 5.96 | 6.60 | 7.41 |
| 1.45 | 2.22 | 3.20 | 4.48 | 4.95 | 6.00 | 6.65 | 7.45 |
| 1.50 | 2.27 | 3.25 | 4.55 | 5.00 | 6.05 | 6.70 | 7.49 |
| 1.55 | 2.32 | 3.30 | 4.60 | 5.05 | 6.09 | 6.75 | 7.53 |
| 1.60 | 2.37 | 3.35 | 4.65 | 5.10 | 6.13 | 6.80 | 7.58 |
| 1.65 | 2.42 | 3.40 | 4.70 | 5.15 | 6.17 | 6.85 | 7.62 |
| 1.70 | 2.47 | 3.45 | 4.72 | 5.20 | 6.21 | 6.90 | 7.66 |
| 1.75 | 2.52 | 3.50 | 4.77 | 5.25 | 6.26 | 6.95 | 7.70 |
| 1.80 | 2.57 | 3.55 | 4.81 | 5.30 | 6.30 | 7.00 | 7.75 |
| 1.85 | 2.65 | 3.60 | 4.85 | 5.35 | 6.34 | 7.05 | 7.79 |
| 1.90 | 2.72 | 3.65 | 4.90 | 5.40 | 6.38 | 7.10 | 7.83 |
| 1.95 | 2.77 | 3.70 | 4.94 | 5.45 | 6.43 | 7.15 | 7.88 |
| 2.00 | 2.83 | 3.75 | 4.98 | 5.50 | 6.47 | 7.20 | 7.91 |
| 2.05 | 2.89 | 3.80 | 5.03 | 5.55 | 6.51 | 7.25 | 7.96 |
| 2.10 | 2.96 | 3.85 | 5.07 | 5.60 | 6.55 | 7.30 | 8.00 |
| 2.15 | 3.03 | 3.90 | 5.11 | 5.65 | 6.60 | 7.35 | 8.04 |
| 2.20 | 3.10 | 3.95 | 5.15 | 5.70 | 6.64 | 7.40 | 8.08 |
| 2.25 | 3.17 | 4.00 | 5.20 | 5.75 | 6.68 | 7.45 | 8.13 |
| 2.30 | 3.24 | 4.05 | 5.24 | 5.80 | 6.73 | 7.50 | 8.17 |
| 2.35 | 3.31 | 4.10 | 5.28 | 5.85 | 6.77 | 7.55 | 8.21 |
| 2.40 | 3.38 | 4.15 | 5.32 | 5.90 | 6.81 | 7.60 | 8.25 |
| 2.45 | 3.45 | 4.20 | 5.36 | | | | |

Old rates are those of December, 1915.

For common labor paid by the day, the scale of new rates per day shown shall apply, with the provision, however, that as a minimum 20 cents per 8-hour day, 22½ cents per 9-hour day, 25 cents per 10-hour day, 27½ cents per 11-hour day, and 30 cents per 12-hour day will be added to the rates paid per day as of December 31, 1917.

(2) Employee "C" was employed in 1918, but not in 1915. Rate of pay on the district where he is employed in 1918, in 1915 was \$1.10 per day. The 1918 rate of pay is, on the same district, \$1.50 per day. The new rate is \$1.87 per day. He will, therefore, be entitled to receive from January 1, 1918, to May 31, 1918, 37 cents per day additional for each day he worked in that period.

While it is expected that the Board of Railroad Wages and Working Conditions hereinafter created shall give consideration to all questions of inequality as between individuals and classes of employees throughout, sufficient information is available to justify certain conclusions with respect to the mechanical crafts, and in the case of machinists, boilermakers, blacksmiths, and other shop mechanics who have been receiving the same hourly rates, the increases named in this order shall apply, with a minimum wage of 55 cents per hour.

It is recognized that this may still leave among shop employees certain inequalities as to individual employees, to which the Board of Railroad Wages and Working Conditions will give prompt consideration.

For common labor paid by the hour, the scale named herein shall apply with the provision, however, that as a minimum, 2½ cents per hour will be added to the rates paid per hour, as of December 31, 1917.

Method of Applying Increases to Hourly Rates

1) Machinist worked in January, 1918, eight hours per day, 27 days, total 216 hours straight time.

The rate of pay for this position in December, 1915, was 34 cents per hour, new rate under this order 48 cents per hour, but with minimum rate of 55 cents per hour as herein ordered, will receive \$118.80 in January, 1918, his rate of pay was 37½ cents per hour, for 216 hours, equals 81.00

Difference one month..... \$37.80
On basis of working same amount straight time each month for five months (January 1 to May 31)..... 189.00
Also worked in same period 90 hours overtime at time and one-half, new 55 cents minimum rate, or 82½ cents, equals \$74.25
Was paid at 37½-cent rate pro rata overtime for 33.75
23.62

Balance due January 1 to May 31, 1918..... \$212.62

SECTION C—Rates of Wages of Railroad Employees Paid Upon Hourly Basis

| | | [Rates of pay in cents per hour.] | | | | | |
|-------------------|-------------------|-----------------------------------|-------------------|-------------------|-------------------|-------------------|-------------------|
| Old rate per hour | New rate per hour | Old rate per hour | New rate per hour | Old rate per hour | New rate per hour | Old rate per hour | New rate per hour |

*Old rates" are those of December, 1915

(2) Machinist worked in January, 1918, 10 hours per day, 26 days, total 260 hours straight time.

The rate of pay for this position in 1915 was 34 cents per hour, new rate under this order, 48 cents per hour, but with minimum rate of 55 cents per hour as herein ordered will receive \$148.00 in January, 1918, his rate of pay was 37½ cents per hour, for 260 hours, equals 97.50
Difference one month..... \$50.50
On basis of working same amount of straight time each month for 5 months (January 1 to May 31)..... 252.50
Also worked in same period 90 hours overtime at pro rata rate, new 55 cent minimum rate, equals \$49.50
Was paid at 37½-cent rate pro rata overtime for 15.75

Balance due January 1 to May 31, 1918..... \$243.25

(3) Machinist "D" was employed in the same shop in December, 1915, and in 1918 on the same class of work. His hourly rate in December, 1915, was 35 cents for 9 hours, 26 days a month. He was paid for overtime and Sunday work at time and one-half. On January 1, 1918, his hours were reduced to 8 and his rate increased to 40 cents. The new hourly rate applicable to his 1915 rate, viz.: 49½ cents being less than the minimum of 55 cents, his new rate will be 55 cents per hour. In 1918, from January 1 to May 31, he worked 234 hours per month or an average of one hour overtime daily on the 1918 schedule. This for five months gives him 130 hours overtime. He has been paid as follows:

1,040 hours straight time, at 40 cents..... \$416.00
130 hours overtime, at 60 cents..... 78.00
Total..... \$494.00

His back pay will be computed as follows

1,040 hours straight time, at 55 cents..... \$572.00
130 hours overtime, at 82½ cents..... 107.25
Total..... \$679.25
Deduct payment at 1918 rates..... 494.00
Back pay due..... \$185.25

and his future rate per hour will be 55 cents.

(4) In the case of employee "E," who was employed in a shop where the rate for his position was 35 cents per hour for 8 hours' work in 1915, with time and one-half for overtime, but in the same position and same shop with the same hours in 1918 his rate is 45 cents per hour; his earnings in 1915 in the standard 208-hour month would be \$72.80 per month, and he would be entitled to the new hourly rate of 49½ cents per hour. His straight time and overtime earnings and back pay would be computed in exactly the same manner as machinist "D." The principles illustrated will apply to all men paid by the hour, whatever their occupation may be.

Section D—Rates of Wages of Railroad Employees Paid Upon Piecework Basis

METHOD OF APPLYING INCREASES TO PIECE RATES

(1) The pieceworker shall receive for each hour worked, the same increase per hour as is awarded to the hourly worker engaged in similar employment in the same shop.

(2) If the hourly rate has been increased since 1915 to an amount greater than the increase herein fixed, then the higher rate shall prevail.

(3) Where there was no piece rate for an item or operation in the piece-rate schedule of 1915, adjust the current price by such an amount as a similar item or operation has been increased or decreased since December 31, 1915, or as near such a plan as practicable.

(4) It is understood that the application of this order shall not, in any case, operate to reduce current earnings.

(5) When a pieceworker works overtime or undertime, he shall receive that proportion of the increase provided in the schedule which the time actually worked bears to the normal time in the position.

(6) Overtime is not to be considered solely as the num-

ber of hours employed in excess of the normal hours per month in the position, but rather the time employed in excess of the normal hours per day.

(7) Employee "F" was employed under a piecework schedule in a shop where the basic hourly rate was 35 cents for eight hours, with time and one-half for overtime. This rate under the plan illustrated above will be increased to 49½ cents per hour. Difference, 14½ cents.

Regardless of the schedule of piece rates under which he is paid, under this order "F" will be entitled to receive 14½ cents per hour in addition to his piecework earnings for every hour worked in 1918 unless the hourly rate shall in the interim have been raised and a proportionate increase made in the piecework schedule.

For example: Assume that "F" made \$90 in December, 1915, at his piecework. At the hourly rate he would have earned only \$72.80, and his hourly rate must therefore be increased to 49½ cents.

If, in January, 1918, he has attained sufficient skill to earn \$100 on the same piecework schedule, he will be entitled to receive, nevertheless, 14½ cents per hour for each hour of straight time worked, and for each hour of overtime, 21¾ cents additional (if time and one-half for overtime is in effect).

Assume that in the five months, January 1 to May 31, "F" has worked 1,040 hours straight time, and 130 hours overtime, and has, at his piece-work schedule thus earned \$500.

He will be entitled, nevertheless, to receive as back pay, the following amount:

| | |
|--|----------|
| 1,040 hours at 14½ cents per hour..... | \$150.80 |
| 130 hours at 21¾ cents per hour..... | 28.28 |
| | \$179.08 |

But if in January, 1918, the basic hourly rate had been increased to 50 cents, and this increase had been correspondingly expressed in his piece-work schedule, he would be entitled to no back pay. If, on the other hand, the hourly rate had been increased from 35 cents in 1915 to 45 on January 1, 1918, and this increase had been expressed in a corresponding increase in the piece-work schedule, then "F" would be entitled to receive back pay at 4½ cents per hour for straight time and 6¾ cents per hour overtime.

If the practice in the shop, however, had been to pay pro rata for overtime, then the rate for such overtime since January 1, 1918, would be pro rata at 4½ cents, or 14½ cents per hour, according to whether piece rates had been or had not been increased.

(8) Employee's December, 1915, rate was 38½ cents; which rate in this order for 8 hours per day entitled him to 54½ cents per hour. His basic rate had, by January 1, 1918, been raised to 42½ cents per hour. Piece work rates had not been raised in the interval. This man earned in 208 hours \$100. He is entitled to a raise of 11¾ cents per hour.

| | |
|-------------------|---------|
| 113½ cents × 208: | |
| 1 month..... | \$24.44 |
| 5 months..... | 122.20 |

Section E.—Rates of Wages of Railroad Employees Paid Upon Mileage Basis

The following rates will apply "per day" or its established equivalent in "miles":

| Passenger engineers | | Passenger engineers | | Passenger engineers | | Passenger engineers | |
|---------------------|--------|---------------------|--------|---------------------|--------|---------------------|--------|

If there were mileage rates in effect in December, 1915, which are not included in the above tables, they shall be increased in accordance with the following percentages:

| | Per cent |
|---|----------|
| Rail passenger engineers and conductors | 1 |
| Rail passenger firemen and brakemen | 2 1/2 |
| Rail passenger conductors | 15 1/2 |
| Rail passenger longshoremen | 3 |
| Rail passenger brakemen and freight | 3 1/2 |
| Rail freight engineers and firemen | 5 1/2 |
| Rail freight firemen and brakemen | 4 1/2 |
| Rail freight conductors | 20 1/2 |
| Rail freight brakemen and longshoremen | 16 1/2 |

Method of Applying Increases to Mileage Basis

(1) Rates for overtime as now in effect, whether providing for pro rata basis or in excess thereof, shall be increased by same percentage as straight time rates.

(2) Miles run, in excess of the established equivalent of a day (or of a month where such basis prevails) shall be paid for pro rata.

(3) If any increase has been made in the mileage rates of employees paid on that basis in December, 1915, it will be understood that the per cent of increase allowed by this order is inclusive of such interim increases and that the new rate is computed from the base rates of December, 1915.

(4) Example (1): Engineer "G," passenger service, received \$4.25 per day of one hundred miles in 10 hours in December, 1915. According to this plan, although in 1918 this rate was \$4.25 per hundred miles in 8 hours, the rate will be increased 11 1/4 per cent to \$4.73 per 100 miles (\$4.7281 equalized as \$4.73). He will be entitled to back pay for every 100 miles run at the rate of 48 cents per 100 miles.

Example (2):

| | |
|---|----------|
| Conductor through freight: | |
| 2,950 miles at 4 cents, at new rate, would entitle him to 4.82 cents, or | \$142.19 |
| He was paid,..... | 118.00 |
| Leaving to be paid..... | \$24.19 |
| He made 26 hours and 10 minutes overtime, equivalent, on basis of 12 1/2 miles per hour, to 327 miles, which, at the increased rate of 4.82 cents per mile, entitles him to \$15.76 | |
| Was paid, at 4 cents per mile..... | 13.08 |

A difference of..... 2.68

| | |
|------------------|---------|
| One month..... | \$26.87 |
| Five months..... | 134.35 |

This principle will apply to all employees of the train and engine service who are paid on the mileage basis. There are some railroads in the United States upon which men in the train and engine service are paid on a monthly wage. Such employees will be entitled to the increased rates named in Article 2, section A.

(5) Since the application of the increases hereby granted will tend in individual cases to give increases greater than is appropriate or necessary to those train and engine men who make abnormal amounts of mileage and who, therefore, make already abnormally high monthly earnings, the officials of each railroad shall take up with the respective committees of train and engine men the limitation of mileage made per month by employees paid upon a mileage basis, so as to prevent employees now making such abnormal mileage profiting by the wage increases herein fixed greatly in excess of employees habitually making a normal amount of mileage. It shall be understood that any such limitation of mileage so arrived at shall not preclude the officials of a railroad from requiring a train or engine man to make mileage in excess of this limitation when the necessities of the service require it. The officials of each railroad will report to the regional director such arrangements agreed upon and any cases of failure to reach such agreements.

Section F—General Rules for Application of Wage Increases

(1) In the application of the scale the wage runs with the place. If in the past two years an employee has been

promoted, his new wage is based upon the rate of increase applicable to the new schedule governing the position to which he has been promoted.

(2) In applying these percentages to the hourly, daily, monthly, or mileage rates for December, 1915, in order to determine the rates to be applied, beginning January 1, 1918, each decimal fraction over 1 per cent shall be equalized as follows:

Less than one-fourth of 1 per cent, as one-fourth of 1 per cent.

Over one-fourth of 1 per cent, but less than one-half of 1 per cent, as one-half of 1 per cent.

Over one-half of 1 per cent, but less than three-fourths of 1 per cent, as three-fourths of 1 per cent.

Over three-fourths of 1 per cent, as 1 per cent.

(3) These increases are to be applied to the rates of wages in effect on December 31, 1915. They do not represent a net increase at this time.

(4) As to the employee who may have been promoted since December 31, 1915, his increase will be based upon the rate of his present position as of December 31, 1915.

(5) As to the employee who has been reduced in position, his increase will be based upon the rate of his present position as of December 31, 1915.

(6) The new rates named herein, where they are higher than the rates in effect on January 1, 1918, will be applied to the occupants of positions that carried the rates in December, 1915.

(7) In those cases where increases have been made by the railroads since December 31, 1915, in excess of the amounts herein ordered, present wages shall apply, for in no instance shall the application hereof operate to reduce present rates of pay.

(8) Reductions in hours between December 31, 1915, and January 1, 1918, are not to be regarded as increases in pay.

(9) The wage increases provided for herein shall be effective as of January 1, 1918, and are to be paid according to the time served to all who were then in the railroad service or who have come into such service since and remained therein. The proper ratable amount shall also be paid to those who have been for any reason since January 1, 1918, dismissed from the service, but shall not be paid to those who have left it voluntarily. Men who have left the railroads to enter the Army or Navy shall be entitled to the pro rata increases accruing on their wages up to the time they left, and the same rule shall apply to those who have passed from one branch of the railroad service or from one road to another.

(10) This order applies to foremen, chief clerks, and others employed in a supervisory capacity, as well as to their subordinates.

(11) This order shall be construed to apply to employees of railroads operating ferries, tugboats, lighters, barges, and any other floating equipment operated as terminal or transfer facilities, but shall not be construed as applying to railroad employees on cargo and passenger carrying equipment on lakes, rivers, or in coastwise or ocean traffic.

(12) The provisions of this order will not apply in cases where amounts less than \$50 per month are paid to individuals for special service which takes only a portion of their time from outside employment or business.

(13) Office boys, messengers, chore boys, and similar positions filled by employees who are under 18 years of age will receive the following increase per month:

\$20 increase per month where December, 1915, rate was from \$50 to \$45 per month.

\$15 increase per month where December, 1915, rate was from \$20 to \$30 per month.

\$10 increase per month where December, 1915, rate was less than \$20 per month.

Article III—Rules Governing Conditions of Employment

Section (a).—THE BASIC EIGHT-HOUR DAY

The principle of the basic eight-hour day is hereby recognized. Where employees are paid upon a daily or monthly basis, the new compensation herein established will apply to the number of hours which have heretofore constituted the actual day's work. For example, where an actual day's work has been 10 hours, the new compensation will cover the 8 basic hours and 2 hours overtime. Additional overtime will be paid pro rata.

METHOD OF APPLYING BASIC EIGHT-HOUR-DAY RULES

- (1) Position which in December, 1915, paid \$2 per 9-hour day:
Old rate, \$2 per day.
New rate, \$2.51 for 8-hour basic day.
Overtime, \$1.4 cents per hour.
New rate, \$2.83 for 9-hour service; 83 cents increase.
- (2) Position which in December, 1915, paid \$2.40 per 10-hour day:
Old rate, \$2.40 per day.
New rate, \$2.70 for 8-hour basic day.
Overtime, \$0.68—2 hours, at 34 cents per hour.
New rate, \$3.38 for 10-hour service; 98 cents increase.
- (3) Position which in December, 1915, paid \$75 per month, working 10 hours per day for 26 working days:
Old rate, \$75 per month.
New rate, \$84.60 per month basic 8-hour day.
Overtime, \$21.15—52 hours, at 40.67 cents per hour.
New rate, \$105.75 for same service; increase, \$30.75.
- (4) Position which in December, 1915, paid \$100 per month, working 11 hours per day for 31 working days:
Old rate, \$100 per month.
New rate, \$95.82 per month basic 8-hour day.
Overtime, \$35.93 93 hours, at 38.64 cents per hour.
New rate, \$131.75 for same service; increase, \$31.75.

Section (b).—RATES OF PAY FOR OVERTIME

This order shall not affect any existing agreements or practices for the payment of higher rates of pay for time worked in excess of any standard day. Time worked in excess of the basic eight-hour day hereby established will, when there is no existing agreement or practice more favorable to the employee, be paid on a pro rata basis, as indicated in section (a) of this article.

Section (c).—NO REDUCTION IN TOTAL INCREASE

Pending consideration by the Board of Railroad Wages and Working Conditions hereinafter provided for, no reduction in the actual hours constituting a day's work shall operate to deprive any employee, paid by the day or month, of the total increase in pay granted him by this order.

Article IV—Payments for Back Time

Each railroad will, in payments made to employees on and after June 1, 1918, include these increases therein.

As promptly as possible, the amount due in back pay from January 1, 1918, in accordance with the provision of this order, will be computed and payment made to employees separately from the regular monthly payments, so that employees will know the exact amount of these back payments.

Recognizing the clerical work necessary to make these computations for back pay and the probable delay before the entire period can be covered, each month, beginning with January, shall be computed as soon as practicable and, as soon as completed, payment shall be made.

Article V—Employment of Women

When women are employed, their working conditions must be healthful and fitted to their needs. The laws enacted for the government of their employment must be observed and their pay, when they do the same class of work as men, shall be the same as that of men.

Article VI—Colored Firemen, Trainmen and Switchmen

Effective June 1, 1918, colored men employed as firemen, trainmen and switchmen shall be paid the same rates of wages as are paid white men in the same capacities.

Back pay for period January 1, 1918, to May 31, 1918, will be based only upon the increases provided in Article II of this order for such positions. Back payments will not apply to the further increased rate made effective by this Article.

Article VII—Board of Railroad Wages and Working Conditions

There is hereby created a Board of Railroad Wages and Working Conditions which shall consist of the following members: J. J. Dermody, F. F. Gaines, C. E. Lindsey, W. E. Morse, G. H. Sines, A. O. Wharton.

This board shall at once establish an office at Washington, D. C., and meet for organization and elect a chairman and vice chairman, one of whom shall preside at meetings of the board.

It shall be the duty of the board to hear and investigate matters presented by railroad employees or their representatives affecting.

- (1) Inequalities as to wages and working conditions whether as to individual employees or classes of employees.
- (2) Conditions arising from competition with employees in other industries.
- (3) Rules and working conditions for the several classes of employees, either for the country as a whole or for different parts of the country.

The Board shall also hear and investigate other matters affecting wages and conditions of employment referred to it by the director general.

This board shall be solely an advisory body and shall submit its recommendations to the director general for his determination.

Article VIII—Interpretations of This Order

Railway Board of Adjustment No. 1 is authorized by Article 9 of General Order No. 13 to perform the following duty:

"Wages and hours, when fixed by the director general, shall be incorporated into existing agreements on the several railroads, and should differences arise between the management and the employees of any of the railroads as to such incorporation, such questions of difference shall be decided by the Railway Board of Adjustment No. 1, when properly presented, subject always to review by the director general."

In addition to the foregoing, other questions arising as to the intent or application of this order in respect to the classes of employees within the scope of Railway Board of Adjustment No. 1 shall be submitted to such Board, which Board shall investigate and report its recommendations to the director general.

Similar authority may be conferred on any additional railway board of adjustment hereafter created.

Decisions shall not be rendered by such boards until after approval by the director general.

Prior to the creation of additional railway boards of adjustment to deal with questions as to the intent or application of this order as it affects any other class of employees, such questions, with respect to such employees, shall be presented to the Director of the Division of Labor, United States Railroad Administration, Washington, D. C.

BRAZILIAN COAL FOR GOVERNMENT RAILWAY.—It has been announced that the Brazilian Central Railway (a Government-owned line) has contracted with the Sao Jeronymo Coal Mining Company, which is extracting domestic coal in large quantities, for 50,000 tons of Brazilian coal. According to a report from Vice Consul R. P. Mommensen, of Rio de Janeiro, the contract price is 50 milreis (about \$12.50) per ton.

Interior View of the Large Passenger Car Shop

New Grand Trunk Car Shops at Port Huron

Special Attention Given to Arrangement to Insure
Distribution of Power and Possibility of Extension

WITH THE EXCEPTION of the installation of machines the Grand Trunk has completed the construction of a complete new layout at Port Huron, Mich., for the construction and repair of freight and passenger cars. Including tracks and buildings the new plant covers an area of 55 acres and represents an expenditure of more than \$700,000. The layout includes two buildings for the repair of passenger cars with a total capacity of 27 cars, a steel freight car shop and a wood freight car shop each with a 28-car capacity, a repair track yard with a capacity for 200 cars and auxiliary buildings including a modern power plant, a cabinet shop, blacksmith shop, machine shop, wood mill, dry kiln, general offices and paint and general stores buildings, as well as a complete system of piping and fire hydrants for fire protection, watchmen's shanties and other facilities of minor importance.

One of the principal car repair shops for the Grand Trunk lines west of the St. Clair river has been located at Port Huron for many years. During the winter of 1914-1915 the old plant was destroyed by fire. Its loss was a serious handicap to the railroad and as its replacement with as little delay as possible was essential, work was begun on the plant as soon after the fire as plans could be prepared and the necessary property acquired.

The old plant which was built almost at the beginning of the road's operation was located in the older part of the city on the river front at the terminus of the line previous to the construction of the tunnel under the St. Clair river. It was small and inadequate and the site would not permit of the expansion necessary to meet present day needs. Furthermore its location precluded the provision of ample switching facilities.

Consequently, after the fire, it was decided to abandon the old site and locate the facilities on property adjoining the tunnel line and convenient to the main switching yard and roundhouse. At this point it was possible to lay out the plant in such a way as to produce a minimum amount of switching and a maximum degree of efficiency in the handling of bad order cars.

The Plant

In planning the layout of the new plant special attention was given to the arrangement of the buildings with a view to the economical distribution of power and the possibility of extension and to ensure the materials being handled by a direct movement from the stores to the finished car. To this end as may be seen in the general map of the plant, the power plant and stores buildings occupy a central location with the various other buildings located conveniently about the central unit.

The passenger car shops include two buildings, the larger shop being 134 ft. 6 in. by 305 ft. 6 in. with a capacity for 15 cars. The small shop is 134 ft. 6 in. wide by 140 ft. long and has a capacity for 12 cars. The cabinet shop, the only two-story building in the layout, is connected to the small passenger car shop.

These shops are so planned that each car under construction or repair occupies one bay with an ample allowance for working space. The two buildings are parallel to each other with a space of 100 ft. between them which is occupied by a Nichol standard 80-ft. electrically-operated transfer table, designed to carry 50 tons of cars.

Both buildings are of concrete and brick construction with

3-in. plank floors and tar and gravel roofs. The roofs are designed with monitors running across the buildings, lighting and ventilating each bay. Additional light and ventilation are provided by the windows. The middle sash of alternate windows are hinged and metal sash chain-operating devices are provided for the ventilators in both the windows and monitors.

The cabinet shop is 53 ft. wide by 250 ft. long. The first floor is occupied by the glue room, acid room and the upholstering room. The cabinet work is done on the second floor. An electrically operated elevator is provided in this building. The freight car shops provide the facilities for the construction and repair of freight cars. These shops are divided into equal sections by brick fire walls, one section being devoted to steel cars and the other to wood cars. Both sections of the shops are planned for the cars to enter at one end. A repair track yard with capacity for 200 cars is located convenient to this shop.

Each division of the shop is 78 ft. wide and 360 ft. long, providing a capacity for 28 cars. In addition to the standing tracks, four of which are provided in each shop, both sections are provided with two service tracks. The arrangement of these tracks is shown in the sectional plan. The natural lighting and the ventilation plans are similar to those of the passenger shops, as is the construction with the exception of the floor, which is of mastic laid on a 4-in. concrete base.

The power plant consists of the boiler room 55 ft. by 98 ft. and an engine room 35 ft. 6 in. by 70 ft. This building is of concrete and brick construction, with a tar and gravel roof, carried on steel trusses, thus avoiding posts in the rooms. A brick partition separates the two rooms. The floor in the boiler room is of concrete, while a maple floor is used in the engine room.

Three 200 b.h.p. and three 150 b.h.p. return tubular boilers are provided in the power plant, the boiler pressure being 150 lb. per sq. in. The boilers are fitted with superheaters giving 150 deg. superheat when coal is used and 200 deg. when wood refuse is used. Three of the boilers can burn either coal or wood, and three can burn coal only. They are

lines. Owing to the large amount of special work in painting and varnishing, the heating requirements in the plant are considerable, requiring about 50,000 sq. ft. of radiation, which is provided by means of cast iron radiators of the wall type and pipe coils distributed as required.

The brick chimney for the boilers is 150 ft. high, 13 ft. 5 in. in diameter at the base, and 6 ft. 6 in. in diameter at the

Interior View of the Wood Mill

top. It rests on a concrete base 30 ft. in diameter, and was built by the Heine Chimney Company of New York. The coal for the boilers is delivered direct to bunkers inside the boiler room by means of hopper cars discharging through a steel trestle having a capacity of two cars in the house. The ashes will be taken direct from the boilers through a pipe conveyor located beneath the floor in the building and rising

General Layout of the New Car Shop at Port Huron

adapted for hand firing because of the large amount of refuse of varied character which will be burned.

The boilers supply heat to the entire plant, power for two steam hammers in the blacksmith shop, and for testing out radiation in cars in the passenger car shops as well as for minor lines for heating water in the cabinet shop, glue room, etc. All steam lines are fitted with an asbestos insulating covering and are laid in concrete trenches in which space is also provided for steam return pipes, air lines to various buildings and tracks, water lines for fire protection and gas

outside to the proper height for delivery direct to a car. The ash ejector was furnished by the American Steam Conveyor Corporation, Chicago, and is operated by the ejection of steam from the boilers at the far end of the conveyor. The carpenter shop and woodmill are fitted with shaving exhaust systems, which delivers wood refuse to the boiler room. The draft for these systems is furnished by a fan arrangement.

The engine room contains two boiler feed pumps, two vacuum pumps, a fire pump, an open type water heater, and two air compressors of 2,500 cu. ft. combined capacity, of

the compound type, specially adapted for use with superheated steam. The superheat of these air compressors may be controlled by proportioning their supply of wet steam.

The machine and blacksmith shop building is 138 ft. by 299 ft. and is planned in a similar manner to the freight car shops, with a fire wall separating the two rooms. A cinder floor is provided in the blacksmith shop.

The woodmill is of frame construction and was built

ence as a result of having to remove one car to get at or remove another. Each compartment is separate from the other and capable of being used independently. The heat will be supplied by means of steam pipes located below the rail level. A special system of air ducts will provide ample air changes which will be capable of regulation. Provision is also made for the introduction of steam as required to check too rapid drying. The walls and the roof are insulated by air cavities so that an even temperature may be maintained.

The general stores building is constructed on the same general lines as the car shops, and is provided with racks and shelves designed especially for the varied stores which have to be carried in stock. Office space for the storekeeper and his staff is provided at one end. The other buildings include the paint stores building, the battery charging room, and a bicycle storage room and a garage at the main entrance. The paint stores building and battery charging room are of fireproof construction.

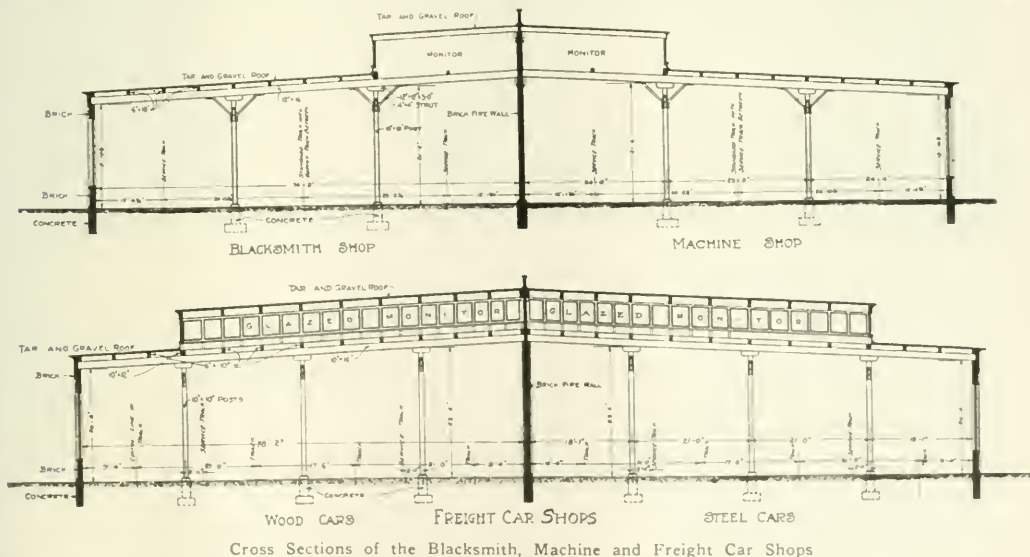

The general offices are attached to one end of the stores building with a brick firewall between. The interior is divided by means of terra cotta hollow tile walls, and the exterior walls are furred with the same material. All interior walls and ceilings are plastered and painted.

The layout provides for ample storage space for wheels, steel, lumber, etc., and special attention has been paid to economical operation. Ample sanitary facilities and lockers are provided in each building for a full quota of workmen when the plant is in operation. Electrical energy for lighting and for the operation of the machines is supplied by the Port Huron Electric Power Company. Provision has also been made for fire protection by the erection of a 100,000-gal. steel storage tank, 100 ft. above the ground line, with a complete system of piping and fire hydrants situated at convenient points. The fire pump in the engine

occupied by an industrial plant. To utilize the land properly for railroad purposes these buildings had to be removed. From these and the old roundhouse and freight car repair shops which were wrecked after the fire, large quantities of usable material were salvaged and utilized in the construction of the new plant with a considerable saving in the requirements for new materials, time and money.

This salvaged material, in addition to an old building which was moved bodily to a new foundation and re-

This entire project has been carried out under the direction of H. R. Safford, chief engineer of the Grand Trunk. The contractor was James Stewart & Company of New York.

Alba B. Johnson Elected President of Railway Business Association

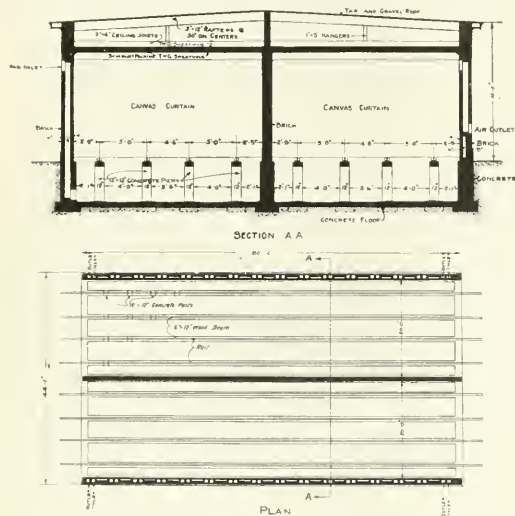

ALBA B. JOHNSON, president of the Baldwin Locomotive Works, was elected president of the Railway Business Association by the general executive committee at a special meeting held in New York, May 23, to take effect forthwith, George A. Post, who has served as president since the association was formed, having declined re-election. This was pursuant to authority given to the committee by the association at its convention in Chicago, April 8. The other elective offices, seven vice-presidents and treasurer will be filled later. The executive members, eight of whose terms have just expired, are appointed by the president. The secretary is a permanent officer during pleasure of the executive committee.

The committee on nominations and organization, in addition to recommending the election of Mr. Johnson, reported progress on organization to meet the problems arising out of adjustment to the new conditions in railway purchasing as discussed at the Chicago convention of the association.

It is expected that the election and re-organization will be completed at a meeting of the general executive committee to be called for some date in June.

Beside his work as a locomotive builder, in which capacity he is thoroughly familiar to the readers of the *Railway Age*, Mr. Johnson has for many years been active in the leadership of business organizations. He was chairman of several of the Foreign Trade conventions and president of the American Manufacturers' Export Association. He was the leader in the movement two or three years ago for strengthening and reorganizing the resources and service of the Philadelphia Chamber of Commerce, and is now president of the Pennsylvania State Chamber of Commerce. It was at the annual meeting of the Chamber of Commerce of the United States at Chicago in April that Mr. Johnson delivered his now well-known address urging a wide latitude for the individual railway manager in determining what locomotive designs are best adapted to the conditions under which he operates, and also urging that in whatever standardization might be attempted care should be taken to facilitate rather than obstruct mechanical progress.

News that Mr. Johnson had consented to undertake the presidency of the Railway Business Association was received

Section and Plan of the Dry Kiln

modeled, included 517,000 ft. b.m. of timber of all sizes, 900,000 brick and miscellaneous materials. The new wood mill requiring approximately 35,000 ft. b.m. of timber was built almost entirely of salvaged materials and the second-hand timber was utilized in other buildings for plank flooring, sheathing, rafters, sleepers, forms for concrete, sheet piling, etc. The salvaged brick were used as backing in the new brick buildings.

The miscellaneous materials recovered included 400 wood and 30 steel sash, 8,600 lb. of steel rods, bars and angles which were used as reinforcing in concrete lintels and in foundation work, and 8,000 lb. of steel utilized for anchor bolts, dowels, straps and plates. Also, several thousand

A Sectional View of the Passenger Car Shops

hangers and brackets used in connection with the heating equipment, etc., were manufactured on the site from second hand material by company blacksmiths. A considerable quantity of miscellaneous material such as pipe, fittings, valves, etc., were likewise salvaged from the industrial plant which was abandoned and a material saving in expense, as well as time, was effected by this arrangement owing to the rapidly increasing costs of new material and the difficulty in getting prompt delivery.

on all sides with expressions of gratification that a man so engrossed in operations on as large a scale as Mr. Johnson should have regarded the work of the Railway Business Association as a call which he ought not to decline, and of confidence that with his prestige and personality he would command the hearty support both of the members and of many other manufacturers whom it is hoped to enroll in view of the new conditions under which railway purchasing is now done.

Doings of the United States Railroad Administration

Bituminous Coal Prices; the Federal Managers; Standardization of Operating Statistics

New Regional Directors

DIRECTOR GENERAL McADOO has announced the appointment of N. D. Maher, president of the Norfolk & Western, as regional director of the new Pocahontas Region, with office at Roanoke, Va., and of B. L. Winchell, director of traffic of the Union Pacific System, as regional director of the Southern Region, with office at Atlanta, Ga., both effective on June 1. Mr. Winchell succeeds C. H. Markham, whose appointment as regional director of the new Allegheny Region, with office in Philadelphia, was announced last week.

The Pocahontas Region will include the Chesapeake & Ohio east of Louisville, Ky., Columbus and Cincinnati, O., including the Chesapeake & Ohio Northern, the Norfolk & Western and the Virginian and the terminals and harbor operations of all lines reaching Hampton Roads. In accordance with the policy announced by the director general last week that the regional directors, as well as the federal managers to be appointed in charge of the operation of each property, will be required to sever their official relations with the particular companies and to become exclusive representatives of the Railroad Administration, Mr. Maher has

Administration apparently regarded the corporations as its agencies, but only a short time was required to demonstrate that the corporations and the government bore to each other the relation of landlord and tenant and the impossibility of an officer in authority being able to serve both at the same time with equal loyalty has become increasingly evident as the negotiations between the government and the representatives of the corporations regarding the contract for the compensation of the railroads have progressed. Some of the leading railroad counsel have been transferred from the operating to the corporate organizations, as have the chairmen of boards or of executive committees, and they have been free to represent the interests of the stockholders in their relations with the government unreservedly. But on some roads the president performs the function of chairman and the necessity for vigorously supporting the interests of the stockholders in dealings with the government while at the same time working for the government and in effect on its payroll as an operating officer has created an embarrassing position for many railway executives which was apparent on both sides. Moreover, many railway officers do not like some of the policies which the Railroad Administra-

Region

W. J. Cunningham
Manager, Operating Statistics Section,
Division of Transportation

resigned as president of the Norfolk & Western and Mr. Winchell as director of traffic of the Union Pacific and both have severed all connections with corporate interests.

Federal Managers

The director general's announcement of the plan of appointing federal managers for each railroad property has caused more comment than any action taken since the government assumed control of the railroads. The dramatic effect of a proposal to displace some 200 of such powerful individuals as railroad presidents have been popularly supposed to be has led to some misunderstanding of the purpose of the plan and undue prominence has been given in many of the published reports to the idea of friction and lack of co-operation between the railroad officers and the administration. While it is known that there have been some instances of friction it has been due primarily to an inherent difficulty in the situation. For a time the Railroad

Administration is putting into effect and undoubtedly welcome an opportunity to retire gracefully from any active part in carrying out the government's program while continuing their former relation to their companies.

Pending the selection of the federal managers the railroad presidents will continue in charge of the operation of their properties, although the impression has been created by the newspapers that they were all deposed when the announcement was made that federal managers would be appointed. The selection of the federal managers is being made upon recommendations of the regional directors. It is probable that a considerable number of the presidents who are particularly operating officers will be retained in charge of operation as federal managers, leaving the corporations to be represented by the chairmen. It has already been announced that Samuel Rea, president of the Pennsylvania and Daniel Willard, president of the Baltimore & Ohio, will remain with the companies rather than become identified

with the Railroad Administration. It is stated at Mr. McAdoo's office that this is of their own volition and that of their directors and that no special action has been taken in case of either of them, but it is understood that they were called to Washington recently and informed of the intention to appoint federal managers for their roads.

While the official statement referred to the preservation of the identity of each railroad as a unit except so far as may be necessary, the boundary lines of the new regions which have been created will place several large systems in two regional jurisdictions and it is understood that in the case of the Pennsylvania and possibly the Baltimore & Ohio and some other systems separate federal managers will be appointed for the eastern and western lines, reporting to the regional director for the territory in which the lines in their charge are located.

Railroads to Pay More for Coal

President Wilson has settled the protracted controversy between the Railroad Administration and the Fuel Administration as to the price to be charged the railroads for coal, by a compromise under which the railroads will pay the regular government price fixed for all consumers by the Fuel Administration, but instead of giving the coal operators the benefit of the increase it will be used to reduce the general price of bituminous coal by 10 cents a net ton. It is estimated that this will increase the railroad fuel bill by approximately \$45,000,000 per annum, or an average of about 25 cents a ton, while it will save consumers in general about \$60,000,000. The railroads have always obtained their coal at a price considerably below that paid by other consumers, because they use such a large proportion of the coal output of the mines and because they were able to guarantee a car supply to the mines producing railroad fuel coal. This reduced the overhead expenses of the mine operators. When the government prices for coal were fixed last year the railroads in most cases were not affected because they had already made contracts for the coal year beginning April 1. As these contracts were about to expire this spring, John Skelton Williams, director of the division of finance and purchases of the Railroad Administration, endeavored to have the railroad contracts renewed at a low figure, but the Fuel Administration took the position that the railroads should pay the same price as all other consumers. This would mean a large increase in the operating expenses of the railroads and the plan was opposed by the Railroad Administration, which took the position that there were sound business reasons for selling coal to the railroads at a differential price whether or not they were controlled by the government. The controversy was referred to President Wilson, who had already established a precedent by ruling that the government should pay the same price for steel and other materials that it had fixed for other consumers. The railroad officers connected with the administration, however, advanced the argument that if the railroad price was to be increased, the coal operators would thereby receive such a large additional profit as to justify a reduction in the general price and this position was finally sustained by President Wilson.

The Fuel Administration has, therefore, issued an order, under the authority of the President, directing that all prices for bituminous coal, f.o.b. mines in the coal producing districts throughout the United States, fixed by the executive order of August 21, 1917, and subsequent orders of the Fuel Administration, should be reduced as to all shipments made after 7:00 a. m. on May 25, 1918, by the sum of 10 cents for each net ton of 2,000 pounds.

Another question raised in connection with the dispute as to the price of coal involved the question of disposition of coal cars, the Fuel Administration urging the abolition of the practice of giving mines furnishing railroad fuel a pref-

erential car supply. This point was resolved in favor of the Fuel Administrator. A statement issued by the Fuel Administration says that the reduction will mean an annual saving to consumers estimated by the Fuel Administration at \$60,000,000, and that the increased cost of railroad fuel occasioned by the President's order is also estimated at \$60,000,000 per annum. The reduction of 10 cents per ton on all coal will, however, reduce the net increased cost to the railroads from \$60,000,000 to \$45,000,000 per annum.

"Under the President's plan," the statement says, "the railroads will furnish cars to all coal mines alike without discrimination except as dictated by the prior requirements of the railroads for operating purposes and the needs of domestic consumers and of the war. Under the present war demands the maximum output of every mine, working at full time, would still be insufficient to meet the country's coal needs. The principle of equal car supply has accordingly been adopted so as to make for as steady an operation as possible of all properties and for continuous employment of men, thus making for maximum output. The introduction of the principle of even car supply will reduce the general average of overhead of mine operation and thereby justifies the administration in putting out a price reduction order."

The order has no effect on the price of anthracite coal.

Reduced Fares for Soldiers and Sailors

Under an order issued by Director General McAdoo, soldiers and sailors of the United States forces when furloughed and traveling at their own expense will be granted a rate of approximately 1 cent per mile for travel on railroads under control of the government. Agitation for reduced rates for soldiers and sailors has been going on for some time and several bills have been introduced in Congress for the purpose. The director general's statement said that the reduction was in realization of the fact that the payment of full railroad fare means a serious hardship to soldiers and sailors who desire to visit their homes before going overseas. The order is to be effective as soon as necessary details can be completed and the fare will be available on delivery to ticket agents of certificates signed by commanding officers. Such certificates of standard form will be prepared and distributed with the utmost promptness.

Committee on Operating Statistics

For the purpose of standardizing operating statistics and of keeping the Railroad Administration currently informed as to the results of railway operations as revealed by the statistics, the operating statistics section of the division of transportation has been created with W. J. Cunningham, James J. Hill, professor of transportation at Harvard University, as manager, and Joseph L. White, formerly statistician in the comptroller's office of the Union Pacific System, as assistant manager. To assist in the inauguration of the work, an advisory committee on operating statistics has been formed with Mr. Cunningham as chairman, and including also J. J. Ekin, general auditor, Baltimore & Ohio; J. G. Drew, vice-president Missouri Pacific; George R. Martin, vice-president, Great Northern; H. W. Mackenzie, comptroller, Seaboard Air Line, and W. C. Wishart, statistician, New York Central.

The operating statistics section has now been at work about three weeks and has received copies of the operating statistics forms used by the various railroads, which are being studied with a view to the permanent adoption of possibly seven or eight standard forms, which will not only be uniform in size and form, but will also employ units compiled on the same basis so that comparisons between different roads may be made on the basis of standard units. The idea is to introduce into the field of operating statistics a uniformity such as has been introduced into the accounting classification by the Interstate Commerce Commission. This will

enable the administration more readily to check up and compare the results being obtained on different roads. While the preliminary work of the committee consists principally of the initiation of a standard system of statistics it is to be continued with the function of collecting and analyzing the statistical returns.

Prof. Cunningham, who is on a leave of absence from Harvard University, has had an extensive experience in railway work and at the time he was appointed to the professorship in 1916 he was president's assistant on the Boston & Maine.

Transportation Charges Put on Cash Basis

The collection of transportation charges by carriers under federal control has been put on a cash basis, effective on July 1, by General Order No. 25 issued by Director General McAdoo, which provides that as of that date credit accommodations shall be cancelled which may be in conflict with the following regulations:

(1) Tickets shall be sold only for cash in advance of service. Baggage charges are subject to the same rule as tickets, except C. O. D. baggage and storage charges, which must be paid in cash before delivery.

(2) In cases where the enforcement of this rule, with respect to freight, will retard prompt forwarding or delivery of the freight or the prompt release of equipment or station facilities, carriers will be permitted to extend credit for a period of not exceeding 48 hours after receipt for shipment of a consignment if it be prepaid, or after delivery at destination if it be a collect consignment, provided the consignor if it be a prepaid consignment, or the consignee if it be collect, file a surety bond either individual or corporate, in an amount satisfactory to the treasurer of the carrier. The form of such bond shall be prescribed by the chief legal officer of the individual carrier, conditioned upon and providing for payment of all charges within 48 hours after forwarding or delivery of the freight. Upon receipt and acceptance of such bond a carrier may accept and forward prepaid consignments or may deliver collect consignments in advance of payment of all charges thereon to the amount covered by the bond. Failure to pay such charges within the time prescribed will automatically cancel such credit.

(3) Treasurers of individual carriers are required to arrange and conduct all matters relating to such credits. They shall designate the amount, end accept or reject the surety offered. Bonds may be required and accepted for individual consignments or blanket bonds may be accepted from individual shippers or consignees to cover all of their consignments for a given period, the period of the credit in such cases shall, however, be limited to 48 hours on each shipment as prescribed in the preceding paragraph.

(4) In case of any question as to the accuracy of charges, bills must be paid as rendered and claims presented for alleged errors. This will not prevent adjustments by agents of obvious errors.

(5) Freight consigned to "order" or to "order notify" shall be delivered only upon surrender to the agent of the carrier. If the original bills of lading for such freight, and the payment of the freight charges thereon as herein provided. Provided, however, if such bill of lading be lost or delayed the freight may be delivered in advance of surrender of the bill of lading upon receipt by the carrier's agent of a certified check for an amount equal to 110 per cent of the invoice, or upon receipt of a surety bond either individual or corporate acceptable to the treasurer of the carrier in an amount for twice the amount of the invoice.

(6) The extension or creation of local collection bureaus or agencies will be authorized by the director of public service and accounting, as and when such bureaus may be found to be necessary or expedient.

(7) Bonding or underwriting arrangements with respect to credits extended, now in effect by individual carriers, shall be discontinued as of July 1, 1918, or as soon thereafter as existing contracts are terminable.

(8) Advice of the foregoing regulations shall be promptly given to all to whom credit accommodations are now extended, so that the regulations may be put into effect at the time desired with as little inconvenience as possible.

(9) Payment of transportation charges by check will be considered as a payment in cash for the purpose of this rule, although, of course, if it is known to the agent to be fictitious, checks are not to be taken or cashed by agents under any circumstances, except for transportation charges.

(10) Until otherwise ordered by the director of public service and accounting, transportation service rendered other than to the federal government.

For the purpose of preventing inconvenience which might result from a rigid interpretation of the order, C. A. Prouty, director of the division of public service and accounting, has issued an explanatory circular as follows:

"The director general is about issuing an order putting the payment of all transportation charges upon a cash basis, and is especially desirous that this shall result in as little inconvenience as possible to the public. The rule should be interpreted in a practical business way. If, for example, the consignee who is financially responsible, is accustomed to send for his freight in the morning and the collection of the freight charge is effected in the afternoon, that should be treated as a cash transaction so long as the

consignee continues to pay its freight charge promptly upon presentation of the freight bill. Similar application of the rule should be made in the collection of a prepaid charge from a shipper. That is to say, payment of such a charge if made on the day the shipment is forwarded will be treated as a cash transaction.

"The enforcement of the cash rule will require payment by the shipper and consignee for the most part, without opportunity for the correction of errors in the freight bill, but in all cases where a mistake is obvious or where it is plainly indicated upon the face of the bill, the agent should make the correction before exacting payment.

"The director general is also anxious that the public shall understand that the reason for the promulgation of this order is to prevent discrimination between shippers and consignees. The extending of credit in the payment of transportation charges to one person while it is denied to another results in a preference in favor of the person to whom credit is given. While repeated attempts have been made in the past to check this evil, competitive conditions have rendered it impossible to do so. At the present time many shippers and consignees, especially large ones, enjoy with respect to many of their freight bills a credit not only of days but of weeks and sometimes of months. There seems to be no way of dealing with this except to enforce the cash rule.

"The director general further instructs me to say that he has under consideration rules, which will be promulgated in the near future, touching upon the settlement of overcharges and claims for loss and damage which he believes will result in the prompt and fair disposition of such matters with a minimum of inconvenience to the public."

Suits Against Carriers in Remote Jurisdictions

The Railroad Administration is taking vigorous steps to do away with the practice of prosecuting suits against carriers in remote jurisdictions, such as suits for personal injury, freight and damage claims, etc., which has caused a great deal of unwarranted expense to railroads in the past. In General Order No. 18, issued on April 9, the director general ordered that all suits against carriers while under federal control must be brought in the county or district where the plaintiff resides, or in the county or district where the cause of action arose. The order was later amended slightly in the interest of convenience. The director general has now issued a further general order, No. 26, to provide that such suits now pending shall not be brought to trial during the period of federal control, although new suits may be instituted in the proper place.

The order recites that "There are now pending against carriers under federal control a great many suits for personal injury, freight and damage claims, and that the same are being pressed for trial by the plaintiffs in states and jurisdictions far removed from the place where the persons alleged to have been injured or damaged resided at the time of such injury or damage, or far remote from the place where the causes of action arose; the effect of such trials being that men operating the trains engaged in hauling war materials, troops, munitions or supplies, are required to leave their trains and attend court as witnesses, and travel some times for hundreds of miles from their work, necessitating absence from their trains for days and sometimes for a week or more; which practice is highly prejudicial to the just interests of the government and seriously interferes with the physical operation of railroads; and the practice of trying such cases during federal control, in remote jurisdictions is not necessary for the protection of the rights or the just interests of plaintiffs."

It is therefore ordered that upon a showing by the defendant carrier that the just interests of the government would be prejudiced by a present trial of any suit against any carrier under federal control which suit is not covered

by General Order No. 18 and which is now pending in any county or district other than where the cause of action arose or other than in which the person alleged to have been injured or damaged at that time resided, the suit shall not be tried during the period of federal control; *Provided*, if no suit on the same cause of action is now pending in the county or district where the cause of action arose, or where the person injured or damaged at that time resided, a new suit may, upon proper service, be instituted therein; and if such suit is now barred by the statute of limitations, or will be barred before October 1, 1918, then the stay directed by this order shall not apply unless the defendant carrier shall stipulate in open court to waive the defence of the statute of limitations in any such suit which may be brought before October 1, 1918.

"This order is declared to be necessary in the present war emergency. In the event of unnecessary hardship in any case either party may apply to the director general for relief, and he will make such order therein as the circumstances may require, consistent with the public interest. This order is not intended in any way to impair or affect General Order No. 18—as amended by General Order No. 10-A."

Safety Work Being Organized

Rapid progress is being made by H. W. Belnap, manager of the safety section, with plans for establishing safety committees on every division of every railroad in the United States. While the majority of the roads in the past have had safety organizations, some of them have been much more active than others and Mr. Belnap, in consultation with some of the principal safety officers of the railroads, has been making a study of the various forms of organization with a view to establishing a uniform plan of organization on all of the roads and of prosecuting the work vigorously in all sections of the country. At a meeting in Mr. Belnap's office on May 23 and 24, attended by about 15 of the heads of the safety organizations of the larger roads, a general plan of organization was adopted, which follows closely the organization adopted by an auxiliary committee of the committee on transportation of the American Railway Association appointed in 1913 to consider the best method of promoting the widespread establishment of safety first organizations. Mr. Belnap is receiving hearty co-operation from the men that have been prominent in the safety first work on the railroads and is planning a vigorous campaign to extend safety and accident prevention work to every division. As there are approximately 1,000 railroad divisions in the country and as the safety committees will average possibly 20 men, it is expected that an organization of 20,000 men will shortly be engaged in the campaign for inculcating safety ideas among the railroad employees.

A. C. Needles, vice-president of the Norfolk & Western, has been appointed federal manager of that road and L. E. Johnson, chairman of the board, was elected president to succeed N. D. Maher, appointed regional director of the Pocahontas Region.

Short Lines

The question of the attitude of the Railroad Administration toward the short line roads is still arousing much interest and discussion. While a considerable number of such roads have already been practically relinquished at their own request, the names are not being made public pending the decision as to the others. A. H. Smith, regional director for the eastern railroads, recently gave out in a circular a list of 87 short line roads as having been relinquished. This has been rather widely published but at the offices of the Railroad Administration it is stated that a tentative list was given out through some error or misunderstanding and now Mr. Smith has issued another circular stating that it has been concluded to cancel the list and that the lines will

be further considered. Meanwhile the railroad presidents were directed to countermand any action based thereon. Of the 87 in the list only 12 had been relinquished and some of them never were under federal control. Instructions were issued that the universal interline waybill must be used by roads not under federal control if they expect to use joint rates.

In connection with the short line situation John Barton Payne, general counsel for the Railroad Administration, wrote the following letter to Senator Overman on May 18:

"Appropos of your discussion of the Carolina & Yadkin River Railway:

"I beg to call your attention to the very great difficulties which the Railroad Administration confronts with reference to the short line roads. You know, of course, that many people believe that the government should take these roads and operate them. Many of them are not necessary for any government purpose, but it is a matter of profound interest that they be continued in operation, because they serve the highest needs of many local communities. What is best has given the director general and his staff great anxiety.

"I submit the following suggestions as to a solution of the problem:

"(a) If the roads are taken over by the government, there will be an immediate raise in wages of all employees in keeping with the wage adjustment which has just been made with the trunk lines, and there will be a demand for an improvement in service and an improvement in general conditions on the lines, so as to bring the roads up to the standard of the trunk lines. This will be due to the fact that they are under government control and the government should treat everybody alike.

"(b) It seems to me that the roads themselves, the communities, and the government will be benefited if the following happens:

"(1) That the government see that the short line roads have a fair division of the joint rates; in many cases heretofore they have not enjoyed a fair division.

"(2) Also an increase in rates—this must be by the state commissions—so as to keep them on a parity with the rates on the trunk lines, which must be raised to meet existing conditions; also the government will see that the roads are furnished, as far as possible, with an adequate supply of cars, so that they may serve the public, and that the freight shall not be so routed as to discriminate against these lines.

"Please advise me whether, in your opinion, if the administration adopts such a policy as is here outlined, it will not best serve the public and the government."

New Appointments

C. R. Capps, traffic assistant to the regional director of the Southern Region at Atlanta, Ga., has been appointed traffic assistant to C. H. Markham, regional director for the Allegheny Region, with office at Philadelphia, and A. R. Smith, vice-president in charge of traffic of the Louisville & Nashville, has been appointed traffic assistant to the southern regional director, with office at Atlanta, succeeding Mr. Capps.

The Troop Movement Section of the division of transportation has been created and George Hodges, chairman of the Committee on Relations Between Railroads of the American Railway Association, has been appointed manager of the section with office in the Homer building, Washington, D. C. The troop movement section will arrange for and supervise the details of the movement of troops with their impedimenta, routing, provision of equipment, etc. Mr. Hodges has been in charge of this work since the entrance of the United States into the war, first, as secretary of the Committee on Co-operation with the Military Authorities, later as general secretary of the Railroads' War Board, and since the government took over the railroads, as the representative of the American Railway Association.

Annual Convention of the Railway Fuel Association

The Proceedings Were Dominated from Start to Finish By
an Enthusiastic Spirit of "Win the War"

THE OPENING MEETING of the International Railway Fuel Association was reported in the *Railway Age* of May 24, 1918, page, 1287. In addition to the papers published in that number, addresses were delivered at the first day's session by R. H. Aishton and Thomas Britt. These are given in part below.

The Railroads and Their Relation to the Fuel Problem

By R. H. Aishton

Regional Director, Western District, United States Railroad Administration

I was appointed Western regional director last January, just about the time that we were in the thick of the fuel problem, and I give you my word that the railroad's relation to the fuel problem last winter was a big one. I never want to go through such an experience again; and neither do the railroad men. There were times when there was not four hours' fuel in this city. If, by any effort of mine, and any effort of yours, we can prevent that thing occurring again, let's do it. Unless we do it, the coming winter is going to be much worse than last winter.

Facing what we face now, this association has the greatest opportunity ever laid before any set of men in the world. Our duty plainly is to support the men in uniform "over there." Suppose that we get the same enthusiasm on this fuel question—the same patriotic impulse on the part of every man in the vast army of two million railroad men in this country, that was shown in the Liberty Loan drive. There would not be any fuel famine; there would be no difficulty. There would not be any railroad problem if we would just do that. If we save one scoop of coal an hour on each locomotive it will save 765,000 tons of coal, or 17,000 carloads a year. Does any man in this audience believe he cannot do that? You may think that it is putting a heavy load on the fireman or the engineer. But there are a hundred ways in which coal can be saved other than through the engineer and fireman, and there is scarcely a man on a railroad that does not have some relation to coal saving.

Take the man in the shop. The intelligence put into the work and its inspection has an immediate effect on the

amount of coal a locomotive burns. The car man can have an immediate effect on coal consumption in the care of journals and lubrication. The train despatcher, with a little more energy and forethought in ordering his trains over the road, can save just as much as the fireman. The agent at the country station may keep a train waiting two or three minutes. The enginemen have to burn coal generously to make up the time lost through the agent's carelessness.

There has been a great shift in the movement of traffic in this country that very few people realize. When war broke out nearly four years ago it changed the flow from every coal-producing field in this country. Before the war all the vessels that came across the water were loaded with Newcastle coal, enough to bring them here and take them back. But the minute war broke out they reversed the operation. They took coal from us at Baltimore, Boston and everywhere else to carry them over there and bring them back. They couldn't get coal over there.

There was a tremendous growth of business in the Central Eastern manufacturing territory and New England. That shifted the movement of the coal in the West and the East, and we had to change the movement of our coal in Illinois, Indiana and Kentucky and take it into other districts. That readjustment is constantly going on.

Not only railroad men but the people who mine the coal can help. I worked in a mine myself once, and I know how much gobs, as they call it, can come up in a car of coal, and I know what an awful mess it makes when you attempt to put it in the firebox. That is a point on which the miners can help.

What can the operator who sells the coal do? I know of coal being mined in Illinois that is hauled on one railroad three or four hundred miles to the City of Chicago and then switched to the line of another railroad; there is a direct line which reaches the same point. We are trying to get arrangements whereby for instance, coal from the latter point will come over the latter line and not over the C. & E. I and we are building up our terminals here with that end in view.

Then there is the consumer. I don't think the consumer has reached the point where he realizes that the saving of an hour or a day in the unloading of a car of coal means anything. He must realize that it may save some soldier's life over in France. All of us—railroad men, consumers and

everyone who has anything to do with this movement—must get into the attitude expressed in Order No. 8 issued by Director General McAdoo on February 21.

Suggestions for Saving Coal

By Thomas Britt

General Fuel Agent, Canadian Pacific

Mr. Britt, who attended the convention as the representative of Sir George Bury, chairman of the Canadian Railways' War Board, spoke in part as follows:

There is an apparent annual shortage of over 50,000,000 tons of coal to be made up by elimination of wastage. What are we going to do to conserve fuel and thus help win the war?

First of all—what are we doing? The most drastic feature of our program has been the reduction in passenger service with a simultaneous increase in freight traffic; this, of course, as a matter of sheer necessity to meet war requirements. In the handling of freight we are seeking to apply the well-established principle, that the greater the speed, the greater the consumption of coal. Hence fast freights are by no means a desideratum. In addition we have endeavored to run our freight trains at full capacity tonnage, thus securing the maximum results with the minimum of fuel consumption. Another feature of fuel conservation is the elimination of needless delays by a careful arrangement of schedules and rapid despatching.

To say that good engineering is an essential element in the process of conserving fuel is to mention a basic principle. Our locomotive and boiler-house firemen cannot be too well instructed on this point; with them, in the final analysis, rests the successful issue of our present campaign. Mechanical devices such as superheaters, automatic fire doors, etc., may accomplish a great deal in avoiding unnecessary wastage, but certainly the human element is the dominant factor—we cannot get away from it. Give us a body of expert and conscientious firemen, and I dare say the problem is solved. Our firemen are as loyal as any group in the service, but quite frequently they fail to grasp the seriousness of the situation that confronts us, as well as the importance of the occupation which is theirs.

Another tangible means of saving coal to win the war is to substitute wherever possible, utilizing gas-house coke for heating stations, etc. A considerable amount of scrap wood can be utilized as fuel in shop boilers; old ties can be gathered up and burned for the same purpose.

I might more earnestly ask in exchange for our share in this worthy enterprise that our railroads be not overburdened any longer with a lot of foreign matter under the guise of coal. I have found it necessary to have whole carloads of this extraneous matter dumped into the ditch, it being absolutely worthless as fuel for any purpose. There is certainly no economy there. The situation is much worse if such matter finds its way into ships' bunkers—transports especially—for then the lives of thousands are placed in needless jeopardy. A remedy must be found for all this, and I have no doubt that the government will insist upon the proper cleaning of coal at the mines.

The overloading of tenders has been the cause in the past of an incalculable waste. Thousands of tons have been lost by scattering coal along the highway. Measures have been taken to avoid this frightful deficit, and yet observation along the right-of-way of our railroads would indicate that there is still room for improvement. Ashpits also are frequently a source of wastage.

Looking at the question in a broad way, is it not quite evident that we are just beginning to wake up to the necessity of economy? Moreover, have we not literally squandered our inheritance by failing to economize? Now that the times are critical, we are endeavoring to amend matters. The pinch of want together with the soaring of prices are making us all realize that our only salvation lies in saving.

The Need for Fuel Conservation

By P. B. Noyes

Director, Bureau of Conservation, United States Fuel Administration

The solution of the war fuel problem is a task quite beyond the power of any administration or administrator. It lies in the hands of a thousand agencies and millions of men. It is because the men gathered here can do more to help the Fuel Administration serve the war than any similar group in the country that Mr. Garfield has taken such a keen interest in this convention.

The coal supply is short. Last winter it was short and the immense new requirements for war purposes threaten to make it shorter still the coming winter. The data we have compiled show that 625,000,000 tons of bituminous coal will be needed this year. The mines which must get out the coal, and the railroads which must carry it, were pressed nearly to their limit before the war. They cannot take on 200,000,000 tons of additional production. Fix your minds on what you know of the burdened condition of the leading railways three years ago. Add to this the tremendous burden of war supplies, troop transportation, material for ship building, and food for our Allies, and then picture to yourself what it means to those same railways with facilities little if any greater than three years ago, to provide transportation for 200,000,000 additional tons of coal. Conceive of this increase as 16 solid trains of gondola cars filling 16 tracks from New York to San Francisco. A veritable freight yard filled with coal cars extending the breadth of this continent. And this represents only the increase of coal transportation demanded of the railroads. All of those four million cars must be switched in and out and carried hundreds of miles by our already burdened transportation system if war demands are to be met and the usual industrial life of the country be at all preserved.

The coal business is in physical proportions so far beyond any other business in the country that emergency remedies which can be successfully applied to any of the others will hardly make a dent in the coal shortage. To meet the demands this year 12,500,000 tons of bituminous coal must be hauled every week. And yet, the success of the war is likely to depend just on this supply of coal. Coal to manufacture supplies and ammunition on a greater scale than Germany, and coal to transport these supplies and transport millions of men both in this country and across to Europe, is the first essential of our success. Behind this we have the necessity for coal to maintain life at home, to preserve our economic system and keep our ordinary industries running and keep labor employed. As much coal as was mined last year will be needed this year for war purposes alone. We must save 65 or 70 million tons or go to the restriction of so-called non-essential industries.

There has been much talk of shutting down non-essential industries but a little investigation shows that only a short distance down this road lies financial ruin and unemployment of labor on a scale which would bring disaster at home and failure in war. At least twenty billion dollars of capital is invested in legitimate manufacturing enterprises producing goods not strictly needed for the war. Ten million men support their families from the work they do in these factories.

All responsible agents of the government now realize that keeping labor reasonably employed and only taking it away from non-war work as fast as it can be employed on war work, is nearly as important for success in this war as the manufacture of munitions and ships. Granted that we must have 100 per cent fuel for munitions and ships, we shall fail as a nation if we do not provide this without a complete breakdown of our industrial system.

Here is a new aspect of fuel economy. You have often

been told how a shovelful of coal saved means more guns and more ships and more supplies for our soldiers. Have you realized that the only hope of keeping our other industries going and the great working population of the country prosperous and happy lies in a greater production of coal than seems at this time possible, or in a saving of coal now wasted by carelessness?

Fuel is a small part of the raw material of most manufacturing institutions. The fuel expense in most highly organized industries is little over one per cent of the total cost of the goods. On the other hand, this one per cent. is absolutely vital. Without it the factory closes. The other 99 per cent are useless. We are called upon to view a ton of coal as equal to five or six hundred pounds of ship plates or shells, but every ton of coal saved for our factories means the employment or non-employment of a hundred men.

This is the new idea I wish to bring you today. That over and beyond the desperate need of coal for war purposes lies an equally desperate need of coal to preserve the lives and happiness of the population. The threatened shortage of coal can easily mean unemployment and financial ruin.

Those of you here who produce coal should realize that every extra ton you take out of the mine is likely to keep a hundred extra workmen from idleness and you who are re-

enthusiasm or other stimulus, gets up to 75 per cent of his possible, is a brilliant success in his field of endeavor. The background of this terrible war is raising the efficiency of every man and woman in the United States. The more the meaning of the war has come home to us, the more we have approached our possible efficiency. This is a real force and should be applied directly to fuel economy.

There has been much discussion as to what will "win the war." Not every one, I fear, has faced the terrible alternative of what it would mean to lose the war. Let me tell you what I think it would mean.

Only once in civilized times has a single race dominated the world. Only once has a swollen tyranny proved so powerful that no human power could oppose it. The Roman Empire was such a world dominion—brutal, restless. The Roman Empire could not be destroyed from without—it died from internal decay. But what did this mean to the world? The Roman Empire was one thousand years decaying. A thousand years known in history as the "dark ages." For a thousand years civilization and all that it stands for went backward into darkness.

Here is the black threat of the present struggle as I see it. Another brutal autocracy threatens to ship the leash and get beyond the power of civilization's curb. Another world

P. B. Noyes

Director, Bureau of Conservation,
United States Fuel Administration

Labor Advisor, United States Fuel
Administration

Harry N. Taylor

Vice-President, Central Coal & Coke
Company

sponsible for consuming the coal can enjoy the thought, when faithfulness and care have saved a ton, that you have thereby made a hundred families happy. If you remember that railway locomotives burn more than a quarter of all the coal mined in the country, you will not accuse me of exaggeration when I say that it is in your power and in the power of the railway firemen and the organization with which he works to save enough coal to turn threatened national disaster into national prosperity.

Fuel economy in a scale which will really save the country from industrial disaster demands first, a study of methods and, second, a willingness to take pains. I am especially interested today in getting through to you the full significance in this crisis of every man's "doing his best."

It has been rightly said that if every man who burns coal will do the very best he knows how without a word of new information, the saving effected will result in plenty of coal for every purpose. Under the present stimulus, I credit every one with giving more attention to economy than ever before, but this matter of doing one's best is relative. It is proportioned to the background of necessity which lies in our minds.

Few men ever reach 100 per cent of their possible efficiency. Most of us never reach 50 per cent. Any man who through

dominion, another Roman Empire. And it is not of the tyranny, the slavery and misery of that world empire in its heyday that I am thinking. It is of the ages of decay. For a thousand years, perhaps five thousand, the world would struggle in darkness while the German Empire was decaying. In my mind, we are not struggling for the happiness of our children or grandchildren. It is for 50 generations which, if we fail to win this war, may flounder in the black mire of a powerful but decaying German Empire.

It is with such a background that I appeal to you to make the efficiency of your work one hundred per cent perfect. Start today the real campaign, the most practical campaign, the every-man-do-the-best-he-knows-how-campaign. Miraculous results will follow.

A paper on the fuel oil situation was prepared by M. L. ReQua. In his absence the paper was read by Robert Collett, assistant manager of the Piere Oil Corporation.

The normal increased consumption of fuel oil for the year 1918, based upon the average increase over a period of 14 years, will approximate something over 20,000,000 bbls. An abnormal increase due to war conditions, will probably greatly add to this amount.

The only possibility for reduction in consumption is that induced by high prices. To what extent this may retard

business is uncertain, but the consensus of opinion is that it will have small effect owing to war conditions. We are, therefore, faced with the necessity of handling a tonnage considerably in excess of last year, viewed solely from the standpoint of railroad transportation.

As you are aware, a large percentage of the tank steamers which have hitherto supplied the Atlantic coast refiners with their supply of crude oil from Mexican and Gulf ports have been taken over by the navy for trans-Atlantic service.

As a consequence a material readjustment in transportation facilities becomes necessary. The deficit caused by the taking over of the tank steamers, as well as by the increased consumption, will have to be made up by increased pipe-line and tank-car movement. Arrangements have been made by which crude oil deliveries by pipe line to the Atlantic coast will be increased about 26,000 bbls. per day—which is equivalent to about 20,000 bbls. per day of fuel oil. Still further increases in pipe-line capacities are under way which will materially increase their efficiency. But at the very least calculation an additional rail movement in tank cars of about 100,000 bbls. per day will be necessary in order to take care of the urgent fuel oil requirements in the Atlantic coast territory.

Production of oil in the United States is divided, approximately, in the following proportions: California 30 per cent; Wyoming, 3 per cent; Texas and Louisiana, 17 per cent; the mid-continent field of Kansas and Oklahoma, 40 per cent; Illinois and Indiana, 4 per cent; and Pennsylvania, 6 per cent.

If coal were available it would be highly desirable that the use of oil be discouraged wherever possible; but unfortunately conditions governing the supply of coal are also acute. We are stating the problem, therefore, from the viewpoint of the oil division of the Fuel Administration, in the hope that, if conditions make it possible, the substitution of coal for oil may be made wherever practicable.

It will be necessary to move a great many trainloads of fuel oil for the shipping board and the navy from Texas or Oklahoma to the various ports on the Atlantic coast, and the supply of tank-car equipment will be taxed to its utmost to fill the requirements; consequently any saving in this movement, by substituting coal for oil in the territory east of the Mississippi and permitting the fuel oil so saved to move by the shorter distances from the Indiana-Illinois fields and from the Pennsylvania fields to the Atlantic coast, will represent a very great saving in transportation.

Another feature of our problem is to convince the consumers of petroleum products of the necessity of increasing their storage capacity and to take advantage of the summer months to accumulate storage to carry them over during those months when the transportation facilities will be congested. This applies equally to the railroad companies and those industries that have been in the habit of living from hand to mouth, as it were, in the matter of their oil supplies.

A campaign of education for the prompt unloading of tank cars by the railroad shops is very urgent. Motive power departments particularly have a habit of partly unloading a tank car at one shop, then switching it to another division point for further unloading. In this way they are responsible for the outrageous abuse of tank cars of private ownership.

The probability of the return of any of the tank steamers which have been commandeered by the navy, or for the construction of new tank steamers before the spring of 1919 is very remote; consequently it is of vital importance to the war program that the oil division of the Fuel Administration should have the thorough co-operation and support of the coal men and the railroad men to prevent a fuel oil famine and a return of the conditions which obtained during January and February of this year.

What the Coal Operator Can Do

By Harry N. Taylor

Vice President, Central Coal & Coke Company, Kansas City Mo.

There are three great factors concerned in this question of fuel supply and distribution, any one of which can render helpless the other two—the producer, the transporter and the consumer.

The producer may be ready to ship the coal and the consumer be ready to take it; but if the transportation is lacking, the other two are helpless. The railroads act in a dual capacity in relation to the fuel situation—they are both transporters and consumers; but viewing them from their primary standpoint—transporters—let me say that I believe no body of men in this broad land of ours is more alive to the importance of the work before them, or will more patriotically perform their duties than the great army of railroad men.

The coal operator, whom we class as the producer, is passing through the most extraordinary period in the history of his industry. He is confronted with the most tremendous task of supplying an ever-increasing demand, while the means at his command are being constantly curtailed and production threatened. His men are being enlisted or drafted into the army, his machinery is wearing out through constant use during the strenuous year just passed; there is little hope of replacement, owing to the heavy demand made on all machinery manufacturers for war supplies.

His allies—the railroads—are also being called upon to move an extraordinary tonnage created by war demand, which taxes them beyond their power of performance. This necessarily hampers the coal operator, through lack of motive power and shortage of car supply. Surely we are all confronted by a great task, calling for determination and courage if it is to be successfully accomplished; but that is just what must be done. Every one of us must first think, then plan, then do, and the do must be spelled with a capital D.

The railroads, the second link in the problem, have had in the past five or six years a situation very similar to that of the coal operator. Constantly increasing costs of labor, material and supplies, with no means at their command to increase revenue to meet the demands made upon them, they have fought manfully against these adverse conditions, and have done wonders with the resources at their command. Now that the extraordinary demands of the war are forced upon them, they face difficulties seemingly insurmountable.

In the past few years many roads have been forced into actual bankruptcy, while others were forced to make heavy drafts on surplus earned in the past to provide motive power and cars to meet these emergencies. For years the big shippers of coal have done all they could to aid the railroads, by joint appeal to get permission to increase rates, so as to make a fair return for service rendered, and to provide means for adequate motive power and cars properly to conduct their business. This was done, not because the coal men are philanthropists, but because they realized that unless this was done they would pay far more dearly for enforced idle time at their mines for lack of adequate car supply than they would pay through a reasonable advance in rates.

The demands of the public for coal supply now requires steady and full running time at all mines, six days per week, every week in the year.

When the legislative bodies governing railroad operations finally realized the true situation, and were made to believe what the railroad managements had been saying for six long years, a change in conditions had arisen, which, even with increased revenue, made it almost impossible for the railroads to secure the necessary equipment, owing to congested conditions in all manufacturing establishments.

Link number three in the problem is the consumer. The consumer now finds the situation up to him, and as yet only

a comparatively few have realized the great responsibility resting on the vast consuming public, if the threatened shortage in coal supply is to be overcome.

Although the figures available at Washington show that there was produced in the year 1917, 550,000,000 tons, in round figures, of bituminous coal, while the largest production in any previous year was 505,000,000 tons, still in the face of the fact of this extraordinary increase in production, the year 1917 found this country so short of coal that even though the figures showed a splendid increase the country faced an actual coal famine. Every railroad, manufacturing interest and individual consumer was brought face to face with a shortage of supply, the like of which was never before experienced. In ordinary times, this great increase of almost 50,000,000 tons would have found the coal industry demoralized by over-production, while the actual condition in the war year of 1917 found us destitute of fuel in many parts of this broad land of ours, found our war preparations hampered, found our railroads and manufacturing plants crippled, and threatened the successful outcome of the war.

Coal was the main-spring of industry in peace times, but it is the very heart and sinews of the country's welfare in times of war. We have had the experience of 1917 to guide us as to our duties and necessities for 1918. We know we must produce 50,000,000 additional tons of bituminous coal in 1918 over and above the production of 1917, if we are to meet the demands and necessities of the war.

There are two ways by which the threatened shortage in coal supply can be overcome: First, by increased production; second, by conservation. Every effort is being put forth by the coal operators and miners' organization, the individual miner and the railroads to produce the maximum tonnage.

The records of production as reported from Washington from week to week since January first are not entirely satisfactory. One week we show a little gain, and another week we show a little dropping back. This record, so far this year, compared with the previous year, on the whole shows a little gain, but not enough to spell security.

We can make a splendid inroad into the shortage ahead of us if we will pay special attention to the conservation of coal, and conservation must be called upon to a greater degree this year than ever before, if we are to meet the war necessities. If the coal operator will see to it that the miner gives him clean coal, and if the miner will follow out his patriotic duty and clean the coal, as he should, at the face, by the elimination of impurities, we will relieve the railroads of the necessity of hauling the impurities, we will add greater efficiency to the performance of the locomotive power, and aid in the movement of trains. Clean coal will add to the efficiency of every manufacturing plant and every warship and transport, giving more speed to industry, and will help win the war by adding efficiency as well as supply.

By eternally trying to produce, and infernally trying to conserve, with every effort we have within us bent towards the end of our patriotic duty, with the great consuming public alive to the real situation, with every citizen a helper, not a knocker, we can and will meet this great need of coal.

What the Coal Miner Can Do to Help

By John P. White

Labor Adviser, U. S. Fuel Administration

There are upwards of 700,000 men employed in and around the coal mines. This vast army of men engaged in this very important industry plays a great part in the prosecution of the war, because upon the success of coal production largely depends the efficiency of our nation in this crisis.

The miners early realized that it was necessary to stabilize conditions during the period of the war, and when the Washington wage scale was negotiated by the miners and operators and approved by the Government an advanced step was

taken towards the attainment of maximum coal production. At no time in the history of the mining industry has there been such peace and tranquility as now prevails, and it is due to the fact that both operator and miner realize the duty they owe to the government in this crisis.

The coal miner by loading every available railroad car can aid in increasing the production of coal for transportation to the various markets of the country. During last winter's severe fuel shortage the miners in many localities in this country worked on holidays and Sundays in order to relieve the situation. If an adequate car supply can be regularly maintained in the principal coal producing districts of the country by the railroads, there will be no need for alarm about shortage of fuel, because we have an abundance of coal and a great army of the best coal miners in the world. If given steady employment the 87,000 mine workers in Illinois could produce 150,000,000 tons of coal annually instead of working 160 days and producing less than half that amount.

If the operators, the miners and the railroads co-operate, an abundance of coal for all needs, domestic and otherwise, will be supplied. My knowledge of the miner leads me to believe that he is willing and anxious to enter upon team work in this matter with his employer, the government and all concerned, if given the proper opportunity; and it is only by this method that maximum results can be obtained. The miner has always been a man who loved his independence and he can be relied upon to contribute his full effort when approached in the proper spirit. In other words, he will co-operate, but cannot be driven.

The miners sense their duties in this war as keenly and as loyally as any other group of citizens. They are engaged in a most hazardous occupation and are entitled to the sympathetic co-operation of the government and the public, as well. They are a militant body of men that love their rights, and their organization, which is the labor expression of the mining industry of this nation, has been one of the greatest agencies we have, in my humble judgment, for the promotion of industrial peace during this war.

The coal operator should see that the individual working place is ready for the miner so that he may load his day's output of clean, marketable coal; the railroad should endeavor to see that the cars which are promised are at the mines; and the miner can afford to relax those rules which in normal times he feels justified in maintaining and take into consideration that we are now engaged in the greatest war in the history of mankind. Team work from the forces herein enumerated, including the government through its Fuel Administration, will make it possible for our men at the front and our Allies to be supplied with everything necessary to the successful prosecution of the war.

Individual Effort Toward Fuel Saving

By Eugene McAuliffe

Manager Fuel Conservation Section, Division of Transportation, United States Railroad Administration

The most important angle of my subject to which consideration should be given, is that of individual effort, greater effort, a more unified effort than we have in the past attempted. We are making tremendous strides toward greater individual effort. We have passed the first mile post, but what we who remain at home, we, the real reserve force of the American Army must do, is to complete the work of reconstruction of our daily lives so as to make ourselves a living, breathing, fighting part of the country's military force, standing unalterably behind the men at the front.

War is a contest, not alone of fighting skill, but of mining skill in tons output; of railroad skill as measured by raw and finished materials moved, passengers, including soldiers and sailors moved. We are, as I said before, soldiers all,

perhaps ununiformed, but standing behind our boys who are the first line troops, standing behind that first line in solid formation with every faculty alert and active, every muscle strained, ready and anxious to give support when the assault comes and not a shifting, careless, care-free dollar-seeking crowd, careless of the measure of duty we perform, indifferent to the quality of the material we produce; indifferent as to whether it arrives on time or otherwise. There can be no middle course, we must take on more responsibility. More work. One-third of the man power of the country, or more than ten million men are now directly, or indirectly, engaged in the war and the end is yet far off. The casualty list, as yet a tiny, trickling stream, will soon grow into a brook; it will pause as it runs past the door of many, many an American home. If we are to prevent this brook from growing into a river, a river of American and Allied blood, we must as miners and railroad men, mine coal, mine clean coal, move coal and save coal; we must crush our individual prejudices, our likes and dislikes. We must "Carry On"! Can we not as miners and railroad men strip ourselves of all passion for profit; all controversy and prejudice; all obstruction, of whatever character; and go out with the determination to forget self; with the firm determination to follow our ideals, the successful conclusion of which will offer worldly opportunity without end?

At this time I can only urge effort, studied effort, along the lines you men of experience well know; with the maximum of patience in dealing with the thousands of new men who are entering the mines and the transportation service. A little more effort, a trifle better understanding of the supreme necessity of completing the task we have begun, looking to the present hour as one of cheerful sacrifice, the future one of return, in spiritual and material wealth.

You have been asked to come to this meeting, perhaps at material sacrifice to yourselves to assist in launching a coal conservation movement inaugurated by the United States Railroad and Fuel Administrations. What has been said in the past two days should inspire us all to greater effort. This meeting of coal miners, coal operators and railroad men, suggested an opportunity to make a stentorian appeal for more coal, cleaner coal, and the saving of coal and fuel oil.

Other Business

Warren S. Stone, grand chief of Brotherhood of Locomotive Engineers, who was on the program of the first day's session, was unable to attend.

At the opening of Friday's session a telegram from C. R. Gray, director division of transportation, United States Railroad Administration, was read. Mr. Gray expressed regret that he could not attend the convention as he had planned. A telegram from H. A. Garfield, United States Fuel Administrator, was also read. Mr. Garfield regretted his inability to attend the convention and promised that the Fuel Administration would work hand in hand with the International Railway Fuel Association.

The meeting on Friday was also addressed by C. E. Allen, deputy fuel administrator of Illinois, who spoke on "The Supply and Distribution of Fuel."

On Thursday evening a meeting was held in the Louis XVI room of the Hotel Sherman at which motion pictures, prepared under the direction of Major E. C. Schmidt of the United States Railroad Administration on the Minneapolis, St. Paul & Sault Ste. Marie, were exhibited. These films showed the results of good and poor methods of firing by scenes on the road and close-ups of the interior of fireboxes. The proper methods of building fires were also illustrated and sections of the films pointed out the need of co-operation by employees in all departments of the railroad in order to secure the maximum economy in the use of fuel. Several copies of these films will be sent out by the United States Railroad Administration and they will be exhibited before

audiences of railroad men in all sections of the country.

On Friday afternoon a business session was held at which the following officers were elected: President, L. R. Pyle, fuel supervisor M., St. P. & S. Ste. M.; vice-presidents, C. M. Butler, supervisor of fuel, Atlantic Coast Line; J. B. Hurley, road foreman of engines, Wabash Railroad, and H. B. MacFarland, engineer of tests, Atchison, Topeka & Santa Fe; secretary-treasurer, J. G. Crawford, fuel engineer, Chicago, Burlington & Quincy. Executive committee for two years: R. R. Hibben, assistant fuel agent, M. K. & T.; B. P. Philippe, coal agent, P. R. R.; T. Duff Smith, fuel agent, Grand Trunk Pacific; A. N. Willsie, chairman fuel committee, C., B. & Q.; for one year: H. B. Brown, superintendent fuel department, L. V.; L. J. Joffray, general fuel inspector, I. C.; H. Woods, fuel inspector, C. & A.

During the meetings addresses were made by Sergeant Brown, a Canadian soldier; Trooper Scott, of the Anzacs, and Private Peat. A detachment of the band from the Great Lakes Naval Training Station furnished music.

A Simple Milk Ticket

RAYMOND C. FISCUS, chief clerk of the passenger department of the Lake Erie & Western, at Indianapolis, Ind., has devised a new and simplified ticket for use by the baggage department of that road in the transportation of milk, and he has applied for a patent on it. One of the three coupons of this ticket is reproduced in the engraving. Above the coupon here shown is a similar one for use in returning the empty can to the shipping point, and the lower one, of the same size, is used as the selling agent's stub. The matter on the upper coupon and on the

| LAKE ERIE & WESTERN RAILROAD CO. | | | | | | | |

| Form C. M.-I | | | | | | | |

stub has been so arranged that the three coupons, being folded together, can all be punched at the same time.

Heretofore, different forms and colors of tickets have been used for cans of different size and for different destinations; and cream tickets have been different from milk tickets. This form answers for all of the varied conditions. Where the traffic is heavy the name of the station from, or the station to, or both, can be printed on the tickets. The ticket is fastened to the can by means of an eyelet in the upper end of the upper coupon; and the upper coupon remains attached to the can until the return journey is completed.

This form has already been adopted by several lines.

SUEZ CANAL BRIDGE FINISHED.—The swinging bridge over the Suez Canal at El Kantara, about thirty-five miles south of Port Said, Egypt, has been completed. The bridge affords direct railway communication between Cairo and cities in Palestine.

Activities of Western

Regional Director

R. WASHINGTON, regional director of western railroads, Chicago, is the first regional director to take any steps toward the unification of telegraph service. In Circular No. 107 sent to western lines on May 22, he announced that the following wire connections had been arranged for handling the business of the executive and administrative departments of the Railroad Administration. The purpose of establishing these wire routes, he says, is to relieve commercial telegraph companies and avoid the payment of telegraphic tolls by the railroads.

Send messages to the Chicago & North Western general office telegraph office, Chicago, for following:

Director-general department, including car service section, Washington, D. C.; the regional director of eastern railroads, New York City; the regional director of southern railroads, Atlanta, Ga.; and the regional director of western railroads, Chicago, Ill. Routes to New York and Atlanta are open at all times. For Washington, through wire service is provided at 11 A. M., 4 P. M. and 8 P. M., central time.

CHICAGO-PORTLAND, VIA OMAHA

Wire route C. & N. W. Omaha, U. P., O. S. L., Denver, Ogden and Salt Lake; O. W. R. & N. Portland.

CHICAGO SAN FRANCISCO AND LOS ANGELES VIA OMAHA

Wire route C. & N. W., U. P., O. S. L., Ogden, S. P. San Francisco and Coast Line points, L. A. & S. L. Los Angeles.

CHICAGO-PORTLAND AND SEATTLE VIA ST. PAUL

Wire route C. & N. W. St. Paul; N. P. Tacoma; S. P. & S. Portland.

Wire route C. & N. W. St. Paul; G. N. points their line.

CHICAGO-ST. LOUIS-KANSAS CITY

Wire route—Wabash, St. Louis and Kansas City.
Missouri Pacific, St. Louis, Kansas City.
Rock Island, Chicago-Kansas City.
Santa Fe, Chicago-Kansas City.

CHICAGO-ST. LOUIS-KANSAS CITY FOR BEYOND

St. Louis to Southwestern points via M. K. & T., St. L. S. W. or M. P. through Railway Exchange Building.

M. K. & T., all points including Houston.

M. P. for T. & P. and I. & G. N. points.

St. L.-S. F. and T. R. R. A. loop or pony wire connection arranged with Wabash effective May 21.

Kansas City M. P., Pueblo; D. & R. G. Denver; connection Denver with Colorado Southern by messenger.

K. C. T. and K. C. S. will later have loop or pony wire connection with M. P. for present such business can move via Santa Fe or Rock Island through K. C. T. Office.

Santa Fe, all points their line and G. C. & S. F. in Texas.
Rock Island to points Southwest their line, T. & P. Fort Worth and E. P. & S. W. El Paso.

General Service

Railroads not enumerated and having wire connections with routes indicated should take advantage of this service through such connections. To make this arrangement a success it is important messages be handled promptly through relay offices.

Payments—Publications

In Supplement No. 3 to Circular No. 65, issued on May 22, the regional director says: "The director general has reached the conclusion that railroad companies will be permitted to charge to operating expenses the customary pay-

ments to such publications as Poor's Manual, Moody's Manual, John Moody's Manual, the Financial Chronicle, etc., for maps and subscriptions.

Approval of Contracts

Circular No. R. P. C. 11, issued on May 23, by the western regional purchasing committee, gives the following instructions:

Roads should continue to make contracts for material and supplies when it is advantageous to do so. Contracts should not be made for a longer period than one year, nor contain a clause permitting them to run until notice of cancellation. If it is believed that a contract should run longer than one year, the reasons should be stated and the matter will be taken up with the regional director for approval.

Contracts should conform to the regional purchasing committee's general letters dated April 24 and April 30. Copies of all contracts and extensions thereof now in force which have not been filed, should be sent this committee at once. In submitting contracts for approval, attach a tabulation of the competitive bids, and if the contract price is not the lowest explain why it was accepted. It is realized that the lowest price is not always the most advantageous, but the committee would like to have an explanation in such cases for its information.

An agreement or order for material to cover delivery over an extended period, should be treated as a contract in submitting to the regional purchasing committee for approval. As an example, it might be desirable to place order for 50,000 bbl. of cement to be delivered as required throughout the season. Purchases on approved requisitions for material for current consumption will not be referred to this committee for approval.

Abolishment of District Freight and Passenger Committees

Supplement No. 1 to Circular No. 35, dated May 23, reads: "The committee appointments shown in the memorandum accompanying Circular No. 35, dated March 1, are hereby cancelled. It will be understood that these committees will continue with any uncompleted work assigned to them pending or subject to the appointment of committees by the regional freight and passenger traffic committees under authority conferred upon them in Circular No. 88."

Movement Oil and Tank Cars

In a communication to western railroads, dated May 16, the regional director says: "Oil interests complain that some roads are not furnishing junction cards covering the movement of their tank cars. In order to reduce tracing of cars to the minimum, it is highly important that care be exercised in car record offices to insure that complete and proper junction movements be supplied all private car line owners."

Iron, Ore and Grain Traffic—Upper Lake Ports

Circular No. 104 issued by the regional director on May 24 is as follows:

Effective at once the following railroad committee is appointed to represent the railroads and this office, engaged in handling iron, ore and grain traffic at Lake Superior and Upper Lake Michigan ports: W. W. Walker, vice-president of the Duluth South Shore & Atlantic, Duluth, Minn.; W. A. McGonagle, president of the Duluth, Missoula & Northern, Duluth, Minn.; F. S. Elliott, general superintendent of the Great Northern, Superior, Wisc.; E. D. Brigham, assistant freight traffic manager of the Chicago & North Western, Chicago; W. F. Tyler, superintendent of the Chicago, Milwaukee & St. Paul Great Bay, Wisc.

This committee will co-operate with committees appointed to represent the iron, ore, grain and vessel interests, to insure expeditious and economical movement of this important

traffic, with the view of conserving both rail and water transportation to the greatest extent possible. Mr. Walker, in connection with his duties as representative of this office at Duluth, handling general operations at that point, will also assume the duties as chairman of this committee, with headquarters at Duluth. Such orders or instructions as may be necessary will be issued by him with the authority of this office.

Conserving Supplies and Repairing Materials and Tools

Supplement No. 2 to Circular R. P. C. No. 10, issued by the regional purchasing committee on May 25 is as follows: Some replies to Supplement 1 to R. P. C. No. 10 do not give the information desired, although they show that attention has been given to reclaiming of material. In order that data may be complete, please furnish the following information:

1. List of points at which you are carrying on general reclamation work, and facilities, buildings, organization and equipment at each point for reclaiming.
2. List of kinds of material you are at present reclaiming:
 - (a) By means of oxy-acetylene welding.
 - (b) By means of electric welding.
 - (c) By means of forging equipment.
 - (d) By means of rolling mills.
 - (e) By other means.
3. Are the facilities at all central points adequate for the work, or do you recommend additional equipment at any of the points? If so, what?
4. Could any central points with present equipment take care of more work, if desirable that they handle material from other roads in adjacent territory which may not be equipped with the necessary facilities?
5. What suggestions have you to make for reclaiming additional material?
6. Advise what equipment you have in the maintenance of way department for repairing frogs, crossings, switch points, etc.; also in locomotive and car department and outlying repair shops for repairing castings, couplers, knuckles, etc.

It is desirable that the fullest advantage be taken of all existing facilities for this kind of work. Those in charge of such work should confer with other lines in their locality, with a view of making such recommendations as are desirable. This report should be in this office not later than June 18, 1918.

Billing Export Freight

Circular No. 110, dated May 25, reads: The freight traffic committee, New York, advise their instructions contained in G. O. C. permits are not being carried out so far as applied to commercial shipments destined to north Atlantic ports for export, causing delay to shipments and cars at destination. The principal difficulty is failure to observe the following instructions:

1. Waybills must show the letters "G. O. C." followed by permit number.
2. Bills of lading must show definite consignee, as indicated in G. O. C. permit, and shipments must not be accepted billed to the "order of" any person or firm.
3. Billing agents must require shipper to name the steamship line and this information must be shown on the waybill. (This requirement applies only to commercial shipments for export.)
4. Waybills for export shipments to the allies are governed by requirements shown above except that it is unnecessary to include the name of the steamship line on waybills.

All agents should be given complete instructions to avoid delay to this class of shipments at seaboard. For your further information, the following indicates the method of securing G. O. C. permits and the information contained therein:

A shipping permit is secured by consignee by application to the export division, freight traffic committee, north Atlantic ports, Room 800, No. 141 Broadway, New York City. This permit bears a number preceded by the letters "G. O. C."

Information contained in permits is as follows:

- (a) Name of party or firm (name of steamship line) and port to which shipment is consigned.
- (b) Shipper.
- (c) Point of shipment.
- (d) Commodity.
- (e) Quantity.
- (f) Port destination.
- (g) Route.
- (h) Statement

as to the earliest and latest dates between which shipments may be forwarded. (i) Waybilling agent is instructed to endorse on waybill the G. O. C. number.

Orders of the Southern Regional Director

C. H. MARKHAM, REGIONAL DIRECTOR of the Southern roads, has issued the following circulars, among others:

Circular letter No. 182 addressed to chairmen of district and local operating committees gives the following advices as information and to prevent confusion and waste of time in committee meetings:

Credits and Collection of Freight Charges: These matters are being given general consideration, with the view of adopting some national rule. Your local committee is not, therefore, expected to act until it receives general instructions.

Milling-in-Transit, etc.: All of these questions are being given general consideration, and as changes are not permissible except through proper tariff publication, it is not necessary for committees to devote time to discussion of these questions.

Reconsigning, etc.: The matter of trap car charges is having general consideration. Trap car minimums should be advanced wherever practicable. Where committees are in doubt as to proper minimum, they should submit recommendation for instructions. Committees should endeavor to minimize use of trap cars either by having shippers substitute drays or loading cars less frequently. Local committees should endeavor to work these matters out, having in mind that the policy of the administration is to meet the convenience of shippers in these matters when it can be done without interference with its regular transportation business. Trap car service is in the nature of drayage, and railroads are not bound to perform such service.

Intra-terminal Switching and Charges: Questions of increases in charges for intra-terminal switching are being considered generally, and need not be considered by your committees. Each committee should make a thorough analysis of the intra-terminal switching services performed within its jurisdiction and prepare and send in a statement in accordance with attached form.

City Ticket Offices and Commercial Freight Agents' Offices: Questions concerning are in hands of separate committee and need not be given attention by your committee.

New Routing Plans proposed, for both carload and less than carload freight, should be submitted for approval before putting into effect.

Four O'Clock Closing Hour: Questions that have been referred to this office are being given general consideration, and further reference need not be made in your proceedings, pending final instructions. As information, at one point the local committee handled the question locally and effected the change.

Special matters on which the committee desires ruling from this office should be taken up separately by letter, instead of being covered only in proceedings of your meeting.

When reporting unification worked out, date effected, etc., proceedings should invariably show amount saved; where not actually known, same can be approximated. In reporting reductions in switching service indicate number of switch engine hours saved, showing separately wages of crew and fuel expense.

Circular letter 190 instructs the roads to expedite the return movement of all empty baggage and express cars assigned to express service to the road originating the traffic. In instances where there is inability to provide necessary equipment to handle perishable commodities in express train service, reports should be made to the office of the regional

director so the proper arrangements may be made to protect such requirements. The circular states that the Food Administration program is reported to be seriously embarrassed by reason of inadequate express car service, due apparently to failure on the part of railroads to return promptly to the owning roads or to express service on their own roads, baggage or express or other equipment assigned to express service in order that schedule car runs may be maintained.

Circular letter No. 192 states:

"There has recently occurred on tracks within the reservation of one of the army camps a very serious derailment to a troop train, resulting in loss of life and very serious injury to a number of soldiers.

"It is desired that all tracks within army camps which are maintained by the army, over which passenger movements are made, have regular and careful inspection, where repairs are necessary, the situation should be reported to the proper army representative for attention, and failing to receive attention the repairs should be made by the railroad falling against the war department for the cost."

In circular letter No. 197 attention is directed to the importance of giving prompt movement to corn shipments at this season to prevent heating resulting in losses.

Circular letter No. 198 stresses the importance of giving prompt movement to new locomotives coming out of shops. The roads are directed to arrange so that there will be no delay in transit to new locomotives on their lines.

When Caterpillars Ran on Rails

NO STORY OF A TRIP on the early transcontinental railroad was considered complete without an account of delays due to herds of buffalo or flocks of grasshoppers crossing the track. The buffalo has disappeared and grasshoppers are no longer so numerous as to give trouble; however, there is still one of nature's creatures whose desire for a life on the rail occasionally causes trouble. The Mc-

Steam Blowers Arranged to Clear Caterpillars from the Rails

Cloud River Railroad runs from Sisson to McGavie, Cal., through a territory where caterpillars exist in large numbers. During the spring these insects climb on the head of the rail and cover it completely. As the caterpillars are crushed under the wheels both the wheels and the rails become so slippery that it is impossible to haul a train or to stop it effectively with the brakes. On heavy grades the locomotives slip and stall and the trains start to slide backward down the hill.

The difficulties of operating trains under these circumstances made it necessary to devise some method of getting rid of the pests. Trenches dug along the right-of-way are often effective in stopping the progress of the pests, but the

distance over which they advanced made such a procedure impracticable in this case. Brooms and scrapers on the locomotives proved worse than useless for they crushed the caterpillars instead of removing them. The solution of the difficulty was found in steam jets directed at the rail a short distance ahead of the wheels of the locomotive. By this method the caterpillars were blown 20 or 30 ft from the rails and about half of them were killed. The others would always return to the top of the rail, however, so it was necessary to equip each engine with blowers. As the locomotives ran both forward and backward steam jets were placed behind the rear tender trucks as well as ahead of the pilot. The illustration shows the arrangement of pipes on the tender. The amount of difficulty caused by caterpillars on the McCloud River line varies from year to year. During some seasons only a few appear but one spring the trouble continued for about ten weeks.

Joliet Journal Box

A JOURNAL BOX with a new type of lid combining several desirable features is now being manufactured by the Joliet Railway Supply Company, Chicago. The important points of the design of this box are the complete sealing of the outer opening of the box by the lid, the use of a spiral spring for holding the lid in place, and the interchangeability of the standard M. C. B. box lid.

The complete seal on the outer edges of the Joliet journal box, with flanges on the lid both inside and outside, makes the lid dust and water proof. This is made possible by plac-

Lid of Joliet Journal Box in Open and Closed Positions

ing the lid over the mechanism beyond the front of the box.

A spiral spring and shock are placed in a cap at the top of the lid. The shock bears on the lug, which is of a contour similar to that of the lug on the standard M. C. B. journal box. The arrangement is such that the spring holds the box firmly in either the open or the closed position. In case the original lid becomes broken or lost the standard M. C. B. journal box lid can be applied.

General News Department

The annual meeting of the Railway Signal Association will take place in New York, September 19 and 20.

A delegation of Colorado Citizens headed by Senator Shafroth called at the Railroad Administration on Wednesday to urge a loan of six million dollars to the Denver & Salt Lake to build a proposed tunnel under James Peak.

The station men of the Grand Trunk have had their pay increased. The amount of the advance has not been published, but an agreement on all points of difference between the company and the employees was announced at Montreal May 24, following protracted negotiations.

A bottle of liquor found in the cab of a Canadian Pacific locomotive, when brought into court at Windsor, Ont., on May 22, was held by the court to be evidence of a violation of the temperance law of Ontario, and the engineman and fireman of the locomotive were each fined \$250 and costs.

Fines for running unsafe freight cars were imposed on the Southern Railway in the United States district court at Macon, Ga., May 16, and also one on the Ocilla Southern for using an unsafe locomotive. The offense in each case was the absence of suitable uncoupling chains.

Hon. William G. McAdoo, secretary of the treasury and director general of railroads, went, last Monday, for a brief rest, to White Sulphur Springs, W. Va., at the order of his physician. It is expected that, while there he will give some consideration to recommendations for appointments of federal managers of railroads.

Francis A. Bonner, formerly Associate Director of the Bureau of Railway News and Statistics, Chicago, and prior to that railroad and assistant financial editor of the Chicago Evening Post, has become associated with Lee, Higginson & Company, Chicago, in charge of the department of statistics and publicity.

The Kansas City, Mexico & Orient is a railroad over 700 miles long, yet Mr. McAdoo has not taken control of it; and on Monday last, a delegation of citizens from towns along the line appeared before the officers of the Railroad Administration at Washington and urged that the Government take over the road.

The Railroad Administration has an actuary. He is Theodore H. Price, of New York. Circular No. 27, announcing his appointment, says that the actuary is to compile and analyze statistics and make reports concerning various economic problems connected with the functions of the Railroad Administration, which will be referred to him by the director general or members of the staff.

Colonel Henry W. Thornton, general manager of the Great Eastern Railway, is now a Brigadier General in the British Army, having been promoted to that position on his recent return from France. He has been a member of the British Railway Executive Committee since the beginning of the war, and has had charge of channel transport. He went from America to England in February, 1914.

Freight cars passing Columbia, Pa., in the trains of the Pennsylvania Railroad on Sunday, May 12, numbered 9,173, by far the largest movement in a single day ever recorded at that point. This total includes both loaded and empty cars, both westbound and eastbound. For the whole of the first half of May the daily average was 7,868 cars, or 357 more than the best previous record for a month. The records at Lewistown Junction, west of Harrisburg, show similar increases.

Miss Katherine Stinson, the "aviatrix" carrying letters for the Post Office Department (having been appointed special messenger) flew from Chicago, Illinois, to Binghamton, New

York, on Thursday, May 23, without a stop, thus breaking all former non-stop aviation records in America. The distance is about 783 miles, and the time was about 12 hours. The best previous non-stop record was 700 miles. Miss Stinson had set out to fly to New York, but she had to land because of lack of fuel.

The University of Illinois, at its summer session, June 17 to August 9, will offer special advanced courses in the mechanics and properties of materials of construction and in materials testing, planned especially for instructors in mechanics, for chemists who wish to fit themselves to take positions involving the physical testing of materials, and for men who wish to fit themselves for positions in commercial or government testing laboratories. The extensive equipment of the Testing Laboratory of the University will be available for this work, which will be under the charge of Prof. H. F. Moore. Taken together, these courses will constitute a short course of intensive training for men who desire to qualify as testing engineers in the government service or elsewhere.

The New York, New Haven & Hartford, has asked the Fuel Administration to send 150 additional cars of commercial coal over that road daily, and has issued to shippers and consignees a notice calling upon them to make renewed efforts to unload cars with the utmost promptness. The Fuel Administration cannot be expected to grant this increase permanently, or to order a greater increase, unless cars are emptied and sent back with the best possible despatch. The circular to consignees gives figures showing that cars are not being released so well as in former periods. All users of coal and other bulky commodities are asked to have their freight shipped regularly, not trying to rush excessive quantities the moment that an embargo is lifted; and attention is called to the necessity of frequent conferences between all concerned so that there may be no misunderstandings.

The aerial mail route between New York and Washington, has completed its second week, but some trips have had to be omitted because of fogs. From the fragmentary reports published, it appears that one set of fliers covers the route between New York and Philadelphia and another set between Philadelphia and Washington. On Wednesday, May 22, there was no start from New York, and none from Philadelphia toward New York, fog prevailing at both places. On Monday, the 27th, no start was made from New York, though the airplane from the south arrived at New York on time. On the 23rd, Lieut. Bonsall, flying in a very large airplane, equipped with a Liberty motor, made the round trip from New York to Philadelphia and return in three hours; and the total time of the northbound trip, Washington to New York, on that day, was given at two hours, fifteen minutes. Except as here noted the schedules of the second week appear to have been carried out. Wherever the weight of the mail has been mentioned it has been from 50 lb. to 160 lb.

Saving \$4,200 a Year

Brunswick people will continue to use the old, antiquated, inadequate station of the Atlantic Coast Line, while the new, up-to-date station of the Atlanta, Birmingham & Atlantic will remain closed. The matter has been discussed ever since the new order of things became effective on April 1, when the three roads (including the Southern) were put under the unification system. Brunswick people had only one kick coming, and that was that a real passenger station had been abandoned, while an old one, offering no protection for passengers in the way of sheds, etc., was still being used. Agreeing that the new station of the A., B. & A. affords the most adequate facilities, especially in bad weather, the rail-

road committee says that it would cost \$550 per month more to operate the A, B. & A. station, and for this reason, the change can not be made. But it is war time, and Brunswick people will accept the decision without further fight.—*Atlanta Constitution*.

Accident Bulletin No. 64

The Inter-state Commerce Commission's quarterly accident bulletin No. 64 comes out only one week behind No. 63, which was noticed in the *Railway Age* of May 21, page 1,300. The total number of persons killed on the railroads of the United States in the three months ending with June, 1917, was 2,389, and of injured 47,443, making the total casualties 49,832, or 1,594 less than in the quarter last preceding. The totals of the three principal classes of persons in the three principal classes of accidents are as below:

Casualties Three Months Ending with June 1917

| Class | Passengers | | Employees | | Other persons | |
|----------------------------|------------|---------|-----------|---------|---------------|---------|
| | Killed | Injured | Killed | Injured | Killed | Injured |
| In train accidents | 1 | 805 | 83 | 896 | 44 | 68 |
| In train service accidents | 42 | 881 | 474 | 10,779 | 1,619 | 2,270 |
| In industrial accidents | — | — | 190 | 31,147 | 26 | 597 |
| | 43 | 1,686 | 657 | 44,822 | 1,689 | 2,935 |

The most notable change as between this and the last preceding quarter is under the head of passengers killed in train accidents—1 as compared with 38. Bulletin 63 included the rear collision at Mount Union, Pa., February 27, in which 19 passengers were killed. A marked falling off in the number of employees killed appears in all of the three classes of accidents; in the first two classes it is to be expected because of the milder weather and more normal general conditions prevailing in the months of April, May and June, as compared with winter conditions. As was noted in connection with bulletin 63, the item "other persons" killed and injured in train accidents includes cases where a train strikes an automobile or a trolley car at a crossing. In the quarter under review there were 31 accidents of this kind, in which railroad property was damaged to the extent of \$5,500; non-trespassers killed 23, injured 32. The number of trespassers killed in train accidents was 18.

Comparisons with Quarter Ending March 31, 1917

| | Bulletin 64 | Bulletin 63 |
|--|-------------|-------------|
| Total casualties | 49,832 | 51,426 |
| Total persons killed | 369 | 2,346 |
| Total persons injured | 47,443 | 49,080 |
| Passengers killed in train accidents | 1 | 38 |
| Employees killed | 657 | 842 |
| Total collisions | 1,712 | 1,633 |
| Collisions per million locomotive miles | 3.59 | 3.48 |
| Total derailments | 2,584 | 2,370 |
| Derailments per million locomotive miles | 5.35 | 5.05 |
| Damage to railroad property by train accidents | \$3,653,770 | \$3,078,370 |
| Shopmen worked, hours (Class 1 roads) | 10,054,371 | 317,760,570 |
| Casualties to shopmen per million man-hours | 48.60 | 50.65 |
| Casualties per million man-hours in: | | |
| stationmen | 25.67 | 24.03 |
| trackmen | 22.20 | 23.00 |
| bridgemen, etc. | 2.58 | 27.60 |
| other employees | 1.82 | 18.03 |

The bulletin contains reports, made by the Bureau of Safety, on 18 collisions and derailments which were investigated. The last accident bulletin for a whole year (No. 62) was noticed in the *Railway Age* of September 14, 1917, page 462.

The Pennsylvania's Liberal Policy*

I have read your interesting discussion of the use of Pennsylvania station in New York City by other railroads. In justice to the memory and ability of the late Alexander J. Cassatt and to the judgment of the Pennsylvania Railroad management, there are some broader aspects of this whole question of the joint use of passenger terminals which are of particular interest at this time. Every additional step taken for increased use of the Pennsylvania station in New York City is in full accord with this company's policy, and is simply a further vindication of our management. This station has been used in the past not only for trains of the Pennsylvania, New Haven and Long Island railroads (to which the Baltimore & Ohio is now added) but it is the passenger entrance to New York for all of the railroad systems south of Washington. Twenty-eight years ago the

Pennsylvania negotiated plans for bringing directly into New York all of the railroads serving that City, and on an equal footing with each other. We, between 1890 and 1900, perfected, with Gustav Lendenthal, the North River Bridge and terminal project and obtained a Federal charter; but the other railroads would not agree to join, and the Pennsylvania was left to work out its own problem. There is nothing either in the history of our New York Terminal or in the present situation to justify the idea that the use of Pennsylvania station by other railroads could not be brought about, by agreement between the companies, because of divergent railroad ownerships. Yet wide circulation has been given to such misleading assertions.

In the City of Washington you will find that the great Union station there was constructed and paid for jointly by the Pennsylvania and the Baltimore & Ohio but its use was granted on equal terms to all of the railroads of the South reaching Washington, and they have an equal voice in its management. Further, you will recall that the Pennsylvania through the acquisition of a large amount of Baltimore & Ohio stock, a number of years ago, endeavored to bring about a true community of interests between the two companies, which would produce co-operation, permit the elimination of ruinous competition, and make possible more efficient and convenient service to the public, at the same time assisting to stabilize both companies financially, and enable them to use, for betterments, their surplus over reasonable dividends. Unfortunately, the agitation of those times finally resulted in shaping a public policy which discouraged all attempts of the railroads to introduce co-operative principles into the service of transportation, or to merge or combine their facilities. The consequence was an artificial and undue accentuation of competitive tendencies. To blame this state of affairs upon private ownership, as many newspapers are doing, is obviously unjust in the face of the fact that it was forced upon the companies against the will, and contrary to the efforts, of a vast majority of the owners and managers. If any reasonable criticism can be made against private ownership, it is that it has perhaps offered too many facilities and luxuries to the public, and too frequent train service.

I do not question the right of any newspaper to discuss private ownership vs. Government ownership, as economic policies, and to advocate or oppose either one fairly and in accordance with true convictions; but I resent the continual mis-statement by some newspapers and individuals of the facts concerning private ownership, and the unfair and unwarranted aspersions cast upon the motives and purposes with which the railroads have been managed under it. No management will more emphatically endorse than the Pennsylvania Railroad every effort to abolish unnecessary duplication of facilities, and open others to common use, upon equitable terms, where public convenience and economic results justify such action.

Competition for Labor

The Department of Labor has been requested by the Railroad Administration to assist the latter in preventing the disorganization of the labor market by competing government contractors. Most of the railroads are now hiring their labor through the regular government service. Private contractors holding government contracts have, however, refused to cooperate with the government in the matter of securing labor, and as a consequence are disorganizing the labor market.

Many of the firms mentioned in the protests received from the Railroad Administration are said to have been making extensive advertisements in a great many southern papers to the detriment of both railroads and farms. The Director General was advised by Assistant Secretary Louis F. Post that although the department does not at present possess the necessary authority, it hopes to be able to put an end to this practice in the near future.

Convention of Railroad Police

The International Association of Railway Special Agents and Police will hold a convention at Baltimore, Md., on June 19, 20 and 21, with headquarters at the Emerson Hotel. The secretary is W. C. Parrrell, Baltimore.

*From a letter to The Evening Journal, Philadelphia, from Samuel Rea, president of the Pennsylvania Railroad.

REVENUES AND EXPENSES OF RAILWAYS

THREE MONTHS OF CALENDAR YEAR, 1918, CONTINUED

| Name of road. | Average mileage operated. | Freight. | Passenger. | Total operating revenues. | Maintenance of way and equipment. | Traffic. | Trans- portation. | General. | Total. | Operating ratio. | Net from railway operation. | Railway accruals. | Operating (or loss). | Increase (or decrease) last year. |
|-------------------------------------|---------------------------|-------------|-------------|---------------------------|-----------------------------------|-------------|-------------------|-------------|-----------|------------------|-----------------------------|-------------------|----------------------|-----------------------------------|
| St. Louis-San Francisco..... | 4,761 | \$8,569,549 | \$1,434,491 | \$13,830,371 | \$1,924,153 | \$3,096,249 | \$163,238 | \$5,827,640 | \$417,491 | \$11,445,939 | \$2,882 | \$2,374,432 | \$1,665,072 | \$1,832,463 |

Traffic News

George A. Perry has been appointed secretary-treasurer of the Transportation Club of Louisville, Ky., to succeed W. T. Vandenberg, who recently resigned on the occasion of his removal from the city.

The Board of Railway Commissioners of Canada have issued a revised tariff of prices for interswitching, making this accommodation practically universal throughout the Dominion. The term "interswitching" is used to define the movement of loaded freight cars from one road to another for delivery to a consignee within the same city.

The Seaboard Air Line announces the discontinuance of 20 freight traffic offices as follows: Augusta, (Ga.); Boston, Baltimore, Chattanooga, Chicago, Cincinnati, Florence, (S. C.); Greenville, (S. C.); Kansas City, Louisville, Miami, (Fla.); Memphis, New Orleans, New York, Nashville, Oklahoma City, Pittsburgh, Philadelphia, Rochester and St. Louis.

In an order issued on May 22, the Nebraska State Railway Commission ordered the Chicago, St. Paul, Minneapolis & Omaha, the Chicago, Rock Island & Pacific and the Union Pacific, to discontinue within 10 days the practice of making deductions of one eighth of one per cent on small grains and one fourth of one per cent on corn in making settlement for shortage in shipments of bulk grain.

The report of lake commerce passing through the canals at Sault Ste. Marie, during the month of April shows a movement of 422,489 short tons; 356,693 eastbound and 65,196 westbound. Practically all of the eastbound traffic was grain and iron ore, the total for grain being 6,524,676 bu. and of ore 147,188 tons. The heaviest westbound traffic was soft coal, 88,076 tons of which passed through the canals.

Coal Production

A slump in loading on Saturday, after a good five-day performance, caused bituminous coal production during the week ended May 18 to decline slightly, according to the Geological Survey. The total production of soft coal during the week is estimated at 11,732,000 net tons, an average daily production of 1,955,000 net tons, compared with 1,971,000 net tons during the week of May 11. Anthracite shipments during the week increased 6 per cent. The percentage of full-time output lost on account of car shortage during the week ending May 11 was reduced to 11.2.

New Coal Mines Must Be Approved

By Railroad and Fuel Administrations

The United States Fuel Administration announces that it will encourage the opening of new coal mines, whenever it appears to its satisfaction that this can be accomplished without taking labor from mines already developed and capable of producing more coal than at present. But as coal is not commercially produced until it is loaded into railroad cars at the tippie, the Fuel Administration is unwilling to approve of the opening of new mines, even when labor is abundant, if it appears to the Railroad Administration impossible or inexpedient to furnish the necessary railroad facilities.

All applications for the development of new mines must go first to the railroad upon which the connection is desired. Copies of the application and accompanying papers will be forwarded to the Regional Director, and he will forward the papers with his approval or disapproval to the director of the division of transportation of the railroad administration. This officer will submit a copy of the application and papers with the recommendation of the regional director to the Fuel Administrator.

Representatives of the Railroad Administration and of the Fuel Administration will, thereupon, agree upon the approval or disapproval.

Commission and Court News

Court News

Uniform Live Stock Contract

The New York Appellate Division holds, in a damage action against a live stock carrier, where there was a uniform live stock contract and a waybill, that the valuations contained in the filed tariffs govern the damages for stock killed, and recovery for injuries to other stock must be in the ratio of the stipulated to the real value.—*Dickerson v. Erie*, 169 N. Y. Supp., 5. Decided February 8, 1918.

Reasonable Despatch

A carrier received a carload of potatoes on the afternoon of September 1, and undertook to carry them with reasonable despatch. The normal time for delivery was 20 hours. The New York Appellate Division holds that delivery at 7 p. m. September 5, after an intervening holiday and a congestion in its yards due to a threatened strike, was not a breach of its contract of carriage.—*Carr v. Long Island*, 169 N. Y. Supp., 569. Decided March 1, 1918.

Recovery of Freight Undercharges

A tariff of freight rates duly filed and published and not disapproved by the Interstate Commerce Commission has the force of a statute, binding alike on shipper and carrier. In an action to recover undercharges computed according to the tariff in force, the Kansas Supreme Court holds that it is error for the trial court to receive and consider proof that the commodities shipped were not classified in the tariff according to correct principles.—*Atchison, T. & S. F. v. Young* (Kan.), 171 Pac., 1156. Decided April 6, 1918.

Alighting from Moving Train

Generally it is negligence *per se* for a passenger in full possession of his senses and faculties to alight from a train while it is in motion. The West Virginia Supreme Court of Appeals holds that the failure of a brakeman, standing nearby, to warn a passenger, standing on the steps of a car ready to alight, did not excuse such contributory negligence. The brakeman had a right to assume the passenger would not alight while the train was moving.—*Bartley v. Western Maryland* (W. Va.), 95 S. E., 443. Decided March 5, 1918.

Duty as to Perishable Goods

In an action for damages to perishable goods in a refrigerator car, the Oregon Supreme Court holds that if the goods are sound when a carrier takes them from an initial carrier, its whole duty is fulfilled if and when it thoroughly re-ices the car, as reasonably necessary, and with fair diligence takes proper care of it over its line. A carrier of perishable goods is not liable as an insurer. The measure of its duty is to use reasonable care and diligence, considering the nature of the goods.—*Daniels v. N. P.* (Or.), 171 Pac., 1178. Decided April 10, 1918.

Twenty-eight Hour Law—Proper Feeding

Under the Twenty-Eight Hour Law the federal district court for the Eastern District of Pennsylvania held a railroad entitled to recover for 250 lb. of hay prepared in advance and furnished to each carload of a shipment of cattle, although a quantity of hay amounting to 150 lb. to 250 lb. was placed in the racks in each car by the shipper when the cars were started; it being the statutory obligation of the carrier to feed during the period of rest, and it being the opinion of the Department of Agriculture, stated in a circular issued for the information of carriers, that 250 lb. per car is a proper allowance. The court said: "The whole defense, so far as it has merit, is seen upon analyses to

rest upon the unstable foundation of the assertion of a right in the shippers to refuse to feed, and yet reserve to themselves to dictate in what manner the duty shall be performed by the carrier. They have no such right."—*Pennsylvania v. Swift & Co.*, 248 Fed., 315. Decided February 13, 1918.

Rental Contract Exempting Railroad from Liability for Negligence

A man leased part of a right of way as a pasture under a contract exempting the railroad from liability for its negligence. It was alleged that his animals were killed on the track (where there was a view for more than a mile) and that the speed of the train was excessive; that no attempt was made to stop the train. The Georgia Court of Appeals held that wilful or wanton negligence was not shown. The provision of the contract exempting the railroad company from liability for negligence was not void as contrary to public policy.—*Hearn v. Central of Georgia* (Ga.), 95 S. E., 368. Decided March 12, 1918.

Liability for Undercharge on Freight

The Minnesota Supreme Court holds, in an action by a railroad company to recover from the consignee a balance of the legal freight upon an interstate shipment, he having accepted the shipment, paid the amount of the freight erroneously understated in the bill of lading, and settled with the consignor on that basis, that the defense of *estoppel* is not available; for the consignee is conclusively presumed to have had knowledge of the published legal rate. If the consignee, the presumed owner, accepts an interstate shipment and pays part of the freight, the law implies an agreement on his part to pay the balance to the carrier, where, as here, the carrier, at the time of the delivery of the shipment, has no knowledge of the arrangement between the consignor and consignee as to the payment of the freight, and the consignor then is and ever since has been insolvent.—*C. M. & St. P. v. Greenberg* (Minn.), 166 N. W., 1073. Decided March 22, 1918.

Employers' Liability Act Decisions

The Michigan Supreme Court holds that the state industrial accident board was without jurisdiction to entertain the claim for compensation under the Workmen's Compensation Act of a widow whose husband, a railroad employee, was killed in working on an interstate train, used in interstate commerce; if the widow was entitled to recover, her only remedy was under the federal act.—*Miller v. G. T. W.* (Mich.), 160 N. W., 833. Decided March 28, 1918.

The Michigan Workmen's Compensation Act provides that no proceeding for compensation shall be maintainable unless the claim shall have been made within six months after the injury. Where an employee refused to accept compensation under the Compensation Act, but sued under the federal act and suffered nonsuit, the Michigan Supreme Court holds he could not thereafter receive compensation, no claim having been filed within six months, as required.—*Schuld v. Pere Marquette* (Mich.), 160 N. W., 1018. Decided March 27, 1918.

Stoppage in Transit—Seizure of Goods

A shipper of lumber to a company in Chicago, on learning of the company's bankruptcy, stopped the lumber in transit while it was still in the State of Wisconsin. In a suit by the shipper for the value of the lumber the Wisconsin Supreme Court holds that the railroad did not convert the lumber and become liable for its value by moving it from the point where it was stopped to its yards in Chicago, especially as the claimant was not injured thereby, though on the arrival of the lumber in Chicago the consignee's receiver in bankruptcy obtained an order from the bankruptcy court for the delivery of the lumber to him; as the bankruptcy court could have compelled the delivery of the lumber wherever it was physically located, the railroad company having officers and agents at Chicago upon whom service of process could have been made. A carrier is not responsible for goods taken from its custody by valid legal process, provided it gives the owner prompt notice of the suit, so that he may have an opportunity to protect his interest. Even if such the order of the bankruptcy

court could not be classed as legal process fair on its face, the railroad company was not liable to the shipper, as it had no power to determine the controversy between the shipper and the receiver, and was not bound to determine it at its peril. In turning over the lumber to an officer of the bankruptcy court the lumber was not lost to the shipper, but was turned over to a court having power to determine the controversy.—*Morgan v. Chicago & N. W. (Wis.)*, 166 N. W., 777. Decided March 5, 1918.

Notice of Claim by Shipper

The Oklahoma Supreme Court holds that a claim for the value of a shipment of grain misdelivered by the carrier is sufficiently made to satisfy the requirements of the bill of lading that any claim based on failure to make delivery shall be made in writing within four months after the time for delivery has elapsed, where it appears that the defendant and the plaintiff negotiated a settlement of the plaintiff's claim by letter before the expiration of the four-month period, and that the claim was declined after the expiration of such period on grounds other than that the plaintiff had not complied with the four-month clause of the bill of lading.—*Rock Island v. Pruitt (Okla.)*, 171 Pac., 718. Decided March 12, 1918.

Termination of Liability on Delivery— No Duty to Switch Delivered Goods

The New York Central, in compliance with the wishes of the consignee and in accordance with the custom between them, placed a car containing a shipment of fruit, immediately on its arrival at Utica, its destination, on a public team track for the consignee to unload. The consignee from time to time unloaded part of the fruit, and a week later, offering to pay the charges, requested the railroad to switch the car to the D. L. & W., about one-half mile, so that the car might be sent out over that road. The Central had no tariff covering the switching, and its freight agent, because of that fact, would not move the car. The consignee sued the road for damages. The New York Court of Appeals has reversed a judgment for the plaintiff and granted a new trial for the following reasons: There is no common law rule requiring the railroad to switch or transfer the car. It was not bound to accept goods for carriage beyond the terminus of its line or to carry except on its own line. Contract, express or implied, or statutory regulations or authorized regulations of a public board may modify or make inapplicable this common-law rule. That was not done here. The placing of the car on the team track for unloading, concurred in and acted on by the plaintiff, completed the delivery and terminated the defendant's duty as a common carrier; and thereafter he was not even a warehouseman. The duty of guarding and protecting the car was the plaintiff's. While a railroad is not permitted to cast aside its character as such and transmute itself into an ordinary bailee, a consignee cannot, by a mere request to change, for any purpose, the location of delivered goods, reconstitute the delivery company a common carrier as to those goods. *Anthony v. N. Y. C. (N. Y.)*, 119 N. E., 90. Decided February 26, 1918.

United States Supreme Court Hours of Service Act

Following its decisions in *Rock Island v. U. S.* and *Chicago & N. W. v. U. S.*, 226 Fed. 27, 30, the Circuit Court of Appeals for the Seventh Circuit affirmed a judgment of the district court against the Chicago & Alton for \$100 penalty for violating the Hours of Service Act by permitting a switch tender to remain on duty more than nine hours. The Supreme Court of the United States has affirmed that judgment. The switch tender was on duty for twelve consecutive hours in a shanty continuously operated night and day where, by the use of the telephone, he received and delivered orders pertaining to train movements—not mere switching within the yard; and in such service mental and physical alertness are of great importance. By permitting this the court holds that the railroad violated both the language and purpose of the act.—*Chicago & Alton v. U. S.* Decided May 20, 1918.

Equipment and Supplies

Locomotives

THE CHINESE GOVERNMENT RAILWAYS, PEKIN-MUKDEN LINE, have ordered 14 Mikado locomotives from the Baldwin Locomotive Works.

Freight Cars

F. V. B. PRICE, Columbia, Miss., is inquiring for 5 40-ton tank cars.

W. K. GRACE & Co., New York, is inquiring for 5 tank cars for export.

THE BLEYER TANK LINE, Buffalo, is inquiring for 5 to 10 8,000-gal. 40-ton tank cars.

THE NEW JERSEY ZINC COMPANY, New York, is inquiring for 10 to 35 sulphuric acid tank cars.

Signaling

PENNSYLVANIA LINES WEST OF PITTSBURGH.—This road has contracted with the Union Switch & Signal Company for the installation of a 59-lever Type "F" interlocking machine at Logansport, Ind. This machine will have 15 levers operating 16 switches and 8 derails and 25 levers operating 26 signals and 19 spare spaces. Style "E" signals and Type "M" switch movements will be used throughout.

THE JACKSONVILLE TERMINAL COMPANY (Jacksonville, Fla.) is to install a Union electro-pneumatic interlocking at Myrtle avenue (Tower No. 2) the machine to have 122 working levers, 5 spare levers and 8 spare spaces. There will be 63 three-position dwarf signals, 22 suspended bridge signals, 5 high ground signals, 66 single switches and derails, 25 double slip switches (with movable frogs) and 1 movable point frog. The field work will be done by the construction forces of the Terminal Company.

LIGHT RAILWAYS AFTER THE WAR.—At the last meeting of the Essex County Council of England, a resolution was passed urging the Government to include in any scheme for after-war reconstruction a national system of light railways in which adequate provision should be made for the needs of Essex.—*The Engineer, London*.

SOUTH MANCHURIA RAILWAY REORGANIZATION.—The South Manchuria Railway has announced a reorganization of the staff of its general offices at Dairen, according to the report of Consul A. A. Williamson from that city under date of January 17. The principal branches under the new arrangement are: Secretariat (under Dr. S. Kunisawa, director-in-chief); department for general affairs (T. Kawakami, director); mining department (S. Kabayama, director); land department (K. Kaino, director); accounting department (R. Kawamura, director). The Manchuria Daily News quotes Mr. Kawamura, director and acting superintendent, as follows: "The real aim of the reorganization is to give greater attention to all matters concerning the personnel (appointments, promotions, retirements, and disciplining of the company's employees), and also constant inspection of the efficiency of work done by the different units of the company. From this consideration the two new sections of personnel and inspection have been created in the secretariat under the director-in-chief. Since the affairs concerning the personnel demand specially careful consideration and are matters of interest to the governor-general of Kwangtung, under whose direct control lies the South Manchuria Railway, a member of the company's directorate is put at the head of the personnel section. The bureau for general affairs and the bureau of foreign intercourse have been abolished, together with the bureau of technics. The mining section and the geological institute have been amalgamated into the geological section. Assistant superintendents are to be appointed to each unit, opening a way of advancement to the capable and worthy."

Supply Trade News

Ward W. Willetts, vice president and treasurer of the Curtin Supply Company, Chicago, who was one of the organizers of that corporation in 1899, was re-elected at a recent meeting of the board of directors.

George A. Post, Jr., western representative of the Standard Coupler Company, has received a commission as captain in the Ordnance Department. Mr. Post graduated from Cornell University in 1905 and has been connected with the railway supply field since graduation.

William Dewar Ellis, who was president of the Schenectady Locomotive Works when it was merged with the American Locomotive Company some years ago, died at his home in New York, May 23, aged 63 years. His father, John Ellis, had been one of the founders of the Schenectady Locomotive Works, and Mr. Ellis succeeded his brother in the presidency of the corporation. He retired about fifteen years ago.

Stephen C. Mason of the McConway & Torley Company, Pittsburgh, was elected president of the National Association of Manufacturers at a meeting of the board of directors held in New York, May 23, following the three-day convention. Mr. Mason is the seventh president of the association. He succeeds as president, **Colonel George Pope**, who died April 19 last.

The National Lumber Manufacturers' Association held its sixteenth annual meeting in the Congress hotel, Chicago, on May 20 and 21. About 150 representatives of manufacturers, retail dealers and consumers of lumber participated in the meeting, which considered some of the special problems confronting the lumber industry at this time. Following the meeting an economic conference was held for the discussion of cost economies as related to the production of lumber.

Chicago Pneumatic Tool Company

The following changes in the organization of the manufacturing and sales departments of the Chicago pneumatic Tool Company have been effected by H. A. Jackson, the company's new president:

W. H. Callan, manager of the company's two compressor plants at Franklin, Pa., has been appointed general manager of plants, with headquarters in Chicago. **W. P. Pressinger**, manager of the compressor and engine departments at Chicago, has been appointed general manager of sales, with the same headquarters. **H. D. Megary**, previously with the Bethlehem Steel Company, South Bethlehem, Pa., has been made assistant to the president at Chicago. **G. A. Rees**, general

purchasing agent, has been promoted to manager of purchases and stores at Chicago. These officers will report directly to the president.

In addition, the following changes have been made in the sales department. These officers, most of whom formerly reported directly to the president, will hereafter report to the general manager of sales and will constitute his staff: **J. G. Osgood**, manager of the pneumatic tool sales division; **C. B. Coates**, manager of electric tool sales division; **H. L. Dean**, manager of compressor sales division, formerly assistant manager of the compressor department at New York; **B. R.**

Hawley, manager of engine sale division, formerly assistant manager of the engine department at Chicago; **T. J. Hudson**, manager of the motor truck sales division. All of these men will have headquarters in Chicago. The above appointments were effective May 27.

W. P. Pressinger, who has been promoted to general manager of sales, was born in New York City on September 27, 1871. In 1887, he entered the employ of the Clayton Air Compressor Works, New York. He remained with that company for 13 years, rising to the position of manager of sales. In 1900 Mr. Pressinger organized the New York Air Compressor Company of which corporation he was secretary and general manager. In the following year the company was assimilated by the Chicago Pneumatic Tool Company. Mr. Pressinger has been manager of the compressor department of that company up to the time of his appointment as general manager of sales, as afore-mentioned. He is also president of the Compressed Air Society.

Westinghouse Electric & Manufacturing Company

The Westinghouse Electric & Manufacturing Company in its fiscal year ending March 31, 1918, did a gross business of \$95,735,407, over \$6,000,000 more than in 1917. The volume of sales for the regular products of the company was greatly in excess of any previous year. The net income available for dividends and other purposes at the close of the year was \$15,405,681 as compared with \$18,079,889 for the year ending March 31, 1917.

In addition to the regular quarterly dividends at the rate of 7 per cent on the preferred and common stocks a special "Red Cross" dividend was paid, making a total of \$5,610,848 for all dividends paid during the year. Special appropriations were made for the protection of inventory book values and to establish a research and development fund. After deducting these appropriations and other miscellaneous adjustments the net surplus as of March 31, 1918, is \$26,404,695, an increase of \$8,299,396 over the net surplus as of March 31, 1917.

New Plants.—The property and plant account includes expenditures during the year in connection with the new plant known as the Essington Works, located near Philadelphia. This plant, which is now completed and nearly equipped, is operating with a force of about 3,000 men which it is expected will be increased to approximately 5,000 during the year. Contracts with the United States Government for equipment for cargo ships will occupy the capacity of this plant for approximately two years.

Another important improvement completed during the year was a factory at Trenton, N. J., for the manufacture of incandescent lamps. This factory has been in operation for some months.

British Westinghouse Electric & Manufacturing Company, Ltd.—In 1916 a proposal was made to the company's directors for the purchase of the holdings in the British Westinghouse Electric & Manufacturing Company in order that a controlling interest might be transferred from the United States to England. After careful consideration the directors concluded that the commercial position of the British Westinghouse Company would be improved if the control of that company were owned in England instead of the United States, and decided that the sale of the American company's entire holdings was the only satisfactory solution of the situation. Accordingly negotiations were concluded under which its holdings of 4 per cent debenture stock and preference and ordinary shares in the British Company were sold to a syndicate formed in London (Electric Holdings, Ltd.), and payment therefor has been received in 5 per cent prior lien debenture bonds maturing in ten years. These bonds are secured by the pledge of all the sold securities sold and certain other additional collateral. This change in the investments was made without change in book values and has, therefore, not affected the balance sheet. Certain new trading agreements of mutual advantage have been entered into between the British Company Electric Holdings Ltd., and this company.

Increased Inventories and Notes.—One of the features of the year was the large increases in inventories made necessary by the unprecedented volume of the company's busi-

W. P. Pressinger

ness. As a result the company during the year increased the total of its outstanding notes payable by \$12,282,301, the total amount of notes payable outstanding as of March 31, 1918, being \$30,186,051. This includes \$15,000,000 one-year notes and \$2,433,551 on account of Liberty Loan Bonds subscribed for by the company and its employees.

Orders on Hand.—As of April 1, 1918, the value of unfilled orders in hand was \$147,857,580, of which \$110,185,007 was for the regular products of the company. No facilities heretofore employed on regular products are engaged on munition work.

CONSOLIDATED AND CONDENSED GENERAL BALANCE SHEET, MARCH 31, 1918
(Except New England Westinghouse Company)

| ASSETS | |

Trade Publications

LIBRARY CATALOG.—The Portland Cement Association, Chicago, Ill., has issued a 60 page catalog of the books, periodicals and pamphlets in the library of that association on the literature of the cement industry. This library which is open to the public has an up-to-date index containing approximately 65,000 cards, following the standard library practice.

KEYSTONE QUALITY.—The Keystone Manufacturing Company, Buffalo, N. Y., has issued a 40-page booklet describing and illustrating the line of ratchets for both drills and wrenches manufactured by that company. Prices and dimensions for ratchets designed for various purposes are shown as well as the auxiliary parts used. Several pages are devoted to cataloging the various styles of Westcott Adjustable S-wrenches.

CONSTRUCTION EQUIPMENT.—The Waterloo Cement Machinery Corporation, Waterloo, Iowa, has issued a new catalog of 60 pages which illustrates and describes the line of equipment manufactured by that company including concrete mixers, hoisting equipment operated by gas engines, pumps and air compressors. Information is given in sufficient detail to demonstrate the application of the various styles of equipment to special purposes.

RAILWAY WATER SUPPLY.—The Layne & Bowler Company, Memphis, Tenn., has issued a 64-page booklet which contains an exposition of its plan for developing water supplies in the dual role of engineer and contractor, with a contract stipulation guaranteeing a certain water discharge for the source developed. The book is also a catalog of the line of water service equipment manufactured by that company which includes turbine pumps and well screens. The book describes the various types of this equipment with illustrations of typical installations in actual service. The last 8 pages are devoted to tables and formulae of use in connection with water service problems.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company, which was authorized by the Railroad Administration to resume construction on the Osage County & Santa Fe from Caney, Okla., to Pawhuska, as announced in the *Railway Age* of May 24, has also been granted permission to extend this line from Pawhuska to Fairfax Junction, 27 miles further.

The Santa Fe has also been authorized to extend for 30 miles the North Texas & Santa Fe, the track on which has already been completed from Shattuck, Okla., 28 miles west.

CHICAGO, MILWAUKEE & ST. PAUL.—This company will build a new engine terminal at Ottumwa Junction, Iowa. The grading contract for the terminal and for a new freight yard at the same point has been awarded to Roberts Brothers & Peterson, Chicago. The construction of the buildings will be handled by the Wither- spoon-Englar Company, Chicago. The new structures will include an 18-stall roundhouse, an 85-ft. terminal, a water-softening plant, powerhouse, water tanks and other terminal buildings. The track work will be done by the St. Paul's own forces. The estimated cost of the improvements to be made at Ottumwa Junction is \$500,000.

The St. Paul is also contemplating the extension of numerous passing tracks to permit the handling of longer freight trains on the main line between Chicago and Omaha and between Chicago and Minneapolis. The grading work will be contracted out and the track work will be done by the railroad's own forces.

DENVER & RIO GRANDE.—This company has awarded a contract to the Utah Construction Company for the construction of a new freight and engine terminal at Soldier Summit, Utah. This will consist of division terminal tracks to hold 1,000 cars with a total trackage of 15 miles, including repair tracks, a wye and engine terminal tracks. The engine terminal will contain a rectangular engine house of 24 stalls, a power house, a small shop and store house, oil house, ice house; coal, ash and sanding facilities; a car shop, a station and office building, a hotel and 24 cottages for employees, and section buildings. The work will require 430,000 cu. yd. of grading and 2,500 cu. yd. of masonry.

ILLINOIS CENTRAL.—This company is asking bids on a building for the American Express Company at 14th street and the Illinois Central tracks, Chicago. The structure will be 26 ft. by 300 ft., with brick walls and a composition roof.

THE SOUTHERN PACIFIC PLANS have been completed for enlarging and lining with concrete 17 tunnels through the Tehachapi mountains and work will be started soon. This work will be done by pneumatic methods, the concrete mixer being located at the portal of the tunnel and the material being conveyed to place by air pressure.

SPANISH EXPORTS TO UNITED STATES AND POSSESSIONS.—Total declared exports from Spain to United States and possessions during 1917 were valued as follows: To United States, \$35,733,492 against \$33,768,822 in 1916; Philippines, \$985,330 against \$1,022,757; Porto Rico, \$887,593 against \$851,601; total, \$37,606,415 against \$35,643,180.—*Commerce Reports*.

JAPANESE RAILWAY COAL NEEDS.—The Imperial Japanese Railways will buy from 300,000 tons to 500,000 tons of coal during the fiscal year 1918 in some foreign market, partly for the purpose of economizing its fuel cost and partly for the purpose of reducing the prices of coal in the home market. The yearly consumption of the Government railways amounts to, roughly, 2,000,000 tons.—*The Far Eastern Review*.

CURAN RAILWAY CONSTRUCTION.—Work is soon to be begun on that part of the Maniciragua branch, extending from Caunao to Cumanayagua, a distance of 20 miles. This branch goes through very undulating country, and will require a large amount of fill and trestlework, the trestle later giving way to steel. From Caunao to the Bay of Cienfuegos, a distance of 6¼ miles, a separate line, consisting for the greater part of double-track, is now in process of construction, and it is stated that work on the pier terminal will soon be commenced.

Railway Officers

Executive, Financial, Legal and Accounting

L. Moore has been appointed chief land appraiser of the New York Central with principal office at New York.

H. J. Holt, vice-president and auditor of the Manitou & Pikes Peak, has been elected president, with headquarters at Manitou, Colo., succeeding **C. W. Sells**, resigned.

L. B. Williams has been elected treasurer of the New York, Chicago & St. Louis, with headquarters at Cleveland, Ohio, succeeding **Otto Miller**, resigned to enter the army.

E. P. Clawson has been appointed auditor of the Peoria Railway Terminal Company, in charge of all accounts, with headquarters at South Bartonville, Ill., succeeding **J. McMahon**, resigned.

Charles C. James, chief clerk in the office of the vice-president and controller of the Southern Pacific, at New York, has resigned to become assistant controller of the Merchant Shipbuilding Corporation, with headquarters at Bristol, Pa.

Irving Herriott, general attorney for the Chicago & North Western, with headquarters at Chicago, has resigned to take up the general practice of law, and has associated himself with the legal firm of Montgomery, Hart & Smith, Chicago.

Operating

W. N. Deraamus has been appointed superintendent of car service, of the Kansas City Southern, with headquarters at Kansas City, Mo.

The transportation, traffic and accounting offices of the Dayton, Toledo & Chicago have been moved from Dayton, Ohio, to Covington, Ohio.

W. W. Fuller has been appointed safety supervisor of the Seaboard Air Line, with headquarters at Norfolk, Va., vice **J. L. Query**, assigned to other duties.

P. T. Reilly, who has been appointed superintendent of the Mahanoy & Hazleton division of the Lehigh Valley, with headquarters at Hazleton, Pa., as has been announced in these columns, began railway work in 1888, as a water boy, at Meshoppen, on the Lehigh Valley, and has been in the continuous service of that road ever since. He later served consecutively as freight handler, time-keeper, foreman in the maintenance of way department, assistant yardmaster at Coxton, Pa.; conductor and yardmaster at Coxton, and general yardmaster of the Coxton territory. He subsequently served as assistant trainmaster at Wilkes-Barre, and later became inspector of transportation. In May, 1916, he was appointed

general car inspector, with headquarters at Bethlehem, Pa., which position he held at the time of his recent appointment as superintendent of the same road, as above noted.

H. C. Bixler, superintendent of stations and transfers of the Pennsylvania Railroad, with office at Philadelphia, Pa., has been appointed superintendent of the Manhattan division, with headquarters at New York. This division has been re-established and will embrace the freight and passenger terminal facilities of the Pennsylvania Railroad in New York

City, New York Harbor, including Brooklyn and Greenville. **J. F. Deasey**, assistant district chief agent at Philadelphia, succeeds Mr. Bixler as superintendent of stations and transfers, with office at Philadelphia. **F. G. Grimshaw**, superintendent of motive power of the New Jersey division at New York, has been promoted to assistant to the general manager, with headquarters at Philadelphia. **E. J. Cleave**, superintendent of the Trenton division at Trenton, N. J., has been transferred as superintendent to the Philadelphia Terminal division with headquarters at West Philadelphia to succeed **A. B. Clark**, who has been transferred as superintendent to the Trenton division to succeed Mr. Cleave. **J. B. Hutchinson, Jr.**, acting superintendent of the Cresson division, with office at Pittsburgh, has been appointed superintendent of the same division and **A. B. Cuthbert**, acting superintendent of the Cresson division, with office at Cresson, has been appointed superintendent of the same division.

H. C. Bixler who has been appointed superintendent of the Manhattan division of the Pennsylvania Railroad, with headquarters at New York, was born on March 21, 1868, at Bradford, Pa.

H. C. Bixler

He entered the service of the Pennsylvania Railroad on May 17, 1887, as a telegraph operator on the Pittsburgh division. He subsequently served successfully as train despatcher and assistant trainmaster and in 1910 and 1911 was trainmaster at the Pennsylvania Terminal, New York City. On November 9, 1911, he was promoted to assistant superintendent of the Philadelphia Terminal division and on May 1, 1916, was promoted to superintendent of stations and transfers with office at Philadelphia, Pa., which position he held at the time of his recent appointment as superintendent of the Manhattan division of the same road as above noted.

W. H. Foster, general superintendent of the New York, New Haven & Hartford Lines West, has been appointed also general superintendent of the Central New England, with headquarters at New Haven, Conn., vice **G. W. Clark**, assigned to other duties, and **Harry C. Oviatt**, who resigned in October, 1917, as general superintendent of the New York, New Haven & Hartford Lines West, to enter the service of the American International Corporation, has been appointed superintendent of the Central New England, with headquarters at Poughkeepsie, N. Y.

J. A. MacDonald, superintendent of the Prairie du Chien and Mineral Point divisions of the Chicago, Milwaukee & St. Paul, **R. E. Sizer**, trainmaster, and **A. J. Klumb**, master mechanic, with headquarters at Milwaukee, Wis., have been transferred to Madison, Wis.

A. E. Lloyd, superintendent of the Alliance division of the New York Central at Alliance, Ohio, has been transferred to the Western division, with headquarters at Chicago. **E. W. Brown**, assistant division superintendent at Chicago, has been appointed division superintendent, with office at Alliance, Ohio.

Harry W. Forman, the well-known writer on train despatching and train rules, formerly for several years train rule examiner on the Nashville, Chattanooga & St. Louis, has been appointed assistant to the general superintendent of the Western Pacific, with office at San Francisco, Cal. Mr. Forman has been in the service of the Western Pacific for some time past. He entered railroad service in August, 1873. He has worked for fifteen different railroads and has served as trackman, as a mechanic in the machine shops, and in clerical positions. In the train service he began as brakeman, and was soon promoted to conductor. Next he became

P. T. Reilly

telegraph operator and station agent, from which he was promoted to the position of train despatcher. In this department he has served for many years, and on a number of different roads. Under various titles—chief despatcher, superintendent of telegraph, chairman of train-rule boards, trainmaster and inspector of transportation—he has been constantly engaged in the promotion of good practice and good discipline. He was one of the pioneers in grappling with the difficult, elusive, and never-ending problem of securing for American railroads a perfect code of train rules, and highest standards of efficiency in train operation. His well-known book, "Rights of Trains on Single Track," embodies the fruits of his long and profitable studies of this branch of the railroad art, and is the only thorough discussion of it that was ever published.

Traffic

T. J. Wright has been appointed general agent of the Atlanta, Birmingham & Atlantic, with office at Brunswick, Ga., vice **J. B. C. Blitch**.

John D. Carter, general agent of the freight department of the Atchison, Topeka & Santa Fe, with headquarters at Detroit, Mich., has been appointed assistant general freight agent of the Trans-Oceanic Company, of San Francisco, which operates a steamship line between San Francisco, Seattle and the Orient. Mr. Carter will have headquarters at Chicago.

D. E. Sullivan has been appointed division freight agent of the Baltimore & Ohio, with headquarters at Chicago; **E. C. Law**, commercial freight agent at Toledo, Ohio, has been appointed division freight agent, with office at Toledo; **J. R. Lee**, commercial freight agent at Detroit, Mich., has been transferred as commercial freight agent to Toledo, Ohio, and the position of commercial freight agent at Detroit has been abolished.

J. G. Cantrell, general western agent of the Seaboard Air Line, with office at St. Louis, Mo., has been appointed assistant general freight agent, with office at Jacksonville, Fla., vice **C. A. Carpenter**, who has been appointed district traffic agent, with office at Orlando, Fla. **C. E. Muller**, general agent at Baltimore, Md., has been appointed assistant general freight agent, with office at Savannah, Ga., vice **V. C. T. Tompkins**, transferred. **M. O'Connor**, southwest freight agent at New Orleans, La., has been appointed commercial agent, with office at Montgomery, Ala., vice **F. C. Cheney**, transferred. **C. E. Thomas**, commercial agent at Memphis, Tenn., has been transferred as commercial agent to Richmond, Va., vice **C. L. Parker**, resigned to accept service with another company.

Engineering and Rolling Stock

A. R. Kipp, mechanical superintendent of the Chicago division, of the Minneapolis, St. Paul & Sault Ste. Marie, with headquarters at Fond du Lac, Wis., has been transferred to Minneapolis, Minn.

C. H. Blake has been appointed road foreman of engines on the Southern Kansas division, of the Atchison, Topeka & Santa Fe, with headquarters at Chanute, Kan., succeeding **W. A. Moon**, assigned to other duties.

Elliot Sumner, superintendent of motive power of the Central division, of the Pennsylvania Railroad, with office at Williamsport, Pa., has been appointed superintendent of motive power of the New Jersey division, with office at New York, succeeding **F. G. Grimshaw**, promoted, and **E. W. Smith**, master mechanic of the Philadelphia division succeeds Mr. Sumner.

James B. McClain who has been appointed bridge engineer of the Seaboard Air Line, with headquarters at Norfolk, Va., as has already been announced in these columns, was born in 1877 at Washington, Pa. He began railway work in July, 1906 as masonry inspector on the Seaboard Air Line and two years later was promoted to inspecting engineer. In 1911 he was appointed resident engineer and on January 1, 1917, was appointed assistant bridge engineer, which position

he held at the time of his recent appointment as bridge engineer, of the same road, as above noted.

George H. Brown, acting principal assistant engineer of the Eastern Pennsylvania division of the Pennsylvania Railroad with office at Altoona, Pa., has been appointed principal assistant engineer of the same division, and **Elmer Irving**, acting division engineer of the Philadelphia division, with office at Harrisburg, has been appointed division engineer of the same division.

William S. Jackson, whose appointment as mechanical superintendent of the Erie, with headquarters at New York, has already been announced in these columns, was born on August 12, 1878. He began railway work on August 16, 1892, with the Lake Shore & Michigan Southern and served to July, 1911, consecutively as engine despatcher, roundhouse foreman, and general foreman. He then went to the Interstate Commerce Commission as locomotive boiler inspector, and later was made locomotive inspector at Cleveland, Ohio, until January, 1917, when he entered the service of the Erie as general inspector. In August of the same year he became master mechanic of the Kent division at Marion, Ohio, which position he held at the time of his recent appointment as mechanical superintendent of the same road, as above noted.

Purchasing

M. C. Moles was appointed storekeeper of the St. Louis division of the Chicago, Rock Island & Pacific, with headquarters at St. Louis, Mo., succeeding **F. E. Hartzler**, who has enlisted in the 49th Regiment, U. S. Railway Engineers. **John Stammers** was appointed storekeeper of the Kansas division of the Chicago, Rock Island & Pacific, at Herington, Kan., succeeding **J. E. Thomas**, resigned.

Obituary

Thomas H. Simmons, formerly general freight agent for the Chicago, Rock Island & Pacific, at Chicago, died at his home at Chicago, on May 23, at the age of 69 years, following a long illness. Mr. Simmons was born in Augusta, Me., on May 28, 1849. His railroad career began, when in the spring of 1872, he joined an engineering corps that was running the preliminary surveys for the Omaha & North Western, now a part of the Chicago, St. Paul, Minneapolis & Omaha. In August, 1872, he went to Marshalltown, Iowa, as a timekeeper for the Central Iowa, now the Minneapolis & St. Louis. Subsequently he was clerk and chief clerk in the general freight department and agent at the Eddyville Transfer, Iowa, of the same road and the Keokuk & Des Moines, now a part of the Chicago, Rock Island & Pacific. In November, 1879 he was appointed assistant general freight agent of the Iowa Central, now a part of the Minneapolis & St. Louis, at Marshalltown, Iowa. On April 1, 1886 he went to St. Paul, Minn., as general northwestern freight agent, of the Minnesota & North Western, now a part of the Chicago Great Western, and the Central Iowa, returning to Marshalltown in August of the same year as general freight agent of the Iowa Central. In the following year he became assistant general freight agent at Cedar Rapids, Iowa, of the Burlington, Cedar Rapids & Northern, now a part of the Rock Island, and in 1893, he was made general freight agent. From June 1, 1902 until May 1, 1903, Mr. Simmons was assistant general freight agent of the Rock Island at Cedar Rapids and on the latter date was transferred to Chicago as assistant general freight agent of the lines east of the Missouri river. On February 1, 1906 he was promoted to general freight agent, working in that capacity until January 1, 1910, when he was assigned to special work. The latter part of the same year, upon his own request, he was sent to Cedar Rapids as commercial agent, which position he held until July 1, 1916, when he was forced to leave the service of the company on account of ill health, and was placed on the pension roll.

RELIEF FUND FOR FILIPINO RAILWAYMEN.—The directors of the Manila Railroad have started a relief fund for the benefit of the employees with an initial appropriation of \$15,000, which is two per cent of the total salaries paid last year. Two per cent of each year's salaries, deducted at the end of each quarter, will be added to the fund.

EDITORIAL

Railway Age

EDITORIAL

By far the most important work to be accomplished by the men who will meet in Chicago at the joint convention of the Master Car Builders' and the

Opportunities for the M. C. B. Association

Master Mechanics' Associations will be the revision of the present M. C. B. Interchange Rules, in order that they may meet more adequately the require-

ments of the unified operation under government control. There are nowhere men more capable of doing this work than in the M. C. B. Association. It is their mission and their duty to adapt the rules to the present conditions. If they don't, somebody else will. Already some local agreements have been made to meet these new conditions, but they are not standard nor in accordance with general practice. The M. C. B. Association has here a great opportunity to justify its existence. It will do so if its members have a vision broad enough to view the unification of railways in the proper perspective. There are several important questions that have been discussed which must be settled definitely. One of these is the elimination of billing for repairs to foreign cars and an adequate method for checking the work done. Another is the advisability of adopting a "run, repair or transfer" rule. A third is the uniformity of repairs to cars. Still another, and by far the most important, is, What can be done to speed up the repairs to cars? It is the function of the M. C. B. Association to discuss all of these problems and to pass authoritatively on them. All discussion must be based on the fact that now the railroads are under government control.

Quite a large percentage of the population of the United States is foreign born or children of foreign-born parents. Far too little attention has been given to Americanizing these people; many of them cannot even speak the English language and have no conception of American ideals. This is a deplorable

June 14
is

Flag Day

state under normal conditions, but is particularly dangerous in time of war. Misunderstandings in industrial plants and communities which threatened to become serious have frequently been easily adjusted by getting these people to see the situation in its proper light. These situations must, of course, be handled with patience and tact as they arise, but more than this, it is necessary that these people be thoroughly Americanized as rapidly as possible. This is all the more important because German agents find so fertile a field for spreading their propaganda among them. The railroads have many foreign-born employees and not a few Americans who need to be educated in a higher degree as to their duties and responsibilities to this country. Special attention should be given, therefore, to observing a simple Flag Day program in order that all employees may gain a clearer understanding of the war and the reasons for our participation in it, and that they may be stirred to put forth greater efforts in strengthening the transportation machine to meet the abnormal demands which are being placed upon it. A simple program has been recommended, including a flag-raising to be accompanied by singing the Star Spangled Banner, a salute to the flag with the Pledge of Allegiance, an appropriate address, and the singing of "America." Railroad officers should use their influence also

in encouraging the industries in their immediate neighborhood to observe Flag Day.

The apprehension expressed in these columns a short time ago that some railway employees, especially those in shops,

Railway Strikes in War Time

would be dissatisfied with the wage increases granted by the Railroad Administration, has been justified. Strikes have occurred in shops of the Southern Railway and the Rock Island, and

more extensive trouble seems to be impending. These things have prompted Director General McAdoo to issue a statement sharply criticising employees who have struck. It reminds them that they are now working for the government, and in the present emergency should give it loyal support. As a matter of fact, there was no sufficient justification for strikes or threats of strikes on the railways before the government took over their operation. The country was at war then as now; it needed the most efficient service the railways could render then as now to enable it to carry on the war; and therefore every employee who was disloyal to the railways then was through them disloyal to the nation. Since the government assumed the operation of the railways, however, it has made special efforts to eliminate discontent and the causes of it from the ranks of railway employees. It has granted them an increase in wages, and has provided means for acting on all their legitimate complaints. In the circumstances, it would seem that the government has a right to ask railway employees to stay at their posts and render it efficient service, even though their conditions of employment and wages are not satisfactory in all respects. The government has done considerable for railway employees as a class and nothing, or even less than nothing, for railway officers as a class; and yet if railway officers should organize and threaten to leave their posts in a body they would be branded as traitors by everybody, including the railway employees. Does the fact that a man is a railway officer rather than a railway employee determine the kind and amount of duty he owes to his country in time of war?

The operation of trains over lines not used extensively may be carried out without any form of block signals, but it is

Signaling on Multiple Track Lines

necessary in the operation of an ordinary steam road at maximum capacity to use some form of block signaling, for otherwise the greatest capacity of the tracks cannot be obtained nor can

train movements be made with safety. It is therefore generally recognized that signals are necessary for intensive operation with safety, and the question is, as to the manner in which this operation can be effected by signals and the character of signals necessary. The answer to this question depends to a great extent upon the kind of traffic handled and the extent to which tracks are assigned to certain classes of trains. A type of signaling that may be applicable to one road may not be suitable on another line where different operating conditions exist.

In order to derive the greatest benefit from signals, it is assumed that a careful study will be made of conditions before the type or character of equipment is recommended.

While manual block may be used to advantage in certain places, there are manifestly drawbacks to its use in the great majority of cases on busy multiple track lines. The principal disadvantage of this type of block signaling is the excessive cost for the operation of a number of block stations if any material results are to be obtained. The element then affecting track capacity is the length of the blocks. Theoretically, the shorter the blocks are, the greater is the track capacity. This is true only within certain limits. If a track is assigned to high speed passenger train operation it is necessary that such trains get the caution indication of the signal ahead at a point far enough in the rear that a service stop may be made. This means that beyond a certain limit it is not advantageous to shorten the blocks for such trains. On a track assigned exclusively to a certain class of freight trains where the speed is materially less than that on high speed passenger tracks, the blocks may be made considerably shorter as these trains can be stopped within a shorter distance. When a track is used for both high and low speed movements, a different length of block is again necessary to obtain the best results. With the proper assignment of tracks for various classes of service on a road with four or more tracks, and with these tracks properly signaled, the best use of the tracks is obtained. The tracks assigned to passenger traffic exclusively are almost without exception not used to their capacity, while the freight tracks are quite often overtaxed. The congestion on the latter can be relieved materially by running freights over the passenger tracks during certain periods. Where such use is made of these tracks, the capacity can be materially increased and this can be bettered further by the location of interlocking plants governing cross-overs at certain points.

Elsewhere in this issue is an article on the effect of signals in increasing track capacity on busy multiple track lines of this character. Inasmuch as the proper installation of automatic signals and interlocking increases the track capacity materially, and at such a low cost as compared with other means of producing the same results, it would appear advisable that such work be given careful consideration by all whose duty it is to provide increased track facilities for the present huge volume of traffic.

Time is the Important Consideration

CURRENT MAINTENANCE WORK is usually started as soon as the frost leaves the ground. In most parts of the country it is well under way by the middle of April. It is now the first of June, but only limited progress has been made, particularly in such heavy work as the renewal of rails and ties. This delay is already serious and will become increasingly so as it continues from week to week.

Most maintenance work is seasonal in character, much of it necessarily so. On the average line, forces are increased to the summer basis by April 1 and work is pushed rapidly until about July 1. By that time, particularly in the central and middle western states, the small grains are ripe and a large part of the men leave for the harvest fields, reducing the forces on the roads practically to those required for routine work only. It is then generally impossible to make much progress with the heavier work until early in September and by that time it becomes necessary to concentrate attention on the closing of the season's work and preparations for winter. Therefore, with two of the three best working months already gone it is necessary that activities be greatly increased if serious consequences are to be avoided next winter.

The need for a heavy season's work should be universally realized. There has been a gradual accumulation of deferred maintenance for the last three or four years until the

roads are now probably two full years behind their normal rail renewals. On top of this condition came the unusually severe winter with its increased wear and tear on the track. As a result more than the usual amount of work *must* be done if the roads are to go into the winter in *even as good condition* as last year.

The general uncertainty among railway men as to the government's policy is responsible for some of this year's delay. However, the most important causes contributing to this condition are shortage of labor, rails and ties, and the agencies for the relief of all of these problems have been transferred entirely or in large measure into the hands of the government.

The roads were notified early in the year that the government had taken over the purchase of rails. Since that time no rails have been ordered, and although only about 2,000,000 tons, or less than two-thirds of a normal season's requirements, are now under contract on earlier orders, only about 25,000 tons are being rolled per week, at which rate less than one-half of the tonnage now on order will be secured in time to be laid this year. The outcome of such a condition is apparent to all familiar with the maintenance of railway tracks.

Similarly conditions in the tie industry, accentuated by the centralization of purchases and inspection, are leading to a serious shortage of ties. This situation is particularly acute on those roads which use untreated ties and which do not, therefore, store them any considerable length of time. While most of those roads which treat their ties have a sufficient number on hand to meet the requirements for this season, they also will be short when this supply runs out owing to the fact that the stocks in the tie yards are not being fully replenished. The tie situation is particularly serious because good ties are absolutely essential to safe operation, furthermore, ties cannot be produced and seasoned in a day.

The shortage of labor is universal. The government took a radical step which is expected to relieve the situation considerably when it issued an order a few days ago specifying certain occupations as non-essential for men of draft age and giving men in such occupations the choice of entering industries essential to the welfare of the country or of being inducted into the army at once. The government can go still further by opening certain sources of supply which will afford further relief, particularly to the railways. For instance, it was said several months ago on the authority of the United States Department of Labor that 100,000 Porto Ricans were ready to come to this country and that shipping had been provided to bring them here. Over two months have elapsed and none of these men has been reported as arriving on the railroads in this country. Another source of labor is Mexico. The roads in the southwest have recruited their track laborers almost entirely from Mexicans for a number of years, and have found them satisfactory. This avenue was closed on May 1, 1917, by the alien immigration law, which imposed a head tax and a literacy test on all immigrants. Since that time the immigration of Mexicans has been so small as to be almost negligible. The government has recognized the existence of this source of labor by arranging for the temporary admission of agricultural laborers from that country for a period not exceeding six months. A considerable number of men were brought into the Southwest under this arrangement in 1917, and under date of April 12, 1918, the Bureau of Immigration of the United States Department of Labor issued a circular outlining the conditions under which laborers of this character may be admitted this year.

With labor available in Mexico and with the pressing need for it in this country it would seem advisable, as a matter of public policy, to lift the restrictions, at least for the duration of the war, in order that the railways and other

industries may secure the men so essential to their proper operation. Action must be taken, and taken promptly, if serious results are to be averted. As stated above, maintenance of way work is seasonal in character and must be done before fall, if at all. In the meantime the roads must soon be prepared to face another winter.

The Position of the Accounting Officers

IT IS A LONG STEP from the old conception of the railroad auditor as a confidential bookkeeper for the president of a railroad company to the recognition by the government that the accounting officers are a necessary part of the economical operation of the transportation system of the United States under government control. Charles A. Prouty, director of the Division of Public Service and Accounting of the United States Railroad Administration, was to have made an address before the Association of American Railway Accounting Officers at the annual convention at St. Louis on May 29, but, being prevented from doing so, wrote the Association a letter, setting forth his views as to the position of accounting officers under government control. In the course of this letter he says: "The operating revenues, which are reflected in the accounts kept by our accountants, belong to the United States. The director general can remove or employ any accountant upon any railroad under federal jurisdiction. Our accountants are, therefore, in a direct sense, the employees of the government." The letter is published elsewhere, together with the proceedings of the accountants' association, and it apparently clears up the situation about which some accounting officers felt more or less uncertainty.

The duty of the accounting officers who are thus taken into government service is single and undivided. Their entire responsibility is to the government. On the other hand, the association has still among its members railroad officers whose responsibility is to the stockholders and who are employed by the corporation, not by the government, and it has also among its members accounting officers of railroads which have not been taken over by the federal government, so that its responsibilities as an association are three-fold.

In commenting on the amalgamation of the various railroad associations in these columns last week, it might have been pointed out that the association of accounting officers is distinct and separate from those associations which may be combined with the American Railway Association. It would appear necessary to keep this accounting officers' association separate. Just as in a railroad company's organization, that part of the personnel which originates expenditures and receives money is kept entirely distinct from that part which audits expenditures and receipts, so it would appear to be proper to continue this broad distinction in so far as the associations are concerned.

Ever since 1906, the Association of American Railway Accounting Officers has been working in co-operation with the Interstate Commerce Commission in the perfection of a system of railway accounting, and probably the Interstate Commerce Commission, and especially those members of it who had to deal directly with the association, would be the first to acknowledge the value of the services which the association, and more especially its executive committee and committee of 25, have rendered. The continuation of the association and of the work of the committees and the meeting together of the membership is of great importance. A railroad auditor is peculiarly liable to get into a rut, to permit himself to get so close to the mass of detail work under his supervision as to lose perspective. The meetings of the association are the best and about the only antidote to this

tendency. Discussion of what the other fellow is doing, discussion of general principles and of new methods are a necessity for any progress and even for keeping abreast of day to day requirements.

A great deal of credit is due to American railway accounting officers for the independent stand which they have maintained, especially since 1906. The accounting officer was peculiarly liable to pressure from above, he was considered a non-revenue producing man. The fact that with the moral support of the government the accounting officers have stood out against their own executives in some cases and worked for a sound system of accounts open to public inspection is worthy of note. Now that the officers of the railroads under federal control become government employees, the Association can continue to perform a most important work by carrying on the ideals of sound accounting and full publicity.

The Railroad Administration and the Railway Officers

THE EFFECTIVENESS of an army of any given size depends mainly on its having enough experienced and competent officers to train, discipline and lead the soldiers in it and on the spirit of its official personnel. Even though the privates of an army are intelligent and courageous, it will not long be an efficient fighting machine unless it has plenty of good officers, and the officers are full of fighting spirit and are able to command the unstinted respect, confidence and loyalty of the men in the ranks.

The organization of a railway bears a closer resemblance to that of an army than the organization of any other kind of industrial institution. The railways of the United States have about 20,000 general and divisional officers, or approximately one officer for every 100 employees. The efficiency with which our railways have been operated in the past has been due mainly to the kind of officers they have had, from those who have had direct, detailed supervision over the work of the employees up to the presidents and the chairman of the board.

In a very large majority of cases the officers of all classes have risen from the ranks; and the higher officers usually have come up step by step through the various official grades to the positions which they now occupy. They have learned their business by experience and have owed their promotions to merit. This has not been true in every case, but the exceptions have not been numerous. Promotion having been based on merit, there has been intense emulation between ambitious officers on the same road, and between officers occupying corresponding positions on different roads, to get results which would demonstrate their superior capacity and gain for them commensurate rewards. While there has been friction especially within recent years, between some classes of the employees, on the one side, and the officers, on the other, the men usually have had respect for and confidence in their superiors, and there has resulted the able leadership and esprit de corps which have enabled our railways to combine excellence of service with economy of expenditure as they had not been combined on any other system of railways in the world.

It is unfortunately necessary to take cognizance of the fact that recent developments have had a tendency to impair the official morale and discipline on our railways. Since government control was adopted there has been a feeling on the part of both employees and officers that the latter cannot exercise the same authority over the former that they have in the past. Furthermore, the higher officers have had a large part of their power of initiative and decision regarding important matters taken from them and transferred to the Railroad Administra-

tion. Many men of official rank, especially in the traffic department, have been dismissed from the service, and others in some departments are apprehensive regarding the future of their positions. Many in the law departments have had their salaries reduced. Finally, to mention the most conspicuous and important example of all, notice has been given that the presidents of the companies are to be superseded as the chief executive officers of the physical properties by federal managers. The federal managers will report to the regional directors, and they, in turn, to the office of the Railroad Administration at Washington.

It has been understood that many of the presidents will be offered the positions of federal managers of their railways, but it has been reported that their salaries will be sharply reduced. Questions have been raised as to the effect which this will have upon the positions of operating officers, such as vice-presidents, general managers, superintendents of motive power, chief engineers, and so on, and upon the salaries and the opportunities of such officers. There are many ambitious men of lower rank who have looked forward to the time when they would be promoted to the highest offices, and many of these have become much disturbed regarding their prospects of retaining their positions and of securing promotions such as they feel they must secure to satisfy their ambitions and to compensate them for the energy and ability they are willing and anxious to put forth.

The result of these developments is that an alarming and dangerous feeling of uncertainty, unrest, irritation and pessimism is spreading among railway officers. It is not shared by all, but it is rapidly extending farther and farther among all classes and all ranks. There are also many employees who are intensely loyal to their officers and if this feeling continues to grow it will permeate extensively among the employees. It was hoped that the advance in wages recently granted would tend to encourage and stimulate employees, but, on the contrary, it is not as much as many expected, and, in consequence, while it has reduced discontent in some quarters, it has actually increased it in others. There are many officers, high and low, who are indignant and pessimistic because they believe that the officers as a class have not been treated considerably or fairly by the Railroad Administration, and while they entertain this belief it is not to be expected that they will exert themselves energetically to quiet the discontent among the employees. Men who feel that they have "troubles of their own" are more likely to think about their own troubles than to try to promote contentment among others.

So far as concerns the officers of the railways the existing situation presents a striking contrast to that which existed twelve months ago. At that time, as now, railway officers had more hard work to do than they ever had. Then, however, they were not merely trying to operate the roads more efficiently than ever before, but they were enthusiastic, optimistic and full of "punch." The railway managers voluntarily had undertaken to work the railways as a single system to demonstrate to the government and public that railway owners, officers and employees in a time of national stress could and would, without any governmental compulsion, submerge their competitive and selfish rivalries and interests and render to the government and public a larger and more efficient transportation service as a means to helping win the war than could possibly be secured under government management. From the optimism which prevailed then to the pessimism which prevails now, from the keenness for achievement which prevailed then to the spirit of hesitation and doubt which prevails now, there has been a long descent for the worse.

The *Railway Age* in thus describing the situation is not indulging in conjecture. It is its business to know, not merely what railway officers are saying, but what they are thinking, and the assertions made here as to their present state of mind are based upon information which has been gathered by intimate conferences with officers in all departments

and of all ranks in all parts of the country. Of course, they do not all regard matters in the same way. They look at the situation from different angles and are subject to different influences. But the general atmosphere of railway officialdom at present is one of dubitation, apprehension and gloom.

This is a condition which the welfare of railway employees and officers of the railways themselves and of the nation ought not and must not be allowed to continue. Men are made efficient or inefficient largely by the influence of fear and of hope. But in all men of spirit and ability the hope of appreciation and of reward is a far more powerful stimulant to efficiency than is fear. Persistent pessimism wins no battles for individuals, organizations or nations.

The present condition of mind of the railway official personnel can be corrected partly by the Railroad Administration and partly by railway officers themselves. The Railroad Administration should make a greater effort than it has to get the point of view of the officers who are out on the lines and actually operating the trains and maintaining the track, structures and equipment. Railway officers of all ranks have been much disturbed about their futures ever since government control was adopted. Their concern was naturally turned into deep apprehension when it was announced that the presidents were to be deposed as the chief executive officers of the roads. The present officers, high and low, have been used to the leadership of these presidents, and directly or indirectly owe their positions to them. Naturally, they have apprehended that the deposition of the presidents would result in radical changes in the official personnel of the roads, and with lightning playing all around them they do not know where it is going to strike.

To those who have closely watched developments under government control, the decision of the Railroad Administration to appoint federal managers of the various lines caused little surprise. When the railroads were first taken over it was generally assumed that the government was going merely to take control of their management and that the actual operation would be left in charge of the companies and their agents. In course of time it has become apparent that the term "government control" is a misnomer and that the government is not merely controlling management but is assuming the function of operation. Now, while men representing the companies could without trouble or embarrassment operate the properties under government control, their position under a system of government operation was sure to become difficult and embarrassing. Government operation having been decided upon it was natural for the Railroad Administration to prefer to put federal managers representing only itself in charge of operation.

In order, however, to get the best possible operating results, while at the same time avoiding having in charge of operation men who owe duties to both the railway corporations and to the government, it seems vitally important that in all cases where it is practicable the presidents of the railways shall be appointed the federal managers, and that where this is not practicable the vice-presidents in charge of operation, if competent men, shall be appointed. This would tend greatly to reduce the general fear now so prevalent that sweeping changes will be made in the official personnel.

Furthermore, it seems extremely desirable that there should be none of the wholesale slashing of salaries of which there has been so much talk and so much apprehension. It would be impracticable to make heavy reductions in the salaries of the higher operating officers without scaling down the salaries of other officers. Now the railway industry is a great industry, and one which demands the best talent that can be obtained. But the best talent will not stay in it and will not enter it unless it is made clear, not merely by words, but by acts, that as great opportunities for carving out successful careers by merit are to be afforded in it as in any other industry.

Fortunately, some late developments indicate that this

is the general policy which probably will be followed by the Railroad Administration. All the regional directors who have been appointed are former railway presidents. All the federal managers who have been appointed, with one exception, have been either the presidents or the operating vice-presidents of the roads of which they have been put in charge. There has as yet been no general cutting of salaries except in the law department. It is a cause of regret from the standpoint of operating efficiency that some of the ablest railway executives of the country are going to stay with the companies, and therefore will not be able in future to direct the operation of the properties, but most of the selections thus far made for regional directors and for federal managers have been good. If the same general policy in making appointments is followed in future, and if the Railroad Administration makes clear, not merely by what it says, but by what it does, that ambitious and able men will be given the same opportunity for careers in the railway business in future that they have had in the past, a large part of the gloom which now hangs over the railway business ought to be dispelled.

Meantime, to a large extent regardless of these matters, railway officers have a duty to perform to themselves, to the railways and to the country. It is indisputable that the lot of many of them has not been recently, and is not now, a happy one. Some of the ablest and most public-spirited railway executives in the country have had their careers suspended, if not actually terminated, by the adoption of government operation. This is a tragedy for them and a misfortune for the country. Those who stay in the service probably will not find their lots as satisfactory under government operation as they have been under private operation. But neither they nor anybody else can afford to forget for a moment that the country is at war, and that war is having unhappy and even disastrous results for many persons. Many young men who had just got well started in their careers have had to leave their offices and business places and go into the army. Men engaged and employed in many essential lines of business are making more money than they ever did, but, on the other hand, many engaged in so-called "non-essential" lines are seeing their businesses drift downward and are confronted with heavy losses, if not ruin. As for the labor situation on the railways, employers in every line of industry are having serious difficulties in dealing with labor. Therefore, as unsatisfactory as the lot of many railway officers is at present, if they will look around them they will find, if that is any consolation, that there are many persons whose situation is fully as disagreeable as their own.

Some railway officers are likely to reply that if they could look forward, as people in other lines of endeavor can, to an improvement in their condition the present situation would be more tolerable, but that government operation probably will lead to government ownership, and that official service on the railways under government ownership would be entirely intolerable to them. That is doubtless true. Few men of ambition and brains would care to stay on the railways under government ownership. But even if government operation were certain to lead to government ownership the duty of railway officers to stay at their posts during the war and do the best work that they can would be plain. Furthermore, it is very far from certain that government operation will lead to government ownership. It seems much more probable now that government operation will prove to be the most effective preventive of government ownership.

Many of the people of this country had come to favor government ownership because they had accepted the view of the advocates of state socialism that government operation of the railways would in some way work a miracle which would result in better service, lower passenger and freight rates, higher wages and large profits for the public treasury. The present trial of government operation, even though it be as successful as human genius and energy can make it, will

demonstrate that there is no magic in government management, and it may and probably will greatly increase rather than diminish the chance of a continuance after the war of private ownership and management of railways.

Railway officers are now going through what probably will prove to be the most trying part of their experience with government operation, because they are right in the midst of the transition from private operation to government operation. When this transition is completed we believe and hope that they will find that they are still serving under very many of the same leaders that they were before, that there have not been as radical changes in personnel and salaries as they fear, and that an increasing amount of consideration for their interests, their rights and their legitimate ambitions will be shown by those in authority. Unless this is done the morale of the railway official staffs will be destroyed and government operation will prove an utter failure. Those in high places in the Railroad Administration undoubtedly are keenly conscious of this; and being conscious of it, they are not likely to act in a manner which in the long run would inevitably defeat every plan and effort they may make to operate the railways efficiently. The future of railway officers as a class, both during and after the war, probably will prove to be far more happy and successful than so many of them now fear.

A New Field for Pork Hunters

THE POSSIBILITIES of the Railroad Administration's revolving fund as a pork barrel have already been scented from afar by many eager citizens and their constituted representatives, some inspired by local pride and interested in local improvements at national expense, and others merely enthusiastic over the possibilities in the way of increased transportation efficiency to be derived from the expenditure of a few millions in places which private capital has not regarded as promising fields for investment.

While there is as yet no indication that the Railroad Administration proposes to allow the large funds at its disposal and under its control to be drawn upon for expenditures in parts of the country where it will do the most good politically instead of from a railroad standpoint, many of the same people who have been active in soliciting and procuring appropriations for their districts have not been slow to perceive the possibilities along that line afforded by the fact that the government is now administering the railroads. Mr. McAdoo's outside office has frequently been thronged with delegations of waterway advocates anxious to point out the immense relief that could be afforded the transportation systems of the country by the improvement of waterways that have been neglected or whose usefulness had been put at a disadvantage by railroad competition and the announcement of the railroad budgets amounting to \$938,000,000 that had been approved by the division of capital expenditures, together with the invitation to the roads to apply to the division of finance and purchases for loans if necessary, has opened up a vista of new opportunities.

Even before the budgets were announced Judge Lovett's office was the recipient of much advice from Senators and Congressmen as to where railroad improvements were imperatively needed. Thus far it has been possible to give such applicants the reply that capital and labor are limited on account of the war and that expenditures must be confined strictly to necessities. As a result the budgets as recently announced were in the form in which they were made up by railroad officers as revised by the regional directors and approved by the division of capital expenditures according to the principles of railroad efficiency and with recognition of the fact that the country is engaged in a war. For example, very few expenditures were approved for new passenger stations or for extensions.

But many members of Congress who hardly knew where the Interstate Commerce building was have been seen in its vicinity of late at the head of large delegations who knew of excellent projects which might be furthered by a government loan to a railroad whose own credit would not stand the strain. Senator Shafroth of Colorado thus appeared with a delegation last week to urge that the government loan \$6,000,000 to the Denver & Salt Lake Railroad for the purpose of building the much bruted tunnel through James Peak which Denver will never be happy without.

A minor but illuminating illustration of the attempts communities already are beginning to make to secure from the railroads by political influence what cannot be secured by other means is afforded by the case of Delaware, Ohio, a small place a few miles from Cleveland. Formerly the Big Four Railroad operated some shops there. The Journal-Herald, a local newspaper, records that "the Delaware shops have been practically extinct for seven years." The railroad has made them so for reasons of transportation efficiency. "When the government took over the railroads of the country 13 freight trains were passing through Delaware daily eastbound and 10 westbound," says the Delaware Journal-Herald. "All these trains are now going over the Bellefontaine route." In order to get the operation of the practically abandoned shops renewed and the freight trains run through Delaware again—for the sake of Delaware, of course, and not of railroad efficiency—the Chamber of Commerce of that town has appealed to Congressman William A. Ashbrook, of the district in which Delaware is located, and

similar matters through Congress. The method of approach to a congressional appropriation is well-known but Congress now has very little to say about running the railroads and the Railroad Administration organization consists mainly of practical railroad officers and not of the type of men usually found in government offices. It is easy to get appropriations through Congress because members who have no interest in them vote for them on a reciprocity basis so that a similar courtesy will be shown as to projects in which they are interested.

Moreover it is much easier to turn down raids on the pork barrel during war times than during times of peace.

New York, New Haven & Hartford

THE RISE IN MARKET PRICE of the stock of the New York, New Haven & Hartford within the past two months has led to the calling of the stock among brokerage house customers, the "mystery stock." While it is true that, under the government guarantee of railroad net income, the New Haven will receive an amount that would not presumably justify it in immediately beginning payment of dividends on its stock, it is, nevertheless, far from a mystery as to the improvement that has taken place in the affairs of the company. During 1917, there was a big improvement in operating conditions; there was a steady progress in carrying out a plan for much needed betterments; there was marked progress in untangling the complicated intercorporate relations of the New Haven

The New York, New Haven & Hartford

to United States Senator Pomerene. The Journal-Herald says that Congressman Ashbrook "gladly offered to look into the matter in the interest of Delawareans," and that Senator Pomerene "was heartily in favor of taking up the cause of Delawareans." What is national railroad efficiency from a political point of view compared with the local interests of Denver, Colo., and Delaware, Ohio?

Applicants for money for projects of this kind now have a more difficult task to perform than when trying to get

and its subsidiaries and controlled companies; and, since the close of the calendar year 1917, the floating debt situation has been cleared up by the government buying at par the \$43,964,000 one year 6 per cent notes, the proceeds of which paid off the greater part of the \$45,000,000 notes which were issued April 16, 1917, and due April 15, 1918. The New Haven's floating debt is now taken care of till April 15, 1920, through a provision which permits of the renewal of the notes taken by the government for a second year. Total

operating revenues in 1917 amounted to \$88,788,000; an increase over 1916 of \$5,355,000. Of this increase \$3,345,000 was in passenger revenue. Total operating expenses amounted to \$61,970,000; an increase of \$7,598,000 and of this increase \$5,161,000 was in transportation expenses. This was an increase of 14 per cent in transportation expenses, but it would appear that the entire amount represented increased rates of wages and per unit costs of fuel and material and that actually the company expended less units of work in moving a 15 per cent greater freight business and an 11 per cent greater passenger business than in 1916.

The ton mileage moved in 1917 was 2,776,000,000; an increase over 1916 of 208,000,000 ton miles. The total number of passengers carried one mile in 1917 was 1,814,000,000; an increase over 1916 of 164,000,000 passenger miles. The mileage of revenue freight trains decreased by 817,000 and the average revenue freight train load was 397 tons in 1917, an increase of 71 tons over 1916. With an increase of nearly 11 per cent in passenger revenues, there was a decrease of over 3 per cent in passenger train mileage. These results were obtained without any increase in the number of locomotives in freight or passenger service. As a matter of fact, 55 locomotives were scrapped or sold and only one added.

Since the end of 1917 the New Haven has begun to receive some of its heavy Santa Fe type freight locomotives which have been ordered for more than a year. Preparatory to putting in service these heavier locomotives, the company during 1917 carried out a quite extensive program of additions and betterments.

There was \$1,072,000 spent for new and improved bridges; \$1,017,000 for additional yard facilities; \$626,000 for improved locomotive facilities; and \$571,000 for additional yard passing sidings. The total, chargeable to capital account, for additions and betterments, exclusive of equipment, was \$5,473,000. There was \$621,000 spent for new equipment and improvements to equipment; and payments on equipment trusts amounted to \$960,000. The greater part of the income which should result from the additions and betterments to roadway and track will not be shown before the figures for 1918 are made up. Some of the expenditures for equipment, however, were immediately productive. For instance, the company spent \$146,000 for superheaters and additional safety appliances. The expenditures on superheaters added during the year 131,000 pounds to the tractive power of the locomotives in service. As already mentioned, 55 locomotives were scrapped; but the addition to tractive power through the installation of superheaters was alone equal to the tractive power of nine of the locomotives disposed of.

President Pearson, in his annual report, gives credit for the improvement in freight train loading, car loading, and number of passengers per passenger train mile, to the public as well as to his organization, and the public did unquestionably co-operate with the management, especially as regards car loading, and it put up with the inconveniences in the way of passenger service because of a better understanding of the New Haven's problems. The board of directors, in a resolution which was ordered printed in the annual report, give full credit to Howard Elliott, who resigned as president on May 1, 1917, for the greatly improved public relations of the company. There could be no doubt of the importance of Mr. Elliott's services in this respect. The removal of the obstacles in the way of permanent financing by the action of the Massachusetts, Rhode Island and Connecticut railroad commissions and legislatures may safely be assumed to have been due in good part to Mr. Elliott's efforts. Making full allowance, however, for this and certain other favorable circumstances, there still remains a large measure of the total progress made which must be credited

to the aggressive business-like methods of the new management. Neither the increase of 70 tons in average train loading nor the increase of 12 per cent in average revenue lading per loaded car could have been accomplished without a determined and well directed effort on the part of officers and employees of the railroad company. Further evidence of better operation is given by the fact that the amount spent for hire of equipment was \$676,000 less in 1917 than in 1916; the total in 1917 being \$2,671,000.

The operation of the New York, New Haven & Hartford has often been likened to the operation of a vast freight and passenger yard. It is pretty generally recognized that one of the most important features in the economical operation of a large yard is to have ample yard facilities. The New Haven has suffered severely, especially in the last three years, from the lack of yard facilities, engine house facilities and passing tracks. With so large a part of its business passenger business and so large a part of its freight business fast freight, the main tracks have been subject to severe congestion. One important object in ordering the heavy Santa Fe freight locomotives which are now beginning to be put in operation was to obtain a much heavier train load without reducing the average speed of freight trains to any harmful extent. There have been differences of opinion as to how effective this experiment will prove, but the past year has demonstrated that even without these locomotives it has been possible to inspire the organization so as to produce greatly improved results in moving more tonnage with less freight train mileage.

Mention has already been made of the temporary clearing up of the floating debt situation. The government has approved of \$24,316,000 for additions and betterments to the New Haven, eliminating only \$4,248,000 of the sums which the company asked approval of for this purpose.

At the end of the year, the company had \$4,495,000 cash and had written off through profit and loss during the year \$6,276,000 loss in the liquidation of the New England Navigation Company, \$1,163,000 loss in the liquidation of the Millbrook Company, \$3,000,000 loss in the surrender of the New England Steamship Company, and \$828,000 on loss in the sale of securities. The profit and loss surplus now stands at \$3,429,000. It is rather interesting to note that settlement was made with E. H. McHenry by the payment as recommended by a board of arbitration of \$100,000, and with Charles S. Mellen, former president, by the payment of \$95,000.

The time for the sale of the stock of the Boston & Maine, which is held by the Boston Railroad Holding Company and controlled by the New Haven, has now been extended to February 1, 1919.

Throughout the report there is a business-like facing of facts, even when they are unpleasant, and a record of progress being made especially in better operation which should be good reading to holders of New York, New Haven & Hartford securities.

The following table shows the principal figures for operation in 1917 as compared with 1916:

| | 1917 | 1916 |
|--------------------------------|--------------|--------------|
| Freight revenue | \$50,700,000 | \$47,700,000 |
| Passenger revenue | 14,400,000 | 11,000,000 |
| Other revenue | 9,670,000 | 8,400,000 |
| Material and supplies consumed | \$6,100,000 | \$6,700,000 |
| Maintenance of equipment | 1,000,000 | 1,000,000 |
| Transportation expenses | 55,160,000 | 50,000,000 |
| General expenses | 1,700,000 | 1,700,000 |
| Total operating expenses | \$61,970,000 | \$58,400,000 |
| Operating income | \$26,730,000 | \$24,300,000 |
| Income taxes | 2,400,000 | 2,400,000 |
| Net income | \$24,330,000 | \$21,900,000 |

Letters to the Editor

More on the Short Line Problem

ST. PAUL, MINN.

TO THE EDITOR:

Since the power given to the President by the act of March 21, 1918, to relinquish of his own volition control of railroads that are not needful or desirable, must be exercised before July 1, 1918, the director general necessarily has had to make rapid decisions and to act promptly in the matter of the relinquishment of the short line railroads, control of which he does not wish to retain, and he will have to continue to act quickly during this month, if he is to make use of that power. On the other hand the President has power to take into federal control any needful or desirable railroad, and therefore can take a relinquished road again.

If it should be clear that the President would not retake control of a large number of the short line railroads, control of which was relinquished, are they to be left to shift for themselves? Is there, or can there be no middle ground between federal control and abandonment of responsibility and assistance to the United States? Should there not be some further method devised for the handling of the short line railroads not under federal control, in a uniform manner, affiliated with the controlled railroads and supervised and assisted by the United States Railroad Administration. There seem to be fears on the part of some of the owners of these roads that in the midst of handling the more dominating problems of the larger railroads, the short lines may be overlooked or given scant consideration. It may be admitted that these fears are groundless; nevertheless too much stress cannot be laid on the fact that their disposition and operation is a serious question for many persons and communities, particularly in the West, and therefore, one of the most important problems presently to be solved by the United States Railroad Administration. It is therefore important to study the short line problem.

The Railroad Administration has one of the greatest problems ever laid on one man or set of men in managing and directing the transportation system of the country, and naturally would not wish to be hampered with the care of roads that need continual nursing and special attention in order to be kept in operation. There are many roads whose financial problems would not be solved by being kept in federal control (though other difficulties above adverted to would be avoided) because the just compensation as defined, calculated and allowed under the terms of the act of March 21, 1918, would not be sufficient to pay their charges and war taxes; and yet no conditions of war operation, receivership or recent expenditure, not fully reflected in operating railway income of the prescribed period, exist to warrant the President to make a special agreement. Some other means must be found.

It is not a sufficient answer to say that it is not the business of the United States to protect private investments, for though this might have been said before federal control had been taken of the railroad systems of the United States, a new element has been introduced in the fact that the Railroad Administration by its control over routings can make or break any railroad that is outside of federal control. Yet though this is persuasive of an obligation on the part of the United States to make some arrangements for the protection of the short line railroads, it is by no means conclusive. The great national purpose is to win the war, and to that end everything else must be subordinated and, if necessary,

sacrificed. The decisive question is whether a railroad is needful or desirable in a comprehensive national system of transportation; but there are many viewpoints to be considered in reaching a conclusion on the question of need or desirability.

The case of the railroad which handles a large quantity of essential commodities is simple. But it is unlikely that such a road would have very serious financial difficulties in any case. This would also be true of the plant facility.

There is a larger question than whether a community produces sufficient essential commodities to make it immediately necessary that a railroad be maintained. If, without fulfilling this condition, a community is a growing one, entirely dependent for its transportation on the short line railroad, or if large numbers of people who work in other communities on essential commodities live on the line of such short line railroad and are entirely dependent on it for transportation, then it would seem to be desirable that such a railroad should be insured of future existence. The development of new communities, and the protection of the normal conditions of life for the people is an important function of the government in the war emergency. Developing communities must be encouraged if the future of the country is to be made secure, and it would be no ultimate economy to save money by abandoning a railroad if the equivalent, or more, were lost by making people, dependent on that railroad, move to other communities.

Reduced to lowest terms, it would seem that the only railroad that can be left to its fate is the railroad which ought never to have been built, and which might better now be scrapped.

The owners of the short lines naturally recognize that the control of routings is the power of the Railroad Administration which affects them most, and they urge particularly that if left out of federal control an arrangement be made whereby routings in their favor will be observed. Such an arrangement would seem to be entirely impracticable, for it would destroy one of the most valuable gains resulting from unified control of railroads, namely, the ability to ship over the shortest and most direct line and the elimination of traffic solicitation. But, on the other points some uniform arrangement and some federal assistance ought to be given.

It would seem that the government should make agreements with the short lines which are not kept within federal control, (a) to assist the short line in financing itself during the period of the war, the budget of operating expenses and financial requirements of the short line to be subject to governmental approval and control; (b) that the government should allow to the short line railroad the same percentage of division of rates that it had prior to the beginning of federal control; (c) that the government should insure its pro rata share of car supply; (d) that the government should permit it to make all of its purchases through the regional purchasing committee and that it be given the benefit of prices fixed or obtained by the government; and (e) that it be given the right to call upon the United States Employment Service for labor and stand upon the same plane as other railroads.

This would probably require additional legislation; but there is no essential objection to that. The government is in a new and uncharted field, and it cannot be expected that the first plan and the first law passed in pursuance thereof, however wise the framers, will cover every possible phase of so widespread and intricate a problem as taking from private ownership and control and placing in federal control the vast railroad transportation system of this country.

SANFORD H. E. FREUND,
Assistant General Counsel, Great Northern.

Electrification of New York Connecting Railroad

Link Between the Pennsylvania and the New Haven Eliminates
Eleven and Thirteen Mile Car Ferry Routes

THE NEW YORK CONNECTING RAILROAD, constructed and owned jointly by the Pennsylvania Railroad Company and the New York, New Haven & Hartford Railroad Company, forms an important connecting link in the heart of greater New York City between the existing railroad lines of these two companies. It is used both for freight and passenger service, separate tracks being provided for each. The connection with the New Haven Railroad is at Port Morris and the connection with the Pennsylvania Railroad for passenger service is at Sunnyside Yard in Long Island City, from which point through trains are operated into the Pennsylvania Station, New York, via the Pennsylvania tunnels under the East River. The two-track freight line extends from the New Haven connection at Port Morris to Fresh Pond Junction, thence over the Long Island Railroad to Bay Ridge, from which point a short car ferry (about three miles long) completes the connection with the Pennsylvania Railroad Company's main freight terminal at Greenville, N. J., on New York Bay. The New York Connecting Railroad with its connections with other railroads is shown in Fig. 1.

The principal New York Connecting Railroad data are as follows:

| | |
|---|--------------|
| Length of two-track passenger line, Port Morris to Sunnyside Yard, miles..... | 1.1 |
| Length of two-track freight line, Port Morris to Fresh Pond Junction, miles..... | 2.0 |
| Length of two-track freight line, Port Morris to Bay Ridge, miles..... | 2.0 |
| Maximum grade westward, approaching Hell Gate bridge, two miles, per cent..... | 1.2 |
| Maximum grade eastward, approaching Hell Gate bridge, 1.7 miles, per cent..... | 7.2 |
| Length of four-track passenger and freight section, Port Morris to Sunnyside Junction, miles..... | 3.0 |
| Length of Hell Gate bridge, between approaches, ft..... | 927 |
| Length of Hell Gate bridge outside approaches, ft..... | 1,150 |
| Cleared height of bridge above mean high water, ft..... | 135 |
| Cost of Hell Gate bridge..... | \$4,000,000 |
| Cost of the New York Connecting Railroad..... | \$6,000,000 |
| Total cost of line, including the Bay Ridge improvement..... | \$10,000,000 |

Method of Operation

Formerly, the interchange of a few passenger trains between the Pennsylvania and the New Haven Systems was by a car ferry route of about 11 miles from Jersey City to Harlem River and the freight interchange was by a still longer ferry, about 13 miles, between Greenville and Oak Point. As these float services were conducted by the New Haven, the New York Connecting which takes their place is operated entirely by the New Haven.

For satisfactory operation in connection with the New Haven Railroad's electric passenger service between New York and New Haven it was decided to electrify the passenger tracks of the New York Connecting Railroad so that through trains may be operated into the Pennsylvania Station, New York, without changing engines. This electrification has been carried out by the single-phase, overhead catenary trolley system of the same operating characteristics as that employed on the New Haven, the current delivered being at 11,000 volts and 25 cycles. The New Haven passenger locomotives used in this service are of the A.C. D.C. type and are, therefore, capable of operating through the East River tunnels, which are equipped with third rail into the Pennsylvania Station, the change from overhead to third rail operation being effected at the east end of Sunnyside Yard. Power for operating the trains on the New York Connecting Railroad is supplied direct to the trolleys from the New Haven System at Port Morris without auxiliary transmission or feed wires as these are not necessary for the present passenger service.

Trolley Supporting Structures

Two general types of structures are used for supporting the overhead catenary trolley. Where the track is located on

the ordinary type of right-of-way tubular pole structures (either with cross-catenary supporting spans or with brackets) similar in design to those used for the Pennsylvania Railroad electrification at Philadelphia have been adopted;

Fig. 2. Type of Post Used to Span Bridge Expansion Joints

on the bridges and viaducts it is not feasible to use this type of construction and here substantial structural steel bridges are employed.

On the steel viaduct either side of Hell Gate, the bridges

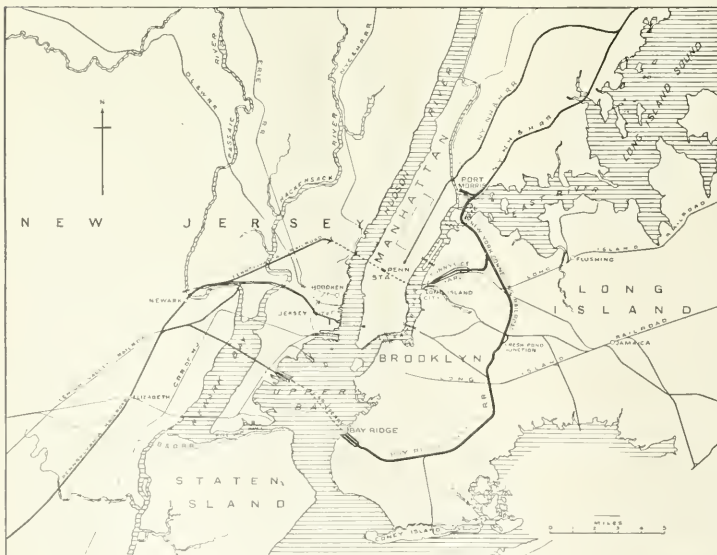

Fig. 1. Map of New York Connecting Railroad

are supported on heavy double brackets riveted directly to the girders underneath the track. As most of these supports are at expansion joints between the deck girders, it was neces-

sary to separate these brackets in order to provide for expansion and obtain satisfactory widths of bearing. The bolts on one side of each post fit into slotted holes to allow for movements due to temperature changes. Because of this width of base, posts with curved members were used on the trolley bridges as shown in Fig. 2. The cross-beams on these bridges are built up of double channels laced together and

Fig. 3. Trolleys Are Supported on Hell Gate Bridge by Attaching the Cross Wires to the Steel Members of the Bridge

reinforced at the center by sag braces. A special bridge which is similar in design to the other structures except that the truss is considerably deeper is used to carry signals.

Within Hell Gate Bridge the trolleys are supported by cross-wires attached to the steel members of the bridge, making a very light, inconspicuous system not detracting from the appearance of the bridge, as is shown in Fig. 3. At either end of Little Hell Gate Bridge ornamental reinforced concrete bridge towers are used to support a cross-beam for carrying the trolleys. One of these beams is also used as a safety anchor for the trolleys. This is shown in first illustration.

On Bronx Kill Bridge, Fig. 4, the trolley insulators are attached directly to overhead steel members with safety anchors at each end. At Port Morris on the north end where the tracks approach the junction with New Haven the trolleys are supported on single track structural brackets part of which also support certain of the New Haven trolleys of the line to Harlem River. These may be seen in the background of Fig. 5, the structure in the foreground being of special design for the transition between the two types. On the southern approach where the railroad is carried on fill between concrete retaining walls for about 3,000 feet, the trolley structures rest on the retaining walls and are similar to those on the steel viaduct, except that the sides of the posts are parallel instead of being curved.

Between this retaining wall section and Sunnyside Junc-

tion which is the head of the four-track railroad where the passenger tracks leave the freight line for the connection at Sunnyside Yard, there are several trolley supports consisting of guyed tubular poles with cross catenary wires to support the trolley, as shown in Fig. 6. Between Sunnyside Junction and Woodside avenue on the passenger line, trolley supports are of the two-track guyed tubular bracket type and beyond Woodside avenue they are single track tubular

Fig. 4. On Bronx Kill Bridge, the Trolley Insulators Are Attached Directly to Overhead Steel Members

brackets without guys. This type of construction is shown in Fig. 7.

Catenary Trolley System

As the New York Connecting Railroad is to be maintained and operated by the New Haven Railroad, details of hardware that have become standard on the New Haven System have been followed closely. The trolleys have been erected over the passenger tracks throughout their length, and over

Fig. 5. Transition Structure Used Between Two Different Types of Trolley Construction

the westbound freight track from Port Morris to the top of the grade at Hell Gate Bridge to permit electric pushers to be used to help the freight trains up the grade.

The trolley system consists of a 9 1/16 in., 7-strand, extra high strength galvanized steel catenary messenger supporting with hangers a 2 0 B. & S. gage grooved copper auxiliary messenger and 3/0 B. & S. gage grooved high strength bronze

trolley wire. The hangers consist of a galvanized iron rods screwed into a clamp that engages the messenger at the upper end. On tangents the hanger screw into a clamp at the lower end that is attached to the copper auxiliary messenger. On curves the lower end of the hanger is used as a bolt to hold a clamp which engages both the auxiliary messenger and the contact trolley. The spacing of the hangers on tangents is approximately 40 ft. with two bolted clamps between each pair of hangers attaching the contact trolley to the auxiliary messenger. On curves the hangers are placed about 15 ft. apart. A typical view of the trolley supports and the trolleys on a curve is shown in Fig. 8.

The trolley is insulated from the structures by three 10 in. free swinging porcelain discs, similar to those used in the yards of the New Haven Railroad. An insulator arrangement of this kind has the advantage of economy, insulation, ample strength and, most important of all, provides insurance against interruption to service due to the failure of any one insulator unit. In anchoring and sectionalizing the catenary system three 6 ft. wood strain insulators have been used in multiple with an equalizing yoke.

At each trolley bridge on tangents there is a steady to prevent excessive swinging of the trolley during high winds. These steadies are insulated from the structures by strings of three porcelain insulators similar to those used to support

Fig. 6. Guyed Tubular Poles with Cross-Catenary Wires to Support the Trolley Are Used Where the Passenger Tracks Leave the Freight Line

the trolley. The trolleys are insulated from each other by single 6 ft. wood strain insulators. No steadies or pull-offs are used on curves, the system floating naturally into an inclined position. The height of the contact trolley above the top of rail on and between Bronx Kill and Hell Gate bridges is 18 ft. because of overhead structural clearances within the bridges. Either side of these points the trolley rises to a normal height of 22 ft. above the rail.

Transmission Lines

The four-track structural trolley bridges are fixed on each side with tubular bracket poles cemented into the structural posts. Cross arms are provided to carry four high voltage wires on the upper arm and two on the lower arm. At present there are no wires on the upper arm, as the extent of the present electrification does not require trolley feed wires. The lower arm each carry 1 0 B. & S. gage power wires for the signal system. These are mounted on a New Haven standard insulator for 11,000 volts, although the initial voltage is only 2,200. In case of failure on one side the current will be automatically thrown to the circuit on the other side.

On the passenger connection between Sunnyside Junction and Sunnyside Yard the signals are fed by a single 2,200

volt rubber-insulated cable, which is carried on a $\frac{1}{2}$ in. Siemens-Martin steel cable outside of the one- and two-track bracket structures. A switch at Sunnyside Junction automatically throws this cable onto the power circuit that is energized. On these structures a cross-arm is provided for four future trolley feeders.

A $\frac{1}{2}$ in. galvanized Siemens-Martin ground wire has been run on top of the bonnet poles on both sides of the four-track bridges and on the top of the single post structures.

At each signal bridge on the viaduct circuits have been run between the signals and relay boxes which are on top of the concrete piers and against the steel girders. Access has been provided to the relay box by means of ladders and platforms.

The rails used on the New York Connecting Railroad are the Pennsylvania Railroad standard 125-lb. steel rail. Each joint is bonded with two No. 1/0 duplex pin terminal bonds, similar to those used on the New Haven Railroad, except that the thickness of web in the extra heavy rail required a slightly longer terminal.

Communication Lines

For the purpose of railroad communication a telephone and telegraph conduit line has been built connecting with the Pennsylvania Railroad at Sunnyside Yard, and the New Haven Railroad at East 132d street between Harlem River and Port Morris, with connections into the railroad towers and to frequent telephones on the railroad.

On the viaduct the conduit line consists of six fibre ducts

Fig. 7. Guyed Tubular Bracket Type Poles Are Used for Single and Double Track Construction

protected by heavily reinforced concrete and provided with steel splicing chambers. In the fill south of the viaduct a six-way underground conduit line has been constructed of vitrified clay duct encased in concrete. The standard manhole is a pre-cast oval reinforced concrete type with concrete covers. Rectangular concrete manholes cast in place have been used at special locations and in a short 12-duct section west of Woodside avenue. Concrete test houses are provided on the passenger section at East 132d street, Sunnyside Junction and at Woodside avenue, where the telephone cables are terminated for testing and for lateral circuits.

A 45-pair cable has been installed along the passenger

section. This cable is lead-covered and consists of 12 pairs No. 13 B. & S. gage copper wire quaded, and 32 pairs No. 16 B. & S. gage copper wire quaded, and one lead encased test pair. The test house at East 132d street is connected with the Harlem River Station by an aerial cable. In the steel splicing chambers on the viaduct the telephone cable has been offset to allow for expansion and contraction of the steel girder, which amounts to about three-quarters of an inch. On Hell Gate and Little Hell Gate bridges, however, the maximum expansion in the bridge system will be about 10 in. and here the cable has been terminated with potheads and flexible rubber insulated cables used for connection between the potheads. South of Sunnyside Junction a similar cable has been run along the freight line to Bay Ridge, most

Fig. 8. Typical Trolley Construction for Use on Curves

of the way being carried overhead. The poles used are southern pine impregnated with creosote by the vacuum process. This cable line connects with the Long Island Railroad System at their East New York Substation, a new 24-pair cable connecting with Jamaica.

The principal materials were furnished by the following manufacturers:

THE BRITISH BOARD OF TRADE is given further powers for the restriction of railway passenger traffic by additions to the Defense of the Realm Regulations. Authority is now given for prescribing the conditions on which tickets may be issued and passengers carried, either generally or in specified localities, or for journeys exceeding specified distances, and for enabling priority to be given on railways to any passengers or classes of passengers, and for enabling railway companies to refuse to carry passengers, and to refuse access to stations or trains in order to give priority to other passengers, and to remove passengers obtaining such access without authority.

Doings of the United States Railroad Administration

First Appointments of Federal Managers Announced— Administration Meets Shop Labor Troubles

WASHINGTON, D. C.

THE APPOINTMENTS already announced of federal managers to operate the railroads for the government instead of for their companies undoubtedly give some indication of the policy to be followed in the selection of the others, whose names are expected to be given out shortly. Five appointments have already been announced and in at least four of the cases the men selected are those who would naturally have been expected to be picked out. In two cases the new federal managers have been presidents, and in three cases they have been operating vice-presidents. Mr. Stevens, who has been appointed federal manager of that

Western, might have been appointed federal manager of his road, but he was made regional director and, therefore, required to give up his direct connection with his own road. In the case of the Pennsylvania and the Baltimore & Ohio the presidents have practically occupied the position of chairman of the board and as their systems are located in two regions, and therefore will have two federal managers, the appointment of either as federal manager would have been a distinct demotion.

The appointments already announced show that the integrity of many railroad systems is to be considerably dis-

Elisha Lee

Lines East

G. W. Stevens
Federal Manager, Chesapeake & Ohio

J. H. Young
Federal Manager of the Virginian.

A. C. Needles
Federal Manager, Norfolk & Western

part of the Chesapeake & Ohio that lies within the Potomac region, has been president of his road in charge of its operation, while the company had a chairman in New York. In the case of the Virginian, Mr. Young, the operating president of another road, was appointed in place of a president who had his office in Wall Street. Mr. Needles, the operating vice-president of the Norfolk & Western, was chosen as its federal manager and a similar policy was followed in the case of the Baltimore & Ohio and the Pennsylvania, where Mr. Thompson and Mr. Lee were appointed in charge of the lines included in the Allegheny region.

Undoubtedly Mr. Maher, president of the Norfolk &

turbed by the creation of the new regions because their lines extend beyond the regional boundaries. This is the case with the Baltimore & Ohio and the Pennsylvania, part of whose lines are in the Eastern region and part in the Allegheny region, and the Chesapeake & Ohio also has lines in both the Eastern and Potomac Regions. Some smaller lines are also added to the jurisdiction of the federal manager for the Norfolk & Western. As a result, the jurisdiction of a federal manager, as it is apparently the intention that they shall report to only one regional director, in a great many instances will not correspond to the jurisdiction of the former railroad organizations. A similar result will

probably be seen when announcement is made of a further decentralization of the Western region.

The selection of federal managers, in addition to the few that have been announced, has been under consideration by the regional directors who met with Director General McAdoo at White Sulphur Springs on Wednesday of this week to go over the entire subject with him, so that the appointments may be announced this week.

George W. Stevens

George W. Stevens, federal manager of the Chesapeake & Ohio, with headquarters at Richmond, Va., was born on June 29, 1851, at Utica, Ohio, and began railway work February 1, 1864. He served successively as office messenger, agent's clerk and operator on the Baltimore & Ohio until February 1, 1870; then as agent, despatcher's assistant and train despatcher on the Pittsburgh, Cincinnati & St. Louis. From 1873 to 1890 he was in the service of the Wabash, St. Louis & Pacific and its successors as follows: Eight years train despatcher, two years superintendent Ohio & Indiana division, $3\frac{1}{2}$ years superintendent Eastern division; from January 1887 to 1890, assistant general superintendent; on January 1, 1890, he was appointed general superintendent of the Chesapeake & Ohio, and then to February 1900 he was general manager. Since February 1, 1900, he served as president of the same road, also since March 1910 as president of the Hocking Valley and since July 1910 as president of the Chesapeake & Ohio of Indiana.

Elisha Lee

Elisha Lee, who has been appointed federal manager of the Pennsylvania Railroad, Lines East of Pittsburgh and Erie, with headquarters at Philadelphia, Pa., was born September 24, 1870, at Chicago, and was graduated from the Massachusetts Institute of Technology in the class of 1892. He entered the service of the Pennsylvania Railroad in November of the same year as a rodman in the office of the division engineer, Tyrone division. From August, 1895, to October, 1897, he was on leave of absence. In April 1899, he was appointed assistant supervisor, and two years later was promoted to supervisor. In August, 1903, he was appointed assistant engineer in the maintenance of way department and in April, 1907, was promoted to principal assistant engineer on the Philadelphia, Baltimore & Washington. On March 24, 1909, he was appointed superintendent of the New York, Philadelphia & Norfolk, and two years later was promoted to assistant to the general manager of the Pennsylvania Railroad Lines East of Pittsburgh and Erie. In April, 1914, he was appointed general superintendent of the Philadelphia, Baltimore & Washington with office at Wilmington, Del., remaining in that position until May, 1916, when he was appointed assistant general manager of the Pennsylvania Railroad, with headquarters at Philadelphia; since April 1, 1917, he has served as general manager. Mr. Lee served also as chairman of the Conference Committee of managers of the eastern railroads of the United States from 1912 to 1914. In that position he had charge, on behalf of the various railroads interested, of the negotiations with the trainmen's brotherhoods, and of the presentation of the railroads' case in the arbitration of employees' demands for increased pay. In 1915 he became chairman of the National Conference Committee of Railroads, representing practically all the railroads in the United States in the controversy with the trainmen.

A. W. Thompson

A. W. Thompson who has been appointed federal manager of the Baltimore & Ohio lines east, with headquarters at Baltimore, Md., was born on May 8, 1875, at Erie, Pa., and was graduated from Allegheny College, Meadville, in

1897, as a civil engineer. The following year he began railway work in the engineering department of the Pittsburgh & Lake Erie, and in 1899 was appointed assistant engineer of surveys on the Pittsburgh division of the Baltimore & Ohio. He was made assistant engineer of the Pittsburgh division in 1900, and the following year was appointed engineer of the Cumberland division. In 1902 he returned to Pittsburgh as division engineer, and the following year went back to the Cumberland division as superintendent. He was transferred to Wheeling, W. Va., in 1904 as superintendent of the Wheeling division, and from 1907 to April, 1910, he was chief engineer maintenance of way. In April, 1910, he was promoted to chief engineer of the Baltimore & Ohio system including the Baltimore & Ohio Southwestern, and remained in that position until December, 1910, when he was made general manager with office at Baltimore, Md., and since April 11, 1912, he has been vice-president.

Arthur C. Needles

Arthur C. Needles, who has been appointed federal manager of the Norfolk & Western, was born on January 10, 1867, at Baltimore, Md. He was educated in the public schools and at Swarthmore College, Pennsylvania. He began railway work in 1882, as a rodman on the Washington, Ohio & Southern, and in 1883, became a rodman in the engineering department of Norfolk & Western, and was then yard clerk and brakeman on the same road. In 1884 he was made night and day yardmaster, and from April, 1887, to August, 1890, he was yardmaster first at Pulaski, Va., and then at Bluefield, W. Va. On August 1, 1890, he was appointed assistant trainmaster and on December 25, 1898, was made trainmaster of the Radford division. He was then for one month assistant superintendent of the Pocahontas division, and in June, 1901, was promoted to superintendent of the Shenandoah division. The following year he was transferred to the Norfolk division. From December, 1902, to February, 1904, he was superintendent of the Pocahontas division and was then promoted to general superintendent. In December, 1912, he was appointed general manager and subsequently became vice-president with headquarters at Roanoke, Va., of the same road.

Joseph H. Young

Joseph H. Young, who has been appointed federal manager of the Virginian Railway, was born January 17, 1864, at Salt Lake City, Utah, and was educated at the University of Utah. He began railway work in 1882, with the Utah Central as office boy and warehouseman, and was later agent and operator at various stations, and then bill clerk on the same road. He was with the Union Pacific as ticket clerk and train agent at Ogden, Utah, from 1883 to 1886, and was superintendent of the Utah division of the same road from 1891 to 1902. From 1886 to 1889 he was traveling passenger agent of the Chicago & North Western, and then to 1891 was general agent of the Salt Lake & Eastern, and general superintendent of the Utah Central. Mr. Young was general superintendent of the Rio Grande Western, now part of the Denver & Rio Grande, at Salt Lake City, for two years from 1902, and then became general superintendent and later general manager of the Colorado & Southern at Denver. For a short time during 1907, he was general superintendent of the St. Louis & San Francisco. He was general superintendent of the Southern Pacific at San Francisco from 1907 to 1910, and in the latter year was elected president of the Alaska Steamship Company, the Northwestern Steamship Company, Ltd., the Northwestern Commercial Company, the Northwestern Fisheries Company, and the North Coast Lighterage Company, and vice-president of the Copper River & Northwestern. From May, 1912, to January, 1914, he was president of the Spokane,

Portland and Seattle, the Oregon Trunk Railway, the Oregon Electric Railway, the United Railways, the Spokane & Inland Empire, the Pacific & Eastern, and the Dalles, Portland & Astoria Navigation Company, with office at Portland, Ore. In May, 1914, he was elected president of the Norfolk Southern, which position he now leaves to become federal manager of the Virginian Railway as above noted.

Railroad Administration Has Labor Troubles

The Government does not propose to tolerate strikes as a method of securing wage increases and those who attempt to employ that method were characterized in effect as friends of the Kaiser in a telegram addressed by Director General McAdoo to the officers of the various organizations of railway shop employees on May 30 as his comment on the action of shop employees of the Southern Railway at Alexandria, Va., who went out on strike on May 28 as a protest because the increase in wages awarded them in the director general's wage order was smaller than they considered satisfactory.

Mr. McAdoo's telegram, reminding the shopmen that

report of the Railroad Wage Commission and he had ordered a minimum of 53 cents an hour for such employees, but general dissatisfaction with the rates was expressed throughout the Southeast where the wages had recently been fixed by arbitration on an eight hour basis, as well as from other parts of the country.

The first manifestation of the complaint in the form of a strike was at the Alexandria shops, where between 500 and 400 men stayed away from their work on May 28. The strike apparently was not authorized by the organizations and on the following day, after conferences between the men and J. F. Anderson, acting president of the International Association of Machinists, with E. C. Sasser, superintendent of motive power of the Southern, they agreed to return to work. It was also reported that strikes were contemplated on other roads but the assurance that the board would soon meet to take up the matter induced the men to remain at work.

Director General McAdoo's telegram, sent to the executives of the various shop craft unions, was as follows:

"The strike of certain shopmen, machinists, etc., in the

The Regional Districts

they are now government employees and declaring that any complaints as to the wage decision should be referred to the new Board of Wages and Working Conditions was also intended as a general reply to many protests which have been sent to the Railroad Administration that the increases ordered represent little or no advance in the case of many classes of employees who had already received from the railroads enough to approximate or exceed the new scales. A large proportion of these protests came from representatives of the shop employees and others whose wages as fixed in the order were less than the same men could receive by leaving their railroad work for munitions plants or other government contract work where the wages are high. The complaints were referred to W. S. Carter, director of the division of labor, who telegraphed replies saying that the new wage board had been created to adjust such conditions. Special consideration to the case of the shop employees had been given by Director General McAdoo in revising the

railroad shops at Alexandria, Va., has created a very painful impression on the public mind. I cannot believe that these men knew what they were doing. They are all employees now of the United States Government. They are not employees of any railroad corporation, therefore, this was a strike against the Government of the United States. It is the first time in the history of our Government that any of its employees have attempted a strike against their Government. Such action is incredible. For the good of our beloved country and for the honor of railroad men in the service everywhere, I hope that there will be no repetition of what every one must condemn as unpatriotic in the highest degree.

"The Government cannot, of course, be coerced or intimidated by any of its employees. It is anxious to do justice to all, and will do justice to all as far as it is possible to measure justice. Recognizing that there are probable inequalities in the recommendations of the Wage Commission

which should be impartially considered and dealt with, I appointed in my General Order No. 27, dated May 25, a Board of Railroad Wages and Working Conditions, composed of three representatives of labor and three representative railroad men, whose duty it is to hear and to pass upon all petitions and complaints. Every class of employees or parts of classes of employees who feel that they have just ground for complaint under the wage decision should submit their cases promptly to this board, and they will be given just and impartial consideration. The American people have just been called upon to pay largely increased freight and passenger rates for the purpose of paying in part the increased wages, amounting to more than \$300,000,000 awarded to railroad employees.

"Suppose they should strike against the Government because they do not think they are fairly treated in being forced to pay these increases for the benefit of railroad labor, what would happen to our country? Suppose the railroad officers should strike because they disliked the orders of the government, and should refuse to obey them, what would happen to them? Suppose that railroad employees should strike against the decisions of their government and hamper the operation of the railroads at a time when transportation is essential to protect the hundreds of thousands of American boys now fighting on the battlefields of Europe to save the lives and property and liberty of railroad employees serving here at home, what would happen to our country?

"The Kaiser probably would get it. We cannot all get exactly what we want in this world, nor can we win this war unless each and every citizen is willing to submit to the laws of the land and to the decisions of those in authority.

"We railroad men particularly must give unswerving and loyal support to our government, no matter what our individual views and disappointments may be, relying upon a fair hearing of our complaints and the justice of our cause, and accepting patriotically the final decisions of those in authority who under our laws are charged with the responsibility of making them.

"While in the German drive now going on the sons of railroad men and the sons of Americans of every class are dying on the battlefields of France to save America and democracy in the world, shall there be found among us any set of men who are unwilling to sacrifice something of their personal views and individual desires to support America's heroes, who are making the supreme sacrifice for us?

"I earnestly hope that from one end of this great land to the other it may never be said again that any railroad man, officer, or employee was so unpatriotic as to strike against his own government when it is in the midst of the most perilous war of all history. It is the highest duty of patriotic men to remain at their posts with the railroads, where they are so urgently needed for the safety of the country, and to rely upon the Board of Railroad Wages and Working Conditions and the director general for the just consideration of their claims.

"I am sure that I can count upon you to immediately urge upon your men by wire the wisdom and patriotism of the course I have suggested."

When, in spite of this appeal, word was received that the employees of the Silvis shops of the Chicago, Rock Island & Pacific had gone on strike, demanding an increase to 75 cents an hour, J. A. Franklin, assistant to the director of the division of labor, was despatched to the scene to investigate the situation.

The Board of Wages and Working Conditions, created in the director general's wage order, held its first meeting at Washington on Saturday, June 1, and organized by electing G. H. Sines, vice-president of the Brotherhood of Railroad Trainmen, as chairman, and F. F. Gaines, formerly superintendent of motive power of the Central of Georgia, as vice-chairman. The other members are J. J.

Dermoddy, vice-president of the Order of Railroad Telegraphers; A. O. Wharten, president of the railway employees' department of the American Federation of Labor; C. E. Lindsey, formerly division engineer of the New York Central; and W. E. Morse, formerly general manager of the Denver & Salt Lake.

Representatives of the shop craft unions appeared at a hearing before the Board of Wages and Working Conditions on Monday and urged that the wage scale ordered by Director General McAdoo be not put into effect until it is revised, saying that great dissatisfaction would be created, and that it might be impossible to avoid many strikes. They pronounced the proposed scale as applied to the shop employees to be inequitable, saying that it would nullify all the reforms that have been worked out in their wage scales since 1915, because the proposed increases are based on the wages of December 31, 1915, whereas since then there has been a considerable readjustment in wages as the result of arbitration. In place of the new scale proposed, they asked for the rates which they had originally asked at the hearing before the Railroad Wage Commission, which included an eight-hour standard day, six days a week, time and a half for overtime, 75 cents an hour for most classes of employees, and 56¼ cents an hour for car men of less than four years' experience. They urged speedy action to revise the scale in order to prevent an exodus of employees to shipyards and munitions plants, and based their claims for higher pay principally on the comparison with the wages and conditions in the shipyards. The shop employees were represented by J. F. Anderson of the International Association of Machinists, G. C. Van Dorens of the Brotherhood of Blacksmiths and Helpers, Otto E. Hoard of the Amalgamated Sheet Metal Workers, John J. Purcell of the Brotherhood of Electrical Workers, J. S. Wilds of the Brotherhood of Railway Car Men, and D. M. Jewell of the Brotherhood of Boilermakers and Iron Shipbuilders and Helpers. They claimed to represent directly 250,000 men and approximately 500,000 men, including the employees not members of the organizations. G. H. Sines, chairman of the board, explained that Director General McAdoo is anxious to see justice done for all classes of railroad employees.

I. C. C. Authorizes Special Supplements

The Interstate Commerce Commission, which is given authority in the railroad control act to review the increased rates ordered by the director general, is issuing the necessary orders to enable the director general to comply with the law in the filing of the tariffs which are to go into effect on June 10 and June 25. In his statement announcing the proposed increases issued on May 25, which was published on May 27, Mr. McAdoo said that in making the rates effective a simple form of tariff authorized by the Interstate Commerce Commission must be used and that this would lead to the temporary disregard, to some extent, of established groupings and differentials. A few days later the commission gave out copies of special permission orders, No. 45,950 and No. 45,951, "for the use of common carriers under federal control," modifying the provisions of its tariff circular rules to permit the carriers to file special supplements to their freight and passenger and baggage tariffs, respectively, in abbreviated form in order that they may begin to secure the advantage of the increased revenues on the scheduled dates. The form of the special supplements is prescribed in the orders. A similar procedure was followed in the 15 per cent rate case last year in order to expedite the proceedings.

Special Permission No. 45,950, which applies to freight tariffs, is as follows:

"Whereas, The President of the United States through the director general, United States Railroad Administration, has initiated and prescribed freight rates to be applied on all freight traffic carried by railroad and steamship lines

under federal control, except the traffic carried entirely by water to and from foreign countries, as set forth in General Order No. 28, dated May 25, 1918, of said director general;

"And *it hereas*, The director general, United States Railroad Administration, has requested such modification of the tariff rules of the commission as will permit said carriers under federal control to file special supplements to freight tariffs in abbreviated form and to permit filing with this commission by such carriers freight tariffs and effective supplements which have not been heretofore filed, thereby enabling carriers under federal control, in the present emergency, to secure in an economical and expeditious manner increased revenues to be derived from increases in freight rates initiated and prescribed, in said General Order No. 28, of May 25, 1918; and

"*It appearing*, That the commission's rules and regulations, Tariff Circular 18-A, in section (i) of Rule 4 require an explicit statement of the rates, in cents or in dollars and cents, per 100 lb., per barrel or other package, per ton or per car, together with the name or designation of the places from and to which they apply; in section (c) of Rule 9 limit the number of, and the volume of effective supplements to any tariff and forbid supplements to tariffs issued in loose-leaf form; in section (k) of Rule 9 prohibit a change in any rate sought to be increased by a rate which is under suspension by order of the commission; and in section (a) of Rule 54 provide that rates filed must be allowed to go into effect, and cannot be changed for at least 30 days after the date when the rates have become effective;

"*It is ordered*, That the provisions of Tariff Circular 18-A in Rules 4 (i), 9 (c), 9 (k), and 54 (a), be, and they are hereby, temporarily waived in the particulars hereinafter set forth, but not otherwise, as to, and confined to, special supplements filed under authority hereof by common carriers under federal control; *Provided*, That there shall not be in effect at any time more than one such special supplement to the same tariff; and

"*It is further ordered*, That said carriers under federal control be, and they are hereby, permitted to file special supplements to freight tariffs to provide for cancellations, minimum weights, minimum charges, and increases in rates and charges by the percentages or amounts set forth in said general order of the director general; and such special supplements shall be in form as follows."

The special supplement form includes a table of increased rates which is made effective by the following: "Effective June 25, 1918, all rates then in effect named in tariffs enumerated herein and in prior supplements thereto, as indicated, to each of which tariffs this is a special supplement, are increased to the rates shown in column B in table of rates on pages — to — inclusive, hereof. If a prior supplement thereto contains rates to become effective upon a later date as indicated thereon, such rates will, on such later effective date, be increased to the rates shown in Column B in the table of rates." It is also stated that the supplement does not increase charges for terminal or transit services or facilities, switching, weighing, demurrage, car service, transfer, diversion, reconsignment, refrigeration, icing, storage, elevation or other special services. Other rules regarding the application of the rates are given.

The special permission as to passenger fares and baggage charges is similar in form and modifies the rules which require an explicit statement of the fares in cents or in dollars and cents, together with the name of the places from and to which they apply, which limit the number of supplements, which prohibit a change in any fare sought to be increased by a fare which is under suspension by order of the commission and which provide for 30 days' filing of tariffs. It is provided that the increased fares

may be stated by the use of any of the three following plans, viz:

By a mileage table of fares when the distances are published in the tariff which is to be supplemented.

By a table, where the fares in tariff as amended are specifically named, providing that the increased fares will be as named in the special supplement.

By the publication of specific fares, in cents or in dollars and cents, from and to specified points, and to provide that fares from and to other important points will be made by use of extension basis, also to omit temporarily the unimportant points.

The rate tables prescribed for the special supplement are to show that where the mileage or rate published in tariff or effective supplement is as shown in Column 1 the fare in coaches will be as shown in Column 2, the fare in standard sleeping or parlor cars will be as shown in Column 3 and the fares in tourist sleeping cars will be as shown in Column 4. Additional details are prescribed as to constructing fares on a mileage basis and other tariff features.

Protests Against Increased Rates

A flood of protests against the new rates ordered by the director general in General Order No. 28 has poured in upon the Railroad Administration by letters, telegrams and personal calls. While there are many complaints because of the size of the increase, which came as somewhat of a surprise to those who have listened to predictions in the past that the government could raise wages and reduce rates at the same time, the bulk of the protests were directed to the disturbance in rate relationships which will result from the plan of putting the increases into effect and readjusting them afterwards. Some of the complaints came from state railroad commissions, some of whose rates are said to be increased two and three fold.

The director general on May 31 announced the appointment by the regional directors of traffic committees to deal in their respective territories with all questions as to freight rates arising under General Order No. 28. These included the following committees whose appointment has heretofore been announced as succeeding the various traffic associations and rate committees to deal with general rate matters:

Eastern Freight Traffic Committee, B. O. Russell, chairman, 143 Liberty street, New York City; an Official Classification territory.
Southern Freight Traffic Committee, R. M. White, chairman, Walton building, Atlanta, Ga.; for Southern Classification territory.
Western Freight Traffic Committee, A. C. Johnson, chairman, Transportation building, Chicago; for Western Classification territory.

The following district freight traffic committees have also been appointed:

New England District Freight Committee, J. J. Keefe, chairman, South Station, Boston, Mass.
Transit Line District Freight Committee, E. J. Gorman, chairman, 143 Liberty street, New York City; N. Y.
Louis Line District Freight and C. C. Commission, for Kansas, chairman, Railway Terminal Co., Kansas City.
Central District Freight Committee, C. J. Brann, chairman, Transportation building, Chicago, Ill.
Central District Coal and Coke Committee, J. C. Young, chairman, 34 Penna. Station, Pittsburgh, Pa.
Chicago District Freight Traffic Committee, J. P. Fryer, chairman, Third Building, South Side, Chicago, Ill.
St. Louis District Freight Traffic Committee, J. W. Williams, chairman, 1000 Olive, St. Louis, Mo.
St. Paul District Freight Traffic Committee, J. H. Foy, chairman, St. Paul, Minn.
Kansas City District Freight Traffic Committee, J. P. Gorman, chairman, Kansas City, Mo.
Portland District Freight Traffic Committee, W. R. Gorman, chairman, 1000 Broadway, Portland, Me.
Seaside District Freight Traffic Committee, W. C. Gorman, chairman, San Francisco, Cal.

The announcement says:

"The director general invites the co-operation of the shipping public in working out a satisfactory adjustment of freight rates on the higher level now necessary. All shippers who desire to make suggestions as to the maintenance of

established differentials, or the re-adjustment of freight rates under General Order No. 28, may present their views through the freight traffic officers of the railroads serving them; but if shippers feel, after presenting such matters to their home roads, that they want their views given further consideration, the freight committee for the territory or district involved will be glad to hear and consider any proposal or suggestion the shippers have to offer."

Under an administrative order all protests were referred to the division of public service and accounting but after a conference it was decided to refer them to the local freight committees. All telegraphic inquiries were answered but the letters received were so numerous that early in the week it had not been possible to give replies to them. Clifford Thorne's protest arrived in advance of the issuance of the order, based on newspaper predictions as to the amount of the proposed increase. It was in the form of a memorial addressed to the director general, signed by representatives of western and central western live stock and petroleum and grain shippers' associations which, he said, have a combined membership of over a million.

The memorial pronounced the proposed increase a travesty on justice and attempted to remind the director general that the increase does not mean just one payment of the estimated billion dollars, but a billion dollars annually, "equivalent to more than 6 per cent on the par value of all railroad securities outstanding." It is stated that an advance of 20 per cent in passenger fares and 5 per cent in freight rates would take care of the largest estimate on the proposed wage increase and that the shippers should not be expected to pay all the increased expenses of the railroads resulting from the war. Mr. Thorne also points out that the director general has surrounded himself with a staff composed exclusively, with a few rare exceptions, of former railroad officials, who would be unconsciously biased by the general desire of the railroads to have rates on a high level in case they are returned to private management or even in case government ownership should follow, because the net income at the time might be a factor in determining the purchase price. These circumstances, he said, render it imperative that the recommendations made by the director general's staff should not be followed until the shippers have been heard from. It is declared to be impossible to state at the present time what economies may be effected by the unification of the railroads under government control and the falling off of net income for one or a few months is said to be of little significance. It is declared that the guaranty to the railroads, based on their net income for the past three years, is a war measure and should be borne by the people as a whole rather than by the shippers, who are denied any protection from the increased costs in their business.

Mr. Thorne had previously wired to the commission for a hearing on the subject of oil rates, but the commission had to inform him that it could do nothing in advance of a formal complaint after the effective date of the tariffs. Mr. Thorne was given an appointment with Director Prouty on June 4 to talk over the matter.

A meeting of representatives of the state railroad commissions consisting of the executive committee and the special war service committee of the National Association of Railroad and Public Utilities Commissioners, was held at Washington on June 4 and 5 at the call of C. E. Elmquist, Washington representative of the association. The meeting was also attended by some of the Interstate Commerce Commission members who were formerly state commissioners. Mr. Elmquist had written a letter to Mr. McAdoo on May 16, requesting a consultation with the state commissioners before rates were increased and expressing the opinion that under the federal control act the President cannot initiate intrastate rates except in accordance with the laws of the several states. He, therefore, suggested not only that the state com-

missions be consulted about the proposed increase and the effect it would have upon the public and the revenues of the carriers in the several states, but also that the director general comply with the local laws by filing intrastate tariffs. He also asked for an opportunity to examine the proposed tariffs or any memoranda outlining the proposed increase in advance, as the representative of the state commissions. Mr. McAdoo did not answer the letter, but on May 27, after announcement of the proposed increase, sent a telegram to the state commissions expressing the hope that they would understand the necessity for the increase and regretting that he had not been able to consult with them beforehand.

The new rates will bear rather heavily upon the iron and steel industry and manufacturers of these products, many of whom have government contracts on a lump sum basis, so that their profits will be greatly reduced unless an allowance is made for the increased rates. The railroads in Central Freight Association territory had already initiated an increase in iron and steel rates from a commodity to a class rate basis, before the general order was issued, by filing with the Interstate Commerce Commission applications for permission to file tariffs.

Most of the protests against the higher passenger fares come from state commissions and users of mileage books, who must turn in their unexpired mileage on June 10 for exchange. It has been announced that unexpired commutation tickets will be honored until they are used-up and will not be cancelled on June 10.

It has been reported that the electric interurban railways would also file applications with the state commissions and the Interstate Commerce Commission for increases in their fares to 3 cents a mile and that the Pullman Company would propose a minimum of \$2 for overnight rates in sleeping cars in place of \$1.50.

It has been announced that round trip excursion passenger rates to the Pacific Coast will be made this year on a basis 20 per cent higher than last year's rates. This rate was allowed for the convention of the Associated Advertising Clubs at San Francisco in July.

The Interstate Commerce Commission has issued special permission order No. 47,060 prescribing a form of tariff supplement to be used in putting into effect the order of the director general that officers, enlisted men, and nurses of the Army, Navy and Marine Corps, when traveling at their own expense, shall be allowed to purchase tickets at one-third of the regular rates.

The commission has also issued a supplemental order modifying its outstanding orders fixing rates for the future to permit the rates and fares ordered by the director general to be made effective.

Canadian railways have also filed applications with the Interstate Commerce Commission for authority to advance rates on their traffic within the United States to the level of the new rates ordered by Director General McAdoo.

Commerce Counsel for the Railroad Administration

R. Walton Moore, of Washington, D. C., who as commerce counsel for the Southeastern railroads has been a prominent figure in rate litigation before the Interstate Commerce Commission and who represented the southeastern lines in the fifteen per cent case, has been taken over as a member of the staff of the Railroad Administration as assistant general counsel in charge of matters before the Interstate Commerce Commission. In this position Mr. Moore will have charge of representing the administration in the proceedings to ensue before the commission in connection with the large number of protests and the readjustment of the rates to preserve existing relationship as far as possible. Frank W. Gwathmey, who has been associated with Mr. Moore, has also become connected with the legal department of the Railroad Administration.

Four Express Companies to Be Consolidated

One Company to Be Agent for Railroad Administration Under
Private Management But Will Share Profits

THE FOUR PRINCIPAL express companies operating in the United States, the Adams Express Company, the American Express Company, Wells Fargo & Company, and the Southern Express Company, are to be combined into a new company, effective on July 1, to be known probably as the American Railroad Express Company, which will be given virtually a monopoly of the express business by a contract with the United States Railroad Administration for the carrying on of the express business for all the railroads under federal control.

This plan, which has been worked out after several weeks

per cent of the gross earnings. This percentage was arrived at by taking the average for ten years of the payments by the express companies to the railroads.

Out of the balance of the revenues the express company will pay operating expenses and taxes and, if earned, a dividend of 5 per cent on the capital stock. If more than 5 per cent is available for distribution, out of the next 2 per cent the express company will receive 1 per cent and the government 1 per cent; out of the next 5 per cent available for distribution the express company will receive 1 per cent and the government 2 per cent; any further amounts available for distribution will be divided one-quarter to the express company and three-quarters to the government.

An important feature of the arrangement is that the new company will be capitalized only to the extent of actual property and cash put into the business and it was stipulated by the government that this should not exceed \$40,000,000. The actual amount determined upon is \$35,000,000, including that issued to the old companies in proportion to the physical properties to the amount of \$30,000,000

B. D. Caldwell,
Chairman of the Board

of negotiations between the representatives of the express companies and the division of public service and accounting of the Railroad Administration, has been sanctioned by the director general in place of the plan earlier proposed, which it is understood was advocated by the express companies, for placing the express companies under government operation in the manner adopted for the railroads.

Under this arrangement there will be no government guarantee of earnings but the express company will be a private corporation acting as the director general's agent for carrying on the express business. The character of the service and the character of the rates will be under the director general's control and subject to initiation by him and the government will share in any profits above 5 per cent on the capital stock.

Whereas the express companies now have contracts with the railroad companies by which they pay to the latter a fixed percentage of their gross earnings, usually about 50 per cent, for "express privileges," they will now have but one contract with the government and the director general will receive 50

George C. Taylor,
President

and \$5,000,000 issued at par for cash to represent working capital.

One of the points which received considerable discussion during the negotiations was as to whether railroad employees should continue to act as agents for the express company as station agents now do, receiving as compensation a percentage commission on the business handled. Under the plan decided upon, while the new express company is permitted, upon arranging therefor with the director general, to use railroad employees in express service,

the entire compensation of all such employees, both for railroad and express services, will be fixed and paid by the director general and the express company will compensate the director general for services rendered by such employees to the express company. The Railroad Administration, which was represented chiefly in the negotiations by Luther M. Walter, assistant to the director of public service and accounting, objected to a plan which would give opportunity for competition between railroad and express in the person of the agent, who might be interested in diverting shipments to the express if he were to receive a commission on such business.

The new arrangement will make it possible to avoid a great deal of wasteful duplication of facilities and to eliminate a large amount of accounting with the individual railroads, which while necessary under the old system of separate contracts between the express companies and the various railroad companies will be unnecessary under the new system.

The offices of the competing companies will be consolidated or otherwise readjusted to the new conditions and new routes will be opened.

The government should receive as its proportion of the express earnings, on the basis of last year's business about \$100,000,000 a year in revenue. An application of the express companies for a 10 per cent increase in rates is still pending before the Interstate Commerce Commission.

A statement announcing the plan issued by the director general says: "The director general is greatly pleased to inaugurate this salutary method of division of profits. The express company is given a continuing inducement to accomplish the greatest efficiency and economy, and yet the government will enjoy an increasingly great proportion of the benefits of all such efficiency and economy."

Officers

George C. Taylor, president of the American Express Company, is to be president of the new company. B. D. Caldwell, president of Wells Fargo & Co., is to be chairman of the board. William M. Barrett, president of the Adams Express Company, will be a director and member of the executive committee. The following have been selected as operating vice-presidents:

R. E. M. Cowie, now vice president and general manager of the American Express Company, will have charge of the Atlantic Departments.

E. A. Stedman, now vice president and general manager of Wells Fargo & Co., Chicago, Central Departments.

C. D. Summy, general manager of the American Express Company at Chicago, in charge of Southwestern Departments.

A. Christesen, vice president and general manager of Wells Fargo & Co., San Francisco, in charge of Pacific Departments.

E. M. Williams, vice president in charge of traffic for the Adams Express Company, in charge of Southeastern Departments.

F. M. Hollbrook, vice president in charge of traffic of Wells Fargo & Co., New York, will be located at Washington as assistant to the president.

D. S. Elliott, vice president in charge of traffic of the American Express Company, New York, will be in charge of traffic for the new company.

J. W. Newlean, vice president and controller for Wells Fargo & Co., Chicago, will be the vice president in charge of accounting for the new company.

E. E. Bush has been selected as manager of maintenance and purchases.

T. B. Harrison and C. W. Stockton, now general attorneys for the American and Wells Fargo & Co., respectively, will act as general counsel.

President Taylor's Statement

President Taylor issued a statement regarding the new arrangement as follows:

"Hereafter the express companies will eliminate the individual identity which has separated them for the last three-quarters of a century and offer to the government and to their joint patrons a unified, single express service. In the future merchants, manufacturers, and individuals need merely specify 'by express' and the entire man power and vehicle power of the express world will respond to their call.

"At no time in the history of the railroads has the volume of express traffic been so great as it is today, the business reaching a total during the last fiscal year of over \$200,000,000.

"Already the vast terminals now maintained by the various companies are being unified for a practical saving of time and transfer.

"The new move will bring into one organization over 100,000 men now trained in express service. It will be the policy of the company to maintain a broad gage attitude toward its employees, many of whom have spent their lives in the service and thousands of whom have made great personal sacrifices in carrying the immense burden of the last three and a half years.

"In the past the express companies have been vital factors in the conveyance of merchandise and foodstuffs. They have eliminated distance and the time element between the manufacturer and his market. The move is designed to improve the distribution of commerce and agriculture and the business of the country may look upon it with confidence that their interests will be carefully and intelligently served."

The non-transportation activities of the separate companies, such as money orders, travelers' checks, travel department, and foreign exchange will not come under the consolidation, but will be conducted by the individual companies as in the past, the officers of the new company acting as agents for the old companies in the handling of these features.

Mr. Taylor also said: "The policy of the new express company will be that of close co-operation with all patrons and the public in general, in an effort to give better service in every way. The fact that competition disappears will in no way be taken advantage of in our attitude toward the public. The merchant bodies and shippers with whom I have been so fortunate to come in contact during the past 25 years of service with the American, as well as the officers and employees, will, I am sure, attest to the policy of courtesy, fair treatment and prompt action in all dealings with them and this same policy will be rigidly followed with the new company. The task of joining together all the lines and facilities of the several companies and the providing of new and necessary equipment will take time but it will be accomplished as rapidly as possible. The new company will settle up the unadjusted matters, such as claims and others items, of the old companies so as to give to the public the least possible delay or annoyance.

"The new company will take over the pension plans of the old companies and a new pension plan will be worked out at once for application in the future. Plans are already under way for scaling up of wages of many employees, toward more uniformity in the various classes, first consideration being given to those in the service drawing the lower rates of pay.

"New through car routes will be established to do away with rehandling and to better utilize railroad facilities, all going toward greater efficiency and better service. With but one express company, any officer of which will afford a contact with all express matters, no confusion will exist and the public will be saved many delays and annoyances which have obtained in the past. Considering the interest of the

government and the co-relation of the express companies with the United States Railroad Administration, we are sure the public will soon realize that the change is in the right direction."

Burns D. Caldwell

Burns Durbin Caldwell, chairman of the board of the consolidated express company, was born at Placerville, El Dorado county, Cal., on April 27, 1858. He was graduated from high school at Chambersburg, Pa., in 1873, at the age of fifteen, and the same year began railway work as a clerk in the auditor's office of the Vandalia Railroad, at Terre Haute, Ind. He was rapidly promoted and in 1881 became chief clerk in the general passenger and ticket department of the Vandalia at St. Louis, Mo., remaining in that position for about four years. In 1885 he was appointed chief clerk in the general passenger and ticket department of the Missouri Pacific and the St. Louis, Iron Mountain & Southern at St. Louis and in 1888 was appointed assistant general passenger agent of these lines. In June, 1892, he was chosen chairman of the Western Passenger Association, with headquarters at Chicago. This position he filled until July, 1899, when he went to the Delaware, Lackawanna & Western as traffic manager and later he became vice-president of the same road.

In 1911, he resigned to become president of Wells, Fargo & Co., with headquarters at New York. Mr. Caldwell is a director of a number of railway companies and is also president of the Harlem Transportation Company.

George C. Taylor

George C. Taylor, the new president of the consolidated express company, has had a meteoric career. Not yet 50 years of age, he entered the service of the American Express Company at Ripon, Wis., in 1885, as a wagon helper. While attending Ripon college in the same city he was employed at night on a short express run between Ripon and Winneconne, and in that manner paid his way through school. In the next few years he filled practically every position in the office service of the company, such as transfer clerk, trace clerk, money clerk, cashier and agent at various points throughout the western states. He was subsequently chief clerk to the superintendent of express service on the Great Northern and then route agent on the same railroad and on the Missouri, Kansas & Texas, the Illinois Central and the Yazoo & Mississippi Valley when American Express service was inaugurated on those lines in 1892 and 1893. He was then appointed assistant superintendent of the southern division of the American Express Company, with headquarters at St. Louis, following which he went to Chicago as general agent. From Chicago he went to Cleveland, Ohio, as assistant general manager of the Central division, and from there was transferred two months later to the newly created Pacific division, with headquarters at Salt Lake City, with the title of manager. On July 1, 1911, he returned to Chicago as general manager of the western department in charge of all the company's lines west of Buffalo, N. Y. In February of the following year he was also elected vice-president. Hardly more than two years later, on June 16, 1914, he was elected president of the American Express Company with headquarters at New York, to succeed James C. Fargo.

Mr. Taylor makes friends easily and has an exceptionally large acquaintance among the employees of the American Express Company. He does not believe it necessary for an executive to hold aloof from his subordinates, but on the contrary mixes with all on terms of sympathetic comradeship. Furthermore, he possesses the faculty of maintaining the best of discipline in his organization and, at the same time, of winning the respect and loyalty of all who are associated with him in his undertakings. He always gives heed to the counsel of others, and, in fact, encourages all

employees from the lowest to the highest to submit suggestions calculated to improve express service. While he appreciates the advice of others, he needs no assistance in making decisions. After giving thorough consideration to a matter he decides quickly and subsequent experience generally confirms the soundness of his judgment. Naturally frank and devoid of guile, he is equally outspoken in criticism and commendation. In a word, he is a natural executive and organizer. Perhaps no incident better illustrates his initiative than his prompt action on behalf of American tourists in the central empires at the opening of the European war. The precipitate inception of the great conflict had demoralized international credit to such an extent that travelers' checks were not honored except when the issuing company had deposits to cover them in the countries of our present enemies. Accordingly, Mr. Taylor lost no time in sending several million dollars in gold to Germany, with the result that all travelers' checks drawn on the American Express Company were cashed in full. Mr. Taylor is a native of Ripon, Wis., where he was born Oct. 21, 1868.

Robert E. M. Cowie

Robert E. M. Cowie, vice-president of the Eastern departments of the new company, with headquarters in New York, entered the service of the American Express Company October 2, 1883, as an office boy or junior clerk in the office of R. B. Poore, then superintendent of the Ohio division at Cleveland, Ohio. On June 1, 1886, he was promoted to the position of secretary to the general superintendent of the Southwestern division at Cleveland, Ohio, and on June 23, 1890, he was transferred to Chicago as secretary to General Manager Antisdel. Later, upon the advancement of Mr. Antisdel to the position of vice-president and general manager, Mr. Cowie became assistant vice-president and general manager. In November, 1906, he was appointed assistant general manager of the Western department. On January 25, 1910, he was appointed manager of the Central department at Cleveland, Ohio, and the following July he was transferred as manager of the Pacific department at Salt Lake City, Utah, the headquarters later being changed to Denver, Colo., and Los Angeles, Cal., respectively. In January, 1915, he went to New York as vice-president and general manager in charge of the Eastern lines.

E. A. Stedman

E. A. Stedman, vice-president of the Central department of the new company, with headquarters at Chicago, entered the service of the American Express Company in June, 1878, as a clerk and cashier and served at various places in Iowa. In June, 1882, he went to Wells, Fargo & Co. as money clerk at Denver and the next year he was appointed agent at the Union Pacific transfer depot at Council Bluffs. In 1884 he became route agent at Bismarck, N. D. The following year he was assigned to the position of route agent with headquarters at Emporia, Kan., and in 1886 he served as cashier at Kansas City.

Mr. Stedman was appointed assistant superintendent at Chicago, in charge of the Illinois division, in 1887, when Wells Fargo service was first extended east of Missouri. He was made superintendent of the New York division, with headquarters at Binghamton, N. Y., in 1888, when Wells, Fargo & Co. inaugurated its service east over the Erie Railroad and two years later his headquarters were transferred to Jersey City. On January 1, 1892, Mr. Stedman was made general agent at New York and seven years later he was appointed assistant manager of the Atlantic department and on January 1, 1902, assumed the duties of acting manager. The following October he was made manager of the same department. Mr. Stedman became general manager of the company on September 1, 1906, and was appointed vice-president and general manager at New

York in August, 1908. He became vice-president and general manager at Chicago on August 1, 1911, and has served also as a director of the company since 1910.

C. D. Summy

C. D. Summy, acting general manager of western lines of the American Express Company at Chicago, Ill., has been elected vice-president of the new company and has been placed in charge of the southwestern department. Mr. Summy started his career as agent and transfer man of the American Express Company at Barnesville, Minn., in 1890. In that capacity he met all trains night and day and made deliveries in a push cart, for which he received a salary of \$50 a month. Three months later he was transferred to Red Wing, Minn., where he held the agency of the company for a year. He spent another three months as clerk in the superintendent's office at St. Paul, Minn., following which he went to Dallas, Tex., as chief clerk to the superintendent there. In the next year he was appointed assistant route agent and subsequently route agent in Texas with headquarters at Sedalia, Mo., St. Louis and Dallas, Tex., consecutively. In 1901 he became chief route agent, in 1903 assistant superintendent, and two years later superintendent of the Texas division with headquarters at Dallas. On the first of January, 1907, Mr. Summy was appointed assistant to the assistant general manager at Chicago. In the following year he was transferred to Omaha, Neb., as assistant general superintendent of the Iowa-Nebraska division. When American Express service was inaugurated on the Union Pacific lines in 1910 he was placed in charge of the newly created Overland division at Omaha. In 1911 he went to St. Louis, Mo., as manager of the southern department, and in 1915 was appointed acting general manager in charge of western lines at Chicago in place of J. A. D. Vickers, deceased.

A. Christeson

A. Christeson, vice-president of the Western departments of the new company, with headquarters at San Francisco, Cal., has been engaged in the express business for 40 years. He began as a driver for the American Express Company at Fort Dodge, Ia., in 1873, and the following year served as driver for that company at Dubuque. In 1875 he was promoted to messenger between Sabula and Marion, and later served as messenger on Sioux City and Yankton route. From 1877 to 1881 he was agent at Creston and in 1882 served at different times as agent and route agent. He was appointed assistant superintendent for Wells Fargo & Co. at Denver, Colo., and served in that capacity between 1883 and 1884. In the latter year he was appointed superintendent at St. Paul, Minn., which position he held until 1886, when he was made superintendent at Lincoln, Neb., and continued there until 1887. From January, 1888, to 1897 he was superintendent at Houston, Tex., and in January of the latter year he was appointed manager for the central department with headquarters at Kansas City. On January 1, 1899, his headquarters were transferred to San Francisco and he subsequently became general manager and finally vice-president and general manager of the same company.

Edgar M. Williams

Edgar M. Williams, who has been appointed vice-president of the Southern departments of the new company, with headquarters at Atlanta, Ga., entered the service of the Southern Express Company at an early age. In 1891 he was appointed secretary to M. J. O'Brien who was vice-president and general manager. Following the election of Col. O'Brien to the presidency of the company, Mr. Williams was appointed assistant to the president, which position he held until 1907, when he was made general superintendent and later general manager of the Western department. On

July 15, 1912, he was appointed second vice-president in charge of traffic, and in 1915 he was elected vice-president. On October 5, 1916, he was appointed vice-president in charge of traffic also of the Adams Express Company with office at New York.

Frederick S. Holbrook

Frederick S. Holbrook, assistant to president of the new company with headquarters at Washington, D. C., was born September 25, 1864, and began railway work in 1881 as a clerk on the Ogdensburg & Lake Champlain at Norwood, N. Y. He served consecutively from 1886 to 1889 as chief clerk to the general agent of the same road, and later was agent of the same road, the Central Vermont and Canada Atlantic. From 1890 to 1893 he served as cashier of the Ogdensburg Transit Company at Chicago, then to 1895 he was cashier on the Central Vermont, New York, until 1899 when he was appointed commercial agent of the same road at New York. In February, 1900, he was appointed assistant general freight agent of the West Shore and about one year later became first assistant general freight agent of the New York, New Haven & Hartford at Boston. In July of the same year he was made general freight agent of the same road with office at New Haven and from September, 1908, he was chairman of the Committee on Uniform Classification at Chicago. From May, 1909, to January, 1912, he was chairman of the Official Classification Committee at New York. He was then appointed general traffic manager of Wells Fargo & Co., and since October, 1913, has served as vice-president in charge of traffic of that company.

Dixon S. Elliott

Dixon S. Elliott, vice-president in charge of traffic of the new company, entered the service of the American Express Company on December 9, 1879, as office boy and all-around assistant in the office at Kewanee, Ill. Two years later he was sent to Streator, Ill., as clerk. The same summer he was transferred to Geneva Lake, Wis., as a clerk and the following November was promoted to cashier at Galesburg, Ill. On January 1, 1883, when the joint office in Peoria, Ill., was discontinued and the American opened an office of its own, Mr. Elliott was sent there as one of the assistants to the agent. In October of the same year he was transferred to Davenport, Ia., as cashier and in the summer of 1884 was promoted to agent at the transfer point at Pacific Junction, Ia. After serving a year at Pacific Junction, Mr. Elliott was transferred to St. Joseph, Mo., as chief clerk in the superintendent's office of the Missouri division which position he held until the fall of 1887, when he was promoted to route agent with headquarters at Sioux City, Iowa. In 1889 he went to Chicago as chief clerk in the office of the general superintendent and in 1893, was made chief clerk of the specially created World's Fair Department of the American Express Company, having charge of the details of management of the World's Fair office. He was then appointed superintendent of the Nebraska division, but before the appointment could take effect changes in railway lines necessitated transfers in superintendents and another officer was assigned to the duties. When the American Express gave up its contract on the Great Northern in favor of the newly organized Great Northern Express Company in July, 1893, Mr. Elliott became superintendent of the Great Northern Company at St. Paul, Minn., at the same time looking after the interests of the American Express Company. In 1896 he was placed in charge of the accounting department of the Great Northern Company as auditor, and in 1901 was appointed general manager. In 1910 he was elected president of the Great Northern Express while position he held for the next five years. In March 1915 he returned to the American Express Company to become vice-president in charge of traffic.

J. W. Newlean

J. W. Newlean, vice president and controller of Wells Fargo & Co., at Chicago, will be vice-president in charge of accounting of the new company. Mr. Newlean was born at Chicago in 1875 and entered railroad service in 1891 in the freight claim department of the Burlington & Missouri River, now a part of the Chicago, Burlington & Quincy. He later served in various capacities in the accounting department of the Union Pacific System and Southern Pacific. In 1909 he was appointed general auditor for the receivers of the Chicago Great Western and upon the reorganization of that company was appointed auditor. On January 1, 1911, he was appointed general auditor of the Illinois Central, the Yazoo & Mississippi Valley and the Indianapolis Southern. On March 7, 1912, he resigned to become controller of Wells Fargo & Company with headquarters at Chicago. He was elected vice-president and controller of that company on September 1, 1913.

E. E. Bush

E. E. Bush, manager of maintenance and purchases of the new company, entered the service of the American Express Company in December, 1880, as a driver and money clerk at Cedar Rapids, Ia. The following year he was transferred to the office of the superintendent of the Iowa division to serve as over and short clerk, and later as chief clerk first at Council Bluffs, Ia., and later at Des Moines. In 1887 he went to Chicago as chief clerk in the office of the general superintendent and three years later was appointed secretary to the second vice-president at Chicago. While in this position Mr. Bush became interested in the work of the western traffic department. When the traffic department in charge of all lines was established in New York in 1898, he was appointed secretary to the general traffic manager. Since that time he has been engaged exclusively in traffic department work, and in March, 1915, was appointed traffic manager in charge of all the company's lines.

T. B. Harrison

T. B. Harrison, general counsel of the new company, was born in Russellville, Ky., October 12, 1866, and was educated at Bethel College in Russellville, and in the University of the South at Sewanee, Tenn. In March, 1889, he was appointed stock claim agent and clerk to the district attorney for the Owensboro & Nashville division of the Louisville & Nashville, and at the same time practiced law in Russellville. In 1892 he went to Louisville as law clerk in the law department of the same road, and served successively as chief clerk, assistant district attorney for Kentucky, district attorney for Kentucky and general attorney for the whole system. He came to New York in January, 1908, as special counsel for the Adams and American Express companies, since which time he has been handling rate and tax and other important matters for these companies before the Interstate Commerce Commission, also before the state commissions and in the state and federal courts.

Charles W. Stockton

Charles W. Stockton, general counsel of the new company, entered the service of Wells, Fargo & Co. in 1881 as agent at Silver City, Idaho. The following year he was promoted to clerk in the superintendent's office in Portland, Ore. He was steadily promoted and in the early nineties served as division superintendent of Wells Fargo in Kansas. As part of his duties he helped to end outlawry in southern Kansas and Indian Territory and during a period of seven years in connection with Grover B. Simpson, now general superintendent at St. Louis, succeeded in cleaning up the

territory. He later studied law and was admitted to the bar. He then entered the legal department of Wells Fargo and gradually advanced until in 1913 he was promoted from commerce counsel to general counsel. On June 26, 1917, he became vice-president and general counsel at New York of the same company.

Agreement Between the Government and Express Companies

The agreement between the government and the express companies recites that "whereas the director general is of the opinion that the express transportation business upon the railroads and systems of transportation under federal control can be most efficiently carried on through the agency of a single corporation, which shall act as the sole agent of the government in conducting said business," the express companies shall cause to be organized a corporation for the purpose of carrying on for the director general the express transportation business upon the railroads under federal control and elsewhere, as may be determined by the director general.

From the gross revenue from express traffic on lines under federal control the company shall pay the director general 50¼ per cent. To the balance there is to be added the net revenue derived from operation over other lines, miscellaneous income and income from invested money or securities, to make up what is known as "gross contract income." From this the express company is to pay operating expenses, rentals, taxes, except war taxes, and other proper expenditures, the remainder being termed "contract income for division." From the contract income for division an amount equal to 5 per cent on the capital stock shall first be set apart for the payment of dividends or general corporate purposes, which shall be cumulative, and shall be termed "primary allowance." Any excess of contract income for division over the primary allowance up to 2 per cent on the capital stock shall be divided, one-half to the company and one-half to the director general. The remainder, to the extent necessary, shall be paid into a guaranty fund which shall not exceed 10 per cent on the capital stock and which shall be held by the express company to insure its ability to pay each year 5 per cent on its capital stock. Any earnings from this fund shall be considered as contract income for division. If the contract income for division in any year shall not be equal to 5 per cent, the amount lacking shall be withdrawn from the guaranty fund and the fund shall therewith be restored in the same manner as it was originally created. Any amount in the guaranty fund at the termination of the contract or that may be due thereto and not required for the purpose for which it was established is to be divided between the express company and the director general in the proportion of 40 per cent to 60 per cent. After the accumulation of the guaranty fund any contract income for division in excess of the 5 per cent primary allowance and the 2 per cent shall be divided as heretofore described.

It is provided that all salaries paid by the express company to its officers shall be reasonable and all salaries in excess of \$10,000 a year shall be reported to the director general. If he shall determine that any such salary is unreasonable and shall notify the express company in writing the maximum salary which he regards as reasonable, any amount in excess of the salary so fixed which shall be paid shall be excluded from any accounts of the express company used in determining the contract income for division.

Any controversy which may arise as to the performance of any part of the contract is to be submitted to and determined by the Interstate Commerce Commission after full hearing and its decision thereon shall be final.

How Signals Can Increase Track Capacity

A Ready Means of Increasing the Amount of Traffic That
Can Be Moved on Busy Multiple Tracks

By C. C. Anthony, Los Altos, Cal.,
Formerly Assistant Signal Engineer, Pennsylvania Railroad.

WITH A MODERATE train movement, not closely approaching its capacity, a railroad may be operated without signals with a fairly good degree of safety. Under certain peculiar conditions, such as are found on some elevated roads, operation at maximum capacity may even be carried on quite safely without signals. Under ordinary steam-road conditions, however, operation at maximum capacity, with a satisfactory degree of safety, is practically impossible without block signaling, at least. The question, therefore, is not whether greater capacity can be attained with or without signaling. Signaling being necessary for intensive operation with safety, the question is, How is the capacity of the road affected by the kind and character of the signaling? Block signaling, while increasing the safety of operation in a greater or less degree, may either increase or decrease the number of trains that can be run with reasonable safety on a given unsignaled road; its effect depends upon certain features of the installation. Of interlocking it may be said generally that it always facilitates train movement in some measure and so adds something to the capacity of the road.

Elements Affecting Capacity

The principal element of the block system that affects the capacity of the road, is, of course, the length of block; and, since manual blocks, because of the excessive operating cost of short blocks, are typically much longer than automatic blocks, automatic blocking may be said generally to be essential for maximum capacity. The effect of shortening blocks is shown, and a very fair comparison between manual and automatic blocking is supplied by calculations made on a large road on which controlled manual block had been in service for many years. It was assumed that passenger trains

averaged 1,275 feet in length and 35 miles an hour in speed; fast freight 2,075 feet and 20 miles an hour; slow freights 4,075 feet and 10 miles an hour. For the purpose of arriving at a maximum capacity it was assumed that there would always be a train ready to run when the track was available.

On a division having blocks (controlled manual) averaging 8,951 ft. in length on the passenger tracks, with a maximum length of 29,949 ft., it was found that 115 passenger trains could be run on each track in 24 hours, or 67 fast freight trains; or 32 slow freights. That is, these were the calculated track capacities for the three kinds of trains, assuming, in each case, that trains of the specified kind were run exclusively. With automatic blocks 4,200 ft. long, the corresponding figures were: 288 passenger trains, 180 fast freights, 90 slow freights. Except as the length of block varies in proper relation to the variations of speed imposed by physical conditions, etc., the maximum length of block controls the spacing of trains. But, from the point of view of signal equipment and operating force, average length is the basis of comparison. In this case, then, it appears that the reduction of the average length of the block from 8,951 ft.—a moderate length for manual block—to 4,200 ft., would multiply the track capacity for passenger trains about two and one-half times; for fast freights somewhat more, and for slow freights nearly three times.

Effect of Reducing Length of Block

If trains could be run a block apart, every reduction in the length of block would mean a corresponding increase of capacity, but this is evidently impossible except in the case of trains moving at very moderate speed, which might safely run at an interval of a little more than the length of a

block. For high-speed trains there must be provision for a cautionary signal indication at a point so far in the rear of the stop signal at the entrance of any occupied block, that a train running at the highest practicable or permissible speed can make a service stop between that point and the stop signal. In the ordinary course, when trains are running unobstructedly, each train will keep far enough in the rear of the train ahead to find each signal clear as it approaches. Practically, therefore, the minimum interval between the rear of one train and the front of the following train must be somewhat more than the length of block plus the distance within which the fastest trains can make a service stop. This latter distance being fixed, reducing the length of block has relatively less and less effect on the interval between trains, as the blocks are made shorter. If the length of block is made less than the stopping distance, the cautionary indication must be carried back more than one block, at the cost of some added complication in the signal system; and the number of signals and the cost of the signaling will increase rather rapidly in comparison with the benefit in the way of permitting closer spacing of trains and consequently increasing the capacity of the road.

The running of trains at different speeds on the same track of course complicates the situation. For the slow trains the distance required for stopping is short; and short blocks with the cautionary indication one block in the rear of any signal at stop, as in ordinary practice, would be satisfactory, and would allow several such trains to be run in succession with about the minimum occupancy of the track. The fast trains, on the other hand, require cautionary indications at a greater distance from the stop signals; and if the length of block is made equal to this distance, so that the cautionary indication is again carried back only one block, the distance between slow trains, if they are spaced so as to receive clear signals, will be much greater than in the previous case, where the signals were assumed to be spaced to suit the speed of these trains. It is possible, of course, to meet both conditions in a measure, by a suitable arrangement of signals—with a certain amount of advantage in the particular case, for example, where there is frequently occasion to run several slow trains in the intervals between fast trains on a given track. High cost of the road or of additional trackage, as in a subway, may also require the attainment of extreme capacity by similar expedients in the arrangement of signals for relatively short blocks, even where all trains are of the same kind and all run at high speed. For ordinary conditions, however, a length of block equal to the distance required for stopping the fastest trains, gives about as great capacity as can be utilized to advantage.

Use of Passenger Tracks for Freight Movements

In practice, except sometimes in suburban territory, a multiple-track road does not usually have, or have in prospect, a passenger-train movement that approaches the capacity of two tracks; although the movement of freight trains may tax the capacity of two tracks. Under these conditions manual block may not seriously limit the capacity of the road if permissive blocking of freight trains, or of slow freights at least, is practiced. A few times each day it might be convenient to run two or three passenger trains closer together than (absolute) manual block will permit; but the greater spacing of the trains in a few cases of this kind does not greatly lessen the capacity of the tracks. The situation is not at all as it would be if a considerable number of passenger trains could be sent over the road in close succession, and the track could then be used by freight trains during a long interval; the conditions determining the schedules of passenger trains rarely permit such a favorable arrangement. The absolute block for passenger trains also causes a small loss of track use when freight trains are run on the passenger tracks in the longer intervals between passenger trains. The first freight going

on to the passenger track may have to wait a few minutes for the comparatively long manual block to be cleared by the last passenger train using that portion of the track; and the last freight may have to clear the passenger track a little earlier, for the next following passenger train, than would be necessary with the much shorter blocks that would naturally be used in the automatic block system on such a road. Here again the practical effect on track capacity is not very serious; although there is, of course, a greater effect on theoretical capacity based on the assumption that there is always a freight ready to enter upon a passenger track at the beginning of any interval between passenger trains sufficient for the movement of one or more freights. Permissive blocking of freight trains, however, or of most of them, assuming that slow freights are largely in the majority, makes possible almost, if not quite, as large a movement on a road of average alinement, as can be attained under any other method of operation.

Benefits of Automatic Signals

It is an interesting fact that automatic blocking has even been opposed, when about to be installed, on the ground that, with it, as good train movement would not be possible as under the manual block in use at the time, with permissive blocking for the numerous slow freights. This occurred on a busy four-track division of an important trunk line—a division having a very large through freight movement, and not a particularly favorable alinement for "running on sight." It is a still more interesting fact that, after automatic signals had been in service for a time, it was frankly admitted that the movement had never been handled better. Naturally the freight trains, when moving normally, would keep far enough apart under the automatic block to get clear signals and so avoid frequent stops. Presumably the freer and steadier movement due to running mostly on clear signals more than made up for the sacrifice of the closer running that is possible under permissive manual block.

The Assignment of Tracks

Interlocking affects the capacity of a multiple-track road in two quite different ways. In the first place, as on any road, whatever the number of tracks, it may facilitate the train movement by eliminating the stopping or slowing of trains at drawbridges, junctions and grade crossings of other roads. If such places are numerous the effect on capacity may be very material.

In the second place, the tracks of a multiple-track road cannot generally be used to capacity unless trains of different classes can be run on each track as opportunities arise. For this purpose groups of crossovers must be provided at frequent intervals; and these facilities practically cannot be used to advantage without interlocking. This full utilization of facilities depends also upon the assignment of the tracks, as to the current of traffic on each. In practice this seems to have been, to some extent, a matter of policy; use of the tracks to capacity has not always been the chief end. Probably the most notable examples of two exactly opposite policies in this matter is furnished by the assignment of tracks on the four-track lines of the New York Central (between Albany and Buffalo) and of the Pennsylvania.

When the New York Central was four-tracked the interchangeable use of the tracks was, very likely, given little if any consideration; the main idea seems to have been to separate the freight from the passenger traffic as completely as possible—partly, if not largely, for the sake of safety. Accordingly the arrangement was that of two double-track roads—the two south tracks assigned to passenger trains, eastward and westward, and the two north tracks to freight trains. Even with both pairs of tracks run righthandedly, an eastward train, for example, in moving from the passenger to the freight track, or vice versa, would have to obstruct the inter-

vening westward passenger track, and westward crossover movements would, similarly, block the eastward freight track. With right hand running on the passenger tracks and left-hand on the freight tracks, as the tracks have been used for many years, eastward crossover movements block both westward tracks; although westward trains can be crossed over readily enough. In fact, in the absence of interlocked crossovers arranged for direct movement, without backing, the crossing of eastward trains, except in emergencies, was so nearly out of the question that back off passing sidings connected with the eastward passenger track were provided for the use of certain fast freights that were regularly run on that track.

On the Pennsylvania the advantage of being able to use the tracks as desired, by crossing trains over without obstructing other tracks and without backing, was seen very early in the development of four-track operation. The two tracks on one side of the center line were, therefore, assigned to eastward trains, passenger and freight, and the two on the other side to westward trains. Except where the character of the traffic or some local conditions make the interchangeable use of the tracks impracticable or of no advantage, this is the most usual arrangement—as seen on the Lake Shore (now the New York Central West of Buffalo) and the New Haven roads, among others. At the same time full sets of crossovers (for direct movement from passenger to freight tracks and freight to passenger, at each place) with interlocking were provided. Finally, on four-track lines so equipped, trains were run with the current of traffic by signal; a freight train, for example, receiving a signal to cross over to the passenger track (used for movement in the same direction) would proceed without a train order and regardless of any passenger trains that might be overdue, and would continue on the passenger track until crossed back to the freight track at another interlocking. The dispatcher, watching and directing the movement, was thus able to use every minute of available time on any track, without any of the losses of time or opportunity frequently met with in the use of train orders. By this method of operation, wherever each track is not fully occupied by trains of the class assigned to it, the capacity of a four-track road can be utilized in the highest degree. This kind of operation is also very convenient, and is often taken advantage of, as a means of getting a fast passenger train past a slower one without delay to either. In that case one of the passenger trains, of course, uses the freight track for a considerable distance. The result is often delay to freight trains, which may, in the aggregate, amount to a material reduction of capacity for freight-train movement. However, this is a matter of balancing the gain against the loss.

The Use of More Than Four Tracks

When more than four main tracks are required, it is commonly advantageous to assign at least two tracks to certain kinds of trains, either because one or more pairs of tracks can each be kept pretty fully occupied most of the time by trains of one speed; or because four of the tracks, say, can be operated more satisfactorily with certain entire groups of trains removed to tracks assigned to them exclusively than can six or more tracks with all kinds of trains intermingled to a certain extent in the effort to facilitate the movement of all as much as possible and to make the best use of every track. For example, two tracks on a six-track road may be assigned to slow freights which, following one another at the same speed, require very little attention from the dispatcher. In fact, these two tracks may not even adjoin the other four, but, as in some actual cases, may be located several miles away where better grades and alignment can more readily be secured. There are also examples of two tracks so separated from the others and provided with passing sidings that trains of more than one speed can be run on them—as slow freights and certain fast freights—to the greater relief of the

four tracks operated interchangeably and in use quite frequently for running passenger trains around one another. In that case the advantage of interlocking again becomes apparent. Plants at the entrance switches of the sidings, by saving stops of trains, add something to the capacity of the tracks, and saving stops of freight trains of course means money saved whether or not increased track capacity is of any present value.

Even when the traffic is quite heavy for the number of tracks, the train movement may be so irregularly distributed that one track or another may be idle over considerable distances and for considerable periods a few times every day; at the same time the movement in the direction opposite to that of the current of traffic on the idle track may tax the capacity of the assigned tracks.

Movements Against Current of Traffic

Provision for movements against the current of traffic may then add materially to the capacity of the road under the actual conditions of train movement, which may not admit of much change and must, therefore, be handled as it exists. Such movements can be and are made readily enough by train order. But that these movements may be made to the greatest effect and so as to utilize every available interval on any portion of a track, it is highly important that the crossovers at every point be arranged for direct movement from any track to any other, in either direction, and, of course, interlocked. The ideal provision for such operation would be controlled manual block, permitting the running of trains in either direction on a given track by signal, without train orders, and automatic block signals for both directions. The latter is, perhaps, the more important equipment of the two; for if several trains can use an idle track, as many of them as possible should be sent through in the available time; they should not be impeded by long manual blocks from interlocking to interlocking in the direction against the normal current of traffic.

On the other hand, it may be found in practice that tracks can seldom be used against the current of traffic for any more extensive movements than the running of one or two trains around slower trains occupying their normal track. In that case, short (automatic) blocks in the reverse, in addition to the normal, direction, may not be of great advantage. Short blocks would be desirable, however, if there were frequent occasion, for example, to use two tracks in the normal direction for passenger trains of different speeds, for a distance of ten, twenty or more miles, while keeping a procession of freights moving by using one of the other tracks against the current of traffic.

Controlled manual block adds to the facility of the movements, as compared with train orders, in a rather small degree, and affords some increase of safety. If automatic signals are installed for the reverse movements, however, the additional cost of controlled manual block is a relatively small item. Up to the present time such elaborate equipment has been applied chiefly on the middle track of three-track roads, where the traffic is frequently reversed and short blocks are as important in one direction as in the other. Whether the cost of an extensive installation of a line of four or more tracks would be justified would have to be worked out by a careful study of the train movement, to determine how much time various stretches of track would be available, and how many trains there would be to use them against the current traffic. It is to be noted, however, that equipment of the inside tracks of a four-track road would ordinarily be sufficient. There could rarely be any advantage in crossing trains over one of the tracks assigned to trains in the opposite direction, in order to use the other, the outside, track against the current of traffic; it would be much simpler to concentrate the light movement on the outside track and use the inside track to facilitate the heavy movement.

The use of tracks against the current of traffic by train order seems to have been developed—at least to have attracted attention—on double track much more than on four-track roads. Well-known examples are the Chicago, Burlington & Quincy and the Cleveland, Cincinnati, Chicago & St. Louis roads. The latter particularly has been extensively signaled for movements in both directions on each track. The reason for the difference undoubtedly is that on double track the advantage stands out prominently; in no other way can fast trains pass slower trains without more or less delay to the slow trains on sidings. Whereas, on a four-track road, interference between fast and slow trains is largely eliminated by the duplication of tracks, and operation against the current of traffic may not seem to offer anything more than a small increase of this advantage; although a careful study might show that it would improve the train movement considerably.

The Importance of Interlocking

From everything here considered it is plain that signaling plays an indispensable part in the operation of a multiple-track road at or near capacity. Except possibly in a few special cases, block signaling is essential for the reasonably safe operation of trains at close intervals; and the necessity of short blocks makes automatic signals practically the only choice. With the heavy traffic for which a multiple-track road exists, interlocking at drawbridges, junctions and crossings becomes increasingly important as a means of keeping trains moving and so getting the maximum number over the road. Sets of interlocked crossovers, at intervals of a few miles, arranged for direct movements between all tracks, are essential for the full utilization of the tracks. And complete signaling for movements in both directions on part of the track is, in some cases at least, an effective means of adding to the capacity of the road under the actual conditions of train movement.

Important Orders of Western Regional Director

DURING THE PAST WEEK R. H. Aishton, regional director of western railroads, issued a number of orders, the most important of which are reproduced below:

Increased Freight and Passenger Rates

Circular No. 117, dated June 1, is an interpretation of the director general's General Order 28:

Many inquiries are being received relating to the application of General Order No. 28—Increased Freight and Passenger Rates—so far as the smaller roads are concerned. To correct any misunderstanding, this is to advise that General Order No. 28 applies to all steam railroads. Tariffs, therefore, should be filed increasing rates under General Order No. 28 for or by all steam railroads, and such tariffs should bear on the title page the legend shown at the end of exhibit attached to General Order No. 28, reading as follows:

"The rates made effective by this schedule are initiated by the President of the United States through the director general, United States Railroad Administration, and apply to both interstate and intrastate traffic.

"This schedule is published and filed on one day notice with the Interstate Commerce Commission under General Order No. 28 of the director general, United States Railroad Administration, dated May 25, 1918."

On passenger tariffs use word "fares." On baggage tariffs use word "charges."

Capital Expenditures

Circular No. 112, dated May 28, reads: The following is in answer to several inquiries which have been made by carriers relative to capital expenditures:

1. Carriers may contract and start work in excess of \$25,000 in advance of approval of D. C. E. Form 4, pro-

vided the work is included in the budget which was approved by the director-general or the director, division of capital expenditures, excepting those budgets which were *conditionally* approved. It is possible, however, that under certain conditions work authorized in the approved budget may be stopped, and in all contracts provision should be made by the carrier for such contingency.

2. Some carriers have understood the language of director general's Circular No. 25, calling for a progress report on additions and betterments, to make it applicable only to work approved on D. C. E. Forms 3 and 4. It is the intention that reports called for in said Circular No. 25 shall cover all work included both in the approved budget and in D. C. E. Forms 3 and 4 which have been submitted.

3. D. C. E. Form 3, which covers work costing less than \$25,000 and more than \$5,000, should be submitted at the time it is decided to proceed with the work covered thereby, and it is not necessary to wait until the work has been actually commenced.

Conserving Rubber

Supplement No. 3 to Circular R. P. C. No. 10, dated May 28, states: The division of transportation and the central advisory purchasing committee at Washington are again calling attention to the grave situation resulting from the shortage of crude rubber. In connection with the conservation of rubber the following should be observed:

1. All hose to be as small in size and short as possible consistent with the use it is to be put to. Check up car heating and washout plants particularly, as considerable saving can be made in some places.

2. Wire wound hose of less number of plies and at correspondingly decreased cost may often be substituted for special hose frequently used for withstanding high pressure.

3. Substitute lengths of iron pipe for hose wherever possible.

4. Discontinue the use of rubber mats and step treads in cars and other places where used.

5. Sheet rubber can often be replaced with composition packing at less cost and at the same time conserving the supply of rubber.

6. Old rubber should be carefully collected and disposed of as scrap.

Contracts Involving Labor and Material

Circular No. R. P. C. 12, dated May 28, reads: Apparently there is some misunderstanding as to the meaning of that paragraph in regional director's Circular No. 54, of March 27, which reads as follows:

"It should be understood that authority to do work does not carry with it authority to purchase material; if the material is not in stock, the department doing the work should procure it on approved requisition through the purchasing department."

The misunderstanding seems to exist in those cases where departments other than the purchasing department make contracts for erection of buildings, etc., which include both labor and material.

In such cases the following should apply: Competitive bids should be obtained from contractors. The bid should include an itemized list of equipment and material to be furnished, specifying grades of lumber, specification for brick, etc., with unit prices and the f. o. b. point at which they apply, with the understanding that the railroad company may furnish any or all of the items as it sees fit, and the bid be reduced accordingly.

These propositions should be submitted to the purchasing department and prices carefully checked by it to ascertain that they are not higher than government prices, on such material as prices have been fixed, and that prices quoted on other materials correspond with prices the railroad company is paying for similar grades. If the purchasing department can furnish some of the material more advantageously, the engineering or other departments should make

requisition for such material and the purchasing department should handle it. The desire is to obtain material at the lowest possible prices and to see that no higher than government prices are paid where such prices have been fixed. The fullest co-operation should be had between the engineering or other departments and purchasing department in respect to the handling of such contracts so that no delay will ensue.

Scrap Prices

Circular No. R. P. C. 13, dated May 28, states: The following ruling by the chairman of the sub-committee on scrap iron and steel, of the American Iron & Steel Institute, has been issued by the central advisory purchasing committee:

"We are having considerable trouble as a result of buyers making offers to scrap purchasing agents on scrap material for use for special purposes, and it now becomes necessary for us to enforce more rigidly the ruling recently made by Mr. Replogle and approved by us, namely:

"The prices approved by the President for iron and steel scrap cover all sales of scrap because it would be impossible to determine accurately at the time of sale for what purpose the material sold would finally be used. This basic principle may not be abrogated by any specific technicality."

"This means that rails, unless sold for relaying purposes, may not be sold at a price in excess of \$34 for any purpose whatsoever, while scrap rails may not be sold at any price in excess of \$29. Railway steel axles may not be sold at any figure in excess of \$46.50 delivered, irrespective of the use to which the buyer says they are to be put."

Locomotive Crane Requirements

In a communication, dated May 29, western roads were asked to wire not later than May 31, their requirements of locomotive cranes, steam shovels, electric traveling cranes and gantry cranes for the remainder of the year and not now under order, showing each separately.

District Freight Traffic Committee Is Appointed

The western freight traffic committee, A. C. Johnson, chairman, has appointed six district freight traffic committees in the western railroad region which will have charge of freight rules and regulations in their respective jurisdictions and will constitute standing committees, the members of which will give their entire time to this work when necessary. A proposal to change rates, rules or regulations may originate with the district committee or with any railroad operating within the jurisdiction of the committee. While it is expected and preferred that shippers shall deal with the appointed representatives of the railroads directly concerned, the district committee will be accessible to the public and will consider promptly any applications, complaints, or suggestions that may be submitted. Until further advised, the district committees will refer to the western freight traffic committee all proposals of changes in rates, rules or regulations on which they recommend action. The district committees are authorized to appoint sub-committees or call upon officers or employees of railroads in their respective jurisdictions for any required service or information.

The Chicago district freight committee will have headquarters at Chicago, and its jurisdiction will include the northern peninsula of Michigan, Wisconsin, Iowa, Illinois and Missouri on and north of the Chicago, Rock Island & Pacific between St. Louis and Kansas City. The members of the committee are as follows:

F. P. Eymann, chairman, freight traffic manager of the Chicago & North Western, Chicago. H. E. Pierpont, freight traffic manager of the Chicago, Milwaukee & St. Paul, Chicago. H. H. Holcomb, assistant freight traffic manager of the Chicago, Burlington & Quincy, Chicago. S. G. Lutz, vice president in charge of traffic of the Chicago & Alton, Chicago. F. G. Banister, secretary.

The St. Louis district freight traffic committee will have headquarters at St. Louis, Mo., and will have jurisdiction over Missouri, south of the Chicago, Rock Island & Pacific between St. Louis and Kansas City, and all of the states of Oklahoma, Arkansas, Texas and Louisiana. The members of the committee are as follows:

J. L. West, chairman, freight traffic manager of the Missouri, Kansas & Texas, Dallas, Texas. W. A. Hamblin, assistant freight traffic manager of the Missouri Pacific, St. Louis. L. Koch, member of rate committee Southwestern Tariff Committee, St. Louis. J. E. Johnson, member of rate committee Southwestern Tariff Committee, St. Louis. T. A. Leland, secretary, chairman Southwestern Tariff Committee, St. Louis.

The St. Paul district freight traffic committee will have headquarters at St. Paul, Minn., and will have jurisdiction over Minnesota, North Dakota, South Dakota and Montana east of Butte, Helena and Havre inclusive. The personnel of the committee is as follows:

H. M. Pearce, chairman, general traffic manager, Chicago, St. Paul, Minneapolis & Omaha, St. Paul, Minn. Healy Blakely, general freight agent, Northern Pacific, St. Paul, Minn. H. H. Brown, assistant traffic manager of the Great Northern, St. Paul, Minn. G. O. Somers, secretary.

The Kansas City district freight traffic committee will have headquarters at Kansas City, and will have jurisdiction over the states of Wyoming, Nebraska, Colorado, Kansas and New Mexico (Albuquerque and Deming and east). The committee is constituted as follows:

D. R. Lincoln, chairman, assistant general freight agent Missouri Pacific, St. Louis, Mo. F. Montmorency, general freight agent of the Chicago, Burlington & Quincy, Omaha. Nels J. R. Kuntz, general freight agent of Atchison, Topeka & Santa Fe, Topeka, Kansas. C. P. Dowlin, secretary, member of the rate committee of the Southwestern Tariff Committee, St. Louis, Mo.

The Portland district freight traffic committee, with headquarters at Portland, Ore., will have jurisdiction over Washington, Oregon, Idaho and Montana (west of Butte, Helena and Havre). The committee is as follows:

F. W. Robinson, chairman, traffic manager of the Oregon, Washington Railroad & Navigation Company, Portland, Ore. W. D. Skinner, traffic manager of the Spokane, Portland & Seattle, Portland, Ore. E. D. Burroughs, western freight traffic manager of the Chicago, Milwaukee & St. Paul, Seattle, Wash. S. J. Henry, secretary, assistant general western freight agent of the Northern Pacific, Tacoma, Wash.

The San Francisco district freight traffic committee, with headquarters at San Francisco, Cal., will have jurisdiction over California, Nevada, Utah, Arizona and New Mexico (west of Albuquerque and Deming). The personnel of the committee is as follows:

W. G. Barnwell, chairman, assistant freight traffic manager Atchison, Topeka & Santa Fe, San Francisco. G. W. Luce, freight traffic manager of the Southern Pacific, San Francisco. H. K. Faye, traffic manager of the Western Pacific, San Francisco. F. W. Gomph, secretary, agent of the Pacific Freight Tariff Bureau, San Francisco.

The western freight traffic committee also announces that the tariff publishing agencies named below will be continued:

Trans-Continental Freight Bureau, Chicago. R. H. Countiss, chairman. Western Trunk Line Committee, Chicago. E. B. Boyd, chairman. Southwestern Tariff Committee, St. Louis, Mo. F. A. Leland, chairman. Pacific Freight Tariff Bureau, San Francisco, Calif. F. W. Gomph, agent. Texas Tariff Bureau, Austin, Texas. A. C. Fonda, chairman.

Priority Instructions Re Material from Steel Companies

Bulletin No. 1, sent to purchasing agents of western roads on June 3, by the regional purchasing committee, reads: For your information we quote below paragraphs from instructions issued to steel companies, May 20, by E. B. Parker, Priorities Commissioner:

It is imperative that Railroad companies and locomotive builders should secure with reasonable promptness plates required to repair and build locomotives so that the railway motive power may be maintained, and additional locomotives constructed to meet war requirements. Instead of issuing priority certificates covering each order placed by railroad companies and locomotive builders, you are hereby authorized and directed to manufacture and ship to steel companies and locomotive builders a weekly list of defective rolling stock with you such text, boiler and tank orders may be covered by them of you, not to exceed, however, the production of your 1918 plate output which the total tonnage of orders placed with you for railroads and locomotive builders is less than the total tonnage of all other plate orders covered by "Class A" requirements. Such manufacture and distribution of plates to railroad and locomotive builders will be made concurrently with the manufacture and distribution of orders of the "Class A" certificate.

Circulars of the Southern Regional Director

C. H. MARKHAM, regional director of the Southern district, has issued the following circulars:

Circular letter No. 199 directs attention to the order of the Interstate Commerce Commission specifying headlight requirements on locomotives and says:

"It is understood that some of the roads are not complying with the provisions of this order, pending the outcome of court proceedings. The director general has instructed that the order should not be modified, and that the railroads should proceed in good faith to carry out the terms of the order, i. e., that locomotives shopped for general repairs should be equipped with electric headlights, that any new locomotives should be so equipped, and that the work should be followed diligently. Please be governed accordingly. The locomotives which have been ordered by the Railroad Administration are all to be provided with electric headlights, conforming to the requirements of the Interstate Commerce Commission's order."

Circular letter No. 204 directs railroads to take up with the office of the regional director for authority before entering into any contracts for freight car repair work at outside shops. It is stated that this matter is being gone into extensively by the Car Repair Section, which will be prepared to undertake whatever freight car repair work it may be necessary to have done at outside shops.

In Circular No. 200 railroads are asked to furnish information regarding the handling of loss and damage claims, including a reproduction of the pay roll for the freight claim department for the month of May, enlarged to show the name of each clerk and department head, the duties of the employees in detail, their daily or monthly rate of compensation, percentage of time devoted to the handling of loss and damage claims and other classes of work, etc.

With Circular letter No. 201 was sent a statement showing claims for loss and damage to freight received during the year 1917, claims on hand May 1, 1918, and the number of months behind in final disposition of claims for roads under government control in the Southern region. Roads were asked to use this statement for the purpose of determining by comparison with other roads as to whether or not, judged by the number of claims received, each line is getting proper results in the matter of claim reduction, whether or not claims are being disposed of with a reasonable degree of promptness, and whether or not proper attention is being given to the clearing from suspense of claims charged to that account.

In Circular letter No. 202 the roads are asked to issue instructions covering the detailed regulation for the inspection, cooperation and selection of cars in fit physical condition for handling such commodities as grain, flour, sugar, etc., to the end that every possible precaution may be taken to insure the proper transportation of freight of a character likely to be damaged by reason of the condition of the equipment.

In Circular letter No. 205 roads are asked to advise promptly the percentage of section labor short on each line as of June 1.

Circular letter No. 207 states that in line with the general standardization scheme it has been recommended that the 40-ft. stock car be used rather than the 36-ft. car. That conclusion may be reached, the roads are asked to express their views on such questions as whether the all year revenue from a 40-ft. car will justify carrying around a 4-ft. longer car, the effect of the 40-ft. car on trackage, loading and unloading chutes, and as to which is the better car from a revenue-producing point of view.

Circular letter No. 208 states that the Norfolk & Western

has 15 light weight locomotives which it can spare for service elsewhere. A description of the locomotives is given and the roads are asked to advise if they desire to utilize any of these locomotives.

Conserving Material

Circular letter No. 211 outlines various ways of conserving material and reclaiming and repairing old material. In view of the increasing difficulty in obtaining a sufficient amount of iron and steel products, the circular says, it is more important now than ever that every piece of material that is fit for further use or that can be repaired and used should be used in place of new material. Under no circumstances must any material be scrapped until it is positively known that it cannot be repaired by some process or that the cost of repairs by suitable means is prohibitive, or that by some economical process it cannot be converted into another class of useful material. A list of some of the materials to be saved and methods of reclaiming is appended and roads are asked to send to the office from time to time lists of additional articles and methods, with full description when necessary, so that they may be published for the benefit of the other regional roads.

Industrial Railroads

In Circular letter No. 215 the railroads are asked to furnish complete lists of all industrial railroads touching any part of their systems, with name of owning industry, officer in charge, character of industry, junction point and connections with any other carriers, also number of miles operated and division or allowance, if any, per car or per ton, and total allowance for the calendar year 1917.

Passenger Fares

In order to familiarize agents and conductors with new tariffs ordered by General Order No. 28 and the method of constructing the new fares thereunder, it is suggested in circular letter No. 217 that the railroads arrange to hold day or evening schools of instruction, established in the larger cities, where there are headquarters of lines whose representatives have been in attendance at the rate meeting in Washington and who are familiar with the situation. This should be extended so far as possible by calling in the principal ticket agents on the line for similar instruction. Tariffs for this purpose are to be available by June 5. In this connection it is stated that as much publicity as possible should be given to the conditions that specific forms of tickets sold prior to June 10 will be redeemed and that this does not apply to commutation tickets.

Circular letter No. 220 quotes a letter from Edward Chambers, director of the division of traffic, stating that several complaints have been received in regard to the failure of railroads to make desirable passenger train connections, particularly at intermediate points, when it can be done by only slight readjustments in train schedules. Often these connections are broken by a few minutes of time, but the resultant delay to passengers is several hours. The railroads are asked to have this subject given the necessary consideration and to advise as to such connections as may need adjustment.

Circular letter No. 221 advises that contributions of railroads to Railroad Young Men's Christian Associations during the period of federal control may, until otherwise ordered, be made in reasonable amounts as heretofore.

B. L. Winchell became regional director of the Southern district on June 1. His first circular letter was No. 222 regarding salaries of railroad officers, in which the presidents of railroads in the Southern district were asked to furnish him with a statement of salaries paid to executive officers and heads of the several departments, indicating the titles of such officers and department heads.

Association of American Railway Accountants, 30th Annual Meeting

Meeting of Railway Accounting Officers

A Strictly Business Meeting Attended by 250 Members
Important Report on New Conditions

THE 30TH ANNUAL MEETING of the Association of American Railway Accounting Officers was held on May 29 and May 30 at the Hotel Statler, St. Louis. After the singing of the Star Spangled Banner and an address of welcome by Mayor Keil of St. Louis, a letter from C. A. Prouty, director, division of public service and accounts of the United States Railroad Administration, was read in part as follows:

Letter from Director Prouty

At the last moment matters which cannot be postponed keep me in Washington. May I ask you to convey to your association and through it to the railway accountants of this country a single word from me?

The operating revenues which are reflected in the accounts kept by our accountants belong to the United States. The director general can remove or employ any accountant upon any railroad under federal jurisdiction. Our accountants are, therefore, in a direct sense the employees of the government. What the director general asks is that our accountants shall at all times bear this in mind and shall render to him loyal and efficient service. The accountant who measures up to that standard will be fully protected in his position, nor is there in contemplation any reorganization nor disruption of present organization which will affect his status for the future.

Personally I will, to the extent of my authority and of my influence with the director general, see that every accountant has fair treatment according to his desert, having reference both to the present and to the future.

But I appeal to you now upon a much broader ground. These railroads were taken under government control to win this war. The transportation which they alone furnish is fundamental and the war cannot be won without it. Whether our railroads can be successfully operated depends entirely upon their employees. No man, no matter what his

ability may be, can accomplish much without the loyal and efficient support of his co-workers from the lowest up to the highest.

The accountant who desires to do his full part in the present crisis can best serve his country by the faithful and painstaking performance of that thing which he is employed to do. Upon the broad ground of public duty, therefore, I appeal to you one and all to pull together, each man in his own particular sphere for the winning of this war.

It is a personal regret that I cannot be with you. I am not an accountant and could not discuss the problems of technical accounting, but there are certain things which I feel should be accomplished during this period of federal control in which the accountant plays a most important part and some of these things I should have been glad to suggest to you.

I am also anxious to become acquainted with our railway accountants. If anyone sees anything which in his opinion ought to be brought to my attention, he will confer a favor by writing to me. If his letter is marked personal I shall be sure to read it. I also hope that no accountant visiting the city of Washington will fail to call at my office. Let him state who he is and that he comes at my request.

Report of the Executive Committee

After some correspondence with Charles A. Prouty, director, Division of Public Service and Accounts, United States Railroad Administration, the following committee was appointed to confer with Director Prouty and also to represent the association in its dealings with the director general's office: A. H. Plant, chairman, controller Southern Railway; C. B. Seger, vice president and controller Union Pacific; A. B. McDonald, vice president and controller, Southern Pacific Company; R. A. White, general auditor, New York Central; and Frank Nav, controller Chicago, Rock Island & Pacific. The remainder of the ex-

ecutive committee's report dealt with the various subjects connected with the administration of the association's affairs.

Corporate, Fiscal, and General Accounts

The attention of the committee was directed to a letter written by the chairman of the committee to the director general of railroads in which the aid of the Committee on Corporate, Fiscal and General Accounts, either as a whole or through an appropriate sub-committee, was tendered to him in connection with any matters relating to railway accounting which may arise under his administration.

The action of the chairman was approved and a sub-committee, consisting of A. H. Plant, chairman; C. B. Seger, R. A. White and A. D. McDonald, was appointed and directed to hold itself in readiness to act in the event its services are required. The sub-committee was given full power to act for the committee without referring individual conclusions to it for approval. Its actions and activities, however, are to be reported from time to time to the full Committee.

Government Transportation Accounts

The chairman of the committee advised it of the activities of the sub-committee on military transportation accounting in its efforts to speed up the settlement of accounts of the railroads against the several departments of the federal government for the transportation of men and materials. He pointed out that while substantial progress had been and is being made, delays to some extent continue, some of which are due, apparently, to inability to secure adequate clerical forces trained in the application of land grant rates and equalizations; others to the technical initial audits required under regulations, and still others to the adjudication of freight claims.

Efforts are being made in the following manner to overcome such delays and to, as far as practicable, enable the railroads to collect currently revenues earned by them for services rendered the government:

It has been suggested that the original audit be limited to administrative examinations, and that the accounts be paid immediately after such examinations. The railroads to guarantee to the government repayments of all discrepancies found in final audits to bases of classifications and tariffs applicable. Such a guarantee was authorized by the war board—a further guarantee has been authorized by the director general of railroads.

The adjudication of claims for losses and damages under existing regulations is more or less arbitrary, and to some extent unnecessarily delays the settlement of transportation accounts. The matter was brought to the attention of the Secretary of War, who promptly directed that a plan be devised by which such claims could be promptly and properly adjusted without delaying the settlement of transportation accounts.

Colonel G. F. Downey, Depot Quartermaster, Washington, D. C., wrote to the chairman of the Subcommittee on Military Transportation Accounting, in part as follows:

My plan is as follows: Do away with government bills of lading, and use commercial bills of lading with the same railroad routine for government freight now in use for private shipments, which is the bulk of the railroads' traffic and on which their methods of doing business have been based and brought to their present condition.

Instead of issuing a government bill of lading as now, give a freight transportation request to be exchanged for the accomplished railway bill of lading at the point of origin, similar to the present transportation request for passenger service which is exchanged for a railroad passenger ticket. In other words, handle freight traffic in exactly the same manner as passenger traffic, issuing a request to the initial carrier in return for the railroads' written guarantee to perform the service and make delivery.

The freight transportation request should be issued in triplicate and serially numbered, the railroad commercial bill of lading carrying the number of the transportation request and the transportation request carrying the number of the commercial bill of lading, which will be sufficient to connect up the shipment, thus leaving both the government and the

railroad to handle their records, accounts and billing by their own methods and not force them to adopt parts of the systems of the other. Of the three copies, the original signed by the shipping quartermaster is given to the carrier's agent at point of origin, who turns it in to his railroad accounting head, who in turn uses it as a voucher in an account to the depot quartermaster, who will make settlement with the initial carrier as provided by law. The duplicate copy will be sent by the shipping quartermaster to the depot quartermaster, Washington, D. C., on the date of issue; while the third or tissue copy should remain with the shipping officer as his record of shipments made.

In exchange for this transportation request, the shipping quartermaster receives from the railroad agent an accomplished commercial bill of lading, and in turn sends it to the consignee. The consignee calls on the railway agent at destination, receives the goods, and surrenders the commercial bill of lading, thus closing the transaction. Claims for losses and damages will be adjusted by the consignee at time of delivery. If there is a shortage, the railway agent should so certify to the receiving quartermaster, who sends the certificate to the depot quartermaster, who will collect the claim from the carrier.

If the receiving quartermaster and the carrier's agent at point of destination cannot agree as to losses and damages and responsibility for the same, a full statement by each of the facts in the case with the bill of lading should be sent to the depot quartermaster, who will submit it to a board composed of a member from the railway accounting branch, a member from the auditor's office, and the depot quartermaster, or a similar board, who will settle the disputed claim. The action of this board to be final and settlement made immediately by the final carrier, if the responsibility is placed on him.

Presentation of this plan will be made to higher authorities, but I am submitting it to you in order to get an expression of opinion from the railroads before taking action. It proposes such a radical change, involving not only the war department, but also the treasury department and all other government agencies, that it may take time to put the plan into operation. But the railroads' approval and acceptance will materially hasten its adoption and will serve to relieve the present congestion of accounts.

The plans proposed by Colonel Downey were discussed and endorsed by the committee. The general scheme is approved. It was, however, pointed out that it would be necessary to work out the details of the plan proposed. The Accounting Committee, U. S. Railroad Administration, will endeavor to do this.

War Revenue Tax

The sub-committee handling this matter, consisting of A. H. Plant, chairman; A. D. McDonald and R. A. White, reported that it is co-operating with the Internal Revenue Department in handling questions arising with respect to the application of the war revenue tax and it has prepared a pamphlet covering all matters relating to the application of the tax.

Compilation of Ton Mile Statistics

The committee considered a letter of August 9, 1917, from G. J. Bunting, comptroller, Chicago, Milwaukee & St. Paul, with respect to carriers discontinuing the compilation of tons one mile in connection with merchandise or l.c.l. shipments. The committee is of the opinion that carriers should continue to compile ton miles.

The report was signed by A. H. Plant, chairman and was accepted by the association.

Committee on Freight Accounts

Interline Waybilling and Percentage Divisions

The special subcommittee to which this subject has been assigned did considerable preliminary work in the way of conferences with traffic officers and traffic organizations, and substantial progress was made looking to the adoption of through rates and simplified division bases.

As a result of the interest taken by members of Director General McAdoo's staff early in the year 1918, the attention of traffic officers and others was directed to the necessity for improvements along these lines, and in many cases the traffic associations were found ready and willing to undertake constructive work.

In view of the promulgation of general order No. 11 by the director general, and the expectation of a further general order providing for simplified divisions, as indicated in paragraph 13, of Order No. 11, it is felt that the subcommittee, for the time being at least, should cease its activities.

Shipping Bill as a Waybill

At its annual meeting held in Chicago, Ill., September 26 and 27, 1917, the Association considered the following letter from A. W. Lishawa, Assistant Auditor Freight and Ticket Accounts, Delaware, Lackawanna & Western Railroad Company, dated June 28, 1917, addressed to President Robinson:

At this period of activity when it is incumbent upon carriers to use every expedient toward greater efficiency in the transportation of freight and at the same time conserve their interests and reduce to a minimum the errors which, it is reasonable to expect, will increase as a result of the necessity of placing inexperienced clerks at stations, I wish to make a suggestion, the adoption of which will eliminate considerable work in waybilling and render the freight less liable to go astray, therefore, recommend the following:

Receiving agents, instead of preparing a waybill, shall use the shipping bill portion of the bill of lading in lieu thereof; this to be effective not only for freight local to the carrier transporting it, but for traffic to immediate connections, the idea being to allow the original document to go through to destination and treat it as a waybill. This would be advantageous in many respects and there will be no occasion for errors caused by transcription of information.

Under present conditions, the shipper prepares the bill of lading in three or more parts, of which he retains two; a third part, containing all the information necessary to move the freight, is given to the agent and is used as a basis for the issuance of the waybill, all the data originally shown on the shipping bill being transcribed thereon. To this operation alone it is safe to say that the majority of errors in waybills are due, especially in misreading the number of articles which in itself results in a large percentage of Overs and Shorts—mistakes in copying the name of consignee (which delays delivery; also, when waybills are prepared by forwarding station, the haste with which they are made, due to the "dups" not being picked up until 4:00 p. m., is the cause of many errors therein—and other irregularities, all of which might be avoided by the use of the shipping bill as the original document.

Your committee considers the proposed plan as practicable by special arrangement with a limited number of shippers that are willing to co-operate with the carriers and have the necessary traffic organizations.

The plan is impracticable, under existing conditions, for general adoption, for the reason that forms in use by many shippers throughout the country are not uniform as to size and arrangement, and such uniformity is not obligatory upon shippers. There would be the further difficulty that carriers could not require shippers to furnish documents suitable for use as waybills.

Government Transportation

At the present time there does not exist any reason for not settling currently in interline accounts, waybills covering property for the government, and it is, therefore, recommended that paragraph 117, 1917 Synopsis, be canceled and that interline waybills covering property for the government be settled currently in the same manner that other interline waybills are settled.

Unit Waybill

The form of waybill prescribed in General Order No. 11, issued by the director general, is recognized as the A. A. R. A. O. standard form of interline waybill in lieu of A. A. R. A. O. forms 101, 101a, and 101b.

Incomplete and Illegible Freight Bills

The National Industrial Traffic League and your association are working together to bring about an improvement in the preparation of freight bills.

It is further suggested that the railroad agents and receiving clerks call attention of shippers, at time of receipt of freight for shipment to any illegibility or defects in shipping orders with a view to proper correction at that time, and that similar co-operation be extended on the part of consignees in drawing attention of railroad agents to illegible or defective freight bills at the time such freight bills are tendered.

The report signed by W. W. Strickland, chairman, was accepted.

Committee on Passenger Accounts

Daily Plan of Interline Ticket Accounting

On account of the duplication of work in handling a multiplicity of items both for the initial and honoring carriers, this association does not recommend the daily plan of interline ticket accounting.

Government Transportation

Resolved, That all tickets issued on government orders be reported to interested carriers with revenue in the current month, such items to be transcribed on separate sheets marked "Government," the total to be included in regular report.

The association's recommendation as contained in paragraph 212, page 93 of the 1917 Passenger Synopsis is hereby rescinded.

Abolition of Prepaid Orders

Resolved, That this association reaffirms its previous recommendation for the absolute abolition of prepaid orders, system, local and interline, both in accepting and placing the orders by telegraph, mail, or sale of such orders or the transmission of cash for any such purpose, and be it

Further Resolved, That the members of this association prevail upon their respective passenger traffic officials to agitate this question in the various associations who have not as yet taken action in line with the foregoing.

The report was signed by L. C. Esschen, chairman, and was accepted by the association.

Committee on Disbursement Accounts

War Taxes Upon Foreign Lines' Freight Charges on Company Material

Resolved, That war taxes, when assumed as such by the carrier, on express charges or on foreign lines' freight charges on company material, also war taxes on parlor car and Pullman fares, telegraph and telephone tolls, club dues, etc., paid by the carrier or by its officers or employees, should be charged to Account 532, "Railway Tax Accruals," except that these taxes, when in connection with Road and Equipment projects, if assignable, should be included in the cost of the property acquired or constructed, and accounted for in accordance with the note under Account 75, "Taxes." And be it

Further Resolved, That the increased cost on account of increase in rates of postage should be charged to the appropriate Stationery and Printing Account.

These resolutions were referred back to the committee.

Other Committee Reports

A very comprehensive report was made by the committee on disbursement accounts, A. P. Di-brow, chairman, on the use of mechanical devices in disbursement accounting. This report was accepted and will be published in full in these columns next week.

The committee on terminal companies' accounts, on accounts with governments, on conference with the Master Car

Builders' Association, and on conference with the Freight Claim Association reported that they had had no matters referred to them and they, therefore, held no meetings. The committee for conference with the American Association of Passenger Traffic Officers, J. C. Briggs, chairman, asked that the subjects of uniform interline tickets, separate ticket coupons required by subsidiary companies, etc., be left with it, and the association, therefore, left these subjects with the committee for further consideration.

Revision of the Constitution

At its annual meeting in Chicago, September 26-27, 1917, the association adopted the following resolution:

Resolved, That the president and the two vice-presidents shall constitute a special committee on the revision of the constitution and by-laws, whose report shall be submitted for action at the next annual meeting of the association.

In order that the association may have before it an explanation of the reasons for some of the more important changes suggested, your committee submits the following explanatory statements:

Change in Name.—The present name of the association is composed of six words and is so long that it is practically never referred to by its full name, either in conversation or in writing. Members generally refer to it as "The Association." Railway periodicals and even some members call it the "Accounting Officers' Association," or some other abbreviated form.

The name suggested is the Railway Accounting Officers' Association.

Membership Qualifications.—Your committee submits a revision of the membership qualifications to the extent of restricting honorary membership, so as to make it truly an honor, and, therefore, difficult to obtain. The experience of the executive committee has demonstrated that this is necessary in order to prevent the honorary membership list growing beyond its bounds and to prevent honorary membership becoming so general as to lose its significance.

Voting.—Your committee submits a suggestion for clarifying the provision under which a vote by roads shall be taken, so that there may be no doubt as to the procedure under such conditions.

Ex-Presidents to be Members of the Executive Committee.—As the executive committee is charged with the duty of supervising and administering the affairs of the association, your committee has suggested a provision in the constitution that the ex-president is to be a member of the executive committee. That is the practice with some railway associations, clubs and other organizations. Your committee has suggested that the number of elective members on the executive committee be reduced to six, three for each year, the ex-president to serve for two years. The executive committee would then consist of: President, first vice-president, second vice-president, two ex-presidents (one to drop off each year and the last retiring president to succeed him), six elected members (three to be elected each year, instead of four as now).

This would have the effect of making the executive committee consist of each existing administration and would constantly give that committee the benefit of the ideas and experience of the two previous presidents, as well as the president, the two vice-presidents, and the six elected members.

A provision has been incorporated in the suggestion of your committee to take care of the situation arising from your members of the executive committee having been elected to serve on it one year beyond the term when this amended constitution would become effective. In order to provide for that condition, it is necessary that in the first year, if this suggestion is adopted, that only one ex-president serve on the ex-

ecutive committee and in the second year after the adoption of this provision and thereafter the full effect of it would be in force.

Change in Committees.—Your committee has offered the suggestion that the word "standing" be eliminated from the title of each committee, for the word is superfluous, as every committee provided in the constitution is inevitably a standing committee.

Your committee has also offered the suggestion that the name "Committee on General Accounts" be used in lieu of "Committee on Corporate, Fiscal, and General Accounts." The words "corporate" and "general" are synonymous, and, of course, all or nearly all railroad accounts are "fiscal."

Believing that the work of the Committee on Accounts with Governments might properly be handled by the Committee on General Accounts, your committee has suggested abolishing the Committee on Accounts with Governments.

Time of Annual Meeting.—The time provided for the annual meeting, the last Wednesday in the specified months, falls in the busiest part of the month for most accounting officers and automatically acts to decrease the attendance at the meeting. Your committee has, therefore, suggested that the association's annual meeting be held on the second Wednesday in the months from April to September.

President's Address

After the reports of the committees had been discussed and accepted, J. A. Taylor, president of the association and controller of the Central of New Jersey, made an address in part as follows:

Such momentous events have come to pass during the year just ended and our minds are so full of them that it is impossible to forego some reference thereto and as particularly affecting the members of this association, I refer to the fact that we are now directly enrolled in the service of the government and it behooves everyone of us to realize and appreciate that fact by standing shoulder to shoulder in support of it and putting aside all selfishness, buckle on the armor of self-sacrifice.

We are working in the office, some because our country requires it, some because age or condition demands it. We are doing hard work, good work, patriotic work, but compared with the lot of our soldiers in France, it's pretty easy for us. They live in the slime of the trenches, prepared to make the supreme sacrifice at any moment and we are slackers and traitors to them if we fail in one iota in our loyalty and our duty to them. We can do very little for them in comparison with what they are doing for us, but we can and must give them our deepest loyalty, not only in thought, but in deed and deny ourselves that they may not suffer.

Election of Officers

R. E. Burger, first vice-president of the association and assistant auditor of the Wabash, was elected president; A. D. McDonald, second vice-president of the association and vice-president of the Southern Pacific, was elected first vice-president, and J. G. Drew, vice-president of the Missouri Pacific, was elected second vice-president. Jerry Welch, assistant general auditor of the Chicago, Milwaukee & St. Paul, J. Leslie, controller of the Canadian Pacific, and H. D. Foster, assistant general auditor of the Chicago, Burlington & Quincy, were elected to succeed the retiring members of the executive committee.

EQUIPMENT EXPORTS from the port of New York during the month of March, 1918, consisted of locomotives valued at \$964,492, freight cars at \$455,360, and steel rails at \$305,198.—*Bulletin of the National City Bank, New York.*

General News Department

The National Safety Council has been restored to the list of associations, to the support of which the Railroad Administration allows railroad companies to contribute and charge the amount to operating expenses.

Moving oil in train loads as practiced in the west has been recommended for adoption on eastern railroads, and the car service section is holding a conference on the subject at Washington this week. E. B. McIntyre, of the western regional directors' staff, and B. L. Swearingen, supervisor of oil traffic at Kansas City, are explaining to eastern men the details of western practices.

The Switchmen's Union of North America, which held its annual convention in St. Louis, Mo., last week, passed a resolution petitioning the director-general to prevent the Brotherhood of Railway Trainmen from renewing percentage contracts with the railroads which guarantee that 85 per cent of railroad employees shall be members of the brotherhood. These contracts, the switchmen declare, operate to the disadvantage of switchmen who are members of their organization.

The Airplane Mail Service

The airplanes carrying mail between New York and Washington appear to have made good records on two of the six days in the third week of their career; or, at least, we find no unfavorable mention in the newspapers except on four days. On Thursday, May 30, there was no start from either end, because of mist. There is not much difficulty in starting in a fog, but there is liable to be great difficulty in selecting a place in which to land. On the 31st, a similar condition was reported, both from New York and Philadelphia. On Saturday, June 1, there was no start from New York, but the plane arrived at New York from Philadelphia on time, in 62 minutes. On Monday, June 3, Lieut. Millar started from New York about noon, but was forced to land at Woodbridge, N. J., near Rahway, because of trouble with his motor. He telephoned at once to New York, and Lieut. Webb, in another machine, went out to take his place. On Monday it was planned to take 200 pounds of letters by airplane from New York to Boston, but mishaps occurred in starting and the trip was given up. Cable despatches of May 27 announced the beginning, on that day, of a regular airplane mail service between Paris and London.

Chicago Railway Supply Companies' Red Cross Fund

The committee organized by the railway supply companies of Chicago to raise contributions to the Red Cross Fund succeeded in raising \$188,864. The committee's quota was only \$175,000, and, under all the conditions, the showing made is very gratifying.

Short Lines

In Atlanta, on May 24, the state railroad commissioners of Georgia, Alabama, North and South Carolina, Tennessee, and other southern states, held a conference on the matter of the status of the short line railroads, and will follow the lead of the Texas commissioners in making representations to Director General McAdoo in behalf of the taking over of all of the short lines.

Railroad Earnings for April

The Interstate Commerce Commission has made public a partial summary of railway returns showing revenues, expenses and income of 149 large roads for the month of April and for the four months ending with April. While the report shows a considerable improvement in April as compared with the preceding three months, the railway operating income for April is about \$2,000,000 less than for April, 1917, or \$65,234,392 as compared

with \$67,521,014. For the four months the report shows operating income of \$132,520,313 as compared with \$230,661,022. Operating revenues in April show an increase of \$45,000,000, but expenses increased \$47,000,000. For the four months the operating revenues were \$93,000,000 greater than in 1917, while the expenses were \$189,000,000 greater.

A Personal Injury Catechism

[Grand Trunk Safety Bulletin No. 15—Melbourne.]

Q.—What kind of a safety record did Grand Trunk men make last year?

A.—There was a decrease of about 22 per cent in the number of employees killed and of about 8 per cent in the number injured in 1917 compared with 1916.

Q.—Are most of the injuries received by employees of a serious or permanent nature?

A.—No. Only a small per cent are serious or permanent; but any case may become serious, especially cuts, open wounds and eye injuries where infection (blood poison) may develop. Every real injury should be given some attention and first aid obtained.

Q.—Why do we have to make reports of every little trivial injury?

A.—For two reasons. The injury itself may possibly develop more seriously than expected, in which case there should be a record; and we want to know how it happened, regardless of how serious was the result.

Q.—Then when you say a certain number of employees were injured during a certain period there is no distinction between the case of a mashed finger and the loss of an arm?

A.—No. And really there is no distinction from a prevention standpoint. What counts is the cause, not the result. It may, and often is, purely a matter of good fortune that a man receives only a mashed finger instead of loss of his limb or his life. For instance, a brakeman went between two moving cars to stop leakage between air hose. He slipped and fell, but fortunately his body was thrown clear of rail and only the ends of his fingers were caught by wheels. Every time a preventable injury occurs, one thing is absolutely certain. *There is something wrong with man, methods or material*; and the first thought in the mind of the foreman, or other person in charge, after the injured has been cared for, is to find out what and where the wrong is and correct it. Fully 80 per cent of all injuries sustained by railroad men can be and should be prevented. Train, yard, engine and trackmen get hurt most frequently, but this does not mean that these branches of the service are naturally of an extra hazardous nature. Hundreds and thousands, in fact a great majority of the total number engaged in train and track service, never get a scratch. But while this service is reasonably safe for the man who complies with the rules, it's mighty unsafe for the chance-taker and rule violator. There are some men who would get hurt if they had a job as floor walker in a department store. The man who has gone between moving cars time and again, when he hears of some other fellow getting killed doing that stunt (and it's a stunt that kills a lot of them every year), should do some mighty serious thinking. He should end up by saying "I'm alive and that lad is dead, not because I deserve to live, but solely because I was lucky." Doing work that way is a gambler's proposition, simply and solely. Guess I'll call it off right here and now. There's many a man in the cemetery or crippled for life who would be alive and able today if he had applied this little homely truth.

The two chief causes of injuries and deaths to train, yard, engine and trackmen are being struck by cars or engines and falling from cars or engines. It's the same on every road. If we could remove these two causes from our casualty lists the statistical report of the Board of Railway Commissioners and of the Interstate Commerce Commission so far as they would apply to these employees would contain no other figures than a railroadman's income tax schedule.

Q.—Is it possible to remove these two chief causes and others of like nature?

A.—Yes, mostly. But it cannot be done by making more rules, adding more safety appliances or changing existing methods of operation. It's purely and simply a man proposition. Nothing else. There were 14 Grand Trunk men killed last year by being struck by trains, cars or engines. Nine of these were struck in broad daylight and clear weather, with nothing whatever to prevent their seeing the engine or car, if they had looked. Three cases occurred during darkness, but with clear weather and only two when it was both dark and stormy or raining. In only one case were other cars or engines operating nearby at the time. One of these men was a fireman who had gotten off his engine and after going a considerable distance turned and stepped directly in front of a passenger train. It was daylight and clear and he had been twice warned to look out for that particular train. Another was a fireman going from roundhouse to office when it was dark and very stormy and was struck by engine backing up. One was a yard foreman struck by his own engine in clear daylight. One was a train baggeman who stepped upon track in front of engine. One was a shopman taking short cut across yard instead of going a few steps out of his way to reach regular pathway. One was a crossing watchman walking along tracks on his way home instead of using the street. In another case a yardman attempted to cross directly in front of an approaching car when it was raining and he slipped on wet rail, fell and was run over. One was a bridge watchman struck by engine on bridge. Four were trackmen at work on tracks and two were brakemen sent out to flag who sat down on track and went to sleep. Both these men had had ample rest before being called out and had been on duty but a short while.

Another thing that does not look right about this business. In six of the fourteen cases, no one on the engine or car saw the man before he was struck or knew that he had been struck, although four of these cases occurred in daylight and only two in stormy or rainy weather. When men are working on track, especially during unfavorable weather conditions, there is a duty on the part of engineers, firemen and men riding cars to look out for them and give ample warning. * * * Five yard foremen and helpers were killed while making coupling between bad order cars, because they failed to notify another crew switching on same track of their position, with result that other crew shoved cars against the cars they were working between.

Of the entire number killed only 6, or about 11 per cent, were killed as a result of any defect in track, structure, tools or appliances.

Operating Revenues and Expenses of

Express Companies for 1917

The Interstate Commerce Commission has issued the following statement, subject to revision, compiled from monthly reports, showing operating revenues and operating expenses of the principal express companies for the calendar year 1917:

| Item. | 1917 | | 1916 | | 1917 | | 1916 | | 1917 | | 1916 | |
|--|-------------------|--------------|----------------------------|-------------|----------------------|--------------|----------------------|-------------|----------------------|---------------|----------------------|---------------|
| | Adams Express Co. | | Great Northern Express Co. | | American Express Co. | | Northern Express Co. | | Canadian Express Co. | | Southern Express Co. | |
| Charges for transportation..... | \$53,730,035 | \$45,893,923 | \$3,808,456 | \$3,622,395 | \$75,920,831 | \$63,413,452 | \$361,043 | \$3,233,148 | \$4,951,768 | \$4,259,011 | \$19,300,341 | \$18,039,247 |

Railroads at Bargain-Counter Prices

Seven railroads in New Brunswick, aggregating in length about 250 miles, are being taken over by the Dominion government, evidently because they are unable to live independently. According to the Toronto Globe, from which we take the statement, these lines "were built when railroads were cheap," which means, perhaps, when investors of the too-hopeful class were having their own way too freely. The seven roads are named below. The date shown is that on which the government takes possession, and the "price" is the sum which has been voted by Parliament. For the two roads against which no date is shown, the negotiations are not yet completed:

| | Length | Price |
|------------------------------------|--------|-----------|
| June 1. Caraquet & Gulf Shore..... | 80 | \$200,000 |
| June 1. Elgin & Havelock..... | 27 | 30,000 |
| June 1. Kent & Northern..... | 27 | 60,000 |
| June 1. Moncton & Buctouche..... | 32 | 70,000 |
| June 1. St. Martins..... | 30 | 75,000 |
| July 1. Salisbury & Albert..... | 45 | 75,000 |
| June 1. York & Carleton..... | 10 | 15,000 |

All of these roads have sufficient vitality to appear in the Official Guide, except the York & Carleton, and all of the time tables show at least one train each way every week day.

Southern Pacific Enginemen's Grievances Settled

A dispute between the Southern Pacific lines in Texas and Louisiana and a joint committee representing the enginemen, firemen and hostlers was settled on May 23 at Houston, Texas, by a board of arbitration representing the railroad, the men and the United States Board of Mediation and Conciliation. The main grievance was the practice of running engine crews off their regularly assigned divisions. The railroad company maintained that it had the right to use crews from one division when needed on another in irregular or emergency service, and while this right had been freely exercised from the earliest operation of the line, it had been done without abuse of the privileges of the men. The award of the arbitration board condemns the practice of running crews off their regularly assigned divisions and specifies that men shall not be so run except in case of undoubted emergency. It further provides that when crews are run off their regularly assigned division, they shall be returned "deadhead" or "light" to their respective divisions, unless there is sufficient traffic to use them in service without necessarily setting back assigned crews of the division.

A number of individual grievances were also settled in the award. In addition, the decision provided that employees who volunteer or are drafted for service in the army or navy will be granted leave of absence for the period of the war, and will retain their seniority rights, provided they return to railway service within a reasonable time after their discharge from military or naval service, and are in physical and mental condition to assume their duties as determined by the re-examination rules of the railroad.

Railway Revenues and Expenses

The Interstate Commerce Commission has issued a summary of railway revenues and expenses for the month of March and three months of the calendar year, covering the returns of 191 roads out of the 196 for which reports are usually issued. Railway operating revenues for March were \$365,347,593, as compared with \$316,614,123 in March, 1917. Expenses were \$282,864,256, or \$54,000,000 greater than for March, 1917, and railway operating income was \$67,351,846, or \$6,000,000 less than for March, 1917. For the three months, railway operating income shows a reduction of \$108,000,000, from \$189,882,892 in March, 1917, to \$81,630,244. Operating revenues were \$939,165,933, an

increase of \$57,000,000; operating expenses were \$813,192,279, an increase of \$162,000,000, and taxes were \$44,175,806, an increase of nearly \$4,000,000. The eastern roads had a deficit of \$4,989,725, while the southern roads had operating income amounting to \$31,124,822, and the western lines had an operating income of \$55,495,147.

The Interstate Commerce Commission has also issued summaries for January, February and March, covering only roads having operating revenues above \$1,000,000 in the year ended December 31, 1917. These tables include 180 Class 1 roads and 16 switching and terminal companies and are reprinted herewith.

Note: There are included in this statement 79 roads in the Eastern District, 35 in the Southern District, and 82 in the Western District—total, 196 roads.

*Debit item.

*Includes freight for 1 road in the Eastern District, 1 in the Southern District, and 1 in the Western District.
 **Includes freight for 1 road in the Eastern District, 1 in the Southern District, and 1 in the Western District.

Safety and Loyalty*

Never in our history was there a greater need for persistent accident prevention work than there is at the present time. A conservative estimate indicates that by the time this war is over the man-power of the world will be decreased 25,000,000 men, a number almost equal to the wage earning population of this country. Even today with our country at war must the cause of safety be upheld and its progress continued. Because lives are

* Extract from an address delivered by Marcus A. Dow, General Safety Agent of the New York Central Lines, at a Safety Rally held in Keith's Theatre, Indianapolis, Ind., on Sunday, May 5.

necessarily sacrificed for a righteous cause on the battle front, other lives must not be unnecessarily sacrificed at home through carelessness and neglect. The killing of 22,000 and the injuring seriously of half a million industrial workers a year in all classes of industry in the United States is a serious drain on the man-power of the nation, at a time when every available man is needed for the work that is to be done. Our duty is clear; we must keep the machines going, keep the railroads and industries up to their highest point of productive efficiency—but we must keep as far as possible from having accidents or anything that will tend to lessen that efficiency.

Safety today involves a bigger thing than only industrial safety.

Excludes figures for Colorado Midland Ry., Missouri Pacific Ry. and St. Louis, Iron Mountain & Southern Ry.

It involves not only the prevention of accidents but also the prevention of an invasion of our fair land by a cruel and destructive enemy. Every American today, to be true and loyal, has got to be a good safety man. He has got to put his shoulder to the wheel and give the best service that it is possible for him to give. He must give a full day's work every working day and should do nothing that will in any degree impair his ability or the ability of others to give that full measure of service. He must perform more work, steeper work, more conscientious work and more willing work than he has ever performed in his life before. For a railroad man to be off work, even temporarily, merely to suit

his own personal ends deprives the country immeasurably of services that are needed, and whether intended or not is an act of disloyalty. Careless, work-shifting, "go-by" different work, "Don't give a rod" sort of work on the part of any man today is disloyalty to the country because it handicaps our boys over there in their effort to win this war. If every American man only realize this and go to his very best day with a clear head, determined to give a hundred per cent service, keep his mind on his job, work continually and yet work carefully, he will do more than all else to back up the splendid boys who are extending the gates of liberty over in France.

SUMMARY OF MONTHLY REPORTS OF MAJOR RAILROADS FOR MARCH, 1918

Wabash Pittsburg Terminal.

Traffic News

Twelve miles an hour for over 35 hours is the speed record said to have been made recently by five loaded motor trucks from Akron, Ohio, westward to Chicago, 440 miles. The trucks arrived at Chicago in the evening, were unloaded and received east-bound loads, and started back the next morning.

The Wabash has discontinued the following trains: No. 6 leaving Chicago for Montpelier, Ohio, at 4:05 p. m., and No. 9 leaving Montpelier for Chicago at 6:30 a. m.; No. 3 leaving Detroit for Chicago at 3:15 p. m.; No. 13 leaving Detroit for Montpelier at 5 p. m., and No. 52 leaving Montpelier for Detroit at 7:45 a. m.

The Department of Agriculture reports that a commercial truck load of eggs was carried recently from Vineland and Millville, N. J., to New York city, about 140 miles, and was delivered with not one egg broken. Delivery from the shipper to the wholesaler was made in 15 hours. The 5-ton truck carried 150 crates of eggs weighing nearly 4 tons.

The North Pacific Coast lines have asked the Interstate Commerce Commission for authority to issue tariffs showing increased terminal charges on export freight. The proposal does not affect shipments (made in due season) for which government licenses have been issued and shipping space engaged, the purpose of the present action being to prevent congestion at the ports by freight for which necessary arrangements have not been made.

The freight traffic committee of the Railroad Administration for the Eastern territory announces that C. C. McCain, 143 Liberty street, New York city, will furnish information concerning through freight rates to and from points on railroads not reaching New York, in this function taking the place of the numerous offices heretofore maintained in New York city by Western and Southern roads. On westbound freight destined for shipment by steamship on the Pacific Ocean, Mr. McCain will issue export bills of lading, in exchange for the domestic bills of lading given by the Eastern railroads when the freight is forwarded.

Round trip passenger rates to the Pacific coast have been announced by the Railroad Administration, typical examples of which are:

| | |
|-----------------------------------|----------|
| New York to San Francisco..... | \$138.24 |
| Boston to San Francisco..... | 143.04 |
| Baltimore to San Francisco..... | 130.74 |
| Washington to San Francisco..... | 130.74 |
| Pittsburgh to San Francisco..... | 115.68 |
| Chicago to San Francisco..... | 87.60 |
| Kansas City to San Francisco..... | 72.60 |

These rates will go into effect on June 15 and the tickets will be good to return until October 31. The rates are about 20 per cent higher than those of last year.

Resolutions of Lumber Manufacturers' Association

The National Lumber Manufacturers' Association at its annual meeting at Chicago on May 21 adopted resolutions concerning minimum weights, weighing rules, and the bulkheading of lumber. The association opposes the plan of bulkheading lumber loaded on open cars, as proposed by a committee of the Master Car Builders' Association but approves the method of loading, as indicated by test car 90114, loaded under the auspices of the M. C. B. committee and the Southern Pine Association. It is believed that this last-mentioned method of loading is adequate to prevent shifting of load by ordinary handling. The association is opposed to the method of varying minimum weights according to the cubical capacity of cars, and favors a minimum of, for example, 34,000 pounds for cars under 36 feet long and 40,000 pounds for cars 36 feet long and over, provided that actual weights shall govern when cars are loaded to their full visible capacity, and that the minima applicable to the size of cars ordered shall be protected in the event cars of larger size are furnished by the carrier. Carriers are urged to accept the principle that lumber does not usually change in weight in transit, and that the initial weight should govern, except where reweighing shows a palpable error. The lumbermen desire that

carriers in Southwestern and Western Trunk Line territory shall become parties to the national code of weighing rules, whereby it becomes incumbent upon them to notify shippers of changes in weights en route.

Time for Paying Freight Bills

A large delegation of commercial traffic managers headed by G. M. Freer, president of the National Industrial Traffic League, protested vigorously to C. A. Prouty, director of the division of public service and accounting, on May 27, against some of the provisions of General Order No. 25, establishing a 48-hour credit basis for the payment of freight charges. They contended that payment within 48 hours would mean duplication of work in connection with the handling of claims for overcharges, and that both shippers and carriers would have to increase their clerical forces to carry out the plan. They suggested a period of one week instead of 48 hours. The principal point made by the shippers was that correct freight bills cannot be rendered within 48 hours, and that sufficient time is not allowed for checking by the shipper. Arrangements were made for further discussion of the subject in a conference of accounting officers and representatives of the shippers.

Coal Production

Production of bituminous coal during the week ended May 25 equalled and even slightly exceeded the record week of May 11, according to the Geological Survey report. The output of soft coal, including lignite and coal made into coke, during the week ended May 25 is estimated at 11,811,000 net tons, an increase of approximately 100,000 net tons over the production of the preceding week. The average production per working day is estimated at 1,968,000 net tons as against 1,952,000 net tons during the week previous and 1,829,000 net tons in May, 1917. Anthracite shipments fell off slightly during the week of May 25, amounting to 40,752 cars, against 41,011 during the week of May 18.

A Coal-Loading Record

A world's record was made, according to a report to Director General McAdoo in loading coal on the steamer "Tuckahoe," which docked at the Baltimore & Ohio Curtis Bay Pier, Baltimore, at 9:15 a. m., May 25, and started loading at 9:15 a. m., finished loading at 11:55 a. m., finished trimming at 12:05 p. m. and sailed at 2:10 p. m., having loaded in 2 hours and 55 minutes 4,992 tons, or 108 cars of bituminous coal for New England ports. The steamer was built by the United States Shipping Board, having been launched in 27 days and started on its cruise in 35 days, another world's record.

Extensive Thefts of Silk

The Silk Association of America has issued a statement in which it is declared that since January 1, 1918, thieves have operated 184 times in the New York and New Jersey districts, stealing parcels or bales of silk worth at least \$1,500,000. The war time price of silk has resulted in the organization of bands of thieves that rob lofts, express company stations and railroad cars night and day. Dealers and burglary insurance companies have been requested to be on the alert for the stolen silk, complete descriptions of which are furnished. The Erie Railroad alone is said to have suffered to the extent of about \$750,000; and other roads report thefts proportionally large. It is believed that much of the stealing is done by railroad employees, yardmen and switching men, who rob cars at night, conceal the loot and then get rid of it through confederates and "fences."

In Paterson one night last week a band of thieves backed a wagon up to a silk warehouse, removed bales of silk containing 14,000 yards, worth \$1 a yard, got away without detection and rushed the goods to a dye house, where they were changing to color from pink to black when discovered.

Every important silk manufacturing concern or dealer in the New York district has suffered heavily. The list of robberies, with details of stolen goods, covers fifteen closely typewritten pages.—*New York Sun.*

Commission and Court News

Personnel of Commissions

William A. Magee, of Pittsburgh, has been appointed a member of the Pennsylvania Public Service Commission.

Court News

Consignors' Liability for Freight Charges

In a suit brought by a railroad against the consignors and the consignee it was shown that 36 carloads of hay were shipped from Newport, Neb., to South Omaha, I. o. b. The hay was delivered to the Union stockyards Company on the consignee's order and without collecting the freight charges. The consignee became insolvent. The Nebraska Supreme Court held that the consignors were liable for the legal freight charges with the consignee.—*Chicago & N. W. v. Queenan* (Neb.), 167 N. W., 410. Decided April 12, 1918.

Overcharges and Undercharges

The federal district court for the Southern District of California holds, citing decisions of the United States Supreme Court and other jurisdictions in regard to other statutes, that under the California Public Utilities Act, if a rate be charged or collected different from the one published in the tariff a refund may be had in the case of an excess, or a recovery of the difference in case of an undercharge. No mistake of fact, or special practice, engagement, or understanding of the parties, will suffice to change this general rule.—*In re Independent Sewer Pipe Co.*, 248 Fed., 547. Decided March 4, 1918.

Rights of Purchaser of Railroad

The Ohio Supreme Court holds that where a railroad company organized under the laws of that state, with authority to exercise the sovereign power of the state, has built and operated as a common carrier a line of railroad, portions of which are along and across public highways or other railroads, the railroad becomes impressed with a public interest. A purchaser of it, either at judicial sale or otherwise, has no right to operate it for his own private purposes or the purposes of those with whom he may privately contract, to the exclusion of the public.—*State v. Black Diamond Co.* (Ohio), 119 N. E., 195. Decided November 13, 1917.

Connecting Railroads—Penalty for Delay

The South Carolina Supreme Court holds that the state statute making connecting carriers agents of each other and liable for damages caused by delays occurring on connecting lines with a right of action against the carrier at fault does not render a railroad liable under a statute penalizing delays where the delay occurred on the line of a connecting carrier. It would not be a reasonable construction to hold that the carrier which was not in default could be held responsible for loss, damage and injury to the property which it could recover and also for a penalty which it could not recover.—*Marion Cotton Oil Co. v. Atlantic Coast Line* (S. Car.), 95 S. E., 536. Decided March 8, 1918.

Webb-Kenyon Act in Oklahoma

The Oklahoma Constitution and Laws forbid the manufacture and sale of intoxicating liquors in that state. The Circuit Court of Appeals, Eighth Circuit, holds that as the purpose of the Webb-Kenyon Act was to remove from the protection of interstate commerce all shipments of liquor into those states, territories, or districts where the manufacture or sale thereof is unlawful, and to render the state law applicable, the interstate shipment of intoxicating liquor into the state of Oklahoma is unlawful, and a common carrier cannot be enjoined from refusing to receive such shipments. Interstate shipments of intoxicating liquor into por-

tions of Oklahoma which formerly were comprised in an Indian reservation are not authorized because the Indian titles have been extinguished.—*Missouri, K. & T. v. Danciger*, 248 Fed., 36. Decided December 27, 1917.

Res Ipsa Loquitur

The doctrine of *res ipsa loquitur* means that the circumstances connected with an accident are of such an unusual character as to justify, in the absence of other evidence, the inference that the accident was due to negligence. A locomotive boiler explosion was caused either by the engineer's negligence in admitting cold water into the boiler or the railroad's failure to repair the locomotive. In an action by the engineer for injuries caused by the explosion, the New York Court of Appeals holds that the plaintiff had the burden of proving that the accident was due solely to the second cause, and the rule of *res ipsa loquitur* did not shift that burden. *Francy v. Rutland* (N. Y.), 119 N. E., 82. Decided February 12, 1918.

Passenger on Shipper's Pass—Contributory Negligence

One who was traveling on a shipper's pass accompanying stock being carried to market got off the caboose at a station where the train was stopping, and while waiting at the station was ordered or directed by the station agent and a brakeman to take a key and deliver it to a trainman at the cattle pens and to ride back on that part of the train. He voluntarily obeyed the order or direction, and while getting upon the side of a car to ride back was caught between the side of the car and the cattle chute and received injuries from which he died. The Kansas Supreme Court holds that as he voluntarily placed himself in a position of obvious danger and was not engaged in looking after or caring for the stock in his charge, the railroad was not liable in an action to recover for his death.—*Shore v. Atchison, T. & S. F.* (Kan.), 171 Pac. 612. Decided March 9, 1918.

Notice of Arrival of Shipment

One who delivers property to a carrier consigned to himself at a place where he does not reside and has no representative or place of business, is bound to put himself in a position to receive notice, and, failing to do so, cannot be heard to complain that notice was not given. A consignor in Monte, Wash., shipped a carload of apples to himself at Crosby, N. D., with directions to stop for partial unloading at Kenmare, N. D. The party with whom the consignor had made arrangements to care for the apples at Kenmare knew of their arrival and found them in good condition when he made inspection. The Washington Supreme Court, in an action for damages alleging failure to properly care for the shipment, holds that, as the party at Kenmare was the consignor's agent for purposes of receiving notice, the railroad's failure to notify the consignor of the arrival of the shipment at Kenmare would impose no liability, notice to the consignor being unnecessary. The railroad's duty thereafter was that of a warehouseman.—*Rosenbaum v. Northern Pacific* (Wash.), 172 Pac., 238. Decided April 18, 1918.

Discrimination as to Switching Charges

The Illinois Supreme Court holds that it is a discrimination against shippers, within the prohibition of the State Public Utilities Act, for a railroad having the line haul to absorb the switching charges of cars delivered to it by certain roads, while refusing to absorb those on cars delivered by other roads, the only difference in the situation being that some of the roads are steam and the others electric. As the shipper, and not the connecting carrier, is the one affected, this is not a matter for contract between the roads.—*Commission v. Illinois Central* (Ill.), 119 N. E., 294. Decided April 17, 1918.

Section 52 of the Illinois Public Utilities Act provides that the Public Utilities Commission shall have power to enforce reasonable regulations for the weighing of cars and freight. The Illinois Supreme Court holds that this provision is inconsistent with, and therefore impliedly has repealed the prior state statute requiring railroad companies to install track scales on demand of shippers at stations from which a required amount of grain is shipped.—*Commission v. Cleveland, C. C. & St. L.* (Ill.), 119 N. E., 310. Decided April 17, 1918.

Equipment and Supplies

Government Cars and Locomotives

The central purchasing committee of the Railroad Administration is still meeting representatives of the specialty manufacturers and is distributing the orders for the equipment of the cars and locomotives ordered by the government. Most of the contracts have been decided upon in the case of the locomotives and the committee is working this week on the car specialties and some of those for the locomotives which have not yet been settled. It is expected that all of the orders will have been placed by the end of this week.

It is reported that orders for 392,000 axles for the cars have been awarded as follows: 95,000 to the Carnegie Steel Company, 84,000 to the Illinois Steel Company, 149,000 to the Pollak Steel Company, 16,000 to the Laclede Steel Company, 18,000 to the Pittsburgh Forge & Iron Company and 30,000 to the Midvale Steel Company.

Contracts for the draft gear for the 100,000 cars have also been distributed as follows: Sessions, 50,000; Westinghouse, 20,000; Cardwell, 15,000; Miner, 10,000; and Murray, 5,000.

Freight Cars

A. J. OLIVER, Houston, Tex., is inquiring for tank cars.

THE UNITED STATES WAR DEPARTMENT is inquiring for 100 40-ton tank cars.

THE INDUSTRIAL MANUFACTURING COMPANY, New Orleans, La., wants to rent three to six tank cars.

THE OKLAHOMA PETROLEUM & GASOLINE COMPANY, Tulsa, Okla., is inquiring for 100 to 200 10,000-gal. tank cars.

Miscellaneous

FOREIGN TRADE OPPORTUNITIES.—Commerce Reports for May 31 contains the two following foreign trade opportunities. Information concerning them may be obtained from the office of the Bureau of Foreign and Domestic Commerce at Washington or from any of its district and co-operative offices.

27012.—A railway company in Spain desires to purchase 2,000 tons of steel railroad rails about 10 meters in length, weighing from 20 to 30 kilos per meter, and profile of section to follow as closely as possible to that shown in drawing, which may be examined at the Bureau or its district offices. (Refer to file No. 100525.) It also wishes to purchase all secondary material, such as plates, spikes, etc. Quotations may be made f. o. b. New York. Payment will be made by cash against documents or to suit seller. Correspondence should be in Spanish. Reference.

27016.—A French firm in England wishes to purchase locomotives, trucks, carriages, wagons, etc., for railways, new or second-hand. Is also open to any agency proposition. Reference.

Signaling

THE RICHMOND, FREDERICKSBURG & POTOMAC has placed an order with the Union Signal Construction Co. for the complete installation of an electro-pneumatic interlocking at Acca Wye, Richmond, Va.; a 57-lever machine including 6 spare spaces. The switches will be operated by Model 14 electro-pneumatic movements, equipped with Style "C" switch valves. A. C. track circuits will be provided throughout. The material is being furnished by the Union Switch & Signal Company.

THE NEW YORK, NEW HAVEN & HARTFORD has ordered from the Union Switch & Signal Company the material for an electro-pneumatic push button machine for the operation of the switches and signals at the new Cedar Hill Classification yard, New Haven, Conn. The machine has 42 units for switch operation, 2 for signal operation and 4 spare spaces. The switches will be operated by direct acting electro-pneumatic switch movements with direct current track circuits provided for detector locking.

Supply Trade News

The United States Metallic Packing Company, Philadelphia, has moved its offices in that city to 221 North Thirteenth street.

Lloyd H. Atkinson has resigned his position as president of Atkinson & Utech, Inc., to become vice-president of the Air Reduction Company. He will, however, continue to serve on the board of directors of Atkinson & Utech, Inc. John J. Utech has been elected president to succeed Mr. Atkinson, and I. W. Glasel has become secretary and treasurer of the same company.

Joseph W. Weinland, sales manager of the brake beam department in the Chicago office of the American Steel Foundries, has been appointed district manager of the

Liberty Steel Products Company, with headquarters at Chicago. Mr. Weinland was born at Chatsworth, Ill., on December 13, 1877. In 1902, he entered the service of the Western Steel Car & Foundry Company, as assistant purchasing agent. A considerable part of his time was spent on the Pacific coast, purchasing lumber to be used in the building of cars. Later he was promoted to purchasing agent of the Anniston, Ala., shop. For a period of five years following 1907, he was engaged in the construction and sale of 50 houses at Burnham, Ill. In 1912 he re-entered the railway supply field with the American Steel Foundries as sales manager in the brake beam department, which position he held until his recent appointment, as mentioned above.

Charles A. McCune, for 12 years connected with the Commercial Acetylene Company of 80 Broadway, New York, has resigned to accept the position of sales engineer with the Page Steel & Wire Company, 30 Church street, New York. Mr. McCune was born in Jersey City, N. J., in 1879, and before entering the acetylene field was for several years connected with the Safety Car Heating & Lighting Company. He left in 1906 to take up the duties of assistant engineer with the Commercial Acetylene Company and since then has been actively engaged in this industry, his work in the greater part being devoted to the development and application of dissolved or compressed acetylene. In 1908, he perfected the first successful inverted acetylene burner and mantle for railroad car lighting purposes; this system being partly used on the Delaware, Lackawanna & Western until a few years ago, when the road practically went over to electric lighting. In 1916, Mr. McCune became chief engineer of the Commercial Acetylene Company. Mr. McCune will

J. W. Weinland

C. A. McCune

he succeeded by David Ahldrin, who was formerly connected with the A-G-A Company and also the Commercial Acetylene Company.

Walter J. Cummings, vice president of the McGuire Cummings Manufacturing Company, Chicago, has been elected president, succeeding John J. Cummings, deceased.

The Parkesburg Iron Company announces the following changes among its resident sales managers, effective June 1, 1918: R. J. Sheridan, New York and G. W. Denysen, Boston, after July 1, 1918; J. A. Kirkhead, San Francisco. The other selling representatives remain the same as at present.

Frank Lucas DeArmond, who for a number of years has been an officer of the Protectus Paint Company, Philadelphia, has severed his connection with that company for the duration of the war, having been appointed a captain in the quartermaster's corps, construction division.

The Dayton Manufacturing Company, Dayton, Ohio, announces the election of the following officers at its recent annual meeting: J. Kirby, Jr., president and general manager; N. Emmons, Jr., vice-president and assistant general manager; J. Leidenger, second vice-president, and H. D. Hendrick, secretary and treasurer.

The election of Stephen C. Mason, secretary of the McConway & Torley Company of Pittsburgh, as president of the National Association of Manufacturers, announced in last week's issue, is of more than ordinary interest to the railway and railway supply field, because Mr. Mason's entire business career has been confined to some branch of railroad work. He began on November 10, 1880, as a station agent in his home town, Lyndonville, Vt. As soon as he took up the work he learned telegraph operating, and before he was 20 years old was called to the headquarters of the Connecticut & Passumpsic Railroad, and made local freight agent at the headquarters of the division. After a few months' service there he was taken into the superintendent's office and made his private secretary. After the creation of the Interstate Commerce Commission, Mr. Mason applied for and secured a position with that body in Washington first in the office of the auditor of the commission, where he had charge of the tariffs filed by the railroad companies. Upon the creation of the division of statistics, of which Professor Henry C. Adams was the head, Mr. Mason was placed in that department, and remained there until 1896, when he occupied the position of assistant statistician. At that time he was offered a position with the McConway & Torley Company of Pittsburgh, which he accepted in January, 1896, and in whose service he has been continuously ever since. He has served in various capacities. His first experience was gained as a traveling representative, after which he acted as assistant to the superintendent of the plant, thus gaining a practical experience in the manufacturing operations. Later he was designated assistant to the president, in office which he held until the death of Charles B. Krauth, when he was elected secretary of the company, and some two or three years later made a member of the board of directors.

S. C. Mason

Alfred R. Miller, treasurer of the Canadian Westinghouse Company, Hamilton, Canada, died at his home in that city, April 28. His whole business life was devoted to the interests of the Westinghouse Company. He entered their service as bill clerk in 1897, was promoted consecutively to head bookkeeper in 1903, acting assistant treasurer in 1904, assistant treasurer in 1907, and the treasurer in 1917.

Alb-Ch In.crs Manufacturing Company

The net income of the Alb-Ch In.crs Manufacturing Company, Milwaukee, Wis., for the year 1917 was \$4,010,490.51, compared with \$3,167,020.21 for the calendar year 1916. The comparative earnings by quarters for the last two years are as follows:

| | 1917 | 1916 | 1915 |
|----------------|----------------|----------------|----------------|
| First quarter | \$1,014,154.44 | \$744,666.67 | \$1,014,154.44 |
| Second quarter | \$1,014,154.44 | \$744,666.67 | \$1,014,154.44 |
| Third quarter | \$1,014,154.44 | \$744,666.67 | \$1,014,154.44 |
| Fourth quarter | \$1,014,154.44 | \$744,666.67 | \$1,014,154.44 |
| Total | \$4,010,490.51 | \$3,167,020.21 | \$4,010,490.51 |

The large volume of business now on order, the company's annual report states, insures the utilization of stocks of materials at present on hand. The company has continued to establish liberal reserves to cover the contingencies of operation. The larger production requiring more intensive operation, and the bringing into service of machines and equipment unused for some time together with expenditures designed to increase efficiency in manufacture, have resulted in increased expenditures for maintenance and larger reserves for depreciation. The amount expended during the year for maintenance, renewals and general upkeep of plant and equipment was \$1,889,603, all of which amount has been charged to the cost of manufacture. In addition to this sum there has been set aside for depreciation of plant and machinery and charged to cost of manufacture a total amount of \$841,908.

Reserves have been set aside before the determination of profits, which it is estimated will meet all requirements for taxes. Development expenditures for drawings, patterns, tools and experiments designed to improve and broaden the present lines of manufacture and to provide for new lines have aggregated \$251,257. These expenditures have been charged to the cost of manufacture.

In 1917 four dividends of 2 1/2 per cent each were declared on the preferred stock; this is a total of 10 per cent for the year, of which 7 per cent was for regular dividends and 3 per cent was to apply on account of accumulated dividends. After these payments there remained 7 per cent in arrears on accumulated dividends on the preferred stock. The book surplus at the close of the year 1917, after deducting dividends paid and declared, was \$5,463,604.

To provide for the delivery of the largely increased volume of business, it has been necessary to expend larger amounts than usual for plant improvements. These expenditures, aggregating \$1,187,500 consisted principally of additions to equipment and extensions to plant buildings. A large portion of the additional equipment was built in the company's shops, and the extensions to plant have been along lines contemplated in the original plans.

The net working capital of the company as on December 31, 1917, comprising cash, receivables, marketable securities, and current inventories, less accounts payable, payroll, dividends and taxes accrued and other current obligations, amounted to \$16,431,546, as compared with \$13,831,163 on December 31, 1916, an increase of \$2,600,383 for the year. While offering our services and available equipment to the government, and co-operating in every way possible in the government's program connected with the successful prosecution of the war, the company has accumulated its regular customers and continued to extend its regular lines of manufacture to the fullest extent possible under the present status. The volume of business on hand on December 31, 1917 was \$27,087,251, an amount substantially in excess of the made orders on hand at any time in the previous history of the company.

| Income Statement | | Balance Sheet | |
|------------------|----------------|---------------|-----------------|
| Sales (Income) | \$4,010,490.51 | Assets | \$16,431,546.00 |
| Cost of Sales | (1,889,603.00) | Liabilities | \$13,831,163.00 |
| Profit | \$2,120,887.51 | | |
| Other Income | \$251,257.00 | | |
| Total Income | \$2,372,144.51 | | |
| Expenses | (1,531,654.00) | | |
| Net Profit | \$840,490.51 | | |

Financial and Construction

Railway Financial News

ALABAMA, TENNESSEE & NORTHERN.—The United States District Court at Mobile, Ala., on May 20 issued a decree of sale of this road which has been in the hands of receivers since November 22, 1915.

CANADIAN NORTHERN.—The Board of Arbitration appointed to fix a value for the \$60,000,000 capital stock of this company, not previously owned by the Dominion Government, and now acquired or authorized to be acquired by it, gave out its decision May 26. On the basis that the depreciated value of assets exceeds the liabilities by not less than \$25,000,000 (contrasting with the company's figures of \$85,000,000 and the government counsel's \$22,000,000), and having given consideration also to the prospective earning capacity of the system, the arbitrators conclude that the \$60,000,000 stock October 1, 1917, was worth \$10,800,000. The Act of Parliament, however, limits the award to not exceeding \$10,000,000.

CHICAGO, MILWAUKEE & ST. PAUL.—The directors met on May 29, but again took no action on the dividends which were due March 1. This is the fifth successive monthly meeting which has occurred without any decision on the semi-annual dividends due last March. Failure of the directors to take action on either the preferred or common dividends which would normally have been declared in January, combined with the facts that the company's articles of association prohibit payments of dividends for any period during which they were not earned and that the St. Paul's profits last year were equivalent to only \$3.85 a share on the preferred stock, or little more than enough to meet the semi-annual payment made last September, make it seem probable that no further dividend on either stock can be declared out of 1917 earnings. This does not, however, mean that, with the conclusion of the contract with the Government, now under negotiation, regular dividend on the preferred, at any rate, may not be paid in future. The next meeting of the board will be held on June 27 when it is expected that some action will be taken on the dividend question provided the contract with the government is signed in sufficient time.

NATIONAL RAILWAYS OF MEXICO.—Rafael Nieto and Mario Mendez have been appointed chairman and vice-chairman, respectively, of the board of directors. Mr. Nieto will act as executive president of the company succeeding Alberto J. Pani, resigned.

NEW YORK, NEW HAVEN & HARTFORD.—See editorial comments elsewhere in this issue.

Railway Construction

CANADIAN GOVERNMENT RAILWAYS.—Plans are being made to carry out work on the western lines during the next year as follows: District No. 2, double 16-ft. reinforced concrete culvert and fill to replace pile trestle at O'Brien, Superior district, mile 30.2, to cost about \$45,000; district No. 3, main line, 8-ft. by 10-ft., stream tunnel and fill to replace timber trestle at Winnipeg, Superior district, mile 47.1, to cost about \$60,000; district No. 3, 50-ft. deck plate girder and fill to replace timber bents, Grand Trunk Pacific branch, Fort William, Superior district, mile 27.7, to cost about \$22,500, and 10-ft. by 10-ft. stream tunnel and fill to replace timber bents at Fort William, Superior district, mile 41.3, to cost about \$59,000; double 16-ft. reinforced concrete culvert and fill to replace timber bents at Raith, Superior district, mile 118.1, to cost about \$52,500, and 10-ft. by 10-ft. stream tunnel and fill to replace timber bents at Raith, Superior district, mile 124.4, to cost about \$30,000.

CLOCKS IN RUSSIA ADVANCED TWO HOURS.—Beginning May 31, clocks throughout Russia were advanced two hours in order to save light and fuel.

Railway Officers

Executive, Financial, Legal and Accounting

Bond Anderson, freight claim agent of the Southern Railway, with office at Atlanta, Ga., has been appointed assistant comptroller, with office at Cincinnati, Ohio, vice **E. Miller**, resigned.

William Kissam Vanderbilt, Jr., vice president of the New York Central Lines, with headquarters at New York, has been elected president, to succeed **A. H. Smith**, who has

W. K. Vanderbilt, Jr.

resigned because of his position as regional director. Mr. Vanderbilt was born on October 26, 1878, at New York, and was educated at Berkeley, St. Mark's and Harvard College. He began railway work in December, 1903, with the New York Central & Hudson River under vice-president **W. J. Wilgus**. Upon the acquisition by the New York Central of the majority ownership of certain trolley lines of the Mohawk Valley Company, in 1905, he was made vice-president of the Mohawk Valley Company and other subsidiary trolley lines. In July, 1910, he was appointed assistant to the president of the New York Central & Hudson River, and on March 7, 1912, was elected vice-president of the New York Central Lines. In January, 1914, he was made a member of the finance committee.

Charles Augustus Peabody, president of the Mutual Life Insurance Company of New York, has been elected president of the Illinois Central to succeed **C. H. Markham**, who has resigned because of his position as regional director. Mr. Peabody does not pretend to have any special knowledge of railway operation and has taken the office temporarily to look after the corporate interests and tide over the present period of transition. Mr. Peabody was born on April 11, 1849, at New York, and is a graduate of Columbia University. He is also a vice-president and a member of the board of managers of the Delaware & Hudson; a director of the Illinois Central, the Union Pacific, the New York & Harlem, the Baltimore & Ohio, and Wells Fargo & Co.

C. A. Peabody

Operating

W. P. Lamb, chief clerk in the Chicago office of **A. H. Smith**, president of the New York Central, has been promoted to assistant superintendent of the western division, with headquarters at Chicago, succeeding **E. W. Brown**, effective May 15.

J. R. Banks has been appointed trammaster of the Coal & Coke, with office at Charleston, W. Va., vice R. E. Samples, resigned.

A. E. Pistole, trammaster on the Texas & Pacific at Marshall, Tex., has been promoted to superintendent of the Rio Grande division, with headquarters at Big Springs, Tex., succeeding W. M. Kent, transferred to Ft. Worth, Tex., in place of W. H. DeFrance, transferred, effective June 1.

Earl W. Brown, assistant superintendent of the western division of the New York Central, with headquarters at Chicago, whose promotion to superintendent at Alliance, Ohio, was announced in the *Railway Age* on May 31, was born on April 7, 1871. He began his railway career on June 5, 1887, as a track laborer on the Lake Shore & Michigan Southern, following which he was freight brakeman, car tracer and clerk in the trainmaster's office. On November 15, 1902, he was appointed yardmaster, and subsequently became assistant trainmaster and trainmaster. On December 15, 1913, he was appointed assistant superintendent of the western division of the New York Central lines at Chicago, which position he held until his recent promotion, as mentioned above.

Edward Clemens, chief clerk to general manager of the Terminal Railroad Association of St. Louis, has been promoted to superintendent of car service, succeeding W. T. Aylesbury, assigned to other duties. Mr. Clemens was born in St. Louis County, Mo., in 1884, and began his railroad career as a messenger in the freight department of the Terminal Railroad Association of St. Louis, 17 years ago. He was chief clerk in the traffic department of that road for a number of years, and from that position was advanced three years ago to chief clerk to the general manager. Mr. Clemens' promotion to superintendent of car service of the Terminal Railroad Association of St. Louis was effective on May 22.

E. Clemens

J. E. Snedeker has been appointed superintendent of the Wichita division of the Missouri Pacific, with headquarters at Wichita, Kan., and M. McKernan, acting superintendent at that point, has been appointed superintendent of the southern Kansas division, with headquarters at Coffeyville, Kan., succeeding R. G. Carden, effective June 1.

Pocahontas Region

In Circular No. 1, issued under date of June 1, N. D. Maher, regional director of the Pocahontas Region, announces the appointment of three federal managers, covering the roads included in the Pocahontas Region, as follows:

George W. Stevens, president of the Chesapeake & Ohio, as federal manager of the Chesapeake & Ohio east of Louisville, Ky., Columbus and Cincinnati, Ohio, including the Chesapeake & Ohio Northern, with office at Richmond, Va.

A. C. Needles, vice-president of the Norfolk & Western, as federal manager of the Norfolk & Western, including the Virginia & Carolina Railway and the New River, Holston & Western, with office at Roanoke, Va.

J. H. Young, president of the Norfolk Southern, as federal manager of the Virginian Railway, with office at Norfolk, Va.

Until further notice, the terminals of all railroads at Norfolk and Portsmouth and the Norfolk & Portsmouth Belt Line Railway will be under the jurisdiction of the federal manager of the Norfolk & Western. Terminals at Newport News will be in charge of the federal manager of the Chesapeake & Ohio.

In Circular No. 2, Mr. Maher also announces the following appointments:

T. S. Davant, vice president of the Norfolk & Western, as the traffic assistant of the regional director, and of D. E. Spangler, general superintendent of transportation of the Norfolk & Western as transportation assistant to the regional director. Both will have offices at Roanoke, Va.

Traffic

J. H. Mara has been appointed industrial commissioner of the Missouri Pacific, with headquarters at St. Louis, effective June 1, succeeding D. E. King, deceased.

W. P. Behen, general agent of the Cincinnati, Indianapolis & Western, at Chicago, has left the service of that company to go with the Liberty Steel Products Company, as sales agent, with headquarters at Chicago.

Following the elimination of certain passenger and freight traffic positions recently by the Railroad Administration, the Chicago & Alton has made the following appointments, effective May 28: Barth Reidy, general agent at Indianapolis, Ind., has been appointed district traffic agent, at Kansas City, Mo.; James Mann, district freight agent, at Springfield, Ill., has been appointed district traffic agent, at Springfield; S. B. Wade, general agent, at Little Rock, Ark. has been appointed district traffic agent, at Bloomington, Ill.; C. E. Norris, division freight and passenger agent, at Mexico, Mo., has been appointed district traffic agent at Mexico; E. C. Meyer, general agent, at Milwaukee, Wis., has been appointed district traffic agent at Chicago. Will G. Howard, general agent, at Pittsburgh, Pa., has left the service.

Engineering and Rolling Stock

John Vass, road foreman of engines of the Grand Trunk, at Battle Creek, Mich., has been appointed assistant master mechanic of the Ontario lines, with headquarters at Allandale, Ont., in place of J. R. Donnelly, retired.

E. W. Smith, who has been appointed superintendent of motive power of the Central division, of the Pennsylvania Railroad, with office at Williamsport, Pa., as has already been announced in these columns, was born at Charlesburg, W. Va., on September 21, 1885. He is a graduate of the Virginia Polytechnic Institute, and he entered the service of the Pennsylvania Railroad on August 1, 1906, as a special apprentice. On July 26, 1909, he was made motive power inspector, was advanced to motive power foreman on September 1, 1912, and on October 15, 1913, he was appointed assistant master mechanic at the Altoona machine shops. On July 1, 1916, he was advanced to assistant

E. W. Smith

engineer of motive power in the office of the general superintendent of motive power at Altoona, and on October 10, 1917, he received his appointment as master mechanic of the Philadelphia division, with office at Harrisburg, which position he held at the time of his recent appointment as superintendent of motive power of the same road as above noted.

Railway Officers in Government Service

P. E. Hennessey has been appointed joint livestock agent at the National Stock Yards district, East St. Louis, Ill.

George R. Loyall, assistant vice president of the Southern Railway, has been appointed assistant to B. L. Winchell, Regional Director of the Southern district, with office at Atlanta, Ga.

Thomas L. Lipsett, district passenger agent of the Pennsylvania Railroad, with office at Washington, D. C., has been appointed by the Railroad Administration as district passenger agent representing the Washington terminal lines, with office at Washington.

George Hodges, who has been appointed manager of the troop movement section of the division of transportation of the Railroad Administration, with office at Washington, D. C., was graduated from St. Paul's School at Concord, N. H., and entered railway service in 1886 with the Erie. He remained with that road until 1903 when he entered the service of the Baltimore & Ohio. In 1908 he was appointed assistant agent for the receivers of the Seaboard Air Line. At the expiration of the receivership in 1910, he took up the work of the Special Committee on Relations of Railway Operation to Legislation, which was then under the chairmanship of the late F. O. Melcher, vice-president of the Chicago, Rock Island & Pacific, and in 1912 he became secretary and treasurer of that committee, and also assistant general agent of the American Railway Association, with headquarters in Chicago. In April, 1916, he was elected chairman of the Committee on Relations between Railroads, of the American Railway Association, and in this position he was also chairman of the Per Diem Rules Arbitration Committee, and chairman of the American Railway Association Committee on Weighing and on the Marking, Packing and Handling of Freight.

R. Walton Moore, of Washington, D. C., and Fairfax, Va., who for many years has been special counsel for most of the southern railway and steamship companies as their representative in matters before the Interstate Commerce Commission and in litigation growing out of commission proceedings, has been appointed assistant general counsel of the United States Railroad Administration in charge of affairs before the commission. Mr. Moore was born in Fairfax, Va., and graduated from the Episcopal High School of Alexandria, Va., and from the University of Virginia. He began the practice of law at Fairfax and is still nominally member of a firm in Fairfax which has a large practice. He has been one of the leading lawyers of Virginia, and had represented various steam and electric railways in northern Virginia in connection with his general practice, when in October, 1907, he was appointed assistant special counsel for the southern railway and steamship lines as assistant to Judge Edmund Baxter of Nashville. Six years ago, on the death of Judge Baxter, he was appointed special counsel, and his firm has been one of the most prominent in this class of work. Mr. Moore for a time was a member of the state senate of Virginia; was a presidential elector on one occasion, and was chairman of the legislative

George Hodges

R. W. Moore

committee of the state constitutional convention, which framed the constitution of Virginia in 1902. He served for several years as a member of the Board of Visitors of the University of Virginia, and of William & Mary College, and was for a time president of the Virginia State Bar Association.

G. H. Parker, assistant comptroller of the Philadelphia & Reading Railway, has been appointed assistant to **Walker D. Hines**, assistant director general of railroads, with office at Washington, D. C.

H. B. MacFarland, engineer of tests of the Atchison, Topeka & Santa, at Chicago, and **G. M. Davidson**, chemist and engineer of tests of the Chicago & North Western, at Chicago, have been appointed members of the inspection and test section of the United States Railroad Administration for the western railroad region. Mr. MacFarland has also been assigned to one of the 18 districts which have been created for the inspection and testing of materials which will be used in the construction of the car and locomotive equipment recently ordered by the Government. His district will comprise southern Ohio and the territory tributary to St. Louis. **F. Zeleny**, engineer of tests of the Chicago, Burlington & Quincy, has also been assigned to this work for the district comprising Chicago and surrounding territory.

Obituary

Charles E. Benton, formerly general attorney for the Missouri Pacific, at Ft. Scott, Kan., died at his home in Los Angeles, Cal., on February 23. Mr. Benton was born at Astoria, Ill., on December 12, 1857. After graduating from the high school at Lewiston, Ill., he studied law and later was admitted to the bar, after which he went to Iola, Kan., where he engaged in the general practice of law. There he served two years as county attorney. In 1884, he was appointed assistant attorney of the Missouri Pacific for southern Kansas, and in 1890 was transferred to Ft. Scott, Kan. He was later appointed general attorney, to succeed **J. H. Richards**, and served in that capacity until January 1, 1914, when he resigned on account of failing health. Since that time he resided at Los Angeles, Cal.

Col. Joseph Harvey Richards, formerly general attorney of the Missouri Pacific, at Ft. Scott, Kan., died in that city on April 17. Colonel Richards was born at Spencer, Kan., on April 7, 1844. He received his education at Wabash College and read law with Gen. Lew Wallace. In the early eighties Colonel Richards was appointed general attorney for the Missouri Pacific at Ft. Scott. He served that company in this capacity for a period of 26 years, and during that time he was also receiver of the St. Louis, Ft. Scott & Wichita, and directed the construction of the lines between Wichita, Kan., and Hutchinson, and between Eldorado, Kan., and McPherson. In addition, he was president of the construction company which built the Missouri Pacific branches from Ft. Scott to Rich Hill, Mo., and from Ft. Scott to Pittsburg, Kan. Several years ago Colonel Richards was forced to retire on account of failing health, and at that time was succeeded by Charles E. Benton, whose death is also announced in this issue.

OPERATION OF ALGERIAN RAILROADS.—Algeria has a total of 2,320 miles of railroad, of which 1,513 are State owned and 807 miles privately owned. The former are not only owned, but are operated and maintained by the Government and the profits are turned into the national treasury. With regard to the private lines, the Government guarantees the interest charges and controls the traffic. The total receipts of the State lines in 1916 amounted to \$6,228,755 and of the private lines \$5,302,557.—*Commerce Reports.*

TRAFFIC ON NEW ZEALAND RAILROADS IN 1917.—The New Zealand railways for 1917 carried 14,173,115 passengers, as compared with 14,201,506 for 1916, of whom 355,832 passengers traveled on season tickets, as compared with 330,622 for 1916. During the year there were 6,239,172 tons of freight carried, as compared with 6,370,946 tons for 1916. This was accomplished notwithstanding the considerable reduction in the number of trains run and the increased passenger and freight rates.—*Commerce Reports.*

The report of the standing committee on disbursement accounts of the Association of American Railway Accounting

Mechanical Office Devices

Officers, which is published in part elsewhere in this issue, is the most comprehensive discussion of the use of mechanical devices in disbursement accounting that has ever been put on record so far as we know. There were two other reports, one on the use of mechanical devices in passenger accounting and one on the use of mechanical devices in freight accounting, both of which are worthy of careful study, but are not printed in our report of the meeting because of a lack of space and of a certain amount of overlapping. A. P. Dishrow, auditor of disbursements of the Erie, is chairman of the committee on disbursement accounts; and the Erie has been one of the most progressive of the larger roads in adopting and adapting mechanical devices to audit office work. The committee has had, because of war conditions, an unusual opportunity to study the results of substituting girls and labor-saving devices for expert men. The report is, therefore, timely and might well be studied by executive officers as well as by accounting officers.

Under this caption, Collier's Weekly published in its issue for June 8 the following editorial:

"Our Railways Are Good— Why?"

"Those who know often speak of our American railways as the best on earth. The underlying reason is fairly well shown in one recent issue of the 'Railway Age.' In glancing it over we noticed a summary of a 200-page report by a special committee organized over five years ago to investigate the stresses in railway tracks. They made over 250,000 observations on rail strains alone, and the work is continuing. In time we are going to know how a railway track ought to be built and why, instead of leaving the roadbed largely to the professional instinct of the section boss and his gang. Another group of practical men have been getting data as to the transverse fissures or splits in steel rails, and there will be fewer accidents in years to come because of their work. Another paper, bristling with tables and diagrams, tells how to reduce the 'dynamic augment' for heavy locomotives. It seems that the big locomotive pounds on the rails because some of its parts are relatively too heavy and that various modern (and lighter) alloys of steel will help cure that bad habit. A fourth paper points out the deep interest in education that railroaders must take if their forces are to have the right human training and intelligence. It appears that our railways ought to co-operate with our public schools. All this from one number of one technical paper, and we have indicated only the high points! Busy brains make good railroading, and the U. S. A. has 'em."

Collier's has indicated the main reason why the railways of the United States have been so efficiently managed. Their officers, although in reality only employees, have taken a keener interest in, and have worked harder to promote, efficiency than most men do in the case of businesses they them-

selves own. This has been mainly because promotion in the railway business has usually been based on merit because there has been plenty of room for individual initiative; and because the rewards in reputation, power and income which have been won by the most energetic and able men have been in proportion to their energy and ability. These incentives will make "busy brains" in any line of activity. Also, the destruction of these incentives, which would inevitably occur under government ownership, would soon produce idle instead of busy brains; and then inefficiency speedily would succeed efficiency. Did any paper ever publish an issue containing as many articles regarding work being done along different lines to increase efficiency in the postoffice department as the *Railway Age* published in the issue referred to (February 22, 1918) regarding work being done along various lines to increase efficiency on the railways?

The Railroad Administration is beginning to decentralize its organization. This is a gratifying tendency. Decentraliza-

Decentralizing Railroad Management

tion will contribute toward increased efficiency of operation, and at the same time render it practicable for the railways to deal more satisfactorily with local conditions. Since government operation was adopted the *Railway Age* has several times commented on the dangerous centralization of management which was occurring. We have also suggested a reorganization of the railways along regional lines after the war as having more prospective advantages and fewer prospective disadvantages than any other plan which could be adopted under private ownership and management (See editorial "The Future of the Railways," *Railway Age*, January 18, page 159; also "Lord Shaugnessy's Warning," same issue, and "Revolutionizing Railway Organizations," March 22, page 694). The Railroad Administration originally divided the country into three regions, eastern, southern and western, and put a regional director in charge of operation in each of them. The *Railway Age* contended that these regions were too large even for present operating purposes, and suggested that after the war, if the railways were reorganized along regional lines, there should be created not less than five and probably not more than ten regions. The Railroad Administration has now divided the eastern region into three regions, and it seems probable that it will find it expedient to subdivide the western and southern regions. If this is done it will place in charge of the regional director's managers of railway whose operation they can supervise more effectively. It will also give opportunity to compare the results gained on different railways in the same region, and on the railways of different regions, in a way that will be stimulating to operating efficiency generally. While the program of decentralization is being carried out it is to be hoped it will be made to include the department of purchases. This department has laid itself open to more just criticism than any other branch of the Railroad Administration. The delays which have occurred in the placing of orders for equipment, and for the specialities to be used on it, has seriously reduced the number of cars and locomotives it will be possible to make and deliver in time for the movement of the heavy business of next fall and winter. Some

severe criticisms can be and are being passed also on the way in which in many cases orders have been divided. There have been altogether too many instances in which the prices of the things bought apparently have been considered to the exclusion of quality. Developments up to the present time indicate that the concentration of the purchase of equipment, rail and coal, in the Washington office was a serious mistake. The sooner steps are taken to rectify this mistake in some way the better it will be for all concerned. The policy of decentralization which apparently is being entered upon is based on sound principles of organization. What seems to be required to get the best results from the railways, whether under government or private management, is *centralized control and decentralized management*. Centralized management of a railway system as large as ours would prove a failure whether attempted under government or under private control. But by dividing and operating the railways in such regional groups as are suggested by geographical and commercial conditions the Railroad Administration will get better results during the war than it would under a highly centralized plan, and may point the way to a satisfactory solution of the railroad problem after the war.

Continuous Truss Bridges

STEEL BRIDGE CONSTRUCTION has presented a most contradictory aspect since the beginning of the European War. The number and size of the bridge projects have been largely restricted by a lack of funds and the high price of steel; nevertheless probably greater progress has been made in the development of materials in new designs and in improved fabrication and erection methods than in any corresponding period in recent years. One marked departure from former practice, in this country at least, has been the use of superstructures continuous over more than two supports, a condition which has been studiously avoided even where continuity was a prime requisite of the process of erection. Thus in cantilever bridges it has been the general practice to cut away erection members so that a simple span was suspended between the projecting arms, while in cases where one simple span was erected by the cantilever process from an adjoining one, the two spans were cut apart as soon as the second span became self-supporting.

An example of a marked departure from this practice is to be found in the Kettle Rapids bridge on the Hudson's Bay Railway described on another page of this issue. The trusses for the three spans are continuous from end to end. This is one of three important railroad bridges under construction within the last 18 months which follow this practice. The Bessemer & Lake Erie over the Allegheny river has two groups of three continuous spans, and the Chesapeake & Ohio Northern bridge over the Ohio at Sciotoville has continuous trusses 1,500 ft. long, supported on three piers.

Considering this question from the theoretical standpoint there is nothing new in this idea; on the other hand practical considerations have discouraged this form of construction in the past. Girder bridges for track elevation subways having intermediate supports were at one time constructed with continuous plate girders, but this proved objectionable in these short spans because the reversal of reactions on the abutments with the passage of trains resulted in the rapid pounding of the bridge seats. This condition has been avoided in the Bessemer & Lake Erie bridge by the introduction of a counter weight at the end of one of the shorter spans.

The prime requirement, that of unyielding supports, was satisfied beyond any question at the site of all of the three bridges mentioned above. Each afforded rock bottom at a readily available depth. Beyond this, experience and marked improvement in the last three years in the handling of the

heavy bridge loads with high power jacks was probably the important factor in the adoption of these designs, since it assured success in obtaining the necessary adjustment of the bearing elevations to obtain the assumed distribution of stresses. While complications in the calculations of stresses once formed a formidable obstacle, they no longer constitute an argument against this form of design.

Importance of Yard

Projects Recognized

THE LARGEST ITEM in the classified statement of additions and betterments authorized by the Railroad Administration was that for additional yard tracks and sidings. This amounted to \$81,383,955 as compared to \$64,297,478 for shops, buildings and engine houses and \$51,207,704 for additional main tracks, the next largest items. The total of these three items, \$196,889,137, all of which will be applied to increasing the capacity of existing railway lines in this country, represents 44.6 per cent of the entire appropriation for additions and betterments. The most significant fact concerning these allotments is that they are based on a thorough study of the entire railway situation by men eminently equipped for the work and supplied with the most comprehensive array of data ever compiled on the physical needs of the American transportation system. It is true that the estimates submitted by the roads were based on their war needs and that they were judged very largely on that basis. Nevertheless, the work authorized represents to a large extent exactly what the roads would have done of their own volition in times of peace, had they been free to make adequate expenditures.

The proportion of the total allotted to terminal work corresponds to the prevailing knowledge of railway men as to the relative need of this important part of the railway plant. While the necessity for the extension of facilities of this class was not demonstrated in as spectacular a manner last winter as was the demand for better facilities for the repair and care of locomotives, the dire need for more yard and passing track capacity has been manifested indirectly in so many ways and presents a condition so well understood as to require no elaboration. Additional main tracks are necessary but not in the same degree as yard tracks and sidings. There are cases where main tracks are taxed absolutely to capacity and some large expenditures are authorized to overcome this condition. Thus the Cincinnati, New Orleans & Texas Pacific was granted \$3,960,000 and the Cleveland, Cincinnati, Chicago & St. Louis \$4,409,874 for this purpose. But while trains are delayed in getting through sections of single track on a busy road, it is far more common to see trains held out on the line awaiting opportunity to enter an overloaded terminal.

Much money will be spent for the improvement and extension of existing yards, with the object of relieving the stress as quickly as possible. It is but human to look for a "key log" with the hope that the jam may be relieved by proper attention at some critical point, but too often the layout is so hopelessly inadequate that alterations or enlargement can result only in impotent patch work. For this reason it is not surprising to find that the recently announced budget covers authority for not a few large new yards, some of them on sites entirely independent of existing developments.

It requires foresight and courage to spend a million dollars on a freight yard. The same amount spent for second track would look much more effective, and probably gives quicker returns, but from the number of million-dollar appropri-

tions in the list, it is evident that the need for yards is thoroughly appreciated. The size of the appropriation for yards and side tracks is one of the most hopeful things about the construction program, and this, together with the amount set aside for shop buildings, engine houses, etc., should, when the work is finished, go a long way toward making the American railroads a better transportation machine both in war and in peace.

The Vindication of the Railway Managers

GOVERNMENT OPERATION of the railways is vindicating private management. Many of the most important things it is doing are things which the management of the railway companies tried to do before government operation was adopted and which the government through regulation or otherwise prevented. It is showing that the railway situation under private management would have been made much better in some respects if the public authorities would have permitted it.

Many of the leading railway presidents will remain officers of the companies under the new regime, but almost all the men who are being appointed to important executive positions in the Railroad Administration are former railway officers and are being selected because they are the best men for the positions. The Hearst newspapers and other socialistic publications assert that inefficiency broke down private management. If private management was incompetent, how did it happen to develop and put in important places the men the government regards as the best fitted to operate the railways in the present crisis? The managements of the railways have been criticized and regulated by many men in both private and public life who have set themselves up as authorities on railway affairs. Why has none of these been put in charge of the operation of a railway? Justice Brandeis, Clifford Thorne, Commissioner Charles C. McChord, the editor of the Hearst newspapers, for example, have overflowed with criticism of the management of the railways in the past and with suggestions as to how it could be improved. The Hearst newspapers are now telling the director general in detail just what he ought to do. Why in this great emergency, when their knowledge of how to run a railway could be so usefully employed, do we not find the names of these men in the lists of those being appointed as regional directors and federal managers? Doubtless we would under government ownership in time of peace. Under government operation in time of war their qualifications do not commend them to the serious consideration of the government.

For many years before the adoption of government operation, railway managers endeavored to reduce wasteful competition. They tried to do this by making pools of traffic and earnings, by organizing traffic associations, by forming community of interest arrangements, by causing their companies to acquire stock interests in each other, and by actual consolidations. The companies and their managers were denounced, persecuted and prosecuted for these efforts. Law after law was passed, court decision after court decision was rendered to maintain absolutely unrestricted competition.

The railway managers contended that these laws and court decisions were unjust to the railways and harmful to the public, but legislatures, regulating authorities and courts were deaf to their arguments. On December 28, 1917, it was still contrary to our laws and public policy for parallel railways to co-operate in handling traffic or to co-ordinate their facilities. On December 29, 1917, however, the gov-

ernment had taken charge, and in this short interval of time had discovered that, contrary to its previous opinion, all competition or semblance of competition was wrong, and that the railways must not merely co-operate, but must be merged into and operated as a single system. Like most sudden converts, the government became a more zealous exponent of railroad monopoly than the railway owners and managers ever were. Furthermore, the general public endorsed the new policy unreservedly as it did the old, and apparently did not realize that the government had turned a somersault. The very people and publications who before egged the government on to compel the railways to compete, now heartily commend it because it has stopped the "wasteful competition." They consider it a great achievement for the government to have abolished the rivalries between the railways which until last December it forced them to continue.

For many years the railway companies had been complaining that they were subject to too many masters. They asked that exclusive federal regulation be substituted for regulation by both the state and national governments. State and federal regulation continued, however, to vie with each other in heaping burdens and restrictions upon them. But when operation by the federal government was adopted, it instantly became clear to the federal authorities that it would be impracticable for them to manage the railways efficiently, without discrimination and in the interest of the entire country, if the states were allowed to regulate operation, to impose taxes and to fix rates regardless of the policy followed by the federal government.

The railway managers began ten years ago to point out that wages and other expenses of operation were rapidly increasing, and that it would be necessary to advance rates to enable the roads to earn enough adequately to develop their facilities. While between 1906 and 1917 the average annual wage of railway employees increased 67 per cent, the average freight rate and the average passenger rate actually declined. In 1917, after the United States had entered the war, the representatives of the railways presented to the Interstate Commerce Commission data showing that an advance of 15 per cent in rates was needed then, and that further advances probably would be needed later on. The Interstate Commerce Commission granted only part of the advances asked for. On December 5 it sent a special report to Congress, in which it indicated that it could not advance rates enough to meet the situation. The enormous increases in expenses which were then occurring have continued, however, and what was unthinkable then has become easily thinkable under government operation. The Railroad Administration is making advances of approximately 25 per cent in both freight and passenger rates, and is bringing the state rates up to the level of the interstate.

The vindication of our former private management of railways is written large in these developments. The government is now refraining from doing many things which the managers of the railways under private operation tried to get it to desist from doing, because it has become manifest that they were unwise and contrary to the public interest. It is doing many things which the railway managers tried to get it to do because it has become clear that they are wise and in the public interest. However disagreeable some features of the existing situation may be to men like Frank Trumbull of the Chesapeake & Ohio, E. P. Ripley of the Santa Fe, Samuel Rea of the Pennsylvania, Daniel Willard of the Baltimore & Ohio and Fairfax Harrison of the Southern, who are remaining in the service of their companies and therefore ceasing to be managing railway executives, they can have the satisfaction of feeling that government operation is vindicating many of the most important public policies for which they have stood.

Illinois Central

THE ILLINOIS CENTRAL held its operating ratio in 1917 down to a slightly lower figure than 1916; in fact, it was lower in 1917 than in any year since 1907. It was 71.54 in 1917, 71.66 in 1916, and, prior to that, for a number of years, ranged around 76.

The most astonishing part of the 1917 performance, however, was the fact that with an increase of over 21 per cent in ton mileage of freight and of over 15 per cent in passenger mileage, there was an increase of only 17.97 per cent in operating expenses, notwithstanding the fact that there was an increase of 8.60 per cent in freight train miles and 5.14 per cent in passenger train mileage. Furthermore, there were substantial increases in maintenance expenses. The roads

pocket cost of moving the business—increased nearly 30 per cent, but on some of the eastern roads transportation expenses increased to an even greater per cent with an actual reduction in passenger train mileage and only a very slight increase in freight train mileage; while the Illinois Central's passenger train mileage increased over 5 per cent and freight train mileage over 8 per cent.

The Illinois Central charged nearly 14 per cent more for maintenance of way and over 7 per cent more for maintenance of equipment in 1917 than in 1916. As a matter of fact, however, because of shortage of labor and materials, there was \$959,000 charged to maintenance of way expenses in 1917, which was carried over as a reserve into 1918. The amount charged was \$11,289,000; an increase over 1916 of \$1,368,000, but the amount spent was approximately \$10,300,000 or only a few hundred thousand dollars more than was spent in 1916. Similarly, in maintenance of equipment, while \$18,214,000 was charged, an increase of \$1,233,000, \$475,000 of this increase was additional charges for depreciation. This of course, is a bookkeeping charge only and, while the actual amount spent for repairs of locomotives was considerably larger in 1917 than in 1916, repairs of freight train cars cost considerably less.

Notwithstanding the scarcity of labor and high prices of materials, the Illinois Central spent \$15,643,000 for additions and betterments, which included \$6,047,000 for freight cars, \$601,000 for locomotives, and \$666,000 for passenger train cars. The largest items of additions to roadway were \$997,000 for station and office buildings, \$640,000 for grading, \$722,000 for bridges and culverts, and \$674,000 for other track material. The station and office building at Sixty-third street, Chicago, was completed, as was also the station at Mattoon, Illinois. Quite a number of stations at smaller towns and cities were enlarged and improved. There was \$549,000 spent for signals and interlocking plants. When two short sections, one between Vaughn, Miss., and Canton, and the other between Canton and Asylum, are completed, the entire line of the Illinois Central from Chicago to New Orleans will be completely block signalled. During the year there were installed 381 track miles of automatic block signals.

The only new locomotives which were put in service were 14 6-wheel switching locomotives; but 18 saturated steam locomotives were equipped with superheaters.

The character of traffic on the Illinois Central did not change greatly in 1917 as compared with 1916, with the exception of a larger proportion of coal being carried and a smaller proportion of products of agriculture. The following table shows the percentage of each class of commodity carried to the total freight tonnage handled:

| | 1917 | 1916 |
|------------------------------|-------|-------|
| Products of agriculture..... | 14.44 | 17.84 |
| Products of animals..... | 2.83 | 3.21 |
| Products of mines..... | 48.24 | 45.37 |
| Products of forests..... | 15.76 | 15.06 |
| Manufactures..... | 12.49 | 12.08 |
| Merchandise..... | 4.16 | 4.59 |
| Miscellaneous..... | 2.08 | 1.62 |

The average length of haul of freight was quite a little longer in 1917; being 264 miles. The average revenue per ton per mile was less by two-tenths of a mill; being 5.2 mills in 1917. There was a good gain in car loading; the average loading per loaded car was 26.94 tons in 1917 as against 24.09 tons in 1916.

The Illinois Central earned its dividends comfortably in 1917, even without taking into its income any payment on the part of the Yazoo & Mississippi Valley interest on the Louisville, New Orleans & Texas second mortgage income bonds, or dividends on the Dubuque & Sioux City stock owned. Railway operating income amounted to \$18,606,000; an increase of \$1,846,000. The two reductions in non-operating income just mentioned brought the amount down to \$8,009,000, as compared with \$13,016,000. After the pay-

The Illinois Central and the Yazoo & Mississippi Valley

whose reports have been reviewed so far this year in these columns which have been able to hold down the operating ratio in 1917 to anything comparable to that of 1916 did so either through a large reduction in train mileage, compared to business moved, or smaller maintenance expenses, or both. The Illinois Central did very well in increasing its freight train load; the average in 1917 for all freight being 700 tons as against an average in 1916 of 624 tons; but the fact that expenses per train mile did not go up in greater proportion than they did is the most remarkable part of the year's operations. It is true that transportation expenses—the out-of-

ment of interest charges, rentals, etc., there was \$15,016,000 available for dividends in 1917 and \$17,466,000 in 1916. Dividends call for \$7,924,000.

The following table shows the principal figures for operation in 1917 compared with 1916:

| | 1917 | 1916 |
|-----------------------------------|--------------|--------------|
| Average mileage operated | 4,766 | 4,767 |
| Freight revenue | \$58,443,367 | \$49,437,830 |
| Passenger Revenue | 16,908,698 | 14,717,849 |
| Total operating revenues | 87,144,286 | 73,740,266 |
| Maintenance of way and structures | 11,789,315 | 9,921,656 |
| Maintenance of equipment | 18,214,178 | 16,980,995 |
| Traffic | 1,332,011 | 1,301,244 |
| Transportation | 29,076,858 | 22,553,004 |
| General | 2,083,163 | 1,848,339 |

Chicago & North Western

INCREASES IN THE AMOUNTS PAID to employees, for fuel, for repairs to locomotives and rolling stock, and for maintenance of way and structures, were the principal factors preventing the Chicago & North Western from realizing on a 10 per cent increase in operating revenues in the year ended December 31, 1917.

The total operating revenues for the year were \$108,265,000, as compared with \$97,979,000 in 1916. Operating expenses, however, increased from \$65,121,000 in 1916 to \$78,759,000 in 1917. The increase of 20 per cent in expenses, comparing with 10 per cent increase in business, increased the operating ratio from 66.46 per cent in 1916 to

The increase in payments to labor for 1917 as against 1916 totaled nearly \$9,000,000 of which over \$5,000,000 was due to higher rates of compensation. The percentage of operating expenses paid to labor in 1917 was 60.12 as compared with 59.31 in 1916, or 58.27 in the calendar year ended December 31, 1915.

The increase in cost of fuel for locomotives is an old story, but it is interesting to observe that fuel for train locomotives alone showed an increase of more than \$2,000,000 and was 33 per cent over 1916. The total increase in costs of fuel for locomotives was \$2,651,800.

The increase in maintenance of way charges in 1917 over 1916 was \$1,563,000 and followed a similar increase of slightly more than that amount in 1916 over 1915. The increases, of course, were principally in track laying and surfacing, the expenditures for that purpose having increased about 25 per cent in each year. The increase in cost of repairs to locomotives and freight cars similarly represented something that was evident in 1916, but it is noteworthy that whereas in 1916 there was an increase in charges to maintenance of equipment of \$1,800,000 over 1915, in 1917 the total again increased \$2,800,000 over 1916, increases in successive years of about 14 and 19 per cent. These increases are especially emphasized by a comparison on the basis of units:

| | 1917 | 1916 | 1915 |
|-----------------------------|-------|-------|-------|
| Maintenance of way per mile | 1,652 | 1,459 | 1,261 |
| Repairs per locomotive | 3,392 | 2,748 | 2,281 |
| Repairs per freight car | 87 | 78 | 66 |
| Repairs per passenger car | 721 | 594 | 501 |

It should be added however that, even with these increases, so great were the increases in transportation expenses the

The Chicago & North Western

72.75 in 1917, and the net revenue from operation amounting to \$29,506,000 in 1917 was about \$1,000,000 less than in the previous year. Increases in taxes and decreases in non-operating income were partly compensated for by decreases in interest charges, so that the net income of \$17,125,000 in 1917, was likewise \$3,000,000 less than in 1916. The usual dividends of 7 per cent were paid, but for the second half of the year on a larger capitalization so that the balance for the year of \$5,265,000 was just over \$4,000,000 less than in 1916.

charges for maintenance of way in 1917 were 17 per cent of the total operating expenses as compared with 18 per cent in 1916, and the charges for maintenance of equipment were 22.7 per cent of total operating expenses as compared with 23 per cent in 1916. The percentage of total operating expenses chargeable to transportation increased from 52.9 in 1916 to 54.8 per cent in 1917.

The North Western's freight business in 1917 was 10.5 per cent greater than in 1916 on the basis of freight revenue, 7 per cent greater on the basis of tons of freight carried, but

13 per cent greater on the basis of ton mileage carried. The revenue per ton mile on the North Western is somewhat low compared with some of the other roads in its territory, but it is interesting to observe that whereas in 1915 the average revenue per ton mile was 8.3 mills; in 1916 it was 8.0 mills and in 1917 only 7.8 mills. The total tonnage was 60,288,000 as compared with 56,408,000 in 1916 and the ton mileage of revenue freight was 9,220,973,000 in 1917 as against 8,130,953,000 in 1916.

The tendency towards heavier train loads continued in 1917 assisted presumably by the energetic campaign for heavier car loading. The average train load increased during the year from 510 tons to 544 tons, nearly 7 per cent. The average load per loaded car increased nearly 9 per cent, from 23 to 25 tons. The amount of equipment on hand of all classes was greater on December 31, 1917, than on December 31, 1916, the number of locomotives being 128 greater and the number of freight cars 3,834 greater. The increases in each case were undoubtedly due as much to caution in retiring old equipment as to additions of new equipment.

During the year the North Western issued \$15,000,000 of common stock, equal to 10 per cent of its total preferred and common. It redeemed \$4,541,500 of funded debt, of which something over a million was equipment bonds and \$3,118,000 was 7 per cent first mortgage bonds of the North Western Union Railway maturing June 1, 1917. At the end of the year the company had \$5,722,000 cash, nearly \$5,000,000 less than on December 31, 1916. Loans and bills payable at the end of the year totaled \$2,295,000 as against no loans or bills payable on December 31, 1916.

The following table shows the principal figures for operation in 1917 as compared in 1916:

| | 1917. | 1916. |
|---------------------------------------|--------------|--------------|
| Average mile operated..... | 8,108 | 8,308 |
| Freight revenue..... | \$72,264,461 | \$65,380,165 |
| Passenger revenue..... | 24,516,358 | 22,329,509 |
| Total operating revenue..... | 108,264,963 | 97,978,844 |
| Maintenance of way and structure..... | 13,394,113 | 11,831,004 |
| Maintenance of equipment..... | 17,899,338 | 15,087,346 |
| Traffic expenses..... | 1,354,007 | 1,340,016 |
| Transportation expenses..... | 43,177,646 | 34,433,717 |
| General expenses..... | 2,306,507 | 1,982,639 |
| Total operating expenses..... | 78,758,989 | 65,120,827 |
| Taxes..... | 5,677,480 | 5,016,527 |
| Operating income..... | 23,815,406 | 27,835,731 |
| Gross income..... | 27,311,451 | 30,794,904 |
| Net income..... | 17,125,030 | 20,368,924 |

New Books

Poor's Manual of Industrials for 1918. 2,736 pages, bound in cloth. Published by Poor's Manual Company, 80 Lafayette Street. New York. Price \$10.

Poor's Manual now occupies somewhat the same position as regards industrials as Poor's Manual of Railroads occupied in the railroad field twenty-five or thirty years ago. It is the most complete source of information about industrials in one volume which we have. Now that the railroads are being operated under government control, and public utilities are finding it difficult to make both ends meet, industrials offer one of the only attractive fields for investments outside of government bonds. It is needless to say that accuracy and intelligence are used in the compilation of the figures which are included in Poor's Manual of Industrials. In most cases, there is an income account and general balance sheet given for each company, and a description of the stock and other securities outstanding. There is also, in most cases, a short description of the character of the business done by each particular company, but, if it were possible to enlarge any part of this already very comprehensive manual, additional space might be used to give further facts in regard to the character of the business. No matter how small a statistical library a banker or individual can afford, Poor's Manual of Industrials must of necessity be included in it.

Letters to the Editor

An Opportunity for the Railway Supply Manufacturers' Association

NEW YORK.

TO THE EDITOR:

As an ex-president of the Railway Supply Manufacturers' Association, I am naturally still interested in the present and future of that association, particularly because of the fact that ever since I started to work on its committees I have felt that the organization should be of a more permanent nature so as to work for the best interests of the railway supply fraternity at all times.

Since this world war has interfered with the holding of our annual conventions in conjunction with the M. C. B. and M. M. Associations, it appears that the R. S. M. A. has practically passed out of existence. To me the passing of this association, if such it be, is not a pleasant thought. I am addressing this letter to you in hopes that it will be published, and that sufficient interest will be created for us to get together and in some way perpetuate the old R. S. M. A.

Many other industries are fully organized, and have their duly authorized officers and committees who are co-operating with the government, with the idea of facilitating the big job in hand. The biggest burden of all has fallen to the railroads, and an industry which supplies the railroads with all kinds of equipment is essentially an important factor in such a crisis. In any crisis, the necessity of the right kind of organization and organized effort is essential. During the past weeks, when so many of us have had to spend our time in Washington, the lack of the proper organization has been brought home to us. Since the railroads have been taken over by the government, we have had to conform to the new conditions, and, I believe I may say without fear of contradiction, that no other body of men representing such tremendously big interests have gone to the capitol unorganized.

The ramifications of the railway supply industry are such that individual effort, while it is of service, oftime fails in accomplishing the best results, and necessarily means the loss of much time and energy, to say nothing of unnecessary waste of money. This is the time when we should not only talk conservation, but should organize our efforts along conservation lines, and act accordingly. Our President rightfully felt that the railroads could better serve the common cause by being brought under one head and operated as a unit during this crisis, and, I believe that the wisdom of his action has already been demonstrated. In dealing with this centralized authority, we should unite our efforts and organize in such a way that the administration could call upon representative and authorized officials of our organization for general information, which they could collect from its members. I do not mean to suggest the elimination of the individual interest, but such representatives could properly handle the preliminaries, and would save the government officials much time and energy.

As a fraternity, we have never gotten together to discuss our every-day business problems, for which there may have been good reason in the past, but I feel that we can best show our patriotism by getting together and offering Uncle Sam the services of a united railway supply fraternity. Let's get together and perpetuate the R. S. M. A., for which so many of us have worked in the past, and make it an organization of service of which we will all be proud.

OSCAR F. OSTBY.

General View of Bridge.

Difficult Bridge Construction in a Cold Country

Hudson Bay Railway Trusses Over Kettle Rapids Are
Continuous Over Four Supports

By W. Chase Thomson
Consulting Engineer, Montreal, Que.

THE HUDSON BAY RAILWAY extends from The Pas, the northern terminus of the Canadian Northern in Manitoba, to Port Nelson on Hudson Bay, a distance of 424 miles. Although primarily intended as a short route for the export of grain to Europe, the railway opens up a valuable territory, rich in minerals, fish and pulp-wood and of great agricultural possibilities. The grading has been completed throughout, and the rails have been laid to mile 332. The Kettle Rapids bridge is at the second crossing of

vention of Lake Winnipeg, which serves as a huge reservoir, the flow of water in this river throughout the year is remarkably uniform. At Kettle Rapids, the lowest water level recorded to date is 316.0, and the highest water level, with the river unobstructed by ice, 319.0, a difference of only 3 ft. But, with the freezing of the river and the consequent jamming of huge quantities of drift ice, the channel is greatly obstructed and the water rises suddenly. In the winter of 1916-17, a height of 338.5 was reached on February 3.

The highest ice peaks have always been found on the islands, where piers 2 and 3 are located. In the winter of 1916-17, when the water was at its maximum height of 338.5, there were ice peaks as high as 344.5, the same as had been observed during the winter of 1913-14, but, with the fall of the water, they settled to elevation 342.0, and remained there until melted.

The main channel at the bridge site is only 350 ft wide and it is estimated to be about 200 ft deep at the center; the current is very swift, and there is always a certain amount of open water. Directly above and below the bridge site, however, the river freezes all the way across, but only after the jamming of the ice and the consequent rising of the water. It is evident that there can never be any danger from ice, either to the superstructure or to the piers, for the steelwork is 15 ft. clear of the highest fixed ice peaks, and there is running ice only when the water level is much below its maximum elevation.

In locating the line, advantage was taken of two very conveniently placed islands, allowing a central span of 400 ft., with piers and abutments on the solid rock. This rock is of pre-cambrian origin and is a tough granitoid gneiss.

The bridge is a continuous structure 1,000 ft. long, having a channel span of 400 ft and two side spans of 300 ft each. The trusses or main girders are of the subdivided Warren type, 50 ft deep throughout and 24 ft apart center to center,

View from Top of Cableway Tower

the Nelson river, or Kettle Rapids, mile 332, the present end of steel.

The Nelson is one of the great rivers of Canada, its drainage including the prairies of Alberta, Saskatchewan and Manitoba on the west, the Red River valley on the south and part of Ontario on the east, but owing to the inter-

*Abstract of a paper presented before the Canadian Society of Civil Engineers, April 11, 1918.

having 25-ft. panels. There are two lines of stringers, 8 ft. apart center to center; and the base of rail is 17 ft. 6 in. above the center line of the bottom chords. The structure is riveted throughout, and all bracing is rigid; it is fixed at Pier 3, and provided with expansion rollers at all other bearings. The ties are 8 in. x 12 in., 14 ft. long, spaced 12 in. center to center; they are notched $\frac{1}{2}$ in. on the stringers, and every fourth tie is fastened thereto by a $\frac{3}{4}$ -in. hook bolt. The outer guard timbers are 8 in. x 9 in., spaced 10 ft. 10 in. in the clear; they are notched one inch and secured

Expansion Bearings for the Abutments

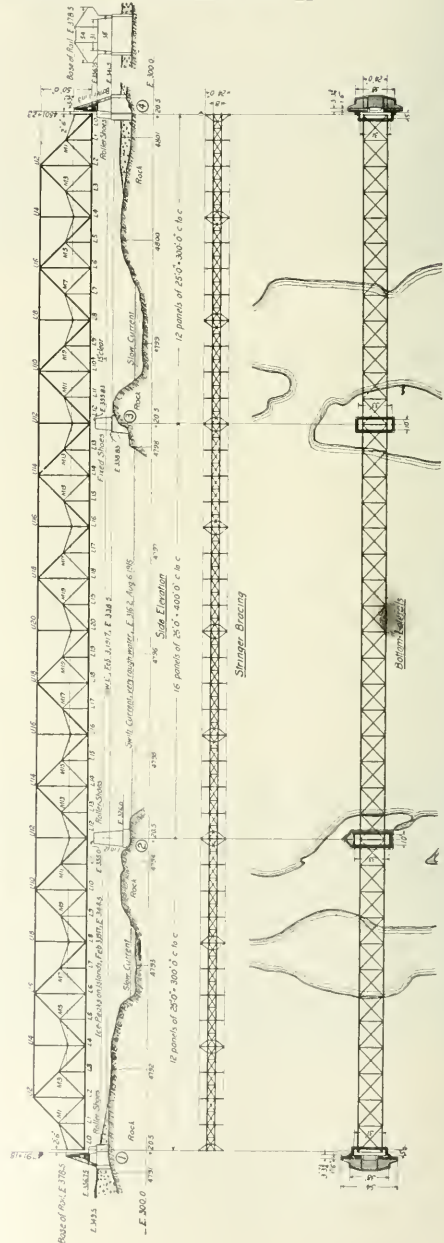

to every fourth tie by a $\frac{3}{4}$ -in. bolt. Steel guard rails, weighing 60 lb. per yd., are provided inside of the running rails, with 8 in. clearance between heads; they are brought together in a frog beyond the ends of the bridge. The main (or running) rails are of A. S. C. E. section 80-lb. At abutment 1, where the total expansion and contraction of the bridge will be about 8 in., they are provided with specially designed expansion joints of the split switch form, with points of manganese steel. Refuge bays, for pedestrians, are provided at intervals of 200 ft.

Three types of bridges were practicable for this location; simple spans, with temporary members over the piers for

Lower Steelwork for the Northern Anchor Span Erected. The Traveler Is Raised on Blocking for Working on the Top Chords

cantilever erection of the channel span; the conventional cantilever bridge, with a central freely suspended span; and a true continuous girder bridge. The first would have been satisfactory, but not economical, owing to the great weight of extra metal required for erection stresses only. The second was rejected partly on account of the objectionable articulated joints at the ends of the suspended span, but principally because of the expensive shop and erection work in connection therewith; for an economically designed cantilever structure would have required a much greater depth over the piers, with considerably less depth at the abutments and for the suspended span, resulting in sloping chords and

General Design of the Hudson Bay Railway Bridge, Over Kettle Rapids

irregular webbing, besides, in order to obtain such economical proportions, it would have been necessary to locate the bottom chords as close to the base of rail as possible, thus largely increasing the quantity of concrete in the substructure.

The third type, as designed and built, is the most rigid of all, and the most economical; for it required no extra metal for erection stresses, except in the bottom chords of the channel span adjacent to the piers, where the increase of section was slight; the simplicity and uniformity of the framing reduced the cost of fabrication to a minimum; and the

Falsework Under Construction for the Northern Anchor Span

continuous horizontal chords, without adjustable joints, greatly facilitated the work of erection.

Details of Design

The structure was designed in accordance with the General Specification for Steel Bridges, issued by the Department of Railways and Canals in 1908, except for a slight modification in the impact formula, affecting alternating stresses only, and a change in the allowable unit-stresses for compression-members. Impact has been computed by the formula,

$$I = \frac{\text{range}}{\text{max}}$$

with the arbitrary stipulation that the *range* shall

be taken as the arithmetical sum of the live load stress of the greater kind and 0.4 of that of the lesser. When the live load stress is of one kind only, the formula reduces to

$$I = \frac{L^2}{L + D}$$

in which L = live load stress and D = dead load

Concerning the unit stresses for compression members, the Department's specification calls for 16,000 lb. per sq. in. reduced by Gordon's formula, using in the denominator the factor 18,000 for square ends, 12,000 for one square and one pin end, and 9,000 for pin ends. It is now quite generally recognized, however, that 16,000 lb. per sq. in. is entirely too high for short column; and the Joint Committee on Columns and Struts in the United States, which has recently submitted its final report, recommends a maximum working unit stress of 12,000 lb. per sq. in. In this bridge, the compression members have been designed in accordance

with the formula, $12,000 \left(1 - \frac{(l/r)^2}{50,000} \right)$, which agrees closely

with that adopted by the Society for values of l/r up to 70, but gives somewhat higher unit stresses for greater working ratios.

The live load used in design is "Class Heavy" of the Department's specification above noted. The bottom laterals have been proportioned on the assumption that the whole of the specified wind loads, both during erection and afterwards, would be resisted thereby, and the wind load stresses in the bottom chords include the vertical effect of the wind loads, equal to their moment about the bottom chords divided by the horizontal distance center to center of chords. The

design includes provision for cantilever erection from piers 2 and 3 to the center of the channel span.

Provision for traction and braking forces has been made by horizontal trussing attached to the top flange of the stringers and to the floor beams at points $M0$, $M4$, $M8$, $M12$, etc., or 100 ft. apart, as shown in the diagram; which forces are transmitted to the main girders through the inclined struts $M0-M1$, $M3-M4$, $M4-M5$, $M7-M8$, etc.

The end floorbeams are provided with stiffeners and bearing-plates at points 16 ft. apart, for jacking up the bridge; and the floorbeams at $M12$ have been specially designed for lifting the bridge, with unit stresses increased by 50 per cent and having stiffeners and bearing plates at points 14 ft. apart.

Latticing of main members has been avoided as far as practicable; but the open sides of compression chord members are double latticed with 5-in. by $\frac{5}{8}$ -in. flats, having two rivets at ends and at intersections; tension chord members are similarly latticed with 5-in. x $\frac{1}{2}$ -in. flats. All of the principal web members are provided with substantial longitudinal diaphragms, which are considered as part of the effective section thereof; and the heavy compression diagonals, $U6-L8$, $U10-L12$, $L12-U14$ and $L16-U18$, are further stiffened by tie plates on their outstanding flanges. All joints and splices are fully riveted throughout.

Rocker bearings are provided throughout, having 8-in. bearing pins at the piers and 6-in. bearing pins at the abutments; and the shoes are steel castings. The bridge is fixed at Pier 3 and movable at Pier 2 as well as at the abutments. At Pier 2 the expansion rollers are 8 in. in diameter, and each set is provided with four 12-tooth cut pinions to prevent skewing. Substantial curtain plates are supplied for the protection of the gears and to keep out the dust; but they are removable for inspection and cleaning of the bearings. At the abutments the expansion rollers are 6 in. in diameter and similarly provided with alinement gears and curtain

Southern Anchor Span Erected, and the Beginning of Cantilever Erection Showing the Temporary Supports for Panel Points

plates. These expansion bearings are shown in one of the drawings. The fixed bearings at Pier 3 are similar to the expansion bearings at Pier 2, except for rollers and bed plates. The bridge seats are too dressed perfectly level and to the exact elevations called for on the drawings, and sheet lead, $\frac{1}{8}$ in. thick, is provided to equalize any minor irregularities of the surfaces.

Owing to the small deflection of this bridge, which is only 3 in. at the center of the channel span, for dead load combined with the maximum effect of the live load, it was con-

sidered unnecessary to provide for a perfectly straight bottom chord under any particular condition of loading; so the trusses have been cambered, in accordance with the more usual method employed for simple spans of moderate length, by increasing the length of the top chord panels. Members *U10-U12* and *U12-U14* have been correspondingly shortened; and $\frac{3}{4}$ in. has been added to the verticals *U12-L12*, to obviate a slight kink at panel points *U12*. At panel points *L12* the ends of the abutting chord members have been bevelled to accommodate the form of the trusses when fully loaded. This method of cambering has greatly simplified the shop work; and the results are entirely satisfactory.

The total estimated weight of steel in the structure (including floor bolts), computed from the detail drawings before the contract had been awarded, was 4,424,000 lb.; and the actual shipping weight, as determined by the scales, was 4,415,000 lb.

Erection

Erection was started on June 6, the earliest date possible; for, before the falsework for the southern anchor span could be placed, it was necessary to blow up huge masses of ice with dynamite. This anchor span was then erected in the usual manner by a 75-ton derrick car, having trucks 35 ft. center to center and a single 50-ft. boom. At *L0*, bottom chords were set 10 in. low, by omitting the upper shoe castings and using flattened pins for bearings. This was to provide

Northern Anchor Span and 100 ft. of the Adjacent Cantilever

for the deflection of the channel span during erection, and to insure that the connections at *L20* could be effected before the chords at *U20* would meet. After the anchor span had been fully riveted, the southern half of the channel span was erected as a cantilever by the same derrick car, the riveting following closely behind the work of erection. Panel point *L14* was supported temporarily by wire cables from panel point *U12* until the connection had been made at *U14*; likewise, panel point *L18* was supported from panel point *U16*, until the connection had been made at *U18*. By August 18, or eleven weeks from the date of beginning, the first half of the bridge was fully erected; and the riveting on this portion of the structure was completed one week later.

The next, and perhaps the most difficult piece of work in connection with the entire erection, was the construction of a double cableway for transporting the materials for the northern half of the bridge to the opposite side of the river. The cables were supported on a rocker bent 40 ft. high, standing on the top chords of the southern cantilever at panel point *U18*, and on a timber tower 120 ft. high from the ground surface, located behind Abutment 4, with center line 60 ft. from panel point *L0*. The span of the cableway was 611 ft.; the sag, under maximum load, 36 ft.; and the horizontal distance of the anchorages, at both ends, from adjacent supports, 400 ft. A triangular equalizing girder, suspended at its ends from the cables and having a lifting hook

at the center, was provided for loading the cables equally. The cableway was designed for a live load of 14 tons, the weight of the heaviest piece to be transported. In addition to its principal function of transporting materials, in which service it gave entire satisfaction, the cableway was of great assistance in the erection of steelwork.

The falsework for the northern anchor span was then constructed, with extension bents reaching to the floor level, for the accommodation of the special traveler provided for the

The Cableway with Its Equalizing Girder

erection of the northern half of the bridge. As this traveler was to be used on the top chords as well as at the floor level, its four trucks (of two 24-in. double-flanged wheels each) were spaced 24 ft. center to center transversely, the same as the trusses, and 50 ft. center to center longitudinally, to coincide with the panel points; it was fitted with two 62-ft. booms and a hoisting engine; and its entire weight, including counterweight, was 60 tons, equally distributed on the four trucks. To provide for the weight of the traveler only, when moving, the top chord members were supported at their middle point by temporary timber posts, resting on special seats at panel points *M3*, *M5*, *M7*, *M9*, etc.

After the delay incident to the construction of the cableway, and the falsework for the northern anchor span, erection

Southern Half of the Bridge Erected

of steel for the northern half of the bridge commenced on September 17. Beginning at Pier 3 (with the traveler at the floor level and working toward Abutment 4) the floor system, bottom laterals and lower members of the trusses were placed, and the falsework extensions removed. The traveler was then blocked up to the height of the top chords, requiring a week for this operation; and the upper part of the steelwork for this anchor span was erected, working from Abutment 4

toward Pier 3. When the traveler had passed panel point U_6 , an additional rocker bent, 40 ft. high, was set up there as an intermediate support for the cables, thereby reducing the span to 400 ft., the maximum sag to 22 ft., and providing ample working clearance above the top of the steelwork. The cantilever erection of the northern half of the channel span was accomplished in the same manner as for the southern half, except that the members were placed principally by

Pier 2 Under Construction

the special traveler, which required temporary timber supports at the center of the top chord panels, already mentioned.

From the time of placing the traveler on the top chords to within two days of the end of November, when the weather suddenly turned severely cold, rapid progress had been made; and it was confidently expected that the bridge would be entirely completed before the end of the first week in December.

On December 8 the center connections at L_{20} had been made, and without the least difficulty; for, on meeting, the trusses had been in perfect alinement and the deflections of the cantilevered arms, exactly equal; thus it had only been necessary to jack forward on its rollers the southern half of the structure, which had purposely been set back 5 in. to facilitate the erection of the closing members. On the southern half of the bridge, the timber floor was practically complete; and the ties had been roughly distributed over the northern half, except at one panel adjacent to the center of the channel span, where the stringers had not at that date been placed; thus the structure was practically supporting its full dead load. Under

the main members was completed, and jacking of the ends was resumed. This operation was again interrupted by New Year's day, but the ends had been raised sufficiently by January 2 to permit of placing the upper shoe castings, without shims. Although the ends were thus $1\frac{1}{2}$ in. below their normal position, the load at each of the four corners, as indicated by the gages on the hydraulic jacks, was exactly 118.5 tons, the amount of the computed dead load reaction. The bridge at the time, however, was covered with many tons of ice and snow; thus it was impossible to determine very accurately the reactions for the normal dead load.

It had by this time been decided to give up the attempt to complete the bridge during the winter of 1917-18, for the men could not work to advantage; a satisfactory job could not be made of the track work; the painting could not be done until the advent of mild weather; and the bridge was perfectly safe. A final adjustment will therefore be made under more favorable conditions, when it is expected that the ends will require to be raised about another inch. With the ends $1\frac{3}{8}$ in. low, levels were again taken on the bridge, with satisfactory results, for the camber at the center of the channel span was found to be $17\frac{3}{8}$ in., whereas the maximum computed deflection due to the specified live-load is $13\frac{1}{2}$ in.

The closing panel of stringers was placed January 4, which ended the work for the season. The remaining work

Beginning of Erection of the Northern Anchor Span, with the Traveler at the Floor Level

comprises a small amount of riveting for secondary parts, some minor adjustments, the completion of the timber deck, including the laying of the rails, and painting.

Substructure

The substructure is of concrete throughout, composed of pit gravel and cement in such proportions as were found by trial to give the best results. It had been intended to construct at least the abutment and pier on the southern side of the river during the autumn of 1916, but the track did not reach the bridge site until the end of October, cold weather set in shortly after, and there was barely time to construct the foundation for Abutment 1. Excavation for this foundation was carried to a depth of over 10 ft. through frozen clay and silt to the solid rock. The concrete was placed during the second week in December, and in very cold weather; but the materials had been heated, the mass was large, and the result was entirely satisfactory, as found from a careful inspection the following spring. The abutment was completed during the month of April, 1917.

Operations at Pier 2 were begun on April 10, and under very adverse circumstances; for the river was then at an elevation of 338.0, or 10 ft. above the average rock surface at this point; and the rock was covered with a solid mass of ice 25 ft. thick. However, it was necessary to get ahead with the work as rapidly as possible; so the ice was excavated, and the rock was bared by May 5, at which date the water had fallen to elevation 325.0. Although the ice walls of the excavated shaft appeared to be perfectly solid throughout, the water percolated through and stood at the same elevation

The Lower Members of the Portal Struts and Sway Bracing Were Omitted Temporarily for the Accommodation of the Derrick-Car

these conditions, careful levels were taken to ascertain the exact deflections of the trusses or main girders. The curves of the bottom chords were remarkably uniform; and the center ordinate was exactly the same as had been computed.

The weather having moderated slightly, although still very cold, work on the bridge was resumed December 16. On the 22d the ends were lifted $3\frac{1}{2}$ in., which was just sufficient to bring the ends of the top chords at U_{20} to a firm bearing. Owing to frequent stoppages due to weather conditions, it was not until the last day of the month that the riveting of

as that in the open river channel, but it was perfectly still, without current or surge. A timber caisson, conforming on the bottom to the irregularities of the rock surface, was then constructed; and all small openings therein were sealed by sheet piling, carefully scribed and driven so as to broom the ends. Every inch of the rock surface inside of the caisson was then picked with needle bars, to insure that it was entirely clear of ice; and heated concrete was deposited by deep-sea buckets. The rock surface at this pier had previously been carefully examined during low water, and found to be absolutely sound; thus every confidence may be placed in the foundation. The footing for this pier was completed on May 9; the construction of the main shaft thereof offered no difficulties, and was effected without incident.

The pit gravel, used throughout on this work, was invariably frozen and required to be thawed by steam; thus all of the concrete was placed warm, and with most gratifying results; for, on removal of the forms, not a single bad spot was discovered. The total quantity of concrete in the work is about 3,000 cu. yd., and of reinforcing steel in the wing walls 2,300 lb.

The laying out of the work was difficult and tedious, owing to the irregularity of the ground and to the necessity of locating Pier 3 by triangulation; but the instrument work was done with such care and precision that all important dimensions and distances were afterward found to be practically exact. In locating the center line of bed plates on Pier 2, and that of the shoe castings on Pier 3, where great accuracy was desired, the piano wire method of measurement was used, taking into account the pull on the ends of the wires and the corresponding sag, as determined on a level surface, and making the proper correction for temperature. The distance between centers of bearings on Piers 2 and 3 was afterward found to agree with the steel structure, as built within 5/16 in.

The entire work has been under the general supervision of W. A. Bowden, chief engineer, Department of Railways and Canals, Ottawa, and of J. W. Porter, chief engineer, Hudson Bay Railway, The Pas. It was designed in full by the writer, who has been retained throughout for consultation in connection therewith. The substructure was fabricated and erected by the Canadian Bridge Company, Limited, Walkerville, Ont. T. B. Campbell, bridge engineer, Hudson Bay Railway, was in charge of the bridge site; I. E. Mahon was the superintendent of erection for the bridge company; and James Carr, representative of the Canadian Inspection and Testing Laboratories, Limited, attended to the field inspection. The entire work has been carried out without loss of life or serious accident.

LOCOMOTIVE SITUATION IN SOUTH AFRICA.—The Minister of Railways in the South African Government, in presenting his railway budget, said that one of the greatest difficulties with which the administration had been faced was that of engine power. The maintenance of locomotives in good order was a problem that touched every country in the world. The British railways had had to send 700 engines overseas for military purposes, and they had 1,400 locomotives over the usual number awaiting repairs. The South African position had been slightly improved. There had been a considerable improvement in the water supply, and by resorting to various expedients, the Union had succeeded in keeping about 75 per cent of its engines in commission. In 1916, 26 per cent of the engines were out of repair, but in 1908 the Cape had 29 per cent of its locomotives in the shops, and Natal had 30 per cent. The greatest difficulty had been experienced in obtaining delivery of new engines. Last year 29 new standard gage engines had been placed in service, but 132 were still under order, and 28 ordered from America, were expected to be ready for shipment within a few weeks.

Orders of Southern Regional Director

B. L. WINCHELL, regional director of the Southern region, has issued the following circulars, among others:

Circular Letter No. 227 states that unless and until some different policy is determined upon, there are no objections to renewal of contracts with insurance companies, whereby the latter are permitted to solicit accident and health insurance among employees, and the railroad companies undertake to collect the premiums therefor by wage deductions with consent of the employee, retaining an agreed upon per cent of the deductions for their services; such contracts being non-exclusive, and assuming that the carrier has been advised by counsel that they do not conflict with any state statute as to payment of wages to employees.

Circular Letter No. 241 states that for the present there will be no change in the manner of issuing free transportation. Federal managers will issue transportation for their respective lines just as they have in the past.

Circular Letter No. 243 states that each shop repairing foreign line locomotives will be expected to give such work the same supervision, inspection and workmanship that is given their own locomotives. Therefore the practice of sending inspectors to supervise repairs to locomotives at foreign line shops will be discontinued. It has been found to be of practically no value, and in some instances has actually resulted in delaying the repairs. When a locomotive is sent to a foreign line shop for repair the road sending the locomotive will furnish all necessary material for repairs; and will also furnish to the railroad which will make the repairs a detailed report of the work to be done, and a complete list of the material which is being furnished. The material shall in all cases be forwarded with or in advance of the locomotive. Inspectors at foreign line shops should be recalled and assigned to their regular work. The foregoing is not intended to apply to locomotives undergoing repairs at contract shops, or at the plants of locomotive builders, nor is it intended to apply to men who are specially assigned to work of collecting and forwarding necessary materials for repairs.

Circular Letter No. 244 asks the railroads to send to the office of the regional director two copies of any circulars, general letters or bulletins issued by them with respect to allowing employees to retain seniority, or providing for reinstatement of employees returning from military or naval service and in order that the matter may be handled in a uniform manner the roads are directed not to issue further circulars of this kind until the matter has been determined.

George R. Loyall, assistant to the regional director, has issued Circular Letter No. 228, calling attention to the importance of storing fuel coal during the summer months so far as practicable, in order to conserve the car supply for commercial shipments during the winter months and asking the roads to report as to what progress is being made in this direction.

In another circular Mr. Loyall submits for consideration and an expression of views, a suggestion which had been made to him, that in these days of retrenchment and economy and shortage of labor it was wasteful to keep so many red cap porters and attendants at the various passenger stations and that the character of earning a livelihood should be classed as non-essential.

Circular Letter No. 226 states that the practice which was general a number of years ago for railroads to employ men known as car tracers who went on foreign lines and looked after home equipment, is useless under present conditions. The roads are asked to advise whether they employ any men for this purpose and, if so, the number and total expense per month.

Doings of the United States Railroad Administration

Railroad Administration Organization Near Completion: Railway Contract Negotiations

WASHINGTON

WITH THE SELECTION of the federal managers, which are being announced by the regional directors after a conference last week with Director General McAdoo and members of his staff at White Sulphur Springs, to be followed by the extension of the policy of decentralization by the further sub-division of the western region into three or four regions, each under a regional director, the organization of the Railroad Administration may be said to be approaching completion. Director General McAdoo is planning to spend most of the summer at White Sulphur Springs, with frequent trips to Washington, leaving the detailed management of affairs in the hands of the staff he has built up, which now reports, in his absence, to Walker D. Hines, assistant director general of railroads. In the past two months he has been at his railroad office but two or three times, when he devoted himself to passing finally on important matters that had been made ready for his decision by his assistants; and when the finishing touches have been added to the machine he is expected to devote still less of his attention to railroad affairs and more to the important questions of financial policy involved in the revenue bill and other treasury matters.

His absence from his railroad office has included about three weeks, when he was touring the country making Liberty Loan speeches and three weeks during which he was confined to his home by illness, although he handled a great deal of business during that time and came downtown occasionally for an important conference. The balance of the time he has spent at White Sulphur Springs, where he has taken a cottage for the summer and where he has an office. Mr. McAdoo is still in poor health, and even though he leaves all possible detail to subordinates he will have enough big problems to settle.

For a time the principal developments in connection with the organization were in the direction of centralization of a mass of detail at the Washington offices, but many of the reports required were considered necessary information for the formulation of general policies. Now that the policies have been further developed the tendency is toward decentralization. While the Washington organization is a large one, it is small in proportion to that of a single large railroad, and it is now in a position to devote its attention mainly to large questions of policy, leaving the details to be settled locally.

The organization now consists of federal managers in charge of the operation of each property, reporting to the regional directors, each of whom has a departmental organization of his own, while the Eastern Region has a sub-district organization. The regional directors report both to the director general on general matters and to the departmental division directors in the central organization, each of whom has a staff of assistants and some of whom have subsidiary sections. Walker D. Hines, who was first appointed assistant to the director general, has recently had his title changed to assistant director general. He now has two assistants, and has recently considerably increased his office space, which indicates that he is taking over more of the executive detail.

The appointments of federal managers that have been announced thus far by the regional directors with the approval of the director general contain few surprises and are such as would be expected from Mr. McAdoo's announcement on the subject. Where the presidents are primarily operating officers they have been chosen, and in other cases

where the presidents have been more closely identified with matters of general policy than with operation, operating vice-presidents or general managers have been selected. In the south the railroad presidents who have been left are Fairfax Harrison of the Southern and Milton H. Smith of the Louisville & Nashville. In the East the appointments already announced leave as corporate officers Samuel Rea of the Pennsylvania, Daniel Willard of the Baltimore & Ohio, F. D. Underwood of the Erie, L. F. Loree of the Delaware & Hudson and several other presidents, but they also include several presidents, while others of the presidents have been appointed regional or district managers.

The appointment of federal managers as exclusive representatives of the government in charge of operation not only removes the corporate officers from any jurisdiction over operation but, it is understood, will displace them from their offices in the railroad office buildings, except as permission to remain may be extended to them by the government officers if sufficient space is available.

Appointments in Eastern Regional District

A. H. Smith, regional director of the eastern district, has announced a number of appointments, including district directors, federal managers and general managers.

James H. Hustis, president of the Boston & Maine and receiver in charge of the road under the United States court, was appointed district director in charge of the New England railroads with headquarters at Boston.

P. K. Todd, president of the Bangor & Aroostook, was made assistant to the district director and general manager of the Bangor & Aroostook with office at Bangor, Me.

H. A. Worcester, vice-president and general manager of the Cleveland, Cincinnati, Chicago & St. Louis, was appointed district director in charge of the railroads in the Ohio-Indiana district.

P. E. Crowley, vice-president of the New York Central, was appointed federal manager of the New York Central and Lake Erie & Pittsburgh.

A. E. Stone, vice-president of the Erie, was appointed federal manager of that road.

F. P. Gutelius, vice-president and general manager of the Delaware & Hudson, was appointed general manager of that road.

F. L. Blendinger, vice-president of the Lehigh Valley, was appointed general manager of that road.

E. D. Bronner, vice-president and general manager of the Michigan Central, was appointed federal manager of the Michigan Central and Chicago, Kalamazoo & Saginaw with office at Detroit, Mich.

F. H. Alfred, president and general manager of the Pere Marquette, was appointed federal manager of that road with office at Detroit, Mich.

A. B. Newell, president and general manager of the Toledo Terminal, was appointed general manager of that road with office at Toledo, Ohio.

H. E. Whittenberger, general manager of the Western Lines of the Grand Trunk, was appointed general manager of these lines with office at Chicago, Ill.

NEW ENGLAND DISTRICT

B. R. Pollock, general manager of the Boston & Maine, has been appointed federal manager of that road with office at North Station, Boston, Mass.

District Directors, Federal and General Managers

J. H. Hustis
District Director of the New England
Railroads

H. A. Worcester
District Director of the Ohio-Indiana
District

P. R. Todd
Assistant to District Director New
England Roads.

P. E. Crowley
Federal Manager, New York Central

A. J. Stone
Federal Manager of the Erie

F. L. Blendinger
General Manager, Lehigh Valley

F. P. Gutelius
General Manager, Delaware & Hudson

E. D. Bronner
Federal Manager, Michigan Central

F. H. Alfred
Federal Manager, Pere Marquette

H. E. Whittenberger
General Manager, Grand Trunk
Western Lines

Federal Managers and General Managers

H. M. Biscoe
Federal Manager, Boston & Albany

E. J. Pearson
Federal Manager, New York, New
Haven & Hartford

G. L. Peck
Federal Manager, Pennsylvania Lines
West

C. W. Galloway
Federal Manager, Baltimore &
Ohio Lines West

J. A. Gordon
General Manager, Detroit,
Toledo & Ironton

G. T. Jarvis
General Manager, Rutland
Railroad

E. H. Coapman
Federal Manager, Southern
Railway

C. M. Kittle
Federal Manager, Illinois Central.

R. V. Taylor
Federal Manager, Mobile & Ohio

W. A. Winburn
Federal Manager, Central of Georgia

H. M. Biscoe, vice-president of the Boston & Albany, has been appointed federal manager of that road with office at South Station, Boston, Mass.

E. J. Pearson, president of the New York, New Haven & Hartford, has been appointed federal manager of the New York, New Haven & Hartford and Central New England with office at New Haven, Conn.

D. C. Douglass, general manager of the Maine Central, has been appointed general manager of that road with office at Portland, Me.

J. W. Wardlaw, assistant to president and purchasing agent of the Central Vermont Railway, has been appointed general manager of the same road, with office at St. Albans, Vt.

L. G. Coleman, superintendent of the Grand Trunk System, has been appointed general manager of the Grand Trunk Railway in New England, with office at Portland, Me.

G. T. Jarvis, vice-president and general manager of the Rutland Railroad, has been appointed general manager of that road, with office at Rutland, Vt.

OHIO-INDIANA DISTRICT

G. L. Peck, vice-president in charge of operation of the Pennsylvania Lines West, has been appointed federal manager of the Pennsylvania lines west of Erie and Pittsburgh; Cincinnati, Lebanon & Northern and Lorain, Ashland & Southern, with office at Pittsburgh, Pa.

C. W. Galloway, general manager of the Baltimore & Ohio Western Lines, has been appointed federal manager of the Baltimore & Ohio Railroad, west of Parkersburg and Pittsburgh, and Dayton & Union Railroad, with office at Cincinnati, Ohio.

E. M. Costin, general superintendent of the Cleveland, Cincinnati, Chicago & St. Louis, has been appointed federal manager of the Cleveland, Cincinnati, Chicago & St. Louis Railway, Cincinnati Northern Railroad, and Central Indiana Railway, with office at Indianapolis, Ind.

B. C. Stevenson, general traffic manager of the Toledo, St. Louis & Western Railroad, has been appointed general manager of that road, with office at Toledo, Ohio.

J. P. Main, general manager of the Detroit & Toledo Shore Line, has been appointed general manager of that road, with office at Detroit, Mich.

G. J. Derbyshire, division superintendent of the Chesapeake & Ohio Railway, has been appointed general manager of that road, with office at Peru, Indiana.

J. A. Gordon, general manager of the Detroit, Toledo & Ironton Railroad, has been appointed general manager of that road, with office at Detroit, Mich.

M. S. Connors, general manager of the Hocking Valley Railway, has been appointed general manager of that road, with office at Columbus, Ohio.

H. A. Boomer, general manager of the Lake Erie & Western Railroad, has been appointed general manager of that road, with office at Indianapolis, Ind.

Federal Managers for Southern Roads

B. L. Winchell, regional director of the Southern region, on June 7 announced the appointment of federal managers for most of the principal roads in the Southern region, to have jurisdiction over all departments of their respective railroads, reporting to the regional director, effective on June 8, as follows:

E. H. Coapman, vice-president in charge of operation of the Southern Railway System, was appointed federal manager of the Southern Railway System, the Georgia Southern & Florida, the Alabama & Vicksburg, the Carolina, Clinchfield & Ohio, and Carolina, Clinchfield & Ohio of South Carolina, with office at Washington, D. C.

C. M. Kittle, vice-president of the Illinois Central, was appointed federal manager of the Illinois Central, the Yazoo

& Mississippi Valley and the Gulf & Ship Island, with office at Chicago, Ill.

W. L. Mapother, first vice-president of the Louisville & Nashville, was appointed federal manager of the Louisville & Nashville and the Louisville, Henderson & St. Louis, with office at Louisville, Ky.

R. V. Taylor, vice-president and general manager of the Mobile & Ohio, was appointed federal manager of that road and the Gulf, Mobile & Northern, with office at Mobile, Ala.

W. A. Winburn, president of the Central of Georgia, was appointed federal manager of that road, with office at Savannah, Ga.

J. H. Young, president of the Norfolk Southern, and federal manager of the Virginian, was appointed federal manager of the Norfolk Southern, with office at Norfolk, Va.

Appointments by Western Regional Director

S. G. Strickland, general manager of the Lines East of the Chicago & North Western was appointed federal manager of that road with office at Chicago. F. Walters, general manager of the Lines West of the Chicago & North Western, was appointed general manager of the whole system with headquarters at Chicago. W. J. Towne, assistant general manager of the Lines East of the Chicago & North Western, was appointed assistant general manager of all lines with headquarters at Chicago. E. E. Nash, assistant general superintendent of the Chicago & North Western at Boone, Ia., was appointed assistant to the federal manager of that road with office at Chicago.

Increased Rates

The increased passenger fares went into effect on June 10 with comparatively little protest. There was one complaint because the Long Island Railroad announced its intention of applying a rate of 3 cents a mile on its Atlantic avenue division running into Brooklyn, but it was decided at Washington that this was a commutation service and that the rates could be increased only by 10 per cent.

An advance in the fares of the Hudson & Manhattan Railroad, including an increase from 5 to 10 cents in the tunnels, also brought a storm of protest, and an effort was made to have the Long Island ruling applied, but it was stated that the increase in tube fares had been personally approved by Mr. McAdoo. On Saturday, however, it was ordered that there should be no increase pending an investigation, and a similar order was made as to the fares on railroad ferry boats between New Jersey and Manhattan points.

Some complications were caused by the fact that the new tariffs covering the passenger fares were not ready until shortly before they took effect. For example, a Washington man who was going to New York on a train at 12:10 a. m. Monday, tried to buy his ticket and reserve his berth on Friday. This is an advisable and sometimes necessary precaution in these days. But he was told that the agent could not sell him a ticket for that train until midnight Sunday, and that he could not sell him a prepaid order because he did not know what the rate would be. Contemplating the difficulty of purchasing a ticket in ten minutes, the man decided to take a train leaving Sunday afternoon.

A conference of the regional passenger traffic committees has been called to meet in Chicago on June 17, with Gerrit Fort, assistant to the director of traffic in charge of passenger matters, to discuss modifications of the rates for tourist and excursion fares.

Division of Operation

Circular No. 32, issued by Director General McAdoo, announces that the name "Division of Transportation" is changed to "Division of Operation," and Carl R. Gray, heretofore director of the Division of Transportation, is appointed director of the Division of Operation.

Railroad Contract Negotiations

Negotiations between the committees representing the railroads and the Railroad Administration over the standard form of contract for the compensation to be paid the railroad companies by the government are proceeding slowly with little prospect of an agreement on the terms much before July 1, when the government wishes to have the matter settled, because by that time it will have to make its decisions as to which of the short lines are to be retained under federal control or relinquished. Another conference between the committees was held on Monday and three more were to be held later in the week. The railroad committees, headed by Alfred P. Thom, counsel for the Railway Executives' Advisory Committee, is apparently proceeding in an effort to maintain the negotiations on an amicable plane, while the special committees representing the National Association of Owners of Railroad Securities have apparently delayed a settlement by a more belligerent attitude of insistence in behalf of the security owners. These committees were represented at the conference by S. Davies Warfield, president of the association, and Samuel Untermeyer, counsel, who recently gave out statements to correct an impression that a satisfactory agreement was in sight, following the meeting of railway executives in New York last week, at which the law committee made its report on the progress of the negotiations.

Both sides are reticent regarding the details of the points in controversy but it is understood that the principal points on which there has been difficulty in reaching an agreement involve the extent to which there shall be departures from the so-called "standard return," the average of the net operating income for 1915, 1916 and 1917, and the extent to which the government may control the disposition of the money paid to the railroad as compensation. The government proposes to deduct from the compensation an amount to represent expenditures for maintenance in excess of the average for the three years and also to order a railroad to make improvements at its own expense regardless of their value to the railroad after the war and the extent to which these points are to be determined by the government or by the railroad have consumed much of the time of the negotiations.

A sub-committee of the law committee of the Railway Executives' Advisory Committee, which has been handling the negotiations for the railroads, made a report to a meeting of the executives at New York on June 5 and there was a protracted discussion of the position of the railroads with reference to the contract. It is understood that the executives adopted a resolution of approval of the work of the law committee, but that a difference of opinion developed between the railway executives and representatives of the National Association of Owners of Railroad Securities, who were represented by a sub-committee and a special committee headed by S. Davies Warfield, president of the association, as chairman, and represented by Samuel Untermeyer and B. H. Inness Brown as counsel. After a meeting of the sub-committee held on the following day a statement was given out by Mr. Warfield, which gives some indication of the present status of the negotiations, which have been given little publicity, as follows:

"If the published reports of the proceedings of Wednesday's meeting of the Railway Executives' Advisory Committee called to consider the contract between the government and the railroads have given the impression that there is a satisfactory agreement in sight between the contracting parties upon the fundamental points involved, that impression should be promptly corrected in the interest of and in justice to the security holders of the roads as well as the government.

"The two committees have been constantly following the

proceedings, one the sub-committee of the National Association of Owners of Railroad Securities, the other, a special committee, representing owners of railroad securities, through meetings held in Washington and elsewhere.

"After weeks of negotiations and careful study of the agreement in its present state of negotiation, the committees have reached the conclusion that it is acceptable in many vital particulars, but are hoping that through further negotiation a document will be evolved which will reasonably protect security holders of these vast properties. We believe that the procuring of a reasonable contract in accordance with the spirit of the President's proclamation, under which these roads were taken over by the government is essential to the stabilizing of the credit situation of the country and to the winning of the war. The billions of dollars for which the government must rely largely on the millions of holders of railroad securities can best be made available to the government by a just treatment of these most important interests. It is in that spirit and with the determination that no false step shall be taken at this critical time that might impair the stability of our financial structure in its direct bearing on the winning of the war, that these committees will endeavor to procure substantial modifications in the tentative draft of contract, so far as the negotiations have progressed with the government officials. It is proper to say that in the negotiations none of the representatives of the security holders have as yet come into close contact with Director General McAdoo in the discussion of the questionable features of the contract.

"At the meeting of the railway executives yesterday the committees addressed a communication to Chairman T. DeWitt Cuyler, of that meeting. This letter contained a copy of an opinion given to the security holders' committee, by Samuel Untermeyer, of counsel, concurred in by associate counsel, in which Mr. Untermeyer takes serious exception to a number of the fundamental features of the proposed contract in its present form, which the security holders' committee unanimously endorsed. The committee's letter to Mr. Cuyler is in part as follows:

"During the earlier part of the negotiations for the contract, its formulation appeared to these committees a comparatively simple matter and they accordingly refrained from intervening, contenting themselves with keeping advised of the negotiations, but it gradually became evident that the contract was developing upon lines that involve a far-reaching departure from the spirit and principles of the President's proclamation and embodying conditions that these committees regard as imperiling the integrity of the properties and the fundamental rights of the security holders.

"When by reason of the constantly increasing demands of the government representatives, this conclusion appeared irresistible, the committee asked and received permission, through counsel, to take part in the negotiations that had been for months proceeding without their presence or participation. It was felt that the association and the special committee could no longer consistently with the purposes of their organizations, escape this responsibility in the crisis that is now confronting the security holders, especially in view of the facts (1) that the contract expressly requires ratification by the stockholders of railroads, (2) that if it is recommended for execution in its present substance of form (which to these committees is unthinkable), the values of railroad bonds and stocks will be gravely imperilled, and (3) that the officers and directors who are now acting for their respective roads were elected by the shareholders under normal conditions of private operation, to perform the current duties of management, and that no such vast power as is now proposed to be exercised by them in tentatively committing their respective companies to this contract, was contemplated. The committees respectfully insist that no

such power should be attempted to be exercised by the executives beyond a mere recommendation to the shareholders for or against the adoption of a contract.

"The views of the committees upon the leading feature of the contract in its present stage of negotiations, so far as its terms have been permitted to become known to the committees or their counsel, Samuel Untermeyer and B. H. Inness Brown, are set forth in the accompanying report of counsel, which has been adopted by the committees in its entirety, and which we will ask you to be good enough to read in full at your tomorrow's meeting in conjunction with this letter.

"In our judgment, the contract should be redrafted in its main features.

"It is, however, their earnest hope and expectation that by the exercise even at this late date of a fair amount of firmness in the association and maintenance of the just rights of the security holders, a reasonable, workable agreement may yet be possible through further negotiations. Our right to be active in these proceedings has been questioned. We represent vast interests in railroad ownership. We were organized to protect that ownership. These committees shall, therefore, continue their efforts to secure a contract which will be fair alike to the owners of railroad securities and to the government. To that end, the undersigned committees will gladly co-operate with your representatives.

"We are facing the imminent peril of the destruction of great property values.

"If and when your body shall conclude upon recommending any action upon the proposed contract we hereby request (1) that action upon the proposed contract be made the subject of special meetings of directors of each railroad. (2) that copies of the proposed contract be sent to each director in advance of the meeting at which action is to be asked, (3) that action upon the contract at the stockholders' meeting be likewise made the subject of a special meeting, and (4) that the stockholders be fully advised of the terms of the proposed contract."

The sub-committee representing the railways consists of Alfred P. Thom, general counsel for the Railway Executives' Advisory Committee; A. H. Harris, vice-president of the New York Central; Burton Hanson, general counsel of the Chicago, Milwaukee & St. Paul; J. P. Blair, general counsel of the Southern Pacific; C. W. Bunn, general counsel of the Northern Pacific; F. I. Gowen, general counsel of the Pennsylvania Railroad, and S. T. Bledsoe, general counsel of the Atchison, Topeka & Santa Fe.

Safety Committees

C. R. Gray, director of the Division of Transportation, has issued Circular No. 5, ordering the organization of safety committees, as follows:

"In order to promote the safety of employees and travelers upon railroads, establish uniformity in the important principles of safety work, and carry out the purpose of the director general's Circular No. 7 of February 19 creating the Safety Section of the Division of Transportation, safety committees, composed of officers and employees, shall be organized on all railroads under federal control.

Each Class I railroad having more than one superintendent shall have a general or central safety committee, composed of the active heads of each department. In addition there shall be formed in each superintendent's territory, and at the principal shops and terminals, with the ranking officer as chairman, division, shop and terminal committees, which shall consist of the heads of departments and one employee representative from each class of service.

"On Class I railroads having but one superintendent it will be satisfactory to have one general committee, composed of department heads and employees representing each class

of service, and such other shop or terminal committees as are found necessary.

"Each carrier shall designate an officer or employee, who will be responsible for the safety work on his road. His name and address, together with detailed information concerning the safety organization perfected, should be furnished the manager of the safety section not later than August 1."

Ghost of Sherman Law Postpones Express Contract

Signature of the contract with the express companies providing for their consolidation was postponed for a time, although it was approved by Director General McAdoo over two weeks ago, because someone objected to the President about a provision in the agreement that seems to project the merger into the period after the war by providing that the express company shall conduct express business for the railroads after the termination of federal control at their request. The idea seems to be that the consolidation of competing companies during the war is all right but that the Sherman law will be in effect afterward. It is understood that the President asked that the contract be held up until this difficulty was ironed out but that it was corrected after Mr. McAdoo had had an opportunity to discuss the matter with the President on Monday. A plan has also been agreed upon which the three express companies owned by railroads will lease their property to the new express company, the rental thus received to go into their outside income.

Agricultural and Industrial Development Work

Industrial department work, of the kind that has resulted in the past from the competition between railroads for the location of industrial plants, is to be discontinued, according to a circular issued by B. L. Winchell, regional director for the Southern District, outlining the policy of the Railroad Administration towards the establishment of new industries and the development of natural resources. The circular says that increase in agricultural production is a very necessary effort at this time; the development of certain natural resources is also very desirable; new industries in the Southern section which will contribute to the production of essentials are very desirable and should be encouraged; but offers of rate adjustments which discriminate against similar industries already in operation in the same or other sections as an inducement to locate on a given line as against another line, and the like, should not be made. The supervision of the activities relating to the promotion of agriculture and industry, the circular directs, should be placed under the jurisdiction of the freight traffic department, because there is a certain amount of consideration or investigation which must be given by freight traffic officers to every industrial or agricultural proposition. The agricultural work, hereafter, should be directed to increase the production, better the quality, better the preparation for market, teach the use of safer containers, proper loading of cars, heavier car loading, and in other ways aid and encourage the producers.

Car Thieves Indicted

The Section for the Protection of Railroad Property, which is conducting a campaign to prevent pilfering from railroad freight cars, has announced the indictment by a federal grand jury at Toledo, Ohio, of 89 persons, including a yardmaster and several railroad employees, in connection with a series of systematic car robberies extending over a period of years. Arrests have also been made at other large switching centers, including Chicago, St. Louis, Pittsburgh, Detroit and Jersey City.

In order that freight cars may be utilized to the maximum by loading in one car when possible two or more shipments each subject to published minima and rates the

same as if loaded separately, the following rules governing the double and triple loading of cars have been adopted by the car service section after careful consideration; and railroads are instructed in Circular CS-12 to issue the necessary instructions in accordance therewith, effective June 1, 1918, so that instructions may be uniform on all railroads.

1. Consignments may be of the same or of separate destinations. If for two or more destinations, intervening consignments must be to agency stations directly en route to the final destination.

2. Each consignment must be properly marked, showing consignee and destination, and must in material be so marked to facilitate the marking of each consignment with the ease, possibility of confusion, error, loss or damage.

3. Bills of lading and separate waybills must be made so as to distinguish each consignment as if loaded in a separate car. Waybills must plainly indicate that car contains two or more separate shipments and should be plainly endorsed "Car contains more than one load, stop at _____ for partial unloading."

4. No diversion or change of destination or reconsigning in transit will be allowed, except where, under published rules, it may be in the same direction and over the same route as in the initial shipments after previous shipments have been unloaded. Movement to final destination will not be considered a reconsigning.

5. Switching or lighterage charges, if any, will be assessed for delivery at each destination, according to current switching tariffs. No switching or lighterage charge will be made against shipper or consignee for return of car to carrier at one destination for its continued journey beyond. The inbound carrier will absorb such charge if any.

6. Agent must supervise unloading and make careful check on quantity and condition of consignment for his station. He must see to it that load remaining in car is retransferred, if necessary, to protect it from damage. He must note on waybill that part of load, for his station, has been removed. He must see that car is promptly reported for movement to next destination.

7. When shipments are for the same destination, notice of arrival and demurrage will be handled as follows:

(A) Where two or more consignments take bulk truck delivery, all consignees will be promptly notified of arrival of car, that simultaneous unloading may be accomplished.

Consignees responsible for detaining car beyond free period must pay the demurrage charge. In the event that more than one consignee fails to remove contents within free period, demurrage will be collected pro rata.

(B) Where one consignee takes bulk truck delivery and another private track delivery, each transaction will be independent of the other, and demurrage will be charged accordingly.

8. Double or triple loading of consignments billed "shipper's order" will not be permitted unless the name and address of the party or firm to be notified is shown on the original shipping instructions and the location of such party or firm is at the billed destination of the consignment.

The Car Service Section, in Circular No. C. S. 13, has promulgated the following rules for the guidance of all carriers in distributing open top cars:

1. Open top cars, suitable for such traffic, should be furnished preferentially for the transportation of coal, coke, ore, and raw materials used in blast furnace operation.

2. Available open top cars, not suitable for the transportation of coal, coke, ore, or raw materials used in blast furnace operation, may be furnished for the transportation of stone, sand and gravel, and when so furnished shall be used preferentially for highway maintenance materials.

3. Open top cars, suitable for the transportation of coal, coke, ore, or raw materials used in blast furnace operation and available on roads producing the same in excess of the demand of such commodities, may be furnished for the transportation of stone, sand and gravel, and when so furnished shall be used preferentially for highway maintenance materials. The return movement to mines or ovens should be utilized wherever practicable in furnishing car supply for stone, sand and gravel. Every endeavor should be made, consistent with keeping up the production of coal, coke, ore and raw materials used in blast furnace operation, to furnish shippers of stone, sand and gravel with a minimum of forty per cent of their normal weekly transportation requirements.

4. Roads which are not producers of coal, coke or ore must not use foreign open top equipment for stone, sand or gravel shipments, except for one load in the course of the return movement to mines or ovens.

5. Where the transportation needs of essential road construction or maintenance projects cannot be met by car supply furnished in accordance with the above rules, the state, county, or municipal officials in charge of the work, should, through their proper state highway department, apply to the director of the Bureau of Public Roads, United States Department of Agriculture, Washington, D. C., for assistance. Such applications will be considered by representatives of the Department of Agriculture, the War Department, the War Industries Board, the Fuel Administration and the Railroad Administration, and in accordance with the recommendations of such representatives, the Car Service Section will endeavor to furnish car supply necessary for approved essential road construction or maintenance.

"It must be understood that car supply for stone, sand and gravel must not be permitted to jeopardize the essential production of coal, coke or ore. If at any time such a result is apparent on individual roads, or generally, orders will im-

mediately issue to curtail the car supply for stone, sand and gravel."

State Commissions Ask Suspension of Rate Order

Members of the state railroad commissions, acting through the National Association of Railway and Utilities Commissioners, have been exerting themselves strenuously to rescue the prerogatives of the state commissions from the fate of oblivion which Director General McAdoo's General Order No. 28 would create as far as their control over rates is concerned. The efforts of the state commissions included a conference in Washington on June 4 and 5, attended by commissioners from 21 states, including the executive and special war committees of the association, which was described in a statement issued by C. E. Elmquist, their Washington representative, as "for the purpose of considering plans looking towards effective co-operation between the states and the federal government in the operation of the railroads," and a pilgrimage on June 6 to White Sulphur Springs for a conference with Director General McAdoo, after which they returned to Washington and discussed their troubles further with C. A. Prouty, director of the Division of Public Service and Accounting.

At the meeting at Washington resolutions were adopted covering four specific points as follows:

1. That the states should continue to exercise their lawful police powers over such things as street cars, railroad crossings, safety appliances, train clearance times, station facilities, and the ordinary questions which are essentially of local concern.

2. That the states continue to exercise control over local rates, either according to the laws of several states, or acting as agencies to be appointed by the director general under the provisions of section 8 of the Railroad Act; and that all intrastate rates, as well as interstate rates affecting the same, be filed with the state commissions according to law.

3. That unless the war emergency is controlling, General Order No. 28, increasing freight and passenger rates should be suspended for a reasonable time to permit readjustments to be made in relationships as well as in class and commodity rates.

4. That additional public representation should be made in the director general's official family.

At the conference at White Sulphur Springs, requested by Mr. McAdoo, these resolutions, as well as arguments and a petition were presented to him. A statement regarding the conference given out from Mr. Elmquist's office said:

"Attention was called to the fact that General Order No. 28 does not prescribe a uniform increase, that class rates are increased from 25 per cent to 350 per cent, commodity rates from 25 per cent to 300 per cent, and passenger fares from 10 per cent to 300 per cent.

"Generally speaking the commissioners are of the opinion that increased rates should be made so far as necessary to take care of the higher operating cost of the railroads during the war, but insist that this increase should be applied to the existing state and interstate rates and classifications. They argued that there is nothing in the present situation which justifies the complete emasculating of the rate schedules which are the result of years of thought and experience and emphasized the fact that the rate order will result in innumerable injustices and discriminations to shippers and communities and that irreparable injury will fall upon thousands of people and industries.

"In their opinion investigations should proceed upon two lines: First, to immediately take care of necessary rate relationships and those increases which will cause undue hardships to shippers, and also the effect of the elimination of state rates. No radical changes in rate structure should be incorporated in an order intended to meet a definite emergency. If any other changes are desirable they should be made only after careful investigation and the hearing of all interested parties. They also believe that a very complete investigation should be made by the Interstate Commerce Commission as to the reasonableness of the increased rates as provided in General Order No. 28.

"The director general gave assurance that reasonable ad-

justments especially in those cases where grievous injury would be done, might be taken care of before June 25 and that Judge Prouty was authorized to deal with those matters."

Not entirely satisfied with the newspaper accounts of the conference obtained from the state commission's side, Mr. McAdoo had an account of the meeting telegraphed from White Sulphur Springs on the following day. From this it appears that the state commissioners explained to him that they did not come to criticize or to complain but simply to seek a basis of co-operation between the state commissions and federal control of railroads. They emphasized the patriotic purpose of their visit, and assured the director general that they were ready to stand back of him to the limit and co-operate with him in every possible way to make the railroads of the country function at the highest notch of efficiency in the support of the war purpose of the nation.

The director general assured them of his appreciation of their support, and told them that he welcomed their co-operation. He expressed regret that he had not been able to confer with the state commissions before determining upon the increased railroad rates but that immediate action was vitally necessary, and months would have elapsed necessarily before each commission could have submitted its suggestions, while, in the meantime, the railroad deficit would have been steadily mounting. It was imperative for rates to be raised on account of the heavy increases in wages, in materials, in fuel, etc.

If it is found that these rates are more than sufficient to cover the necessary expenses of the railroads, then, of course, rates will be reduced. He said to the commissioners that he would be glad to consider any readjustments of rates to fit conditions as they develop. The American people, who are the consumers and must bear the increases of rates in the last analysis, the director general pointed out, are ready to make every sacrifice demanded of them to win this war.

As to the exact definition of the relationship of the state commissions to federal control, the director general stated that this was impossible to make in a general order. This relationship can only be defined as we go along. It would be an evolutionary process. The director general requested the commissioners to appoint a committee to see whether any way could be devised by which a proper synchronization of effort, a proper co-ordination of resources, could be obtained. He assured them that he would welcome such a report and would give it his most earnest consideration. But, in the meantime, the state commissions can render a very great service to the country by advising him regarding matters within their jurisdiction.

Important modifications are likely to be made in Director General McAdoo's order prescribing increases in freight rates before it becomes effective on June 25. The most important change is to be made to meet the objections of the state railroad commissions who complained, not only because their authority was completely ignored by an order to first raise state rates to the level of interstate rates in the same territory, and then to apply increases to rates thus raised, but because this plan would result in advances ranging as high as 300 per cent in some cases. After consideration of the state commissioner's protest, it has been decided to apply the percentage and specific advances directly to existing state rates and classifications, without a preliminary advance; other modifications to be made are elimination of the \$15 minimum rate per car on some commodities, the application of rate increases to purely switching movements which are not in connection with a line haul, and the application of only one increase in the case of a rate made up of the combination of two or more rates, except where the advance is a percentage; some consideration has also been given to a modification of the order eliminating export and import rates.

Board to Adjust Controversies with Shop Employees

Director General McAdoo has issued General Order No. 29 putting into effect as of May 31 an understanding between the regional directors, representing the railways in their respective regions and the officers of the Railway Employees' Department of the American Federation of Labor, the International Association of Machinists, the International Brotherhood of Boiler Makers, Iron Shipbuilders and Helpers of America, the International Brotherhood of Blacksmiths and Helpers, the Brotherhood of Railway Carmen, the Amalgamated Sheet Metal Workers' International Alliance, and the International Brotherhood of Electrical Workers, providing for the adjustment of all controversies growing out of the interpretation or application of the provisions of wage schedules or agreements which are not promptly adjusted by the officials and employees on any of the railroads operated by the government.

The memorandum of agreement is similar to that between the regional directors and the brotherhoods of train employees, which provided for reference of controversies to Board of Adjustment No. 1.

Classification of Budgets for Capital Expenditures

The Railroad Administration on Wednesday announced the classification of budgets of capital expenditures for all railroad and terminal companies for 1918 as approved by the Division of Capital Expenditures with some additions, bringing the previously announced total up to \$946,000,000. The classification of work is as follows:

| Capital Expenditures. | Class of Work. |
|--|----------------|
| Widening cuts and fills, filling trestles, etc. | \$4,969,000 |
| Pallasting | 9,524,000 |
| Rails and other track material | 31,556,000 |
| Bridges, trestles and culverts | 38,035,000 |
| Tunnel and subway improvements | 2,195,000 |
| Track elevations or depressions | 6,691,000 |
| Elimination of grade crossings | 7,784,000 |
| Grade crossings and crossing signals | 640,000 |
| Additional main tracks | 47,471,000 |
| Additional yard tracks, sidings and industry tracks | 98,661,000 |
| Changes of grade or alignment | 5,363,000 |
| Signals of interlocking plants | 11,147,000 |
| Telegraph and telephone lines | 5,031,000 |
| Roadway machinery and tools | 954,000 |
| Section houses and other roadway buildings | 1,510,000 |
| Fences and snowsheds, right-of-way snow or sand fences | 817,000 |
| Freight and passenger stations, office buildings, etc. | 22,940,000 |
| Hotels and restaurants | 99,000 |
| Fuel stations and appurtenances | 6,164,000 |
| Water stations and appurtenances | 13,347,000 |
| Shop building, engine houses | 61,979,000 |
| Shop machinery and tools | 10,544,000 |
| Electric power plants, substations, transmission lines, etc. | 10,771,000 |
| Wharves and docks | 3,236,000 |
| Coal and ore wharves | 7,024,000 |
| Grain elevators and storage warehouses | 2,954,000 |
| Real estate | 3,357,000 |
| Assessments for public improvements | 1,171,000 |
| All other improvements | 28,491,000 |
| Total (excluding equipment) | \$445,639,000 |
| Locomotives | \$199,075,000 |
| Freight-train cars | 206,994,000 |
| Passenger-train cars | 28,340,000 |
| All other equipment | 12,963,000 |
| Improvements to existing equipment | 35,043,000 |
| Total equipment | \$482,417,000 |
| Construction of extensions, branches and other new lines | 18,237,000 |
| Total | \$946,293,000 |

Payment of Freight Charges

Director General McAdoo on Wednesday, postponed the accepted date of General Order No. 25, which provides for taking the collection of transportation charges on a cash basis, from July 1 to August 1. The rule, however, will not apply to transportation service rendered through the departments or bureaus of the United States government to the Allies, to the states, counties and municipalities, to the District of Columbia, Alaska and the American Red Cross.

On Wednesday, Director General McAdoo announced the creation of three new Regional Districts in the West. Complete details concerning these new regions and their directors and other late news of the doings of the railroad administration will be found on page 1439.

Standardization of Indian Railways' Locomotives

Developed by British Engineering Standards Committee
for the Secretary of State for India

By E. C. Poultney

M. Am. Soc. M. E., A. M. Inst. Mech. E.

THE ADVANTAGES TO BE EXPECTED in establishing a standard design of locomotive may be divided under three headings. One would be first cost, as makers having once obtained all the necessary fixtures for machining the details, and the required flanging blocks and other equipment for making the boilers, would be able to manufacture at a minimum cost; in the second place, operating costs would be lower, due to less costly repair parts and owing

to the fact that the locomotive department is vested keep an open mind. Improvement in detail should always be kept in view and advantage taken of any real improvement when such can be suggested. If this is done, keeping in mind that modifications decided on should be such that they are applicable to as many engines as possible, standards will not be sacrificed.

The railways in India are supplied almost entirely with

Standard 4-4-0 Type Passenger Locomotive with Alternate Boilers, 5-ft. 6-in. Gage, Tractive Effort, 19,480 lb.

to the less variety of such parts to be kept in stock, less quantities of each article would be required and the outlay in the value of repair parts would be less. From the point of view of the operating department, advantage is gained from the fact that the wheels and motion of one engine may be used for another engine should occasion arise. In this connection also the value of standard boilers for engines for both passenger and freight service cannot be over-estimated,

equipment made in Great Britain, constructed under the supervision of the consulting engineers acting for the particular railway company ordering the locomotives, and the standard engines now under review were designed at the request of the Secretary of State for India by the Engineering Standards Committee, which was inaugurated in 1901 under the auspices of the leading engineering institutions.

A conference of locomotive superintendents was held in

Standard 4-4-2 Type Passenger Locomotive, 5-ft. 6-in. Gage, Tractive Effort, 20,533 lb. Six-Wheel Tenders May Be Used as Alternate

as using the boiler of one engine to replace the boiler of another often makes it possible to get an engine out of the shops much sooner than would otherwise be possible.

To set against these advantages there is the certain fact that standardization is likely to retard progress in design and development, unless those in whose hands the admin-

Calcutta in December, 1901, at which the question of standardization was considered, and the Locomotive Committee appointed by the Engineering Standards Committee was subsequently formed, composed of members representing the following interests: Government departments, consulting engineers, locomotive builders, locomotive material manufac-

turers, British railways locomotive engineers, Calcutta Locomotive Conference. The committee meets yearly and discusses improvements in design, and the reports received from India submitted by the various locomotive superintendents.

It will be seen that the committee formed represented all the interests connected with the locomotive building industry, and might be considered well able to come to decisions on this important subject.

In general the aim of the Locomotive Standards Committee was to design locomotives, the principal features of which should be standard both in regard to design and dimensions and to the materials used in construction. The boilers and their details, wheels, tires, axles, bogies, frames and frame details, cylinders and motion are the same for each type of engine, and in many instances, such as in the case of the

Commencing in 1903, the first standard locomotives were designed, consisting of two types—one for passenger and the other for freight service, for use on the 5-ft. 6-in. gage lines, and two classes of 4-6-0 engines with six-wheeled tenders and one type of 4-8-0 engine with six-wheeled tender for use on the metre gage lines.

Considering first the broad gage engines, the passenger locomotives were of the 4-4-0 type fitted with six-wheel tenders, and the engines for goods or freight traffic were of the 0-6-0 type, also having six-wheel tenders.

Three chief features were first of all decided, namely, that the working steam pressure should be 180 lb., that inside cylinders should be employed, and that the boilers should be of the Belpaire pattern. This type of boiler was decided on for the reason as stated by the committee, that "it

TABLE I—DIMENSIONS OF 5 FT. 6 IN. GAGE STANDARD LOCOMOTIVES

| Type | Cylinders | Coupled wheels, diameter | Heating surfaces, sq. ft. | | | Grate area, sq. ft. | Weight on coupled axles, tons | Total weight, tons |
|-------|-----------------------|--------------------------|---------------------------|------------|----------------|---------------------|-------------------------------|--------------------|
| | | | Tubes | Firebox | Total | | | |
| 4-4-0 | 18½ in. by 26 in..... | 6 ft. 2 in. | • 1,230 • 1,453 | 128 150 | 1,358 1,603 | 23.3 27.0 | 33.2 35.0 | 52.0 54.5 |
| 0-6-0 | 18½ in. by 26 in..... | 5 ft. 1½ in. | • 1,230 • 1,453 | 128 150 | 1,358 1,603 | 25.3 27.0 | 49.0 51.5 | 49.0 51.5 |
| 2-6-4 | 18½ in. by 26 in..... | 5 ft. 1½ in. | • 1,230 • 1,453 | 128 150 | 1,358 1,603 | 25.3 27.0 | 45.0 46.3 | 76.5 79.3 |
| Tank | | | | | | | | |
| 4-4-2 | 19½ in. by 26 in..... | 6 ft. 6 in. | 1,833 | 157 | 1,990 | 32.0 | 35.0 | 67.25 |
| 4-6-0 | 19 in. by 26 in..... | 6 ft. 2 in. | 1,833 | 157 | 1,990 | 32.0 | 50.5 | 69.0 |
| 2-8-0 | 20 in. by 26 in..... | 6 ft. 8½ in. | 1,914 | 173 | 2,087 | 32.0 | 63.5 | 71.5 |

* Alternative boiler with barrel 5 ft. 1½ in. dia. outside smallest course, 11 ft. long. Steam pressure 180 lb. in all instances.

broad gage 4-4-0 and 0-6-0 types, the 4-4-2 and 4-6-0 types, and the metre gage 4-6-0 type engines for passenger and mixed traffic, the boilers interchangeable.

Owing to the different conditions met with on the various roads, certain details are left to the discretion of the locomotive superintendents of the railways concerned, such details being the design of the chimney and spark arrester device, if any be fitted, also the arrangement of the ash-pan and fire-bars and other details of a similar nature.

The materials used and the design of such parts as are intended to be retained to the specified standards are included in the comprehensive lists drawn up by the committee and known as "Instructions to Designers." These lists de-

gives more steam and water capacity than the usual arrangement with semi-circular outside shell and girder stays for the inside firebox, and with increasing pressures and larger fireboxes the length and weight of girders become excessive and direct staying has to be resorted to." The cylinders motion operated the valves through the medium of rockers. The valves were of the semi-balanced type. The coupled wheels of the passenger engine were 6 ft. 2 in. in diameter, in conformity with Indian practice at the time, so that tires of a size already in extensive use could be employed. In like manner the wheels of the freight engine were made 5 ft. 1½ in. in diameter. Details such as axles, axle boxes, horn-

Standard 4-6-0 Type Passenger Locomotive for 5-ft. 6-in. Gage Lines, Tractive Effort 23,440 Lb. The Same Boiler Is Used on 4-4-2 Type Passenger Locomotive

tail the construction desired and specify the materials. The engines are all built strictly to the specifications, and their construction and the manufacture of the material used are carried out under the supervision of the consulting engineers.

Having reviewed the various types of engines working on the Indian railways, their chief features could be noted and also those characteristics either of design or in the dimensions of the important parts, which should be modified as experience indicated. In that way a starting point was attained.

blocks, cylinders, valves and pistons, valve motion and motion details were identical in each type, and the boilers were also interchangeable. Certain details were left to the individual requirements of the railway authorities, such as the kind of springs employed; helical springs were permitted for the driving axles in lieu of the laminated springs specified.

Latitude was also allowed regarding the brake equipment used, which could consist of either a steam brake acting on the engine and tender simultaneously with the va-

(3) A large double bogie eight-wheel tender, with space for 4,500 gal. of water and 10 tons of coal. Weight loaded, 58.5 tons.

The second report, besides the engines mentioned, described a side tank engine for local service, having the 2-6-4 wheel arrangement. In general, these engines follow closely

the one previously specified, when desired. The total heating surface was thereby increased from 1,358 sq. ft. to 1,603 sq. ft. and the grate area from 25.3 to 27.0 sq. ft. The weight of the 4-4-0 engine was increased from 52 tons to 54.5 tons and that of the 0-6-0 engine from 49 to 51.5

Standard 0-6-0 Freight Locomotive, 5-ft. 6-in. Gage, Tractive Effort, 23,440 Lb.

the 0-6-0 type goods engines, the cylinders, wheels and motion being identical.

These engines are allowed to have two different sizes of boiler:† (1) the standard boiler as fitted to the 0-6-0 goods

tons. More recently the engines of this type have been fitted with the larger type of boiler and have fire tube superheaters of the Schmidt type. The larger engines mentioned have also been superheated, and on this subject the Railways

Standard 2-8-0 Type Freight Locomotive for 5-ft. 6-in. Gage Lines, Tractive Effort, 29,819 Lb.

engines, and (2) a larger boiler, 5 ft 1 1/4 in. outside diameter at the largest course of the barrel.

Experience with the 4-4-0 and 0-6-0 type 5 ft. 6 in. gage engines showed that it might be advantageous to increase

in India Administration Report of 1915 states that "superheated engines fully justify the decision come to by many railway administrations, that all engines for main line work should be fitted with superheaters."

Standard 4-6-0 Type Passenger Locomotive for Meter Gage Lines, Tractive Effort, 15,022 Lb. A Similar Locomotive with Drivers 48 in. in Diameter and 16,706 Lb. Tractive Effort Is Used in Freight Service

the boiler capacity, and in 1910 a standard boiler 5 ft. 1 1/4 in. diameter was designed to be used as an alternative to

As will have been noticed, the first standard engines for the 5-ft. 6-in. gage lines had inside cylinders. while later, when the Ten-wheel heavy type engines were introduced, outside cylinders were adopted. This is explained by the fact that when the first engines were designed it was desired

†The larger boiler was designed in 1910 as an alternative for the 4-4-0 and 0-6-0 engines, and was subsequently adopted as an alternative boiler for the 2-6-4 tank engines.

to make them approximate as closely as possible to existing engines of the same type already in service, which had inside cylinders. The new engines were designed on the same general lines, opportunity being taken to improve the details of construction and bring them into line with the best practice obtaining at that time. On the other hand, when the Ten-wheel engines were designed, they represented a new departure in Indian locomotive practice and were designed to follow closely successful Ten-wheel engines of similar dimensions then operating in England, which engines had outside cylinders.

In construction the engines and tenders are all made from materials which comply with the requirements of the British

duced in diameter for a short length at the firebox end, and swelled for a short distance at the smokebox end. The domes are all built up, the section next the boiler being short in length, thus bringing the joint low down, an arrangement which facilitates the examination and repair of the "regulator" or throttle valve.

The framing is all of open hearth steel, the frame braces and motion plates being steel castings. The axle box guides are also steel castings and have adjusting wedges placed in front. Engine axle boxes are made of either bronze with white metalled bearings, or are either steel castings, steel forgings or wrought iron, in which cases they are fitted with bronze crown bearings, white metalled. Motion details are

Standard 2-6-2 Type Tank Locomotive for Meter Gage Lines, Tractive Effort, 18,648 Lb.

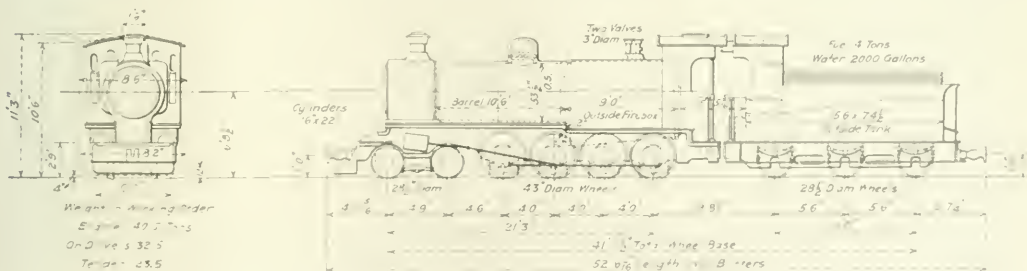

Standard Specification, wherever specifications have been drawn up to cover the particular requirement, and where such standard specifications do not exist the Indian State Railways Specifications, introduced by the late Sir A. M. Rendel, are used.

Generally, steel is used in preference to iron, and steel details are made without weld and all steel used is required to be made by the open hearth process. Exception to the above is to be found in the construction of the foundation, or mud rings and in the draw gear, which details are made of iron in all instances. The steel employed in the construction of the boilers, is all made by the open hearth acid

made of steel, those parts which are case hardened being lower in tensile strength than those not so treated. Coupling rods and connecting rods are milled out to an I-section.

Inside cylinder engines have four-bar guides, outside cylinder engines have two-bar guides and the guide bars on the metre gage engines are of the Laird type. Cylinders are, as usual, iron castings, as are also the pistons. The slide valves are of bronze.

The tenders for both the 5-ft. 6-in. and metre gage lines have outside framing, and the wheels and axles are of the same material as those used on the engines. Axle boxes and their guides are of cast iron. Bearings are of gun metal

Standard 4-8-0 Type Freight Locomotive for Meter Gage Lines, Tractive Effort, 21,218 Lb.

process. All the holes are drilled and steel rivets are used, all riveting being done by hydraulic pressure. Internal fireboxes are of copper with either copper or bronze stays in the water spaces. Copper rivets are used for the inside firebox and the riveting is specified to be done by hand. All boiler barrels are telescopic, the smallest course being next the smokebox. Direct stays are used to support the crown sheet and those adjacent to the tube sheet are arranged to allow for upward expansion of the firebox. Tubes are either of brass or solid drawn steel. When brass tubes are used they are ferruled at the firebox end. In all cases tubes are re-

white-metalled. The centre axle of six wheel tenders is permitted a certain amount of lateral motion by allowing side-play between the axle boxes and guides. In all instances a hand brake is fitted, acting on the tender wheels only. The tenders also have a cab made to correspond to that on the engine, and constructed and arranged in a similar manner. The materials employed in the construction of the engines and tenders comply with the requirements set out in Table IV.

The tables of dimensions give the principal particulars of the different locomotives which have been mentioned. All

weights are expressed in the English ton of 2,240 lb., and water capacities mentioned are all Imperial gallons.

In respect to results obtained in service, these engines seem to have met with a measure of success. In some instances, however, the large engines have been found to be rather heavy for the track. On the other hand, the 4-4-0 type passenger and the 0-6-0 type goods engines in general have been quite successful.

TABLE IV—BRITISH STANDARD SPECIFICATIONS

| | Ultimate tensile strength, tons per sq. in. | Elong. per cent |
|--|---|----------------------------------|
| Crank axles (oil hardened)..... | 30 | 25 min. |
| Crack axles (oil hardened)..... | 35 | 20 min. |
| Straight axles (yield point 50 per cent of ultimate)..... | 35-40 | 25-20 min. |
| Tires..... | 56-62 | 10-8 min. |
| Steel forgings (case hardened)..... | 27 max. | 25 min. |
| Other steel forgings for boiler, etc..... | 25-32 | 27-20 min. |
| Connecting rods, straps, bolts, coupling rods, crossheads, crank pins, eccentric cranks, etc..... | 32-27 | 25-20 min. |
| Slide bars, piston rods, cotter for cross heads, etc.; axle box guide wedges, gudgeon pins, reversing screws, etc..... | 40-45 | 20-15 min. |
| Boiler plates, sections and bars..... | 26-32 | 22 min. |
| Plates 3/8 in. thick and over, sections and bars 5/16 in. and over, except for boilers..... | 28-32 | 20 min. |
| Rivets (bars)..... | 26-30 | 16 min. for plates under 3/8 in. |
| Steel casting (wearing surfaces)..... | 35 min. | 25 min. |
| Steel casting (wheels)..... | 26 min. | 15 min. |
| Copper firebox plates..... | 14 min. | 35 min. |
| Copper rods for stays..... | 14 min. | 40 min. |

NOTE.—Test pieces used are to British standard sizes, having cross section areas proportional to the length on which the elongation is measured.

Orders of Western Regional Director

R. H. AISHTON, regional director of western railroads, Chicago, has issued the following circulars during the last week:

In Supplement No. 2 to Circular No. 50, dated June 4, it was ordered that all lettered signs on the rear of passenger trains be discontinued.

Circular 121, dated June 6, orders that no contracts for repair of cars be placed at outside shops without first securing the approval of the regional director. The Car Repair Section is making an extensive inquiry and will be prepared to undertake necessary car repair work which cannot be done in the railroads' own shops.

In a communication to western railroads on June 4, the regional director announces that railroads which have subscribed in the past to publications for the benefit of employees may continue in the same general policy but shall not radically increase or decrease number of subscriptions.

Supplement No. 4 to Circular No. 65, dated June 6, states that, until otherwise ordered, contributions in reasonable amounts by railroads to Railroad Y. M. C. A.'s are authorized by the railroad administration.

Circular 119, dated June 6, announces that no posters soliciting labor for private industries shall be placed in railroad stations, except when expressly authorized by a proper officer of the railroad company with the distinct understanding that he has authority of the railroad administration.

In a letter dated June 4, the regional director announces that the household goods of an employee of a government-controlled railroad may be transported free of charge over any railroad under federal control in case of his transfer from one place to another. Cartage to and from stations will not be allowed.

Circular No. 123, dated June 6, reads: Where witnesses or others are summoned to Washington by either of the railroad boards of adjustment, round trip transportation shall be furnished by the line on which the individual is employed. Notice from either of the boards requiring the attendance shall be considered sufficient authority for issuance of trans-

portation and it shall be promptly issued and the notice filed with the pass records at office of issuance.

In a letter to western roads, dated June 6, the regional director directs that no sale of locomotives or cars be made without authority from his office. Lines having equipment for sale or wishing to lease or buy equipment will report such wants so that it may be determined if a transfer can be made between lines within the regional territory.

Cost of Second Hand Rail to Industries

In Supplement No. 1 to Circular No. 56, dated June 8, the regional director announces that until further notice the price for second-hand rail will be from \$55 to \$65 per gross ton, depending upon quality and location, f. o. b. carrier's tracks nearest to delivery point. In general, he says, the price per gross ton for good quality of second hand rail for sidings and spur tracks should be \$60 east, and \$65 west, of the Rocky mountains, except that light inferior rail may be sold for \$55 to \$60 per gross ton. Authority must be requested from his office in each instance for the sale of rail.

War Department Needs Transits

In a letter to western railroads, dated June 7, Mr. Aishton calls attention to the fact that the engineer corps of the war department is in the most urgent need of a large number of high grade transits with full verticle circle, erect image, and complete with tripods, similar to C. L. Berger & Sons' No. 4 1/2 mountain and mining transit, Buff & Buff Mfg. Co.'s No. 3-C transit, and W. & L. E. Gurley's No. 27-A transit. According to S. M. Felton, director-general of military railroads, manufacturers in this country are unable to furnish the present and urgent need of transits required by engineer troops now in France. It is necessary therefore to secure from other sources all the high grade transits not in urgent use to secure the number needed. Western lines are asked to report in detail the number and quality of transits that can be spared, together with a statement of their physical condition and their price.

Orders for Southern Pine

In supplement No. 1 of Circular R. P. C. 8, dated June 8, the Western regional purchasing committee announces the creation of a government bureau for the handling of orders of yellow pine lumber. Purchasing agents of railroads will place orders for lumber directly with the manufacturers as previously, but they are not authorized to pay above government prices except in cases of extreme emergency. If purchasing agents are unable to secure lumber directly from the producers they are instructed to advise the regional purchasing committee of their needs; and that body will handle their orders through the director of lumber of the new government bureau mentioned above. On account of the varied methods of describing lumber the regional purchasing committee will soon send to western railroads a form showing lumber lists and prices in usual railroad grades and in such a manner that requisitions can properly be checked back with them and needless confusion can be avoided.

The regional purchasing committee also asks the railroads to notify it of old orders which have been unfilled so that it can take steps to secure action upon them. In this connection the committee points out that there is at present a lull in the demand for the immediate shipment of yellow pine, and therefore an opportunity for the railroads to secure proper attention to their orders. Western railroads are asked to notify the committee if any bridges are badly in need of repairs or if equipment is held up on account of the lack of lumber, as such information can be used to advantage in insisting on delivery.

Conservation of Tin

In Circular R. P. C. 14, dated June 8, the regional purchasing committee calls attention to the scarcity of tin and

the necessity for conserving it to the fullest extent. The letter shows how less tin can be satisfactorily used in babbitt and solder for railroad uses. The regional purchasing committee asks western railroads to observe the strictest economy in the use of tin and to report any experiments that may further conservation.

Interplant Switching

In a communication to western railroads on June 4, the regional director asks for detailed information on interplant switching, giving the names of the industries served, the nature of the switching done, the number of engine hours consumed per day, the charges exacted, whether the charges are established by tariff or whether the railroad is compensated in some other manner through a switching contract; the extent of weighing and reweighing of cars, the movement of cars from one point to another in the plant to finish loading or unloading, the spotting of empties for interplant loading and the movement of loaded cars to the point of

unloading, and whether it is practicable for the industry to provide its own service.

Circular No. 118, dated June 1, says: "It is the desire of the railroad administration that reasonable rules be adopted governing the settlement of claims growing out of the transportation of grain, fruit and vegetables, livestock, fresh meats and packing house products, and coal, coke and ore, and that uniformity of action in this matter between the several railroads be established."

For the purpose of formulating rules to be adopted by the interested railroads subject to approval of the federal administration, I have appointed a committee of freight and general claim agents, composed as follows: M. E. McKirahan, F. C. A., S. P. Co.; H. C. Pribble, G. C. A., A., T. & S. F.; J. B. Shields, F. C. A., C., B. & Q.; W. O. Bunker, G. S. F. C., C., R. I. & P.; Charles Dietrich, F. C. A., C., M. & St. P.; W. F. Every, G. C. A., N. P.; T. S. Walton, G. C. A., M. P.; E. C. Howe, F. C. A., C. & N. W.; and W. H. Hancock, F. C. A., U. P.

The Reasons for Steam Railroad Electrification

The Density of Traffic Has Increased Greatly, Even Under Normal or Pre-War Conditions

By Q. W. Hershey*

THE PERIOD FROM 1895 TO 1902 covers the most rapid expansion of American railroad building. A record of consecutive annual increases in miles of track constructed was made during this time. The rate of construction reached a maximum during the year 1902, when 6,020 miles of new line were laid. From the record of this

the average miles laid each year was approximately 1,000. Most significant, also, is the fact that during the year 1917 there were more miles of track abandoned than built.

The expansion during the period 1895-1902 represented the necessity of meeting the country's development of new territory. Following this period, beginning about 1905, the

Pennsylvania Railroad Just Outside of Broad Street Terminal

maximum year there has been a gradual average decline in building new lines until it reached the low maximum of 933 miles in 1915. From this date, 1915, to the close of 1917

*Heavy Traction-Railway Department, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

problem has been one of expansion to take care of the increasing traffic of existing communities, rather than that of supplying transportation facilities to new communities. In this the problem became one of developing greater operating facilities, such as heavier motive power and intensifying traf-

fic movements through high tonnage, faster speeds, greater trainloads, heavier carloading, etc., all contributing to the expansion of facilities for increased transportation. It was a problem of caring for increasing transportation densities.

About 1903 the electrical art had developed satisfactory locomotives which were efficient and of considerable capacity, and because they were clean and practically noiseless their adoption in certain terminal and tunnel districts was compelled through legislation. For these same reasons, and the showing of reliability which was soon demonstrated, they were voluntarily adopted for numerous main line operations.

It is a striking commentary on the material fitness of electrified operation that we find the electrical installation being turned to in order to supply the method of meeting the requirements of intensified operation. As mileage extension development of the railroads decreased, the application of electrified operation was increased to meet the rising problems of dense traffic. From the start, the application has been continuous and increasing in capacity of equipment and the amount of mileage electrified, until today electrified installations make use of the very heaviest high-speed, heavy-tonnage equipment in the world, and the extent of trackage under electric operation measures a number of thousand miles. All electrifications naturally occupy points in the transportation systems where the density of traffic is very much greater, and the operating requirements more difficult than that of the average mileage.

The following roads now have electrified operations on sections of their main line, or more important auxiliary lines: Baltimore & Ohio; Boston & Maine; Butte, Anaconda & Pacific; Chicago, Milwaukee & St. Paul; Erie; Grand Trunk; Great Northern; Michigan Central; New York Central; New York, New Haven & Hartford; Norfolk & Western; Pennsylvania and Southern Pacific.

The unquestioned reliability of this form of motive power has been proved in the severest service.

A virtually new system of economies becomes the basis of the factors involved in the operation of the newer systems of motive power under electrification. It has been amply demonstrated that one electric locomotive will, ordinarily, do three times as much service as can be done by a steam locomotive. Schedules are speeded up materially. Track transportation capacity is increased, in certain instances, by 100 per cent. The difficulty of mountain grades is virtually overcome. Where formerly it was necessary to maintain three locomotives, now there is but one, and at a lower cost. "Inspection" becomes one of the more important items rather than the "overhaul" item of expense. Where under steam operation, 30 to 40 per cent only of the total hours have been spent on the road, now 90 per cent of each 24-hour period may be given in service on the road. Under emergency requirements, much greater engine mileage may be made between "shippings." Efficiency of engine performance decreases very slowly over extended continuous periods of operation. Track destruction is lessened, better working conditions are found for the health and comfort of the employees, this improvement making for more efficient man-effort, and greater safety therefrom in the operation of the trains. Regenerative braking adds an additional train safety factor and tends considerably to lower the wear and tear on all equipment. There is an expansion of facilities arising from the release of much equipment and labor, through the elimination of hauling of non-revenue producing coal. Greater daily mileage is obtained from freight cars. There is a toning up of the whole operation where the burden of inefficiency imposed through the use of the steam engine is removed, by substituting the electric engine in which the engineman's part is power control, rather than power creation. Lengths of engine runs are materially increased with a consequent elimination of intermediate terminals and repair shops. There is secured a material advantage in the haulage effect

through being freed from the conditions set by the physical limitations of the steam locomotive. Capacity limitations in the electric locomotive are elastic—severe cold weather conditions actually increase its capacity.

In general, the maintenance of high operating efficiency is less complex, and an effort toward continued improvement of this efficiency may be more effectually exerted through concentration at fewer points.

Electric operation secures a marked conservation of natural resources. One pound of coal, or equivalent oil, fuel fed into the power house, may be transmitted and transformed to more effective power at the drawbar than is possible with the steam locomotive. There can be conserved the labor and equipment necessary for transporting coal from the mine to the railroad by the substitution of electrical transmission. Not only is there a great part of the fuel saved through the efficiency of the newer method of utilizing the latent energy of the fuel, but by electrified operation a new scheme of economics is brought into action through the ability to turn to efficient use the great volume of heretofore unreclaimed and unharnessed water power, with a consequent conservation of primal resources. Our ideals of proper stewardship will have been approximated when the raw materials in the great storehouse of natural resources will have been accredited proper value, and whose worth will not be measured entirely by the cost of their present utilization and destruction.

Never in history has our country been confronted with a

Curves Showing Miles of New Steam Line Completed and Miles of Steam Track Put Under Electric Operation During the Past 22 Years

greater transportation problem. Traffic has increased to abnormal proportions. So grave has become the transportation situation that its solution is seriously regarded as the prime element to determine our success in the war. In this connection, it would not be surprising were our railroad electrification problems to fall within the category of other problems legislated as war measures.

There must be safety in railroad operation as nearly perfect as human skill can produce. There must be reliability and non-interruption of service, as perfect as can be secured by the use of the highest class of equipment which has been adequately proved in actual service. Under the immediate war prohibitions and restrictions, the public will uncompromisingly forego luxurious comfort, but when normal times again prevail there will be demanded an improved order of elegance of appointments and means of comfort. What with its peculiar fitness, the additional safety it brings, its record of reliability established, the comfort it dispenses, the high order of efficiency it institutes, the integrity of the trust to future generations which it binds for us in the conservation of primal resources, together with its well founded economies of operation and capacity expansion, all spell electrification.

Mechanical Devices for Disbursement Accounting

Comprehensive Report of the Committee on Disbursement Accounts of the Railway Accounting Officers

THE FOLLOWING is the complete report of the committee on disbursement accounts, A. P. Disbrow (Eric) chairman, of the Railway Accounting Officers' Association presented at the annual meeting held in St. Louis on May 29-30, 1918, and reported in last week's *Railway Age*, page 1389.

Use of Mechanical Devices in Disbursement Accounting

The special committee of five, appointed by the president to prepare recommendations as to how accounting officers may best meet the conditions confronting them with respect to clerical labor and the compilation of accounting and statistical data, particularly with respect to the use of mechanical devices as a means of solving the shortage in experienced clerical labor, in its report dated December 20, 1917, suggested "that each of the Standing Committees make a supplemental report to those already existing in the proceedings of the Association of American Railway Accounting Officers on June 26 and 27, 1912, at Quebec, with regard to the use of mechanical devices."

The subjoined information—regarding the use of mechanical devices in disbursement accounting work—is the result of data obtained by your committee from fifty-three roads.

On request, the secretary of the association will furnish the name of each road indicating that it was using any particular device. This will permit direct inquiry by accounting officers interested in installing similar devices or methods.

In this report, names of devices have been omitted, except in cases where a clear description could not be given without indicating the name of the device.

Non-listing Computing Machines.—Operated by hand pressure on keys, the figures being recorded on dials when keys are depressed. Machines used for multiplication, addition, subtraction and division. Best results are obtained by assigning permanent female operators and training them to operate by touch system.

Making and verifying extensions and footings on vouchers, bills, payrolls and statements.

Prorating common operating expenses between operating divisions, accounting districts, States and classes of service.

Compiling gross ton miles in division accounting offices from wheel reports.

Arriving at totals of paychecks and drafts.

Totaling requisitions and invoices as a check against adding machine tapes, when list is necessary, to avoid calling items back against tape.

Cross footing and balancing monthly statistical sheets to arrive at total for year, avoiding necessity of drawing items off on a work sheet.

Compiling "Employees and their Compensation" statement by classes of employees for Interstate Commerce Commission annual report. Twelve-column machine used, permitting drawing off hours and compensation at same time.

Charts Used in Connection with Non-listing Computing Machines.—Pay roll table, decimal equivalent of days for 24 to 31 day month.

Rate per minute for each hourly rate.

Reciprocal table where constant divisor is used.

Discount table, showing net of \$1.00 after discounts are taken off.

Table of values of freight cars and yearly and monthly depreciated value of \$1.00 at 5 and 6 per cent. Used in ascertaining value to bill for on cars destroyed on foreign lines.

Central Bureau Non-listing Machines.—Non-listing machine work centralized in one department in which none but women operators are employed. Practically all computing machine work for entire Disbursement office done in this central bureau. Permits training operators on all classes of work and reduces waste time to a minimum.

Training Operators for Non-listing Computing Machines.—Central computing machine bureau equipped with a number of listing adding machines. Girls, with no previous experience, started on listing machines and after having become proficient are rotated between the listing and non-listing machines; that is, listing machine operator will spend one week at the listing machine and the next week at the non-listing.

Due to difficulty in securing operators, a student course was established. Girls from 16 to 19 years of age with good fundamental education employed and allowed ten dollars a month while learning, which is not considered as a salary, but merely as lunch money and car fare. As students develop, allowance is increased until they are rated as regular salaried operators. Plan is beneficial to carrier as well as to employee by providing some compensation while learning instead of being obliged to pay a tuition fee.

Adding and Listing Machines.—Operated by depressing keys and pulling a handle or pressing a bar, if motor driven. Records the figures on paper tape or sheets of paper and is used when necessary to have a permanent record of items.

Listing open items in proving balances in ledger accounts (reconcilements). Avoids drawing off on work sheets and footing work sheets. By using wide machine, voucher bill, paycheck, etc., numbers and amounts can be drawn off at same time.

Compile car repair bills. Use specially designed machine, which gives a greater output per day than typewriter, but has disadvantage in not being adaptable to other than straight routine billing.

Purchase invoices posted daily on voucher form in duplicate, the duplicate serving as a voucher ledger. At same time an accumulated total is arrived at to balance against Division Accountants' and Storekeepers' weekly statements of material.

Listing material requisitions by classes, accounts and Accounting Divisions for charge and credit and for statistical purposes.

Listing pay checks, time checks, vouchers, etc.

Prepare pay and time voucher registers.

Post individual equipment cards showing original cost, changes in value, etc.

Adding and Listing Machine, with Shuttle Carriage.—Registering, indexing and abstract work.

Machines Especially Adapted for Multiplication and Division.—Operated by placing levers, representing multiplicand or dividend, in position and turning a crank required number of times, according to numbers in each unit in multiplier or divisor, shifting carriage for each unit. Cannot be used to advantage for addition, but is valuable and a time-saver in arriving at percentages for apportionment of operating expenses and in prorating expenses between States, divisions, etc. Non-listing, both product or quotient and multiplier or divisor being recorded on dials. (Brunsviga and Marchant).

Non-listing and operated in same manner as above and for same purposes, except that numbered keys are used instead of levers for multiplicand or dividend. Can be used for addition, but not with any degree of speed (Monroe).

Non-listing motor driven, operated by depressing keys for

multiplicand, multiplier, dividend and divisor, results recorded on dials. Carriage is automatically shifted for each unit. Can be used with a fair degree of speed for addition, used to best advantage in arriving at percentages and in prorating expenses. (Ensign.)

Non-listing, motor or crank driven. Operated by setting markers for divisor, dividend, multiplier or multiplicand and turning crank or, if motor driven, pressing bar. Requires but one operation for each unit. Cannot be used to advantage for addition, but time-saver in prorating and arriving at percentages. Figures recorded in dials. (Millionaire.)

Operators for Multiplying and Dividing Machines.—Require no previous experience and can be successfully operated by girls.

Non-listing Adding Machine.—Operated by setting keys and pulling lever. Inexpensive machine used for general purposes and shifted from desk to desk as needs require. Operated by inexperienced clerks. Non-listing and used for addition only, figures being recorded in dials.

Cylindrical Slide Rule.—Consists of a cylindrical slide having both rotary and longitudinal movement within an open frame-work of equi-distant bars. Slide contains two logarithmic scales, one on each side of center. On bars are two other scales arranged in same manner as on the slide.

Used principally for proving averages in statistics and arriving at and verifying percentages and pro-rating revenues and expenses by States, divisions, etc., and in apportioning charges for locomotive repairs to classes of service. Does same class of work as multiplying and dividing machines with greater speed, but results are not so accurate beyond four figures.

Typewriters.—For correspondence, statement work and general use. For statement work equipped with tabulators.

Posting index of audited vouchers and bills in loose leaf records. (Rapid fire index.)

Car repair bills and voucher checks made with one writing by means of carbon. Original being voucher check and carbon serving as original bill. Same method in effect in purchasing department to cover purchases of material and supplies.

Equipped with two kinds of type, one plain and one pin-point for drawing drafts and vouchers. Name and address is written using plain type, amount is written using pin-point type to guard against manipulation. Combines typewriter with check protector.

Typewriter With Adding Machine Attachment.—For statement, bookkeeping and other general work where necessary to foot typed figures. Does away with separate operation of footing completed statement after typing.

Transcribing and adding record of bills and vouchers.

Posting bills collectible in loose leaf ledger (Rapid fire index) from bill register, also posting cash and balancing individuals and companies bills collectible ledger for miscellaneous bills, car repair bills and foreign roads overcharge bills.

Prepare car repair bills.

Writing and balancing pay rolls and pay roll registers.

Writing pay rolls and pay checks and totaling pay rolls in one operation. Time books and time sheets audited before pay rolls are written. One line protected check used.

List vouchers to treasurer and prepare voucher register in one operation.

Combined Typewriter and Computing Machine.—(Moon-Hopkins.) An electrically operated combined typewriter and computing machine with four accumulators, adds, subtracts, multiplies and divides and is especially adapted to bookkeeping, statement work and the rendering of bills.

Specially built machine for use in compiling information in connection with U. S. war tax.

Compiling by lines, record of gross earnings, passengers

carried and miles run by each car in various lines and balancing daily with receiving cashier's record.

Compile car repair bills, claim greater output per day obtained than by use of typewriter with adding machine attachment.

Typewriter—Flat Writing.—Machines used where statement or record sheets are too large for ordinary wide carriage machine, where inadvisable or impossible to roll sheets through machine, or where posting to bound books.

Posting ledger charges to primary road and equipment accounts by authorities for expenditures from tabulating machine-punched cards.

Statement and abstract work.

Freight claim draft sheets.

Typewriter Cyclometer.—Attached to typewriter to record output and determine efficiency of individual operators. Records number of key and space bar strokes.

Line-a-Time.—Attached to desk of typist directly behind typewriter and facing operator. Equipped with a lever operated guide for following the line, eliminating the necessity of using a ruler or other flat instrument to follow line and guard against errors when transcribing.

Electric Sorting and Tabulating Machines and Card-Punching Machines.—Operated by punching specially printed cards, figures being used to indicate information. Cards are sorted mechanically and run through tabulator to obtain totals. A number of totals may be obtained in one operation. Operated successfully by assigned women operators.

Condensing charges to operating, road and equipment and other accounts from departmental distributions of labor, material, supplies, fuel and stationery and distribution from bills, vouchers and journal entries.

Condensing revenue by accounts and by states and classes of service.

Condensing charges to operating accounts by operating divisions, accounting districts, states and class of service for statistical purposes.

Condensing charges to Road and Equipment accounts by A. F. E.'s for preparation of statement of charges by authorities and for posting by machine in ledger as a basis for check of completion reports required under Federal Valuation, order No. 3.

Condensing wage statistics for annual reports to Interstate commerce and state railroad commissions.

Compiling basic statistics covering train, locomotive and gross ton miles, special statements of train tonnage performance, tonnage and fuel performance by individual engines and classes of engines.

Equipment record statistics.

Assemble by classes of traffic and states, loss and damage and overcharge claim payments and analyze personal injury accounts.

Individual yard operation reports.

Assemble time of enginemen and trainmen and prepare pay rolls, also compile wage statistics for this class of employees.

Prepare mechanical department pay rolls and distribute the charges. Compile statistics showing cost of repairing individual parts of individual locomotives. Abstracting of distribution by states and divisions; and for Interstate Commerce Commission accounting requirements. (Central Bureau.)

Comparative analysis of overcharge and loss and damage claims paid, divided to show commodities and classes or causes.

Comparative statement of labor or pay roll cost by departments.

Statement of material purchases during month.

Phonographs, Dictating, Transcribing and Cylinder Shaving Machines.—For general correspondence purposes. Letters dictated into machine and recorded on wax cylinders. Cylinder given to operator, who transcribes, using a machine

equipped with transcribing duplicator. Illuminates time lost by stenographer when taking dictation direct from correspondent.

After having transcribed letter, cylinder is shaved and used over again.

Central Bureau for Transcribing.—All transcribing done in central bureau. Cylinders are collected at stated periods and delivered to transcribing department.

Letters transcribed on piece work basis at a fixed price per letter. Telegrams and mailgrams dictated on separate cylinders to permit preferred attention and expedite transcription.

Mimograph Duplicator.—For obtaining a number of copies of circulars, statements, etc., by means of stencils cut on typewriter.

Permatype Stencils.—Used when an unusually large number of copies are required. Stencils can be cleaned and filed away and additional copies may be struck off when desired.

Cutting Stencils.—Carbon copy made at time stencil is cut to facilitate comparison with original draft.

Gelatine Duplicator.—For preparing a small number of copies of circulars, statements, etc. Statement or circular to be duplicated is prepared either by hand or on typewriter with specially prepared ink or ribbon and applied to gelatine surface. Copies are then obtained by applying blank sheets to impression left by original or master sheet. Duplicating surface comes in rolls and after one surface has been used a new one may be obtained by turning a handle.

Clay Duplicator.—Clay composition contained in a tray. Can obtain from 5 to 50 copies. Copies obtained in same manner as on Gelatine duplicator.

Multigraph.—For getting out printed matter. Requires setting of type.

Photography.—Reproducing camera for obtaining photographic reproductions of statistical sheets, vouchers, bills, waybills, etc. Will permit of reduction in size at time of reproduction.

Addressing Machines (Motor Driven).—For rapid addressing of envelopes, printing names on time slips, time rolls, etc.

Preparing time slips, time rolls, pay rolls and inserting names on pay checks.

Addressing envelopes.

Rapid Mail Opener.—For opening incoming mail.

Numbering Machines.—For numbering consecutively drafts, vouchers, bills, etc.

Combination Dating and Numbering Machine.—Dating and numbering consecutively, vouchers in one operation.

Clock Time Daters.—For stamping date and time received on correspondence, statements, etc.

Radial Distributor.—A fan-shaped device with receptacles into which papers are dropped when sorting either in alphabetical or numerical order.

Signagraph.—Used largely by paymasters for signing pay checks. Device permits signing a number of checks at one operation.

Check Protectors.—For inserting amounts on pay checks, drafts and vouchers to guard against manipulation.

Cancelling Machines.—Motor-driven for cancelling, by small perforations, paid pay checks, drafts, vouchers, voucher attachments, etc. Dies can be set to show date of payment.

Hand-operated, cuts a round or square hole.

Air Tubes.—For transmitting telegrams by means of carriers through tubes to and from telegraph office, also for sending special letters (relayed through telegraph office) to other offices in building.

Automatic Electric Elevator.—For transmitting mail, vouchers and other items between offices of the accounting department and between offices of the accounting department and the treasury department. Operated by pressing a button. Car is controlled from and may be stopped at any floor.

Electric Mail Elevator.—Operated between central mail room and all floors in general office building. Used for delivering large quantities of mail to and from mail room. Car is controlled from mail room.

Mail Chute.—Leading to central mail room. Letter drop on each floor and small quantities of outgoing mail are sent to mail room through chute.

Applying United States Stamps.—Stamps applied on outgoing United States mail for entire general office in central mail room by means of machines. Each office encloses its own mail, using a special envelope for United States mail.

Machines used for sealing letters and applying stamps to outgoing mail. Capacity from 6,000 to 9,000 envelopes per hour.

Electric sealing wax pot.

Postal scales for weighing mail.

Pencil Sharpeners.—Placed at convenient points in office.

Spool-o-Wire Paper Fastener.—For fastening papers together. Makes staples from length of wire wound on cylinder inside machine.

Automatic feed paper fastener for files containing few sheets. Makes long narrow clip. (Hotchkiss.)

Rubber Stamps.—Rubber stamps are very generally used to save time of writing. Principal uses: Addressing envelopes in advance of use when addressing machine is not available, stamping date received on inbound mail, reports, vouchers, etc., captions of accounts frequently used, instructions as to prorating on sheets sent to computing machines.

Time Clock Recorders.—For recording on cards time of arrival and departure of clerks employed in office.

For obtaining record of time work was started and completed in connection with output of non-listing machines and determining efficiency of individual operators.

Trucks.—Used to collect books, pay rolls, vouchers, etc., requiring vault protection at close of day. Truck boy makes round of departments, avoiding necessity of clerks from each department making trip. Books distributed by truck boy each morning.

Paper Punch.—Hand power, adjustable, for perforating papers for filing purposes.

Binders.—For binding pay rolls, vouchers, etc., using heavy, hinged cardboard binding sides. Holes for binding purposes cut in records by drills, either hand or motor driven.

Buzzers and Call Bells.—Very generally used for calling clerks and department heads to office or desk of auditor, assistant auditor and chief clerk.

Intercommunicating Telephone System.—Connecting chief and head clerks' desks with auditor and with each other. Operates independently of main telephone exchange, but connected with it for outside calls.

Dictograph interconversing system, master station in comptroller's office to the several branches of the accounting department and in the individual office, the auditor of disbursements with his assistant, the chief and various head clerks.

Each bureau head equipped with a telephone permitting connection with any other department in general office building or outside. Supplemented by an automatic intercommunicating system permitting communication direct between auditor of expenditures and each bureau head or bureau heads with each other. Permits calling each individually or collectively.

Mail Carriers.—Used in transmitting mail between disbursement office and offices of division storekeepers and division master mechanics. Mail is placed flat in carrier without enclosing in envelopes. Carrier is made of heavy cardboard covered with canvas and has a double flap, on one of which is printed Disbursement Office address, and on other address of storekeeper or master mechanic.

Payroll Cans.—Locked boxes with reversible cover on which addresses are painted, used for transmitting pay and

time rolls between maker of roll and disbursement office.

Visible Card Index File.—Used to post time of transportation department employees. Posted daily to cards, name of employee in plain sight at all times. (Can be adapted to other card systems such as employees' rate cards, contract and lease cards, etc.)

Wage Tables.—Hourly, daily and monthly rates, for computing earnings of employees and for verifying extensions of rates on payrolls.

Train and enginemen's rate sheet. Earnings computed from 1 to 100 minutes for each train, engine and yard rate. Used in figuring overtime.

Hourly rates for each monthly rate for a 24 to 31 day month. Used for computing overtime earned by trainmen who are paid at a monthly rate.

Time after which overtime accrues on train runs 100 to 199 miles in length on speed basis of 12½ miles per hour.

Chart showing number of trips made in passenger and way freight service in 28, 30 and 31 day month and earnings per full month for each number of train crew. Used largely to determine earnings when less than full month is worked on monthly paid runs.

Calculating Tables.—For rapid computation of mileage, per cents, etc., principally used in application of fuel prices, applying rates to number of tons of coal issued during the month to arrive at value chargeable to expenses by lines and states.

Lumber calculator. For computing and verifying board measure.

Freight tax computer. Showing amounts to be collected under the war revenue tax for transportation of shipments.

Charts used in connection with statistics showing amounts chargeable through construction and for record of A. F. E.'s.
12-year graphic chart.

1-year statistical chart.

For computation of rail tonnage showing tonnage of rail from 1 to 100 feet on rail ranging from 56 pounds to 90 pounds per yard.

Numbers Assigned to Indicate Class of Service.—Voucher, pay roll, etc., charges assigned to service, i. e., freight, passenger, common, etc., class of service being indicated by a number following the account number. Charges to account 201, for example, are shown 2011-2012-2013, last figure indicating class of service.

Numbers Assigned to Regular Train Runs.—To avoid writing points between which trains run, on time rolls, a number is assigned to regular scheduled runs and number only is shown on roll.

Numbering Bills and Vouchers.—Series started first of each year and vouchers numbered consecutively, beginning with Number 1. Allowance made each month for overlapping numbers. Prevents misfiling and reduces work of filing to a minimum.

Series started first of each month and vouchers numbered consecutively, beginning with number one. The month and year are indicated as such.

Consecutive numbers started first of each year, odd numbers used for January and even numbers for February, etc. Prefix number used to indicate year.

Bills and Vouchers.—Material and supplies and car repair bills and vouchers prepared by shop accountant. Before transmitting to auditor, items are listed on loose leaf bill and voucher register sheets which accompany bills and vouchers to auditor and form part of auditor's record, requiring no further writing. Bill and voucher numbers assigned to shop accountant by auditor who uses same numbers as his own. Car repair bills not sent to auditor, but forwarded direct to foreign lines by shop accountant, list only being sent to auditor.

Preparation of Pay Rolls.—Time posted to time sheet by

foremen in transportation department, all details being shown. Extensions made on time rolls and pay rolls compiled from time rolls, no details of time, rate, etc., being shown on pay rolls. Time and pay rolls sent to auditor's office for verification.

Same method for train and engine rolls.

Semi-Monthly Pay Rolls.—Duplex form used, names of employees being entered on pay roll once a month. Amount earned in second period entered on carbon copy of first period roll.

Station Expense Roll.—To reduce number of vouchers in connection with public utility companies' bills, such as light, water, etc., and to insure quick payment in order to obtain discount, agents are authorized to pay bills as presented and list them on an expense roll which is forwarded to auditor. Auditor issues non-negotiable draft to agent for total amount of payments, agent remits as cash to clear his accounts. Same method is applied to other authorized station expenses.

Employees' Expense Accounts.—To expedite payment of amount due employees for money expended in company service and reduce number of vouchers. Expense accounts, for all men under his jurisdiction, are sent to department head direct and recapped on a special form in triplicate. One voucher drawn in favor of treasurer for total of all expense accounts. Copy of recap and original expense account statements sent to disbursement officer; original and duplicate of recap sent to treasurer, who issues checks for amount due each employee.

Payment of expense accounts made by check. Checks drawn by department heads and forwarded, together with expense statements, to auditor, who, after audit, forwards checks to payee. Treasurer relieved by blanket voucher drawn by each department head.

Quick Payment Ticket.—For immediate daily payment of laborers, especially large bodies of men employed temporarily for special purposes. Ticket is issued to men when they start work, and timekeeper indicates by a special die punch work done, total hours worked and rate paid. Ticket cashed upon presentation to paymaster, amount earned being entered on ticket by paymaster's clerks.

Rail and Ties in Transit.—Cards are prepared, one set for forwarded and another set for received rail and ties. The two sets are matched and unmatched cards represent in-transit items which are followed up.

Skeletonized Blanks.—Bills collectible, vouchers and department bills and invoices covering regularly recurring items, are skeletonized on duplicating machine, leaving blank spaces for date, amount, percentages, etc., and a year supply struck off. Produces standard results, reduces possibility of error and avoids considerable work of preparing pencil drafts and checking and rechecking data monthly.

Form Letters.—Standard printed forms with numbered questions and answers. Used to avoid writing letters. Clerk inserts name and address and pencil checks proper item. Used largely in bill and voucher departments.

Mimeographed standard letter forms. Used to avoid dictating letters. Special blank is prepared by correspondent as instructions to typist indicating form to use and data to insert.

Care of Records.—Voucher papers filed in all steel cabinets of the vertical type. Claim less expensive than old-style binder and prevents mutilation and turned edges.

Central Filing Bureau.—All correspondence, leases and contracts filed in a central bureau. Insures uniformity in filing, complete files and avoids having each sub-department maintain separate files. Files are obtained by request slips signed by sub-department head.

Central "Bring-Up" File.—Papers which employee wishes brought to his attention at some future date for action, sent to central filing bureau, where they are filed in a special "bring-up" file in proper date order.

Organization of the United States Railroad Administration

Supplement to the
Railway Age
June 14, 1918

Central Administration
WALKER D. HINES, Assistant Director General.
H. A. Taylor, Assistant.
C. H. Parker, Assistant.
HENRY WALTERS, Advisory.

DIRECTOR GENERAL OF RAILROADS
W. G. MCADOO

Oscar A. Price, Assistant to the Director General
912 I. C. C. Bldg., Washington.

Regional Administration

Division of Law
401 I. C. C. Bldg.
JOHN HARTON PAYNE, General Counsel.
Arthur Matthews, Special Counsel.
William Elix, Assistant.

Section for Protection of Railroad Property
711 Southern Bv. Bldg.
PHILIP J. O'DHERTY, Manager.
William Robertson, Assistant.
E. Van Sicken, Attorney.
D. B. Leonard, Attorney.

Inland and Coastwise Waterways Committee
708 I. C. C. Bldg.
MAJ. GEN. W. M. BLACK, Chairman.
Walter S. Dickey, Calvin Thompson.
C. A. Tomlinson, M. J. Sanders.
Col. Charles Keller, Secretary.

Division of Transportation
1028 I. C. C. Bldg.
CARL E. GRAY, Director.
W. T. Tritz, Senior Assistant.
H. T. Bentley, Mechanical Assistant.
J. H. Keefe, Assistant.
P. C. Wright, New England Coal.

Full Conservation Section
Southern Railway Bldg., Washington.
Union Electric Bldg., St. Louis.
RIGGS McLAUGHLIN, Manager.
Maude Edward C. Schmidt, Assistant.

Car and Locomotive Standardization Committee
1001 I. C. C. Bldg.
H. T. BENTLEY, Chairman.
H. Butler, F. P. Gaines.
R. L. Eggenhoff, J. Porcelli.
W. R. Lewis, W. H. Wilson.
A. C. Trumbull, R. Quayle.
P. W. Mead, J. T. Walsh.

Safety Section
715 Southern Bv. Bldg.
H. W. BELNAP, Manager.
Regional Supervisors:
H. S. Johnson, Eastern Roads.
Nevy J. Bick, Western Roads.
C. M. Anderson, Southern Roads.

Consumer Standards Advisory Committee
161 Broadway, New York.
J. L. SPENCE, Chairman.

Inspection and Test Section
608 Southern Bv. Bldg.
C. B. YOUNG, Manager.

Operating Statistics Section
W. J. CURRINGHAM, Manager.
Joseph L. White, Assistant Manager.
J. E. Shaw, H. W. Mackenzie.
J. C. Brown, W. C. Wabert.

Division of Capital Expenditures
400 I. C. C. Bldg.
ROBERT S. LOVETT, Director.
E. E. Adams, Engineering Assistant.
F. W. Seaton, Accounting Assistant.

Division of Public Service and Accounts
1114 I. C. C. Bldg.
CHARLES A. FROUTY, Director.
Luther M. Walter, Assistant.

Accounting Committee
A. H. PLANT, Chairman.
C. E. Seger, A. D. McDonald.
R. A. White.

Board of Wages and Working Conditions
718 18th St.
G. H. SINES, Chairman.
P. P. Gaines, Vice-Chairman.
J. J. Dermody, C. E. Lindsey.
W. E. Morse, J. O. Winston.

Locomotive Section
619 I. C. C. Bldg.
FRANK McMANAMY, Manager.
G. P. Robinson, Assistant Manager.
P. P. Flaherty, Mechanical Engineer.

Locomotive Consulting Board
H. T. Bentley, Chairman.
C. E. Palmer, John Purcell.
D. B. MacKean, C. E. Chambers.
G. M. Lewis, R. Quayle.
P. W. Mead, J. T. Walsh.

Car Service Section
16th Floor, I. C. C. Bldg.
W. C. KENDALL, Manager.
W. L. Barber, E. N. De Groot, Jr.
A. G. Guthrie, C. B. Phelps.
G. F. Richardson, J. A. Schenck.

Car Repair Section
701 Southern Bv. Bldg.
J. J. TATUM, Manager.

Troop Movement Section
Homer Bldg.
GEORGE HOOVER, Manager.

Marine Section
704 Southern Bv. Bldg.
W. H. PLEASANTS, Manager.
J. J. Henry, Assistant.
G. A. Tomlinson, General Manager.
New York Canal Section.

Division of Finance and Purchases
704 I. C. C. Bldg.
JOHN SKELTON WILLIAMS, Director.
D. C. Porteous, Assistant.
A. D. McDonald, Acting Treasurer.

Purchasing Section Advisory Committee
105 I. C. C. Bldg.
HENRY S. SPENCER, Chairman.
Samuel Porcher, George C. Yonant.

Finance Section-Advisory Committee
FRANKLIN Q. BROWN, Chairman.
Pauline J. Wade, Frederick W. Scott.

Division of Labor
606 I. C. C. Bldg.
W. S. CARTER, Director.
J. A. Franklin, Assistant.

Board of Adjustment No. 1
711 Southern Bv. Bldg.
C. P. NEILL, Chairman.
L. E. Sheppard, Vice-Chairman.
C. G. Walker, F. A. Burgess.
J. W. Higgins, Albert Phillips.
C. T. Wheeler, W. R. Doss.

Division of Traffic
1011 I. C. C. Bldg.
EDWARD CHAMBERS, Director.
C. B. Buxton, Assistant.
C. E. Wright, Freight.
Gerrit Post, Passenger.
C. W. Kirby, J. P. Holden.

Ticket Standardization Committee
D. P. McCARTHY, Chairman.
C. A. Fox, Secretary. W. J. Cannon.
J. F. Rehner, W. E. Butters.
J. V. Langdon, W. L. Pratt.

Committee on Uniform Classification
Transportation Bldg., Chicago.
R. H. COLLYER, Chairman.
R. C. Fyle, J. E. Williams.
J. E. Cleveland, J. C. Colquitt.

Advertising Committee
A. L. CRAIG, Chairman.

Traffic Representatives in Government Departments
H. M. Adams, Manager Inland Traffic, War Dept.
H. P. Anselmi, Manager Inland Traffic, Navy Dept.
D. L. Gray, Manager Inland Traffic, Shipping Board.
E. E. Jones, Manager Inland Traffic, Food Administration.
F. M. Whitaker, Manager Inland Traffic, Fuel Administration.
J. J. McMillan, Manager Inland Traffic, Petroleum Section, Food Ad.
Immigration.
T. C. Powell, Manager Inland Traffic, War Industries Board.

Allegheny Regional District
C. M. MARKHAM, Regional Director.
Philadelphia, Pa.

Regional Purchasing Committee
S. B. Wight, E. T. Burnett.

Eastern Freight Committee
B. CAMPBELL, Chairman.
L. M. Knifford, W. C. Maxwell.
N. C. Hamilton, Wm. Hodgdon.
W. S. Mallam, C. C. McGinn, Secretary.

Coal and Coke Rate Committee
Eastern District, E. B. Crozier, Chairman.
Central District, J. C. Yanning, Chairman.

North Atlantic Ports Freight Traffic Committee
141 Broadway, New York.
GEORGE D. OGDEN, Chairman.
Francis La Bau, Vice-Chairman.
Richard Van Unsumerson, Elmore D. Hutchings.
Robert E. Baxall, Joseph R. Ruffin.

Marine Department
W. B. Pollock, Deputy Marine Director, New York Harbor.
G. A. Tomlinson, General Manager, New York Canal Section.
A. K. Morris, Director, Tidewater Coal Traffic.

Southern Regional District
B. L. WINCHELL, Regional Director.
Hestley Bldg., Atlanta, Ga.
G. R. Loyall, Operating Assistant.
Charles R. Capps, Traffic Assistant.
F. P. Gaines, S. S. Roberts.

Southern Export Committee
CHARLES T. AIREY, Chairman.
Hestley Bldg., Atlanta, Ga.
W. M. Short, resident representative, New Orleans, La.
J. W. Daley, resident representative, Galveston, Texas.

Southern Passenger Rate Committee
W. J. CRAIG, Chairman.

Southern Freight Rate Committee
RANDALL CLIFTON, Chairman.

Regional Purchasing Committee
P. H. FECHTIG, Chairman.
Albert C. Venn.

Charles Barham
Regional Traffic Representative of U. S. Food Administration.

Eastern Regional District
A. H. SMITH, Regional Director.
Grand Central Terminal, New York.
A. J. Stone, Operating Assistant.
G. F. Randolph, Traffic Assistant.
H. W. Burnham, Secretary.

Budget Committee
New York City.
FRANCIS LEE STUART, Chairman.
A. T. Haddon, H. A. Lane.
A. C. Shand.

Passenger Traffic Committee
J. P. Anderson, J. O. McNamara.
R. H. Wallace, C. L. Hunter, Secretary.
J. W. Daley.

Coal and Coke Rate Committee
Eastern District, E. B. Crozier, Chairman.
Central District, J. C. Yanning, Chairman.

North Atlantic Ports Freight Traffic Committee
141 Broadway, New York.
GEORGE D. OGDEN, Chairman.
Francis La Bau, Vice-Chairman.
Richard Van Unsumerson, Elmore D. Hutchings.
Robert E. Baxall, Joseph R. Ruffin.

Marine Department
W. B. Pollock, Deputy Marine Director, New York Harbor.
G. A. Tomlinson, General Manager, New York Canal Section.
A. K. Morris, Director, Tidewater Coal Traffic.

No Duke
Regional Traffic Representative of U. S. Food Administration.

Regional Purchasing Committee
CHARLES A. HOW, Chairman.
L. S. Carroll, P. A. Bushnell.

Southern Export Committee
(Reporting to Both Regional Director of Western and Eastern Roads)
CHAS. T. AIREY, Chairman, Atlanta, Ga.
J. W. Daley, Galveston, Tex.
W. M. Reed, New Orleans, La.

Freight Traffic Committee
P. S. EUSTIS, Chairman.
L. M. Allen, A. H. C. S. Fre, W. J.

Freight Traffic Committee
P. S. EUSTIS, Chairman.
L. M. Allen, A. H. C. S. Fre, W. J.

James H. Cherry
Regional Traffic Representative of U. S. Food Administration.

Inter-regional Committees
J. M. HERBERT, Chairman, inter-regional committee in charge of rail-way operations at St. Louis and East St. Louis.
W. G. BIEED, Chairman, Chicago committee.
G. E. EVANS, Chairman, Louisville committee.

Poehontas Regional District
H. D. MAHER, Regional Director.
Roanoke, Va.
T. S. DAVANT, Traffic Assistant.
D. E. Spangler, Transportation Assistant.

Budget Committee
New York City.
FRANCIS LEE STUART, Chairman.
A. T. Haddon, H. A. Lane.
A. C. Shand.

Passenger Traffic Committee
J. P. Anderson, J. O. McNamara.
R. H. Wallace, C. L. Hunter, Secretary.
J. W. Daley.

Coal and Coke Rate Committee
Eastern District, E. B. Crozier, Chairman.
Central District, J. C. Yanning, Chairman.

North Atlantic Ports Freight Traffic Committee
141 Broadway, New York.
GEORGE D. OGDEN, Chairman.
Francis La Bau, Vice-Chairman.
Richard Van Unsumerson, Elmore D. Hutchings.
Robert E. Baxall, Joseph R. Ruffin.

Marine Department
W. B. Pollock, Deputy Marine Director, New York Harbor.
G. A. Tomlinson, General Manager, New York Canal Section.
A. K. Morris, Director, Tidewater Coal Traffic.

Western Regional District
E. H. AUSTON, Regional Director.
216 W. Jackson Blvd., Chicago.
Ralph Budd, Capital Expenditures.
W. R. Mead, M. J. Gormley, Operating.
J. G. Woodworth, Traffic.

Regional Purchasing Committee
CHARLES A. HOW, Chairman.
L. S. Carroll, P. A. Bushnell.

Southern Export Committee
(Reporting to Both Regional Director of Western and Eastern Roads)
CHAS. T. AIREY, Chairman, Atlanta, Ga.
J. W. Daley, Galveston, Tex.
W. M. Reed, New Orleans, La.

Freight Traffic Committee
P. S. EUSTIS, Chairman.
L. M. Allen, A. H. C. S. Fre, W. J.

Freight Traffic Committee
P. S. EUSTIS, Chairman.
L. M. Allen, A. H. C. S. Fre, W. J.

James H. Cherry
Regional Traffic Representative of U. S. Food Administration.

Inter-regional Committees
J. M. HERBERT, Chairman, inter-regional committee in charge of rail-way operations at St. Louis and East St. Louis.
W. G. BIEED, Chairman, Chicago committee.
G. E. EVANS, Chairman, Louisville committee.

Freight Traffic Committee
P. S. EUSTIS, Chairman.
L. M. Allen, A. H. C. S. Fre, W. J.

Eastern Regional District

Alfred H. Smith, Regional Director

F. H. ALFRED, Federal Manager, Pere Marquette; office at Detroit, Mich.
A. B. NEWELL, General Manager, Toledo Terminal Railroad; office at Toledo, Ohio.
H. E. WHITTENBERGER, General Manager, Grank Trunk Western Lines; office at Chicago.

Ohio-Indiana District

H. A. Worcester, District Director; Office at Cincinnati, Ohio.

New England District

New England District

J. H. Hustis, District Director; Office at South Station,
Boston, Mass.

27. JOHN F. ADAMS, General Manager, Rutland; office at Rutland, Vt.

Allegheny Regional District

C. H. Markham, Regional Director, Office at Broad
Street Station, Philadelphia.

ELISHA LEE, Federal Manager, Pennsylvania Lines east of Pittsburgh and Erie: office at Philadelphia.
A. W. THOMPSON, Federal Manager, Baltimore & Ohio Lines East

Pocahontas Regional District

N. D. Maher, Regional Director; Office at
Roanoke, Va.

Southern Regional District

Southern Regional District

B. L. Winchell, Regional Director; Office at
Atlanta, Ga.

Northwestern Regional District

Northwestern Regional District

R. H. Aishton, Regional Director; Office at Chicago.
S. G. STRICKLAND, Federal Manager, Chicago & North Western;
office at Chicago. F. WALTERS, General Manager, Chicago & North Western;

Other appointments have not yet been announced.

Central Western Regional District

Hale Holden, Regional Director; Office at Chicago.
Names of federal or general managers not yet announced.

Southwestern Regional District

B. F. Bush, Regional Director; Office at St. Louis, Mo.

Pacific Coast Sub-district. District director not yet announced.
Names of federal or general managers not yet announced.

The following changes should also be made in the chart on the adjoining pages, these changes having been announced too late for incorporation in the chart itself.

REGIONAL ADMINISTRATION—Note the appointment of three Regional Directors in the West as shown in the type above.

DIVISION OF TRANSPORTATION—The name of this division has been changed to Division of Operation.

DIVISION OF OPERATION—A recently created **COMMITTEE OF FREIGHT TRAFFIC CONTROL** with offices in the Southern Railway Building, Washington, consists of **GEORGE R. LOYALL**, Chairman, O. H. Hobb, S. H. Billings and E. T. Wilcox. A similar committee with the same title with headquarters at Cincinnati consists of **F. B. MITCHELL**, Chairman, G. Krause, B. Arnold and J. B. Ford.

DIVISION OF LABOR—G. W. W. Hanger has been appointed assistant director.
EASTERN REGIONAL DISTRICT—F. Labau has been appointed traffic assistant to the regional director, succeeding George F. Randolph.

Late changes

Not shown
on chart.

George B. Harris

GEORGE B. HARRIS, chairman of the board of directors of the Chicago, Burlington & Quincy, died at his home in Chicago, on June 10, following an illness of about a month. Mr. Harris was in his seventieth year, and belonged to the same generation of railroad executives as Hughitt, Ripley, Cassatt and Earling. He was of the old school of railway executives who carried on their duties quietly and conscientiously and rarely took the public into their confidence. Mr. Harris was indefatigable in his efforts to build up the property which he served and thoroughly mastered every problem presented to him. Although he was rather gruff in manner, he possessed a keen and sympathetic appreciation of the trials and difficulties of his subordinates, and was ever ready to lend a helping hand to the unfortunate. As a result he won the love of the employees of his road as few railroad executives have succeeded in doing. He was a good judge of men and surrounded himself with a capable staff. While he exacted a full measure of effort from subordinate officers, he was quick to recognize and commend ability.

When he became president of the Chicago, Burlington & Quincy in February, 1901, the financial policy of the company was cautious and its operating methods conservative. These policies to which the railroad owed its high standing at that time were carried on by Mr. Harris until James J. Hill secured control. With marked adaptability Mr. Harris applied the Hill methods to the operation of the Burlington with success, and in this he was ably assisted by Darius Miller and Daniel Willard, later presidents of the Burlington and Baltimore & Ohio respectively.

Mr. Harris was born in Brookline, Mass., on December 20, 1848, and moved to Hannibal, Mo., with his parents when a boy of 16. His father was at that time appointed land commissioner of the Hannibal & St. Joseph, then a line across Missouri and subsidiary to the Burlington. Mr. Harris became an office boy for the road which employed his father and later became a clerk in the office of the treasurer and paymaster of the same line. From 1870 to 1875 he was cashier in the land department of the Burlington & Missouri River in Nebraska, with headquarters at Lincoln, Neb. From 1876 to 1877 he was secretary of the South Platte Land Company in the same city. In 1878 he returned to the Burlington & Missouri River as purchasing agent, and in the following year went to the Atchison & Nebraska, at Atchison, Kan., as superintendent and general agent. In 1880 he was again employed by the Burlington & Missouri River as assistant general freight agent, with headquarters at Omaha, Neb. Two years later he went to Chicago as purchasing agent of the Chicago, Burlington & Quincy. In 1883 he was ap-

pointed assistant to the general manager of the Atchison, Topeka & Santa Fe, at Topeka, Kan., and in 1884 went to St. Paul, Minn., as general manager of the Chicago, Burlington & Northern. He was elected president of that road, with headquarters at St. Paul, in 1889. In 1890 he became second vice president of the Chicago, Burlington & Quincy, with office at Chicago, and continued in that position until February 20, 1901, when he was elected president in place of Charles E. Perkins, resigned. On January 15, 1911, the directors finally yielded to his demand that he be replaced by a younger man. He was succeeded by Darius Miller, who died some years later, and in turn was succeeded by Hale Holden, the present president. From 1911 up to the time of his death, Mr. Harris was chairman of the board of directors, and in that capacity gave the younger executives of the road the benefit of his long experience and his thorough knowledge of the property.

George B. Harris

Clean Coal

MORE VIGOROUS REGULATIONS than those heretofore issued to insure the production of clean bituminous coal have been made public by the United States Fuel Administration. These regulations will become effective at 7 A. M., June 1, 1918, and supersede all prior orders on this subject.

No bituminous coal will be permitted to be sold, shipped, or distributed, if the same contains such quantity of rock, slate, bone, sulphur, fire clay, shale, or other impurities, that it would not have been considered merchantable prior to January 1, 1916.

Shipments from bituminous coal mines in which the coal is naturally of such character as to be unfit for market may be prohibited by the Fuel Administration. Operators also of bituminous mines whose products are capable of being made

merchantable by complying with the requirements of the Fuel Administration in regard to the removal of impurities, and who fail to comply with those requirements, will be required either to unload and clean such coal, if it has been loaded into cars or bins, or to deduct 50 cents per ton from the government price. In the event of repeated violations on the part of such operators, such further action will be taken by the Fuel Administration as it may deem advisable.

The Fuel Administration statement says that the enormous increase in the demand for bituminous coal incident to the entrance of the United States into the war, encouraged the opening of numerous so-called coal mines, a large percentage of the output of which resembled coal solely in color. This product brought the same price on the market as clean coal. The inevitable result was a general deterioration in the quality of all bituminous coal put on the market, and a consequent proportionate decrease in the heat generated in the furnaces of the country.

The Administration also made public an order under which operators of bituminous coal mines may receive a special allowance for coal mechanically washed or extraordinarily cleaned or picked in such manner that the fuel value of the coal will be substantially increased by the removal of waste and impurities. No special allowance, however, will be made for the ordinary method of cleaning or picking coal.

Canada's Big Railway Year

A GENERAL REVIEW of railway operations in Canada for the calendar year 1917 was presented in the *Railway Age* of January 4, 1918, page 36 and some of the more important problems confronting the Canadian railways were considered in an article in the issue of April 5, page 849. In dealing now with the official figures for the statistical year ended June 30 last the task is reduced to more or less simple proportions. There was an unavoidable element of speculation in the general groundwork of the article in the issue of January 4. The definite and established facts, however, are bigger, better and more inspiring than were the assumptions made at that time. That is to say, when all the accounts had been worked out, and details woven into a fixed fabric, the showing makes 1917 stand out more conspicuously as a year of unprecedented railway activity than was assumed from incomplete data.

It is fashionable to start all reviews with gross earnings. They are regarded as pivotal in their relationship to other results, and properly so; but it is quite possible to exaggerate their essential value. It is only when other things are equal that total receipts become basically important. In this instance, the balance is preserved. The gross earnings had a total of \$310,771,479. When the earnings of such units as the Pullman Company and the tunnel and bridge companies are included the final aggregate rises to \$313,492,949. The betterment over 1916 was \$49,965,792. The full meaning of this growth is not grasped until the eye helps the mind by glancing at such a comparative statement of gross earnings as the following:

| | |
|------------|--------------|
| 1887 | \$38,841,609 |
| 1897 | 52,353,276 |
| 1907 | 146,738,214 |
| 1917 | 310,771,479 |

The advance of gross earnings must be measured, of course, in the light of increased mileage, and by that test the foregoing results do not lose their inspiring value. Taking the same ten-year periods, the facts with respect to earnings per mile of line are as follows:

| | |
|------------|---------|
| 1887 | \$3.188 |
| 1897 | 3.163 |
| 1907 | 6.536 |
| 1917 | 8.051 |

Rail line in 1917 produced \$295,550,030, water line \$4,397,311, incidental \$10,407,099 and joint facilities \$417,039. These totals included \$220,032,565 from freight, and \$63,131,647 from passengers.

Operating expenses aggregated \$222,890,637, or \$42,348,378 more than for the preceding year. An analysis of this sum shows a fair proportion charged to maintenance. The figures for the various divisions of accounts are as follows:

| | | Per Cent |
|---------------------------------------|---------------|----------|
| Way and structures..... | \$41,154,193 | 18.46 |
| Equipment | 46,371,178 | 20.80 |
| Traffic | 6,236,811 | 2.79 |
| Transportation—fuel | 114,327,344 | 51.29 |
| Transportation—water | 3,271,893 | 1.47 |
| Miscellaneous operations | 3,962,544 | 3.40 |
| Transportation for investment—Cr..... | 18,207 | 0.01 |
| Total | \$222,890,637 | |

The traffic out of which earnings grew was represented in the moving of 121,916,272 tons of freight and 53,749,680 passengers. The growth in public service was in the same ratio as increased earnings.

Facts collateral to earnings, operating expenses and public service, might be epitomized as follows:

| | |
|---|----------------|
| Operating mileage | 38,604 |
| Passengers carried one mile..... | 3,150,127,428 |
| Tons, carried one mile..... | 31,186,707,851 |
| Receipts per passenger per mile, cents..... | 1.945 |
| Receipts per ton per mile..... | .690 |
| Passengers per train..... | 59 |
| Tons per train..... | 436 |
| Average passenger journey, miles..... | 37 |
| Average freight haul..... | 256 |
| Passengers per mile..... | 1,362 |
| Tons per mile..... | 3,159 |
| Passengers density | 79,829 |
| Freight density | 807,946 |
| Passengers per car..... | 16 |
| Tons per car..... | 22.24 |

The salient fact in the foregoing tabular statement is the average trainload. It has made most gratifying gains during recent years, and particularly since the stress of war conditions, in the face of shortage of equipment, led to intensive loading. It had crept up from 260 tons in 1907 to 342 tons in 1913. Then it began to move in real earnest, and passed quickly to 411 tons in 1916 and on to 436 tons last year. The so-called Railway War Board helped in the valuable work, as well as in the betterment of the carload as was shown in the above mentioned articles.

The effect of war conditions is seen in train mileage. In 1914, when 46,702,280 passengers were carried, the mileage of passenger trains was 45,219,048; in 1917, with 53,749,680 passengers, the mileage was 44,083,575. In 1916 it was nearly two millions less. Freight train mileage is a direct matter of tonnage to be moved, and in the face of a large increase in that regard the total ran up from 55,343,193 in 1914 to 62,863,724 in 1917. Nevertheless, heavier carloads and trainloads kept down the aggregate quite materially.

For the first time, in 1917, the hour unit for the measurement of compensation to railway employees was given effect. This was done wholly for the sake of preserving uniformity with the prescription of the Interstate Commerce Commission. It is too early to say whether or not the new method will yield results which can be regarded as a countervail to the loss of all bases of comparison for preceding years. It is very difficult indeed to prescribe a schedule and a classification which will be satisfactory, owing to the confusion created by the plan in vogue of having not only three or four scales for employees of the same class, but of having this mixed system applicable to such employees on the same road. In this connection, it may be said that the salaries and wages bill in Canada for 1917 amounted to \$129,626,187.

Ten months of the current statistical year have passed, and it seems comparatively safe to predict that, notwithstanding the trying conditions which developed last winter, gross earnings will not fall behind those for 1917. The railways have had four months under the increased traffic rates, and the effect is appreciable. Of course, this estimate can only be based on the results revealed in the weekly returns of the larger roads; but it may be said that nothing has thus far occurred to indicate otherwise than a gain for the year ending June 30. That this will carry with it a corresponding gain in net earnings seems more or less doubtful, in view of the rising cost of operation. Railways are not immune from the higher cost of living, so keenly felt at the present time by individuals. Those which are sufficiently prosperous find the collector of special taxes at their doors to take away a considerable proportion of betterments realized; so that it seems almost inevitable the total of net earnings for all railways in Canada will show a decline for the current year.

Within the past few weeks the prime minister has foreshadowed the extension of public ownership by the addition of the Grand Trunk and Grand Trunk Pacific, as well as a batch of independent branch lines in the Maritime Provinces, to the system now operated by government. This

movement has been foreseen ever since the Draxton-Aworth report was made more than a year ago, and is the sequence to the taking over of the Canadian Northern. These roads had fallen into financial difficulties, and it was obvious, moreover, that much duplication of mileage could be eliminated, and economy of operation brought about by a comprehensive scheme of consolidation. This leaves only a score of roads of even local importance apart from the Canadian Pacific, outside the sweep of expropriation by government. The discussion which has taken place in parliament points to the conclusion that the steps thus far

taken momentary and extensive as they undoubtedly are, do not entirely dispose of what we have come to call the Railway Problem in Canada. Whether or not it will end in the establishment of a single system depends very much on the turn of events and the development of public judgment.

Conservation has extended its long arm to official publications. All government reports are this year reduced to mere skeletons of their former bulk, and railway reports are among those which have been much abridged. All details omitted are, however, kept available for inquirers.

Three New Regional Directors Appointed

Hale Holden Becomes Director of Central Western Region
and B. F. Bush Director of Southwestern Region

DIRECTOR GENERAL McADOO on Wednesday announced the division of the Western railroads into three regions instead of one region as heretofore.

R. H. Aishton, hitherto regional director of the Western Region is appointed regional director of the Northwestern Region with office at Chicago, with jurisdiction over the railroads from Chicago to the North Pacific coast.

regional directors will have jurisdiction are given in the tables below on this and the following page

The New Regional Districts

NORTHWESTERN REGION

The Northwestern Regional Director will have jurisdiction over the following roads:

Chicago & Northwest
Chicago, St. Paul, Minneapolis & Omaha
Chicago Great Western
Chicago, Milwaukee & St. Paul
Great Northern
Minneapolis & St. Louis
Minneapolis, St. Paul & South St. Mary
Northern Pacific
Oregon Washington R. R. & Navigation

Hale Holden

Hale Holden is appointed director of the Central Western Region with office at Chicago with jurisdiction over the railroads in the territory from Chicago to the Pacific coast.

B. F. Bush, president of the Missouri Pacific, is appointed regional director of the Southwestern Region with office at St. Louis and with jurisdiction over the railroads running from St. Louis to the southwest.

There will also be a Pacific coast sub-district under Mr. Holden, but the appointment of the district director has not yet been announced.

The roads and lines over which the three newly appointed

B. F. Bush

CENTRAL WESTERN REGION.

The Central Western Region will comprise the following lines:

Atchison, Topeka & Santa Fe.
Chicago, Rock Island & Pacific, except the line St. Louis to Kansas City, the line east of El Reno, the line from El Reno to Memphis, and branches south of Chickasaw, Okla.
Chicago, Peoria & St. Louis.
Chicago & Alton.
Chicago & Eastern Illinois.
Chicago, Terre Haute & Southwestern.
Chicago, Burlington & Quincy.
Colorado & Southern.
Denver & Rio Grande.
El Paso & Southwestern.
Illinois Central, line south of Cairo & Paducah.
Los Angeles & Salt Lake.
Northwestern Pacific.
Oregon Short Line.
Quincy, Omaha & Kansas City.
Southern Pacific Lines west of El Paso and Ogden, except those north of Ashland, Mo.
St. Joseph & Grand Island.
Union Pacific.
Western Pacific.

SOUTHWESTERN REGION.

The Director of the Southwestern Region will have jurisdiction over the following roads:

Fort Worth & Denver.
Fort Worth & Rio Grande.
Gulf Coast & Santa Fe.
Gulf Coast Lines.
Galveston, Harrisburg & San Antonio.
Houston & Texas Central.
Houston, East & West Texas.
International & Great Northern.
Kansas City Southern.
Louisiana & Arkansas.
Louisiana Ry. & Navigation Co.
Louisiana Western.
Midland Valley.
Missouri Pacific.
Missouri, Kansas & Texas.
Morgan's Louisiana & Texas.
Rock Island, lines south of Chickasaw, Okla.; El Reno to Memphis and branches, and St. Louis to Kansas City.
St. Louis & San Francisco.
St. Louis Southwestern.
San Antonio & Aransas Pass.
Texas & Pacific.
Texas & New Orleans.
Wabash (St. Louis to Kansas City and Omaha).
Wichita Falls & South Western.
Texas Midland.
Wichita Valley.

Price Assistant to the Director General

A. Price, heretofore private secretary to the director general, has been appointed assistant to the director general, and M. Brice Clagett has been appointed private secretary to the director general; J. W. Roberts has been appointed auditor of the Railroad Administration, reporting to the Division of Public Service and Accounts.

HUGE COFFEE POT FOR SOLDIERS.—What is believed to be the largest coffee pot in the world has just been completed at the power house of the Pennsylvania Railroad at Front and Third streets, Long Island City. In the pot 418 gallons of coffee may be made every half hour. It is for the use of the Canteen Section of the Long Island City Branch of the Red Cross, which has taken upon itself the task of serving coffee and sandwiches to the soldiers entraining and detraining there every day.

FRANCE HONORS RAIL WORKERS.—Premier Clemenceau has signed an order praising the railroad workers for the endurance and energy they have shown in moving troops to the present battle-front. According to despatches from Paris dated April 21, two high railroad officials have been made Commanders of the Legion of Honor, two others have been made officers of the order, and seventeen have been made Chevaliers. Twenty railroad men have received military medals.

Train Accidents in April¹

THE FOLLOWING IS A LIST of the most notable train accidents that occurred on the railways of the United States in the month of April, 1918:

| Collisions | | | | | |
|-------------|-----------------------------|----------------|---------------------|---------------|-------------|
| Date | Road | Place | Kind of Accident | Kind of Train | Kil'd Inj'd |
| 10. | N. Y. N. H. & H. | Pomfret | rc | F. & F. | 4 3 |
| 25. | Chicago, B. & Q. | Bayard. | bc | F. & F. | 6 3 |
| 27. | N. Y. C. & St. L. | Moorheads | bc | P. & F. | 1 7 |
| 28. | Macon & B. | Odessadale. | bc | P. & F. | 0 2 |
| 29. | Louisville & N. | Cave City | rc | F. & F. | 1 2 |
| Derailments | | | | | |
| Date | Road | Place | Cause of Derailment | Kind of Train | Kil'd Inj'd |
| 5. | St. Louis-S. F. | Hamden. | d. bridge | P. | 1 32 |
| 8. | N. Y. Central. | Amsterdam. | d. truck P. & F. | P. | 1 23 |
| 8. | Texas & N. O. | Colmesneil. | d. eq. | P. | 0 3 |
| 13. | Pennsylvania. | Dix. | b. rail | P. | 0 1 |
| 14. | Texas & Pac. | Baird. | tornado | F. | 0 1 |
| 15. | Long Island. | Central Islip. | b. rail | P. | 3 37 |
| 17. | Atlantic C. L. | Cross Bayou | fire | P. | 0 9 |
| 18. | Nashville, C. & St. L. | Vinings. | | P. | 0 3 |
| 19. | Chicago, M. & St. P. | Freeport. | b. wheel | F. | 0 0 |
| 21. | Southern. | Atthens, Tenn. | | F. | 2 0 |
| 29. | Erie. | Corning. | b. journal | F. | 0 3 |
| 30. | Northern Pacific. | Casselton. | malice | P. | |

The trains in collision near Pomfret, Conn., on the 10th were eastbound freights. The leading train had been nearly stopped and the following train struck it at about 15 miles an hour, damaging the engine, caboose and ten cars. One conductor and two brakemen were killed, and four other trainmen were injured, one of them fatally. The second train was running in disregard of a caution card, requiring the speed to be kept under control.

The trains in collision at Moorheads, Pa., on the 27th were a westbound passenger and an eastbound freight. The freight was standing on a side track and the passenger train ran over a misplaced switch and into the head of the freight. Both engines, three cars on the passenger train and six cars on the freight, were badly damaged. One passenger was killed and three passengers and four employees were injured.

The trains in collision on the Chicago, Burlington & Quincy at Bayard, Nev., on the 25th were an eastbound through freight and a westbound work train. Both engines and six cars were badly damaged. Two trainmen and four laborers were killed and three employees were injured. There was a blinding snowstorm at the time and the work train approached the station not under complete control.

The trains in collision at Odessadale, Ga., on the 28th were a westbound passenger and an eastbound freight. The conductor of the passenger train and one passenger were injured. The collision was due to confusion in flagging.

The trains in collision at Cave City, Ky., on the 29th were southbound freight No. 71, second section, and freight No. 13, third section, following it. The leading train was standing at a water station. One brakeman was killed, and two other trainmen were injured. The engineman of the approaching train had fallen asleep.

The train derailed near Hamden, Okla., on the 5th was northbound passenger No. 716. The train, running at 30 miles an hour, broke through a bridge which had been weakened by a flood, and the engine, baggage car and first two coaches fell through and were partly submerged in a stream. The baggageman was killed and 28 passengers and 4 trainmen were injured.

The trains involved in the derailment on the New York Central about one mile west of Amsterdam, N. Y., on the 8th were an eastbound freight, a westbound passenger train, (the Empire State express No. 51) and eastbound express

¹Abbreviations and marks used in Accident List:
rc. Rear collision—bc, butting collision—rc, Other collisions—b, Broken—d, Defective—unf, unforeseen obstruction—unx, Unexplained—derail Open derailing switch—ms, Misplaced switch—acc, obst. Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler. Explosion of locomotive on road—fire, Cars burned while running—P or Pass, Passenger train—F, or Fc, Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

No. 16. The freight train, on track No. 4, was derailed by the breaking of an arch bar of a truck of a loaded freight car, and several cars fell across tracks 3 and 2. The Empire State express, on track No. 2 was derailed by the obstruction. The engine was overturned and the engine-man was killed. A part of the wreckage fouled track No. 1, and train 16 ran into it: its engine was partly overturned and the engineman was injured. The fireman of No. 51 was also injured, and the newspapers printed the names of 20 or more passengers said to have been injured, but not seriously. This accident was reported in the *Railway Age* of April 12, page 968.

The train derailed near Colmesneil, Tex., on the 8th was northbound passenger No. 155. The locomotive was overturned and three employees were injured. The derailment was due to the wheels of the engine truck becoming locked, which resulted in the left front wheel climbing the rail. Truck inspectors had failed to notice that the brake shoes were not in place and that the truck had been running to the left.

The train derailed at Dix, Pa., on the 13th was eastbound express No. 510. One coach and one parlor car were thrown off the track by a broken rail. Sixteen passengers were injured, all except one of the injuries being classed as slight.

The train involved in the accident on the Texas & Pacific, near Baird, Tex., on the 14th of April, was a westbound freight. The train was struck by a tornado, and five loaded cars in the middle of the train were overturned and fell in a wreck in the ditch. One trainman was injured.

The train derailed on the Long Island Railroad near Central Islip, L. I., N. Y., on the morning of the 15th of April, about 4 o'clock, was a westbound special passenger, carrying 700 soldiers from Camp Upton to Long Island City. Six cars were overturned and ditched. Three soldiers were killed and 37 were injured. The cause of the derailment is believed to have been a broken rail. An officer of the road writes that the cars, all of which were steel, came through the wreck with very little injury. The damage was confined almost entirely to the trucks. The train consisted of a locomotive and 12 cars, and is said to have been running at about 30 miles an hour. The broken rail was of 80 lb., A. S. C. E., section, rolled by the Lackawanna Iron & Steel Company in 1898.

The train derailed at Cross Bayou, Fla., on the evening of the 17th, was southbound passenger No. 39. The train was derailed by the weakening of a trestle which had been damaged by a forest fire which occurred a short time before the train arrived. Nine passengers were injured slightly. The engine passed over the weakened portion of the bridge. No car was overturned.

The train derailed at Vinings, Ga., on the morning of April 18, about 4 o'clock, was the southbound Dixie Flyer. The engine was overturned, and the fireman was fatally scalded. Three other trainmen were injured.

The train derailed near Freeport, Ill., on the 19th was an eastbound freight. The wreck took fire from friction of metals when the cars were wrecked and 14 loaded cars were burnt up. Estimated loss \$50,000. The cause of the derailment was a broken wheel.

The train derailed near Athens, Tenn., on the 21st was freight train No. 53, third section. Fourteen loaded cars were thrown off the track and wrecked by the sudden stopping of the train when the brakes were applied by the cutting of the hose. Of five trespassers riding on the train, two were killed. One of the trespassers had cut the hose with a view to stopping the train at Athens, the speed of the train preventing them from carrying out their original purpose of jumping off while it was in motion. The road was blocked for about twelve hours.

The train derailed near Corning, N. Y., on the 29th was a westbound freight. Six cars of coal and a number of

empty cars were piled up in a bad wreck blocking both main tracks. Three trespassers riding in a freight car were injured. The derailment was caused by a broken journal.

The train derailed on the Northern Pacific near Casselton, N. D., on the 30th was the westbound North Coast Limited. The locomotive and first four cars were ditched, but there were few injuries to persons, and all were reported slight. The derailment was due to the misplacement of a switch by mischievous boys, 12 and 13 years old, with the avowed intention of seeing a wreck. They were taken before a court and were sent to the State Reform School.

Electric Car Accidents.—Serious accidents to street cars were reported in the newspapers in the month of April at Tompkinsville, N. Y., on the 19th; Texarkana, Tex., on the 27th and at Birmingham, Ala., on the 25th. In the last-named accident a car was overturned on a curve and four passengers were killed.

An English View of Government Ownership

(From the *Railway Gazette*, London.)

A RECENT ISSUE of the *Railway Review* (the organ of the British railway labor unions) contains a rather disingenuous plea for railway nationalization after the war. By way of introduction, the writer admits that:—

"To the man in the street the question of railway nationalization may not be enticing today as it was before the war . . . passenger fares have gone up 50 per cent, excursion trains abolished, no certainty in the delivery of goods and parcels, so that in many cases he may be thinking that state ownership is not an unmixed blessing. Railway men, however . . . know that never since the inception of railways have they been worked so efficiently or so much traffic handled in relation to staff employed . . .

The steady stream of munitions . . . the flow to the docks of all the paraphernalia of war . . . a most smashing argument for public ownership of railways, for under the old competitive system of handling traffic and running railways such work would have been impossible."

We are familiar with this sort of argument in the columns of the lay press, but the *Railway Review* ought to—and does—know better. Our railways are being efficiently worked in war time precisely because from the outset of war the government has very wisely left their operation in the hand of the experts responsible for administration and operation during times of peace. Anyone with any knowledge of the results of direct industrial control by the state at present will realize how much the country has gained, and how the prosecution of the war has been aided, as the result of not having state railways.

THE GRAND TRUNK EMPLOYEES' PATRIOTIC ASSOCIATION of Toronto has contributed for patriotic purposes \$50,989.31. The association was organized in August 1915, and the financial statement is from that date to December 31, 1917. To the Toronto and York Patriotic Fund was donated \$15,000; to the British Red Cross \$2,750; British Sailors' Relief, \$1,000; motor ambulances \$3,093.20 and Christmas boxes to enlisted men \$910.50. These are some of the larger items of disbursement.

245 AMERICAN LOCOMOTIVES are now in operation on railway lines in France according to press despatches. They were brought to France in parts and set up in the army machine shops. Likewise 514 American freight cars of thirty-ton capacity have been set up, and 700 more are in process of being assembled, while another 700 are on the way. The railroad freight car of France is of the ten-ton type.

General News Department

For the Alaska railway, the appropriations committee of the House of Representatives has decided to approve for the next fiscal year an appropriation of \$5,250,000. This would keep at work the present force of 5,000 men.

Repairs of locomotives are now being rushed. Frank McManamy, manager of the locomotive section of the Railroad Administration, says that on the government-controlled roads about 4,800 engines are passing through the shops each week, or 700 more than a year ago.

Camp Upton, on the Long Island Railroad, 65 miles east of New York city, was visited on Sunday last, by about 17,000 people. Most of them traveled from New York by the Long Island Railroad, but every road leading to the camp was congested by automobile traffic.

Car Seals are to be investigated by a committee of customs officers which has just been appointed. The committee will meet at Buffalo. It will be particularly interested in seals of the self-locking type and a suitable seal for use with cord or other material for securing packages.

Freight congestion, east of the Mississippi River, is now virtually ended, or nearly so, according to a review compiled by the Railroad Administration. Only about 11,000 cars above normal were this week reported on Eastern lines, as compared with 160,000 above normal last January.

An appropriation of \$3,500,000 for the continuation of the railroad valuation work for the fiscal year ending June 30, 1919, is included in the sundry civil appropriation bill, reported to the House on June 10. Other appropriations for the Interstate Commerce Commission amount to \$2,045,000.

Stockyards at railroad terminals are the subject of a resolution, adopted by the Senate on June 6, directed to the director general of railroads, calling for information as to what, if any, action is contemplated in regard to taking over such yards as a part of the railroad system; and as to what, if any, additional legislation is necessary. The resolution was introduced by Senator Norris of Nebraska.

A senior inspector of motive power is wanted by the United States Civil Service Commission, for a position in the Division of Valuation, of the Interstate Commerce Commission, Eastern district; salary \$1,800 a year. Applications will be received up to July 16. Applicants must be between 25 and 60 years old and the examination will cover the qualifications for all grades in this department up to \$3,600 a year.

The airplane mail service has somewhat improved its performance during the past week. On June 7, the flyer from New York to Philadelphia, and the one from Philadelphia to New York, both decided not to start because of unfavorable weather; and the same condition was reported on June 11. A flight was made from New York to Boston on June 6, and it was the intention to return the next day, but the actual start from Boston was not made until June 11. Lieut. T. H. Webb, on that day, came through in three hours, carrying with him, as passenger, Postmaster W. F. Murray, of Boston. Also on board was the aviator's mechanic, and the mail weighed 20 lb. The airplane mail service between London and Paris is reported as very successful, the third day's round trip having been made in five hours, fifteen minutes.

Complete control of iron—that is, of the distribution of all manufactured steel products and pig iron, has been taken over by the War Industries Board. An agreement has been entered into with a committee of the American Iron & Steel Institute under which the board will pass upon all applications for steel products and pig iron. With certain exceptions, pig iron or steel manufactured products are to be shipped only on priority certificates issued by the Priorities

division of the board. Reports are to be made weekly of shipments made not covered by priority certificates and if there is still any surplus it may be disposed of to other customers if approved by the director of steel supply, J. L. Replogle. It is understood that there will be little or no steel for non-essential industries.

Secrecy as to troop movement is called for by the committee on Public Information, in a circular addressed to editors and correspondents. Following the publication recently of a notice of a troop train movement due to occur in eastern Illinois, the track was tampered with. Enemy sympathizers evidently learned of the troop train movement because of the premature newspaper publication of the fact, and removed rails from the track of the Wabash road. A trackwalker luckily discovered the break in time to repair the damage before the troop train passed.

New Railway Units Organized

The War Department announces that the organization of five new regiments and nineteen battalions of railway engineers is being completed by S. M. Felton, Director General of Military Railways. The work has been done in conjunction with the Engineer Corps. When the new forces are put on duty, there will be 50,000 Americans engaged in railroad construction and operation in France. A total of \$160,000,000 has been spent on railway materials alone, this sum not including supplies provided and used by the Engineer Corps proper. All the nine regiments now in service have been in France since August, 1917. Six of them have been engaged in construction work, building and rebuilding railways, building docks, rearranging terminal facilities in the line of efficiency and generally providing for the heavy shipments of Americans and American supplies. The other three regiments have been engaged in operation. Some of the railway troops have been engaged in the actual fighting line. The new troops will be used part for construction and maintenance, and part for operation. They also will do their part with the rifle and the bayonet should necessity arise. The \$160,000,000 used for railway supplies has gone for such items as 1,727 engines, 22,630 freight cars, and 359,000 tons of steel rails. Much of the work thus far has had to do with terminal facilities, including wharves, docks and lighterage at the water front, switching facilities at inland points, shops, round-houses, etc.

Washouts in Iowa

Exceptionally heavy rains inundated railway tracks in central Iowa and caused a suspension of train movement on a number of lines the latter part of last week. On June 3, the Chicago-Omaha line of the Rock Island was washed out at points near Grinnell, Malcolm, Brooklyn, Carnforth and Victor. The line between Des Moines and St. Paul was also washed out between Cambridge and Buckeye.

The Chicago & North Western encountered its greatest trouble near Tama, Iowa. The Chicago-Omaha line was flooded between that point and Montour and the branch running northwest from Tama was washed out at Eldora, Gifford and Gladbrook. The Chicago-Omaha line was also washed out between Dunlap and Dow City, and at Boone.

The Chicago, Milwaukee & St. Paul suffered its most severe washout between Amana and North English on its Cedar Rapids line. On Chicago Great Western there were washouts between Carroll and Harlan, and between Ira and Baxter. The Lehigh branch was also flooded. Other Iowa railways also suffered considerable damage from high water. For several days passenger trains were delayed on account of floods, and trains had to be detoured at many places.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF APRIL, 1918.

| Name of road | Average mileage operated during period | Operating revenues | | | Maintenance of way and structures | | Operating expenses | | | Operating ratio | Net from railway operation | Railway tax accruals | Operating income (or loss) | Increase (or decrease) last year |
|---|--|--------------------|-----------|------------|-----------------------------------|-------------|--------------------|------------------|---------|-----------------|----------------------------|----------------------|----------------------------|----------------------------------|
| | | Freight | Passenger | Total | Passenger, (inc. misc.) | Equip- ment | Traffic | Trans- portation | General | | | | | |
| Alabama & Vicksburg | 141 | \$137,988 | \$40,922 | \$193,312 | \$19,333 | \$30,914 | \$4,606 | \$64,133 | \$6,000 | \$23,848 | 63.92 | \$69,892 | \$1,516 | 42.11 |
| Alabama Great Southern | 317 | 184,929 | 178,532 | 711,852 | 50,306 | 148,556 | 13,753 | 2,705 | 8,736 | 230,291 | 84.94 | 44,059 | 1,104 | 44.59 |

MONTH OF APRIL, 1918 (CONTINUED)

I. C. C. Employees Liable to Military Service

In response to a House resolution, the Interstate Commerce Commission has submitted a report, giving a list of 164 of its employees of draft age, for whom requests for exemption from military duty or deferred classification have been asked by the commission and allowed. The report states that the civil, structural and electrical engineers, and a number of other employees for whom exemption was requested are members of the commission's organization for valuing the railroads, and that 571 men, out of a total of 2,240 employees, have left the service of the commission to enter the military service.

Headlight Order Effective July 1

The Interstate Commerce Commission's order of October 11, 1915, requiring locomotives to be equipped with high-power electric headlights, which has been three times extended, becomes effective on July 1. It applies to all new locomotives and all locomotives sent to the shop for general or heavy repairs after that date; and all locomotives must be equipped by July 1, 1920. About 40,000 engines are now equipped with high-power lights, which leaves about 26,000 more to be equipped. The new standard locomotives recently contracted for by the Railroad Administration are to be equipped with lights ordered from the Pyle-National Electric Headlight Company, but on other locomotives the roads may use any light they desire, if it complies with the commission's order. This requires for road locomotives a light "which shall afford sufficient illumination to enable a person in the cab who possesses the usual visual capacity required of locomotive enginemen, to see in a clear atmosphere, a dark object as large as a man of average size standing erect at a distance of at least 800 feet ahead and in front of such headlight." For yard locomotives the distance is 300 feet.

Regulation of All War Industries

The War Industries Board announced, at Washington, on June 11, that measures would at once be taken to prevent further increase in the volume of war orders and the number of establishments handling them in the area known as the congested manufacturing and transportation district: The New England States, Eastern and Southern New York, Pennsylvania as far west as Williamsport and Altoona, all of New Jersey and Delaware, and Eastern Maryland, not including Baltimore. Exceptions to this policy will be made only if necessary to provide for war needs. The increased industrial activity in the Eastern states has created a requirement for coal which exceeds the limit of possible transportation of coal, plus necessary materials for manufacture. A map of the congested and restricted districts has been issued to all government departments. The new policy will be made effective by the allocating of new contracts whenever possible in Western Pennsylvania, Ohio, Indiana, Illinois, Mississippi Valley regions and the South. The demand for war materials is actually greater at present than the capacity of manufacturing plants, and, consequently, a continual expansion is in progress.

Increased Employment of Women

The Pennsylvania Railroad reports that in the ten-day period from May 27 to June 5 inclusive, on the lines east, 4,477 employees left the service and 5,122 new ones were hired. The net gain of 645 occurred entirely in the last two days of the period and was apparently sporadic. The figures do not include the forces in the general offices. There was a rapid increase in the number of women employees, accompanied by a decrease in the number of men. On May 27 there were 5,682 women, and on June 5, this number had increased to 7,227. As the total number of both men and women hired exceeded by 645 the number who were lost, it appears that there had been a loss of exactly 900 male employees as against a gain of 1,545 females.

As the total divisional forces (excluding the general office forces) have recently been averaging between 148,000 and

150,000, the rate of "turn over" indicated by the ten-day test is approximately 100 per cent per year. Comparatively few changes took place among the enginemen, conductors and other employees holding positions which are only reached after a considerable length of previous service. Trainmen in other grades, however, were coming and going constantly, and this was true also of shop men, trackmen, etc. There is at present a serious scarcity of firemen, brakemen, car repairmen, trackmen and engine repairmen. There are currently about 14,000 "bad order" cars on the Pennsylvania, or about 4,000 above normal; all due to lack of men.

Railway Business Association and Government Purchasing Policies

Alba B. Johnson, president of the Railway Business Association, has sent a letter to the members of that organization asking for suggestions as to co-operation of the railway supply industry with the Railway Administration. The letter, in part, follows:

"Government purchase of rolling stock and specialties has now progressed to a point where it is possible to appraise some of the policies which the Railroad Administration is pursuing. It is assumed and in some instances has been announced that none of these policies is to be regarded as a rigid precedent but that suggestions are invited for improvement affecting the future. Many aspects can be effectively dealt with only in a representative way. It is for the Railway Business Association to frame recommendations and urge them upon the authorities. In order that the general executive committee may proceed in the matter with intelligence it is essential that members give us the benefit of their experience and ideas. Statements whether written or oral will, if so desired, be regarded as confidential. The Railway Business Association is the counsellor of each of its members and the advocate of their united purposes. No industrial group has served or can serve the country more vitally. No one can with greater propriety than our members be accorded consideration by the government. We are not mere petitioners for business. We are citizens, making sacrifices like all other citizens, and equipped to aid in the momentous enterprise which engages the nation's energies.

"We are organized to help our members give the fullest co-operation to the Railroad Administration. We are also organized to assure that the Railroad Administration has the fullest understanding of our dignity and potentiality as a guild, as well as of the particular limitations and perplexities under which our establishments are doing their part in the nation's supreme business."

Hudson Bay Railway

A recent debate in the senate of the Canadian parliament brought out a discussion of the present status of the Hudson Bay Railway, in which it developed that no construction on the road itself has been done during the past year. A bridge, however, was completed at the second crossing of the Nelson river. Up to date, a length of 332 miles of the line has been finished, and track is yet to be laid on 92 miles. Trains are being operated on 214 miles, on a part of which there is daily train service. The part of the line operated has paid expenses. The last year in which any considerable amount of construction material was transported by water to Port Nelson, the terminus of the line, was 1914. In the summer of that year, 36 voyages were successfully made through Hudson strait and Hudson bay, and large quantities of freight were carried by ordinary tramp steamers without hazards or difficulty. With specially constructed ships the season, it is believed, could be considerably prolonged. During six weeks of the summer, engineers and navigators reported that the navigation of the bay was safer than the navigation of the St. Lawrence river to Quebec, and during the remaining six weeks, the navigation of Hudson strait was as safe as the route to Quebec.

Up to March of this year, \$20,161,000 had been expended on the Hudson Bay Railway, of which \$13,814,000 had been

spent directly on the construction of the road and \$6,347,000 on terminals and harbor improvements at Port Nelson. The latter sum also includes the cost of steamships, which are now in general service throughout the year.

The north and south arms of the bridge across the Nelson river at Kettle Rapids were connected in December, 1917, so that track laying can be continued this season. Grading between Kettle Rapids and Port Nelson has been fully completed, and filling and ballasting has been done as far as Kettle Rapids. Owing to the shortage of ocean tonnage, no further shipments of supplies have been made to Hudson Bay this season. A limited program is being carried out at Port Nelson in which materials and supplies on hand are being utilized. The island crib work at that point has been extended and dredging has been continued.

Chicago Car Thieves Captured

Secret service officers of the Chicago railways arrested six private railroad watchmen and one ten-cent-store dealer in Chicago on June 8 in a roundup of railway thieves. Three of the men are charged with larceny and three others are held on burglary charges. Rosario di Giacomo, the store keeper, is being held on two charges, receiving stolen goods and bribery, having offered Michael Mulvey and Timothy Buttiner, detective sergeants, \$100 each when they arrested him, after they had discovered in his possession more than \$15,000 of loot taken from box cars, and other railroad property. His store, the police declare, has been used as a headquarters for the thieves. When Giacomo offered them the bribe, the detectives took the money for evidence and placed him under arrest. The men will be prosecuted under Section 11 of the Railroad Control Bill, which provides a maximum penalty upon conviction of 10 years' imprisonment or a \$5,000 fine or both for stealing railroad property, or tampering with or knowingly impeding the operation, use or possession of railroad property.

The campaign against stealing from Chicago railroads is being carried on by the Chicago railroad police commission, consisting of T. E. Pratt, special agent of the Chicago, Burlington & Quincy; William Briggs, captain of police of the Pennsylvania lines, and H. H. Germain, superintendent of special service of the Rock Island lines. G. M. Bryan has been appointed chief inspector for the new commission, and Martin Quinn, captain. An office has been opened in Room 646 Transportation building, Chicago, and railroad men are urged as a patriotic duty to report to it any thefts from their companies. While the unification of secret service work on Chicago railroads was first initiated by the committee of Chicago railroad presidents, the commission has received the approval of Director-General McAdoo; and it is a part of the property-protection section of the railroad administration, of which Philip J. Doherty is manager. The scope of the work of this section was outlined in the *Railway Age* of May 10, page 1168.

That the Chicago switching district is a fertile field for more intensive policing is indicated by estimates which place the stolen merchandise in that territory at \$1,000,000 annually. The Chicago railroad police commission will have immediate charge of all railroad premises, including passenger stations, shops, yards, elevators and also of equipment, and will have a force of about 1,000 operatives. In addition, individual railroads will maintain their own special police who can be called on for assistance by the commission when the occasion arises.

The Roadmasters' Convention

At a meeting of the Executive Committee of the Roadmasters' Association, held in Buffalo on June 1, and attended by about 40 members of that Association, it was decided to proceed with the arrangements for the annual convention of the association, which will be held at the Auditorium Hotel, Chicago, on September 17-19. The program will have particular reference to the problems now confronting the men in the track department. The Track Supply Association will also present an exhibit. It was decided to eliminate all entertainment features.

Traffic News

The Washington, Baltimore & Annapolis Electric Railway has applied to the Public Service Commission of Maryland for authority to increase passenger fares to correspond with the rates now in effect on government controlled roads.

Coal Production

The observance of Memorial Day in the mines in the northern states caused the production of bituminous coal during the week ended June 1 to decrease 1,025,000 tons, or 8.7 per cent, according to the report of the Geological Survey. The total production was 10,774,000 net tons. Anthracite shipments during the week decreased 8,832 cars or 22 per cent. For the country as a whole, improvement is reported in the car situation for the week ended May 25.

Westbound Fuel Restrictions

Because of the increasing demand for fuel for war purposes in the East, the Fuel Administration, beginning June 20, will prohibit the movement of bituminous coal, westbound, from coal operations on the line of the Chesapeake & Ohio in the Kanawha district, east of and including St. Albans, W. Va. By-product coal and coal intended for the manufacture of gas or for other special purposes may, however, be moved when the consumers have obtained a permit from the Coal Zone Permit Bureau. Public utilities and similar plants, which now have contracts with operators in these producing fields, must also secure permits for the westbound shipment of such coal. When coal from these fields is to be shipped to Toledo and Sandusky, for lake trans-shipment or vessel fuel, the trans-shipper or dock operator must secure the necessary permit.

Similar orders will be at once promulgated, prohibiting the movement of any high volatile coal from the Kanawha and Kenova-Thacker districts of West Virginia and the Big Sandy district of Kentucky to any Indiana consumers.

Passenger Fares Around New York

The one-way passenger fare between New York city and Newark, N. J., nine miles, has been fixed at 27 cents. From Church street, New York, to Park place, Newark, the passenger trains are run jointly by the Hudson & Manhattan and the Pennsylvania railroads, and for a few days after the new tariffs went into effect, the price for single and round-trip tickets was lower at New York than at Newark, the Hudson & Manhattan having been ordered to postpone its advances; but on June 13, the 27-cent rate was prescribed for both roads; the round-trip rate being 54 cents. Street-car lines between Jersey City and Newark are demanding authority to make advances in their rates to correspond with those of the standard railroads. The ferries between Manhattan and Jersey City are moving to increase their fares from three cents each to five cents, and it is understood that the approval of the Interstate Commerce Commission is assured.

The Hudson River Day Line of steamboats has been authorized by the Interstate Commerce Commission to make its fare between New York and Albany three dollars; distance 143 miles.

The abolition of excursion fares and special rates for soldiers has given rise to loud complaints in many places. Between Camp Upton, L. I., and New York city, 65 miles, soldiers have been carried at one cent a mile, when on short furloughs, and for one half cent a mile during certain hours of the night, but now, except on formal furloughs of 48 hours or more, and when provided with a special certificate, they must pay the regular rate, which including the tax, is, for a round-trip, \$4.21. Between New York city terminals and Pelham Bay park, the fare of a large car, there has been a radical increase in fare, and many travel seriously.

Commission and Court News

Interstate Commerce Commission

In a tentative report to the Commission, Examiner Thurtell approves the application of the Illinois Traction System for an order establishing through routes and joint rates between points on its line and points on the New York Central.

Court News

Order to Furnish Separate Freight and Passenger Trains Held Unreasonable

An order of the Nebraska Railway Commission required the Missouri Pacific to furnish separate trains for freight and passenger service. The Nebraska Supreme Court holds that it is not *prima facie* unreasonable, but if it is shown that the installation of a separate passenger train would make the operation of the branch line unremunerative, and it is conceded that both passenger and freight business within the state are carried on at a loss, and that the whole interstate system is in the hands of a receiver on account of inability to pay fixed charges, such order may violate the due process clause of the Constitution.—*Marshall v. Bush* (Neb.), 167 N. W., 59. Decided April 12, 1918.

Discretion of Directors as to Eminent Domain

The Pennsylvania Superior Court holds that there is nothing in the Public Service Act which authorizes the Public Service Commission to order a railroad company to exercise its power of eminent domain for the purpose of constructing a siding from its tracks to the plant of a light, heat and power company. The discretionary right to exercise such power has always been lodged in the board of directors of the railroad company, and the act does not substitute the discretion of the public Service Commission for that of the board of directors.—*Lycoming Edison Co. v. Commission*, 67 Pa. Superior Ct., 608. Decided July 13, 1917.

Abolition of Grade Crossings

The Pennsylvania Public Service Commission approved the plans of a railroad company to change a portion of the road system of a township so as to substitute one overhead crossing for two dangerous grade crossings. No objection was made either by the railroad company or abutting property owners. On appeal by the township from the order the Pennsylvania Superior Court held that the township had no standing to object to the order because it failed to direct the railroad company to maintain the roads changed or to award to the township a lump sum of money for an alleged increased burden thrown on the township.—*Great Bend Tp. v. D. L. & W.*, 67 Pa. Superior Ct., 95. Decided July 13, 1917.

Discrimination by Expediting—Consequential Damage

The New York Appellate Division holds that an agreement with a shipper to expedite a shipment at regular rates, no special rate having been published for expediting, is a discrimination, in violation of the Interstate Commerce Act, and relief on such unlawful contract will be denied. It also holds that where there is no other contract between the shipper and the delivery carrier, the rights of the parties are to be measured solely by the bill of lading issued by the initial carrier. Under a provision that the amount of the carrier's liability shall be computed on the value of the goods at the time and place of shipment, the shipper is not entitled to damages for delayed delivery or for inability to use the goods for a certain time from their damaged condition.—*Grossman Mfg. Co. v. N. Y. C.*, 169 N. Y. Supp., 213. Decided February 21, 1918.

Equipment and Supplies

Additional Locomotive Orders

The United States Railroad Administration is expected to place shortly orders for 390 locomotives in addition to the 1,025 ordered some time ago; 245 from the American Locomotive Company, 100 from the Baldwin Locomotive Works, and 45 from the Lima Locomotive Corporation. The orders, it is understood, will be divided about as follows: From the American Locomotive Company, 130 light Mikados, 100 6-wheel switching and 15 heavy Santa Fe. From the Baldwin Locomotive Works, 57 heavy Mikado, 13 light Pacific and 30 Consolidation for anthracite burning. From the Lima Locomotive Works, 45 light Mikados. This distribution, however, may be changed, that depending upon the ability of the Lima Locomotive Works to handle its order. When the order is placed it will bring the total of orders placed with the three companies up to 800 to the American Locomotive Company, 570 to the Baldwin Locomotive Works, and 45 to the Lima Locomotive Corporation.

Car and Locomotive Specialties Ordered

The Central Advisory Purchasing Committee of the Railroad Administration has ordered the principal specialties to be used for the equipment of the 1,025 locomotives and the 100,000 freight cars, for which orders were placed about May 1. In some cases the equipment is to be furnished or purchased by the builders, and in all cases formal orders will be placed by the car and locomotive builders with the specialty manufacturers. Some of the orders for specialties have not yet been definitely settled. The list of those already ordered is as follows:

Locomotives

| | |
|--|--|
| Tender truck bolsters..... | All engines, Pittsburgh Steel Foundry Co. |
| Journal box for tenders..... | To be purchased by builders. |
| Air brakes | 773 Westinghouse Air Brake Co. |
| 250 | New York Air Brake Co. |
| Brick arches | To be purchased by builders. |
| Radial buffers | Franklin Railway Supply Co. |
| Pilot bumpers | To be purchased by builders. |
| Cradle castings | To be purchased by builders. |
| Blow-off cocks | 725 Everlasting, Scully Steel & Iron Co. |
| 300 | Southern, So. Loco. Valve Gear Co. |
| Boiler covering | To be purchased by builders. |
| Uncoupling devices | All engines, Imperial, Imp. Appliance Co. |
| Automatic fire doors..... | 590 Shoemaker, Nat. Ry. Devices Co. |
| 435 | Franklin. |
| Friction draft gear..... | All engine tenders, Westinghouse Air Brake Co. |
| Valve gear | 500 Walschaert. |
| 340 | Baker. |
| 185 | Southern. |
| Reverse gear | 745 Ragonnet. |
| 200 | Lewis. |
| 50 | Brown. |
| 30 | Mellin. |
| Headlight turbines and generators | All engines, Pyle Nat. Elec. Head. Co. |
| Side frames for freight engine tenders | American Steel Foundries. |
| Steam gages | Buckeye Steel Castings Co. |
| 310 | Ashteroft Manufacturing Co. |
| 515 | Ashton Valve Co. |
| Steam heat gages for passenger engines | 90 Ashton Valve Co. |
| Water gages | All engines, Sargent Co. |
| Injectors | 480 Nathan Manufacturing Co. |
| 395 | Hancock Inspirator Co. |
| 150 | Ohio Injector Co. |
| Cheek valves and stops..... | All engines, Nathan Manufacturing Co. |
| Lubricators | 600 Nathan Manufacturing Co. |
| 425 | Detroit Lubricator Co. |
| Driving box lubricators..... | All engines, Franklin Railway Supply Co. |
| Metallic packing | 555 Paxton-Mitchell Co. |
| 470 | United States Metallic Packing Co. |
| Coal pushers | 250 Locomotive Stoker Co. |
| Regulators for passenger locomotives | 65 Vapor. |
| 23 | Leslie. |
| Bellringers | All engines, Harry Vissering & Co. |

| | | |
|--|-----|---|
| Sanders | 181 | United States Metallic Packing Co. |
| | 200 | Hanlon Locomotive Sander Co. |
| Coal sprinklers | 40 | Harro Vossing & Co. |
| | 46 | William Sellers & Co. |
| Stokers | 48 | Hannack Inspirator Co. |
| | 179 | Duplex Locomotive Stoker Co. |
| | 179 | Standard Stoker Co. |
| | 25 | Hanna Locomotive Stoker Co. |
| (Swinging and Planch types take coal pushers.) | | |
| Blower valves | 41 | Engines Sargent Company. |
| Safety valves | 64 | Consolidated Safety Valve Co. |
| | 33 | Curtis |
| | 75 | Ashton Valve Co. |
| Brake shoes | 41 | Engines American Brake Shoe & Foundry Co. |
| Grate shakers | 41 | Engines Franklin Railway Supply Co. |
| Boiler tubes | 41 | Engines Franklin Railway Supply Co. |
| Unit safety draw bars | 41 | Engines Franklin Railway Supply Co. |

Freight Cars

| | | |
|--------------------------------|---|-----------------------------------|
| Truck bolsters | 46,000 | American Steel Foundries. |
| | 21,000 | Bussey Steel Castings Co. |
| | 21,000 | Scullin Steel Co. |
| | 8,000 | Gould Coupler Co. |
| | 3,000 | Bettendorf Co. |
| Couplers | 33,000 | American Steel Foundries. |
| | 15,500 | Bussey Steel Castings Co. |
| | 7,500 | Gould Coupler Co. |
| | 8,000 | McConway & Torley Co. |
| | 46,000 | National Malleable Castings Co. |
| Side frames, cast steel | 35,000 | American Steel Foundries. |
| | 14,500 | Bussey Steel Castings Co. |
| | 16,000 | Scullin Steel Co. |
| | 6,500 | Gould Coupler Co. |
| | 8,000 | Bettendorf Co. |
| Uncoupling device for couplers | All cars | Imperial Appliance Co. |
| Pressed steel ends | 50,000 | Pressed Steel Manufacturing Co. |
| Friction draft gear | 50,000 | Sessions, Standard Coupler Co. |
| | 25,000 | Westinghouse Air Brake Co. |
| | 19,000 | Cardwell, Union Draft Gear Co. |
| | 6,000 | Murray, Keyoke Railway Equip. Co. |
| Dust guards | All cars | Wm. N. Thornbergh Co. |
| Air brake hose | To be furnished with air brake equipment. | |
| Brake shoes | All cars | American Brake Shoe & Fdy. Co. |
| Draw bar yokes | 50,000 | Union Draft Gear Co. |
| | 50,000 | Bussey Steel Castings Co. |
| Air brakes | 75,000 | Westinghouse Air Brake Co. |
| | 25,000 | New York Air Brake Co. |

(The number in each case represents the number of cars or locomotives where two or three of a device is used in a single car or locomotive.)

The final apportionment of the order for 100,000 cars has been changed somewhat since the figures were originally announced. The list was published in the *Railway Age* of May 10, page 1169. The changes are as follows:

REVISED APPORTIONMENT OF CARS

| Company | 50-ton S. S. Box | 40-ton D. S. Box | 30-ton Composite Gondola | 20-ton H. Q. | 10-ton I. S. Gondola | Totals |
|------------------------------------|------------------------|------------------------|--------------------------------|-----------------|----------------------------|--------|
| American Car & Foundry Co. | 9,000 | 11,000 | 5,000 | 4,000 | 1,000 | 31,000 |
| Bettendorf Company | 3,000 | ... | ... | ... | ... | 3,000 |
| Cambria Steel Company | ... | ... | ... | 7,000 | ... | 7,000 |
| Haskell & Barker Car Co. | 6,000 | ... | 2,000 | ... | ... | 8,000 |
| Keith Car & Manufacturing Co. | ... | 1,500 | ... | ... | ... | 1,500 |
| Laconia Car Company | ... | 1,000 | ... | ... | ... | 1,000 |
| Lenoir Car Works | ... | 2,000 | ... | ... | ... | 2,000 |
| Liberty Car & Equipment Co. | ... | 1,000 | ... | ... | ... | 1,000 |
| Major Car Corporation | ... | ... | 3,000 | ... | ... | 3,000 |
| Mt. Vernon Car Manufacturing Co. | ... | ... | 4,000 | ... | ... | 4,000 |
| Pacific Car & Foundry Co. | ... | ... | ... | ... | ... | ... |
| Pressed Steel Car Co. | ... | ... | 5,500 | ... | 2,500 | 14,000 |
| Pullman Co. | 6,000 | ... | ... | 3,000 | ... | 9,000 |
| Ralston Steel Car Co. | ... | ... | ... | 4,000 | ... | 4,000 |
| St. Louis Car Co. | 1,000 | ... | ... | ... | ... | 1,000 |
| Standard Steel Car Co. | ... | ... | ... | ... | ... | ... |
| McGuire-Cummings Manufacturing Co. | ... | 500 | ... | ... | ... | 500 |
| Totals | 25,000 | 21,000 | 29,000 | 11,000 | 1,000 | 86,000 |

The proposed order for 2,000 40-ton box cars to the Barney & Smith Car Company was not placed, and 1,000 of these cars were added to the order of the American Car & Foundry Company, 500 to that of the Keith Car & Manufacturing Company, and 500 were ordered from the McGuire-Cummings Manufacturing Company.

The proposal which was tentatively advanced at the beginning of the negotiations with the specialty manufacturers that they forego royalties on their patents or pool patents so that various companies could manufacture the same patented device was dropped.

Freight Cars

THE LEVAL TRADING COMPANY, New York, is acquiring for sale steel derrick car.

THE AMERICAN SMELTER SALT-ED COMPANY, New York, is acquiring for 8 gravity tank car with a capacity of 82 cu. ft.

THE ILLINOIS CENTRAL contemplates the purchase of 7 10,000-gal. steel tank cars for the handling of a residue oil to be and timber treating plant and fuel oil used in the operation of speed burners on southern lines.

Signaling

THE CENTRAL OF GEORGIA is to install an electric interlocking at Boundary street adjacent to the Union passenger station at Macon, Ga. This station is used by the Central of Georgia the Southern, and the Georgia Southern & Florida. The machine will have 85 working levers. The contract for the apparatus and for installation has been given to the General Railway Signal Company.

THE ILLINOIS CENTRAL is to erect automatic block signals between Springfield, Ill., and Marine, 73 miles, at a cost of about \$155,000, and between Princeton, Ky., and Hsley, 18 miles, at a cost of about \$51,000. A telephone circuit will be installed in the Grenada district of the Mississippi division between the division and general offices and the principal stations, at a cost of about \$30,000.

THE BALTIMORE & OHIO is to install automatic block signals on its line, double track, between Laughlin Junction, Pa., about three miles east of Pittsburgh, and Goehring, Pa., about 35 miles west of Pittsburgh, and near Callery. Plans for this signaling were made some time ago, but their execution has been deferred until now. The signals will be three-position, and DC circuits will be used throughout, with low-voltage machines.

The Baltimore & Ohio is making extensive additions to its tracks at Gray's Ferry, Philadelphia, Pa., and has asked for bids for the construction of a large electric interlocking plant. This interlocking is to control the switches and signals at the east end of the Eastside Yard, near Wharton street. Between the extremes of this interlocking there are four main tracks, all of which will be signaled for the operation of trains in both directions.

AUSTRIANS LOOT FOOD TRAINS—Press despatches state that trainloads of food are being continually looted in Austria. One train of 100 trucks destined for the relief of Vienna reached the capital with only four trucks.

WAR-SAVINGS SERVICE—The government wishes to enlist every man, woman and child of the nation in war-savings service. When an individual buys war-savings stamps he enlists in the production division of the nation, thereby supporting and backing up the fighting division before it goes overseas and in the seas.

Supply Trade News

David T. Hallberg, sales representative of the P & M Company, with headquarters at Chicago, has been promoted to district sales agent, with the same headquarters.

Henry Fischer, general sales manager of the Verona Tool Works, with headquarters at Pittsburgh, Pa., has resigned from that company to go with the Proctor & Gamble Soap Company at Cincinnati, Ohio.

George M. Coale, formerly of the Continental Lumber Company at Houston, Tex., has been elected vice-president of the Duncane Lumber Company, with headquarters at Chicago. Mr. Coale will have charge of railway sales.

Stanley W. Midgley, general sales manager of the Acme Supply Company, Chicago, has been appointed western representative of the railroad sales department, in the newly-created western office of the Liberty Steel Products Company, Chicago.

The new accessory plant of the **American Locomotive Company** at Richmond, Va., where piston valves, flexible staybolts, reverse gears and the other accessories are to be manufactured, has been placed under the charge of **Ross Anderson** as manager.

At the first annual meeting of the directors of the United States Switch Company, located at Eau Claire, Wis., **F. E. Nicoles**, division superintendent of the Chicago, St. Paul, Minneapolis & Omaha, at Eau Claire, was elected vice-president; **Charles McArthur**, secretary and treasurer, and **Lee T. Pond**, assistant secretary and treasurer. **James W. Hubbard** was re-elected president and general manager.

C. E. Smith & Co., consulting engineers, St. Louis, Mo., announce that in the absence of **C. E. Smith**, who has received a commission in the national army, their business will be conducted under the direction of **W. S. Dawley**, formerly chief engineer of the Chicago & Eastern Illinois, who for several years past has been out of railway service, and has been engaged in consulting engineering work.

The **Bird-Archer Company**, manufacturer of locomotive boiler chemicals, has moved its Chicago offices to 1105 Peoples Gas building, the change having been necessitated by larger space requirements. This company has recently increased its manufacturing facilities by opening a new factory in Chicago, and a new factory at Cobourg, Ontario, besides materially increasing the output of its Philadelphia factory.

Walter H. Allen, of the staff of the William Wharton, Jr., & Co., Inc., with office at New York, has been transferred to the Pittsburgh office of this company in the capacity of sales engineer in charge of track work in the Pittsburgh and Cleveland district. Mr. Allen was formerly division engineer of the Pennsylvania Steel Company, with headquarters at Steelton, Pa., and was later attached to the sales organization of the Maxwell Motor Company of Detroit, Mich.

The officers of the Chicago Malleable Casting Company, the Universal Draft Gear Attachment Company, and the Union Draft Gear Company, of Chicago, have formed a new corporation called the **Allied Steel Casting Company** of Chicago, and have purchased the Harvey, Ill., plant, **Whiting Foundry Equipment Company**. The officers of the new company are: **J. T. Llewellyn**, vice-president of the Chicago Malleable, president; **C. J. Nash**, president of the Universal Draft Gear, vice-president; **J. S. Llewellyn**, secretary-treasurer and general manager of the Chicago Malleable, secretary-treasurer and general manager; **C. H. Tobias**, secretary and treasurer of the Union Draft Gear, assistant secretary-treasurer. The officers and organizations of the Chicago Malleable Casting Company, the Universal Draft Gear Attachment Company and the Union Draft Gear are not changed, and the companies continue business as before.

Railway Construction

ALASKAN RAILROAD.—The Alaskan Engineering Commission is surveying a branch line between Moose Creek and Baxter, about five miles. **T. W. Secrest**, locating engineer, is in charge of the work.

CANADIAN NORTHERN.—This company has authorized the extension of its Elrose branch in Saskatchewan easterly 25 miles to Alsack and grading is now under way. A contract has also been let for the grading on an extension from Gravelburg, Sask., northwest 14 miles towards Swift Current. Another extension will be built from Hanna, Alta., southeast 47 miles towards Medicine Hat. Contracts for the grading of this line have also been let.

ILLINOIS CENTRAL.—**M. L. Windham**, Centralia, Ill., has been awarded a contract for the grading work for additional yard tracks to be constructed at that point at a total estimated cost of \$171,000. The work involves about 30,000 cu. yd. of grading; the track work will be done by the Illinois Central's own forces. (May 17, page 1257.)

The Illinois Central has received bids on the construction of mechanical facilities at **Fulton, Ky.**, **Amboy, Ill.**, and **Mounds, Ill.** The work at **Fulton** will include the removal of the old roundhouse and other buildings on the site, the construction of a 12-stall roundhouse, a machine shop and boiler room; a concrete stack 5 ft. by 150 ft.; a standard office, store and oil house; a toilet building; 2 Robertson cinder conveyor pits; an engine-men's tool equipment building; a standard brick sand drying house; a standard wet sand bin 77 ft. by 9 ft. 4 in.; a standard dry sand storage bin; sanding equipment, including sand drum, air reservoir, piping and sand delivery spouts; sewers and water works. The work at **Amboy** involves the clearing of the site by the removal of the present buildings, the construction of a 12-stall roundhouse; a 100-ft. turntable; a machine shop and boiler room; a concrete stack 5 ft. by 150 ft.; a standard office, store and oil house; a toilet building; two Robertson cinder pits; engine-men's tool equipment building; a standard brick sand drying house; a standard wet sand bin 84 ft. by 9 ft. 4 in.; a standard dry sand storage bin; sanding equipment, including sand drum, air reservoir, piping and sand delivery spouts; sewers and water works. The work at **Mounds, Ill.**, will involve the construction of practically the same facilities as at **Fulton** and **Amboy**; the roundhouse, however, will have 24 stalls and the turntable will have a diameter of 85 ft. The Illinois Central is asking for bids on a 500-ton frame coal chute at **Gwin, Miss.**, and a 600-ton frame coal chute at **Fulton, Ky.**

This company's program for 1918 includes considerable track construction. Six additional yard tracks will be built at the **Wildwood yard, Chicago**, at a cost of about \$75,000 and side track will be laid between Eighteenth and Twenty-eighth streets, Chicago, which with a rearrangement of existing facilities to provide a switching lead, will cost about \$35,000. Second main track will be extended between **Belleville, Ill.**, and **Wilderman** at a cost of about \$55,000; 21 tracks will be extended in **Nonconah yard** at **Memphis, Tenn.**, at a cost of about \$209,000 and a new northbound departure yard consisting of six tracks will be built at that point, at a cost of \$120,000. At **Champaign, Ill.**, a new six-track northbound yard will be constructed costing \$118,000 and at **East St. Louis** a new yard containing five additional 60-car tracks will be built and the old yard will be enlarged to include five additional 50-car tracks at a cost of \$96,000.

Water purifying plants will be installed at four points in **Iowa** on the **Albert Lea** district of the **Minnesota** division at a cost of \$33,000 and five plants will be installed on the **Cherokee** district of the **Iowa** division at a cost of \$45,000. Additional water facilities at **Gilman, Ill.**, will cost \$26,500 and new water facilities at **Pesotum, Ill.**, will cost \$33,000.

At **La Salle, Ill.**, a new freight house with a second-story office, necessary track changes and a conversion of the present freight house into an engine house will cost approximately \$50,000.

Joseph E. Nelson & Sons, Chicago, have been awarded a contract for the construction of new mechanical facilities at **Paducah, Ky.** (May 17, page 1257.)

Railway Financial News

CHICAGO & NORTH WESTERN.—See editorial comments elsewhere in this issue.

CHICAGO, ROCK ISLAND & PACIFIC.—Action on the semi-annual dividends on the preferred stock has been deferred pending receipt of 90 per cent of its estimated standard returns, application for which has been made to the government.

DENVER & RIO GRANDE.—Securities to the value of \$10,418,700 belonging to this company have been seized to satisfy the judgment recently obtained by the Equitable Trust Company in behalf of the Western Pacific bondholders. It is understood, also, that 100,000 shares of stock of the Utah Fuel Company of a par value of \$10,000,000, owned by the Denver & Rio Grande, will be sold on June 20 in further satisfaction of the judgment.

HAWKINSVILLE & WESTERN.—This company, which recently suspended operation of its 23 mile line between Hawkinsville, Ga., and Perry, was ordered by the Georgia Railroad Commission to resume operation not later than June 20. This road has been operated by the Ocala Southern under lease.

ILLINOIS CENTRAL.—See editorial comments elsewhere in this issue.

NEW YORK CENTRAL.—The directors have declared the regular quarterly dividend of $1\frac{1}{4}$ per cent.

NEW YORK, NEW HAVEN & HARTFORD.—J. P. Morgan & Co. and other bankers have made arrangements for the sale of \$3,420,000 6 per cent equipment trust certificates which will provide the bulk of the required funds for the purchase of equipment costing \$4,756,000.

SIDELL & OLNEY.—The petition of this company, which is owned by the Cincinnati, Indianapolis & Western, to dismantle its 85 miles of line between Sidell, Ill., and Olney, was denied by the Illinois Public Utilities Commission.

URUGUAY BUYS RAILWAY.—The Uruguayan Government has decided to buy the British-owned Central Uruguay Railway. Payment will be made with the proceeds of an internal bond issue. The original concession for the Central Uruguay Railway was granted in 1865. It was to extend from Montevideo to the Rio Negro, 168 miles due north. In 1868 the concession was transferred to a British company. Ten years later the company was reorganized and the terms of the concession were rearranged, the company undertaking to construct a line beyond the northern bank of the Yi River. Since that time three extensions have been built. They are known as the Western, Northern and Eastern extensions. Besides these extensions the Central Uruguay also operates the North Eastern Railway. The total mileage under control is about 980.

WAR GARDENS OF AN ENGLISH RAILWAY.—The London, Brighton & South Coast Railway has now 4,000 allotments cultivated by its employees or by the wives and children of men who are serving the colors.

"PUBLIC ROADS" MAGAZINE ISSUED.—May saw the birth of a new monthly periodical in the Department of Agriculture, "Public Roads," issued by the Office of Public Roads and Rural Engineering. Its 48 pages, some of them illustrated, contain material intended primarily for state and county highway officials actively engaged in the construction and maintenance of highways. The principal object of the publication is to act as a medium of exchange of knowledge and experience between highway departments of the 48 states. The magazine is designed to be a permanent and complete record of activities and construction under the Federal aid road act. Because of the limited allotment for printing expenses the circulation has been restricted to federal, state and county officials actively engaged in road work.—*Official Bulletin*

Railway Officers

Executive, Financial, Legal and Accounting

A. C. Needles, federal manager of the Norfolk & Western, announces that the title of **J. W. Cox**, controller, has been changed to general auditor, with office at Raleigh, Va.

James B. Wright, district attorney of the Louisville & Nashville at Knoxville, Tenn., has been appointed an assistant in the legal department of the Railroad Administration at Washington, D. C.

James H. Hustis, having resigned as president and director of the Boston & Maine and its subsidiaries, **Woodward Hudson**, general counsel, with office at Boston, Mass., has been elected as his successor in these capacities.

W. E. Eppler, chief of bureau department of accounts of the Quebec, Montreal & Southern and the Niperville Junction Railway, has been appointed controller, with office at New York, and **H. D. Chamberlain**, freight claim agent, has been appointed auditor, with office at Albany, N. Y.

L. K. Luff, auditor of revenue of the Delaware & Hudson, has been appointed general auditor; **W. J. Daller** has been appointed auditor of revenue; **A. J. Gies**, auditor of miscellaneous accounts, has been appointed auditor of expenditures, and **W. L. Schneider** has been appointed freight claim agent, all with offices at Albany, N. Y.

W. H. Finley, chief engineer of the Chicago & North Western with headquarters at Chicago, Ill., has been elected president to succeed **R. H. Vishton**, who has resigned to serve under the United States Railroad Administration. Mr. Finley was born in New Castle county, Del., and was educated in the public schools at Wilmington, Del., and by private instruction in engineering. He entered the service of the Edgemor Iron Company at Wilmington in 1881, remaining with that company until 1887, when he began railway work in the bridge and building department of the Chicago, Milwaukee & St. Paul. He left the employ of that road in 1892 to go to the Chicago & North Western as engineer of bridges. Since

W. H. Finley

then he has been successively principal assistant engineer and assistant chief engineer, being promoted to chief engineer in June, 1914. He now becomes president of the same road with headquarters at Chicago, as above noted.

M. M. Joyce, general attorney for the Minneapolis & St. Louis has been promoted to general auditor in charge of the law department of that road. **Donald Evans** has been appointed general attorney to succeed Mr. Joyce. Both Mr. Joyce and Mr. Evans will continue to have headquarters at Minneapolis, Minn. **F. M. Miner**, general counsel, has left the service of the company and that position will not be filled for the present.

Frank Trumbull, chairman of the board of the Chesapeake & Ohio, with headquarters at New York, has been elected also president to succeed **George W. Stevens**, who has been appointed federal manager of the road; **H. T. Wickham**, **F. M. Whitaker** and **G. B. Wall**, vice-presidents, all with headquarters at Richmond, Va., have resigned their position with the company, but will continue in charge of their re-

spective departments under the federal administration as assistants to the federal manager; **M. J. Caples** has resigned as resident vice-president of the Chesapeake & Ohio, at Columbus, Ohio, but remains as vice-president of the Hocking Valley. **F. H. Davis** and **C. E. Graham** have been elected vice-presidents of the Chesapeake & Ohio.

Operating

Marvin Hughitt, Jr., vice-president of the Chicago & North Western at Chicago, has resigned.

A. C. Needles, federal manager of the Norfolk & Portsmouth Belt Line, announces the appointment of **George S. Shafer** as general manager. Mr. Shafer's title heretofore was president and general manager, with headquarters at Norfolk, Va.

S. M. Braden, general superintendent of the Chicago & North Western, at Norfolk, Neb., was appointed general superintendent of that road in charge of the Western lines, with headquarters at Omaha; **C. T. Dike**, general superintendent at Huron, S. D., was appointed assistant general superintendent at Boone, Ia.; **G. W. Dailey**, superintendent of the Wisconsin division at Chicago, was appointed assistant general superintendent at Huron, S. D.; **C. H. Reynolds**, superintendent at South Norfolk, Neb., was appointed assistant general superintendent at Norfolk, Neb.

District Directors and Assistant District Directors

James H. Hustis, president of the Boston & Maine, and receiver in charge of the road under the United States court, with headquarters at Boston, Mass., has been appointed district director of the United States Railroad Administration, in charge of New England railroads, with headquarters at Boston. Mr. Hustis was born in New York city in 1864, and began railroad work as office boy in the general manager's office of the New York Central & Hudson River. In 1891, he was appointed trainmaster on the Harlem division, and two years later was made assistant superintendent. In 1900, he was appointed superintendent of the Harlem division, and later was made superintendent of the River division (the West Shore), and served as superintendent of the Rome, Watertown & Ogdensburg, of the Hudson division, and of the Putnam division. In 1907, he was made general superintendent of the Western district, and in October of the same year was given charge of the Boston & Albany, with the title of assistant general manager. In June, 1911, he was given the title of vice-president, and the operation of the Boston & Albany was put entirely in his charge. In November, 1913, he was elected president of the New York, New Haven & Hartford, and in August, 1914, he resigned as president of the New Haven to become president of the Boston & Maine.

Percy R. Todd, president of the Bangor & Aroostook, with headquarters at Bangor, Maine, has been appointed assistant to district director of the United States Railroad Administration and general manager of the Bangor & Aroostook, with office at Bangor. Mr. Todd was born on December 4, 1859, at Toronto, Ont., and was educated in the Collegiate Institute at Ottawa. He began railway work as clerk and telegraph operator in the general office of the St. Lawrence & Ottawa, now a part of the Canadian Pacific, at Ottawa, which positions he held until 1875. He served until 1882 as Canadian agent of the Ogdensburg & Lake Champlain, then as general traveling agent of the National Despatch Line, at Chicago, until 1885; and from July to December of the same year, he was commercial agent of the New York, West Shore & Buffalo, at Albany, N. Y. Later he was chief clerk in the general freight department of the same road at New York, leaving in October, 1886, to become general freight and passenger agent of the Canada Atlantic, at Ottawa, Ont. He served in that capacity until December, 1889, when he went to the West Shore Road as general freight agent. Three years later he was appointed traffic manager of that road. From February, 1901, to November, 1903, he was second vice-president of the New York, New Haven & Hartford; then for two years, first vice-president of the same road. From January, 1907, to January 1913, he was vice-president of the Bangor & Aroostook, and then became president, which position he held to the time of his present appointment.

H. A. Worcester, who has been appointed district director of the United States Railroad Administration in charge of the railroads in the Ohio-Indiana district, with headquarters at Cincinnati, Ohio, was born November 18, 1862, at Albany, N. Y. He is a graduate of Yale University, and entered railway service in December, 1885, as assistant stationmaster of the New York Central & Hudson River at the Grand Central station, New York City. In August, 1891, he went to Buffalo, N. Y., where he did clerical work for the Lake Shore & Michigan Southern. A year later he was appointed assistant trainmaster of the Franklin division and in February, 1893, was promoted to superintendent of the Lansing division. He was transferred to the superintendency of the Detroit division in June, 1896, where he remained until November, 1902, when he was appointed superintendent of the Eastern division. In February, 1905, he became superintendent of the Western division, but remained in that position only three months, at the expiration of which time he entered the service of the Michigan Central as assistant general superintendent. In November of the same year he was promoted to general superintendent. In February, 1906, he returned to the Lake Shore as general superintendent, and in the following October was appointed assistant general manager of the Cleveland, Cincinnati, Chicago & St. Louis, with office at Cincinnati. He was appointed general manager of this road in July 10, 1913, and since January 1, 1916, he has served as vice-president and general manager of the same road.

Traffic

F. H. Hill, traveling freight agent of the Atlanta, Birmingham & Atlantic, has been appointed division freight agent, with office at Fitzgerald, Ga., vice **C. I. Allen**, who has been appointed general agent, with office at Birmingham, Ala., vice **V. E. Whitaker**, promoted.

Engineering and Rolling Stock

Don C. Bowman, assistant engineer, in charge of the construction of new yards and other improvements on the Wabash, at Granite City, Ill., has been promoted to division engineer maintenance of way, with headquarters at St. Louis, Mo.

W. M. Punter, Canadian manager of Saxby & Farmer, Ltd., with headquarters at Montreal, Que., has been appointed signal engineer of the Canadian Northern, eastern lines, with headquarters at Toronto, Ont. **W. Adams** has been appointed signal inspector at Port Arthur, succeeding **H. E. McDonald**, who has been transferred to the Duluth, Winnipeg & Pacific, succeeding **K. Lafferty**, resigned. **J. J. Crowe** has been appointed acting signal inspector, at Edmonton, Alb., in the place of **R. C. Gardner**, who has enlisted in the United States army.

Railway Officers in Government Service

G. W. W. Hanger, assistant commissioner of the United States Board of Mediation and Conciliation, has been appointed assistant director, Division of Labor, of the United States Railroad Administration.

Obituary

H. G. Sexton, superintendent of the Eureka Nevada Railway, with office at Palisade, Nev., died at Colfax, Cal., on May 23, 1918, at the age of 50. Mr. Sexton had been in the railroad work in the construction and operation departments for about 25 years.

Robert Dunlap, western solicitor of the Atchison, Topeka & Santa Fe, with headquarters at Chicago, died at his home in that city on June 10. Mr. Dunlap was born at Cincinnati, Ohio, on October 4, 1853. He was educated at Cincinnati University, and entered the railway service of the Santa Fe in 1883 as assistant attorney, since which he has been consecutively, from 1895 to 1897, assistant to the general solicitor for the receivers of that road; from 1897 to 1915, general attorney of the reorganized road, and from 1915, western solicitor. His railroad career has been entirely with the Santa Fe, he having served that road in a legal capacity continuously for a period of 35 years.

EDITORIAL

Railway Age

EDITORIAL

The reports of railway earnings and expenses gradually are growing better. Statistics for the first four months in 1918 show an increase in total earnings of \$9,540,000; but owing to more largely increased expenses and taxes, a decline in net operating income of \$98,100,000. Nor is this the whole story.

Railway Earnings and Expenses

When the retroactive advances in wages have been included the net operating income for these four months will really be reduced over \$100,000,000 more, making the decline in operating income as compared with last year for these four months almost \$200,000,000. But April makes a better showing than preceding months. With an increase of \$45,000,000 in total revenues, there was a decline in net operating income of only \$2,300,000. In the absence of the increase of wages, it might be said that conditions in April were approaching normal. But the advance in wages will convert a nominal loss of \$2,300,000 in April into an actual loss of about \$28,000,000. It is evident that steps toward largely advancing the rates were not made any too soon to save the Railroad Administration from incurring a huge deficit this year; and present indications are it will have some deficit in spite of the advance.

The Railroad Administration has authorized the expenditure by the railroads during 1918 of nearly \$450,000,000 for additions and betterments and in excess of \$18,000,000 for extensions of branches and for new lines. The classified addition and betterment items include \$98,661,000 for yard tracks and sidings; \$61,979,000 for shop buildings, engine houses and auxiliary facilities; \$47,471,000 for main tracks; \$38,035,000 for bridges, trestles and culverts, and \$31,556,000 for rails and other track materials. To obtain the full measure of value from this construction program the work must be completed before the difficulties of winter operation are encountered. To complete a program of this magnitude in the few months remaining before cold weather sets in is a large order that will tax the ingenuity of the roads to the limit. A considerable portion of this work must be done in localities remote from cities or other sources of labor, adding materially to the difficulties of the situation. Even under normal conditions it would be difficult to complete this program by the usual methods, and with the scarcity of labor and the great demand for contractors of ability to carry on essential government work, the problem becomes more complicated. Certain important eastern roads are meeting the situation by utilizing their own forces, detaching men from the engineering department to take entire charge of a project and holding them responsible for the completion of the work in a reasonable period. These men recruit their own organizations, place orders for materials and, in fact, perform practically all of the functions of a contractor. The roads profit by the plan, both by avoiding the necessity of paying a contractor's percentage and by the savings effected in accounting and inspection, while the engineers in charge have the advantage of utilizing men from other departments, when necessary, and railway equipment for the work without the necessity of detailed accounting to arrive at the distribution

One Way to Get Work Done

of expense. This plan has been followed on a number of roads for several years. It would appear to warrant further extension this year.

The recent order of the Railroad Administration requiring the prompt payment of freight charges, will doubtless prove unpopular with shippers and likewise will meet with favor among railway officers. One of its effects is to force the public instead of the carrier, to wait for its money in case of errors in billing. Under former conditions credit was generally extended to consignees for a period of a week and, in the event of inaccuracies in the freight bills, until corrected bills were rendered. In the case of large firms, however, bills passed through so many departments that they were rarely settled within the time limit. It was not unusual for bills to be checked by the manufacturing plant receiving or forwarding the freight, by the traffic department of the industry, the accounting department and the treasury department before payment of freight charges was authorized. In addition, an assiduous search for errors in billing by both shippers and consignees really developed into an abuse in the case of many large firms, which deferred payment on freight bills in their entirety when one insignificant entry proved to be inaccurate.

Freight Bill Order a Boon to Roads

There seem to be no records indicating the extent to which freight charges were settled under credit arrangements. Railroad officers familiar with the subject, however, estimate that considerably more than 50 per cent of all freight charges are settled through credit transactions. In view of this condition the losses in uncollectible freight charges are relatively small in relation to the operating revenues of the carriers. In the year ended December 31, 1916, uncollectible freight revenues for all the railroads in the United States amounted to \$818,422, or 0.022 per cent of the total operating revenues of \$3,691,065,217. Under the new order, however, even this small loss will be prevented.

The granting of credit is not absolutely prohibited under the new plan but is limited to 48 hours after shipment or delivery at destination, and is granted for that period only when a surety bond in an amount satisfactory to the treasurer of the carrier is filed. In a circular explaining the order, the Railroad Administration states that the new rule must be interpreted in a practical business way. If, for example, a consignee who is financially responsible is accustomed to send for his freight in the morning and the collection of the freight charge is effected in the afternoon, that arrangement will be treated as a cash transaction so long as the consignee continues to pay his freight bills promptly upon presentation. Similar application of the rule will be made in the collection of a prepaid charge from a shipper. Perhaps the greatest objection which shippers have raised to the new plan is that it gives them no opportunity to check bills for inaccuracies. The director general, however, promises prompt and fair settlement of overcharges and claims for loss and damage. Furthermore, he authorizes agents to make corrections in bills before exacting payment in cases wherein a mistake is obvious or it is plainly indicated upon the face of the bill.

As previously suggested, a distinct advantage of the new

plan is that it eliminates delay in the settlement of freight charges, thereby saving the carriers much time and expense as well as giving them the benefit of the interest which formerly accrued between the performance of service and the settlement therefor. From the standpoint of the various classes of shippers and consignees the order is likewise beneficial as it prevents discrimination. As the director general points out, the extension of credit in the payment of transportation charges to one person while it is denied to another results in a preference in favor of the person to whom credit is given.

Selling Mechanical Supplies Under Government Operation

THE CONDITIONS under which cars and locomotives and the specialties on them are sold under government operation of the railways are radically different from those under which they were sold when the railways were operated by the different companies.

Under private operation there was not only competition between the concerns selling the materials but also between the railway companies buying them. Each supply company had a large number of actual or prospective customers, and failure to get certain large prospective customers or the loss of some large customers a concern already had, while a matter of importance, was not a matter which was vital. Under government operation, on the other hand, the purchase of all equipment and of all specialties used on new equipment has been placed in the hands of a single committee, and therefore a supply concern's success or failure in negotiating with this committee is a matter of almost vital importance.

A list of the car and locomotive specialties bought by the Central Purchasing Committee to be used on the 1025 locomotives and 100,000 freight cars recently ordered by the Railroad Administration was published in the *Railway Age* for June 14, page 1448. A comparison of the distribution of orders shown by this list with the way in which orders for car and locomotive specialties have been distributed in the past sufficiently explains why the managers of some supply companies express great satisfaction with the way in which the Central Purchasing Committee has distributed the orders while others express only mild satisfaction, and others very great dissatisfaction. Some concerns which have had the largest business in their lines in the past have secured an even larger part of the total business in those lines than heretofore. Other concerns, some having large, some having small, parts of the total business in the past, have received about their usual proportions. Some concerns which have had very large parts of the business in their lines heretofore have received very small parts of the orders, or none at all. Some concerns which under the old conditions secured only a small part of the orders in their fields have under government operation secured the lion's share of the business.

It is very difficult after studying the list of orders to conclude that any particular principle governed in their distribution. In many instances it would appear that the factor of price was controlling, but in not a few cases it is evident that this was not the case. One of the notable consequences of the new method of buying is that it has resulted, in many branches of the railway supply field, in a reduction of the number of concerns which have succeeded in getting orders. A good many concerns which have done a large business in the railway supply field were given no business at all, or so little as to be equivalent to almost nothing. In other cases concerns which were just beginning to get a foothold were disappointed in receiving no orders. In still other cases, however, comparatively unknown concerns got a large amount

of business, and likewise in some cases large orders were placed for comparatively unknown devices.

On the whole, we should say that the two most characteristic features of the centralized buying of car and locomotive specialties have been, first, to put relatively greater stress on prices and less on quality than was done when railways bought separately; and, second, to reduce the number of concerns from which purchases are made. We believe both these tendencies are largely due to the fact that under the present system the technical officers of the railways, who are the best judges of the goods, have less influence and a committee of purchasing officers more influence in determining the things that shall be bought than was the case under separate management of the various railways.

Obviously, both price and quality should be given due consideration, and if the former is given greater weight than the latter the effect will be to cause deterioration of the physical properties of the railways. Likewise, it would appear that a narrow rather than a wide distribution of orders is undesirable, not only from the standpoint of railway supply concerns as a whole, but also from the standpoint of the railways. The giving of orders to a comparatively small number of concerns will tend to reduce the number of concerns in the supply business. This will tend to create monopolies; to increase the difficulty of holding down prices; and to reduce the amount of competition in improving and developing specialties for the railway market.

The Railway Business Association has asked its members to report to it their experiences in dealing with the purchasing department of the Railroad Administration and to offer it their suggestions as to how the railway supply industry can co-operate with the Railroad Administration. No doubt some good suggestions will result from this canvass of the situation. In our opinion, one of the main things needed to insure that purchases shall be made on a sound basis is that the mechanical, engineering and other technical officers of the railways shall be advised with more freely by those doing the buying and that their recommendations shall be given very much more weight. They are the men who know best the merits of the various articles the railway supply companies have to sell and who are, therefore, best able, having in mind both quality and price, to say how orders can most advantageously be distributed.

Government Operation vs. Private Management and Profit Sharing

OPPORTUNITY for a comparison of the results of government operation, with a guarantee of net income to the private owners, and private ownership and operation under a plan of profit-sharing between the corporation and the government, will be afforded by the plan which has just been adopted for handling the express business of the country.

The four principal express companies have now been merged and, subject to the competition of the parcel post, will be given virtually a monopoly of the express business, although under strict government supervision and control. The railroads, although they are officially said to be under "federal control," will be actually under the exclusive management of the government when the new federal managers are appointed, and the corporations that own the property, having for some time been considered as agencies of the government, are now transferred to the role of landlords whose principal function is to collect their rent, pay their interest, dividends and taxes, see that the tenant does not injure the property and make such improvements to it as the tenant desires and is willing to pay the interest on—although there has been some contention from the government side that some of the aforesaid improvements must be

made regardless of interest considerations. The railroad corporations will also continue to look after their outside investments but these are aside from the question of transportation. The comparison is at least an interesting one in spite of the disparity in the magnitude of the operations and the character of the business.

In the plan adopted for dealing with the express companies, an attempt has been made to avoid what many have considered a defect in the plan under which the government is operating the railroads. It has been argued that much of the incentive to efficiency and economy on the part of railroad officers has been removed by the guarantee of earnings. Perhaps that argument no longer applies since the corporations, whose earnings are guaranteed, are no longer to have anything to do with operation, which is to be under the direction of federal managers responsible solely to the Railroad Administration in the same way that they formerly were to their directors. At any rate the incentive afforded under private management by the desire to earn a profit and the necessity for making both ends meet no longer applies to the management of any particular unit of the railroad system.

When it was proposed to adopt a similar plan for the express companies the government declined and instead it has worked out an arrangement by which there is an incentive to earn a profit, yet the amount of the profit that goes to private capital is to be limited by the plan of division with the government on a sliding scale. The scaling down of the capitalization of the four great express companies from a total of \$57,000,000 to about \$35,000,000 and the possibilities for economy afforded by unified operations should insure a greater opportunity for the payment of dividends, particularly if the application for a 10 per cent advance in rates now pending before the Interstate Commerce Commission should be granted, whereas the express companies recently have been in a serious financial condition. The Interstate Commerce Commission's report of express revenues and expenses for the calendar year 1917 just issued, shows that the eight companies covered in the report had a deficit for the year of \$184,305 as compared with operating income for the previous year of \$8,926,075 and this was in spite of an increase in gross revenue from \$190,000,000 to \$222,000,000.

The percentage of the gross earnings which is to go to the government, 50 $\frac{1}{4}$ per cent, was arrived at by taking the average for 10 years of the payments by the express companies to the railroads for express privileges, but that part of the bargain is more favorable to the companies than the former arrangement because they will have a single contract with the government, instead of separate contracts with the individual railroads, and will thus be saved a large amount of accounting which has formed so large a proportion of their expenses.

While it is apparent that the government has driven a close bargain with the express companies, limiting their profits to a modest return on a greatly reduced capitalization, the condition into which the express business had fallen had become so precarious that the new plan undoubtedly will be regarded as a great measure of relief. Harassed on all sides with increased expenses, subject to a competition with the parcel post under conditions which gave every advantage to the latter, overwhelmed with a large volume of traffic that formerly went to the railways while they were dependent upon the railways for cars in which to handle the business, the express companies saw no way out except the plan which had been followed in the case of the railroads, particularly as their affairs were so closely bound up with those of the latter.

The arrangement adopted at least gives them an opportunity to stay in business, while the railroad corporations are practically shelved for an indefinite period, and will

also give the express company a large opportunity to demonstrate its capacity for public service.

Wage Awards and the Shortage of Labor

THE LONG HERALDED WAGE ADVANCE, which was approved by the director general on May 25, has resulted in very general dissatisfaction in many quarters. This is due primarily to the computation of the increases on the basis of the rates paid on December 31, 1915, two and one-half years ago. While the wage commission followed a logical course in computing the increased costs of living and the increases in wages necessary to compensate therefor on a pre-war basis, the roads in many cases had already given their employees, individually or collectively, increases equal to or greater than those awarded by the wage commission with the result that many employees now receive no increases whatever. This in itself, while disappointing to those employees, would not have been so serious if the employees had not been led to build up hopes of universal increases. When these hopes were shattered, as they were in the cases of thousands of employees, the disappointment and dissatisfaction were keen. This was made evident at once by threatened strikes among organized employees in the shop crafts and a deluge of formal protests. This dissatisfaction will also be reflected among the unorganized employees by their exodus into other industries.

The situation is particularly acute in those branches of railway service employing unskilled or semi-skilled labor for which only a limited amount of training is required, as in the track and car repair departments. Here the wages are the lowest, the competition with other industries the most severe and the turnover the highest. As an indication of the present high turnover, the Pennsylvania Railroad kept a special record for the ten-day period from May 27 to June 5, in which interval 4,477 employees left the service and 5,122 were hired (exclusive of general office employees), the net gain of 645 occurring entirely in the last two days. As the railroad on which this comparison was made employs approximately 150,000 men, this is equivalent to an annual turnover of approximately 100 per cent. When it is considered that comparatively few changes occur among enginemen, conductors and other employees, who secure their positions only after a considerable length of service, the high rate of turnover in the other branches becomes more evident. Even this high rate is going to be greatly increased within the next few weeks. A provision in the wage award stipulates that no increase shall be paid to an employee who leaves the service voluntarily. Owing to this fact many men who receive relatively small increases are waiting to receive their back pay before leaving the roads and as soon as they get this they will go to other industries.

The greatest competition for labor which the railways are meeting at the present time is that from industries engaged in war work, such as the manufacture of munitions and the building of ships. In these industries wages have risen out of all proportion to the advances on the railroads. It is therefore not surprising that many men are leaving the roads for these industries, especially as the plea that those employed by them are engaged in patriotic service can be made as forcibly by the ship yards and munition plants as by the railways.

The adequate maintenance of locomotives and the prompt repair of cars are essential to the successful handling of the heavy business now being offered to the roads and which will be greatly augmented when the grain begins to move

in a few weeks. The Railroad Administration has shown its realization of the necessity for a larger plant by authorizing the expenditure of nearly \$500,000,000 for addition and betterment work on the roadway this year. The demands for the current maintenance of tracks and structures are equally pressing. At the same time progress on all of this work is being greatly impeded by the lack of men, a condition which is becoming more severe as the season advances. Since the railways are unable to secure the men that are needed to keep the roads in proper condition, some method must be devised and, devised promptly to secure sufficient men, either by the removal of the restrictions on the importation of labor from Mexico and other sources, or by the fixing of relations between the wages and working conditions offered by industries and contractors on government work in comparison with those which the roads are permitted to offer in a way to remove the adverse competition which now exists.

Boston & Maine

THE INCREASE IN THE COST of fuel on the Boston & Maine in 1917 as compared with 1916 would have left the company with almost no margin over interest charges, even if there had been no other increases in unit costs of materials and of labor. As it was, the Boston & Maine earned \$59,451,000 in the calendar year, 1917, or over 7 per cent more than was earned in 1916; but operating expenses amounted to \$47,165,000, an increase of 23 per cent over the previous year, notwithstanding the fact that charges for maintenance of way were no higher in 1917 than in 1916. It is pretty safe to say that the Boston & Maine will be unique among the larger roads in the small increase in taxes. Taxes amounted to \$2,157,000 or only a few thousand dollars more than the 1916 taxes. Gross income available for interest charges amounted to \$11,358,000, or \$4,884,000 less than the 1916 gross income. Interest charges call for \$11,778,000, leaving a deficit in 1917 of \$419,000. All of the interest charges, however, were not paid and there is now \$3,228,000 interest matured which has not been paid. The higher unit cost of fuel alone increased expenses by \$4,600,000.

The following table shows the percentage of each class of operating expenses to operating revenues:

| | 1917. | 1916. |
|--|-------|-------|
| Maintenance of way and structures..... | 10.4 | 11.1 |
| Maintenance of equipment..... | 14.8 | 12.8 |
| Traffic..... | 7 | 8 |
| Transportation..... | 50.4 | 41.7 |
| Miscellaneous..... | 5.5 | 4 |
| General..... | 2.5 | 2.3 |
| Total..... | 79.2 | 69.1 |

In so far as better operation is concerned, the Boston & Maine is making steady progress. The ton mileage carried in 1917 was 3,342,000,000; an increase over 1916 of 4.7 per cent. The average revenue train load was 383 tons, an increase of 4 per cent over the previous year. The average carload per loaded car was 19.42 tons, an increase of 9.9 per cent over the previous year. The increased train loading was particularly good because traffic conditions were such that there was a greater proportion of empty car mileage in 1917 than in 1916; and there were only four new locomotives taken into service, so that the gain of over 15 tons per train was due largely to the efforts of officers and employees.

The principal changes in character of traffic were a decrease in tonnage of products of agriculture and the tonnage of manufactures carried with a large increase both in tonnage of anthracite coal and of bituminous coal carried. In 1917, 2,805,000 tons of anthracite was carried, or over

1,000,000 tons more than in 1916; and 4,162,000 tons of bituminous coal was carried, an increase of 752,000 tons over 1916. The total tonnage of manufactures was 6,016,000, or 623,000 tons less than in 1916.

There was a substantial increase in passenger business, the total number of passengers carried one mile being 927,000,000, or over 9 per cent more than in 1916. In June, 1917, Camp Devens—the cantonment which the war department built near Ayer, Mass.—was opened and this presumably added largely to the passenger business of the two divisions of the Boston & Maine serving this section of Massachusetts.

James H. Hustis, who was, up to the time of the receiver-

The Boston & Maine

ship, president of the Boston & Maine, and who was appointed by the court temporary receiver, has been appointed district federal manager of railroads in New England by the Railroad Administration. He retains, however, his duties as an officer of the court in charge of the Boston & Maine. During the year \$2,344,000 was spent for additions and betterments. The work of physical rehabilitation of the Boston & Maine is going on, but, of course, not on as large a scale probably as would be the case were conditions normal. It would appear to a student of the Boston & Maine situation, without long continued intimate knowledge of the physical condition of the whole property, that the installation of modern, scientific principles of railroading, and the carrying out of the physical betterments such a program would necessitate, and the readjustment of the rental situation are more important for the return of the Boston & Maine to solvency than large expenditures for additions. It may be a recognition of the importance of carrying on the program which Mr. Hustis has inaugurated of improved operating methods, improved relations between employees and officers and between the public served and the railroad personnel that the court, Mr. Hustis himself, and the Railroad Administration came to the agreement to have Mr. Hustis continue to act both as receiver and as district federal manager.

Under the federal control act, it would be possible to use a part of the so-called revolving fund created by the act to purchase securities of a reorganized Boston & Maine;

and efforts are now being made to carry out a reorganization under federal supervision and approval.

The following table shows the principal figures for operation in 1917 as compared with 1916:

| | 1917. | 1916 |
|--|--------------|--------------|
| Average mileage operated..... | 2,305 | 2,305 |
| Freight revenue..... | \$15,080,737 | \$33,640,587 |
| Passenger revenue..... | 17,814,738 | 16,052,106 |
| Total operating revenue..... | 59,450,779 | 55,363,545 |
| Maintenance of way and structures..... | 6,197,311 | 6,132,045 |
| Maintenance of equipment..... | 8,786,745 | 7,088,573 |
| Traffic expenses..... | 446,565 | 430,298 |
| Transportation expenses..... | 9,957,651 | 23,078,034 |
| General expenses..... | 1,473,720 | 1,263,188 |

*Deficit

Chicago, St. Paul, Minneapolis & Omaha

LIKE ITS PARENT COMPANY—the Chicago & North Western—the Chicago, St. Paul, Minneapolis & Omaha had to meet in the year ended December 31, 1917, greatly increased charges for labor, for fuel, for repairs to locomotives and rolling stock and to a lesser extent for maintenance of way and structures. Unlike the North Western it did not increase its operating revenues greatly, the increase in total operating revenues being only \$622,000 or about $\frac{3}{4}$ per cent, and the increase in freight revenues only one-third of one per cent.

The total operating revenues for the road during 1917 were \$21,477,000 as compared with \$20,855,000 in 1916. The increase was chiefly in passenger revenues, which were 6 per cent greater in 1917 than 1916. Operating expenses increased from \$13,609,000 to \$15,841,000, bringing the operating ratio from 65 up to 74 per cent; the net revenue from operations was \$5,635,000, or \$1,611,000 less than in 1916. The net income was \$2,119,000. The usual dividend of 7 per cent on the preferred stock was paid but only 5 per cent on the common instead of 7 per cent as in 1916; the balance for the year was \$403,000, as compared with \$1,628,000 in 1916.

The freight revenue earned during the year totaled \$13,885,000, representing an increase of 0.34 per cent over the high figures of 1916. This increase was due, however, not to an increase in tons carried or even in the total ton-mileage but to an increase in the revenue per ton-mile from 8.1 mills to 8.3 mills. There was in fact a decrease in the total ton mileage of 2.11 per cent. With this decrease in ton mileage there was a 5 per cent decrease in freight train mileage, the average load per loaded car having been increased from 22 to 23 tons and the average train load from 414 tons to 429 tons. With this almost stationary level of freight traffic on the high basis of 1916, there was an increase of 6 per cent in passenger revenues. The number of passengers carried showed a slight decrease, but the average distance each passenger was carried and similarly the average revenue per passenger, showed increases.

The total increase in operating expenses for the year as compared with 1916 amounted to \$2,233,000. The increase in charges for maintenance of way was not considerable, being only \$121,000. Increases in the cost of labor and other items were partly balanced by decreases in the amounts spent for rail and ballast, these latter decreases being the result presumably of the difficulty of securing steel for the usual program.

Charges for maintenance of equipment increased \$482,000 in 1917 over 1916, these increases being represented almost entirely by more expensive repairs to locomotives and freight cars.

It was, of course, in transportation expenses that the great-

est increases in costs were shown, because of the higher compensation for labor and for fuel. The total increase in transportation expenses was \$1,599,000 of which increase \$534,000 was in labor and \$998,000 in fuel. The cost of fuel for train locomotives alone was over 40 per cent greater in 1917 than in 1916.

During the year \$884,000 was spent for additions and betterments exclusive of additional equipment. Of this

At the end of the year the company had cash on hand \$473,000 as compared with \$2,519,000 at the close of business in 1916. The company had on hand also \$3,176,000 worth of materials and supplies, over twice as much as at the end of 1916. On December 31, 1917, there were \$500,000 in loans and notes payable as against none in December 31, 1916, and miscellaneous accounts payable had increased from \$149,000 to \$343,000.

The following table shows the principal figures for operation in 1917 as compared with 1916:

| | 1917. | 1916. |
|--|--------------|--------------|
| Average mileage operated..... | 1,749 | 1,753 |
| Freight revenue..... | \$13,884,710 | \$13,837,306 |
| Passenger revenue..... | 5,741,038 | 5,414,952 |
| Total operating revenue..... | 21,476,509 | 20,855,286 |
| Maintenance of way and structures..... | 2,481,820 | 2,360,323 |
| Maintenance of equipment..... | 3,016,674 | 2,534,794 |
| Traffic expenses..... | 344,105 | 356,121 |
| Transportation expenses..... | 9,279,431 | 7,680,387 |
| General expenses..... | 544,356 | 498,883 |
| Total operating expenses..... | 15,841,318 | 13,609,879 |
| Taxes..... | 1,327,995 | 1,053,393 |

| Gross income..... | 4,837,725 | 6,664,051 |
| Net income..... | 2,118,589 | 3,714,975 |
| Dividends..... | 1,715,986 | 2,087,222 |
| Surplus..... | 402,603 | 1,627,754 |

New Books

War Adjustments in Railroad Regulation. Edited by C. H. Crennan. 6 in. by 9 in. bound in cloth, 334 pages, non-illustrated. Published by the American Academy of Political and Social Science, Philadelphia, Pa. Price, paper, \$1, cloth, \$1.50.

This volume of the Annals of the American Academy of Political and Social Science deals exclusively with the problems of railway regulation. It contains 23 papers on this subject including the following: Principles and Practices of Car Service Regulation by H. E. Byram; Federal Control of Railroads in War Time by Max Thelen; Regulation of Car Service Under Government Control of Operation by John J. Esch; Reconstituting Railroad Regulation by George A. Post; Government Operation of American Railroads by Clifford Thorne; Physical Needs of the Railways Under Government Control, by Julius H. Parmelee and Adjustment of Labor's Demands During Federal Control of Railroad Operation by Gleen E. Plumb.

Reports of Committees of the American Association of Railroad Superintendents. Edited by the Secretary. 188 pages. Illustrated. 6 in. by 9 in. Bound in Paper. Published by the Association. J. Rothchild, Secretary, Union Station, St. Louis, Mo.

Owing to the fact that the thirteenth annual meeting of this Association which was scheduled to be held in Minneapolis, Minn., on August 8-10, 1917, was indefinitely postponed, the reports of the committees which were to have been presented at that meeting have been published in a volume which also contains a number of valuable papers on transportation problems. These include papers by W. G. Besler, president and general manager, C. R. K. of N. J.; L. F. Loree, president, D. & H.; L. F. Johnson, president, N. & W.; E. Raymond, general superintendent, A. T. & S. F.; W. S. Williams, general superintendent, Illinois Central, and others. Reports are also presented on a large number of subjects of immediate interest to transportation men.

Construction Progress on the Alaskan Railroad*

The Main Track Has Been Laid to Mile Post 211 on This 471-Mile Government Project

By Col. Frederick Mears, U. S. A.
Formerly Member of the Alaskan Engineering Commission

IN THE SPRING OF 1914, President Wilson appointed the Alaskan Engineering Commission, with William C. Edes designated as chairman and chief engineer; which commission was thereby directed and empowered to make the field surveys, detailed examinations and reports under the general direction of Franklin K. Lane, secretary of the interior. The results of the season's work were embodied in a report by the Alaskan Engineering Commission, and formed the basis for the President's action in the selection of what is commonly called "The Western Route" for the government railroad, running from Seward on the Kenai peninsula to Fairbanks, the head of navigation on the Tanana river, a distance of 471 miles.

The first link in the chain to connect tidewater with the interior of Alaska and the coal fields was the single-track, standard-gage railroad, starting at the town of Seward, at the head of Resurrection Bay. This railroad, originally called the Alaska Central and later changed to Alaska Northern, was first conceived by certain Seattle capitalists in 1903 for the purpose of securing a more direct route from the Pacific Ocean to the interior of Alaska. The ultimate intention was to extend the line northeasterly to Circle City, about 130 miles from Fairbanks. Later it was hoped to open extensive coal deposits known to exist on the Matanuska river.

Actual construction began at Seward in 1904, and grading was finished and track laid to Kern creek, mile 71, and some work was done along Turnagain Arm north of Kern creek, but in 1909 all construction work was suspended.

Purchased by United States Government

In April, 1915, a formal contract was entered into by which this road was to be acquired for the sum of \$1,150,000, much less than its original cost, and a sum within the value of the physical properties as computed by our engineers. In June, 1915, when the season opened, control of the road was taken over by the government, but it was not until August 25, 1915, that litigation over the title ceased and an initial installment of \$500,000 was paid.

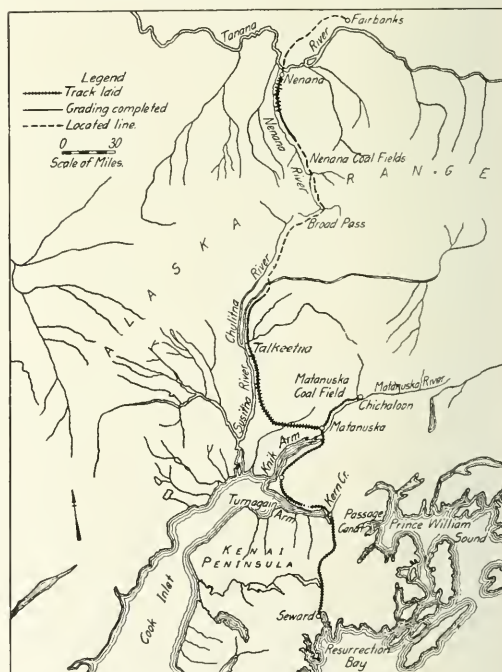

The Alaskan Engineering Commission began the repair of the Alaska Northern in the early summer of 1916, about the time that the final payment of \$650,000 was made (June 30, 1916), and the United States Government came into full possession of the property. During the summer, about 500 or 600 men were employed in various branches of construction work.

For the greater part of the distance along the line of the railroad the right-of-way had never been cleared for more than a few feet on either side of the track. During 1916, the right-of-way was cleared to a width of 100 feet for a distance of 35 miles. Other forces were used to rebuild the grade and repair the roadbed and track. In the original construction of the road, in order to save expense, much curvature had been introduced. Many wooden trestles were built to save the cost of embankments, and these, in many instances, were placed on sharp curves. A number of these structures were badly decayed and needed renewing. A re-

location of parts of the line was made and it was found feasible to replace a number of the structures by embankments, and at the same time greatly improve the alignment. Considerable work of this nature was done by station men during the season, and the line was vastly improved, especially between miles 7 and 12, and between miles 18 and 20. About 12 miles of track was raised on its original alignment, it having been built too low to allow proper drainage, principally between Seward and mile 4, and between mile 33 and 40.

Bridges and Trestles

A new bridge, consisting of five pony truss spans of 56 ft. each, was built across the Resurrection river at mile 3, to

Progress Map of the Alaskan Railway

replace an old trestle, badly decayed, which originally was built too low. A total of 2,172 ft. of entirely new trestle bridges was built at different points, where needed, to replace abandoned structures, and about five miles of bridging was thoroughly inspected and repaired. The superstructures, generally speaking, were found to be in good condition for light traffic.

From the south end of the Seward yard, north for about five miles, the old 56-lb. steel was replaced with new 65-lb.

*Abstracted from an article in the Alaska Railroad Record. A description of this line appeared in *Railway Age Gazette* of April 20, 1917, page 828.

steel, obtained from the stock bought with the railroad, and enough 70-lb. steel was received and distributed to complete the line to mile 12. There were placed under the track 30,000 cu. yd. of gravel ballast and about 80,000 cross ties. Considerable work was done in the terminal yard at Seward, and about a mile of new sidings was laid, and a wye put in. An industrial spur was laid, following along the water front on the south boundary of the town, affording rail facilities for warehouses and industries.

The rolling stock bought with the railroad, consisting of 3 engines, 3 box cars, 2 cabooses and 17 flat cars, was put in serviceable condition, and to them have been added 2 box cars, 6 flat cars, 2 cabooses, 10 12-cu. yd. Western side-dump cars, and 2 passenger coaches. The repairs to the property during the summer made it possible to operate a train consisting of a 60-ton engine, caboose and several cars, from Seward to Kern creek, on October 2, 1916.

Season of 1917

The work of rehabilitation continued steadily during 1917. The number of men employed varied from 300 in January to 700 in August, with a corresponding reduction in the late fall. About 400,000 cu. yd. of material were moved in this process, resulting in the complete repair of the track and roadbed for standard traffic from Seward to the first summit, mile 12, and the partial repair of roadbed, track and bridges, from mile 12 to Kern creek.

The road was operated from Seward to Kern creek during the summer, whenever the train movement did not interfere with the repairs or changes to track and roadbed. Operation was continued in this manner until January, 1918, when traffic north of mile 40 was interrupted by the deep snow.

TABLE OF YARDAGE
REHABILITATION ALASKA NORTHERN

| | Common | Loose rock | Frozen | Solid rock | Total |
|---|---------|------------|--------|------------|----------------|
| Excavation during 1916 (miles) | | | | | |
| 1-71) | 180,105 | 14,153 | .. | 72,016 | 266,174 |
| Excavation during 1917 (miles) | | | | | |
| 1-71) | 188,453 | 8,390 | 10,467 | 220,992 | 428,304 |
| Total | 368,558 | 22,543 | 10,467 | 293,008 | 694,578 |
| Cost to December 31, 1917 | | | | | |
| Purchase of Alaska Northern | | | | | \$1,157,839.49 |
| Rehabilitation, Alaska Northern, including repairs and maintenance, but not including equipment or supplies on hand or in transit, to December 31, 1916 | | | | | 774,277.51 |
| January 1, to December 31, 1917 | | | | | 845,660.95 |
| Total | | | | | \$2,777,777.95 |
| Equipment | | | | | 181,255.44 |
| Supplies on hand and in transit | | | | | 369,393.01 |
| Total | | | | | \$3,328,426.40 |

Average cost of road to December 31, 1917, 70.8 miles, not including equipment or supplies on hand, about \$39,000 per mile.

Work on the New Line

On March 4, 1915, Congress passed an act appropriating \$2,000,000 for the beginning of construction on the Alaska railroad. The work which was contemplated with the initial appropriation was to build from Anchorage to the Matanuska river, a distance of 35 miles, covering about one-half the distance from tidewater to the Matanuska coal fields. In addition to the building of the railroad grade, certain terminal facilities of a temporary nature were planned at Anchorage.

The first work began in May, 1915, when clearing of the right of way commenced, followed by grading forces who were placed upon the work as rapidly as the engineers could stake it out. Construction camps were established at various points along the line, and these camps, as far as possible, were supplied by barges working along the east shore of Knik Arm. A considerable outfit of freight teams was also required to move supplies from the points along the Arm to the grading camps.

At the end of 1915, the right-of-way had been cleared

towards the coal fields for a distance of 40 miles. The grading had been completed ready for track for about 35 miles, and track had been laid to Eagle river, a distance of 13 miles. About three miles of yard track had been laid at Anchorage in the material yard and dock approach.

Continuing Construction During 1916

Eagle river is crossed in mile 127.6 by a long wooden bridge with a 60 ft. truss span over the main river channel. The erection of this bridge consumed two or three months after track had reached the bridge. As soon as the structure was complete, track gangs started laying steel towards Peters creek, mile 136.5, eight miles distant, at which point the railroad comes very close to the east shore of Knik Arm, both as to location and grade elevation. The track was laid during a severe winter under trying conditions, and was put down solely for the purpose of pushing material and supplies to Peters creek, which point could profitably be used as a winter shipping base for all construction materials and supplies needed for the Matanuska branch line.

During the spring and summer of 1916, work was actively continued on the branch line, with the result that by November the track was pushed out to King river, a point 61 miles from Anchorage, 23 miles from the junction, and 14 miles from Chickaloon, the end of the line to the coal fields. A large winter construction camp was established at the end of steel, from which to continue work towards Chickaloon.

In the month of March, 1916, several station gangs were given contracts for clearing right-of-way on the main line north of Matanuska, leading toward the Susitna valley, as it was desirable to have this right-of-way cleared of timber and undergrowth as early as possible to make way for grading. Under this plan the right-of-way was cleared for a distance of 10 miles north of Matanuska Junction early in the year. At the beginning of 1916, the available funds for the prosecution of the construction work were insufficient to meet all demands, and it was accordingly decided to favor the work on the branch line toward the coal fields. This caused an unavoidable delay in the beginning of active operations on the main line. About July 1, when money was available for the purpose, grading gangs started work north of the Junction, and early in the summer the first 10-mile section was completely covered.

Revision of Line

The size, rapid growth, and general importance of the town of Anchorage made it desirable in 1916 to put the main line of the railroad through the town, instead of passing four miles to the eastward as originally surveyed. The new line swings around the town on a low grade elevation, and crosses Ship creek immediately at the west end of the freight yards, connecting with the line formerly known as the Ship creek spur. The so-called Ship creek spur line, which had been built the previous season, was utilized and became a part of the new main line.

The right-of-way was cleared on the new line south of Anchorage before the snow was off the ground, and grading commenced in this district in the month of May. The work was pressed during the summer and in the early fall the grade was made ready for the track, which was laid southward from Anchorage for a distance of 10 1/2 miles. While this work was in progress materials and supplies were shipped around by water into Turnagain Arm, and distributed at various camps along the Arm as far south as Rainbow creek (mile 94).

Work Started on Upper Susitna River

The adopted location for the new railroad closely follows the Susitna river for a distance of 75 miles, and advantage was taken of this situation to attack the railroad line along the upper river. While it is necessary to stretch the imagi-

nation a little to say that the Susitna river is a navigable stream, still it was found possible to operate a steam-driven, stern-wheel river boat, capable of carrying a cargo of 100 tons on its own bottom, from the construction base at Anchorage to the old Indian village of Croto, a point about 50 miles above the mouth of the river. The Commission purchased the river steamer "Omineca" for this work (which had been used for similar purposes for the Grand Trunk Pacific in the construction of its line in Canada), and used it continuously during the 1916 season, between the points named, a distance of about 70 miles.

Light draft boats were operated on the upper river. They carried all of the materials and supplies used during the season to the amount of 2,685 tons. They also transferred the various superintendents, civil engineers, construction men, and station gangs to the new work, to the number of 1,019 persons.

The headquarters for the Talkeetna district was established at a point called Talkeetna, at the confluence of the Talkeetna and Susitna rivers. During the season the right-of-way along the adopted location was cleared from Sheep creek (mile 203) to Indian river (mile 265), and the road-bed was graded in various disconnected sections over a total distance of 22.8 miles. At the same time additional construction materials and supplies were delivered at a point on the upper river, near some heavy rock work, where they were available to use the following season, before the river opened to summer navigation.

Terminal District

Although a good camp had been established at Anchorage during the 1915 season, there still remained a large amount of work to be done in order properly to equip this important point as a construction base. Accordingly, during the 1916 summer season a number of buildings were erected. The completed track, which was extended from Peters creek (mile 136½) to Matanuska Junction (mile 151), was also taken over by the Terminal district, and maintained and operated as a revenue-producing line. On January 1, 1916, the commission started to collect fares from all persons desiring to take advantage of the construction trains, on the basis of 6 cents per passenger mile, and during the winter and spring of 1916 a complete set of blank forms for railroad operation were prepared and put into use, in accordance with the Interstate Commerce Commission's requirements.

Comparatively large construction forces were continued at work during the winter of 1916-17. At the close of the 1916 season there remained about 14 miles of heavy grade to complete along the Matanuska branch line, near the coal fields, and this part of the line (almost entirely solid rock), was entirely covered by the month of February. Station gangs were established at such intervals as to insure completion of the line during the early summer. About 320 men were employed on this district through the winter, and by August 15 the line was completely graded. Track was laid ahead from King quite rapidly, using a Roberts track-laying machine to put down the steel and ties. The end of the line reached Chickaloon on October 20, 1917.

The construction department worked a good many men along Turnagain Arm, south of Anchorage during 1917. About 1,000 men, divided into approximately 50 station gangs, were employed throughout the winter and early summer, and at the time of the present writing (March, 1918) the grade has been practically completed between Anchorage (mile 115) and Bird Point (mile 81). Track has been laid southward from Anchorage for 24 miles, reaching a point known locally as Falls creek, or mile 91. The remaining interval between Bird Point (mile 82) and Kern creek (mile 71) will be completed in August, 1918.

The line from Kern creek (mile 71), (the end of the Alaska Northern Railroad), to Potter creek, mile 101, along

the north shore of Turnagain Arm, is the heaviest continuous construction on the whole railroad. Occasionally, for a short distance, a bench occurs, on which the line can be placed with easy construction; but for the greater part of the distance, the line has to be benched in on heavy transverse slopes. The contour of the country is very irregular, making it impossible to secure light work even by the introduction of very sharp curvature. In many cases deep embankments and gulches occur, and in order to save expensive cuts in the precipitous rock bluffs it was necessary to make heavy fills, the slopes extending into the waters of Turnagain Arm, where they are affected by the heavy tides. The rock encountered is mostly of a hard slate, with some quartzite dikes.

Character of Work Along Turnagain Arm

Many timber culverts and small trestle openings were required along Turnagain Arm, and at several points tress bridges were necessary over the larger streams. It is estimated that about 8,000 lin. ft. of snowsheds will eventually be required in this district; and these sheds will have to be of very substantial character to withstand the shock from the slides which frequently start from long distances up the cleared mountainside.

About 2,250,000 cu. yd. of excavation has been accomplished along Turnagain Arm at the present writing, about half of which (or a little more than 1,000,000 cu. yd.) was solid rock. There remained to complete this section only 170,000 cu. yd. on January 1, 1918.

Work in the Talkeetna district was somewhat handicapped during 1917 on account of shortage of funds, but nevertheless a small force worked during the summer, with the result that track was pushed northward to Montana creek, mile 211, and with the exception of a few disconnected sections, grade was made ready for track between Montana creek (mile 211) and Dead Horse hill (mile 249).

Some of the important items of work accomplished in the Anchorage division between May 1, 1915, and December 31, 1917, are the following:

| | |
|--|----------------------|
| Excavation | 7,530,697 cu. yd. |
| Permanent bridges | 18,031 lin. ft. |
| Track, main line, including Matanuska branch | 158 miles |
| Completed line from Anchorage to Matanuska coal fields (74.9 miles), original estimate | \$3,352,243.00 |
| Cost to December, 1917: | |
| Main line, as far as Matanuska Junction | 1,479,587.68 |
| Matanuska branch | 2,183,776.13 |
| | <hr/> \$3,663,363.81 |

THE GIBRALTAR STRAITS TUNNEL.—Interest has lately revived in the scheme for a tunnel beneath the Straits of Gibraltar, which has, like that for a railway link between England and France, made an appeal to engineers for a generation or more. Some of the technical aspects of the project have been under discussion before the French Society of Civil Engineers, and it does not appear to be thought that there are any abnormal difficulties on the engineering side. Owing to the depth of water and character of the sea bed and the underlying strata, it would be necessary to construct such a tunnel at a depth, it is believed, of some 840 meters (2,756 ft.); and the length between Tarifa, the suggested point of departure on the Spanish side of the Straits, and either of the alternative points of emergence on the Morocco coast, would be about 15½ miles. The London Times points out that it is assumed by the advocates of the scheme that the cost of construction would not exceed £10,000,000 (\$50,000,000), but necessary port improvements would call for the expenditure of an additional £4,000,000 (\$20,000,000). There can be no doubt that the linking of the European and African railway systems would give a great stimulus to French and Spanish trade, and on the assumption that the tunnel beneath the Straits of Dover is constructed, the tunnel would provide over the Trans-African railway a through route between England and South Africa.

Doings of the United States Railroad Administration

Director General McAdoo Gives Out a Statement as to the Policy of Federal Control

WASHINGTON, D. C.

DIRECTOR GENERAL McADOO on June 15 gave out the following signed statement of the policy of the Railroad Administration:

"The policy of the United States Railroad Administration has been informed and shaped by a desire to accomplish the following purposes which are named in what I conceive to be the order of their importance:

"*First*, the winning of the war, which includes the prompt movement of the men and the material that the government requires. To this everything else must be subordinated.

"*Second*, the service of the public, which is the purpose for which the railways were built and given the privileges accorded them. This implies the maintenance and improvement of the railroad properties so that adequate transportation facilities will be provided at the lowest cost, the object of the government being to furnish service rather than to make money.

"*Third*, the promotion of a spirit of sympathy and a better understanding as between the administration of the railways and their two million employees, as well as their one hundred million patrons, which latter class includes every individual in the nation, since transportation has become a prime and universal necessity of civilized existence.

"*Fourth*, the application of sound economies, including:

- (a) The elimination of superfluous expenditures.
- (b) The payment of a fair and living wage for services rendered and a just and prompt compensation for injuries received.
- (c) The purchase of material and equipment at the lowest prices consistent with a reasonable but not an excessive profit to the producer.
- (d) The adoption of standardized equipment and the introduction of approved devices that will save life and labor.
- (e) The routing of freight and passenger traffic with due regard to the fact that a straight line is the shortest distance between two points.
- (f) The intensive employment of all equipment and a careful record and scientific study of the results obtained, with a view to determining the comparative efficiency secured.

"The development of this policy will, of course, require time. The task to which the Railroad Administration has addressed itself is an immense one. It is as yet too early to judge of the results obtained, but I believe that great progress has been made toward the goal of our ideals. All those who have had a share in this great work, including especially the members of my staff and the officers and employees of the railways, have shown intelligence, public spirit, loyalty and enthusiasm in dealing with problems that have already been solved and attacking those that still await solution.

"With their continued co-operation, I feel assured of a future in which the lessons of our accumulating experience will be effectively employed to humanize the science of railroading and negate the idea that corporations have no souls."

Operating Statistics Section

The organization of the Operating Statistics Section of the Division of Operation, with W. J. Cunningham as manager, was noted in a recent issue. Circular No. 8, issued by

the Division of Operation, announces the functions of the section as follows:

The Operating Statistics Section will arrange for, and supervise, the making of standardized reports and statistics pertaining to the maintenance and operation of railroads under federal control; and will make such compilations of statistics as may be required.

The monthly report of freight operations, heretofore compiled and issued by the Bureau of Railway Economics, will be compiled and issued by the Operating Statistics Section. Railroads will send their individual reports (American Railway Association Form F O 2) for the months of April, May, June and July to the Operating Statistics Section instead of to the Bureau of Railway Economics. Reports for April which have already been sent to the Bureau will be turned over to the Operating Statistics Section.

Effective with the month of August, 1918, statistics relating to maintenance and operation will be required on standardized forms. These forms, and instructions as to their use, will be sent out within the next two weeks.

Uniform Methods of Organizing and Conducting Safety Work

H. W. Belnap, manager of the safety section of the Division of Operation of the Railroad Administration, has issued the following outline of the organization of safety committees, which is recommended to the railroads to be followed in perfecting safety organizations on all Class I railroads, as ordered by Circular No. 5 issued by C. R. Gray, director of the division of operation. The recommended outline is for the purpose of establishing uniformity in methods of organizing safety committees, as well as to stimulate an interest in accident prevention and measures intended to reduce the hazards of railroad employment. The recommended form of organization is as follows:

A committee to be known as the General Safety Committee shall be organized, composed of general and division officers of the road, chosen in such a manner that all the different departments of service shall be represented on that committee. The chief operating officer, or such other general officer as he shall designate, shall act as chairman. This committee shall have general supervision of the safety organization.

On each division shall be formed a Division Safety Committee, composed of division officers, with the superintendent as chairman, and one or more representatives of each of the different classes of service.

In each large shop shall be formed a Shop Safety Committee, composed of the principal officers of the shop, with the ranking officer as chairman, and one or more representatives of each of the different classes of service. If the shop is under the jurisdiction of the division superintendent, the committee shall report to the Division Safety Committee, otherwise to the General Safety Committee.

In each large terminal shall be formed a Terminal Safety Committee, composed of the officers in charge, with the superintendent or ranking officer as chairman and one or more representatives of each of the different classes of service. If the terminal is under the jurisdiction of the division superintendent, the committee shall report to the Division Safety Committee, otherwise to the General Safety Committee.

Where conditions require, local committees may be organized in yards, roundhouses, smaller shops, large freight houses, etc.

The General Safety Committee shall meet at least quarterly. Other safety committees shall meet monthly and report proceedings on proper form to the General Safety Committee.

The principal officers of the division, shop or terminal shall be permanent members of the committees. Other members shall serve for a period of six months or a year at the discretion of the chairman, but it is inadvisable to change all the members at one time.

The employee members of the various committees attending meetings shall be paid their regular wages and such expenses as they necessarily incur in going to and from committee meetings.

The safety organization should invite the fullest co-operation of every employee in calling to the attention of the various committees, practices and conditions which are not conducive to safety, but such information communicated by any one to these safety committees shall not be used as a basis of disciplinary action.

On each railroad there shall be an officer in charge of safety work. The amount of time which it will be necessary for him to devote to the work should be governed entirely by local conditions. He should compile statistics for the information and guidance of safety committees, issue bulletins, attend all meetings of General Safety Committee; also such division, shop and terminal committees as he feels require his presence in order to maintain the proper degree of interest. He should carefully review minutes of all committee meetings.

The circular states that it is manifestly impossible to formulate suggestions which are universally applicable. In perfecting this committee form of organization, it is realized that local conditions must in every case govern the personnel of each committee. Official titles vary with the individual railroads and in some cases the duties of more than one of the positions indicated may be vested in one person. Committees may, therefore, be enlarged or decreased, as conditions require. The details of the organization of committees is properly left to the managers of the various properties, but it is desired that they adhere as closely as practicable to the outline suggested, which is as follows:

GENERAL SAFETY COMMITTEE

| | |
|---|---|
| Vice-president or General Manager, General Superintendent, Chief Engineer, Engineer Maintenance of Way, Signal Engineer, Superintendent of Motive Power, Superintendent of Rolling Stock, Mechanical Engineer, Superintendent Freight Transportation, | Superintendent Passenger Transportation, General Claim Agent or Claims Attorney, Chief Surgeon, General Storekeeper, General Safety Agent or Supervisor, Secretary (of Committee), Such other officers as are deemed advisable. |
|---|---|

DIVISION SAFETY COMMITTEE

Division Superintendent, Chairman

| | |
|---|---|
| Division Engineer, Trainmaster, Master Mechanic, Road Foreman of Engines or Traveling Engineer, Signal Supervisor, Division Storekeeper, Claim Agent or Adjustor, District or Division Safety Agent (if any), (a) Yardmaster, (a) Agent or Operator, (a) Roadmaster or Supervisor of Track, | (a) Track Foreman, (a) Bridge and Building Department Employee, (a) Engineman, (a) Fireman, (a) Conductor, (a) Brakeman, (a) Switchman, (a) Car Repairer or Inspector, (a) Signalman, (a) Shopman, etc., Secretary. |
|---|---|

SHOP COMMITTEES

Superintendent of Shops or Master Mechanic, Chairman

| | | |
|---|----|---|
| Locomotive department General Foreman, Roundhouse Foreman, (a) Machinist, (a) Boilermaker, (a) Blacksmith, (a) Sheet Metal Worker, (a) Shop Storekeeper, (a) Electrician, (a) Foundryman, (a) Hostler, (a) Crane Operator, Secretary, | or | Car department General Foreman, (a) Carpenter, (a) Car Repairer or Inspector, (a) Woodworker, (a) Millwright, (a) Machine Operator, (a) Painter, (a) Electrician, (a) Storekeeper, Secretary. |
|---|----|---|

NOTE.—In some instances it may be advisable to have separate committees in the car and locomotive departments—in others a joint committee is preferable.

TERMINAL SAFETY COMMITTEE.

| | |
|---|---|
| Superintendent, Trainmaster or General Yardmaster, Chairman, Day Yardmaster, Night Yardmaster, (a) Switch Foreman or Yard Conductor, (a) Switchman, (a) Engineman, | (a) Fireman, (a) Section Foreman, (a) Station Employee, (a) Car Department Employee, (a) Car Clerk, Checker or Sealer, Secretary. |
|---|---|

Members marked (a) should serve for a period of six months or a year at the discretion of the chairman.

This form of organization follows closely that recommended by a committee of the American Railway Association in 1913 (Circular No. 1333.)

W. P. Borland, assistant chief inspector of safety appliances of the Interstate Commerce Commission, has been appointed assistant manager of the Safety Section, and Charles W. Gregg of the New York Central has been added to the staff of regional supervisors, with office at Washington.

Supplement to the Wage Order

The Director General has issued the following Supplement No. 1 to General Order No. 27:

"The following will be added as general rules to Section F, Article II:

"(14) For positions created since December, 1915, the salaries will be readjusted so as to conform to the basis established in General Order No. 27, for positions of similar scope or responsibility.

"(15) Where wages were increased through arbitration or other general negotiations, which cases were definitely closed out prior to December 1, 1915, but which for any reason were not put into effect until after January 1, 1916, the increases fixed by General Order No. 27 will be applied to such basis of wages as if they were in effect in December, 1915."

Interchange Inspection

To the end that interchange inspection work may not be duplicated under government operation of railroads, so that more repair work and less unnecessary inspection will result, the Division of Operation has ordered, in Circular No. 7:

1. That joint arrangements shall be made to prevent such duplication in inspection by arranging all inspection forces at interchange points with a head or chief joint inspector as conditions require, to supervise the forces and see that inspection and repairs are properly made to car equipment.

2. Present M. C. B. Rule No. 2 is modified as follows:

(a) Loaded cars offered in interchange (except those having defective safety appliances) must be accepted by the receiving line, which may either run, repair or transfer lading from car.

(b) The repairs to car or transfer of lading is to be done by the railroad having facilities nearest available. If facilities are equally available by both railroads, the car will be moved to facilities located in the direction car is moving.

3. If car is shopped for repairs due to:

(a) Old defects that existed before car was loaded—
 (b) Lading requiring transfer or readjustment on account of not being in accordance with M. C. B. Loading Rules—
 (c) Overload requiring transfer of lading—
 (d) Not being within clearance dimensions over route it is to pass—
 (e) Not meeting A. R. A. third rail clearance—

The facilities nearest to car will be used in making repairs to car or transfer of lading.

4. Should the location of facilities require a receiving line to make transfer, the delivering line will not be billed for transfer or readjustment of lading, but the chief joint or head inspector will make report and forward to the head of the mechanical department of both railroads. The railroad responsible for conditions making necessary the shopping of car for old defects or transfer of lading, will impose discipline for willful and inexcusable violation of M. C. B.

Federal Managers and General Managers

B. R. Pollack
Federal Manager, Boston & Maine

S. G. Strickland
Federal Manager, Chicago & North Western

C. H. Ewins
Federal Manager, Philadelphia & Reading and Central of New Jersey

Ralph Peters
Federal Manager, Long Island

H. W. McMaster
General Manager, Wheeling & Lake Erie

B. A. Worthington
General Manager, Cincinnati, Indianapolis & Western

M. S. Connors
General Manager, Hocking Valley

B. C. Stevenson
General Manager, Toledo, St. Louis & Western

H. A. Boomer
General Manager, Lake Erie & Western

L. G. Coleman
General Manager, Grand Trunk Railway in New England

Rules of Interchange and Loading, and A. R. A Rules, the same as instructed in director general's Order No. 8, for violation of safety appliance law.

5. Cars whether loaded or empty having safety appliance defects will have such defects repaired immediately upon discovery and will not be offered in interchange. If necessary to move a car to shops for repairs of safety appliance defects, it must be moved to shops of the company upon whose line it became defective.

6. Empty cars offered in interchange, if in safe and serviceable condition, must be accepted.

7. Bad order cars which previously had been delivered in bad order under load must be repaired by the road making transfer, if it has facilities and material; if not, the nearest repair point on any line, having material and facilities, should make the repairs.

8. With these modifications, owners must receive their own cars when offered home for repairs at any point on their lines where repair facilities and material are available.

9. Such inspectors as are now engaged on duplicate work will be assigned to repair work so as to insure maximum safety of operation and prompt movement of traffic.

Changes in Rate Order

The first break in Director General McAdoo's rate order in response to the many complaints that have been made came on June 12 in the form of a supplement to General Order No. 28 making changes demanded by the state railway commissioners to apply the proposed percentage and specific increases directly to the existing intrastate rates instead of first advancing those rates to the level of corresponding interstate rates and then advancing them again. The state commissioners had asked either that this be done or that they be given further recognition by allowing them to order the advances. The changes which were later announced in the supplement were briefly mentioned in last week's issue. The state commissioners were reinforced in their demand by a large number of congressmen who had been induced to bestir themselves on behalf of shippers and state commissions. A group of southern senators who thought their states were peculiarly affected by the order held a conference in the office of Senator Smith of South Carolina, chairman of the Committee on Interstate Commerce, and joined in a protest to Mr. McAdoo, asking him to confer with them on the subject. Mr. McAdoo designated Director Prouty of the Division of Public Service and Accounting as his representative and Mr. Prouty conferred with the senators. Whether or not Mr. Prouty so understood it, the senators took it that he had power to act in the matter, and they announced after the conference that the state rates, classifications and minimum weights would be taken as the basis for the advance. However, the matter was discussed at a staff meeting of the Railroad Administration before the supplement was issued.

The Director General's statement of the changes made by the supplement was as follows:

The supplement eliminates from General Order No. 28 the provisions to the effect that state rates be cancelled where in conflict with interstate rates and provides instead that the increases on both class and commodity rates prescribed by the order as amended, shall apply to both interstate and intrastate rates; except that between points in the state of Oklahoma the class rates for both single and joint lines shall be as prescribed by the Interstate Commerce Commission in the last Shreveport decision, plus 25 per cent.

The increased class rates are to be governed by the several classifications, both interstate and intrastate, including exceptions thereto and minimum weights that govern the existing rates; except that the minimum 25 per cent class rate scales are subject to the four standard classifications named in the original order.

No change is made in the specific increases provided on commodities except that the increase of 15 per cent on cotton is to apply to any quantity instead of carloads and the provisions on sugar in carloads have been amended to more clearly provide for maintenance of existing relationships.

Intrastate rates and rates for transportation by water not now on file with Interstate Commerce Commission are to be filed, but where now restricted to intrastate traffic, the tariffs are to continue such restrictions.

The minimum charge of \$15 per car will apply only to line haul shipments and not to brick, cement, coal, coke, logs, ore, sand and gravel and stone (broken, crushed or ground), on which the existing rates as increased under section 2 of the order shall apply.

Section 20 is amended to provide specifically that the rates to be increased are those existing on May 25, 1918, including changes previously published but not then effective and not under suspension, except that the increases will apply to rates authorized or ordered by the Interstate Commerce Commission prior to May 25, 1918, and published between May 25, 1918, and June 15, and that where rates so authorized or ordered are not published before June 15, they may be increased as provided in the order by subsequent revision.

Section 21 provides the proper legend to be used on the tariffs to provide interstate or intrastate application as authorized by the amended order.

Instructions have also been issued to the railroads to make modifications in the export and import rates as they would be affected by the general order. The order provides for the cancellation of the special import and export rates for the purpose of leaving in effect the domestic rates, but it has been discovered that many of the domestic rates are merely paper rates which have not moved any business and, therefore, have not been kept in line so that the application of these rates would result in very large and disproportionate increases. Therefore, specific advances in import and export rates have been worked out which are to be applied as tentatively reasonable and to go into effect on June 26; after which they may be given further consideration.

Simplified Accounting Practices

Director General McAdoo on June 12 issued two general orders for the purpose of effecting a simplification in the accounting practices of the railroads under federal control, in recognition of the fact that they are being operated as a single system and that their revenues are in effect the revenues of the government.

SETTLEMENT OF INTER-ROAD BILLS AND ACCOUNTS

General Order No. 30 provides that, effective July 1, 1918, the following regulations shall govern the settlement of all inter-road bills, statements, and accounts rendered by one carrier under federal control against or for account of another carrier under such control.

(1) Settlements by vouchers and the drawing of drafts in settlement of individual inter-road bills, statements, and accounts rendered by one carrier under federal control against another carrier under such control, except as provided for in paragraph (2) hereof, shall be discontinued.

(2) The regulations herein prescribed shall not include:

(a) Settlement of accounts between a carrier under federal control and a carrier not under such control.

(b) Settlement of accounts between carriers under federal control for the transactions which do not properly belong on the federal books of either carrier interested.

(3) Each bill, statement, or account made and rendered by one carrier under federal control against or in favor of

another carrier under such control, and forwarded on and after July 1, 1918, shall be plainly stamped on the face thereof, as follows: "Included in settlement, month of _____ 191 ____." Such stamp shall indicate the month in which the amount represented by the account will be included for settlement by the carrier rendering the account, and it shall be included in the same month's settlement account by the receiving carrier. No such bill, statement, or account made and rendered in one month shall be back-dated for a prior month.

(4) On the first of each month each carrier shall prepare and render each other carrier with which it has inter-road transactions, as a basis for a settlement for the month just ended, a statement of debits and credits, in abstract, showing the nature and total of each bill, statement, or account forwarded by it to each other carrier during the preceding month.

(5) There shall be opened as of July 1, 1918, on the federal books of each carrier, a clearance or settlement account with each other carrier under federal control with which it has inter-road transactions.

(6) As inter-road bills, statements, or accounts are made and rendered they shall be charged or credited as the case may be, through the clearance or settlement account prescribed in the preceding paragraph.

(7) As inter-road bills, statements or accounts are received they shall be:

(a) Examined as to correctness, as prescribed in General Order No. 20;

(b) Charged or credited to the appropriate operating or other account;

(c) Credited or charged (as the case may be) by the receiving carrier to the carrier originating the account through the appropriate clearance or settlement account prescribed in paragraph 5 hereof.

(8) The total of each statement for a given month shall be accepted as rendered, and on or before the fifteenth day of each month subsequent to that for which such statement was rendered the creditor carrier shall draw upon the debtor carrier for the balance between the two statements exchanged by them.

(9) In the event the statement referred to in paragraph 4 indicates that the originating carrier has charged or credited the other carrier with a bill, statement, or account which has not been received, the carrier to which the statement is rendered shall accept the account and credit or debit the originating carrier therewith to the debit or credit of a suspense account. Such receiving carrier shall immediately take the matter up with the originating carrier for the purpose of locating the missing bill, statement, or account. If it be found that such amount was included in the statement in error, adjustment shall be made therefor in a subsequent statement. If manifest errors be found in such statements by a receiving carrier, the attention of the originating carrier shall be called thereto and such error or errors shall be adjusted in the statement for the subsequent month.

EQUIPMENT AND FACILITIES ACCOUNTS

General Order No. 31 provides that, effective July 1, 1918, the following rules and regulations shall govern the accounting for the use of equipment or facilities of one carrier under federal control by or for the account of another carrier under such control, provided, nothing herein contained shall be construed to warrant the discontinuance of the keeping, rendition and settlement of such accounts by a carrier under federal control in favor of or against a carrier not under federal control, in the same manner as heretofore.

1. Hire of Freight and Passenger Train Equipment.

1. The practice of recording, computing and paying per diem, mileage, or rental for the use of freight and passenger

train cars of one carrier under federal control by or for account of another carrier under federal control, and the adjustment of differences, claims, etc., between such carriers which clearly relate to transactions incurred on or after January 1, 1918, shall be discontinued.

2. Junction cards, interchange reports, location records, and all other records and reports necessary to determine the location of equipment shall be kept, rendered, and compiled as heretofore.

11. Joint Facilities—Bills for Use of.

3. Effective with costs incurred on and after July 1, 1918 bills rendered by one carrier under federal control against another carrier under such control for maintaining and operating (including taxes and rental) tracks, yards, terminals and other facilities, including costs to operate equipment used therein, shall be computed, rendered, charged and paid on the following bases:

(a) In cases where the tenancy is not changed under government operations: The total cost of maintenance, operation, taxes and rental, as provided for under existing agreements, and the amounts thereof borne by each user, for a period not less than six months ended December 31, 1917, shall be determined by the owning or operating carrier. From such costs, the percentage of the total borne by each user to the total costs shall be determined. The percentages thus determined shall be applied monthly to the total costs incurred on and after July 1, 1918, and bills shall be rendered and paid on the results thus obtained.

(b) In cases where tenants or users are admitted to facilities not heretofore jointly used: Federal managers of the facilities to be jointly used shall determine, as between themselves, a fair and equitable arbitrary basis for the apportionment of the total costs of maintenance, operation, taxes and rental which should be paid by each tenant. Such basis shall thereafter during the period of federal control be used by the owning carrier as a basis for preparation and rendition of bills against the tenants or users, and such tenants or users shall pay such bills as rendered.

(c) In cases where the number of tenants or users of facilities now used by tenants under agreements with owners is increased or decreased: The literal compliance with the terms of such agreements shall be temporarily suspended, for the period of federal control, and a fair and equitable basis of use shall be determined as prescribed in paragraph b preceding, except that due regard shall be given to the terms of existing agreements in fixing such arbitrary basis.

(d) In cases where a lump sum charge has been made by an owning or operating carrier which is under federal control for the use of a facility used by another carrier which is under such control, such bills for the lump sum charge shall be rendered and paid during federal control as heretofore; provided, however, if there be a change in such tenancy by the admittance of other tenants or otherwise, and the contractual basis upon which the lump sum charge is made be disturbed thereby, an arbitrary basis of charge by the owner against the tenant or tenants shall be determined as prescribed in paragraph b hereof.

4. Details heretofore required in support of joint facilities, bills, statements and accounts shall be discontinued, except that such bills shall show the totals chargeable and creditable, to the primary operating revenue, expense, tax and rental accounts prescribed by the Interstate Commerce Commission, or which may hereafter be prescribed.

5. If materials and supplies, the value of which is carried in the accounts of one carrier under federal control, be used by another carrier under such control for maintaining or operating equipment or facilities jointly used, the value at which such materials and supplies are carried in the accounts of the carrier furnishing them shall be billed against and paid for by the carrier using them as heretofore,

except that percentages for overhead and other carrying expenses shall not be added to the cost thereof.

Traffic Committee Abolished

The Interregional Traffic Committee, appointed by Director General McAdoo on February 9 to make a study of the larger traffic movements with a view to seeing what steps could be taken to shift traffic from the more seriously congested ports, has completed its work and has been abolished. The committee, which consisted of B. L. Winchell, chairman, George F. Randolph and T. C. Powell, has submitted various advisory reports to Mr. McAdoo and the Division of Traffic, regarding changes which could be made in the routing of traffic now that the railroads are being operated as a single system and it is understood that some of its recommendations have already been put into effect.

Cincinnati Freight Control Committee

The Division of Operation has formed a Committee of Freight Traffic Control, composed of F. B. Mitchell, chairman; G. Krause, B. Arnold and J. B. Ford, with office at Cincinnati, Ohio, to secure all necessary reports covering freight traffic passing Ohio river gateways at Cincinnati, Ohio, Louisville, Ky., Cairo, Ill., Evansville, Ind., Paducah, Ky., and Portsmouth, Ohio, and to require reports covering traffic which is routed through either of these gateways, or which may be held for either of them on account of congestion. They will give particular attention to the handling of freight for the government, recommending any measures which will facilitate its movement. The committee will decide upon all embargoes affecting traffic passing through these gateways, their extent and duration, placing same through the regional directors, and keeping the Car Service Section constantly and fully advised. They are expected to study the traffic passing these gateways, with the view of detecting and remedying any movements which are out of line or proper route, conferring freely with the Divisions of Traffic and Operation, including the Car Service Section.

Pocahontas Regional Purchasing Committee

N. D. Maher, regional director of the Pocahontas district, has announced the appointment of a Regional Purchasing Committee, consisting of E. T. Burnett, purchasing agent of the Norfolk & Western, as chairman, and B. T. Jellison, purchasing agent of the Chesapeake & Ohio. The committee will have its office at Roanoke, Va.

Board of Adjustment No. 2

In conformity with the provisions of General Order No. 29, Railway Board of Adjustment No. 2 has been constituted as follows: W. H. Penrith, assistant general manager, Chicago & Alton; E. F. Potter, assistant to general manager, Soo Line; A. C. Adams, superintendent of shops, New York, New Haven & Hartford; E. A. Sweeley, master car builder, Seaboard Air Line; W. F. Kaderly, general superintendent, Georgia Southern & Florida; Robt. J. Turnbull, inspector of transportation, Atlantic Coast Line; H. J. Carr, International Association of Machinists; George W. Pring, International Brotherhood of Boiler Makers, Iron Ship Builders & Helpers of America; G. C. Van Dornes, International Brotherhood of Blacksmiths & Helpers; F. H. Knight, Brotherhood Railway Carmen of America; Otto E. Hoard, Sheet Metal Workers' International Alliance; and F. J. McNulty, International Brotherhood of Electrical Workers.

The board will meet shortly to elect a chairman and vice-chairman and organize for business as provided in General Order No. 29. A circular will be issued giving notice when the board is ready to perform the duties entrusted to it.

Express Contract Held Up

The proposed contract between the Railroad Administration and the express companies has struck several snags in the office of the attorney general, where it has been under consideration for several days, although it is understood that the snags were discovered by the postmaster general before the document was referred to the Department of Justice. The postmaster general, possibly mindful of the competition which his department might experience at the hands of a unified express company after the war, is said to have raised a question at a cabinet meeting as to whether the proposed merger of the express companies if allowed to continue after the war, would not constitute a violation of the Sherman law. The attorney general, to whom the contract was then referred, insisted that it be rewritten to remove what he held to be a guarantee against prosecution under the anti-trust law and to provide for the complete unscrambling of the merger after the war by the return of the property to the owning express companies. A conference on the subject was held on Tuesday between Director Prouty of the division of public service and accounting and General Counsel Payne, representing the Railroad Administration, and Attorney General Gregory and his assistant G. C. Todd, after which Messrs. Payne and Prouty held a further conference with the representatives of the express companies.

Transportation Conditions in Eastern Territory

The Railroad Administration has given out a report submitted to Director General McAdoo on May 29 by A. H. Smith, eastern regional director, regarding transportation conditions in his territory since January. The report in part follows:

The chaotic conditions into which the railroads in this territory got during the severe winter months have been straightened out with promptness and the recovery is at this time such as to enable me to report to you an almost normal situation in the movement of traffic, and also the fact that the railroads in this territory are now in such order as to make possible the movement of considerable additional tonnage if offered. Perhaps the greatest congestion existed in the territory of Pennsylvania, Maryland, and West Virginia, served more particularly by the Pennsylvania, Baltimore & Ohio, and Philadelphia & Reading. On February 6 the Pennsylvania reported 27,588 cars above normal for movement; today the number so reported is 3,532, and these are held because consignees are unable to accept. The Baltimore & Ohio at its worst on February 6 had 21,415 cars above normal; today there are 1,348. In the entire territory of the Eastern District there were on February 6, 161,000 cars above normal; today the total is 16,891 and these are widely distributed. An acute car shortage prevailed all during the winter. At the present there is no shortage of closed cars and practically a full supply of open cars. With the better weather the physical condition of motive power has been improved and passenger trains are operating more punctually.

The factors which impaired railroad operation so seriously during the winter months were: First, the unusually severe weather; low temperature, and storms, one following another so closely as to make it impossible to recover in the interim. Second, the shortage of motive power due to failure to receive locomotives ordered in 1916 and 1917 for use during the past winter. The necessity for these locomotives was anticipated and the orders placed with builders, but the priority which it was necessary to exercise in building locomotives for service abroad made it impossible to deliver. Third, the acute labor shortage.

Since January 1 there have been many measures adopted for efficient operation, among which may be mentioned:

1. The elimination of approximately 2,200,000 miles per month of unessential passenger train mileage.

2. The assignment to the eastern railroads of 122 locomotives constructed for the United States military railways in France; also 125 locomotives constructed for the Russian government, as well as 118 locomotives under order for the southern and western roads.

3. The transfer of power from one road to another to relieve congestion or shortage of power. All roads are required to report surplus equipment and it is distributed wherever the need for it appears. On May 21, 215 locomotives belonging to eastern railroads were rented on this basis to other roads in the eastern territory.

4. Diversion of traffic to less congested routes and the expedited movement of empty box, refrigerator and stock cars westbound and empty coal cars to mines via most available routes, regardless of loaded haul.

5. Handling company fuel and material by most direct routes, saving unnecessary haulage, which under private

11. Institution of "sailing days" in the handling of l. c. l. freight. In a very large number of instances regular cars previously loaded daily are now forwarded but three times a week, which is resulting in a decrease of 50 per cent in the number of cars used and a consequent increase of 100 per cent in the tonnage per car handled.

12. The routing of freight to tidewater via the delivering line at destination has resulted in a very great relief to the seaboard terminal facilities, all freight for Staten Island now being routed so far as possible Baltimore & Ohio freight for the Bronx, New York Central freight for Bayonne and Constable Hook via the Lehigh Valley, etc. Furthermore, arrangements were made for the loading of freight to steamers direct from the piers, the freight being routed via the line reaching the pier, which resulted in great economy in the use of terminal and marine facilities. There has also been a considerable volume of freight diverted to other ports to relieve the New York export situation.

13. The saving in power account diversion of traffic to

Map Showing the Three New Regions in the West

control was sometimes done to give the greatest proportion of a through rate to the receiving line.

6. The common use of terminal facilities at large commercial centers.

7. The interchange of labor to eliminate accumulations of l. c. l. freight.

8. Restriction on available equipment for certain classes of loading, which has been possible under unified control, permitting the urgently required traffic to be loaded and moved to the exclusion of less necessary commodities.

9. The classification of freight by the originating railroads to permit trains to be run through to Western termini without re-switching.

10. The co-ordination of harbor facilities at New York, in order that the greatest possible service could be obtained from the floating equipment and facilities; including the breaking of ice in the bays, rivers and slips during the periods of low temperature, to permit the operation of marine equipment.

roads with most favorable grades, resulting in saving of engine efficiency.

14. The facilities of the eastern railroads' locomotive and car repair shops are being constantly scrutinized in an endeavor to find space for repairing locomotives of other eastern railroads not so well situated, and to date 98 eastern railroad locomotives have been repaired and 28 additional are undergoing repairs at shops other than those of the owning lines. In addition, arrangements have been made with the western railroads for the repair of 66 eastern lines' locomotives, 22 of which are at present in western shops undergoing repairs.

15. The running of locomotives through over more than one road in connection with troop and freight movement to save power and the delay to traffic.

16. The movement of anthracite coal and empty equipment through the Pennsylvania tubes.

17. The placing of coal on team tracks, New York City, for unloading to relieve the coal shortage.

18. The diversion of bituminous coal to piers of New York harbor where it could be dumped most expeditiously to relieve the need of bunker coal for ships waiting in New York harbor.

On February 1 blast furnace production was 57 per cent of capacity, and by-product coke 67 per cent. At that time 113 out of 290 blast furnaces were out of blast. At the present time the blast furnace situation is practically normal, there being no furnaces out of blast because of lack of transportation, those which are not in operation being out for repairs. The American Iron & Steel Institute report furnaces now in operation which have been out of blast during the past three or four years so that it may be said that steel and iron production is at this time not impaired because of lack of transportation service.

The movement of coal via the Great Lakes is progressing satisfactorily, there being an increase of 26 per cent in cars dumped in vessels so far this season. The ore movement from the Lakes is also ahead of last year to the extent of four per cent in cars shipped.

During the winter months steel tonnage piled at the plants awaiting shipment continued to increase, and reached the peak about March 1, at which time there were approximately 500,000 tons awaiting movement due to embargoes and lack of cars. This tonnage has been moved with the exception of about 40,000 tons which is held account of embargo.

With the improvement of the weather and the coal car supply, there has come an increase in the bituminous coal loaded; the average figures for January showing 15,639 cars loaded per day, and for the first 25 days of May, an average of 19,726 cars. In January an average of 5,713 cars of anthracite coal were loaded per working day, which has increased to 6,583 cars in May.

The average anthracite coal dumped at tidewater ports in January per calendar day was 820 cars; in May 1,109. Bituminous coal dumped in January, all ports, was 1,403 cars per day, and in May 2,236. The average daily movement of anthracite coal into New England in February was 463 cars per working day; in May 617; while the bituminous movement into New England in February was 331 cars per day; and in May 492.

On January 1 there were on hand at North Atlantic ports approximately 41,000 cars of export freight in cars, on piers, and on the ground. This has been reduced to approximately 28,000 cars. This improvement has been brought about by the permit system of control based upon steamship requirements, or what is known as the consignee basis of regulation of shipments. It has resulted in eliminating all complaint of delay to ships awaiting cargo.

The discontinuance of fast freight service made it necessary to establish continuous movement service for handling export traffic from the Central West and West to the East. The export delivered steamships shows a progressive increase. In March it averaged 940 cars per calendar day; while in May the average is 1,172 cars per day.

The overseas tonnage of United States government freight is increasing by leaps and bounds, due to the heavy troop movement, and, with the mutually co-operative measures being taken with the war department for its regulation, is moving without interruption and on an entirely satisfactory basis.

Director General McAdoo has telegraphed a reply, saying in part: "It is a record of railroad achievement of the highest order in the face of difficulties of unprecedented character. I congratulate you and the officers and men under you for the loyal and effective service they have rendered to their country in bringing the railroads in the eastern territory up to such a high standard of operation in so short a time. We railroad men have been given a big part of the responsibility for lick-

ing something spelled with four letters out of the Kaiser and his military gang. It is a rare privilege and what you have already done shows that we are going to do our share of the job to Uncle Sam's taste. Keep up the good work."

More Time Wanted to Decide Status of Short Lines

At the request of Director General McAdoo, a joint resolution has been introduced in the House and Senate to extend the time within which the President may relinquish control of any railroad, as provided in section 14 of the railroad control act, from July 1 to January 1, 1919. John Barton Payne, general counsel for the Railroad Administration, who transmitted the request, said that a plan for dealing with the short lines would be agreed upon eventually but that it had been found impossible to do so within the time allowed by the act.

Answering a Senate resolution introduced by Senator Cummins directing him to furnish information as to the contracts between the government and the railroads for compensation, Director General McAdoo has sent a communication saying that no contract has yet been executed with any carrier, and none has refused to execute a contract. Upon the approval of the federal control act, the question of agreeing upon a standard form of contract between the government and the carriers was taken up, the government being represented by Messrs. Clark, Meyer, Hall, and Anderson, members of the Interstate Commerce Commission; Judge Prouty, director of public service and accounting of the Railroad Administration; Nathan Matthews, of Boston, employed as special assistant to the general counsel; and John Barton Payne, general counsel; and the carriers being represented by their counsel. No conclusion of these discussions has yet been reached.

Representatives of the short lines at a hearing before the House Committee on Interstate Commerce, held to consider the resolution on June 15 and 17, urged that the resolution be amended to provide that no short line shall be released unless competing roads are released at the same time. John Barton Payne represented the administration in urging the passage of the resolution.

Negotiations in the form of contract are still progressing but with every indication that it will be a long time before any agreement will be reached.

Director General McAdoo Away for a Rest

Director General McAdoo, who left Washington June 12 for White Sulphur Springs, where it was announced he would spend a large part of the summer, left again on Saturday, without his destination being announced, to rest and recuperate, at the orders of his physician, in some place where he will not be disturbed by callers, telegrams or telephone calls. Mr. McAdoo has been under a heavy burden and needs a rest. It is given out that his poor health is solely the result of his recent attack of laryngitis, which has affected his vocal cords and made it difficult for him to speak and has caused him difficulty for some time.

Waterway Advocates Busy

A large delegation of waterway advocates from St. Louis and the Mississippi valley, including a number of congressmen, held a conference at Washington on June 17 with Director Prouty of the Division of Public Service and Accounting, as Mr. McAdoo's representative, to urge the Railroad Administration to inaugurate a barge service on the Mississippi river from St. Louis to New Orleans at an expenditure of between \$7,000,000 and \$8,000,000. The arrival of the committee in Washington was heralded by the insertion in the Washington papers of an advertisement directed to Director General McAdoo in the form of a two-column editorial from the St. Louis Post-Dispatch, charging that the railroad officers on the director general's staff and others on whom he has called for advice have "smothered" a recommendation of the

Inland and Coastwise Waterways Committee in favor of the establishment of the barge service. It was stated that the committee appointed by Mr. McAdoo to investigate the use of waterways has recommended a barge service which could be provided at an expenditure of \$7,350,000 to carry 1,080,000 tons of freight per year and return net earnings of \$1,526,000, or 18 per cent on the investment, and that the committee had also recommended the establishment of a barge service on the New York State Barge Canal, which has been put into effect, but that the report of the committee as to the Mississippi river was referred by Mr. McAdoo's railroad assistants to a committee consisting of John Howe Peyton, president of the Nashville, Chattanooga & St. Louis; Frank B. Bowes, vice-president of the Illinois Central, and F. C. Reilly, freight traffic manager of the St. Louis-San Francisco, who rejected the recommendation for the use of the Mississippi river.

At the office of the Railroad Administration it was stated that the reports both of the waterways committee and of the railroad committee were merely advisory reports for the benefit of the director general and that no decision had been reached.

Interpretations of Wage Order

At the request of the executive officers of the four brotherhoods of train service employees, who conferred with Mr. McAdoo on June 12, the director general has issued two formal interpretations of General Order No. 27 increasing the wages of railroad employees. Interpretation No. 1 approved a recommendation of Railroad Board of Adjustment No. 1, to which had been referred a communication from the brotherhood executives asking for a construction of the order in so far as it relates to the bases of pay for yard engineers, firemen, conductors or foremen and brakemen or helpers. The board's recommendation states that as these classes of employees had a guaranteed minimum day's pay, irrespective of how expressed in schedules, the increases granted by the order should be applied to such employees upon the guaranteed minimum day's pay of December, 1915, and that, therefore, their increases should be computed upon the table given in Section B of Article 2 of the order, which is a scale of wages for employees paid upon a daily basis.

Interpretation No. 2 states that the following bases will be observed in the application of rates of pay in General Order No. 27:

All persons employed in any capacity, and receiving less than \$250 per month in salary, will receive the increases named in the director general's General Order No. 27, unless specifically excluded therein.

Passenger Service.—All conductors, baggagemen, flagmen and brakemen paid on the mileage basis and performing more than the minimum daily mileage will be paid under the provisions of Section E, Article 2.

All conductors, assistant conductors, ticket collectors, baggagemen, flagmen and brakemen paid under the monthly guarantee of the Eastern and Southeastern Territory, will be paid under the provisions of Section A, Article 2, and the daily rate will be 1/30 of the monthly rate.

All conductors, baggagemen, flagmen and brakemen paid on the monthly basis will be paid under the provisions of Section A, Article 2.

Local Freight Service.—All conductors, engineers, firemen, flagmen and brakemen paid on the mileage basis will be paid under the provisions of Section E, Article 2.

Local freight conductors, engineers, firemen, flagmen and brakemen paid on the monthly basis will be paid under the provisions of Section A, Article 2.

Through Freight Service.—Conductors, engineers, firemen, flagmen and brakemen paid on the mileage basis will be paid under the provisions of Section E, Article 2.

Conductors, engineers, firemen, flagmen and brakemen paid

on the monthly basis will be paid under the provisions of Section A, Article 2.

Work Trains.—Conductors, engineers, firemen, flagmen and brakemen paid on the mileage basis will be paid under the provisions of Section E, Article 2.

Conductors, engineers, firemen, flagmen and brakemen paid on the monthly basis will be paid under the provisions of Section A, Article 2.

Specified Trip Rates.—In passenger, through freight or local freight, the increases in trip rates shall take the percentages applicable to each class of service respectively.

Special Allowances.—All arbitrary or special allowances, previously paid on the hourly basis, will be paid at the new hourly rate.

Arbitrariness or special allowances, previously paid on the basis of mileage, will be paid on the new mileage rates.

If the schedule amount bears no relation to miles or hours, such arbitrary or special allowances will be increased in accordance with the percentage shown under Section E, Article 2.

Engines which have come into the service since 1915, on which rates have been applied—for the purpose of computation under General Order No. 27, consider such rates as being applicable December 31, 1915, and apply appropriate increases from January 1, 1918.

The negotiated rate since the Arbitration of the Engineers and Firemen in the East and West, for transfer service—for example, the \$4.50 rate for engineers and the \$3 rate for firemen in the Western territory shall be increased under Section B of Article 2. Where through freight rates apply to transfer service, the increases under Section E, Article 2, will apply.

Where the guaranteed daily minimum is an arbitrary rate, and is not based on hours or miles, engineers and firemen will be paid the rate under the provisions of Section B, Article 2. Where the guaranteed minimum is based on mileage, engineers and firemen shall be paid the rate under the provisions of Section E, Article 2.

Hostlers.—The rates in Section B, Article 2, shall apply to hostlers, based upon rates in effect December, 1915.

Auditor for the Railroad Administration

J. W. Roberts, who has been appointed auditor of the Railroad Administration, as reported in last week's issue, has been auditor for the Bureau of Valuation of the Interstate Commerce Commission. His duties are to audit the accounts of the Railroad Administration and those between the administration and outside enterprises, such as the express companies, and the railroad and steamship corporations. It is expected that after the question of the railroads' compensation is settled he will have a large force of field assistants.

Car Service Section Has Chicago Office

W. L. Barnes, assistant manager of the Car Service Section, has been transferred to Chicago, where he will have charge of matters pertaining to the use of tank and refrigerator cars.

REMEMBER THAT NATIONAL WAR SAVINGS DAY IS JUNE 28.—Pledge yourself on or before that day to save to the utmost of your ability and to buy War Savings Stamps that there may be more money, labor and materials to back up those who fight and die for you.

TO AID RUSSIAN RAILWAYS.—Press despatches from Moscow, dated May 17, state that Col. George H. Emerson, with eight members of the Railroad Mission headed by John E. Stevens, which has been in Russia for the last year, is on his way to Biologda from Vladivostok at the request of David R. Francis, American Ambassador to Russia. The purpose is a conference on the possibilities of an improvement in the railway situation in Russia.

Officers Required for Railway Troops Orders of the Southern

Regional Director

S. M. FELTON, director-general of military railways has issued a new call for railway men for service on the American lines of communication overseas.

With the growth of our armies in France many additional officers for railroad troops that are now forming and which will be formed in the near future will be required. The director general military railways realizes the necessity of retaining American railroad officers in their present positions and that the operation of the American railroads must be maintained, but there is such necessity for officers for railway troops in France that he is calling for *experienced railroad men who are now employed in other active pursuits*. He has requested that railroad officers send to him the names of their acquaintances who would be possible candidates under this ruling.

The following statement gives an outline of the qualifications required; the official rank for which commissions will be issued, with their several rates of pay; the commutation for quarters being allowed when officers are maintaining their families in this country:

| Qualification | Rank | Rate of pay | | | Total | |
|---|---------|-------------|---------|-------------------------|---------|---------|
| | | U. S. | Foreign | Commutation of quarters | U. S. | Foreign |
| | | | | | | |
| Asst. general manager..... | Major | \$3,000 | \$3,300 | \$720 | \$3,720 | \$4,020 |
| General superintendents..... | Major | 3,000 | 3,300 | 720 | 3,720 | 4,020 |
| Superintendents—Motive power..... | Major | 3,000 | 3,300 | 720 | 3,720 | 4,020 |
| Division superintendents..... | Captain | 2,400 | 2,640 | 576 | 2,976 | 3,216 |
| Master mechanics..... | Captain | 2,400 | 2,640 | 576 | 2,976 | 3,216 |
| Engrs. maintenance of way..... | Captain | 2,400 | 2,640 | 576 | 2,976 | 3,216 |
| Trainmasters..... | 1st Lt. | 2,000 | 2,200 | 432 | 2,432 | 2,632 |
| Div. engrs.—maintenance of way..... | 1st Lt. | 2,000 | 2,200 | 432 | 2,432 | 2,632 |
| Chief dispatchers..... | 1st Lt. | 2,000 | 2,200 | 432 | 2,432 | 2,632 |
| Road foremen of engines..... | 1st Lt. | 2,000 | 2,200 | 432 | 2,432 | 2,632 |
| General yardmasters..... | 1st Lt. | 2,000 | 2,200 | 432 | 2,432 | 2,632 |
| Enginehouse and shop foreman..... | 1st Lt. | 2,000 | 2,200 | 432 | 2,432 | 2,632 |
| Asst. division engineers..... | 2nd Lt. | 1,700 | 1,870 | 288 | 1,988 | 2,158 |
| Yardmasters..... | 2nd Lt. | 1,700 | 1,870 | 288 | 1,988 | 2,158 |
| Supervisors and roadmasters..... | 2nd Lt. | 1,700 | 1,870 | 288 | 1,988 | 2,158 |
| Asst. enginehouse and shop foremen..... | 2nd Lt. | 1,700 | 1,870 | 288 | 1,988 | 2,158 |

In addition to the above there is a small allowance made for heat and light which varies according to the location of station and season of the year.

It is desired that as many men as possible communicate with the Director General Military Railways' office, 6th & B streets, N. W., Washington, D. C., and that in these communications they give in detail their railroad experience and their references. The call for these men is pressing and it is hoped that there will be a hearty response.

IN CIRCULAR LETTER No. 252 issued by B. L. Winchell, regional director for the Southern lines, the jurisdiction of the Southern Passenger Committee is extended over union depot ticket offices and it is instructed to determine whether the ticket selling force and the Information Bureau in any union depot ticket office is adequate and competent satisfactorily to conduct the business of the office and serve the public; to determine whether the salaries paid the ticket agents and other employees in said offices are sufficient to secure and retain competent men and to fix said salaries; and to determine whether the physical facilities at such offices are sufficient or are best arranged for prompt and satisfactory service to the public, and to suggest to the carriers operating the office such changes and alterations as are deemed necessary to improve conditions.

Circular No. 252 issued by G. R. Loyall, assistant regional director, states that the Railroad Administration does not approve the practice of permitting persons known as "live tracers" to accompany shipments of freight, including government freight, and, unless specifically provided for in published tariffs, no person shall be permitted to accompany freight shipments in transit or to have access to railroad yards and property for so-called purpose of locating and expediting movement of a particular class or individual cars of freight. Similar instructions have been issued by other regional directors.

Circular No. 256, issued by Regional Director B. L. Winchell, asks the railroads to advise what measures have been taken to deal with the embargo situation to the end that all shippers may readily procure accurate information and as to what plan is being pursued whereby the various headquarters and division officers keep themselves informed of prospective shipments with a view of getting them forwarded as soon as embargoes against given destinations or sections may be lifted. The regional director particularly wants to know how the railroads deal with the situation as concerns shippers at points at which the railroads have no resident officers or traffic department representatives.

Freight Operations of Steam

Railways for 1915, 1916 and 1917

THE BUREAU OF RAILWAY ECONOMICS has made the following compilations for the American Railway Association, giving the comparative summary of freight operations for the calendar years 1915, 1916 and 1917:

| Item | UNITED STATES | | | Per cent of inc. or dec. 1917 compared with— | |
|---|-------------------------|-----------------|-----------------|--|--------|
| | Year ended December 31— | | | 1916 | 1915 |
| | 1917 | 1916 | 1915 | | |
| Freight train-miles..... | 653,932,568 | 641,202,142 | 572,305,829 | 2.0 | 14.3 |
| Loaded freight car-miles..... | 15,765,509,155 | 15,732,077,674 | 13,649,285,729 | 0.2 | 15.5 |
| Empty freight car-miles..... | 6,691,111,173 | 6,694,542,195 | 6,696,582,974 | d 0.1 | d 0.1 |
| Total freight car-miles—loaded and empty..... | 22,456,719,268 | 22,426,619,869 | 20,345,868,703 | 0.1 | 10.4 |
| Freight locomotive-miles..... | 751,820,895 | 732,837,255 | 662,526,273 | 2.6 | 13.5 |
| Revenue ton-miles..... | 89,168,754,904 | 357,620,566,671 | 298,184,700,418 | 8.8 | 30.3 |
| Non-revenue ton-miles..... | 15,250,306,588 | 33,374,423,961 | 30,319,094,371 | 5.6 | 16.5 |
| Average number of freight locomotives in service..... | 30,805 | 30,555 | 29,834 | 0.8 | 3.3 |

ASK POOR TO QUIT PARIS—Press despatches state that measures have been taken by the French Ministry of Public Works to facilitate the departure of poor families from Paris. This step is not taken because it is considered imminent danger is threatening the capital but from the wish to aid people of modest means to avoid the difficulties due to the crowded conditions at the railroad stations recently. Beginning with Sunday, June 23, family tickets for third class passage will be delivered by all railroads. The first member of a family paying full rate and the others half fare. The minimum distance for a new destination is 160 miles. The

tickets will only be delivered to families whose annual rent does not exceed \$120 with 20 more for each member of a family consisting of more than two persons.

THE LONDON, BRIGHTON & SOUTH COAST has issued the 17th edition of its Roll of Honor containing the names of men who have died on active service, and the number and percentage of men enlisted. The total number of men enlisted is 4,896, which is 30 per cent of the total employed, while 355 of this number have died on active service, which is 7.25 per cent of the men enlisted.

Storage Battery Trucks, Tractors and Locomotives

THERE ARE FOUR DISTINCT TYPES of machines made by the Industrial Truck Co., Holyoke, Mass. These are a tractor, two types of load-carrying trucks, an elevating platform type truck and a locomotive with flanged wheels for running on rails. The first four types mentioned are equipped with hard rubber tires. A distinguishing feature of this line of equipment is that the greater number of parts in any one machine are interchangeable with the corresponding parts in any other.

The tractors are manufactured in two types, namely, an end control and a center control tractor. A tractor with end control is shown in the illustration. The difference in arrangement on the center control truck is that the operator sits in the center and can by changing seats operate in either direction without having to turn his tractor around. In congested or narrow aisles this is often a very valuable feature. Either

Storage Battery Tractor

type steer on all four wheels and are built as two or four wheel drives. The two-wheel drive machine can be converted to a four-wheel drive by the owner by purchasing the necessary worm and wheel housings, differential, etc.

The frame is built up of commercial rolled channel section steel and the bumper plates are of heavy boiler plate bent at the corners and riveted to the frame. Coupler castings are of the three-step type which makes it possible to use trailers of various heights.

The battery boxes are constructed with easily removable side doors for changing batteries and with a hinged top plate for easy access for flushing or inspection. Any type of battery can be supplied up to a maximum of 42 cells of the A-8 type Edison battery or 24 cells of a lead battery with 21 plates per cell. The removal of four nuts makes it possible to lift the frame and battery box from the chassis, leaving the entire driving mechanism accessible for inspection and repairs.

Power is transmitted from the motor through a single reduction worm and gear down through a differential to the wheel by means of a rugged universal joint capable of operating at an angle of 43 degrees. This universal joint is enclosed in a patented dust and oil-proof case formed by the pivoting wheel knuckle and its supporting yoke.

Wheel bearings are a high grade type of ball bearing and are considerably oversized to permit the universal joint to be drawn out through the full floating mounting of the wheel. The pivot bearings are of such a size that it is easier to steer the tractor than it is to steer the average pleasure car.

Two separate brakes are provided. The emergency brake is operated by the left foot and the service brake by the right.

To operate the tractor the operator must be sitting in the seat with his left foot pressing the emergency brake pedal down. If his left foot is lifted from the brake pedal the brake is applied and a clutch on the controller shaft throws the controller handle out of gear and the controller into neutral position. It is then impossible to start the machine again without first releasing the emergency brake and bringing the controller handle back to the neutral position. The electric horn is operated by a push button in the controller handle. An additional safety feature is found in the tilting steering wheel. This wheel is so located that the operator must tilt the wheel in order to leave his seat. This tilting arrangement is interlocked with the controller shaft clutch so that under no circumstances can the power be applied until the steering wheel is in the running position.

The locomotives are heavy and substantial machines built for any practical gage from 24 in. to the standard gage of 56½ in. Except for the absence of differentials, universal joint drive mechanism and steering mechanism and the substitution of flanged steel wheels for rubber tired ones, the locomotives contain all of the features described for the tractors. They are adapted for use in factories, warehouses, munition plants, depots, freight terminals, mines, etc. Practically all of the parts are interchangeable with those of the trucks and tractors.

The load carrying Type "L" truck and elevating platform type "E L" truck are of 4,000 lb. capacity. Each of the trucks has exactly the same power parts and with the exception of the motors all parts are interchangeable with those of the tractor. With a fleet of trucks and tractors of this type it would be necessary to keep on hand only one additional power unit to keep the fleet secure against loss due to accident or breakdown. The elevating mechanism on the type "EL" truck will lift its rated load of 4,000 lb. to a height of 5 in. and is operated by a hydraulic ram which in turn is connected through its pump to a small motor. A unique feature of this mechanism is that it requires no expenditure of current in lowering the load which means an appreciable saving.

Ball, radial and thrust bearings are used throughout, hardened pins in the renewable bushing are provided for all joints, and lubrication is taken care of by means of grease cups of the ratchet type.

Concrete Caissons Sunk by Open Dredging Method*

Development of This Form of Foundation from Simple Boxes
to Cylinders Driven to Great Depths

By L. W. Skov

Assistant Engineer Bridge Department, Chicago, Burlington & Quincy, Chicago, Ill.

IN THE CONSTRUCTION of ordinary railroad bridges, it is quite frequently necessary to put the footings a considerable distance below the ground line or the bed of the stream to obtain a good foundation or to eliminate danger from scour. It is in foundation work of this kind that the concrete caisson sunk by the open method of excavation has its field. By the selection of the proper design, concrete caissons sunk by this method can be built to cover a large variation of soil and sinking conditions, as the caisson can either be built complete over its final location before the

Design and Construction

The walls of the caissons are designed for a variable unit load equal to that usually used in designing walls retaining an earth fill. In cases where a considerable head of water is expected the hydrostatic pressure is added to the above unit pressure. The bottoms of the sidewalls and interior struts are tapered down to a width of from 3 in. to 1 ft. on the bottom, to form a cutting edge. Where caissons are sunk through clay or sand it is customary to leave the concrete cutting edge unprotected; where gravel, rip rap or other hard materials are encountered the cutting edge is protected by steel angles or hardwood timbers, depending on the material through which the caisson is to be sunk. Steel-protected cutting edges are not used except where the material penetrated is very hard and offers a great resistance. The hardwood cutting edge is found to give better protection to the concrete and on account of its greater width gives a much stronger caisson wall near the bottom.

Openings are left in the interior walls of sufficient size to allow the free passage of men and tools from one chamber to another in caissons where the excavation is to be done

Fig. 1—An Early Type of Caisson

sinking operations start, or it can be partly built, sinking started and additional sections of concrete added from time to time as the sinking progresses. If the location of the pier is in the wet part of the channel, the caisson will be built on temporary staging and lowered to position on the bed of the stream by means of lowering screws or built on an artificial island.

Some of the reasons for the use of the concrete caisson are: (1) The elimination of wooden or steel sheet pile cofferdams, which must necessarily be made larger than the neat dimensions of the footing, to allow room for wales and bracing. (2) The walls of the concrete caisson are practically impervious to water. (3) The finished structure is one solid piece of concrete, no timbers being imbedded in it, as would be the case where a construction requiring interior bracing is used. (4) The amount of timber required for forms for a concrete caisson is very much less than that required for building cofferdams. This, of course, is a very great advantage at the present time, as the government has reserved all of the larger sizes of timber for shipbuilding and other government construction activities. (5) The amount of equipment required is reduced, inasmuch as it eliminates the use of sheet pile driving equipment, and allows a reduction in pumping equipment. (6) Eliminates the pulling of sheet piling, where the leaving in place of the sheet piling is objectionable. (7) Saves time in construction, as it is not necessary to first drive a cofferdam.

Fig. 2—A Later Type with Battered Walls

by hand. The walls of the caissons are made of 1:2:4 concrete and the core of 1:3:6 concrete, the only reinforcing used in the core is the stub bars for tying on the neat work.

In cases where caissons are sunk to eliminate danger of scour, it may be found necessary to drive piling to carry the load. In this case the piles are driven in the usual way, after the excavation has been completed. Caissons sunk under these conditions are usually full of water and require sealing around the piles with a tremie. After the concrete has set sufficiently, the water is pumped out, the piles cut off, and the balance of the caisson filled with concrete.

When it is desirable not to have the caisson project above

* Abstracted from a paper presented before the Western Society of Engineers, June 10, 1918.

the ground line a triple-lap wooden cofferdam is built on top of the concrete caisson, the lower wale being bolted to the concrete. When the pier has been constructed it is an easy matter for a diver to remove this wooden crib by unscrewing the nuts on the bolts holding down the cofferdam.

Fig. 1 shows one of the first concrete caissons built by the Burlington. Steel angles and plates were used to protect the concrete cutting edge, which is made very narrow to insure sinking of the caisson by its own weight. It has, however, been found by experience that it is not necessary to employ as narrow a cutting edge as the one used for this case. On this job a concrete cap covering was cast on top of the caisson, for the purpose of making a more nearly watertight joint between the caisson and the core. Subsequent experience has shown that this is not necessary.

Fig. 2 shows a caisson built one year later than the one shown in Fig. 1. It will be noted that the design of cutting edge has been changed, and that no protection is used for the concrete. The cross struts or walls have been raised two feet above the cutting edge, which allows a passage for the water from one compartment to the next and in that way simplifies the pumping problem. The outside of the walls has also been tapered off toward the top, the idea being to reduce skin friction. It has been found, however, that the difference in friction for the straight wall and the battered wall is very small and the battered wall design has been discarded on account of the greater cost of forming. This caisson was hand excavated, the material being removed by shoveling in stages. As the caisson was sunk for the purpose of getting below the scour line, and as there was no hard ground here near the surface, softwood piles were driven to carry the load. This caisson was sunk through clay, and only a small amount of water was encountered.

One caisson built in 1912 was sunk through stiff clay,

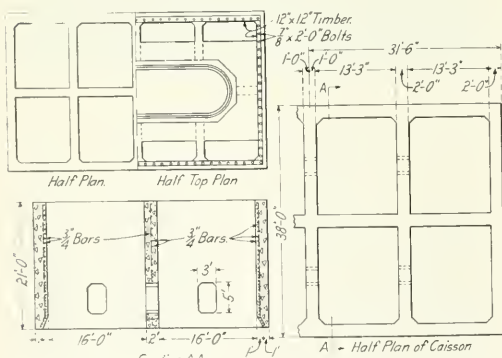

Fig. 3—Large Caisson Used for Pier 8 of the Metropolis Bridge

and for a while considerable trouble was experienced in making it settle. Even after the excavation had been removed below the cutting the box would remain suspended. It so happened that the old bridge at this point was a pile trestle, the new caissons being built between the old pile bents. The foreman one day conceived the idea that it would be possible to put up struts resting on the top of the caisson and long enough to reach the bottom of the stringers of the trestle bridge which would deflect under load, and then let a train across the bridge and in this way give the box an initial start. This scheme was tried and worked very well. After the caisson was once started, the skin friction was reduced enough to allow it to sink down as far as the excavation had been made.

A caisson sunk in the Missouri river at Kansas City, was built on made ground, retained by a dyke of cement sacks filled with sand. The sinking conditions here were very unusual, as the land side of the caisson had to penetrate a rock ledge while the river side was resting in sand and an old garbage dump.

The rock was blasted and removed by loading on skips and raising with a derrick. Considerable trouble was encountered from the water breaking in on the river side and several logs were encountered which had to be removed from under the cutting edge by pulling them into the caisson; one large log encountered about 10 ft. below the ground had to be cut off outside of the chamber before it could be pulled

Fig. 4—Type of Caisson Used in the Ashland Bridge

in. The water trouble was finally overcome by the liberal use of cinders placed along the river side and the caisson landed on a rock bottom.

Fig. 3 shows the caisson used for pier No. 8 of the Metropolis Bridge over the Ohio river, and is the largest concrete caisson ever built by the Burlington. It was sunk through a sandy clay to a depth of 50 ft. below the ground line where a sand foundation was obtained. Originally it was planned to sink this caisson about 35 ft., but when this depth was reached the soil was still unsatisfactory to carry imposed loads, so it was decided to continue sinking. A timber cofferdam built on top of the caisson was wrecked by the high water and was replaced by building an additional 16 ft. of concrete caisson on top of the original one.

The excavation was removed by two clamshells operated from stiff leg derricks resting on pile supports driven at opposite corners of the caisson. Upon the completion of the excavation 129 soft wood piles were driven with long leads extending down into the caisson. The driver rested on top and was easily moved from pile to pile. After all the piles had been driven the caisson was sealed through 40 ft. of water with a tremie. After the concrete had sufficiently set the caisson was pumped out and the remainder of the concrete poured in the dry. The caisson was not completely filled with concrete, but open pockets were left along the two sides of the pier to save material. Upon the completion of

the pier to the top of the concrete caisson the timber crib was removed, letting the dirt fall into the open side pockets.

When it is necessary to sink to a great depth a considerably larger caisson is required if it is constructed of wood, thus adding a large amount of additional excavation, as well as area subject to skin friction and at the same time reducing the average weight per cubic foot of volume to a large extent. This will be more clearly seen when we remember that as timber weighs only about two-thirds as much as water, it will require a considerable amount of concrete or other ballast to be placed in a timber caisson before any weight is available for the overcoming of skin friction. The overcoming of the skin friction of rest usually requires ballast of some kind even with concrete caissons when sunk to a considerable depth.

Fig. 4 shows a design of caisson especially adapted for deep foundation work. The pressures used in designing this kind of a caisson are the same as previously mentioned, and for great depths attain a considerable magnitude. It may seem at the first glance that it would not be necessary to design for hydrostatic pressure in addition to the usual earth pressure, but the caisson is sealed with only a few feet of concrete, and it is pumped dry before the core is filled with concrete. With this in mind, it will readily be seen that it is the proper thing to do; furthermore, the fill against the walls is a loose one, giving a maximum chance for large pressures being developed. The circumferential steel in the circular shaft, would not be required if we were sure of equal distribution of pressure along the entire circumference of the shaft; this, however, is a little too much to expect, there being a good many ways in which the equilibrium may be disturbed, such as cave-ins in the loose ground, boulders, scour on the up-stream half, or floating bodies striking the shaft. Caissons of this type, like the ones already discussed, can be built on artificial islands or on falsework, and lowered in place by the use of lowering screws. In some cases it may be economical to build a cofferdam, pump the water out and start the caisson on the inside.

The reason for the enlarged rectangular-shaped bottom section is to give larger bearing area and to reduce skin friction. Experience shows that this is a very effective way of doing both. Some fear was felt, when the first caisson of this design was being built, that the steering would be difficult; however, this proved to be erroneous. Rather the opposite is true. The railroad rails shown embedded near the top of what may be called the working chamber, are placed there to protect the concrete from excessive abrasion, due to the bucket rubbing against the sides of the working chamber. The shaft is built up in successive sections poured in place. In this case the sections were 15 ft. but this can be varied to any length desired. The caisson just described was one of several sunk in the Platte river,* near Ashland, Neb.; several circular steel caissons were also sunk for this bridge.

RAILWAYMEN'S WAR BONUS IN ENGLAND INCREASED.—The war wage of 21s. (\$5.04 a week now granted to certain classes of railwaymen engaged in the manipulation of traffic has been advanced to 25s. (\$6.00) a week. Boys and women will also receive certain advances in the war wage now granted to them.

A VAST LIGHT RAILWAY SYSTEM has been created in France, according to the British War Cabinet report for 1917, involving the supply during last year of approximately 1,700 miles of track and the whole of the equipment. Exclusive of these light railway systems the total amount of permanent railway track supplied complete to all theatres of war was about 3,600 miles.

Orders Governing Western Regions

THE RAILROADS included in the newly created Northwestern, central Western and Southwest region, will be governed by the following orders recently issued by R. H. Ashton:

A communication dated June 12, asks that railroad managers be just as careful during the period of federal control to prevent damage to National forests from fires started by locomotives, as they were under private control when the possibility of heavy claims by the government made careful railroad operation good business practice.

A circular, dated June 13, states that the United States Fuel Administration will encourage the opening of new coal mines whenever it appears that this can be done without taking labor from mines already producing. New mines, however, should not be opened if it appears to the Railroad Administration impossible or inexpedient to furnish the necessary railroad facilities. The supplement sets forth in detail the procedure to be followed in filing applications for the opening of new mining properties.

Supplement No. 1 to Circular R. P. C. No. 2, dated June 12, contains a letter sent by the War Industries Board to the Central Advisory Purchasing Committee at Washington outlining a tentative method of procedure in securing cement supplies for the railroads. Railroads are urged to endeavor to get the benefit of the prices fixed by the government in placing orders for cement where such prices are lower than those which they are now paying. The supplement also contains a list of prices of cement at various points throughout the country fixed by the War Industries Board for the four-month period ending August 31.

Supplement No. 1 to Circular R. P. C. No. 13, issued June 14, clears up certain misunderstandings in connection with the disposal of scrap rail. The present maximum price for scrap steel rail, sold for rerolling purposes, is \$14 per gross ton delivered at the consumer's works. This classification includes scrap steel rail five feet and over, standard sections, 50 lb. and heavier, free from frog, switch and guard rails. This may include pieces of switch points five feet and over, 50 lb. and heavier, which may be cut off so that no part of the taper is included, or other similar pieces five feet and over in length. Because of the difference in price of \$5 between other scrap rail and rail for rerolling it may pay roads to sort scrap rail more carefully and cut off the tapering portions of switch points. Other scrap rail should not be sold at above \$29 per gross ton delivered at the consumer's works, except when sheared to short lengths for use in cupolas or hand charging furnaces, when it may be sold at not above \$34. Crop ends from resweld rail come under the short length class at \$34 a gross ton.

Supplement No. 1 to Circular R. P. C. No. 5, issued June 15, contains additional instructions concerning the purchase of locomotive fuel. While railroads and coal operators are free to make contracts for railroad fuel at the prices agreed upon, that price shall not be in excess of the government price. Railroads are not permitted to furnish a preferential or supply in consideration of a reduced price. Carriers may contract for a large amount of fuel for delivery each month from any operator as the necessity may require. Contracts, however, should not cover a period exceeding 12 months. If for any reason it is advisable to make a contract for a longer period, such a transaction must be previously approved by the regional purchasing committee. Railroads are requested to obtain bids on fuel requirements at the earliest possible moment and submit contracts for approval to the regional purchasing committee.

In making contracts the question of fuel should be carefully considered. On account of the scarcity of coal roads

*The caisson was built by the U. S. Army, Corps of Engineers, under the supervision of the U. S. Army, Corps of Engineers, at Ashland, Neb.

will undoubtedly be compelled to use grades which heretofore have not been desirable.

Supplement No. 1 to Circular No. 121, issued on June 14, asks railroads to report the number of contracts with outside companies for repairing cars and the number of cars by classes undergoing such repairs. Copies of the contracts are also asked for together with a statement of the average cost per car for repairs on each contract, apportioned according to the cost of the labor, the material furnished by the contractor and the material furnished by the railroad to the contractor.

In a communication to western roads, dated June 12, the announcement is made that the director-general authorizes each of the railroads under federal control to purchase one membership in the American Society for Testing Material. Railroads are asked to designate representatives for this society who can give the matter adequate attention.

Circulars on Track Labor

Supplement No. 4 to Circular No. 63, dated June 11, states that in order to co-ordinate the work of the government and private labor agencies in obtaining track labor, the various private employment bureaus at Chicago, Kansas City, Mo., St. Louis, Minneapolis, Minn., Duluth, Kansas City, Kan., Superior, Wis., St. Paul, Minn., Omaha, Neb., and Sioux City, Ia., were taken over by the United States Employment Service. Under the present scheme of organization any railroad desiring track labor will file its order directly with the government agency or with its branches, the former private agencies. Railroads are authorized to continue their present organizations for securing track labor but these will be under the general direction of the government employment service. The railroad agencies will offer no rates of pay, working conditions or boarding conditions different from those offered through the government agencies. When a railroad has its own labor agencies it will place its orders with the United States Employment Service at the same time that it places them with its own agencies, so that the federal organization may have equal opportunity to secure the required men.

Supplement No. 5 to Circular No. 63, dated June 13, provides that the standard day for all track laborers shall be 10 hours and that the maximum rate of pay for a track laborer outside of the large terminals, important industrial centers and metal mining regions shall be 27½ cents per hour. Within the large terminals and in important industrial centers the maximum rate shall be 30 cents an hour. The minimum rate shall be that fixed by the director general's order No. 27 and where minimum rates are higher than the maximum rates above specified, they shall apply. No allowances of any kind shall be made for board, or for any other reason, that have the effect of increasing compensation. Railroads may continue the practice of paying the fare for laborers from labor markets to the point needed and their return fare to the point where employed. Labor agents are not permitted to recruit laborers or forces for one company from another road.

A telegram sent to western lines on June 15, asks for information on the behalf of the Board of Railroad Wages and Working Conditions concerning the normal summer force of the various kinds of common labor and the classes of common labor which are needed quickly to put the property in normal shape for winter service; the rates of pay recommended as necessary to obtain an adequate supply of common labor; and the minimum differential expressed in per cent over the usual monthly earnings of common labor which should be paid a foreman.

Advertising Regulations

Circular No. 126 issued by the regional director of western railroads on June 11, directs that lines be governed by

regulations relative to advertising prepared by the inter-regional advertising committee, A. L. Craig, chairman. These regulations provide that time-table folders will be informative only. All advertising of luxurious trains, claims of superior service, slogans, illustrations, and extraneous matter of every description, including paid and complimentary advertising, is to be eliminated. Trade marks, however, which serve to distinguish the folders of various lines and systems may be used.

A limited free distribution of local folders is authorized in foreign territory to meet the needs of the public and of ticket agents. The distribution of local folders in foreign territory may be covered either in whole or in part by the use of gateway folders to be prepared jointly by lines in the territory leading up to a gateway. In order to test the practicability of gateway folders the lines in the eastern region will issue a folder showing condensed service of all lines westward from Chicago, while lines in the western regions will issue a folder covering service on all lines from Chicago eastward. Joint folders between commercial centers will follow the standard for general local folders but may vary to such an extent in form and arrangement as will best show the service via all lines. Folders are to be distributed through the ticket offices and railroad information bureaus. No distribution is to be made on trains.

For the information of the public and ticket agents lines may at once issue resort, hotel and boarding house lists, but they should contain no maps or illustrations and where practicable will be jointly issued by lines interested. Descriptive resort publications are to be discontinued until further notice. Publications setting forth agricultural possibilities of sections of the country not now fully settled, may be continued, but where practicable should be joint. When reduced fares are made for special trains operated on account of state, county or industrial fairs, local excursions, etc., a limited amount of advertising is permissible.

The regulations also specify the manner in which schedules of individual roads shall appear in the Official Guide. No expense is authorized for representation in any other railway guide.

A letter sent to northwestern and central western railroads on June 17 contains a report from one of the largest western flour mills which indicates what can be done in connection with the intensive loading of flour. During the month of May this mill loaded 38 cars, with total marked capacities of 2,910,000 lb., with 3,228,986 lb. of flour, or 10.96 per cent overload.

Report of the
Fifty-first Annual Meeting
of the
Master Car Builders' Association,
and of the
Fiftieth Annual Meeting
of the
American Railway
Master Mechanics' Association

Chicago, June 19 and 20, 1918.

Comment on the Meetings

Grain Cars for Western Roads

THE MOST IMPORTANT matter brought before the attention of the joint meeting of the Master Car Builders' and Master Mechanics' Association was that of the car situation for grain loading in the West. Orders have been issued to send box cars to western roads to handle what will be a bumper crop. Cars have been sent indiscriminately to the western lines with the result that most of the roads are overwhelmed with box cars unsuitable for grain loading. One road received 4,000 cars which will have to be repaired before they are suitable for handling grain. Of about 2,000 on one road specified for grain shipment only 15 per cent were fit for that service. Another road reports only about 20 to 25 per cent of the cars received were suitable for this purpose. Something must be done to relieve the situation. It has been suggested that in ordering cars west the orders should state that the cars sent must be suitable for handling grain, and that the western roads be permitted to refuse cars not fitted for this commodity. The car repair situation the country over is serious. The shops both in the East and West are congested. The output is limited on account of lack of labor and material. In order adequately to meet the situation it will be far more practical to pick out the cars suitable for grain and send them West than to send unsuitable cars West and have them repaired there. Unless relief is given the western lines at once it will be impossible to handle the vast grain business this year.

Welding Truck Side Frames

THE PRACTICALLY unqualified endorsement of welding truck side frames and bolsters by the association seems surprising in view of the data presented in the exhibits accompanying the report. Of the two sets of tests the greater weight has apparently been given to those shown in book B. There were 23 castings tested in this series, of which only three broke in the weld. However, some of the tests give no indication of the strength of the welded members in tension. Six of the castings included in the tests reported in book B were welded in the compression member and one was tested transversely. Eliminating these we find that 13 of the test castings welded in the tension member failed outside the weld, while three failed in the weld. The data in book A were not summarized by the committee. Of the 21 side frames and bolsters, the test results of which are published in this exhibit, three castings had no defects, two had defects but were tested without being welded, and two were welded in the compression member. Of the remainder 11 broke in the weld and three outside the weld. Thus of all the parts welded in the tension member that were tested in both series 14 failed in the weld while 16 failed at other points.

It is reasonable to assume that the welding of these castings was done with fully as much if not more care than would be given to similar work under actual repair conditions. The committee in its report emphasizes the fact that the skill of the operator is the most important factor influencing the strength of the weld. Unfortunately this cannot be controlled by any rules adopted by the association to govern welding practice. Unquestionably the application of autogenous welding to the reclamation of side frames and

bolsters will effect great economies and will help to keep equipment in service particularly under the present conditions of the material market. Careful supervision of the work will be necessary however to prevent failures from occurring. Care must be taken until the best method is finally determined. If wrecks should occur due to improper workmanship on welded parts the result might be the prohibition of this practice, desirable as its adoption may seem in the present circumstances.

M. C. B. Association and Federal Control

THE MASTER CAR BUILDERS' ASSOCIATION has in the past performed an exceedingly important function in the handling of inspection, repair and interchange problems of freight cars. Its field of usefulness is by no means reduced under government control. This association through its Arbitration committee has studied these problems for years and experience gained in this work makes it well qualified to continue it. Since the railroads have been under the control of the government the standard M.C.B. rules have been revised in different parts of the country to an extent which under the conditions of private ownership would not be tolerated. The Division of Transportation in issuing Circular No. 7 has made a radical modification of the rules. The order was put into effect without giving the M. C. B. Association an opportunity to modify its rules to agree with the circular. This naturally creates confusion among the inspectors and repair men who at best find it difficult to interpret the present rules. For the sake of uniformity and in order that the existing rules may be kept up-to-date and in accordance with the latest developments of the Railroad Administration all such matters should either be sent out through the M. C. B. Association as a government order or the association should be permitted to issue changes to the rules simultaneously in order that any conflicting rules may be revised. In view of its past experience this association can be made a valuable adjunct to the Railroad Administration.

Revision of Loading Rules

THE MASTER CAR BUILDERS' loading rules are an important factor in securing the maximum utilization of cars. If cars are not properly loaded the full capacity cannot be utilized, and the car is apt to be delayed in transit owing to the necessity of transferring or readjusting the lading. Evidently it was a realization of this fact that led to the complete endorsement of the loading rules by the Railroad Administration. While the intent of the clause in Circular No. 7 issued by Mr. Gray in which he states that discipline will be imposed for violation of the Master Car Builders' rules is not clear, it is safe to say that the intention is to compel shippers to load cars in accordance with these rules. With the authority of the Railroad Administration added to the weight which the Master Car Builders' rules carry, the committee should be able to get splendid results.

The present conditions require that cars be loaded, not

necessarily in the manner that is cheapest for the shipper, but in a way that will utilize the maximum capacity of the car and enable it to be sent to its destination without delay. The loading rules should be revised at once to secure this result. The committee has met the situation in a manner that leaves little to be desired. The adoption of the changes in the rules for loading lumber now under consideration should eliminate one of the major causes for transferring loads. Some other changes in the present rules with the same end in view should bring good results by insuring better utilization of cars and a reduction of the expense of transfer and loss and damage to lading.

Displaying Foresight After the Fact

WILLIAM SCHLAFGE, of the Erie, president of the Railway Master Mechanics' Association, ranks high among the mechanical officers of the railways of the country. His address at the meeting in Chicago was in part an inspiring appeal to the association's members to accept loyally and in good faith the new regime in railway affairs, and to do all they can to make government operation of railways a success.

There are features of Mr. Schlafge's address, however, which seem eloquently to manifest the common faculty of hindsight, rather than that very unusual faculty, foresight. By implication he criticises the Master Mechanics' Association because it had not during its 50 years of existence in time of peace "made constructive efforts to assist the nation to react reasonably to the conditions of war with its tremendous added burden upon the transportation facilities," or "so shape its course even to render assistance to the end, palpably in sight for many years, of a thorough co-ordination of the transportation business of the country in the interests of its people."

We submit that this is all very far fetched. If any member of the Master Mechanics' Association had suggested in one of its conventions prior to three or four years ago that this organization should take steps to assist the nation "to react reasonably to the conditions of war" he would have been laughed out of the meeting hall. Perhaps that is the reason why Mr. Schlafge never made the suggestion; for we are quite sure that he never did make it.

To criticise a civilian technical organization on the ground that it did not take steps to assist the nation to "react reasonably to the conditions of war," when it is notorious that the government of the nation itself did nothing of the kind until we were almost at war, borders on the absurd. Similar comment may be made on the reference to "the end, palpably in sight for many years, of the thorough co-ordination of the transportation business of the country." To whom was this end so "palpably in sight?" Mr. Schlafge conceded that the end was not palpable to "railroad interests," for he added: "It is only fair to say, however, that the limitations upon its (the Master Mechanics' Association's) proper expansion and development were largely beyond its control because of the general failure of railroad interests to recognize the fundamental principle that the transportation business of a nation is a natural state monopoly, and that, sooner or later, a progressive state will either dominate the control of its transportation lines or own them." The end in question certainly was not "palpably in sight" to government officials, for they were engaged in defeating by proceedings under the anti-trust law, every effort the now despised "railroad interests" themselves made to bring about co-ordination. It must be, then, that it was merely to Mr. Schlafge that this end was "palpably in sight." It is a great pity that there are so many people in the world who do not reveal what they have foreseen until after it is an accomplished fact.

Having disclosed that "to foreseeing men it has been clear

for many years that even peace conditions demanded the nationalization, either under private control or public ownership, of all the transportation agencies of the country," Mr. Schlafge proceeds to show that, "therefore, standardization of the instrumentalities of commerce was inevitable at the highest efficiency was to be attained." He goes on merely to defend standardization of locomotives but to condemn the Master Mechanics' Association because "this association practically failed to recognize the inevitable trend of events, so that when, as a necessary war measure, the national railway administration demanded a standard locomotive, the association had no standard to offer." The American Railway Association did have a standard freight car to offer, and it was not adopted. Why was there no standard locomotive available? Simply because nobody in the railway business—except, possibly, Mr. Schlafge—who kept very quiet about it—considered that, in the diverse circumstances in which locomotives must be operated, standardization of locomotives was either feasible or expedient.

It is extremely desirable that railway officers of all ranks and in all branches of the service should accept the new regime of government operation of railways gracefully and put forth all of their ability and their energy to make it a success. Their self-respect and their patriotism will impel them to do so. But loyalty and patriotism do not demand, and their self-respect should forbid, that they shall stultify themselves, and cast discredit upon their former superior officers and the associations to which they have belonged by criticising failure to do things which those making the criticisms never suggested ought to be done, and which the government and the public opinion of the United States prevented from being done. The course of the Railway Master Mechanics' Association, and the management of the railways of the United States, were not nearly so benighted before the adoption of government control as Mr. Schlafge would now have us believe; and even if they were this would be a late day for him and other railway officers to break their silence on the subject.

Saving Fuel in Power Plants

THE DISCUSSION of the report on Fuel Economy and Smoke Prevention at the Master Mechanics' Association meeting drew attention to one source of fuel economy which has generally been neglected. This is the railroad power plant. It is true that the aggregate saving which may be made in railroad power plants is small when considered in relation to the possibilities in locomotive service, inasmuch as probably not more than eight per cent of the total amount of fuel used by the railroads is consumed in power plants. At present, however, no possible saving should be overlooked, and while the supervision of fuel consumption in locomotives is very generally well organized and working according to highly developed plans, practically no organized effort has ever been made toward economy in the power plant. It has lately been repeated several times that with the careful application of the information on fuel economy which is already generally known, there would be an ample supply of coal to meet all requirements. To attain this end, however, organized effort is necessary. A study of railroad power plant conditions should generally be made with a view to developing effective methods of applying this knowledge and checking the performance of power plants. The plan of power plant supervision referred to by W. J. Tolbert in his discussion of the report, has resulted in a material improvement in conditions relative to fuel economy on the Rock Island. An aggregate saving of fuel too large to be neglected will result from a general development of some such plan of supervising the power plants of all the railroads of the country.

Master Mechanics' and Master Car Builders' Convention in Session at Chicago on Wednesday Morning, June 19

Master Car Builders' Association Proceedings

The Maintenance of Freight Cars and the Rules of Interchange Receive Special Attention

THE FIRST session of the joint meeting of the Master Car Builders' Association and the American Railway Master Mechanics' Association was held in the Florentine room of the Congress hotel, Chicago, June 10, 1918. C. E. Chambers, president of the Master Car Builders' Association, presided. The meeting was called to order at 10:20 a. m.

While the papers of the two associations were presented without any attempt at segregation—the meeting being in

fact a joint session—the following report of the proceedings of this meeting will be classified for convenience under the two heads.

Remarks by President Chambers

Gentlemen: We welcome you this morning at another one of our annual meetings. It is not necessary to state that since a year ago we have been making history and it is also unnecessary to state that each day we do not know what is

G. W. Wildin
Vice-President, M. C. B. Association

J. S. Lentz
Treasurer, M. C. B. Association

V. R. Hawthorne, Secretary,
M. C. B. and M. M. Associations

going to happen, and what will be the condition of affairs the next day. The uncertainty of the times has made it necessary to follow out the principle established one year ago in holding as brief a meeting as we could to take care of the necessary business. Perplexing problems are coming before us from time to time in the form of instructions or orders. As an executive committee we get requests from the United States government or the Railroad Administration to consider certain changes; at other times we get a notice that such and such things are ordered. In that case it is only necessary to notify you that these orders have been put into effect, and this is going to continue. Many times orders will be sent out that individually we may not concur in, but we are all working for the one great cause—to win the war.

What we have gained in the way of progress in 50 years or more that these conventions have been held is by reason of the general getting together of a number of opinions, and boiling them down to find out which seems to be the best. That, I think, in all cases is the wise plan. However, regardless of what order may come, it is up to each of us individually or collectively to put into effect to the best of our ability anything that our government may want.

Letter from J. J. Tatum

The secretary read the following letter from J. J. Tatum, manager of the car repair section, U. S. Railroad Administration:

"It would have given me a great deal of pleasure to have been able to meet all at the annual meeting this year, but I feel at this writing it will be almost impossible. There are pressing matters here at Washington that require my attention, and I feel I will be compelled to sacrifice the pleasure it would afford me to attend this meeting.

"There is a stupendous task before all of us; our obligations to the nation at this time are greater than ever before in our history. For this reason I feel I should remain at Washington as close to the 'firing line' as possible, to give all possible support to the Railroad Administration that is within my power. Today you and I are helping by our efforts in keeping up the railroads of the United States to fight the greatest of all wars for Democracy. You and I have the task to see that every possible piece of rolling stock is made available to carry foodstuffs and munitions to our soldiers

'over there.' Not only for those noble men who have left our country, but for our allies, and the noble women of this and our allied countries who are doing Red Cross duties for our soldiers. There is nothing we can do for them that will equal what they are doing for us; they are giving their all, the best they have, their life. We should be equally willing to do as much for them over here.

"In closing I would ask that we all pledge ourselves to our President of the United States, his director general of railroads and assistants, to give all we have in ability and force at our command, in order that they may be able, through the railroads, with our energy and effort to meet every requirement of their responsibility and by the united efforts of our men we will have placed our flag in the foremost ranks for democracy and liberty of the whole world."

I. S. Downing (C. C. C. & St. L.): I move that this association pledge itself to the assistance of Mr. Tatum's entire section of the government's work. The motion was carried.

Report of the Secretary

The report of the secretary, V. R. Hawthorne, showed the membership in the Master Car Builders' Association on June 8, 1918, to consist of 446 active members, 593 representative members, 14 associate members and 19 life members; a total membership of 1,072. The receipts during the two years were \$67,470.37 and the disbursements \$65,300.50, leaving a balance for the period of \$2,169.87.

(The report was received and a committee consisting of W. R. McMunn (N. Y. C.), J. H. Milton (C. R. I. & P.) and J. A. Carney (C. B. & Q.) was elected to audit the records.)

The President: Among the members that have died during the past year none is more noticeable than that of Joseph W. Taylor. He had been with the association so long that it seemed that he would always be there. I know that all the members miss him. We were very fortunate, however, in being able to secure, at least temporarily, Mr. Hawthorne, who from his number of years of railroad life not only was fitted for the office, but, having served practically one year as a member of the special committee inspecting the railroads, was exceptionally well fitted for this task, and it seemed to be most opportune that he should be at our disposal just at this particular time.

Revision of the Rules of Interchange

WITH THE APPROVAL of the Executive Committee, this committee has continued the rendering of interpretations of such questions as have been asked by the members regarding the rules. The committee has decided that until the status of the Master Car Builders' Association in relation to the Master Car Builders' Rules of Interchange shall be established no change in these rules will be recommended except in the rules governing prices of material. During the year, arbitration cases No. 1061 to

J. J. Hennessey
Chairman

1147 have been decided and copies have been sent to the members in accordance with our usual practice.

Changes in Rules Governing Prices of Material

RULE 98.

The committee recommended that the table of prices for wheels and axles shown on page 128 be revised as follows:

| | New | Second-hand | Average credit price |
|--|-------------------------------|-------------|----------------------|
| One 36-in. cast iron wheel..... | Eliminate this item. | | |
| One 33-in. cast iron wheel..... | { From... \$9.00 | | \$4.75 |
| | { To... 15.00 | | 7.75 |
| One 33-in. cast steel wheel..... | { From... 19.50 | | 9.75 |
| | { To... 37.00 | | 16.00 |
| One 33-in. wrought or rolled steel wheel.. | { From... 19.50 | | \$4.50 |
| | { To... 50.00 | | 8.00 |
| One M. C. B. Standard axle, 140,000 lb.. | { From... 25.50 | \$15.25 | 4.50 |
| | { To... 46.50 | 27.00 | 9.30 |
| One M. C. B. Standard axle, 100,000 lb.. | { From... 19.50 | 11.75 | 3.70 |
| | { To... 40.00 | 24.00 | 8.00 |
| One M. C. B. Standard axle, 80,000 lb.. | { From... 16.50 | 16.00 | 3.00 |
| | { To... 33.00 | 19.80 | 6.70 |
| One M. C. B. Standard axle, 60,000 lb.. | { From... 13.00 | 7.75 | 2.00 |
| | { To... 26.00 | 15.00 | 5.30 |
| One M. C. B. Standard axle, 40,000 lb..... | Price to remain as at present | | |

RULE 120.

The committee recommended that the average scrap credit

tee, of which I am chairman, and it is covered in a report we are making. We failed to concur in any suggestion of that kind, for reasons which are stated in the report. Briefly stated, the reasons are that \$1.10 would not go anywhere near covering the expense of repairing a triple valve, and we feel that the price fixed should be an average price, for the repairs and cleaning, because the present scale of prices would result in neglecting the question of repairs and confining attention almost exclusively to the more profitable job of cleaning.

Mr. Goodnow: Answering Mr. Burton, the Arbitration Committee was not aware that this matter had been referred to his committee. The average price of \$1.10 is obtained by the billing records of at least all of the roads represented on the Arbitration Committee, and I believe of one or two others. The expense of taking the triple off, taking it to the air brake room and giving it the necessary attention, including the testing, are included in this item. These records show that on several thousand cars on each road it runs from \$.90 to \$1.20. Therefore, the average of all was taken at \$1.10, which would, of course, carry the 35 per cent with it. You understand that there are certain exceptions, such as converting an *H* triple to a *K* triple, and one other that is mentioned.

Mr. Burton: I do not know how the price could possibly cover anything except the minor repairs that ordinarily go with the valve in its cleaning and oiling, especially when it includes the material and substitution of worn sockets and worn packing rings, and things of that kind. Such a price as this leads to the practice of putting old material in the valves in making ordinary repairs.

Mr. Goodnow: It probably would not if you take the individual triple, but if you take the thousands that go to your triple valve room the general average will cover it.

Mr. Burton: The principal point is that the rule will result in neglecting the triple valve entirely.

Mr. Goodnow: If he wants to take that chance on his road, that is true. The association is trying to check that matter now by having a report filed by all roads as to the tests they make and the style of rack they use. It would seem to me that if the Air Brake Committee has a report to make, that this report must be held up until we have the benefit of their report. I move that that one matter be held in abeyance until Mr. Burton's committee makes its report.

Mr. Osman: May we not have an expression from the committee as to this truck question?

Mr. Goodnow: The committee by its last action on Rule 113 for the settlement of cars, attempted to reimburse the car owner for the car since the war prices went in in 1914, by departing from the old arbitrary rule of prices as established in the M. C. B. rules and accepting the book values of cars. I appreciate that is not going to take care of the point that Mr. Osman raised, because the old arbitrary value will stand on the trucks if they are held. I think at the present that this is one of the things to be given consideration before the rules are issued in October.

The arbitrary values do not represent the value of the truck, either as salvage or scrap at the present time. But that is tied up with the general value of the car. Prior to 1914 we settled on the arbitrary value, but the arbitrary value of cars prior to 1914 does not represent the reproducing cost of that car today by any means. It did fairly compensate the company at that time for what cars were costing then. Now, if you are going to pick out the item of trucks, I can't see how we will handle it. Two years ago we attempted to establish fair valuations of cars, but had to give it up. When it comes to the trucks on cars prior to 1914, I am not prepared to say this morning just how that could be handled.

The President: There is no report coming before us that will have any bearing on that.

Mr. Goodnow: The committee has practically no report at

all. The prices that were changed were changed on account of being brought up by Mr. Tatum. On account of the suggestion coming from that source the Arbitration Committee recognized it and made those changes. Otherwise the committee has not taken any action, but did think that it could do so before the rules are issued in October.

J. J. Hennessey (C. M. & St. P.): There was a feeling a year ago that several questions would possibly come up before the rules would be changed. You remember the Arbitration Committee was authorized by the association to make such changes as they found absolutely necessary, and that was the feeling when the committee made this report.

A. E. Smith (Union Tank Line): I would like to ask what the association is going to do with the rule becoming effective on October 14 in regard to tank cars.

Mr. Goodnow: That is another rule that will simply have to be held in abeyance and action taken in the issuance of the rule, or in a circular prior to that time, taking care of that feature, if it is a necessity.

The President: I think now is the time for some action to be taken.

I. S. Downing (C. C. C. & St. L.): On the Big 4 at all inspection points we have put this Circular No. 7 in effect. If there are other rules that must be changed I think we should ask Mr. Gray if it would not be better to modify the rules through the Arbitration Committee. If we don't do it we are going to get badly mixed up.

F. C. Schultz (Chief Joint Inspector, Chicago): It occurs to me it will be necessary to take action on this now. Circular No. 7 will probably go into effect July 1. Mr. Goodnow is right; several changes are made. It occurs to me that within these two days we could work out something that would be in harmony with Circular No. 7 and adopt it as of July 1. Our rule provides that we can refuse cars under certain conditions. This rule compels the acceptance of all cars. That is one item alone that requires attention.

Mr. Goodnow: I don't believe that the Arbitration Committee would be able to act on the floor on embodying Circular No. 7 in the M. C. B. rules. That order is perfectly plain, and if it is to be put in, I believe that the Arbitration Committee can weave it into the rules, if the balance of the rules are to remain undisturbed and in line with authority. At the present time I don't feel that there is any action that can be taken until we have some expression of that kind. The interchange in the different terminals at the present time is being conducted on entirely different plans. Each big district or territory is independently putting in rules and systems carrying out its own ideas and governed by the local conditions.

The President: It goes without saying that Order No. 7 is effective. It doesn't say July 1 or December 1, but it says June 8, and so we have got to put that into effect. I think it would require some little thought as to just what M. C. B. rules might be affected by this order. I agree with Mr. Downing that a proper channel would seem to me to place these suggestions before the Arbitration or Executive committees for consideration.

Mr. Downing: I have maintained that there is no better way to interchange cars than under the M. C. B. rules. You might take the same position with regard to this general order that Mr. Goodnow does about the A. R. A. rules. It is not a physical operating rule. The repairing of cars at the nearest repair point is not a part of the M. C. B. rules. Determining the cost of the transfer as the transfer is made is not a part of the M. C. B. rules.

The President: We all may expect what we might consider a good many irregularities during transformation. All these things will be taken care of in a proper way when we have had time. As president of this association I naturally would raise the question as to just what Mr. McAdoo and Mr. Gray expect us to do or how they expect us to do it. I think we

should have suggestions for consideration, and I think this matter will shape itself in due time.

C. F. Giles (L. & N.): May I ask if there has been any response made to the communication in regard to the coordination of these associations with the American Railway Association, which was considered at our meeting in May?

The President: Mr. Schlafge's letter and my letter were presented to Mr. Thompson, and they were brought before the Executive Committee of the American Railway Association possibly two weeks ago. Mr. Thompson called a meeting in New York on June 28 to go over this matter further.

Mr. Goodnow: It occurred to me that the recommendations of the Master Car Builders' Association would take care of the situation as suggested by Mr. Downing; that is, this association be recognized as a section of any association that may be formed. It seems to me that this is not the proper time to undertake to embody Order No. 7 in the M. C. B. rules. That order has been issued over the signature of Mr. Gray, approved by Mr. McAdoo, and all we can do now is to put it into effect, trusting that later on the Master Car Builders' Association, as a section of the proposed organization will be given an opportunity to pass upon questions of that kind before the order is put into effect. I believe if that organization is effected that it will take care of this situation.

F. W. Brazier (N. Y. C.): That was just the point I was going to raise. I think the members of this association, of fifty years' standing, know better how this should be handled than people that have had no experience. I was in hopes that the resolution which the joint bodies made here to the American Railway Association would have gotten further along and would have gotten before such men as Mr. McAdoo, and that they could see that here is a body of men that really has made the railroads easy running by its rules of interchange.

There are very few officers who know the condition of the equipment that is running through the country today. We have over 2,000 box cars standing on our line, and if I were asked tomorrow to put them in the grain service only about 10 per cent of them would be fit. Everybody seems to think the equipment is all right, but there is going to be an awakening by and by.

I am willing to go on record, and practically every car man ought to be, about the condition of the equipment of the country today. The gondola cars, which come north loaded with lumber, are substituted for hauling coal and other commodities for which they are not suited.

Mr. Goodnow: It seems to me that the railroads have not yet fully understood that there is only one railroad in the United States. There are now no independent roads. I believe that Circular No. 7 is only the start of the changes which will have to be made under the new order of affairs. Doing what we have called interchange in the past, is eventually going to resolve itself into the same thing as handling cars over your own line from one division to another. Undoubtedly when that is brought about, the proper regulation of the repairs and maintenance of equipment will come along with it. I have in mind one large terminal at the present time that is departing entirely from the established practice in the past. The receiving line's inspection is being cut out and the delivering line is inspecting the cars for protection under the rules where defect cards are due. It handles it with one force of inspectors. It needs no joint force to handle it, and if it works out it will be the simplest plan for handling cars under the present demand.

The M. C. B. rules are going to be changed. It is not a question of inspecting for certain defects on the car, belonging to a private car line, or an individually owned car, but the prime essential in connection with railroad cars is the question of their maintenance, and that is the only thing vitally important at the present time. There is no inter-

change inspection now, and should not be at a future question of maintaining the cars, and it will resolve itself into a repair proposition.

Samuel Lang (P. & E. L.): The fact that this order is issued shows that our superiors in Washington think this action is necessary. I do not think we should do anything today to criticize this action.

James Coleman (G. T.): I think the rules will be changed materially from time to time, and as orders are issued from Washington, the Arbitration Committee should apply them to the rules as they now stand. I understand that an order issued today abolishes the per diem. If that is true, all of the equipment in this country is practically pooled. The next question is in connection with maintenance of equipment. We should be prepared to consider certain recommendations to see how we shall maintain our equipment because it is all pooled.

The President: There is a question before us by Mr. Goodnow in connection with the report of the Arbitration Committee on withholding a portion of the report referring to the cleaning of triple valves.

Mr. Laughlin: There are certain changes in the way of making effective dates in the rules which will be necessary to facilitate the movement of equipment, and I understand from this discussion that these changes will be made by the Arbitration Committee before the rules are put into effect. I have in mind Paragraph F of Rule 3, which relates to the refusal of cars that have not been equipped with brine retaining devices. All the cars will not be equipped by the date when the rules are to be made effective, and we are asking for an extension of that time. I would like to know if that will be considered.

Mr. Goodnow: That naturally will be considered. As I have stated before, it was the intention to re-issue the rules the same as usual, provided we got advice that that should be done. At the same time, as to such questions as Mr. Smith and Mr. Laughlin have brought up, such matters should be presented in writing, so that they will not be overlooked. I think these rules are all dated October 1, and none has to be acted on prior to that time.

(Mr. Goodnow's motion was carried.)

W. J. Tollerton (C. R. I. & P.): (reading a letter) It has occurred to me that, in view of the desirability of avoiding, in every possible way, delays to freight cars incident to the making of repairs when standard material is not available, that the M. C. B. Association should issue a circular authorizing the railroads to make wrong repairs, as they may see fit, to foreign cars in their possession whenever such wrong repairs can be made in a manner permitting the car to be retained satisfactorily and safely in the service for which it is intended.

At the present time there are undoubtedly a great many instances where cars are being held out of service a number of days awaiting the receipt of standard material ordered from the owner, when in reality wrong repairs could be made and the car released with but a trivial delay.

If the M. C. B. Association sees fit to issue instructions of this character, it is my further recommendation that during such period as the association may see fit to permit of such practices, the party making the wrong repairs should be absolved from any claim on the part of the car owner for the expense of standardizing repairs upon the arrival of the car on its home rails.

(Continuing, he said.)

The western lines are all in the same position as regards foreign cars coming to their roads. As Mr. Goodnow has said, the receiving line has nothing to say as to what class of equipment shall be taken in interchange. In the past few months the foreign cars on our railroads have increased something over 200 per cent. Within the last two weeks we received an order from the car distributing section at Wash-

ington ordering 1,000 box cars to our lines for grain movement, and the prompt handling and loading of cars is important. It is a problem with us to handle that vast number of cars.

Take the case of a car coming from the New Haven and going to Herrington, Kan., for a load of grain. If we could put it in shape to load and send to the Atlantic seaboard, it would be folly for us to be held down by some restriction compelling us to go to the New Haven for certain repair parts, or be penalized for making wrong repairs. What has happened to us has happened to every railroad in the west. Therefore, I think it is very important that some modification be made of the wrong repair rule as it now exists.

Mr. Brazier: I wish to make a motion, that the Executive Committee send out a notice to the members to the following effect: Empty cars of 60,000-lb. capacity or over, when placed on shop or repair tracks for repairs must not be returned to commercial service until they have been placed in condition to meet full M. C. B. inspection without exceptions, including United States Safety appliances.

We are practically one railroad since the pooling question has been settled. If any car can be made fit for grain service, make it fit for grain service. If it is not fit for heavy freight, make such repairs to it as are necessary and use it for coarse freight.

There are many open top cars that are perfectly safe to carry lumber, but they cannot be used for ore and coal because the mechanism of the hopper doors and floor conditions are such they will not even carry coal, much less ore, and someone must repair these cars. For years we have done as little repairing as we could on foreign cars and keep them moving. We had about five per cent bad order cars ourselves and on looking over the foreign cars we had, we found a less percentage of bad order cars than with our own. We were not taking any more foreign cars for repair than we had to; we preferred to do the work on our own cars.

As far as the safety appliances are concerned, you can put on anything you like, and as long as they meet the requirement of the federal law, we will not say a word, as long as the repairs fill the bill. We lack 8,000 cars of having our gross number of cars completed, and we are going to treat your cars that way, gentlemen, whether you like it or not.

Mr. Coleman: I wish Mr. Brazier would embody in his recommendation that cars shall be inspected for certain classes of commodity or loading. In case there are 2,000 bad order cars on the New York Central they may go to the Rock Island, and that road will have 2,000 cars to repair before it can use them for loading grain. We have 75 per cent of our foreign cars, out of nine per cent held for repairs, in the shop today. These we got on our lines because our transportation department did not say what they wanted to load in the cars. You must get the co-operation of the transportation department and traffic department in order to make a proper inspection of these cars for loading, and each railway asking for cars should say what they want to load in them.

A distinction should be made in inspection, and that is why I suggest certain recommendations be made to Washington as to how we should keep the cars in repair and maintain them. The time is coming when there will be no billing for repairs to cars as there will be only one railway.

Mr. Goodnow: The remarks by Mr. Brazier and those by Mr. Coleman are foreign to what Mr. Tollerton started to bring before us. The M. C. B. rules at the present time, so far as wrong repairs are concerned, are very elastic and the change which was made some two or three months ago positively permitted repairs of any kind to foreign cars so long as they were owner's defects and the only redress the car owner had was to charge for the labor to correct them. That only excepts the wrecked cars—if you wreck a car the M.

C. B. rules require that you rebuild it. I feel that the Arbitration Committee, if it is the expression of the meeting, would be willing to take under further consideration the portions of the report dealing with wrecked cars and the permitting of billing for labor only in correcting wrong repairs. I think it would be well to have Mr. Tollerton make that as a motion and then the Arbitration Committee will simply change its rules.

J. H. Milton (C. R. I. & P.): In our shops and on our railroad the work on the cars of other roads has increased about 75 per cent. We are making every effort possible, to turn out the foreign cars so that they will haul grain or any commodity you may wish to load in them. In unloading these cars on a railroad, if it has not the facilities for repairing the car at that point it will certainly have to provide them. In that case they have to undergo a back haul on it, and it will be very expensive to haul the car from one place to another. If you are not going to put all the repairing of the bad order car on to the other fellow we have got to get into the game somewhere and make facilities to take care of the cars.

As far as the repairs of their own cars is concerned I think the roads can take care of that, but we must understand that each road will have authority to make such repairs as it can with the best means at hand. We have been doing that on our railroad, and using such material as we can find, for such parts as grab irons, center posts, etc. It is much cheaper, even if we have to pay for it, to put these parts on with wrong material than to hold the cars for 60 days.

C. N. Swanson (A. T. & S. F.): We are facing one of the biggest grain crops which we have ever had and with scarcely a car with which to commence moving that crop. Orders have been issued that we are to receive about 15,000 box cars for grain loading. They have already begun to reach our lines and an inspection of 39 cars showed that only 9 of them were fit for grain loading. What will be the result? The side tracks of the western roads will be congested with bad order cars and no facilities for taking care of them, and no cars for loading, and we are faced with one of the most serious problems we ever had in the west.

W. J. Tollerton: I move that the Arbitration Committee be instructed to withdraw the rule permitting the billing for correction of improper repairs.

C. W. Van Buren (C. P.): In any changes you might make in the rules I would like to call your attention to the fact that there are Canadian railroads which are not under federal control, and I ask you when you are making changes in these rules, to insert a clause which will cover the situation of the Canadian railroads.

Mr. Coleman: The railways in Canada will no doubt consider changing their policy to meet the changed conditions over here. They will have to do that in order to interchange their cars going to and coming from the United States. What that change will be I do not know. We are ready to do that and we are considering it now.

The President: I do not believe the motion as put is going to hurt any individual railroad as much as they think it will. I think in the past many ill-advised things have been done to make things standard.

Mr. Laughlin: I understand that this is restricted to cars under federal control. I am saying this, because I think it should be said, and I am saying it in favor of refrigerator cars, because under certain circumstances if certain materials not having the same insulating value were used, it would affect the efficiency of the cars.

The President: The rule contemplates the safety of the car and the efficiency of the car, so I cannot see that it would damage your cars at all.

M. F. Covert (Swift & Company): In connection with Mr. Tollerton's motion I think some exception should be

made to the effect that roads not under government control be excepted, because there have been certain rulings by Mr. Prouty of the Division of Accounts in connection with a certain order that has been issued and that order has reference to returning bills for correction. Mr. Prouty has ruled in the case of private lines that that order only referred to roads under federal control, and therefore Mr. Tollerton's motion would conflict with private ownership.

Action Taken

The report of the committee was approved.

T. H. Goodnow (C. & N. W.). The Arbitration Committee, at a special meeting held since presenting its report,

decided to ask the approval of the following resolution to be immediately issued as a circular:

"M. C. B. standard 60,000-lb. capacity axles with third seat less than the condemning limit for such axle but above the condemning limit for a non M. C. B. standard axle may be used until October 1, 1920 to replace M. C. B. standard 60,000-lb. capacity axles with wheels less than the condemning limit for such axle, but above the condemning limit for non M. C. B. standard axles."

This is simply recognizing a practice already in effect, but it will make it plain to some who feel it is not a matter of it should be at the present time.

On motion the recommendation was adopted.

Discussion on Freight Car Maintenance

THE CHAIRMAN: It is of great importance that the Master Car Builders' Association go on record as to the importance of the requirement that cars delivered for loading by other lines be in fit condition for the loading intended. Some of the western lines are going to be loaded up with cars sent to them for the loading of grain which they will not be able to use. The western lines are going to suffer unless they can get some relief from the lines sending the cars and the intervening lines before the cars get into the loading territory.

C. E. Fuller (U. P.): It ought to be the consensus of opinion of the association as well as the railroads in general that an order for cars should carry with it an understanding that the cars be at least in serviceable condition for the commodity which they are to haul. Cars have been sent to the western lines with bad order cards on them. The condition of the cars plainly indicate that they have been on the repair track for months.

The crop of wheat in Kansas and Colorado, if nothing interferes with it, is going to be the largest crop we have ever had, and it is going to take a large number of cars to handle that grain quickly. In general, repair points on western lines are far apart and if the eastern lines send bad order cars it is going to swamp all of us. The desire to move cars quickly is an incentive to the transportation departments to move them irrespective of their condition and have them repaired at the loading point. There is a limit to that, and if the mechanical departments do not make a strenuous effort to have the roads send only cars in suitable condition for loading we will not be able to handle the business.

No one knows more about what should be done to make cars acceptable than the members of this association, and we should not sit still and approve, or not disapprove, of a practice that is ultimately going to get us into trouble. We are going to be blamed for this condition and we had better make ourselves felt before we are in trouble, and not afterward.

Many cars are all right for rough loading, and unfortunately we in the west have a lot that are in that condition, and if we get still more there is a limit to our capacity to handle these cars.

F. C. Schultz (C. J. L., Chicago): What must be done is to control the situation in some manner in the way of repairs. The bad order situation today as far as this city is concerned is worse than it ever was since I can remember. It is going to get much worse on account of the pooling of equipment. We must get ourselves in a frame of mind by which we can't tell a Rock Island car from a Union Pacific car. If we were able absolutely to control the movement of bad order cars into a territory where they have the loading, we could repair them. In a city like this or others as large

we should co-ordinate our facilities. There are occasions here where private car shops are out of work when our railroad shops are full of bad order cars and if some plan could be worked out by which we could put the cars where we could repair them and assemble the material we could do something.

T. H. Goodnow (C. & N. W.): The situation just referred to is the least of our troubles. Under the congested conditions of handling traffic we have got to repair the cars outside of the large cities, and that is particularly true of the lines in the west. The sixth clause of circular No. 7 of the Division of Transportation says, "empty cars offered on interchange, if in safe and serviceable condition, must be accepted." Under the Car Service Commission's rulings, M. C. B. rules so far as the acceptance of cars is concerned have practically been abrogated. Empty cars must be accepted regardless of their condition. They have said to you in effect if they were not fit for grain, use them for brick; if they were not fit for brick, use them for something else. That is the condition that has to be reconciled. Whether this clause that I have just read is in line with the Car Service Commission's idea I do not know. If circular No. 7 is to prevail, it will help the mechanical departments out of their trouble somewhat.

The grain car repairing situation is not the whole problem. Cars are repaired at points where there are no shop facilities. For handling home cars the material is framed and shipped out to these points in car-load lots. Today that condition is entirely changed. You can't frame material in advance. At large repair tracks with no facilities you have to handle the individual foreign car as it comes; either frame the material by hand or wait to send to shop points and get it framed. The output of repaired cars is reduced enormously on account of that one condition.

There is another condition. All of us have certain cars that we were re-enforcing. On the Chicago & North Western we are putting on cast steel draft arms and changing the draft gear on some 12,000 cars. We have material piled up that we have no use for because we do not have those cars on our line. The foreign roads cannot carry a stock of that material and repair those cars as they get them because that would tie up an untold amount of money. Those cars should not be continued in service in their present condition. They have short draft timbers and will not stand modern service. If we are not going to get our cars back we are not going to be able to improve the equipment of the country as it should be improved and as most roads are and have been arranging for during the past five or six years.

Cars that have been used in the east in loading steel and steel products would continue in that service without repairs, but the minute those cars go to the northwest for grain, if there is a post shoved away or a splinter out of the floor so

there is a hole in it, they must be repaired. No one road has the facilities to repair a lot of cars unloaded on it within a few weeks' time and get them distributed to the elevators. It is very necessary that the roads as a whole in all sections of the country help in putting cars in condition for grain. If circular No. 7, clause 6, is to apply, then we probably will be in a position somewhat to enforce that through the refusal of unserviceable cars when offered in interchange.

F. W. Brazier (New York Central): If you went out in your yards and inspected foreign cars as closely as you do your own, instead of having five per cent or 6 per cent bad order cars you would have 25 per cent, and the sooner that is generally known the better. We are up against a serious problem on the rate we are paying our men. It is impossible to hold men at the rates the railroads pay when the men in ammunition plants and common street laborers are getting better rates. It is impossible to get any long yellow pine for sills. We are splicing everything and anything. I want to call attention to the repairs of foreign cars. We are all government employees now, trying to help the government out. We have got to make our shops repair all classes of cars. We have started to do so on the New York Central. Right or wrong, we are going to put on anything we can to get the cars in safe and serviceable condition.

J. J. Hennessey (C. M. & St. P.): Every road should make an effort to put its own cars in better condition than they are now. I realize that we are only divisions of the American railroad, but every road can repair its own cars in better shape and for less money than can a foreign road. It has the material on hand, framed and ready to put on. If we would all make an effort to put our cars in first class condition before they leave the home road we would not have such a congestion of cars as we are having today.

I want to endorse the proposal that no cars should be accepted unless they are serviceable for the commodity they are ordered for.

I. S. Downing (C. C. C. & St. L.): Our men are being taken by the war. We can't replace them. It is going to be impossible to repair any more cars than we have been repairing. I do not believe in hauling whole trainloads of pine lumber to the north to repair wood underframe cars. Even if the Government had to build shops in the South for the purpose of putting wooden underframes under the cars, it would be a better investment than to haul the lumber north, then haul the cars north and put the wooden underframes under them and then haul them all back south for loading. Those light capacity cars should be kept in the section where they have the material. In the north we handle heavier trains. On our division from Indianapolis to Cleveland we had 15 ends pull out in one day, draft timbers and all, on classes of cars that probably all roads are re-enforcing.

Another thing that has increased this bad order situation is the fact that most of the roads have cars standing on their side tracks that they were going to dismantle. In 1916 we tore down something like 1,700 cars. We would have torn down just that many more in 1917, but instead of doing that we put them in service. In 1916 and 1915 we could not get force enough to repair those cars and we can't get it now. I am not opposed to contract shops, but it has been my experience that every time we give a contract shop a lot of cars to repair, they take our men. Until our own facilities are worked to capacity we should not let cars to contract shops. If we would start right now in the transportation department to send every car that comes out of the shop fit for grain in the direction of the roads that have the big grain loading, we will get enough cars in the west. I don't believe that all of our equipment is in a rundown condition but we are not going to be able to get men and material enough to repair all of these cars which are in such bad condition. The impression seems to prevail that a car repairer can be made in about

three weeks. You cannot make a first class car repairer under three or four years. Women are not satisfactory in this class of work. We are trying them, but a woman cannot do that kind of work.

In view of the fact that we cannot get men to keep up even our ordinary running repairs, we ought not to have to spend money on repairs for cars to haul grain when standing in our freight houses there are cars in which they are loading steel and other commodities, that are suitable for the loading of grain, and the steel and other commodities could be loaded in the same cars we are trying to repair.

J. H. Milton (C. R. I. & P.): We are making every effort possible to take care of foreign equipment. In the last two months our repairs on foreign cars have increased about 75 per cent. We have on our railroad between fifteen and eighteen shops doing heavy repairs. We find in doing work on the cars of other roads, that if a car has a drawbar or draft-arm pulled out, a drawbar or draft arm is put into the car, without doing the other work that should be done at the same time; the car goes through ten or twelve transfers and the last road that receives it is the one which has to do the work on it. We are taking out side and end sills and putting in posts and braces, and doing everything that possibly can be done to get the cars in condition to haul the freight they are intended to haul.

J. C. Fritts (D. L. & W.): The conditions in the east are nearly as bad as they are in the west. We meet the same conditions in regard to the loading of coal that the western roads are going to meet in loading grain. What has brought about this condition? Certainly, to a large extent, the pooling of equipment. From a transportation standpoint that is easy to do, but from a maintenance standpoint it is a difficult proposition. Every car man in this country ought to put his shoulder to the wheel, and the Government can rightly expect some advice from this Association, which has been handling the car problem for the last 50 years. We have a lot of so-called foreign cars on our road that are in very bad shape, and as near as I can find out every other road is in the same condition. We have reduced our repair output at least 30 per cent on account of the so-called foreign car situation throughout the country. The re-enforcement of cars has been entirely stopped. We have any amount of trouble pulling ends out of cars with short draft sills. We are loading cars heavier than we have ever done before in the history of the road, and pulling longer trains, and consequently we must repair the cars to meet these new conditions.

It has never been possible, and never will be, to have all cars in such shape that they will handle commodities of all kinds. Therefore when a body of cars moves under Commission order, designation should be made as to what they are going to be loaded with so that an inspection can be made and the bad cars sorted out and diverted to other traffic. That will relieve a lot of empty hauling, and a congestion of cars in bad order in sections where a large movement of a certain kind of commodity is to be handled.

By centralizing material we can bring about much economy in operation. If we had one point in Chicago, one in New York, one in Buffalo and at other convenient places, where we could keep material for these various foreign cars, and where we could get it in case we had a foreign car on our tracks that needed repairs of an unusual character, we could make the proper repairs. The present practice will never bring about the results that are looked for.

Cars should be delivered direct to the original owning road when they are in bad order. When they cannot be returned directly arrangements should be made by the transportation department to load them to the original road, or a road that can deliver them direct. In that way we can get rid of a lot of cars we are now holding for material and on which we have to make wrong repairs.

I wish to call attention to the air brake situation.

We are cleaning 10 per cent more cars than before and still I find hundreds of cars on our line which are out of date. That indicates to me that some road is not doing what it ought to do. If this practice is continued we will be in serious shape on the mountains in handling trains next winter.

C. E. Chambers (C. R. R. of N. J.): The reason that the air brakes have not been cleaned as frequently as they should be is that we have not had the men to take care of the work. The reason you do not put on re-enforcements on short draft cars is that you do not have the men and material. Foreign bad order cars must be put in serviceable condition including the safety appliances. Many times you do not have to repair a car so as to make it serviceable for carrying grain, but you can make it serviceable for rough freight. When the car goes to a road which has to use the car for carrying grain that road must repair the car and make it suitable for that purpose.

Action Taken

The meeting adopted the following resolutions concerning the handling of cars with the suggestion that they be forwarded to the Railroad Administration at Washington for consideration.

The first resolution was: "It is the recommendation of this association that cars ordered from one part of the country to another or from one road to another on authority of the Car Service Commission for designated loading shall first be inspected by representative of the mechanical department of the road furnishing the cars as to their fitness for the loading intended and be side-carded showing that

they have been passed A. O. K. for the service to be performed when offered unless it has been specially arranged to send bad order cars."

The second resolution included several recommendations varying widely in character but all intended to facilitate traffic, as follows:

"First, that if possible cars of recent construction or construction that have not been reinforced be confined to main roads and kept off of trunk line railroads with heavy grades where heavy tonnage trains are handled.

"Second, that all loads must be loaded strictly in accordance with the M. C. B. loading rules within the clearance dimensions of the roads over which the cars route and no cars will be moved from the loading point unless so loaded.

"Third, that all unloaders will be held strictly accountable for any damage done to cars in unloading. This applies to damage to cars in unloading machines as well as damage such as tearing out cross tie braces of open cars etc., resulting from unloading bulk loading with machinery.

"Fourth, that in the repairs of cars the M. C. B. standards and rules governing the maintenance of air brakes must be strictly followed out when cars are on repair, classification or other tracks, so that the air and hand brakes of such cars will be in proper condition for handling on grades.

"Fifth, that the coupling speed of all cars and locomotives should not exceed a reasonable speed for safety.

"Sixth, that railroads are hereby required to carry in stock castings and other materials standard to their cars for which substitution cannot be made or which cannot be purchased in the open market."

Specifications and Tests for Materials

THE COMMITTEE report covers the different subjects which were reviewed during the past year and recommends that changes be made in the several specifications, as shown under the respective exhibits.

Exhibit A.—Specifications for Steel Axles

1. SECTION 5—Drop Tests.—Change to read as follows:

"(a) The test axle shall be so placed on supports 3 ft. apart that the tup will strike it midway between the ends. It shall stand without fracture

A Corner of a Chemical Laboratory

five blows from a tup of 2,240 lb. falling from a height as specified, and the permanent set produced by the first blow shall not exceed that specified for axles of corresponding dimensions, as shown in the following table. The axle shall be turned through 180 deg. after the first and third blows.

"(b) The permanent set is the difference between the distance from the straight-edge to the middle point of the axle measured before the first blow and the distance measured in the same manner after the blow. The straight-edge shall rest only on the collars or ends of the axle.

"(c) The temperature of the axle, when tested, shall be between 40 and 120 deg. F."

2. Table.—Omit the words "Weight of Tup, 2,240 lb. Supports 3 ft. Apart," and the words "Result of First Blow" shown in last column, and add to the table a column, under "Size of Axle, In." with the heading "Length Overall, In." and "84 3/4, 86 1/2, 88 1/2, 90 3/4," for axles having journals 4 1/4 by 8, 5 by 9, 5 1/2 by 10 and 6 by 11 in. respectively.

3. SEC. 10.—Permissible Variation.—Change the tolerance for excess length overall, from 5/32 in. to 1/8 in.

Exhibit B.—Specifications for Mild Steel Bars for Passenger and Freight Equipment Cars

1. SEC. 10.—Number of Tests.—(a) Change to read as follows:

"One tension and one bend test shall be made from each melt; except if material from one melt differs 1/8 in. or more in thickness or 1/16 in. or more in width, one tension and one bend test shall be made from both the thickest and the thinnest material rolled. When the material from separate melts cannot be identified, one sample shall be taken from each lot of 50,000 lb. or fraction thereof. When the bars in any lot are not all of the same diameter or thickness, samples shall be taken so as to represent each size differing in diameter or thickness by 1/8 in., and in all cases the thickest and the thinnest sections shall be represented."

2. SEC. 11.—Permissible Variations. Change to read as follows:

"All bars shall conform to the limits given in the following table."

(Add the following table, to supersede present Table No. 1 and Paragraph (b) Flat Bars—(1) and (2) M. C. B.

1917 Proceedings, page 827, and M. M. 1916 Proceedings, page 603.)

ROUNDS, SQUARES, HEXAGONS.

| Size. | Variations in Size. | |
|--|---------------------|-------------------|
| | Under. | Over. |
| Up to and including $\frac{1}{2}$ in. | .007 in. | .007 in. |
| Over $\frac{1}{2}$ in. and including 1 in. | .010 in. | .010 in. |
| Over 1 in. and including 2 in. | 1/64 in. | 1/32 in. |
| Over 2 in. and including 3 in. | 1/32 in. | 3/64 in. |
| Over 3 in. and including 5 in. | 1/32 in. | 3/32 in. |
| Over 5 in. and including 8 in. | 1/16 in. | $\frac{1}{8}$ in. |

FLATS.

| Width of Flats. | Variation in Thickness, Under and Over. | | Variation in Width, Under and Over. | |
|--------------------------------------|---|----------|-------------------------------------|----------------------------------|
| | Under. | Over. | Under. | Over. |
| Up to and including 1 in. | 1/64 in. | 1/32 in. | 3/16 in. and under. | 3/16 in. up to $\frac{1}{2}$ in. |
| Over 1 in. up to and including 2 in. | 1/32 in. | 3/64 in. | 3/16 in. up to $\frac{1}{2}$ in. | $\frac{1}{2}$ in. up to 1 in. |
| Over 2 in. up to and including 4 in. | 3/64 in. | 1/16 in. | 1 in. up to 2 in. | 2 in. up to 4 in. |
| Over 4 in. up to and including 6 in. | 1/16 in. | 3/32 in. | | |

Exhibit C.—Specifications for Rivet Steel and Rivets for Passenger and Freight Equipment Cars

1. SEC. 5.—**Number of Samples for Chemical Analysis.**—Omit the words "for Chemical Analysis," and also omit the words, forming the last sentence of Paragraph (a), "These samples shall be used for check analysis by the purchaser."

2. SEC. 19.—Change to read as follows:

"Dimensions of Head. Rivet heads shall conform to the dimensions shown on the purchaser's standard drawings, when so specified, otherwise the heads shall conform, within five per cent above or below, to the dimensions shown in Table No. 2."

Proportions of Standard Rivet Heads

(Add the following table and formula, to supersede the present Table No. 2 page 831, M. C. B. 1917 Proceedings; page 607, M. M. 1916 Proceedings.

TABLE II.

DIMENSIONS FOR RIVETS.

| diam. of Rivet. | Cone Head. | | | Button Head. | | Steeple Head. | | Countersunk Head. |
|-----------------|------------|--------|--------|--------------|-------|---------------|--------|-------------------|
| | A | B | C | B | C | B | C | |
| 1/4 | 15/64 | 7/16 | 7/32 | 7/16 | 3/16 | 1/2 | 1/4 | 1/8 |
| 5/16 | 19/64 | 35/64 | 9/32 | 35/64 | 15/64 | 5/8 | 5/16 | 5/32 |
| 3/8 | 23/64 | 21/32 | 21/64 | 21/32 | 9/32 | 3/4 | 3/8 | 3/16 |
| 7/16 | 27/64 | 49/64 | 25/64 | 49/64 | 21/64 | 7/8 | 7/16 | 7/32 |
| 1/2 | 15/32 | 7/8 | 7/16 | 7/8 | 3/8 | 1 | 1/2 | 1/4 |
| 9/16 | 17/32 | 63/64 | 1/2 | 63/64 | 27/64 | 1 1/8 | 9/16 | 9/32 |
| 5/8 | 19/32 | 13/32 | 35/64 | 13/32 | 15/32 | 1 1/4 | 5/8 | 5/16 |
| 11/16 | 41/64 | 113/64 | 39/64 | 113/64 | 33/64 | 1 3/8 | 11/16 | 11/32 |
| 3/4 | 45/64 | 5/16 | 21/32 | 5/16 | 9/16 | 1 1/2 | 3/4 | 3/8 |
| 13/16 | 49/64 | 127/64 | 23/32 | 127/64 | 39/64 | 1 5/8 | 13/16 | 13/32 |
| 7/8 | 53/64 | 117/32 | 49/64 | 117/32 | 21/32 | 1 3/4 | 7/8 | 7/16 |
| 15/16 | 7/8 | 141/64 | 53/64 | 141/64 | 45/64 | 1 7/8 | 15/16 | 15/32 |
| 1 | 15/16 | 13/4 | 7/8 | 13/4 | 3/4 | 2 | 1 | 1/2 |
| 1 1/16 | 1 | 155/64 | 15/16 | 155/64 | 51/64 | 2 1/8 | 1 1/16 | 17/32 |
| 1 1/8 | 1 1/16 | 131/32 | 63/64 | 131/32 | 27/32 | 2 1/4 | 1 1/8 | 9/16 |
| 1 3/16 | 1 1/8 | 25/64 | 13/64 | 25/64 | 57/64 | 2 3/8 | 1 3/16 | 19/32 |
| 1 1/4 | 1 11/64 | 23/16 | 13/32 | 23/16 | 15/16 | 2 1/2 | 1 1/4 | 5/8 |
| 1 3/8 | 19/32 | 21/32 | 113/64 | 21/32 | 11/32 | 2 3/4 | 1 3/8 | 11/16 |
| 1 1/2 | 113/32 | 25/8 | 15/16 | 25/8 | 11/8 | 3 | 1 1/2 | 3/4 |
| 1 3/4 | 141/64 | 31/16 | 117/32 | 31/16 | 15/16 | 3 1/2 | 1 3/4 | 7/8 |
| 2 | 17/8 | 31/2 | 13/4 | 31/2 | 1 1/2 | 4 | 2 | 1 |

Exhibit D.—Specifications for Heat-Treated Knuckle Pivot Pins for Passenger and Freight Equipment Cars

1. SEC. 3.—**Chemical Composition.**—Omit the lower limit for manganese, 0.40, and change to read: "Manganese, not over 0.60 per cent."

2. SEC. 6.—**Drop Tests.** Change to read as follows: "This test shall be made on a standard M. C. B. drop-test machine (see Plate 29-D), the pins resting on rounded supports held rigidly 10 in. center to center, shall be subjected to one blow by a 1,640-lb. tup dropping from a height of 3 ft., or a 2,240-lb. tup dropping from a height of 2 1/4 ft. and shall show a deflection of not less than 15 deg. or more than 30 deg., without cracking or breaking."

Exhibit E.—Specifications for Air-Brake and Train Air-Signal Hose

1. SEC. 3.—**Tests.** Change to read as follows:

"Hose shall be subjected to the following tests, which shall be made with the temperature of the air not lower than 65 or higher than 90 deg. F., and the samples shall be kept at a temperature within these limits for at least one-half hour previous to the time of test."

Exhibit F.—Specifications for Welded Pipe

1. SEC. 4.—**Flattening Test.** Change to read as follows:

"For steel pipe over 2 in. in diameter, a section 6 in. in length shall be flattened until the distance between the plates is one-third the outside diameter of the pipe, with the weld located 45 deg. from the line of direction of the applied force, without developing cracks."

2. Add a new Section 5, to read as follows, and re-number subsequent sections accordingly:

"5. **Fracture Test.**—For wrought-iron pipe, a section 6 in. in length shall be flattened until broken by repeated blows of a hammer or by pressure; the fracture developed shall have a fibrous appearance."

3. Change present Section 5 to read as follows:

"6. **Bend Test.**—For wrought iron or steel pipe 2 in. or under in diameter, a sufficient length of pipe shall bend cold through 90 deg. around a cylindrical mandrel, the diameter of which is 15 times the nominal diameter of the pipe, without developing cracks at any portion and without opening in the weld."

4. Change present Section 9 to read as follows:

"10. **Workmanship.**—For pipe 1 1/2 in. in diameter or under, the outside diameter at any point shall not vary more than 1/64 in. over nor more than 1/32 in. under the standard. For pipe 2 in. in diameter or over, the outside diameter shall not vary more than one per cent over or under the standard. All pipe shall be provided with the prevailing standard thread which shall make a tight joint when tested to the internal hydrostatic pressure at the mills. The threads shall not vary more than 1 1/2 turns either way when tested with a Pratt & Whitney standard gage. All burrs at the end of the pipe shall be removed."

Exhibit G.—Specifications for Air-Brake Hose Gaskets

1. The following revision to supersede the present specifications:

1. **Scope.**—These specifications cover all gaskets for use in air-brake and air-signal hose couplings.

2. **Material.**—Gaskets shall be made of a rubber compound that will be tough and have enough elasticity to conform to the requirements for strength and elongation, and that the gasket can be readily applied in the couplings under all service conditions and form an air-tight seat.

3. **Deflection Test.**—(a) Gaskets shall be subjected to

a deflection test by suspending a weight of 20 lb. on the gasket. Under this load the increase in the inside diameter shall not exceed 0.8 in., the measurement to be taken on the inside of the gasket within 15 to 20 seconds after the application of the load, with the load applied. The support and the hook to which the weight is attached shall each have a diameter of 1.4 in.

(b) When the deflection test has been completed the gaskets shall be allowed to relax, before subjecting them to the tension test, for a period of not less than 15 minutes.

4. **Tension Test.**—Gaskets shall be subjected to a tension test by inserting into the gasket two semi circular blocks, each having a 180-deg. fillet of the same radius as the original inner radius of the gasket, and pulled at a speed of 20 in. per minute. Under this test the gasket shall show a minimum tensile strength of 90 lb. and a minimum elongation of 200 per cent.

5. **Test Specimens.**—Deflection and tension test specimens shall be the finished gasket and tests shall be made with the temperature of the air not lower than 65 or higher than 90 deg. F., and the specimens shall be kept at a temperature within these limits, for at least one-half hour previous to the time of test.

6. **Number of Tests.**—(a) One deflection and one tension test shall be made on each of five gaskets selected, to represent each lot of 1,000 gaskets or fraction thereof.

(b) Not less than 80 per cent of the gaskets tested shall conform to the requirements of both the deflection and tension tests.

| | A | B | C | D | E | F | G |
|-----|------|-------|-------|-------|-------|-------|-------|
| ... | 9.64 | 11.64 | 10.12 | 10.16 | 11.14 | 11.14 | 11.32 |
| ... | 1140 | 171 | 143 | 116 | 116 | 144 | 150 |
| ... | 1150 | 181 | 153 | 121 | 119 | 153 | 158 |

7. **Dimensions.**—All gaskets shall conform, within the minimum and maximum tolerances, to the nominal dimen-

sions shown in Fig. 1, and (c) adopted by the community in 1911.

All gasket shall be uniform in size and extend

3 Workmanship.

b) **Marking.**—All gaskets shall have the manufacturer's name or trade mark, M. C. B. standard monogram, and the date when made legibly marked on the inside edge, as shown in Fig. 1.

11. **Rejection.**—(a) Gaskets represented on samples which fail to conform to the requirements of these specifications will be rejected.

(b) Gaskets which, subsequent to test and inspection at the factory or elsewhere, and their acceptance, show defects or imperfections will be rejected and shall be replaced by the manufacturer.

Exhibit H.—Specifications for Structural Steel, Steel Plate and Steel Sheets for Passenger Equipment Cars

(1) **SECTION 5.—Chemical Composition.** Change the sulphur content from 0.05 to 0.06 per cent.

(2) SEC. 11—Permissible Variations.—(a) (2) (c) to read as follows:

"(a) The cross-section, or weight per lineal foot of shapes shall not vary more than 2.5 per cent from that specified.

(b) **When Ordered to Weight per Square Foot.**—The weight of each lot of sheets in each shipment shall not vary from the weight ordered more than the amount given in Table 1. One cubic inch of steel is assumed to weigh 0.283 lb.

“(c) **When Ordered to Thickness.**—The thickness of each sheet shall not be more than 0.01 in. under that ordered. The overweight of each lot of sheets in each shipment shall not exceed the amount given in Table II.

"(d) A variation from the length ordered of $\frac{1}{8}$ in. under and $\frac{1}{4}$ in. over will be permitted for sheets or shapes under 12 ft. in length, and a variation of $\frac{1}{4}$ in. under and $\frac{1}{2}$ in. over will be permitted for sheets or shapes 12 ft. and over in length."

Exhibit I.—Specifications for Structural Steel, Steel Plate and Steel Sheets for Freight Equipment Cars

(1) SECTION 5.—Chemical Composition. Change the sulphur content from 0.05 to 0.06 per cent.

TABLE 1—PERMISSIBLE VARIATIONS OF PLATES ORDERED TO WEIGHT

PERMISSIBLE VARIATIONS IN AVERAGE WEIGHTS PER SQUARE FOOT OF PLATES FOR WIDTHS GIVEN, EXPRESSED IN PERCENTAGES OF ORDERED WEIGHT

(1) SEC. 8.—Permissible Variations. Change to read as follows:

"(a) The cross-section, or weight per lineal ft. of shapes shall not vary more than 2.5 per cent from that specified.

"(b) **When Ordered to Weight per Square Foot.**—The weight of each lot of sheets in each shipment shall not vary from the weight ordered more than the amount given in Table No. 1. One cubic inch of steel is assumed to weigh 0.2833 lb.

"(c) **When Ordered to Thickness.**—The thickness of each sheet shall not be more than 0.01 in. under that ordered. The overweight of each lot of sheets in each shipment shall not exceed the amount given in Table II.

"(d) A variation from the length ordered of $\frac{3}{8}$ in. under and $\frac{1}{4}$ in. over will be permitted for sheets or shapes under 12 ft. in length, and a variation of $\frac{1}{4}$ in. under and $\frac{1}{2}$ in. over will be permitted for sheets or shapes 12 ft. and over in length."

The report is signed by C. D. Young, chairman, Pennsylvania; J. R. Onderdonk, B. & O.; J. J. Birch, N. & W.; I. S. Downing, C. C. C. & St. L.; Frank Zeleney, C. B. & Q.; A. H. Fettes, Union Pacific; H. B. MacFarland, A. T. & S. F.; G. S. Sprowle, A. C. L.; and H. G. Burnham, Northern Pacific.

Discussion

F. M. Waring (P. R. R.): In the specification for rivet steel there is a change in the clause for chemical analysis to make the meaning clear and a new table for dimensions of rivet heads. In the specification for air brake and signal hose the only change made was the insertion of a paragraph in reference to the temperature at which the test pieces shall be tested. The specification for air brake hose gaskets has been changed as to form and also as to substance in regard to the deflection tests and slightly different requirements

inserted. A change in the specification for steel plates was made in the sulphur content raising it from .05 to .06 per cent and inserting a table of permissible variations in thickness and over-weight. In the specifications for structural steel for freight cars, the same changes were made as in the structural steel for passenger cars.

Action Taken

J. J. Burch (N. & W.): I move that Exhibit J be withheld. Since getting up the report the government has issued a specification covering cast steel side frames and truck bolsters which in some respects conflicts with this and I think we should withhold our recommendation.

Mr. Waring: I believe that such a motion would find favor with the committee.

I. S. Downing (C. C. C. & St. L.): Is it the idea to adopt the government specification which is an expedient and lessen our quality of materials and what we really should have? Shouldn't we go on with our specifications and make them as they should be and then accept the exception that has got to be made with war material? If you take tin out of your journal bearings, which they have told us to do now, we have an idea that the lining will be pretty soft. We know we can't get the tin and we want to comply with their instructions, but we don't want to go on record making specifications for journal bearings without the tin lining that would make them too soft.

Mr. Waring: I think the committee would like to review this subject. In the opinion of the majority of the committee perhaps something better than the present government specifications is to be desired. I don't think there is the slightest intention on the part of the committee to put in an inferior grade of material; in fact, the tendency is all the other way.

Mr. Burch's motion was carried.

Brake Shoe and Brake Beam Committee Report

C. D. Young
Chairman

OWING TO THE EXISTING conditions arising from the national crisis, this committee has only been able to meet once this year. The committee agreed that, with the exception of one item, namely, the addition of dimensions on the brake head gage, as shown on M. C. B. sheet 17, it would report progress for the year 1918. The following items which were up for consideration, and by correspondence, through the year:

The committee recommends that M. C. B. sheet 17, "Standard Brake

Head, Shoe and Key-Standard Gages for Brake Head and Shoe" be changed as follows:

(a) A radius of $5/32$ in. to be shown at each corner of the gage where it enters the toe of the head, and that the open dimension (marked K) should be changed from $1\ 5/16$ in. to $1\ 3/16$ in.; this change is made to provide the proper clearance for the gage entering the head.

(b) That there should be shown on this same gage a dimension of $1\ 1/4$ in. for the width of the head where the

gage enters, and that a $1/8$ in. radius should be shown at the intersection of the sloping line with the bottom of the fork at the upper and lower toe openings of the head.

The above two items are to be submitted to letter ballot as new standards.

The following subjects are before the committee at the present time for their consideration, and upon which the committee reports progress:

First.—The committee is investigating the desirability of modifying the present standard brake beam gage as shown on M. C. B. sheet 17-A, with a view of simplifying the gage and reducing its cost; the new gage to provide for checking substantially the same dimensions and angles as the present gage.

Second.—M. C. B. sheet 17 shows a new standard contour for brake head. The question of a modification of this contour to meet foundry practices, as recommended by brake beam manufacturers, is being considered. The committee is awaiting its final decision for additional information, and to ascertain what, if any, action is taken by the Railway Administration in providing a new brake head for the cars being purchased this year.

Third.—The present Recommended Practice M. C. B. sheet R shows the recommended practice for No. 2 Brake Beam. The committee is considering, in connection with this beam, the location and design of two upper hanger openings as shown in dotted lines on this sheet, in order to provide a more satisfactory bearing area for the openings to meet certain requirements in foundry practice, as suggested

by the manufacturer. The committee is also considering a modification in the vertical location of the center hanger openings with reference to the radial line of the brake beam to the truck axle, and has received recommendations from the manufacturers on this subject, which, if accepted, will modify the present dimensions as shown on M. C. B. sheet R.

Fourth—The committee is considering, in conference with the manufacturers, a change in the face dimensions of the brake head as shown on M. C. B. sheet 17, in which a bearing area of 1 3/8 in. is provided for the brake head where it bears against the brake shoe, and is also considering the res-

truction of the 1 1/2 in. clearance of the 17 1/2 in. dimension which was made standard last year.

The report is signed by C. D. Young, chairman; P. B. & W. Prof. C. H. Benjamin, Purdue University; T. L. Burton, N. Y. C. & H. B. Young, U. S. Railroad Administration; C. H. Bily, C. M. & St. P.; G. H. Gilman, Nor. Pac.; and L. I. Burns, Mich. Cent.

Action Taken

There was no discussion. The report was accepted and submitted to letter 14107.

Welding Truck Side Frames, Bolsters and Arch Bars

W. O. Thompson
Chairman

IN ACCORDANCE with the action taken by the association at the 1916 convention, this subject was referred to the Executive Committee with the recommendations that the views of the majority of the committee prevail, that a special committee be appointed to investigate the subject and determine the possibilities and limitations of this practice with reference to truck sides and bolsters, and that if welding is permitted certain specific instructions shall be framed as to how the work shall

be performed to produce the result desired and to bring the structure up to a proper condition for service. One member of the committee dissented from the report made in 1916.

The committee arranged to have tailed and welded side frames and bolsters shipped to two manufacturers, where suitable facilities were provided for conducting the tests, 23 of which were made at the Bettendorf Company's plant, Bettendorf, Iowa, and 21 at the American Steel Foundries plant, Alliance, Ohio. A 1,500-ton hydraulic press was used for this purpose at Bettendorf and a Riehle testing machine of one million pounds capacity at Alliance, Ohio.

The general arrangement of the machines and the manner in which the tests were made to determine the strength of welds, also the views and data of each individual piece tested, are shown in photo views folios A and B. Each member of the committee and the secretary of the association have been furnished copies. [See the résumé of the data in folios A and B given at the conclusion of the report.—Editor.]

The committee in preparing this report have endeavored specifically to mention and illustrate the results obtained welded material by submitting the following tests:

TEST NO. 5: BOOK "A" ANDREWS SIDE FRAME

This frame was received from the railway to be welded by the manufacturer. The frame had a crack in the tension member 33 1/4 in. long, as shown in Fig. 1, and for the information of the committee was tested without welding, as it was a good sample of a frame that would be considered unsafe and would not be accepted under load in interchange. Under a load of 195,000 lb. the crack opened slightly, under a load of 230,000 lb. the crack opened 3/8 in., and under a load of 250,000 lb. the tension member broke as shown in Fig. 2.

TEST NO. 8: BOOK "A" ANDREWS SIDE FRAME

This frame was removed from a truck by the railway, due to a crack 1 1/2 in. long in the tension member. It was placed in the machine and tested without being welded, fracture taking place under load of 332,000 lb.

From the described tests and the data contained in Books 1 and B, it is evident that the art of welding, which has formerly been defined as a process of uniting two pieces of metal by hammering them together while hot, may be safely extended to the joining of two pieces of metal by fusion.

In one of the committee reports on this subject (1916) the position was taken that fractures indicate weakness in the design of cast steel truck side frames and bolsters, and the welding would not add to the strength, but introduce a condition of further weakness by improper workmanship, thereby introducing another chance for failure. This is truly a bad combination and applies equally to other parts of cars, either of cast steel, rolled or pressed sections when built into a design inherently weak.

In this report the designs were not taken into consideration, for the reason that they were made by engineers skilled in car construction employed by the railroads and manufacturers and approved by superior officers before being specified. When cracks or failures occur, due to a poor quality of metal, track conditions, overloading of cars, bolster springs too weak and going solid, or other causes, the frames and

Fig. 1—Book A, Test 3. Side Frame Before Testing. Cracks 33 1/4 Inches Long

Bolsters are subjected to greater loads and stress than that for which they were designed.

The frame shown in Fig. 1 had a crack 1 1/2 in. long, yet under tests did not show signs of opening until a load of 195,000 lb. was applied, and opened 3/8 in. under a load of 230,000 lb. The frame used in Test No. 8 Book A, with a crack 1 1/2 in. long, took a load of 332,000 lb. before the fracture occurred. Any methods employed in welding or preventing cracks of this character from extending would permit the frame to remain in service with safety, as it is only in isolated cases that frames ever failed without giving sufficient

warning that by ordinary inspection replacement or repair could be made to prevent accident or derailment. In many cases they have been kept in service until the crack commenced to open or extend into the vertical section before removal and without anxiety on the part of mechanical officers responsible for their performance.

A number of the castings tested were welded where broken entirely across the tension member, yet the welds were sufficiently strong so that under test, the casting broke at some location other than the weld. Therefore, the proper welding of side frames and bolsters should be permitted, the limit to

Fig. 2—Book A, Test 3. Side Frame Broken Through Crack. Breaking Load, 259,000 Lb.

prohibit welding to be when the strength of the weld would not equal that of the joining sections.

The committee invites your careful consideration of the following in all autogenous welding:

Selection of Operations

First.—Experience has shown that an ordinary helper, handy-man or laborer is not possessed of the ability to make proper welds, as they are not conversant with the changes which metals undergo while being welded. A competent mechanic should be selected and given the necessary instruction by an experienced welder before being assigned to this important work. When the desired proficiency has been acquired, the operator's ability should be certified to by the mechanical officer in charge or by an instructor qualified by

dation should be made by a competent operator or instructor.

Third.—Great care should be exercised to prevent welding under load becoming a general practice for the reason that internal strain is liable to be set up through welding, which

Fig. 3—Book A, Test 9, Side Frame Broken Through Weld. Breaking Load, 149,600 Lb.

can be avoided by preheating. Therefore, it is considered good shop practice to preheat cast steel and pressed form bolsters and side frames and this should be done whenever possible.

Fourth.—In making the weld the fracture should be cut

Fig. 4—Book A, Test 16. Truck Bolster, Broken Through Weld. Breaking Load, 159,300 Lb.

or burned out beveled or V shape in order that a good surface will be obtained for the uniting of the metal, care and patience as well as skill being employed to prevent oxidiza-

Method of Testing the Truck Frames

experience in general railroad welding with the method involved.

Second.—Only in an emergency should an attempt be made to weld a side frame or bolster until it has been removed from the car, and whenever it is necessary to do so the recommen-

tion. To insure this, the work should be placed at an angle that would allow the flowing out or blowing out of all slag or impurities in the fused metal; the operators giving the torch a rotary movement, will assist in their removal and make a stronger weld than if this practice was not observed.

It is also considered good practice to increase the welded section 15 or 20 per cent a short distance on each side of the weld and gradually taper down to the original thickness of section.

Tip.—Experienced authorities in electric welding claim that the success of removing the part to be welded from a car may be facilitated by welding right in position on the car, the only hindrance being the ability of the operator to clean

the metal at the end of the track, which would have a tendency to prevent the track from working across.

After chipping the metal about the V should extend nearly through the plate or section, the operator should start to weld at the broad farthest point from the outside edge and work the weld back toward the edge. This process has proven more successful than where the weld was commenced at the outside and added toward the center. In much of the

out the check or crack in the proper manner before starting to make the weld.

In repairing a broken part where the material is not too heavy or over one inch in thickness it can readily be done by chipping out equally on each side of the crack, making the cut about 30 degrees. This can ordinarily be done with an air hammer and chisel, or by hand if it is impossible to get the air hammer to the job. Be sure to chip out the entire crack, even if it extends only part way across the section, chip far enough back so there will be no portion of the crack in the metal. Failure to do this permits the crack or crack to continue to work its way across the metal to the farther side, due to the constant vibration, even after the weld has been made. If it is impossible to chip or cut out the check or crack's section so as to eliminate it, good practice would

be to drill a hole at the end of the crack, which would have a tendency to prevent the crack from working across.

After chipping the metal about the V should extend nearly through the plate or section, the operator should start to weld at the broad farthest point from the outside edge and work the weld back toward the edge. This process has proven more successful than where the weld was commenced at the outside and added toward the center. In much of the

work introduced has a tendency to expand the parts being welded, when cooling takes place it produces a strain on the inner portion of the weld.

It is very difficult to present detail instructions on this class of work, as practically every job is a problem of itself, the grade of material to be used depending on the quality of the stock to be welded. The diameter of the electrode, thickness of material, the place where the work is to be done, and the strength necessary to have in the weld when completed, are or should be all based on the knowledge of the operator working on the welding of the part. Hence the necessity of having an operator with an extended experience on work of this character.

NOTE.—The committee recommends that when welding is done the weld should be made smooth like on steel dies, let-

ters and numerals, used legibly to stamp the initials of the road, place, date and identification number of the welder; this not only as an incentive for the operator to do his best work, but also to result in a more careful supervision and inspection, as well as a convenient means of locating the responsibility for inferior workmanship.

The thanks of the association are due the American Steel Foundries and the Bettendorf Company, who placed their testing facilities at the entire disposal of the committee.

The report was signed by W. O. Thompson, chairman,

Fig. 5—Book B, Test 4. Side Frame Welded in Tension Member. Failed at Journal Box. Breaking Load, 223,900 Lb.

N. Y. C.; G. W. Rink, C. R. R. of N. J.; J. J. Hennessey, C. M. & St. P.; A. M. McGill, L. V.; R. W. Schulze, St. L. & S. F.; Willard Kells, A. C. L.; J. R. Gould, C. & O.; E. H. Sweeley, Long Island, and C. F. Giles, L. & N.

Results of Tests

Folios A and B, which were introduced as exhibits by the committee, contained data concerning the tests conducted at the American Steel Foundries and the Bettendorf plant, respectively. The general results of these tests are given in the table. The deflection and permanent set were re-

Fig. 6—Book B, Test 16. Body Bolster Welded in Tension Member, Broken in Tension Member Outside the Weld

corded for a side frame of each type, a truck bolster and a body bolster.

The committee presented the following summary and conclusion in connection with the tests reported in Book B.

Summary

Of the 23 tests as per data herewith there were 10 castings in which the original fracture had consisted of a complete break of the entire tension member, the fracture extending well into the web, with the exception of test No. 19, the tension member of which was broken in from both sides, but not quite wholly fractured. (See photograph 1391.)

Of these 10 castings the tension member of which was entirely fractured, only three broke in the weld under test. (See test No. 11, casting F-8; testing No. 17, casting F-1; and test No. 20, casting F-3.)

If, in view of the data herewith submitted, it is desired to weld tension members that are almost wholly broken, with

the fracture showing porosity, the welded portion should be built up to a considerable extent for 2 in. or 3 in. over the surface to compensate for what may have been a weak point.

Conclusion

As a conclusion it may be said that the tests clearly indicate that properly made welds are satisfactory.

In view of these tests and experiments it is considered important that in making such welds consideration should be given to the tensile strength of the welding material as compared with the tensile strength of the casting welded. If Norway iron or other welding metals of low tensile strength are used, the welds should be built up an amount sufficient to compensate for the total tensile strength of the section to be welded.

Discussion

Chairman Thompson: The committee, with the one exception, is fully in accord with the practice endorsed in the report. It has endeavored to recommend a method for successfully welding truck sides and bolsters.

F. M. Waring (Pennsylvania): The committee states that the proper welding of side frames and bolsters should not be prohibited. It also presents a conclusion that it is difficult to give instructions for this class of work and that the quality of the welding may vary to a large extent. I think that is true. Very often a good weld will even show a higher tensile strength than the original material, but when that part is put into service and subjected to tension or to vibration quite frequently we find that detailed fractures develop at the junction of the welding metal and the original metal. They progress across the section until it is too weak to carry the load. Such a weld will show up excellently on a tensile test.

C. E. Chambers (C. R. R. of N. J.): I don't think we should prohibit the electric welding of cast steel frames. The Central of New Jersey equipped 1,000 cars with about the first cast steel side frames that were made. Probably 75 per cent of those frames have been welded at some point. Very few of them have failed after being welded. After we started reinforcing the weld I don't know of any failures.

J. J. Hennessey (C. M. & St. P.): Of the thousands of truck sides that have been welded we have only had failures in wrecks, and those we welded again. Where a truck side has been broken clear through we don't weld them.

I. S. Downing (Big Four): We started welding truck sides at a great many points and had many failures. Then we put an expert in charge, and now I am convinced that if it is done under the proper supervision you can weld a truck side just as well as anything else.

J. H. Milton (Rock Island): We are welding six or seven hundred couplers a month and knuckles, truck sides, body bolsters and truck bolsters and are having very good success.

I. S. Downing: This association should go on record as approving recovering material in any way possible.

C. E. Fuller (Union Pacific): We have welded new eyes in couplers. If properly done it is absolutely safe, but you must have an experienced operator.

Action Taken

F. M. Graff (Erie): I move that this Association recognize as good practice and sanction the extension of autogenous welding to all parts of car equipment.

C. T. Ripley (Santa Fe.): I think that would work wrong in the case of car wheels. The wheel committee should be considered in connection with that. Before it is recommended there should be more experimenting done. A series of experiments has been made to demonstrate the value of welding and annealing and the results are remarkable. Under tests welded sides would break very much more easily before annealing than afterward.

(Mr. Graff's motion was carried.)

The recommendations of the committee were accepted.

Report of Committee on Loading Rules

A. Kearney
Chairman

THE COMMITTEE submitted the following recommendations covering additions and changes in the present Code of Loading Rules. The committee has received a number of recommendations and suggestions from the Regional Directors and others, relative to new rules to cover lading not taken care of in the present Code of Loading Rules and changes in the present rules. The suggestions in the main have reference to the conservation of the car supply by increasing the load carried per car

and by prohibiting the use of hopper bottom cars for shipments of pig iron, billets and similar material, so that this type of cars may be available for ore and coal shipments.

On account of the apparent necessity that immediate action be taken, this committee has prepared several new rules and revised others, sending them to the executive committee for their approval, they being later issued as a supplement to the present Code of Loading Rules.

The rules which have been revised and issued as a supplement to the present Code of Loading Rules by the Executive Committee, are as follows: Supplement Circular No. 16, issued November 20, 1917, revising rules 31, 53, 98-A and 98-B, 103-A and 124-B; Supplement Circular No. 35, issued March 4, 1918, revising rules 57, 58, 117-D and 121-B, and Supplement Circular No. 42, revising rule 53.

Proposed Changes in the Loading Rules

In addition to the foregoing, the committee recommends the following changes in the present M. C. B. Loading Rules:

Rule 7.—Change the second sentence, reading "If lading is placed on top of sides of gondola cars, etc.," to read "If lading is placed on *bearing pieces located on top of sides of gondola cars, etc.*"

Explanation. To clarify the intent of the rule.

Rule 9.—In the first line after the word "project" change the word "over" to "*beyond*."

Explanation. To permit of loading longer material as a single load without the use of an idler.

Rule 10.—In the second line after the word "project" change the word "over" to "*beyond*," also add to the last sentence the following: "*except flat cars of 60,000 lb. capacity equipped with an inverted truss may be used as an idler.*"

Explanation. Relative to changes in rule, see explanation under Rule 9. The addition to the rule will permit 60,000 lb. capacity wooden flat cars having inverted trusses to be used as idlers.

Rule 12.—In the second sentence of note, change the 36 in. dimension to 46 in.

Rule 21.—In the first line after the word "project" change the word "over" to "*beyond*."

Explanation. See explanation Rule 9

Rule 23.—Change the first sentence after the word "car" to read "*except as provided for in Rules 80 and 82.*"

Explanation. To make the requirements more definite as to when it is permissible to use bearing pieces or to use

lading pieces between the bolster and the end of the car.

Page 22.—Change general heading reading as follows: "Rules governing the loading of lumber on open cars," to read "Rules governing the loading of lumber *or timber* on open cars."

Page 25.—Change heading relative to loads on single cars reading as follows: "Lumber loaded on single cars as in Figs. 5 and 6," to read "Lumber *or timber* loaded on single cars as in Figs. 5 and 6."

Rules 32 and 33.—In the first line after the word "lumber" insert the words "*or timber*."

Rule 34, Section B.—In the first line after the word "lumber" insert the words "*or timber*."

Explanation. To clarify the intent of the rules.

Rule 34, Section C.—Change the first paragraph reading as follows: "For loads of lumber not lapped or stripped, the size of hardwood stakes must not be less than;" to read "For loads of lumber *or timber* not of equal thickness, which can not be lapped or stripped, the size of hardwood stakes must not be less than;"

Explanation. To clarify the rule as to lumber or timber that may be loaded without being lapped or stripped.

Page 33.—Change heading reading as follows: "Long lumber loaded on top of single loads as in Fig. 7," to read "Long lumber *or timber* loaded on top of single loads as in Fig. 7."

Page 35.—Change heading reading as follows: "Lumber loaded as per Figs. 8 and 9," to read "Lumber *or timber* loaded as per Figs. 8 and 9."

Explanation. To make the heading conform to the changes in rules referring to lumber shipments.

Rules 36 and 48.—Change last sentence to read as follows:

"Stakes must not be less than two feet nor more than four feet apart *from center to center of stakes.*"

Explanation. To clarify the rules as to the permissible distance between stakes from center to center. This change has no bearing on the spacing of the stake pockets as referred to in Interchange Rule 3, paragraph (N).

Rule 41.—In the second line after the words "bearing pieces," insert "*having a bearing surface bottom and top its entire length.*"

Explanation. To clarify the intent of the rule.

Page 38.—Change heading reading as follows: "Lumber loaded as per Figs. 10, 11, 12 and 13," to read "Lumber *or timber* loaded as per Figs. 10, 11, 12 and 13."

Explanation. To clarify the intent of the rule.

Rule 49.—In the second line after the word "Section" insert "*having at least 10 in. bearing surface bottom and top extending the entire length of bearing piece.*"

Explanation. To clarify the intent of the rule.

Page 38.—Change the second heading reading as follows: "Lumber on gondola cars as per Figs. 14 and 15," to read "Lumber *or timber* on gondola cars as per Figs. 14 and 15."

Explanation. To clarify the intent of the rule.

The heading on all cuts referring to lumber loading should be changed to read "Lumber *or timber*."

Rule 51.—In the first line after the word "Material" insert "*except Logs, Telegraph and Telephone Poles, Piling and Props.*"

Explanation. This is an undesirable manner of loading logs and poles.

Figs. 14, 14-A, 15 and 15-A omit reference to "*Logs, Telegraph and Telephone Poles, Piling and Props.*"

For explanation, see Rule No. 51.

Rule 52.—In the second line after the word "inches" insert "*in section having at least 10 in. bearing surface bottom*"

and top extending the entire length of bearing piece and".

Explanation: To clarify the intent of the rule.

Rule 81-L.—Second line: Change the words "with two bearing pieces and two or four sliding pieces" to read "*with two bearing pieces with or without sliding pieces.*"

Explanation: To clarify the intent of the rule.

Rule 113.—At the end of the third sentence add a sentence reading: "If the pipe do not completely fill the space between stakes, angular shocks not less than 4 in. x 5 in. in section should be placed against the outside pipe and securely nailed to the bearing piece."

Rule 114.—A sentence should be added to the rule reading as follows:

"If the pipe do not completely fill the space between the stakes, angular shocks not less than 4 in. x 5 in. in section should be placed against the outside pipe and securely nailed to the bearing piece."

Explanation: To make the rules conform to the changes made in Figs. 78 and 79.

Figs. 78 and 79.—Change bearing pieces from 4 in. x 5 in. to 2 in. x 4 in. to make the cuts conform to Rules 113 and 114, also show on cuts the *maximum distance between the ends of the two top courses of pipe in the center.*

LOADING OF LARGE MILL BLOCK, LARGE BRIDGE STONE, SHODDY, BREAKWATER OR OTHER LARGE STONE, HAVING REGULAR OR IRREGULAR SURFACES.

Rule 120.—"Mill block having a regular surface to rest on car floor, no dimension of such bearing surface being less than the height of stone, should be protected on the sides and ends by cleats not less than 2 in. x 4 in. in section, of sound straight-grained lumber, extending at least three-fourths of length or width of stone. When the stone is loaded close together or wedged apart, cleats are required on sides and ends only of outside stone. When such stone is loaded in tiers, standard end and side protection must be provided.

"Mill block containing as much as 100 cu. ft., resting on channel or scabbled surface not less than 25 sq. ft., or proportional for increased sizes, must be so loaded that the weight of total lading will be uniformly distributed over the floor of the car, resting on a layer of sand, cinders or crushed stone, covering the entire bearing surface of the stone.

"Gondola cars are preferable for such shipments, but if flat cars are used, the lading must be placed at least 18 in. back of end of car. Each block of stone loaded lengthwise, crosswise or obliquely must be protected against creeping by side and end cleats, securely nailed to floor of car with 40-penny nails. (When two blocks of stone are loaded parallel and close to each other, or wedged apart, they will be considered as one stone as to cleating.)

"If stone is placed lengthwise of car and is 4 in. or closer to side of car, two standard side stakes 6 in. in height must be placed opposite such stone in lieu of cleats, on that side of stone. Stone must not be loaded obliquely when it is possible to load it lengthwise or crosswise of car.

"Cleats must consist of not less than 2 in. x 4 in. sound straight-grained lumber, and extend at least three-quarters of length or width of stone.

"If the 2-in. cleat does not have a full 1-in. vertical bearing for its full length against edge of stone, cleats may be built up to the requisite height, retaining the specified width."

Rule 120-A.—"Large stone containing as much as 30 cu. ft. and having a regular surface of at least 8 sq. ft. to rest on car floor, but no dimension of such bearing surface being less than 1 ft. 6 in., should be protected at the end with standard end stakes extending at least one-half the height of the stone. In no case must the height of the stone be more than one and one-half times the smallest dimension resting on the car floor. The distance from the end of the stone to the inside edge of the stakes must be not less than 6 in.

measured across the car; otherwise standard board should be securely nailed to the inside of the stakes. When single large blocks as much as 6 ft. in length are loaded crosswise of the car, the end protection should be two standard stakes extending at least one-half the height of the stone.

"Any large stone having regular surface, not covered by the preceding paragraph, must, in addition to the specified end protection, be secured at the sides by the standard stakes opposite the stone. The distance from the end of stone to the inside of stakes must be not less than 12 in. measured lengthwise of car. If on account of the location of the stake pockets or for any other reason this distance can not be obtained, standard boards should be provided opposite the tier of stone to prevent any possibility of the stone becoming insecure. Boards should be securely nailed to the inside of the stakes."

Rule 120-B.—"Large stone with irregular surfaces, loaded on flat cars, must be securely wedged, stripped or blocked to prevent the stone from rocking. Standard end protection must be provided as specified in Rule 120-A, also two stakes must be placed opposite each outside piece of stone. The end of the stone must not be less than 12 in. from the inside edge of the stakes measured lengthwise of car. If on account of the location of stake pockets or for any other reason this distance can not be obtained, standard boards should be provided opposite the blocks of stone to prevent any possibility of the stone becoming insecure. When such stone is loaded in gondola cars it should be securely wedged, stripped or blocked if there is any possibility of the stone rocking. Large block bridge, shoddy, breakwater or other large stone should not be loaded in gondola cars unless there are derrick facilities for unloading."

Explanations: A paragraph has been added to cover small mill blocks containing less than 100 cu. ft., also the paragraphs have been rearranged in order to clarify the rules.

Fig. 104-A, Rule 126—Manner of Loading Wood Cores 3 ft. to 4½ ft. Long in Box or Stock Cars

Rule 126.—Add a paragraph reading as follows:

"Wood cores and similar round wood 3 to 4½ ft. in length should be loaded as per Fig. 104-A. This method makes the stripping of door opening unnecessary."

The report was signed by A. Kearney, chairman, assistant superintendent motive power, Norfolk & Western; A. B. Corinth, general car inspector, Atlantic Coast Line; L. H. Turner, superintendent motive power, Pittsburgh & Lake Erie; R. L. Kleine, chief car inspector, Pennsylvania; E. J. Robertson, superintendent car department, Minneapolis St. Paul & Sault Ste. Marie; C. N. Swanson, superintendent car shops, Atchison, Topeka & Santa Fe; H. C. May, superintendent motive power, Chicago, Indianapolis & Louisville, and H. H. Harvey, general car foreman, Chicago, Burlington & Quincy.

Discussion

A. Kearney (N. & W.), chairman: The other items still pending are as follows: Loading pipe on flat cars, and loading sheet or iron plates in box cars. We will soon be able to submit a report on this. The committee has been working on the loading of concrete culvert pipe on flat cars and will have something governing that soon. Then we have rules 56 and 57 relating to changing the height of lading requiring the wiring from four to five feet. The last relates to requiring bulkheads in connection with the shipment of dressed lumber on flat or open cars. The loading of dressed lumber on open cars has given us a good deal of concern. During the last year an embargo was put out by one of the lines entering Chicago which was objected to by some of the lumber shippers. A great deal of correspondence ensued and finally the embargo was lifted. After meeting the lumber people a special committee was formed of railroad men and lumber shippers, but principally shippers from the south. An arrangement designed at Altona, by Mr. Kleime was put into the hands of the lumber shippers with the idea of building up a number of loads and shipping them to destination to see how they ran and how the loads held. As yet we have no report from the loaders. It might also be interesting to add that the lumber shippers appealed to the Interstate Commerce Commission and we, in turn, received some correspondence through Mr. DeGroot who now has that matter in

hand. He told me a few days ago that the embargo had been lifted on the line running out of Chicago and they thought it would remain so until they got the final report from the lumber committee and the sub-committee and finally our committee on loading rules.

If in order I would suggest that the balance of the report be put in shape as quickly as possible and submitted to a special ballot, unless you would care to adopt it in the near future. Our idea is that it could be sent out in advance of the regular October issue of the report the shippers would receive a good deal of benefit in the meantime.

F. W. Brazier (N. Y. C.): I want to call the attention of the committee to a severe accident we had lately in loading structural timber 60 ft. long piled upon two cars. The train was running from one track to another such a strain was put on the stakes that they broke off and the timber fell over on the passing track. Fortunately only a detachment occurred. These timbers were loaded according to the M. C. B. rules.

Action Taken

Mr. Brazier: I move that the report be adopted as read.

J. J. Hennessy (C. M. & S. P.): I would like to second that motion to the effect that the report be received and adopted as read and that the report of the committee and sub-committee be referred to the Executive Committee without waiting for letter ballot.

The motion was carried as amended.

Couplers, Report of Standing Committee

R. L. Kleime
Chairman

THE M. C. B. STANDARD D coupler was adopted by special letter ballot in 1916 and is now shown in the 1917 Proceedings, Sheet 23-B. The following details were left for further consideration and investigation: Contour line; design of 6-in. by 8-in. shank and key slot; gages to insure interchangeability of coupler parts; and, specifications for purchase and acceptance. This report covers briefly the investigations of the above features, with definite recommendations for adoption.

Two contour lines, the No. 5 and the No. 10, as shown in previous reports of the committee, were thoroughly tried out in connection with both road service and laboratory tests of the experimental couplers, including the Type D. Practically equal numbers of each contour were used. The various phases of the investigations covering this subject are given in brief as follows:

Angling and Coupling.—This question has been discussed in previous reports of the committee. The results of tests conducted demonstrated that either the No. 5 or No. 10 line permits at least as much horizontal angling as the M. C. B. 1904 line, with a slight advantage in favor of No. 5; and both the No. 5 and No. 10 lines provide for more vertical angling than the present M. C. B. 1904 line, the No. 10 line providing the larger amount.

The No. 10 lines when coupling with themselves require a slight amount of momentum to effect the final closure of the knuckle on curves. This is also true when coupling to

the M. C. B. (1904) contour but only when the knuckle of the latter is open. This momentum is inapplicable to the knuckle when coupling even at low speeds.

Observations of actual couplings were made but no instance has any difficulty been reported in coupling with the No. 10 lines.

Conclusions on Angling and Coupling.—In view of the various tests and road experience, either the No. 5 or No. 10 contour is acceptable.

Slack in Contour.—While slack in couplings has generally been considered undesirable, a certain amount of slack in any contour line is essential to provide for freedom in coupling as well as angling. It is not the initial slack in the contour line but the ultimate slack developed by wear and distortion of parts with which we are concerned.

The slack as follows for the three contour lines under discussion when the couplers are new, having *new* contour lines:

14-32 in., M. C. B. 1904 contour line.

21-32 in., No. 5 contour line.

1 in., No. 10 contour line.

To obtain data on actual conditions in service three separate investigations were conducted by the committee as follows:

First Investigation.—This covered M. C. B. (1904) contour couplers and was given in the 1917 report from which we quote the following:

| Coupling | | Coupling | |
|---------------|-----------|----------|-----------|
| Contour | Slack | Contour | Slack |
| M. C. B. 1904 | 14-32 in. | No. 5 | 21-32 in. |
| No. 5 | 21-32 in. | No. 10 | 1 in. |
| No. 10 | 1 in. | | |

From the above it is clearly evident that the M. C. B. 1904 contour lines develop a large amount of slack under service conditions.

Second Investigation.—This covered a train of N. & W. 20-ton capacity cars equipped with Type D couplers of No. 5 and No. 10 contour which had been in service about

Advantages of No. 10 Line.—The No. 10 line on account of having the coupler face and front face of the knuckle parallel to each other and perpendicular to the longitudinal center line of the coupler shank provides ideal conditions for pushing service in that it keeps the longitudinal center line of mating couplers in alignment. This was clearly demonstrated in tests conducted on a 2 per cent grade and 9 deg. curves on the Pennsylvania with locomotives and cabin cars equipped with No. 10 contour line couplers.

By eliminating the inclined face on the head of the coupler the nose of the knuckle is relieved of strains in coupling and buffing, furthermore, the wedging action due to the knuckle

Exhibit "A"—No. 10 Contour

engaging both the face of the coupler and the guard arm is also eliminated.

Conclusions on Contour Line.—At a joint meeting of the coupler manufacturers and M. C. B. Coupler Committee, held at Altoona, March 29, 1918, the coupler manufacturers were unanimous that but one contour line should be adopted and that the same should be decided by the Coupler Committee. The committee thereupon unanimously agreed to recommend for adoption the No. 10 contour line, as shown on Exhibit A.

Note.—At this meeting R. E. Janney, of the American Steel Foundries, presented his views on the contour lines with the request that it be embodied in the minutes of the meeting. Accordingly it is included as Exhibit B.

Design of Six-inch by Eight-inch Shank and Key Slot

Exhibit C shows the design of the 6-in. by 8-in. shank as agreed upon between the coupler manufacturers and the M. C. B. Coupler Committee at the meeting held at Altoona, March 29, 1918. This design was also approved by the Committee on Car Construction and conforms with the design adopted by the United States Government for freight cars. This shank takes a 1 1/2-in. by 6-in. key.

Gages to Insure Interchangeability of Coupler Parts

Since the M. C. B. Standard D coupler and parts will be made by different coupler manufacturers, interchangeability is a very essential and important feature. The committee in conjunction with the manufacturers has very thoroughly gone into the matter and recommends for adoption as standard, gages which will control the coupler and all its parts. To maintain the correctness of these gages, master gages have been designed and are now being placed in the hands of the coupler manufacturers.

Note.—The drawings of the gages listed above are on file with the association.

The committee has tried out these gages on the product of two of the coupler manufacturers and finds that the gages control the interchangeability of the parts as intended.

Specifications for Purchase and Acceptance of Couplers

Uniform specifications for the M. C. B. Standard D coupler have been developed jointly with the coupler manufacturers, the M. C. B. Committee on Specifications and Tests of Materials and the Coupler Committee and are appended as Exhibit D. These specifications have been tried out and are found to be satisfactory.

The principal departure from the present M. C. B. Standard coupler specifications is in the omission of the physical tests for the complete couplers and separate knuckles, as such tests are unnecessary since we have but one design and this design has been fully tested out before adoption as standard. The recommended specifications provide for physical and chemical tests of the steel, checking of the annealing as well as limiting weights of the coupler and parts, which, together with the gages, will fully control the product.

These specifications involve the testing of the various heats of steel at the time of manufacture and are acceptable to the coupler manufacturers if carried out by a central inspection bureau controlled by the M. C. B. Association or some other central body.

Recommendations

In accordance with the above report the committee recommends that the following be submitted to letter ballot for adoption as Standard of the Association in connection with the Standard D coupler:

- I. No. 10 Contour Lines as shown on Exhibit A.
- II. Design of 6-in. by 8-in. Shank and Key Slot for same as shown on Exhibit C.
- III. Gages to insure interchangeability of coupler parts.
- IV. Specifications for Purchase and Acceptance as per Exhibit D.

The report was signed by R. I. Klein, chairman Penn-

Exhibit "C"—Design of 6 in. by 8 in. Shank for Standard "D" Coupler

sylvania: G. W. Wilkin, I. W. Brazier, New York Central; F. H. Stark, Missouri; J. W. Small, Seaboard Air Line; J. A. Pilcher, Norfolk & Western; and W. Alexander, Chicago, Milwaukee & St. Paul.

Exhibit "B"

R. E. Janney submitted a statement in favor of the No. 5 contour. Mr. Janney claimed (1) that there is as much room for vertical angling in the No. 5 contour as in the No. 10; (2) that hook lock in couplers with the No. 10 contour will cause the blow in buffing to fall on the face of the contour just beyond the guard arm and on the lugs on the coupler while with the No. 5 contour the contact is distributed over the whole face of the contour from the base of the guard arm to the throat of the knuckle; and (3) that the buffing force of the coupler has no influence on face breakage.

Mr. Janney also stated that when coupling with the No. 10 contour the car will start to move away before the momentum of the knuckle can close it far enough for the lock to drop.

Exhibit "D."—Specifications for M. C. B. Standard "D" Couplers, Knuckles, Locks and Other Parts

1. *Scope.*—These specifications cover all cast steel for complete couplers and for repair parts.

I. MANUFACTURE.

2. *Process.*—The steel shall be made by the open-hearth or electric-furnace process and in accordance with the best foundry methods.

3. *Heat Treatment.*—(a) Unless otherwise specified, all castings shall be allowed to become cold before the process of heat treatment (annealing). They shall then be uniformly heated to the proper temperature to refine the grain and cooled uniformly in the atmosphere.

(b) If the results of physical tests of any melt do not

been poured from a melt for the purpose of identifying each casting in that melt.

II. CHEMICAL PROPERTIES AND TESTS.

5. *Chemical Composition.*—The steel shall conform to the following requirements as to chemical composition:

| | | |
|------------------|---------------|----------|
| Carbon | 0.23 to 0.35 | per cent |
| Manganese | not over 0.75 | per cent |
| Phosphorus | not over 0.05 | per cent |
| Sulphur | not over 0.05 | per cent |

6. *Ladle Analysis.*—To determine whether the material conforms to the requirements specified in Section 5, an analysis shall be made by the manufacturer from a test ingot taken during the pouring of each melt. Drillings for analysis shall be taken not less than $\frac{1}{4}$ in. beneath the surface of the test ingot. A copy of this analysis shall be given to the purchaser.

7. *Check Analysis.*—Check analysis may be made by the purchaser from drillings taken from the test coupons described in Section 4, paragraph (b), which have satisfactorily passed the physical requirements. These drillings shall be

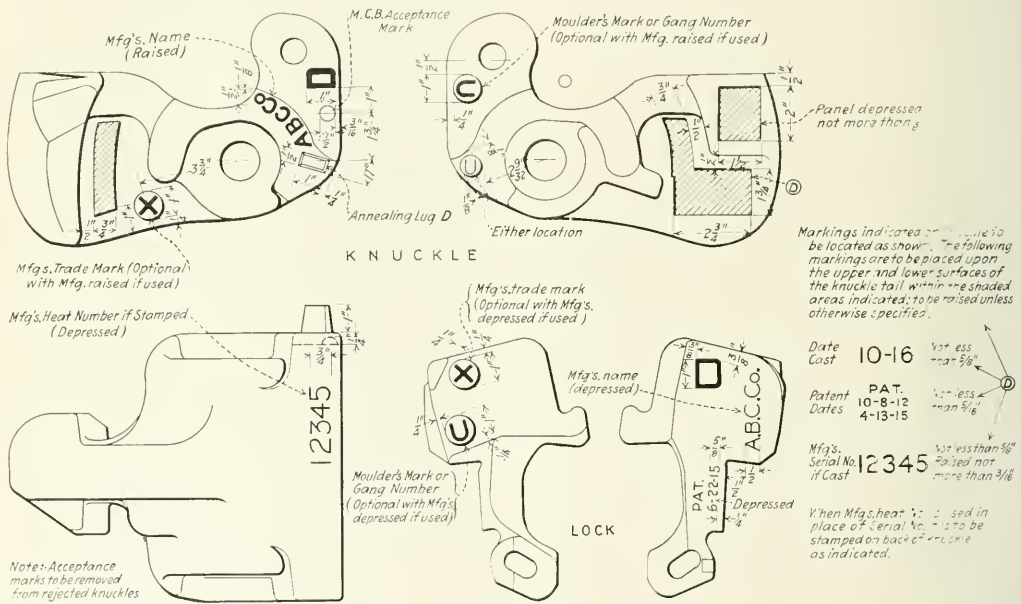

Fig. 2

conform to the requirements specified, a manufacturer may re-treat such melt, but not more than two additional times. Tests after re-annealing shall be made as specified in Sections 7 and 8.

4. *Annealing Test Lugs and Physical Test Coupons.*—(a) For the purpose of determining the quality of annealing, annealing lugs shall be cast with and attached to each casting when presented for inspection. The location of the annealing lugs shall be as shown by Figs. 1 and 2.

(b) A sufficient number of test coupons to provide a test for each melt shall be cast with and attached to the coupler bodies or knuckles when presented for inspection. The size of coupon shall be sufficient to insure a machined test piece as required in paragraph 11-c, and shall be cast on the coupler bodies or knuckles at a location optional with the manufacturer. The manufacturer shall keep a record of the coupler bodies and knuckles by serial or heat numbers which have

taken not less than $\frac{1}{4}$ in. beneath the surface. The phosphorus and sulphur content thus determined shall not exceed that specified in Section 5 by more than 20 per cent.

III. PHYSICAL PROPERTIES AND TESTS.

8. *Tension Tests.*—(a) The steel shall conform to the following minimum requirements as to tensile properties:

| | |
|--|--------|
| Tensile strength lb. per sq. in. | 60,000 |
| Elastic limit, per cent tensile strength. | 40 |
| Elongation in 2 in. per cent. | 20 |
| Reduction of area, per cent. | 30 |

(b) The elastic limit shall be determined by an extensometer.

9. *Annealing.*—To determine the quality of annealing, the inspector will have not less than two of the annealing test lugs, preferably those farthest away from each other, nicked and broken off from each bar and knuckle for the examination of the fracture. If, in his opinion, the anneal-

ing has not been properly done, he will require the castings to be re-annealed as prescribed in Section 3. If, after annealing or re-annealing, any casting is so much out of gage as to require bending in order to bring it within the gage limits, it shall be re-annealed before it shall be accepted. In event of failure of the inspector and manufacturer to agree upon the quality of annealing as determined by the fracture, the

10. *Waiving Test.*—Test will be waived on orders for less than ten complete couplers or less than one hundred parts other than bars, in which event all castings shall preferably be from the same melt, and the manufacturer shall furnish the purchaser a copy of his record showing satisfactory chemical analysis and physical properties obtained from the melt of steel in question, and the annealing lug showing his proof

Fig. 3—Normal Annealing

Fig. 4—Over Annealing

Fig. 5—Under Annealing

matter shall be arbitrated by polishing and etching a portion of the annealing lug to develop the structure and examining this under the microscope. If the structure is in accordance with Fig. 3, the material will be considered to be properly annealed, but if the structure is similar to that of Fig. 4 or 5 the manufacturer shall re-anneal the castings to produce a structure like Fig. 3.

11. *Test Specimen.*—(a) Test specimens shall be obtained as prescribed in Section 4.

(b) When sufficient coupons have not been cast a test specimen may be cut from a finished casting at a location mutually agreed upon by the inspector and the manufacturer, and this casting replaced in the lot.

(c) Tension test specimens shall be machined to $\frac{1}{2}$ in. in diameter with a 2 in. gage length, with either blank or threaded ends to suit the holder.

12. *Number of Tests.*—At least one chemical and physical test shall be made from each melt of steel represented.

13. *Tests of Knuckle Pivot Pins.*—For each two lots of 100 couplers or less, otherwise accepted, one pivot pin shall be removed from a complete coupler and subjected to the requirements of the M. C. B. specifications for heat treated knuckle pivot pins. If this pin fails to pass the specifications, all pins in this lot of couplers will be rejected. Pins thus removed from the assembled couplers shall be replaced by the manufacturer by an additional pin after the test in order to complete the coupler.

14. *Grouping.*—The manufacturer shall have the material grouped in lots of 100 complete couplers or 100 detail parts, and this will be an inspection lot. Where possible, care should be taken to put all couplers of the same melt number in the same lot. The manufacturer should endeavor to cast as many parts from one melt on a given order as is possible.

IV. VARIATIONS IN WEIGHT AND GAGE

15. *Weight.*—(a) One detail part of the lots as established by Section 14 shall be weighed and come within the limits as shown in the table. Failure of any part to come within the minimum weight shall reject that detail and each such detail in the entire lot so represented shall then be weighed and every piece less than the minimum weight shall be rejected.

(b) When couplers are purchased complete and assembled, each assembled coupler shall be individually weighed and shall come within the limits as shown in the table. Detail parts shall come within the limits as shown in the table, one coupler being dismantled in each 100 and weighed.

(c) When castings are more than the allowable maximum weight as shown in Fig. 6, and all other requirements are satisfactory, castings may be accepted at the maximum allowable weight, excess weight being at the expense of the manufacturer.

LIMITING WEIGHTS—"D" COUPLER

| | Minimum pounds | Maximum pounds | |

16. *Gage.*—(a) Castings shall conform to the prescribed limits and gages. Five per cent of each lot of 100 or less, but in all cases at least one of the complete couplers or separate parts in each, shall be completely gaged. Assembled couplers shall be dismantled before gaging.

(b) Failure of any part in the lot to come within the gages or limits shall be sufficient cause to reject the lot so represented. Failure of a lot to meet the gages will not be sufficient cause to reject a re-offering of the same lot on the same order after the manufacturer has adjusted these parts to the gages. After this adjustment by the manufacturer, the inspector will then gage ten couplers or pieces selected at random in the lot, and failure of any to meet the gages will reject the entire lot, which shall not again be offered.

(c) The inspector shall inspect and gage each coupler in a lot in order to determine if they comply to the contour gage.

V. WORKMANSHIP AND FINISH

17. *Workmanship.*—(a) The castings shall conform to the size and shape as shown on M. C. B. standard drawings and shall be finished in a workmanlike manner.

(b) When assembled, knuckles and locking pins or blocks must work freely, but the lost motion between knuckles and locks must be such that the knuckle cannot be pulled forward by hand beyond the proper contour line, but $\frac{1}{8}$ in. to $\frac{1}{4}$ in. lost motion in opposite direction is desirable.

(c) In order to determine that the requirements of paragraph (b) have been complied with, not less than ten couplers out of each lot of 100 shall be tried. Failure of any one properly to operate will be sufficient cause for rejection of the lot, but this does not prohibit the manufacturer re-offering the lot on the same order for inspection after adjustment, providing it is shown that all other requirements of the specifications have been complied with.

18. *Finish.*—The castings shall be free from blow holes, sand pockets, shrinkage cracks and other injurious defects.

19. *Sand or Shot Blast.*—All castings shall be properly cleaned by sand or shot blast or other approved process. The inspector may require that any or all castings again be subjected to sand or shot blast or cleaning in order to better examine for checks and shrinkage cracks which in his opinion would be detrimental to the strength of the castings.

20. *Welding.*—Welding minor imperfections which do not impair the strength of the castings will be permitted when done under the jurisdiction of the inspector and by a practice approved by him. All castings shall be re-annealed after such welding.

VI. INSPECTION AND REJECTION

24. *Inspection.*—(a) The inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture, test and inspection of the material ordered. The manufacturer shall afford the inspector, free of cost, all reasonable facilities to satisfy himself that the material is being furnished in accordance with the specifications.

(b) The purchaser may make the chemical test to govern the acceptance or rejection of the material in his own laboratory or elsewhere. Such chemical tests, however, shall be made at the expense of the purchaser.

(c) The physical tests may be made at the plant of the manufacturer, providing the purchaser is satisfied with the accuracy of the test machine and that the pulling speeds for determining the elastic limit and ultimate strength are in accordance with the recommended practice of the American Society for Testing Materials for two-inch test piece.

(d) All tests and inspection shall be so conducted as not to interfere unnecessarily with the operation of the works.

(e) After the inspection and tests have been completed and before castings are loaded, at the option of the purchaser, all remaining annealing lugs shall be removed and surface where located put in a workmanlike condition.

25. *Rejections.*—(a) If any of the test coupons or annealing lugs selected to represent the melt do not conform to the requirements specified in Sections 7, 8 and 9, the lot will be rejected.

(b) The basis of acceptance of physical tests shall be upon test coupons showing clean fracture without blow holes or imperfections and that break within the middle third of gage length. In event the test coupon is imperfect or breaks outside of the middle third of the gage length, additional test coupons shall be furnished, but this shall be the only cause for reheating for the physical tests, except as specified in paragraph 3 (b).

(c) All castings which show any injurious defects or do not conform to the weights or gages shall be rejected.

(d) From each bar or knuckle rejected by the inspector

under these specifications, he shall cause to be clipped the M. C. B. acceptance mark shown on Figs. 1 and 2.

Discussion and Action Taken

R. L. Kleine (P. R. R.): Five of the six coupler manufacturers are now in position to turn out the M. C. B. standard couplers. They all have received the gages and are satisfied with the specifications as they have been developed jointly between the manufacturers and the coupler committee.

F. W. Brazier (N. Y. C.): The interesting part of the coupler situation is that the government after the 51 years of existence of the Master Car Builders' Association has looked upon us as knowing what a good coupler is and adopted it. May I ask if the government accepted No. 10 contour line?

Mr. Kleine: As far as I know they have adopted No. 10 couplers as standard for cars.

Mr. Brazier: I think we may as well adopt the No. 10 contour line as we must have it.

(F. Giles (I. & N.)) Shortly after the convention of 1916 we built a large number of cars to which we applied this standard coupler and it has proved highly satisfactory. I have no report of a single failure of one of the couplers since. It has practically eliminated broken knuckle pins where we had thousands of them with the old type.

A. Kearney (N. & W.): I move that each part of the report as the committee has recommended to be presented to letter ballot be so handled.

The motion was carried.

The Report of the Tank Car Committee

FOR THE YEAR 1918 the Tank Car Committee does not recommend that the existing specifications be disturbed.

Owing to the conditions brought about by the war, it has been necessary to suspend some of the requirements, as, for instance, that of the use of large quality steel in the construction of Class III tanks, and that of hydraulic retests of all classes of tanks, the former until July 1, 1919, and the latter until January 1, 1920.

Safety Valves

Leakage.—The principal complaints regarding the details of the tank cars have come from the field producing casing head gasoline, and, in brief, were that the safety valves were not tight, and did not adequately relieve the pressure, as it was claimed locomotive pop valves of the same size would do.

The committee secured a number of sample safety valves and subjected them to tests, mounting them on a large drum and supplying steam from a locomotive boiler. The committee has in its possession an extensive report, giving the performance of each of these valves as originally assembled, and also as reassembled with parts of the different valves. As this report is very voluminous it is not included here, but a copy will be filed with the secretary of the Association.

It developed that all of the valves tested had a capacity very much better than any locomotive pop valve of the same diameter, for the reason that the lift was several times as great. The complaint regarding the lack of capacity was evidently made under a misapprehension, due to the method of making the test. If the valve is mounted on a container of small volume, the initial movement of the valve relieves the pressure, so that the amount of lift is hardly measurable. On the other hand, if the container is of large size, as in actual service, the lift is very great, one pound increase above the popping pressure producing in the best valves a vertical lift of about 0.3 in. This is shown by diagram P.2738. For comparison, diagram P.2745 is given, the valve having the same housing, but a clapper from which the maker had entirely omitted the outside huddling lip. (See Fig. 1.)

It was found that the standard dimensions of the safety

valves are not always followed, and that in the case of individual valves the deviations resulted in a reduction of the possible capacity by over one-half.

During the tests it developed that there was a very close relation between the inner edge of the lip at the lower periphery of the clapper and that of the outside corner of the seat. The best performances were obtained when the plate of the valve seat and that of the under side of the lip most nearly coincided, in which case the actual leakage was that due to the difference between the out-

Fig. 1—Safety Valve Lift Tests

side diameter of the seat and the inside diameter of the lip on the clapper.

So far as the tests have gone no valve has proved to be absolutely tight up to popping pressure. After the seats were ground the valves were assembled for test on the drum, and water poured into the cavity above the clapper. The leakage was principally in the form of isolated bubbles to within a few pounds of popping pressure. The point at which leakage ceased when the valve closed differed with each valve.

A conical valve will fit a conical seat only when the axes strictly coincide, the reason being that the only circular conic section is that normal to the axis. With any tilting the section becomes elliptical. This explains why valves are

all conditions. The governing requirement then was that the valve should adequately vent the tanks in case they were exposed to fire. It was not expected that higher settings would be required and the valves were designed from the safety standpoint. With the springs used the clearance around the wings of the valve was ample. When it became necessary to provide for the 25 lb. setting it was felt that the changes should, if possible, be confined to the substitution of a heavier spring than that in the original design. The outside diameter of the coil being practically fixed by the casing, an increase in the diameter of the wire reduced the

does not feel warranted to accommodate any change from the present standard angle of 45 deg.

Experience has developed that some of the details of the valve shown by Fig. 9-A of the specifications should be modified.

The drawing of the spring follower shows three small lugs which engage the flat faces of the nut on the bottom of the valve stem. It was believed that the valve could be rotated on its seat without causing the stem to turn in the threaded nut, but it has been found in practice that turning the valve around on its seat has a tendency to loosen the bottom nut, thus changing the setting of the valve. With existing valves this can be most easily provided against by the use of two nuts jammed on the bottom of the thread, with a washer above the upper nut of sufficient thickness to prevent the lugs on the under side of the follower engaging the nuts. For future valves it is recommended that the depth of the base be increased from $2\frac{1}{2}$ in. to 1 $\frac{1}{2}$ in. as shown in Fig. 9-A, which will eliminate these lugs.

The angle of 45 deg. for the under side of the valve stem head has been indicated.

Safety Valve Applied to Top of Dome. Fig. 10-A. The thickness of the skirt below the threaded portion of the spring case has been reduced from $2\frac{1}{2}$ in. to 5/16 in., without changing the inside diameter, because of complaints that owing to foundry variations the skirt would not in all cases pass through the threaded opening in the collar on the dome, except by machining all over. As the skirt has no function other than to guide the lower end of the spring, there is no reason why the $\frac{1}{8}$ in. additional freedom should not be allowed.

It has developed that the arrangement of the inside radial ribs, shown by section B-B of the spring case, results in foundry difficulties, and that to avoid these some valves have been made with four ribs instead of eight as called for. As these ribs are intended to center the spring, none of them should be omitted, but their form has been modified as shown on the drawing of the case in Fig. 10-A to provide proper draft in molding.

The surfaces to be dressed (D) have been indicated on the drawing of the spring case. These are the same as in Fig. 9-A, and should have been shown when Fig. 10-A was prepared.

Apparatus for Testing Safety Valves in Place on Cars. It has been found that while the apparatus shown by Fig. 13 of its specifications, is sufficiently strong for testing valves with 12-lb. setting, it should be strengthened for use with the 25-lb. setting, and the committee has revised the design which it recommends be substituted for the present design. The figures for the "Scale Reading in Lb.", page 42, should be changed in the case of the 25-lb. setting to a minimum of 450 and a maximum of 550, to agree with those on the revised print which are correct for the 25-lb. tolerance adopted last year.

Class V Car

During the year a number of Class A cars have been built for handling export cases and the committee hopes that in time such loaded trucks will be available for ordinary commercial shipments. While the specifications call for a standard test of 30 lb. per square inch the manufacturers of their own volition have been making the cylinder tanks to 50 lb. pressure.

The committee has approved designs for the safety valve, the inlet and outlet pipes, their attachment to the dome head, and the restraining bar.

Section 20 (10) of the specifications provides that the safety valve shall be of the levered type. In order to get a satisfactory arrangement of the valve on the dome and the committee suggested a design of safety valve with a screw fit, however, and this could be safely used on the safety valve

Fig. 10—A—Corrected Drawing of Spring Case for 5-inch Safety Valve Applied to Top of Dome

clearance between the head of the coil and the wings of the valve encircled by the coil. When the workmanship of the springs is good not much interference need be expected, but with carelessly made springs there is probably interference explaining why valves tight in one position may leak when turned to another.

One of the valves tested was set 15 deg. to the vertical. This valve stuck to a dangerous extent, and the committee

is not manipulated after being applied as is the case with the inlet and outlet valves. To cover this feature, the committee recommends that the word "preferably" be inserted between the words "shall" and "be", so that the requirement will read: "Valve shall preferably be of the flanged type, etc." The requirement that the design of the valve must be approved, remains.

The government in ordering tank cars for general service has accepted the Master Car Builders' Specification for Class II car.

The report is signed by: A. W. Gibbs, chairman, Pennsylvania; Thomas Beaghen, Jr., Union Tank Line; C. E. Chambers, C. R. R. of N. J.; Wm. Schlafge, Erie; S. Lynn, P. & L. E.; John Purcell, A. T. & S. F., and O. J. Parks, General American Tank Car Corporation.

Discussion and Action Taken

C. E. Chambers, (C. R. R. of N. J.): The committee has gone to a great deal of trouble and spent much time trying to ferret out the trouble with the safety valves. It found large spring irregularities and irregularities in the material and sizes. It has been very difficult to find a spring that would pop at the proper pressure and close at any given pressure. Several of the springs would be almost tight up to 20 lb. and then commence to blow a little bit and let loose at 25 lb. They would not seat until they got down to 3 lb. pressure with quite a considerable blowing all the way down. The tests are still being carried on.

Mr. Chambers moved that the association grant \$500 more for the continuing of this test. The motion was carried and the report was accepted.

Report on Train Brake and Signal Equipment

THE COMMITTEE submitted the following report:

Part 1—Water Raising System

J. E. O'Hearne, superintendent motive power, Chicago & Alton, having reported improper performance of brakes on passenger cars having a water-raising system in conjunction with L triple valves and suggesting that the air supply for the water-raising system on cars with this type of triple valve be taken from the air pipe leading from

the object being to have one fixed charge for all triple valves applied and a fixed credit for all valves removed, regardless of conditions, so as to facilitate billing.

The committee does not concur in this recommendation for three reasons:

First: the charge should be proportional to the service rendered.

Second: the inauguration of such a scheme would necessitate a difference between charge and credit which would be in excess of the present charge for cleaning and oiling only, and less than the present permissible charge for repairs, thereby tempting a road handling foreign cars to neglect entirely the question of repairs and to confine attention to the more profitable job of cleaning and oiling for which the authorized charge would be excessive.

Third: granting that the proposed method if adopted would not encourage "bad practice" on the part of repair men, considerably more time and labor would be required than is now available in arriving at a satisfactory credit and charge price.

Part 3—"A" and "B" End Double Cylinder Passenger Cars

A non-member of the association having raised the question as to how the A and B ends of passenger cars having two brake cylinders, with their pistons travelling in opposite directions, could be determined, the subject was referred to this committee, evidently because of the brake cylinder and direction of piston movement being used as a means of designating the A and B end of single cylinder cars.

The committee could devise no practical scheme whereby the A and B end of double cylinder cars could be properly designated by any part of the brake.

Part 4—Triple Valve Test Rack

The drawings shown in Fig. 3 between pages 474 and 475, 1917 Proceedings, shows an operating handle R which, as far as the committee has been able to learn, has never been made a part of the test rack, what is known as a "blocking device" being used instead. As the blocking device serves every purpose anticipated through the use of the operating handle referred to, and is in quite general use, it is the recommendation of the committee that the triple valve test rack drawing, Fig. 3, be revised in accordance with exhibit A of this report, and that the first paragraph at the top of page 484, 1917 Proceedings, pertaining thereto, be revised to read:

"During this test there must be a steady exhaust of air from the vent port of valve B to insure the proper differ-

T. L. Burton
Chairman

the triple valve to the supplementary reservoir, adjacent the former, the subject was considered in conjunction with practically all types of passenger brakes. The committee believes that, as a fundamental principle, when the water-raising system is used on cars whose air brake equipment includes an air reservoir, which is supplementary to the auxiliary reservoir, the air supply for the water raising system should be taken from the reservoir in which the air pressure is not reduced during service brake applications. On this basis the air supply should be taken from the following points in the brake system with the types of brakes mentioned below:

- (a)—Schedule PM—from the auxiliary reservoir.
- (b)—Schedule PC—from the emergency reservoir.
- (c)—Schedule UC—from the emergency reservoir.
- (d)—Schedule LN—from the supplementary reservoir.

Where a cut-out cock is used in the brake system for cutting out the supplementary or emergency reservoir, the air connection for the water-lifting system should be made between the reservoir cut-out cock and the triple valve or control valve.

Part 2—Charges and Credits for Repairs to Triple Valves

J. J. Tatum, superintendent freight car department, Baltimore & Ohio, suggested the advisability of a fixed charge and credit covering the substitution of a triple valve in good order for a defective valve, or a valve due to be cleaned and lubricated, in lieu of a standard charge for cleaning and oiling, with additional charges for repairs.

ential being maintained on the triple valve piston. If, in making this test, the triple valve for the 8 in. cylinder releases or indicates excessive ring leakage make another test, after blocking the triple valve piston in service lap position."

Part 5—Cleaning Air Brakes

At the last convention of the Air Brake Association, the following resolution was adopted:

"It is earnestly and unanimously recommended that the Master Car Builders' Association quickly supplement interchange rule No. 60, at least for the duration of the war, so that foreign car brakes bearing cleaning stencils nine months old or more may, when on repair or other tracks where the work can be done, be cleaned and repaired and the proper charges made against the owning road.

"This does not change the present rule which makes a

for doing the work properly but are not permitted to bill car owners for similar repairs to foreign cars, unless the brakes are tested and their condition determined before cleaning the cylinder and triple valve. The recommendation of the Air Brake Association also harmonizes with M. C. B. rule No. 1.

The report was signed by T. J. Burton, chairman, consulting air brake engineer, N. Y. C.; B. P. Flory, N. Y. O. & W.; J. M. Henry, P. R. R.; L. P. Streeter, Ill. Cen.; R. B. Rasbridge, P. & R.; W. J. Hartman, C. R. L. & P.; and G. H. Wood, A. T. & A. T.

Discussion

T. J. Burton (N. Y. C.): Mr. Henry suggested that the committee should have recommended another triple valve test rack and should have made a definite recommendation on designating the A and B ends of double cylinder pas-

Exhibit "A"—Assembly Diagram, Triple Valve Test Rack. Fig. 3.

twelve months old stencil or over an ineffective brake and permits switching of the car at will to the repair track. It does not suggest that cars stenciled nine or ten months be switched to repair tracks, it is merely to take the greatly needed advantage of such cars being on tracks where the work can be done to do it, without in two or three months having to switch them and take them out of service when they are so greatly needed, and incur the additional expense of switching, which is more than the cost of cleaning."

The committee has carefully considered the above resolution and earnestly recommends its early adoption by the M. C. B. Association, if concurred in by the proper committee on rules. In fact the practice on many roads is to clean, oil and test brakes on home cars when the stencil dates are approximately nine months old, providing the car is out of service where help and facilities are available

single cars. Unfortunately he could not be present at the time these subjects were discussed or I think he would have been fully in accord with the views of the Committee.

L. H. Goodrow (C. & N. W.). The charge for cleaning, including the testing of the triple valves and also including the repairs, is the matter that was left open in connection with the report of the Arbitration Committee. I get the impression from Mr. Burton's remarks that his committee was going to make a recommendation as to a charge for this, but I see instead it has discouraged the practice. I am somewhat surprised at the reason that it gives. I do not believe that the question of charges is going to have anything to do with the working of the triple valve, especially under present conditions. It is to the benefit of no one to take advantage of an opportunity of not doing honest work.

The Arbitration Committee went very carefully into this matter and the arbitrary figure set for doing this work is based on several thousand cars and the experience of three or four roads. *I feel that so long as charges for work are going to be continued the divided costs as now shown in the rules should be withdrawn and the arbitrary figures recommended in the Arbitration Committee's report adopted.*

T. L. Burton: As was stated the committee felt in arriving at the conclusion in Part 1 of the report, that any so-called average price that might be fixed for doing anything to a triple valve, from cleaning and oiling it up to and including heavy repairs, would not result in the maintenance of the equipment to the standard at which it should be maintained. The price for cleaning and oiling a triple valve, is about 50 cents. We know that the cost of repairs, exclusive of bushings and parts mentioned by the Arbitration Committee, will run as high as \$10. That is the actual cost of doing the work, not the cost proposed in the M. C. B. rules. Do you think a man will hold himself down to doing a two dollar job and get a dollar for it, when he can keep busy on a 50 cent job and get 75 cents for it? The result as we see it will be that there will be no repairs made, except in remote cases, and it was with the thought of at least trying to maintain a reasonable standard that I raise the issue.

T. H. Goodnow: The committee fully understands that

an individual triple might cost \$8, and also took into account the hundreds of triples that would have only cleaning and testing, at an average price of \$1.10. I feel assured that Mr. Burton is overlooking the fact that there is only one railroad and one company's cars at the present time.

T. L. Burton: I am not overlooking that.

T. H. Goodnow: I think that it is entirely a matter of honesty. The Arbitration Committee stands back of the arbitrary figure of \$1.10 as representing the average cost, and in that we have the advantage of the knowledge of the special committee which for some time has been checking this work all over the country.

J. J. Hennessey (C., M. & St. P.): It seems to me that Mr. Burton has lost sight of the fact that the basic principle of the M. C. B. rules is common honesty. If you wipe that out there is nothing left to the rules.

E. W. Pratt (C. & N. W.): If this is a matter of averages why is any charge made at all?

Mr. Goodnow: There has been no authority given up to the present time to eliminate charges for car repairs and the charge in question is an item of car repairing and therefore so far as we know to be continued at the present time.

Action Taken

The recommendation of the Arbitration Committee was accepted.

Report on Train Lighting and Equipment

J. R. Sloan
Chairman

THE committee, as recommended in last year's report, took up the question of standardization of ball bearings for axle generators. The 412 bearing in ball annular size had been made recommended practice for truck hung axle generators and had been generally adopted by the generator manufacturers previous to the advent of the body hung generator. When the committee took the matter up it found that body hung axle generators were on the market, using the following sizes of ball bearings, viz., 304, 307,

308, 407, 408, 409, 410, 411 and 412, a total of ten different sizes.

The committee obtained from the axle generator manufacturers all data relative to the various types of axle generators they were building or contemplated building, necessary to determine the proper size of bearing to use. This information was transmitted to the ball bearing manufacturers, who formed a committee and made recommendations as to the size of bearing that should be used in each case.

A joint meeting of the representatives of the ball bearing manufacturers, axle generator manufacturers and this committee was then called. At this meeting the following recommendations were unanimously adopted:

1. *Truck hung generators:* All truck hung generators should use the 412 size bearing.

2. *Body hung generators:* (a) Body hung generators requiring, to transmit the necessary power, a 3 in. belt or smaller, to use the 407 size. (b) Body hung generators

requiring, to transmit the necessary power, a 4 in. belt, to use the 409 size. (c) Body hung generators requiring, to transmit the necessary power, a 5 in. belt, to use the 412 size.

3. The same size of bearing should preferably be used on both pulley and commutator ends, but if desirable from a design and manufacturing point of view, the following sizes of bearings may be used at the commutator end: (a) Those requiring to transmit the necessary power, a 4 in. belt, may use a 407 bearing. (b) Those requiring to transmit the necessary power, a 5 in. belt, may use a 409 bearing.

After arriving at this agreement, the Franklin Railway Supply Company discovered that to use this 407 bearing on their T-35 generator would entail a redesign and would result in a design that would not be in proportion to the balance of the equipment. They, therefore, requested that they be allowed to use the 404 bearing on this size of generator, to which the committee unanimously agreed.

The committee would, therefore, recommend that the following sizes of ball bearings be accepted as recommended practice for axle generators:

| TRUCK HUNG | BODY HUNG | | | | | Franklin Railway Supply Co. |
|------------------------|--|------------|---------|------------|--------------|--------------------------------------|
| | WIDTH OF BELT REQUIRED TO TRANSMIT NECESSARY POWER | | | | | |
| | 5 Inch— | | 4 Inch— | | 3 Inch | |
| Both Ends | Pulley | Commutator | Pulley | Commutator | Both Ends | T-35 Both Ends |
| 412 | 412 | *412 †409 | 409 | *409 †407 | 407 | 404 |
| Preferred, †Alternate. | | | | | | |

*Preferred. †Alternate.

The committee also took up the question of the rating of axle generators referred to in last year's report and have made a series of tests as to the temperature attained by the generator in service on the road and on the bench. While these tests have been completed, the work was finished so recently that the committee has not been able to study it and will, therefore, present a report on this subject next year.

The members of the committee have been asked as to what was the intent of its recommendations in the 1917 report as to changes in the Passenger Car Rules. In order to make the matter clear we would advise as follows: 1. That

the rate per car mile which the owning road was permitted to bill the handling road was intended to cover all expense in connection with electric car lighting. 2. That all expenses incurred, while the car was on a foreign road, in maintaining the electric car lighting equipment, were chargeable against the owner unless due to unfair usage, derailment or accident.

The report is signed by: J. R. Sloan, chairman, Pennsylvania; C. H. Quinn, N. & W.; D. J. Cartwright, Lehigh Valley; E. W. Jansen, Illinois Central; E. Wanamaker, C. R. I. & P.; Alex. McGary, N. Y. C.; L. G. Billan, B. & O.

Discussion and Action Taken

W. R. McMunn (N. Y. C.): Is it the intention that we should charge for inspection as well as repairs?

J. R. Sloan (Pennsylvania): All expenses should be included. There is a lot of inspection made when the car is on a foreign road and considerable labor expended in making such inspection when it is not necessary. Where inspection is necessary I think the labor should be charged against the owning road.

Mr. McMunn: I think it is entirely improper and in conflict with rule No. 1 of the M. C. B. Passenger Rules. I object to it further on account of the impracticability of

checking the character of the inspection made to the electrical apparatus on the cars and because of the fact it will complicate the car repair bills.

I. S. Downing (Big Four): I move that this matter be referred to the arbitration committee.

F. M. Waring (Pennsylvania): The inspection of electric lighting equipment is done by special men—experts—and the work is entirely different from the ordinary run of inspection for safety. I think it is a proper charge against the car owner.

Mr. McMunn: I think the proper thing is to let those men make the inspection and if they find defects in making the inspection let them charge for any repairs.

C. I. Giles (L. & N.): There is not any more reason why there should be a charge made for inspecting electric lighting equipment than for making a charge for inspection of any other part of the car.

M. R. Reed (Penna.): I do not think that the cost of inspection of this electrical equipment should enter into the expense chargeable against the owner.

Mr. Sloan: The only inspection we had in mind was inspection made at a terminal enroute and was not to be made unless advance information was received that the car was in trouble. (Mr. Downing's motion was carried.)

Report on Standards and Recommended Practice

T. H. Goodnow
Chairman

THE FOLLOWING is a report covering such subjects as have been referred to this committee during the past year:

Wheel Defect, Worn Coupler Limit, Worn Journal Collar and Journal Fillet Gage. (Standard.) Page 440. Sheet M. C. B. 16. A member suggests that the standard wheel defect gage be changed to show a radius of 5/16 in. at the lower right-hand corner and a radius of 3/8 in. at the lower left-hand corner for the purpose of checking the fillets of journals. The

committee concurs in this suggestion.

Box Car Side Door Fixtures. (Standard.) Page 715. Sheet M. C. B. 50. A member calls attention to considerable trouble being experienced with the breaking of house car door fastenings, due to the failure of the door hasp through the eye-hole. The committee refers this to the Committee on Car Construction.

Center Plates. (Recommended Practice.) Page 545. Sheet M. C. B. 4. A member recommends that this be advanced to standard, eliminating the center plate shown on Sheet M. C. B. 20. The committee refers this to the Committee on Car Trucks.

Definitions and Designating Letters of General Service Freight Equipment Cars. (Recommended Practice.) Pages 738-743. Through the secretary, a communication was received from the General Chemical Company, requesting the appointment of a classification for a steel tank of M. C. B. construction (Class 2) equipped with a combination concrete and lead lining. The committee concurs, and suggests the following:

TL—Lead Tank. Of same general construction as oil tanks, but having lead lining.

The report is signed by: F. H. Goodnow, chairman, C. & N. W.; C. E. Fuller, Union Pacific; A. R. Ayers, N. Y. C. & St. L.; O. C. Cromwell, B. & O.; O. J. Parks, German-American Car Lines; R. E. Smith, Atlantic Coast Line; C. F. Thiele, Pennsylvania Lines; and A. G. Trumbull, Erie.

Discussion

T. H. Goodnow, (C. & N. W.) chairman: Since this report was made, the question of the change in the width of the 4 1/4-in. by 8-in. and 5 1/2-in. by 10-in. journal bearings, as made last year, has been brought to the attention of the committee on standards. That change was made on the recommendation of J. T. Wallis, chairman of the Car Truck Committee. This was brought up by a number of different members of the association and by C. B. Young who is in charge of the tests and inspection at Washington. Mr. Young wrote a letter to the committee as follows:

"I wish to call your attention to the fact that the M. C. B. Proceedings for 1917 show that the bearings for 5 1/2-in. by 10-in. and 4 1/2-in. by 8-in. axles were changed so that the over-all width of the bearings was increased to 5 7/8 in. and 4 3/4 in., respectively. The drawings for the gages for these bearings, shown on M. C. B. Sheet 14, have not been revised since 1913, and therefore, are for the narrower or old style bearing. Also the wedges for these bearings have not yet been changed in the M. C. B. Proceedings for 1917. If I read the drawings in the M. C. B. 1917 Proceedings correctly the slope of the sides will not be the same as before, and, therefore, the gages and wedges will not fit and will result in needless difficulty and confusion."

Prior to that time I had referred the matter to Mr. Wallis, as it originally came up through his committee, and I have received the following letter from Mr. Wallis:

"In regard to increasing the over-all width of 4 1/4 in. by 8 in. journal bearing shown on M. C. B. Sheet 6 from 4 1/4 in. to 4 3/4 in., and increasing the over-all width of the 5 1/2 in. by 10 in. journal bearing shown on M. C. B. Sheet 12 from 5 1/2 in. to 5 7/8 in., so as to provide sufficient material

Page 442—*Material and Chill.*

Paragraph (b) It shall not exceed 1 in. in the middle of the tread nor be less than 3/8 in. in the throat for wheels having a maximum weight of 625 lb.

Paragraph (c) It shall not exceed 1 in. in the middle of the tread nor be less than 7/16 in. in the throat for wheels having a maximum weight of 700 lb.

Page 444—*Marking*

Paragraph 15, Marking (The last sentence of this paragraph should read as follows:) Wheels conforming to the requirements and furnished under this specification shall have plainly formed on the outside plate, M. C. B. 1909 for wheels of nominal weight of 625 and 725 lb., and M. C. B. 1917 for wheels having a nominal weight of 700 and 850 lb.

Sufficient time has not elapsed since the adoption of the new recommended practice cast-iron car wheels of 700 lb. and 850 lb. weight to draw any conclusions based upon actual service, and the committee is, therefore, not in position at this time to recommend changing the shape of the plate or the weight of the 625 and 725 lb. wheels.

The report is signed by W. C. A. Henry, chairman, Pennsylvania; C. W. Van Buren, Canadian Pacific; J. A. Pilcher, N. & W.; O. C. Cromwell, B. & O.; J. M. Shackford, D. L. & W.; H. E. Smith, N. Y. C.; C. T. Ripley, A. T. & S. F.; and F. T. Slayton.

Action Taken.

The report was received with no discussion.

Other Business

F. W. Brazier (N. Y. C.) offered a resolution as follows: "Resolved, when empty cars of 60,000 lb. capacity or over are placed on shop or repair tracks for repairs they must not be returned to commercial service until they have been placed in condition to meet full M. C. B. inspection without exceptions, including United States Safety Appliances." This resolution was adopted.

At a meeting of the Executive Committee of the Master Car Builders' Association, I. S. Downing of the Big Four was made third vice-president, vice George W. Wildin, who has left railroad service. T. H. Goodnow, (Chicago & North Western) was appointed a member of the executive committee to fill the unexpired term of Mr. Downing. The personnel of the committees will remain unchanged for the coming year. The dues of association will remain the same as last year.

The secretary read a letter from R. W. Schulze, superintendent car department, St. Louis-San Francisco, asking that the association make some recommendation either for or against the application of switch chains on twin loads.

It was voted that the provision of the M. C. B. rules requiring defect cards for switch chains delivered with double loads should be eliminated.

It was voted to submit to letter ballot the matter of making metal spacing blocks behind the coupler horn nontandatory.

Wm. Schlafge
President, M. M. Association

F. H. Clark
First Vice-President, M. M. Association

Master Mechanics' Association Proceedings

Includes a Timely Discussion on the Conservation of Fuel
on Locomotives and in Power Plants

THE REPORTS of the Master Mechanics' Association were presented in conjunction with those of the Master Car Builders' Association at the joint meeting of the executive committees and representative members of the two associations at Chicago, June 19 and 20. In the absence of President Schlafge and Vice-President Clark, W. J. Tollerton, second vice-president of the association, officiated.

Mr. Schlafge Resigns

Mr. Schlafge in the following letter to the association tendered his resignation:

"In view of the decision to continue the present officers of the Association for the period of the war, I feel obliged to resign the office of president, and respectfully request that it be accepted as of June 19, 1918.

W. J. Tollerton
Second Vice-Pres. M. M. Assn.

C. F. Giles
Third Vice-President, M. M. Assn.

Angus Sinclair,
Treasurer, M. M. Association

"This action is taken with the deepest regret and reluctance but personal and official reasons, the weight of which I am entitled to judge, commend this course and I am committed to it irrevocably.

"May I be permitted to thank the members of the Association for conferring upon me the honorable trust that I now return to them and, in a more intimate sense, to express my gratitude as well as my thanks for the splendid support that I have received from all of the officers and members in the past two years. This chapter of my life will stand in undimmed letters to the end and that my interest in the affairs of the Association shall never abate."

Mr. Chambers: I am sure we all regret to see the stand Mr. Schlafge has taken. The executive committee, or joint executive committee, owing to many changes that were taking place from time to time and the difference in handling affairs that have come up, have deemed it wisest to continue with the present officers and make as few changes as possible until things assume a more quieted condition.

In the absence of Mr. Schlafge, Mr. Tollerton read his address to the association.

President Schlafge's Address

In this passion time of the world, in this greatest of all crises, not only individuals, but every association of individuals and every agency of human thought and action, especially those intimately related to the vital necessities of the nation's life must pass through a course of searching self-inquiry to determine to what extent the individual, or the association, or the agency is responsive to the full duty that rests upon him or it. In harmony with this thought, it is pertinent to recall that the test of the capacity of any individual or of any organization is his or its reaction to supreme emergencies. This association is an organization purporting to promote the interests of rail commerce in respect, primarily, of mechanical operation and the problems thereto related arising in the conduct of that vast enterprise.

The test then is—"Has this association, with exactly 50 years of experience behind it, so conducted its affairs; has it so impressed itself upon the thought of the railway world; has it so utilized its opportunities that it has in fact achieved the leadership that reasonably and logically could have been expected, so that in the supreme emergency of the nation's need, the director general of the national railways could turn to it as a perfectly organized and efficient instrumentality of railroad work and find in its proceedings solutions of many of the problems that he had to solve, and an active, smoothly running agency to put into effect the conclusions of its experience and to give constructive advice?" Did it so shape its course to render assistance to the end, in sight for many years, of a thorough co-ordination of the transportation business of the country in the interest of its people?

Candor compels the admission that while the association has justified its existence it has not taken the high place to which it might have aspired. It is only just to say, however, that the limitations upon its proper expansion and development were largely beyond its control because of the general failure of railroad interests to recognize the fundamental principle that the transportation business of a nation is a natural state monopoly and that, sooner or later, a progressive state will either eliminate the control of its transportation lines or own them.

To far-seeing men, it has been clear for many years that even peace conditions demanded the nationalization, either under private control or public ownership, of all the transportation agencies of this country. It was, therefore, apparent that standardization of the instrumentalities of commerce, as well as of methods was inevitable if the highest efficiency were to be attained and the nation be well served according to its constantly growing business expansion. This association practically failed to recognize the ineluctable trend

of events so that when, as a necessary war measure, the National Railway Administration demanded a standard locomotive, the association had no standard to offer.

All the voluntary railway associations have failed, more or less, to do the good they might have done for the simple reason that, as units, or collectively they had no authority to constrain the railroads to the standards they did prescribe. This brings us to the question of the future of the associations.

Both major mechanical associations have been continued by the director general of railroads as railway organizations to the support of which the carriers may contribute. It is obvious that, if the approval is to stand indefinitely, both associations must bring themselves into harmony with the demand that these, and all similar railway agencies, shall be fully co-ordinated under a plan that will insure the achievement of stated and definite ends.

Conceding that co-ordination does not necessarily imply consolidation, it seems, nevertheless, that the logic of the situation might justify an institution to be called, for example, the American Railway Mechanical Association, organized to effect definite and highly useful ends as a unit. The institution of a new organization to cover the field now occupied by two can be effected without impairing the usefulness of either; on the contrary, their usefulness would be increased.

I earnestly commend to the association the wisdom of complete responsiveness to the letter and spirit of the director general's desire that the work of all such organizations be brought into close co-ordination, clearing their conclusions through one central authoritative body which, it is submitted, should be the American Railway Association. There is a growing conviction in many quarters that sentiment is the chief obstacle in the way of consolidation and, however admirable sentiment may be in its proper place, it is scarcely entitled to any consideration here.

It is suggested that a plan can be worked out, using the American Railway Association as the clearing house, whereby the results of all railway experience can be crystallized into settled practice and whereby the sum of knowledge may be increased and an organization perfected meriting at least a quasi public footing, that will be able and qualified to render valuable constructive service to the nation in time of peace as well as war.

Let me urge with equal earnestness the necessity of accepting and in every way encouraging the principle of the standardization of locomotives. There is little merit in the argument that standardization implies the end of improvement and progress. It would and ought to stop ill-advised and ill-considered innovation. By accepting the principle of standardization and applying it to details of construction, a start will have been made that will rapidly reduce the ranks of those real obstructionists who are always on the job to cover every sign post on the road to progress with the legend "It can't be done."

With the authority of the government back of this proposition and crediting its proponents with a full appreciation of the value, not to say the necessity, of locomotive efficiency, may we not still dismiss all fears that evolution will be a violent dither or that any substantial discouragement will be given to American enterprise to continue to apply its genius to keep the development of the locomotive abreast of the improvement that America shall make in all other directions. Also it should be kept in mind that whatever the ultimate fate of the railroads may be, all signs indicate that they will be operated in the future as a national system and the efficiency of their whole operation rather than of a given portion of it will be the test.

It is quite generally agreed that the present is inopportune to take such a radical step on account of the delay it will cause in deliveries. The force of this objection is dissipated

by the reflection that the duration of the war is problematical and that the present is the very latest time to take essential steps to guard the future. Standardization of ships and submarine chasers has justified itself—Why not locomotives?

The association has done much valuable work through its various standing and special committees. Many of the more important committees covering assignments of live subjects such as Fuel Economy and the related subjects of Mechanical Stokers and Powdered Fuel and Superheater Locomotives and Train Resistance Tonnage Rating, as well as the essential committees on Standards and Recommended Practice will be asked, doubtless, to collaborate with agencies created by the National Railway Administration.

All endeavors within the scope of the association's activities are indissolubly joined to the dominant issue of the national defense and it cannot be stated too often that the yard stick by which effort was measured in times of peace is utterly inadequate for application to the quality and quantity of endeavors that America now expects. A whole-hearted responsiveness to the plans and policies of the National leadership is the duty of every citizen and if more may be expected of any class than of another, it surely may be expected from

those like ourselves who are actually in highly essential government service.

We stand here today in the place of that small group of forehanded men who a half century ago conceived and organized this association. Through all the years that have passed since then, it has held true to its original purposes and ideals. If it has failed in any respect to achieve the commanding position that it might have held, it must be granted that from its pioneer days it has been an active constructive force in its own field. Our faces must now turn hopefully to the future and, with the high inspiration of this stirring age to guide and encourage us, resolutely "carry on" and make up the lost opportunities of the past days.

Report of Secretary

The secretary reported the following membership: Active members, 902; representative members, 98; associate members, 17; honorary members, 45; and a total membership of 1,062. The total receipts during the two years ending June 18, 1918, were \$16,308.56; disbursements, \$12,809.35, leaving a cash balance of \$3,499.21.

The treasurer reported a back balance of \$2,115.50.

Report of Committee on Fuel Economy and Smoke Prevention

Front End of Norfolk & Western
Maillet

WE are here, not in our former capacities as the officers of individual railroads, but as officers of the government, responsible no longer to private corporations for efficient performance of duty, but instead to the United States Railroad Administration and in a larger sense to the public, whose servants we are. The committee considers that it should first point out the added duties and obligations which the new conditions have imposed upon us, with the hope that we may stimulate the

sympathetic co-operation of every man in the mechanical department who is responsible for the use of fuel.

Never before in the history of the nation has there been a time when the fuel supply was generally inadequate to the demand, and never before was it so essential that our industries should be maintained at their maximum rate of production. It is realized now that upon the United States rests the hope of all the free people of the world, and it is not too much to say that the realization of this hope depends in no small degree upon the effective distribution and use of the available fuel supply.

According to the official figures in 1917 the railroads consumed 158,000,000 tons of coal. Estimates of the Fuel Administration indicate that the consumption in 1918 will aggregate 166,000,000 tons, an increase of seven per cent over last year. It is believed that this entire estimated increase can be avoided and a substantial saving effected over last year if the earnest co-operation of every railroad employee can be enlisted in the application of individual economies.

A few days ago the United States Fuel Administration

in an official statement said that "A saving of 60,000,000 tons of coal was the one possible avenue of escape from national disaster. The necessities of war must be supplied. The coal deficit must inevitably come out of the necessary fuel for non-war industries. These industries employ millions of our population and furnish the backbone of our national wealth. Factories will shut down and men be out of work in proportion to the coal deficit. Every ton of coal saved will keep 50 workmen from idleness and permit additional creation of several hundred dollars of national wealth.

Of the 60,000,000 tons of coal that the Fuel Administration states it is necessary to save, a million and a quarter tons per month could be saved by simple methods of economy that any man using fuel on a railroad could at once apply, without a minute's delay for additional appliances or personal instruction. These men have only to be impressed with the importance of the subject to make this potential saving a practical reality and the committee believes that every road foreman, supervisor, traveling engineer and fireman should immediately be acquainted with the situation so that its importance may be understood by every engine crew in the country.

But this probable shortage in the supply is not the only factor that demands our consideration. The fact is, that in the opinion of the Fuel Administration it is physically impossible to transport all the coal needed so that it may fairly be concluded that the difficulty is mainly one of transportation. This means that for every pound of coal saved, a pound of another needed commodity may be transported and in the same proportion may the present traffic situation be relieved and subsequent congestion avoided.

A saving of 10 per cent in the coal consumption on American railroads means a reduction in demand of 332,000 cars, which is the approximate equivalent of 8,300 trains per annum, representing a movement during the period of greatest congestion in the winter months of more than eight hundred trains per month. This is not all that the suggested economy could accomplish. If 10 per cent saving could be immediately effected by December 1, the reserve supplies could be increased by fully six million tons, thereby further avoiding

a repetition of the congestion and traffic interruption of last winter.

In its first report the committee provoked some discussion because of its comments in respect to the purchase of coal to specifications naming a definite standard of quality. The necessity for utilizing all the coal in the ground was then emphasized and to this principle there can be no dissent. In the past three years, however, the increasing demand for coal has unquestionably resulted in a deterioration in the average quality, while in the face of actual shortage, industrial plants have accepted a grade of fuel undeniably inferior to previous averages. This has resulted in correspondingly reducing the quality furnished the railroads, the claim not infrequently being made that coal accepted by private consumers should satisfactorily meet the requirements for locomotive purposes—an argument ignoring, not only the difference in combustion conditions, but the economic disadvantage resulting from the shipment of slate, bone, rock and other impurities familiar particularly to users of bituminous coal. These impurities reduce the available units of transportation, increase the cost of labor per ton of combustible transported, unloaded and utilized, reduce the efficiency of power plants, increase the necessity for excess plant capacity, not infrequently actually reduce plant output and always impair locomotive performance both directly by reducing operating efficiency and indirectly through the consequent increase in the cost of repairs.

For these considerations, a reasonable improvement should now be demanded in the quality of all coal loaded for railroad use. It would not be unreasonable to require the pre-war competitive standard.

The committee has heretofore chiefly considered the elements of fuel economy in their direct application, believing the scope of its work did not properly include many of the indirect factors that exert no inconsiderable influence upon railroad fuel consumption. But the critical situation portrayed in the official announcements of the Fuel Administration have suggested that brief reference should be made to some of these factors in order that emphasis may be placed upon the relation of all mechanical department employees to the problem of fuel economy and conservation.

There is not an element of locomotive maintenance that does not in some degree affect fuel consumption. Moreover, there are features of our maintenance that are intimately related to the coal consumption so that the question is one which should have large general interest to all employees of the mechanical department.

In order that the matter may be brought to the attention of those concerned briefly and comprehensively, a tabulation has been made indicating those details most affecting fuel economy in a properly designed locomotive. As far as any relative weight may be attached to the influence of these parts in fuel consumption, they have been arranged in what appears to be the order of importance, considered in relation to the maximum general effect.

LOCOMOTIVE DETAILS MOST AFFECTING FUEL CONSUMPTION

| BOILER | | ENGINE | |
|-------------------------------|------------|---------------------------------|--|
| Leaks | | Leaks | |
| Flues | | Cylinder packing | |
| Superheater | | Valve packing | |
| Mud ring | | Cylinder heads | |
| Firebox | | Cylinder | |
| Shell | | Steam chests and covers | |
| Flue end | | Inter per Adjustment | |
| Flues | | Steam valves | |
| Brick arch | | Steam and bridges | |
| | AIR SYSTEM | Safety valves | |
| Air pump cylinder packing | | Worn or Defective Parts Not Pa- | |
| Air pump rod packing | | cking Leaks | |
| Air pump governor relief port | | Crack bars | |
| Flue | | Tire | |
| Flue Couplings | | Rolls | |

One of the most frequent causes of poor steaming locomotives is a leak in the boiler front door or frame, which is frequently compensated for by a reduction in the area of the exhaust nozzle, thereby placing a double burden upon the

boiler and the coal supply further lack. Every report of a poor steaming locomotive now requires immediate and special attention. We should so organize and instruct our forces as to insure prompt investigation and the application of the proper remedy in every instance.

In addition to the physical condition of the locomotives and their efficient operation, there are a number of particulars in which the motive power department may prove the effective agency for fuel conservation and to those brief references may profitably be made. The subject may be grouped under two headings, those relating to the locomotive and those to engine house conditions.

Probably there is no single source of immediate and absolute waste as great as the ash pit. Every pound of unconsumed combustible that finds its way to the ash pit is a direct loss and the total aggregates huge proportions. It is impossible to eliminate this waste entirely but it can be minimized by proper firing methods so that the locomotive will reach the pit with a light fire, by dumping the engines as soon as possible after arrival at the ash pit so that the use of green coal may be avoided, and by prompt movement from the pit to the engine house.

Another prolific source of ash pit waste is caused by defective crane buckets and careless crane operation. Coal is lost through the buckets into the ash pit. There are frequent instances where the boiler washing program is not transmitted to the engine dispatcher so that locomotives are dumped and fired up again before it is decided that they are to be washed, thus necessitating a second trip to the ash pit. It is safe to estimate that with a modern locomotive a loss of not less than four tons of coal is involved in this proceeding. Cars unloaded with a clam shell bucket are frequently re-consigned to the mines with coal in the hopper amounting to a ton or more. Our transportation necessities now demand that empty supply coal equipment be examined by the coal pocket foreman and every pound removed before the cars are re-consigned.

Two other factors require mention; one is unnecessary movement of engines and the other excessive use of air pump.

There are innumerable particulars in which engine house auxiliaries may increase the fuel cost. Relatively, the coal consumption is small compared to that of locomotives but the necessity for economy should lead us to investigate every avenue of waste.

The Fuel Administration is about to inaugurate a campaign for power plant fuel economy and is even considering the desirability of authorizing the distribution of coal to power plants on the basis of their relative efficiency. Railroad officers have given little attention to this phase of the subject but it now requires immediate and special consideration. Probably the most practical results could be obtained through special reports covering the essential factors in the use of fuel for all purposes, other than locomotives, handled through the engineering departments that are a part of most railroad mechanical organizations.

The sources of greatest waste about shops and round-houses, are usually heating equipment or the lack of it. It is certain that during the coming winter no division of the Railroad Administration can justify its position as an advocate of fuel economy if no attempt is made to eliminate the coal basket and open coal fire usually observed at ash pits and water cranes. In all such places an inexpensive form of enclosed sheet steel stove should be substituted.

The heating equipment for engine houses, shop buildings and offices is frequently installed without reference to the usual principles governing the amount of radiation required, and the result that many buildings, particularly the smaller ones are greatly overheated. Under the existing conditions, no office should be heated to exceed 65 deg. F., and a temperature of 60 deg. F. would be entirely suitable for most buildings where forced labor is not required. All radiators

producing temperatures in excess of the actual requirements should promptly be eliminated.

Another common source of heat loss is found in steam pipes installed under ground, the course of which is frequently indicated by melting snow in the winter months. Exposed piping is often left uncovered. Effective means should be taken to insulate all such piping and suitable traps should be installed and maintained on all radiating systems.

There is one other problem relating to fuel conservation which is of great importance and although it may not involve any direct responsibility on the part of the mechanical department, it concerns the railroad organization as a whole and for that reason deserves attention at this time. This is the storage of coal, which will undoubtedly be required to a greater extent than heretofore not only because it permits the accumulation of large reserve supplies against extraordinary demands, but because it accomplishes a stabilization of the entire fuel supply situation.

In the past there have been huge losses because of the spontaneous combustion of stored coal, particularly bituminous, and this has not only resulted in loss of fuel, but has affected subsequent locomotive efficiency in some degree and made labor demands upon our organization at a time when labor could have been more advantageously employed elsewhere. The prevention of spontaneous combustion has received much study by various investigators, but the latest and most comprehensive treatment of the subject appears in the University of Illinois bulletin No. 6 on "The Storage of Bituminous Coal," by H. H. Stouk, Professor Mining Engineering.

The committee has selected from this publication certain conclusions which have been summarized to cover the conditions peculiar to the methods at present in use for the storage of coal by railroads.

Instructions for the Storage of Bituminous Coal.

1. The risk of spontaneous combustion in stored bituminous coal increases with the percentage of slack, consequently as far as practicable only lump coal should be stored and this should be as free from dust and fine coal as possible. This consideration suggests the selection of the less friable coal for storage purposes.
2. The risk of fire from the storage of fine coal or slack may be minimized by the exclusion of air from the interior which may be accomplished
 - (a) by a closely sealed wall built around the pile or
 - (b) by close packing of the fine coal.
3. It is advisable that coal for storage purposes be as dry as possible. It should not be dampened when or after it is placed in storage.
4. Where a choice is possible, coal having low sulphur content should be shipped for storage purposes.
5. The risk of spontaneous combustion is minimized by so packing that air cannot enter the pile.
6. The segregation of fine and lump coal in the same pile should be avoided.
7. Where space permits coal should be stored in low piles, divided by alley-ways.
8. The different varieties should not be mixed and stored in the same pile.

Storage appliances and arrangements should be so designed as to permit the coal to be quickly removed and large piles should not be made when there is no provision for loading quickly.

In storing coal, care should be exercised to remove pieces of wood, greasy waste or other easily combustible material.

All storage piles should be regularly inspected and the temperature recorded. If the temperature reaches 150 deg. F., the pile should be watched carefully and if it rises to 175 or 180 deg. F. the coal should be removed as promptly

as possible. The temperature should be taken with a thermometer at various places in the storage pile and at varying depths.

Where stored coal is under the jurisdiction of the mechanical department, it is recommended that these instructions be adopted as far as practicable and where the responsibility rests with the transportation department, that the subject be brought to the attention of the proper officer.

Heretofore we have approached the problem of fuel economy with a view to its effect upon operating expenses. Now we are obliged by force of circumstances to effect economy in order to conserve the available supply, and since as the director general says "The government now being in control of the railroads, the officers and employees of the various companies are no longer serving private interests. All now serve the government and the public interests only," we have a new obligation and a new duty and must grasp the spirit of the new era. Co-operation is necessary—individual effort indispensable.

The report is signed by: Wm. Schlafge, chairman, Erie; W. H. Flynn, Mich. Central; D. M. Perine, Penna. R. R.; Robert Quayle, C. & N. W.; D. J. Redding, P. & L., E.; W. J. Tollerton, C. R. I. & P., and F. H. Clark, B. & O.

Discussion

W. J. Bohan (N. P.): We hear a great deal of statistics about how much coal we are using and the places where it is wasted but no specific recommendation as to how to save it. Have any of the representatives any specific solution of the problem of conserving the coal, not only in locomotives but generally? The firemen and men handling the plants in shops can do a great deal to save coal if they had some specific rules to follow.

W. J. Tollerton: Few railroads have given the attention to stationary plants which they merit. The general practice, if a small terminal is to be established, is to pick out a discarded locomotive boiler for a heating plant—the most extravagant thing that could be put in. Our road some years ago, in common with a great many other railroads, established fuel supervising departments, not only for locomotives, but to supervise the fuel used in stationary plants. We have a supervisor of stationary plants, whose duty is not only to see that there is an adequate supply of steam for the work intended to be done at the shop or round house, but to follow the use of that steam from the time it is generated in the boiler until it is used up. He also has supervision over all the piping. If there are steam engines in the plant the valve motion is gone over, the air compressors are kept in shape and the exhaust steam is used for heating. If the boiler is of old design and uneconomical, recommendations are made to discard it and put in a more efficient boiler plant. The stack, the draft, and similar features, not only of locomotives but of stationary plants are of the utmost importance. We have a trained engineer who studies all these problems and makes his recommendations.

E. G. Gross (C. of Ga.): Statistics and the conclusions which are drawn from them, are the very things we need to correct our practice. The report is replete with positive suggestions. Nearly everything that is specified about the locomotive on the road will apply to the stationary power plants.

W. J. Bohan: I would like to ask Mr. Tollerton if, on his road, the power plant supervisor has absolute control of the power plant?

W. J. Tollerton: The supervisor of the stationary plants, in common with the supervisor of locomotive fuel, reports to the general mechanical superintendent, and the recommendation for any change or alteration or improvement in the stationary plant is made by the mechanical department; the actual execution of the work is by the superintendent's force. The specifications for all standard boilers as well as loco-

motive boilers are made by the mechanical department. When they are on the ground, however, the installation is made by the superintendent's force, under the supervision of the mechanical department.

W. J. Bohan: How is the coal handled? One plant may take run of mine coal, another No. 4, and another No. 5, and so on. Does the power plant supervisor have control not only of the design but also of the operation of the power plants? The average railroad lets everyone, from division superintendent to the supervisor of bridges and buildings, run the boiler plants.

W. J. Tollerton: The superintendent handles the distribution of fuel on his division; he supplies the coal chutes with fuel and supplies the stationary plants with fuel. But if he has been told that a certain stationary plant on his division can use slack coal successfully, it must be provided with slack coal. Another stationary plant on the same division may be assigned run of mine coal. At the end of the month if for any cause he has furnished the slack coal plant

with the run of mine coal he is notified of the fact from our office. He is asked by his general manager why he did not provide the necessary fuel, and is called upon to make the necessary explanation.

E. W. Pratt (C. & N. W.): Only last week the committee of arrangements of the Fuel Association held a very important meeting here in Chicago. Mr. McAuliffe, who is now manager of the Fuel Conservation Section of the Railroad Administration, is a member of that committee. The addresses delivered at the convention of the association will be sent under personal cover in government envelopes to every railroad company, every engineer and fireman and every shop man in the motive power department. To the first two classes, there will be included an instruction book, which has been devised by the Fuel Conservation Section and some other information of an official nature. Following that, I understand the railroads of the country will be divided into fuel districts, practically corresponding with the regional districts.

Specifications and Tests for Materials

Spring Testing Machine

THE COMMITTEE on Specifications and Tests for Materials submitted its report covering the different subjects which were reviewed during the past year, including also its report for the previous year (1916-17), with certain modifications, and made its recommendations as shown under the respective exhibits.

Exhibit A.—Specifications for Staybolt Iron

RECOMMENDED PRACTICE

1. **Scope.**—These specifications cover all staybolt iron.

1. MANUFACTURE

2. **Process.**—The iron shall be rolled from a bloom, slabpile or boxpile, made wholly from reworked puddled pig iron, or reworked knobbed charcoal iron. The puddle mixture and the component parts of the bloom, slabpile or boxpile shall be free from any admixture of iron scrap or steel.

3. **Definition of Terms.**—(a) Bloom. A bloom is a solid mass of iron that has been hammered into a convenient size for rolling.

(b) Slabpile. A slabpile is a pile built up wholly from flat bars of iron, of the full length of the pile.

(c) Boxpile. A boxpile is a pile, the sides, top and bottom of which are formed by four flat bars and the interior of which consists of a number of small bars the full length of the pile.

(d) Iron Scrap. This term applies only to foreign or bought scrap and does not include local mill products free from foreign or bought scrap.

II. CHEMICAL PROPERTIES AND TESTS

4. **Chemical Composition.**—At the option of the purchaser and when so specified, chemical analysis shall be made and drillings taken from tension test specimens which shall conform to the following requirements as to chemical composition:

| | |
|------------|-------------------------|
| Phosphorus | not over 0.150 per cent |
| Manganese | not over 1.10 per cent |

III. PHYSICAL PROPERTIES AND TESTS

5. **Tension Tests.**—(a) The iron shall conform to the following requirements as to tensile properties:

| | |
|---|---------------|
| Tensile strength, lb. per sq. in. | 47,000-52,000 |
| Yield point, per cent of tensile strength | 60 |
| Elongation in 2 in., min. per cent | 30 |
| Reduction of area, min. per cent | 48 |

(b) The yield point shall be determined by the drop of the beam of the testing machine. The speed of the crosshead of the machine shall not exceed $\frac{3}{4}$ in. per minute. After passing the yield point the testing speed shall be between 3 and 4 in. per minute. The distance between the grips shall not be less than 10 nor more than 11 in.

(c) In no case shall the variation in tensile strength between the maximum and minimum figures, for one offering of iron under these specifications, be more than 3000 lb.

6. **Bend Tests.**—(a) Cold-bend Test. The test specimen shall bend cold through 180 deg. flat on itself in both directions without fracture on the outside of the bent portion.

(b) Nick-bend Test.—The test specimen, when nicked 25 per cent around with a tool having a 60 deg. cutting edge, to a depth of not less than 8 nor more than 16 per cent of the diameter of the specimen, and broken, shall show a clean fiber free from crystallization.

(c) Bend tests shall be made by pressure.

7. **Etch Test.**—The cross-section of the test specimen shall be ground or polished and etched for a sufficient period to develop the structure. This test shall show the material to be free from steel.

8. **Test Specimens.**—All test specimens shall be of the full section of material as rolled.

9. **Number of Tests.**—(a) Bars of one size shall be sorted into lots of 100 each. Two bars shall be selected at random from each lot or fraction thereof and tested as specified in Sections 5 and 6, except that only one of these bars shall be tested as specified in Section 7.

(b) If any test specimen from either of the lots originally selected to represent a lot of material contains surface defects not visible before testing, but visible after testing, or if a tension test specimen breaks outside the middle third of the gage length a retort will be allowed.

IV. PERMISSIBLE VARIATIONS IN SIZE

10. **Permissible Variations.**—The bars shall be truly round within 0.01 in. and shall not vary more than 0.005 in. above nor more than 0.01 in. below the specified size.

V. FINISH.

11. **Finish.**—The bars shall be smoothly rolled and free from slivers, depressions, seams, crop ends and evidence of being burned.

VI. MARKING.

12. **Marking.**—The bars shall be stamped or marked as designated by the purchaser.

VII. INSPECTION AND REJECTION.

14. **Rejection.**—(a) Material represented by samples which fail to conform to the requirements of these specifications will be rejected.

(b) Individual bars which will not take a clean, sharp thread with dies in fair condition or which, subsequent to the above tests at the mills or elsewhere and their acceptance, develop defects in forging or machining will be rejected and shall be replaced by the manufacturer.

Exhibit B.—Specifications for Cast-Iron Cylinders and Cylinder Parts for Locomotives

1. The following revision to supersede the present Specifications for Locomotive Cylinder Castings, Cylinder Bushings, Cylinder Heads, Steam Chests, Valve Bushings, Packing Rings and Superheater Castings.

1. **Scope.**—These specifications cover cast iron for locomotive cylinders, piston valve bushings, piston valve pack-

Fig. 1—Mold for Arbitration Test Bar

ing rings, piston valve bull rings, cylinder bushings, piston packing rings and piston head or bull rings.

I. MANUFACTURE.

2. **Process.**—All castings shall be made from good quality, close-grained gray iron. Cylinders shall be cast in dry sand molds.

II. CHEMICAL PROPERTIES AND TESTS.

3. **Chemical Composition.**—The iron shall conform to the following requirements as to chemical composition:

| | |
|------------------|------------------------|
| Phosphorus | not over 0.70 per cent |
| Sulphur | not over 0.12 per cent |

4. **Ladle Analysis.**—An analysis shall be made by the manufacturer from a test bar taken during the pouring of each melt, a copy of which shall be given to the purchaser or

his representative. This analysis shall conform to the requirements specified in Section 3.

5. **Check Analysis.**—A check analysis of drillings taken from the fractured end of the transverse test bars may be made by the purchaser, and shall conform to the requirements specified in Section 3.

III. PHYSICAL PROPERTIES AND TESTS.

6. **Transverse Test.**—(a) The arbitration test bar, as described in Section 8, shall be placed horizontally upon supports 12 in. apart center to center, and when tested under a centrally applied load, the transverse strength shall not be less than 3200 lb. for castings $\frac{5}{8}$ in. or less in thickness, nor less than 3500 lb. for castings over $\frac{5}{8}$ in. in thickness; and

Fig. 2—Mold for Chill Test Specimen

the deflection, for either thickness of material, shall not be less than 0.09 in.

(b) If the transverse strength or the deflection of the first test bar does not conform to the requirements specified in paragraph (a), a test may be made on the second bar, as provided for in Section 8, which shall conform to the requirements specified.

(c) The application of the load, for a deflection of 0.10 in., shall be within a period of from 20 to 40 seconds.

7. **Chill Test.**—A sample of the molten iron shall be chilled in a cast-iron mold. The sample shall be allowed to cool in the mold until it is a dark red or almost black, when it may be knocked out and quenched in water. The sample, when broken, shall show a close-grained gray iron, with a well-defined border of white iron at the bottom of the fracture. The depth of the white iron shall not be less than $\frac{1}{16}$ in. for castings $\frac{5}{8}$ in. or less in thickness, nor less than $\frac{1}{8}$ in. for castings over $\frac{5}{8}$ in. in thickness.

8. **Test Specimens.**—Two arbitration test bars and one chill test bar shall be poured from each melt of iron, in accordance with the form and dimensions as shown in Figs. 1 and 2, provided that the diameter of the arbitration test bar shall not vary more than 0.02 in. above or below the specified size.

9. **Number of Tests.**—One transverse test, except as specified in Section 6 (b), and one chill test shall be made to represent each melt.

IV. WORKMANSHIP.

10. **Workmanship.**—Castings shall be smooth, well cleaned, free from shrinkage cracks and other injurious defects. When castings are to be machined, sufficient allow-

ance shall be made on patterns, that the castings will finish to blue-print dimensions.

V. MARKING.

11. **Marking.**—When so specified, the manufacturer's name or identification mark, the date when cast, the purchaser's pattern number and such other marking as may be designated, shall be cast on each casting in raised letters and figures.

VI. INSPECTION AND REJECTION.

12. **Inspection.**—(a) The purchaser or his representative shall be given reasonable opportunity to enable him to witness the pouring of the castings and test specimens, as well as to be present when physical tests are made.

(b) In case the inspector is not present to witness the pouring of the castings and test specimens, the manufacturer shall make all tests required by the specifications and, upon request, shall furnish the purchaser with a copy of the results of his tests and shall hold the transverse test and the chill test specimens, subject to examination by the inspector.

(c) The purchaser may make the tests to govern the acceptance or rejection of the material in his own laboratory or elsewhere. Such tests, however, shall be made at the expense of the purchaser.

(d) All tests and inspection shall be so conducted as not to interfere unnecessarily with the operation of the works.

13. **Rejection.**—(a) Castings represented by samples which fail to conform to the requirements of these specifications will be rejected.

(b) Individual castings which, subsequent to the above tests and inspection at the foundry or elsewhere and their acceptance, show defects or imperfections will be rejected and shall be replaced by the manufacturer.

14. **Rehearing.**—Samples tested in accordance with the requirements of these specifications, which represent rejected material, will be held for 14 days from the date of test report. In case of dissatisfaction with the results of tests, the manufacturer may make claim for a rehearing within that time.

Exhibit C.—Specifications for Mild Steel Bars

(See Exhibit B in the report of the Master Car Builders' Association Committee on Specifications and Tests for Materials.)

Exhibit D.—Specifications for Tank and Underframe Rivet Steel and Rivets

(See Exhibit C in the report of the Master Car Builders' Association Committee on Specifications and Tests for Materials.)

Exhibit E.—Specifications for Locomotive Rivet Steel and Rivets

1. **SEC. 6.—Number of Samples for Chemical Analysis.** Omit the words "for Chemical Analysis" and also omit the words forming the last sentence of paragraph (a), "These samples shall be used for check analysis by the purchaser."

Exhibit F.—Specifications for Welded Pipe

(See Exhibit F in the report of the Master Car Builders' Association Committee on Specifications and Tests for Materials.)

Exhibit G.—Specifications for Steel Axles for Locomotive Tenders

1. Add a new Section 1. to read as follows, and re-number subsequent sections accordingly:

"1. **Scope.**—These specifications cover axles up to and including those 6½ in. in diameter at the center. Axles

over 6½ in. in diameter at the center shall not be subject to the drop test, but may be purchased under the Standard Specifications for Annealed and Unannealed Carbon Steel Axles, Specifications for Quenched and Tempered Alloy Steel Forgings, or Specifications for Quenched and Tempered Carbon steel Axles, Shafts and other Forgings for Locomotives and Cars."

2. **SEC. 5.** Omit the "Formula" and "Note" as shown under the present paragraph (b), and change the present Section 5 to read as follows:

"6. **Drop Test.**—(a) The test axle shall be so placed on supports 5 ft. apart that the tup will strike it midway between the ends. It shall stand without fracture five blows from a tup of 2240 lb. falling from a height as specified, and the permanent set produced by the first blow shall not exceed that specified for axles of corresponding dimensions, as shown in the following table. The axle shall be turned through 180 deg. after the first and the third blows.

(b) The permanent set is the difference between the distance from the straight-edge to the middle point of the axle measured before the first blow and the distance measured in the same manner after the blow. The straight-edge shall rest only on the collars or the ends of the axle.

(c) The temperature of the axle, when tested, shall be between 40 and 120 deg. F."

3. **Table.**—Make the following changes:

Omit the words "Weight of Tup, 2240 lb. Supports 3 Ft. Apart."

Add to the table a column under "Size of Axle, In." with the heading "Length Over All, In." and the dimensions "84½, 86½, 88½, 90½," for axles having journal dimensions 4¼ by 8, 5 by 9, 5½ by 10 and 6 by 11 in., respectively.

Under "Maximum Permanent Set, In.," change the values "6¼" and "4½" to read "6¼" and "4½," respectively.

4. **Present Section 10. — Permissible Variation.** Change the tolerance for excess length over all, from 5-32 in. to 1⁄8 in.

Exhibit H.—Specifications for Boiler and Firebox Steel for Locomotive Equipment

1. **SEC. 3.—Chemical Composition.** Omit from the requirements the copper content "not over 0.05 per cent" for firebox steel.

2. **SEC. 13.—Weight.** Change to read as follows:

"The overweight of each lot* in each shipment shall not exceed the amount given in the following table. One cu. in. of steel is assumed to weight 0.2833 lb."

(Substitute the following table for the present one, shown on page 551.)

PERMISSIBLE OVERWEIGHT OF PLATES ORDERED TO THICKNESS
PERMISSIBLE EXCESS IN AVERAGE WEIGHT PER SQUARE FOOT OF PLATES FOR WIDTHS GIVEN, EXPRESSED IN PERCENTAGE OF NOMINAL WEIGHT

| Order or range, inches | Under 48 in. | 48 in. to 60 in., excl. | 60 in. to 72 in., excl. | 72 in. to 84 in., excl. | 84 in. to 96 in., excl. | 96 in. to 108 in., excl. | 108 in. to 120 in., excl. | 120 in. to 132 in., excl. | 132 in. to 144 in., excl. | 144 in. to 156 in., excl. | 156 in. to 168 in., excl. | 168 in. to 180 in., excl. | 180 in. to 192 in., excl. | 192 in. to 204 in., excl. | 204 in. to 216 in., excl. | 216 in. to 228 in., excl. | 228 in. to 240 in., excl. | 240 in. to 252 in., excl. | 252 in. to 264 in., excl. | 264 in. to 276 in., excl. | 276 in. to 288 in., excl. | 288 in. to 300 in., excl. | 300 in. to 312 in., excl. | 312 in. to 324 in., excl. | 324 in. to 336 in., excl. | 336 in. to 348 in., excl. | 348 in. to 360 in., excl. | 360 in. to 372 in., excl. | 372 in. to 384 in., excl. | 384 in. to 396 in., excl. | 396 in. to 408 in., excl. | 408 in. to 420 in., excl. | 420 in. to 432 in., excl. | 432 in. to 444 in., excl. | 444 in. to 456 in., excl. | 456 in. to 468 in., excl. | 468 in. to 480 in., excl. | 480 in. to 492 in., excl. | 492 in. to 504 in., excl. | 504 in. to 516 in., excl. | 516 in. to 528 in., excl. | 528 in. to 540 in., excl. | 540 in. to 552 in., excl. | 552 in. to 564 in., excl. | 564 in. to 576 in., excl. | 576 in. to 588 in., excl. | 588 in. to 600 in., excl. | 600 in. to 612 in., excl. | 612 in. to 624 in., excl. | 624 in. to 636 in., excl. | 636 in. to 648 in., excl. | 648 in. to 660 in., excl. | 660 in. to 672 in., excl. | 672 in. to 684 in., excl. | 684 in. to 696 in., excl. | 696 in. to 708 in., excl. | 708 in. to 720 in., excl. | 720 in. to 732 in., excl. | 732 in. to 744 in., excl. | 744 in. to 756 in., excl. | 756 in. to 768 in., excl. | 768 in. to 780 in., excl. | 780 in. to 792 in., excl. | 792 in. to 804 in., excl. | 804 in. to 816 in., excl. | 816 in. to 828 in., excl. | 828 in. to 840 in., excl. | 840 in. to 852 in., excl. | 852 in. to 864 in., excl. | 864 in. to 876 in., excl. | 876 in. to 888 in., excl. | 888 in. to 900 in., excl. | 900 in. to 912 in., excl. | 912 in. to 924 in., excl. | 924 in. to 936 in., excl. | 936 in. to 948 in., excl. | 948 in. to 960 in., excl. | 960 in. to 972 in., excl. | 972 in. to 984 in., excl. | 984 in. to 996 in., excl. | 996 in. to 1008 in., excl. | 1008 in. to 1020 in., excl. | 1020 in. to 1032 in., excl. | 1032 in. to 1044 in., excl. | 1044 in. to 1056 in., excl. | 1056 in. to 1068 in., excl. | 1068 in. to 1080 in., excl. | 1080 in. to 1092 in., excl. | 1092 in. to 1104 in., excl. | 1104 in. to 1116 in., excl. | 1116 in. to 1128 in., excl. | 1128 in. to 1140 in., excl. | 1140 in. to 1152 in., excl. | 1152 in. to 1164 in., excl. | 1164 in. to 1176 in., excl. | 1176 in. to 1188 in., excl. | 1188 in. to 1200 in., excl. | 1200 in. to 1212 in., excl. | 1212 in. to 1224 in., excl. | 1224 in. to 1236 in., excl. | 1236 in. to 1248 in., excl. | 1248 in. to 1260 in., excl. | 1260 in. to 1272 in., excl. | 1272 in. to 1284 in., excl. | 1284 in. to 1296 in., excl. | 1296 in. to 1308 in., excl. | 1308 in. to 1320 in., excl. | 1320 in. to 1332 in., excl. | 1332 in. to 1344 in., excl. | 1344 in. to 1356 in., excl. | 1356 in. to 1368 in., excl. | 1368 in. to 1380 in., excl. | 1380 in. to 1392 in., excl. | 1392 in. to 1404 in., excl. | 1404 in. to 1416 in., excl. | 1416 in. to 1428 in., excl. | 1428 in. to 1440 in., excl. | 1440 in. to 1452 in., excl. | 1452 in. to 1464 in., excl. | 1464 in. to 1476 in., excl. | 1476 in. to 1488 in., excl. | 1488 in. to 1500 in., excl. | 1500 in. to 1512 in., excl. | 1512 in. to 1524 in., excl. | 1524 --------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|-----------------------------|
|---------------------------|-----------------|----------------------------|----------------------------|----------------------------|----------------------------|-----------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|-------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|-----------------------------|

and Unannealed Carbon Steel Axles, Shafts and other Forgings for Locomotives), 577 (Specifications for Quenched and Tempered Alloy Steel Forgings), and 583 (Specifications for Quenched and Tempered Carbon Steel Axles, Shafts and other Forgings for Locomotives and Cars), to conform to the latest type of American Society for Testing Materials specimen.

Exhibit J.—Specifications for Annealed and Unannealed Carbon Steel Axles, Shafts and Other Forgings for Locomotives

1. SEC. 12.—Retests. Change paragraph (b) to read as follows:

"When annealed forgings are specified, if the fracture of any test specimen shows over 15 per cent crystalline a sec-

ond test shall be made. If the fracture of the second specimen shows over 15 per cent crystalline, the forgings represented by the specimen shall be re-annealed. The fracture shall be considered crystalline if the crystals which it contains are so large that the cleavage planes or sides of these crystals are easily visible to the eye."

The report is signed by C. D. Young, chairman, Pennsylvania; J. R. Onderdonk, B. & O.; A. H. Fetter, Union Pacific; Frank Zeleny, C. B. & Q.; H. E. Smith, N. Y. C.; H. B. MacFarland, A. T. & S. F.; Prof. L. S. Randolph, Virginia Polytechnic Institute.

Action Taken

There was no discussion. The report was accepted and will be submitted to letter ballot.

Design and Maintenance of Locomotive Boilers

C. E. Fuller
Chairman

TWO YEARS AGO a report was presented offering basic ratios to be considered in locomotive-boiler design, covering also, in a general way, the use of autogenous welding in the maintenance of boilers, which this committee found was being utilized by many roads with very satisfactory results. Last year Circular E was issued, requesting data covering the subject of autogenous welding as applied to locomotive boilers. Replies were received from 36 roads, indicating the extent to

which they are using these processes, and the committee now presents the results of the investigation.

Smoke Boxes

There is no doubt that the construction and renewal of smokeboxes is handled expeditiously and economically by the use of autogenous welding. For joining smokeboxes at the longitudinal seam, several roads use the oxy-acetylene torch, while an equal number prefer to electric weld this seam. The usual method followed is to tack the edges of the sheet together at intervals of about 8 in., with strips about 2 in. long, then complete the weld, thus providing for more uniform expansion of the sheet than if a through weld were made. Wherever welded seams have been used, the results have been satisfactory. The cost is approximately 60 per cent of a riveted seam.

Practically all of the roads reporting cut off old or damaged smokebox plates by oxy-acetylene. It appears to be the usual practice to weld in small plates, but for larger plates to use riveted joints. The reinforcing rings in smokeboxes are usually not disturbed, the weld being made ahead of the ring.

Flues

The practice of electric-welding flues, particularly superheater flues, is quite general. The flue is applied in the usual manner, after which the firebox ends are beaded and welded lightly around the bead. Where used, the results have been satisfactory, although some trouble has been experienced from leakage when locomotives are located at points which have no welding apparatus. Of the roads re-

porting, 42 per cent use the oxy-acetylene or electric process for filling up pit holes in flues.

From the reports it is evident that a broad field for the application of autogenous welding lies in the safe-ending of flues, or the welding in of a new section near the center for the purpose of lengthening them for re-application. The advantage which comes from not having to limit the length of safe ends, on account of the capacity of flue-welding machines, certainly offers an opportunity to reclaim material which would otherwise not be serviceable. Of the roads reporting, 20 per cent are using the autogenous welding process for safe-ending flues, with satisfactory results. Three of the reporting roads have welded a new section into the flues, and the results from this practice have also been satisfactory.

Of the roads reporting, 20 per cent practice cutting out for replacement the entire flat surface of the front flue sheet, without disturbing the flange or rivets. This method, however, has not been generally adopted, and it is usual to cut out the entire old sheet by the acetylene process, and to replace it with a new one. The practice of cutting out the section of the front flue sheet under the dry pipe, containing the flue holes, and replacing it by welding in a new section suitable for the application of superheater flues, has not met with wide favor, although the roads doing this report satisfactory and economical results. One road reports that by following this practice it can replace sheets at a cost of \$28, as compared with \$150 for entire new sheets riveted in place.

The majority of roads reporting do not apply back flue sheets by welding, but this is being satisfactorily accomplished on some few roads by either process. The use of oxy-acetylene or electric welding for repairing cracks in the knuckle of flue sheets is quite general and produces good results. There is, however, a wide variance in the methods of welding. Seventeen roads report that such cracks are welded on both sides, six weld on the water side only, while three weld on the fire side only. One road reports that it prefers to use electric welding from the water side, and oxy-acetylene from the fire side.

For repairing cracks in flue-sheet bridges, the usual practice is to remove the adjacent flues, cut the sheet, both sides, at about a 45 degree angle, and then fill in the space.

Staybolts

A number of roads are using oxy-acetylene torches for burning off the projecting ends of new staybolts before riveting them over. The results obtained have been, in most cases, satisfactory. To insure all bolts being cut off uniformly, one road uses a guide next to the nozzle.

Electric welding of cracks radiating from staybolt holes seems to be the most satisfactory. It is customary to remove

the staybolt, chamfer the hole for the purpose of eliminating the cracks, or, should the crack extend too far for this, to bevel both hole and crack to 90 degrees and fill the crack and hole up solid; the sheet is then drilled and tapped for the application of a new staybolt.

Fireboxes

There is no part of the boiler where the application of these processes of welding has been so uniformly successful or resulted in greater economy than for firebox application and repairs. Ranging in scope from putting in entire new fireboxes to building up around leaky mud-ring rivets, the manifold utility of autogenous welding seems to be limited only by the ingenuity of the operator.

Of the roads reporting, 25 per cent are using the electric process for welding in entire new fireboxes. The application of part or full firebox sheets and door sheets has been quite generally practiced. Door sleeves are renewed, part wrapper sheets and part back heads applied, and the application of patches reduced to a minimum by welding.

Where patches are required, the work is accomplished by welding, at about 60 per cent of the cost of riveted patches. The forms of patches used vary with individual roads. Some cut the sheet out with square edges, lay the patch over the hole in the sheet, with a lap around the outside of about $\frac{3}{8}$ in., the patch being beveled on its edges, and build up over the bevel and onto the sheet. Another method is to flange the edges of the hole outwardly, lay the patch on the extending flange, with its beveled edge projecting outside the flange toward the sheet, and then join the beveled edge of the patch to the flange by building up a bead. Still another method followed on repairs to firebox sheets is to V out the sheet on the fire side, place a patch which has edges beveled in the opposite direction from the sheet into the opening, then fill up the 90-deg. opening. With this style of patch, an expansion knuckle parallel to the vertical center line of staybolts provides for stresses. The results are uniformly satisfactory. For filling up staybolt or rivet holes, both processes are largely used. Eight of the reporting roads weld exterior bosses, usually by the oxy-acetylene process, on the outside wrapper sheet, to give increased full threads for angular radial staybolts. Only two roads report having welded in arch tubes, while three weld firebrick arch studs to firebox side sheets successfully.

Three roads have reported cutting off firebox and wrapper sheets above mud rings to avoid disturbing mud-ring rivets, then welding new fireboxes at this point. This practice, as yet, has not been followed to any extent.

The welding of cracks is usually limited to those from 4 in. to 35 in. long, the latter being done only to keep the locomotive in service. Practically 8 in. is considered about as long a crack as it is desirable to weld for permanent repairs, most roads preferring not to exceed 4 in.

Mud Rings

For mud-ring repairs, either electric or oxy-acetylene welds are used, the former being preferred. The usual method followed is to cut out a piece of the side sheet, over the crack, in the mud ring, bevel the mud ring from the top, then fill up the opening, after which the sheet is patched. In cases where the mud ring is removed from the locomotive, some roads prefer to bevel from both sides and then weld. A large saving in the cost of repairs results from welding mud rings in place. Troublesome leaks in mud-ring corners are eliminated by building up the caulking edge.

General

Among the many other repairs made by these methods may be cited reducing worn washout plug holes, reclaiming superheater units, building up worn places on stayed surfaces and welding up abandoned flue or plug holes.

The use of a carbon electrode or a metal electrode is

primarily dependent on the size and strength of the weld desired. The carbon-electrode process should be used on work of considerable size if maximum strength is not a limiting factor, and is very desirable for rapid cutting. When using the carbon electrode it is customary for the operator to heat around the weld, so that extensive contraction may be avoided.

The metal electrode process, which is generally used in the various phases of boiler maintenance work, has the advantage of confining the heat more closely, and is used for welds requiring strength and for small work. The current required has a much lower value than that used with the carbon-electrode process.

If the current is too high for the size of welding wire being used, it is found the metal oxidizes and the weld becomes hard and brittle. Representative practice appears to be about as follows:

| | |
|---------------|---------------|
| 1/8 in. wire | 11-15 amperes |
| 3/16 in. wire | 11-15 amperes |
| 1/4 in. wire | 14-20 amperes |

The voltage at the panel should be from 70 to 75, reduced at the arc to about 20 to 30 volts. By following these limits it has been found the metal flows in its most natural state, leaving the weld unoxidized and ductile.

As a general rule, it is desirable after starting a weld to complete it if possible before stopping, on account of the effect of the contraction of the sheet if work ceases. In some cases it will be found advisable to have two men work alternately in order to accomplish this. On account of the wide variance in the methods followed, and the costs reported, the committee does not feel that definite recommendations can be formulated, believing that local conditions so far govern these as to make such recommendations of little value.

While it is gratifying to consider how much has been accomplished in the use of the oxy-acetylene and electric processes for boiler maintenance, it is believed that the art is still in a formative and developmental state, and the future will see even greater progress, as the possibilities of economical application are exploited. It may not be amiss for this committee to sound a warning against too radical application. Stayed surfaces and appurtenances, which are not subject to direct radial pressure, offer a safe and attractive field for future experiments, and any work for the time being should be limited to these sections of the boiler.

The report was signed by C. E. Fuller, chairman, superintendent motive power, Union Pacific; A. W. Gibbs, chief mechanical engineer, Pennsylvania; D. R. MacBain, superintendent motive power, New York Central; M. K. Barnum, assistant to vice president, Baltimore & Ohio; R. I. Smith, general superintendent motive power, Atlantic Coast Line; C. B. Young, mechanical engineer, Chicago, Burlington & Quincy, and J. Snowden Bell.

Discussion

I. W. Pratt (C. & N. W.): We are spending a great deal of money for new shell sheets that are merely pitted in the belly; personally I can not see any danger with the present state of the art in welding up a pit hole there.

C. E. Fuller (Union Pacific): The welding of a pair of courses is nothing new. It has been practiced by the locomotive builders for a great many years. The objection that the government has had against its practice was the inability to determine the factor of safety of the welded sheet. There is no question but what a lot of gas in the shell can be taken care of with absolute safety as there is plenty of strength in the shell with the possible exception of the circumferential seam around the sheet.

C. L. Chambers (C. & R. R. of N. J.): I think it would be perfectly safe if a maximum depth of pitting could be established.

Action Taken

The report was received and the committee was continued.

Revision of Standards and Recommended Practice

W. E. Dunham
Chairman

AFTER CONSIDERATION of the present Standards and Recommended Practices of the Association, together with the replies received to the circular of inquiry sent to members, the committee submits the following report:

Driving Wheel Centers (STANDARD.) PAGES 529-530

1. A member suggests that the $\frac{1}{8}$ -in. retaining lip on the tire shown in connection with the details of driving wheel centers should be omitted. The committee concurs in

the suggestion and the secretary will be instructed to correct the drawings.

Specifications for Steel Axles for Locomotive Tenders (STANDARD.) PAGES 533-536

2. A member calls attention to the fact that inasmuch as axles for engine trucks are ordinarily tested under the drop from the same nominal center diameter as car axles, there should be a sheet of standard engine truck axles and a table for the drop tests made to correspond. The committee does not concur in the suggestion.

Journal Boxes, Bearings and Wedges (STANDARD.) PAGES 536-537

3. *For Journals 3 $\frac{3}{4}$ by 7 in. Sheet M. M. 4.* A member calls attention to the fact that the arc recess is not shown on Sheet M. M. 4, although its omission for larger-sized wedges was adopted by letter ballot in 1916, and suggests that similar action is advisable for the 3 $\frac{3}{4}$ by 7 in. journal box in question. The committee does not concur in the suggestion.

4. *For Journals 4 $\frac{1}{4}$ by 8 in. Sheet M. M. 6.* A member calls attention to the arc recess being indicated in the wedge in the plan and cross-section views of the journal box, and suggests that they should be omitted. The committee notes the error, and the secretary will be instructed to correct the drawings.

5. *For Journals 4 $\frac{1}{4}$ by 8 in. Sheets M. M. 6 and 7.* A member calls attention to the over-all width of bearing, 4 $\frac{1}{8}$ in., leaving an edge which is too thin after boring for a 5/16-in. lining metal, and suggests increasing this width to 4 $\frac{3}{8}$ in. The committee concurs in the suggestion.

6. *For Journals 5 by 9 in. Sheet M. M. 9.* A member calls attention to the arc recess being indicated in the wedge in the cross-section view of the journal box, and suggests that it should be omitted.

The committee notes the error, and the secretary will be instructed to correct the drawings.

7. *For Journals 5 $\frac{1}{2}$ by 10 in. Sheet M. M. 12.* A member suggests that the plan view of the journal box on Sheet M. M. 12 is misleading, as it is not clear whether the arc recess refers to the wedge or the brass. The committee does not concur in the opinion expressed.

8. *For Journals 5 $\frac{1}{2}$ by 10 in. Sheets M. M. 12 and 13.* A member recommends increasing the over-all width of 5 $\frac{1}{4}$ in. to 5 $\frac{3}{4}$ in., in order to allow for proper boring of the ocaring, the 5 $\frac{1}{4}$ in. leaving an edge which is too thin after

boring for 5/16-in. lining metal. The committee concurs in the suggestion.

Solid Wrought Carbon Steel Wheels

(RECOMMENDED PRACTICE.) PAGES 543-546. SHEETS M. M. H, I, J AND K

9. A member suggests that the drawings on Sheets H, I, J and K should show four 1 $\frac{1}{4}$ -in. holes through the plate, located at suitable radii so as to assist in holding the wheel when turning up in a lathe. The committee does not concur in the suggestion.

10. A member suggests advancing these specifications to Standard. The committee concurs in the suggestion.

Minimum Thickness for Steel Tires

(RECOMMENDED PRACTICE.) PAGE 547. SHEET M. M. B.

11. A member suggests advancing to Standard. The committee concurs in the suggestion.

Wheel Circumference Measure for Steel and Steel Tired Wheels

(RECOMMENDED PRACTICE.) PAGE 547. SHEET M. M. B.

12. A member suggests advancing to Standard for steel, steel tired and cast wheels, and eliminating the circumference measure shown on Sheet M. M. 20. The committee concurs in the suggestion.

Rotundity Gage for Solid Steel Engine and Truck Wheels

(RECOMMENDED PRACTICE.) PAGE 547. SHEET M. M. B.

13. A member suggests advancing to Standard. The committee concurs in the suggestion.

Plane Gage for Solid Steel Wheels

(RECOMMENDED PRACTICE.) PAGE 547. SHEET M. M. B.

14. A member suggests advancing to Standard. The committee concurs in the suggestion.

Specifications for Air Brake Hose Gaskets

(RECOMMENDED PRACTICE.) PAGES 591-592

15. A member suggests that the title should read, "Gaskets for Air Brake Hose Couplings." The committee does not concur in the suggestion.

Specification for Chain

(RECOMMENDED PRACTICE.) PAGES 594-597

16. A member suggests that in Section IV, paragraph 8 (a), the word "injurious" be incorporated in the first line, and in paragraph 8 (b) the word "perceptible" be incorporated in the last line. The committee does not concur in the suggestion.

Safety Appliances

(STANDARD.) PAGES 635-640

17. A member suggests that any conference or other published rulings of the Interstate Commerce Commission, as regards Safety Appliances as far as they pertain to steam locomotives, be published as a part of the proceedings. The committee concurs in the suggestion.

Inspection and Testing of Locomotive Boilers

(STANDARD.) PAGES 640-648

18. A member suggests that the reference to the date of July 1, 1912, should be omitted in paragraph 37. The committee does not concur in the suggestion.

Rules and Instructions for Inspection and Testing of Steam Locomotives and Tenders

(STANDARD.) PAGES 648-665

19. A member suggests that with the weight of springs in use in spring buffers between engine and tender, the 74-in. compression required in the last paragraph of Rule 22 is too much, and suggests that this be reduced to 52 in. The committee does not concur in the suggestion.

20. A member suggests that, inasmuch as we have had sufficient experience in autogenous welding to know that an autogenous weld can be made as solid as a fire weld, when welding up cracks, the second paragraph of Rule 28 be changed to admit of autogenous welding of cracks in rods. The committee does not concur in the suggestion.

21. A member suggests that the Rules 29 and 31, covering headlight requirements on road and yard engines, be superseded or modified by the latest instructions. The committee concurs in the suggestion, as covered by paragraph 24 of this report.

22. A member suggests that in the second paragraph of the Rule 52, in reference to the height between tender and locomotive decks, the words "when on straight and level track" should be added. The committee does not concur in the suggestion.

23. A member suggests that modifications of the original rules, when given by the Interstate Commerce Commission, should be embodied in the rule or attached as an explanatory note. The committee concurs in the suggestion.

24. A member suggests that interpretations and rulings shown in connection with the Rules and Instructions for Inspection and Testing of Locomotive Boilers and Their Appurtenances, and the explanations of the Rules and Instructions for the Inspection and Testing of Locomotives and Tenders be included as a part of the Proceedings. The committee concurs in the suggestion.

Rules for Determining Stresses in Locomotive Boilers

(RECOMMENDED PRACTICE.) PAGES 719-720

25. A member calls attention to the omission in the introductory paragraph of the fact that these rules apply only to new construction and not to existing boilers. The committee notes the omission and the secretary will be instructed to correct it.

Special Report on Pipe Unions

26. The committee would report that, owing to the death of H. G. Stott, chairman of the committee of the American Society of Mechanical Engineers who was to handle the matter of standard pipe unions, no progress has been made during the year.

New Business

27. A member raises the question as to the possibility and practicability of developing standards with respect to driving axles, engine truck axles, bearings, boxes and wedges along the lines of standardization now being completed in connection with freight equipment cars by the A. R. A., or the efforts in this direction made by the Harriman Associated Lines some time ago. The committee does not concur in the suggestion.

28. A member suggests a standardization of the draft gear attachments on both old and new tenders. The committee does not concur in the suggestion.

The report is signed by W. E. Dunham, chairman, C. & N. W.; M. H. Haig, A. T. & S. F.; A. G. Trumbull, Erie; C. D. Young, Pennsylvania; G. S. Goodwin, C. R. I. & P.; R. L. Ettenger, Southern; and B. B. Milner, N. Y. C.

Action Taken

There was no discussion of this report. It was received and the recommendations were adopted.

Train Resistance and Tonnage Rating

IN ORDER THAT THIS COMMITTEE might have the benefit of the experience of the various roads in connection with train resistance and tonnage rating, Circular H, dated January 22, 1917, was issued, making request for replies to the following questions:

1. Have any tests been conducted on your road to determine the rolling resistance of freight or passenger cars of modern design other than that covered in the committee's report at the June, 1916, convention?

2. If so, what use of it has been made in connection with determining tonnage rating?

3. Please furnish curves showing the results obtained in such tests, to show the relation of resistance to weight of car or to the speed, or both.

4. Give general description of cars tested, including: (a) capacity, (b) light weight, (c) wheel base, (d) type of truck, (e) size of journals.

5. Give general description of track conditions under

which tests were made, i. e., weight of rail, kind of ballast, etc.

6. Give brief description of manner in which tests were conducted.

7. Please furnish such information as you may have in regard to the value of the superheater in increasing the available drawbar pull of the locomotive, giving the source of such information.

8. What method of supervision is in effect on your road to insure that the prescribed tonnage ratings are being hauled?

9. What would you recommend as a system of supervision which would be available to all roads?

10. Is any allowance made for the mechanical stoker in the calculation or application of tonnage rating on your road?

11. If such allowance is made, describe fully the basis for it.

Twenty-five replies to this circular were received. None of the roads gave any information in regard to Questions 1, 2, 3, 4, 5 and 6 with the exception of the Baltimore & Ohio and the Pennsylvania Lines West of Pittsburgh. The B. & O. furnished a resistance curve as shown on Plate A, which was drawn as a result of tests conducted on the B. & O. during October, November and December 1910, and January, 1911. This curve represents the average resistance of the cars used, the predominating car having the following characteristics:

| | | |
|------------------|-------|--------------------------------|
| Capacity | | 110,000 lb. |
| Light weight | | 40,000 lb. |
| Wheel base | | 10 ft. 6 in. |
| Truck | | 4 wheel cast steel with frames |
| Size of journals | | 10 in. by 1 in. |

O. C. Wright
Chairman

These tests were conducted on track constructed of 90-lb. and 100-lb. rail with rock ballast. The average temperature under which the tests, represented by this curve, were made, was approximately 75 deg. F.

The Pennsylvania Lines West furnished a resistance curve as shown on Plate B, this curve having been drawn as a result of tests of Pennsylvania Lines' Class *G1*, *Gla* and *G1b* cars, the characteristics of which are shown by the following table:

| | <i>G1</i> | <i>Gla</i> | <i>G1b</i> |
|-----------------------|------------------|------------------|------------------|
| Capacity, lb..... | 100,000 | 100,000 | 100,000 |
| Light weight, lb..... | 39,200 | 39,050 | 38,700 |
| Wheel base..... | 28 ft. 9 in. | 27 ft. 9 in. | 27 ft. 3 in. |
| Type of truck..... | Arch Bar | Arch Bar | Arch Bar |
| Size of journal..... | 5½ in. by 10 in. | 5½ in. by 10 in. | 5½ in. by 10 in. |

These tests were made on track constructed with 85-lb. rail, part of which was laid on cinder ballast and part on stone ballast. The cars tested were of approximately the same dimensions as cars represented by the resistance curve as shown on Plate 11 of last year's report for 8-wheel cars. The resistance, it will be noted, is somewhat higher, which is probably due to the fact that these tests were made on 85-lb. rail, whereas the tests of the cars represented on Plate 11 of last year's report were made on 100-lb rail.

The New York Central is the only road which gave any information in connection with Question 7 regarding increased tractive power due to superheat. The information given is shown on Plate C and is for two locomotives identical

Plate A—Resistance of Freight Cars on Level Tangent Track—Baltimore & Ohio

in every respect with the exception of the superheater. The data for these locomotives are shown in the tabulation below:

| Item | Saturated | Superheated |
|--------------------------------------|------------------|------------------|
| 1. Class..... | G-6 | G-6 |
| 2. Size of cylinders..... | 23 in. by 32 in. | 23 in. by 32 in. |
| 3. Diameter of drivers..... | 63 in. | 63 in. |
| 4. Steam pressure..... | 200 lb. | 200 lb. |
| 5. Grate area..... | 56.5 | 56.5 |
| 6. Number of large tubes..... | None | 34—5¼ in. |
| 7. Number of small tubes..... | 444—2 in. | 233—2 in. |
| 8. Tube heating surface..... | 3,474 sq. ft. | 2,542 sq. ft. |
| 9. Firebox heating surface..... | 185 sq. ft. | 185 sq. ft. |
| 10. Total heating surface..... | 3,659 sq. ft. | 2,727 sq. ft. |
| 11. Superheater heating surface..... | None | 580 sq. ft. |

The following replies were received to Questions 8, 9, 10 and 11:

CHICAGO, BURLINGTON & QUINCY

8. The daily tonnage statement and monthly summary are checked in the general manager's office.

9. After the rates are worked up, a man in the general office should be assigned the duty of seeing that the rates are maintained, and if rates are found to be incorrect they should be revised, provided that there is no operating condition which needs correcting.

10. Stoker engines haul more tonnage.

11. Our Mikado engines with 28-in. by 32-in. cylinders, 64-in. drivers, 180-lb. pressure, and 60,000 lb. tractive power, are given an average of 7 per cent more tonnage when equipped with stokers. Our engines larger than this were equipped with stokers when purchased. With the stoker it is pos-

Plate B—Resistance Curve on Level Tangent Track—Pennsylvania Class G-1, G-1a, G-1b Cars

sible to keep up the boiler pressure on these large engines, which accounts for the greater tonnage hauled.

BALTIMORE & OHIO.

8. A daily record is kept showing the tonnage handled by each train and the theoretical rating for the given run. This statement is furnished to the superintendent, general superintendent and also the Bureau of Operating Statistics. The information given by the above record is referred to at frequent intervals for the purpose of checking observance of rating.

9. A method similar to that described in the answer to Question 8 should apply with good results to the operations on the road.

10. Yes.

11. In figuring ratings for hand-fired engines, a limit of 4000 lb. of coal per hour was fixed. With stoker engines, we have figured on the basis of 6000 to 7000 lb. per hour at maximum effort. This resulted in ratings about 10 per cent higher than with hand-fired engines of the same type.

PENNSYLVANIA LINES WEST OF PITTSBURGH

8. There is no direct supervision to insure that the prescribed tonnage shall be hauled. Ratings are made up based on tests, calculations or general practice. If criticism is made of any rating by the division officials, investigation is made to determine the correct rating, and the rating sheets are revised accordingly.

The engine rating sheets are issued in book form by the superintendent of motive power and approved by the general superintendent.

9. After the adoption of a rating, which is accepted as correct by the transportation department, there seems to be no reason why full tonnage should not be hauled.

Failure of a locomotive to handle full tonnage should be investigated by the trainmaster, road foreman of engines and master mechanic and the necessary steps taken to prevent recurrence of the failure.

10. No allowance is made for the mechanical stoker in calculation of ratings.

In reply to Questions 8 and 9 other roads reported that yardmasters and conductors were required to check trains, their reports being forwarded to the transportation officers. Computing machinery is used in some cases to figure the

sions, but it is necessary to know that the boiler is of sufficient capacity to supply the cylinders with steam at full boiler pressure and that it is possible to supply the firebox with the required amount of coal to evaporate the required amount of water. If the coal required per hour is beyond the capacity of a fireman, as it is in the case of many of our modern locomotives, a mechanical means of delivering the necessary coal to the firebox should be provided.

Second, from the standpoint of the transportation department, which should be vitally interested in this subject, and the question of loading trains under different weather conditions. Too often the setting of the rate is left in the hands of a yard clerk, who does not appreciate the importance of using the highest rate which can be hauled. The committee recommends that on every railroad the chief transportation officer provide a means of following up closely the train loading from day to day, with a view of determining the cause for hauling less than the rated tonnage and correcting the practice wherever possible.

Question 10 of the circular, in regard to taking into account the mechanical stoker, was asked by the committee in view of the fact that some of the roads have shown in their tabulated tonnage rating sheets higher tonnage for locomotives equipped with the stoker by from 5 to 13 per cent as compared with locomotives of the same type not equipped with stokers.

This committee cannot ignore the generally known fact that there are in every-day service on many railroads locomotives of a size and capacity so great that their rate of steam production, when hand-fired by a good fireman working at maximum capacity, cannot develop the maximum power for which they were designed, and that exactly similar locomotives, except that they are stoker equipped, are being operated at their maximum possible rate of steam production and developing their maximum power. It is our opinion that advantage should be taken of the opportunity of hauling whatever increase in tonnage is made possible by the ability to maintain full steam pressure by the use of the stoker. On the other hand, this is a matter of supervision, which should be taken care of in the designing of the locomotive, as in setting a proper tonnage rating it must be assumed that the specified boiler pressure can be maintained.

The report was signed by O. C. Wright, chairman, Pennsylvania; H. C. Manchester, Delaware, Lackawanna & Western; C. E. Chambers, Central Railroad of New Jersey; J. H. Manning, Delaware & Hudson; Frank Zeleny, Chicago, Burlington & Quincy; Maj. E. C. Schmidt, fuel conservation section, United States Railroad Administration; Joseph Chidley, New York Central and J. L. Carroll, Baltimore & Ohio.

Action Taken

W. E. Dunham (C & N W): The present report and also the past reports of this committee have all been reports indicating what the practices are and calling attention to the latest development in actual tonnage rating of locomotives on the railways of this country. It is one of the perpetual things which will continue with us, and I think the motive power departments of the railroads should receive from this committee from year to year a memorandum of the progress and practices recommended by it upon the subject of tonnage ratings.

The President: I think it is a committee that may well be continued because each year some new developments may come up. I think a motion to receive this report and continue the committee will be in order.

Mr. Dunham: I move that the report of the committee be received and the committee continued to report progress from time to time.

The motion was duly seconded and carried.

Plate C—Pull Speed Curves, Saturated vs. Superheated Locomotives. Class G-6 (Consolidation)—New York Central (Big Four)

tonnage. One road uses surprise tests by the trainmaster to insure that ratings are adhered to.

Summary

The resistance curves forwarded to the committee in answer to Questions 1, 2, 3, 4, 5 and 6 of Circular II and as covered by Plates A and B are submitted as a matter of interest.

The information shown on Plate C in regard to the value of the superheater corroborates very well similar information included in committee's report of 1916.

In regard to Questions 8 and 9 of the circular, the committee asked for this information, as it was indicated on the floor of the 1916 convention that the association desired the committee to present recommendations covering the supervision of the application of tonnage ratings. The committee was unable to obtain a great deal of information on this subject from the members to use as a guide for making such recommendations. However, the committee feels that this is a matter of very great importance and one which is not being given the attention by many of the roads which it should receive.

The supervision of the application of tonnage rating should be carried on from two standpoints:

First, from the standpoint of the mechanical department, to see that the locomotives are so designed and maintained as to be able to deliver at all times, under the conditions to which they are subjected, their rated drawbar pull. It is not sufficient to design a locomotive and say that because we have a certain size of cylinder, a certain diameter of wheel and a certain steam pressure the locomotive will at all times deliver a certain drawbar pull, corresponding to these dimen-

Semi-Elliptic Springs—Manufacture and Repair

M. F. Cox
Chairman

THE ART OF SPRINGMAKING dates back many years. As applied to locomotives, we find semi-elliptic springs practically the same in design as on the first locomotives of the Phineas Davis and Ross Winans type, about 1830. The methods in machine manufacturing have changed in keeping with modern progress. The advent of improved oil furnaces and other highly specialized machinery has simplified the construction, eliminated nearly all of the expensive hand work and greatly reduced

the cost of manufacture. What is said here applies to open-hearth steel of the following composition:

| | Per Cent. |
|-----------------------------|-----------|
| Carbon | 1.00 |
| Manganese | 0.03 |
| Phosphorus, not above | 0.25 |
| Silicon, not above | 0.15 |
| Sulphur, not above | 0.03 |
| Copper, not above | 0.03 |

It is essential, that spring steel of a good, reliable quality be purchased to a specification, and also necessary that the

tors. Material of unsatisfactory character may sometimes be improved and made to meet the requirements by hardening at a higher temperature. A .90 carbon quality spring steel should harden satisfactorily under a temperature as low as 1500 deg. F. Spring plates which have been hardened and fail, showing a coarse, white grain, indicate over-heating.

Operations in Spring Manufacture

There are eleven or twelve essential operations required in the preparation and manufacture of standard design semi-elliptic springs, mentioned below in order: shearing plates to length; upsetting, welding and punching ends of main plates (hot); rolling ends to a taper (one operation); nibbing the center of the plates; trimming the ends; rolling the plates and quenching (one operation); drawing the temper; assembling for banding; banding; testing and painting (paint bath).

Leaving the ends undrawn without any taper, practiced by some, reduces the cost by one operation, and it is claimed increases the life of the springs; the finished appearance of the spring, however, is not as neat.

The Spring

Locomotive driving springs and those for engine trucks, trailer and tender trucks are almost universally of the elliptic and semi-elliptic type, composed of a number of steel plates, according to the load they are required to carry. The plates of the various lengths are laid one upon the other,

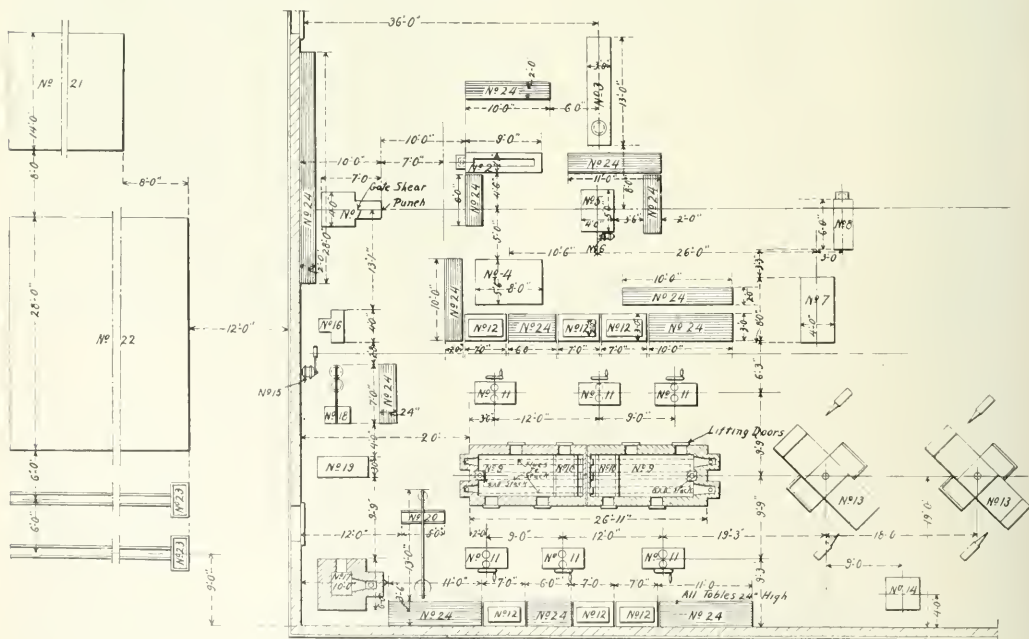

Fig. 1

springmakers obtain a correct knowledge of the character of the steel before beginning operations. The quality of the steel and the heat treatment are the all-important fac-

varying from 5/16 in. to 5/8 in. thick, and from 3 1/2 in. to 6 in. wide.

For many years the popular length of springs has ranged

from 34 in. to 42 in. from center to center of spring hanger slots. In order to standardize the shop construction, full-sized metal templates should be made for each main plate, for all classes of springs.

The length of the smallest leaf is usually made twice the width of the band, and the other plates are graduated accordingly.

A Typical Spring-Plant Arrangement

The machinery required for a railroad having 1,110 loco-

Fig. 2

Fig. 3

Fig. 4

Fig. 5

motives and 667 passenger cars is shown in Fig. 1 herewith, a list of which is as follows:

| No. | Machine | Size |
|-----|---------------------------------|--------------------------------|
| 1. | Combination punch and shear | 14-5 in. by 6 in. by 1 1/2 in. |
| 2. | Triple oil furnace for machines | 14-5 in. by 108 in. |
| 3. | Band remover | 16 in. by 16 in. |
| 4. | Tapering rolls | 6 in. by 5 1/2 in. |
| 5. | Combination trimmer and titter | 6 in. by 5 1/2 in. |
| 6. | Motor 8 h.p. for No. 5 | 600 r. p. m. |
| 7. | Air bending machine | 18 in. by 12 in. |
| 8. | Oil furnace for No. 7 | 18 in. by 7 1/2 in. |
| 9. | Heating furnace oil | 6 in. by 6 in. |
| 10. | Tempering retorts in No. 9 | 6 in. by 6 in. |
| 11. | Spring rolls | 24 in. by 6 in. |
| 12. | Oil and water cooling vats | 24 in. by 6 in. |
| 13. | Double forges—coal | 1,600 lb. |
| 14. | Steam hammer | 1,600 lb. |
| 15. | Motor for line shaft | 6 in. by 6 in. |
| 16. | Spring assembler air | 6 in. by 6 in. |
| 17. | Box banding furnace | 54 in. by 54 in. |
| 18. | Spring bender—air | 14 in. by 7 in. |
| 19. | Water tank for No. 18 | 14 in. by 7 in. |
| 20. | Spring tester 1,500 lb. | 14 in. by 26 in. |
| 21. | Spring steel shed | 14 in. by 26 in. |
| 22. | Spring storage shed | 14 in. by 34 in. |
| 23. | Paint tanks and dipping racks | 14 in. by 4 in. |
| 24. | Serving tables 24 in. by | 12 in. by 1 in. |

The material throughout this department goes forward without side or back movement.

Fig. 2 is a finished spring used for general purposes and is the accepted standard design. Fig. 3 occupies less vertical height and will take a shorter hanger than Fig. 2.

The more camber and set a spring has, the stiffer it is apt to be. It is better to design driving springs a little stiffer than otherwise. Many manufacturers are now making locomotive springs with plain main leaves and end clips, as shown in Figs. 4 and 5. By this method two expensive operations are eliminated and the cost of manufacture reduced. These clips serve best when made of strap spring steel, boiler steel or drop forging. Malleable iron or cast-steel clips are only satisfactory on very light equipment.

The practice of manufacturing the main plates as shown in Fig. 6 is still standard with many railroads for engine and trailer truck springs as well as for driving springs.

Bandmaking

In small shops, where bandmaking is done by hand and the stock is usually selected equal to that of crown band, the fuller is used as shown in Fig. 7, after which the ends are drawn down, bent and welded. Where the stock is standard for size of band, the bending may be performed as in Fig. 8a on an air press, and welded by hand or Bradley strap hammer. Fig. 8b represents the most approved method of machine-made bands; the bending is done on an air machine and welded in a four inch forging machine.

Setting

The setting or cambering operation precedes the tempering. Spring manufacturers differ somewhat on this point and also as to the spacing of the plates to provide for free-

Fig. 6

Fig. 7

Fig. 8a

Fig. 8b

dom and flexibility. Some think the shrinkage which occurs in the hardening process provides for this, while others insist that no extra space should be allowed. Experience in one shop has demonstrated that a space of 5/16 in. should be allowed between the main and the adjacent plates, diminishing toward the shortest one to within the last four or five plates; these may be set without any space allowance. See Fig. 9.

A number of plates may be placed in the fire together, as many as the operator can handle to advantage, after heating slowly to a good red color, they should then be drawn down with short, rapid strokes of the hammer or rolled as before stated. The steel should be worked at a moderate heat and at as even temperature as practicable. Overheating the ends and corners is to be avoided as it often causes them to chip off and fracture.

Tempering

In the tempering of spring plates, good judgment is required in order to meet with reasonable success. First of all, the furnace must be constructed exactly right and be under perfect control in order to maintain a uniform temperature throughout this very important process. If this is not done, the results will be confusing and unsatisfactory. Where a large number of springs are to be tempered in oil, it is necessary to have an oil tank of at least 200 gal. capacity, surrounded by a volume of water sufficient to keep the oil moderately cool, and there should be a false bottom or grate to prevent the spring plate coming in contact with the accumulation of scale and dirt which forms at the bottom.

Fish oil has been generally used in tempering, and it has proven satisfactory. Other varieties of oil and compounds are in use for which good results are claimed.

It was thought at one time that oil, after becoming hot, would not harden steel as effectively as cold oil or cold water. Long-continued practice has proven that steel spring plates, when hardened in oil moderately hot, possess all the requisite qualities. Some springmakers, after tempering, allow the plates to cool in a separate bath of oil and slowly harden, in order that the shape of the plates may change as little as possible.

After the leaves have been rolled to camber and tempered by quenching, the next operation is to place the plates in a retort, such as is shown in Fig. 1, which is a part of the heating furnace (No. 9) where the plates are brought up to a temperature (known as the flashing point) at which they become blue when cooled in air. This relieves any local strains that may set up in the hardening process, and gives a uniform temper and produces springs of good quality.

A tempered plate, after becoming cold, should not be struck with a hammer, as it often leads to fracture after the spring has been placed in service. A majority of all the ordinary tempering is left to the eye of the skilled operator, a method which is not altogether reliable. By the use of a pyrometer, or other heat-measuring instrument, much of the uncertainty of this operation may be eliminated and more satisfactory results obtained.

Then follows the assembling of the plates, clamping same tightly, in machine No. 16, Fig. 1. The band is heated

Fig. 9

in Furnace No. 17 and applied in machine No. 18. Care should be exercised that the band be placed exactly central, in order that the load may be distributed evenly; it should be made to the correct size, heated and put quickly into place with 40 to 50 tons pressure, and cooled in a water tank, No. 19.

The use of hydraulic or pneumatic power for this operation is essential. Testing the springs for uniformity of set under load is done under scale No. 20, after which they are ready for the paint bath.

Furnaces

The heating of spring plates is of vital importance, and no single detail contributes more to the success of this operation than a perfect-working furnace. The furnace hearth should be made equal to that of a sand-bottom furnace, so that the steel may find a suitable surface to rest on. The

heat should completely surround and uniformly penetrate the piece of steel. Pyrometer readings should be taken periodically at different locations within the furnace to insure that a uniform temperature is being maintained over the entire furnace.

Spring Repairing

The operations required in repairing elliptic and semi-elliptic springs are few and simple. After the spring band is taken off, an inspection of each plate is made for superficial defects. Plates which are found to be pitted or badly corroded are discarded. A close inspection will disclose most of the imperfections. Care must be used in the selection of such of the old plates which appear suitable for

Fig. 10

further use. It is not correct to use plates of different thicknesses; uniform flexibility will be impossible with such a practice. It has been demonstrated that a plate, for example, 7/16 in. thick, worked in among those 3/8 or thinner, will be the first one to break.

Reclaiming spring plates is not altogether a satisfactory operation. It is a question whether it is not more economical in the end to supply new plates throughout. It has been noted that in substituting new plates of original strength for old ones, the new plate will often be the first to fail. If the camber in an old plate is standard, it indicates suitability for further service. One road reports the labor cost for repairing springs for eight months of last year at an average of .017 cents per lb. Another reports cost of manufacture of new springs for the past four years at \$1.07 per 100 lb. and repairing at 72½ cents per 100 lb.

The operation of re-applying an old spring band is the same as that required for a new one, as is also the retesting of the spring. Spring inspection should include loose bands, broken plates, free height below standard and total thickness of plates at edge of band.

End Connections

The ends of tender springs are subject to frequent failures; perhaps 70 per cent of them fail on this account.

Fig. 21 shows a design for overcoming this trouble. Under normal load the ends of each spring bear upon the recessed portion of the end forging; as the load is increased the bearing points are supplemented and reinforced, thereby shortening the length of the springs automatically and providing additional strength to take care of the extra load.

In conclusion, we believe it good practice to concentrate all spring work at one shop, the one most centrally located, where men may be trained and made expert in the art of springmaking. At this place there should be all necessary tools and scientific equipment that will insure a uniform as well as a high grade of workmanship. The greatly increased

size and weight of modern locomotives makes this subject one of considerable importance. There is still room for improvement, both as to methods of repairing and manufacturing springs.

The report was signed by M. F. Cox (chairman), Louisville & Nashville; Eliot Sumner, Pennsylvania; A. G. Trumbull, Erie; F. W. Pratt, Chicago & North Western; F. A.

Loque, Minneapolis; St. Paul & Sault Ste. Marie, C. A. Gill, Baltimore & Ohio and G. W. Rink, Central Railroad of New Jersey.

Action Taken.

There was no discussion of this report. It was received and the committee discharged.

Development of Locomotive Feed Water Heaters

By J. Snowden Bell, Associate Member

J. Snowden Bell
Individual Paper

THE ECONOMIC VALUE of an appliance by which any substantial portion of the heat units contained in the waste gases of combustion and the exhaust steam of a locomotive can be made available in heating boiler feed-water, is too obvious a proposition to require discussion, and it was recognized by engineers at a very early day. While experiments have been made from time to time with numerous appliances of this character and have ordinarily failed to prove sufficiently satisfactory in practice to cause them to

be continued in regular service, the undeniable correctness of the general principle upon which they are based warrants, if not positively demands, its renewed consideration, particularly in view of the rigid economies in every department which present conditions have rendered indispensable, not merely to the profitable operation, but even to the very existence of the railroads of the United States.

After a general review of a number of feed-water heaters, A. L. Holley, in his comprehensive book, "American and European Railway Practice in the Economical Generation of Steam," 1861, makes the following statement:

"It is impossible to state the exact economical results of feed-heating—either the saving of fuel or the cost of repairs; because no experiments which fairly estimate all the conditions have been made. It is quite sufficient, for present purposes, however, to know that there is a saving worth making, and it is very obvious that the cost of maintaining such heaters as Clark's and Eaton's can not materially detract from the economy. It would, therefore, be unreasonable to neglect this improvement any longer, or, indeed, at least, where fuel is expensive." (p. 130.)

Mr. Holley's statement is as pertinent and noteworthy to-day as when written 56 years ago, and its importance is accentuated by the fact that appliances of improved construction have been produced since he wrote it, and by the urgent present demand for the adoption of every improvement for which an operative economy, greater than the cost of construction and maintenance, can be assured with reasonable probability.

Feed-water heaters are of two different types, which may be termed, respectively, (a) "surface" heaters, being those in which the heating medium, either gases or steam, is applied to the surfaces of channels or passages (usually tubular) through which the feed water traverses on its way to the boiler, and (b) "injection" heaters, in which steam is discharged directly into the feed water. The former type,

in which the transfer of heat from gases or steam to the feed water is effected through walls of comparatively thin metal is that which has been the more frequently experimented with, and, for several reasons, would seem to be the more practical and desirable of the two types.

[The author sketched the development of feed water heaters from 1802 up to the present time showing the designs and giving descriptions of those experimented with both in the United States and abroad, the last one described being that of the Locomotive Feed Water Heater Company.—Editor.]

In a report on a system of feed-water heating used in France, the following conditions were laid down by a committee of French engineers, in 1896, as being those which should be followed as nearly as possible in a locomotive feed-water heater:

"First.—Simplicity, and facility for examination, cleaning and overhauling.

"Second.—That the heater should take up little room and be of a minimum weight.

"Third.—The heater should give a continuous and certain supply of hot water.

"Fourth.—That the feed heater should be heated by steam that would otherwise be lost.

"Fifth.—That the steam used for the heater should vary with the quantity of feed required."

The paper of Trevithick & Cowan (*Proceedings, Institution of Mechanical Engineers*, March-April, 1913, pp. 353-356) clearly indicates that to effect the increase of the temperature of feed water to such a degree as will result in a substantial economy sufficient to warrant the application of a feed-water heater, a pump must be adopted as the feeding member instead of an injector, and this has been done in the systems before noted as having met with approval in European practice. After stating that two feed-water heating agents are available, *i. e.*, the exhaust steam discharged from the cylinders and the waste gases passing out of the stack, and that the process may result in reaching temperatures at which even the so-called hot-water injectors will not work, they proceed with what they term "a reconsideration of the feeding system generally," the following excerpt from which is believed to be of sufficient interest to be here presented.

"The ordinary injector will not pick up water above about 120 deg. to 125 deg. F., and the feed cannot, therefore, be effectively heated before it reaches the injector, while the admixture in that apparatus of live steam with the feed so raises the temperature of the latter that full advantage can not be taken of subsequent heating by either of the agents available. An injector may feed into a boiler at 180 lb. per sq. in. pressure, about 11.2 lb. of water for every 1 lb. of steam used. If the supply be at 65 deg. F. the delivery will be about 160.5 deg. F. This increase is not an economic gain. Delivery falls off as the boiler pressure rises, and the temperature of delivery is higher at the higher pressures. Subsequent feed-heating is of less advantage now than it would have been when pressures were lower.

"For each 1 lb. of steam used in the cylinders (1 + a fraction) must be produced in the boiler, from the temperature of the injector discharge, in order to supply both the engine and injector. The B. t. u. thus to be produced are given for various pressures in Fig. 1, by curve No. 1, which is based on data published by S. L. Kneass. If, subsequent to delivery from the injector, the feed be heated by the cylinder exhaust to 210 deg. F. the boiler work is reduced, as denoted by curve No. 2. The work needed increases with the boiler pressure. Heat can further be transmitted from the waste gases, and an average feed temperature of 280 deg. to 290 deg. F. obtained, but compensation can in no way be secured for heating during part of the process with live steam.

"At modern pressures the ordinary exhaust injector shows a thermal saving over the live-steam injector of some 9 per cent. The supplementary portion of the exhaust injector is handicapped by the water fed to it being already at a high temperature (about 180 deg. F.). Its steam consumption is thus high, and the final temperature of discharge is about 280 deg. F. Additional feed-heating is thus impracticable, even by the waste gases. The only gain procurable with this injector is that due to the use of part of the exhaust steam; this, however, may exceed the thermal gain of 9 per cent or so. In a more recent form of exhaust-steam injector the efficiency of the exhaust-steam jet has been improved, and much less supplementary live steam is needed. Though the thermal position is the same with both types, the discharge temperature is thus lower with the later pattern. The final temperature with the later type is 195 deg. F. compared with 280 deg. F. with the earlier, and further feed-heating is practicable.

"The pump offers advantages over the injector in connection with feed-heating since, with it, the feed temperature is not increased in the process of raising the pressure, and the temperature head is sufficient for the effective transfer of heat to the pump delivery, successively from the exhaust steam and the waste gases. On account of the sudden demands which a locomotive feed pump is called upon to meet, such an appliance should be arranged to work with water at moderately low temperatures, and the greater part of the feed heating process should be carried out between the pump and the boiler clack.

"Independent steam pumps suitable for locomotive work will deliver 100 lb. of water for about 1.5 lb. of steam, working at end against 180 lb. pressure. Curve No. 3, Fig. 1, shows the B. t. u. to be provided by the boiler for each 1 lb. of steam delivered to the cylinders, using pump supply and feed at 65 deg. F. Curve No. 4 shows the work required if the pump exhaust be utilized for feed-heating, about the same amount being required at all pressures. The pump and injector are then on an equal footing at modern pressures. Heating, further, by the main cylinder exhaust to 210 deg. F., reduces the boiler work to the amounts shown by curve No. 5. This system has a considerable advantage over the injector feed combined with heating to 210 deg. F. (see curve No. 2), and this is maintained if the feed-heating be carried still further."

The circular of inquiry which was addressed to the members of the Association and a few foreign motive-power officers, asked their opinion whether or not the application of feed-water heaters to locomotives, if a successfully operative design could be applied, "would be of advantage or effect sufficient economy of fuel to justify the cost of application and maintenance." In a few instances the replies were to the effect that the writers had not had any experience with feed-water heaters, and therefore did not feel warranted in offering an opinion, but in almost all the other cases the expressions were favorable to the feed-water heater.

Upon the basis of the unquestionable advantage obtained in the long-established use of feed-water heaters in station-

ary and marine practice; the reported satisfactory results of their operation on European locomotives; the probable increase of advantage from their use in connection with the now practically universal application of superheating; and the views expressed by the large majority of the replies of members to the writer's circular of inquiry, the following conclusions, as to the question of the advisability of the application

of feed-water heaters to locomotives, are submitted for the consideration of the Association:

(a) That the theoretical advantages of an appliance of this type, in the economization of fuel and boiler maintenance, or a corresponding increase in boiler capacity, are attainable without involving a structural complication and cost, and expense of upkeep, that would be sufficient to reduce such advantages to any appreciable extent.

(b) That an economy of fuel of at least ten per cent, as well as a reduction in the cost of boiler maintenance, under normal conditions, can be obtained by the application and operation of a correctly designed locomotive feed-water heater.

(c) That in order to be acceptable and of practical advantage in locomotive service, the design of a feed-water heater should, *first*, comply with the five general requirements of the Committee of French Engineers, noted above; *second*,

Fig. 1—Saturated Steam Boiler Output in B. t. u. Necessary with Various Conditions of Feed for Each Pound of Steam Used in the Cylinders.

should not be complicated by appliances for heating by the waste gases, but should utilize exhaust steam only as a heating medium; and, *third*, should provide for the separation and deposit of mud and saline matters, and should be easily accessible for their removal and for repairs.

Action Taken

The report was received without discussion.

Other Business

Dues of the association will remain the same as last year. Owing to the resignation of Wm. Schlafge as president of the association, an election of officers was necessary. The following were elected: F. H. Clark, general superintendent motive power, B. & O., president; W. J. Tollerton, general mechanical superintendent, C. R. I. & P., first vice-president; C. F. Giles, superintendent machinery, L. & N., second vice-president; C. H. Hogan, assistant superintendent motive power, N. Y. C., third vice-president; and H. C. Manchester, superintendent motive power and equipment, D., L. & W., member of the executive committee.

General News Department

G. V. Lomonosoff, head of the Russian railway mission to the United States, has been dismissed by the Russian ambassador because of a political statement.

Max Thelen, president of the California Railroad Commission, has been appointed supervisor of war contracts under Quartermaster General Goethals.

The Railroad Detectives' Association convention, which was to have been held in Baltimore this week, has been abandoned; this because of "unforeseen conditions breaking out on the railroads."

The machine shop of the Texas & Pacific at Marshall, Tex., was destroyed by fire on June 9, estimated loss, including machines, patterns and valuation records, \$300,000. The boiler shop and the erecting shop were slightly damaged.

James N. Wallace, president of the Central Union Trust Company of New York, has been appointed a member of the advisory committee to the director of the division of finance of the Railroad Administration. The other members of the committee, previously announced, are Franklin Q. Brown, chairman; Festus J. Wade, and Frederick W. Scott.

The salary of the chief inspector of locomotive boilers of the Interstate Commerce Commission is to be raised from \$4,000 to \$5,000 a year, the salaries of the two assistant inspectors from \$3,000 to \$4,000 and of the district inspectors from \$1,800 to \$3,000; all by virtue of a law passed by the Lower House of Congress, on June 5, and by the Senate, on June 18.

The Chicago, Burlington & Quincy has organized 50 students of the University of Chicago into a special gang which will start for Sheridan, Wyo., on June 17 to spend the summer on track work in that vicinity. This road has also secured nearly 300 high school boys for its track gangs as a result of a campaign which local officers have made in the high schools.

Employees of the Pennsylvania Railroad in military or naval service, including those from lines both east and west of Pittsburgh, now number 16,407. This is shown by reports just completed for the purpose of revising the figures on the service flag which hangs in Broad Street Station, Philadelphia. When the flag was first hung, March 20, 1918, the single blue star in the center contained the number 11,769, showing an increase of 4,638.

Scarcity of steel is now so very general that the amount which may be used for railroad purposes will be determined only after careful scrutiny. The agreement between the American Iron and Steel Institute and the War Industries Board, providing for complete government control of the distribution of steel and steel products, was noticed last week. When a railroad requires steel, the need for it must be first approved by the Regional Director, and it must then be passed upon by J. Leonard Replogle, director of steel supply for the War Industries Board, who assigns the amount due to one of the various plants. The steel required for the government cars and locomotives was allotted by Mr. Replogle through the American Iron & Steel Institute. After the priority of manufacture has been established, it is then necessary to arrange for priority in transportation.

The appropriation for railroad valuation was discussed in the House on June 14, and an effort was made by Representative Walsh of Massachusetts to strike out the provision in the sundry civil bill \$3,500,000, but he did not succeed. Mr. Walsh took the position that values have so increased that the work which is finished will be of but little real value, and that the men and money employed in the work could be better employed in other ways. Representative Shirley, chairman of the appropriations committee, defended the bill,

saying that the field work is 70 per cent completed, and will be finished in January, 1920 while the office work should be completed a year later than that. He said the commission proposes to have a division whose special duty it will be to check up the additions made by the railroads so that the valuation will be brought up to date. An amendment to strike out the appropriation was rejected without a record vote.

The airplanes carrying letters between New York and Washington have completed their first month's operation and it is announced in Washington that during this time they have carried over five tons of mail matter. The post office department regards the demonstration as successful, but is disappointed because the quantity of letters offered has not met expectations. A reduction in rates, from 24 cents an ounce to 16 cents, is under consideration. A considerable number of trips have been omitted because of fogs, the total number of which, however, is not mentioned. To surmount the difficulty of fogs it is proposed to have signal stations on the outskirts of New York and Philadelphia so that audible signals can be given, to enable aviators to get their bearings. The distance travelled in this first month is given as 11,109 miles. On June 12, Lieut. Culver made the trip from Philadelphia to New York, in 42 minutes, or at the rate of 127 miles an hour.

Messengers of the Western Union Telegraph Company were summoned before Grand Juries at Boston, New York and Washington, last Thursday morning, June 20, on charges of carrying letters on passenger trains contrary to the postal laws, which forbid the transmission of letters by private parties outside the mails. These messengers were carrying "night letters" between the cities named, and it is said that this practice has been in vogue for several months past. It appears that copies of these telegrams suitable for delivery at destination are typewritten at the originating office, and messengers have carried large numbers of them, presumably because of congestion on the wires. It is said that the Post Office Department has had knowledge of this transportation of letters by train for several months past, but it is quite generally assumed that the present action of the officers of the law has been instigated by the Commercial Telegraphers' Union, which is seeking to break down the rule of the Western Union that members of that labor organization shall not be employed in its offices.

Railroad Men Thanked

Director General McAdoo has issued a circular expressing his appreciation of the patriotism of the railroad employees of the company who volunteered for Liberty Bonds and supporting them to meet the War Savings Stamp. The circular says, in part:

"I am deeply gratified to learn of the large number of railroad employees who have subscribed for the third issue of Liberty Bonds. A large number of railroad employees will receive substantial amounts of stock in the company, and many of them will be able to invest as much as he possibly can in the War Savings Stamp."

The Cost of a Collision

Reports from Washington, Ky., tell of a number of settlements which have been made by the Louisville & Nashville for the death or injury of passengers in the Sheldersville wreck last December. The Rev. H. H. Mathurin receives \$13,000 for the death of his wife, Lee Mathurin; \$1,600, Arch Puller, for the death of his wife; Tom Miller, \$12,000 for the death of his daughter; and F. T.

Cherry, \$32,000, for death of father, mother and brother; Tom Craven, Cox Creek, \$15,000, for death of wife and son; Mack Miller, \$25,000, for death of wife and son; J. B. Overall, \$16,000, for death of son and sister; Dr. R. H. Miller, \$13,000, for death of wife; three daughters of Charles Johnson, \$8,000, for death of father.—*Nashville Banner*.

Patriotic Texas Station Men

[From a Southern Pacific Agent.]

Mr. W. E. Costello.

Superintendent, Ennis, Tex.

Dear Sir—

In view of the existing and ever-growing scarcity of labor, both local and national, we the employees at this station vote to reduce the force by one man, thereby adding materially to the man-power and treasury of the Government.

We believe it is no longer a matter of each man doing his bit, but rather a matter of doing his utmost; and we shall distribute the work of the relieved man as equally among us as possible, and endeavor to keep the work of the station up to standard efficiency. (Signed by the agent, cashier and two operators.)

Inspection and Test Section

H. E. Smith, engineer of tests of the New York Central, has been named as chief materials inspector of the Inspection and Test Section of the Railroad Administration. He will have charge of the inspection and testing of all the material purchased for use of the Railroad Administration.

C. T. Markel, general foreman and chief locomotive inspector of the Chicago & North Western, and J. A. Rickabaugh, supervising inspector of the Pennsylvania, have been appointed respectively, chief construction inspectors of locomotives and cars. They will have charge of the inspectors at the various locomotive and car plants throughout the country where the Railroad Administration has purchased equipment.

Engineer Officers' Training Camp

An Engineer Officers' Training Camp will be opened about August 1 at Camp Humphreys, Va., where 2,000 candidates for commissions as captains and first lieutenants will be trained under the same facilities provided for the 17,000 engineer replacement troops now there preparing for overseas service. These facilities include the ordinary military arrangements, and in addition, some fifteen special schools to instruct men on such operations as mining, quarrying, gas and flame defense, barb wire fortification, water supply and railroad communication. Many applications for entrance to the training camp have been received. To examine these candidates, General Black has designated a traveling board which will visit several of the larger cities and determine the physical and mental fitness of the applicants. Candidates for first lieutenancies should be between 32 and 36 years old, and those for captaincies, between 36 and 42.

Alaska Railroad

Charles A. Sulzer, delegate from Alaska, made an unsuccessful effort in the House on June 15 to secure an increase from \$5,250,000 to \$7,250,000 in the appropriation for continuing the work on the construction of the Alaska railway. Mr. Sulzer said that while last year the Alaskan Engineering Commission obtained \$14,000,000, the Department of the Interior this year, on account of the war, reduced its estimate by 50 per cent to \$7,350,000; and he presented a letter from the acting secretary of the interior, saying that the further decrease recommended by the appropriations committee would work a serious hardship. The letter said that a force of over 2,500 men is now employed upon the work, and that if the appropriation be made less than the estimate, a dispersal of the force is likely to result. Mr. Sulzer said the reduction proposed by the committee would cut out the projected extensions on the north end of the Anchorage division from the Susitna river to Hurricane Gulch and the south extension of the interior division from Lignite to

Riley creek. Representative Mondell, who spoke on behalf of the appropriations committee, defending the reduction, said that the recommended appropriation would be sufficient to keep the organization intact and to extend the Seward division to the Turnagain Arm, while the line between Turnagain Arm and Anchorage would be completed with funds now available.

Train-Lot Movements of Oil to Be Extended

The Car Service Section of the United States Railroad administration held a conference at Washington on June 7, with representatives of the various railroad regions, the Fuel Administration and oil producers and refiners. The experience of the railroads in the western region in handling oil in train lots was discussed in detail. (The train-lot plan was described in the *Railway Age* of May 24, page 1275.) It was pointed out that the plan has proved so successful in the "mid-continent" oil fields that there is now a surplus of approximately 1850 tank cars in that territory. As a result an increased output of oil is now possible. The application of the train-lot plan of moving oil in the other railroad regions received considerable attention at the meeting and will be the subject of further study by the several regional operating officers. A steady increase in oil traffic is expected as long as the war continues.

Imported Injury Suits Not to Be Heard

The first judicial action following the issuance of Order No. 26 by the director general of railroads took place in the Hennepin county (Minn.) district court, when a personal injury case imported from Nebraska was continued until the end of the war. The injury sustained by the plaintiff occurred last year at Center City, Neb., or about 700 miles from the court. The section of the director general's order which forbids the trial of such cases until after the period of government control aims to prevent such interference with efficient railroad operation as would result from requiring railroad officers and employees to go long distances from their work to appear in court. The action of the Minnesota court virtually removed from its calendar 150 other suits of a similar character. Minnesota tribunals, and especially the courts of Hennepin county, have been a "dumping ground" for personal injury suits originating all over the Northwest.

Freight Claim Agents Meet at Chicago

In response to a call by the regional director, 75 freight claim agents from the principal western railroads met at Chicago on June 12 to consider the formulation of uniform rules for the settling of claims. Methods of reducing the number of claims and of investigating and disposing of claims more promptly were also discussed. It was believed feasible to do away with a great deal of investigation which was necessary under corporate control of railways instead of tracing to fix the responsibility for liability on one of the roads participating in the movement of a shipment, some plan will be devised according to which claim payments will be prorated among the participating roads on a mileage or some other basis. The recommendations of the meeting will be considered by the Railroad Administration, and no doubt will lead to some action by it in the near future.

Railroad Administration Receives Conscience Money

The Railroad Administration the other day received the first item for its "conscience fund" in a letter from a man who enclosed \$100 to pay for various rides he had enjoyed on railroad trains without the formality of meeting the ticket collector face to face. He also enclosed an itinerary of his free trips, which he asked to have checked up so that he might be informed whether he owed more than the \$100. As he did not mention the dates of his rides, the Railroad Administration is not quite sure as to the proper tariff rate to be charged for "side-door Pullman" accommodations, nor as to whether or not the rides were taken before or after the railroads were taken under government control. Therefore, it probably will be compelled reluctantly to appear

less persons entirely that its correspondent and will not attempt the difficult task of allocating the \$100 to the treasures of the various railroads. This is on the theory that the conscience of the repentant traveler was revived by the fact that the railroads were taken over by the government and that he would have been likely to have sent the money to private corporations.

U. S. Employment Service to Regulate Labor

The government is to control labor distribution as completely as possible. After August 1, industries employing more than 100 men will be required to employ common labor through the United States Employment Service. The Department of Labor aims at the elimination of private competition for workers, and all government departments and boards concerned with war production and having to do with the letting of contracts for war materials have agreed to its plans. Felix Frankfurter, assistant to Secretary of Labor, is chairman of the "War Policies Board" of the Department of Labor. All war industries will be requested to facilitate in the centralization program by stopping independent labor recruiting activities which have demoralized the labor market, caused a tremendous labor turnover, and kept a large part of the available labor constantly jumping from one place to another.

President Wilson on June 17 issued a proclamation approving the plan and urging all employers engaged in war work to refrain from recruiting unskilled labor in any manner except through the central agency.

Claims Attorneys to Simplify Their Work

A. H. Smith, Regional Director, New York City, quoting a letter from the Railroad Administration at Washington, asks all the railroads in Eastern territory to provide for conferences of claims attorneys, looking to the adoption of a uniform policy with respect to handling personal injury claims while the roads are under federal control, the desire of the administration being (1) to prevent the causing of loss or injury, and (2) to deal with any claims which occur directly with the person or persons affected. In the simplest possible way without the services of an intermediary. The federal control act contemplates that suits for personal injuries may be brought as heretofore, but provides that executions may not be levied on the property of the carrier while in the possession of the Government. This means that while a judgment may be recovered, it devolves upon the director general to provide for payment, and this places upon him the responsibility of considering the merits of the claim, and the persons to whom payment is made. It is the desire of the director general that justice shall be done to all employees who are injured in the discharge of their duties, but verdicts based upon prejudice or passion cannot be countenanced. It will be the policy of the Government to discourage litigation and to deal directly with injured sections.

Progress of Mountain Home Association

The board of directors of the Railroad Men's Mountain Home Association announces that the organization now owns an extensive ranch of 160 acres as well as three cottages and many other improvements now on the property, including a spring house and barns. The ranch has been the summer home of a number of people for 25 years and one of its attractions is a remarkably fine view of Denver and the surrounding country from a radius of more than 100 miles. The ranch can also be seen from Denver (20 miles) the site of the home being about 2,000 ft. higher than the city. The association hopes to have the cottages ready for occupancy about 60 days and will then be able to accommodate approximately 50 men.

Railroads in increasing numbers are contributing to the support of the home and voluntary contributions from individual employees in other lines are also being received in increasing amounts. The creation of the home and its purpose were discussed in the *Pathway* issue of March 22 and May 24. This recuperation camp is primarily for convalescent railroad men returning from the front. While President Wilson has announced his consent, it is the result of a concerted effort

port and is maintained only with the voluntary contribution of those interested in making it a success. Those desiring to support the undertaking should visit the First National Bank of Denver, the trustees of the association. Attention is called to the "Heritage" Association raising funds for the home recently endorsed by the Association of Transportation and Carrying Company Officers. The secretary of the far-seeing association has sent a "Heritage Card" with two stamps attached to each member with the request that the recipient fill the card and forward it to the treasurer of the mountain home.

Railroad Administration Warns Thieves

The property protection section of the Railroad Administration has prepared a poster 14 in. by 22 in. which is being issued in large numbers to give the public the benefit of the heavy penalties provided under the laws of the United States for stealing or tampering with railroad property. The poster which is reproduced here will be put up in conspicuous places in every railroad passenger and freight station, in railroad yards and shops in flagmen's stations on railroad cars and, in fact, in all places where railroad property has been subject to theft in the past. It is believed that the thorough dissemination of information concerning the severity of punishment under the federal law will prove of material assistance to the secret service of the railroads in its campaign against thieves. The poster in which the Railroad Administration has been uniform and strenuous in the enforcement of the law was outlined in the *Pathway* of May 10 (page 1,158), and of June 14 (page 1,447).

WARNING
THAT
THE FEDERAL LAW
MAKES IT A
FELONY
PUNISHABLE BY
TEN YEARS IMPRISONMENT

To steal from any railroad car.
To break open or to enter such car with intent to steal.
To obtain by fraud or deception from any railroad car, station house, platform, trainboat, vessel, or wharf, any goods or chattels which constitute or are a part of any interstate or foreign shipment, or
To buy, receive, or have possession of such goods or chattels, knowing the same to have been stolen.

VIOLATIONS OF THIS LAW WILL BE RIGOROUSLY PROSECUTED

Reduction in Mail Pay

The annual rate of compensation to the 40,000 postmen carrying the mail was over \$8,000,000 less on October 1, 1918, than it was on October 1, 1916, according to a statement by Postmaster General Harless in a letter to Representative Bore on June 15 in reply to a statement by Senator McPherson resulting from the establishment of the new basis of payment. The new basis went into effect on midnight of October 31, 1916. At that instance, the total cost of mail and money pay, but the annual rate of pay to the postmen decreased \$3,250,000. However, the Department of the Interior immediately began its campaign for the transportation industry to systems of increasing facilities and of more efficient dispatching of the mail, so that the result that the new rate of pay to the postmen payable and monthly distribution. The Post Office Department's expenditure of nearly \$7,000,000 annually for the mail and its money pay, the following figures on another subject, namely, rate of pay to the postmen in various cities:

| | |
|---------------|-------------|
| City | Rate of pay |
| Albany, N. Y. | \$1.00 |
| Albany, N. Y. | \$1.00 |
| Albany, N. Y. | \$1.00 |
| Albany, N. Y. | \$1.00 |
| Albany, N. Y. | \$1.00 |
| Albany, N. Y. | \$1.00 |
| Albany, N. Y. | \$1.00 |
| Albany, N. Y. | \$1.00 |
| Albany, N. Y. | \$1.00 |
| Albany, N. Y. | \$1.00 |

Mr. Harless stated: "It seems to me, however, that the most important question is whether the Post Office Department has raised the cost of carrying the mail to such a point that we can ask the railroads."

Mr. Harless also quoted from the statement issued by the department a statement that in 1917 the railroad companies received in service amounting to 11,677,000,000, and that the reduction in compensation was at the rate of 12 per cent.

Chicago Track Elevation Work to Go On

A settlement has been reached between the Railroad Administration and the Chicago City Council Committee in relation to the track elevation work which has been held up since the railroads were taken over by the government. Under the plan agreed upon, work amounting to \$395,000 will be carried out and expenditures aggregating \$5,500,000 will be deferred. The work on the Illinois Central's Kensington & Eastern Line is avoided by discontinuing the operation of trains over a portion of the line. Work will also be abandoned temporarily on the Chicago & Western Indiana and on the Rock Island crossing at Cottage Grove avenue, where the work that was contemplated involved a cost of \$4,500,000. Track elevation work on the Baltimore & Ohio Chicago Terminal, from 64th Street to 69th Street will be completed at a cost of \$200,000. The Englewood Connecting Railroad (Pennsylvania Lines) track elevation, to cost \$1,000,000, will be deferred. The completion of the grade separation of Vincennes Road and Eighty Seventh Street with the Chicago, Rock Island & Pacific is authorized, at a cost of \$185,000. This work is partly completed and streets are left in a bad condition. No agreement was reached on the Illinois Central's South Chicago branch, involving 40 crossings within a distance of two miles, and that work will probably be deferred.

The Traveling Engineers' Association

The Railroad Administration has authorized the Traveling Engineers' Association to hold the next convention at Chicago, Ill., commencing September 10, 1918. The following are the subjects to be discussed:

(1) Fuel Economy under the following heads (a) Value of present draft appliances; can they be improved to effect fuel economy? (b) Best practice for handling locomotives at terminals to reduce coal consumption. (c) How can engine-men and firemen effect the greatest saving of fuel when locomotives are in their charge? (d) Whether it is most economical to buy cheap fuel, at a low heat value or a higher priced fuel at a greater heat value. (e) The most economical method of weighing fuel when delivered to locomotives, in order that individual records of coal used by engine-men and firemen may be kept. (f) Superheat applied to locomotives as effecting coal consumption.

(2) Engine Failures—causes and remedies, best methods of investigating same, and placing responsibility.

(3) The use of superheat steam in slide valve engines. Drifting, relief and by-pass valves or the absence of any one or all on superheat locomotives equipped with piston valves.

(4) Cab and cab fittings on modern locomotives, from the viewpoint of the engineman.

(5) How can the traveling engineer and general air brake inspector best co-operate to improve and maintain the air brake service?

There will be opportunity for such other matters as may be considered of interest to the association and the railroads under changed conditions.

Express Merger to Be Unscrambled After the War

The contract between the Railroad Administration and the express companies, providing for a consolidation into a single company, was the subject of a prolonged discussion, as noted on page 1466 of this paper. The objections of the postmaster general and the attorney general prevailed, and as a result of the conference held on Tuesday, the following provision was inserted in the contract:

"It is the intention that the provision herein made for carrying on the express transportation business through the agency of a single corporation shall continue in effect only during the period of federal control; and nothing herein contained shall be construed as sanctioning any combination or merger of the properties or business of the express companies to last beyond that period." Another clause provides that the express companies shall maintain their individual corporate existence and that on the termination of federal control their property or its equivalent shall be reconveyed by the new corporation.

Schweyer's Automatic Train Stop

An automatic train stop invented by D. H. Schweyer, of Easton, Pa., which requires no moving part on the roadway, and in which also, the principal member depending from the locomotive is immovable, is being tried on the Colebrookdale branch of the Philadelphia & Reading, between Bechtelsville, Pa., and Barto, and a public demonstration is to be made at Barto on Sunday, June 23, at 10:30 a. m.

A choke coil depends from the right side of the locomotive, 12 $\frac{3}{4}$ in. outside the gage line of the rail, with its bottom face $\frac{4}{16}$ in. above the top of the rail. This choke coil is in series with a condenser in the circuit of a steam turbine generator carried on the locomotive.

On the track, parallel to the right hand rail and 13 in. outside the gage line is a track armature, about 30 in. long, with its upper surface 2 $\frac{1}{4}$ in. above the top of the rail.

As the locomotive passes over a signaling point, the engine member clears the track armature 2 $\frac{1}{4}$ in.; and the current in the coil, (a. c.) drops in value 50 per cent. This current is connected to a transformer through an a. c. relay, the armature of which drops when the current is weakened; this opens the internal circuits of two neutral relays, one clear and the other caution; and at the same time a visual cab indicator (lamp) is energized through a back contact.

This process stops every train. But to provide for proceed indications, the leading truck of the locomotive is insulated from the frame, and at the moment that it passes the track armature it is on a short insulated section of track. On the locomotive there is a polarized relay, in a circuit which runs from the insulated truck to the frame of the locomotive and thence to the ground. Through the insulated truck this circuit is energized by a local track battery, the current from which is governed by the condition of the block or blocks ahead, so as to energize the caution relay or the clear relay as may be appropriate.

The plans for use of this stop on an electric railway provide for fixing a receiving coil on the locomotive so that it will hang midway between the two running rails and 3 $\frac{1}{2}$ in. above the plane of the top of the rails. A track coil, even with the tops of the rails, is momentarily energized by a local battery. The receiving coil passes through the flux produced by the track coil so as to cause the caution or the clear indication at the moment that the choke coil is under the influence of the track armature.

A failure of the local battery, or the breaking of a wire, would result in the application of the brakes and the stopping of the train. The application of the brakes is made by means of slide valves, operated by electro-pneumatic valves, controlled by the relays on the engine.

Provision for service application of brakes is made by means of an expansion reservoir, and the regulation of the degree of reduction of air pressure is effected by varying the amount of expansion space.

The choke coil on the locomotive is normally affected only by the track armature; other structures such as the rails of side tracks, or guard rails, may affect the coil but not in sufficient degree to open the relay. Any structure on or near the track which might possibly affect the circuit on the locomotive can be made harmless in this direction by the use of manganese steel, which is non-magnetic.

Federal Managers

The following table gives a list of the federal and general managers whose appointments have thus far been announced. The names are arranged alphabetically by roads.

ALABAMA & VICKSBURG.—See Southern Railway.
BALTIMORE & OHIO LINES EAST.—A. W. Thompson, Federal Manager, Baltimore, Md.
BALTIMORE & OHIO LINES WEST OF PARKERSBURG AND PITTSBURGH.—C. W. Galloway, Federal Manager, Cincinnati.
BANGOR & AROOSTOOK.—P. R. Todd, Assistant to District Director and General Manager, Bangor, Me.
BOSTON & ALBANY.—H. M. Biscoe, Federal Manager, South Station, Boston, Mass.
BOSTON & MAINE.—B. R. Pollock, Federal Manager, North Station, Boston, Mass.
BUFFALO & SUSQUEHANNA.—E. R. Darlow, General Manager, Buffalo, N. Y.
BUFFALO, ROCHESTER & PITTSBURGH.—T. F. Brennan, General Manager, Rochester, N. Y.
CAROLINA, CLINTCHFIELD & OHIO OF SOUTH CAROLINA.—See Southern Railway.
CENTRAL INDIANA.—See Cleveland, Cincinnati, Chicago & St. Louis.
CENTRAL NEW ENGLAND.—See New York, New Haven & Hartford.
CENTRAL OF GEORGIA.—W. A. Winburn, Federal Manager, Savannah, Ga.

defined in R. H. Countiss' tariff I. C. C. 1048, and all other points in the United States east of the Mississippi river via the Pacific coast: Agricultural implements, machinery, oil well supplies, sewing machines, railway equipment, locomotives, freight and passenger cars, lubricating oils, \$1.25; cigarettes and tobacco, \$1.56½; iron and steel articles from Colorado, 60 cents; Chicago, 75 cents; Pittsburgh and east, 85 cents. The import rates via the Pacific coast include green coffee, 80 cents; chinaware and glassware, \$1.87½; rubber, \$1.56½; silk, \$7.50 (l. c. l.); tea, \$1.87½; tin, \$1.25, and raw sugar, 87½ cents.

Car Service Office at Chicago

The car service section of the Railroad Administration is to establish at Chicago on July 1 a refrigerator department, for the purpose of facilitating the expeditious and economical handling of refrigerator cars, and W. L. Barnes, assistant manager of the car service section (Washington), will go to Chicago, and will have supervision over refrigerator cars, both those of railroad and those of private ownership. There will also be established, under the charge of Mr. Barnes, a tank-car record office, to deal both with railroad-owned and privately owned tank cars.

Coal Production

Bituminous coal production during the week ending June 8 was the largest in history, according to the weekly report of the Geological Survey. The soft coal produced, including lignite and that made into coke, is estimated at 12,465,000 net tons, an increase over the week of June 1 of approximately 1,900,000 net tons, or 17.8 per cent, and the same increase over week of June 8, 1917. The average daily production is estimated at 2,077,000 net tons, considerably in excess of the 1,791,000 net tons during the week preceding, and 1,789,000 net tons during the same week of the preceding year. Anthracite shipments during the week ended June 8 increased approximately 9,000 carloads or 28.3 per cent. During the week ending June 1, 29.4 per cent of full time output was lost for various causes, of which 8.4 per cent is said to be attributable to car shortage.

Consolidated Ticket Offices

The Eastern Committee on Consolidation of Ticket Offices reports the approximate dates fixed for opening the following union city ticket offices:

| | | |
|-----------------------------------|--------------------|---------|
| New York—31 W. 32nd St., July 5 | Cleveland | July 1 |
| New York—64 Broadway, July 10 | Toledo | July 1 |
| New York—114 W. 42nd St., July 10 | Indianapolis | July 10 |
| Philadelphia | Boston | July 10 |
| Baltimore | Cincinnati | July 15 |

The following consolidated offices have been in operation since the dates mentioned:

| | | | |
|-----------------------------------|---------|------------------|---------|
| Rochester | May 1 | Brooklyn | June 17 |
| Syracuse | May 1 | Reading | June 10 |
| Williamsport | May 1 | Wilmington | June 17 |
| Grand Rapids | May 23 | Pittsburgh | June 17 |
| Detroit | June 1 | Buffalo | June 17 |
| Washington | May 6 | Newark | June 17 |
| New York—27 Chambers St., June 17 | | Columbus | June 17 |
| (280 B'way) | June 17 | Dayton | June 17 |

Taking the Bull by the Horns

New York State's new large canals have been in operation now more than a month, and the progress toward success has been disappointing, not only to shippers but to the United States Government. In fact, the situation has become so acute that it is proposed by the transportation interests of the State to take some immediate action to prevent the remainder of the season passing without at least demonstrating that the State has not thrown away \$154,000,000 without bringing about some improvement over the old canals. With this purpose in view, the shipping interests will hold a convention in Albany on June 26, at which time, it is claimed, the searchlight will be turned upon whatever impediments stand in the way of using the new waterways in expediting shipments between the Great Lakes and the seaboard. Invitations have been sent out to more than a thou-

sand shippers and transportation companies inside the State to be present. It is understood that it is the intention not to invite any State officials to the convention. The shipping men propose to get the business men of the State together and to take the bull by the horns.—*Journal of Commerce, New York.*

Exports Control Committee

An Exports Control Committee to have complete control of the movement of export freight to the ports has been created, consisting of: Major General G. W. Goethals, representing the War Department; Rear Admiral C. J. Peoples, representing the Navy Department; George D. Ogden, general freight agent of the Pennsylvania, representing the Railroad Administration; P. A. S. Franklin, representing the Shipping Control Committee, and D. W. Cooke, vice-president of the Erie, representing the Traffic Executive controlling Allied traffic. It will be the duty of this committee to inform itself: As to the probable amount of freight which must be exported for the prosecution of the war. How this war freight can best be routed through the various ports. How much of other essential export traffic has to be handled. The amount of local traffic necessary for each port. The committee will have authority to select the port to which specified freight shall be transported for trans-shipment overseas for the use of the War and Navy Departments, the Allied governments and others. The committee will also decide the distribution of the combined amount of all exports, as between the various ports, so as to facilitate its handling at, and avoid congestion in, any one port. The headquarters of the committee will be at Washington.

Regulations Respecting Advertising

Edward Chambers, director, division of traffic of the Railroad Administration, has issued a pamphlet of regulations respecting railroad advertising, giving detailed specifications for the construction of time table folders, advertising in the Official Guide, which is to be reduced in size, and for other forms of advertising. The new regulations amplify the circular instructions issued by the regional directors in March and will result in important economies.

For the convenience of the public individual time tables are to be issued by each carrier for free distribution. District time tables may be issued wherever economy or practicability can be secured thereby. Uniformity for each line is to be observed. Folders are to be informative only, claims of superior service to be eliminated. It is suggested that when there is a new issue because of change of time a supply only sufficient to meet the needs of each office for not exceeding 30 days be furnished. While standardization is to be followed as closely as possible any line, the service of which does not warrant a folder of the size specified, may reduce the size to correspond with its requirements. A limited free distribution of local folders is to be allowed in foreign territory, to meet the public need.

Except when required by state law, time table display cards, posters, etc., showing departure of trains, or regular train schedules, designed for posting at line stations, hotels or other public places are not to be used. For the information of the public and ticket agents railroads may issue brief hotel and boarding house lists. The issuance of resort publications has been discontinued until further notice; but when it has been determined that public policy permits they may be issued jointly, but must be informative only and "conservatively descriptive." All work on such publications for the present must be discontinued. Publications informative of the agricultural possibilities of sections not now fully settled may be continued, but where practicable should be joint. Publications intended to exploit limited or other luxurious train service, or other competitive features, are to be discontinued. A limited amount of advertising is permissible when reduced rates are made for special occasions.

Under the general prohibition of anything exploitative is given a list including such things as bill boards, souvenir books, blotters and calendars, wall maps, etc.

Detailed directions are given for representation in the Official Guide, which is to be issued monthly as at present, "at least until such time as it can be arranged to change train schedules less frequently"; and no expense is to be incurred for representation in any other railway guide.

Equipment and Supplies

Cars and Locomotives For Lines in France

The United States Government is expected to place large orders shortly for additional cars and locomotives for service on the military railway lines in France. General Pershing has cabled to Washington requirements for locomotives, cars and steel which will greatly increase the orders already placed by S. M. Felton, director general of military railways, which include about 30,000 cars and 2,000 locomotives. The number of cars and engines wanted has not been given out, but it is understood that it is so large as to cause some perplexity on the part of the authorities in charge of the apportionment of the steel supply.

390 Locomotives Ordered

The order for 390 additional locomotives, mentioned last week, as about to be placed by the Railroad Administration, has now been placed.

Car and Locomotive Specialties

The Central Advisory Purchasing Committee has announced the following additional awards for specialties for the government cars and locomotives:

Locomotives

| | |
|--|---|
| Metallic connection between engine and tender..... | 400 Franklin Ry. Supply Co. 385 Barco Mfg. Company. 240 Greenlaw Mfg. Co. |
| Springs | To be purchased by builders. |
| Throttle valves | All Chambers Valve Company. |
| Roller steel wheels..... | Forged Steel Wheel Company. Standard Steel Works Company. |
| Yokes for tenders (cast steel) | All, Buckeye Steel Castings Co. |

Cars

| | |
|-----------------------------|---|
| Journal bearings | 8,000 Haskell & Barker Car Co. 10,000 Bostwick-Lyon Bronze Co. 11,000 Southern Brass Company. 20,000 Keystone Bronze Company. |
| Wheels (steel) | Balance of order to be placed later. 3,000 Midvale Steel & Ordnance Co. 7,500 Forged Steel Wheel Company. 2,500 Carnegie Steel Company. |
| Wheels (cast iron)..... | 126,000 Griffin Wheel Company. 13,000 Brown Company. 13,000 Buffalo Car Wheel Fdy. Co. 16,000 Bass Foundry & Mach. Co. 16,000 New York Car Wheel Wks. 20,000 National Car Wheel Company. 8,000 Ramapo Iron Works. 8,000 Southern Wheel Co. 4,000 Standard Steel Works Co. 8,000 Albany Car Wheel Co. 4,000 Louisville Car Wheel & Ry. Sup. Co. 56,000 Pressed Steel Car Company. |
| Door fixtures | 248,000 American Car & Foundry Company. 64,000 Haskell & Barker Car Co. 32,000 Mt. Vernon Car Mfg. Company. 16,000 Lenoir Car Works. |
| Door operating mechanism... | 25,000 single sheathed box. Camel Company. 25,000 double sheathed box. Union Metal Products Company. |
| Roofs | Composite gondola and 55 ton hopper cars. Combination of car builders design with Enterprise safety lowering device. 17,000 Murphy, Standard Ry. Equipment Co. 16,500 Chicago-Cleveland Car Roofing Co. 16,500 Hutchins Car Roofing Company. 10,000 American Steel Foundries. |
| Springs | 5,250 Crucible Steel Co. 5,500 Union Spring & Mfg. Co. 5,350 Pittsburgh Spring & Steel Co. 2,400 Ft. Pitt Spring & Mfg. Co. 52,000 Railway Steel Springs Co. 3,000 W. G. Mitchell Spring Works. 7,500 Pressed Steel Car Company. 7,500 Standard Steel Car Company. 1,500 Keith Ry. Equipment Company. |
| Angle cock holders..... | All Railway Devices Company. |
| Ratchet brake levers..... | For composite gondolas and 55 ton hoppers 25,000 Robert H. Blackall. 20,000 Railway Devices Company. |

Orders for the plates, bars and shapes for the cars and locomotives have been distributed among the steel companies.

One Car Completed

Although all of the specialties had not yet been ordered, Director General McAdoo's office announced on June 19 that he had just been notified by President Woodin, of the American Car & Foundry Company, that the first of the 33,000 freight cars for which that company held the contract had been completed, and that work on the entire order is progressing. The letting of this contract was announced on April 26.

This is a sample or model car built for inspection purposes and does not necessarily conform to complete final specifications.

For the purpose of facilitating delivery of cars and locomotives ordered, Central Advisory Purchasing Committee has established a procurement section which will follow up and expedite the delivery by keeping in close touch with progress of work at different plants and by rendering such assistance as possible in the procurement and delivery of materials needed. This section will be in charge of H. C. Peare. His office is at Washington, and he succeeds the Advisory Committee on Materials.

Machinery and Tools

THE CHICAGO, INDIANAPOLIS & LOUISVILLE has issued an inquiry for four 36-in. x 12-ft. engine lathes, four 24-in. x 10-ft. engine lathes, four 42-in. boring mills with bar head, three 30-in. planers, two air compressors of 1,500 cu. ft. per min. capacity, and one of 500 cu. ft. per min. capacity.

Track Specialties

THE NORFOLK & WESTERN is inquiring for 8,000 kegs of spikes.

THE NEW YORK, CHICAGO & ST. LOUIS is inquiring for 1,700 kegs of spikes.

THE PENNSYLVANIA LINES have ordered 3,000 kegs of spikes of two Pittsburgh companies.

THE BALTIMORE & OHIO has placed an order with a Pittsburgh concern for 1,000 kegs of spikes.

LIGHT RAILWAYS IN PRUSSIA.—The aggregate mileage of light railways in Prussia at the end of March, 1917, was about 6,705 miles as against about 6,659 miles at the end of the previous fiscal year. The gages of these lines varied between 2 ft. and the German standard gage (4 ft. 8½ in.). The capital invested at the end of March, 1917, was nearly \$185,000,000.

THE RAILWAY BOARD OF INDIA has sanctioned the following surveys by the Darjeeling-Himalayan Railway: A meter gage line from Oslampur to Siliguri, via Titalia, a distance of about 36 miles; a meter gage line from Titalia or Ramgumte to Jalpaiguri, a distance of about 22 miles; for converting the Kissen-gunge-Islampur line from the 2 ft. to the meter gage, a distance of about 18 miles; and for a 2-ft. gage line from Islamour to Dinajpur via Lahiree Hat with a branch from Lahiree Hat to Haldibari, a distance of about 89 miles.

THE URUGUAYAN RAILWAY PURCHASE.—Private advices received from Buenos Aires state that the bill pending in the Uruguayan Congress, which would authorize the government to purchase the Uruguayan Central Railway and a number of public utilities from British interests, provides for the issuance of government bonds to the amount of 65,000,000 pesos, or \$67,000,000 in American money. In order to insure the success of the flotation, the measure contains the rather unusual feature of compelling exporters to receive 25 per cent of the selling price of their goods in these bonds. It is explained that capital is comparatively scarce in Uruguay and, inasmuch as those engaged in the export trade are the most prosperous class in the country at the moment, it is the intention of the government to conscript a part of their newly acquired wealth in the sense of forcing them to subscribe to the bonds.—*Broad Street Gossip in the Wall Street Journal.*

Supply Trade News

W. M. Bosworth has resigned as mechanical engineer of the Norfolk Southern to go into the engineering department of the Undertert Stoker Company, Chicago, Ill.

Charles P. Wright, sales representative of the American Brake Shoe & Foundry Company at Chicago, has been appointed assistant to the vice-president, with headquarters at Chicago, effective June 1.

The directors of the Pullman Company on June 10 elected **John F. Kane** secretary, succeeding **A. S. Weinsheimer**, deceased, and **Charles S. Sweet**, formerly chief clerk in the president's office, was elected assistant secretary, succeeding Mr. Kane.

The **Q & C Company**, of New York and Chicago, announces the appointment of the General Supply Company, Ltd., of Canada (358-360 Sparks street, Ottawa, Canada, with branch offices at Montreal, Winnipeg and Vancouver), as sole representatives in Canada.

David T. Hallberg, whose promotion to district sales agent of the P & M Company, with headquarters at Chicago, was announced in these columns on June 14, was born at Ottum-

wa, Iowa, on September 11, 1885. After completing his education in the public schools in that city, he went to Chicago in 1901, and was there employed in the printing industry until he entered the passenger and advertising department of the Atchison, Topeka & Santa Fe, in 1905. Later he was appointed western representative of the Santa Fe Employees' Magazine, and remained in that position until he entered the service of the P & M Company as material inspector in May, 1910. Shortly

after that he became western representative and in January, 1918, he came to Chicago as sales representative, which position he held until his present promotion to district sales agent, as mentioned above.

G. H. Corse, Jr., has resigned as traffic manager of G. Amsinck Company, New York, to become traffic manager of the Robertson-Cole Company, of New York, general exporters of motor cars, steel, etc., with headquarters at San Francisco. Until a few months ago, Mr. Corse was foreign passenger agent of the Union Pacific System.

The degree of Doctor of Engineering was conferred upon **Walter V. Turner**, maker of engineering for the Westinghouse Air Brake Company, at the University of Pittsburgh at the annual Commencement, in recognition of his valuable services to the engineering profession and to humanity. Mr. Turner is considered the foremost pneumatic engineer in the world, and has over four hundred (400) inventions, covered by U. S. patents, in use on most railways of the world and in many large industrial plants.

The **Universal Draft Gear Attachment Company**, Chicago, has joined with **John T. Llewellyn**, president of the Chicago Malleable Castings Company and associates in the purchase of the Harvey (Ill.) plant of the Whiting Foundry & Equipment Company, just west of the tracks of the Baltimore & Ohio Chicago Terminal. The stated consideration is \$75,000. The property includes a one-story building, about 400 by

125 ft., and two or more acres of land. The plant will be used mainly for the manufacture of steel castings for railroad cars. This transaction disposes of the smaller of two pieces of property of the Whiting Foundry & Equipment Company at Harvey.

Stanley W. Midgley, whose appointment as western representative in charge of railroad sales of the Liberty Steel Products Company at Chicago was announced in the

S. W. Midgley

Railway Age, on June 14, was born at Chicago in 1875. After completing his education at the Lewis Institute (Chicago) he entered the sales department of the Great Western Cereal Company, having charge of the wholesale trade, with headquarters at Chicago. From 1902 to 1906, Mr. Midgley was general sales representative of the National Car Cooler Company, at Chicago, and from 1906 to 1914 he was western representative and western sales manager of the Curtin Supply Company, in

the same city. Subsequently, he became general sales manager of the Acme Supply Company, with headquarters in Chicago, and remained with that company until his recent appointment as mentioned above.

The **Westinghouse Electric & Manufacturing Company** has purchased the property, business and good-will of the Krantz Manufacturing Company, Inc., Brooklyn, N. Y., manufacturers of safety and semi-safety electrical and other devices, such as auto-lock switches, distribution panels, switchboards, floor boxes, bushings, etc. The supply department of the Westinghouse Electric & Manufacturing Company will act as exclusive sales agent for the products of the Krantz Manufacturing Company, Inc., Brooklyn, N. Y., continued under its present name **H. G. Hoke**, of the Westinghouse Electric & Manufacturing Company, will represent the supply department at the Krantz factory.

Frank W. Edmunds has been appointed general eastern sales manager of the Schroeder Headlight & Generator Company, of Evansville, Ind., with offices at 30 Church street, New York.

F. W. Edmunds

Mr. Edmunds like many of the prominent men allied with the railway supply industry, began his business career as an office boy. His first employer was the man who put up the money for and built the famous "Monitor" of Civil War days, John A. Griswold, president of John A. Griswold & Co. With this company Mr. Edmunds stayed until it became the Troy Steel Company and then some years later liquidated. In the meantime he had been made secretary, treasurer and general sales manager. He then became secretary of the

Q & C Company at Chicago, acting also as western representative of the Pennsylvania Steel Company. He returned from this position to become associated with the Pressed Railway Lamp Works, of New York, with which company he has been for 15 consecutive years, resigning as sales manager to accept the posi-

tion mentioned above. The change becomes effective June 15. Mr. Edmunds served for years on various committees of the Railway Supply Manufacturers Association and other associations, and is now the secretary treasurer of the Signal Appliance Association.

George M. Coale, whose election as vice-president of the Duncan Lumber Company, with headquarters at Chicago, was announced in the *Railway Age* on June 14, was born at Gosport, Ala., on May 30, 1885. In 1903 he entered the employ of the Keith Lumber Company, at Voth, Tex., as a clerk, remaining with that company until 1905, at which time he was appointed assistant sales manager of the Continental Lumber Company at Houston, Tex. The latter part of the following year he was elected secretary and sales manager of the same company. In 1909 he became northern sales manager for the Kirby Lumber Company, with headquarters at Chicago, with which company he remained until 1911, when he returned to the Continental Lumber Company, as vice-president. He retained that position until his recent election as vice-president in charge of railway sales of the Duncan Lumber Company of Portland, Ore.

D. F. Crawford, who recently resigned as general manager of the Pennsylvania Lines West of Pittsburgh, has been elected vice-president of the Locomotive Stoker Company, with headquarters at Pittsburgh, Pa. When in railway service, Mr. Crawford obtained extensive experience in both mechanical and executive positions. He was born at Pittsburgh December 4, 1864, and attended the city and private schools and also the Pennsylvania Military College. He entered the service of the Pennsylvania System in July, 1882, in the freight department, transferring to the Altoona shops in December, 1885, as a special apprentice. From 1889 to February 1, 1892, he was an inspector in the test department. In February, 1892, he was appointed assistant master mechanic of the Fort Wayne shops of the Pennsylvania Lines West of Pittsburgh. From July 1, 1895, to November 1, 1899, he was assistant to superintendent of motive power of the Northwest System of the Pennsylvania Lines West and on the latter date was made superintendent motive power of the same system, where he remained until August 1, 1903, when he was appointed general superintendent of motive power of the Pennsylvania Lines West of Pittsburgh. On January 1, 1917, he was promoted to general manager of the Lines West. Mr. Crawford was president of the Master Mechanics' Association in 1913, and in 1915 he was president of the Master Car Builders Association. Since 1903, he has devoted much time and attention to the use and development of mechanical stokers for locomotives—and during this period developed the Crawford underfeed stoker, which is in extensive use on the Pennsylvania Lines West.

D. F. Crawford

Conference of Allied Manufacturers and Publishers

Representatives of the business and editorial departments of a large number of business papers were the guests at luncheon at the University Club in Chicago on June 17 of the manufacturing concerns associated with the Allied Construction Machinery Corporation. The occasion was a conference for the discussion of the American export situation after the war and of the means by which the publishers and the manufacturers can co-operate for their mutual benefit.

Announcement of the purpose of the conference was made by D. H. Nichols, managing director of the Allied Publicity

Bureau, and the toastmaster was S. T. Henry, vice-president of the Allied Construction Machinery Corporation. The speakers and their subjects were: F. A. Smythe, president of the Thew Automatic Shovel Company, "Publicity in the Sales Program"; W. T. Beatty, president, Austin Manufacturing Company, "Problems Encountered in Advertising Road Machinery"; E. J. Mehren, vice-president, McGraw-Hill Publishing Company, "The Publisher's Ability to Serve"; Charles F. Lang, president, Lakewood Engineering Company, "Visualizing Sales Through Publicity"; W. S. Kies, vice-president, American International Corporation, "Foreign Trade and American Manufacturers"; James H. Foster, president, Hydraulic Pressed Steel Company, "Manufacturing Efficiency in War Times"; Carl A. Luster, president, Clyde Iron Works, "The Value of Quality in Direct Appeal"; W. H. Taylor, president, Iron Age, "Conditions of the Iron and Steel Trade Now and After the War."

The Allied Construction Machinery Corporation was organized chiefly to further export trade, and is now studying conditions both at home and abroad with a view to promoting such trade for the companies associated with it after the war. The conference with the publishers in Chicago was the first of a series of conferences which the Allied Manufacturers will hold with different classes of persons and concerns with which they do business. Following the conference in Chicago on Monday, the manufacturers, accompanied by a number of the publishers, started on a tour of inspection of the plants of the allied manufacturers which will take them to Aurora, Ill.; Milwaukee, Wis.; Duluth, Minn.; Colfax Springs and Newton, Iowa; Cleveland, Ohio, and Lorain. The final conference between the manufacturers and publishers will be held at the Cleveland Athletic Club on June 28. The plants to be visited are those of the companies whose presidents appeared as speakers at the luncheon on Monday and also of the C. H. & E. Manufacturing Company; the Sterling Wheelbarrow Company, and the Barber-Greene Company. The purpose of the inspection trip is to so familiarize the publishers with the plants and products of the manufacturers as to enable the former to give the manufacturers better service through their advertising columns.

Trade Publications

WROUGHT IRON PIPE.—A photomicrograph showing a section of pipe magnified 60 diameters is an interesting feature of a folder recently issued by the A. M. Byers Company, Pittsburgh, Pa. The reason for the rust resisting properties of wrought iron is clearly brought out, and records of installation of Byers pipes are cited in the folder.

SWEDISH PURCHASE OF GERMAN RAILS.—The Swedish Railway management has entered into a fully guaranteed agreement with the German Steel Trust for the delivery of 80,000 tons of rails. One-third of the deliveries is to be made in each of the years 1918, 1919, and 1920. Payment is to be made by the deposit of Swedish crowns in the German Reichsbank, and about half of the amount, reckoned at 11,500,000 crowns (\$3,105,000) is to be paid immediately.—*Commerce Reports.*

EXEMPTIONS FOR BRITISH RAILWAYMEN.—A question in the English Parliament on the exemptions from military service granted by railway companies to railway employees received this answer: All railway men are protected from military service under arrangements originally made between the War Office and the Railway Executive Committee and continued by the Ministry of National Service. The release of railway employees for military service is carried out under the instructions of the Railway Executive Committee, and in agreement with the men's representatives. By this agreement, men are released in order of medical grade, age, marital conditions, and number of children. Any man considering himself to be released out of his turn has the right of appeal to an independent committee appointed by the Board of Trade, and accepted by the Railway Executive Committee and the men's unions. Railway men have the same rights of appeal to tribunals on other than occupational grounds as are enjoyed by other men.

Railway Financial News

ALABAMA, TENNESSEE & SOUTHERN. The reorganization committee of which G. C. Van Tuyl, Jr., president of the Metropolitan Trust Company of New York, is chairman, has adopted a reorganization plan for this company. It provides for the issuance of (1) \$3,500,000, 30-year 6 per cent prior lien gold bonds, \$850,000 of which are for the cash requirements of the plan, the rest to be reserved for general corporate purposes; (2) \$2,110,000 general (2d) 30-year mortgage gold bonds; (3) \$1,700,000 6 per cent preferred stock at par of which \$1,527,000 will be presently issuable under the plan; (4) \$2,500,000 common stock at par of which \$2,424,000 (y. t. c.) will be presently issuable under the plan. The new common stock will be assigned to George C. Van Tuyl, Jr., Louis A. Bright, George E. Warren, James C. Colgate, John I. Cochran and H. A. Smith, to be jointly held by them and their respective successors as voting trustees for five years with the right either to terminate the trust at an earlier date, or to continue it for a further period of three years in the event that during the said period of five years the full rate of interest of 6 per cent per annum shall not have been paid on the general mortgage bonds for at least three years of said period. The plan gives the terms of exchange for existing securities and holders are advised to deposit their holdings with the Metropolitan Trust Company, 60 Wall street, New York City, on or before July 12.

BALTIMORE & OHIO.—An application has been filed by this company with the Ohio Public Utilities Commission for permission to issue \$20,000,000 5 per cent bonds. This action is understood to forecast an early request by the company for funds from the Railroad Administration to meet maturing equipment obligations and to provide for improvements recommended by the Railroad Administration.

BOSTON & MAINE.—See editorial comments elsewhere in this issue.

CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA.—See editorial comments elsewhere in this issue.

DENVER & RIO GRANDE.—William Salomon & Co. on the steps of the County Court House of New York County Thursday bid \$4,000,000 for the right, title and interest of the Denver & Rio Grande in the stock of the Utah Fuel Company, which has a par value of \$10,000,000. The banking firm acted on behalf of the Western Pacific Railroad, which has a 95 per cent interest in the \$38,000,000 judgment against the Denver & Rio Grande, which was obtained several months ago by the Equitable Trust Company as trustee of the old Western Pacific first mortgage bonds. The remaining 5 per cent interest is held by the old Western Pacific first mortgage bondholders who did not join in the reorganization. The sale was conducted under a protest of the Bankers Trust Company, acting as trustee for the first and refunding bondholders of the Denver & Rio Grande. The bid made by Salomon & Co. places a nominal value of \$12,300,000 on the Utah Fuel property, inasmuch as the \$4,000,000 price was paid for the equity in the property over and above the \$2,300,000 Utah Fuel bonds outstanding and the \$4,000,000 cash which must be paid to the Guaranty Trust Company to redeem the stock which is pledged with it as trustee, as collateral security for the Rio Grande Western consolidated mortgage. The Bankers Trust Company's protest served notice that that company, acting as trustee under the Denver first and refunding mortgage, would at the proper time take such action as may be appropriate to protect the first and refunding bondholders' interest in the Utah Fuel stock.

ERIE.—This company has applied to the New York Public Service Commission for permission to issue \$12,500,000 6 per cent series B mortgage bonds for general capital expenditures.

PHILADELPHIA & READING.—William K. Vanderbilt, Jr., and C. E. Dilkes have been elected directors to succeed Alfred H. Smith and William L. Kinter, respectively, resigned.

WESTERN PACIFIC.—See Denver & Rio Grande.

Railway Officers

Executive, Financial, Legal and Accounting

T. H. Gathin, assistant to the president of the Southern Railway, has been appointed assistant to president, with headquarters at Washington, D. C.

A. M. Schoyer, resident vice president of the Pennsylvania Line West of Pittsburgh, with office at Chicago, has been transferred to Pittsburgh, Pa., and the Chicago office has been abolished.

Samuel Rea, president of the Pennsylvania Railroad and subsidiary companies, has been elected also president and director of the Long Island, in succession to **Ralph Peters**, who has resigned to become federal treasurer of the Long Island.

E. S. Jouett, general attorney of the Louisville & Nashville, has been appointed general counsel, and **J. H. Ellis**, secretary, has been appointed treasurer, also treasurer of the Louisville Bonders and St. Louis, both with headquarters at Louisville, Ky.

Alexander R. Lawton, vice president of the Central of Georgia, with office at Savannah, Ga., has been elected president of the Wadley Southern to succeed **William A. Winburn**, resigned to accept service with the United States Railroad Administration.

George M. Shriver, vice president of the Baltimore & Ohio, has been elected vice president and a director also of the Washington Terminal Company, succeeding **A. W. Thompson**, who has been appointed federal manager of the Baltimore & Ohio eastern lines.

L. S. Smith, assistant treasurer of the Texas & Pacific, has been appointed treasurer for the receivers of that company, with headquarters at Dallas, Tex., effective June 2. **C. W. Veitch**, secretary and treasurer, with headquarters at New York, has been retained as secretary at New York.

H. T. Wickham, vice president and general counsel of the Chesapeake & Ohio, is now federal counsel. **L. F. Sullivan**, controller, has been appointed general auditor. **J. W. Nokely**, general auditor, has been appointed assistant general auditor, and **J. A. Hancock**, assistant treasurer, has been appointed treasurer, all with headquarters at Richmond, Va.

A. H. Plant, controller of the Southern Railway, has been appointed controller of the same road also the Georgia Southern & Florida, the Atlantic & Vicksburg, the Carolina, Charlotte & Ogle, and the Carolina, Charlotte & Ohio of South Carolina. The following assistants to vice president of the Southern have been appointed on the same roads: **G. W. Taylor**, staff officer, transportation; **J. Hainen**, staff officer, mechanical; **F. W. Brown**, staff officer, headquarters; **H. H. Laughton**, staff officer, materials and supplies; **W. H. Gatchell**, staff officer, loss and damage prevention; **Alex. Grant**, rail trade manager; and **W. M. Netherland**, manager dining cars. **Randall Clifton**, freight train manager, has been appointed to the manager, and **E. H. Shaw**, freight trade manager, has been appointed assistant trade manager. All with headquarters at Washington, D. C.

Operating

Ralph Peters, president of the Long Island, has been appointed federal treasurer, with office at New York.

W. P. Kenney, president of the Great Northern, has been appointed federal manager, with headquarters at St. Paul, Minn.

W. J. Harahan, president of the Connecticut A. & L. R., with headquarters at New Britain, Conn., has been appointed federal manager.

A. T. Hardin, vice president of the New York Central, has been appointed assistant regional director, Eastern Railways, with office at New York.

H. L. Ingersoll, assistant to the president of the New York Central, has been appointed mechanical assistant in the office of the eastern regional director, New York city.

J. M. Hannaford, president of the Northern Pacific, has been appointed federal manager, with headquarters at St. Paul, Minn.

H. E. Byram, president of the Chicago, Milwaukee & St. Paul has been appointed federal manager, with headquarters at Chicago.

B. A. Worthington, president of the Cincinnati, Indianapolis & Western, has been appointed general manager, with office at Indianapolis, Ind.

T. F. Brennan, vice-president of the Buffalo, Rochester & Pittsburgh, has been appointed general manager, with headquarters at Rochester, N. Y.

Richard O'Sullivan, superintendent of the Ulster & Delaware, has been appointed general manager, with headquarters at Kingston, N. Y.

George E. Evans, fourth vice-president of the Louisville & Nashville, has been appointed staff officer—operation, with headquarters at Louisville, Ky.

R. H. Wilbur, vice-president and general manager of the Lehigh & New England, has been appointed general manager, with office at Philadelphia, Pa.

J. D. Hawks, vice-president and general manager of the Detroit & Mackinac, has been appointed general manager, with headquarters at Detroit, Mich.

H. C. May, superintendent of motive power of the Chicago, Indianapolis & Louisville, has been appointed general manager, with office at La Fayette, Ind.

J. H. Nuelle, general superintendent of the New York, Ontario & Western, has been appointed general manager, with headquarters at Middletown, N. Y.

H. W. McMaster, vice-president and general manager of the Wheeling & Lake Erie, has been appointed general manager, with office at Cleveland, Ohio.

Morris Rutherford, vice-president and general manager of the Lehigh & Hudson River, has been appointed general manager, with headquarters at Warwick, N. Y.

J. J. Bernet, president and general manager of the New York, Chicago & St. Louis, has been appointed general manager, with headquarters at Cleveland, Ohio.

G. R. Huntington, general manager of the Minneapolis, St. Paul & Sault Ste. Marie, has been appointed federal manager, with headquarters at Minneapolis, Minn.

E. M. Rine, vice-president and general manager of the Delaware, Lackawanna & Western, has been appointed general manager, with headquarters at New York.

R. N. Hudson, president and general manager of the Louisville, Henderson & St. Louis, has been appointed general superintendent, with headquarters at Louisville, Ky.

C. H. Erwing, vice-president of the Philadelphia & Reading, has been appointed federal manager of the same road, and the Central of New Jersey, with office at Philadelphia, Pa.

Kenyon B. Conger, assistant secretary, assistant treasurer, and real estate agent, of the Hudson & Manhattan, has been appointed general manager, with office at New York.

A. M. Darlow, assistant to president and superintendent of motive power, of the Buffalo & Susquehanna, has been appointed general manager, with headquarters at Buffalo, N. Y.

J. S. Spelman has been appointed general superintendent of the Western Pacific, with headquarters at San Francisco, vice **E. W. Mason**, resigned to accept appointment as major of engineers, U. S. Reserve.

R. V. Taylor, federal manager of the Mobile & Ohio, and the Gulf, Mobile & Northern, has been appointed federal manager also of the Southern Railway in Mississippi, with headquarters at Mobile, Ala.

D. F. Crawford, general manager of the Pennsylvania

Lines West of Pittsburg, has resigned to become vice-president of the Locomotive Stoker Company, with headquarters at Pittsburg, Pa., as mentioned in another column.

C. M. Kittle, federal manager of the Illinois Central, the Yazoo & Mississippi Valley and the Gulf & Ship Island, has been appointed federal manager also of the Mississippi Central and the New Orleans Great Northern, with headquarters at Chicago, Ill.

James Shannon, trainmaster of the Northern Pacific, has been appointed superintendent of the Pasco division, with headquarters at Pasco, Wash., vice **W. C. Sloan**, who has been granted leave of absence to enter military service overseas.

L. C. Gilman, president of the Spokane & Island Empire and of the Spokane, Portland & Seattle, has been appointed district director of the Puget Sound district, in charge of railroad operation in Washington and Oregon, with headquarters at Seattle, Wash.

M. J. Gormley, operating assistant to regional director, western railroads, has been appointed assistant regional director of the northwestern railroads, and **J. G. Woodworth**, traffic assistant in western region, has been appointed traffic assistant in northwestern region.

Ira L. Anderson has been appointed trainmaster of the Cherokee, Sioux Falls and Onawa districts of the Illinois Central, with headquarters at Cherokee, Iowa, succeeding **William E. Ausman**, resigned to enter military service, effective June 7.

W. L. Mapother, federal manager of the Louisville & Nashville and the Louisville, Henderson & St. Louis, with headquarters at Louisville, Ky., has been appointed federal manager also of the Nashville, Chattanooga & St. Louis and the Tennessee Central.

M. J. Wise, assistant to general manager of the Mobile & Ohio, with office at Mobile, Ala., has been appointed staff officer—operation, of the Mobile & Ohio and the Gulf, Mobile & Northern. The staff officer will assist the federal manager in all details of operation.

Jas. Shannon, trainmaster of the Northern Pacific, at Spokane, Wash., has been promoted to superintendent of the Pasco division, with headquarters at Pasco, Wash., succeeding **W. C. Sloan**, who has been granted leave of absence to go into military service overseas.

Stanley W. Crabbe, whose appointment as superintendent of the Canadian Pacific, with headquarters at Schreiber, Ont.,

has already been announced in these columns, was born on August 9, 1885, at Teeswater, Ont., and was educated in the public and high schools. He began railway work on May 25, 1903, with the Canadian Pacific as a trackman, and has been in the continuous service on that road ever since. He served consecutively as telegraph operator, yard agent and terminal agent, until his recent appointment as superintendent of the same road with headquarters at Schreiber as above noted.

S. W. Crabbe

E. T. Lamb, president of the Atlanta, Birmingham & Atlantic, with office at Atlanta, Ga., has been appointed federal manager of the Atlanta, Birmingham & Atlantic, the Atlanta & West Point, the Western Railway of Alabama, the Charleston & Western Carolina and the Frisco lines east of the Mississippi river.

A. W. Trenholm, vice-president and general manager of the Chicago, St. Paul, Minneapolis & Omaha, has been appointed federal manager, with headquarters at St. Paul, Minn. The terminals of all the railroads at Minneapolis and St. Paul, including Minnesota Transfer, will be under the jurisdiction of Mr. Trenholm.

On account of the consolidation of the Evansville & Indianapolis with the Chicago & Eastern Illinois for operating purposes under federal management the positions held by **C. B. Falley**, general superintendent of the former road, at Terre Haute, Ind., and **R. E. Farmer**, assistant superintendent at the same point, have been abolished.

W. W. Walker, vice-president and general manager of the Duluth, South Shore & Atlantic, has been appointed federal manager, with headquarters at Duluth, Minn. Mr. Walker, in addition to his duties as federal manager of the D. S. S. & A., will have charge of the ore, coal and grain traffic to and from Lake Superior and upper Lake Michigan ports.

E. D. Leavitt, trainmaster of Western division of the Southern Pacific, has been appointed assistant superintendent of the Stockton division, with headquarters at Stockton, Cal., vice **W. M. Stillman**, who has accepted service with the government, and **F. E. Yoakum** has been appointed trainmaster of the Western division, with office at Oakland Pier, Cal., vice Mr. Leavitt.

Horace Baker, general manager of the Southern Railway, lines west, has been appointed general manager of the same lines, the Georgia Southern & Florida, and the Alabama & Vicksburg, with headquarters at Cincinnati, Ohio. **W. N. Foreacre**, general manager of the Southern Railway, lines east, is general manager of the same lines, also of the Carolina, Clinchfield & Ohio, and Carolina, Clinchfield & Ohio of South Carolina, with headquarters at Charlotte, N. C.

J. G. Cowan, assistant superintendent of the Galena division of the Chicago & North Western at Chicago, has been promoted to superintendent, with the same headquarters, in place of **B. E. Terpin**, transferred to the Wisconsin division at Chicago, succeeding **G. W. Dailey**, promoted to assistant general superintendent at Huron, S. D. **J. Leppla**, assistant division superintendent at Chadron, Neb., has been transferred to the Galena division at Chicago, to take the place of Mr. Cowan.

W. A. Baldwin, general superintendent of the Erie, lines west, with office at Youngstown, Ohio, has been appointed transportation assistant, with jurisdiction over transportation matters heretofore in charge of the general manager. **E. T. Campbell**, assistant general manager at New York, has been appointed traffic assistant with jurisdiction over traffic matters. **R. E. Woodruff**, superintendent of transportation, at Youngstown, has been appointed general superintendent, lines west, vice **W. A. Baldwin**, promoted. **A. E. Wallace**, general superintendent at Chicago, has been appointed assistant general superintendent, lines west, and **C. D. Ward**, special agent, at Jersey City Terminal, has been appointed general agent at Chicago (with jurisdiction over Chicago and Hammond terminals), vice **F. G. Lantz**, transferred. The jurisdiction of the general superintendent of lines west is extended over the Marion division, and the offices of the general superintendent at Chicago and the superintendent of transportation, lines west, are abolished.

Traffic

D. M. Goodwyn, general freight agent, of the Louisville & Nashville, has been appointed assistant freight traffic manager, with headquarters at Louisville, Ky.

Francis LaBau, traffic manager of the New York Central (Buffalo and east thereof) has been appointed traffic assistant to the regional director, Eastern Railways, with office at New York city.

G. H. Ingalls, traffic manager of the New York Central Railroad, lines west of Buffalo, has been appointed resident traffic assistant to the regional director, Eastern Railways, with office at Chicago.

George W. Williams, commercial agent of the Chicago,

Rock Island & Pacific at Detroit, Mich., has been appointed division freight agent with headquarters at Des Moines, Iowa, to succeed **Albert W. Eberhart**, deceased.

F. L. Norman, commercial agent of the Grand Trunk at Seattle, Wash., has entered the service of the Grand Trunk Pacific Coast Steamship Co., Ltd. The Seattle and Portland offices of the Grand Trunk have been abolished effective June 1.

F. M. Whitaker, vice-president of the Chesapeake & Ohio, has been appointed traffic manager, with headquarters at Richmond, Va., and **R. H. Vaughan**, general manager of the Blue Ridge Dispatch, has been appointed assistant general freight agent of the C. & O., with headquarters at Cincinnati, Ohio.

D. E. Sullivan, northwestern freight agent of the Baltimore & Ohio, at Minneapolis, Minn., has been appointed division freight agent at Chicago. **J. R. Lee**, commercial freight agent at Detroit, Mich., has been transferred to Toledo, Ohio, succeeding **E. C. Law**, who has been appointed division freight agent at Toledo. The position of commercial freight agent of the B. & O. at Detroit has been abolished.

Charles Emil Muller, who has been appointed assistant general freight agent of the Seaboard Air Line with headquarters at Savannah, Ga., was born on June 17, 1884, at Baltimore, Md., and received a college education. After serving in various capacities with the Baltimore Steam Packet Company, he entered the service in the Seaboard Air Line, in March 1905, as soliciting freight agent, at Baltimore, Md. He later served as contracting freight agent and since January 1, 1914 as general agent, at the same place, until his recent appointment as assistant general freight agent, of the same road, as above noted.

As a result of the director general's order to eliminate off-line traffic offices, the Chicago & North Western announces a number of changes in its traffic department, effective June 10. The following assistant general freight agents, with headquarters at Chicago, have been appointed division freight and passenger agents: **M. J. Golden**, headquarters at Boone, Iowa; **E. W. Hoops**, headquarters at Chicago; **H. C. Cheyney**, headquarters at Green Bay, Wis. The following general agents at off-line offices have been appointed traffic agents, with headquarters at various points on the Chicago & North Western: **H. B. Loucks**, Jr., Antigo, Wis.; **B. H. Bennett**, Eagle Grove, Iowa; **W. L. Stannard**, Fond du Lac, Wis.; **John Mellen**, Huron, S. D.; **C. A. Thurston**, Mason City, Iowa. The following general agents at on-line points have been appointed traffic agents: **W. B. Richards**, headquarters Council Bluffs, Iowa; **E. E. Benjamin**, headquarters Deadwood, S. D.; **W. R. McGinnis**, headquarters Norfolk, Neb.; **H. J. Wagen**, general agent at Winona, has been appointed division freight and passenger agent same headquarters.

Engineering and Rolling Stock

A. G. Smith has been appointed electrical engineer of the Boston & Albany, with headquarters at Boston, Mass., vice **C. W. Dodge**, resigned.

Charles S. Churchill, assistant to president of the Norfolk & Western, has been appointed, by the federal manager, chief of valuation, with office at Roanoke, Va.

J. A. Burnett, electrical engineer of the Grand Trunk, with office at Montreal, Que., has been appointed technical assistant with the British War Mission, Washington, D. C.

H. A. Cassil has been appointed engineer in charge of way of the Pere Marquette, with duties as assistant in track maintenance and construction, and headquarters at Detroit, Mich.

L. J. Putnam, principal assistant engineer in the Chicago & North Western, was promoted on June 12 to chief engineer, succeeding **W. H. Finley**, who was formerly chief president of the road.

F. J. Monahan, former engineer on the Missouri line in the Louisville & Nashville, has been appointed master mechanic of the Birmingham division, with headquarters at Boyles, Ala.; **James** and **T. H. Hogan** has been appointed

master mechanic of the Memphis line, with headquarters at Paris (Tenn.) shops, vice Mr. Monahan.

R. S. Parsons, assistant to president and general manager of the Erie, has been appointed chief engineer; **G. B. Owen**, chief engineer, has been appointed superintendent of maintenance; **H. Knight**, superintendent of maintenance, has been appointed assistant superintendent of maintenance; **R. H. Boykin**, assistant superintendent of maintenance, has been appointed assistant to superintendent of maintenance; all with headquarters at New York. The positions of general manager and assistant general manager have been abolished.

R. J. Middleton, valuation engineer of the Chicago, Milwaukee & St. Paul, at Chicago, has been promoted to assistant chief engineer of the Puget Sound lines, with headquarters at Seattle, Wash., succeeding **E. O. Reeder**, who has retired on account of ill health. **T. H. Strate**, valuation field engineer, with headquarters at Minneapolis, Minn., succeeds Mr. Middleton at Chicago, and **F. M. Sloan** takes the place of Mr. Strate at Minneapolis. **E. B. Crane** has been appointed assistant valuation engineer, with headquarters at Chicago. These changes were effective on June 15.

C. E. Lindsay, division engineer of the Mohawk division of the New York Central, with headquarters at Albany, N. Y., has accepted a position on the Board of Railroad Wages and Working Conditions under the United States Railroad Administration. **W. A. Murray**, division engineer of the Pennsylvania division, with office at Jersey Shore, Pa., succeeds Mr. Lindsay. **G. N. Edmondson**, division engineer of the Rochester division, with headquarters at Rochester, N. Y., has been transferred to Jersey Shore, succeeding Mr. Murray. **J. W. Stevens**, supervisor of tracks, with headquarters at Clearfield, Pa., has been appointed acting division engineer, Rochester division, succeeding Mr. Edmondson. **A. R. Jones**, assistant engineer in the office of engineer of track at New York, has been appointed supervisor at Clearfield, Pa., succeeding Mr. Stevens. **A. E. Johnson**, assistant engineer on the staff of division engineer of the Eastern division at New York, succeeds Mr. Jones.

Frank Carleton Huffman, resident engineer on construction, on the Chicago & North Western has been promoted to principal assistant engineer, succeeding **L. J. Putnam**, promoted. Mr. Huffman was born at Milford, Ind., on October 26, 1876. He was educated at Purdue University, graduating in 1905. He entered railway service with the Cleveland, Cincinnati, Chicago & St. Louis in June, 1903, as a rodman. During the summer months of the following two years he followed the same line of work with the same railroad. In the latter part of 1905 he went to the Pennsylvania Railroad at Pittsburgh, as assistant on the engineering corps. The following year he entered the employ of the Chicago & North Western as instrument man. Later he was appointed assistant engineer on construction. In 1908 he became assistant state engineer of South Dakota, at Pierre, S. D. The following year he returned to the North Western as locating engineer, with headquarters at Chicago. In 1912 he was appointed assistant resident engineer for the St. Louis, Peoria & North Western, a subsidiary of the Chicago & North Western. After the St. Louis line was completed he became resident engineer of construction, with headquarters at Chicago, having charge of grade reduction on the Southern Illinois division, the construction of the Kinnickinnic elevator at Milwaukee, the terminal elevator at South Chicago and the elevator at Council

F. C. Huffman

Bluffs, Iowa. Mr. Huffman was engaged in this work until his present promotion as noted above.

Purchasing

E. W. Grice, assistant to president, of the Chesapeake & Ohio, has been appointed manager of purchases, stores and safety, with headquarters at Richmond, Va.

C. S. Goldborough, assistant to president of the Erie, at New York, has been appointed assistant to the federal manager with jurisdiction over the purchasing and stores department, and will perform other duties assigned to him.

H. P. McQuilkin has been appointed assistant general storekeeper of the Baltimore & Ohio, with office at Baltimore, Md., succeeding **E. W. Thornley**, who has been furloughed to accept service in the office of the Allegheny Regional Purchasing Committee.

Special

J. C. Tucker, assistant to vice-president in charge of operating of the Erie, at New York, has been appointed assistant to the federal manager with jurisdiction over the telegraph, employment, and safety departments, and will perform other duties assigned to him.

Percy R. Flanagan, general agent of the Chicago Great Western, at Spokane, Wash., has been assigned to duty as property protector, with headquarters at Chicago, effective June 1. The scope of his duties will include the protection of shippers' property in transit, as well as the property of the company.

Railway Officers in Government Service

W. C. Wishart has been appointed operating statistician in the office of the eastern regional director, New York city.

W. L. Barnes, assistant manager of the car service section of the Railroad Administration (Division of Transportation) at Washington, has been transferred to Chicago, where he will supervise refrigerator car and tank car service.

H. C. Woodbridge, assistant to general manager of the Buffalo, Rochester & Pittsburgh, has been appointed regional supervisor in the Fuel Conservation section, of the United States Railroad Administration, with headquarters at Philadelphia, Pa.

H. K. Mack has been appointed supervisor of coal traffic for the Railroad Administration in the southern Illinois coal fields, with headquarters at Herrin, Ill., effective June 12. Mr. Mack will have general charge of equipment and such other duties as may be assigned to him.

A. C. Everham, terminal engineer of the Union Pacific at Kansas City, Mo., has been assigned to work as a supervising constructing quartermaster, with the rank of major, in the quartermaster's corps of the National Army. Major Everham is now located at Washington, D. C.

H. T. Bentley, superintendent of motive power of the Chicago & North Western, who has been serving at Washington as mechanical assistant in the Division of Operation of the Railroad Administration, has resigned that place, and has returned to his office in Chicago. His duties at Washington will be taken over by **Frank McManamy**, manager of the locomotive section. The announcement says that Mr. Bentley's services have been very satisfactory, but ill-health has led him to ask to return to Chicago. As chairman of the committee on standards, he has had active charge of preparing standards for government engines and freight cars.

Obituary

E. H. Spalding, division engineer of the Duluth, Missabe & Northern, died at his home in Duluth on May 28 at the age of 67.

J. D. McNamara, passenger traffic manager of the Wabash, died on June 17, at St. Louis, Mo., from injuries received in an automobile collision.

C. J. Stewart, mechanical superintendent of the New York, New Haven & Hartford, with headquarters at New Haven, Conn., died recently at Twin Lakes, Conn., at the age of 51.

EDITORIAL

Railway Age

EDITORIAL

"Safety-First" is now eight years old and is a somewhat hackneyed topic, but any one who reads the article on the subject which is printed on another page of this paper, giving an up to date picture of a large safety organization, will at once be reminded that there is nothing stale about it. Ambitious

National Campaign for Safety-First

railroad officers have, today, as definite a field for activity in this direction as did those of eight years ago, for the constant accessions of new men in the service and the innate carelessness of all men (except as they cultivate alertness of mind) call for the constant repetition of old lessons. Men walk in front of moving cars, or neglect to report loose planks, or indulge their fondness for taking risks in various ways, just as they did in 1910. Men who seem otherwise to be level-headed will risk their lives to save one minute. Thousands of our railroad men have gone to France and are engaged in an enterprise where safety is rightly placed secondary; their first care is for the glory of the flag and the protection of helpless humanity, a duty which often must ignore safety. For us who are not soldiers, but who have a duty efficiently to feed, clothe and comfort the soldiers, the prime duty remains the same as before; to keep body and mind fit for the highest efficiency. Safety-first means safety all the time. One who, for a high cause, ignores personal safety is, indeed, a hero; but the every-day demand on the railroad man is for that patient continuance in well-doing which often proves more difficult than heroism.

The unsatisfactory condition which the country's transportation system is in at the present time is chiefly due to the malevolent and stupid policy of regulation of railways which prevailed for about ten years before we entered the great war. The railways were being operated, when government control was adopted, with the highest efficiency ever attained by any transportation system; and that they were unable to handle all the country's business was due to the arrest of the development of their facilities which had been caused by regulation. Two of the worst features of our system of regulation were the exercise of duplicated and often conflicting authority by the state and interstate commissions, and the prohibition of the Sherman law against every form of co-operation between parallel railways. It was hoped that, with the adoption of government control, the country would be freed from the effects of state regulation and the anti-trust law as applied to transportation, but this hope is being dissipated. The advance in freight rates, as originally planned, contemplated bringing the state rates up to the level of the interstate rates. The state commissions have made such a row about the matter, however, that they have frightened the Railroad Administration, and now it is announced that where state rates are lower than interstate they will be not brought to the same level. In other words, the unfair discriminations in rates resulting from both federal and state regulation are to be continued under government control. Again, the express companies have been merged, for both their good and that of the public, and the merger as originally planned was intended to be continued after the war. But the attorney-general of the United States has interposed, and a provision

has been inserted in the contract under which the express companies must be unscrambled after the expiration of government control of railways. We think we detect a strong odor of politics about these matters. At any rate they indicate that the Railroad Administration is capable of showing much more aggressiveness in dealing with railway presidents than in dealing with the politicians. It is a disgrace to the nation that the discriminations in rates growing out of state and federal regulation should thus be continued and that the asinine application of the Sherman law to the transportation business should be perpetuated.

It is a universally acknowledged axiom that "experience is the great teacher." This statement is true only insofar

What Lessons Do Collisions Teach?

as the lessons obtained from such experience are made applicable to similar conditions which may arise at some time in the future. Wracks have occurred on American railroads in the past—and will continue to occur in the future. Lessons learned from such accidents in the past should be applied to eliminate as far as humanly possible such accidents occurring in the future. The collision which occurred on the Michigan Central at Ivanhoe, Ind., about half way between Gary and Hammond on the morning of June 22, appears to have been another case of plain man failure, the result being that a large toll of human life was taken.

The annual report for the year ending June 30, 1917, made by the Bureau of Safety to the Interstate Commerce Commission shows that of 11 collisions investigated which occurred in automatic block signal territory, 8 or 73 per cent, were caused by the failure of the engineman properly to obey signal indications.

The point at which this accident occurred is on double track territory equipped with modern automatic block signals, the roadbed and physical property being in excellent condition and the operation of trains being under the best modern American railway practice but still such catastrophes occur. What is the remedy?

Had this accident occurred with the railroads under private control certain papers would have immediately started a hue and cry over the *gross incompetency of the railroads under private management*, and would have come forward with a panacea to cure all ills of like nature, viz., the substitution of government operation.

Irrespective of the fact that this particular road is under government control, and that no deficiency in the physical property exists, the wreck occurred. The government has long recommended that certain steps be taken to lessen chances of such accidents, and it would appear that such recommendations should be put in force now that the roads are under government operation. It would appear advisable that some form of automatic stop should be employed in conjunction with the automatic signals to prevent just such accidents as that which occurred. The argument has been advanced that such an installation would tend to lessen the responsibility of the engineman and would put a premium on carelessness. This need not be the case. Such an automatic stop should be so devised as to register any disobedience of a signal indication on the part of the engineman in addition to applying the air and stopping the train. This

record could be used for the proper administration of discipline as warranted by facts.

The railroads have long been investigating the possibilities of automatic stops but development of such apparatus cannot be accomplished in a day. The development must be gradual and improvements made as found necessary, as was the case with automatic signals.

It appears the time is past when the roads should wait until the ideal stop can be developed before such an application is made and this is now a matter deserving the serious consideration of the Railroad Administration.

When it is shown that an employee is responsible for such an accident he should be prosecuted under the criminal laws of the state wherein the accident occurred and if found guilty the penalty for such offense should be imposed. If employees realized they were required to pay the penalty for acts of carelessness greater care would be exercised.

The Reorganization of the Railways

THE REORGANIZATION of the railroads under government operation is being made very complete. Organization is, first, a matter of personnel, and, second, of the offices which the officers hold and of the relations which the offices bear to each other.

The changes being made in personnel are greater in some sections and on some roads than in other sections and on other roads. A larger proportion of presidents are being appointed federal managers in the West than in the South, and a larger proportion of the presidents in the South are becoming federal managers than in the East. All over the country, however, the changes in personnel being caused by the appointment of general managers, federal managers, district managers and regional directors are very considerable. In many cases vice-presidents are being appointed federal managers, thus succeeding to many duties formerly performed by the presidents. In some cases general managers have been appointed federal managers. In other cases presidents of small roads have been appointed merely general managers. In two instances regional directors have been given charge of railways in territories in which they previously had had little or no experience.

It is a notable fact, however, that with few exceptions the executive and operating positions of importance have been given to railway men, and that those to whom they have been given have been men who already occupied high positions in the service or who had been put in line for promotion to high positions by the managements of the railway companies. While there may be ground for criticism in the fact that the government has adopted the policy which has caused many men of ability and experience to leave important executive positions, nobody who believes in the ability and fitness of the higher officers of the railways generally can offer any general criticism of the appointments thus far made to the positions of regional director, district manager, federal manager and general manager. Almost without exception men who are regarded in the railroad business as fitted by ability and experience for these places have been appointed.

The form of the new organization and the functions and relationships of the different offices in it present an interesting contrast to the organization which existed under private operation. Under the old organization many railway presidents were chief executives, reporting only to their boards of directors. In other cases there were chairmen who outranked the presidents. In most cases, however, the chairmen handled financial matters and large questions of railroad public policy, and the president was the real chief executive of the property. Under the new organization the federal manager of a railway has quite an imposing hierarchy over him. In some terri-

tories he reports to a district manager. Of higher rank than the federal or district manager is the regional director, of whom there are now seven. Ranking still above them are the heads of the divisions of the Railroad Administration in Washington, who report to the assistant director general and the director general. In other words, in all cases the federal manager has at least four officers of higher rank over him, and in some territories five. All of these officers of higher rank have assistants of their own.

Now, in order to bring about due co-ordination of the railways it may be necessary to superimpose upon the federal manager this hierarchy of officials, but it is evident that unless the new organization is operated with great skill the position of the federal manager, especially of a large road, is going to be made very difficult. He will receive suggestions and instructions from numerous officers of higher rank, and he will have a lot to do if he observes all these suggestions and instructions. He will also have to perform functions formerly performed by the vice-president in charge of operation, the vice-president in charge of traffic, and the president of the road. This will be especially true on a road on which the vice-president in charge of operation has been made federal manager and no officer occupying a position equivalent to that of vice-president in charge of operation has been appointed. If the federal manager devotes too much of his time and energy to carrying out the suggestions and instructions of his superiors he will neglect work which he ought to do in order properly to maintain the property and serve the public. If, on the other hand, he devotes himself intensively to operating and maintaining the property and trying to satisfy the public, he may find himself in hot water because of failure to carry out all the suggestions and instructions of superior officers.

It seems obvious that, as under the old organization of the railways the president was the man who chiefly determined whether the railway was managed efficiently or not, so under the present organization the federal manager will mainly determine whether the operation of the property will be efficient or not. The success of the federal managers in getting results and the comfort or discomfort of their positions will depend very largely upon the authority and freedom of action they are given by the Washington office and by the regional directors. It never was true that a railway could be successfully operated from Wall Street, and it never will be true that the various parts of the railway system of the United States can be successfully operated from Washington. The regions into which the railways are divided even under the new organization contain an average of almost 40,000 miles of line, and this much mileage of railway cannot be well operated from a single headquarters. Therefore, if good results are to be obtained the Washington office will have to delegate very large authority and give great freedom of action to the regional directors and they, in turn will have to delegate very large authority and give great freedom of action to the district and federal managers. The present organization has the form of a great bureaucracy. It easily could be allowed to develop the red tape and the practice of "passing the buck" which are characteristic of the typical bureaucracy. There is danger that it will develop these characteristics in any case, and it certainly will unless the federal managers are given large authority and opportunity, the Washington office and the regional directors devoting themselves chiefly, not to trying to direct in detail the operation of the properties, but to trying to co-ordinate their operation.

Before government control was adopted it was predicted that it would result in the development of a great "overhead" organization. This prediction is being rapidly verified. Probably without such an organization the object of securing the operation of the railways as a single consolidated system could not be fully attained. It would appear, however, that in the long run the cost of this overhead organization will approach and perhaps equal any savings which may be made

by changes or reductions in the staffs of the individual lines. Only subsequent developments will show what increases in the efficiency and the economy of operation will be secured.

Control of Export Traffic

THE ANNOUNCEMENT LAST WEEK by the Secretary of War, the Secretary of the Navy and Director General McAdoo of the creation of a joint exports control committee with complete power to control the movement of export freight, represents one of the most important steps toward co-ordinating war transportation that has yet been taken by the government. If such a committee is able to organize itself so as to function in accordance with its purpose and its authority, it is not difficult to believe that its formation a year or two ago might have prevented most of the difficulties, at least from an operating standpoint, that led to the government's commandeering of the railroads; but, like many other things that are now being done, its necessity was not sufficiently recognized until after bitter experience had taught the lesson.

It is not only the duty of the committee to inform itself as to the probable amount of freight which must be exported for the prosecution of the war, how this freight can best be routed through the various ports, how much other essential export traffic must be handled and the amount of local traffic necessary for each port, but the functions of the committee are far more than advisory. It is to have authority to select the port to which specific freight shall be transported for trans-shipment overseas for the use of the army and navy, the allied governments and others, and it is given the responsibility of deciding the distribution of the combined amount of all exports as between the various ports so as to facilitate its handling at any one port and to avoid congestion at any one port. In order to carry out its important task with full knowledge of the various requirements, the committee consists of authoritative representatives of the War and Navy Departments, the Railroad Administration and the shipping interests and the Traffic Executive controlling the allied traffic. Its organization is the result not only of numerous conferences between all interests involved, but of numerous special studies that have been made by experts representing the Railroad Administration and the Shipping Board into the conditions surrounding export traffic.

Long before the United States entered the war, the results of a lack of co-ordination and control of export traffic were made evident in serious congestion throughout the eastern industrial section and particularly at the North Atlantic port terminals. Shippers who received their money for goods consigned to the allied governments as soon as the freight was loaded on cars were naturally over-zealous in starting freight toward the ports regardless of the possibilities of handling it at destination or of the capacity of boats to carry it across the ocean. At a time when the country had not yet awakened to the seriousness of the situation railroads were too reluctant to place drastic embargoes and rather than risk the unpopularity of doing so, tried to crowd more freight through the neck of the bottle than could be accommodated. When the embargoes finally were placed it was too late. More freight than could be transhipped had been carried to the eastern terminals, choking the main lines as well as yard and terminal tracks, and when this situation developed to such an extent that it was necessary to unload freight on the ground, the congested condition extended so far back toward the west that it was difficult to return empty cars. The unpopularity of the embargo was so great that freight would often be embargoed half way towards its destination and intermediate lines were blocked in both directions.

This condition became steadily more acute and, while many people blamed the railroads, the railroads retorted by saying

that the difficulty was with the shipping situation. They were carrying freight to destination as billed, but ships were not available to take away the freight they had delivered. While certain ports were overcrowded others were not being utilized to capacity, but the railroads had no control over the routing of freight, and goods were sent to the ports where the boats were most numerous. When efforts were made to secure a larger number of sailings to the ports which were not being utilized to capacity the shipping interests said that the freight offered at those ports was not sufficient to justify them in sending vessels there.

Now the routing of freight has been taken out of the hands of the shipper and placed in the hands of the railroads, and with the creation of the exports control committee there is sufficient authority to direct the railroads where to put the freight and simultaneously to direct the boats to go there and get it. Moreover, the committee will be able to develop a policy which has already been under way for some time, of using the embargo for regulative purposes. The congested condition has improved to such an extent that it is not necessary to use embargoes to prevent the movement of freight, but they may be used to prevent it from going in the wrong direction. When embargoes were formerly treated as an emergency measure to be applied whenever and wherever the necessity became evident or, as too frequently happened, a little bit after that time, they frequently caught the freight part way to its destination in such a way that it could move neither backward nor forward, but only added to the congestion. Now it is possible to apply the embargo at the point of origin so that consignments will not be sent to ports where they cannot be handled, but may be diverted to places where they are needed and can be accommodated. This is expected to develop a much more intensive use of the South Atlantic and Gulf ports, which still have much unutilized capacity and still greater potential capacity.

Changing Wheels on Freight Cars

THERE ARE ALMOST none of the repairs ordinarily included in the everyday maintenance of freight cars which can long be overlooked for the sake of the immediate advantage without seriously impairing future transportation capacity. There are some repairs, however, which, for the sake of safety, must not be neglected even for temporary advantage. Truck repairs belong to this class. That there has been some neglect of this important matter is indicated by the epidemic of truck failures generally experienced last winter. These failures may in part be attributed to the extraordinary weather conditions prevailing, but the one great underlying cause was probably the letting down of the standard of wheel maintenance, permitting defective wheels to remain too long in service before removing them.

Defective wheels are not only unsafe in themselves, but may result in more deterioration of the whole structure of the car, especially the truck, in one mile than would ordinarily occur in hundreds of miles of service. There should be a general raising of the standard of wheel conditions. Wheels should be changed before they reach the M. C. B. limits rather than a little after these limits are reached. The average car load has materially increased during the past year owing to heavier loading of all classes of cars and, on many lines, to an increase in the proportion of commodity freight moved in maximum capacity loads. Furthermore, war conditions have forced a lowering of former standards of track maintenance. Truck failures mean wrecks and consequent loss of equipment and lading, and temporary suspension of traffic movement. At present we can ill afford to stand any of these losses. Safety, therefore, demands that the condition of wheels be improved by a

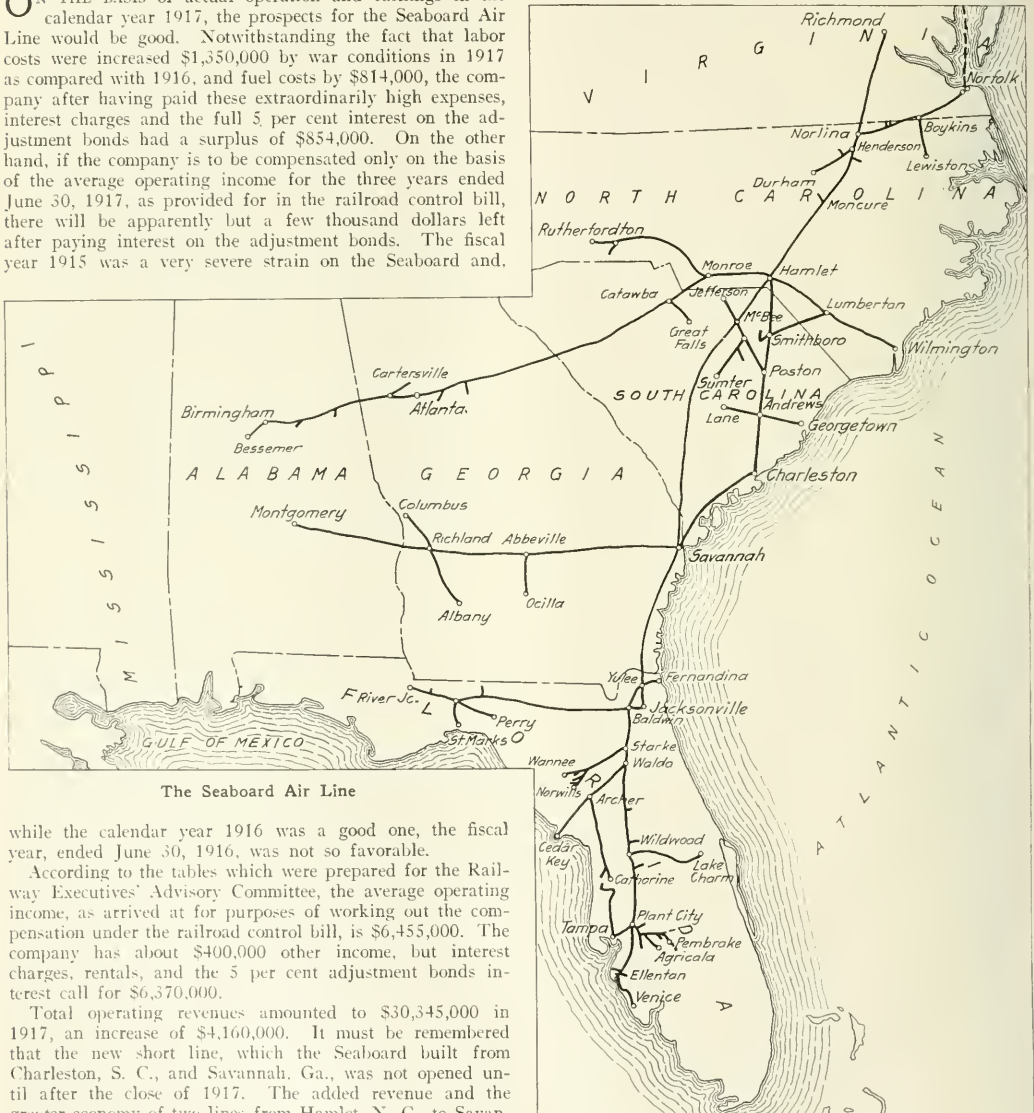

more rigid inspection and changing of the wheels of all cars passing over the repair track, before the M. C. B. limits have been exceeded.

Seaboard Air Line

ON THE BASIS of actual operation and earnings in the calendar year 1917, the prospects for the Seaboard Air Line would be good. Notwithstanding the fact that labor costs were increased \$1,350,000 by war conditions in 1917 as compared with 1916, and fuel costs by \$814,000, the company after having paid these extraordinarily high expenses, interest charges and the full 5 per cent interest on the adjustment bonds had a surplus of \$854,000. On the other hand, if the company is to be compensated only on the basis of the average operating income for the three years ended June 30, 1917, as provided for in the railroad control bill, there will be apparently but a few thousand dollars left after paying interest on the adjustment bonds. The fiscal year 1915 was a very severe strain on the Seaboard and,

will have the further increased revenues from the new line and a larger proportionate operating income, justify the belief that so far as actual showing is concerned, the road will do well in 1918.

It would appear that the Seaboard is one of the companies which will suffer a real injustice if an adjustment is not made in working out the compensation to provide for

The Seaboard Air Line

while the calendar year 1916 was a good one, the fiscal year, ended June 30, 1916, was not so favorable.

According to the tables which were prepared for the Railway Executives' Advisory Committee, the average operating income, as arrived at for purposes of working out the compensation under the railroad control bill, is \$6,455,000. The company has about \$400,000 other income, but interest charges, rentals, and the 5 per cent adjustment bonds interest call for \$6,370,000.

Total operating revenues amounted to \$30,345,000 in 1917, an increase of \$4,160,000. It must be remembered that the new short line, which the Seaboard built from Charleston, S. C., and Savannah, Ga., was not opened until after the close of 1917. The added revenue and the greater economy of two lines from Hamlet, N. C., to Savannah were, therefore, not available. The new line was opened January 1, 1918, and should add to revenues as well as decrease the cost of handling through business from Florida to Richmond and Norfolk. The facts, therefore, that the 1917 gross revenues increased by 15.89 per cent and operating expenses by 23.87 per cent, and in 1918 the Seaboard

special cases. In view of this situation, it is understood that the Seaboard will make application for an increase in its compensation to cover at least the interest on the investment occasioned by the cost of these lines, which will amount to at least \$850,000. It is also understood that it has in

contemplation the making of other just claims which will add to this amount.

The operation of the road was seriously hampered by the shortage of labor in 1917. Common labor, especially, was almost impossible to procure in the quantities needed; thus, in addition to the increased price of coal, a much heavier labor charge had to be paid to get this coal placed on tenders. Track labor was particularly scarce and poor. There was \$8,216,000 spent for maintenance of way in 1917, an increase of only a few thousand dollars over 1916; but the 1917 expenditure represented less work done than was done in 1916 and is not an accurate measure of the amount that would have been spent had track labor been available.

Maintenance of equipment cost \$5,105,000, an increase over 1916 of \$1,195,000. Both increased cost of labor and increased costs of materials figured in this maintenance of equipment expenditure.

Transportation expenses amounted to \$10,252,000, an increase of \$2,560,000 over 1916. The increase in fuel cost has already been mentioned. Higher wages paid to engineers and trainmen affected the Seaboard as it did all other roads that were forced to grant higher wages to the brotherhoods under the guise of an eight-hour day law. There were other costs, however, which bore particularly heavy on the Seaboard as, for instance, labor at stations which, in 1917, cost \$567,000, an increase of \$108,000 over 1916. Yard conductors' and yard foremen's wages amounted to \$159,000 in 1917, an increase of over \$50,000, or nearly 50 per cent.

The following table shows the percentage of each class of operating expenses to total operating revenues:

| | 1917 | 1916 |
|--------------------------|--------|--------|
| Maintenance of way | 6 | 12.17 |
| Maintenance of equipment | 16.8 | 14.95 |
| Traffic expenses | 34.7 | 4.47 |
| Transportation expenses | 37.40 | 1.67 |
| Miscellaneous expenses | 6.67 | 0.58 |
| General expenses | 1 | 0.10 |
| Total | 101.17 | 100.00 |

Passenger revenues amounted to \$7,777,000, an increase of \$2,428,000. Freight revenues amounted to \$19,674,000, an increase of \$1,462,000. The tonnage of freight carried totalled 10,729,000, an increase over the previous year of only 2.22 per cent; but the average length of haul was 192 miles, an increase of over 1.3 per cent. The average rate per ton per mile was 9.56 mills, or 1.75 per cent lower than in 1916. The average trainload was 859 tons in 1917 as against 355 tons in 1916. The carload was considerably better in 1917; the average being 17.68 tons as against 16.18 tons in 1916; and on all freight, including company freight, the average carload was 20.31 as against 18.23, an increase of more than 10 per cent.

The following table shows the principal figures for operation in 1917 as compared with 1916:

| | 1917 | 1916 |
|-------------------------------------|--------------|--------------|
| Average mileage operated | 4,431 | 4,471 |
| Freight revenue | \$19,674,000 | \$18,212,000 |
| Passenger revenue | 7,777,000 | 5,349,000 |
| Total operating revenue | 27,451,000 | 23,561,000 |
| Maintenance of way and structures | 8,216,000 | 3,197,524 |
| Maintenance of equipment | 5,105,000 | 3,909,974 |
| Traffic expenses | 3,699,000 | 967,000 |
| Transportation expenses | 10,252,000 | 8,663,688 |
| General expenses | 644,000 | 708,173 |
| Total operating expenses | 27,816,000 | 17,511,000 |
| Taxes | 1,800,000 | 1,100,000 |
| Operating income | 7,235,000 | 7,448,999 |
| Gross income | 7,729,187 | 7,880,431 |
| Net income | 1,046,000 | 2,862,011 |
| Interest on 5 per cent income bonds | 1,200,000 | 1,250,000 |
| Surplus | 854,067 | 1,612,011 |

Letters to the Editor

A Report "Greatly Exaggerated"

TO THE EDITOR:

In your issue of May 3, page 1152, you say that Patrick Ryan, locomotive engineer of the Illinois Central, member of the American Railway Engineers' Regiment in France, was killed in action on April 18. This is not correct.

Pat Ryan was traveling engineer on Kentucky division of the Illinois Central when he enlisted in the Engineers' Regiment, and I am today in receipt of a letter from Pat in which he states that he is not dead but that they are using him for a traveling crane in the back shop of a French locomotive works. He stands 6 ft. 4 in. in his stocking feet and says he is able to pick up a French locomotive under each arm and place it where it is desired.

I. E. HILL,
Superintendent Kentucky Division (Illinois Central).

General Order No. 20

TO THE EDITOR:

In the writer's opinion General Order No. 20 is based on the idea that every person who has anything to do with statements, bills, etc., will consider it his patriotic duty to live up to the intent of the order to the best of his ability, without taking advantage of the injunction which the order places on the road against which the billing is rendered. That all of us are not playing the game fairly is illustrated by the following actual case where the billing road takes advantage of the protection against checking and absolutely disregards the last sentence of the order, which reads:

"The carrier rendering such statements, bills, etc., shall take the necessary measures to insure the correctness thereof."

A car repair bill was recently rendered which contained charges made against nearly 100 cars, 46 per cent of the cars and 59 per cent of the amount of the charges did not belong to the road billed. These errors were so apparent that a glance detected them and checking was not necessary. Request was made for correction and the only reply made by the billing road was the following notation made on the original request for correction: "See Order No. 20 of April 22, 1918; withdraw exception."

While no road should pick up errors in violation to Order No. 20 it is absolutely necessary to take some step to prevent deliberate attempts to bluff such glaring errors to a conclusion.

It is evident either that the person making the bill did not fully digest General Order No. 20, which was mentioned as backing for the billing road's position, or it was a deliberate attempt to "put one over." Ordinary precaution was not exercised to get the correct initials of the cars repaired when the repair cards were made out because it would be very unusual to get 46 per cent of the car initials wrong, especially when the repairs were supposed to be made at twelve different places on the billing road. Again, the person who made the bill did not use the Equipment Register to ascertain whether the cars belonged to the road billed. If railroads are going to live up to General Order No. 20 in not checking car repair bills and bills can be rendered for cars that do not belong to the roads billed against, what is to prevent the billing of half a dozen roads for the same repairs? What such proceedings will lead to is very apparent and they should be nipped in the bud.

I. E. GIVIN,
Mechanical Engineer, Chicago, Ill.

Temporary End of Double Track in the East Approach Cut of the Sherman Hill Tunnels

Completing the Double Track on the Union Pacific

Heavy Traffic Necessitated the Construction of 96 Miles
of Second Main Line During 1917

NEW IMPROVEMENTS carried on by the railroads during the past year are of greater importance as a war necessity than the closing of the last gaps in the double track line of the Union Pacific between Omaha, Neb., and Granger, Wyo. The traffic over this important artery of the country's commerce has increased greatly during the last 15 years, but the enormous impetus which war activities have given to the transportation of various commodities from the Pacific coast, combined with the almost total absence of shipping via the Panama Canal has imposed an unusually heavy burden on the Union Pacific, and in consequence the 96 miles of single track still remaining at the beginning of 1917 constituted a most serious obstacle to the free movement of the traffic.

This single track was in three sections: from Pine Bluffs, Wyo., to Archer, a distance of 33.35 miles in the engine

struction carried out between 1898 and 1902 and in consequence such grade revisions as were made in this recent work do not radically affect the existing operating arrangements. In general the prosecution of this work was characterized by an effort to complete short sections of the second track as quickly as possible in order that they could be turned over to the operating department immediately, and these additions to the existing double track, made from time to time during the course of the work, did much to relieve the congestion of traffic under which the operating department was laboring.

A Comparison of Traffic Densities

Some idea of the growth of the traffic on the Union Pacific may be gained from a comparison of the train movements at the present time with those at the completion of the grade

Map of Union Pacific Lines in Wyoming, Showing Sections of New Double Track

district between Sidney, Neb., and Cheyenne, Wyo.; from Buford, Wyo., to Hermosa, a distance of 11.11 miles in the engine district between Cheyenne and Laramie; and from Wamsutter, Wyo., to Point of Rocks, 51.9 miles in the engine district between Rawlins, Wyo., and Green river. The first of these sections is located within the limits of the Union Pacific's water grade line from Archer, Wyo., to Omaha and involved no grade or line changes. The other two sections are within the limits of the extensive recon-

struction work in 1902. At that time the average movement daily in each direction, on the engine district between Rawlins and Green river was four passenger and 7.5 freight trains. In comparison with this, in August, 1917, there were 9 to 10 passenger trains and an average of 16.5 freight trains each way, taking no account of the great increase in train load resulting from the use of heavier power. There have been days in the last year when as many as 90 trains were handled through the sections of single track.

The characteristics of the freight train movement in this same engine district for one month in 1917 is indicated by the following statement:

RAWLINS TO GREEN RIVER, 114.2 MILES

August, 1917

| | Net tons one mile | Net ton miles per mile of line |
|--|----------------------|-----------------------------------|
| Westbound | 30,057,000 | 264,000 |
| Eastbound | 19,170,000 | 168,000 |
| Total | 49,227,000 | 432,000 |
| Average total number of freight trains daily | 89 | 655 |
| Average net tons per train | | |

Between Cheyenne and Laramie the train movement was even heavier because practically the same traffic is handled in trains that averaged lighter.

CHEYENNE TO LARAMIE, 127 MILES

August, 1917

| | Net tons one mile | Net ton miles per mile of line |
|--|----------------------|-----------------------------------|
| Westbound | 1,800,000 | 208,100 |
| Eastbound | 246,000 | 434,300 |
| Total | 2,046,000 | 642,400 |
| Average total number of freight trains daily | | 37 |
| Average net tons per train | | 556 |

The figures for the average trainload in 1917 are not as large as those in 1916, as shown by the following table:

AVERAGE NET TONS PER TRAIN AUGUST 1, 1916 TO AUGUST 1, 1917

| | 1916 | 1917 |
|-------------------------|----------|------|
| Nebraska division | 660 tons | 1917 |
| Nebraska division | 763 tons | 1916 |
| Wyoming division | 606 tons | 1917 |
| Wyoming division | 707 tons | 1916 |
| Western division | 671 tons | 1917 |
| Western division | 671 tons | 1916 |

There are two reasons for this: a greater proportion of unbalanced eastbound traffic in 1917 than in 1916 and the necessity for loading engines lighter in consequence of the congestion of traffic in order to expedite movement. There is, however, one exception to the conditions indicated in the

only 1.2 miles west of Creston, the Union Pacific crossing of the Continental divide. Nevertheless the country traversed between Wamsutter and Point of Rocks bears more of the characteristics of a heavy rolling country than a mountainous region. Because of this fact it was possible to locate the original line with westbound grade not exceeding 1.3 per cent and an eastbound grade not over 1.28 per cent. In the revision work started in 1898 these grades were reduced to a maximum of 0.8 per cent in each direction. The double track work recently completed was the occasion of a further grade improvement, in that an eastbound line is provided with the maximum grade of 0.5 per cent and since this grade is not exceeded between Point of Rocks and Green river, the eastbound track has a ruling grade of 0.5 per cent for the 93 miles from Green river to

Widening Solid Granite Cut for Second Track

West Portal of the Twin Tunnels

above table and this is on the ninth engine district, between Evanston, Wyo., and Ogden, Utah, where the trainload was increased from 608 net tons in 1916, to 645 net tons in 1917, as a result of the completion of the grade reduction and second track between Wamsutter and Emory, described in the *Railway Age Gazette* of August 24, 1917, page 529.

The Work Between Wamsutter and Point of Rocks

The longest single piece of double track work in the Union Pacific project was between Wamsutter and Point of Rocks, 51.9 miles, which comprises over one third of the engine district between Rawlins and Green river. Wamsutter is

Wamsutter. Advantage will be taken of this condition by loading eastbound tonnage trains for the 0.5 line and then reducing tonnage at Wamsutter to run the remaining distance to Rawlins. The improvement in grade was accomplished with a departure from the existing alignment only in the 15.86 miles between Tipton and Bitter creek. The second track follows the existing alignment for the entire distance from Wamsutter to Tipton and from Bitter Creek to Point of Rocks, although a slight change of alignment was made near the latter place to reduce curvature. Aside from the improvement in grade, the relocation between Tipton and Bitter creek accomplished a saving of 0.226 miles of distance and the new line has only four curves with a total angle of 105 deg. 37 min. as compared with 15 curves with a total angle of 195 deg. 37 min. on the old line. The maximum degree of curve is 2 deg. on both lines.

On the east end of the section the work in the vicinity of Wamsutter and Tipton was relatively light, consisting for the most part of filling from borrow pits alongside with some large pits in the hillside. Near Red Desert there is an embankment $\frac{1}{4}$ mile long which was widened for second track from a large steamshovel pit. There was also some soft hill work in this same vicinity with the second track alternating in the inside and outside of the old line.

Under normal conditions the grading on the change of line west of Tipton would be classed principally as team work, but owing to the shortage of men and teams it was handled largely as a steamshovel job, since shovels were used in cuts much smaller than are usually considered profitable

work for them. The largest work included two cuts 25 ft. deep and a fill 25 ft. high near Tipton. Between Point of Rocks and Tipton the total excavation was 450,000 cu. yd. of which 275,000 cu. yd. was from borrow. Near Monel a fill of 46,000 cu. yd. having a maximum height of 10 ft. was made with a steamshovel converted into a drag-line excavator. It was equipped with a 55-ft. boom and a 2-cu. yd. drag line bucket. This machine worked down one side of the fill and up the other, borrowing from pits on either side that were separated from the toe of the embankment by berms 40 to 50 ft. wide. Two drag scrapers were employed to dress up the fill as the work progressed.

The bridge work consists in converting single-track, through-girder spans into double-track structures. At the crossing of Bitter creek where there are now three tracks, the 50-ft. single-track girder span is being replaced by three I-beam deck spans with open decks. There are also several arch culverts. The country traversed by this work is dry, there being no usable water supply in the entire distance between Point of Rocks and Wamsutter, so that the facilities for supplying the operating department with water in

Section Through the Old Tunnel Showing Platform Built for Repairing the Lining

this district had to be extended to furnish water also to the construction forces.

The new passing tracks are 4,000 ft. long. These include center passing tracks at Red Desert and Black Buttes, a new westbound passing track at Bitter creek and eastbound passing tracks on the new line opposite Monel and Table Rock. The work on this section was started in May, 1917, and finished in November, but large sections of the second track had been placed in service for a considerable time before the last work was completed.

The Sherman Hill Work

The work on Sherman hill, the highest point on the Union Pacific, involved the construction of 11.11 miles of second track between Cheyenne and Laramie. The crossing of the Laramie mountains constituted one of the most formidable obstacles in the original construction of the Union Pacific and was accomplished with adverse grades of 1.85 per cent and 1.66 per cent against eastbound and westbound traffic respectively, and with a maximum elevation of 8,247 ft. above sea level. Between 1900 and 1902 this part of the line was largely reconstructed. A new eastbound line on an independent location was built from Laramie to Hermosa, 15

Laying Track on the New Line Near Table Rock

miles, and a new single track line for traffic in both directions was built from Hermosa to Buford, 11 miles, so that the grades opposing the eastbound traffic were reduced to 0.82 per cent. Between Cheyenne and Buford, 26 miles, improvements were made, but it was found impracticable to provide a better grade than 1.65 per cent against westbound traffic, this being one of only two places on the Union Pacific between Omaha and Ogden where the 0.82 per cent ruling grade determined upon in 1898 proved impractical. The other point is between Emory, Utah, and Wahsatch where a new 1.14 per cent eastbound line was built in 1916.

The relocated line from Hermosa to Buford involved heavy work, including a tunnel 1,800 ft. long and several high fills and reduced the summit of the elevation to 8,010 ft. With the completion of double track up Buford hill, this section remains the one gap in the double track until the completion of the work undertaken last year. The character of this line is shown on the profile. A number of large gulches were encountered, some of which required embankments 120 to 130 ft. in height, and in the construction of the first track involved yardages of 500,000 to 760,000 cu. yd. of earth, while the entire 11 miles required a total of about 5,000,000 cu. yd. of material.

On the other hand the construction of the second track alongside the existing line involved the handling of only about 300,000 cu. yd. of material for the entire distance, so that it was the construction of the second track tunnel, rather than the embankments which constituted the most formidable feature in the work recently completed.

Excavation on the new work exclusive of the tunnel was classified as 125,000 cu. yd. rock and 25,000 cu. yd. earth in the cuts, with 150,000 cu. yd. of borrow. The most important question involved in this work was the stability of

the thin slabs of material placed on the sides of the high embankments to widen them the required amount, but owing to the absence of moisture and the preponderance of rock in both the old and new embankments, no trouble was encountered. The rough faces of the slopes afforded an adequate bond in most cases but as a special precaution the fills were benched, even resorting to the use of explosives in some cases before the new filling was placed. Excavation in the rock cuts was conducted with extreme care to avoid blocking the line and as shown in one of the photographs it was carried on with the use of narrow gage material tracks to avoid any use of the main track. No bridge work was involved in this

Dumping Muck from the East Heading Off a Trestle

project; drainage through the embankment was provided for by the extension of culverts.

The Tunnel

The twin tunnels on the Sherman hill pass through a ridge of granite having a crest 85 ft. above the top of rail, which reaches an elevation of 7,930 ft. on a vertical curve in the tunnel, the crest of a second summit that is separated from the main summit at Sherman station by a sag, having a minimum elevation at Dale creek of 7,800. The new tunnel is the same length as the old one and is located on a center line 52 ft. to the north of the old center line. This involved a base width of the approach cuts of over 50 ft. which, considering that each cut had a maximum depth of over 50 ft involved a large increase in the cut excavation. The decision as to this feature, as with all matters having to do with the construction of the new tunnel, was determined by one consideration—the safety of the existing tunnel, for any accidents interfering with the movement of trains through the latter would have involved the interruption of the transcontinental traffic of the Union Pacific without chance of any detour east of Ogden.

Accordingly one of the first precautions taken was to repair the timber lining of the old tunnel to guard against rock falls resulting from vibrations incident to blasting on the new work. The manner in which this was done without interference with traffic is shown in the cross sectional drawing of the tunnel where a rolling platform is indicated on which men were supported while at work patting the timber work and filling voids in the packing. Owing to rush work in the completion of the original tunnel, the overbreaks in the arch and sides were larger than usual and a large amount of packing was necessary.

The new tunnel was driven by the top heading and bench

method from four faces, one from each portal and two from a shaft driven down from the surface at mid length and which was also connected with the old tunnel by an adit. The work on the heading was first carried out to the full width of the section down to the level of the wall plates of the arch timbering but after noting some indications of distress in the walls of the old tunnel following blasts, the work on the headings was restricted to a 12-ft. drift along the north side. The remaining portion of the arch was later removed by shooting holes drilled parallel to the axis of the tunnel, taking special care not to disturb the wall between the two bores. The bench was taken down in two lifts of eight feet each, the muck being removed by air-operated steamshovels.

In the headings two Ingersoll-Levner water drills were used mounted on columns and drilling 14 to 15 holes 6 ft. deep. Only one shift of drillers was employed on each heading although a gang of muckers worked at night. The gangs consisted usually of four drillers, four muckers, one nipper and one shift boss. The muck was collected in dump cars running on a two-foot gage track, and was dumped at the end of the bench where it was picked up by the steamshovel with the rest of the spoil from the bench. The muck from the two interior headings was disposed of on the surface near the head of the shaft.

The progress in the headings was from 5 to 5½ ft. per day, while the progress of the shovels on the bench was about 4 ft. per shift, so that when working two shovels and two shifts a total progress of 16 ft. was made daily.

The bench was shot in two lifts of 8 ft. each using three

Air Operated Shovel Picking Up Muck at the West Bench

holes 5 ft. center to center drilled from the top of each lift. These holes were drilled by jack hammers about 6 in. back from the face, but the center hole was considerably closer to the face than the others. Any trimming was done with plug drills or jack hammers. The holes were first sprung with 10 to 12 sticks of 40 per cent gelatine after which they were charged with 20 sticks of the same explosive.

The Utah Construction Company, Ogden, Utah, which had the general contract for the entire Sherman hill section, carried on the work on the headings of the tunnel with its own men employing an average of about 100 men. The Christensen Construction Company of Salt Lake City was the sub-contractor for the east heading and employed about 60

men. The supporting plant of the general contractor located west of the west portal of the tunnel consisted of five 100-hp. boilers, four Ingersoll-Rand compressors having a capacity of 500 cu. ft. of free air per minute, with pumps for the supply of water to drills, etc.

The tunnel was timbered as shown in one of the photographs with timbers used previously on tunnels on the Wahsatch work done the year before, but it was decided to replace the timber work with concrete just as soon as the shovels had completed the removal of the bench. The concreting was carried on from three concrete plants, one located above each portal and one at the head of the shaft. From these plants, concrete was spouted into small cars running on tracks at the level of the arch springing line, from which it was again spouted into the wall forms or shoveled into the arch. The tunnel work involved 36,000 cu. yd. of rock excavation and 10,000 cu. yd. of concrete.

The shaft was started in April, 1917, and the headings from the shaft in May, while the outside headings were started in June. The work on the double-track section outside the tunnel was also started in April and was all completed about September 26, except for a section a mile long through the tunnel. The track through the tunnel will be ready for service about mid-summer of this year, this being the last section of the double track to be placed in operation.

All of the new work on the double-track project including the tunnel work was carried on by the engineering department of the Union Pacific under the general direction of R. L. Huntley, chief engineer with W. S. Woodworth, engineer in charge; W. G. Tinney was resident engineer in charge of the work between Pine Bluff and Archer; H. C. Mann was in charge of the work west of Wamsutter, and F. W. Newhart has supervision of the tunnel construction. The track laying and ballasting was handled by the maintenance of way department under the direction of W. R. Armstrong, engineer of maintenance of way. The entire project was under the general supervision of E. E. Adams, consulting engineer of the Union Pacific System, New York City.

Orders Governing Western Regions

DURING THE PAST WEEK the following were among the orders issued to the railroads in the western regions: Supplement No. 2 to Circular 126, dated June 21, is in explanation of Supplement No. 1, which provided that no trains or other devices containing advertising matter for governmental activities be placed in passenger coaches. It was not intended by these instructions that advertising matter which had heretofore been displayed in coaches should be ordered removed, but rather that no additional advertising matter be displayed until a definite standard has been adopted.

A communication dated June 21, outlines the specifications for United States standard interchangeable electric headlight, which is being placed on all the standard locomotives recently ordered by the Railroad Administration. The blueprints and wiring diagrams are not yet available, but will be distributed shortly. Each headlight equipment will consist of one 500-watt, 32-volt turbo-generator, one micrometer lamp stand and one dimming device, the case to be air tight, round headlight case, No. 22 U. S. S. gage steel, with copper (32-oz.) triple-plated reflector, 18 in. in diameter and 9 in. deep, and an automatic circuit connector complete. The headlight will be of the incandescent lamp type, conforming to the requirements of the Interstate Commerce Commission in an order dated December 26, 1916. The socket for supporting the headlight will be located at the rear of the reflector and will support the headlight lamp in a horizontal position, so mounted that it can be moved in any direction with fine adjustment, to

permit of focusing the headlight lamp and locking in any position. Suitable electric connections must be provided so that on removing the reflector from the headlight case the circuits will be broken automatically and, in replacing, it will be made automatically. A small unit incandescent lamp will be provided in the headlight case for illuminating the locomotive number. Headlight dimming resistance of rugged construction to withstand severe operating conditions will be provided with each turbine generator equipment.

Sub-committees of the San Francisco district freight committee have been appointed at Los Angeles, Cal., and Salt Lake City, Utah.

The city ticket offices of the railroads in Minneapolis and St. Paul will be consolidated. In the former city they will be located in the Office Equipment building and in the latter city in the Great Northern building.

Orders of Southern Regional Director

B. L. WINCHELL, regional director of the southern region, has asked the railroads in his territory to furnish at the earliest possible date, for the year 1918, an estimate of gross revenue, showing separately the customary items of traffic earnings and an estimate of traffic expenses.

A. R. Smith, traffic assistant to the southern regional director, in a circular letter says there exist among lines in the southern region both formal and informal agreements under which one or more of the parties thereto are given preferential treatment in the routing of traffic within the control of another. The circular states that it should be understood that under common operation these agreements must be disregarded if they conflict in any way with the efficient and economical transportation.

G. R. Loyall, assistant regional director, calls attention to the light loading of cars originating in some parts of the southern region, especially cars loaded with lumber, and asks the roads to have attention given to the loading in order to obtain the maximum capacity of the cars, in view of the fact that cars are being moved empty long distances to supply the demand for lumber loading.

Circular letter No. 266 authorizes the railroads to transport between points on their lines the railroad track scale testing equipment of the United States Bureau of Standards and to provide transportation for the authorized attendants accompanying them.

Circular letter No. 267 states that the question of new rail inspection is up for consideration. Railroads are asked to advise whether they have a department for rail inspection, whether they have a contract with R. W. Hunt & Company or other inspection concerns and, if so, the terms of the contracts and the dates of expiration, together with their recommendations as to what should be done in the matter.

In the interest of sanitation and for uniformity, the roads are directed to discontinue the use of aisle carpets on the floors of passenger coaches.

Revenue passenger trains are to be given precedence over special trains, according to a circular issued by G. R. Loyall. The circular says that in cases where a special train with officers is operated over the line, if it is the practice to have passenger trains take the siding, the practice should be discontinued as it is desired that passenger trains hold the main line.

The Railroad Administration is considering a reduction in the number of signatures required on vouchers. B. L. Winchell, Southern regional director, has issued a circular letter asking roads in his territory to furnish information as to their present practice with respect to approval of vouchers and asking for suggestions, based on experience, as to the least number of signatures necessary to insure ample protection.

Doings of the United States Railroad Administration

Standard Equipment Assigned to Roads. More Budgets Approved. New Freight Rates in Effect

THE INCREASES IN FREIGHT RATES ordered by Director General McAdoo in General Order No. 28 went into effect on June 25 with the modifications published in the supplement issued on June 12 and in the order fixing specific export and import rates. Various changes of a minor character were also made by interpretations sent to the railroads by the division of traffic after complaints from shippers had been heard by Luther M. Walter, assistant director of the division of public service and accounting, and Paul P. Hastings of the division of traffic. They have also heard many complaints which will be referred for adjustment to the regional and district freight committees, who, as promised by the director general, will endeavor to work out a more satisfactory adjustment of rates on the higher level by maintaining existing differential and other relationships after the order is in effect. Mr. Walter and Mr. Hastings gave a hearing last week to the protests of the shippers of sand, gravel, brick, cement and crushed stone.

The higher rates are to be reflected in increased prices for many commodities. An announcement by the Price Fixing Committee readjusting the government prices for logs and lumber provides that any additional cost for log freight occasioned by the rate order is to be added to the prices fixed on logs so affected; the higher freight rates have also played a part in the discussion of iron and steel and wheat prices.

Fuel Administrator Garfield has issued a warning that prompt action will be taken against any dealer or distributor of coal who increases the price of fuel on hand to include the amount of the new increased freight rates and ordering that the increased rates may be included only in prices charged for coal upon which the higher rate actually has been paid.

The Interstate Commerce Commission issued an order extending for 30 days the time within which joint rates with railroads not under federal control may be filed, until July 26.

Express Contract Signed

The express contract between Director General McAdoo and the four principal express companies (Adams, American, Wells Fargo and Southern), the basis of which was announced by the director general on May 28, was signed by representatives of the express companies on June 21 and by Walker D. Hines, assistant director general, on the following day. The complete terms of the contract, which, as noted in last week's issue, were amended to provide for the reconveyance of the express properties to the individual express companies upon the termination of federal control, were communicated to the director general, who is in California, and received his personal approval.

The contract provides for the carrying on of the express business for all of the railroads under federal control, and the new express company now established, which will be known as the American Railway Express Company, will be the director general's agent for carrying on the express business. As announced on May 28, the character of the service and of the rates will be under the director general's control and subject to initiation by him. The contract will remain in force during the period of federal control unless previously abrogated. The contract provides that it can be cancelled by either side upon six months' notice after being in effect for four years.

Arrangements have also been made to have the new company take over the operation of the property of the Northern

Express Company, the Great Northern Express Company and the Western Express Company, operating on the Northern Pacific, Great Northern and Minneapolis, St. Paul and Sault Ste. Marie railroads, respectively, whose property will be leased to the merger company because the Railroad Administration declined to make individual contracts with them.

Board of Adjustment No. 2

Railway Board of Adjustment No. 2 met in Washington on June 21 and organized by selecting E. T. Potter, of the Minneapolis, St. Paul & Sault Ste. Marie, as chairman, and E. J. McNulty, of the International Brotherhood of Electrical Workers, as vice-chairman. The board has designated the following dates as the beginning of each of its regular monthly meetings during the remaining portion of the year 1918: July 2, August 6, September 3, October 1, November 5 and December 3. W. S. Murrian, until recently superintendent of motive power of the Southern, has been appointed a member of the board succeeding W. F. Kaderly.

Change in Diversion and Reconsignment Rules

The car service section announces that in connection with tariff provisions affecting reconsignment and diversion, the Director of Traffic has instructed that the following clause be inserted under the heading of "Conditions" in Rules and Changes Governing the Diversion or Reconsignment of Carload Freight:

"Orders for diversion or reconsignment will not be accepted under these rules at or to a station or to a point of delivery against which an embargo is in force, or, except on perishable freight, coal, coke or fuel oil to a station or to a point of delivery against which an embargo was in force at the time that the shipment was forwarded from point of origin. Shipments made under authorized permits are not subject to this condition."

This change will be made in the regular way on statutory notice, but in the meantime it is desired that all railroads shall issue the clause as an embargo making the provision immediately effective.

C. S. Lake has been appointed assistant to the director of the division of operation, to have general charge of the relations between the division of operation and the labor adjustment boards Nos. 1 and 2. He will co-operate with the boards and with the division of labor to arrange for putting into effect promptly the rulings of the boards.

Assignment of Standard Equipment

The Railroad Administration has made an apportionment to the various roads under federal control of the 1,415 locomotives and 100,000 freight cars ordered by the Central Advisory Purchasing Committee. The apportionment is based on orders placed by the roads as revised by the regional directors and the officers of the central administration at Washington. It has been decided that the cars and locomotives will not be treated as the property of the government or as a "circulating reserve" as has been occasionally suggested, but they will be assigned to the railroads and will of course become their property in practically the same way as other equipment, although they will be subject to transfer to other roads when occasion requires. The federal manager of each road has been notified of the number assigned to it and asked to submit a formal requisition to the Division of Capital Expenditures, which has already

approved the budgets of the roads, including a total of \$497,031,860 for equipment. This item, however, includes \$36,959,423 for improvements to existing equipment, and \$28,459,830 for passenger cars, and \$12,970,109 for other equipment not comprised in the orders placed by the administration, as well as equipment previously ordered by the railroads.

The financing of the equipment ordered by the government will be handled in the same manner as other capital expenditures, that is, the railroads will finance it themselves wherever possible and if necessary they may apply to the government, through the Division of Finance and Purchases, for a loan from the revolving fund.

The 1,415 locomotives include the original order for 1,025 and the additional order recently placed for 390 and are all of the standard types except that 30 of the Consolidation type for anthracite burning have been ordered for assignment to the Philadelphia & Reading.

The assignment of the locomotives is as follows:

| DISTRIBUTION OF STANDARD LOCOMOTIVES | | |

It is understood that orders for 50,000 additional cars, to include stock, refrigerator, general service and flat cars, are to be placed after the delivery of the first cars ordered is well along, from plans and specifications which have already been prepared by the car and locomotive standardization committee.

Locomotives to Work Their Way Home

The new locomotives turned out by the builders on orders placed by the government, and others to be delivered hereafter, will be required to work their way home, under steam and pulling a train of cars, according to a plan now under consideration by the Railroad Administration. The idea of imitating the practice that has grown up in the automobile and truck business, of driving new cars and trucks away from the factory instead of shipping them, has been recommended by Frank McManamy, manager of the locomotive section of the Railroad Administration, with the idea of making the locomotives do their bit en route to the roads to which they have been assigned, instead of being pulled in trains as in the past, in recognition of the fact that locomotives are no longer to be considered as merely the property of an individual road. It is estimated that this plan applied to 3,000 new locomotives a year would handle perhaps 500,000,000 ton miles of freight a year, by enabling each engine to haul a train, instead of itself occupying space in a train and exerting a dead weight equal to about three cars. The idea is to have the engines accompanied by a messenger from the locomotive plant, according to the usual practice, to look after the bearings, etc., during the trip, and to have them handled by regular crews of the roads over which they pass. It is believed that they will be delivered in better condition if used at the front of a train and given a thorough inspection at terminals than if handled in the usual way and that they may be "broken in" just as satisfactorily in this way as if the process were postponed until their arrival at the home road.

Freight Car No. 1

Although the completion of the first freight car of the government's order for 100,000 was announced last week by John Skelton Williams, director of the division of finance and purchases of the Railroad Administration, in the name of Director General McAdoo, there is thus far no news of car No. 2, or of the other 99,999 which are still to be built, and a considerable time may elapse before No. 2 arrives. Some curiosity was manifested by those who have been keeping track of the progress of the specialty orders placed by

the Central Advisory Purchasing Committee, as to how the American Car & Foundry Company could have completed a car as announced at a time when the brake beams, side bearings and journal boxes had not yet been decided upon. We are informed that the car company had no inside information as to just what specialties to use on Car No. 1, but that from its standpoint the car represented merely the model, sample or pattern car, such as is usually turned out as the first of a large order, for inspection purposes, and might, therefore, be equipped with any specialties in stock, to be replaced later after the purchasing committee has finished its work and the ordered specialties have been built. No definite promises were made by the Railroad Administration as to the delivery of the cars. Its announcement of the first order simply stated that it was hoped the entire order would be completed in time for the fall and winter business. But when the locomotives were ordered, delivery was promised in July. A sample locomotive may be expected during the coming week, but deliveries are not expected until August.

Companies to Be Informed Regarding Capital Expenditures

In order to conform to the organization created by the appointment of federal managers and especially to afford railroad companies notice and timely information of the character and estimated cost of additions, betterments, terminals, road extensions, motive power, cars and other equipment made on or in connection with their properties during federal control, and also to invite the suggestions of the companies respecting such improvements, the Division of Capital Expenditures, Judge R. S. Lovett, director, has issued Supplement 1 to D. C. E. Circular No. 1, dated March 27, 1918, effective July 1, 1918, making the following amendments:

First: The monthly report to be made on D. C. E. Form 2 is to embrace projects involving a charge to capital account of less than \$1,000 instead of \$5,000 as required in D. C. E. Circular No. 1, this change commencing with the report for the month of July, 1918.

Second: The minimum amount to be reported on D. C. E. Form 3 is to be reduced from \$5,000 as fixed in D. C. E. Circular No. 1, to \$1,000, so that the projects to be reported on D. C. E. Form 3 shall be those involving a charge to capital account of not less than \$1,000 nor more than \$25,000.

Third: A monthly report of all work authorized during the month involving a charge to capital account of less than \$1,000 for each project or job, should be made on D. C. E. Form 6, grouped by classes of work showing location, general description and amount chargeable to capital account only.

Fourth: No changes are made in D. C. E. Forms 1, 1-A, 4 and 5.

Fifth: (a) Four copies of D. C. E. Forms 1, 1-A, 2, 3, 4, 5 and 6 should be prepared by the federal managers.

(b) Two copies of D. C. E. Forms 1, 1-A, 2 and 5 should be sent direct to the director of the division of capital expenditures at Washington, one copy to the regional director and the other copy to the president of the company in whose name the forms are submitted. These copies are for information only and require no action.

(c) Three copies of D. C. E. Forms 3 and 4 should be sent to the regional director and one copy to the president of the company in whose name the forms are submitted.

(d) Two copies of D. C. E. Form 6 should be sent direct to the director of the division of capital expenditures at Washington, one copy to the regional director, and the other copy to the president of the company in whose name the form is submitted.

Sixth: The regional director should at once transmit to the director of the division of capital expenditures the original and one copy of D. C. E. Forms 3 and 4, retaining the other copy for his file and information. In case he approves without qualification, he should sign the forms accordingly. In case he disapproves, he should transmit with the form a memorandum of his views.

Seventh: D. C. E. Forms 3, 4 and 6, sent to the president of the company, are intended as notice to the company of the character of the work and the estimated cost thereof, and should be submitted by the president to the board of directors (or a committee of the board exercising its power) for its approval; and the president or the secretary of the company should promptly inform the director of the division of capital expenditures of the action of the board or committee, using D. C. E. Form 7. If for any reason the board or committee should object to the expenditures covered by these forms, the president or secretary should inform the director of the division of capital expenditures of the reasons therefor in order that such objections may receive attention before his final decision, and a copy of such letter should be sent to the regional director.

It is important that the board of directors or the committee act promptly upon all such reports, and that the president or secretary inform the director of the division of capital expenditures without delay, as work cannot be postponed pending advice of such action.

Eighth: When the expenditures covered by D. C. E. Forms 3 and 4 have been approved by the director of the division of capital expenditures, one copy of each form will be returned direct to the federal manager of the line, together with a letter of transmittal, listing thereon the forms returned by serial number and amount chargeable to capital account. A copy of this letter will be sent to the regional director as information to note on his copy of the forms the action taken by the division of capital expenditures. A copy will also be sent direct to the president as advice to the company of the action taken.

Ninth: In the event the director of the division of capital expenditures should decide that expenditures covered by D. C. E. Forms 3 and 4 should not be made or that the work for which the expenditures are requested should be deferred, one copy of the form will be returned to the federal manager of the line with a letter stating the reason for the action taken, a copy of which will be sent both to the regional director and to the president of the company for their information and record.

Tenth: It should be understood that the foregoing does not in any manner modify the authority given by General Order No. 12 issued by the Director General, March 21, 1918, to proceed with work which does not involve charges to capital account in excess of \$25,000. All work within such limit may be contracted for and commenced subject to the conditions specified in paragraphs (a) and (b) of part fifth of such general order, without awaiting action of the board of directors or of the director of the division of capital expenditures.

More Budgets Approved

Additional budgets of capital expenditures for 1918 approved by R. S. Lovett, director of the division of capital expenditures, have brought the total up to \$971,780,739 on June 24. This represents not only the budgets of additional railroads, but also some changes in those which had previously been approved. The total now includes \$454,449,990 for railroads, but also some changes in those which had previously \$20,298,869 for extensions. Through the approval of budgets, the Railroad Administration is able to eliminate competitive railroad building. Both in the case of terminal and branch line extensions approval has been withheld of expenditures on behalf of one railroad when the same service

could be performed by an existing facility or line of another railroad, except where the project was so near completion that it would be an injustice and cause a waste of money to stop it. One instance which has been made public where government control has been exercised to prevent a duplication of an existing line concerns a case where the Monongahela Railroad proposed to extend a line up the Monongahela river in West Virginia parallel to the Morgantown & Wheeling Railway. Work on the Monongahela extension was stopped in the fall of 1917, but when it applied for permission to continue the work this spring the application was approved by the regional director and by Judge Lovett. Later it was learned that the Morgantown & Wheeling Railway, which would be paralleled by the extension, could perform the service which would be performed by the new line for only a slight expense for rehabilitation and that its property would be injured by the construction of the new line, so the approval for the new extension was revoked.

Short Lines

A list of several hundred short line railroads, to be relinquished from federal control because the railroad administration does not consider them of sufficient value to warrant paying them a guarantee, is expected to be announced on July 1.

The right of the representatives of short line railroads not to be relinquished from Federal control was transferred on June 24 to the Senate Committee on Interstate Commerce, which held a hearing on the resolution proposed by the Railroad Administration extending until January 1, the time during which control of any railroad may be relinquished. The short line representatives, who declared that many of them will be ruined if they are left to compete with the Government railroad system, have asked that the resolution be amended to provide that no line shall be relinquished while control of competing lines is retained. B. M. Robinson, president of the American Short Line Railroad Association, declared that the announced intentions of the Railroad Administration, as well as the resolution in the shape it was introduced, nullify the clear intention of Congress that the short lines should be retained. Ben B. King, of Dallas, Texas, and C. D. Cass, of Waterloo, Ia., members of the executive committee of the short line organization, also testified, saying that the proposal of John Barton Payne, general counsel of the Railroad Administration, to refrain from making contracts with short line railroads would destroy their credit, regardless of any promises made as to the Government's policy toward them. Mentioning the cases of the Gulf, Texas & Western, the Denver & Salt Lake and the Colorado Midland, they declared that the earnings had already been greatly reduced since the Government took control of the railroads because freight shipments have been diverted to other lines. The Government, they said, has refused to exercise jurisdiction over these lines since the managements of the roads have insisted on compensation based on the three-year average of net operating income, while the Government takes the position that this was made a maximum instead of a standard by the insertion of the words "not exceeding" in the railroad control law preceding the definition of the so-called standard return.

In testifying before the House Committee on Interstate and Foreign Commerce last week, General Counsel Payne of the Railroad Administration had stated that the regional directors have recommended the release of several hundred short lines, which, he estimated, it would cost the Government about \$20,000,000 a year to retain on a basis of guaranteed earnings.

A committee of bondholders of the Denver & Salt Lake has issued a circular regarding its negotiations with the Government, stating that it was advised that the road had

been relinquished after the Railroad Administration officials had proposed that the road be operated by the Government without compensation.

Members of Congress apparently are inclined to sympathize with the position taken by the short line and Senator E. D. Smith, chairman of the Senate Committee on Interstate Commerce, is understood to have told the President on Tuesday that the resolution extending the time for deciding on the status of the short lines cannot be passed before July 1. This would require prompt action by the Railroad Administration in determining its policy. John Barton Payne and Walker D. Hines conferred with the President later in the day and there were indications that the Railroad Administration was speeding up its work in connection with the short lines preparatory to announcing its decision.

Kansas City, Mexico & Orient to Be Taken Over

The Kansas City, Mexico & Orient, regarding which there has been some uncertainty as to whether it would be retained under Federal control or relinquished with the short lines, has agreed tentatively upon a contract with the Railroad Administration for compensation. The plan provides for the payment of \$150,000 to meet the interest on the receivers' certificates and a division of the net operating income between the Railroad Company and the Government, with an option to the Government to commute this into a payment of \$350,000 a year after an experience of six months. It was understood at one time that it had been decided to relinquish this road and a large delegation of people from the territory traversed by the line came to Washington and asked that the road be taken over.

McManamy Appointed Mechanical Assistant

Frank McManamy has resigned as chief inspector of locomotive boilers of the Interstate Commerce Commission and has been appointed mechanical assistant to the director of the Division of Operation of the Railroad Administration, effective on July 1, succeeding H. T. Bentley. In this position he will have jurisdiction over the Car Repair and Inspection and Test Sections and general charge of matters pertaining to locomotive and car equipment. Mr. McManamy has also been manager of the Locomotive Section of the Division of Operation, having charge of locomotive maintenance while Mr. Bentley was in charge of the work of standardization of locomotive and car design.

F. A. Delano Resigns

F. A. Delano, member of the Federal Reserve Board and former president of the Wabash, has tendered his resignation to the President to accept a commission in the army engineer corps, for railroad service in France. His resignation has not yet been accepted.

Uniform Classification Committee

The Uniform Classification Committee submitted its report to the Interstate Commerce Commission on Wednesday and the commission will hold a series of hearings on it.

Exports Control Committee

The exports control committee organized at a meeting on Wednesday by electing as chairman George D. Ogden, freight traffic manager of the Pennsylvania Railroad and representative of the railroad administration. The committee will have offices in both Washington and New York.

INCREASED RAILWAY FARES IN IRELAND—The recent increase in ordinary passenger fares by 50 per cent on the railways in Great Britain was ordered to apply to Ireland from June 1.

Canadian Northern Stock

Valued at \$10,800,000

AFTER SITTING 50 DAYS in March, April and May, taking over 1,500,000 words of evidence and filing 211 exhibits, an arbitration board consisting of Sir William Meredith, chief justice of Ontario, representing the Canadian government; Wallace Nesbitt, K. C., of Toronto, representing Mackenzie, Mann & Co., and Chief Justice Harris of Nova Scotia selected as the third member, gave a unanimous award on May 25, placing a value of \$10,800,000 on the 600,000 shares of Canadian Northern capital stock.

The agreement under which the arbitration was held was made on October 1, 1917, by the king, represented by the Ministers of Finance and of Railways and Canals, Mackenzie, Mann & Co., Ltd., and the Canadian Bank of Commerce. In accordance with an act passed in the 1917 session of the Dominion parliament providing for the acquisition of the Canadian Northern stock, the arbitrators were selected to determine the value of 600,000 shares as of October 1, 1917. In arriving at their decision they were authorized to consider the reproduction cost new of the railroad but not to include therein any increase in value of labor, material or of property due to the war. It was agreed that if the value of the stock was found to total \$10,000,000, or more, the price to be paid therefor would be that figure, but if the value ascertained should reach less than that amount the value so determined would be the price paid by the government. It was also understood that the arbitrators' decision would be final, if unanimous, and that the price determined would be paid by the government within three months from the receipt of the award, less its proportionate share of the amount of any liabilities ascertained by the government to be outstanding against the railroad and undisclosed to the arbitrators. No deductions were to be made for liabilities properly chargeable to capital account unless the corresponding value produced thereby had been taken into consideration as an asset of the company.

In their decision the arbitrators admitted that the problem before them was one of great difficulty and subject to a great diversity of opinion. While the ascertainment of a surplus of assets over liabilities or the reverse is not a conclusive test of the value of stock, it is an element which cannot be ignored and which engaged much of the time and consideration of the board. After finding the reproduction cost of the physical property based on pre-war prices and making due allowance for depreciation and land grants, the arbitrators found the surplus of assets over liabilities of the company on October 1, 1917, to be not less than \$25,000,000. The board pointed out, however, that the valuation of physical property of a railway by the reproduction new method, less depreciation, is not to be regarded as the ascertainment of the real value, but is only a means to that end and, in fact, the only estimate available. Among the other considerations entering into the valuation were the prospective earning power of the company, its past earnings and expenditures, its present financial position, the location of the lines and their construction, the other railways already existing in competition, the rate of interest on the company's funded and other debts, and the probable future growth of the population and business of the country.

The \$10,800,000 award places a value on the 600,000 shares of the Canadian Northern at \$18 each, but as the amount to be paid for the property was limited by the agreement to \$10,000,000, the value per share according to the decision was \$16.66.

Rail Production in 1917

THE AMERICAN IRON AND STEEL INSTITUTE, New York, has issued a special bulletin giving the production of rails during 1917 as compared to previous years, since 1902 inclusive. According to the table given below, the production of rails in 1917 was 2,944,461 tons, or larger by 110,000 tons than in 1916. However, when the totals are considered in the light of the exports of rails during those two years, it will be seen that the consumption of rails in this country was considerably less than in 1916. During 1917 almost one half a million tons of rails were exported by the

| 1912..... | 2,105,144 | 1,099,926 | 119,390 | 3,455 | 3,327,915 | |
| 1913..... | 2,527,710 | 817,591 | 135,043 | 2,436 | 3,502,780 | |
| 1914..... | 1,525,851 | 323,897 | 95,169 | 178 | 1,945,095 | |
| 1915..... | 1,775,168 | 326,952 | 102,083 | | 2,204,203 | |
| 1916..... | 2,269,600 | 440,092 | 144,826 | | 2,854,518 | |
| 1917..... | 2,292,197 | 553,325 | 118,639 | | 2,944,161 | |

*Reroiled from old steel rails. Included with Bessemer and open-hearth steel rails from 1901 to 1910 inclusive. †Small tonnages rolled in 1909 and 1910 but included with Bessemer and open-hearth rails for these years.

United States Government alone for the use of the army in France. Another notable fact shown by the table is that the relative production of Bessemer rails has increased since 1915. In 1917 it represented 18.11 per cent of the total production as compared to 15.42 per cent in 1916 and 14.83 per cent in 1915.

Another table shows the production of renewed and reroiled rails for 1911 to 1917 inclusive, from which it is seen that in spite of the demand for rails there has been a further reduction in the practice of reroiling old material, the total being only 127,646 tons in 1917 as compared to 148,686 in 1916 and the maximum tonnage of 198,836 tons in 1913.

PRODUCTION OF RENEWED AND REROILED RAILS, 1911-1917

| Reroiled from new seconds, new defective rails, etc. | | | | | |
|--|----------------------|--------|-----------------------|----------------|---------|
| Years | Open-hearth Bessemer | Total | Rolled from old rails | Total reroiled | |
| 1911..... | 2,631 | 19,379 | 22,010 | 91,751 | 113,761 |
| 1912..... | 13,740 | 29,446 | 42,586 | 119,390 | 161,976 |
| 1913..... | 13,052 | 30,741 | 43,793 | 155,043 | 198,836 |
| 1914..... | 13,538 | 13,234 | 26,772 | 95,169 | 121,941 |
| 1915..... | 6,477 | 2,652 | 9,129 | 102,083 | 110,212 |
| 1916..... | 1,711 | 2,149 | 3,860 | 144,826 | 148,686 |
| 1917..... | 1,825 | 7,182 | 9,007 | 118,639 | 127,646 |

Further insight into the deficiency of rail production is to be found from the table giving the production of rails by weight per yard. Here it is seen that for 1917 the rails weighing 85 lb. and less than 100 lb. amounted to 989,704 tons and rails weighing 100 lb. and over aggregated 763,526 tons or a total of 1,753,230 tons in the weights of rails com-

LONDON-PARIS MAIL BY AIR.—An aerial postal service between London and Paris has been inaugurated.

monly used for renewals on important lines. This compares with 1,992,192 tons for 1916.

70-Ton Side Dump Hopper Cars Built by E. J. & E.

Center Sill Is Not Continuous; The Floor Members Are Arranged to Withstand Buffing Stresses

THE ELGIN, JOLIET & EASTERN is building in its shops at Joliet, Ill., 500 steel hopper cars. These are of the side dumping type and have a rated capacity of 140,000 lb. and a cubical capacity of 2,533 cu. ft. The length over the end sills is 41 ft., the maximum width

ends toward the center of the car are cut at an angle approximately the same as the slope of the floor at the ends. At the center plate the sills pass through bolsters made up of two plates stiffened with angle irons and Z-bars. The end sill is built up of a 12-in. channel and pressed steel shapes. The side sills are made of 12-in. 20.8-lb. channels and extend only a short distance beyond the bolster toward the middle of the car. The center sill channels are fastened at the inner ends to three transverse members, a 4-in. by 5-in. angle at the extreme end, a 7-in. 16-lb. channel and a 6-in. by 6-in. angle opposite the ends of the hopper doors. These members serve to transfer the stresses from the center sills to the floor members.

The main floor is made up of 5 16-in. floor girders fastened to numerous transverse A-frames built up of angle bars. Along the lower edges of the floor on each side of a 5-in. by 4-in. angle and at the top ridge there is fastened a 4-in. by 4-in., 18.5-lb., 100-deg. angle. This angle extends to the bolster while the main floor and sloping end are joined about two feet from the bolster. The end of the top angle is attached to two bent plates with angles at the lower ends, these angles being riveted to the upper flanges of the center sills. The main floor member is further stiffened by the runway, which is a 7-in. channel, fastened to the floor by numerous pressed steel supports.

There are three openings in the floor on each side to allow the links of the door mechanism to pass through. At each of these points the floor is stiffened with angles and the plates which form the openings for the door arms are

Center Sills and Bolster Assembled and Placed on Truck

is 9 ft. 10 3/4 in., and the maximum height of the car body is 11 ft. The average light weight is 57,500 lb.

One of the unusual features in the design is the way in which the floor members are made to serve as a part of the

Elgin, Joliet & Eastern Hopper Car

underframe. The center sills are not continuous from end to end, but extend only a short distance beyond the ends of the hopper openings. They are each made up of two 15-in. 40-lb. channels tied together at several points, each of the four channels being 12 ft. 5 9/16 in. long. The

used to support gusset web plates which serve to stiffen the sides.

The sides are designed as girders and arranged to assist in transferring the weight of the loading to the bolsters. The top chord member is a built angle 4 in. by 3-in., weighing

11.9 lb. per foot. The lower chord member is a 4-in. by 3-in. angle. The stiffeners opposite the gusset plates are cross-tie sections weighing 9.5 lb. per foot. At the ends of each bolster the sides are supported by two 2½ in. by 3-in. angles.

The side plates are ¼ in. thick while the floor plates have a thickness of 5/16 in. It has been found that the life of the floor and sides is about equal when these thicknesses are used. The sloping end floor sheet extends from the hopper up over the bolster to the end of the car, and is supported by angle irons. The vertical end plate is supported by four pressed steel end posts in addition to the angle iron corner post. The end sheet is stiffened at the

Main Floor Member Being Assembled. Note Extension at End for Attachment to Center Sills

top by a bulb angle of the same section as that used on the sides.

The dump doors are 20 ft. 11½ in. long and 2 ft. 10½ in. in height. They are stiffened by angles along the top and bottom, and at the points where the operating mechanism is attached. There are five links attached to each door, two at the ends which pass outside the hopper opening, and three at intermediate points which pass through openings in the floor. The links are connected to arms on shafts carried under the sides of the floor. The links are bent so that they have a toggle action, and are self-locking when the doors are in the closed position. The shafts which control the operation of the doors are attached to the main

Ends and Floor Section Assembled and Side Gusset Straps in Place

operating shaft by chains. Two turn-buckles are placed in each chain to allow the position of the shaft to be so adjusted that both doors will close together. The main operating shaft extends under the floor to the end of the car, and is controlled by a hand wheel and chain attached to an arm on the end of the shaft. The arrangement of the dumping mechanism is clearly shown in one of the illustrations.

The trucks used under these cars have Andrews cast steel side frames, rolled steel wheels, Simplex truck bolsters and Ajax brake beams conforming with the M. C. B. speci-

fications for No. 3 beams. An unusual feature of these trucks is the combination brake rod safety hanger and brake beam guide. This is also shown in one of the illustrations. It is made of ½ in. sheet steel formed to fit over the spring plank. A hole is punched in the lower portion of the safety hanger for the brake rod to pass through, and the upper end is bent down horizontal so that it extends over the com-

Sides and Ends in Place Ready for Application of Doors and Appliances

pression member of the brake beam and serves to prevent the beam from tipping.

The couplers used on these cars are the M. C. B. type D No. 5 with 6-in. by 8 in. shanks and 9½-in. butt, attached to the yoke with a key. The yoke is of 1¼-in. by 5-in. wrought steel. The draft gear is the Miner type A-15. Westinghouse air brakes are used with the K-2 triple valve and a 10-in. by 12-in. air cylinder.

Express Rates Increased

A 10 PER CENT INCREASE in interstate express rates is allowed by the Interstate Commerce Commission in a decision rendered on June 22 after an order had been issued denying the supplementary petition of the express companies for a 15 per cent increase in rates. The orders were issued after it had been announced that the amended contract between the express companies and the director general providing for unified operation during the period of federal control had been signed. An abstract of the opinion by Commissioner Clark is as follows:

Wells Fargo & Company and the Adams, American, and Southern express companies handle more than 95 per cent of the total express traffic. The evidence in their behalf shows that many of the conditions which have operated to reduce the net earnings of the railroads have affected the express companies in like manner, that emergencies have made necessary the shipment of articles by express that heretofore have moved by freight, and for the handling of which the express companies are not adequately compensated; that the lack of facilities to handle an unexpected and unprecedented volume of traffic requiring expedited movement has resulted in serious congestion; that the increased traffic and the attraction of employees to other lines of business have necessitated the employment of more experienced men and the use of unsuitable equipment; and that under these conditions the service has deteriorated and the ratio of operating expenses to revenue has increased to such an extent that their aggregate earnings are inadequate to such an extent that their present rates are insufficient to meet operating expenses.

By far the largest item of operating expense, after de-

ducting payments for express privileges, is that of labor, and there have been very heavy increases in labor costs. Charges for maintenance, and stable and garage expenses have largely increased. So also have payments on account of loss and damage claims because of the congestion, the shortage of suitable equipment, the careless or inefficient work of inexperienced employees, and the increased value of the shipments. It is unnecessary to discuss in detail these and various other conditions shown of record. Their existence is conceded; the necessity for corrective measures is obvious and imperative; and it is urged that relief from their untoward effect upon the applicants' service and revenues can be obtained only by increasing the rates, inasmuch as all possibilities in the way of operating economies have been exhausted. We will, therefore, proceed to consider the evidence relating to the financial conditions of these carriers and the probable effect upon their revenues of the proposed increased rates.

Wells Fargo & Company

Wells Fargo & Company's operating revenue increased from \$12,945,464 for the first seven months of 1916 to \$15,514,000 for the same period of 1917, but its operating income decreased from \$1,238,761 to \$137,250. Substantial deficits occurred in January, February, June and July, 1917. Had all its rates on state and interstate traffic been 10 per cent higher than they were its operating income for the period would have been \$1,445,847.

American Express Company

The American Express Company's operating revenue increased from \$17,293,759 for the first seven months of 1916 to \$20,968,190 for the same period of 1917, but its operating income decreased from \$1,080,538 to a deficit of \$96,796. Deficits occurred in the same four months as in the case of Wells Fargo & Company. Had the rates of the American Express Company on all traffic been 10 per cent higher than they were its operating income for the period would have been \$1,725,191.

Adams Express Company

The Adams Express Company's operating revenue increased from \$12,838,524 for the first seven months of 1916 to \$14,886,907 for the same period of 1917, but its operating income decreased from \$546,914 to a deficit of \$1,173,188. March was the only one of the seven months of 1917 in which it did not operate at a deficit. Had all its rates been 10 per cent higher the operating income for the period would have been \$209,521. The net operating results of the Adams Express Company for the first seven months of 1917 were much more unfavorable than were those of any other company. This was due in part at least to the fact that the greater proportion of its business is in the east and on lines where the unusual conditions were earlier encountered and more severely felt.

Southern Express Company

The Southern Express Company's operating revenue increased from \$4,774,852 for the first seven months of 1916 to \$5,377,990 for the same period of 1917. If there be included as a deduction from net operating revenue the sum of \$150,000 which this company estimated it must pay as normal income tax and war tax, its operating income for the first seven months of 1917 was \$624,206, or \$185,274 less than for the same period of 1916. The exhibits filed by this company indicate a deficit of \$35,003 for the month of July, but this amount was shown to be \$28,571 more than it should have been, because the tax item of \$150,000 was apportioned only to the months of May, June, and July instead of to the entire seven months' period. Without deducting these taxes, the Southern Express Company had

an operating income for July of \$14,996 and of \$774,206 for the seven months' period. Had all its rates been 10 per cent higher than they were its operating income for the period, with war taxes deducted, would have been \$1,063,670.

The data submitted by all the applicants include deductions representing normal income tax and war tax, but except for the Southern Express Company the amounts are so small as not materially to affect the result.

The Four Companies Collectively

Considering the four companies as a unit, their operating revenue from domestic transportation was \$47,852,600 for the first seven months of 1916 and \$56,747,089 for the same period of 1917, but their operating income decreased from \$3,675,694 to a deficit of \$508,527. The deficit would have been approximately \$321,776 but for the inclusion of income and war taxes. Deficits occurred in the months of January, February, June, and July. Had all the rates of the four companies been 10 per cent higher, their operating income for the period would have been \$4,444,231.

Other Express Companies

The smaller express companies, except the Canadian, showed substantial increases in operating income. The figures for the first seven months of 1916 and 1917, which include the net income derived from their foreign and non-transportation business, are stated below:

| | Great Northern. | Northern. | Western. | Canadian. |
|------------|-----------------|-----------|----------|-----------|
| 1917 | \$147,370 | \$177,377 | \$55,864 | \$77,900 |
| 1916 | 91,796 | 137,902 | 34,752 | 140,423 |

The Situation as of December 31, 1917

During the remaining months of 1917, and for that year as a whole, reports filed with the commission show that the net operating results were much more unfavorable than during the seven months' period ended July 31.

Excluding war taxes and the net income derived from the foreign and nontransportation business, it is estimated that the net operating results from the domestic traffic of the four principal companies were as follows:

Operating income or deficit

| | August to December, 1917 | Calendar year 1917 |
|-------------------|--------------------------|--------------------|
| Adams | *\$2,237,697 | *\$3,410,885 |
| American | *183,764 | *280,560 |
| Southern | 345,519 | 1,119,726 |
| Wells Fargo | *117,707 | 56,294 |
| Total | *\$2,193,649 | *\$2,515,425 |

*Deficit.

Conclusions

It is apparent that the Adams, the American, and the Wells Fargo companies, which together transact about 86 per cent of the total express business, and that the smaller companies, in a somewhat lesser degree, require the additional revenue which the proposed increased rates would yield to enable them to afford adequate service and to meet the constantly increasing costs of operation. Accepting as approximately correct the estimated additional revenue which the increased rates will yield, it is far from certain that, under a continuance of present separate operation, it would be sufficient to offset the increases in wages and other operating costs.

The protests against the proposed increased rates are comparatively few and relate principally to those of the Southern and the smaller express companies. It is unnecessary, however, to particularly consider the revenues or rates of each individual carrier. In the former proceedings, 24 I. C. C., 380; 28 I. C. C., 131; and 35 I. C. C., 3, these express companies were treated substantially as a unit. And, as is well known, they have recently been merged into one company, which will be operated as an agency of the government under

a contract with the United States Railroad Administration.

Upon all the facts of record we conclude and find that the application should be granted. An order will be entered accordingly.

Commissioner Atchison in a dissenting opinion said in part: "What is said in the majority report as to the increased cost of performing express service is undeniable. But it is clear from the record that the increases in costs are far heavier in Zone 1, which embraces roughly the territory east of the Mississippi and north of the Ohio and Potomac rivers. The density of traffic and population is greater and the general rate basis is lower in this zone than elsewhere in the country. The added costs are much greater on less than carload than

on carload traffic, and on small than on large packages or articles.

"It is entirely feasible to adjust the express schedules so that the burden of these additional costs shall be borne in the sections where such added costs are incurred, and by the kinds of traffic which have caused the increased expense, but this is not done. Instead the burden is laid upon all kinds of traffic, and is imposed in relatively heavier degree upon localities already carrying the highest rates and which are not responsible for the greatest part of the added financial burden of these carriers."

The new rates are to be established on not less than five days' notice.

The Chinese and Japanese Railways Compared

Japan's Lines Have a Semi-Military Organization.
China Is Hardly Master Over Its Own Railways

By Frank Rhea

CHINA HAS ABOUT 6,500 miles of railroads today, of which 2,300 are what I call concessioned railways—really nothing more or less than other governments operating railways in China. There are almost 3,800 miles of the Chinese government railways which I will refer to later. In Japan there are about 6,000 miles of the Imperial Government Railways of Japan which is one of the best examples of government ownership in existence today. The three railway situations in the world which can be put in

A Semi-Military Management

The Japanese railways are organized on the British departmental basis with a Germanized semi-military management superimposed on top of it. That, to me, answers whether we wish to take up that method of railroad organization. If we want to get the German or the Japanese efficiency, we will have to superimpose the semi-military organization. One goes with the other.

Japan is a very rough country. The lines are 5 ft. 6 in.

A Station on the Canton-Hankow Line

parallel columns and the performance figures studied most interestingly are America, Japan and Germany. The performances of the Japanese railroads are quite remarkable in a number of respects. They have a very light goods wagon with a capacity of 10.6 tons. Those goods wagons each move 110,000 ton miles a year while the American railroads move about 160,000 ton miles a year in cars of 41 tons capacity. Therefore, we have quite a number of things to learn from the Japanese railways.

gauge, the grades are steep, the curvature is sharp and the railroads have cost practically \$80,000 in gold per mile for the Japanese government to acquire. It did not cost quite that to build them; it includes some of the profit to the former owners, who were private individuals.

The Japanese railways were bought through a rather peculiar business transaction which is a long story, but which resolves itself down to a brief statement that the earnings for a period of years were multiplied by 20, which capitalized the earnings at 5 per cent.

For several years the Japanese have made a very careful effort to manufacture their own railway equipment requirements. In 1910 they bought about 40 per cent of the requirements out of the country. In 1914 they reduced this

*This is a paper read at the annual meeting of the National Free-Trade Convention at Atlantic City, N. J., June 1, 1918, by Mr. Frank Rhea, of the American Railway Association, and the Far East as a part of the program of the International Domestic Commerce Conference. The paper dealt with the American railway materials. A translation of the paper into Chinese and Japanese appeared in the "Hankow Daily" of May 21. The paper is now in the press.

to less than 5 per cent. They have since gone up to about 12½ per cent. Manufacturing in Japan is typically along the line of private manufacturing. The two plants which are most important today in the manufacture of railway equipment are the Osaka Locomotive & Car Works and the Kawasaki dock-yards, both of which have modern and moderately well equipped plants. They have been fostered by long-time contracts for both locomotives and carriages for the Imperial Government Railways.

With an adequate supply of labor and materials (both of which are very short in Japan today) these two plants can turn out about 250 locomotives a year, about 1,250 passenger cars and 6,000 to 7,000 goods wagons, in addition to a considerable amount of other materials, fabricated structural materials, shop machinery, etc. The wages at both these works have been substantially increased since the war. At present common labor costs from 25 cents to 50 cents gold a day. The wages of mechanics range from 50 cents to \$2 a day. This was an undreamed of wage for a Japanese mechanic previous to the war.

The Japanese in China

Probably the most serious situation in the long run of Japanese development is in China, particularly in Manchuria and probably later Shantung, as illustrated by the

same and the Japanese in the Shikoku works are all administrative and tactful. Every trained man, every engineer, is a Japanese and the Japanese apparently are very much interested in seeing that the Chinese keep busy.

An interesting problem in that connection was my study of the Tungshang works of the Peking-Mukden Railway which have at the present time about seven Britishers running the works and I was interested as to why the Tungshang works could not get the results that the Shikoku works did. I concluded it was very largely for the reason that they did not have somebody in each one of those positions—a crane man, an engine man, or whatever it might be—that kept things going. Those seven Britishers had about half their time occupied in the administration of the railroad itself and could not put the push into the Chinese.

The South Manchuria Railway

We have looked on the South Manchuria Railroad as a private corporation. It is, so-called. As a matter of fact, the South Manchurian Railway is directly under the administration of the Colonial Department of the Government of Japan. It is actually the instrument of Japan in handling the investigation, development, manufacturing and transportation organization of Manchuria. We always talk in this country of the big part of the United States being Texas.

On the Canton-Hankow Railway

Shakado works of the South Manchuria railways at Darien, which are not only a very complete layout of railway work shops but are as well completely equipped for manufacturing general engineering products. In recent years these works not only furnished fabricated structural materials needed by the Japanese in their developments in South Manchuria, such as the Thiazin color and the Penhiha iron furnace, the Anshan steel plant now in construction, but have as well sent back to Japan structural material, machinery for locomotives to Indo-China, and have built considerable equipment for the Korean and Manchurian railways.

I visited the Shikoku works where there were about 4,150 men employed, of which over 80 per cent were Chinese, principally the upstanding, robust men from Shantung who make excellent mechanics if properly developed and properly supervised and directed. These same remarks apply to the other works in South Manchuria and also in Japan.

It looks to me that one of the serious matters we have to consider in the Far East is not so much what Japan will do in Japan proper as what she will do in China and we have to face the fact that the Japanese are the one yellow race which has administrative and organizing ability and initiative. I don't know whether it's initiative, but they do it just the

Well, Manchuria is equal to Texas with Louisiana and Arkansas added, and is equal practically to the four Northwest states of Washington, Oregon, Idaho and Montana.

The concession railways of China constitute the French-Hunan lines extending from French Indo-China into Hunan, the ex-German Shantung lines now in the hands of Japanese, and the South Manchuria Railway already mentioned. In addition there is the Chinese Eastern Railway crossing Manchuria about which much has been said recently but which really can be left without further mention on account of the present chaotic condition in that part of the Far East, because Manchuria is China and not Russia.

There are about 1,100 miles of this line, of which over 900 miles constitute part of the trans-Siberian route. There is 152 miles in a branch from Harbin to Chang Sha, where connection is made with the Japanese South Manchuria line. This line runs through a very fine agricultural country with a great deal more live stock than is the average in all the rest of China.

Of all the situations in this part of the world, I think we are most interested in the Chinese Government railways, and I speak of this as Chinese Government railroads advisedly. These are administered by the Chinese Ministry of Com-

munications and remarkable progress has been made notwithstanding the great difficulties which have taken place in China in the last few years in nationalizing these railways and I use the word nationalizing advisedly.

I went to China quite of the opinion that we had little chance to get anything but the small amount of business on account of the concessions to the other countries. Without doubt the Chinese railroads are very real examples of business following investment and unless we go after both the investment and the business, it will remain so in many ways.

There are, however, features which I do not understand which, in my opinion, may mean much to us in the future if taken advantage of. First, everyone seems to have taken it for granted that the principal problem was to build railways in China, but I was struck with the similarity of the problem from the one we have at home and which we are suffering from in America, that the real problem is to furnish the ultimate capital to develop the railways of China after they have settled down and know about what they can do. It is not only the problem of first building the railways but it is a large problem to furnish the capital and additional equipment to go ahead and bring those railways to the ultimate development, and the ultimate development of the railways in China is certainly going to be very interesting on

the railroads a consolidated whole. This control by the Ministry of Communications is losing its effect to a certain extent by the amortizing of the loans and the Chinese gradually taking hold of it but that has a long time to run and they are needing all the earnings which they have to put back into property to take care of the constantly growing business.

The Peking-Mukden Railway in five years has had an increase of 50 per cent in traffic with an increase of equipment of about 20 per cent. The other roads have had larger increases with less increase of equipment. Today China is an excellent place in my opinion for the Americans to introduce the selling of equipment or equipment bonds on what seems to me to be a very gilt-edged security to pay for it in the end; one interesting fact is that up to date China has not defaulted on any of her railway obligations.

New Lines Needed

The building of new lines in China is one of the things which deserves a great deal of consideration. The one line which they need immensely is the line from Canton to Hankau, making connections across that part of China and I feel warranted in making the statement that they will never get the Chinese currency straightened out until they get transportation facilities in China for the reason that you cannot have exchange without transportation facilities. You cannot have stability of exchange; therefore they will continue to have their local currencies in China until they get transportation.

I went to China with the idea that I would not undertake to study the loan situation. I found if I was going to make any intelligent report whatever on the railway markets of China, I would have to study loans. I found it a very interesting subject, one of the most interesting subjects I have ever taken up, and in doing that I feel a great deal of sympathy for the Chinese notwithstanding a great many of their shortcomings.

Chinese Have Been Imposed Upon

The Chinese today have been imposed on. The Chinese situation, as a whole, has not been allowed to develop on account of limitations, restrictions of a great many of these loan agreements which are utterly selfish from the standpoint of the people who own them, and I believe that one of the greatest things that could happen to China is to have her railways taken in hand, untangled, straightened; it will be to the good not only of China as a whole but to the good of the actual owners of the loan securities.

The Chinese at the same time no doubt should take steps to remove some of their leaks and obstructions and other difficulties of that kind. The Chinese would probably have to admit and agree to a general supervising situation. I think, however, that they would readily do that. In fact, I was told they would, and by very good authority—in one instance by the vice-president of the Ministry of Communications Committee. He said they would be very glad to exchange twelve different piecemeal controls for one comprehensive control.

The railways of China today have an equity in their balance sheets and this is not fictitious value but is a real assessment of about \$450,000,000 Mex. Of this the Chinese Government controls (in round figures) an equity of about \$1,500,000 Mex. In other words today they do own actually about one third of their own railways. Therefore I think that one of the conditions of peace should be the straightening out of some of the Chinese situation, particularly the results of the battle of concessions, and the battle of concessions in my opinion laid some of the foundation stones for the war. And if they are not corrected, they will be a contributing element to another war.

Japanese Troops in Possession of the German-built Railway at Tsing-Tao

account of the character and density of traffic which will ultimately develop.

Chinese Railways Lightly Equipped

Today the Chinese railways are very lightly equipped as we see it in America. With earnings of approximately \$20,000 Mex. per mile of line they have $\frac{1}{2}$ of a locomotive per mile, $\frac{1}{4}$ of a passenger car per mile and $\frac{3}{4}$ of a goods car per mile of line. The Japanese, with earnings not greatly different, have 4 of a locomotive, 1.2 passenger cars and 7.6 goods wagons while we in America have $\frac{1}{4}$ of a locomotive, $\frac{1}{45}$ of a passenger car and 9.8 freight cars, all very much larger than the Chinese. Germany in 1913, with earnings of \$22,000 gold per mile, had $\frac{3}{4}$ of a locomotive, $2\frac{1}{4}$ passenger cars and $17\frac{1}{2}$ goods wagons, all larger than the Chinese.

The Chinese are making five complete loadings of goods wagons a month, some lines making six complete cycles of loading of a goods wagon a month, and moving a haul of about 146 miles. Americans with a haul of 260 miles make a loading of a little over two a month. The Japanese are loading about four and a half times, I believe, although I was not able to get very definite figures on that feature.

Therefore, the transportation problem of the Chinese railways today is a very interesting one and one of the great difficulties is that they have superimposed on them some 12 loan-restricting ideas tying the Japanese' hands as to making

Rear End Collision at Ivanhoe, Ind., on Michigan Central

AT 3:57 A. M., SATURDAY, June 22, an empty westbound equipment train on the Michigan Central, consisting of 20 tourist sleepers and 1 coach, crashed into the rear of the second section of a circus train, at Ivanhoe interlocking plant, near Hammond, Ind., killing 78 and injuring 120 persons on the circus train, according to the latest available information. Trainmaster F. S. Whipple, who accompanied the second section of the circus train, was evidently killed in the accident as no trace of him has been found. Many of the bodies recovered were charred beyond recogni-

tion in charge of Engineman A. Sargent and Conductor L. Johnson passed the Michigan City depot at 2:55 a. m.; Porter at 3:20 a. m.; East Gary, at 3:34 a. m., and Tolleston at 3:52 a. m.; and crashed into the rear end of the second section of the circus train at 3:57 a. m.

This portion of the Michigan Central is a double track line completely equipped with automatic block signals. The track is on tangent for over a mile east of the point where the wreck occurred. At the point of the accident the Gary & Western tracks are parallel to and 85 ft. north of those of the Michigan Central. The night was clear with nothing to obstruct the view, the accident occurring in the country with no manufacturing plants or factories nearby. The westbound home signal for Ivanhoe interlocking plant is located

The Track Layout of the Ivanhoe Accident

tion and it is doubtful if the total number of killed and missing will ever be determined.

After a performance at Michigan City, Ind., the Hagenbeck-Wallace circus was being moved in two sections to Hammond, Ind. These trains were being run over the Michigan Central to Ivanhoe, at which point they were diverted over the Gary & Western into Hammond. The interlocking plant at which the accident occurred is approximately five miles west of Gary and four and a half miles east of Hammond. The second section of the circus train con-

950 ft. east of a crossing of the Elgin, Joliet & Eastern and 270 ft. east of the crossover switch leading to the Gary & Western tracks.

The second section of the circus train traveled from Porter to East Gary, a distance of 9.2 miles, in 24 minutes, running at an average speed of 23.4 miles an hour. The empty equipment train traveled this distance in 14 minutes, running at an average speed of 39.1 miles an hour. The circus train covered the distance between East Gary and Tolleston, 6.5 miles, in 14 minutes, an average rate of 27.9 miles an

A General View of the Ivanhoe Accident Showing the Debris, the Gary & Western at the Right and the Howe Signal in the Distance

sisting of 27 cars, passed the Michigan City depot at 1:00 a. m., pulling up to Tenth Street, where the loading was completed. This train left there at about 2:30 a. m., arriving at Porter, 11.8 miles distant, at 3:06 a. m.; at East Gary, 9.2 miles from Porter at 3:30 a. m.; at Tolleston, 6½ miles from East Gary at 3:44 a. m. and at Ivanhoe approximately 3.3 miles from Tolleston at 3:55 a. m. The train sheets show that the empty equipment train, pulled by engine 8485 and

hour, while the empty equipment train covered the same distance in 18 minutes at an average rate of 21.7 miles an hour. The distance between Tolleston and Ivanhoe, approximately 3.3 miles, was covered by the circus train in 11 minutes, running at an average speed of 18 miles an hour, while the empty equipment train covered it in 5 minutes, running at an average speed of 39.1 miles an hour. The empty equipment train passed East Gary 4 minutes after the circus

train, while at Tolleston the interval between the two trains was 8 minutes. From this it appears the empty equipment train slowed up materially between East Gary and Tolleston, or while passing through the city of Gary, but resumed an average speed of 39 miles an hour at or near Tolleston.

The second section of the circus train consisted of stock cars, flat cars and four sleeping cars, which were just ahead of the caboose. These sleeping cars were converted wooden equipment. The engine plowed through the sleeping car

A Close View of the Burning Debris

and after the crash these four cars and one flat car were destroyed by fire, which evidently started from the gas lighting system with which the sleeping cars were equipped. That the casualties were so large was due to the sleeping cars being of wooden construction and that they were equipped with three tiers of double deck bunks instead of two as in ordinary sleeping cars.

The second section of the circus train had a blazing

journal box on one of the cars and stopped, after having started to cross over to the Gary & Western tracks with the rear of the train at a point approximately 500 ft. in advance or east of the home signal of the Ivanhoe interlocking plant on the westbound main track of the Michigan Central and 4,300 ft. beyond or west of the distant signal. An automatic block signal was located 6,100 ft. east of the distant signal. When the second section of the circus train stopped to cool the hot box the flagman started back with fuses and lantern. It appears from the preliminary investigation that the automatic signals and the signals of the flagman were disregarded by the engineer of the circus equipment train, as, after the accident the distant signal for the interlocking plant was found to be in the stop position with the red light showing, while the automatic block signal was found to be in the caution position with the yellow light also showing properly. This shows that the signals were handled properly. The signal system consists of one stop, two caution, upper and lower signals.

After receiving the caution indication the engineer should have been prepared to stop at the next signal in advance. Rule 8 of the automatic block signal rules in the book of Rules for the operating department of the Michigan Central reads, "A train passing an automatic distant signal which indicates caution must be under control so it may be stopped on reaching the home signal." All employees involved in this accident, and in fact all employees in the entire transportation service are examined on all block signal and operating rules once a year as required by the State of Indiana.

Engineman Sargent has been in the service of the Michigan Central from 25 to 28 years, is an extra passenger engineman and is about 55 years old. He reported for duty at 9:50 p. m. on June 21, having been off duty since 1:50 p. m. on June 20. At the time of the accident he had been on duty 6 hr. and 27 min. with a total time off duty of 12 hr. prior to starting work. Mr. Kraus, fireman was called for duty at 12:15 a. m. on June 22, after having been off duty from 12:25 a. m. on June 21, or 28 hr. and 50 min. prior to starting work. He had been on duty 2 hr. and 42 min. when the collision occurred.

Further investigation indicates that Engineman Sargent was dozing or asleep, which was responsible for the accident. The flagman of the circus train was back from 600 to 800 ft. at the time of the accident. At the coroner's inquest at Hammond Tuesday, Engineman Sargent under his constitutional rights refused to testify at this time. Conductor Johnson stated to Sargent after the wreck, "This is quite a bad mess we got into," and asked him what was

A View of the Wreck

the matter. Sargent's answer was, "I must have been dozing." The circus officials on Tuesday compiled a list of dead and missing which totals 78.

The circus officials on Tuesday compiled a list of dead

and missing which totals 78.

THE UNITED STATES IN 1917 PRODUCED 142,000,000 BARRIS OF CELESTINE OIL, AGAINST 108,000,000 IN 1916, 210,000,000 IN 1910, AND 14,000,000 IN 1900, AND THIS COUNTRY NOW PRODUCES TWO-THIRDS OF THE OIL OF THE WORLD, ACCORDING TO A COMPILATION BY THE NATIONAL COAL BANK OF NEW YORK.

Tests with 2-10-2 Locomotive on the Union Pacific

Breaking Up Trains and Use of Helper Engines Eliminated;
Results Show High Sustained Capacity

THE UNION PACIFIC SYSTEM has recently reduced the grades on certain parts of the Western Division. With a view to increasing the train load on the reconstructed line, locomotives of the 2-10-2 type were designed for this division under the supervision of C. E. Fuller, superintendent of motive power and machinery and A. H. Feters, mechanical engineer. Twenty-seven of these engines were built last year by the Baldwin Locomotive Works, fifteen for the Union Pacific, six for the Los Angeles and

have given very satisfactory results. A condensed profile of the line on which they are operating is shown below. The reconstruction work has not been completed on this line and there are short sections where the grade is still 63 feet per mile, uncompensated for curvature. In tests the 2-10-2 type locomotives handled 4,800 tons eastbound over this division at an average running speed of 15 m. p. h. The average coal consumption was 358.4 lb. per thousand gross ton miles. The curves reproduced herewith show the tractive

Profile of the Union Pacific Between Ogden, Utah, and Evanston, Wyoming

Salt Lake and six for the Utah Railway. Of these, ten were placed in service on the Union Pacific between Ogden, Utah, and Evanston, Wyo., a division 75.8 miles long. The old line between these points had ruling grades of 93 feet per mile eastbound, while the new line has a ruling grade of 60 feet per mile. East of Evanston for 400 miles the ruling grade is 43 feet per mile. The 2-10-2 type locomotives

effort and drawbar pull developed and also the horse power. A maximum of 2,940 horsepower was developed at a speed of 30 m. p. h. This is at the rate of one horsepower for every 121.6 lb. weight of the locomotive in working order, which is unusually good performance.

The Union Pacific 2-10-2 type locomotives have a rated tractive effort of 70,450 lb. with 285,500 lb. on the driving-

Heavy Freight Locomotive for the Union Pacific Which Develops 2950 Horsepower

tives were designed primarily to move the same tonnage eastbound over the new line with a ruling grade of 1.14 per cent, compensated for curvature, that the Mikado locomotives handle over the line with .83 per cent grades. A secondary object was the elimination of helper service on this district, which has several difficult grades.

These locomotives have been in service for six months and

which the ratio of adhesion is 4.05. The total equivalent heating surface is 7,045 sq. ft. or one sq. ft. for each 10 lb. of tractive effort. The ratio in water and steam capacity for the heavy class of freight service in which these engines are used.

The boiler is of the straight-top type with a wide, deep firebox placed back of the drivers and over the rear truck.

A combustion chamber four feet long extends forward into the boiler barrel, and the tubes have a length of 22 ft. The middle barrel ring has a slope on the bottom to provide a sufficiently deep water space under the combustion chamber. All seams in the firebox and combustion chamber are welded, with the exception of that uniting the back sheet with the crown sheet and side sheets. The seam around the fire-door opening is also welded. Flexible stay-bolts are used in the breaking zone and in the six front rows of stays over the combustion chamber. At the point where the three upper rows of flexible stays on each side pass through the boiler barrel, bosses are welded to the sheet in order to provide a sufficient number of threads for the staybolt sleeves. Both the coal burning and oil burning locomotives are equipped with Security sectional arches and the coal burners are fired by Street type "C" stokers. The superheater consists of 45 elements and has a superheating surface of 1,262 sq. ft.

The piston valves are 15 in. in diameter and are driven by Walschaert valve gear which is controlled by a Ragonet power reverse gear having both air and steam connections. The piston heads are steel castings of dished section 7 in. wide with phosphor bronze bearing rings and gun iron packing rings. The piston rods are of open-hearth steel heat treated and hollow-bored. The same material is used for the crank pins and driving and trailing axles which are also hollow-bored. Long driving boxes are applied to the

with a spherical surface to provide sufficient flexibility.

The driving brake system is divided between the third and fourth pairs of wheels. The rear cylinders are placed in a horizontal position back of the main pair of wheels, while the front cylinders are placed vertically and are bolted to the cylinder saddle casting. The arrangement is such that all shoes bear on the backs of their respective wheels. The tender is carried on forged steel wheels, and is of the Vanderbilt type, with equalized trucks and a one-piece cast steel frame.

The principal dimensions and ratios of the locomotives are as follows:

| General Data | |
|--|--------------|
| Gage | 4 ft. 8½ in. |
| Service | Freight |
| Fuel | Coal or oil |
| Tractive effort | 70,450 lb. |
| Weight in working order | 357,600 lb. |
| Weight on drivers | 285,500 lb. |
| Weight on leading truck | 23,600 lb. |
| Weight on trailing truck | 48,500 lb. |
| Weight of engine and tender in working order | 554,200 lb. |
| Wheel base, driving | 22 ft. 6 in. |
| Wheel base, total | 41 ft. 5 in. |
| Wheel base, engine and tender | 77 ft. 6 in. |

| Ratios | |
|--|---------------|
| Weight on drivers ÷ tractive effort | 4.05 |
| Total weight ÷ tractive effort | 5.08 |

main axle and lateral motion boxes to the front axle. The latter are used in connection with the Economy constant resistance leading truck.

The frames are annealed vanadium steel castings 5½ in. wide and spaced 42 in. between centers. They are braced transversely between adjacent driving wheels and also at the third, fourth and fifth pairs of driving pedestals. The driving box wedges are self-adjusting. The Commonwealth rear frame cradle is applied in combination with the Delta trailing truck, which serves the triple purpose of a frame, radius bar and equalizer. The trailing truck is equalized with the two rear pairs of drivers, the equalization being through a central vertical, heart-shaped link which is suspended from a transverse beam hung from the rear driving springs. This link acts not only as the equalizer connection, but also as the rear truck radius bar pin. It is circular in section at its lower end, and is guided in the frame cradle casting. The bearing between the equalizer frame of the truck and the locomotive frame is made

ROAD TRANSPORT PROBLEM IN ENGLAND.—By an order in council, new powers are vested in the British Board of Trade for providing and maintaining an efficient system for the transport of freight by road. The Board may regulate, restrict, or give directions respecting the use for the purpose of road transport or the sale or purchase of horses or vehicles engaged on road transport. The Board may also require any horse or vehicle to be placed at their disposal either absolutely or by way of hire. Power is given to prohibit transportation of freight of any class by road and to prescribe the radius or distance within which freight may be conveyed by road.

New York Central Safety-First Department

A Salaried Specialist on Each Division; Results of
Experience in Refinement of Details

THE ESTABLISHMENT of safety committees on all railroads under federal control, as announced in circular No. 5, of the director of the division of transportation, noticed in the *Railway Age* of June 14, page 1422, puts into effect, throughout the country, a system of instruction and supervision, as related to the duty of railroad employees to look out for the bodily safety of themselves and their fellow workers, which has already accomplished remarkable results on a considerable number of important railroads, and which is sure to be of great benefit on any road wherever it is carried out with vigor and persistency. The term "safety first," as introduced into the railroad world by R. C. Richards, in 1910, means two things: (1) the simple operation of reversing the habits of mind of those men who, from excessive engrossment in their work, make care for their own safety secondary and (2) the correction of the mental attitude of those others who neglect their own safety, not because they are too earnest in their work, but because they lack the instinct, or intelligence or training, to put anything first; who are unsystematic or lazy or thoughtless in various directions.

This process of correction, though simple, is not easy; the task is a never-ending one; and committees are necessary. On every railroad division, to attend to the rather humdrum business of keeping the men keyed up to the importance of remembering one of the fundamental conditions of their vocation—that of keeping themselves fit to perform their duties. The universal principle that what is everybody's business is nobody's business is in evidence every day of the year; and only a thoroughly efficient organization can avert the well-known weakening effects that are observable in any enterprise in which the principle is forgotten.

Mr. Gray's circular, before referred to, follows closely the lines laid down by the American Railway Association in 1913 (Circular No. 1333), under nine heads. The plan was outlined in the *Railway Age* of April 21, page 1461.

To put the character of this plan before the reader in concrete form we give below a sketch of the operation of the system on the New York Central Lines, under the direction of Marcus A. Dow, general safety agent, who has built up a thorough and efficient organization throughout the twenty or more divisions of the roads under New York Central control. He has an assistant general safety agent in his office at New York city, and one on each important division of the road, sixteen of these in all (some of them attending to one large and one small division). These division agents devote their whole time to this work. For a good part of the year—except in the summer—they have the benefit of one or other of the two motion pictures which have been devised by Mr. Dow for use as aids in impressing their lectures on the employees. Two cars, with attendants, are devoted to these pictures and the safety agents give lectures to the employees, 50 to 75 at a time, in these cars, as they are moved about.

The keynote of the New York Central safety-first system is the maintenance of regular committee meetings on every division, with constant correction of any inattention or negligence of the committee members. Many of the innumerable small duties that appeal to the safety-first committee-man are so elusive that many man—strong-minded men as well as those not so strong—fail to do their best *except as they are held to very definite regulations*; and the prevention of the general lapse into carelessness, which would naturally follow this condition, constitutes about the whole function of the safety-first department.

The report of the meeting of the Safety Committee of the Syracuse division of the New York Central, on November 5, 1901, affords a typical illustration of the amount and kind of work done at such a meeting. This report fills 18 large pages, and the transcript of it which is given, covers 100 pages. Initially verbatim down as far as the headings of the columns. From that point, onward, we have several sample paragraphs illustrating the kind of advice coming from different departments, limitation of space forbidding the reproduction of the whole report, which included 166 items having to do with faults in physical features (ending on the 16th page) and 44 paragraphs having to do with the correction of improper practices. In this particular report no item, whatever have found a place in the last column ("Referred to general committee") and only one item, No. 1084, is found in the column headed "No Action." The extent to which these meetings go into particulars will be understood when it is noted that Mr. Leonard, general yardmaster, who reported item No. 1091, reported also 46 others. (But in this case there had been no meeting for three months.) Mr. Schell, the safety agent of the division (devoting his whole time to this work) made 14 suggestions, all but one of which were referred to some department for attention. That is to say, his observations came before this meeting as new business, whereas most of the items reported by other members had to do with matters which had already received some attention and in many cases had been finally settled. The instructions given by the general safety committee to the division committees call upon members to report, to the proper officer, every unsafe condition or practice as soon as discovered, and if such reports are made, and are properly acted upon, the committee member can, of course, report both the discovery and the correction at the same meeting.

A subject which is continued from one meeting to another appears, by number, in the records of each successive meeting until it is finally disposed of. A report of each division meeting must be sent to the general safety agent at New York City, within ten days after adjournment. Where a committee decides to take no action, it is required to give the reasons for such decision (which requirement however appears to have been disregarded in this particular case). If a matter is referred to the general committee the chairman of the division committee must give full information, including where appropriate plans for improvements of structure, and estimates of costs; and the division committee is required to make a definite recommendation.

| Item No. | Member reporting, and his recommendations. | Action taken | Give item numbers in these columns | | |
|--|--|---|------------------------------------|---------------------------|-------------------------------|
| | | | Corrected | For further consideration | Referred to General Committee |
| 826 | Switchstand in station platform at Akron between main tracks into which passengers might walk after alighting from trains after dark | Held for further investigation | | 826 | |
| 1064 | Mr. J. Parker submitted report from C. A. Kaehl, suggesting that railing along track 4, east end river bridge, be extended farther east and along platform to the old Carpenter Shop, Rochester | Railing has been extended | | 1064 | |
| 1072 | Mr. C. C. Gleiner suggested fence across the end of the sidewalk, south side of tracks, west side of West street, Syracuse | Matter now up with DL&WRR as fence would be on their property | | 1072 | |
| 1076 | Mr. T. Leonard submitted report from Asst. Yd. Master R. F. Smith, that a large number of old rails were lying between tracks 12 and 13 of the Westbound Advance Yard | Account of shortage of track laborers, only part of the rails have been picked up. Will be taken care of soon | | 1076 | |
| 1082 | Mr. C. E. Olp suggested car replacer racks be provided in Batavia yard so that the replacers would be out of the way | Racks have been provided | | 1082 | |
| 1083 | Mr. C. E. Olp suggested guard be provided around a dwarf signal near station platform at Batavia to prevent passengers from running into same. | Not necessary | | 1083 | |
| 1090 | Mr. E. Lambert, October 28th, found board with upturned nails at east end of Belle Isle Yard | Nails were bent over so points were even with board | | 1090 | |
| 1091 | Mr. T. Leonard submitted report from Yardmaster C. T. Farrell, who on Aug. 10th observed upper deck door of car 60390 to be swinging | Inspectors put door back in place | | 1091 | |
| 1095 | Mr. T. Leonard submitted report from Yardmaster C. T. Farrell, who on Sept. 15th observed trespasser in a drunken condition attempting to board a westbound freight train, DeWitt Yard | Sent him from yard | | 1095 | |
| 1104 | Mr. T. Leonard submitted report from Yard Conductor S. R. Widrick, who on Aug. 27th found broken rail, track 5, Westbound fast freight yard | Repaired by section-men | | 1104 | |
| 1111 | Mr. T. Leonard submitted report from Yard Brakeman C. Abend who on Aug. 1st discovered drawhead between main track 4 and yard track 1, westbound class yard, DeWitt | Removed to place of safety | | 1111 | |
| 1112 | Mr. T. Leonard submitted report from Yard Brakeman A. B. Hill who Aug. 3rd discovered had door which would not clear other cars on adjacent tracks in class yard, DeWitt | Car cut out and repaired | | 1112 | |
| 1152 | Mr. J. Parker submitted report from Maintainer S. V. Doran, who reported guy wire from telegraph pole close to highway leading to freight house at Palmyra | Reported to supt. of telegraph for correction and report | | 1152 | |
| 1163 | Mr. J. Parker submitted report from Foreman C. W. McCulley, who on Sept. 25th observed two of Judd's expressmen shoving trunks from a truck, one just missing two young ladies, Syracuse Station | Taken up with Judd's Express Co. and their men instructed that trunks should be pulled off and not shoved off | | 1163 | |
| 1174 | Mr. J. T. Howley submitted report from Yardmaster Dooley, who on Sept. 15th found brake beam down on NYC 497289, being switched on ladder | Stopped engine and had brake rigging removed | | 1174 | |
| 1187 | Mr. J. T. Howley submitted report from Clerk Riley, who on Oct. 9th found large lump of coal lying between tracks 7 and 8 west end of Syracuse Yard | Removed same to switch cabin for fuel | | 1187 | |
| 1202 | Mr. C. D. Schaff suggested that a four inch post be erected in the center of the top entrance to subway stairs, middle platform, Syracuse passenger station, to prevent possibility of a baggage truck running down the stairway | Referred to division engineer who advised on Aug. 27th that post had been erected | | 1202 | |
| 1235 | Mr. A. M. Clough submitted report from Trainmaster C. E. Olp, that limbs of trees obstructed the view of flagman at the Town Line crossing west of Bergen | Trees have been trimmed | | 1235 | |
| 1236 | Mr. A. M. Clough submitted report from Trainmaster C. E. Olp, that the W. P. (factory) have at times barred a car out so that it fouled track 3 to enable them to unload sand into sand house | Requested them to make some other arrangements and never do this | | 1236 | |
| <p>Mr. Everett reported cautioning Western Union messenger several times about jumping on and off moving trains.</p> <p>Mr. Lambert reported cautioning Brakeman J. E. Ryan about crossing tracks at west end DeWitt yard, too close ahead of moving cars.</p> <p>Mr. T. Leonard submitted report from Yard Master P. J. Loughrey, who on Sept. 29 observed Yard Brakeman Rank step in front of a moving car to adjust knuckle, and cautioned him regarding same.</p> <p>Mr. G. J. Klump reported cautioning nine of his men working on the Lewiston branch regarding all unsafe practices in general.</p> <p>Yard Clerk Lincoln reported cautioning Yard Brakeman C. M. Carlisle about running in front of moving cars in order to open knuckle.</p> <p>Yard Master Howley reported cautioning two soldiers who were attempting to board a moving train on track 4.</p> <p>Mr. J. F. Robinson reported cautioning several children about crossing tracks at Station Lyons, on a short cut to school.</p> <p>Yard Master White at Batavia reports cautioning section foreman whom he observed to run across the tracks without looking to see if there was a train approaching.</p> <p>Mr. Clough reported cautioning Maintainer T. Doyle at Churchville about running motor cars too close together.</p> <p>Mr. C. E. Olp reported cautioning passenger on train No. 304 about placing hand under window when attempting to lower same.</p> <p>Mr. E. Alexander reports cautioning Doper Clyde Fressey about riding on side of cars going into coal trestle at DeWitt.</p> <p>Mr. C. F. Ray reported cautioning section men who were unloading car coal at DeWitt, carrying it in baskets on their backs across main track 4, where there is a sharp curve with a high bank; instructed them to put a flag out to guard them.</p> | | | | | |
| BOLL OF HONOR. | | | | | |
| <p>J. H. Mann, operator, Lyons, on November 2 reported fire flying from BD-6, engine 3868, passing that station, and had train stopped at Lyons Junction, where car with broken truck was found.</p> <p>F. A. Palmer, signalman, SS 18, Palmyra, on July 31 discovered brakes sticking on train 1st 45, passing that station, and stopped train at SS 20, where brakes were released.</p> | | | | | |
| <p>This record, it will be seen, embodies only subjects and results. The discussion may take anywhere from an hour to a half day or more and may be recorded in such degree of brevity, or fulness, as may be found desirable.</p> | | | | | |
| <p>FOR CONSIDERATION OF THE CHAIRMAN OF THE DIVISION SAFETY COMMITTEE At Chicago, Illinois. Station Milltown. Date May 10, 1918. Your attention is called to following practice or condition: Hole in freight house Platform; flooring worn and broken. Existing at (Give Exact Location) No. 1 Inbound house. Action taken or recommended repairs be made at once. Recommendation made: (Signed) C. C. Miller, Member Safety Committee If car or engines reported, always give initial and number.</p> | | | | | |
| <p>The current record, from day to day, of the doings of the safety department, between meetings, is embodied mainly in three forms; a card, form ST7, used by committee members to advise the chairman of the division committee of defects or wrong practices which the individual member himself cannot correct; another card, of which a sample (No. 4856) is shown below, to be used by the safety agent in advising of-</p> | | | | | |

ficers of work needing to be done, and, third, a daily report, to be sent to the headquarters at New York, by each of the division safety agents. A sample card of form ST7 shown on opposite page.

The form headed "Safety Work card" is made in duplicate, the duplicate being sent to the general safety agent at New York; and he, if a response is not in due time received from the superintendent or other officer who has the matter in hand, sends an inquiry to that officer to see what is the cause of the delay.

SAFETY WORK CARD

N. 4856

Baltimore, April 30, 1918.

Mr. N. Emerson, Agent

Dear Sir: Have today made inspection of Track 1 to Bridge Ave. Plant, Delaware Ave. and recommend the following work be done:

Our varies over track are about 18 ft. 5 in. above rail. Should be not less than 21 ft. This does not clear man on top of box car. Danger poles should be put in to be used to determine until tracks are raised.

C. J. Heller, Safety Agent

[Response]

The above work was completed on May 15, 1918, as recommended.

N. Emerson

This card must be signed by proper office and forwarded in sealed envelope to the General Safety Agent as soon as work is completed.

The report, given below, signed J. A. Daley, is that of the safety agent of the Middle division of the Michigan Central for May 15. It contains seven items, three of which are here omitted because of lack of space.

Sample or *subset* *Actual* *True* *Kaiser et*

Mr. MARCUS A. DOW,
General Safety Agent

Date May 15, 1918.

| Place | Item | Reflected to | Remarks |
|-----------|---|--------------------|---|
| Dowagiac | Ex. truck at station not blocked and left dangerously close to main tracks. | Package man | Baggageman left it just for minute, but said it was not habit |
| Lawton | 20 ft. iron pipe that serves as flag staff fastened to railing post at freight house by rope twine. | Water man | Arranged to have it wired securely |
| Kalamazoo | Top step broken and half board missing on freight house steps, east end. | Work crew No. 2741 | |
| " | Interviewed Mr. Shakespear, owner of tree menacing main tracks at Betsford Yd. and secured permission to have same cut down by next | | |

Number of employees talked to individually regarding safe practices:

| | | | |
|------------|-------|------------|-----|
| Enginemen | ... 1 | Trackmen | ... |
| Firemen | ... 1 | Stationmen | ... |
| Conductors | ... 3 | Shoemen | ... |
| Brakemen | ... 4 | Others | ... |
| Switchmen | ... 1 | Crossing | ... |

How many specific improper practices did you see and talk to a supervisor?

How many improper citations did you see and how many for correction?

Gave a little safety talk to jury at 8 o'clock then went to the starting with motor car from North to South and explained the different kinds of accidents that can occur and the responsibility with regard to handling car in approaching street car.

J. A. Levy

The personal work done by the division safety agents, as indicated by their daily reports, is summarized at the general office each month in a statement showing, for each agent, the number of men in each class who have been spoken to, and the number of specific remedial measures taken. A sample of this report for the month of May is shown in the double column table.

Another interesting monthly statement is that showing

what has been done by each of the two motion picture cars, and its location on each day of the month.

That for the month of March is as follow

| LOCATION OF MOTION PICTURE CASE | | | DATE WIT. | | |

The differences in the number of persons in attendance is due to various conditions, as for example how many times in one day an audience can be gathered, and also how many employees are within walking distance at a given location. The report for March shows that from the first until the fifth inclusive, the car on the lines east was in charge of C. D. Schaff; from the sixth to the twenty-ninth, in charge of C. J. Weber. The car on the lines west was in charge of C. W. Hammond, from the second to the seventeenth, and of J. P. Tinley from the eighteenth to the twenty-sixth.

The number of employees killed and injured on the New York Central, including employees not on duty is shown in a statement which is made up every three months on form STO. This form, for the New York Central Lines East of Buffalo, has columns for 14 divisions, including the Marine division, and six other columns for the shops, the large shops being treated, so far as this department is concerned, as independent of the divisions. This report is too large for reproduction in this place, but the reader will be interested in the classification of causes of personal injury. Every statistician having to do with accident records has his own ideas as to the character of this classification, and the extent to which it should go into detail, and whether or not this New York Central classification should be recommended for universal use is a question which need not be considered at this time; but the whole list of causes is reproduced because it is the result of several years of experience. It has recently been revised in some particulars. One class, No. 10, of injuries includes all accidents of this kind, regardless of cause, but under every other head the descriptive research is intended to touch only the cause of the accident. To the clerks using the report, the likelihood of arrangement is a fatal convention.

- 20 Eye injuries.
- 21 Falling from engines or cars, moving (not due to defects).
- 22 Falling from engines or cars, standing (not due to defects).
- 23 Falling from scaffolding.
 - (a) Due to breakage or giving away.
 - (b) Due to other causes.
- 24 Falling from ladders.
 - (a) Due to ladder slipping.
 - (b) " " breakage.
 - (c) " " other causes.
- 25 Falling over scrap iron, air hose, couplers, and other removable obstructions.
- 26 Falling over rails, ties, signal wires and other permanent appurtenances.
- 27 Falling into engine pits, etc.
- 28 Getting on or off engines or cars moving.
- 29 Getting on or off engines or cars standing.
- 30 Gang planks, shipping or giving way.
- 31 Hand, motor, push cars or velocipedes.
 - (a) Colliding.
 - (b) Derailed.
 - (c) Struck by train or engine.
 - (d) Other causes.
- 32 Handling reverse levers.

 - (f) Other causes.
- 38 Parting of trains.
- 39 Rough handling of trains.
- 40 Ropes, cables or chains slipping or giving way.
- 41 Shaker bar slipping off lug.
- 42 Stepping on nails.
- 43 Struck by engines or cars.
- 44 Struck by engines or cars on adjoining track.
- 45 Struck by permanent side obstruction.
- 46 Struck by overhead obstruction.
- 47 Struck by piece of exploded torpedo.
- 48 Struck by coal falling from engine tanks or cars.
- 49 Struck by objects thrown from cars, engines, platforms, etc.
- 50 Struck by tools or other objects falling from shelves, scaffolding, platforms, etc.
- 51 Squirt hose pulling off, bursting or cock opening.
- 52 Slipping on apron of engine (except falling off).
- 53 Slipping on snow or ice on or between tracks.
- 54 Slipping on snow or ice on cars (except falling off).
- 55 Slipping on snow or ice at other places.
- 56 Slipping from other causes.
- 57 Throwing switches (not struck by engines or cars).
- 58 Tools, use of:
 - (a) Struck by tools in hands of other persons.
 - (b) Self inflicted injury not due to defects.
 - (c) Defective hand tools.
 - (d) Use of jacks (not defective).
 - (e) Defective jacks.
 - (f) Use of air hammers, drills, etc.
- 59 Working under or around cars or engines without protection.
- 60 Working under or around cars or engines with protection.
- 61 Not otherwise specified.

Besides the classification according to causes, this statement gives the total number of accidents under each of six classes of service, namely: 1, road service; 2, yard service; 3,

lectures to gatherings of employees and to individuals. To record and make simple the lessons of accidents or of blunders on one part of the road for the benefit of employees on other parts is a necessary part of the management of any railroad. A sample circular, that issued by Mr. Dow for the month of October last, contains seven paragraphs concerning accidents which have recently happened on the New York Central Lines, a sample paragraph being as follows:

A baggageman was standing in the open doorway of a baggage car of a moving train with his head against the door jamb. The air brake was applied suddenly and the door slammed shut, catching his head and fracturing his skull. This was a very unsafe place for the employee to stand and it should have been apparent to him.

Notes of this kind are already familiar to railroad men and need no further elaboration. A monthly compilation of this kind is valuable in proportion to the measure in which it enables the lecturer to bring his lessons up to the minute, and to give them local color.

These monthly circulars are sent not only to the safety supervisors, but also to the chairmen of committees. These chairmen number 60, the number of committees being larger than the number of railroad divisions because of the existence of separate independent committees for the large shops and also of sub-committees on some of the large divisions.

One of the important elements of interest in the divisional committee meetings is the reading of short essays by individual members of the committee, particularly by those classed as employees as distinguished from officers; employees who have a store of experience, but who have not had much experience in writing or speaking. This arrangement, drawing out the capabilities of these men, often proves peculiarly profitable, not only to the man himself but to the whole committee. To stimulate activity in this direction the general safety agent sends out, each month to the division chairmen,

PART OF A MONTHLY SUMMARY OF SAFETY AGENTS' DAILY REPORTS (MAY, 1918).
NUMBER OF EMPLOYEES TALKED TO INDIVIDUALLY REGARDING SAFE PRACTICES.

Total Attendance 5,065

shopmen; 4, trackmen; 5, station men, including freight handlers; 6, others.

The reader now has some idea of the machinery by which the safety department is run; but (it is scarcely necessary to say) no machine, not even such a human machine as this one, can take the place of an energizing mind; and Mr. Dow does not rest his reputation for efficiency on any organization, howsoever smoothly it may work. "Safety-first" makes its appeal to the individual's conscience and civic pride and to his devotion to humanity, as well as to the ordinary motive of good discipline and efficiency; and cold formalism must be got rid of as completely as possible. To this end the headquarters office is constantly engaged in gathering and putting into proper shape all available lessons of accidents everywhere, for use by the division safety agents in their

a topic on which the chairman, acquainted with his committeemen, gets one member to write. Thus, after another month the general safety agent has 60 essays, all on the same subject.

REPORT ON AUSTRALIAN RAILWAYS.—P. A. Anthony, general manager and chief engineer of the Federated Malay States Railways, has been appointed to make a report on the railways of South Australia.—*The Engineer, London.*

THE GREAT WESTERN OF ENGLAND has completed the construction of another ambulance train for use on the continent, and when it was recently put on view to the public at Paddington station, a charge of 1s. (\$24) was made, the money being devoted to charitable purposes.

St. Louis Committee Excels in Entertaining Troops

Car Service Committee With Assistance of Y. M. C. A. and Patriotic Citizens Does Great Work

PROVIDING OVER 182,000 soldiers and sailors with comforts and entertainment in the course of one year constitutes an enviable record which is rendered more remarkable by the fact that these services were performed free of charge by patriotic railroad officers and citizens in co-operation with the Y. M. C. A. The organization which accomplished this is the Soldiers' and Sailors' Welfare Committee of the St. Louis committee of the Car Service Section. This body was created at the first meeting of the St. Louis car service committee in the spring of 1917 and consists of Rubens Humphrey, chairman, who is also executive secretary of the St. Louis Railroad Y. M. C. A., T. K. Knight, S. S. Huffman, P. W. Conley and A. S. Johnson. From the first the committee's great opportunity for service was recognized and very soon an auxiliary committee was formed principally for the purpose of meeting all troop trains passing through the St. Louis gate-way. The members of this sub-committee were drawn from representative bodies of men and women in the city who had been active in patriotic, civic and philanthropic work. By October 1, 1917, fully 100 men and women were giving their time and enthusiastic effort to the work of the auxiliary committee.

What has been, and is being, done by the Soldiers' and Sailors' Welfare Committee includes many activities, all co-ordinated to secure the best results. For example, carefully selected groups of ladies and gentlemen, all of whom are volunteer workers, meet troop trains in the yards and serve the soldiers and sailors with tobacco, candy, fruit, magazines, papers, souvenir post cards and other comforts. Often troops are permitted to leave their trains for several hours or half a day and at such times the Railroad Young Men's Christian Association opens its doors to the men and permits them to use the swimming pool, billiard tables, bowling alleys, reading rooms, library and other available means

of entertainment, without cost. Free writing material is provided and oftentimes the stamps for letters. The Y. M. C. A. restaurant is available to the men and, if any happen to be without funds, as is sometimes the case, no charges are made. In addition, free sleeping accommodations are provided for those who may have to stay in the city over night.

One of the first steps taken by the Soldiers' Welfare Committee was the establishment of an information bureau on the second floor of the St. Louis union station, which is operated by a sub-committee composed of 60 ladies, most of whom are the wives of railroad officers. At this bureau telegrams are sent for the men, relatives found, free writing material provided, magazines distributed, the sick taken care of, and such other assistance rendered as is possible. An important part of the work at Union Station is meeting recruits from all the central district states bound for Jefferson Barracks. These "new" men are given free baths, free beds and frequently free meals until they proceed to the barracks. During the month of December and January when the weather was unusually severe, the committee housed, fed and entertained over 1,000 men in relays of 200 without one serious case of illness.

Committee Builds Huts to Accommodate Men

The work of the Soldiers' and Sailors' Welfare Committee had not been under way long before it was found that the accommodations for the men at the railroad Y. M. C. A. building were taxed to such an extent that railroad members were being denied their privileges. Accordingly, a Y. M. C. A. hut was constructed in front of the Railroad Association building. This structure was erected in the middle of December, 1917, in the short space of 24 hours. The hut, shown in the photograph, is of frame construction, 20 ft. by 120 ft., lighted by electricity and heated by steam.

It did not take long, however, to discover that additional facilities were needed and as a consequence a permanent brick structure, 40 ft. by 140 ft., was built. This hut contains an auditorium seating 800, with a stage and all necessary equipment, including dressing rooms, and is used at night for sleeping purposes. Cots and blankets supplied by the government provide accommodations in this hall for at least 300 men. Canteen service for visiting soldiers and sailors is also provided in this building. Entertainments are staged in the auditorium practically every evening. Dramas, comedies, musicals, patriotic and religious addresses, folk dancing and boxing are among the entertainments provided.

In addition to the entertainment provided there, the city as a whole has extended its hospitality to the men. Through the courtesy of the baseball clubs of St. Louis, several hundred soldiers and sailors have been able to attend big league games without charge. Through the kindness of public spirited citizens of St. Louis several hundred boys have had the privilege of seeing the city by automobile. The welfare committee has also looked after the needs of men who have been rejected for army service. Many of these have been sheltered in the hut and in some cases provided with positions.

The welfare committee's record for the month of May, which is not included in the statistics for its first year's work previously alluded to, is noteworthy. During that time its members met 203 trains, served 59,269 men on trains, 23,198 in the huts and 3,921 at the booth in the station, making a total of 86,388 men served; of this number, 2,507 were provided with sleeping accommodations in the huts, 11,832 with baths and 16 with medical aid. Nearly 17,000 were fed in the canteen at the brick hut and 700 additional were fed in the Railroad Y. M. C. A. building. Approximately 11,000 attended social, educational and religious meetings, while 43,328 letters were mailed through the committee, of which 2,767 were provided with postage by the Y. M. C. A. In addition, positions were secured for 15 rejected men.

Freight Operations for March

THE BUREAU OF RAILWAY ECONOMICS has issued the following report showing the comparative freight operations of the railways for the month of March and the three months of the calendar year, compiled for the American Railway Association.

Some Big Fellows for the French 380's at a Munitions Station

Handling Bulk Cement With a Clamshell

DURING 1917 transportation difficulties caused the cement manufacturers to use gondola cars for the shipment of their product both in bags and in bulk. The lading was protected against the weather by tarpaulins and no appreciable difficulties were experienced by this innovation; in fact, in the case of bulk cement, some material advantages were obtained. Until necessity had demonstrated otherwise, all plans for the use of bulk cement were based on the assumption that the need of adequate protection against rain precluded the use of anything but a closed car. As a result of this the cement of necessity was unloaded either by hand or with a power shovel of the type used for unloading grain at elevators, and when cement was being supplied to concrete mixers mounted on cars as has frequently been the case with concrete work on railroads in cities, it was necessary to suspend the platforms from the sides of the cars so that the cement could be wheeled from the side doors of the cement car to the mixer on an adjacent car.

With a demonstration of the practicability of the use of the open top car in this service, the unloading problem was greatly simplified. If done by hand the gondola car can be equipped with runways like those used on the tops of sand and stone cars, but of greater significance is the possibility

lowered the sand and stone through the hopper into the mixer.

Just beyond the end of the mixing plant car were cars containing the concrete materials, the cement car being nearest the mixer with the other cars beyond. Materials in these cars were transferred to the hoppers over the concrete mixer by means of a clamshell bucket operated by a locomotive crane which ran on a track alongside that on which the mixer and material cars were standing.

It has been found that the cement car can be cleaned out thoroughly by the man who passes the signals for the dropping of the clamshell into the material cars and as a result there is very little loss of cement. Careful observations have shown that the loss with cement handled in this manner is less than in the case of sack cement. The tarpaulin which is used to cover the cement is rolled back over the temporary frame work which is built on the cars to support it, so that only a portion of the contents of the car is exposed to the weather at one time.

DUTCH SCRUTINIZE TRAINS.—According to press despatches a semi-official communication has been issued by the Netherlands government in reply to the expression of fear by the British that the control over railroad traffic through the Province of Limberg was inadequate. It says that the trains are submitted to two examinations upon their entry into Holland. The arrangement of the Netherlands gov-

Unloading Bulk Cement With a Clamshell

of using the clamshell bucket which is so widely used in handling the fine and coarse aggregates for concrete work.

A good example of what has been accomplished along this line is illustrated in the photograph which shows one form of car-mounted mixing plant which was used for the construction of an ore trough at the Illinois Steel Company's Bay View plant at Milwaukee, Wis. The concrete was mixed by a one-yard mixer mounted on a flat car which also supported the bins, hopper and belt which held and carried the raw materials. Above the inclined belt there were separate bins for the sand, stone and cement. The sand and stone dropped on the belt and were conveyed into a measuring hopper immediately alongside the mixer. The cement was shoveled by hand into a measuring box directly above the hopper, and when ready the bottom of the box, which was made of a removable steel plate, was pulled out and the cement fol-

lowed to fall into the mixer. The sand and stone dropped on the belt and were conveyed into a measuring hopper immediately alongside the mixer. The cement was shoveled by hand into a measuring box directly above the hopper, and when ready the bottom of the box, which was made of a removable steel plate, was pulled out and the cement fol-

THE KATANGA RAILWAY, IN BELGIAN CONGO was completed on May 22, thus setting up through communication by rail from Capetown to Bukama on the Congo River, and by rail and navigable waters as far as Boma and the mouth of the Congo. This great work, which may be considered as a section of the line from the Cape to Cairo, has been accomplished under very difficult circumstances owing to the war. The British railway from Buluwayo reached the frontier of the Congo in 1909. Thence it was prolonged under Belgian control, first to Elisabethville (1910), and then to Kambove (1913). Construction, interrupted for a time at the outbreak of the war, was taken up with energy, and has just been brought to a successful ending.

General News Department

D. I. Forsythe, assistant chairman of the Chicago Committee of the Car Service Section, United States Railroad Administration, has been appointed acting chairman to succeed A. M. Schoyer, resigned.

The Palatine, Lake Zurich & Wauconda has filed application with the Illinois State Public Utilities Commission for permission to discontinue operation. The road extends between Palatine, Ill., and Wauconda, 15 miles.

The presidential and diplomatic suite of rooms at the Union Station in Washington, formerly used exclusively for State purposes, has been converted into a canteen station for soldiers, sailors, and marines in transit, and will be in charge of the American Red Cross.

The movement of freight over the main line of the Pennsylvania Railroad now exceeds all former records. At Columbia, Pa., the average daily movement of cars, eastbound and westbound, for the first fifteen days of June, was 8,462. The best previous monthly record was that of May, which was 8,066 cars a day.

The United States Employment Service has established a division of engineering with A. H. Krom, secretary of the American Association of Engineers, Chicago, as director. Opportunity will be given technical men to register for emergency government work or for permanent advancement in positions meeting their qualifications. The office is at 29 South La Salle street, Chicago.

The Federal Employment Bureau at Altoona, Pa., is operated in connection with the employment department of the State of Pennsylvania, and considerable numbers of applications are received. On June 21, seven men were provided with railroad employment. At the same time the Pennsylvania Railroad Company notified the bureau that it would like to hire 2,519 men (or women). Places are waiting on that road in all departments.

The Northwestern Pacific was indicted by a federal grand jury at San Francisco, Cal., on June 18, on a charge of destroying and failing to keep permanent records of its history and operations as required by the Interstate Commerce Commission. The action against the road is the result of the disappearance of papers and documents deemed essential to an accurate valuation of the company's property by the commission.

The Western Regional Purchasing Committee has advised the roads in that area of a considerable amount of new and second hand material available for use by other roads. This material includes 24,400 new and second hand rail braces, a second-hand air compressor, a locomotive type boiler 61 miles of 60-lb., 70-lb. and 80-lb. A. S. C. T. rail complete with turnouts and fastenings, two 50-ton locomotives, second cars and a large number of through, deck truss and girder bridge spans.

Maximum prices for anthracite coal at Lake Superior and Lake Michigan docks have been announced by the Fuel Administration. The prices are higher than those of last winter, due to the increase in freight rates and the increased cost of handling at the docks. No advantage will result to producers, as the mine prices for coal going to the Great Lakes will be the same as the mine prices for the rest of the tonnage. The order affects only shipments made from the docks on and after June 25.

The train despatchers are not satisfied with the increases in pay awarded them by Mr. McAdams' general order No. 27, and many communications on their behalf have been received by the Board of Wages and Working Conditions, asking for further consideration and readjustment. A committee of despatchers called on the Board last week but were put off until later.

came the Board was well pleased with the work of the despatchers, in the hope of making a reconsideration this week. The despatchers will be given a hearing later.

Prices of iron, as fixed in the agreement made by the price fixing committee of the War Industries Board, and the representatives of the iron ore, pig iron and steel interests have been approved by President Wilson. The maximum prices now prevailing on ore, pig iron and iron and steel products are to be continued in effect for three months ending September 30, but the base price of Lake Superior iron ore delivered to lower lake ports are increased 45 cents a gross ton, effective July 1, in amount of the increase in freight rates.

At Cumberland, Md., one day last week 21 lawyers performed a great service for local business men by unloading a lot of freight at the freight house of the Baltimore & Ohio, relieving a troublesome congestion which had been caused by the impossibility of securing help. Crowded out of enterprise reporters as well as enterprising lawyers, that accident having made for one of them about a million of copy, which was well spread with names and personal addresses. The lawyers unloaded a carload of tar, a car of mixed merchandise and other things, and received each 24 cents an hour.

Purchase of the Virginian Railway, by the government, is proposed in a bill introduced in Congress on July 21 by Senator James Hamilton Lewis of Illinois. The Virginian runs from the coal fields of West Virginia to the water at Norfolk, and the Senator's proposal includes 125,000 acres at West Virginia coal lands. The total proposed expenditure is \$115,000,000. Mr. Lewis bases his proposal upon the necessity of insuring an adequate supply of coal for the navy, and he says also that such a purchase would afford the means to make a test, on a small scale, of government railroad ownership.

H. A. Garfield, United States Fuel Administrator, has issued a statement saying that no suppression has arisen in certain quarters as to the meaning of the word "government price," as used in the announcement of the recent increase in the price of railroad coal. It is stated that the government prices for coal are maximum prices, and that it follows as a matter of course that any consumer, including the railroads, may buy for less, provided it is mutually agreeable, but that the preferred war supply has been threatened and will not be in consideration in the contract or understanding.

The Chicago sub-committee of the Federal Coal Inquiry Committee has been established and its plan of operation announced for eastern lines. It has been directed at Chicago, with George H. Ingham, vice-president of the New York Central, as chairman. Mr. Ingham has named a sub-committee to assist him, consisting of S. K. Rice, general agent of the New York, Chicago & St. Louis; Herman D. F. Forthe, secretary of the Brotherhood of Locomotive Engineers; and W. J. Schuch, general superintendent at the New York Central Lines; W. B. G. G. superintendent of the Michigan Central; H. F. Whittenberger, general manager of the Grand Trunk; and W. H. Scribner, general agent and superintendent of the Pennsylvania.

Examiners of Accounts (Male), for service under the Interstate Commerce Commission, are called for by the United States Civil Service Commission. They are examined in the Bureau of Valuation and in the Bureau of Commerce Accounts. First general grades of candidates will be available from this examination, the salaries in the first grade being from \$2,200 to \$3,000, and in the second grade from \$1,900 to \$2,700. Approximately 100 positions will be principally

for duty in the field, but some appointments may be made for duty in Washington. It is desired to secure eligibles of large experience, and a register of eligibles will be established for each of the following branches of accounting:

(1) Steam railroads. (a) General accounts. (b) Disbursement accounts. (c) Construction accounts in engineering department. (d) Accounting and statistical work in valuation departments. (e) Freight accounts. (2) Electric railroads. (3) Steamship service. (4) Other common-carrier service (including pipe-line, sleeping-car, and telephone and telegraph service.) (5) Public accounting practice (as a certified public accountant or in the office of a certified public accountant.) Applicants should indicate the grade for which they desire to be examined; and they must not have reached their forty-eighth birthday.

The sundry civil appropriation bill was passed by the Senate on June 24. It carries an appropriation of \$3,500,000 for continuing the valuation work of the Interstate Commerce Commission and one of \$5,250,000 for the Alaska Railroad. The bill had been passed by the House. The Senate added an amendment making the unexpended balance of the appropriation of \$20,000 for the Joint Committee on Interstate Commerce (the Newlands Committee), available until expended. The committee discontinued its work when the government took over the railroads, but has the balance of the year in which to submit a report. Another amendment increased the appropriation for the safety appliance and accident work of the Interstate Commerce Commission from \$250,000 to \$313,000.

Accident Record—Correction

In the derailment of the "Dixie Flyer" on the Nashville, Chattanooga & St. Louis at Vinings, Ga., April 18, the fireman was injured, slightly; he was not fatally scalded, as was stated in our report printed on June 14.

Bureau of Railway Economics to Be Continued

The Bureau of Railway Economics, whose expenses, under an order of the Railroad Administration, may not be charged to the operating accounts of the railroads after June 30, is to be maintained by the railroad corporations, at least until the end of the calendar year. This was recently decided by the executive committee after a great majority of the roads subscribing to the bureau had agreed to continue their regular contributions. The extensive railway library of the bureau has been taken over by the Railroad Administration, but, for the present at least, is to be retained at the offices of the bureau.

Railroads have been authorized by the Railroad Administration to continue to contribute to the maintenance of the American Museum of Safety, New York City.

The Supreme Court's Respect for State Courts

A verdict awarding \$25,000 damages to a boy of seven years, whose foot was cut off by a freight car moving on a side track, was one of the scraps of court news published in the New York papers about a year ago. The sum awarded looked very large, especially as it seemed plain, from the facts as published, that the accident (on the Erie Railroad in New Jersey) was due to the child's own fault. He was playing marbles and put his foot across the rail under the car in an endeavor to recover a lost marble. The United States Circuit Court of Appeals sustained the verdict, holding that the New Jersey law, making any person in such a case guilty of contributory negligence, should not apply to infants, though a New Jersey State court had said that it should. The Supreme Court of the United States on May 20, last, in a decision delivered by Justice Holmes, disapproved this view and reversed the judgment. Apparently it remains true, still, in New Jersey, that but for the specific statutory prohibition, a railroad could be mulcted in \$25,000 for allowing such an accident to happen on its premises! There was some argument on the claim that the plaintiff had been invited on the tracks, but Justice Holmes says that it is not a question of the susceptibility of the boy to the temptation to play on or around the cars;

rather he was impelled simply by the wish to recover his marble. Two justices of the United States Supreme Court dissented from the majority view because the New Jersey State Court, whose opinion had been respected, was not the highest court of the state.

Unused Rails at Vancouver

The Canadian government (Department of Railways and Canals) is negotiating with representatives of the Russian government in the United States for the purchase of rails (150 miles) lying on the Vancouver docks. These rails have been rusting there since the collapse of the Russian Empire. Negotiations, however, are slow and unsatisfactory. The Russian government is in such a chaotic condition that the Canadian authorities are never certain with whom they are dealing. The rails are light weight but in view of the present shortage it is felt that it will be possible to utilize them. In addition to the rails, there are said to be no less than 4,000 cars for Russia stored at the Pacific coast. The cars, unfortunately, cannot be used on Canadian lines.

The Train Despatchers' Association

The annual convention of the Train Despatchers' Association of America, scheduled to be held at Grand Rapids, Mich., on June 18, failed of a quorum (25 members), owing chiefly to the inability of members to be spared from their duties. The only member of the executive committee present was the secretary-treasurer-editor, J. F. Mackie. The annual report to the executive committee by the secretary-treasurer announced that the receipts for the year were \$2,431, and the expenditures \$3,483, leaving a deficit of \$1,052, which, added to that of the previous year makes a total deficit of \$1,658, which the Association owes wholly to Mr. Mackie. The membership list indicated a total membership of 635, a falling off of 314 from the previous year.

In the absence of a quorum, the meeting organized itself into an adjustment committee and made the following recommendations to the executive committee, which has power to fill all vacancies and holds over until its successors have been duly elected and qualified: The election of E. W. Weston, chief despatcher of the Northern Pacific at Livingston, Mont., as president, in place of F. N. McPhee, resigned; the election of J. P. Finan, despatcher of the Atchison, Topeka & Santa Fe, Needles, Cal., as secretary-treasurer and editor, to succeed J. F. Mackie, resigned, and the election of F. I. Felter, chief despatcher of the New York Central lines, electric division, Grand Central terminal, New York City, as member of the executive committee in place of C. C. Barnard, resigned; the continuance of the publication of the Train Despatchers' Bulletin reduced in size; the inauguration of a vigorous campaign for members among train despatchers in sympathy with the present principles of the Association, under which train despatchers are regarded as division staff officers bound to render supreme loyalty to the service and not to any protective organization. The meeting pledged loyalty to these principles and active support of them. There was no meeting of the train rules committee during the year, and consequently no report.

J. P. Finan, F. I. Felter and F. H. Hadley expressed their willingness to wait unofficially upon the Director-General in order to protest against the apparent discrimination against unorganized employees, more particularly train despatchers, in the latest award of the wage adjustment commission, which gives train service employees percentage increases based on present pay instead of that of December, 1915. Accordingly, a conference with C. A. Prouty, director of the division of public service and accounts, was arranged for June 22.

Railway Financial Officers

L. W. Cox, secretary of the Society of Railway Financial Officers, announces that the executive committee has decided that the holding of the annual meeting for this year shall be deferred until further action; and that the monthly bulletin of the society be discontinued for the present. Bulletins may be issued from time to time, with the approval of the executive committee.

Commission and Court News

State Commissions

The Public Service Commission of Massachusetts, in accordance with a recent act of the legislature, has been reorganized, and consists now of three members instead of five as formerly. The new commission, as designated by the governor on June 22, consists of F. J. Macleod, Joseph B. Eastman, and Everett E. Stone. All were members of the old commission.

At a conference with shippers held at their request at Chicago on June 24, the State Public Utilities Commission of Illinois, refused to take any action with reference to Order No. 28 of the Director-General, advancing freight rates 25 per cent, which went into effect on June 25. Shippers said that the increased rates would work great hardship in connection with contracts made before the freight advance was announced and which include no provision for shipments at advanced rates. The utilities commission advised those who had grievances to get in touch with the Director-General and request him to authorize state commissions to hear such cases and make recommendations to him at Washington.

The Public Service Commission of Maryland has refused to allow, without the usual 30 days' notice, increases of fare proposed by the Washington, Baltimore & Annapolis electric railway, and the Baltimore & Annapolis Short Line. These roads wished to increase their local fares to three cents a mile, with corresponding increases in season tickets, and their application is understood to have been approved by the United States Railroad Administration, operating competing steam railroads. The Public Service Commission found, however, that for the first four months of this year, the first-named road had gross revenues of \$744,074 as against \$314,988 in the same period of 1917; while the Short Line had gross revenues of \$142,060, almost double the receipts for the first four months of 1917. The carriers will probably now renew their applications, with the thirty-day proviso, and the commission is expected to make a further study of the tariffs.

Court News

Intervening Cause of Injury

The South Carolina Supreme Court holds that, in an action for personal injuries under the federal act by a station master who was assaulted by a robber at night while engaged in interstate commerce, the proximate cause of the injury was the act of the robber, and not the defendant railroad company's failure to maintain sufficient lights about the station. When the negligence alleged appears merely to have brought about a condition or situation under which another and entirely independent and efficient agency intervenes to cause the injury, the latter is the proximate cause and the former the remote cause.—*Carter v. Atlantic Coast Line (S. Car.)*, 95 S. E., 357. Decided February 19, 1918.

Injuries to Passenger Stepping Off Car

A passenger stepping off a car upon a stepping box placed by trainmen on the platform was injured by the box slipping from under his feet. In an action against the railroad it was not claimed that the stepping box was defective, that the passenger was not given ample time to alight, that the place or the manner in which the box was placed was careless, improper, or negligent, and all the testimony confirmed the railroad's claim that the box was level and firm and did not move prior to the passenger's stepping upon it. The New York Court of Appeals holds that the rule of *res ipsa loquitur* did not apply against the railroad, and that the evidence was insufficient to show any negligence on its part. *Beltz v. B. R. & P. (N. Y.)*, 119 N. E., 81. Decided February 12, 1918.

Equipment and Supplies

Car and Locomotive Specialties

The Central Advisory Purchasing Committee of the Railroad Administration has practically completed the ordering of the specialties for the government's order for cars and locomotives. The following additional orders have been placed for the 100,000 freight cars:

Brakebeams:

- 14,250 American Steel Foundries.
- 14,250 Chicago Railway Equipment Company.
- 14,000 Joliet Railway Supply Company.
- 14,000 Davis Brakebeam Company.
- 14,000 Damascus Brake Beam Company.
- 14,000 Buffalo Brake Beam Company.
- 8,000 Haskell & Barker Car Company.
- 7,500 Pressed Steel Car Company.

Journal Boxes:

- 32,500 Union Spring & Manufacturing Company.
- 38,875 National Malleable Castings Company.
- 28,500 T. H. Symington Company.
- 16,125 Gould Coupler Company.
- 4,000 American Malleable Company.
- 8,000 Haskell & Barker Car Company.
- 2,000 Pacific Car & Foundry Company will secure on Pacific coast.

Steel ends for composite gondolas:

- 12,000 Standard Railway Equipment Company.
- 8,000 Chicago-Cleveland Car Roofing Company.

Side bearings:

- 40,000 A. Stucki Company.
- 30,000 E. S. Woods & Co.
- 30,000 Wine Railway Appliance Company.

The following additional specialties have been ordered for the locomotives:

Side bearings for tenders:

- All—A. Stucki Company.

Brake beams for tenders:

- All—Chicago Railway Equipment Company, except 170 to be furnished by the Baldwin Locomotive Works.

Freight Cars

THE LEHIGH & NEW ENGLAND is inquiring for one snow-plow.

THE WISCONSIN STEEL COMPANY is inquiring for one flat car.

THE TERMINAL RAILROAD ASSOCIATION OF ST. LOUIS is inquiring for one dump car.

BALFOUR, WILLIAMS & Co., New York, are inquiring for a number of 8,000-gal. tank cars.

THE GENERAL CHEMICAL COMPANY, New York, is inquiring for one 40-ton steel drop bottom, gondola car.

Machinery and Tools

THE NEW YORK CENTRAL LINES is inquiring through its purchasing department in Cleveland, Ohio, for the following list of machines for its various shops in the Central West: One combination grinder; one 42-in. heavy-duty planer; one 36 x 36-in., 12-ft. bed planer; five 24-in. high-duty shapers; one 1¼-in. drill press; two 104-in. boring and turning mills; one 42-in. boring mill; one punching machine with 12-in. throat, with capacity to drill 1-in. hole through 1-in. steel; one 30-in. power cold saw; one No. 3 rotary bevel shear; one 96-in. 500-ton hydraulic wheel press; one 24-in. slotter; two universal tool grinders; one 3½-ft. radial drill; one 24-in. x 12-ft. engine lathe; one 4-in. turret lathe; one 18-in. x 14-ft. engine lathe; one 30-in., 6-ft. 6-in. centers, engine lathe; one 26-in. x 10-ft. back geared engine lathe; one 18-in. x 8-ft. engine lathe; one 24-in. x 8-ft. engine lathe; one 3-in. x 36-in. turret lathe; one 18-in. x 8-ft. lathe; one 6,000-lb. steam hammer.

Supply Trade News

With a view to obtaining a closer coordination of the commercial and railroad services and sales, the **Air Reduction Sales Company**, after July 1, will handle its railroad sales through its own railroad department, instead of through the Franklin Railway Supply Company. Ellsworth L. Mills has been appointed sales manager of the railroad department and apparatus department, with headquarters at 120 Broadway, New York.

M. B. McBride has resigned as auditor of the Seattle, Port Angeles & Western and the Puget Sound & Willapa Harbor, subsidiaries of the Chicago, Milwaukee & St. Paul, to accept the position of general auditor of the Pacific Car & Foundry Company in Seattle. This company is enlarging its plants at Portland and Renton (Seattle) and has recently taken a contract to build 2,000 box cars for the United States Government. The works are now turning out, among other business, 15 new box cars a day for the Union Pacific.

Clarence R. Neher, consulting engineer, Buffalo, N. Y., died recently in that city. Mr. Neher had been engaged in engineering work since 1880, and at various times since was employed in an engineering capacity by a number of railroads, principally the Ohio & Western and the Richmond & Danville. In 1889, Mr. Neher was appointed division engineer on the Rochester division of the Western New York & Pennsylvania. Recently he was identified with the construction of a new trolley line of the International Railway between Buffalo and Niagara Falls, which has recently been put into operation.

W. S. Murrian, superintendent of motive power and equipment of the Southern Railway, resigned, effective May 1, to become president and general manager of the Southern Locomotive Valve Gear Company, Knoxville, Tenn. Mr. Murrian learned the trade of machinist and worked in that capacity for several years. He came from the Union Pacific 15 years ago to the position of master mechanic of the Southern Railway at Alexandria, and was later transferred to Spencer, N. C., in the same capacity. At that time the Southern Railway was building the largest locomotive shops on the system at Spencer. After about two years service at that point, Mr. Murrian was promoted, in 1906, to superintendent of motive power, with headquarters at Knoxville, Tenn. Mr. Murrian is personally interested in the specialties now being manufactured by the Southern Locomotive Valve Gear Company, and he is also thoroughly familiar with the efficiency of the commodities, the Southern Railway having adopted the Southern valve gear as its standard several years ago. Mr. Murrian succeeded General L. D. Tyson, now in active service in the United States Army, who had been president since the organization of the company until recently when he resigned.

Trade Publications

INSLEY PRODUCTS.—The Insley, Mfg. Company, Indianapolis, Ind., has issued a 100-page catalog descriptive of its power handling equipment. This publication opens with a general discussion of the gravity method of handling materials, including some cost data, followed by illustrations of various installations of this equipment on different classes of concrete construction projects. The back part of the catalog is devoted to descriptive illustrations and lists of the various types of equipment handled, including buckets, chutes, hopper cars and portable conveyors, etc.

WHEN YOU BUY WAR SAVINGS SEAMLESS you do not give money, you loan it at 4 per cent, repaid immediately. You help your Government, but you help yourself even more.

THE UNITED STATES FINANCE STEEL RAILS in the calendar year 1917 valued at \$23,500,000 and cars for railways at \$11,883,000, according to a bulletin of the National City Bank of New York.

Railway Construction

CHICAGO, MILWAUKEE & ST. PAUL.—This company has commenced the construction of a connection with the Chicago & North Western entering both lines in the Chicago yard and district, with a view to making the Greening yard available to the railroad lines. One connection is being made to the North line from Morrisville, Ill., just west of the Greening yard, and the other from Tebbin, just to the east of Morrisville, Ill. The contract for the grading of the Morrisville connection has been awarded to John M. Andrews, Chicago, and the grading on the Tebbin connection is being done by John Marcell, Inc., Chicago. Constructing some additional tracks at the Greening yard 44 miles of double track will be laid at a cost of about \$300,000. Track laying will be done by the company's own force.

The St. Paul has commenced grading for double track construction in Minnesota. Second track will be laid to connect up all the gaps in the present double track from St. Paul, Minn., to Aberdeen, S. D. The contract for the grading has been awarded to Morris & Dougherty, St. Paul, Minn., and track laying will be done by company forces.

The railroad is preparing to rebuild its bridge over the Missouri river at Clumberlain, S. D. A new pontoon, 266 ft. long, and two steel truss spans, each 300 ft. long, will be erected by company forces.

The St. Paul is rebuilding its engine house at Calmar, Iowa, which was recently destroyed by fire.

CHICAGO, ROCK ISLAND & PACIFIC.—This company is preparing to build three short stretches of second track in Missouri between Allerton and Trenton and two in Kansas between Topeka and Herinton.

CHOCTAW, NEWCASTLE & WESTERN.—This railway is being built from a connection with the Chicago, Rock Island & Pacific, at Alderson, Okla., to Coal Fields, six and one-half miles. C. M. Conway, of Texarkana, Ark., has the contract for the work, which was begun in March. About 75 per cent of the job has been completed. The principal commodity which will be carried will be coal, the annual tonnage of which is estimated at 500,000.

LEBAN, JOHET & EASTERN.—This company is asking for bids on a brick building, containing lockers, toilet rooms, dormitories, etc., for engineers and firemen, at Gary, Ind. It has also asked for bids on water softeners to be located at Frankfort, Ill., and Springfield, and reinforced concrete loading stations at South Chicago, Ill., and Gary, Ind.

KANSAS CITY & MOBILE.—The railroad has awarded a contract to the Austin Company, Cleveland, Ohio, for the construction of an industrial freight house, 40 ft. by 50 ft., with a canopy platform, 12 ft. by 60 ft., a two-story office building and basement, 144 ft. by 42 ft., and an industrial freight house, 32 ft. by 300 ft., at Chicago, Mo. Work on the structures will require about one month, by the end of May 17. The industrial freight house is to be completed within 50 days of the start work on the building, and the office building by May 28.

GOODYEAR TOWNSHIP.—This company is putting in approximately 60 miles of double track at various points on its main line this season.

HEATH AVENUE.—Work is now under way on a structure with concrete frame, a two-story structure located at Asheville. The structure is a 24-ft. wide section freight house, with a small section on one end, and is essentially for a large entering shop, with an end on the passenger side, passenger locomotive loading station, and the necessary trade fixtures.

THE LORING RAILROAD.—This company is preparing plans for three passenger and a freight depot at San Mateo, Cal.

YONK & GARY COMPANY.—This company has contracted with the Yonk Company, Cleveland, Ohio, for a section of double track, known as the West Conductor, Ohio road. The main structure is a one-story, 20-ft. wide freight house, with a small section on one end, and is essentially for a large entering shop, with an end on the passenger side, passenger locomotive loading station, and the necessary trade fixtures. The last contract is for approximately \$250,000 and must be completed in 60 working days.

ANNUAL REPORT

Seaboard Air Line Railway Company—Report of the Directors

FISCAL YEAR ENDED DECEMBER 31, 1917.

PORTSMOUTH, V.A., April 18th, 1918.

To the Stockholders of the Seaboard Air Line Railway Company:

The Board of Directors submits the following report of the operations of your properties for the year ended December 31, 1917:

INCOME ACCOUNT FOR YEAR ENDED DECEMBER 31, 1917, COMPARED WITH YEAR ENDED DECEMBER 31, 1916.

| | 1917 | 1916 | Increase |
|---|-----------------|-----------------|----------------|
| Gross Revenue | \$30,345,146.01 | \$26,184,487.25 | \$4,160,658.76 |
| Operating Expenses and Taxes | 23,097,430.89 | 18,743,598.01 | 4,354,832.88 |
| Net Operating Revenue (after Taxes) | 7,247,715.12 | 7,441,889.24 | 194,174.12† |
| Uncollectible Railway Revenue | 9,833.70 | 12,890.34 | 3,056.64† |
| Operating Income | 7,237,881.42 | 7,428,998.90 | 191,117.48† |
| Other Income | 391,375.25 | 460,431.79 | 69,056.54† |
| Gross Income | 7,629,256.67 | 7,889,430.69 | 260,174.02† |
| Rents and Other Charges | 261,430.75 | 210,135.81 | 51,294.94 |
| Hire of Equipment | 405,354.28 | 143,991.87 | 261,362.41 |
| Applicable to Interest | 6,962,471.64 | 7,535,303.01 | 572,831.37† |
| Fixed Interest Charges | 4,858,404.50 | 4,673,292.39 | 185,112.11 |
| Balance | 2,104,067.14 | 2,862,010.62 | 757,943.48† |
| Full 5% Interest on Adjustment (Income) Bonds | 1,250,000.00 | 1,250,000.00 | |
| Net Income | \$854,067.14 | \$1,612,010.62 | \$757,943.48† |

† Decrease.

The Gross Revenue increased 15.89 per cent., Operating Expenses increased 23.87 per cent., Taxes increased 14.01 per cent., Operating Expenses and Taxes increased 23.23 per cent.

The Operating Expenses, exclusive of Taxes, were 71.57 per cent. of the Gross Revenue, as compared with 66.96 per cent. the previous year; and including Taxes, 76.12 per cent. of Gross Revenue as compared with 71.58 per cent. for the preceding year.

In common with all other roads, this Company had to meet increased prices in labor and material, due to war conditions. The increase in the prices of these items added to Operating Expenses as follows:

| | |
|----------------|-------------|
| Labor | \$1,349,936 |
| Coal | 813,628 |
| Other material | 759,935 |

a total arbitrary increase of \$2,923,499. If this arbitrary amount be deducted from the Operating Expenses, they would have shown an increase of 7.20 per cent., instead of the 23.87 per cent., shown above, and the operating ratio, including Taxes, would have been 66.48 per cent., instead of the 76.12 per cent., as compared with 71.58 per cent., for the preceding year. These increases were anticipated and this Company, in common with other carriers, filed with the Interstate Commerce Commission early in the Spring a request for an increase of 15 per cent., in freight rates. The requested increase was denied by the Interstate Commerce Commission. The anticipations of the Company, however, as to the situation were realized, and only by the strictest economy was the property maintained at its former standard without further materially reducing the operating income.

On account of the conditions confronting the railroads of the country, the President took over this property with others by proclamation of December 28, 1917, and the details of the contract with the stockholders for the use of the property by the government are now being worked out.

FUNDED DEBT.

The \$688,000 First and Consolidated Mortgage, Series "A," Six Per Cent. Bonds sold during previous year and mentioned in last annual report were delivered on January 31, 1917.

\$364,000 First and Consolidated Mortgage, Series "A," Six Per Cent. Bonds were sold during the year. An issue of \$4,000,000 Two Year Six Per Cent. Secured Gold Notes, dated September 15, 1917, payable September 15, 1919, redeemable in whole or in part at the option of the Company at 100 per cent. of the face amount thereof and accrued interest at any time upon thirty days published notice, secured by the pledge of First and Consolidated Mortgage, Series "A," Six Per Cent. Bonds of the Company, were sold during the year for the purpose of providing for the acquisition of property, including the extension or improving its facilities or properties, improving or maintaining its service and for the discharging or lawful refunding of its obligations.

The \$55,000 outstanding Roanoke and Tar River Railroad Company First Mortgage Six Per Cent. Bonds maturing April 1, 1917, were refunded at maturity by the issue of First and Consolidated Mortgage, Series "A," Six Per Cent. Bonds, in accordance with the provisions of the First and Consolidated Mortgage. The holders of the Roanoke and Tar River Railroad Company First Mortgage Bonds were paid in cash and the First and Consolidated Mortgage Bonds received in this transaction were placed in the treasury of the Company.

EQUIPMENT.

Equipment shown in last annual report as having been undelivered on December 31, 1916, under Equipment agreement, Series "R," viz:

- 3 Mountain Type Passenger Locomotives.
- 2 Gas Electric Motor Cars.
- 50 Steel Under and Upper Frame Caboose Cars

were received during this fiscal year. An equipment agreement, Series "S," was entered into on December 1, 1917, for the purchase of:

- 16 Mallet Type Freight Locomotives.
- 10 Santa Fe Type Freight Locomotives.

Under said agreement the cash payment of \$604,340 was represented by a deferred certificate which was received into the treasury of the Company and will be pledged under its First and Consolidated Mortgage in accordance with the provisions thereof, and the remainder of the purchase price was represented by Equipment Trust obligations aggregating \$1,200,000,

bearing interest at the rate of 6% per annum, payable in twenty semi-annual installments of \$60,000, on the first day of June and the first day of December in each year, commencing June 1, 1918, and ending December 1, 1927. Of this equipment there was received during the year:

5 Mallet Type Freight Locomotives.

In addition to the equipment named above, the following were purchased and placed in service during the year:

- 1 Business Car.
- 2 Barges.
- 1 Steam Ditching Car.

MAINTENANCE OF WAY AND STRUCTURES.

ROADWAY, TRACK AND STRUCTURES.

Roadway, track and structures of the company have been properly maintained at a cost of \$3,215,505.46, which represents an expenditure per mile of \$28.98.

SIDE TRACKS.

38.45 miles of new sidings and extensions of existing sidings were constructed, and there were deducted by removal and changes of old sidings, 7.53 miles, making a net increase over previous year of 30.92 miles. There were also constructed 0.39 miles of new sidings on leased lines.

TIE RENEWALS.

The renewals were 1,241,697 cross ties and 751 sets of switch ties, and the cost, \$380,746.09 was charged to Operating Expenses.

RAIL.

100.10 miles of new 90-lb. steel rail were laid in the main line, releasing therefrom lighter worn rail. There was charged net to Operating Expenses therefor, \$147,529.95, and to Capital Account \$124,585.64.

In addition 32.08 miles of released 60, 70 and 75-lb. steel rail were laid on branch lines, releasing 68-lb. and lighter rail, and there was charged to Operating Expenses therefor, \$24,048.13, and to Capital Account \$28,373.87.

BALLAST.

91,765 cubic yards of gravel and slag ballast were put under main line track during the year, and of the total cost thereof, \$232,715.65 was charged to Capital Account.

TRESTLES FILLED.

2,722 lineal feet of wooden trestles were filled in during the year and of the total cost thereof, including culverts, \$8,038.60, was charged to Operating Expenses.

TRESTLES REBUILT AND BALLAST DECKED.

There were built during the year out of cresooted timber 1,970 lineal feet of ballast decked trestles, replacing old open decked trestles and in addition thereto 1,582 lineal feet of old wooden trestles were driven with cresooted piles and capped for ballast decking this year, and of the total cost thereof \$16,997.88 was charged to Operating Expenses and \$23,748.68 to Capital Account.

TRESTLES STRENGTHENED.

17 trestles were strengthened for heavy traffic by making them 4-ply chord, at a cost of \$6,587.97 charged to Capital Account.

BRIDGES.

Work has been done on seven bridges, replacing with steel, or strengthening them for heavier traffic.

Three of these bridges were authorized during the year and all of them have been completed. Of the bridges completed, the principal ones are the three bridges mentioned in last year's report as having been destroyed by the high water of July, 1916, and are as follows:

- Catawba River, near Mount Holly, N. C., three through truss spans, each 165 feet long, and one deck girder span 50 feet long.
- Catawba River, near Van Wyck, S. C., four through truss spans, each 147 feet long.
- Wateree River, near Camden, S. C., one through truss span 200 feet long.

MAINTENANCE OF EQUIPMENT.

The equipment of the Company was fully maintained during the year at a cost of \$5,105,472.29.

Included in the cost of maintenance is \$114,901.58, representing value of equipment destroyed or retired from service during the year and credited to Cost of Equipment.

There was also included in the Cost of Maintenance \$516,321.10 for depreciation, which was credited to Reserve for Accrued Depreciation.

The cost of maintenance per article owned was as follows:

| | |
|--|------------|
| Average cost per annum per Locomotive owned | \$3,626.77 |
| Average cost per annum per Passenger car owned | 1,095.31 |
| Average cost per annum per Freight car owned | 84.15 |

GENERAL REMARKS.

The extension from Charleston, S. C., to Savannah, Ga., mentioned in last year's report, has been completed, and will be put into operation January 1st, 1918, thus providing two separate and distinct main lines between Hamlet, N. C., and Savannah, Ga. Also, the grade revision work between Hamlet, N. C., and Charleston, S. C., previously mentioned, has been completed, and together with above extension, a through line has been obtained from Hamlet, N. C., to Jacksonville, Fla., via Charleston, with a maximum five-tenths percent. grade in both directions. The new portion of the line from Charleston to Savannah has a maximum three-tenths percent. grade line in both directions which, with the improvements realized from the grade revision between Hamlet and Charleston, will effect a large saving in the handling of traffic between Hamlet and Savannah, and will greatly increase the tonnage per train compared with the tonnage which can be handled via the present Columbia route.

The grade revision work on certain sections of the line between Sanford, N. C., and Hamlet, N. C., mentioned in report of last year, has been completed, thus eliminating two pusher grades and providing a five-tenths percent. grade against northbound traffic and an eight-tenths percent. grade against southbound traffic on these sections. Train operation has thereby been facilitated, hazard reduced, and a saving effected in operating cost.

During the year, a spur track, used and owned jointly by the Southern, Atlantic Coast Line and Seaboard Air Line, has been built to reach the National Army Cantonment located at Columbia, S. C. This spur, together with necessary connecting track, is about 3.64 miles long, and is reached

by the Atlantic Coast Line and South in through to the sea, and by the Seaboard Air Line over approximately 4.81 miles at the main line. The company's track, it connects with and serves the yards and tracks built by the government within the camp reservation. In addition to the main spur and connecting tracks in the above, tent yard tracks with a total capacity of approximately 175 cars, were built by the three railroads in order to provide adequate operating track facilities.

Two side tracks, having a total capacity of approximately 100 cars, have been constructed at Montgomery, Ala., to serve the National Guard Camp.

Construction is now in progress on several important industrial spur branching off the main line between Charleston, S. C., and Savannah, Ga. These spurs will reach fertile farm lands especially adapted to early vegetable culture, and will be a big factor in the industrial development along this line. A part of these spurs will be completed and put into operation early in the coming year and others will be completed later in the year.

All of this work will readily lend itself to plans for further future extensions and developments.

New shop facilities and additions to the present facilities have been provided during the year at Andrews, S. C. This work includes a boiler pit, engine pit, 200-ton coal elevator, sand house, and an extension to the boiler house. In addition, work is now in progress on an 84-foot tankable, oil house, and water facilities for both fire protection and service purposes, all of which will be completed during the coming year.

A coach shop and an upholsterer shop, both equipped with automatic sprayers, have been built during the year at Hermitage, Va., to replace an old building destroyed by fire. New and modern machinery has also been installed, thus providing facilities for repairing coaches at the north end of the company's line.

In order to accommodate the large locomotives recently purchased, it was necessary to lengthen the roundhouses and provide engine pits of greater length at Hermitage, Va., Raleigh, N. C., and Hinton, N. C. This work

is now in progress and will be completed during the early part of the coming year.

Three additional water towers at the present Hermitage, Va., have been installed at Montgomery, Ala., to supply the water for the camp.

A new coal pit has been built at Raleigh, N. C., during the year. A new fire is now under construction at the elevator. It is a new pit, 10 ft. wide and 10 ft. deep. It will be used to replace the old one, which was destroyed by fire and was in a bad state of repair.

The work of the year at the building of the new water towers at this terminal, New Carolina, 100 feet long, and 10 ft. wide, is now in progress. It will be used to replace the old one, which was destroyed by fire and was in a bad state of repair.

The work of the year at the building of the new water towers at this terminal, New Carolina, 100 feet long, and 10 ft. wide, is now in progress. It will be used to replace the old one, which was destroyed by fire and was in a bad state of repair.

The work of the year at the building of the new water towers at this terminal, New Carolina, 100 feet long, and 10 ft. wide, is now in progress. It will be used to replace the old one, which was destroyed by fire and was in a bad state of repair.

The work of the year at the building of the new water towers at this terminal, New Carolina, 100 feet long, and 10 ft. wide, is now in progress. It will be used to replace the old one, which was destroyed by fire and was in a bad state of repair.

The work of the year at the building of the new water towers at this terminal, New Carolina, 100 feet long, and 10 ft. wide, is now in progress. It will be used to replace the old one, which was destroyed by fire and was in a bad state of repair.

Railway Financial News

BALTIMORE & OHIO—The Ohio Public Utilities Commission has authorized this company to issue \$20,000,000 5 per cent bonds, which are to be sold at not less than 80. Of these \$3,000,000 are to pay for improvements made in the past and the balance to pay for improvements approved by the Director General.

BROOKLYN RAPID TRANSIT—To provide for the extension of \$57,735,000 6 per cent notes due July 1, the War Finance Corporation is to loan the Brooklyn Rapid Transit Company \$17,320,000 or such less sum as is necessary to carry out the following plan. Note holders are asked to deposit their notes with the Central Trust Company, New York, and the holder of each \$1,000 note has the option of taking either \$300 in cash and \$700 face amount of new three-year 7 per cent Brooklyn Rapid Transit notes, or of taking \$1,000 of new three-year 7 per cent notes. In other words, he can take 30 per cent in cash and renew the remaining 70 per cent, or renew the entire amount of his notes. The new notes will be secured by the collateral now deposited as security for the old notes, and, in addition, by \$39,000,000 Brooklyn Rapid Transit consolidated and refunding mortgage bonds. The New York Times says that while these notes are outstanding, the Brooklyn Rapid Transit will pay no dividends in stock and none in script unless the script shall be made to rank junior to the equities of the note holders in the assets of the company.

CHICAGO, ROCK ISLAND & PACIFIC—This company has declared the regular semi-annual dividends of 3½ per cent and 3 per cent on the 7 per cent and 6 per cent preferred stocks, respectively, payable July 20 to stock of record July 5.

ERIE—This company gave notice on Tuesday of offers to extend until July 1, 1928, three issues of underlying bonds maturing on July 1 this year. They are the \$1,500,000 first mortgage 5 per cent bonds of the Buffalo & Southwestern Railroad, \$1,000,000 Buffalo & Southwestern Division 5 per cent bonds of the Erie Railroad and \$300,000 terminal 5 per cent bonds of the Chicago & Atlantic Railway. It is intended to extend the first and last named issues subject to prior redemption at 105 and interest. Holders of all three issues are asked to deposit their securities with the July 1 coupon attached at the offices of J. P. Morgan & Co. In the case of the Buffalo & Southwestern division issue temporary receipts will be issued exchangeable for bonds of an equal amount, and there will also be paid in cash \$110 on each \$1,000 bond. The investment yield will be approximately 6½ per cent. Similar conditions will apply in the case of the Chicago & Atlantic terminal bonds.

except that the cash payment will be \$75 and the yield on the entire bonds about 6 per cent.

PENNSYLVANIA—The dividend declaration has been deferred until the meeting of the board of directors to be held in July.

PITTSBURGH, CHICAGO & ST. LOUIS—The directors have deferred action on the dividend and dividend statement being made as follows: "The consolidated Pittsburgh, Cincinnati, Chicago & St. Louis (Pittsburgh), having commenced business on February 1, 1917, has no dividend record during the three years' test period. The board therefore deferred action until such approval has been secured and the money therefor obtained from the government on account of compensation for the use of the property."

SAN DIEGO & ARIZONA—This company is asking the California Railroad Commission to extend to December 31 the time within which it may issue \$1,500,000 bonds which the commission has authorized.

SEABOARD AIR LINE—See editorial comments elsewhere in this issue.

UNION PACIFIC—Kidd, Loch & Co., New York, have purchased from the Union Pacific a new issue of \$20,000,000 10-year 6 per cent bonds to be secured by a deposit of railroad bonds owned by the company. The sale of this issue has been approved by Director General McAdams. It is understood that the bonds will be offered for public subscription in the near future at 98 per cent and accrued interest.

VALPARAISO—See item in General News Department of this issue.

PETROLEUM PROSPECTS IN NEW SOUTH WALES—A company has been organized for the purpose of determining whether petroleum can be found in New South Wales, Australia. A modern derrick has been erected and machinery installed near Penrith, about 40 miles from Sydney, where surface oil has been found in numerous places in the vicinity of this town well. This will be the first test made in New South Wales for petroleum. The driller who is in charge of operations is a practical oil man from the United States. *Commerce Reports*

PROMOTING ENTERING CHINESE IN JAPAN—The preliminaries in connection with the entering mission that is to be held, in the interests of the Netherlands East Indies, at Batavia in 1919 are already in progress. The mission will probably be divided into six different sections: (1) Japan and means of communication (railways, telegraphs, and telephony); (2) irrigation, drainage, water works, etc.; (3) roads and bridges, new planning, architecture, etc.; (4) production of energy, electricity and water; (5) mining and geology; (6) miscellaneous. The participants in the mission will comprise the experts from the different Dutch colonies and also from the neighboring countries, such as Siam, America, Japan, Australia and South Africa. *Indian Engineering*

Railway Officers

Executive, Financial, Legal and Accounting

Thomas Hall Gatlin, whose appointment as assistant to president of the Southern Railway, with headquarters at Washington, D. C., has already been announced in these columns, was born on November 8, 1876, at Tarboro, N. C., and was educated at Trinity College, Durham, N. C. He began railway work in May, 1892, in the engineering department of the Atlantic Coast Line. From 1899 to 1901 he served as chief engineer of the East Carolina Railway, and from March, 1905, to July, 1906, was assistant chief engineer in maintenance of way office, in charge of track work drafting and later was engineer maintenance of way, on the Middle district of the Southern Railway at Knoxville, Tenn. On August 1, 1911, he was appointed assistant chief engineer maintenance of way and structures on the Southern Railway at Washington, D. C., and from January, 1917, to June, 1918, served as assistant to vice-president in charge of operation, which position he held until his recent appointment as assistant to president of the same road, as noted above.

T. H. Gatlin

Frederick P. Small, first vice-president and secretary of the American Express Company, has been appointed secretary of the American Railway Express Company, with headquarters at New York. He was born at Augusta, Me., and in 1895 entered the services of the Merchants' Despatch Transportation Company. The following year he went to the American Express Company as a stenographer, and subsequently served consecutively as cashier of the eastern financial department, chief clerk and assistant manager. In 1907 he was appointed line auditor, and later served as second assistant to the first vice-president, until 1914, when he was promoted to first assistant, and was also made assistant secretary of the company. In February, 1915, he was appointed assistant to president, and two months later he was appointed also secretary of the company. Since March, 1918, he served as first vice-president and a member of the executive committee, retaining his duties as secretary of the same company, and now becomes secretary of the American Railway Express Company as above noted.

F. P. Small

Edwin G. Buckland, vice-president and general counsel, of the New York, New Haven & Hartford, with headquarters at New Haven, Conn., has been elected president to succeed Edward J. Pearson.

R. H. Swartwout, vice-president of the Norfolk Southern, with headquarters at New York, has been elected president, to succeed J. H. Young.

John W. Platten, chairman of the board, of the Gulf, Mobile & Northern, with headquarters at New York, has been elected president, succeeding **W. F. Owne**, who becomes assistant to federal manager.

Harry Bronner, chairman of the finance committee of the Missouri Pacific, has been elected president, succeeding **B. F. Bush**, resigned to become regional director of southwestern railroads. Mr. Bronner has been connected with banking and industrial corporations for many years. In 1887 he entered the banking business of Hallgarten & Co., New York, and became a member of the firm in 1904. In October, 1917, he retired from the active banking business, after having become senior partner of that concern. Mr. Bronner has also taken an active part in many railroad reorganizations, notably the Baltimore & Ohio, the Colorado & Southern, and the St. Louis-San Francisco. He has also assisted in the reorganization of a number of industrial companies, and has been actively connected with many corporations, but more particularly with the Missouri Pacific, the Denver & Rio Grande, the American Locomotive Company, the Bethlehem Steel Corporation, the Sloss-Sheffield Steel & Iron Company and the J. G. White Engineering Corporation.

Caleb S. Spencer, vice-president and treasurer of the Adams Express Company, with headquarters at New York, has been appointed vice-president and treasurer of the new American Railway Express Company, with the same headquarters. Mr. Spencer was born at Catskill, N. Y., and entered the service of the American Express Company in 1872, as office boy at Catskill. Two years later he was transferred to Rondout, and later served as general clerk at Westfield, Mass. In 1874 he went to the Adams Express Company as a messenger and in 1876 became waybill and money clerk at New Haven. He subsequently served consecutively as agent at South Norwalk, agent at Fall River, route agent, assistant superintendent at Boston, Mass., and in 1882 became superintendent at Boston. He later served in the same capacity at Bridgeport, and in 1894 was made manager of the New England department. From 1908 to 1913, he retired for rest and travel, and then returned to the service of the Adams Express Company as treasurer and trustee. In 1916 he was appointed vice-president and treasurer of the same company, and now becomes vice-president and treasurer of the American Railway Express Company.

C. S. Spencer

M. B. McBride, auditor of the Seattle, Port Angeles & Western and the Puget Sound & Willapa Harbor, with office at Chicago, has resigned to become general auditor of the Pacific Car & Foundry Company, Seattle, Wash.

Operating

W. L. Park, vice-president of the Chicago Great Western, has been appointed general manager, with headquarters at Chicago.

W. H. Bremner, president of the Minneapolis & St. Louis, has been appointed general manager, with office at Minneapolis, Minn.

John B. Warrington, division superintendent of the Philadelphia & Reading, has been appointed terminal manager at Washington, D. C., with jurisdiction over the Washington Terminal Company, the terminals of the several railroads

and Potomac Yard, reporting to Regional Director Markham of the Allegheny Region.

F. E. House, president and general manager of the Duluth & Iron Range, has been appointed general manager with office at Duluth, Minn.

A. J. Davidson, general superintendent of the Spokane, Portland & Seattle, has been appointed general manager, with office at Portland, Ore.

Otis Bass has been promoted to chief dispatcher on the second district of the Nebraska division of the Union Pacific, at Grand Island, Neb.

LeRoy Kramer, vice-president of the Pullman Company, has resigned, effective June 30, to become federal treasurer of the St. Louis-San Francisco.

M. P. Blauevelt, vice-president of the Lehigh Valley, has been appointed assistant regional director of the Allegheny region, with office at Philadelphia, Pa.

William A. McGonagle, president and general manager of the Duluth, Missabe & Northern, has been appointed general manager, with office at Duluth, Minn.

B. B. Greer, vice-president and general manager of the Colorado & Southern, has been appointed assistant regional director of central western railroads.

J. P. O'Brien, vice-president and general manager of the Oregon-Washington Railroad & Navigation Company, has been appointed general manager, with office at Portland, Ore.

G. L. Benson has been appointed division superintendent of the Erie, with headquarters at Kent, Ohio, succeeding **J. C. Pierson**, who has been granted leave of absence.

O. Hodges has been appointed superintendent of the Anthony & Northern, with headquarters at Pratt, Kan., succeeding **J. D. Feeney**, who had previously been acting superintendent.

W. J. Jenks, general manager of the Norfolk & Western, continues under the United States Railroad Administration as general manager of that road, with headquarters at Roanoke, Va.

H. L. Crandall has been appointed superintendent of the Minnesota, Dakota & Western, with office at International Falls, Minn., vice **C. H. Woodford**, who has been assigned to other service.

S. A. Eddy has been appointed assistant trainmaster on the Superior division of the Chicago, Milwaukee & St. Paul, with headquarters at Green Bay, Wis., succeeding **D. W. Kelly**, promoted.

C. G. Burnham, executive vice-president of the Chicago, Burlington & Quincy, has been appointed federal manager of that road and of the Quincy, Omaha & Kansas City, with office at Chicago.

A. M. Schoyer, resident vice-president of the Pennsylvania Lines at Chicago, has been appointed assistant to the federal manager of the Pennsylvania Western Lines, with headquarters at Pittsburgh, Pa.

W. B. Wood, general manager of the Grand Rapids & Indiana, continues under the United States Railroad Administration as general manager of that road, with headquarters at Grand Rapids, Mich.

B. C. Byers, assistant general superintendent of the Cleveland, Cincinnati, Chicago & St. Louis, has been promoted to general superintendent at Indianapolis, Ind., succeeding **E. M. Costin**, promoted to federal manager. **C. S. Millard**, division superintendent at Mattoon, Ill., succeeds Mr. Byers, with office at Indianapolis. **P. T. White**, superintendent of the Peoria & Eastern at Indianapolis, succeeds Mr. Millard at Mattoon, and **Robert Alison**, trainmaster at Galion, O., has been appointed superintendent, succeeding Mr. White.

Charles H. Reynolds, whose appointment as assistant general superintendent of the Chicago & North Western, with headquarters at Norfolk, Neb., was announced in the *Railway Age* on June 14, was born at Springfield, Ill., on July 13, 1859. He entered railroad service with the Chicago & North West-

ern in June, 1879, as a clerk at Winona, Minn., and subsequently he was chief clerk in the safety office and division superintendent of the Fremont, Elkhorn & Missouri Valley, now a part of the North Western. From March, 1903, to the date of his recent promotion noted above, he was division superintendent of the North Western at Norfolk, Neb.

Traffic

L. M. White, general agent of the Missouri Pacific at Detroit, Mich., has left the service of that company to go with the Judson Freight Forwarding Company at Detroit as export agent.

Engineering and Rolling Stock

Leigh Goodrich Curtis, whose appointment as assistant chief engineer of the Baltimore & Ohio, with headquarters at Baltimore, Md., was announced in the *Railway Age* on May 31, was born at Hamilton, Ohio, on November 28, 1874. After completing his education in the Ohio State university in 1899, he entered railway service as a civil engineer in the office of the superintendent of maintenance of way in the Baltimore & Ohio at Zanesville, Ohio. In December, 1900, he was promoted to assistant engineer in the same office. Two years later he became assistant division engineer at Chicago, and in June, 1903, he was promoted to division engineer at the same point. From April, 1910, to 1914, he was engineer in charge of maintenance of way of the north-west district, following which he became district engineer of the Chicago division at Chicago, which position he held until his appointment as assistant chief engineer, as mentioned above.

L. J. Putnam, whose appointment as chief engineer of the Chicago & North Western, with headquarters at Chicago, Ill., has already been announced in these columns, was born at Mac-

L. J. Putnam

crest, Iowa, on February 17, 1878, and was educated at Cornell College, Mount Vernon, Iowa, where he studied civil engineering. He began railway work in June, 1898, with the Illinois Central, and in June of the following year went with the Chicago & North Western as an instrument man. From February, 1901, to March, 1906, he was assistant engineer in construction, location and maintenance on that line, following which he was acting division engineer of the Ashland division at Kaukauna, Wis. Beginning with March, 1907, he was successively assistant engineer in charge of street and track and terminal improvements at Jersey City, N. J.; assistant engineer in charge of the construction of a bascule bridge over the north branch of the Ohio river, and the Wells street yard at Chicago, resident engineer on the Milwaukee track elevation, and resident engineer on the Leveau street dock construction. From July, 1910, to April 1, 1912, he was with the Milwaukee, Sparta & North Western, a subsidiary of the Chicago & North Western, first as resident engineer in construction and then as acting resident engineer. On April 1, 1912, he was promoted to division engineer at Chicago, Ill., and in May, 1913, he was again promoted to principal assistant engineer with headquarters at Chicago, which position he held until his promotion as noted above.

W. C. Kegler, engineer in charge of way of the Cleveland, Cincinnati, Chicago & St. Louis, with headquarters at Galion, Ohio, has been appointed district engineer in charge of construction, with the same headquarters. **W. S. Burnett**, engineer in charge of way of the Cincinnati Sandusky division, with headquarters at Springfield, Ohio, has been appointed district

engineer in charge of construction, with the same headquarters. **J. E. Kissell**, engineer maintenance of way of the Cairo division, with headquarters at Mt. Carmel, Ohio, has been appointed acting engineer maintenance of way at Galion, Ohio, in place of Mr. Kegler. **E. J. Byer**, assistant engineer maintenance of way at Galion, Ohio, has been appointed acting engineer maintenance of way at Mt. Marmel, Ill., succeeding Mr. Kissell, transferred. **R. B. Stokley**, assistant division engineer maintenance of way at Springfield, Ohio, has been appointed acting engineer maintenance of way at Springfield, Ohio, in place of Mr. Burnett. The above changes were effective June 24.

Robert J. Middleton, whose appointment as assistant chief engineer of the Puget Sound Lines of the Chicago, Milwaukee & St. Paul, with headquarters at Seattle, Wash., succeeding E. O. Reeder, retired, was announced in the *Railway Age* of June 24, was born at Greenwood, Ark., in 1881, and graduated from the civil engineering department of the University of Arkansas in 1903. On February 2, 1906, Mr. Middleton entered the service of the Chicago, Milwaukee & St. Paul as a draftsman in the bridge and building department at Chicago. In the fall of that year he was promoted to assistant engineer on the Kansas City division at Ottumwa Junction, Ia., where he remained until October, 1908, at which time he became assistant engineer on the Evanston track elevation, at Evanston, Ill. Three years later he was appointed assistant engineer in charge of the construction of the Savanna, Ill., and Godfrey yards. In January, 1913, he was promoted to engineer of track elevation at Chicago, and in April, 1915, he became valuation engineer, which position he held until his present promotion as noted above.

Thomas H. Strate, whose promotion to valuation engineer of the Chicago, Milwaukee & St. Paul, succeeding R. J. Middleton, was announced in these columns on June 21, was born at Moorhead, Minn., on April 9, 1880, and received his education at the University of Minnesota, graduating from the civil engineering department in 1901. On June 3 of that year, Mr. Strate entered the service of the Chicago, Milwaukee & St. Paul as a rodman and chairman on the Preston branch in Iowa. Later he became instrument man. From 1902 to 1903 he was resident engineer on construction and grade reduction at Faribault, Minn., and during the following three years he was assistant engineer in charge of maintenance and construction in the district office at Minneapolis, Minn. Subsequently, he was consecutively locating engineer, assistant division engineer and division engineer of construction on the line between Glenham, S. D., and Marmarth, N. D., and on the James river branch between Aberdeen, S. D., and Mobridge. From 1912 to 1915 he was construction

R. J. Middleton

T. H. Strate

engineer on double track work between Minneapolis, Minn., and Aberdeen, S. D., following which he became valuation field engineer, which position he held until his recent promotion as noted above.

C. M. Rogers, inspector of tonnage rating of the Chicago, Rock Island & Pacific, has been appointed supervisor of stationary plants, with headquarters at Chicago, effective June 15, succeeding **J. H. Edwards**, resigned.

E. O. Reeder, assistant chief engineer of the Puget Sound Line of the Chicago, Milwaukee & St. Paul, with headquarters at Seattle, Wash., whose resignation from that position on account of ill health was announced in the *Railway Age* on June 21, has been connected with the Chicago, Milwaukee & St. Paul for many years. His first connection with that company was in the purchasing department previous to 1875, where he was connected with the purchases of ties, timber, etc. His first work in the engineering department was in connection with the construction of a tunnel at Tunnel City, Wis. In 1879, he became resident engineer at Melvina, Wis., and had charge of the engineering work between Melvina, Wis., and Westby. Later he was transferred to Fayette, Iowa, following which he assisted in the survey and location of the bridge over the Mississippi river at Sabula, Iowa. Subsequently, he was engaged in a number of surveys, including the line from Monroe, Wis., to Dubuque, Iowa, and the Ottumwa line from Cedar Rapids, Iowa, to Sigourney. Later, Mr. Reeder took charge of the chief engineers' office, where he had much to do with the location of the Puget Sound line. He then became principal assistant engineer. He was appointed chief engineer of the Puget Sound lines with headquarters at Seattle, Wash., in June, 1911, and was made assistant chief engineer when this line was consolidated with the St. Paul. He remained in that position until his resignation as noted above.

Railway Officers in Government Service

Fred Pettijohn has been appointed chief accountant of the Railroad Administration, reporting to the auditor, **J. W. Roberts**.

C. S. Lake, formerly general manager of the Seaboard Air Line, has been appointed assistant to **C. R. Gray**, director of the Division of Operation.

B. J. Feeney, traveling engineer of the Yazoo & Mississippi Valley, with office at Memphis, Tenn., has been appointed supervisor of the Fuel Conservation section, Southern Regional district, United States Railroad Administration, with office at Atlanta, Ga.

C. B. Dailey, assistant to the director of purchases of the Southern Pacific, has been appointed assistant manager, and **L. G. Plant** has been appointed progress engineer of the Procurement Section of the Central Advisory Purchasing Committee of the Railroad Administration.

Railway Officers in Military Service

J. J. Duggan, chief dispatcher of the Southern Pacific at Bakersfield, Cal., has received a lieutenant's commission in the United States Army, and is now en route to France to serve in an overseas contingent.

C. H. Nichols, formerly chief dispatcher of the Southern Pacific at Bakersfield, Cal., has received a commission as first lieutenant, and has been assigned to Company C, 31st Railway Engineers, stationed at Ft. Leavenworth, Kan.

TEUTONS BUILDING TWO RAILWAY IN FINLAND.—According to Associated Press despatches the Germans are building two temporary railways in Northern Finland. One line runs eastward toward Kem on Mourmansk railway in Russia and the other northeastward from a rail-end in Finland toward Petoenga Bay, which is included in the strip of the Mourmansk region which Russia is preparing to cede to Finland. Construction work is easy as there are many small lakes which can be utilized.
