By Sunday, February 3, the number of freight cars above normal—number waiting to be moved, both eastbound and westbound, loaded and empty—had increased in eastern territory by several thousand over the numbers one week previous, but on that day trains were moving on nearly all lines, and the New York Central sent east from Syracuse about 2,000 cars. The Pennsylvania, which suffered severely in the storms of January 26-28, had got its main lines and most of its branches in fair condition. But on Sunday night the temperature fell rapidly, and with high winds, filling cuts faster than plows could clear them, stopped freight traffic almost completely on the main line of the New York Central west of Albany, and the difficulties on the other trunk lines and in the anthracite region were scarcely less severe. On Tuesday morning Regional Director A. H. Smith reported serious difficulties on account of weather "all the way from Albany to Elkhart" (101 miles east of Chicago). From data gathered in his office on Tuesday it was estimated that throughout the entire eastern district the reduction of freight tonnage, because of severe weather conditions, was from 20 to 50 per cent.

In New York harbor navigation was impeded seriously, making delivery of coal increasingly difficult. Several tugs with loaded tows of coal were caught in ice in Long Island Sound. Shortage of labor at tidewater piers, due to extreme cold, seriously retarded the unloading of coal, and the coal was badly frozen.

All lines reported freight trains stalled in drifts, and a

number of minor derailments due to ice in flanges and switches.

At Cincinnati on Tuesday conditions were improving, low temperature having caused the river to drop quite rapidly, but interchange tracks were still under water. About 50 per cent of the lines were still blocked by flood conditions.

Placing of empties in the Somerset coal region was discontinued on Monday at 3 p. m., due to severe blizzards, with drifting snow and derailments of through trains and empties.

The Lake Shore Limited due to arrive in New York Monday was held in a drift 24 hours. A train of stock had been stalled in the snow in northern New York since early Monday evening. Many men were having their faces, feet and hands frozen so that the releasing of stalled trains was carried on under great difficulty.

Trains were being delayed at all important terminals waiting for engines from round-houses, due to inability to get men to work. Four eastbound freight trains were stalled in snow west of Syracuse Monday and not shoveled out until Tuesday, though 20 engines and a large gang of men were kept at work Monday and Monday night as long as they would work. It was so cold that the men refused to remain, claiming they could not live out of doors. Freight operations in that territory were practically suspended.

The Situation on Wednesday

So much for the situation on Tuesday. On Wednesday Mr. Smith's office summarized traffic and weather conditions as still extremely severe, but in the Central West the temperature was rising rapidly. Freight movement Tuesday was "practically at a standstill." Such roads as did move any freight reported movement from 5 to 25 per cent of normal. Freight trains were stalled in snow and engines were frozen. There was a shortage of water for engines: the water plugs froze as fast as they were thawed out. Deraillments were caused by broken truck frames.

Throughout New England high wind made it impossible to keep tracks open and practically all freight trains that started out were stalled in snow. The snow was so hard and packed in so solid that a large number of serious derailments of plows, engines and cars further blocked operations.

On Wednesday morning there was 6 to 8 inches of new snow in northwestern New York. No freights were being operated in that section. Passenger trains were running from 2 to 4 hours late. South of Corning on the New York Central a northbound freight train was derailed by a broken truck, throwing cars on southbound track directly in front of a southbound freight, which struck the wreckage, derailling the engine and four cars. In northern Indiana Tuesday's blizzard blocked several roads, the cuts filling with snow. In western Pennsylvania it was necessary to limit passenger trains to six cars and then they were barely able to proceed with two engines. In the coal regions the cuts are blocked with from 16 to 20 feet of snow and the placing of empties is still greatly hampered; there is a good supply of cars if they can be placed. Two rotary plows have been sent from the Erie Railroad to assist in clearing branch lines in the Pennsylvania coal regions.

At Cincinnati the river fell, but ice from the flood was still seriously blocking railroad operation. The Ohio roads on Tuesday moved 560 cars of coal north from the coal fields. Placement of coke empties and movement were seriously affected.

Coal moved into Chicago Tuesday, amounted to 1,158 cars, about 70 per cent of normal. The Chicago, Terre Haute & South Eastern was again temporarily shut down by snow drifts. A new spreader was put in service to keep cuts open, but the conditions were so bad that very little was accomplished. Thirty-five cars of anthracite coal were moved through the Pennsylvania tubes to Long Island on Tuesday. Five steamers were bunkered in New York on Wednesday.

Unnecessary Telegraphing

By J. L. Coss

THE SEVERAL ARTICLES which have been published recently concerning this subject might well go farther into the detail of the numerous abuses in this line. A large portion are due to pure laziness on the part of certain employees. For instance all sorts of clerks, including some chief clerks, who are authorized to use the telegraph will write a telegram and send it to the telegraph office—the messenger boy will carry it there and bring the reply back to their desks—in preference to making a mailgram, because they thus save themselves the trouble of enclosing the telegram in an envelope.

Chief clerks who have the assigning of the agents and the operators will order a man to a certain place to relieve another employee and then make no arrangements whatever for transportation for either of them, knowing all the time that they cannot travel on the trains without a pass. Then these men commence to send telegrams for transportation; and after waiting awhile they will come in on the despatcher's circuit to be fixed up with wire transportation. And the despatcher may be busy and may lay out some train while he is preparing the wire passes.

Files of papers are sent out to agents and others and prompt return is required. But no attention is given to this requirement until the general office begins to trace for them and then the division clerks commence to burn up the wires for the return of those papers.

Another flagrant abuse of the wires arises from neglect to apply the necessary discipline against employees who do not follow the instructions contained in bulletins and circulars. For instance a local freight conductor neglects or refuses to move a short load or an empty from some station. The trainmaster may criticize the chief despatcher or the trick despatcher for not seeing that the car was moved (and I have seen just such action) and then the chief despatcher, if he is not able to put over his argument that it is a matter that is strictly up

to the conductor falls into the habit of putting out messages to the local conductors (to do certain work) in a reckless way which is wholly uncalled for. His course only serves to make more telegraphing and simply calls the attention of the conductor to his known duty. After a while the men in charge of trains will become careless, and assume that if anything is wanted, beyond going from one terminal to the other, they will be advised by telegraph. It would be just as logical for the roadmaster, in the evening, to telegraph to all his foremen to be sure and come out on the track the next morning at seven o'clock.

I once worked on a division where there was a heavy interchange of traffic at many junction points and much irregular work all the time; but I do not think there were half a dozen messages about filling out trains, etc., during my stay there, which was about a year. The division officers had their men well instructed, and they went along and handled the trains to the satisfaction of all concerned. Such an arrangement can be carried out on any railroad; and the men would rather work that way than to be receiving a telegram at every station what to do at the next.

There is far too much telegraphing done concerning the furnishing of cars at stations for local loading. If the afternoon form of telegraphic car report were filled out in the proper manner by the agent who orders cars this report would answer every purpose; but this is not done and very little is said to the man who neglects it. Some roads require a separate message sent to the chief despatcher when stock cars are required; but why should not the car report suffice? The daily car report made up by the agents and mailed in to the division office is sufficient for answering many tracers, if the clerk receiving the report would look at it instead of putting it directly into a pigeon hole. The consist of a train should give all the information necessary for the next terminal to handle it; why send a separate message because there is stock and meat in the train? The icing instructions as well as the loading time of the stock, etc., can be put on the consist.

All of these troubles are due to the fact that the persons not doing their part are not held responsible.

United States Marines on the Second Lap to Berlin

General News Department

The Illinois Central station and hotel at Centralia, Ill., were destroyed by fire on February 5.

The office building of the Maine Central at Portland, Me., was damaged by fire on February 2 to the amount of \$50,000. The train dispatchers had to establish a temporary office in the Boston & Maine building.

H. T. Bentley, superintendent of motive power and machinery, and E. E. Betts, superintendent of transportation, of the Chicago & North Western at Chicago, have been called to Washington, D. C., for an indefinite period to assist the director-general of railroads.

The "terminal" passenger station at Chattanooga, Tenn., according to a press despatch of January 22, is to be used for all of the roads entering that city; and the union station, used by the Nashville, Chattanooga & St. Louis and its affiliated lines, will be devoted wholly to offices.

Suspension of manufacturing, to conserve coal, has been ordered in Canada for three days, Saturday, Sunday and Monday, February 9, 10, 11. The order, which was recommended by the fuel controller of the Dominion, includes munitions plants, but does not apply to the Maritime provinces or to Western Canada.

W. T. Wolff, superintendent of freight station service of the Pennsylvania Western Lines, Pittsburgh, Pa., addressed the Iowa Commission on Car Service and a large gathering of railroad officers and shippers at the Chamber of Commerce, Des Moines, Iowa, on January 31. He spoke on the intensive loading of freight and the "sailing day" plan.

The Alton & Jacksonville, a 21-mile, standard gage line between Alton, Ill., and Jerseyville, has suspended business and the property will be sold as junk. The State Public Utilities Commission of Illinois, in an order issued last December, authorized the railway line to cease operations, but the company was delayed in doing so by suits brought by the bondholders.

The flood of January 28 in Southwestern Virginia, washed away 15 bridges on that section of the Southern Railway between Bristol and St. Charles, 92 miles. At the natural tunnel, 600 ft. of track was undermined. Between Big Stone Gap and Appalachia, 5 bridges were destroyed, and between Appalachia and St. Charles, 6 others. There were numerous washouts all along the line, and two trestles were destroyed.

Red Cross work rooms, completely equipped, have been opened at the Chicago passenger terminal of the Chicago & North Western. The active membership and organization of the new workshop will include the wives, mothers, sisters and daughters of North Western employees residing in Chicago and suburbs. Mrs. R. H. Aishton, wife of the president of the road, is general chairman of the workshop and work will be carried on under her direction. The rooms will be open from 9.30 a. m. to 4.30 p. m. every day of the week, except Sunday, and the work will include knitting, the preparation of surgical dressings, the making of hospital and refugee garments, etc.

The Grand Trunk Railway, of Canada, is celebrating its sixty-sixth anniversary, and the Montreal "Daily Star" has published a four-page historical sketch, giving many facts of interest both to the public and to railroad men. The Grand Trunk, like other roads in America and England, is now doing a greater business than ever before, and the "Star" finds ample evidence that the task "is being carried out in a more expeditious and efficient manner than on similar American railroads running to the seaboard." Speaking of some of the misfortunes of the railroad, the article says that it is an honorable, patriotic corporation which has been the victim of railway legislation, and

"has been forced to accept the handicap of an ill considered transcontinental road engineered for party and not for patriotic ends." This historical sketch has been reprinted in pamphlet form.

Railway Regiments' Tobacco Fund

One contribution to the Railway Regiments' Tobacco Fund was received during the past week from the Empire Steel & Iron Company, of Catawauqua, Pa., for \$20.

Government Regulation of Fuel Oil

President Wilson, on February 4, issued a proclamation putting under license the manufacture and distribution of fuel oils; and a series of regulations has been issued by the Fuel Administration establishing a preferential list of consumers which is headed by railroads and steamships. Difficulties in transportation are mentioned both in the proclamation and in the Fuel Administration's statement as having made the order necessary.

Equipment Necessary for Engineering Regiments

The scope of the work of equipping the regiments of railway engineers now in France is indicated by the cost of materials ordered up to date, which approximates \$70,000,000. The equipment so far ordered includes several hundred locomotives, more than 100,000 tons of rails, more than 3,000 complete turnouts, 500,000 ties, 12,000 freight cars, 600 ballast cars and 600 miles of telephone wire and apparatus, as well as large quantities of construction and repair equipment.

Snow in the Alleghenies

Climbing from the hatch-holes in the roofs of their cabs, two engine crews released themselves from a snow trap on the loop track at Gallitzin, Wednesday morning, (January 30), following the cave-in of a wall of snow. They had to wait until a shovel gang could release them. The same condition prevailed on Monday morning at Gallitzin. Near New Florence a laborer was walking along in the snow when he stumbled over an object concealed in the white mass. He investigated and found he had tripped upon a brake wheel sticking up from a buried box car on a sidetrack.—*Alleghena Tribune*.

New Engineering Regiments Authorized

Major Frederick Mears, member of the Alaskan Engineering Commission, has been authorized to recruit a railroad construction regiment for active duty in France. No one will be recruited from the present employees of the Alaskan Engineering Commission without the approval of the chairman. Recruiting offices for the regiment are to be opened at different points in the United States, which will be announced later.

Three additional forestry regiments are also to be organized. The co-operation of the Forestry Service of the Department of Agriculture has been extended in the selection of the personnel and equipment.

Safety Appliance Orders Further Extended

The Interstate Commerce Commission has granted the application of the railroads for a further extension of time from March 1, 1918, to September 1, 1919, in which to make their freight cars in service on July 1, 1911, conform to the standards prescribed by the commission in paragraphs b, c, e and f of the order of March 13, 1911.

creased 34.9 per cent, mile operating income decreased 9.6 per cent.

Operating income per mile decreased 17.3 per cent in the east, decreased 7 per cent in the south and decreased 4.8 per cent in the west.

November net operating income per mile was 28.8 per cent less in 1917 than 1916, 29.9 per cent less than in 1915 and 29.2 per cent greater than in 1914.

United Engineering Society Elects Officers

At the annual meeting of the trustees of the United Engineering Society, held in New York on January 25, the following officers were elected for the ensuing year: President, Charles F. Rand, member American Institute of Mining Engineers; first vice-president, Calvert Townley, member American Institute of Electrical Engineers; second vice-president, Robert M. Dixon, member American Society of Mechanical Engineers; treasurer, Dr. Joseph Struthers; secretary, Alfred D. Flinn, member American Society of Civil Engineers; chairman finance committee, J. Vipond Davies, member American Society of Civil Engineers.

Binghamton Engineering Society

The annual meeting and banquet of the Binghamton Engineering Society was held on Monday evening, January 21. The following officers were elected for the ensuing year: past president and chairman of executive committee, Robt. B. Hoadley; president, C. A. Dayton, assistant division engineer of the Delaware, Lackawanna & Western; first vice-president, C. E. Anderson; second vice-president, Charles Van Amburgh; third vice-president, Burt E. Nelson; secretary, D. M. Edgerton; treasurer, F. A. Tillman; librarian, Ray Fitzpatrick.

A "Mournful Jest"

[From the Wall Street Journal]

If a jest can be mournful surely that is one which the Senate Committee on Interstate Commerce has played upon the Interstate Commerce Commission. Early last year the commission covertly, and later in the year openly, abdicated its legal function of making the railroad rates of the country. In June it temporized. In December it threw up its hands in the attitude made familiar by the war correspondents and cried "Comrade!" in the direction of the White House. The war was too much for the commissioners. With a world in turmoil, they were unable to shake off the ancient habit of cherishing the shippers' "interest," which had reached its logical conclusion by depriving shippers of adequate transportation. So the commission quit.

No wonder, then, that President Wilson and Director-General McAdoo consider it necessary to take the supreme rate-making authority out of the hands of the commission and put it in those of the federal railroad administration. Very likely it was because they were afraid that if the commission retained its strangle-hold on rates given it by existing law it would remain a mere obstacle instead of an administrative body.

But it is quite as likely that the members of the Senate committee eliminated this transfer of rate authority from the railroad control bill for exactly the same reason. If such an amendment is adopted by Congress, that body will have sent the commission back to its appointed task as relentlessly as any judge ever dismissed a writ of habeas corpus and remanded the prisoner to his cell or the rock pile.

So far as outward appearances indicate, the commission has confined its activities since its despairing outcry of last December to ordering an assuredly temporary disruption of the Pacific coast rate adjustment, and to issuing two or three times a week an ill-digested and misleading report upon freight traffic movement and the condition of eastern terminals and yards. The character of these reports challenges the attention of Mr. McAdoo, if not of the President himself. They come, at least as a formality, from the pen of Commissioner McChord. By insinuation and intimation they convey the idea that the railroads have either willfully or through sheer incompetence neglected the condition of their motive

power, and that the lamentable condition of the carriers in the eastern section today is the direct result of gross mismanagement.

The fact is, as even Mr. McChord has once or twice inadvertently admitted in his issued statements, that the railroads simply cannot obtain the mechanics to keep their locomotives in good order, under the strain of an unprecedented traffic and the worst winter weather the East has experienced in a generation. Nearly a year ago railroad owners warned the commission of the alarming rate at which they were losing shopmen under the attractive wage offers of industrial plants. Revenues sufficient to permit liberal increases in wages or the purchase of additional power would have helped. But the commission knew better, as it always had before.

Now the Senate committee proposes that the commission shall fry in its own fat. Though these be war times, the spectators may be permitted a grim smile.

Detailed Instructions for Car-Saving

E. E. Betts, superintendent of transportation of the Chicago & North Western, has issued a circular to agents, conductors and others which "gets right down to business." Along with numerous well known admonitions Mr. Betts promulgates the following:

To Agents, Trainmen and Others:

"There is a shortage of cars everywhere. We are short in excess of 10,000 box cars, and the same proportion exists as to other classes of equipment. Forty-ton and fifty-ton cars may be loaded to their actual axle-carrying capacity; and do not forget that in the loading of company freight, we should set a good example. Require shippers to give the weight of the load they intend to ship and endeavor to provide a car to fit.

"Have cars spotted on arrival; notify consignee by telephone; urge him to unload at once; call him again if he fails you. Much can be done by a personal call. If no bill, wire the billing station. If you cannot get results, wire me. Urge consignees not to use 48 hours to unload a car; the saving of half a car day will be appreciated.

"Switch the car out the same day that it is made empty. Nothing discourages a merchant or chills his enthusiasm so much as to have a car lie around on his side track a day or two, after he has exerted himself to get it unloaded.

"Never permit an empty car to be delayed one hour for want of information as to what to do with it. Always have this information in advance of the time the car is unloaded. If you don't know what to do with it, find out from your train dispatcher when it arrives under load; not after it is made empty. If car is to be reloaded at your station, have it spotted quickly. We will not hold cars for prospective business. Give brief but adequate reasons for detention of cars more than 48 hours. When company material arrives, notify consignee immediately by telephone or telegraph and confirm in writing. If car is not released within 24 hours, telegraph the superintendent.

To Train Conductors:

"Do all the switching. Report cars at blind sidings. If no disposition received, keep after it. Do not set out cars containing small consignments of freight at stations where cars are not required, but unload freight and take car to some station requiring cars. Watch for cross hauling of cars and tell the train dispatcher. An empty car should always be the object of suspicion. . . ."

The Hyman-Michaels Company, of Chicago, has sent to its customers a circular calling attention to the increases in demurrage rates and showing, by a table, the additional cost *per ton of loading* for each day that a car is held; for example, a load of 30 tons held six days beyond the free time pays \$1.10 per ton. Shippers are enjoined to load material which is strictly according to specifications and avoid rejections. "Do not ship cars to your own name or to shipper's order. Ship cars to consignees located at the final destinations and avoid reconsignments. Cars so shipped will not be held by railroads on account of unknown consignees. It is important to specify the railroad reaching destination.

"Mail the invoice the day car is loaded. If unable to do so furnish advance notice promptly, by telephone or messenger, of car number and initials, material, weight, consignee and destination. If the weight is not known before car leaves the loading point furnish all other information in advance and then advise weight promptly.

"Mills should ascertain daily the new cars on hand. If no advice of shipment has been received, the mills should advise shippers promptly the car number and initials, also the kind of material. Advise by telephone or messenger when possible. Mills should inspect and weigh cars immediately on arrival and notify shippers promptly of any discrepancies. Advice by telephone or telegraph is preferred."

Traffic News

The Buffalo, Rochester & Pittsburgh has discontinued two trains on the Rochester Division, two on the Buffalo Division and (south of Butler) two on the Pittsburgh Division.

Provost Marshal General Crowder has announced that the movement of the last increments of men selected in the first try for the National Army, about 75,000 men, will begin in January 23, and continue for five days.

The agricultural departments of the Chicago, Burlington & Quincy and the Colorado & Southern are conducting a special campaign to induce growers in dry land sections to put in a large acreage of pinto beans during the coming season.

A campaign to encourage the establishment of manufacturing industries in the Southwest, is proposed by C. E. Schaff, Governor of the Missouri, Kansas & Texas; this in response to a word from Washington that factories for the making of munitions and war materials ought to be established in the Middle West and southwest. Mr. Schaff has issued a circular setting out the advantages to be found, close at hand, in the southwestern territory, and urging all citizens to co-operate.

Erving T. Bush, chief of embarkation for the War Department at New York City, under General Goethals, quartermaster-general, is now assisted by a staff of civilians in the work supervising the shipment of all supplies through the port of New York for the American forces in Europe. W. J. Edwards is in charge of the steamship division; H. G. Simonds in charge of the warehouse division; Charles H. Ketcham, formerly superintendent on the Southern Pacific, and before that on the Delaware, Lackawanna & Western, is in charge of the railroad division, and W. F. Hersey is general superintendent of piers, with P. B. Blanchard as assistant. It is understood that T. V. O'Connor, president of the International Association of Longshoremen, will be put in charge of the employment and labor division. Other assistants in Mr. Bush's office are J. O. Hammit and Lieut. Philip L. Gerhardt.

Emergency Methods Used to Move Coal

Emergency measures for the protection of domestic consumers in Chicago against suffering from the lack of coal have recently been taken by the Illinois State Fuel Administration and the railroads. R. H. Aishton, regional director of railroads, directed Illinois roads to sidetrack all freight, including coal and flour, in order to expedite coal shipments. The state administrator ordered mine operators to ship the entire output of Illinois mines on February 5 to domestic consumers, public utilities and other preferred consumers. The Cook County fuel administrator issued an order dividing Chicago into 12 zones for the purpose of hastening deliveries of coal to domestic users. Coal operators and dealers were notified that the Garfield order legally releases them from all contractual obligations with industries not named in the preferred list of the order.

Embargoes on the North Western

A. C. Johnson, general traffic manager of the Chicago & North Western, announces that henceforth embargoes will be levied daily, but only to agents at stations from which freight frequently moves to eastern territory. Agents not receiving cargo notices are not permitted to accept freight of any kind, either in carloads or less, destined to points east of the Indiana-Illinois state line, without special authority from the office of the general traffic manager. Agents receiving embargo notices are instructed to perfect a system for filing them, whereby they can be referred to conveniently and the necessary information given to the public without delay or refusal. Agents are warned particularly against permitting cars to be loaded, or signing bills of lading covering cars arbitrarily loaded by shippers, contrary to current embargoes. Any cars so loaded must be held under demurrage until embargoes are modified to permit their acceptance.

Plan to Relieve New York Port Congestion

At a conference of representatives of the Shipping Board, the railroad administration, the Army and Navy, shipping interests, and of the British government, held at Washington on January 30, a shipping control committee was formed to allocate ship tonnage which will take steps to relieve congestion at the port of New York by diversion of transatlantic traffic to other ports. Not only Philadelphia, Baltimore and Newport News, but especially the southern ports, are to be developed. Edward Chambers, traffic adviser to Director General of Railroads McAdoo, attended the conference and will arrange for the routing of export freight via southern gateways.

Dr. F. H. Dixon, professor of economics at Dartmouth College and chief statistician of the Bureau of Railway Economics, has been appointed a member of a research division appointed by the United States Shipping Board to investigate transportation problems in connection with the work of the Shipping Board.

To Map Out Army Truck Routes

The pathfinder car of the Highways Transport Committee of the Council of National Defense starts this week on a new task of mapping out army truck routes for the government. The committee has already laid out an official route from Detroit to the seaboard and another from Buffalo to the seaboard. It is now proposed to tap every truck manufacturing point in the central West and pick out feeder lines to two great main highways running eastward.

The pathfinder will go as far West as the Mississippi river and will map routes from cities in Wisconsin, Illinois, Michigan, Indiana, and Ohio. The car will be in charge of Raymond Beck, Field Engineer of the Highways Transport Committee. As each state line is reached a representative of the state highway department will join the car and proceed over the roads of his own state.

When this trip is completed the government will have four main highways forming connecting links between the great manufacturing centers of the country and the Atlantic seaboard. Motor transports on their way to France will follow these routes and will carry cargoes to relieve railroad freight congestion. The drivers will secure their training under service conditions and be better fitted for their tasks of driving when they reach the war zone.

Revised Demurrage Rules in Effect February 10

As briefly noted in last week's issue, page 257, the Director General of Railroads has modified the new demurrage rules which were put into effect on January 21, and which were objected to in some particulars by a committee representing the National Industrial Traffic League. The changes are described in General Order No. 7, which becomes effective on February 10, and which contains the new rules in detail in an appendix. The "bunching rule," as it appears in revised form, reads as follows:

"Cars for Unloading or Reconsigning.—When, as the result of the act or neglect of any carrier, cars originating at the same point or at intermediate points moving via the same route and destined for one consignee, at one point, are bunched at originating point, in transit, or at destination, and delivered by the carrier in accumulated numbers in excess of daily shipments, the consignee shall be allowed such free time as he would have been entitled to had the cars been delivered in accordance with the daily rate of shipment. Claim to be presented to carriers' agent within fifteen (15) days."

The demurrage rules do not apply to:

1. Cars loaded with live stock;
2. Empty cars placed for loading coal at mines or mine sidings or coke at coke ovens and cars under load at mines or mine sidings or coke at coke ovens;
3. Foreign export freight awaiting ships at ports;
4. Coal for trans-shipment at tidewater or lake ports;
5. Empty private cars stored on railroad or private tracks, provided such cars have not been placed or tendered for loading on the orders of a shipper.

The Interstate Commerce Commission has approved for filing, at the request of the Director General, tariffs of the eastern railroads containing new demurrage rules and regu-

lations governing cars of anthracite and bituminous coal or coke for trans-shipment by vessel. These rules apply also on cars held for or by consignors or consignees for unloading, forwarding directions, or for any other purpose, except cars re-consigned or reshipped for rail delivery or to another rail destination, when they will be subject to the national car demurrage rules.

An average of three days per car free time will be allowed. A notice of arrival must be sent or given to the consignee in writing or as otherwise agreed to by carrier and consignee upon arrival of cars and billing, and time will be computed from the first 7 a. m. thereafter. Holidays, but not half-holidays, will be excluded. A car is to be considered as released at the time the vessel registers for the coal or coke, or earlier when cars are unloaded before the vessel registers. The day on which shipments are transferred by written order and acceptance to another party is to be considered the date of release of the car for the account of the original consignee, and the detention shall follow the car and be charged in the account of the new consignee.

Average agreement.—Settlement shall be made on basis of the detention to all cars released during each month. The date of arrival notice shall be subtracted from the date of release. From the total days' detention to all cars thus obtained deduct three days free time allowance for each car; the remainder, if any, will be the number of days to be charged at the rate of \$3 per car per day. Excess credit days of any month can not be deducted from excess debit days of another month. At lake ports, however, cars released during April and May are to be considered as May detention and treated as one month. Loaded cars on hand at the close of navigation will be recorded released on that date in computing the average detention; and subsequent detention will be subject to the National car demurrage rules.

Co-operation Between the Railroad

and Food Administrators

Plans have been worked out for co-operation between the Railroad Administration and the Food Administrator in the matter of car supply for shipments of foodstuffs. Edward Chambers, who is Mr. McAdoo's traffic adviser, was formerly transportation manager of the Food Administration, where he gathered much information concerning conditions in various localities which will be valuable in directing the movement of cars.

Under the plan now prescribed, shippers will apply for cars as usual and if their requisitions are not filled, they are to apply to the Food Administration at Washington, or its local agents. Dealers in grain and grain products, not promptly served by the railroad agent, may, after a reasonable time, apply to the representative, for that zone, of the Food Administration, Grain Division, giving name of consignee, name of commodity and all details. Shippers of sugar, beans, rice, perishable fruits and livestock, if not properly served, may apply directly to the Food Administration in Washington, giving all details. Diversion in transit will not be permitted except for perishable freight. It is hoped that the new arrangement will enable the Food Administration to give to the director-general of railroads definite information so that cars can be distributed to supply the most acute needs.

Relief for the Cotton Situation

In accordance with plans which have been worked out for greater co-operation between the railroad administration and the Shipping Board, Edward Chambers, traffic adviser to Mr. McAdoo, on February 1 sent a telegram to C. H. Markham, regional director for the southeastern railroads, authorizing him to accept and forward at current rates via Brunswick, Savannah or Charleston 50,000 to 100,000 bales of cotton for domestic consumption in New York or vicinity or in New England, stating that the Shipping Board will provide ships which will be operated in the regular lines. Mr. Chambers said that there might be some delay at ports awaiting ships, but nothing serious, and that it might be well to arrange to unload cars at ports on arrival, assuming that sufficient storage capacity was available to accept the cotton should it all accumulate before the ships arrived. The cotton should be

routed, he said, via either of these southern ports in an amount sufficient to make full cargoes for New York or New England ports and any desirable rail route to the southern ports might be used, regardless of tariff obligation, at the rate in effect over any route from the same point of origin. Special authority would be issued if it were necessary to use an unauthorized route.

This action was taken in answer to many requests from the south and southwest for relief of the situation caused by cotton being held up in transit. Most of the mills in New England and New York are working principally on government orders. Arrangements were also made to send additional ships to Galveston to carry the accumulation from Texas and Oklahoma when destined for domestic consumption in New England. Representatives of the National Association of Cotton Manufacturers and of the New England association were in conference with Mr. Chambers the day the order was issued and they were much gratified, as many of the mills were running on part time and some were facing a complete shutdown, due to the inability to get the cotton from the south. With the full co-operation of the Shipping Board it is expected that the plan outlined will relieve the situation.

Pipe Line Traffic in December

The United States Geological Survey has issued a statement showing the movement of crude petroleum in December, 1917, as reported by 180 pipe line and refining companies that handle or receive oil direct from the productive fields east of the Rocky Mountains. This compilation includes statements filed by 44 companies operating in the Appalachian field, 83 in the Oklahoma-Kansas field and 53 in smaller fields.

Crude Petroleum Moved from Field Sources (bbls.)

| Field | December, 1917 | November, 1917 | December, 1916 |
|-------------------------|----------------|----------------|----------------|
| Appalachian | 1,870,578 | 2,014,190 | 1,617,734 |
| Utah-Indiana | 229,316 | 281,229 | 274,628 |
| Illinois | 1,694,127 | 1,235,761 | 1,413,075 |
| Oklahoma-Kansas | 12,543,980 | 13,289,455 | 9,940,783 |
| Central and North Texas | 993,805 | 986,444 | 849,857 |
| North Louisiana | 509,510 | 294,389 | 782,983 |
| Gulf Coast | 1,773,225 | 1,613,538 | 1,815,004 |
| Rocky Mountain | 853,602 | 777,906 | 674,846 |

The stocks of crude petroleum on hand at the end of December were, in barrels:

| Source of oil | | Source of oil | |
|-----------------------|------------|-------------------------------|-----------|
| Appalachian | 4,042,829 | Central and North Texas | 5,374,721 |
| Utah-Indiana | 1,906,848 | North Louisiana | 2,643,441 |
| Illinois | 3,585,312 | Gulf Coast | 7,047,337 |
| Oklahoma-Kansas | 94,780,528 | Rocky Mountain | 7,047,337 |

Statistics of petroleum movement in California are not included because of delays incident to procuring first-hand data. In the Rocky Mountain field unusually moderate weather prevailed during the greater part of December. Demand of consumers for crude petroleum in December, though in excess of current production in all fields except the Appalachian and Rocky Mountain fields, was generally less than in November with respect to light gravity oils, but was greater with respect to petroleum valuable for use as fuel. Except in the Oklahoma-Kansas field, the surface reserve of crude oil at the end of 1917 was appreciably less than at the end of 1916.

WOOD USED AS FUEL IN PORTUGAL.—The most serious problem of the year 1916 in Portugal was the scarcity of fuel. Thousands of tons of wood were used by the railways, factories and lighting establishments. All the fast-train services were canceled, with the exception of the express to Madrid three times a week and one between Oporto and Lisbon.

THE BUDGET OF THE SWISS FEDERAL RAILWAYS for the coming year provides, among others, for the following expenditures. For the electrification of tracks, \$3,757,607; for a locomotive roundhouse near the main station of Zurich, \$96,500; for extension of the station of Schlieren, \$68,850; for the reconstruction of the railway on the left bank of Zurich Lake, \$541,400; for a double track from Thalwil to Richterswil, \$96,500; for the extension of the station of Wädenswil, \$19,300; for the extension of the station at Alstetten, \$35,226. In case there should be an improvement in general conditions an additional \$19,300 is to be expended for the extension of the station at Wädenswil; \$38,600 for the transfer of the station at Horren; and \$19,300 for the extension of the station at Winterthur.—Commerce Report.

Commission and Court News

Interstate Commerce Commission

The Interstate Commerce Commission has announced further hearings on the tentative valuation of the Kansas City Southern, one at Kansas City on March 5 on all subjects except the "other values and elements of value," and one at Washington on March 14 on that subject.

Private Car Inquiry

The Interstate Commerce Commission, which recently issued an order reopening the inquiry concerning private cars, begun in 1913 but never completed, has issued a questionnaire for the purpose of bringing down to date the data called for on February 27, 1913. The commission intends to hold further hearings at convenient points throughout the United States to give all interested further opportunity to be heard. Forms calling for statistical data are returnable by March 1. The questions asked call for information regarding the organization of the individual company, firm or corporation owning cars, capitalization and stockholders, number and kind of cars, and statistics showing cost of construction, operation, maintenance, etc., mileage made, character of traffic handled, earnings, rental or other charges collected from or through railroads for use of cars, payments to railroads for hauling, etc.

Personnel of Commissions

Seymour VanSantvoord, chairman of the New York State Public Service Commission, second district, whose term of office expired on February 1, sent to the governor his resignation on the day before, suggesting, in a sarcastic letter, that the governor ought to have made known his intention either of reappointing or of naming a successor. Commissioner James O. Carr, whose term has two years to run, has also sent in his resignation. William T. Emmet, another member of the same commission, died at his home in New York city on February 4 at the age of 49. Of the five members of this commission, two only remain in office, Messrs. Irvine, and Barhite; and the commission therefore can issue no orders. For two vacancies on the commission for the First District, the Governor nominated two men several weeks ago; but the nominations have been held up in the Senate Committee. It is expected, however, that these two men, C. B. Hubbell of New York, and F. J. Kracke of Brooklyn, will be confirmed this week.

Court News

Admission of Liability—Compromise

The Colorado Supreme Court, in an action for damages for killing a cow, holds that evidence that the defendant's claim agent offered to pay in settlement a sum less than one-half of the amount claimed is inadmissible as an admission of liability, for the offer must be deemed to have been one of compromise.—*C. B. & Q. v. Peppard* (Colo.), 169 Pac., 282. Decided 2, 1917.

Claims for Damages to Live Stock

The Michigan Supreme Court holds that though a uniform live stock contract filed with the Interstate Commerce Commission declared that no claim for damages should be allowed unless made in writing, verified by affidavit and delivered to the traffic manager of the carrier within five days from the time the stock is removed from the car, a written communication by the railroad company's local agent at the place of destination made within the time limit prescribed, which stated that the animals had been injured and that claim would be made, is a sufficient compliance with the requirements for notice.—*Snyder v. King* (Mich.), 165 N. W., 840. Decided December 27, 1917.

Crossing Accidents

Where a motorist slackened speed on approaching a track and looked for approaching trains, the Michigan Supreme Court holds that he cannot be held guilty of contributory negligence as a matter of law, though he did not stop and was struck by a train slowly backing along the track, the night being so dark that he could not see the approaching train, on which there were no lights as there should have been, and hence the question of the motorist's contributory negligence was for the jury.—*Mills v. Waters* (Mich.), 165 N. W., 740. Decided December 27, 1917.

Workmen's Compensation

A brakeman was killed at about the time when two cars of an interstate milk train were being coupled. He had charge of the coupling. In proceedings under the New York Workmen's Compensation Act it was contended by the railroad that the death was caused by non-compliance with the Federal Safety Appliance Act and therefore the Workmen's Compensation Act did not apply. The Appellate Division holds that under the evidence the State Industrial Commission was justified in finding that there was no violation of the Federal Act and no negligence of the employer; and the fact that the commission was unable to say what was the cause of the death was immaterial, so long as the cars and appliances were within the law. The commission's award under the New York laws was therefore affirmed.—*Zimmerman v. New York Central*, 167 N. Y. Supp., 501. Decided November 14, 1917.

Tariff Provisions

In a tariff rate case it appeared that the defendant railroad, the Chicago, Milwaukee & St. Paul, has a line from Linton, N. D., through Strasburg, N. D., to Minneapolis, Minn. Its freight tariff names 17 cents per 100 lb. for wheat from Strasburg to Minneapolis, and 16 cents from Linton, the next more distant station, to Minneapolis. The tariff also provided: "Between stations on the C. M. & St. P. rates to and from intermediate stations will be the same as shown to or from the next more distant station to or from which rates are named." The Minnesota Supreme Court holds that this provision applies only to shipping points to or from which a specific rate is not named and which are intermediate between stations to or from which a specific rate is named, and does not apply to Strasburg; and that the legal rate for shipments from Strasburg is the specific rate named therefor.—*Reliance Elevator Co. v. C. M. & St. P.* (Minn.), 165 N. W., 867. Decided December 21, 1917.

Irregularity in Foreclosure Sale

In a suit to foreclose a mortgage on railroad property, the court, having decreed a sale, confirmed the order of sale without an order nisi. On application by a creditor, bondholder and stockholder of the company to set aside the sale and the order confirming it, it appeared that the applicant admitted liability to inform the court of any person or corporation which, in his judgment, would reasonably be expected to become holders for the property, should the sale be set aside, and it did not appear that better terms could reasonably be expected in case of resale. The Circuit Court of Appeals, Sixth Circuit, holds that though the sale was confirmed without an order the irregularity did not prejudice the applicant, and was no ground for setting aside the order confirming the sale, for the applicant had the opportunity, and did in fact present his objections to the confirmation, and it did not appear that the result would be advantageous.—*Painter v. Union Trust Co.*, 246 Fed., 240. Decided December 4, 1917.

Injuries to Car Repairer

A train crew moved railroad cars to and from the yard of an oil company; the oil company exercised no control over the crew, except to instruct the conductor when the train entered the yard where to place incoming cars. In an action for the death of a car repairer in the employ of the oil company working on outgoing cars the Connecticut Supreme Court of Error holds that the crew did not become the servants of the oil company, but remained the servants of the railroad company. When the conductor of such train crew was given the list of locations of incoming cars and

the list of outgoing cars, he had a right to assume that he could move such cars in the usual course, and though charged with knowledge that repairs were made on cars on any of the oil company's tracks, the crew were entitled to believe that no repairs were then in progress on the cars on the tracks specified in the list, and, in the absence of notice that an employee was working on any of the cars, were under no duty to look under the cars, and were not negligent in moving them in the usual way.—*Campbell v. N. Y., N. H. & H., 102 Atl. 597. Decided Dec. 15.*

Workmen's Compensation—Roundhouse Accident

A fireman ran from J. to G. and return, reaching G. at 9:40 a. m. and leaving on the return at 4:10 p. m. On arrival at G. engines were taken in charge by the roundhouse crew, but the firemen while at G. were subject to call and as they left the premises were expected to leave information as to where they could be reached. They were also expected to be ready to take the engine one hour before leaving time, and a rule required them to see that the engine was properly equipped with the necessary tools. There was evidence that there was no set time for performing this duty and some slight evidence of a custom of the firemen to make small repairs. About one o'clock on the day of his death, the fireman in question, after returning from his dinner, put on his working clothes and went to the engine in the roundhouse. About half-past two his dead body was found on the floor of the roundhouse beside the engine and his hands and face were greasy. The Michigan Supreme Court held that the evidence warranted an award by the Industrial Accident Board on the theory that he was on duty when he sustained the fatal injury.—*Meyers v. Michigan Central (Mich.), 165 N. W., 703. Decided December 3, 1917.*

Attempting to Board Train on Off Side

At a station near a large factory where hundreds of workmen took an afternoon train, one of these, intending to board a six-car train, took his stand with others on the side of the track opposite the station platform, and between the main track and three freight cars. As the train drew in, others between the tracks attempted to board it, and one, swinging out, knocked down others, and finally the one first mentioned, who was fatally injured. The New Jersey Court of Errors and Appeals, in an action for his death, holds that there should have been a non-suit, or a direction of verdict, for the defendant. There was nothing to show that the railroad ought to have anticipated, not only that intending passengers would place themselves in the narrow and dangerous space between the main track and the freight cars—a thing that had not happened before—but that one of them would miss his hold and be the immediate cause of injury to others. And if this were a contingency to be anticipated, it was at least as obvious to the deceased as to the company, and in that case the deceased assumed the risk of injury. If it were conceded for the sake of argument that the men were justified by custom in standing on the off side of the main track, there was ample room at either end of the three freight cars to receive the overflow from the platform. The only reasonable inference was that they wished to be first aboard, and endangered their lives and limbs to accomplish that end.—*Kelleberg v. Raritan River (N. J.), 102 Atl. 350. Decided November 19, 1917.*

Relief Fund Sustained

The Pennsylvania Supreme Court holds that a regulation of a railroad relief association that should a member or his legal representative bring suit against the railroad for damages for injury or death, payment of benefits from the fund on account thereof should not be made until such suit should be dismissed, and that any judgment in the suit should preclude any claim on the fund, and should operate as a release in satisfaction of all claims against the company, was valid and was a good defense to a widow's action of assumpsit on the certificate after she had recovered a judgment in a suit against the railroad for the death of her husband, which had been fully paid.

Section 5 of the Act of Congress of 1908, relating to injuries in interstate commerce, and providing that any contract or regulation intended to enable any common carrier to exempt itself from any liability created by the act should to that

extent be void, does not intend that there should be both a payment of benefits from a railroad association fund and a recovery of damages for the injury, at least in so far as payments for both are to be made by the same defendant, in view of the provisions of the act that no action for damages against a common carrier it may set off any sum paid by it to any relief benefit that may have been paid to the injured employee.—*Gatkin v. Pennsylvania (Pa.) 102 Atl. 506. Decided June 30, 1917.*

Railroad Reorganization

The federal district court for the Eastern District of Missouri, in proceedings for the appointment of an additional receiver for the M. K. & T., makes the following rulings. The fact that a receiver of a railroad has expressed his views to those undertaking to formulate a plan of reorganization was not sufficient ground for appointing an additional receiver, where he had not exceeded the limitations or proprieties of his position, or intended to impress his views on those engaged on the plan of reorganization, and had done little more than give his opinion when it was sought, especially where those at work on the plan of reorganization stated that its terms were not based on anything the receiver had said, and the opinions expressed by him related to future conditions about which skilled and competent men might widely differ.

The court will not approve a plan of reorganization of a railroad having no adequate provision for future capital requirements or in which the financing is so close to probabilities that earnings are likely to be absorbed in a lean year or a succession of them by fixed charges, though to avoid such a plan it is necessary to make the interest on junior securities contingent rather than fixed, especially as the public has an interest in every railroad reorganization accomplished by foreclosure; and in practice, when the margin between net income and fixed charges becomes small or disappears under adverse conditions, the insistent demands of contract obligations are always met at the expense of those of a more general, less definite, character.—*Central Trust Co. v. M. K. & T., 246 Fed. 154. Decided October 13, 1917.*

Keeping Vestibule Doors Fastened

In an action for damages for the death of a passenger, it appeared that he was missed from the train soon after it left Kirksville, Mo., north bound, by his daughter-in-law. Next morning his body was found on the track half a mile south of Kirksville. The train, when it passed that spot, was traveling at about 40 miles an hour. It consisted of two sleeping and one chair cars, all vestibule cars. The deceased had been sitting in the chair car, which was in front. In an action for his death the plaintiff's theory was that the deceased fell from the rear sleeper; that knowing the train was a vestibule train he walked to the rear, for some purpose not known, and on stepping on the rear platform found the gate open, fell through, and met his death. The railroad's theory of the case was that the deceased left the train at Kirksville and walked back half a mile down the track and was layed and killed. There was no evidence of robbery. The specific negligence charged was failure to keep the openings to the train securely closed and fastened. The railroad introduced evidence tending to show that the rear gate was up and securely fastened at the time. This was sworn to by the conductor and brakeman. The Kansas City Court of Appeals held that the questions whether the railroad negligently left the rear gate open and whether the passenger fell through the open gate were for the jury. The jury found for the plaintiff, but a judgment in her favor was reversed because of an erroneous instruction declaring that it was the railroad's duty to keep both the door and the gate fastened. It was held that, while a passenger on a vestibule train is privileged to go backward and forward through the train, vestibule doors being maintained for his protection, if the railroad keeps the gate to the platform of the rear coach securely fastened it is not bound to keep the door of that coach fastened. By the instruction given, the jury might have found for the plaintiff by reason of the fact that the rear door of the rear car was not locked even though it found the rear gate was fastened.—*Daly v. Pryor (Mo.), 198 S. W., 91. Decided November 5, 1917.*

Equipment and Supplies

Locomotives

Specifications have recently been determined on orders received by the American Locomotive Company some months ago for the following locomotives:

LONG ISLAND.—4 eight-wheel switching locomotives weighing 203,000 lb.

PORTLAND TERMINAL RAILROAD.—2 six-wheel switching locomotives weighing 166,000 lb.

DELAWARE & HUDSON.—20 Consolidation locomotives weighing 295,000 lb.

CENTRAL VERMONT.—5 Mikado locomotives weighing 276,000 lb.

DELAWARE, LACKAWANNA & WESTERN.—15 Mikado locomotives weighing 321,000 lb.

The first, third and fifth items have been previously reported in the *Railway Age*. Every one of the locomotives in the above list will be equipped with a superheater.

Freight Cars

THE ATLANTIC COAST LINE is reported as having ordered 1,000 40-ton steel underframe ventilator cars from the Standard Steel Car Company.

RUSSIAN GOVERNMENT.—The American Car & Foundry Company has been informed by the Russian Commission to postpone indefinitely the construction of its order for 6,500 1,200 pood four-wheel box cars.

Signaling

THE CINCINNATI, NEW ORLEANS & TEXAS PACIFIC (Southern Railway System) has ordered from the General Railway Signal Company material for an automatic block signal installation between Moreland, Ky., and South Fork, 10 miles, and between Helenwood, Tenn., and Lancing, 26 miles.

THE GREAT NORTHERN is about to make automatic block signal installations between Stryker, Mont., and Rexford, 31 miles, and between Long Lake, Minn., and Delano, 11 miles. These installations will require 75 single arm, upper quadrant, 3-position, top-of-mast, Model 2A signals. The material will be furnished by the General Railway Signal Company and installation will be made by the railroad company's forces.

THE COAL BURNED BY STEAM VESSELS on the oceans aggregates in normal times about \$250,000,000 a year in value out of a total of nearly \$700,000,000 worth passing out of the coal producing countries of the world, according to a bulletin of the National City Bank of New York.

RAILROAD INVESTMENTS OF FRANCE.—In 1923 France will turn over to the Spanish nation all the leading railroads in Spain, which the Republic built and administered under a 99-year lease. It is interesting to note that the roads have cost France more than was expected, and some of the most expensive tunneling in the world was done in northern Spain, where in some sections as many as 20 tunnels within a few miles had to be excavated through the mountains. Many of the lines are antiquated, single track affairs. French investments in Russian railroads have been tragic. For instance, it is estimated that France advanced \$800,000,000 to Russia to construct strategical railroads, particularly in connection with troop moving. Not a dollar of this money, apparently, was spent in railroad building, and it was this lack of transportation which in part led to the military downfall of Russia. Legislative tangles and lack of imperial ukases prevented the French cash from being utilized for what it was intended.—*Wall Street Journal*.

Supply Trade News

A. E. Crone has been elected vice-president and general manager of the Buffalo Brake Beam Company, New York, effective February 1.

The Barco Manufacturing Company, successors to the Barco Brass & Joint Company, Chicago, has recently appointed the Holden Company, Ltd., of Montreal, as its exclusive Canadian agents.

Ben D. Christian and D. B. Graze have been appointed representatives at the Cleveland office of the Crocker-Wheeler Company of Ampere, N. J., succeeding Howard Dingle and W. W. Clark. Effective February 1.

John F. Gilchrist, treasurer of the Federal Sign Company, has been elected president, succeeding J. H. Goehst, deceased. James Gilchrist, at present secretary, has been elected secretary and treasurer and other officers have been re-elected.

Arrangements have recently been completed whereby the business of both the Goldschmidt Detinning Company and the Goldschmidt Thermit Company will hereafter be conducted by the Metal & Thermit Corporation, with general offices at 120 Broadway, New York City.

The Walter A. Zelnicker Supply Company, St. Louis, has established permanent offices at Minneapolis, Minn., 627 Plymouth Bldg., to serve the north central and Canadian trade. Richard K. Papin, formerly St. Louis and Southwestern representative of the Davenport Locomotive Works and for ten years manager of the Zelnicker Company's equipment department, is in charge.

The twenty-fifth anniversary of the organization of the Chicago Railway Equipment Company was celebrated by a dinner given at the Union League Club in Chicago on Tuesday night. The guests included a large number of leading railway manufacturers and other persons interested in the railway supply industry. E. B. Leigh, who has been president of the company throughout its successful career, presided and short addresses were made by officers of the company and a number of the guests.

H. S. Cooper, vice-president of the Independent Pneumatic Tool Company, manufacturers of pneumatic tools and electric drills, who for many years was the manager of the company's eastern branch in New York city, effective February 1, assumed the duties of general sales manager as well as those of vice-president and will have his headquarters at the general offices of the company, Thor building, Chicago. R. T. Scott, the former Pittsburgh branch office manager, has been promoted to the office of eastern manager with headquarters at 170 Broadway, New York. H. F. Finney, who formerly traveled the Chicago and St. Louis territories, has been placed in charge of the company's branch office at Pittsburgh, Pa.

Trade Publications

STANDARDIZED BUILDINGS.—The Trussed Concrete Steel Company, Youngstown, Ohio, has issued a 24 page booklet describing its standardized structures which it carries in stock for quick construction. The book gives in detail the nature of the construction of these buildings and contains a number of illustrations of them in service.

"MY DEAR JIM."—This is the title of a small booklet issued by the Carnegie Steel Company in the form of a letter from a retired steel man to a friend in Medicine Hat. The letter tells in entertaining language of the growth of the Carnegie Steel Company during the last 20 or more years, both as to the extent of its plants and the variety of its products. Following the general outline of the latest Carnegie Shape book, detailed information is given concerning the various sections rolled for structural and industrial purposes, giving the trade reasons for introducing the newer sections.

Financial and Construction

Railway Financial News

BUFFALO & SUSQUEHANNA.—A. A. Jackson, vice-president of the Girard Trust Company of Philadelphia, has been elected a director to succeed Edward B. Smith, deceased.

CHICAGO, MILWAUKEE & ST. PAUL.—The directors, at the regular meeting on January 31, decided to defer action on the semi-annual dividends on both the preferred and the common stocks. H. E. Byram, president, said that the action of the board did not mean that the dividend has been passed, but he would not say whether or not the dividend question would be taken up at a later meeting of the directors, when a more definite knowledge of the terms under which the Government will take over the roads will be possible. He intimated, however, that if the present program for Government control goes through the St. Paul will receive enough to meet its dividends requirements.

DENVER & RIO GRANDE.—Default has been made in the payment of the interest due February 1 on the first and refunding mortgage 5 per cent gold bonds issued August 1, 1908. The semi-annual payment amounts to \$825,975.

See also editorial comments elsewhere in this issue.

HASTINGS & NORTHWESTERN.—See Union Pacific.

NEW MEXICO CENTRAL.—This company has increased its capital stock from \$500,000 to \$2,500,000.

PHILADELPHIA & WESTERN.—W. Barklie Henry, Edward F. Beale and Charles H. Bean have been elected directors to fill vacancies caused by the death of Edward B. Smith and the resignation of George R. Sheldon and G. Trowbridge Hollister, of New York.

ST. LOUIS & SAN FRANCISCO.—The Federal District Court at St. Louis on January 29, formally dissolved the receivership of this company. The court reserved the right to pass on any claims that hereafter may be made against the company as constituted when it went into receivership.

UNION PACIFIC.—The Hastings & Northwestern which operates that portion of the Union Pacific line from Hastings, Neb., to Kearney, 41 miles, has been taken over by the Union Pacific, becoming a part of the system.

WESTERN PACIFIC.—The Western Pacific Railroad Corporation on February 5 declared an initial dividend of 6 per cent on the \$27,500,000 preferred stock, due in quarterly installments beginning February 20. The second payment of 1½ per cent will be made April 1 and the others of equal amount on July 1 and October 1. The corporation is holding company for the Western Pacific Railroad, owning all of the latter's \$75,000,000 stock. On this stock a dividend of approximately \$2,000,000 was paid last December and from this return into the corporation's treasury the preferred stock dividend will be paid.

Railway Construction

ESSEX TERMINAL RAILWAY.—This company is building a steel bridge with concrete foundations, 75 ft. long, over Turkey creek at Ojilway, Ont.

FINANCES OF DUTCH RAILWAYS.—The gross receipts of the State, Holland, and Netherlands Central Railway companies during the first six months of 1916 were 45,029,014 florins (\$18,101,664). Fares were increased 20 per cent beginning January 1, 1917, but the gross receipts in the first six months of 1917 were increased in much less proportion, being 48,135,614 florins (\$19,350,517). The expenses rose in much greater proportion, from 42,161,235 florins (\$16,948,817) during the first six months of 1916 to 48,340,585 florins (\$19,432,915) in the corresponding period of 1917. Thus the business shows an actual loss in 1917.—*Commerce Report.*

Railway Officers

Executive, Financial, Legal and Accounting

J. C. Potter has been appointed auditor and treasurer of the Meridian & Memphis, with headquarters at Meridian, Miss.

Ralph M. Shaw, assistant general counsel of the Chicago Great Western, with headquarters at Chicago, has been appointed general counsel, succeeding J. B. Payne, effective January 28.

H. M. Ristley, head of the transfer department of the Illinois Central, at New York, has been appointed assistant treasurer with headquarters at New York, succeeding R. E. Connolly, promoted.

Osgood H. Dowell, assistant counsel of the Eastern Railroad Association, Washington, D. C., has resigned to become a member of the patent law firm of Emery, Bootz, Janney & Varney, of New York, Boston and Chicago. Mr. Dowell will be located at the Chicago office.

C. M. Kittle, senior vice-president of the Illinois Central, has been placed in executive charge of that line in the absence of C. H. Markham, president who has been appointed assistant to the director general of railroads in charge of south-eastern territory with headquarters at Atlanta, Ga.

J. C. Sweeney, who has been appointed general solicitor of the New York, New Haven & Hartford, with headquarters at New Haven, Conn., as has already been announced in these

columns, was born on November 30, 1874, at New Haven, and graduated from Yale University in the class of 1896. He was in private practice at Providence, R. I., until 1904, when he entered the service of the New York, New Haven & Hartford as trial attorney for the state of Rhode Island, with headquarters at Providence, remaining in that position until 1914, also serving as trial attorney for the Rhode Island Company, which operated the street railways controlled by the New Haven. In 1914 he was

J. C. Sweeney

appointed general attorney of the New Haven with headquarters at New Haven, Conn., and on February 1, was appointed general solicitor of the same road as above noted.

Thomas Fletcher Smith, land and tax agent of the Central of Georgia, with office at Savannah, Ga., has been appointed assistant to vice-president and general manager vice **Charles Molony**, resigned to accept service with another company, and **Edwin Burke McCuen** has been appointed land and tax agent vice Mr. Smith.

R. B. Walker, auditor of disbursements, of the Seaboard Air Line, with headquarters at Portsmouth, Va., having resigned to accept service with another company, **H. W. MacKenzie**, controller, announces the following appointments and changes in title of the officers of the accounting department, effective February 1: **T. W. Mathews**, assistant controller; **L. R. Powell, Jr.**, assistant to the controller; **B. B. McCaa**, auditor freight accounts; **V. T. Boatwright**, assistant auditor freight accounts; **S. D. Locke, Jr.**, auditor passenger accounts; **E. P. Ball**, auditor station accounts; **J. S. Hamilton**, auditor disbursements, and **L. L. Knight**, assistant auditor disbursements.

R. E. Connolly, assistant treasurer of the Illinois Central, has been appointed treasurer, with headquarters at New York, succeeding **A. J. Wykes**, deceased. Mr. Connolly was born on August 11, 1884, in New York City and was educated at New York University. He began railway work in August, 1902, as a clerk in the executive office of the Illinois Central and in 1906 was appointed transfer agent. On October 31, 1916, he was appointed assistant treasurer, with headquarters at New York, which position he held at the time of his recent appointment as treasurer of the same road as above noted.

N. W. Smith whose appointment as general attorney of the New York, New Haven & Hartford with office at New Haven, Conn., has already been announced in these columns, was born on November 18, 1873, at Providence, R. I. He was educated in the public schools of his native town also at Bellows Falls, Vt., and in 1896, graduated from Yale College and two years later from the New York Law School. He was admitted to the bar in New York in 1898 and in Rhode Island the following year. In 1899 he became a junior partner in the firm of Edwards & Angell, Providence, and in 1904, was appointed assistant attorney for Rhode Island of the New York, New Haven & Hartford. In 1907, he was appointed attorney for Rhode Island and in 1914, became Rhode Island counsel, which position he held at the time of his recent appointment as general attorney of the same road as above noted. He also served as general counsel of the Rhode Island Company operating the street railways from about the time the New Haven Company acquired control of that company until it was separated in 1914 from the New Haven Company by the decree in the dissolution suit.

Operating

Henry D. Pollard has been appointed assistant general manager of the Central of Georgia with headquarters at Savannah, Ga.

J. M. Mitchell has been appointed superintendent of the Nezperce & Idaho, with office at Nezperce, Idaho, in charge of traffic and operation, succeeding **C. A. Hawkins**, resigned, effective February 1.

A. R. MacGowan, district superintendent of the Canadian Government Railways, at Edmundston, N. B., has been appointed superintendent of the Pennsylvania division of the Delaware & Hudson, with office at Carbondale, Pa., vice **A. Morgan**.

J. A. MacDonald, superintendent of the LaCrosse division of the Chicago, Milwaukee & St. Paul with office at Milwaukee, Wis., has been appointed superintendent of the Prairie du Chien and Mineral-Point divisions, succeeding **L. T. Johnson** who succeeded Mr. MacDonald.

W. F. Eckert, superintendent of the Reading division of the Philadelphia & Reading, with office at Reading, Pa., has been appointed superintendent of the Wilmington and Columbia division, with office at Reading, succeeding **I. T. Tyson** who has been appointed superintendent of the Reading division, with office at Reading.

J. T. Gilmore, roadmaster of the Chicago, Burlington & Quincy, with headquarters at Greybull, Wyo., has been appointed trainmaster and roadmaster of the McCook division in charge of the line from Orleans, Neb., to St. Francis, Kan.,

and from Republican, Neb., to Oberlin, Kan., with headquarters at Orleans, Neb., succeeding **W. G. Dungan**, transferred.

J. Munday, general superintendent of the Rock Island Southern, with headquarters at Rock Island, Ill., was appointed superintendent of the middle division of the St. Louis Southwestern, with headquarters at Mt. Pleasant, Tex., succeeding **E. Richards**, who has been appointed train rules examiner and safety inspector, with office also at Mt. Pleasant, effective February 1.

J. W. Fitzgerald, superintendent of the Tucson division of the Southern Pacific with office at Tucson, Ariz., has been appointed superintendent of the Shasta division, with headquarters at Dunsmuir, Cal., vice **J. W. Metcalf**, resigned, and **W. Wilson**, superintendent, with office at Portland, Ore., has been appointed superintendent of the Tucson division, with headquarters at Tucson, vice Mr. Fitzgerald.

A. L. Haldeman, division superintendent of the Chicago, Rock Island & Pacific with headquarters at Estherville, Iowa, has been transferred to the Minnesota division with headquarters at Manly, Iowa, succeeding **A. E. Wallace**, resigned to go with another company. **C. E. Green**, trainmaster at Bureau, Ill., has been promoted to superintendent of the Dakota division with headquarters at Estherville, succeeding Mr. Haldeman. **O. O. Hawk**, trainmaster at Eldon, Iowa, has been transferred to Bureau, succeeding Mr. Green.

Patrick Minehan, trainmaster on the Mahoning division of the Erie at Youngstown, Ohio, has been appointed assistant superintendent, with office at Youngstown, vice **John M. Condon**, promoted. **Daniel J. Madden** has been appointed trainmaster, with office at Youngstown, vice Mr. Minehan. **Thomas Fitzgerald** has been appointed terminal trainmaster, with office at Cleveland. **Ezra Chadwick**, chief dispatcher, has been appointed trainmaster with office at Cleveland, and **Rolla A. Smith** has been appointed chief dispatcher, vice Mr. Chadwick.

Victor B. Fisher, trainmaster of the Philadelphia & Reading, with office at Tamaqua, Pa., has been appointed superintendent of the Shamokin division with headquarters at Tamaqua, vice **F. J. Hagner**, assigned to other duties. Mr. Fisher was born on July 8, 1867 at Allenwood, Pa., and received a high school education. He began railway work in the spring of 1882, as a messenger on the Philadelphia & Reading and in the fall of the same year became telegraph operator. In the fall of 1885, he was appointed train dispatcher and in May, 1890, went to the New York Central as yardmaster. The following December he returned to the service of the Philadelphia & Reading as train dispatcher and in September, 1897, was appointed assistant trainmaster with office at Tamaqua. In February, 1913, he was promoted to trainmaster which position he held at the time of his recent appointment as superintendent of the Shamokin division of the same road as above noted.

M. M. Sisson, whose appointment as superintendent of car service of the Detroit, Toledo & Ironton with office at Springfield, Ohio, was mentioned in these columns January 25, entered railway service in December, 1901, as a telegraph operator on the Missouri division of the Atchison, Topeka & Santa Fe. He remained with the Santa Fe until December, 1902, following which he was employed in similar work on the Chicago & North Western. From March, 1904, to January,

N. W. Smith

V. B. Fisher

1906, he was storekeeper for the Victor Fuel Company of Denver, Colo.; on the latter date he returned to the Santa Fe on which line he was an operator and trick dispatcher at La Junta, Colo., until November 30, 1908. From December 15, 1908, to February 18, 1909, he was a trick dispatcher with the Union Pacific at Evanston, Wyo.; following which he was trick dispatcher, night chief dispatcher and chief dispatcher with the Santa Fe at Amarillo, Tex., La Junta, Colo., Winslow, Ariz. and Pueblo, Colo. On October 10, 1914, he was appointed chief dispatcher and trainmaster for the Detroit, Toledo & Ironton, which position he held until the time of his appointment as noted above.

C. H. Buford, trainmaster of the Chicago, Milwaukee & St. Paul, with headquarters at Sioux City, Iowa, has been transferred to the La Crosse division, with headquarters at Milwaukee, Wis., succeeding **B. H. McManey**, who has been transferred to the Northern division, with headquarters at Milwaukee. **R. E. Sizer** has been appointed trainmaster of the Prairie du Chien and Mineral Point divisions, with headquarters at Milwaukee, Wis. **J. E. Hills** has been appointed trainmaster of the Twin City terminals, with headquarters at Minneapolis, Minn. The above changes were effective February 1.

Traffic

H. A. Fidler, general freight agent of the Detroit, Toledo & Ironton at Detroit, Mich., has been appointed traffic manager with same headquarters. Mr. Fidler was born in

H. A. Fidler

Ardensville, Pa., on January 12, 1874. He entered railway service on January 2, 1889, and since that date has been consecutively to April 1, 1893, rate and bill clerk of the Cleveland, Cincinnati, Chicago & St. Louis at Danville, Ill.; from April 1, 1893, to August 1, 1895, yard clerk at the same point; from August 15 to November 24, 1895, night clerk in the freight office at Springfield, Ohio; from November 24 to December 26, 1895, receiving clerk in the local freight office of the Ohio Southern at Springfield; from December 26, 1895, to April 1, 1899, rate clerk in the same office; from April 1 to November 17, 1899, claim clerk in the general freight department; and from November 17, 1899, to August 1, 1900, chief clerk in the same department. He was then assistant general freight and passenger agent until October 1, 1900, and later general freight and passenger agent for the same road to June, 1901. He subsequently served as division freight agent of the Detroit, Toledo & Ironton at Ironton, Ohio, and from August 17, 1913, to August 1, 1914, he was traffic manager of the Big Sandy & Kentucky River at Ashland, Kentucky. From the latter date to May 1, 1915, he was assistant general freight agent of the Detroit, Toledo & Ironton at Ironton, Ohio. From May 1, 1915, to March 1, 1916, he was assistant general freight agent at Springfield, Ohio and from March 1, 1916, to January 1, 1918, he was general freight agent at Detroit, Mich., which position he held at the time of his appointment as noted above. He succeeds **F. H. Osborn**, vice-president in charge of traffic and secretary, who has enlisted in government service.

The authority of **T. D. Geoghegan**, traffic manager of the Gulf, Mobile & Northern, with headquarters at Mobile, Ala., has been extended over the Meridian & Memphis.

W. D. Braddock, advertising agent of the Chicago, Rock Island & Pacific, with headquarters at Little Rock, Ark., was appointed general advertising manager at Chicago, succeeding

H. E. Erickson, who has resigned to become advertising manager of Morris & Co., with headquarters at Chicago, effective February 1.

W. H. Ward, whose appointment as general freight agent of the Indiana Harbor Belt, with headquarters at Chicago, was announced in the *Railway Age* of February 1, first entered

W. H. Ward

railway service in the local freight office of the Union Pacific at Omaha, Neb., in 1890. Three years later he went to Chicago to enter the fast freight line department of the Chicago, Burlington & Quincy. In 1896 he entered the employ of the Indiana, Illinois & Iowa, later taken over by the New York Central, with which road he was chief clerk in the traffic department and assistant general freight agent. Approximately 12 years ago he was transferred to the Indiana Harbor Belt, by which company he has been employed ever since. He was chief of the tariff bureau at Chicago during most of that period and at the time of his promotion to general freight agent, succeeding **J. W. Bingham**, resigned.

H. D. Landry, assistant general freight agent of the St. Louis Southwestern, with headquarters at St. Louis, Mo., will have charge of the industrial department in addition to his other duties, effective February 1.

C. E. Veatch, acting general freight and passenger agent of the Missouri & North Arkansas with headquarters at Harrison, Ark., has been appointed general freight and passenger agent with the same headquarters.

J. A. Middleton, formerly freight traffic manager of the St. Louis & San Francisco, is in charge of oil traffic for the Fuel Administration, instead of the Food Administration, as inadvertently stated in last week's issue, page 286.

F. A. Brown, traveling agent of the Chicago, St. Paul, Minneapolis & Omaha, with headquarters at Kansas City, Mo., was appointed general agent of the passenger department, with headquarters at St. Paul, Minn., succeeding **H. H. Lankester**, resigned, effective February 1.

Oscar Plunket, traveling freight agent of the Wabash, with office at Birmingham, Ala., has been promoted to general agent at Birmingham, succeeding **E. H. Blair**, resigned to engage in other business. **Lee Pesca**, commercial agent, with office at Memphis, Tenn., having resigned to engage in other business, that agency will be temporarily in charge of **G. W. Terry**, traveling freight agent.

J. H. Cherry, assistant general freight agent of the Illinois Central at Chicago, has been appointed regional director for the Illinois State Food Administration. Mr. Cherry will have charge of a bureau which will facilitate the movement of food products on the roads of the state with a view to conserving their full edible value. **F. H. Law**, assistant general freight agent at St. Louis, has been transferred to Chicago to succeed Mr. Cherry.

Engineering and Rolling Stock

E. M. Lake has been appointed master mechanic of the Meridian & Memphis, with office at Meridian, Miss.

K. G. Williams, assistant engineer of the Chicago, Rock Island & Pacific, with office at Memphis, Tenn., has been appointed resident engineer of the Union Railway at Memphis, he will also continue to serve with the Rock Island, the Ar-

kansas and Memphis Railway Bridge & Terminal Company and the American Bauxite Company.

M. F. Longwell, resident engineer of the Union Railway at Memphis, Tenn., has been appointed engineer maintenance of way of the Wabash, with headquarters at Montpelier, Ohio.

A. A. Matthews was appointed chief engineer of the St. Louis Southwestern of Texas, with office at Tyler, Tex., succeeding **W. T. Eaton**, assigned to other duties, effective January 28.

R. D. Quickel, fuel agent of the Southern Railway, lines west, with office at Cincinnati, Ohio, having entered military service. **N. C. Kieffer** has been appointed fuel agent, with office at Cincinnati.

C. H. Montague, master mechanic of the Quincy, Omaha & Kansas City and the Iowa & St. Louis, with office at Milan, Mo., having resigned, **J. C. Woods** has been appointed acting master mechanic, with office at Milan.

N. F. Thompson, district engineer of the Middle district of the New York Central, with office at Albany, N. Y. has been appointed district engineer of the Western district, with office at Buffalo, succeeding **F. E. Paradis**, resigned. **B. C. Martin**, district engineer of the Hudson River Connecting Railroad, with office at Castleton, has been appointed also district engineer of the Middle district, to succeed Mr. Thompson.

W. O. Galbreath, whose appointment as chief engineer of the Missouri, Oklahoma & Gulf, with office at Muskogee, Okla., was announced in these columns on January 25, was born in Porter County, Ind. He graduated from Kansas University in 1898 and entered railway service on the Mexican Central in 1899 in Mexico. He was later employed on the Mexican National and the National Railways of Mexico on location, construction and maintenance work. In 1912 he left the latter company to become engineer of maintenance of the Missouri & North Arkansas. He resigned this position in 1916 to go with the Chicago Great Western, remaining with that company until he received the appointment, as noted above.

Special Officers

James F. Holden, vice-president in charge of traffic of the Kansas City Southern, has been appointed by Director-General McAdoo, an assistant to Edward Chambers, traffic advisor of the director general. Mr. Holden will have general supervision over the transportation of the supplies and materials for the Shipping Board and relations between the railroads and the Shipping Board, as was announced in the *Railway Age* of February 1, page 257. Mr. Holden was born in 1861, at Prince Albert, Ont. He began railway work in 1877 and served consecutively to 1880, as clerk to the superintendent and traveling auditor of the Whitby, Port Perry & Lindsay, now a part of the Grand Trunk; and from 1880 to 1883 as chief clerk in the traffic manager's office of the Midland Railway of Canada. The next year he was appointed local freight agent of the same road at Toronto. From 1885 to 1886, he was traveling freight agent of the Canadian Pacific, at Toronto; then for three years was in charge of agents' accounts, in the accounting department of the St. Louis-San Francisco, at St. Louis, Mo., and from 1889, to 1891, he was chief rate clerk in the general freight office of the same road. In November, 1891, he went to the Choctaw, Oklahoma & Gulf and served as auditor and

J. F. Holden

traffic manager until May 1898 and then to July, 1901, as traffic manager. He was vice-president of the same road from July, 1901 to April, 1902, and in February, 1903, was appointed freight traffic manager of its successor, the Chicago, Rock Island & Pacific. In January 1906, he was elected vice-president and general manager of the Midland Valley and since February, 1910, has served as vice-president of the Kansas City Southern, with office at Kansas City, Mo.

Railway Officers in Military Service

Paul M. La Bach, assistant engineer of the Chicago, Rock Island & Pacific, has been commissioned a major in the Engineer Reserve Corps and has been assigned to staff duty in France. Mr. La Bach was recently commissioned as an ensign in the Fleet Naval Reserve but resigned to accept the army commission. He served as an ensign in the Spanish-American war.

Obituary

Charles C. Rosenberg, for the past 11 years secretary and treasurer of the Railway Signal Association, died at his home in Bethlehem, Pa., on February 2, at the age of 63. He had been in poor health for about five years but he was of such cheerful and courageous disposition that his friends in the association, though they met him regularly at meetings, saw little or nothing in his conversation to indicate his illness. He had been in a critical condition since he was stricken with kidney disease, while away from home on January 12.

Mr. Rosenberg was born at West Portal, N. J., on February 5, 1855, and left school at the age of 14 to become apprentice to a carpenter. He entered railway service in 1875 on the Lehigh Valley as a carpenter. Two years later he was made foreman, and in 1880 he was appointed supervisor of bridges and buildings. Railroad signaling was then in its infancy and the Lehigh Valley was one of the pioneers. Mr. Rosenberg kept his eyes and ears open and as the first signals, primitive in design, were put under his supervision he grew with the art; and in 1896 he was made signal engineer. Prior to this, however—1890—he had been superintendent of the crossting plant of the company at Perth Amboy, where he stayed for two years. From 1892 to 1896 he was again supervisor of bridges and buildings, in the territory between Jersey City, N. J., and Mauch Chunk, Pa.; which included important docks at New York harbor. He was one of the earliest members of the Railway Signaling Club, now the Railway Signal Association, and his name is prominent in the proceedings throughout the life of the association. He was its vice-president in 1900 and its president in 1901 and 1902. He retired from railroad service in 1906, having been in the service of the Lehigh Valley continuously for 31 years; and in the same year he was chosen secretary of the Railway Signal Association. His popularity and efficiency as a secretary are everywhere attested.

Mr. Rosenberg is survived by a widow and three daughters, his only son having died a few years ago. He was as popular locally as he was among his railroad acquaintances and was active in civic, religious and political affairs, but not as a politician. He was a member of the Rotary Club of Lehigh University, and although his education was gained, largely, in the hard school of railroad experience, he seemed to be entirely at home among the professors of the university.

C. C. Rosenberg

EDITORIAL

Railway Age

EDITORIAL

In every hearing on an application for an increase in freight rates, railroad executives have consistently and emphatically prophesied disaster in time of emergency if relief were not granted. Shippers, alive only to their own immediate interests, have just as consistently fought any increase in rates on their particular products, or the enactment of regulations which although aimed to increase railroad efficiency or capacity would interfere with the shippers' convenience or special privileges to which they had become accustomed. The predictions of the railway executives have proved true and the shippers are fast awakening to the seriousness of their error. Their industries are suffering and their productive capacity is restricted because of their having crippled not only a faithful servant, but an indispensable one. From a spirit of criticism and fault finding they are rapidly shifting to one of sympathy and support, as is indicated by the article, "Business Papers Advise Shippers," on page 363. While the roads have been taken out of the hands of the regulators who have so willingly and dutifully listened to the shippers in the past, it is to be hoped that these same regulators will not fail to note the change which is now taking place.

The Shoe Now on the Other Foot

There is no new light thrown on the history of the Wabash-Pittsburgh Terminal by the report of the Interstate Commerce Commission, an excerpt from which is published elsewhere in this issue. The report is signed "by the commission" meaning presumably that it was prepared by a more or less "expert"

A Poor Business Venture

hired by the commission and approved of "by the commission." The report characterizes the building of the Wabash-Pittsburgh Terminal as a poor business venture and it was! The Goulds have made rather more than their share of poor business ventures in the railroad field but their entrance into Pittsburgh was about as unfortunate as the worst of them. And yet the Wabash-Pittsburgh was built in order to give Pittsburgh more adequate railroad facilities. Today even the Pennsylvania Railroad directors would acknowledge that Pittsburgh needs more railroad facilities. The Pittsburgh district shippers gained only a fraction of what they would have, had the project been carried out successfully but still they gained something and stand to gain more as time goes on. The investors in this bad business venture lost very heavily. The commission finds in this a proof that it ought to have jurisdiction over railroad security issues. Maybe if the commission had had the power of veto over security issues the independent entrance into Pittsburgh would never have been built. But that is the most that can be said. Is it conceivable that the commission as constituted in 1904 would have done anything constructive? The commissioners could not have done anything constructive. That is not their conception of what they are there for, nor has it been the conception of Congress. The real lesson to be learned by the Wabash-Pittsburgh failure is that an investor must look out for himself. What he can do is to insist on publicity before the investment is made, not ten years after the enterprise has proved a failure.

It takes years to train a skilled mechanic for railroad shop or engine house work. The roads have lost far more skilled

The Problem of Maintaining the Equipment

workers than they can afford, and yet it is of vital importance that the locomotives and cars be kept in the best possible condition. The emergency can be met in one way only and that is by following the British precedent of scientific dilution of labor. The skilled men who still remain in the service must be carefully studied and used as leaders and demonstrators. It is almost a crime under present conditions, for instance, to use a skilled worker on jobs that can be done by unskilled labor, or even by men of a smaller degree of skill or experience. As we have pointed out, time and time again, the railroad shop and engine house forces have struggled along with entirely too little supervision. In the present emergency, and particularly with the large labor turn-over, it is more than ever necessary that adequate supervision be provided. Steps should also be taken by readjustment of wages and conditions to prevent more skilled men from leaving the railroads to go into other industries. Industry and the conduct of the war cannot go forward successfully with a crippled transportation machine. While a certain amount of new equipment may be secured from the builders during the coming months it will be comparatively insignificant in contrast with the equipment now in service which will be called upon to carry the larger part of the burden. Immediate results, and that is what we are after, can best be secured by repairing the cars and locomotives now in service and maintaining them in good serviceable condition.

When last April the Railroads' War Board was established at the national capital Washington became the greatest railroad center in the world. Its importance as a railroad center was increased when on December 28 the government took control of railroad management. The Railroads' War Board was a committee created voluntarily by the railways and possessing only such authority as they gave it. The director general of railroads is a government official possessing the power of a dictator over both regulation and management. Unified operation of the railways during the war is necessary. Perhaps it was desirable to establish government control of their management, although the *Railway Age* has not changed its opinion that if the laws had been so modified as to give the private managements a fair chance they would have got better results than will be obtained under government control. But of one thing we are sure, and this is that the concentration of control of the railways in Washington is a serious misfortune. Washington is a beautiful city which is very sloppy in winter and very hot in summer, which is inhabited chiefly by government clerks, which has only one industry—politics—and which is therefore the worst place in the United States from which to direct the management of the railways. The story is told of a man who called on Lincoln when he was President, and began to tell him what the public thought. "Wait a minute," said the President. "When did you get here?" "Last night."

The Biggest Railroad Center

the man replied. "All right, then," said the President, "you may proceed; but had you been here a week I wouldn't have listened to you, because nobody who has been in Washington a week knows what the public thinks about anything." The man who stays in Washington without leaving it frequently and coming in contact and talking with people elsewhere not only soon does not know what the public thinks, but he soon loses all touch with what is actually going on in the country.

Washington as a Railroad Center

WASHINGTON has no manufactories, no large wholesale houses, no great financial institutions, only one railroad general office, few literary people except those who camp out there a few months at a time to get "copy." Its only industry, as noted in the preceding paragraph, is politics, the staple of its conversation is political gossip, and almost every man who has been there continuously fancies he has become not merely a great statesman, but also a great administrator capable of telling how any big enterprise, from building a powder mill to running the railroads should be handled.

The other great capitals of the world, London, Paris, Berlin, are capitals of industry, finance, commerce, literature, as well as of politics. In consequence, the public men of England, France and Germany, when they are in the capitals, constantly meet in clubs, offices, hotels, homes, at public meetings, the business, professional and literary leaders of the country. Furthermore, they meet them under normal conditions. In Washington public men seldom meet leaders in the professions, commerce, industry and finance except when they go there as supplicants, protestants, or lobbyists. It makes a great deal of difference in the amount they learn from each other whether public men and business and professional men usually meet on friendly and unconventional terms or as our business and professional men and public men usually meet in Washington. The atmosphere of Washington is made up about equally of grapevine telegrams, complaints, statistics, politics and sworn testimony. Our public men would be much more competent to pass intelligently on the industrial affairs of a great nation with the smoke of Pittsburgh or Chicago in their lungs.

Director General of Railroads McAdoo is an able man. He has surrounded himself with men of experience in railway affairs. But both he and they are going to find it extremely hard to keep in actual touch with conditions on the railroads. Their predecessor, the Railroads' War Board, did. Every operating man knows he cannot keep in touch with what is going on on his railroad and do his work efficiently without spending about one-half his time on the road. Many people think railway officers' inspection trips are junkets. On the contrary, they are indispensable to skillful operation. Mr. McAdoo and his staff will not be able to make frequent inspection trips over the railways of the United States. There are 260,000 miles of them. Their opportunities for keeping in touch with transportation conditions will be of the worst. They will be kept fully informed about the pathology of the railroad business but will hear little about its psychology and physiology. They are now being deluged by complaints; but few persons are taking any pains to tell them of the tremendous and heroic exertions that railway officers and employees have made during this terrible winter to keep the lines open. If Mr. McAdoo and his staff were located in New York, Chicago, St. Louis, St. Paul-Minneapolis, they would hear both the good things and the bad things about railway operation, but in Washington, where there are the headquarters of only one railway, they will hear little but the bad things.

The *Railway Age* has not made the foregoing remarks merely to indulge in persiflage at the expense of Washington. It has made them to call attention to a very real danger.

There is nothing more pathetic than the ideas regarding railroad control and management, their proper methods and probable results, that are constantly expressed in some official quarters in Washington. There are more people in that city who never made an inspection trip over a railroad, never were in a shop, and never saw a wreck cleared up, but who have learned all about how to run the railroads from statistics, Interstate Commerce Commission reports and newspapers, than in any other place in the world. Furthermore, some of them have influence—so much influence that they have contributed very greatly toward making railroad regulation a failure. People of this kind will also make government control of railroads a failure if given a chance. There is only one way to run railroads. That is by the process familiarly known among railway men as "railroading." The location of the office of the director general in Washington will be a great handicap to government control. The handicap can be prevented from producing its natural results only by recognizing its existence and acting accordingly.

The Government Standard Locomotives as a War Measure

TO RELIEVE the shortage of power on the eastern roads this country needs more locomotives or better facilities and more experienced help for making locomotive repairs. The problem is not so much the number of locomotives as it is the condition of the power now in operation. Coupled with the great demands of transportation during the past year and the extremely severe winter we are now experiencing, the dilution and the depletion of the ranks of the "railroad mechanic," in addition to inadequate facilities for handling and repairing locomotives, have made the proper maintenance of locomotives a practicable impossibility.

The time has come when something must be done and done promptly to relieve the situation at the earliest possible moment. Better facilities for handling locomotives, both at the shops and at the terminals, are sadly needed and must not be overlooked. New locomotives also will help bring relief. The director general of railroads, appreciating this situation, is to buy locomotives for the government.

It is probable that freight locomotives of standard design will be constructed to relieve a shortage of power wherever it may occur. By thus concentrating on a standard, or if more than one type of locomotive is to be built, on a few standards, it is hoped to so speed up production that the builders will be able to make more prompt deliveries and produce the locomotives at a lower unit cost than if but few each of a number of designs were built. This will be true, of course, to a certain extent.

The design of the locomotive or locomotives thus built must be a compromise as they must meet widely varying conditions. To be used indiscriminately over the eastern roads these locomotives must come within the clearance limitations and the permissible axle loading of any of the roads on which it is contemplated using them. This will in many cases provide locomotives to some roads well under the rating usually given the particular type of power in question and thus reduce the standard train loading, which will increase the cost of operation and make a greater number of train movements necessary.

Where a particular road is in need of a large number of locomotives of a certain class—of which designs have been made and locomotives built—which meets its individual needs much better than any standard locomotive the government will build, there appears no good reason for the government not approving their construction. The first cost may perhaps be greater, as undoubtedly the locomotives will

be heavier than those ordered by the government, but the operating economies to be secured from a locomotive designed more particularly to suit local conditions will make the extra cost well worth while. As far as the promptness in deliveries is concerned there is a grave question, provided these special locomotives are ordered in sufficiently large numbers, as to whether or not any serious delay to the output of the builders will be occasioned.

As a war emergency measure, however, the government standard locomotive will provide a certain degree of relief in a large number of cases.

* * *

A standard freight locomotive, to be successful, must as nearly approach the capacity requirements of all the roads on which it is likely to be used as is possible in any compromise arrangement, such as it must be. Judging from the extent to which Mikado type locomotives have been ordered during the past two years and the number of roads on which they are in service, it would seem that this type best meets the average requirements. The Mikado type, together with a switching locomotive of the 0-8-0 type, may be expected to fulfill practically all of the requirements for standard locomotives needed to meet the war emergency.

These locomotives should be so designed and equipped that they may be worked to capacity every minute of the time they are in service; there are few locomotives of the Mikado type that can meet this requirement unless equipped with a mechanical stoker. The importance of efficiency of combustion, evaporation and steam utilization hardly need be mentioned. The economic value of coal has been too thoroughly driven home during the past few weeks to require any elaboration here. In both of the above types the firebox should be fitted with a brick arch; the boiler should contain a combustion chamber and be fitted with a superheater.

There are good reasons other than those directly affecting the performance of the locomotive why every one of these features should be included in any locomotive of the size under consideration. One of the serious difficulties the railroads are contending with in the present crisis is the excessive turnover of employees in the locomotive service, especially among the firemen. For a number of years there has been a growing difficulty in securing high grade men for locomotive firemen, owing to the unattractiveness of the conditions under which they must work. The effect of the features of locomotive equipment specifically mentioned above, together with many others designed purely as labor savers, in improving these adverse conditions is very clearly brought out by the Eight-hour Commission in one of the appendices (see page 573) in its recent report to the President and Congress.

* * *

The problem of standardization is one which requires the exercise of the greatest wisdom in its settlement. Within certain limits standardization possesses undoubted benefits, which, however, may very readily be more than offset by the disadvantages arising from carrying it too far. The locomotive of today is the product of a long and continual process of development. Had a rigid standard been adhered to during any considerable period of this process, we should be depending upon locomotives which we now consider obsolete. But as a war measure, and for the purposes already mentioned, this objection does not hold against a reasonable standardization program. Indeed, such a program may possess certain advantages from the standpoint of production and first cost, and it is essential for the creation of an effective liquid reserve of power available for transfer from one system or section of the country to another. The transfer of a common type, some of which are in use on many roads, from one road to another would not lead to the difficulties of maintenance which must necessarily arise where

locomotives belonging to one railroad and standard on its lines only, are thus transferred.

To make available all of these advantages, however, the standardization need not and should not be carried beyond the boiler, frames, cylinders, running gear, cab and tender. To standardize the great class of fittings and devices commonly classed as specialties, would be to reduce the available material now in stock and the productive capacity for the turning out of these essential devices, and thereby place a restriction on the speed of locomotive production. Furthermore, to place a discouraging restriction on the continued development and improvement of specialties including possible developments which may have a direct influence on the efficiency and capacity of the locomotive or the convenience and facility of operation or maintenance even for the period of the war, would be a backward step which we can ill afford to take now, or ever.

Relations of Railway

Officers and Employees

RAILWAY OFFICERS have been accused during the last dozen years of many crimes and misdemeanors. Probably no charge ever made against them has attracted more attention or caused more discussion than the accusation of W. G. Lee and A. B. Garretson, heads of two labor brotherhoods, that railway officers have been "lying down," first to discredit the Adamson law and later to discredit government control. Nor has any accusation ever made against them aroused such bitter resentment among railway officers.

The best answer to the charge that railway officers were lying down before government control was adopted is afforded by the facts. In the year 1917, in the face of unprecedented difficulties, and with no increase in facilities, the railways handled more commercial traffic than ever before, and, in addition, a large military traffic. The labor leaders are sore because the report of the Goethals Commission on the operation of the Adamson law disproved the claims they made as to the effects it would produce and sustained the claims the railway officers made. It showed that the law had not reduced hours of work, but had given the members of the brotherhoods a \$61,000,000 increase in wages, which may militate against them getting all the increases they are now seeking.

As to the charge that railway officers have been "lying down" to discredit government control, it is false, unjust and malicious. Consider the irony of the situation! The very men who ordered a nation-wide railroad strike in August, 1916, and who again ordered it in March, 1917, when it was certain that within a few days the country would be at war with Germany, now charge railway officers with lying down! They were prepared to stop every engine, car and train; and now they appear before the bar of public opinion and indignantly accuse railway officers of disloyalty and sabotage. The record of those who make these charges should be a sufficient indication of their motives and purposes.

It is well known to everybody that railway service has been poorer since government control was adopted than it was before. But there can be no doubt as to the main reasons for this. The railways, and especially the eastern lines, were badly congested when the government took control. Even if weather conditions had been normal and there had been no change in control, service would have grown worse; for January almost always is, for various reasons, the hardest month of the year for railroad operation. But the weather was the worst the present generation of railway officers and employees ever had to struggle against. The congestion which already existed and the severe weather are of course

the principal reasons of the demoralization which has prevailed. Railway executive and operating officers and most railway employees never worked so hard in any month in their lives as in January.

Besides all the other unfavorable conditions, December and January were a period of transition. The intention to adopt government control was announced early in December and it went into effect toward the end of that month. There was bound to be much uncertainty, anxiety and confusion at such a time. If the Kaiser had chosen the time to make the transfer from private to government control and the devil had made the weather, the operating conditions could not have been more difficult.

There appears to have been another factor of importance which is hard to estimate. There are indications that discipline has been declining among some classes of employees. As already said, most employees recently have worked harder than ever before; but there is a manifest feeling that under government control the officers have not the authority and power of discipline they had before. The attitude assumed in some quarters was illustrated by the outburst of Messrs. Lee and Garretson when they appeared before the Railroad Wage Commission and found some railway officers there, Mr. Garretson said, "We do not intend to take the position of discussing this question with our former employers." It is also illustrated by the way some employees are treating the public. But if railway employees are now employees of the government, are not railway officers now officers of the government? And, if so, has not a division superintendent the same authority over a conductor or brakeman that he had under private control? If not, how long will there be discipline and efficiency?

If the privates in an army should begin to flout their sergeants, lieutenants and captains, and even their colonels and generals, because they were "working for the government," how long would the army be an efficient fighting body? The privates might be loyal to the government; but if they were not loyal and obedient to their officers, the effects would be much the same as if they were not loyal to the government. These statements apply with equal force to railroad operation.

The government should, of course, make clear to the employees—indeed, it has made clear—that it intends to treat all classes fairly as regards wages, conditions of employment and all other matters. But it should also disabuse the mind of the public, of railway officers and of railway employees of the impression which now seems to prevail, that government control means a change in the relations of employees to their officers.

New Books

Proceedings of the International Railway General Foremen's Association. 104 pages, illustrated, 6 in. by 9 in., bound in paper. Published by the association, William Hall, secretary, 1061 West Wabash avenue, Winona, Minn.

Although the General Foremen's Association held no convention in 1917, a successful effort was made to give the members of the association as much benefit from the organization as possible. The predetermined papers and reports were written and advance copies were sent to the members. The official proceedings contains these papers, together with many written discussions on them submitted by members of the association. The important subjects discussed include Engine Failures, Causes and Responsibilities, Methods of Meeting the Requirements of Federal Inspection Laws, Alignment of Locomotive Parts to Give Maximum Service with Minimum Wear, and What Interest Has the Locomotive Foreman with Car Department Matters. The association is to be congratulated upon the fact that even though no convention was held, a year book has been issued.

Letters to the Editor

Service Department on Railways

NEW YORK.

TO THE EDITOR:

Mr. Fritch's letter on "Creation of Service Department on Railways," appearing in your issue of December 7, is certainly most timely and the recommendations based on his long and valuable experience will undoubtedly carry weight with our railroad executives. His conclusions coincide with my own as based on a wide steam and electric railway experience.

It would seem rational that so long as the government contemplates guaranteeing returns on properties taken over it should insist on the maximum economy as well as efficiency of their operation. If the railroad executives, still in control of these properties, do not themselves accomplish this the government assuredly will, through more direct operation. This would be a long step toward actual government ownership, of whose wisdom not all are convinced. Can our railroad executives, in the light of their remarkable recent accomplishments, afford to neglect any opportunity to develop the maximum possible economy and efficiency of their respective properties?

In two details my conclusions differ from those reached by Mr. Fritch:

(1) On a large property the director of "service" or efficiency work should be, of course, a competent man, experienced in this line of work, with the title of The (or an) Assistant to the President, as a member of his personal staff exercising only such authority as may be specifically delegated by the chief executive but with the full force and effect of all his authority. In some organizations I am convinced such work would be handicapped at the outset if directed by a vice-president, as such.

On a smaller property such service work may better be organized and inaugurated, if not directed, by an outside specialist. The organization as outlined is definite and fixed, probably designed as the ultimate organization for some one property or group of properties. It would seem to me the better procedure in any case to inaugurate the work with a minimum "service" organization, building up that force as the results accomplished warrant its establishment. On most properties it will be found that certain departments or phases of the work need more attention than do others; hence, in order that the service department itself shall be efficient this procedure is practically necessary. Further, as such service work must demonstrate its worth it is desirable that not too much be attempted at the outset, that whatever is done be excellently well done and that definite or positive results therefrom be obtained—which will prove a convincing argument for the value of "the service department."

W. B. YERANCE.

Consulting Engineer and Operator for Public Utilities.

EXPORTATION OF SCRAP IRON OR STEEL.—The War Trade Board calls attention to the fact that the exportation of scrap iron or steel requires an export license, and that any shipper who exports under any different classification (such as second-hand rails, car wheels, etc.) any articles manufactured of iron or steel which are exported for the purpose of being scrapped at destination is guilty of false declaration and is subject to such penalties therefor as the law provides.

Activities of the Railroad Administration

Transportation Conditions Improve; a Waterways Committee Appointed; Standardization

WASHINGTON, D. C.

A MUCH MORE cheerful set of reports of transportation conditions throughout the country has been reaching the office of the Director General of Railroads during the past week as a result of the moderation of the weather, although floods caused by the sudden thaw continue to cause concern. The better movement of coal and of empty cars to the mines has led to a general expectation that the Fuel Administration order for heatless Mondays would soon be rescinded, as it was rescinded as to a large number of southern states last week. Mr. McAdoo and some of his assistants have been in conference with the Fuel Administration on the subject and it was understood for a time that Mr. McAdoo was insisting that the order be rescinded last week, but he was convinced that it was necessary to continue it until the weather allowed coal to be transported more freely and at least until after the holiday on February 12.

The daily statements given out by the Interstate Commerce Commission of reports to Commissioner McChord of congested conditions at various yards and terminals, however, continue to portray a most discouraging state of affairs, and as they represent conditions several days back of the time they are given out the latest reports still show the effect of the most severe weather conditions. In addition to the bad weather, the reports show a serious condition of shortage and bad condition of power, large numbers of bad order cars, shortage of labor for repairs, delays on the road and at terminals, delays by consignees in unloading cars, and a general cramped condition in the yards which makes prompt handling of cars difficult or impossible. The reports of the inspectors are given out in mimeograph form without comment, but by the time they get into the newspapers they have frequently been accompanied by inferences which the reporters have not always reached without assistance, and statements that the conditions are due to deliberate neglect on the part of railroad officers before the period of government control, and in one widely published story it was asserted that the conditions date from the time when government control was decided upon. All of which naturally causes indignation among railroad officers who have long been predicting publicly that their facilities would be found inadequate to the traffic. For example, the report for February 11 stated that in the Pennsylvania Philadelphia yards on February 8 only 79 trains of 2,291 cars were moved, while 58 trains were held because of no power being available, and that there were 2,400 empty coal cars in the yard, only 247 having been moved west during the past 24 hours. There were 44 locomotives out of service for repairs, 12 being held waiting for material. On January 30 there were on hand for city delivery 2,847 cars, available for unloading, while only 1,127 were unloaded. On February 6 of 2,839 cars available only 986 were unloaded.

At Harrisburg yard on February 7 it was reported that of 457 locomotives assigned, 83 were out of service for repairs. The average time for turning engines at Enola enginehouse was given as 6 hours and 3 minutes, at another 6 hr. and 47 min., and at another 7 hr. and 36 min.

On the Middle division on February 7 it was reported that during the previous 24 hours the number of cars delivered was 2,501, and received 3,070, while 10,709 cars were left over for movement to connecting divisions. On February 3 it was reported that of 46 crews started eastward and 48 started westward, 13 eastward crews and 32 westward crews were relieved on the line under the 16-hour law and

one was required to exceed the 16-hour limit. It was also stated that "for each one of the crews involved, initial terminal delay was excessive."

The East Altoona enginehouse, it was stated, furnished 92 locomotives for 37 westbound trains, being short 86 locomotives for 35 trains, and 48 eastbound locomotives were ordered for which only 32 were furnished. There were 39 locomotives turned out of the enginehouse in 24 hours and 42 in the house on which work would not be completed during the next 24 hours.

At Pitcairn yard it was stated that the yards were so full that classified trains were stored in channels foreign to their proper movement, wherever room could be found for them. It was also stated that the shortage of power was aggravated by the use of freight locomotives for passenger service.

On the New York, New Haven & Hartford on February 5 it was stated that the entire movement was 10,238 cars and there remained on hand awaiting movement 13,595 cars. Similar reports were given for other roads but the report on the Pennsylvania was given more in detail than for other roads.

Washington has been suffering from a fuel famine and the local fuel administrators have ascribed the cause principally to transportation conditions, but Mr. McAdoo's office had a check made and showed that during the period when the coal shortage was at its worst there were usually over 100 more cars available for unloading each day than were unloaded.

Waterways Committee Appointed

Director General McAdoo has appointed a committee of three members to investigate the inland and coastwise waterways of the country and advise him as to the best means of putting them to advantageous use in solving the transportation problem:

The personnel of the committee is as follows: Major General W. M. Black, Chief of Engineers, U. S. A., chairman; Walter S. Dickey, of Kansas City, Mo.; G. A. Tomlinson, of Duluth, Minn., and Colonel Charles Keller, Corps of Engineers, U. S. A., secretary.

Work was begun by the committee immediately following its appointment. The initial step was the assignment of Major S. W. Fox and Major John Stewart, of the United States Engineer Corps, to investigate and report at once the condition of the Chesapeake & Ohio Canal with recommendations as to its utilization and capacity for traffic.

Consideration will also be given to the availability of other waterways throughout the country, such as the Hennepin, Delaware & Hudson, Morris, New York State Barge, Chesapeake & Delaware and Delaware & Raritan canals. The coastwise, Mississippi and lake traffic will also come in for serious attention.

General Black, who in addition to his strictly military duties, is charged as Chief of Engineers with supervising the improvements of rivers and harbors, is well acquainted with all of the waterways of the country. He has been very active in promoting their employment by commercial interests. Appointment of the Committee on Inland Water Transportation of the Council of National Defense was due in great part to his efforts, and since that appointment was made he has insisted upon the use of the waterways for transportation whenever it was more economical or feasible than the use of other means of transportation. He strongly favors the

policy of giving the best transportation to the nation at a minimum cost, regardless of whether it be by water or rail.

Mr. Dickey, who is a manufacturer of burnt clay products with plants in eight cities, long has been active in promoting waterways transportation improvements, and he was largely instrumental in the organization of the Kansas City-Missouri River Navigation Company. This corporation was financed through public subscription and now efficiently operates a boat line between the two cities.

Mr. Tomlinson is one of the shipping leaders of the Great Lakes region. He is identified with the American Shipbuilding Company and has devoted his energies to the up-building of the shipbuilding industry of the country. His interest in the shallow draft waterways of the Atlantic coast as logical extensions of the deeper waterways of the Great Lakes was largely instrumental in his being named as a member of the committee.

Colonel Keller has for several years been on duty as assistant to the Chief of Engineers with particular charge of the executive duties pertaining to the Inland Waterways Commission. He not only is intimately acquainted with virtually all of the inland waterways of the country, but also with a great number of persons who reside near them.

The committee has been instructed by Mr. McAdoo to devote its first attention to projects which can produce results within the year. It will devote particular attention to correlating rail and water transportation and will report as to various projects which have been suggested as to whether better results can be obtained by the expenditure of money on the water facilities or on rail facilities. Mr. McAdoo's authority under the pending railroad control bill in Congress does not extend to the construction of waterways but he is authorized to make expenditures for their equipment.

Standardization

Standardization of railroad cars and locomotives and their parts is one of the plans on which the railroad administration is working and one by which Director General McAdoo expects to accomplish important results. The administration expects to let contracts for a considerable amount of equipment and power, to be paid for out of government funds, after Congress has passed the bill providing an appropriation for the purpose, and it is expected that contracts will also be placed by individual roads under the supervision of the government through its division of purchases, which is under the direction of John Skelton Williams. To what extent it is proposed to have this division take over purchases, or whether it will confine itself principally to the purchases out of government funds has not been made clear, but it is apparently the intention that even if it does not actually make purchases it shall establish standards to be followed by the railroads in making their purchases while under government control and it is hoped to be able to carry the programme to such an extent that

the standards set by the government will be made permanent. It is understood that for this purpose railroad purchasing agents and experts in various lines will be drafted to form a general purchasing or standardizing board on Mr. McAdoo's staff.

Mr. McAdoo has referred to the possibility of standardization as one of the greatest reforms that can be accomplished in the railroad business and while he has not indicated whether or not he would go so far as to destroy the value of patents or of plants making particular specialties by prescribing certain types as standard to the exclusion of all others he has shown that he has great enthusiasm for the general idea. A study is being made for him of the patent situation. He also expects to be able to reduce prices by the fact that hereafter there will be but one buyer for equipment and supplies.

It is considered likely that the designs of the American Railway Association Committee on Standard Box Cars may be used as the basis for the proposed box car standards.

Inspectors to Report on Service

While Messrs. Lee and Garretson have been charging railroad officers with "laying down" and deliberate inefficiency in managing their roads in an effort to discredit the government, some other people have been talking about some examples of inefficiency and discourtesy on the part of some railroad employees since they became in effect government employees and some complaints have reached Director General McAdoo. For the purpose of checking up on such reports, it has been announced, Mr. McAdoo has sent out a large number of inspectors who are to ride trains and observe the character of the service at ticket offices, in dining cars and at other places, and submit reports to him. Among the reports on which he has acted were several relating to incivility at ticket windows and one of a case in which a dining car conductor found a table for a prominent railroad director and his wife ahead of a long line of people who had been waiting.

Railroad traffic associations and committees, as well as various departmental associations maintained by the railroads, whose status was made uncertain by General Order No. 6, recently issued by Director General McAdoo, have been authorized to continue operations until April 30, before which time a conclusion is expected to be reached as to their permanent status. C. A. Prouty, director of public service and accounting, has been writing to those that have inquired as to their status approving payment of such assessments as may be necessary to meet current expenses from funds already in hand. Organizations to which letters have been sent include classification committees, territorial traffic associations, American Railway Association, Accounting Officers' Associations, Committee on Railway Mail Pay and Bureau of Railway Economics. Luther M. Walter, traffic attorney at Chicago, has been appointed assistant to Director Prouty.

Progress of the Railroad Control Bill in Congress

Reported by Senate and House Committees and Discussion
Begun—Differences in Senate and House Drafts

DISCUSSION of the railroad control bill in the form in which it was amended by the Senate Committee on Interstate Commerce was begun in the Senate on Monday and the House was expected to take up its consideration later in the week. A rather long contest is predicted before its passage, but perhaps not so long as if the bill had not been so carefully considered in the committees of both the house and senate, which each devoted about a month to public hearings and two weeks to perfecting the bill in executive sessions.

Both committees have made important changes since the bill was redrafted by Interstate Commerce Commissioner Anderson, and the house bill, which was reported on Saturday as H. R. 9685, differs considerably from the Senate bill, although most of the language is the same. The senate amendments were described in last week's issue. The formal report of the senate committee was filed on Friday, February 7.

There are differences between the senate and the house bills in the provisions for a limitation of federal control after the war and those relating to rate-making. The Senate bill sets the limit at 18 months after the proclamation of peace and the house bill at two years after the President's peace proclamation. The provisions regarding rate-making are diametrically opposed in principle, although it is likely they would work out the same in practice. The senate bill authorizes the President to initiate rates by filing them with the commission, but the commission, after a hearing, is given final authority. The house bill provides that: "Until and except so far as the President shall from time to time otherwise order, the rates, fares, charges, classification, regulations and practices of carriers under federal control shall during the period of federal control continue to be and to be determined as hitherto. But when in the judgment of the President it is necessary in the public interest he may initiate rates, fares, charges, classifications, regulations, or practices, or changes therein by filing the same with the Interstate Commerce Commission in such form and at such time and upon such notice as he shall direct. All rates, fares, charges, classifications, regulations, and practices, or changes therein so ordered, shall be fair, reasonable, and just; and the Interstate Commerce Commission shall upon complaint make investigation and grant full hearings concerning the fairness, justice, and reasonableness of any rates, fares, charges, classifications, regulations, or practices, or changes therein so ordered by the President; and shall make report of its findings and recommendations concerning the same (which findings and recommendations shall prima facie be taken as correct) to the President for such action as the President may deem required in the public interest."

The senate bill has a provision that there shall be no increase of compensation for additions, improvements or betterments paid for out of earnings for investment or surplus earned during the period of federal control, which is not in the House bill. It would seem that this would, to a considerable extent, prevent the investment of such surplus, and, as the committee suggests in its report, result in throwing an unnecessary burden of financing upon the government.

The house bill has a provision not in the senate draft that nothing in the act shall be construed to affect the existing laws or powers of the states in relation to taxation or police regulations of carriers and another, for the benefit of the short lines, that "nothing in this act shall be construed to affect the routing instructions over and the traffic arrange-

ments of such railroads as may not be taken under federal control by the President unless such arrangements and instructions prejudice the transportation of war materials or of government supplies, in which case the President may change the routing of such materials and supplies as the war and national interests demand." Both bills contain a provision not in the Anderson bill that any net railway operating income in excess of the standard return shall be paid into the treasury and placed in the revolving fund created. Both bills also omit the provision which was in the original bill providing for a workmen's compensation fund for injuries or disabilities. The senate committee's report, giving reasons for interpretations of various sections, follows in part:

Senate Committee Report

Your committee were of opinion that this is the time for war emergency legislation and not the time to settle the many controversial and vexed questions concerning our future transportation policy.

Section 1 authorizes the President to agree with the carriers whose property has been taken over that during the period of federal control each carrier may receive as just compensation—in lieu of all rights arising under due process of law—an annual sum not exceeding its average annual railway operating income for the three years ended June 30, 1917, plus a return at a rate to be fixed by the President upon the cost of additional facilities made during the last six months of 1917, the amount of such net earnings and the cost of such additional facilities to be determined by the Interstate Commerce Commission and certified to the President. This is in substance the President's suggestion. The certification of the commission is to be taken as conclusive for the purpose of such agreement. Any operating income in excess of such standard return is to be paid into the Treasury of the United States and placed in the revolving fund.

About 75 great operating railroads do over 90 per cent of the railroad business. It is believed by your committee that most of these great railroad carriers will accept these terms as a just and fair measure of their constitutional rights. Section 1 further provides that ordinary taxes, national and state, shall, as now, be paid out of operating revenue; but war taxes accruing under the act of October 3, 1917, are to be paid by the companies out of their own funds, or charged against the standard return. In other words, the holders of railroad securities are by section 1 (like holders of other securities) to bear their own just portion of the war burden. Section 1 also requires that each agreement shall contain adequate and appropriate provisions for the maintenance and depreciation of the property and the creation of any reserves or reserve funds found necessary in connection therewith; so that the properties may at the end of federal control be returned to the owners in a condition substantially equivalent to their condition when taken over by the government; and that proper adjustments both in the standard return and in the terms of final settlement may be made. Thus even-handed justice will be worked out as between each company and the federal government.

If the rights of all the railroads making returns to the Interstate Commerce Commission are fixed under the provisions of this section, the government will guarantee approximately \$945,000,000 a year.

Since the preparation of this summary, however, the committee has amended section 1 by inserting a provision author-

izing a return, at such reasonable rate as the President may determine, upon the cost of additional transportation facilities made during the last six months of 1917. This addition, of perhaps 10 to 15 millions, is made in the interest of equality, it appearing that 200 to 250 millions of additional capital has during the last half of 1917 been put into transportation facilities by a comparatively few of the carriers taken under federal control.

There has, of course, been much discussion as to the fairness and justice of the proposed amount of the standard return. It should not be overlooked that the gist of the question is, What would these companies be likely to receive from the courts as just compensation? The amount of just compensation is not a legislative question—it is a judicial question. (*Monongahela Navigation Co. v. U. S.*, 148 U. S., 312.) It follows, in the opinion of your committee, that much of the evidence and discussion concerning the so-called surplus is irrelevant. It is plainly in the public interest—and indeed a war need—that the President be authorized to offer to settle with the owners of these properties on a basis approximately equivalent to that which sound-thinking men would advise the owners they would be likely to receive by court decision. The rights of such owners must be tested by present conditions—not by some theory of capitalization never made operative under federal or state law or generally followed by the courts.

Neither Poverty Nor Riches

Questions of value are always difficult questions. It is highly probable, if not certain, if the whole question were remitted to the courts, they would take as the basis for determining just compensation, the actual net earnings for a reasonable period. During the last three years new investment in the properties now under federal control has been at the rate of approximately 375 millions a year. The year ended June 30, 1915, was one of the poorest in recent railroad history. The other two years have been prosperous years. The average of the three years therefore reflects neither poverty nor riches. The purchasing power of the dollar accruing to the stockholder, as well as to the wage earner, has decreased. Dividends in industrial companies have largely increased. The rate of return upon government bonds, both abroad and in the United States, has largely increased.

The percentage of return upon the value of the railroad property taken under federal control can not be accurately stated: for until the federal valuation, now in process, is completed, no one knows the value of that property. The book value may be taken for certain comparative purposes, as of some significance; it must not be regarded as accurate. The proposed standard return, figured upon the book value of all the companies will give a return not far from 5.32 per cent. Comparing this return to that which accrues to the purchaser of government bonds, it seems large; but government bonds run for a period of 25 or 30 years. The proposed guarantee to the owners of railroad securities may run for only a few months. The government is practically a tenant at will.

After the most careful consideration your committee are of the opinion that the owners of these properties would not be unlikely to receive an award from a court at least equal to the proposed offer; that it is therefore the duty of Congress to authorize the President to make such offers as will prevent patriotic and fair-minded American citizens from resorting to litigations, in time of war, in order to determine their rights against their government.

The standard return thus provided for will, if accepted by the various operating companies, be disposed of substantially as hitherto; that is, for the payment of their fixed charges (and war taxes which remain a burden upon the standard return), for dividends, and if any balance remains,

for so-called surplus. The fixed charges ordinarily fall into interest on bonds and other debt obligations, and leased line rentals, generally in the form of interest and dividends on outstanding bonds and stock of leased companies. These rentals are not, as is sometimes thought, properly a part of operating expenses. They are really disbursements for the use of capital; for it makes no practical difference whether the operating company is consolidated with the leased companies and pays interest and dividends upon its own bonds and stock issued in payment for the subsidiary companies' property, or whether it pays interest and dividends upon the stock and bonds of the leased companies. In either event the disbursement is a disbursement on capital account and not on operating account.

The foregoing makes it clear that the railroads accepting the suggested terms will be fully able to make all their usual disbursements to their security holders. In effect, this regular income is guaranteed by the government to the security holders during the period of federal control.

The stabilizing, confidence-producing effect of such guaranty will, as your committee believe, be of great assistance in future war financing.

The terms above indicated will probably be found just and fairly applicable to the security holders of most of the railroads of the country. But there are certain undeveloped and reorganizing roads whose operating income for three years will not fairly test their right to just compensation. Some special provision to meet the just demands of these companies seems requisite. Section 1, accordingly, provides in the last paragraph thereof that, when the President finds that the condition of non-dividend paying carriers is because of non-operation, receivership, or other undeveloped or abnormal condition such as to make the basis of earnings provided for the other carriers "plainly inequitable," as a fair measure of just compensation, then the President may make with such carrier such agreement as under the circumstances of the particular case he shall find just.

Section 2 provides that in case the agreement provided for in section 1 is not made, the President is authorized to pay not exceeding 90 per cent. of the estimated amount of just compensation.

This, in the opinion of your committee, would tend to stabilize conditions for the security holders of the newer struggling companies, whose rights may not be easy of speedy ascertainment.

Section 2 does not require the President to make any payment at all to such owners, thereby avoiding the danger of offering a premium to unreasonable and greedy litigants.

Section 3 provides easily available facilities safeguarding the constitutional rights of owners to have their just compensation determined by due process of law. It also furnishes another opportunity for settlement of cases which may not be satisfactorily disposed of by agreements in accordance with the standard return, or under the special power of section 1.

Section 3 provides that the Interstate Commerce Commission shall, on the application of the President, or of any carrier, appoint boards of referees, the commission and its forces being made not ineligible as such referees. These referees are armed with the usual powers of judicial tribunals—to summon witnesses, require the production of books, etc., and may hold hearings in Washington and elsewhere, as convenience may serve. They may consolidate and classify cases. These boards are to give full hearings, consider all pertinent facts, and report their findings to the President in a form convenient and available for the making of such agreements as are authorized by section 1. The President and such company may then make an agreement for compensation not in excess of that reported by the referees. Failing such agreement, either the United States or the company may file a petition in the Court of Claims; and in the pro-

ceedings in this court such report is prima facie evidence of the amount of just compensation and of any facts reported.

It is the confident opinion of your committee that section 3 not only effectually guards the constitutional rights of all owners but that the proceedings before the referees will be found so complete and satisfactory that few, if any, cases will ever reach the Court of Claims.

Section 4 provides that the agreed or ascertained just compensation may be increased during federal control by an amount reckoned at a reasonable rate per centum to be fixed by the President upon the cost of additions made while the government is in possession. Manifestly an increase in the property used requires a corresponding increase in the compensation for the use. No increase is allowed for additions paid for out of surplus during the period of federal control. Whether a denial of any return upon surplus earnings invested in additional facilities will result in throwing an unnecessary burden of financing upon the federal government and in the accumulation of a dead surplus will require careful consideration by the senate.

The main purpose of section 5 is to give stability to our financial conditions. From the standard return the railroad companies may without permission pay their regular dividends. Conceivably it may be desirable that some of the prosperous carriers should be permitted somewhat to increase their regular dividends; if so, the President's prior approval must be obtained. Non-dividend payers or irregular dividend payers, whose standard or ascertained return warrants dividends, may with the President's permission be put in the dividend-paying class at such rate as the President may determine.

This section goes upon the theory that during the war the railroad security holders ought to receive certain, regular and moderate dividends; but that extra, unexpected dividends—a common source of speculation and manipulation—should not be permitted.

Section 6 is a very important section. It provides for a revolving fund to be made up from an initial appropriation of \$500,000,000, together with any excess earnings of any of the carriers. This fund is to be available to the President for the purpose of paying the expenses of the federal control, supplying any deficit in the just compensation accruing to any carrier, and to provide for rolling stock and terminals, to be used and accounted for as the President may direct, and to be disposed of as Congress may hereafter by law provide. This contemplates that engines, cars, and perhaps terminals, will be purchased or constructed by and will belong to the United States. This rolling stock will be used wherever war and national needs demand—precisely as the Pullman and other private car lines are now used on the lines of the various carriers as the needs of industry or the demands of the seasons require. The ultimate disposition of this rolling stock must await post-war legislation. This section contemplates that such rolling stock, although owned by the United States, will be used on the lines of the various railroads and the use charged for upon the books of the companies, so that at the expiration of federal control the book-keeping of each railroad company will reflect, as hitherto, the traffic which has moved over each road and the cost of operation.

The section further provides that the President may, on or in connection with the property of any carrier, make or order any company to make additions desirable either for war purposes or in the public interest. Doubtless it will be necessary in connection with army camps and shipyards to make substantial extensions of railroad and other carrier property. Your committee believes that such additions and extensions should become and remain the property of the separate carriers, that there should be no confusion of title as to real estate, tracks, and other fixed property between any railroad company and the United States. As it is possible that some

such additional facilities thus made to the property of various carriers will in times of peace be found worth less than the cost thereof, this section provides that claims for loss or damage accruing from such compelled investment shall be settled either by agreement between the carrier and the President, or, failing such agreement, shall be ascertained by due process of law, as provided in section 5.

As some of the companies may not have the requisite funds to pay for such extensions and additions, the President is authorized from the revolving fund to advance all or any part of such cost, these advances to bear interest at rates and to be payable on such terms as the President may determine, so that the United States may ultimately be fully reimbursed for such advances.

Section 6 also provides that the President may, from the revolving fund, expend such sums as he deems necessary or desirable for the utilization or operation of canals and for the purchase, construction, utilization, and operation of boats and other water carriages on the island and coastwise waterways. It is believed by your committee that much relief may be afforded the rail carriers by a further development of the water carriers and of facilities on these natural water highways.

Section 7 provides for financing the maturities of carriers during the period of federal control. It authorizes the President to purchase for the United States, at prices not exceeding par, any securities issued by the railroads, approved by him as consistent with the public interest. Such securities may be sold without loss to the treasury whenever the President deems it desirable, the proceeds of such sale to go back into the revolving fund. The estimates of the maturities for the next four years are as follows:

| | |
|-----------|---------------|
| 1918..... | \$181,696,738 |
| 1919..... | 177,221,052 |
| 1920..... | 164,536,253 |
| 1921..... | 440,905,528 |

Section 8 provides in general terms that the President may execute his powers with relation to the federal control through such agencies as he may determine and fix the reasonable compensation for services rendered in connection therewith, using also the personnel and facilities of the Interstate Commerce Commission and all other governmental bodies.

Section 9 is simply to the effect that nothing contained in this act shall be deemed to restrict the powers heretofore given to the President to take possession and assume control of any and all systems of transportation. It also provides that this act shall apply to any carriers to which federal control may be hereafter extended.

Section 10 provides that so far as not inconsistent with federal control, each of the carriers shall remain subject to all laws and liabilities whether arising under statutes or at common law. It also provides that the President may, whenever in his opinion the public interest so requires, initiate rates by filing the same with the Interstate Commerce Commission, such rates to be fair, reasonable, and just, and that upon complaint the rates thus initiated by him may be reviewed by the Interstate Commerce Commission. In such review the Interstate Commerce Commission may consider all the facts and circumstances existing at the time of the making of the rate. After full hearing the commission may make such findings and orders as are authorized by the act to regulate commerce as amended.

Your committee were of opinion that the commercial organizations of the country should be disturbed as little as the emergency would allow, and that every safeguard should be thrown around the great productive activities of the country and that everything possible be done to inspire confidence in their being protected from unnecessary embarrassment.

Section 11 provides penalties for violation of this act or orders of the President made thereunder.

Section 12 has been inserted at the request of the Depart-

ment of Justice and is intended to provide for continuing the life and status quo of cases pending under the anti-trust and interstate commerce acts.

Section 13 provides that the federal control shall continue not to exceed 18 months after the declaration of peace. It is possible that certain conditions may arise from federal control which will need adjustment before the properties are returned to their owners, and a reasonable period should intervene in which these conditions may be met and adjusted. It may be that the nation will be unwilling to return to the conditions obtaining before the assumption of federal control. Legislation may be demanded radically changing the relation of the government to the railroads from that now existing in the interstate commerce act as amended.

These problems will require time for careful and deliberate consideration. Therefore your committee has suggested a period of 18 months, and they believe it will be found adequate for that purpose.

In section 13 there is also a provision to the effect that the President may, prior to July 1 next, relinquish control of such transportation systems as he may deem not needful or desirable, and may, thereafter, on agreement, relinquish all or any part of any system of transportation.

Your committee also recommends that at any time after July 1, 1918, the President may agree with the owners of all or any part of any system of transportation, when in the opinion of the President further federal control of the same is unnecessary, to relinquish such control to the owners of the roads.

The section also contains a general provision that the President may relinquish all railroads at any time when he shall deem such action needful or desirable.

Your committee have adhered to the set purpose to limit this legislation to war emergency purposes, and to avoid all contentions and controversial questions. We believe that the bill will accomplish these results. It follows closely the President's recommendations. It has in its main provisions and purpose received general approval and comparatively little criticism.

Minority Reports

Senator Poindexter filed a minority report objecting to the inclusion of a time limit and also to the provision authorizing the President to initiate rates subject to review by the commission. This, he said, would be an illogical and unworkable arrangement and it would be a great mistake to restore the railroads to their private owners without in any way changing "the dangerous and unscientific conditions which formerly existed." He advocated a more adequate and extensive government control or operation in the interest of the people.

Senator Cummins also filed a minority report condemning the bill as "dangerously imperfect" and the proposal to leave the roads in the control of the President for 18 months after the war as "utterly abhorrent to the fundamental principles which underlie free government." When peace comes, he said, "the management and operation of the roads should instantly pass to a responsible board, appointed by the President and confirmed by the Senate, governed by law and removed as completely as is humanly possible from the temptation to use authority for personal or partisan advantages."

He also objected to the provision authorizing the President to initiate rates and particularly to the proposed standard of compensation. The estimated \$950,000,000, he asserted, is \$175,000,000 more than what he considers would be fair and just compensation, and amounts to 8.5 per cent upon the par value of all the stock outstanding.

No objection is made to government possession and operation, the only criticism being that "the change was not accomplished immediately after the declaration of war, so

that long before this the confusion incident to the transition would have been overcome."

"It is unfortunate," the report said, "that when, in the last days of December, 1917, the President did act, he left the situation so indefinite and uncertain that nobody knows what railroads have been taken over. Nobody knows whether the men, from the presidents of the companies to the section hands, are working for the government or for their respective corporations, and the morale of the service is seriously impaired. Nobody knows whether the earnings of the railroads belong to the United States or to private companies."

Other objections to the bill were its "failure to provide definitely that additions, betterments and extensions made out of surplus earnings shall belong beneficially to the public and shall not be treated hereafter as capital entitled to a return" and failure to define the position of short-line railroads.

Senator Cummins also presented five amendments carrying out his ideas.

Senator Smith of South Carolina, chairman of the committee on Interstate Commerce, introduced the discussion of the bill with a long speech urging its prompt enactment as a war measure because of its intimate relation to the financial problems of the nation and the bill was made the unfinished business of the Senate.

Senator Kellogg gave notice that he proposed to address the Senate on the bill on Wednesday.

Consideration of the bill in the House was delayed by the unexpected address of the President but Chairman Sims of the Committee on Interstate and Foreign Commerce expected to obtain an agreement for taking it up later in the week.

An abstract of the House committee report follows:

House Committee Report

This measure is war emergency legislation, intended to meet the essential needs growing out of federal control of our greater carrier systems. It is not to be regarded as a bill for government ownership or control of railroads or against government ownership or control of railroads. The bill makes neither for nor against any particular kind of railroad regulation. It undertakes to provide for war needs and only for those.

The act of August 29, 1916, authorized the President in time of war to assume the possession, control, and use of transportation systems. It provided no method for determining the just compensation of the owners of properties thus applied to public use. The right to just compensation is a constitutional right, and the determination of the amount of just compensation is a judicial and not a legislative question.

But Congress may and should provide speedy and easily available judicial machinery for determining this just compensation. (*Monongahela Navigation Co. v. U. S.*, 148 U. S., 312.) It is also desirable that the owners of the properties should, instead of being required to resort to the courts for their rights, be made such offers for just compensation as will probably result in an agreement between them and the United States, determinative of all rights. These two desiderata, together with certain obviously needed supplementary power as to financing during federal control, are the main purposes of this bill.

Section I is a fundamentally important section; for it sets the outside limits of the expected agreements. Its sole function is to provide a basis of such just and proper agreements as may eliminate litigation.

This standard provision will doubtless be found applicable to most railroad companies. But there are some new, undeveloped, reorganizing companies for which some special provision ought to be made. The bill accordingly authorizes the President to make such agreement as he may deem just

with companies whose just compensation he finds will plainly not be measured by the three-year earnings basis.

Naturally there has been much discussion as to the justice of the proposed basis of settlement. Your committee has dealt with this as a practical question. It consequently regards much of the evidence adduced before the committee concerning "surplus" as irrelevant. This is not the time to undertake to settle public policy as to so-called "surplus earnings." The facts are that these companies have during this three year period had certain earnings; that they are entitled as a constitutional right to have their just compensation adjudicated by the courts; that it is probable—almost certain—that any court would take their average earnings for some reasonable period as persuasive, perhaps conclusive, evidence of such just compensation. Viewing their constitutional right in connection with the great public needs of stabilizing the security market—of restoring and not impairing confidence—your committee are of the opinion that the average earnings of three years is a fair basis for a settlement of the rights of most of these owners against their government and ought to be approved. Nineteen hundred and fifteen was one of the worst years in recent railroad history; the other two years were prosperous years. The average of the three years is therefore a fair test of earning power. Moreover, the investment in the properties of railroads now taken over has been increasing at the rate of about \$375,-000,000 a year. The properties the government now has are of larger by about a billion than the properties that made the earnings of 1915, taken as one of the three years in order to reach the standard return.

It is not pretended that the three-year basis is an accurate mathematical test of just compensation, but your committee does believe it to be a basis essentially just, and one that will be plainly understood, easily workable, and generally approved both by the public and by the security holders.

Section 3 provides "due process of law" for non-agreeing carriers and also authorizes an agreement between the President and any company after report by the referees to be appointed by the Interstate Commerce Commission. It is the belief of your committee that few, if any, cases will ever reach the Court of Claims. This section requires no explanation.

Section 4 provides for increasing compensation as the properties used may increase during the period of federal control.

Section 5 limits dividend disbursements to regular dividends except as the President may otherwise permit. Non-dividend payers may, however, pay dividends as permitted. Manifestly any excess revenues accruing from standard return ought not to be made the basis of speculation or manipulation. Steady, regular income is what is desirable during the period of the war.

Section 6 provides for a revolving fund, to be made up of an appropriation of \$500,000,000 from the treasury and any excess revenue derived from the operation of the companies. This revolving fund may be used by the President to provide equipment, additions, and road extensions and to make advances to the companies so far as necessary for these purposes. This section contemplates direct ownership by the United States of new railroad equipment and perhaps of some terminals. It does not contemplate ownership of such road extensions, tracks, etc., as may be necessary in connection with Army camps, shipyards, etc. In the opinion of your committee the title to such additions and extensions should be in the various companies and not in the United States. But as some such extensions will be made for war purposes and cost more than their value during peace times, the right of the company to have a just portion of this compulsory investment paid by the government is protected. This section also provides for the construction and utilization of transportation facilities on our waterways. The burden on

our rail carriers may be much lightened if we make proper use of these great natural highways.

Section 7 provides for government financing of maturities and other necessary capital requirements of the companies during federal control. Securities purchased may, if the President finds it desirable, be sold at not less than cost.

Sections 8 and 10 require no comment.

Section 9 guards the rights of certain railroads which may not be taken over not to have their traffic and routing arrangements unnecessarily injured.

Rate-Making

Section 11 embodies the theory of the President's proclamation, that there shall be no unnecessary disturbance of established methods of procedure by and against the carrier companies. While it is undoubtedly true that during the period of federal control the revenues of the railroads are government money, section 11 (certainly when read in connection with section 8, which authorizes the President to execute his powers through such agencies as he may determine) permits the utilization of the various carrier companies, as a species of government agencies, so that for all practical purposes passengers, shippers, and employees will proceed as hitherto in the exercise and enforcement of all their accustomed rights.

But when federal control for war purposes requires changed methods the President must have power to make such changes. This raises an interesting problem as to rate making. The rate fabric of the country is now based upon the competitive theory. In many instances rail rates have been made for the purposes of meeting, if not destroying, water competition. Section 6, as already pointed out, contemplates that the federal government shall from its own resources create new facilities upon the waterways. Manifestly during federal control rail rates ought not to be made for the purpose of destroying or "meeting water competition." The nation should not compete with itself. It should furnish transportation service, both rail and water, at just and reasonable rates. On the other hand, it is manifestly impracticable and undesirable for the President or any agencies he may create to readjust our present rate fabric. Comparatively little of it ought to be readjusted, and such necessary adjustment should come tentatively and only to meet obvious needs. Your committee is of the opinion that the section 11 now drafted meets the situation in the least objectionable and in the most practicable way. It provides that, except as the President may from time to time otherwise order, rates shall continue to be and to be determined as hitherto.

This leaves the Interstate Commerce Commission and the state commissions to proceed, precisely as hitherto, in the determination of all rate questions unless and until the President, in the exercise of the war power, shall order otherwise. But when the public interest so requires the President may initiate rates, filing them with the Interstate Commerce Commission, to take effect upon such notice as he shall direct. Such rates are to be "fair, reasonable, and just." But to guard against even remote possibilities of error the section provides that upon complaint the Interstate Commerce Commission shall make investigation, grant full hearings "concerning the fairness, justice, and reasonableness" of rates so ordered by the President, and "make report of its findings and recommendations" to the President for such action as he shall deem required in the public interest.

It was suggested that after such hearing the Interstate Commerce Commission should be given power to make orders, thus in effect overriding the President's war power to make rates on transportation systems in his possession and control because of war conditions. It would, in the opinion of your committee, be most unseemly to authorize the Interstate Commerce Commission to overrule the Presi-

dent in the exercise of his war powers—indeed, of any other powers. It should not be overlooked that the President is responsible for the financial results of operating these great carrier systems with gross revenues approximating \$4,000,000,000. It will not be contended that during federal control the carrier systems should not be substantially self-supporting. The general tax payer ought not to be left to make up a large deficit accruing from carrier operations. Wages and prices of materials are exceedingly high and may rise still further. The volume of traffic, great during the past two years, may fall off. Weather conditions have for two months been unprecedentedly bad, making operation extraordinarily expensive. The President, responsible for the general financial result, from factors so numerous, so uncertain and so varying, must be given power commensurate with his responsibility.

Moreover, if the Interstate Commerce Commission were given final power to make rates, what would be its standard of "reasonableness and justice"? Plainly the old, competitive standard unless the present statute is repealed or greatly modified. To authorize the Interstate Commerce Commission to overrule the President and to make such orders as to rates as are now permitted under the Interstate Commerce act would be granting an authority to make rates, based on the competitive theory, applicable to a co-ordinated, unified noncompetitive war control. In other words, the Interstate Commerce Commission could not, until Congress supplied a new code, make orders logically applicable to the "justice and reasonableness of rates" made for a unified, co-ordinated system during war time.

We are satisfied that the method proposed of (a) leaving rates, and rate making, undisturbed except as the President otherwise orders; (b) authorizing the President to initiate rates; (c) providing for a review on full hearing by the Interstate Commerce Commission; and (d) the findings and recommendations of the Interstate Commerce Commission to be reported to the President, so that he may, if necessary, revise his own primary determination—is the best solution of this difficult problem. In practice this method will, we think, give to shippers and consignees all the protection they now have under the established practices of the Interstate Commerce Commission, while enabling the President to make such necessary changes as unified war control demands. It gives also the Interstate Commerce Commission an opportunity to review and to discuss fully the "justice, reasonableness, and fairness" of any rate in the light of the war conditions, without now putting upon Congress the impossible burden of providing a new, noncompetitive rate-making code.

Section 12 provides for penalties to be enforced by the usual processes in the courts, and calls for no comment.

Section 13 provides for continuing the life and status quo of cases pending. It is inserted at the request of the Department of Justice.

Section 14 deals with the duration of federal control. It authorizes the President at any time prior to July 1, 1918, to relinquish control of all or any part of any system of transportation which he thinks not necessary or desirable for national or war purposes, and at any time thereafter to make such relinquishment on agreement with the owners; thus in either case ending all further claim for compensation. But this power will in use be of little importance. The main question is when and how to end general federal control.

While these transportation systems were taken over under the war power, it is easily manifest that they ought not to be turned back to their owners immediately upon the return of peace. They might have been taken, they may be kept, under the commerce clause of the Constitution. Section 6 contemplates the investment of a large amount of government money in rolling stock and perhaps in terminals "to be dis-

posed of as Congress may hereafter by law provide." Section 7 contemplates financing the carriers' maturities; these in the years 1918 and 1919 will amount to approximately \$400,000,000.

Unified control will involve substantial changes in the traffic departments of the various carriers, new routing of much traffic, and many other changes from the methods obtaining under the competitive system. It would be just neither to the public nor to the owners of the properties to return the properties to private control without legislation adequately providing fair and reasonable terms for the liquidation of the government's holdings of railroad securities, for the sale or other use of the government's rolling stock, and for other changes incidental to the war control. It may be that the country will never be willing to have the carriers go back to the old system of unco-ordinated, competitive operation. For many years many forms of new and enlarged regulation have been pending before Congress. That some program of constructive, far-reaching policy ought to be worked out before the railroad companies are returned to private control seems too clear for argument.

The majority of your committee, while accepting these views, are of the opinion that a definite period of two years should be set as the time limit within which such legislation should be matured and enacted. Obviously, the period may hereafter be extended if such extension be found necessary in the public interest. The majority are of the opinion that the insertion of a definite time limit for federal control puts the burden of presenting proper measures of constructive legislation where it belongs—upon the owners of the properties—and that it is inconsistent with the public interest to allow a war control, admittedly assumed for emergency purposes only, to extend indefinitely in time of peace. A minority of your committee hold a different view. They believe that the public interest is much better safeguarded if the federal control herein and heretofore provided for shall be continued until Congress shall after the war otherwise provide.

Clifford Thorne has wired shippers urging them to write to congressmen and senators protesting against giving the President power to initiate rates.

A CHIEF COMMISSIONER FOR AUSTRALIAN RAILWAYS.—As a sequel to the completion of the East-West Transcontinental Railway, there has recently been passed by the Federal Parliament of Australia an act authorizing the creation of a Railway Department, to be presided over by a Chief Commissioner. In addition to the East-West Railway there are two others opened, the aggregate of the three lines being 1,730 miles. Moreover, there are others under construction and proposed. The new commissioner has now been appointed in the person of Norris G. Bell, who has been the chief engineer and acting commissioner. Considerable satisfaction is expressed locally at this appointment, as it does away with all political control. All railways, rolling stock, lands, wharves, stations, machinery, etc., are to be vested in the commissioner, who is to hold office for a period of five years and be paid a salary of £2,000 (\$9,720) a year. The new commissioner is not allowed to buy any locomotives, rolling stock, or motive or tractive power, nor any material of a greater value than £1,000 (\$4,860) from outside the Commonwealth, without the sanction of the Minister, nor without the permission of the latter may any contract be placed where the amount involved exceeds the sum of £5,000 (\$24,300). No increase in the salary of an employee getting more than £500 (\$2,430) a year may be given without the sanction of the Governor-General, while the rights of employees are conserved by a provision which enables an appeal to be made against dismissal by the commissioner or reduction of pay for incapacity or misconduct.—*Railway Gazette, London.*

Fig. 1. 4,000-Ton Spans supported on Trucks Preparing to Moving

Shifting a 4,000-Ton Bridge on Freight Car Trucks

Three Spans of St. Joseph & Grand Island Structure Over the Missouri River Were Moved 136 Ft.

ON NOVEMBER 15 three through pin-connected truss spans 297½ ft. long weighing a total of 4,000 tons were moved longitudinally a distance of 136 ft. on freight car trucks in 15 min. These spans form part of a bridge of the St. Joseph & Grand Island over the Missouri river at St. Joseph, Mo. This change was made to provide room for a longer draw span required by the United States war department. Other operations incident to the shifting of the spans, such as falsework changes, jacking, restoring tracks,

were found after careful investigation to require its entire renewal.

The piers suffered both from undermining caused by scour of the river bottom and disintegration of the stone masonry below the water line. After an unsuccessful attempt to underpin the pivot pier, it was proposed to build new piers down stream and in line with the old ones so that the existing spans could be shifted transversely to the new piers, but the government refused to sanction this plan and indicated

Fig. 2. Elevations of the Old and New Bridges

etc., occupied the better part of a working day. All steps were carried out according to a prearranged plan from which it was found unnecessary to deviate in any way.

This structure carries the trains of the St. Joseph & Grand Island, between St. Joseph, Mo., and Grand Island, Neb., and those of the Chicago, Rock Island and Pacific from St. Joseph to Belleville, Kan., and Topeka. The original bridge was built in 1872, the superstructure being renewed on the old piers and abutments in 1904. The new spans consisted from east to west, of a plate girder approach span, a 357-ft. 8-in. draw span and three 297-ft. 6-in. fixed spans. While the new spans are entirely adequate to handle modern railway equipment, faults developed in the substructure which

that it would not approve any changes which did not embody an increase in the length of the draw span sufficient to provide clear waterways of 200 ft.

This condition being imposed, it was decided to adhere to the present location of the bridge and make room for the longer draw span by shifting the three fixed spans longitudinally west by an amount equal to the difference in the lengths of the two draw spans plus the distance necessary to permit the construction of a new east rest pier just west of the old rest pier. This amounted to a total of 136 ft. 2½ in. and gave ample room for the construction of all of the new piers. The new west abutment and the five new piers supporting the main spans were founded on rock, using the

pneumatic process. One pier and the east abutment are carried on pile foundations.

These new piers were built during the past year. The pivot pier is cylindrical, 31 ft. in diameter with an octagonal footing 50 ft. 6 in. wide. The other piers are of rectangular section except a rest pier for the swing span up stream from the pivot pier which is shaped like a flatiron. The caissons were of timber construction using reinforced concrete con-

crete bridge just outside of the trusses on each side and thus greatly simplify the pile driving. They were capped with 12-in. by 14-in. pieces, on which were placed nine 8-in. by 17-in. timber crossbeams, 30 ft. long, packed solid and spanning between bents on opposite sides of the bridge. These groups of crossbeams served as the supports for four lines of 24-in. I-beams, which carried the two temporary tracks. The piles were driven to rock or to absolute refusal and the bents

Fig. 3. Part Elevation of the Three Spans Showing the Falsework

struction over the roofs to support the piers until the working chambers were sealed. Three of the caissons were built in a pontoon of octagonal shape from which they were floated later by filling the pontoon with water and removing one side of it. After a caisson was removed the pontoon was pumped out and made ready for building the next caisson.

The Plan Adopted

The plan for moving the three fixed spans was briefly to provide falsework for two standard-gage tracks, one directly under each of the trusses, these tracks to be used by freight car trucks on which to haul the spans simultaneously to their new positions. The tractive power was furnished by lines

were sash-braced and cross-braced in both directions with 6-in. by 14-in. timbers.

Under the cast fixed span, the river bed falls off toward the main river channel under the draw span, a condition which demanded a variation in the falsework plan. Between old pier 4 and new pier 3, the bents were placed perpendicular to the track to reduce the obstruction to the stream

Fig. 5. Tearing Out the Falsework for the Main Track Between the Old and New Abutments. One of the Hauling Tracks Is Shown in the Foreground

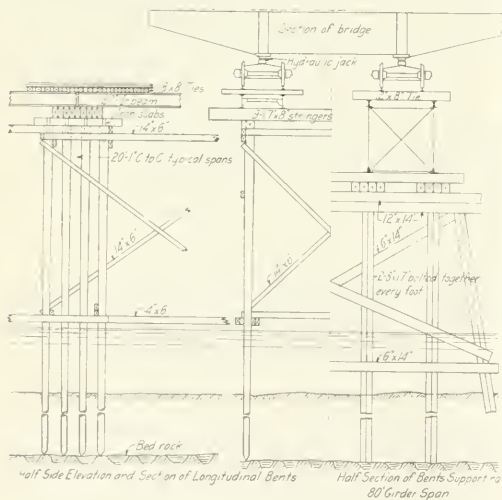

Fig. 4. Falsework Details

from hoisting engines placed back of the new west abutment.

Freedom from settlement and vibration was the prime consideration in the design of the falsework. Under the two westerly spans and between the new and old west abutments the river is shallow and not subject to much current. Consequently it was permissible to place the bents parallel to the

flow. In the space between new pier 3 and old pier 3, which forms a part of the new west channel, the water is materially deeper and there is a strong current. Consequently a wider waterway was desirable, so an 80-ft. deck girder span was introduced, supported at the east end by two frame bents standing on offsets on the side of old pier 3 and on the west end on two bents consisting of six square piles, each made of two 8-in. by 17-in. timbers bolted together. To obtain the desired length it was necessary to splice out these timbers, using angle irons for the splice bars. Trestle construction consisting of bents of the same kind occupied the remaining space between the old and new piers 3. The space between the old and new west abutments (piers 6) formed part of the old west approach embankment, so the removal of the fill to permit work on the falsework required the con-

struction of an independent pile trestle to carry the traffic between the two abutments. This is shown in one of the photographs.

One condition imposed by the plan was that the tracks for the moving trucks pass over the tops of the piers. This required that the spans be jacked up to remove the bearing pedestals and the track placed continuous over the piers and trestlework. After this work had been completed, the spans

Fig. 6. One of the Hauling Trucks, Showing the Jack and Draft Rigging in Place. Plate Blocking May Also Be Seen in Place Around the Plunger of the Jack

were again brought to bearing on the piers, using wooden blocking instead of the pedestals under the shoes.

Another requirement of the plan was that the spans remain in bearing on the piers for the passage of traffic until all preparations for moving were complete, when it was required that the weight of the structure be transferred quickly to the moving trucks for making the shift. This was ac-

Fig. 7. One of the High Power Pumps Supplying Pressure to the Jacks

complished by the use of high power hydraulic jacks mounted on the trucks and operated in gangs from high power pumps installed on the bridge. The pressure was transmitted to the jacks by a main line pipe consisting of extra-heavy wrought steel pipe with branch lines to the individual jacks of small diameter flexible copper tubing. The photographs show these jacks and the high power hydraulic pump from which the pressure was supplied. The pressure-transmitting

fluid was an alcohol mixture. What appear to be in view attached to the side of the jack in the photograph of the jack is the copper tubing through which the pressure is transmitted. The jacks under one of the spans were of 500-ton capacity and those under the other two spans of 1,000-ton capacity. As the average load to which the jacks were subjected in this case was only 70 tons, the pressure on the jack pumps and piping was only 2,000 to 2,500 lb. per sq. in. as compared to the capacity pressure of 10,000 lb. per sq. in.

Jacks were placed on the truck only at panel points 1, 2 and 4 of each span, the trucks under the center panels serving solely as rollers to afford a measure of safety in case of a blowout of one of the jacks. Blocking was maintained on these center panel trucks to within one inch of the steel work. Another safeguard in the jacking was to block up around each of the jack plungers with plates placed on the rim of the jack cylinder. These plates were cut to fit half way around the jack plunger, and were arranged to break the joints, as may be seen in the photographs.

Special Draft Rigging Required

In consequence of the interposition of the jacks between the trucks and the load, an adequate draft rigging was required in the plane of the trucks. This consisted of two lines of structural steel angles made continuous from end to end of the three spans by plate splices at each truck and around the shoes at the ends of the spans. At each truck this

Fig. 8. The Pulling Beam to Which the Tackles Were Attached

connection consisted of a small plate which performed the additional function of a bearing plate for the jack on top of the truck bolster. At the end bearings of the trusses it consisted of a yoke to transmit the traction around the shoes.

One of the photographs shows the pulling beam through which the tension on the pulling tackles was transmitted to the draft rigging. It consisted of two I-beams held together by batten plates and placed cross-wise just ahead of the first two trucks, to which the tackle blocks were lashed or lashed. The pulling rig consisted of four sets of 2-in. rope tackles, each equipped with four-sheave blocks and snafel blocks to give a multiplication of 10 in passing the lines to the spools of the hoisting equipment. The latter consisted of a steam-operated double-drum hoist mounted on a flat car placed at the end of the embankment and a large capacity electric hoist (built for use at the Hill Gate bridge), placed in a house south of the track just back of the abutment.

On the morning of November 15, after the passage of the last trains at 8:15 a. m., the first operation was the removal of the trucks and the tearing out of the temporary trestle between the old and new west abutments. This was accom-

plished largely by the use of locomotive cranes, one standing on the end of the west span and the other on the end of the approach embankment. The next step was to jack up the spans and remove the blocking under the shoes. All was ready for making the shift shortly before noon, and with the giving of a signal the hauling started. The movement was continued without interruption until completed and the total time elapsed was only 13 min. As the movement was practically uniform throughout its duration this is equivalent to an average speed of $10\frac{1}{2}$ ft. per min. The hauling was

Fig. 9. The Motive Power, Steam and Electric Hoists at the West Abutment

stopped at the exact position on a signal from an observer standing on the west end of the superstructure, but buffer timbers were placed against the back wall of the abutment to insure against overtravel.

Following the successful transfer of the span to the new

deck for the railway track but also that for the north highway, so that the flooring for the highway was placed at the same time that the ties and rails for the railway tracks were installed. This work involved a large amount of detail that

Fig. 11. Placing the Pony Bents to Close the Gap

could not be hurried, but it was greatly expedited by a most complete prearrangement for all operations. For this reason it was unnecessary to saw any lumber during the time that the change was being made. Another measure which expedited the work was the drilling of all holes with an electric drill, and when the gap in the track rails was closed the last rails were cut to length and the bolt holes drilled with an oxy-acetylene torch. The bridge was ready for the passage of trains at 5:30 p. m. The absolute precision with which

Fig. 10. The Gap Between the Draw Span and Fixed Span No. 3 After the Shift Had Been Completed

piers, work was started on the closing of the gap between the west end of the draw span and the east end of the east fixed span. This space was now occupied only by the falsework on which the span had been moved, with the two hauling tracks about 10 ft. below the rail level of the bridge. To make up this difference in elevation pony bents previously framed were brought from the east approach by a locomotive crane and set into place. Stringers and ties for the deck, already framed for use, were lifted from a barge floating in the river alongside. This work included not only the

each detail of the day's work was completed, testified to the care and accuracy with which each step had been studied and arranged for in advance by the erection forces.

Other Work to Be Done

Following the shifting of the spans, work has been in progress on the erection of the new draw span. It is the intention to erect the new span in the open position, dismantling one half of the old draw span and providing a temporary draw, following the general plan by which this method

has been used in previous draw span renewals. The work on this bridge is being handled by R. L. Huntley, chief engineer of the Union Pacific, under the immediate direction of A. C. Everham, terminal engineer, Kansas City, and H. M. Stone, assistant engineer, resident engineer at St. Joseph, the entire project being under the general supervision of E. E. Adams, consulting engineer of the Union Pacific System, New York City. The new substructure was built by the Missouri Valley Bridge & Iron Company, of Leavenworth, Kan., and the fabrication and erection of the steel work was handled by the American Bridge Company, which conducted the movement of the three spans described above.

Letters from Overseas*

"OUR WORK ON THE LIGHT RAILWAYS," writes a lieutenant in the Fourteenth Engineers, "is becoming more fascinating as we get deeper into it. The volume of traffic is constantly increasing, and at the present time we are able to handle little but ammunition and supplies. Car shortage seems to be our chief difficulty.

"The power situation is fairly good. On account of the high cost of gasoline (petrol they call it here) we use our steam locomotives wherever our location will permit. Our engines are small, of the 2-4-0 type, and on ordinary grades will handle 10 to 12 cars. They are equipped with brass flues, but on account of shallow fireboxes require constant rolling. The water is very bad, which necessitates washing the boilers about once in six days. Some of our boys had quite a time getting accustomed to the old straight steam brake, with which our engines are equipped, after having used the Westinghouse in the States, but fortunately we have escaped without serious accident.

"In places our track runs up to within 500 yards of the German front line trenches, and it is quite a ticklish job to take a train up there at night without lights, get it unloaded and get away again without being detected. As soon as the enemy discover a train they begin to drop shells, or pepper them with machine-gun fire. One night recently one of our men had the track blown out in front of him; he started to back up and another one landed just back of him and there he was marooned. He jumped into a shell hole and waited until things had quieted down, then crawled out, wen to the nearest control station, got out the trackmen, fixed up the track and got away safely. Another night one of our men stopped his tractor and stepped down into a dugout to get some water; while he was gone a shell landed, and when he came out his tractor was scrap. However, such occurrences are the exception and not the rule.

"Our men are standing up bravely under such conditions; not a whimper or complaint. At first they were a bit timid when entering the danger zone, but when they once got into the work that quickly disappeared. We are connected very closely with the British troops and Light Railways and are constantly rubbing elbows with the Canadians. They are a fine bunch of fellows and good railroad men. I am surprised to find so many C. P. R. men over here; they seem to have responded very generously to the call.

"We have considerable trouble with the 'tanks' crossing our tracks at the most unexpected places, and you can imagine what it does to our track. One night recently one of our troop trains struck a tank which was crossing the track without lights. The train came to a dead stop, the impact throwing the engineer and fireman out on the ground, slightly stunning them. The 'tank,' however, did not stop, but continued on its way, and as soon as it cleared the track, up

starts the engine, breaking away with one car, and before any one realized what had happened was running wild down the hill. After running wild for a couple of miles she turned over in the ditch. Fortunately no one was seriously injured. The 'tanks' certainly are wonderful machines. There is not much left of the barbed wire entanglements when they get through with them. So far the Germans have not made use of them.

"No doubt you have read more or less in the magazines of the development of the art of camouflage. It is truly marvelous what they have done along that line, and what they are able to conceal with a little paint and fixings. The other day I was walking along the track, little dreaming that there was a gun within sight, when a big 12-incher let go within 100 yards of me. Well, for a minute I thought that I had been shot, so great was my surprise. There was not a bush or tree in sight, yet so successfully was it concealed that one would never see it unless one knew it was there. Many of our cars are also painted all sorts of colors and designs; so as far as car decoration goes, Barnum & Bailey have nothing on us.

"When we first arrived in France we were given steel helmets and gas masks. The helmets we find useful as protection against shrapnel, but the gas masks we seldom have to use, although we must carry them, ready at a moment's notice. The gas warfare has proved a great disappointment to the Germans. While it is true that during the early part of the war the Allies' casualties were quite serious, they have invented a mask which is absolute protection against every known gas for an indefinite period, while the mask used by the Germans is protection only against certain kinds of gas, and good for only about two hours. Then, again, the Allies have greatly improved the methods of using gas, which the Germans find it hard to combat. This, together with the fact that the prevailing wind is toward the German lines, has made them deeply regret that they ever started the gas game. Curiously enough, one of the most effective gases is in reality quite harmless. It is known as 'weeping gas.' Its only effect is to get into the eyes and make the tears run so freely as to make it absolutely impossible to see. The smallest quantity is highly effective, but as soon as the gas is removed its effect soon passes off.

"We have an opportunity to see a good many of the prisoners within an hour or two after being taken, and it is not uncommon for them to be quite overcome at the sight of American troops. Many of them tell us they had no idea that the United States had entered the war, and still less that we had troops here.

"Before leaving the States, if I recall correctly, we used to hear rumors of the Allied armies starving, etc. I don't know whether food is getting scarce in the States or not, but I do know that we are getting plenty of good wholesome food here, and so far as I have been able to observe I have seen nothing which approaches a shortage of food supply. It is true that the governments have put certain restrictions on food, but that is but a wise policy of conservation. At any rate, at the present rate of supply we shall be a long, long time starving or, in fact, losing very much flesh. This is true, not only of the American Army, but of all the Allies. Back of the 'Boche' lines, however, we have reason to believe that the situation is different."

CANADIAN PACIFIC RAILROAD STOCK is now held by over 50,000 persons, chiefly in Great Britain, Canada and the United States, approximately 12 per cent of it being held in other countries. The holdings in Canada have increased considerably since the beginning of the war, and now represent over 15 per cent of the outstanding capital stock, distributed among 7,000 holders. In the last four years, the number of shareholders has more than doubled.

*The Railway Age expects to publish regularly letters from railwaymen overseas. If you receive a good letter from a railwayman who is now in France, send it in for publication and let the Railway Age pass it along for all to enjoy.

Organization of the Railroad Administration

Divisions of Transportation, Traffic, Finance and Purchases, Labor and Public Service and Accounting

WASHINGTON, D. C.

DIRECTOR GENERAL OF RAILROADS WILLIAM C. MCADOO announced the organization of his railroad staff on February 6. Up to that time he had been assisted by a temporary staff of advisers, most of whom have been retained in the permanent organization. The names of the staff members with the departments over which they are to have jurisdiction and some of their assistants were published in the *Railway Age* of February 1, page 256, but the news of the formal announcement was delayed in transmission from Washington to New York and was not included in last week's issue.

The organization is as follows: Assistant to the Director General, Walker D. Hines, chairman of the executive committee and general counsel of the Atchison, Topeka & Santa Fe.

General counsel, John Barton Payne.

Director, division of transportation, Carl R. Gray, president, Western Maryland.

Director, Division of Traffic, Edward Chambers, vice-president, Atchison, Topeka & Santa Fe.

Director, Division of Finance and Purchases, John Skelton Williams.

Director, Division of Labor, W. S. Carter, president, Brotherhood of Locomotive Firemen and Enginemen.

Director, Division of Public Service and Accounting, Charles A. Prouty, director Bureau of Valuation, Interstate Commerce Commission.

Additional divisions will be created from time to time as conditions may justify. The Director General has in contemplation a division on capital expenditures and improvements.

Frank McManamy, chief inspector of locomotive boilers of the Interstate Commerce Commission, has been appointed manager of the locomotive section and is attached to the division of transportation. He will also continue in his present office.

Mr. Hines has been acting as assistant to the Director General since the temporary staff was appointed on December 31. Mr. Hines was born February 2, 1870, at Russellville, Ky. He graduated from Ogden College in 1888 and from the University of Virginia in 1893 with the degree of LL.B. He entered railway service in 1893 as assistant attorney of the Louisville & Nashville. From 1897 to 1901 he was assistant chief attorney of the same road, and from 1901 to 1904 first vice-president. From 1904 to 1906 he was a member of the law firm of Humphrey, Hines & Humphrey at Louisville, and in 1907 he became a member of the law firm of Cravath, Henderson & De Gersdorff. In 1906 he was appointed general counsel of the Atchison, Topeka & Santa Fe and in 1908 chairman of the executive committee of the same road. He represented his road before the Interstate Commerce Commission in the 5 per cent rate case, and the anthracite carriers in the commission's investigation into anthracite coal rates; and in the New Haven investigation appeared before the commission on behalf of the stockholders of the New York, New Haven & Hartford. He has also represented the express companies and he summed up the case for the railroads in the argument before the Supreme Court on the Adamson eight-hour law.

A photograph and sketch of John Barton Payne were published in the issue of February 1.

Carl R. Gray has been acting in charge of transportation matters for some time, succeeding Hale Holden, president of

the Chicago, Burlington & Quincy, who was temporarily appointed at the time of the resignation of the Railroad War Board. Mr. Gray has been president of the Western Maryland for the last four years. He was born September 28, 1867, was educated at the Arkansas Industrial University and entered railway service in 1882 as telegraph operator for the St. Louis & San Francisco, after which he was consecutively agent, clerk in the traffic department, commercial agent, division freight agent, division superintendent, superintendent of transportation, general manager, second vice-president and general manager, second vice-president and senior vice-president. On May 1, 1911, he became president of the Spokane, Portland & Seattle, and on May 15, 1912, president of the Great Northern. In March, 1914, he was elected president of the Western Maryland.

Mr. Chambers was also appointed a member of Mr. McAdoo's temporary staff. He has been in Washington since last summer, when he was appointed director of transportation of the Food Administration. He was born February 16, 1859, at Waukegan, Ill., and was educated in the public schools. He entered railway service in 1878 as freight handler for the Atchison, Topeka & Santa Fe at Pueblo, Colo., with which road he has been connected ever since as check clerk, transfer foreman and cashier, agent, commercial agent, assistant general freight agent, general freight agent lines west of Albuquerque, assistant freight traffic manager of the coast lines, and vice-president.

John Skelton Williams, comptroller of the currency and ex-officio a member of the Federal Reserve Board, has had considerable experience both in railroad operation and in finance, as a member of the banking house of John L. Williams & Co., of Richmond, Va. He was born July 6, 1865, in Powhatan County, Va., and was educated at the University of Virginia. In 1895 he became president of the Georgia & Alabama Railway and later with his associates purchased a controlling interest in the roads comprising the old Seaboard Air Line System, of which he was president from 1899 to 1903. He was later president of the Florida Central & Peninsular System and later chairman of the board of directors and the executive committee of the Seaboard Air Line System. He was also president of the Georgia & Florida Railway.

W. S. Carter, president of the Brotherhood of Locomotive Firemen & Enginemen, has been granted a leave of absence by his organization to enable him to take charge of the division of labor and will represent all railroad labor, both organized and unorganized.

C. A. Prouty in his new position will continue as director of the Bureau of Valuation and will have charge of questions raised by any portion of the public as to the adequacy of the service rendered shippers and consignees and as to the safety of railroad operation. He will supervise the inventories of the railroad properties of which the government has possession and control, together with receipts and expenditures in connection with their operation. He will, therefore, represent the interests of farmers, manufacturers, producers and consumers generally.

Mr. McManamy has had experience as a locomotive fireman and engineman and was for a time manager of the western district for the air brake department of the International Correspondence Schools. He entered the service of the Interstate Commerce Commission about 10 years ago as inspector of safety appliances. In March, 1911, he was ap-

pointed assistant chief inspector and in the fall of 1913 he was appointed chief inspector of locomotive boilers.

The manager of the locomotive section will supervise the condition of, and repairs to, locomotives at all railway shops and roundhouses and at outside shops, in addition to his present duties for the Interstate Commerce Commission as its Chief Inspector of Locomotives.

Henry Walters, chairman of the Atlantic Coast Line and of the Louisville & Nashville, who was appointed as a member of Mr. McAdoo's temporary staff, will continue to act in an advisory capacity.

W. T. Tyler, assistant to the vice-president of the Northern Pacific, and H. T. Bentley, superintendent of motive power and machinery of the Chicago North Western, are acting temporarily as assistants to Mr. Gray in the transportation division. The Commission on Car Service and the Bureau of Car Service of the Interstate Commerce Commission have been merged and are attached to the transportation division.

Mr. Chambers also has a staff of assistants, most of whom were mentioned in last week's issue. C. B. Buxton, recently assistant director of transportation of the Food Administration, formerly general agent of the Atchison, Topeka & Santa Fe at Philadelphia and later vice-president of H. L. Edwards & Co., cotton merchants, of Dallas, Tex., is Mr. Chambers' personal assistant. R. C. Wright, general traffic manager of the Pennsylvania, is assistant in charge of freight matters. Gerrit Fort, passenger traffic manager of the Union Pacific System, is in charge of passenger matters. G. W. Kirtley, formerly general superintendent of transportation of the Erie and recently assistant to Priority Director R. S. Lovett, is in charge of matters pertaining to preferential service.

Car Service Section Organized

For the handling of car service and other matters formerly in charge of the Commission on Car Service of the American Railway Association, the Car Service Section of the Division of Transportation has been created. W. C. Kendall was appointed manager of the Car Service Section and W. L. Barnes, E. H. DeGrott, Jr., A. G. Gutheim, C. B. Phelps, G. F. Richardson and J. A. Somerville were appointed assistant managers.

The Car Service Section, according to the circular:

(a) Will have charge of all matters pertaining to car service, including the re-location of freight cars.

(b) Will provide through the regional director, on application of proper governmental authorities, for preference in car supply and movement, where more than 10 cars are involved.

(c) Will receive from railroads such reports, periodical or special, as it may require in order to keep fully informed with respect to the car service, the embargo or transportation conditions.

(d) Must be promptly informed of all embargoes placed, modified or removed, and will, from time to time, recommend such embargo policies and exemptions as the needs of the government, seasonal requirements, or other circumstances may demand.

(e) Will deal directly with railroads with respect to matters within its jurisdiction, and will keep the regional directors properly advised.

W. C. Kendall, superintendent of transportation of the Boston & Maine, has been a member of the Commission on Car Service since its organization. He was born on May 22, 1877, at Pompanoosuc, Vt., and graduated from St. Johnsbury (Vt.) Academy in 1895, and from Dartmouth college in 1899. His first regular railway position was on the Boston & Maine as telegrapher at Boston, Mass., in August, 1899. He subsequently served as clerk to various officers and since March 1, 1912, has been superintendent of transportation of the same road. C. M. Sheaffer, general superintendent of transportation of the Pennsylvania Railroad, who was chairman of the Commission on Car Service, has been recalled by his road. The new section is a merger of the Commission on Car Service and of the Bureau of Car Service of the Interstate Commerce Commission, consisting of Mr. De Groot and Mr. Gutheim. Mr. Barnes, Mr. Richardson and Mr. Somerville were members of the Commission on Car Service. D. E. Spangler, superintendent of transportation of the Norfolk & Western, has resigned on account of ill-health. Mr. Phelps is superintendent of transportation of the Louisville & Nashville.

In addition to appointments previously mentioned in the government departments, the Army, Shipping Board and Food and Fuel Administrations, H. P. Anewalt, general freight agent of the Atchison, Topeka & Santa Fe, Coast Lines, has been appointed director of inland transportation of the Navy Department.

British Engineers Reconstructing a Bridge in Flanders

My Forty Years' Selling Experience in Europe

No Properly Equipped American Firm Ever Lost Money
in Europe—Peace Will Open Big Markets There

By Hugh Reid Griffin

THIS ARTICLE is written from the point of view of an American traveling salesman who has been studying the European field for the past 40 years, who has sold many classes of iron and steel products, who can say he has been fairly successful in dealing with men of every nation in Europe, and who now, while still in Europe, has retired from active business, though he still loves business for the fun there is in it. I hope that I may be able to give a few pointers not only to firms expecting to do business in Europe but also to the representatives they send abroad.

To the firm I would say: Prepare now for the business coming with peace. You may have to do a credit business, often, but you will make money in the end. Andrew Carnegie got his first big start by being prepared to do business, by being ready. He foresaw the need of steel railroad bridges. He didn't go around and try to convince railroads that they were going to need these bridges. He first had a lot of bridge parts made up, then he went to the railroads needing those particular bridges and said: "You've got to have a bridge at such and such a point. It will cost you so much. The bridge is ready to deliver. I know you had to have it, so here it is." Some people would call that luck. I call it being prepared.

To the firm I would also say: Get your young men in the field now. Let them be studying it, learning the language and the ways of the country you want them to do business in. Be sure they are Americans who know your product; who can show all of its good points, for by so knowing a salesman is able to convince a prospective customer and sell in big lots instead of in small parcels, as your foreign agent would probably do.

To the representative I would say: Business is the greatest sport in the world, because every day there's something doing, something new, some new twist in the game to be worked out. A lot of people think you don't have to have much sense to sell goods. It's a colossal mistake. Business is no place for a fool, and foreign business least of all.

Study Your Customer Closely

In doing business in Europe, you have got to study your customer closely. He may take plenty of time to do business, to get started in buying from you, but once you get his confidence you hold him. It is commonly said that you can't drive an English customer away, after he gets used to you.

I think one of the big points of doing business anywhere is to waste all the time you can spare in landing your man, but once you have landed him, and have gotten his signature to a contract, take the first train out of town. No matter whether it is going north, east, south or west, board it. Else your man may change his mind.

The American habit of buying many drinks, of giving big dinners, is often looked on suspiciously over here, and little things like that may ruin a good deal. I remember once in Dusseldorf, Germany, many years ago, in talking with the head of a big firm of steel product buyers, the man told me about an American salesman who came to town and at once gave a banquet to him and his friends, something gorgeous in the way of a banquet. "The next day the salesman came around to sell, and I cut his prices way down," related the man, "because I figured that a firm able to throw money away on banquets must be making big profits and could sell

much cheaper than quoted prices." The foreigner rarely invites anybody to dinner except as a matter of personal liking, of friendship, and then he doesn't splurge. It's just a quiet affair. So he very naturally looks with suspicion on a costly dinner. "Why is this fellow giving me this dinner?" the foreigner asks. "It must be to get something out of me." And before he gets done thinking about it, he concludes that there must be something wrong with the goods.

We must accept good naturedly the peculiarities of people whose ways are not our ways, and try to use our wits to accomplish our end just the same. Many, many years ago I was selling harvesting machinery in Germany. I heard of a prospect in a Polish city. I went there, met a lot of the well-to-do business men of the place, and suggested they should form a subsidiary company for selling machines locally. In this case, they, not I, invited me to a dinner. The thing lasted all night. We told stories, for seven or eight hours straight, as I happen to know German, as well as French—the two languages, which together with English, will carry you around the world.

About daybreak I said to the party: "Look here, gentlemen, I am getting sleepy. If we are going to do any business, let's do it." Well, within a few minutes each of the men subscribed the amount of money necessary to form the total sum to buy up a hundred machines or so.

I went on back to Berlin, finally to Paris, and there I got a wire from the head man of the agreement to come to see him, that there was trouble. When I reached him, he said: "The machines are here all right, but there's a strike among the farm laborers. They won't let us use the machinery, and the farmer buyers are being scared off."

"Oh, is that all?" I said. "Let's go out to that strike. When we got there I made a bee line for the village priest and to him I handed a comfortable sum of roubles for charity. Then I brought up the subject of the machines and the strike. He was an intelligent man, saw the need of the machines, and before the day was over he had gone out, arranged a ceremony, and blessed the machines in the presence of the strikers. So the strike was off.

Changes Brought by the War

My memories of such things run a long ways back; 40 years is four decades—the life of the average man. I began business just after another big war, when Europe was settling down and rapidly developing after the death struggle of 1870-71 between France and Germany, and Germany with a fat indemnity of five milliards of francs—spot cash practically, or short time credit at most. The year 1875 was the year of the great Vienna exposition, and while the United States did not make a large exhibit there, it showed champagne from California, harvesting machinery from the Eastern states, and various other products of American ingenuity. Think, just think, no one has ever heard over here of a large order of California champagne. On the other hand, European crops have been harvested ever since that exposition with increasing numbers of American mowers, reapers and binders.

Consider the champagne and the harvesters. There's a lesson in them. They go to show that you can drink yourself drunk and talk your head off without result, if you offer what is not wanted, while the needed or practical article meets

with a large demand. It was so after 1873 and will be so after the unknown date when this terrible war ends.

To judge what is needed requires familiarity with conditions and a willingness to meet these conditions. No one branch of American manufacture has been pushed as has the harvesting machinery, and in this branch mowers and simple reapers were followed by sheaf binders and, notwithstanding the attempts to copy the models or original devices on the ground, America has so far had the trade and will continue to have it. This success in a special line should stimulate men in other lines.

There is one point we as a nation must consider before that of any foreign trade at all. Since 1865 the United States has never had a commercial marine of any importance on the high seas. England and then Germany have done the carrying. France has had a share but the United States has sat tight and let the other nations carry our products. This condition cannot and will not continue. The world is open to us as never before; it is our great chance to develop further our transportation business which at present, the best in the world on land, stops short at the water's edge. It is not often so considered, but foreign transportation is an industry and a paying one just as much as selling shoes in a foreign land. Hand in hand with the pushing of our manufactures in foreign lands should we push the transportation.

The Possible Markets

England is the easiest market to tackle for us because the language is our own; but the future is not confined to English trade.

Germany had a population of seventy millions, possibly ten millions of which has been killed or disabled. Yet these sixty millions left after the war will be just so many millions of resourceful, needy, obstinate, systematic organizers. In time, Germany, hated and despised now, will, like the Hebrews, blossom and flower into something better than war, murder and depravity. Too much has been made, however, of the bad side of the German character. I have done business with Germans all my life, and I have found them, while exacting in their contracts, always honest to a penny, and therefore excellent people to do business with. They succeeded in business because of remarkable virtues, because they asked, "What do you want?" and then gave it to you. These people must and will live, and perhaps we as a nation will be the ones to help them most in the future, and Germany may become one of our best markets.

France is rich and will not be poor when the war is over. Possibly because of their Republican institutions and the consequent manner of thinking, they are the more nearly like the Americans in character of all the peoples of Europe. Anybody can agree and get along with a Frenchman, and best of all ourselves. They are a people of many qualities which it took this war and their sacrifices in it to understand. For one thing, a Frenchman of business standing will never, *never*, make a contract which he does not expect to keep, nor which he does not clearly see his way to keep.

Russia is a second United States, as far as self-supporting problems affect her. She is weak on many manufactures but has material and will develop.

Austria-Hungary, Roumania, Turkey, even the Balkans, will be big buyers after the war.

Financial conditions should be studied by our best men, just as France, Belgium and England have men busy with all these problems now, getting ready to meet conditions after peace. Naturally, unlimited credit cannot be given. Guarantees will be required, but much that we can supply will provide the means of paying for such supplies. Already an international trade clearing house is being devised, something after the manner in which Morgan, Harjes & Co. acted as agents for England and France in the United States. In this way the manufacturer, the seller, is relieved of the long

individual credit bother. His bank at home provides the credit for him to carry the foreign customer. Also, we need an all-American bank in every big city in Europe.

Among the big articles that will sell—and everything will sell—is steel of all kinds, cement, wood furnishings, windows, doors, floorings, fittings of all kinds, bridges, rails and structural steel. These and hundreds of other items can be sold without too great risk in Europe. The sooner the study of the market begins the better. There is no human probability of a general resumption of industrial output in Europe sufficient for the needs until long after the war. Therefore iron, steel, coal, wood, cotton, food supplies, and a thousand other products we can deliver will find a market.

Cultivating the Market

To cultivate this field and prepare for what common horse-sense tells one must result in the way of demand, the markets should be studied. I cannot repeat this too often. Forty to forty-five years ago it was far less easy to introduce our manufactures, and prejudices were a hundred times harder to overcome. Communications of all kinds were slower and not available.

Once the head of a firm or some one in whom he has confidence has mapped out market prospects, the next step is to get a man in the field. The mere placing of agencies in local districts is not enough. Customers must be seen personally by the American representative.

The art of selling is natural or acquired, though most generally it is born in a man. Let me repeat, the salesman must have an absolute knowledge of his wares, of their good points, and after this he should study closely all the possibilities of his given field. For one thing, he should always be willing to help any firm he comes in contact with whether he can do any immediate business with it, or for it, or not. I have all my life made it a rule to help business people, give them any special information I possessed, whether the firm was American or foreign. Frequently I have seen a business possibility and dropped a line to some firm I knew suggesting that it follow it up, though there was no immediate interest in the affair for myself. This sort of thing pays. Firms remember such favors and when they have something they can throw your way they do it gladly.

The second great requisite for the foreign representative of an American firm, after that of knowing his wares, is that of knowing well his own language and country and then the language and country where he must do business.

These qualifications involve a general store of information which often leads to good business. It makes the salesman able to interest the man he meets in a business way. Selling introduces the personal equation. If a man likes you, is interested in you, he becomes interested in what you have got to sell. Big sales sometimes turn on little points. A buyer has his peculiarities and in passing large contracts he may haggle over minor points that the seller cannot well modify, and in such cases you've got to use your personality, tell the man a funny story, get his attention off his hobby, and close your deal while he is in a good humor.

It is very important never to let your buyer quarrel with you over national prejudices. He may begin by abusing the United States, telling you that its business men never make prompt deliveries, relate how unsatisfactory such and such an arrangement proved as in the case of a friend of his. When he begins to abuse your country, don't get mad about it. Let the steam blow off. Praise his own country, tell him how many of his countrymen have succeeded in the United States, try to think up specific cases, and then lead your man up to the question: "Has he ever visited the United States?" "No," he will probably say. Then tell him he should do so, how we welcome visitors, explain to him some of its good points; don't brag about it too much, because that offends him, makes his own country seem small and insignificant;

But tell him that while it has its good points, many of them were borrowed from the old world, probably from his own country. People in Europe are extremely sensitive about questions of nationality. The English have an air of indifference, of coldness, of superiority about them which offends others, though they really do not mean to be so, being honest and square people in business. The French and the Italians have never liked each other too much, it is said, despite many common interests, because the French, being wealthier and more powerful, have often used, in politics, high handed methods with the Italians, or at least, so the Italians think.

If you find that you are unable to interest foreigners in your country, then clear out and go home and don't come back until you have really learned to talk intelligently about it.

Be ready to learn new points about the country you are in and if some local interest is brought up, follow it and show your interest in it. We are never too old to learn and every man who has talent, position, or ability, whom you meet, if he sizes you up favorably, is willing to help you.

I remember once, in England, that I had a shipment of machinery due in London and this machinery was not labelled or marked according to some new customs rule that had been made after I had ordered it from home. I went down to see the head of the Board of Trade, a gentleman whom I had never met and whom I didn't have time to get an introduction to, or write for an appointment; anyway, letters often involve matters and give the other fellow a chance of getting rid of you politely. So I went into his outer office and told the uniformed porter I wanted to see this man.

"Have you an appointment with him?" Do you know him?" asked the porter. "Certainly," I said, knowing I would never see my man if I appeared to be some stranger whose business was not understood. The porter took in my card, and the man's secretary came out. He did not recall the appointment, said the secretary. "Tell Mr. So-and-So it is absolutely necessary I see him at once on important business," I told the secretary. The secretary disappeared and came back with the word that I would be seen at once. After that, when I got to my man, I explained the case. "I'm sorry I've never met you," I told him, "but I've heard a great deal about your courtesy to American business men, and such-and-such is the case." Well, the man softened up and said while the case was unusual, he would give me a letter that would arrange the matter, he thought, with the customs.

On the question of time, the salesman must possess his soul in patience, whether it is a matter of hours or of years. Be punctual yourself in keeping appointments though your customer may keep you waiting often. Patience, whether Jobastic or Wilsonian, is sometimes a virtue and more frequently a necessity. Once you get into a man's office, you need not be so short and quick, afraid of taking up his time, as is the rule with business calls at home. First take a lot of time, if the man is new to you, making a good impression; mention your connections in the country if they are good and not unfriendly to the man you are calling on. Of course, don't forget the object of your visit. Business is business, and there is a moment when the hammer should fall on the nail and drive it home.

Don't be ashamed of being in business, as they used to be over here. The business of selling is the most interesting occupation in the world. If educated, it broadens and enlarges one's views, it rounds up and polishes and it is the greatest university the world possesses. It makes demands on every professional and artistic instinct a man possesses; after the busy struggle for dollars is over, and a man sums up his work, it leads him to charity and liberality in dispensing his money to help suffering or oppressed humanity.

World-wide business enterprise offers the greatest attraction, it is full of bold adventure, it takes men to the extremes of the earth, it maps out and records facts and furnishes data which no government bureau ever jots down.

Business Papers Advise Shippers

THE SERIOUSNESS of the transportation situation and the resultant threatened decrease of production to industries have caused the Associated Business Papers, Inc., to call for co-operation of the entire business and trade press of the country in urging special efforts on the part of the shippers. The executive committee of the Associated Business Papers, Inc. is sending out to the technical and trade papers the following report.

Your committee, appointed to consider the question of constructive practical suggestions which can be made to the shippers in various lines of industry so that the traffic situation can be temporarily improved and later permanently bettered, has considered the matter and makes the following report.

To win this war we must do things. Do them quickly, with less labor and less waste. We must increase valuable activity and decrease wasteful activity. We are at present suffering from a decrease of activity all along the line. This decrease comes from the inadequacy of the distribution system. It is time for the producer of raw material, the manufacturer, the warehouseman, the jobber and the dealer to understand that distribution, the movement of materials from the point of production to the point of fabrication and the movement of goods from the point of fabrication to the point of consumption is the foundation of all industrial endeavor.

Neither the efficient control of government bodies, nor the wisdom of the railroad men can solve the whole problem. A large part of the difficulty is the local and short haul difficulty, resulting in congestion which extends back into the main arteries of transportation. It is time for the business man in all lines of endeavor to realize that he is not merely a buyer of transportation, at a price per mile or per ton, but that adequate transportation service is absolutely necessary to the profits of his business. At the present time the interest charges on goods in transit frequently amount to very much more than double the cost of the transportation, while the cost of waste, due to inability to secure materials and ship goods, runs into much larger figures.

For these reasons all men who secure their livelihood from the production of materials or goods and the sale of those products, should be interested in pushing for these items, which will enable us to build up an adequate transportation system.

The government has now assumed control of the railroads, and Director General McAdoo has surrounded himself with an able staff of practical and successful railroad operators. A National Highway Committee has been appointed with Roy D. Chapin, president of the Hudson Motor Car Company, as its head, and the Board of National Waterways Association is working with the official committee on this problem. Under these circumstances, and having in mind that we have not in our industries displayed any well organized efforts to aid in the solution of the traffic problem, it is our recommendation that the matter will be best served by our full co-operation with these governmental bodies. It is time to quit kicking about rules which are established in the endeavor to clean up the situation and to concentrate in such a whole hearted and intelligent way that the tangle of transportation difficulty may be more rapidly untied and the situation cleared in record time.

It is recommended for this reason that generally speaking, the shipper should be urged to foster movements in the following directions:

For the Improvement of Railroad Service

1. The provision of adequate rules to secure the full efficiency of transportation service.
2. This includes establishing proper charges for freight

and demurrage and the enforcement of equitable rules of loading and unloading, shipping and packing.

For the Highways

1. The extension of paved highways.
2. Provision for keeping these highways open at all seasons.
3. Proper provision the maintenance of these highways.

For the Waterways

1. The construction of barges and small tow boats to provide for the adequate use of existing highways.
2. Provision for putting into shape existing waterways that have been allowed to become obsolete.
3. Provision for the wise extension of these waterways to correlate with the railroad system.

As a measure of relief from the present congestion, it is recommended that the shipper be advised that he can materially aid himself in the improvement of his own transportation conditions and the elimination of the excessive costs of not being able to do business, by carrying out the following suggestions:

In Connection with the Railroads

1. Co-operate and put it over. Do not kick at changes.
2. Load and unload promptly. Do not wait for a convenient season.
3. Load to capacity.
4. Do not reconsign en route. Decide the destination before the goods leave.
5. Pack securely and mark plainly.

In Connection with the Highways

1. Make a survey of all the incoming and outgoing freight handled within zones of 10, 25, 50 or 75 miles from your city.
2. Ship all goods to be delivered within the above zones over the road by motor trucks.
3. Demand that all goods to be shipped to merchants in your city and originating within the zones mentioned be delivered by motor trucks.
4. Make a census of all motor trucks in your town available for this work.
5. Take up with your local offices of the national express companies and your local haulage and express concerns as to how far they can extend their present delivery routes.
6. Select a committee of the best traffic managers of the concerns in your city to lay out a detailed plan to suit your own local conditions and determine upon the fair rates to be charged.
7. Arrange for a sufficient number of receiving platforms or warehouses where you can use horse wagons and motor trucks up to 3-ton capacity to deliver and set down goods, leaving for the larger trucks the running between the main points in the zones. Do not try to make the trucks running overland between the main points do pick-ups and deliveries. It cuts down their efficiency and makes the maintenance of schedules impossible.
8. Put some trucks in the overland haul work on definite leaving schedules so that goods can be delivered to the receiving platforms or warehouses in time to make up full loads to any given points.
9. Arrange a Return Loads Bureau. Arrange with the local telephone companies to give your regular telephone number to any inquirer calling up and asking for Return Loads Bureau. Post notices in the offices of all of your merchants that you have established a Return Loads Bureau. Post similar notices in conspicuous places in the smaller towns and cities through which trucks running to or from your city will have to pass. This will enable your trucks and those of private truck contractors doing this kind of

haulage and entering your city to quickly collect loads to be transported to their home cities.

10. Bring all pressure to bear upon your mayor and the governor and thence to your highway commissioners to keep all the main highways leading out of your city open during the remaining winter months.

11. Bring all pressure to bear on the proper authorities toward the resumption of the construction of main line highways at the earliest possible moment this spring and for a proper maintenance of the roads all year around.

In Connection with Waterways

1. Secure information upon transportation available on existing waterways covering short hauls.
2. Get behind the movement for immediate production of barges for the large canals, such as the Erie barge canal, which would relieve the freight situation between the lakes, coal regions and the important centers on the Atlantic seaboard.
3. Take up with the traffic manager of your business and the traffic expert of the local chamber of commerce the possibility of the use of waterways for any part of your freight movement and arrange shipping plans accordingly.

The New Army Storage and Traffic Division

SECRETARY OF WAR BAKER on February 10 announced a reorganization of the general staff of the army dividing its functions into five divisions, one of which is the storage and traffic division. Concerning this the announcement says:

"This division shall have cognizance and control of the transportation of all branches of the army and of all munitions and other supplies for the army, both by land and sea, and all storage facilities in connection therewith, under an officer designated as the Director of Storage and Traffic, who shall be an assistant to the Chief of Staff. The duties of this division shall include the following matters:

"(1) All movements of troops, as well as of munitions and of supplies of every kind, including raw materials, and finished products both during manufacture and after assembly, to points of embarkation, interior points, and overseas points, and in and out of all storage.

"(2) All inland traffic, embarkation service, and overseas service relating to the army program, including the employment of all army transports engaged in the transatlantic service, and such commercial shipping as may be used to supplement that service, including all arrangements with the Navy Department for convoy service.

"(3) All storage for munitions and all other supplies of the army on the seaboard and at interior points.

"Direct correspondence between the Director of Storage and Traffic and the commanding officers of ports of embarkation is authorized. Copies of all requisitions, requests, and information of every character received from the Commanding General of our forces in Europe, or his subordinates, which bear upon reinforcements or renewals of supplies, will be transmitted to the Director of Storage and Traffic, and, in general, this officer is charged with the duty of arranging that all supplies for our forces in Europe shall be forwarded in the most expeditious and convenient manner, and to that end he is authorized to exercise control of army shipment, both within the territory of the United States and as the same relates to the overseas haul.

"The embarkation service created under Section 3, G. O. 102, W. D., 1917, is hereby transferred to the Storage and Traffic Division."

The appointment of the director has not been announced.

The Great Northern Elects a New President

A Man Who Believes in Personal Relations with Patrons
and in Taking Pains to Accommodate Them

THE INCREASED importance attached to the maintenance of satisfactory relations with the public makes it desirable to have an executive at the head of a railway who is capable of pursuing a policy which is both understood and approved of in the territory served. No railroad officer has an opportunity to become more adept in reading the public mind and in satisfying the wants and whims of railroad patrons than the experienced traffic man. This type of officer was elevated to the position of chief executive when James E. Gorman was elected president of the Chicago, Rock Island & Pacific, and that road's example was followed on February 12, when William P. Kenney was elected to succeed Louis W. Hill as president of the Great Northern.

Mr. Kenney, although not so well known in the East, has an extensive acquaintance in the Northwest and has a thorough knowledge of the resources and traffic possibilities of the states traversed by his road. "The public be served" has been his motto as the head of the traffic department of the Great Northern, and adherence to this principle has won for him and his company the increasing confidence and good will of shippers and passengers. Mr. Kenney is a believer in close personal relations with patrons and in painstaking efforts to accommodate them, rather than in wholesale methods of publicity. His election to the presidency has been jokingly ascribed to his consummate ability to tell humorous stories in the Swedish brogue. Although referred to in a spirit of jest, Mr. Kenney's wit and genial good humor have played no small part in winning for him a large personal following as well as countless friends for the Great Northern.

A close student of human nature, he is adept in handling the most delicate situations which may develop through misunderstanding or super-sensitiveness. Like others of Celtic stock Mr. Kenney is a born fighter and keen to match his strength with others in the same vocation. In securing competitive business for his line he has been particularly successful. In inculcating a keen business sense in his subordinates he has shown the qualities of a natural leader.

Perhaps the highest compliment which can be paid to Mr. Kenney is that he was a protegee of James J. Hill. Under the direction of the great "empire builder" and later of Louis W. Hill he continued the development work for which the Great Northern long has been noted. He has helped induce immigration to Montana and other western states and has supervised his company's extensive program of practical and educational assistance to the farmer. He has likewise aided

in bringing the attractions of Glacier National Park and other points of interest to the attention of prospective travelers. In fact, his familiarity with this kind of work probably constitutes one of the reasons why he has been selected to direct the policies of a road serving a country still rich in its possibilities for further development.

Mr. Kenney's election as president of the Great Northern as well as Ralph Budd's election as vice-president, illustrates the policy of the Hill lines to give positions of responsibility

to comparatively young men. The former has not yet reached the half-century mark and the latter is barely over 40 years of age. Although Mr. Kenney's career is marked by his rapid rise to high position, it has not been spectacular. His has rather been the steady progress of the persevering, industrious and efficient officer who advances from post to post through sheer merit and remains relatively unnoticed until he surprises his associates by reaching the top.

It is difficult to say when Mr. Kenney left school to enter business life. As a matter of fact, he sold newspapers in the streets of Minneapolis and delivered messages for the Western Union Telegraph Company before he discontinued his schooling. His first railroad position was that of a telegraph operator on the Chicago Great Western from November, 1888, to September, 1889. He then entered traffic work as a clerk in the local freight

office of the same line in Minneapolis, and has been in the traffic department ever since. His connection with the Great Northern dates from September 15, 1902, when he became chief clerk in the general freight office.

Mr. Kenney was born at Watertown, Wis., January 10, 1870, and entered railway service November, 1888, as a telegraph operator on the Chicago Great Western. From 1889 to September 1, 1890, he was consecutively yard clerk and clerk in the local freight office at Minneapolis, following which he was clerk and stenographer to the general agent in the same city until May, 1892. For seven years he was contracting agent of the Great Western, and in 1899 was contracting agent for the Empire Line. He then entered the general freight office of the St. Paul & Duluth, later assimilated by the Northern Pacific, as chief clerk, remaining there until September 15, 1902, when he took a similar position with the Great Northern. On April 1, 1903, he was appointed assistant general freight agent and in January, 1905, became assistant to the fourth vice-president. From May, 1908, to September, 1911, he was assistant traffic manager and during the following year was general traffic manager. Since October, 1912, he has been vice-president in charge of traffic.

W. P. Kenney

Hearings Before the Railroad Wage Commission

Firemen and Hostlers Ask Ten Per Cent Increase with Minimum of \$3.50 Per Day. Other Witnesses

WASHINGTON, D. C.

THE Brotherhood of Locomotive Firemen and Enginemen, representing engineers, firemen and hostlers, on Monday and Tuesday of this week presented to the Railroad Wage Commission the requests for increased wages which it had not got around to presenting to the railroads when the government took over the roads.

The request of the firemen's brotherhood may be generally described as for a 10 per cent increase in wages with a minimum of \$3.50 a day of eight hours or less, 100 miles or less, with time and one-half for overtime, calculated on the basis of eight hours or a speed basis of 12½ miles an hour. In passenger service the minimum is placed at \$3 per 100 miles for road service and \$3.50 a day on short turn-around runs not paid on a mileage basis. A minimum of \$3.75 a day is asked for hostlers running on the main track, as between the engine house and a station, and a minimum differential of 50 cents a day is asked for local freight service over through freight rates. It is also proposed that helpers in electric service shall receive the same rates as firemen in steam service.

Timothy Shea, acting president of the Brotherhood of Locomotive Firemen and Enginemen, presented the case for his organization, representing 103,645 engineers, firemen and hostlers, in place of President W. S. Carter, who has been given a leave of absence because of his appointment as director of the Division of Labor on Mr. McAdoo's staff. He explained that Mr. Carter had charge of the case until his appointment, and he filed an elaborate brief prepared by Mr. Carter, and two exhibits dealing exhaustively with the wages and working conditions and the cost of living, including one entitled "Wages and the Law," by Hugh S. Hanna and W. Jett Lauck.

The proposals, he said, were drawn by a committee of 18, representing the three territorial associations of the brotherhood, in response to numerous complaints received from the members during 1917, and demands for a new wage movement because their standard of living was being depressed by the increased cost of living, and they were "made extremely modest" in the hope that if the railroads were disposed to give any relief they would grant them quickly. They were submitted to a referendum vote on December 22 and approved practically unanimously on January 21, after which they were presented to the director general and referred to the Wage Commission.

The wages of firemen and hostlers are abnormally low, Mr. Shea said, as compared with wages in other industries except where earnings are increased by excessive overtime or excessive mileage, and the work is "almost beyond human endurance." Because of the "conservatism of the organization" they have repeatedly accepted compromises and "lean awards" from boards of arbitration until "their conservatism has been capitalized by the railroads" and many of them are now paid less than unskilled laborers. In the west, Mr. Shea said, they received a 10 per cent increase in wages in 1910, but have not received any increase since, except in a few instances in the 1915 award, which, he said, would have reduced the pay of many employees if they had not been protected by the "saving clause." In the east they had received no increase since 1913. The eight-hour movement, according to Mr. Shea, had brought little relief, and he declared that the Goethals commission report was made up largely of forecasts of what the railroads believed would be the cost of the law rather than actual results.

"We hope that the government will now extend the relief so long denied by the railroads," he said. "These employees are performing a very important duty and the firemen and hostlers are the one class of railroad employees that are underpaid."

When Mr. Shea presented comparisons of wages paid to firemen, ranging from \$2.45 to \$4 for an eight-hour day, with wages in other industries, Chairman Lane of the commission asked why so many examples of wages paid in the San Francisco ship yards were included, such as sheet metal workers at \$6.60 a day, whereas in the case of bricklayers and structural iron workers the average of 30 and 32 cities, respectively, were taken. Mr. Shea said he had not compiled the table. Bricklayers' wages, according to the table, had increased from \$5.17 in 1911 to \$5.83 in 1917, while those of structural iron workers had increased from \$4.58 to \$5.62. The rate usually paid firemen, Mr. Shea said, was \$3.10 or \$3.20 because there is a preponderance of the classes of engines on which those rates are paid.

Chairman Lane asked which class of employment in the table of other industries was most nearly comparable with the work of the fireman, and whether the fact that a man has to serve an apprenticeship in the other employments constitutes a difference. The duties of a fireman are comparable with those of any skilled craft, Mr. Shea replied. Chairman Lane also asked what percentage of the members of the organization are married men and heads of families. Mr. Shea said the records of the brotherhood do not show that fact.

Mr. Shea asked particularly that any settlement be made specific enough to avoid any dispute as to its application to hostlers and he recounted at length his long controversies with the railroads that had refused to apply the awards of arbitration boards or other settlements to the hostlers. Some roads, to avoid paying the awarded scale, he said, have changed the classification of hostlers to roundhouse foremen or engine repairers and have kept the men on a 12-hour day.

He also dwelt at length on the request for time and one-half for overtime, saying that a punitive rate would be necessary to enforce an actual eight-hour day. The best way to prevent train delays, Mr. Shea asserted, would be to penalize overtime and give each locomotive only its "proper tonnage rating." He said the roads had sought to make the application of the eight-hour law as expensive as possible.

Chairman Lane suggested a plan of payment for firemen which would reward economical use of fuel. Any such plan, Mr. Shea said, would be opposed. It had been tried on some roads and had caused a great deal of discontent because it was impossible to measure accurately the amount of coal used by a fireman, and it led to dishonesty on the part of some employees. Railroads are not burning coal now, he said, but are using "real estate."

"That is an experience common to all of us in these days," said Chairman Lane, "but why cannot the brotherhood make itself very useful by devising some plan or system of education among its men to save a percentage of coal?"

The brotherhood publishes educational matter in its magazine, Mr. Shea said, but the bonus system would not work. The fireman does not want to shovel any more coal than he has to, but there should be more competent instructors to show him how to be economical.

Mr. Shea continued his testimony on Tuesday, making numerous objections to statements included in the report of

the eight-hour commission. He particularly objected to a table included in the report showing that firemen spend only a small part of their time in the physical labor of shoveling coal and he referred to an exhibit filed by the railroads in the western arbitration case, showing that in 1,556 trips an average of only one hour and 42 minutes, or 19 per cent, was actually spent in shoveling coal. Mr. Shea said that as firemen shovel from 15 to 20 tons going over a division, if they could handle that amount of coal in such a short time it would not be necessary to send steam shovels to France.

He also filed 11 exhibits which had been used by the brotherhoods in the western arbitration case in spite of the fact that the board in that case was not sufficiently impressed with the presentation made by the brotherhoods to give an award anything like what the men demanded. These exhibits gave statistics as to increased cost of meals and rooms and the increased cost of living, increased work and productive efficiency of the employees, the hazard of the occupation, etc., and he declared that the relief which the men had asked had not resulted from the eight-hour law so that the old statistics were still useful. He also attacked many of the conclusions reached by the Eight-Hour Commission as erroneous on the ground that they were based on the period before the law was actually made effective. Reverting to what he declared to be the practice of the railroads in avoiding increased payments to hostlers, Mr. Shea presented what he called "very sensational testimony" in the form of a report from an employee relating instances of accidents and damage to locomotives caused by using machinists and helpers, boiler-makers and their helpers, or inexperienced or low-paid employees in the place of hostlers. These instances, he said, were samples of conditions on other roads and he cited examples of delays in putting engines through the roundhouse as the result of employing inexperienced men at low wages.

There has also been startling increases in the number of violations of the hours of service law, he declared, and he cited reports from a road which for five years had shown a steady decrease in the number of instances of service over 16 hours, from 824 in 1913 to 89 in 1917, whereas he had received reports of 123 instances on the same road from January 2 to January 24.

"That is not an extraordinary situation at all," said Chairman Lane. "If I were running that railroad I would probably have had that amount of overtime. January was a very abnormal month and I would not put any confidence in figures of that kind."

Mr. Shea declared that the men are saying that railroad officers now feel at liberty to violate the law because they are in the hands of the government. Commissioner McChord said that was a very mistaken idea and probably arose from the fact that some railroads had asked for relief from the provisions of the law, but that he was approving prosecutions for violations of the law every day.

Mr. Shea also introduced an exhibit on the increased cost of living prepared by W. Jett Lauck and also a statement from a clothing dealer showing the large increase in the cost of overalls, gloves and other clothing. In order to be able to maintain their pre-war standard of living, Mr. Shea said, the men should receive an increase of at least 45 per cent.

Mr. Shea was to be followed by W. S. Stone, grand chief of the Brotherhood of Locomotive Enginemen.

Other Witnesses

S. L. Heberling, president of the Switchmen's Union, testified before the Railroad Wage Commission on February 8 regarding the demands presented last October by the union to the railroads with which it has contracts for a 50 per cent increase in wages and time and a half for overtime after eight hours. The practicability of establishing an eight-hour day during the war by punitive overtime was questioned by Chairman Lane.

"I sympathize with you as to the desirability of a standard eight-hour day," he said, "but when industries are short of men would it be more desirable to come to that ideal or to give an increase in pay without disturbing the hours?"

Mr. Heberling said the switchmen did not ask an arbitrary eight-hour day if overtime work was necessary, but wanted to keep the work day as near to eight hours as possible by imposing a penalty for overtime work.

"But would your men not be better satisfied with an increase in pay than with an enforced reduction of hours?" asked Chairman Lane.

"We want enough to make both ends meet," replied Mr. Heberling, "but do not want the principle of the eight-hour day destroyed because of war conditions." Mr. Heberling said that the only limit to the hours of work now is the 16-hour law and that overwork is responsible for the extreme hazard of the switchman's occupation. He also asked consideration for unorganized employees.

C. L. Darling, of Spokane, Wash., A. S. Burrose, of Portland, Ore., and J. C. Wessels, Ashland, Wis., appeared on behalf of train dispatchers on February 8 and asked for increases in pay for train dispatchers to \$255 a month, for chief dispatchers and \$215 for trunk dispatchers, an eight-hour day, one day a week off or double time, two weeks' vacation with pay, and free transportation. They said that opportunities for promotion for dispatchers were being reduced because brotherhood men are given positions as trainmasters and assistant superintendents.

Thomas McNeill, representing car inspectors on the Pennsylvania contended that the inspectors should come under the provision of the eight-hour law because of their part in the operation of trains, but he said the railroad managements have refused to concede this. He also asked increases in wages.

Robert L. Mays, a dining car waiter, spoke for unorganized negro waiters and colored employees generally, asking that they be given the same pay as white employees in the same classes of work. He said the waiters received about \$25 a month for 16 to 18 hours work a day. He asked for an increase in wages, but said that they could not get along without tips unless the pay was increased to about \$100 a month.

The commission has received a large number of telegrams and letters from train dispatchers in all parts of the country challenging statements made by W. G. Lee and A. B. Garretson at the hearing last week in which the dispatchers were referred to as train "delayers" and the railroads were charged with "laying down" and deliberately trying to increase overtime both for the purpose of discrediting the eight-hour law and in an effort to make a failure of government control of the railroads. The dispatchers declared that they were in a position to know that railroad officers are striving with all their energy to expedite traffic, and they demanded under proof or a retraction of the charges. A telegram signed by dispatchers on the Union Pacific said, "We desire to reiterate and brand such statements as malicious falsehood." A letter received from George W. Greenert, a train dispatcher on the Chesapeake & Ohio, said:

"As a train dispatcher I wish to protest against the remarks made by Lee and Garretson before the wage commission as reported by the press today.

"I wonder if the gentlemen are woefully ignorant or are deliberately distorting the truth when they intimate that railroads, from the president down to the train dispatchers, are train delayers as they blantly call them, are laying down.

"They would have you believe that it is within the power of the managements—like Joshua of old—to command the sun to stand still until all the ice and snow of this winter of blizzards is melted and the sun-kissed flowers are waving to and fro by the balmy breezes as the trains pass by. But here they let you see the inside of the plot. The railroads refuse

to do what Joshua did—they are laying down, because they don't want the government to have the railroads.

"Seriously speaking, however, when we see railroad officers 'get on the job' at 5 o'clock in the morning and work steadily, earnestly, faithfully until 10, 11, or 12 o'clock at night and subject themselves to calls at any time during the night; when we see officers working like Trojans to move business through ice and sleet and snow blown head high by blizzards, 36 hours and even longer at a stretch without rest, it makes a man's blood boil with indignation to hear the remarks made to your honorable committee about them laying down.

"As to the train dispatchers—their hours of work and days of work have not been lessened for 30 years. They are on duty continuously during their 8-hour trick and in touch with all trains and all conditions on their divisions of from 100 to 400 miles every minute they are on duty, ever ready to act instantly when necessary to issue orders or instructions for the safety of trains. I have seen them remain on duty from one to three hours in order to look after some important matter and to see that the relieving dispatcher was properly posted—this after they were off duty.

"A dispatcher takes pride and interest in his work (which is like a game of chess) to a degree that is beyond the calculation of dollars and cents. Every dispatcher has 'sweated blood' on his trick many times and would have gladly traded places with some negro section hand—color, flat feet, and all—at these times.

"They do delay trains—and many a man and woman and child are alive today because of the delay. Many a train and engine man is alive and with his family today because the dispatcher delayed them. A broken rail reported, a wash-out, a land slide will cause the dispatcher to act instantly and delay trains. Two trains cannot meet on the same track without a collision—he may delay one of them at a siding with orders to meet another—he does it on purpose. The men delayed, if they are not big enough to see anything but their own train, will damn the dispatchers, call them train delayers and make other light-headed remarks to the farmers along the line.

"I believe that as a whole the railroad train and engine employees, trackmen, dispatchers, and in fact all employees are doing their utmost to make the director general's operation a success and to speed up war transportation to the limit.

"Just wait until we get a little warm weather and watch them roll. Wonderful things will be done in the transportation line the coming eight months. Let us all have a fair and square deal."

Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers, testified before the wage commission on Wednesday. He said his organization had decided not to enter the general wage movement; it did not desire to embarrass the government and he presented no formal demands, but said that the engineers should have an increase, to meet part of the increased cost of living, to a minimum of six dollars a day. He did not criticize the roads as much as the other brotherhood officers.

Mr. Stone also referred to Mr. Shea's testimony regarding increased violations of the sixteen-hour law, saying that the roads had been ordered by Regional Director A. H. Smith, with approval of Mr. McAdoo, to disregard the law as necessary to move traffic during the emergency; but after it had been taken up with Mr. McAdoo he had ordered the roads to observe the law.

THE GRAND TRUNK LITERARY AND SCIENTIFIC celebrated its 60th anniversary recently. It was organized by F. H. Trevithick, in 1857, when he was Locomotive Superintendent of the Grand Trunk, and led to the establishment of G. T. R. libraries at London, Stratford, Belleville and Lindsay, Ont., and Battle Creek, Mich.

The Financial Future of British Railways

THE FOLLOWING EXTRACT is from the January issue of the Railway Magazine of London, Eng. There recently appeared in the Financial Times an able article on the future prospects of British railways, by W. J. Stevens. After recapitulating the war terms arranged in 1914 between the railways and the government, familiar to most readers of the Railway Magazine, Mr. Stevens went on to show that the economies in railway working under government control result in financial benefit for the government and not the railways. Then he disposes of the misapprehension prevailing in some quarters that the government is making no provision for delayed repairs and renewals, which is the reverse to the truth. In fact, one important change wrought by the war in British railway finance is that the companies, instead of being large borrowers, are for the time being very large lenders, and will remain in that position until they are able to resume normal outlays on maintenance and renewals of their permanent way and rolling stock.

When all is said and done, however, says Mr. Stevens, the government has driven a very hard bargain with the railways, and the experience of the latter is in marked contrast to that of other industrial enterprises. A summary published in the Economist shows that nearly all branches of industrial enterprise increased their profits substantially during 1916 and 1917, and are earning much larger percentages than the modest 4 per cent earned on British railway capital. Many of these undertakings have also made and are making large bonus distributions on capital account. The dividends distributed on the ordinary stocks of our railways have not varied much since 1913, but are slightly below the pre-war level. What is more serious is that the income tax has been raised to 5 shillings in the pound, so that what the government seems to give with one hand it more than takes away with the other.

Many thousands of small investors interested in railway stocks are probably quite as much in need of war bonuses as the railway employees themselves, but they have not received them. On the contrary, their income is reduced, and over and above that reduction they are confronted with the increased income tax. That the railway shareholders as a body have not complained is the most wonderful testimony to their patriotism that I know of, but whether it is altogether wise for the government to treat the largest section of the investing public in so niggardly a fashion is another question, and, personally, I have no doubt that it reacts unfavorably on contributions to war loans, etc.

Why are our railways, who have rendered unrivaled services to the community during the war, treated on a different basis from all other industrial enterprises? What essential difference is there between the railway companies and shipping, for instance, that the shipping industry should have been allowed to earn enormous profits and the railways treated in such a cheeseparing fashion? It might be tolerable for the railway industry to submit to the existing arrangement, for which, after all, they have to thank their own directors, but it is high time that needless uncertainty as to the proprietors' future should be removed. They only ask for an assurance that after the government arrangement comes to an end they will be allowed to adjust their charges to the public in such a way to meet, in a reasonable manner, their increased burdens in the form of wages, bills, etc. To a large extent this new burden is already being met by fresh forms of economy, and which will, no doubt, be of a lasting character.

THE VALUE OF COAL AND COKE sent out of the United States since the beginning of 1900 exceeds \$1,000,000,000.

Pulling the Chicago Terminals Out of the Snow

What the Railroads Were Compelled to Do in Restoring
Traffic After the January Blizzards

THE MONTH of January, 1918, will be recorded in railroad annals as a record breaker for snow trouble in Chicago and its environs, not only because of the depth of snow fall, the severity and frequency of the storms and the continuous cold weather, but also because of the complete tieup of traffic which followed the burial of the complex network of badly congested terminals in a deep bed of snow. The efforts made to overcome the blockade which was paralyzing industry and threatening a serious coal famine cost the railroads several millions of dollars and called forth herculean efforts on the parts of their officers and employees.

An account of the two severe storms occurring on January 5 and 11, respectively, and the details of the traffic interference which followed in their wake was given in the news columns of the *Railway Age* of January 18, page 182. The character of the conditions produced by the storms is illustrated in the photographs. While not suffering any worse in the aggregate than the other roads, the Illinois Central was subjected to some of the more spectacular conditions throughout the portion of its line exposed to the sweep of the winds off Lake Michigan. The eight main tracks of this railroad are bounded on the side away from the lake for a considerable distance by a high retaining wall and the snow which piled up against this wall, completely buried the two adjacent tracks and any equipment standing on them. On the other roads not subjected to such an open sweep of the storm the snow was more evenly distributed over all of the tracks.

A large part of Chicago's railway mileage is on elevated embankments and in places where these embankments are occupied by only a relatively small number of tracks the wind accompanying the storms swept away most of the snow, but in many cases main tracks on the elevation are flanked on one or both sides by yards of considerable width so that the conditions approximated those experienced where tracks are on the natural surface. In general the chief difficulty was with the many miles of yard tracks largely occupied by standing cars, the movement of which at the earliest possible

date was imperative to the welfare of not only the city but also the nation.

The railroads employed large forces of men in the removal of the snow and considering that their demands were combined with those of the city for men for street cleaning, it is not surprising that the wage rates in some cases attained almost unbelievable heights. There was, however, a plentiful supply of labor. The wholesale shutting down of industrial plants as the result of the blockade threw many men out of employment who were glad to shovel snow. Some industrial plants turned over large forces of men to the railroads temporarily, while the latter were enabled to recruit large forces from freight handlers, office clerks, draftsmen, etc., many of whom could not be employed at regular work on account of the stopping of the traffic. It is also found that lodging houses were accommodating an unusually large number of idle men who had come into the city for the winter.

Various plans were adopted for recruiting the forces. Some railways depended on the regular employment agencies. Others resorted to the free labor agencies or to picking up the men direct from the streets or the lodging houses. Employment was also encouraged by making special arrangements to pay the men promptly. Some of the roads paid the temporary men daily, a measure which introduced no small task in the time keeping and accounting. It was also necessary to feed the men one or more meals each day. The men were taken to nearby restaurants or boarding houses or special trains were run out at intervals with sandwiches and coffee. During the colder weather arrangements were made to supply the men with hot coffee at frequent intervals throughout the day.

The administration of the work at the large terminal areas in a manner that would insure most effective results and a thorough co-ordination of the efforts being made by the various branches of the rapidly created organizations was no simple task. In this connection the Baltimore & Ohio Chicago Terminal developed a most interesting system. Men of known ability and who had previous experience in fighting snow were placed in charge of various subdivisions of

the terminals and made responsible for the progress within certain prescribed limits. In order that the officers of the road could be kept advised of the conditions at all parts of the terminals and the progress being made in restoring the tracks to operation, as well as give the necessary advice and

despatch men, materials and supplies where most needed, an intelligence bureau was established in the office of the district engineer. All of the telephones in the engineering office were assembled on a single large table where a staff of men was kept busy receiving and answering telephone calls,

Snow Conditions Around Chicago

while a record of the information given and received was kept on a quickly devised chart.

With a knowledge of the situation gained through this system the needs of the men in charge of the various parts of the terminal were fulfilled by different men detailed to look after certain requirements. Thus some men were commissioned to gather laborers, others to requisition or purchase tools to provide lunches for the men, etc.

By far the largest portion of the snow was handled by shovels. Obstructions tended to preclude the use of power equipment in many places, consequently the snow was largely loaded by hand on cars of all classes—flat cars, gondolas, hoppers, box cars and stock cars—and hauled to a convenient point of disposal where they were unloaded by hand. In some cases coal cars were handled direct to mines in the southern or central part of the state where the snow was unloaded on mine spoil banks. One road used locomotive cranes with clam-shell buckets for unloading snow from cars, and while a large yardage was handled in this manner it represented only a relatively small proportion of the total amount of snow unloaded. The Chicago, Burlington & Quincy also made some use of a crane and clam shell bucket, assigned to coaling and cinder pit service, for excavating snow during intervals of the day when it could be spared from its regular work. On another road, boxes with a capacity of seven or eight cubic feet of snow with handles on the sides so that they could be carried by two men, were provided for use in this service where the snow could not be handled conveniently in larger quantities. In some cases wagons and motor trucks were used to haul snow from team yards and freight house grounds, dumping the snow into the river or the lake.

Snow plows were used where practicable, but the use was limited largely to main tracks. On the whole the supply of plows for such use as they could be put to was generally adequate.

One road, however, found it expedient to import a rotary snow plow from western heavy snow country to be used in clearing drifts in cuts, but its use was restricted principally to tracks at some distance from the city.

Of all the equipment available the ballast spreaders were the most effective. They were used in some cases with short wings to clear and flange a single track, but the most efficient results were obtained with the long wings with which an adjacent track was cleared, while the one occupied by the spreader was being flanged. By following this procedure progressively on track after track, it was possible to clear an entire yard of snow, although it was found advisable in some cases to block one track with snow plowed from a series of tracks on either side and later to clear this track by shoveling the snow onto cars. Whether the tracks were cleaned by hand or with spreaders the most difficult task was to remove cars that had occupied these tracks during the storm with the snow in many cases well up under the car bodies. These cars had to be pulled out in small cuts, using one or more engines for three or four cars, a process that frequently proved disastrous to the draft rigging.

Snow melters at the Chicago & North Western passenger terminal installed at the time that this station was built, served in good stead during the recent storms. There are 10 of these installed near the end of the train shed and along the approach tracks. They consist of pits or boxes about 3 ft. by 6 ft. equipped with steam pipes and connected by drains with the city sewers. Shoveling snow into these boxes solved the problem of disposal with a minimum of interference with traffic.

As the work progressed and the tracks were restored to operation it was possible gradually to reduce the maintenance forces on the various railroads to more nearly the normal basis.

A New Scale Test Car

By A. Christopher,

Scale Inspector, Nashville, Chattanooga & St. Louis

THE NASHVILLE, CHATTANOOGA & ST. LOUIS has recently constructed a scale test car at its shop in Nashville, Tenn., the general design of which is shown in the photograph. The car is of iron and steel construction throughout. It has two four-wheel trucks of the standard 80,000 lbs. capacity type, with spaced heavy arch bars extending 27½ in. from the center of base, spaced out to conform to the end of the car. The general dimensions are: Length, 22 ft. 9 in.; width, 8 ft. 4 in.; height to top of runway, 6 ft. 4 in.; extreme wheel base, 14 ft. and intermediate wheel base, 6 ft. Weight, 90,000 lb.

The main body of the car is built of heavy channel iron and I-beams with two cross members built up with heavy angles divided between the transom plates. These plates are of ½-in. steel, 24-in. wide and 8 ft. 4 in. long. The plates are riveted to the longitudinal channels and I-beams. The center plates are of cast iron and weigh 40

The New Car Standing on a Scale

lb. each. Four 24-in., 100-lb. I-beams, 16 ft. long, form two separate compartments which will accommodate 1,100 secondary test weights of 50 lb. each. All joints in connection with the compartment are cemented and welded to prevent leaking. The car is designed with a view to reducing the area as much as possible so as to limit wind pressure.

The car is floored with ½-in. steel plates. The roof is composed of three pieces of ¾-in. steel formed so as to be freed quickly from the water which falls upon it and to provide a runway at the top. Two hand rails are attached for the convenience and safety of the trainmen passing over the car. The end plates are of 1-in. steel, cut to conform to the shape of the roof, and are heavily anchored to the ends of the 24-in. I-beams which form the secondary test weight compartment.

Twenty small jacks are provided in each end plate to hold the secondary test weights so that they will be held securely in place to prevent loss of weight owing to wearing away by shifting. There are two hoisting jacks on each end of the car with swinging straps to connect the jacks to the extending arch bars. By this means the four end wheels are raised to clear the rails. This places 90,000 lb. on the 6-ft. intermediate wheel base. It requires only 11 mm. to connect the straps and raise the end wheels. The test weights referred to above are rectangular in form. They were sealed on an even balance master sealing scale with a capacity of 100 lb. in each pan and are sensible to within 1 lb. grains of their

true value. One-inch gas pipe was used for handholds and for sealing purposes.

The weight of the car when completed and painted was 45,000 lb. No master track scale was available to obtain the correct weight of the car so it was necessary to make 900 50-lb. test weights. A modern 150-ton track scale was tested with the 900 50-lb. test weights on each section by 5,000-lb. drafts up to 45,000 lb. The scale was checked in opposite directions and all small errors corrected.

The correct weight of the car was then taken and the 50-lb. test weights placed in the compartments through the man-holes until the beam registered 90,000 lb. When the car was complete the end wheels were raised to clear the rails, placing the 90,000 lb. on the 6-ft. wheel base. Each section of the scale was tested and checked without an error.

If it is desired at any time to increase the weight of the test car to 100,000 lb. there is ample room in the compartments for 10,000 lb. additional weight. The 6-ft. wheelbase will be used for sectional tests on standard track scales of 85-ton capacity and over, built with a heavy steel bridge and on concrete foundations and walls. The 17-ft. wheelbase will be used to check scales that will not stand the 90,000-lb. test on the 6-ft. wheelbase on account of the deflection in the light scale levers and timber girders, side walls, bearings, etc. To the latter class belongs the larger number of the privately-owned scales on the system. The new car has been in service for three months, during which time it has been tried on many different scales and is proving entirely satisfactory.

Locomotive Front End Spark Arrester

A NEW TYPE OF LOCOMOTIVE spark arrester has been developed and patented for both anthracite and bituminous coal burning locomotives by I. A. Seiders, superintendent of motive power and rolling stock of the Philadelphia & Reading. During the past two and one-half years it has been applied to 474 locomotives, 390 of which

have wide fireboxes and burn anthracite coal, and the remainder have narrow fireboxes and burn bituminous coal. It is claimed that this spark arrester will not appreciably reduce the steaming qualities of the locomotive, and a statement has been made that by its use the fire claims have been reduced 40 per cent.

The sectional photograph shows the device applied to a

Application of Spark Arrester to a Superheater Locomotive

locomotive with a superheater, and the drawing illustrates the application to a saturated steam locomotive. The principal features of this spark arrester consist of a "breaker plate" made up of a slotted plate fitted with deflecting veins, which

Arrangement of the Spark Arrester for Non-Superheater Locomotives

is applied in line of the blue gases ahead of the front blue sheet. This breaker plate tends to break up the largest sparks before they strike the netting. The horizontal diaphragm table plate is perforated with 7/32-in. holes and the side sections are inclined, being attached to the sides of the smokebox. This type of diaphragm reduces the amount of resistance to the draft and adds to the self-cleaning characteristics of the front end. The horizontal table is made up of 8-in. material, being 26 in. square. It is perforated to permit of better entrainment of the gases without decreasing the size of the exhaust nozzle and rests on a flange at the top of the nozzle tip. The blower pipe is fitted into the exhaust nozzle below the table line.

The side table plates are inclined, as shown in the illustration, to prevent the collection of cinders. The fine particles fall to the bottom of these plates on top of the perforated horizontal table and are carried out of the stack by the exhaust. The plate around the steam pipes is so secured that it will not vibrate, opening up holes for sparks to pass through.

The joints in the netting are so made that no openings can occur to permit the passing of unduly large sparks. All nettings and plates are bolted at the side to a 2-in. angle iron, which is riveted to the smokebox.

The front netting and plates are arranged in separate

parts with ample support at their intersections, as shown in the illustration. The center plates may be easily removed when it is necessary to work on the flues, making it unnecessary to remove the entire front end netting or the table.

The spark breaker plate, located directly in front of the tube sheet and back of the front end netting, is secured to the flue sheet over the top row of flues under the T-pipe. It has 16 pressed steel openings 1 in. wide and pressed out 1/2 in. away from the plate for the full length of the plate. Its purpose is to break up the sparks, permitting only the finer particles to pass through the netting in front of it. The larger particles will travel to the front of the smokebox and in their passage be reduced sufficiently to pass through the netting.

The netting used with this device has an oblong opening 3 1/16 in. by 3 1/4 in. In the front end, shown in the drawing, the open area of the breaker plate is 462 sq. in. and the entire netting area has an opening of 1,607 sq. in.

Due to the large opening it will not be necessary to reduce the size of the nozzle to provide the proper draft. In this way it will provide greater economy in fuel.

This front end arrangement has reduced shop maintenance costs due to its self-cleaning qualities. It is simple in construction, strong and durable, and reduces the number of leaky joints in the netting commonly found on locomotives.

Duties and Responsibilities of Engineers and Firemen

Firemen's Work Particularly Laborious; Mechanical Improvements Lighten the Work of Both

THE REPORT of the Eight-Hour Commission, of which General George W. Goethals was chairman, and which was reviewed in the *Railway Age*, February 1, 1918, has an appendix, No. 7, devoted to "Employment Conditions in Train and Yard Service Under the Eight-Hour Law." This was prepared by Victor S. Clark. That part relating to the duties of enginemen follows:

A road engineer's responsibilities and duties are less varied than those of a conductor, but they are more intensive and continuous. His preparatory work is merely to inspect his engine and to see that it is supplied with fuel, water, oil, and other necessities for the run; and his clerical work is limited to making out a time slip for himself and his fireman, and to reporting engine defects and failures. But from the time he takes the throttle at least six things constantly weigh upon his mind—his train orders, the automatic block and manual signals along the line, the track immediately in front, the water gauge, the steam gauge and the sound of his engine. Even a moment's inattentiveness to any of these things may mean delay or disaster. In time the constant observance of these essentials becomes almost automatic and subconscious; but the general testimony of engineers is that the sense of responsibility and of latent danger always remains. In bad weather, when soft tracks and possible washouts or slides are to be watched for, or when blizzards sweep the prairies, burying landmarks and blinding the outlook until only the jarring of the drivers on the frog tells the engineer that a station has been reached, the strain of this responsibility rises to a maximum even with the most experienced. Moreover, a careful engineer does more than run his locomotive according to orders and keep it in condition upon the road. When rounding curves he looks back for hot boxes, he senses in the movement of the slack the development of equipment defects in the cars behind, and in general he co-operates with the caboose crew to maintain the smooth, mechanical operation of the entire

train and is held equally responsible with the conductor for its safety.

Firemen Are Hard Worked

An engineer's physical labor, however, is much less arduous than that of a locomotive fireman. The latter is in this respect the hardest worked man in train service. His direct responsibility is comparatively light, though he must watch signals from the left side of the cab and must read and understand train orders. A very few large locomotives of recent construction have mechanical stokers, but they form an inappreciable fraction of the motive power in use on American railways. A considerably larger part of the engines running in the Southwest and on the Pacific coast burn oil fuel, and in such cases the physical labor of the fireman is comparatively light. In suburban and mountain service, especially where there are long tunnels, electric power—which is cleanest and easiest of all for the engine crew—is being introduced; but this change is still in its infancy. Therefore the typical fireman is a coal shoveler. The amount of coal he must put into the firebox in a given time varies with the size and construction of the locomotive, the class of service in which it is engaged, the weight and speed of the train, the quality of fuel, the grade of the road, weather conditions, and other factors, among which must be reckoned the skill of the fireman himself.

Taking the average of all locomotives upon a representative American railway in 1916, every switch engine burned 135 lb. of coal for each mile it ran, each passenger engine 105 lb., and each freight engine 229 lb. In covering a division of 100 miles the fireman of a freight locomotive would have to shovel more than 11 tons of coal through a low firebox door, stooping and swinging well back to spread the fuel or to place it on thin places in the fire, and opening and closing the door for every scoopful. He performs this labor standing on the unsteady deck of a locomotive, where an in-

experienced man might have difficulty in balancing himself without support. Among other duties of a physical character he must wet down the coal, break up the large lumps, pull the coal forward from the back of the tank or tender box—which sometimes amounts to double handling nearly half the fuel burned—shake the grates, and if the coal clinkers badly he must sometimes clean his fires in the course of the run. He takes on coal and water, attends to other engine supplies, watches the steam gage and the road signals on his side of the cab, and assists the engineer in minor phases of engine operation.

Besides being laborious these duties are sometimes attended by severe physical hardships. The heat thrown out by the fireboxes of the extremely large locomotives now coming into use is intense, especially when a long freight is barely moving up a heavy grade, devouring fuel as fast as it can be piled upon the fire, and making practically no breeze through the cab by its own motion. Firemen on runs of this kind sometimes have to protect themselves with leather aprons to keep the heat from igniting their clothing. When we add to these conditions an outside temperature of 100 deg. or more, such as not infrequently occurs in the southern and prairie states during the summer, a situation is reached that taxes the limits of physical endurance. At such times heat prostrations become frequent—as railway men say, the firemen “burn out” or “the monkeys get them.” They suffer undue strain when a badly clinkered fire has to be cleaned in the middle of a heavy run, for this is rated exceptionally exhausting labor. Firemen are also exposed to more or less suffering from smoke and from gases thrown back from the firebox in passing through long tunnels or snowbeds, especially where more than one locomotive is attached to a train. They sometimes lose consciousness and even die under these conditions.

Mechanical Improvements Lighten the Work

It is a matter of controversy between railway employers and firemen whether the labors and hardships of the latter are increasing or diminishing. On the one hand, much larger engines are now employed than formerly, and the tonnage of trains is constantly growing—two conditions that add to a fireman's burdens. On the other hand, important mechanical improvements have lightened the work of stoking, and the Brotherhood of Locomotive Firemen and Enginemen has secured new working rules in its schedules with many companies that relieve its members of some of their former labor. Such rules are those providing that men shall be stationed at intermediate points on a division to clean fires, or to pull down coal to the front of the tender, and that helper or relay firemen be furnished on exceptionally long or difficult runs.

However, new mechanical devices have contributed more than these rules to alleviating the fireman's condition. Oil-burning locomotives have made possible firing heavy trains through the south-western deserts, where the mercury reaches 120 deg. or more in the shade and the temperature of the breezes through the cab window almost rivals the blast from the firebox door. Brick arches and superheaters, by causing the gases in the firebox to be consumed more completely, and by utilizing a larger fraction of the heat generated for steam production, have lessened the amount of fuel employed to pull a given weight of train. Fire grates are now shaken by power, and air doors enable the fireman, by a mere pressure of his foot, to throw open the firebox to admit coal, where formerly he had to stoop over and pull the door open by a chain. Coal pullers automatically shift the coal forward in the tender tank to a point within reach of the fireman. Mechanical stokers feed the coal from the tender into the fire by a conveyor and blast contrivance, so that the fireman's stoking duties are reduced largely to attendance upon machinery.

An analysis of work performed by locomotive firemen in slow-freight service during four runs with hand-stoked and mechanical-stoked engines, respectively, affords the following

illustrative data: The four hand-stoked locomotives ran an average of 79 miles, pulling trains having an average weight of 3,149 tons, and the firemen were on duty an average of 14 hr. 9 min. Of this time they spent 7 hr., 3 min. in actual manual labor, of which 4 hr., 59 min., or more than one-third of the time they were on duty, was devoted to shoveling coal into the firebox. Most of the remaining time used in manual labor was employed in hooking and scraping fires, shaking grates, breaking up large lumps of coal, shoveling down coal from the rear of the tender, and cleaning fires. Each fireman handled with the scoop—directly into the firebox—about 11½ tons of coal. The time not employed in manual work included rest intervals while running and station work and watching signals.

Similar figures for the four locomotives having mechanical stokers are: Average distance traveled, 115 miles; average weight of train hauled, 2,135 tons; time on duty, 13 hr., 10 min.; time devoted to actual manual labor, 4 hr., 5 min., or 19 per cent less of the time on duty than in case of hand-stoked engines; time employed shoveling coal by hand into the firebox, 1 hr., 24 min., or nearly 25 per cent less of the time on duty than in case of hand-stoked engines; amount of coal burned, 22½ tons, about 2½ tons being fired by hand.

Some objection is still made to mechanical stokers, though they are rapidly being improved. Those of an older type are noisy and dirty, keeping the cab full of flying coal dust. They are a recent invention, the number in use having risen from six of all designs in 1910 to 1,418 in 1916. Even the latter number would not supply the road service of one of our larger railway systems.

Firemen occasionally receive assistance from the engineer and the head brakeman. The latter may shovel down coal from the rear of the tender—though this is forbidden by union rules on some roads—or even fire the engine for a short period, especially in exceptionally hot weather when the fireman shows signs of playing out. He also lights signal lamps and performs other minor services around the engine as a matter of accommodation. Engineers sometimes assist in cleaning fires; indeed, one case was observed where both members of the engine crew and two members of the train crew, including the conductor, were engaged in this operation. Likewise in very hot weather an engineer will put an exhausted fireman at the throttle for a few minutes and fire the locomotive himself. But all these interchanges of service are voluntary, and are more or less the exception. They are looked upon with disfavor by union officials, as tending to create precedents that may be used oppressively by operating officers.

A fair summary of the present situation of locomotive firemen would seem to be that their duties are passing through a transitional phase, where exceptional labor and hardships are imposed in some instances, but where the promise exists not only of remedying these but of making the general condition of this branch of service better than before. The brotherhoods have thrown their influence toward mechanical improvements, in some instances making the adoption of labor-saving devices within a stated time an article of their agreement with employers. Some of these improvements, such as the brick arch and superheaters, are intended primarily to save fuel, which is a most important matter with railway managers. Exceptional hardship is just now imposed on firemen where train tonnage has been increased and large engines have been introduced without these improvements, where double-heading has become the rule not only on grades but over an entire division, and where the recent coal shortage has forced the adoption of inferior fuel, that increases the labor of shoveling and clinkers the grates so that fires demand frequent cleaning. The deterioration of motive power during the late railroad depression, and the subsequent period of excessive traffic and shortage of skilled mechanics, has also added to the labor of both firemen and engineers.

The Wabash-Pittsburgh Terminal Investigation

The Interstate Commerce Commission Finds This Expensive Little Road a Poor Business Venture

THE FOLLOWING excerpts are taken from the report of the Interstate Commerce Commission signed "by the commission" on the Wabash-Pittsburgh Terminal:

The building of the Terminal into Pittsburgh, the resultant break between the Gould and the Pennsylvania Railroad interests, and the subsequent bankruptcy of the Terminal, followed by the collapse of the scheme for a transcontinental railroad under Gould control, are important events in recent railroad history. The possibilities held out, when the bonds of the Terminal were first being sold, of that company's securing a large share of the traffic of the Pittsburgh district, were alluring, and the failure of the company to secure more than barely sufficient traffic to meet its operating expenses was complete. The plan of reorganization, now practically concluded, was unusually drastic.

The Terminal owns a 60-mile single-track road running over 88 bridges and through 18 tunnels from Pittsburgh Junction, Ohio, where it has a connection with the Wheeling, to the corner of Ferry street and Liberty avenue in the city of Pittsburgh. The entrance into Pittsburgh was secured by tunneling the rock-bound ridge on the west bank of the Monongahela river, crossing that river over a bridge 1,504 feet long, and by building a line to its Ferry street station and yards under an old street railway franchise. The record indicates that the Pennsylvania considered the Terminal's entrance into Pittsburgh an invasion of its territory.

In addition to its main line, the Terminal owned a majority of the stock of the Wheeling, and all of the stock and bonds of the coal company. The coal company, in turn, owned the stock and bonds of the West Side Belt—a single-track railroad 21 miles in length—running from a point in the west end of Pittsburgh to Clairton, Penn.

Following the failure of the Terminal to meet its note and interest obligations, receivers were appointed and shortly thereafter its traffic and trackage contract with the Wheeling and the Wabash, considered one of the Terminal's valuable assets, was canceled. Foreclosure proceedings were then brought. The properties of the Terminal were sold, on August 16, 1916, to a reorganization committee and are now owned by a new company, the Pittsburgh & West Virginia. While the property under consideration is now owned and operated by the Pittsburgh & West Virginia, it should be borne in mind that this investigation was confined to the Terminal and its predecessor companies.

Pittsburgh-Toledo Syndicate

The Pittsburgh-Toledo syndicate, formed by a written agreement dated February 1, 1901, and supplement of April 8, 1901, was the outgrowth, as the record shows, of the desire of Andrew Carnegie, of the Carnegie Steel Company, and of the Gould interests, to have another railroad serve Pittsburgh. The idea originated, apparently, with Joseph Ramsey, Jr. He was vice-president and general manager of the Wabash from 1895 to 1901, and president from 1901 to 1905.

George J. Gould, a director of the Wabash, Joseph Ramsey, Jr., its vice-president and general manager, together with Louis Fitzgerald, president of the Mercantile Trust Company of New York, were designated as syndicate managers. Later, Myron T. Herrick, chairman of the board of directors of the Wheeling, and James Hazen Hyde, president of the Equitable Trust Company, became members of the managing board.

The members of the syndicate subscribed \$20,000,000 to be used in acquiring control of the Wheeling and in building a line from a convenient point on the Wheeling to the city of

Pittsburgh. Ramsey was chosen as the active directing manager of the syndicate, and as such applied for charters and franchises, executed contracts for the building of the road, and supervised the expenditures.

In the Wheeling foreclosure proceedings Gould testified that at the time the syndicate was formed the object was to get a line into Pittsburgh and that a connection beyond Pittsburgh was not then contemplated. Ramsey, in the same proceeding, testified that he became president of the Western Maryland in 1903 because he had been made president of the Western Maryland syndicate. Gould was not, apparently, among the originators of the Western Maryland syndicate, but upon becoming interested later, requested Ramsey to serve of this syndicate, presumably to look after the Gould interests.

Neither Gould nor Ramsey testified that the Terminal was to be connected with the Western Maryland to complete the proposed so-called coast to coast line of the Gould interests, but B. A. Worthington, formerly vice-president of the Wheeling and the Terminal, testified in the foreclosure proceedings of the Wheeling as follows:

"If we could have multiplied the tonnage of the Wabash-Pittsburgh Terminal and carried out the plan Mr. Gould had in mind, of connecting up with the Western Maryland, and had the Wabash traffic going that way instead of going up around Detroit, we probably would have kept out of a receiver's hands."

F. A. Delano, who succeeded Ramsey as president of the Wabash and its eastern subsidiaries, testified in the same proceeding as follows:

"I understand it was Mr. Ramsey's idea to cross the Allegheny river with a line that crosses into Pittsburgh. He was trying to get a charter for a bridge, and there connect with the Buffalo, Rochester & Pittsburgh, and thus get an outlet to the east. He also expected, by means of the West Side Belt, and completion of the Western Maryland, to get a good connection or outlet to Baltimore. Both of these things would have made a tremendous change in the whole situation."

Immediately after its organization the syndicate managers entered into a contract with the Union Railroad and the Carnegie Steel Company at Pittsburgh, whereby the syndicate managers, in consideration of receiving certain traffic, agreed to construct, purchase, or lease such lines of railway as would be required to make a continuous route to Chicago.

The syndicate incorporated the Pittsburgh & Carnegie Railroad, and under its charter planned to effect an entrance into the city of Pittsburgh. This charter, however, conflicted with a charter previously granted to the Pittsburgh & Mansfield and so the property of the latter was purchased. The syndicate then incorporated the Washington County Railroad to provide an extension of the Pittsburgh & Mansfield to the Pennsylvania-West Virginia state line, and later consolidated the two companies into the Pittsburgh, Carnegie & Western. It also secured the incorporation of the Cross Creek Railroad and the Pittsburgh, Toledo & Western. Under the charter of the former there was to be constructed the line in West Virginia, and under the latter, the line in Ohio.

The syndicate purchased control of the Wheeling and caused to be executed a traffic and trackage contract between the Wabash, the Wheeling, and the Pittsburgh, Carnegie & Western.

As the construction work under the charters of the three separate railroad companies was nearing completion, the syndicate caused to be organized, by consolidation and merger, the Wabash-Pittsburgh Terminal, to which it made a pro-

posal to transfer the Wheeling stock, a majority of which, issued and outstanding, was owned by the syndicate; the Carnegie traffic agreement, and the traffic and trackage agreement between the Wheeling, the Wabash, and the Pittsburgh, Carnegie & Western were also assigned to the Terminal; the syndicate further agreed to call and pay over to the Terminal the unpaid portion of the syndicate subscription; to assign to it an agreement of the Wabash to purchase \$6,600,000 of Terminal first mortgage bonds for \$6,000,000; and, to discharge and release the Terminal from all indebtedness and claims owing to the syndicate. As the consideration of this undertaking the Terminal agreed to deliver to the syndicate \$20,000,000 of first mortgage bonds, \$20,000,000 of second mortgage bonds, and \$10,000,000 of capital stock.

The acceptance of this proposal by the Terminal resulted in the final call upon the syndicate subscribers and the winding up of the syndicate affairs.

The Wabash-Pittsburgh Terminal

The Wabash-Pittsburgh Terminal is the successor, through consolidation and merger on May 9, 1904, of the Pittsburgh, Carnegie & Western Railroad Company, the Cross Creek Railroad Company, and the Pittsburgh, Toledo & Western Railroad Company, as previously explained.

The articles of consolidation and merger provided that the capital stock of the new company should be \$4,000,000, consisting of 80,000 shares of a par value of \$50 each, and that it was to be exchanged, at par, for the capital stock of the merged companies. On May 11, 1904, the capital stock was increased to \$10,000,000 and this amount was subsequently issued. On the same date authority was given for the creation of a bonded indebtedness of \$70,000,000, consisting of \$50,000,000 first mortgage 4 per cent 50-year gold bonds, and \$20,000,000 second mortgage 4 per cent 50-year gold bonds. The bonds were to be dated May 10, 1904, with interest payable from June 1, 1904; the interest on the second mortgage bonds, however, was "to be payable for the period of six years from the date of such bonds only out of the net earnings and revenues of the company, as defined in said mortgage, and thereafter to be payable absolutely" on the interest dates.

The record clearly indicates that George J. Gould was the dominating factor in the management of the Wabash, the Terminal, and the Wheeling.

The first meeting of the board of directors of the Terminal on May 11, 1904, received and acted upon the before-mentioned proposal of the syndicate.

The proposition of the syndicate was approved and accepted by the board of directors at the same meeting, subject however, to approval of the stockholders, which was given at a meeting held on the same day.

The carrier, in the opening entries on its books, charged to "Cost of road," \$44,000,000, and to "Wheeling & Lake Erie Railroad—Stock on Hand," \$6,000,000, thus offsetting the par value of the following securities issued and outstanding:

| | |
|-----------------------------|--------------|
| Capital stock | \$10,000,000 |
| First mortgage bonds | 20,000,000 |
| Second mortgage bonds | 20,000,000 |

Traffic and Trackage Contracts

The contract between the Carnegie Steel Company, the Union Railroad and the syndicate, referred to in the syndicate's proposal to the Terminal, provided, in substance, that the syndicate should construct or purchase a line of railroad; that the proposed railroad should connect with the Wabash at Toledo; that there should be secured a traffic or trackage arrangement, or both, with the Wabash from Toledo to Chicago; that the Union Railroad should transport cars of the syndicate lines to the works, plants, and tracks of the Carnegie Steel Company, and the charge therefor should be agreed upon with a minimum of 10 cents per ton; and, that the Carnegie Steel Company should give to the syndicate

lines one-fourth of all the tonnage it controlled, when such tonnage was destined to or came from points within and west and south of "central traffic association" territory, but there was to be "deducted from the total tonnage, before computing said one-fourth, freight transported by water, freight routed by consignees, and ores, coal, coke, and limestone, to the works of said Carnegie Company over railways owned, controlled, or leased by said Carnegie Company." The contract was to remain in force for 20 years from February 4, 1901.

On October 10, 1902, the Wabash, the Wheeling, and the Pittsburgh, Carnegie & Western, one of the constituents of the Terminal, entered into a traffic and trackage contract. This contract provided, in substance, for the interchange of traffic, through train service, through rates and divisions, and the routing of traffic to the mutual benefit of the parties at interest. It also provided, in the event any dispute should arise with respect to the interchange of traffic, that each of the parties could operate its trains over the rails of the other party or parties.

The contract provided that, in fixing rate divisions, the Pittsburgh, Carnegie & Western, later the Terminal, would be allowed an arbitrary mileage of not less than 100 miles, instead of its actual mileage of about 60 miles. The contract was to continue in force for 20 years from the date of commencement of operations.

After the contract was made, the syndicate proceeded to build the Terminal property at great expense. The syndicate's subscribers would not accept the Terminal bonds and accordingly, in order to finance the Terminal, a supplemental traffic and trackage contract was executed. With respect to this supplemental contract, dated May 10, 1904, Ramsey further testified:

A. The syndicate subscribers, as represented by Mr. Herrick, Mr. Connor, and Mr. Sanders, declined to accept simply the plain bonds of the Wabash-Pittsburgh Terminal Railway Company just as they stood, without some sort of guaranty. They first wanted the Wabash guaranty.

A. Yes, Mr. Herrick, Connor, and others. And that could not be done, or was not agreed to; and then this supplemental contract was drawn up and afterwards acted upon by the various companies; in the nature of a compromise guaranty, you might call it. It was to give the guaranty of the Wabash and the Wheeling & Lake Erie of 25 per cent of the gross earnings from traffic over these roads, in either direction, to or from the Wabash-Pittsburgh Terminal, in the event of that being necessary to meet fixed charges or make up a deficit of the Wabash-Pittsburgh Terminal. That was the object of this supplemental contract, based on the underlying agreement.

A. The Wabash road, for instance, if it received \$2,000,000 per year in gross revenues from traffic to and from the Pittsburgh terminal, was to pay to the Wabash-Pittsburgh Terminal, in the event of its being necessary to make good a deficit on fixed charges (of the Terminal) 25 per cent of the earnings, leaving 75 per cent to the Wabash, which was estimated would meet all its (Wabash) expenses in handling the traffic, and leave a little over. If it (Terminal) did not need the money, it (Wabash) did not pay the 25 per cent, or 25 cents even, therefore it (Wabash) assumed no obligation; this money came to it (Wabash) from the traffic produced by the Wabash-Pittsburgh Terminal.

The supplemental contract also provided for the extension of the original traffic and trackage contract so as to make its duration 50 years instead of 20 years.

Physical Characteristics

The main line of the Terminal, approximately 60 miles in length, extends from a point at Liberty avenue and Ferry street, in the city of Pittsburgh, in a westerly direction through the foothills of the Appalachian Range, to Pitts-

burgh Junction, Ohio, where it connects with the Wheeling. Over its entire length it crosses a rugged, hilly country.

Except for the first 4 miles, practically all within the city of Pittsburgh, the maximum curvature is 3 degrees and the maximum grade seven-tenths per cent compensated for curvature. The Pan Handle, which is practically parallel, has frequent 1 per cent gradients and curvature up to 8 degrees. If corresponding gradients and curvature had been used on the Fernald the cost outside of Pittsburgh would probably have been reduced by at least one-half. The plans, however, provided for the lightest practicable gradient and curvature.

Eighteen double-track tunnels, having an aggregate length of 20,545 feet, were driven. One of these, called "Bigham tunnel," about 250 feet in length, was afterwards eliminated and changed to an open cut. The construction of the tunnels involved the following quantities:

| | |
|-------------------|-----------------------------|
| Tunnel excavation | 642,000 cubic yards. |
| Timber lining | 17,000,000 feet B. M. Y. P. |
| Masonry lining | 90,000 cubic yards. |

It should be kept in mind that the entire roadbed construction, including cuts, embankments, tunnels, and bridges, was built for two standard-gage tracks, although up to June 1916, only 4.1 miles of second track had been laid.

Inflation in Cost of Construction

In order to determine the actual amount of cash expended for road and equipment, all vouchers and other evidences of expenditures, charged by the carrier or its predecessor companies to road and equipment accounts, were examined, reclassified, and summarized.

From the foregoing the following condensed statement of account as of May 10, 1904, can be made:

| | |
|---|-----------------|
| Received from Pittsburgh F. & W. Syndicate | \$15,873,000.00 |
| Investment in road and equipment | \$15,761,530.86 |
| Retained assets and unadjusted debit accounts | 1,274,102.65 |
| Retained liabilities and unadjusted credit accounts | 1,166,633.51 |
| | \$17,035,633.51 |
| | \$17,035,633.51 |

The opening entries on the books of the Terminal were not based upon the above figures. If they had been, the item of \$15,873,000 would have been offset by the aggregate of the securities issued, \$50,000,000, and the difference between these items, \$34,127,000, would have been carried as discount on securities issued. The amount of this discount would have been subsequently reduced by the following:

| | |
|---|----------------|
| Cash received from syndicate | \$3,521,195.73 |
| May, 1904 | \$704,000.00 |
| June, 1904 | 2,065,506.05 |
| July, 1904 | 5,283.33 |
| October, 1904 | 746,406.35 |
| W. & L. Lake Erie R. R. stock | 6,000,000.00 |
| Second mortgage bonds | 27,186.25 |
| Second mortgage bonds held by treasurer (par value) | 7,000.00 |
| Total | \$9,555,381.98 |

Leaving a net inflation in the original capitalization of \$24,571,618.02. This assumes, of course, that the book value of \$6,000,000 placed on the stock of the Wheeling & Lake Erie railroad represents actual cost.

If the debit balance in the Terminal's road and equipment account on May 10, 1904, had reflected only the actual amount of cash expended for construction to that date it would have been \$15,761,530.86. This amount includes \$1,157,133.51, representing retained percentages due contractors, which was not entered on the books of the Terminal. Obviously the latter amount must be added to the difference between \$9,255,015.37 and \$15,761,530.86 in order to obtain the inflation in the carrier's property account as of May 10, 1904, according to its own records. The difference thus obtained is \$24,650,618.02. This amount differs with the final net inflation referred to above as \$24,571,618.02 by \$79,000, and is accounted for by the three following items:

| | |
|---|-----------------|
| Second mortgage bonds | \$27,186.25 |
| First mortgage bonds | \$2,065,506.05 |
| W. & L. Lake Erie R. R. stock | \$6,000,000.00 |
| Retained assets and unadjusted debit accounts | 1,274,102.65 |
| Retained liabilities and unadjusted credit accounts | 1,166,633.51 |
| Total | \$17,035,633.51 |

The political contributions were made between October, 1902, and February, 1904, to politicians in Pittsburgh two receiving \$30,000 each and another \$17,500. An additional \$10,000 was contributed in February, 1905, to one who had previously received \$30,000.

The books of the Terminal show the following entries in the cost of road account:

| | |
|--|----------------|
| Capital stock | \$4,000,000.00 |
| First mortgage bonds | \$2,065,506.05 |
| Second mortgage bonds | \$27,186.25 |
| Open accounts | |
| Advances to contractors | \$1,011,577.34 |
| Miscellaneous | 2,779.83 |
| Green County Railroad | 54,767.49 |
| Texas & California Construction Co. | |
| Cash from Pittsburgh T. & W. Syndicate | |
| Transferred from Pittsburgh | |
| Carnegie & Western Railroad | \$112,989.11 |
| May, 1904 | 704,000.00 |
| June, 1904 | 2,065,506.05 |
| August, 1904 | 5,283.33 |
| October, 1904 | 746,406.35 |
| Sale of second mortgage bonds | |
| Balance | \$4,746,084.93 |

Reference has previously been made to an unpaid item carried forward from the old accounts under the title of "Texas & California Construction Company," \$45,000. It appears that this amount represents advances made in the early history of the Terminal to the construction company.

Character and Extent of Service

The Terminal has no direct connection with any large industries other than the mining operations, of which there are a dozen or more, located on its line in the vicinity of Pittsburgh. However, the branch connecting the West Side Belt and the Union Railroad furnishes connections with a number of industries located on the latter line.

The Terminal's traffic consists almost entirely of through carload shipments. The amount of local traffic is negligible. The bulk of the traffic consists of coal and ore. In 1916 coal and ore comprised almost 82 per cent, while in 1915 it exceeded 85 per cent of the total tonnage. The amount of general freight has, however, recently increased materially.

Owing to the Terminal's entrance into Pittsburgh at an elevation, the handling of traffic is difficult and expensive and the company is further handicapped by inadequate trackage facilities. It is estimated that about 25 per cent of the traffic, exclusive of coal and ore, is handled through its elevated terminal in Pittsburgh, which can accommodate approximately 40 cars, spotted. The Terminal would undoubtedly secure a larger share of the traffic of the Pittsburgh district if it were not for these operating disabilities.

Sale of Bonds

In addition to the \$20,000,000 of first mortgage and \$20,000,000 second mortgage bonds given to the syndicate as part consideration for the Terminal properties, there were issued, subsequent to May 10, 1904, \$10,250,000 of first mortgage bonds. For this latter amount of bonds there was received in cash \$8,809,828.7, the difference of \$1,440,171.18 between the par value and the proceeds represents brokerage charges and discount. To this should be added \$72,572.02 for other expenses incident to the issuance of these bonds and the \$10,250,000 of first and second mortgage bonds previously issued to the syndicate, making a total of \$1,999,189.15 expenses, commission, and discount entered subsequent to May 10, 1904.

Vermilye & Company and Blair & Company purchased \$5,000,000 of the bonds during the months of October, November and December, 1904, at prices ranging from 82 to 84; Blair & Company purchased \$2,000,000 of the bonds in May, 1905, at 86 net; William A. Read & Company, through G. P. Butler & Brother, purchased \$2,000,000 of bonds in February and March, 1906, at 87½; Frank J. Gould purchased \$500,000 of bonds in July, 1906, at 80 net; \$73,000 of the bonds were sold during January and May, 1908, at prices ranging from 49 4/8 to 58½, and \$663,000 of bonds given as collateral for a note were sold at auction by the trustee in June, 1909, at an average rate of 39.93 per cent.

It is impossible at this time to ascertain the total amount of first mortgage bonds which were eventually sold through brokers to savings banks and insurance companies. The records of bonds deposited soon after the receivership in 1908 show, however, that savings banks deposited \$410,000 and insurance companies \$3,989,000 first mortgage bonds. Changes in ownership no doubt occurred between the date of the original deposits and the date of the final cash payment under the reorganization plan. Presumably some of the banks and insurance companies did not pay the cash required for the reorganization committee's records indicate that in March, 1917, savings banks which had made the final cash payment held \$189,000 and insurance companies \$3,086,000 of first mortgage bonds.

Results of Operations

The carrier's operations between December 1, 1904, the date determined upon as the date revenue operations began, and May 28, 1908, the date receivers were appointed, resulted in a deficit in net income for each year, amounting in the aggregate to nearly \$3,000,000. During this period the excess of operating revenues over operating expenses and taxes was about \$1,000,000, from which fixed charges of about \$4,000,000 were deducted, creating the deficit of \$3,000,000. If the revenue derived from the so-called traffic and trackage guaranty is excluded, it will be found that the carrier's operating expenses and taxes exceeded its revenues.

The operations for the period from May 29, 1908, to March 31, 1916, resulted in a deficit of about \$350,000. During this period of slightly less than eight years, the excess of operating revenue over operating expenses and taxes was about \$680,000. The deficit of approximately \$350,000 was caused by interest on receivers' certificates and other fixed charges.

Lack of freight cars and motive power was apparently one of the Terminal's greatest handicaps and no doubt figured largely in the conditions which brought about the receivership.

Receivership

Receivership proceedings were brought against the Terminal by the Wabash, and on May 29, 1908, F. H. Skelding and H. W. McMaster were appointed receivers. The receivership continued for over eight years, or until August 16, 1916, on which date the property was sold, on the order of the court, to the reorganization committee, the only bidder, for \$3,000,000. The sale was confirmed on August 30, 1916. In confirming the sale the court set aside the objections of the Fearon committee, which claimed that the price was inadequate.

The protracted period of the Terminal receivership was due, apparently, to the difficulty of the situation and by reason of the numerous efforts made by the various interests to work out a plan which would be acceptable to all. The earnings of the carrier, which usually form the basis of any reorganization plan, were uncertain and indefinite until the years 1914 and 1915. Prior to the receivership the Terminal and Wheeling properties worked in close harmony with each other, the Terminal, the Wheeling, and the West Side Belt being operated practically as one property. Upon the appointment of receivers, however, the traffic and trackage contracts were

canceled, the car pooling arrangement was discontinued, and in the words of the Terminal's receiver, each company "stood on its own legs."

A receivership, or an adjustment of the capitalization of the Terminal was, from the beginning, almost inevitable. The company was greatly overcapitalized and according to the testimony of the receiver, which is borne out by the statements of the carrier's earnings, the interest on the first mortgage bonds was not earned even when the payments by the Wabash and Wheeling, of 25 per cent of the gross earnings of these companies on certain business interchanged with the Terminal under the terms of the traffic and trackage agreement, were included.

At the commencement of the receivership the physical property of the Terminal was in poor condition, due to unfinished permanent construction and insufficient maintenance. In order to safely operate the property considerable expenditures have to be made and the money necessary for this purpose was provided largely through receiver's certificates.

Reorganization

The reorganization plan provided that the Terminal should retain control of the coal company and the West Side Belt. Immediately prior to the reorganization the total capitalization of the Terminal amounted to \$60,229,000, consisting of \$10,000,000 capital stock, all held by the Wabash; \$30,236,000 of first mortgage bonds; and \$19,993,000 of second mortgage bonds.

The reorganization plan provided that holders of Terminal first-mortgage bonds should make a cash payment of \$300 for each \$1,000 of bonds deposited with the reorganization committee, receiving in exchange \$300 in preferred stock and \$1,000 in common stock of the new company, the Pittsburgh & West Virginia, together with Wheeling stock on the following basis:

\$28 (par) of first preferred stock;
\$210 (par) of second preferred stock; and
\$390 (par) of common stock.

The plan provides that there will be only \$5,100,868 bonds and mortgages left outstanding in the hands of the public undisturbed by the reorganization. Of these \$3,922,000 are first mortgage bonds of the coal company; \$383,000 first mortgage bonds of the West Side Belt; and \$795,868 mortgages on Terminal real estate. On this basis, the annual interest charges for the Terminal and its subsidiaries will be reduced to \$261,103.

Conclusion

The result of the operation of the Terminal to date shows clearly that the building of this property was a poor business venture. Fifty millions in bonds were issued against a railroad 60 miles in length and which cost about \$25,000,000. The par value of its first mortgage bonds alone exceeded by approximately \$5,000,000 the actual amount of cash expended for property devoted to transportation at the commencement of the receivership. Notwithstanding the assurance of traffic contained in its traffic and trackage agreements, and the 25 per cent guaranty of the Wheeling and Wabash, the Terminal failed to secure sufficient tonnage to enable it to pay interest on its first mortgage bonds.

As has been already shown in detail, the Terminal was not only greatly overcapitalized but the percentage of its funded debt, 83.04 per cent, to total capital obligations was unusually high. Against an actual cash investment in road and equipment and securities of affiliated companies of approximately \$38,000,000, there was outstanding, when receivers were appointed, over \$61,000,000 in securities.

This case illustrates again the great need for control of security issues and emphasizes the wisdom of the Commission's requirement, which has been in effect since 1907, that the charges to the accounts reflecting the carriers' investment in road and equipment shall be based upon the cash cost of the property.

General News Department

A fire at the Lehigh Valley freight transfer, at Oak Island, near New York City, on February 10, destroyed 18 cars, 13 of them loaded, and a large section of the freight platform. Estimated loss, \$40,000.

The Fuel Administration has rescinded the Monday fuelless order, leaving discretion to the state administrators to keep it in force locally, with the approval of Director General McAdoo.

Two carloads of coal were "appropriated" by mobs at Tompkinsville, Staten Island, New York City, on February 6, and carried off in bags, buckets and baskets. In the mob were many women and children.

The striking longshoremen at New York city, now said to number about 2,000, have voted to return to work, pending the consideration of their grievances by the Board of Adjustment of the United States Shipping Board.

The Fuel Administration last week rescinded its order restricting the use of coal on Mondays so far as it applies to the states of North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi and Louisiana.

Senator Henderson, of Nevada, on February 7 introduced a bill, S. 3777, to make absolute the long and short haul clause of the fourth section of the interstate commerce act and take from the Interstate Commerce Commission discretionary power in enforcing it.

The shops of the Pennsylvania at Blairsville, Pa., on the Conemaugh division—a machine shop, a blacksmith shop and a boiler house—were destroyed by fire on February 5. Estimated loss, \$15,000. The fire occurred at 3 a. m. when the temperature was 10 deg. below zero.

The Daylight Saving bill was reported favorably in the lower House of Congress on February 9 by the Committee on Interstate Commerce. The bill provides for setting all clocks ahead one hour during the spring and summer months, beginning on March 30. The bill had already passed the Senate.

A pledge to save Fuel Oil is called for by Albert E. Swabacher, United States fuel administrator for California, who has sent a letter to all locomotive engineers in that state. The Southern Pacific is the greatest consumer of fuel oil in that state and the co-operation of its employees is expected to mean in the aggregate a great saving for other industries. Mr. Swabacher's letter says that the storage supply of fuel oil in California is decreasing at the alarming rate of 1,100,000 barrels a month. The abnormal demands of the last three years have decreased the available storage supply by one half. The pledge cards, which were sent also to the firemen of all California roads, are being signed and returned to the fuel administrator. A duplicate pledge card is to be displayed in a prominent position in the cab of the engine at all times.

A shortage of passenger cars is reported by the Pennsylvania Railroad. This unusual condition has arisen in connection with the rapid growth of war industries in the section between Philadelphia and Baltimore. Special trains are run daily to and from such industries in six localities which require the use of 215 cars. These runs are: Between Philadelphia and Hog Island, 60 cars; between Baltimore and Sparrows Point, 70 cars; between Baltimore and Alderden, 45 cars; between Philadelphia and Eddystone, 22 cars; between West Chester and Eddystone, 8 cars; between Bristol and Eddystone, 10 cars. In addition, 10 cars daily will be required soon for special industrial service between Philadelphia and Bristol, Pa., and five between Trenton and Bristol for the employees of the shipbuilding plant at Bristol. In order thus to provide for these essential war industries, it has been necessary to limit the length of some suburban trains in the neighborhood of Philadelphia and Baltimore. Special passenger train service for war industries is also being operated at Erie, Pa., and Huntington, Pa.

Western Railway Club Meeting

The monthly meeting of the Western Railway Club will be held at the Hotel Sherman, Chicago, on February 18. George Austin, general inspector of boilers of the Atchafalaya, Topeka & Santa Fe, will present a paper on "Locomotive Firebox Maintenance and Repairs."

Salaries of Officers and Directors

Director General McAdoo has recently addressed a letter to the railroads asking for information regarding the salaries of their officers, which was requested by Senator Cummins at a recent hearing before the Senate committee. The roads are asked to state the salaries of directors and of all officers paid more than \$10,000 a year.

Surplus Funds Already Transferred

The surplus funds on some railroads are already being transferred to others that have immediate need for cash. Later a clearing plan for such transactions will be established under the direction of John Skelton Williams, director of the Finance division.

Railway Strike in Argentina

Press despatches from Buenos Ayres dated February 9 report that a general railroad strike was called on that day throughout Argentina. Immediately upon quitting work the strikers began a wild anarchistic demonstration throughout the country. Trains were wrecked, tracks destroyed, cars laden with wheat were burned and wires were cut.

Troops were being rushed to points of greatest disorder in central Argentina. The large yards in the outskirts of Buenos Ayres, which cover 22 city blocks, were set on fire by the strikers, who fought off the firemen all Saturday morning. Exploding train cars added to the conflagrations.

The strike is a fresh outbreak of the labor troubles which have been dormant since last October.

In the riots on the first day of the strike the destruction of property in the city of Buenos Ayres alone amounted to 1,000,000 pesos. Fully one-half of this loss was in wheat, corn and rice seed which was burned.

Telegraph and Telephone Battalion

Has Complete Staff of Officers

The 416th Railroad Telegraph Battalion, the organization of which was noted in the *Railway Age Gazette* of December 7, now has a complete staff of officers. The commanding officer is Major Noten D. Ballantine, until recently, assistant to the chief vice-president of the Rock Island Lines at Chicago, and, previous to that, superintendent of car service of the same company, superintendent of transportation of the Kansas City Southern, and superintendent of telegraph of that road's predecessor, the Kansas City, Pittsburg & Gulf. The captains of the battalion are Clarence J. Bailey who has been train dispatcher and chief dispatcher on a number of roads; Harold B. Sherrard, an experienced telegraph operator, and Julian A. Hielscher, surgeon; the first lieutenants are John B. Delany, battalion adjutant, and telegraph operator for F. W. Wagner & Co., Chicago; Frank C. Johnson, traveling instructor, efficiency department, Pullman; Clarke L. Sheets, operator and radio detector on the Grand Rapids & Indiana; and Robert Skelton Uell, who has had experience as a telegraph operator, dispatcher and chief dispatcher on the Illinois Central, the Atchafalaya, Topeka & Santa Fe, the Northern Pacific, the Mobile & Ohio and the Virginia. The second lieutenants are Samuel W. Hallstrom, a commercial traveler with the Roberts Cone Company, and Edmund J. Miller, operator and dispatcher on the Coast Lines of the Chicago, Milwaukee & St. Paul. At present the battalion is stationed at the Eighth Regiment Armory, Chicago.

Railroad in an Unusual Role

In a suit in the Superior Court of Essex county, Mass., at Salem, January 24, the Boston & Maine figured in the unusual role of plaintiff in a crossing accident, and of securing \$500 damages against the Peabody-Woburn Machine Company. At a highway crossing in West Peabody in June, 1916, a local passenger train was thrown off the track by an automobile freight truck, the locomotive being overturned. The owners of the truck had also entered suit against the railroad and both suits were tried at once. The owner's suit was dismissed and the jury awarded damages to the railroad as above stated. The driver of the truck was killed. No suit was brought by his estate.

Swat the Spy

The Boston & Maine has taken up the cry to "Swat the Spy." It has posted placards in its trains and devotes a page in its time tables emphasizing to its passengers the necessity of keeping their eyes and ears open and of reporting any treasonable action or word. The placards are headed in big red letters, "Your Obligation to Your Country," and close with the exhortation, "It is time YOU woke up—this war is real." In the timetables the appeal to the passenger says in part:

"Everything that happens to cripple transportation should be looked upon with suspicion. Every stranger or any person, whose actions are in any way unusual, must be made to prove his honesty of purpose.

"Every loyal railroad man and every loyal American citizen must make it his business to combat the insidious evil of treasonable treachery.

"Resolve to keep your eyes and ears open and to report to the proper authorities every suspicious thing you see or hear.

"Better a thousand times to do innocence a seeming injustice than to overlook the chance to prevent a terrible catastrophe.

"This war is real; treat it as such."

Additional Railway Honor Men

The Philadelphia & Reading reports that 25 of its officers and employees have received commissions in the army or navy in addition to those mentioned in the *Railway Age* of January 4, page 33. These additions to the names already published in the *Railway Age* make the total number of railway men now holding commissions 1507. The Reading men now holding commissions whose names have not yet been published are as follows:

OFFICERS WHO RECEIVED COMMISSIONS

| Name | Railroad Position | Military Rank | Branch of Service |
|-------------------|-----------------------------|---------------|-------------------|
| M. A. Laucks | Tr. Mast., Harrisburg Div. | Major | 414th Teleg. Bat. |
| Philemon S. Lewis | Pass. Tr. Mast., Read. Div. | First Lieut. | Engineer Corps |

EMPLOYEES WHO RECEIVED COMMISSIONS

| | | | | |
|---------------------|--------------------------------|----------------------|---------------|--------------------|
| Harry Evans | Ch. Tr. Desp. | Phil. Div. | Captain | 414th Teleg. Bat. |
| Francis S. Ferris | Medical Examiner | P. & R. Relief Assn. | Captain | 11th Cavalry |
| Hector Mansfield | Asst. Tr. Mast. | Phil. Div. | Captain | 21st Engineers |
| George W. Supplee | Draftsman | | Captain | Russ. Ry. Service |
| John S. Thompson | Superv. | | Captain | 302d Engr. Regt. |
| W. S. Tunnell, M.D. | Medical Examiner | Relief Assn. | First Lieut. | |
| Ross M. Swartz | Brakeman | | First Lieut. | |
| John W. Snyder | Clerk | | First Lieut. | |
| Wm. H. Starbuck | Electrician | | First Lieut. | |
| E. P. Morton | Computer Val. | | First Lieut. | |
| Edw. R. Meredith | Superv. | Wilm. & Col. Div. | First Lieut. | Engr. Res. Corps |
| Ralph C. Keefe | Computer Val. | | First Lieut. | |
| Wm. B. Carll | Flagman | | First Lieut. | |
| John L. Barrett | Wharf builder | | Second Lieut. | Russian Ry. Com. |
| Herbert G. Foster | Land Tillot | | Second Lieut. | Quarterm. Detach. |
| Chas. S. Heebner | Fireman | X. Y. Div. | Second Lieut. | Co. C, 21st Engrs. |
| Henry R. Heebner | Spec. Officer Clm. | | Second Lieut. | |
| Wm. May | Clerk Acct. Dept. | | Second Lieut. | Sixth Penna. Inf. |
| Robt. C. Montgomery | Clerk Purch. Dept. | | Second Lieut. | 35th Engineers |
| Chas. Nodder | Clerk Com. L. Ofc. | | Second Lieut. | 311th M. G. Bat. |
| John W. Stapleton | Clerk | | Second Lieut. | |
| Chas. Olsen | Master P. & R. Tuk "Conestoga" | | Junior Lieut. | U.S.S. Conestoga |
| Thos. N. Saul | Cent. P. & R. hge "Kimberlin" | | Ensign | |

Traffic News

The railroads in southeastern territory (south of the Ohio and Potomac rivers and east of the Mississippi river) no longer accept or issue prepaid ticket orders.

The Northern Pacific now runs its passenger trains directly into and out of Vancouver, B. C., and interchange of passenger traffic with the Canadian Pacific at Sumas, Wash. on the Canadian boundary, has been discontinued.

One cent a mile for members of the Grand Army of the Republic and of the United Confederate Veterans and their families to and from their annual reunions next summer, has been authorized by Director General McAdoo. The Grand Army of the Republic will meet at Portland, Ore., and the Confederate veterans at Tulsa, Okla. The reduction in fare will be confined to the veterans and members of their families who accompany them on certificates of identification which will be furnished by their department or division commanders.

The Agricultural Department of the Buffalo, Rochester & Pittsburgh is already moving to give to each employee the same plot of garden land that he had last year, if he desires it. As a result of last year's efforts over 28,000 bushels of potatoes were raised in "war gardens" by employees from seed furnished, gratis, by the company. Large quantities of other vegetables were grown. The three farm tractors which were rented to the farmers for plowing and harrowing last year were very successful and the company has bought three more; and it has sent out to all farmers adjacent to its line an inquiry intending to bring forth information which will enable the company to co-operate with the farmers to the best advantage. Especial attention is being given to ascertaining the horsepower in various communities, amount of help available and what success farmers are having in securing fertilizers.

Preference for Grain Traffic

Director General McAdoo announced on February 9 that in order to meet imperative demands for war purposes he had ordered that preference be given for the time being to the furnishing of box cars for grain and grain products and for the movement thereof in the States of Illinois, Indiana, Iowa, Wisconsin, Minnesota, North and South Dakota, Montana, Nebraska, Kansas, Missouri and Oklahoma, with the exception of less than carload merchandise. This preference will be discontinued as soon as the emergency is over. Meanwhile, every effort should be made by farmers, grain dealers and others to facilitate the accumulation, prompt loading and shipment of all kinds of grain.

Good Summer Travel Expected

The heroic measures adopted by the government to relieve freight congestion have affected passenger travel in the east by drastic curtailment of passenger service east of Chicago. Unnecessary to travel has been openly discouraged by Director General McAdoo, and active solicitation by eastern railways has been discontinued. Train schedules west of Chicago are generally retained, and the soliciting forces of western roads are continuing their usual activities both east and west. These roads have, nevertheless, discontinued most of their winter tourist advertising in the public press. The general shortage of coal, widely threatening the comfort of private homes, has variously affected normal social activities and has created a considerable hejira to the south. The net result of these varying influences upon travel has been a normal volume of winter traffic to the south and a considerable curtailment in volume to the far west.

If prediction is at all justified in our day, one may venture the guess that with the passing of a winter of unprecedented weather to hamper traffic, and with the salutary effects of the government's measures to meet the freight congestion, the current embarrassing conditions will be removed and summer vacation travel may be expected in the usual volume. It is reported that during the third year of the war, in both Australia and Canada (two countries bearing close geographical analogies to our own), the volume of domestic travel has not decreased.

The Department of State has announced that passports will not be issued to persons traveling for recreation. This affects those desiring to visit any foreign country except Canada, and inasmuch as Canada looks to "the States" for 70 per cent of her tourist income, this regulation will not be unwelcome to her. Commercial travel, under stimulation of war business, continues unabated. * * * *American Express Company's Travel Bulletin*

Government Freight on the Highways

Motor truck transportation across the State of New York is said to be no longer an experiment, and the State Defense Council announces that motor truck trains will be run this week between Buffalo, Rochester and Cortland and seaboard points. At the request of the Federal government the State Defense Council has taken steps to assure the convoy prompt passage through the State and to see that the 100 men accompanying the train are well cared for. There will be sixty trucks in the first train. A bulletin has been issued calling attention to the fact that under the laws of the State the duty of keeping snows from the roads devolves upon town authorities, and town highway superintendents are urged to begin immediate action to clear the routes, in order that the motor truck convoy be not delayed. The schedule from Buffalo calls for stops at Leroy, Geneva, Syracuse, Utica, Amsterdam, Hudson, Peekskill and New York.

Southern Pacific Pullman Bureau in San Francisco

The Southern Pacific has opened a central reservation bureau in San Francisco for the making of sleeping car reservations for all of its "trains out" of San Francisco for agencies around the bay and on the main line as far as Roseville, Stockton and San Jose. The plan enables six clerks to take care of 6,000 reservations a day; and patrons are saved 50 per cent of their time. The possibility of duplicate sales is eliminated. The bureau is connected by 13 special telephone lines with points in the district at which reservations originate. The bureau clerks sit at a large table with the diagrams in revolving racks within easy reach. They have three small telephone switchboards wired in multiple, and as a lamp lights on the board the first clerk who is free "plugs in" and takes the message. There is no moving about the room and no confusion. The apparatus was arranged and installed by E. L. King, superintendent of telegraph.

Embargoes on the Pennsylvania

The Pennsylvania Railroad has adopted a new plan of handling freight under embargoes. During the existence of an embargo, freight will be handled through a system of special permits covering each individual shipment. The consignee, not the shipper, must apply for the permit, and before authority will be granted to move freight affected by embargo the consignee must show that the goods are necessary to meet his existing requirements, and that he will be able to unload the car or cars without delay.

Two other important changes will be made. All superintendents will be authorized to grant permits for the movement of freight from point to point on their own divisions, and all general superintendents will be authorized to issue similar permits from point to point within their own grand divisions. For the issuance of permits to ship freight from a point on one grand division to a point on another grand division, or to or from points on another railroad, a new embargo bureau has been established at Broad Street Station, Philadelphia, under the direction of W. C. Glynn, assistant general freight agent.

The new plan will enable the railroad to exercise greater control over the movement of freight than has been possible heretofore, while consignees and shippers can arrange more promptly for transportation, as in many cases it will not be necessary to go beyond the division superintendent. It is the belief of the management of the railroad that the new plan will not only permit the movement of a larger volume of freight, but should enable a more uniform operation of industries. It is also expected to reduce materially the amount of correspondence and telegrams and the number of telephone and personal calls.

The new arrangement will not apply in connection with export traffic through New York, Philadelphia or Baltimore, or with domestic carload shipments to New York. This traffic, under war arrangements, is in charge of the Freight Traffic Committee, North Atlantic Ports, 141 Broadway, New York.

Freight Congestion Relieved

With the milder temperatures, which have prevailed since February 6 the railroads in New York, Pennsylvania and New England have made rapid recovery from the serious paralysis under which they had labored throughout the two weeks previous to that day, and thus far the losses suffered are not as heavy as had no very serious disturbance. On the Ohio river the high water has delayed some railroad traffic, and in northern New York there was a new fall of snow and continued low temperatures. With these exceptions the restoration of normal train movements has been general. On the main line of the New York Central the movement of freight has been uninterrupted.

The records of delayed freight, as issued by the eastern regional director, show that the principal roads are getting the better of the congestion at the rate of 5,000 to 8,000 cars a day, in the aggregate, counting both eastbound and westbound movements. In New York harbor, freed from floating ice, coal is moving in nearly or quite normal volume. The daily statement issued on February 13 showed 1,259 cars dumped: 696 anthracite, 563 bituminous. Cars of coal at tidewater yards, 1,247 anthracite and 643 bituminous. Cars in transit within 24 hours of tidewater, 930 anthracite, 804 bituminous. Vessels and barges loaded to be moved, 442 anthracite, 237 bituminous. Vessels and barges waiting for coal, 249.

The daily report of the general freight movement in "eastern" territory showed cars above normal, as follows: "Eastbound, loaded, today 44,969, yesterday 46,040, decrease 1,071. Last bound, empties, today 5,823, yesterday 6,098, decrease 275. Westbound, loaded, 35,710 today, 34,081 yesterday, increase of 1,629. Westbound, empties, 30,488 today, 31,027 yesterday, decrease of 539."

In New England the weather on Wednesday showed 10 to 20 deg. above zero in northern sections, and 28 to 40 above, with some rain, in central and southern parts. Snow-plow had to operate in northern New England Tuesday on account of old snow drifting. Northern New York reported cloudy, and central and western New York cloudy and rain. Mild temperatures in all other parts. At New York in the 48-hour period ending on Wednesday 16 steamers bunkered with 11,115 tons of coal, and 61 cars of anthracite were moved through the Pennsylvania tubes to Long Island.

Receipts of coal at Chicago, in Wednesday's report, total 2,626 cars, which is 25 per cent above normal. Ohio lines moved 924 cars of coal from the coal fields. Loading at all mines on Tuesday was very light because of the holiday and miners not working on account of high water yesterday, causing suspension of operation. High water caused some interference with operation in central New York. The Baltimore & Ohio bridge over the Miami river at Dayton was carried away, blocking the road 48 hours or more. A steel bridge and a trestle over the Miami river at Lawrenceburg, Ind., on the B. & O., 20 miles west of Cincinnati, was carried out by ice, breaking the line between Cincinnati and the west.

In the west the higher temperatures which became general about February 6, enabled the railways to recover rapidly from the effects of the succession of storms which had greatly impeded operation for several weeks. The western regional director of railroads reports that the movement of traffic is now almost normal. Barring a recurrence of the severe winter just passed, there need be no further fear of further food shortages. The rains, which removed much of the snow in Chicago, northern Illinois and Indiana last week took the form of sheet rain at the Mississippi river and did much damage to wires in Iowa and Missouri.

The Indiana and Illinois coal mines are now working to capacity and are producing considerably more than a normal output. The output of Missourian mines is about equal to that of the same period in 1917, and the production of Iowa mines, with some exceptions, is rapidly approaching the records of last year.

Particular attention is now being directed to the movement of grain, and especially soft corn in western territory. Grains, in accordance with the serious character of the winter generally, of railroads.

On February 13 and 14 a total of 1,721 cars of soft corn were shipped to destinations in Canada and on February 14, more than 1,000. About 3,000 cars are now being loaded with grain in the eastern territory. The grain is being to grain car movements, except coal and fuel oil.

Commission and Court News

Interstate Commerce Commission

Increases ranging from 1 to 5 cents per 100 pounds in ocean and rail class and commodity rates from New York, Philadelphia and Baltimore rate points to Chicago, Mississippi river crossings and other western points are proposed in a fifteenth section application filed by W. J. Sedgman, agent.

The Interstate Commerce Commission has dismissed a complaint filed some time ago by C. E. Schafl, receiver of the Missouri, Kansas & Texas, against other southwestern roads, asking the commission to make an investigation of the practice of using 2-cent intrastate fares to defeat the through interstate rates. The complaint was dismissed "upon consideration of the record," and at the request of the complainant.

Western Cement Rates

In the matter of rates on cement between points in western trunk line territory and between points in western trunk line territory and adjacent territories. Opinion by Commissioner Daniels:

Reasonable maximum joint through rates to key points and distance scales are prescribed for the movement of cement in carloads between points in western trunk line territory and between points in adjacent territories and western trunk line territory.

Distances are to be calculated via short-line workable routes.

Fourth section relief is granted at points intermediate to key points, provided that the scale rates herein prescribed are not exceeded at such intermediate points, and that such rates are not in excess of the lowest combination.

A uniform minimum weight of 50,000 lb. is prescribed for the entire territory; a rate 13 per cent higher than the basic rate may be published for a minimum of 38,000 lb.

The practice of making through rates on cement on the basis of combinations is approved as to St. Paul, but disapproved as to Missouri river crossings.

Rates prescribed from Gilmore City, Ia., to all interstate destinations within the territory.

Carriers are directed to withdraw tariffs under suspension and to check in rates in accordance with the findings herein; formal complaints dismissed; fourth section applications denied, except where relief is consistent with the findings herein. (48 I. C. C., 201.)

Personnel of Commissions

P. J. Farrell, solicitor of the Bureau of Valuation, has been appointed chief counsel to the Interstate Commerce Commission, succeeding J. W. Folk, resigned.

The governor of New York has nominated for chairman of the Public Service Commission, Second district, to succeed Seymour Van Santvoord, Hon. Thomas F. Fennell, of Elmira, N. Y., now judge of the Court of Claims. The Senate has confirmed the nomination of F. J. H. Kracke and Charles B. Hubbell as members of the Public Service Commission for the first district.

Court News

Application of Workmen's Compensation Act

The Indiana Appellate Court holds that a railroad car inspector injured while taking a short cut to report to a railroad with which his employer exchanged services of employees under certain conditions, was hurt by an accident arising out of his employment within the Indiana Workmen's Compensation Act.—*In re Maroney (Ind.)*, 118 N. E. 134. Decided December 21, 1917.

Yard Accident

The New Jersey Court of Errors and Appeals holds that no negligence is shown in the case of a yardmaster killed while standing between two tracks, by being struck by a car switched onto another, the customary warning by a halloo being given by several, and, so far as appeared, as soon as any one had reason to think there was danger, in view of the fact that the men had a right to rely on his exercising due care and changing his position if too near the track, a change requiring a shift of only a few inches.—*Healy v. Erie (N. J.)*, 102 Atl. 629. Decided November 19, 1917.

Order of Public Utilities Commission

The Ohio Supreme Court will not substitute its judgment for that of an administrative board created pursuant to an act of Legislature, such as the Public Utilities Commission, as to matters within its province; and before the court will interfere with an order of the Railway Commission or its successors as to issuance of stock by a railroad, it must appear from a consideration of the record that the commission's action was unlawful or unreasonable.—*Pollitz v. Public Utilities Commission (Ohio)*. Decided July 3, 1917.

Construction of Switching Contract

A right of way was conveyed to a railroad company and the company covenanted to switch loaded cars between any industries located on its line in the city for one dollar a car. The Missouri Supreme Court holds that a lessee of the grantee company cannot be required to switch cars for the \$1 charge, where to perform the service it was necessary to pass over the tracks of an entirely independent corporation, the points between which it was ordered to switch cars not being on the line of the railroad company; the latter words referring to the physical line of such company, and not to the independent switching track of another company. *National Enameling etc. Co., v. Granite City & Madison Belt (Mo.)*, 199 S. W. 238. Decided December 3, 1917.

Demand for Cars—Recovery of Penalty

The Georgia Court of Appeals holds that a demand for cars, addressed to the agent of the railroad company at a named point, will, where nothing to the contrary appears, be held to mean that the cars were required at the point at which the demand was made. It is also held that the remedy given by section 2635 of the Civil Code of 1910 and the rules of the Railroad Commission made in pursuance thereof is one in favor of shippers; and one who may have entered a demand for cars, without at that time disclosing his agency for another, cannot recover the penalty thus imposed, where it appears that at the time of the shipment it was disclosed that the cars were intended solely for the use of another, and the bill of lading was issued in the name of the true owner and shipper of the goods. *Central of Georgia v. Rabun (Ga.)*, 94 S. E. 598. Decided December 13, 1917.

Injury to Pullman Passenger by Fright

In an action for damages against the Pullman Company by a woman passenger it was alleged that she was temporarily left alone in a sleeping car which had been placed on a siding in a city to await the next train; that she attempted to open the doors of the car and found them locked or too heavy to open, and that she became greatly frightened and fell into hysteria which lasted several days, and her health was greatly affected thereby. It appeared that the plaintiff only made a single effort to open a door and that it could have been opened by turning a knob and applying a twelve-pound pull. The Texas Court of Civil Appeals held that any negligence of the car porter in temporarily going away, leaving the plaintiff alone, was not the proximate cause of any injury to her from fright at being unable to open the door. If the evidence showed that the plaintiff used every effort to open the doors of the car, that did not disprove the uncontradicted fact that no Pullman car is ever locked so that it cannot be opened by applying the proper degree of force from the inside. Therefore the defendant could not have anticipated that a grown woman could not open the doors. And if she

could not have done so the defendant could not have anticipated that she would have been thereby thrown into hysterics and that the consequences alleged by her would have resulted from her fright. Judgment for the plaintiff was reversed and the cause remanded. *Pelham Co. v. Gutierrez* (Tex.), 198 S. W. 1043. Decided November 21, 1917. Rehearing denied December 12, 1917.

Classification of Baggage

Under the act creating the Texas Railroad Commission delegating to it power to classify and subdivide all freight and property that may be transported over railroads, and despite the statute providing that each railroad passenger shall have an allowance of baggage not to exceed 100 lb., the Texas Court of Civil Appeals holds that it was within the power of the commission to classify and subdivide baggage, and to fix the articles included, determining that baggage shall consist of wearing apparel, etc., and articles carried as samples by traveling salesmen, since if baggage does not come within the term "freight," it comes within the term property. *Levy v. Texas & New Orleans (Tex.)*, 199 S. W. 513. Decided November 17, 1917. Rehearing Denied December 15, 1917.

Report of Railroad Agent

Held a Privileged Communication

The Georgia Court of Appeals holds that a report by the operating agents of a railroad to the superintendent of transportation, made for the purpose of being submitted to the company's counsel, in order that counsel might advise it as to whether or not there was liability on its part for anything connected with the transaction reported, and to enable such counsel to prepare for the defense of the defendant if litigation should arise out of the occurrence, which report was duly transmitted into the hands of such counsel as its proper custodian, constitutes a privileged communication, and its production cannot be enforced by the adverse party in a suit for damages growing out of the occurrence as reported; and this is true although such a report might have been made at a time so nearly contemporaneous with the transaction itself as might ordinarily permit its being received as a part of the res geste thereof. *Atlantic Coast Line v. Williams (Ga.)*, 94 S. E. 584. Decided December 24, 1917.

Furnishing Cars for Coal

In view of a great shortage of cars suitable for coal shipments, occasioned by extraordinary conditions bringing into temporary activity a great many mines that are not equipped with tipples for loading cars, but demand pro rata allotments to them of open-top cars for their shipments, which cannot be furnished without serious detriment to permanent and properly equipped mines, the carrier and the general public, the West Virginia Supreme Court of Appeals holds that a railroad company of which such allotments and distributions are demanded may by promulgation of a regulation applicable to all such mines assign its open-top cars to the permanent and properly equipped mines, and box cars to those loading without tipples and from wagons and trucks. Such a regulation under such circumstances, is neither unreasonable nor unduly discriminatory. *Baltimore & Ohio v. Public Service Commission (W. Va.)*, 94 S. E. 545. Decided December 4, 1917.

TRADE WITH THE GOLD COLONY.—Imports of railway equipment and materials to the Gold Coast Colony, British West Africa, showed an increase of 56 per cent in 1916. The United Kingdom contributed about two-thirds and the United States about one-third of this increase. *—Commercial Report*

COPPER OUTPUT VALUED AT \$510,000,000.—The production of copper from domestic ores in 1917 amounted to 1,850,000,000 pounds, or 38,000,000 less than in 1916, according to the United States Geological Survey. The domestic and foreign output is estimated at 2,362,000,000 pounds, an increase of 103,000,000 over 1916. The domestic production is valued at \$510,000,000, an increase of \$35,000,000 over 1916.

Equipment and Supplies

Locomotives

UNITED STATES GOVERNMENT.—See editorial comment on the Government Standard Locomotives as a War Measure, page 342.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., desires to purchase a second-hand, 50-ton, four wheel saddle tank locomotive with 16 by 24-in. cylinders.

THE CENTRAL OF GEORGIA has ordered 3 Mountain and 10 Mallet type locomotives from the American Locomotive Company. The Mountain type locomotives will weigh 318,000 lb., and the Mallet locomotives 440,000 lb.

THE MISSOURI, KANSAS & TEXAS, reported in the *Railway Age* of February 1 as ordering 20 freight locomotives from the American Locomotive Company, ordered not 20, but 25 locomotives. The locomotives will be of the Mikado type and will be superheated and weigh 314,000 lb.

Freight Cars

THE BUTTERWORTH-JUNSON COMPANY has ordered 75 tank cars from the Cambria Steel Company.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chester street, Philadelphia, Pa., wishes to lease six 8,000-gal. tank cars for four or five months.

Trade Publications

BAKELITE MICARTA D GEARS AND PINIONS.—The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has recently issued a booklet describing the material and the methods of using Bakelite Micarta-D gears and pinions. This is a non-metallic material made up of a special heavy duck of uniform weave, thickness and tensile strength, bonded together with Bakelite by heating under enormous pressure. The material is developed for use where silent operation is desirable and it is especially valuable because of the fact that it is not affected by water or oil, or by most acid or alkali solutions. The booklet gives a complete description of the properties of the material, the methods of working it, a complete outline of the methods of designing the gears and considerable data for the use of the designer. The booklet is thoroughly illustrated with drawings and photographs. Copies may be obtained upon request to the company's nearest office.

TRADE OPPORTUNITIES IN THE ORIENT.—American consuls in the great commercial cities of Shanghai, Tientsin and Hankow report that the American population has increased 25 per cent, and that there never has been such an opportunity as at present to obtain a large share of the valuable oriental trade. A prominent official of one of our western railroads, writing of orient trade, says: "This Far Eastern business, in my judgment is going to continue to grow by leaps and bounds, and I trust that the American business man will realize the possibility of this trade and become more aggressively acquainted with conditions in connection with the same. As I see it, the weakest point in the American business man is the fact that he does not travel abroad. It is only necessary for one to visit these Far Eastern countries to satisfy himself of the great opportunities that lie at our door across the Pacific, and I strongly urge every business institution that has any connection or desire of entering into this wonderful field to visit these countries (or send their representatives) and become acquainted with the real facts and more closely ally themselves with the people of the orient, where they will find an open door, a hearty welcome and many desirable and attractive business opportunities." *—Trade Bulletin (Am. Exp. Co.)*

Supply Trade News

The Schroeder Headlight Company, Inc., Evansville, Ind., has changed its name to the Schroeder Headlight & Generator Company.

C. H. Wilson, southwestern railroad representative for Fairbanks, Morse & Co., has been appointed first lieutenant in the Engineers' Reserve Corps and has been assigned to active duty.

G. F. Evans, formerly connected with the W. C. Moore Company, Columbus, Ohio, has been appointed supervising engineer for the National X-Ray Reflector Company, in the territory comprising Ohio, except Toledo and Cincinnati, West Virginia, and western Pennsylvania, with office at Columbus, Ohio.

G. R. Lewis, division freight agent of the Cleveland, Cincinnati, Chicago & St. Louis, with headquarters at Indianapolis, Ind., and for more than 20 years with the New York Central Lines, has been appointed manager of supplies and traffic, with the Standard Forgings Company of Indiana Harbor, Ind., and will have offices in the Railway Exchange building, Chicago.

W. N. Thornburgh, vice-president and general manager of the Harrison Railway Specialties Company, Sandusky, O., will devote his entire time to his duties as president and treasurer of the William N. Thornburgh Company, manufacturers of the "National" steel and wood dust guard, and purchasers and sellers of used rails, cars and locomotives. He will have headquarters in Chicago, as heretofore.

J. B. Henry, general superintendent of the Union Steel Casting Company, Pittsburgh, has been elected vice-president, to succeed **J. P. Allen,** recently elected president of the company. Mr. Henry will continue to discharge the duties of general superintendent, as heretofore. **W. C. Eichenlaub,** secretary, has also been appointed manager of sales. The other officers of the company are as follows: **C. C. Smith,** chairman of the board; **S. H. Church,** vice-president; **G. W. Eisenbeis,** treasurer.

Frank Fouse, who has been appointed works manager of the Marsh Refrigerator Service Company with office at Milwaukee, Wis., entered the service of the Pennsylvania in 1888. From 1896 to 1901 he was with the Pressed Steel Car Company at Pittsburgh, Pa.; from 1901 to 1908 he was with the Pittsburgh Testing Laboratory and in the latter year he entered the service of the United Fruit Company as general foreman of the car department on the Costa Rica division of the Northern Railway of Costa Rica.

Wilson S. Kinnear, E. A. Little and Carl H. Stengel announce the opening of the office of W. S. Kinnear & Co., engineers-investigators, at 111 Broadway, New York. The company will make general engineering and investment reports, investigations, valuations and reports on steam and electric railways. It may also be consulted on terminal, harbor and dock improvements and developments, land and subaqueous tunnels and heavy construction estimates and supervision, and will specialize on railway and public utility reports and valuations.

The Australian General Signal Company, Ltd.

This is the name of a new company incorporated under the laws of the State of New York, with its charter to be filed in Australia, which will handle the products of the General Railway Signal Company, Rochester, N. Y., and other kindred lines in Australia. The new company's Australian office is located at Dalton House, 115 Pitt street, Sydney, N. S. W.

The offices of the company are as follows: **Walter J. Plogsted,** managing director; **W. W. Salmon,** president; **George D. Mongan,** vice-president and treasurer; **J. P. Braam,** secretary, and **C. M. Terry,** assistant secretary and assistant treasurer.

Walter J. Plogsted, the new managing director, was at one time resident engineer for the General Railway Signal Company at

New York. Since February 1, 1913, he has been employed as an engineer by R. W. Cameron & Co., an export house with a number of branches in Australia. The new company terminates the former arrangement with R. W. Cameron & Co. Mr. Plogsted's headquarters will be at Sydney, New South Wales. **C. M. Terry,** the new assistant secretary and assistant treasurer, was also formerly connected with R. W. Cameron & Co. His headquarters are also in Sydney.

The directors of the company are: **J. N. Beckley,** Rochester, N. Y.; **Thomas W. Funicane,** Rochester, N. Y.; **W. W. Salmon,** Rochester, N. Y.; **George D. Morgan,** Rochester, N. Y.; **C. H. Littell,** Buffalo, N. Y.; **W. J. Plogsted,** Sydney, New South Wales, and **C. M. Terry,** Sydney, New South Wales.

The Chicago Pneumatic Tool Company

The Chicago Pneumatic Tool Company is doing four times as much business as in the pre-war period, according to its annual report for the year ended December 31, 1917, recently made public. In addition, the net profits have exceeded those of any previous year, even after providing for an additional tax of 4 per cent. on the company's net income and for the excess profits war tax. The increased demands made upon the company by the much larger volume of business have necessitated the borrowing of more money to cover increases in the cost and amount of material and labor used, but the sums which have been borrowed are more than offset by the increase in the value of current assets. The company's plants have been taxed to capacity to fill the orders received, making improvements and additions necessary. At the same time the physical condition of the plants has been maintained as usual. The British and Canadian subsidiary companies, both more or less under the control of their respective governments, retained their earnings for the year for additional working capital. To facilitate the marketing of the Little Giant truck, a subsidiary company, known as The Little Giant Truck Company, was incorporated in 1917, with a nominal capital stock which is owned and held entirely by the Chicago Pneumatic Tool Company.

The gross profits for the year 1917 amounted to \$2,006,372. Deductions of funds for developing and perfecting new tools and for the depreciation of physical property amounting to \$437,582; deductions for interest on bonds, and an installment for a sinking fund amounting to \$171,725; and a reservation for income, war income and excess profits taxes amounting to \$227,674, leave a net profit of \$1,169,390. From this amount \$257,952 were set aside for dividends aggregating 4 per cent per annum, and the remainder, exclusive of \$100,223 retained by the subsidiary companies for working capital, was added to the surplus as of December 31, 1916, making the surplus carried forward \$3,648,064.

Large Metal and Chemical Interests

Combine Business Under New Name

Announcement was briefly made in last week's issue of the *Railway Age* that the business of both the Goldschmidt Detinning Company and the Goldschmidt Thermit Company will hereafter be conducted by the "Metal & Thermit Corporation" with general offices at 120 Broadway, New York. These two concerns have been practically combined for the last two years and have occupied joint offices at the above address. The combination, which is controlled exclusively by Americans, has now been put in more permanent form as it is felt that this will tend towards greater efficiency and co-ordination of effort.

The detinning department of the Metal & Thermit Corporation will carry on one of the largest industries of its kind in the world, i. e., the recovering of tin from tin scrap. Approximately 100,000 tons of tin scrap is treated yearly by this department and the recovery approximates the equivalent of 2,000 gross tons of metallic tin. The output of this branch of the corporation consists of pig tin of a quality equaling Straits tin, tetrachloride of tin and detinned billets, the latter being the iron scrap after the tin is removed, compressed into billets and used by iron and steel plants for remelting.

In regard to the Thermit department, this will continue the production and sale of Thermit welding materials and apparatus as well as the various carbonfree metals and alloys which are produced by the aluminothermic process. The process was first introduced in the United States in 1902 and since then the business has grown very fast, particularly in recent years when there has been a very large demand for the metals as well as for the

welding material. In addition to its line of carbonfree metals and alloys, the company produces pure tungsten powder of high quality and in very considerable quantity. It is also selling agent for the output of a large plant in the Middle West producing 50 per cent electric furnace Ferro-Silicon.

The Thermit Welding process is used by practically all the railroads in the United States and Canada for welding broken locomotive frames and other heavy sections. It is also used very extensively by the different steel mills for welding broken equipment, such as rolls, pinions, crank shafts, etc. In fact over 1,000,000 lb. of Thermit is used annually by these two industries alone. The process is extensively employed for the welding of rails for trolley lines, the welding of broken sternposts and rudder frames of steamships and for other welding operations too numerous to mention. The process is quite different from either oxy acetylene or electric welding and is adapted to a much heavier class of work.

The Metal & Thermit Corporation operates four different plants, located respectively in Jersey City, Chrome, N. J., Wyandotte, Mich., and East Chicago, Ind. The Chrome and East Chicago plants are devoted to the tinning industry; the Wyandotte plant to the production of liquid chlorine and the Jersey City plant to the Thermit products, including welding materials, carbonfree metals and alloys and pure Tungsten powder. The corporation operates branch offices and welding shops in Pittsburgh, Chicago, San Francisco and Toronto.

The following are the officers and directors: W. T. Graham, Edgar L. Marston, Daniel G. Reid, F. S. Wheeler, Hubert E. Rogers, F. H. Hirschland, E. L. Ballard, L. A. Welles, Charles F. Dane, Philipp Gensheimer and Fred W. Cohen.

Chicago Railway Equipment Company Celebrates Its Twenty-fifth Anniversary

The Chicago Railway Equipment Company celebrated its "Silver" anniversary on the evening of February 5 at the Union League Club, Chicago. It was the twenty-fifth consecutive annual dinner held around the same table and in the same room. The participants included members of the organization, directors, shareholders and guests.

The table was set for 64 places, and was in the form of a dumb-bell. Two large round tables, 15 ft. in diameter, were placed at the ends; the curved "handle" connecting them being some 21 ft. long. In the center of each round table was the company's trade mark "Creco," 4 ft. in diameter, made of red carnations, and encircled by 12-in. silver letters "Twenty-Fifth Anniversary."

Around the table were 25 miniature transmission poles, replicas of a product of the Franklin plant, used as table lights and bearing the anniversary numbers from one to twenty-five. Alternating were 25 miniature poles, each having a curved bracket holding a suspended silver bell, the clapper of each marking the years from 1893 to 1917. There were other appropriate decorations in silver and carnation red. Practically all the decorations except the flowers were a product of or made by the company.

President E. B. Leigh informed the guests that the dinner was an adjourned shareholders meeting and that all had in due and regular form been clothed with proxies.

In his annual report he recalled that the company had never passed or reduced a dividend and that in the 25 years the distribution to stockholders had aggregated \$3,355,000, all based upon an original cash investment of \$30,000 which had never been increased by sale of securities. He announced that an extra dividend of 25 per cent had been declared at the directors' meeting held in the afternoon, and in commemoration of the 25th anniversary, 5 per cent in cash and 20 per cent in stock, the capital stock having been increased to \$3,000,000.

In the quarter century the floor space devoted to the business of the company had increased from 30,000 sq. ft. to over 800,000 sq. ft., the total land owned to about 60 acres and the number of plants from one to five, located at Chicago, Detroit, Grand Rapids, Mich., Monon, Ind., and Franklin, Pa. Founded originally upon its brake beam business, the company had so far diversified its product that now about 70 per cent is sold to customers other than railroads.

Mr. Leigh also told how the company had started with the original "Hein" (National Hollow) brake beam, and how at the expiration of the foundation patents fifteen years later it had in turn brought on the market the "Creco" brake beam. How ef-

fectively they worked out, he added, and "attributed to the fact that so far as known not a single National Hollow Brake Beam has ever been manufactured or sold by any other than your own company." He also took occasion to comment on the recent rapid developments in the railway situation. He was unable to prophesy what lay ahead, or in his own words: "Standing upon the threshold of 1918, we are confronted with a tremendous interrogation mark—What?" He also commented on the new problem at Washington—standardization—but added that "whether standardization or the present system which recognizes the advantages of initiative, progress and the constant striving for higher efficiency shall prevail" the company is sufficiently well equipped to meet whatever condition may prevail and is confident of receiving its fair share of future business.

The matter of standardization was also brought up later in the evening by Frank W. Noxon, secretary of the Railway Business Association and one of the guests at the big table. In his remarks Mr. Noxon said:

"We have before us, when peace shall come, the project of re-constituting our whole railway system, in some way yet to be thought out, and to be debated out. We have a very animated, a very active, thorough-going propaganda, which has for its purpose to place all of the transportation agencies in the hands of the government. Of course, one of the first things that would result from that would be that the provision of appliances, the provision of rolling stock, and of tracks, of signals, and all those things would be centralized in the hands of some governmental agency.

"I have been wondering how, under such a system, it would be possible for a series of events to occur, such as we heard recorded tonight in these reports; how the event, which I noticed particularly, when at one stage a patent was about to run out, and when the inventive geniuses of the institution were set to work to provide an improvement over the old device—how such an event could come about.

"Naturally, if the government were to have in its hands the matter of developing the equipment, the men who now and in years past have devoted themselves to improvements in competition one with another, first asking the consideration of one railroad, and then finding that railroad indifferent, going to another, and so on until some hospitable mind was found—instead of that the purveyor or developer or inventor goes to some central board not composed of men who have direct personal interest at stake in proving their hospitality towards the new, but men perhaps overburdened with detail, tempted to standardize and over-standardize—and a deaf ear is turned, perhaps. Suppose it is—there is no recourse, there is no appeal. The improvement projected in the mind of the inventive genius is stopped, then and there.

"I question if men of the calibre of the men who have made this company what it is would be attracted to go in or stay in a business where the opportunity was in the hands, as it would be, of a government board.

"I just want to ask you to think of the great advantages, if we can have it, of maintaining some degree of decentralization, in the future, in the development of railway equipment.

"I think we all feel quite open-minded toward substantial changes from what has been in the past. We expect that what we have learned in the war will teach us things that we must apply and embody in a new system; and the question is whether or not we may have, when it is all over, sufficient decentralization so that the plans and schemes for the improvement of railroads may proceed from below, from the railroad managers themselves, and not from some bureau, static and stagnant, so that business men and inventors, men of imagination, will be attracted into that business, and the American people and the whole world have the benefit of rapid rather than slow progress."

The toastmaster for the evening was H. S. Burkhardt, for 13 years president of the company, and who for 15 years has officiated as toastmaster at its annual dinners. Mr. Burkhardt introduced a number of the "old guards" in the company.

In the course of the evening lantern slides were shown of the various plants at various stages both of prosperity and of calamity with a few merry cartoons of company celebrities.

The secretary of the company, F. F. Walker, supplemented the president's report with historical material of a more detailed character, after which the assistant to the president, Arthur Wyman, introduced a number of friends and guests of the company. Among those who spoke were: Judge J. A. Baldwin, Harry C. Bufoloup, Willard A. Smith, Frank Wyman, Wm. E.

Clow, Paul Bakewell, Frank W. Noxon, Samuel O. Dunn, Frank D. Reid, Geo. P. Fisher, J. H. Hlobbrook, W. E. Seatrice, J. M. Hopkins, L. B. Sherman, Geo. R. Nichols, J. H. Bennett.

American Locomotive Semi-Annual Report

The directors of the American Locomotive Company last week issued to the stockholders of the company a semi-annual report for the six months ended December 31, 1917, in which it was shown that the profits available for dividends in the latter six months of 1917 were \$3,969,251, as compared with \$3,630,834 in the same period of 1916.

An abstract of the report follows:

The net profit for the six months ending December 31, 1917, of \$6,010,009, before deduction of taxes, includes \$439,376 of profit on the munitions business, the remaining profit of \$5,570,633 was made entirely from the regular locomotive business of the company. The net profit for the six months ending December 31, 1916, of \$5,453,334, before tax deductions, included a profit on munitions work of \$3,663,520.

The locomotive output of the company for the six months ending December 31, 1917, was practically all obtained from the Schenectady, Brooks, Pittsburgh and Cooke plants, which collectively represent about 70 per cent of the company's locomotive capacity. The Richmond and Montreal plants of the company, which had been engaged exclusively on munitions work since 1915, finished their munitions contracts in July and August, 1917, and the work of restoring those plants for locomotive manufacture was completed during October, 1917. The cost of this restoration work has been charged to a reserve created for this purpose out of previous years' profits and no part of such cost is charged against the income for the six months under review.

The amount of money in inventories of materials and work in process on December 31, 1917, was \$27,830,295. In the largest year of business prior to the war the amount of such inventories was about \$11,000,000. This very large increase of about \$16,800,000 is due to the higher cost of materials and labor, and also to the rearrangement of our locomotive production schedules, to meet the war requirements of the government, which resulted in postponing the construction of locomotives, the material for which had been delivered to our plants.

The company received from the United States government on July 24, 1917, a contract for 150 locomotives to be used in France for the transportation of our troops and supplies. These locomotives were completed during the months of September and October.

Due to the unsettled conditions in Russia the management thought it wise to obtain an adjustment of the contract made in July, 1917, with the Russian government for 250 locomotives, and with the aid of the United States government an adjustment has recently been effected, which, in view of all conditions, is satisfactory to the company.

The company has had numerous inquiries from its stockholders as to dividends paid during the calendar year 1917 in relation to income tax returns. The preferred and common dividends paid by this company in January, 1917, were declared in November, 1916, out of the surplus profits arising from the business of the company for the period ending December 31, 1916. All other dividends paid during the year 1917 were declared out of the profits of the year 1917.

The company had on its books on December 31, 1917, unfilled orders amounting to \$75,624,849.

CONDENSED INCOME ACCOUNT OF THE AMERICAN LOCOMOTIVE COMPANY AND ITS SUBSIDIARIES.

| | Six months to Dec. 31, 1917 | Six months to Dec. 31, 1916 | Increase or decrease |
|---|--------------------------------|--------------------------------|-------------------------|
| Gross earnings..... | \$35,959,126 | \$37,863,594 | \$1,904,468 |

Financial and Construction

Railway Financial News

FITZGERALD, OCILLA & BROXTON.—J. A. J. Henderson, president of the Ocilla Southern, was the highest bidder for the Fitzgerald, Ocilla & Broxton at a receiver's sale on February 5. This is the third time the road has been offered for sale, the court declining to confirm previous sales.

NEW YORK, NEW HAVEN & HARTFORD.—This company is further reducing its note indebtedness by calling for redemption on April 12, of \$241,000 5 per cent collateral trust notes of certain designated numbers, at 101 and accrued interest. This is in accordance with indenture providing that if any collateral is sold notes must be retired with proceeds. The company has already bought in \$1,000,000 face value of these notes, and with those now called for redemption, the amount maturing on April 15 is reduced to \$43,759,000 from the original \$45,000,000 issued last April.

WARABISH-PITTSBURGH TERMINAL.—See comments elsewhere in this issue.

Railway Construction

CHICAGO UNION STATION COMPANY.—This company will build a 14-story warehouse, 328 ft. by 151 ft., on Canal street between Washington and Randolph streets, Chicago. The building will be erected for Butler Bros. and W. R. Linn to take the place of a warehouse which was acquired by the Union Station Company in order to meet the requirements of its terminal plans. The new building will be constructed by John Griffiths & Sons, contractors, and will cost about \$2,500,000.

BLOCK SYSTEM NOT NECESSARY.—From a report printed in Montreal it appears that on the Hudson Bay Railway—or that portion of the line on which track is laid—a train is now run every two weeks. It is for the accommodation of fishermen who have taken fish from the lakes of Northern Manitoba and who otherwise could not find a market. The railway is still in the hands of the contractor; but the government has undertaken to guarantee that the running of the trains shall not be done at a loss.

LOCOMOTIVE DEVELOPMENT IN SOUTH AFRICA.—In his report for 1916 the general manager of the South African Railways and Harbors makes the following comments upon locomotive development: The further improvement of the locomotive boiler is a subject that has engaged the attention of mechanical engineers for some time. The superheater has added greatly to the steaming efficiency, and has neutralized the difficulties associated with the firing of large engines to maintain the pressure of steam necessary for the work required of a modern locomotive. But increased steam pressures are still desirable, and experiments are being conducted in different parts of the world with new boiler designs and other improvements calculated to develop the steaming efficiency and the steam pressure of the locomotive. That very high pressures can be raised and maintained by means of tube or pipe generators has already been established, but it has yet to be proved whether a generator of this type can be successfully adapted to locomotive practice. A generator on these lines has been designed by the superintendent (mechanical), Johannesburg, and inquiries are being made as to the practicability or otherwise of his proposals. The design involves a radical departure from present practice, and will require most careful investigation and consideration before further action is taken. In the experimental stage oil fuel may have to be used, but the object in view is to adapt the engine to burn coal dust, and, that being so, the result of the advance that is being made in the United States with engines designed to use pulverized fuel is being watched with special interest, especially in view of the fact that the use of such fuel eliminates fire hazard.—*Engineering, London.*

Railway Officers

Executive, Financial, Legal and Accounting

Milton Smith has been appointed general solicitor of the Denver & Salt Lake, succeeding Tyson S. Dines, resigned.

E. D. Levy, first vice president and general manager of the St. Louis-San Francisco, with office at St. Louis, Mo., has resigned, effective May 1.

W. C. Yarborough, cashier of the Atlantic Coast Line, with office at Wilmington, N. C., has been appointed assistant treasurer, with headquarters at Wilmington.

C. C. Michie, chief clerk in office of vice-president of the Chesapeake & Ohio at Richmond, Va., has been appointed an assistant secretary, with headquarters at Richmond.

Gaston Craig Hand, who has been elected vice-president of the Kansas City Southern, with headquarters at New York, as has already been announced in these columns, was born on July 2, 1870, at Belmont, N. C., and was educated at St. Mary's (now Belmont Abbey) College, Philadelphia, Law School and New York University. He began railway work in February, 1891, and served successively as station agent and telegraph operator on the Atlantic Coast Line until September, 1893. He was then despatcher's apprentice and train despatcher on the same road to June, 1896, and later served as assistant in the superintendent's office. In July, 1901, he went to the Pennsylvania Railroad as a clerk in the transportation department. From August, 1902, to September, 1904, he was engaged in transportation and other work with bankers in Philadelphia and New York; then was statistician with Ladenburg, Thalmann & Co. bankers, New York. In February, 1908, he was appointed examiner for the Interstate Commerce Commission, Washington, and in December, 1909, he was appointed secretary of the Kansas City Southern, with office at New York, which position he held until his recent appointment as vice-president of the same road, as above noted.

J. W. McCullough, auditor of the lines east of Houston, Tex., of the Gulf Coast Lines, has been promoted to general auditor, with headquarters at Houston, Tex., effective January 15.

W. H. Wright, superintendent of the Wisconsin & Michigan, with office at Peshtigo, Wis., has been appointed auditor, with headquarters at Menominee, Mich., succeeding M. F. Schulze, resigned. W. J. Moriarty, cashier, has resigned.

Decatur Axtell, vice-president of the Chesapeake & Ohio, theocking Valley, and the Chesapeake & Ohio of Indiana, with office at Richmond, Va., resigned from those companies in February 8.

M. P. Blauvelt, controller of the Lehigh Valley, has been elected vice-president with offices at New York and Philadelphia, Pa. A photograph of Mr. Blauvelt and a sketch of his railway career were published in the *Railway Age Gazette* of June 29, 1917, page 1508.

W. H. Hough, auditor of receipts and disbursements of the Susquehanna & New York and the Tionesta Valley, with office

at Williamsport, Pa., has been appointed assistant auditor and C. F. Bower has been appointed manager of receipts and disbursements, succeeding Mr. Hough.

The election of William P. Kenney, vice-president of the Great Northern, with headquarters at St. Paul, Minn., as president of that road is announced elsewhere in this issue. Ralph Budd, assistant to the president, with headquarters at St. Paul, has been elected executive vice-president.

Charles Molony, assistant to vice-president and general manager of the Central of Georgia, with office at Savannah, Ga., has been elected president of the Wrightsville & Thomas, with headquarters at Terminal, Ga. Henry D. Pollard, resigned to accept service with another company.

Operating

W. C. Zeigler has been appointed car agent of the Susquehanna & New York, with office at Williamsport, Pa.

W. C. Barnwell, first truck despatcher of the Georgia Southern & Florida, has been appointed chief despatcher, with office at Macon, Ga.

T. J. Regan, trainmaster on the Northern Pacific at Livingston, Mont., has been transferred to Forsyth, Mont., succeeding L. W. Martin, transferred.

M. Eady, chief despatcher of the Georgia Southern & Florida, has been appointed superintendent of the Hawkinsville & Florida Southern, with headquarters at Askeon, Ga.

W. A. Todd, general roadmaster of the Charlotte & Western Carolina, with office at Augusta, Ga., has been assigned the duties also of trainmaster, with the title of trainmaster and general roadmaster.

E. B. Fisher was appointed superintendent of the Minnesota, Dakota & Western, with headquarters at International Falls, Minn., succeeding F. L. Birdsall, resigned, effective January 1.

M. L. Phelps, superintendent of the Denver & Salt Lake, with office at Denver, Colo., has been appointed general superintendent, with headquarters at Denver, in charge of transportation, mechanical, roadway and engineering departments.

R. J. Carmichael, division passenger agent of the Illinois Central, at Chicago, Ill., has been appointed to the newly created position of instructor of passenger train and station employees on the entire system, with headquarters at Chicago, effective February 16.

A. E. Fillmore, superintendent of car service of the Kanawha & Michigan, with office at Collierville, Tenn., has been appointed superintendent of freight transportation, with the same headquarters. F. H. Young has been appointed superintendent of car service with office at Collierville, succeeding Mr. Fillmore.

H. E. Newcomet, superintendent of the Pennsylvania Lines west of Pittsburgh, Southwest system, with office at Louisville, Ky., has been appointed superintendent of the Louisville division, with office at Louisville, Mo., vice George Le Bouteiller, transferred, and Taber Hamilton, superintendent with office at Decatur, Ill., has been appointed superintendent of the Louisville division, vice Mr. Newcomet.

W. C. Copley, freight trainmaster of the Pennsylvania Railroad, with office at Allentown, Pa., has been appointed special agent; W. B. Moore, passenger trainmaster, with office at Allentown, has been appointed trainmaster; J. B. Phelan has been appointed freight trainmaster and L. L. Banks has been appointed passenger trainmaster; H. DeHuff has been appointed assistant freight trainmaster, with office at Allentown.

J. H. Owen, superintendent of transportation of the Florida East Coast, with office at St. Augustine, Fla., has been appointed general superintendent of transportation. A. L. Pooser, superintendent at New Smyrna, has been appointed superintendent of transportation, Northern Division, with office at New Smyrna, and E. L. Klein, superintendent at Miami, has been appointed superintendent of transportation, Southern Division, with office at Miami.

G. C. Hand

J. K. Johnston, superintendent of the Philadelphia division of the Pennsylvania Railroad lines east of Pittsburgh, with office at Harrisburg, Pa., has been appointed superintendent of the Tyrone division, with headquarters at Tyrone; F. W. Smith, Jr., acting superintendent of the Conemaugh division, at Pittsburgh, has been appointed superintendent of the Philadelphia division, with office at Harrisburg; J. B. Hutchinson, superintendent of the Tyrone division, at Tyrone, has been appointed acting superintendent of the Conemaugh division, with office at Pittsburgh; R. H. Pinkham, division engineer of the Pittsburgh division, at Pittsburgh, has been appointed assistant superintendent of the same division, with headquarters at Cresson; Thomas A. Roberts, agent at Erie, has been appointed assistant superintendent of the Philadelphia division, with office at Glen Loch; G. M. Smith, freight trainmaster of the Maryland division at Wilmington, Del., has been appointed assistant superintendent of the same division, with headquarters at Lamokin, and W. M. Post, assistant signal engineer in the office of the signal engineer, at Philadelphia, has been appointed assistant superintendent of the Middle division, with headquarters at Mifflin.

Traffic

H. A. Jordan has been appointed general freight and passenger agent of the Wadley Southern, with office at Savannah, Ga.

M. J. Curry has been appointed commercial agent of the El Paso & Southwestern, at Detroit, Mich., succeeding D. A. Davies.

C. Dowling has been appointed traffic manager of the Edmonton, Dunvegan & British Columbia, with office at Edmonton, Alta., succeeding A. Campbell.

G. I. Martin, traveling freight and passenger agent of the Denver & Rio Grande, at Salt Lake City, Utah, has been promoted to general agent, at Reno, Nev.

P. A. Marr, district passenger agent of the Illinois Central, at Cincinnati, Ohio, has been appointed division passenger agent, at Chicago, Ill., succeeding R. J. Carmichael, promoted, effective February 16.

Ferdinand G. Lantz, assistant general freight agent of the Erie, with office at Chicago, Ill., has been appointed general agent of the Chicago and Hammond terminals, vice Charles D. Ward, transferred to New York.

Jonas Waffle, general freight and passenger agent of the Chicago, Milwaukee & Gary, at Chicago, Ill., has resigned and his office has been abolished. R. E. Owen has been appointed assistant general freight and passenger agent, with office at Chicago, Ill., effective February 1.

H. T. Duffy, general agent of the Minneapolis, St. Paul & Sault Ste Marie, at Toronto, Ont., has been appointed district passenger agent at Duluth, Minn., succeeding W. H. Lennon, who has been appointed city passenger agent of the Duluth, South Shore & Atlantic and the Soo Line, with the same headquarters. The Toronto office has been closed.

Engineering and Rolling Stock

V. B. Wagner has been appointed chief engineer of the Cripple Creek & Colorado Springs, with office at Colorado Springs, Colo., succeeding M. J. Burgdorf.

V. N. Potts has been appointed general foreman of the locomotive department of the Chicago, Rock Island & Pacific, with headquarters at Liberal, Kans.

H. C. McCullough and W. P. Murphy have been appointed road foremen of equipment of the Chicago, Rock Island & Pacific, with headquarters at El Reno, Okla.

W. W. Lemen has been appointed superintendent of the motive power and car departments of the Denver & Rio Grande, with office at Denver, Colo., succeeding W. J. Bennett.

J. M. Kerwin, master mechanic of the Chicago, Rock Island & Pacific, with headquarters at Estherville, Ia., has been transferred to newly opened headquarters at Silvis, Ill. R. J. McQuade, general foreman of the locomotive department, at

Chicago, Ill., has been appointed master mechanic to succeed Mr. Kerwin, with headquarters at Estherville, Ia.

J. H. Roach, valuation engineer of the New York Central lines west, has been appointed valuation engineer of the lines east and west, with headquarters at New York and Cleveland, Ohio.

W. B. Steeves, locomotive foreman of the Canadian Northern, with headquarters at Saskatoon, Sask., has been promoted to assistant master mechanic of the western district, with headquarters at Edmonton, Alta.

E. M. Sweetman, master mechanic of the Southern Railway with office at Spencer, N. C., has been transferred to the Coster shop, Knoxville, Tenn., as master mechanic, succeeding N. N. Boyden, resigned to go into other business.

F. O. Walsh, superintendent of motive power of the Georgia Railroad, has been appointed superintendent of motive power and equipment also of the Atlanta & West Point and the Western Railway of Alabama, with office at Montgomery, Ala.

W. F. Kuhlke, assistant trainmaster of the Charleston & Western Carolina, has been appointed superintendent of motive power; the position of master mechanic at Augusta, Ga., made vacant by the death of T. B. Irvin, has been abolished.

R. Faries, division engineer of the Williamsport division of the Pennsylvania Railroad lines east of Pittsburgh, with office at Williamsport, Pa., has been appointed division engineer of the Pittsburgh division, with headquarters at Pittsburgh; E. J. Ayars, division engineer of the Allegheny division, at Oil City, has been appointed division engineer on the Williamsport division, with office at Williamsport; C. M. Wisman, division engineer of the Elmira division, at Elmira, N. Y., has been appointed division engineer of the Allegheny division, with office at Oil City; W. E. Brown, assistant division engineer of the Pittsburgh division at Pittsburgh, has been appointed division engineer of the Elmira division, with office at Elmira; C. W. Richey, master carpenter of the Pittsburgh division, at East Liberty, has been appointed assistant division engineer of the Pittsburgh division, with office at Pittsburgh; C. E. Zortman, division engineer of the Conemaugh division at Pittsburgh, has been appointed division engineer of the Delaware division, with office at Wilmington, Del., and S. L. Church, division engineer of the Delaware division, at Wilmington, has been appointed division engineer of the Conemaugh division, with office at Pittsburgh.

Purchasing

W. E. Allen has been appointed purchasing agent of the Gulf, Florida & Alabama, with office at Pensacola, Fla.

M. Velasco has been appointed local purchasing agent of the Constitutional Railways of Mexico, with office at New York, vice F. E. Carrero, resigned.

J. L. Diessl, division storekeeper of the Atchison, Topeka & Santa Fe, at Riverbank, Cal., has been transferred to Calwa, Cal., succeeding J. A. Brackett, who was transferred to Bakersfield, succeeding W. H. Bunch, who has entered the National Army. J. W. Riddings has been appointed storekeeper at Richmond, Cal., succeeding H. I. Heath, who has also entered the National Army.

Obituary

W. H. Guerin, formerly general agent of the Chicago & North Western, at Detroit, Mich., died at Monterey, Cal., January 30, aged 59 years.

Nathan A. Sims, general freight and passenger agent of the Ulster & Delaware since 1887, with office at Kingston, N. Y., died on February 7, at the age of 62.

F. T. Lasier, formerly general agent of the passenger department, of the Chicago Great Western, at Chicago, Ill., died at his home in that city on February 4.

J. W. Bushnell, formerly chief engineer of the Florida Railway & Navigation Company, now a part of the Seaboard Air Line, died on February 4 in his home at Tallahassee, Fla., at the age of 66.

Railway Age

EDITORIAL

The express companies are being hard hit as is indicated by the returns for the ten months ended with October. The

Express Companies Hard Hit

Adams had an operating deficit of \$1,880,000 as against operating income for the corresponding ten months of 1916 of \$933,000. American and Wells-Fargo suffered almost as much; the former had an operating income of \$940,000 in 1917 as against \$2,125,000 in 1916, and the Wells-Fargo an operating income of \$699,000 in 1917 as against \$2,634,000 in 1916. The express companies' gross business was very much larger in 1917 than in 1916 and the amount they had to pay out for express privileges (amounts paid to the railroad companies) increased only in proportion, so that the amounts available to pay operating expenses were much larger in 1917 than in 1916. The expenses mounted up out of all proportion, however, to the increase in business handled. It is well known that a great many shipments which would under ordinary circumstances have gone by freight have been, during the past year, sent by express. The express companies' organization has not been capable of handling this business economically; loss and damage claims have amounted to unprecedented figures; correspondence has in some cases more than doubled. Everywhere the bad effects of congestion have been reflected in increased expenses; hay and grain have increased greatly in price; and the efficiency of express labor has fallen off until the average with some companies is probably not much above half what it was two years ago. The reason for this labor situation is two-fold. Even if the express companies had not had to handle the great increase in business, the depletion of their employees' ranks through the operation of the draft, and the more attractive offerings made by other industries, would have necessitated the hiring of so many new men, that the standard would have been very much lowered. There is added to this, however, the great increase in business. This still further diluted the old carefully trained forces with new inexperienced men. Because of these conditions, it is not surprising that there is so little opposition on the part of shippers to the requests of the express companies for higher rates.

Commissioner George W. Anderson of the Interstate Commerce Commission is one of the closest advisers of Director General of Railroads McAdoo. He is

The Alleged Disloyalty of Railway Men

at the same time a public official who, while he means to be fair, is not disposed to give railway owners and officers any more than their due. Therefore some remarks he made before the Traffic Club of New England on February 12 are significant as indicating not only his own attitude but that of government officials. He referred to the fact that "there are all kinds of nasty remarks afloat as to bad faith on the part of railroad officials and railroad employees—of an alleged desire that federal control be a failure—stories that they are holding up trains, allowing congestions to take place and doing other things to impede traffic." "I want to make my position on that entirely clear," said Commissioner Anderson. "I do not

believe those stories." Mr. Anderson's remarks on this subject are published elsewhere in this issue. He recognized the fact that "the men operating the railroads will make mistakes. They must reorganize their mental processes and their mental habits and readjust them to the new status during the war period. Some of them will not do it easily. He had no doubt, however, that practically all railway officers and employees are loyal. It would certainly be a remarkable thing if railway officers and employees were not loyal. Many of the officers of the railways have sons in the army. All of them have many friends and acquaintances "over there." The same thing is true of railway employees. The railway regiments, composed of railway officers and employees who voluntarily enlisted were, we believe, the first American soldiers actually under fire in France. The officers and employees who have stayed on the railways are as loyal and patriotic as those who have gone into the army. They showed their patriotism before government control was adopted by exerting themselves to move the maximum possible amount of business. They have shown it since by giving the best support they could to the Director General of Railroads. No baser or falsier charge ever was made than that either from disloyalty or desire to discredit government control railway officers and employees have been "lying down."

With the approach of Engineering Week, as the third week in March is known among railway men, with its annual

Conventions in War Time

meeting of the American Railway Engineering Association, its stated meeting of the Railway Signal Association and the annual exhibit of the National Railway Appliances Association, more than the usual amount of interest is being displayed in these meetings this year. Never have these organizations met under as unusual and as strenuous times as the present. Approximately 100 members of the American Railway Engineering Association, or almost ten per cent of the membership, have entered the military or naval service of the country since the last meeting and similar records have been made by the other associations. This exodus has occurred at a time when the demands for trained men on the railways are the greatest ever experienced. As a result there have been a larger number of changes in personnel and more men have been installed in new positions than in any previous year. This condition not only presents an opportunity for these associations to be of real educational service to these men and to the roads which employ them but it places a heavy responsibility upon these organizations to perform this service. The need for relief is not, however, confined to the novices in the field, for the older and more experienced men are also confronted with experiences which are equally new to them. Problems have arisen during the past 12 months which are without precedent in character or in severity. There is no more loyal group of officers in railway service than those in charge of the maintenance of way department. Since the government has taken over the operation of the roads as a military measure to help win the war, the spirit of loyalty to country is now added to that to employer. To serve both most loyally now requires the

maximum of efficiency and this can only be secured by the freest exchange of ideas regarding the best methods and appliances. The American Railway Engineering Association and the Railway Signal Association are preparing programs designed to be of the maximum service to their members in meeting the new conditions and sufficient opportunity will be offered for a discussion of present day problems, which should be of great value. The exhibitors at the Coliseum have an equal opportunity to further the interest of the railways in this time of stress by making their exhibits as educational as possible and by placing special emphasis on those of their products which will aid the roads in maintaining their properties under existing conditions. With these meetings definitely assured, we believe that the railway engineers of the United States and Canada can be of no greater service to their roads than by availing themselves of the opportunities of attending these meetings.

While the subject of standardization of locomotives and cars is being discussed, railway officers and railway supply

Standardization and Existing Equipment

men who are concerned about the outcome should keep in mind one very important fact. This is, that, regardless of the standards adopted for new equipment, there are already in service 66,000 locomotives and about 2,500,000 freight, passenger and work cars. The maintenance of these existing cars and locomotives, and the installation of devices, especially in the case of locomotives, to make them more serviceable, will necessitate a very large part of the total expenditures made by the railways for materials and supplies for years to come. The materials and devices bought for the maintenance or improvement of existing equipment will be much the same as they would have been if government control had not been adopted; and in the main the same railway officers will specify and buy them who heretofore have done so. There will be supervision of all purchases from Washington, as there will be supervision of all parts of management and operation; but that there will be revolutionary changes in the relations between the railroads and the railroad supply business in general is improbable. In fact, without distributing business widely among the plants of the railway supply manufacturing concerns, the railways even under government control could hardly get all the materials and supplies that will be required by them.

The Report on Stresses in Track

THE ACTION of tracks under traffic is complex. Even the distribution of the load of a single pair of wheels through the rails, ties and ballast to the roadbed is accompanied by complications. For this reason track design has generally followed empirical lines while the various analytical treatments advanced from time to time, have not received general acceptance since they have usually suffered from a lack of rigid mathematical proof or the support of reliable experiments. The need for a thorough establishment of the mechanics of track has been sorely felt by students of rails, ties and other component parts of the track structure, and expressions of opinion along this line by interested committees of the American Railway Engineering Association and the opinions of others vitally concerned, crystallized about five years ago in the establishment of a Special Committee on Stresses in Track composed of members of the American Society of Civil Engineers and the American Railway Engineering Association under the leadership of Professor A. N. Talbot, of the University of Illinois.

The efforts of this committee have now borne fruit in a report published in the Proceedings of the American Society of Civil Engineers for January, 1918, which is abstracted on another page of this issue. While not complete, it is sufficiently conclusive to demonstrate that the committee had been working in the right direction. Introducing a mathematical analysis of track action that is unusually simple, considering the complex subject, the committee has directed its efforts, through a comprehensive series of tests, to an evaluation of the several variables encountered in this analysis.

The results are illuminating, for definite numerical values are submitted to express variations in the rigidity or stiffness of track with different weights of rails, sizes of ties, kinds and depths of ballast, etc. One particularly interesting discovery is that the distribution of wheel-loads to the ties is much more uniform than was generally supposed. The data are not sufficiently complete as yet to cover all classes of conditions, but sufficient information is now available to indicate what may be expected with a continuation of this work.

The Government Locomotives

ECONOMY IN TRAIN OPERATION demands that careful study be given the design of the hauling unit, the locomotive, that it may be made to best suit the conditions under which it is to operate. Among the conditions which affect the design of a locomotive may be mentioned grades, curvature, weight of rail, strength of bridges, clearances, speeds, service (freight, passenger or switch), fuel and facilities for handling the locomotives at the terminals. It is obviously impossible to evolve one design of locomotive which will economically meet the variations in all of these conditions. Nor can even a few designs be made to cover them without a serious loss in operating efficiency in some cases. The government in its desire to provide locomotives must give these facts serious consideration. To build locomotives suitable for operating over a wide range of conditions, a sacrifice must be made in operating efficiency on some roads over which they will operate, and this will reduce the net income of those roads.

Granted that now, and perhaps next year, there will be a need for locomotives that can be sent indiscriminately throughout the country to relieve congestion wherever it may occur, the fact remains that where specific roads need new locomotives in any large numbers, far better results will be obtained by providing those roads with locomotives of a design that is best adapted to their particular needs. These locomotives, if built of existing designs, would serve their purpose better than any locomotive of a compromise design that it would be practical to build for a certain set of operating conditions. The number of any general service locomotives ordered by the government, therefore, should be held to a minimum—to a number which will be considered necessary to relieve congestion caused by a lack of power. The danger is in ordering more than is absolutely necessary and thus holding up orders for locomotives of special design for those roads that need them most. As conditions again become normal, and the railroads have an opportunity to adjust themselves to the new conditions, there will be no great need for these general service locomotives, and if there are too many of them it will be difficult to find places in which to use them economically.

In the development of the designs for government locomotives it must be remembered that the railroads will operate them. A locomotive builder's design is not necessarily a locomotive user's design. There are questions of operation and maintenance with which the builder only comes in in-

direct contact. These questions are particularly important in locomotive design—a great deal more so than in car design. Past experience has shown that many locomotives built strictly to the builder's designs have not proved entirely satisfactory when placed in operation. Any new design of locomotive is always sure to require some changes which will be indicated by its performance in service. The question of maintenance is very important. The experiences of this winter have clearly demonstrated this. No one is better able to suggest improvements in design from a maintenance standpoint than the railroad man—the man who maintains them. It is plainly evident that the railroad man's opinion should be given serious consideration in the design of the machine he is to operate and maintain, if he is to be expected to do it efficiently. He is more familiar with the conditions under which locomotives operate. He knows what is needed to alleviate the shortage of power. He is the man that is living with it and suffering for the lack of it. His counsels are necessary to the satisfactory solution of the problem.

The Standard Car

ACCORDING TO REPORTS from Washington the railroads are to have a standard freight car at last. For more than three years the American Railway Association has had a sub-committee working on designs for a standard box car. These standards have been developed by the best car designers in the country, coming from both the builders and the railroads. Every question of design from the construction and maintenance standpoint has been thoroughly discussed and on only but a few features of these designs have all the members of the sub-committee agreed. The lack of agreement on these few features is the reason that the designs have not been submitted to the American Railway Association for its acceptance, for it was felt that it was useless to submit designs without the unanimous approval of the entire sub-committee. This, of course, was right, but the sub-committee is to be criticised for not adjusting the differences of opinion among the members so that an agreement could be reached. Now the matter is to be brought to a conclusion by the Director-General of Railroads, who has appointed a committee of car builders, with S. M. Vauclain as chairman, to produce the standard car. This committee should give full consideration to the deliberations of the A. R. A. sub-committee, for there it will find important points that affect materially the maintenance of the car and the requirements of service.

The purpose of freight car standardization is to provide a car that can be maintained at a reasonable cost, that will be strong enough to fully meet the present operating conditions and that can be built economically by the builders. The proper standards must therefore be in the nature of a compromise between the builders and the railroads. By the nature of his business the builder knows which designs can be constructed most economically. Likewise the railroads know which designs better meet their needs and which can be maintained most economically. The arguments of both must be given consideration. The final design must be such that the interests of both will be properly taken care of.

In every problem of standardization the vital question is how far it should be carried. It is very important that it should not be carried to such an extent that it will discourage any designer or inventor, whether inside or outside the railroad, from seeking to improve existing designs. This would throttle development, which is absolutely foreign to American ideals. Opportunities must be left for improvements that will make the car cheaper in first cost and cheaper to maintain. Insistence must be had, however, on interchangeability and adequate strength. Our railway

equipment would not be as highly developed as it is today if it were not for those who have worked hard and spent money to produce improvements over old or existing designs. Much has been done in this respect and much still remains to be done. The gates should be left open for improvements and it is very necessary that provision be made to encourage anybody to make them. It is only right that those who do this receive remuneration for their labors, expenditures and ingenuity. To put a stop to invention, or to even discourage invention by forming rigid standards for the entire car would be a decided step backward.

How to Improve the Power Situation

THE PRESENT LOCOMOTIVE SHORTAGE may be improved in two ways—by building new locomotives and by putting the existing locomotives into better operating condition. By far the best results for immediate relief will be obtained by improving the condition of the existing locomotives. As was pointed out in these columns last week, the shortage of power is not so much the lack in the number of locomotives as it is the condition of the locomotives. To be sure, new locomotives are needed, the supply from the builders for domestic use last year being practically cut in half by the demands of our Allies. The government fully realizes this and is seeking to supply them speedily, but for immediate relief every possible step must be taken to improve the condition of existing power.

The railroads went into the winter with practically no reserve of power. The extreme traffic demands which had to be met during the past year made it impossible for them to put the locomotives in as good condition for the winter as usual. Furthermore, the labor conditions the country over were in such a state that the shop forces were constantly changing, the efficiency of the men decreased and the output of the shops was reduced. Coupled with this the severe winter with low temperatures and heavy snows made operation very difficult, increasing the wear and tear on the locomotives and greatly hampering the men in making repairs. This has led to an accumulation of locomotives at the shops for repairs to the extent that the shops of those roads which have been congested most badly are overtaxed and locomotives which should go into the shops for repairs are being operated at a sacrifice in efficiency.

The problem is—what may be done to speed up the work necessary to get the locomotives back into shape. On a satisfactory answer to this question depends the speeding up of our industrial machinery and the speeding up of the war. With the backbone of winter broken and the labor situation perhaps becoming a little more stable, an increase in efficiency in the shops may be looked for. In some cases the government will find it necessary to issue priority orders for repair material. So great is the importance of the transportation system at the present time that no road should hesitate to demand prompt deliveries, if by so doing locomotive repairs may be speeded up. In some cases it may be possible to work the locomotive shops in day and night shifts, if the necessary help can be obtained. In all cases, they should be worked to the limit. It should be possible to send locomotives from the eastern territory to western shops on roads that have not been as badly congested. Some of the locomotive builders could perhaps render assistance by taking locomotives in from adjacent roads for repairs, although if such a practice will interfere to any great extent with the production of new locomotives which will be badly needed next fall and winter, this practice is open to question. An opportunity for a great improvement is in the supervision and inspection at the shops, which, even under normal conditions, has not been adequate. With a new class of labor in the shops, which is more or less un-

familiar with railroad repair shop practice, it will be necessary to provide competent instructors or supervisors in greater numbers than has ever been the practice. Needless to say, the quality of this supervision should be of the highest. Without competent and aggressive leaders the work cannot be done efficiently. The remuneration must be sufficient to attract the best men available.

The repairing of existing equipment is the question of the hour; designs for new equipment is a question of the future. Concentrate on improving the condition of the existing locomotives.

Railroad Control Legislation

THE COMMITTEES of both houses of Congress have reported, with some changes, the railroad control bill drafted for the administration. The discussion of the proposed legislation is under way in Congress. Action by the Senate is expected this week. The original bill, which was drafted chiefly by Commissioner George W. Anderson, of the Interstate Commerce Commission, has stood criticism well. Both the Senate and the House bills are founded on it, and neither of them differs greatly from it. This is a compliment to the author, as the hearings before both committees have been thorough, and the members, while manifesting a desire to support the administration, have also shown an inclination to deal both fairly and independently with the problem.

Both committees have accepted the sound principle that, in the circumstances, the President's representative, the Director General of Railroads, should be given a very free hand so that he may control management and operation as the exigencies of commerce and of war may demand. Without a free hand the Director General would be hampered, as the Railroads' War Board was, and could not get the best results or fairly be held responsible if he did not get them. The three points which received the most attention from the committees, and to which the most discussion is being given in Congress, are the basis on which the railway companies shall be compensated for the use of their properties; what authority shall exercise the rate-making power during the period of control, and the duration of control after the war.

The original bill provided for an annual guarantee to each company equivalent to its average annual net operating income during the three years ended June 30, 1917. Attention was called to the fact that in the six months from June 30, 1917, to January 1, 1918, there had been added a substantial investment in the railways on which the proposed basis provided for no return. The house and senate bills have remedied this defect by providing for a return upon this additional investment, the rate of which shall be fixed by the President. Both bills provide, as did the original one, for a different basis of compensation to be fixed by agreement between the President and the carriers in cases where the President may find that the "standard return" would not be equitable.

The original bill provided that a reasonable return, to be fixed by the President, should be paid upon any additional investment in additions and betterments or extensions which might be made by the companies out of their own funds during the period of control. The senate committee has added a provision which reads, "that there shall be no increase of compensation for any additions, improvements or betterments constructed out of or purchased by the earnings for investment or surplus earned during the period of federal control." What does this mean? Many roads after paying out of their guaranteed standard returns their usual interest and dividends, as permitted by the bill, will have

surpluses. Under private control when a company has net operating income in excess of that paid out in interest and dividends it usually invests practically all of this surplus in its property. Does this provision mean that if the companies invest the surplus parts of their guaranteed returns in the properties they will not be paid any return upon this investment during the period of government control? If so, they will have no incentive to invest the surpluses, and the government probably will have to furnish all the new capital put into the railways. But the provision says "surplus earned during the period of federal control." Probably some roads during the period of control will earn their guarantees and something besides. Perhaps the word "surplus" as here used refers to this "something besides." This can hardly be, however, for in another place the bill provides that any net operating income in excess of the standard return shall be paid into the government treasury, which presumably means that it will belong to the government.

The provision regulating return upon invested surplus should be made clear, or, better still, stricken from the bill. While its effect is doubtful, the reason why it was inserted is known. It is a favorite theory of two or three members of the senate committee that railways should not be allowed to pay a return on surplus earnings invested in their properties. This may or may not be correct. But to try to give effect to the principle by adopting a provision which during the period of federal control would prevent any surplus from being invested and thereby force the government to raise all the capital needed for additions and betterments would be a mistake. It would needlessly increase the investment of the government in the railways and render it more difficult to disentangle their relations after the war. It would save the government almost nothing, because if the government has to borrow and invest capital which the railway companies might furnish from their surpluses, it will have to pay almost as much interest on this capital as it would have to pay the companies on the same amount of invested surplus.

The senate and house bills differ in their provisions regarding rate-making. The house bill gives the President—in other words, the Director General—authority to fix rates during control. The senate bill confers the authority on the President, but gives a right of appeal to the Interstate Commerce Commission. The house bill is the more logical in this respect. Under the senate bill the Director General would be held responsible for the operation and the expenses of the railways, but would not have authority to make the earnings equal the expenses. However, it is probable that the final results will be the same, no matter which provision is adopted, for it is not likely that the Interstate Commerce Commission would follow a policy in rate-making antagonistic to that favored by the President.

Perhaps the most significant provisions of the house and senate bills are those relating to the continuance of control after the war. The original bill provided that control should continue until Congress ordered otherwise. This provision was advocated and opposed upon various grounds, but the controversy over it developed into one chiefly between the advocates and the opponents of government ownership. Those opposed to government ownership criticized the provision on the grounds that if adopted it would tend to make it difficult to get the railways out of the hands of the government and that this should not be done because so great a question as government ownership should be fought out in time of peace with the result uninfluenced by legislation enacted to meet a war emergency.

This argument prevailed in both committees. The senate bill provides for control for not more than 18 months and the house bill for not more than two years after the war, and each specifically declares, "Nothing herein is to be con-

strued as expressing or prejudicing the future policy of the federal government concerning the ownership, control or regulation of carriers or the method or basis of the capitalization thereof." These provisions are mainly the expression of a preponderant sentiment against government ownership which was manifested in both committees, and the passage of either provision would be the expression of a similar sentiment by Congress. That a majority of the members of the present Congress are opposed, and strongly opposed, to government ownership has become clearer every day that the railroad control bill has been under consideration. This is a very interesting development.

The consideration of the railroad control bill has presented a marked contrast to that given to most bills relating to railways that have come before Congress during the last ten years. Perhaps the change is largely due to the fact that Congress has considered this bill in the atmosphere of war. We hope and believe it is due still more to an awakening on the part of many members to the fact that the present plight of the transportation system of the country is mainly due to an unwise policy of regulation for which Congress itself has been mainly responsible, and to a realization that the time has come when the welfare of the country demands that the railway problem shall be dealt with very differently from the way in which it has been dealt with in the past.

New Books

Principles of Ocean Transportation, by Emory R. Johnson, professor of transportation and commerce and Grover G. Huebner, assistant professor of transportation and commerce at the University of Pennsylvania. 513 pages, illustrated. Size 6 in. by 9 in. Bound in cloth. Published by D. Appleton & Co., New York. Price, \$2.50.

An up-to-the minute and exceedingly timely book on a subject which is becoming of greater and greater interest from day to day.

The United States by being compelled to build ships to combat the submarine peril is rapidly obtaining a new merchant marine and with leaps and bounds is striving for a position in ocean shipping such as it occupied before the Civil War. What are our possibilities of ultimately attaining that position and of keeping it after the peculiar economic conditions of war have given way to those of peace? The reader will find many elements of optimism in this book. He will find that a nation's ocean shipping is primarily economic. Subsidies or subventions, however much they may help or hurt, will not give a country a merchant marine, unless economic conditions are favorable to that end. In our own case, economic conditions encouraged a merchant marine until just prior to the Civil War. The destruction of American shipping in that struggle and the great transfer of ships to other flags started a decline that was assisted, or rather furthered, by our laws and by the fact that we were still using wooden ships and sails after England had gone to iron ships and steam. For 40 or 50 years after the war, America practically turned from the sea, invested her capital in the West, in the railroads, in iron and steel and other industries. In the legislative halls, ocean shipping was neglected. Neglected, nay more, it was discriminated against with navigation laws that hung like a millstone around a ship owner's neck. The law prohibiting the return to American register of ships transferred to foreign flags during the Civil War, was only one example of what was done.

But now conditions have changed. America has become a world power; she is becoming more and more interested in export trade, and if the United States has not already

reached that point, it is fast attaining a position economically favorable for a standing in ocean shipping in keeping with its export interests and industrial prowess. The United States, to take some of the examples so well brought out in "Principles of Ocean Transportation" can now produce ship plates as cheap as England. We are giving more attention to our navy; construction of naval vessels is of great advantage in the way of economies in ship building costs. We have already on the stocks the beginnings of a new merchant marine. If things go as well as they are going now, and everyone hopes that they will soon be going even better, we shall soon be able to realize the advantages of large scale standardized production of efficient merchant ships. Our tonnage rating laws no longer discriminate against American ships. We have cheaper coal. We have the Panama canal which gives us a direct route to the Western coast of South America and which brings Australia nearer to New York than to Liverpool. And what is most important, the American business man is showing a very lively interest in the possibilities of export trade and American capital is ready and available for investment in ships and shipping. Everything is not ideal, of course, for we still have the "tull-crew law" of ocean shipping in the regulation that 75 per cent of a vessel's crew must understand the language of its officers—just that law that Japan must have been unbelievably pleased to have our Congress pass. The cost of operating a vessel under the American flag is higher than under most other flags, but with an industrial America interested in shipping that obstacle should not prove altogether insuperable.

The book is not a thesis, but it points irresistibly to one conclusion. That is, that the time has now come when we must take advantage of the conditions that lie before us. The book tells how—by means of favorable laws, by private ownership and by a careful and well worked out scheme of subventions. General subsidies paid indiscriminately to shipping will not do. Subventions in the form of payments for carrying the mails, let us say, to particular lines on condition that their ships meet certain high standards of size, speed, convenience and frequent sailings, have produced the desired results in England and Germany, and should do so here. The authors suggest that \$10,000,000 yearly for subventions and payments to encourage a naval reserve would be required and would be sufficient for the United States.

Concerning the question of government ownership of shipping, the following quotation may be taken:

"Should the bulk of the shipping industry in the future devolve upon the government, then the public welfare would be greatly concerned with the relative efficiency of government steamship services; with the danger of political considerations in the employment of officials and employees, in the fixing of charges and in the selection of ports. There is, moreover, no assurance that the government steamship services would in normal times be any less costly to the government than an effective subvention program. There is much in the past experience of the United States government and of the governments of foreign countries that points to the danger of an annual deficit without the assurance of an efficient service."

"Principles of Ocean Transportation" fills the same position for ocean transportation that "Principles of Railroad Transportation," by Professors Johnson and Van Meter, fills for railroads. The subject matter includes a brief history of ships and shipping, brief references to the various kinds of ships, and descriptions of the methods of conducting freight and passenger service. Part III details the organization of the ocean carriers and the relations of the carriers with one another and the public and Part IV relates to the government aid and regulation of ocean commerce and transportation. The book is interestingly written and after each chapter there is given a brief bibliography for the use of those who may wish to go further into the matters in question.

Letters to the Editor

Breaking in Engines

HIAILEYVILLE, Okla.

TO THE EDITOR:

It is the practice of some railroads when an engine is turned out of the shop to break it in by running it out on the road fifty miles or more. This necessitates furnishing a conductor for a pilot. It seems that the engine crew alone could run the locomotive through the yard between the yard limit boards and the same purpose would be served, although some claim this is not sufficient. Some roads use an engine just out of the shops in regular drag freight service with about half tonnage over the division and as a general thing when the other terminal is reached the engine is good for service at its regular rating.

If nothing else will do than to run the engine light over the division, or a part of it, why not put on a full crew and let them unload any material there may be along the line, handle any bad order cars, or do other work of a light nature? There is nearly always some work of this sort to be done and there should be very few times when the engine would not reach the next terminal and be in condition to handle a full train on the return trip. If for any reason the engine is not able to make the next terminal and has to be returned to the shop there is very little lost, whereas by running it out fifty or sixty miles and then returning to the shop the fuel and wages of the engine crew and pilot are wholly lost. At this particular time when it is desired that every cent possible be saved it occurs to the writer that there might be a chance for economy in this direction.

J. L. COSS.

What Is Value?

St. LOUIS, Mo.

TO THE EDITOR:

In the report of the hearings on the valuation of some railroads in Washington on December 10 to 13, 1917, Pierce Butler made the following statement, which, I think, is interesting: "Professor Adams, in a case in which we were both interested, said that it was impossible to define value, but, he said, in a rate case involving the question of confiscation, that it was an 'equitable conclusion' to be reached in a practical way so as to promote the public welfare, and he held that that 'conclusion' was the original cost of the property; for rate purposes, value would be original cost. That is to say, the concrete question put to him was this: If about the time the Indians left the vicinity of Chicago, a railroad company bought a terminal area for \$5,000 that today is worth \$5,000,000 for sale for business purposes, what would be his conclusion? And he said that his equitable conclusion was that for rate-making \$5,000 was the base; that for taxation \$5,000,000 was the base, and that if the carrier were to sell it and get \$5,000,000 and take \$4,500,000 and buy a substitute, that the \$4,500,000 would be the value of the substitute."

I mention these things to illustrate not what may happen, but what has happened when the personal conceptions as to fairness, as to right and wrong, of arbitrators or experts in particular cases are substituted for the principles which have controlled the determination of value in the courts ever since that question first arose.

C. D. PURDON,

Chairman Valuation Committee, St. Louis Southwestern.

Politeness and Intelligence Combined

SECAUCUS, N. J.

TO THE EDITOR:

Every passenger who appreciates the attentions of enlightened and truly Golden-Rule brakemen when he takes a journey in a day coach, must endorse warmly your little editorial lectures on civility. Really intelligent and efficient courtesy cannot be had without a vast amount of lecturing—by you or by somebody—and also a vast amount of teaching on the spot, and "follow-up" work. How absurd to exhort your employees, time after time, by placards displayed on the screen, by trainmaster's talks and in other ways, and yet do so little by way of inspection to see how well these supposed students assimilate the lessons so industriously poured into their ears!

As an example of what is needed in some situations I want to quote a note which I read recently in the New York Tribune. Referring to a place not far from New York City the Tribune said:

"Most of those who got off the 5 o'clock train yesterday at M— emerged from a car whose door was opened by a passenger. There was no trainman at hand, and when the trainman's attention was whispered to the fact that there was nobody to open the door, he said, 'Go ahead and report it. We can't be everywhere at once. . . .'"

That brakeman gave a reply which was all right in substance but all wrong in style. According to the letter and spirit of the instructions which I suppose are given to passenger trainmen on the best roads, this man should have said something like the following:

"I regret that you have been inconvenienced; but I have no authority to improve the situation, and if you are seriously aggrieved I shall have to refer you to the passenger traffic manager. He, no doubt, will adjust the matter to your satisfaction; at least, he has done so on all previous occasions of this kind, so far as I can recall. The trouble, you see, is that we are short handed. To this train of eight cars only two trainmen are assigned, and as one of these men must remain at the rear end to flag, or to be prepared to flag, I alone am left to attend to the vestibule doors of four or five cars. Usually I get around so as to open them all before we reach the station platform, but today I was delayed because one of the doors stuck and caused me a lot of trouble. I assure you that we are doing about as well as you have a right to expect."

Now, in all seriousness, is not that about the course of reasoning which the brakeman is expected to employ?

You suggested, sometime ago, that Harvard University ought to establish an "extension" course to educate freight conductors how to enlighten farmers on matters of public policy as related to railroads. That is very well; but why not begin on something easier?

What are our smartest trainmasters doing to make their passenger brakemen—the individual brakeman—wake up sufficiently to be really pleasing and satisfactory to every passenger he deals with, throughout one whole day?

B. G. S.

"THE FIFTH ARM."—We notice, says the London Globe, one notable omission in the scheme of the Imperial War Museum, and that is railway transport. Marshal Joffre called the present conflict "a railway war" as long ago as 1914, and when its history comes to be written, it will be found that the railway weapon has been of the most essential importance. For instance, the whole of the original German plan of campaign was based on the facilities of the Boche railway system, which again has made possible the constant "see-sawing" of large bodies of troops between the Western and Eastern fronts. "The Fifth Arm," as it has been called, certainly deserves a section to itself in any representative war museum.

The Railroad Control Bill in the Senate

Vote Expected This Week. Compensation, Rate-Making
and Period of Control Debated at Length

WASHINGTON, D. C.

BY A UNANIMOUS CONSENT AGREEMENT reached on Tuesday unlimited debate on the railroad control bill in the Senate will continue until Thursday, February 21, after which debate will be limited to five-minute speeches and it is expected that a vote may be reached possibly by Friday night. Administration leaders have been making every effort to expedite consideration of the bill in order to remove the uncertainty which will exist until it is passed.

Director General McAdoo has urged Congress to act as promptly as possible both for the purpose of enabling him to proceed with his plans for the railroads and also so that the financial situation may be cleared up sufficiently to pave the way for the next issue of Liberty Bonds, which has been postponed.

Senator Smith endeavored on Monday to secure a unanimous consent agreement for a vote on the bill not later than five o'clock on Thursday, but after some discussion this plan was defeated by an objection from Senator Poin-dexter. Senator Smith read a communication from Director General McAdoo, saying:

"May I take the liberty of expressing the hope that the Senate may soon be able to take action upon the pending railroad bill?

"I can not overemphasize the urgent necessity for prompt action in this matter. This is the time of the year when the railroads should be placing orders for essential equipment and making preparation for those improvements in their facilities which will enable them to meet the great and urgent demands for transportation for which they now not only have insufficient motive power and equipment but in many cases inadequate facilities. It is a great task to do the required work in time to get the benefits this year. It is my earnest conviction that every day's delay in setting this work forward is imperilling the success of the war, limiting the industrial efficiency and jeopardizing the general prosperity and welfare of the country. We can not go forward with many matters of vital moment until the pending railroad bill becomes a law."

A similar letter was read in the House by Chairman Sims of the House Committee on Interstate and Foreign Commerce and debate was begun in the House on Tuesday by Mr. Sims.

In announcing his intention to make an effort to secure an agreement for a time for final vote, Senator Smith objected because there had been such difficulty during the past week in keeping a quorum on the floor of the Senate, because so many senators have been attending the hearings in the investigation of the War Department. He declared that this bill is the most important measure that has been before the Senate in a generation or longer and that it is not receiving the attention that its importance entitled it to receive because senators have got into the habit of paying more attention to something that is sensational than to fundamental principle. Senator Cummins announced that he would oppose unanimous consent to fixing the time to vote on the bill until there had been a fair opportunity to debate it.

Discussion of the railroad control bill was begun in the Senate on Monday, February 11, and during the week several speeches were made on the subject by members of the Committee on Interstate Commerce, but with very little debate. The opening speech was in the nature of an explanation of the bill by Senator E. D. Smith of South Carolina,

chairman of the committee. He was followed on February 13 by Senator Kellogg of Minnesota, who declared that in his opinion it was unnecessary to take over the railroads for government operation, but that as the railroads have been taken over the country is confronted with the necessity of making payment for the use of the property thus taken and rendering as effective as possible the operation under government control. Senator McLean of Connecticut opposed the present plan of government possession under private management as a "half-slave, half-free policy that can be justified only at a time when the life of the nation itself is at stake," and declared that it has all the defects of government ownership and none of the benefits of private management under private ownership. He said he would vote for the bill, but that continuation of the condition would be neither justifiable or necessary at the close of the war. Senator Cummins of Iowa opposed the basis of compensation proposed in the bill as being entirely too liberal and urged that at the close of the war the roads be turned over to a board of control to be appointed by the President so that the "one-man authority" would not continue any longer than necessary. On Saturday Senator Robinson of Arkansas spoke, urging early passage of the bill. Senator Watson of Indiana delivered an address emphasizing the importance of guarding against the plan of government control being made a step toward government ownership, which he vigorously opposed and urged that a definite time limit be fixed for the termination of government control. Senator Pomerene also spoke, urging liberal treatment of the roads during the period of control.

Prompt Disposition of the Bill Urged by Senator Smith

Senator Smith urged that so far as possible all other business and subjects of debate be laid aside until a disposition is made of the bill, because of the vital necessity of stabilizing the financial situation, which is seriously affected until the status of railroad securities under the new condition is determined. The action precipitating the necessity of legislation, he said, has already been taken. The roads are in the control of the government, while the property is still in the hands of private owners and the situation creates uncertainty and doubt, which is reflecting itself in embarrassment in the financial world. He outlined the events which led up to the decision to take over the railroads, saying that the result of the efforts of the Railroads' War Board was not satisfactory, or at least did not give the relief which the circumstances imperatively demanded.

"This failure, in part at least," Senator Smith declared, "grew out of the restrictive laws in the interstate commerce act forbidding the pooling of cars and of freight. It may also be noted that the interstate commerce act gave to the shipper the right to route his freight over whatever lines he chooses. This also was an obstacle in the way of distributing freely and fairly the traffic of the country."

The proposed guarantee, he said, seemed to the committee to be a fair basis of compensation when it is considered that while all other enterprises, not being subject to federal regulation in regard to rates and charges, were the beneficiaries of the extraordinarily high prices pertaining during the war period, the railroads could not during this period increase their revenues except as they were increased by increased traffic. While there was an increase in certain rates in the eastern district, in the main the roads were

practically operating under ante-war rates and the increase was not put into operation in sufficient time to be reflected to any appreciable extent in the returns of the roads up to June 30, 1917.

The question of the real value of the property was not considered by the committee as a proper subject for the emergency legislation because the value of the properties is not now definitely ascertainable. The committee has, therefore, taken the aggregate net earnings of the properties resulting under the regulating power of Congress as a just basis on which to compute their compensation in time of the emergency.

Senator Cummins asked whether the government had taken over as a part of the railroad property the cash or non-railroad property not used in the operation of their systems. This, he said, amounted to more than \$800,000,000 for 17 roads. Senator Smith replied that neither the language of the bill, the proclamation of the President, nor the discussion during the hearings contemplated taking over such property. Senator Thomas, author of the act of August 29, 1916, under which the railroads were taken over, interjected here that he certainly had no intention of making it so operate as to invest the President with anything more than the power to control the possession of the physical property of the railroads for war purposes.

Senator Smith quoted figures showing the net operating income of the Class 1 roads, showing that for the year ending June 30, 1917, this was approximately \$36,000,000 more than in the year 1916, and \$337,000,000 more than in 1915, so that the average for the three years is \$124,000,000 less than earned during the fiscal year ending June 30, 1917. Of course, he said, it was a matter of speculation as to whether this increase would have been maintained, but it is reasonable to suppose that the roads would at least have maintained the income of 1917.

Discussing the amendment added by the Senate committee providing that there shall be no increase of compensation for any additions, improvements or betterments constructed out of or purchased by the earnings during the period of federal control, Senator Smith said this question represented one of the greatest difficulties presented to the committee. "I confess that at this stage of my investigation of this question I cannot see the difference between the money thus earned under rules and regulations that we have established and which, when earned, is being invested in further increasing the facilities of the property and money not earned but borrowed from the bank and invested in the property."

The rate-making question, Senator Smith said, gave the committee the greatest difficulty because of the two conflicting principles, one to maintain as far as possible the stability of rates, the other to grant the power to change rates to meet the changing conditions, but upon complaint the commission is still vested with the power to review the rates as heretofore and make its finding of orders as heretofore. The progressive stages of rate regulation, he said, had in the interest of rate stability gradually taken away from the carriers in practical effect the power to initiate rates except upon the prior approval of the commission. That power is now restored to the Director General, subject, however, to the review of the commission.

Senator Cummins' Address

Senator Cummins declared that the compensation proposed in the bill is from \$175,000,000 to \$200,000,000 annually more than it ought to be and that this vast sum is to be taken from the people who are already over-burdened to be given to the railway corporations "without a shadow of right, reason or justice." Also, he said, in his judgment the compensation would be nearly \$200,000,000 a year more than the roads would earn during the next few years if the

property were to remain in their possession. He said he had no objection to the act of the President in taking over the railroads because, although the railway managers under the Railroads War Board "accomplished almost a miracle in the better use and in the higher co-ordination of the transportation facilities of this country," it was not within the power of the railway companies to do the things which this country required to be done under the conditions which confronted and surrounded us. He regretted, however, that the President was not more specific and definite as to which railroads have been taken over. He thought the President should have taken over all of the railroads as a unit and if it was not necessary for him to do that, in his judgment, the President acted without authority.

In discussing the proposed compensation Senator Cummins read a letter sent out by a broker advising the purchase of railway securities and giving figures showing the percentage of earnings on the stock of various roads under the proposed guaranty, which Senator Cummins considered excessive, and he expressed the opinion that if the roads were offered "only fair and just compensation so that they must endure some of the consequences of the war," the railroads would accept it as loyal citizens convinced that a lesser compensation than the bill proposes is, under the circumstances, fair and just, and he also insisted that whether the railroads are given \$1,000,000,000 or from \$750,000,000 to \$800,000,000 annually, as he proposes, cannot in the slightest degree affect the strength of the United States in the war. The proposed basis, Senator Cummins declared, introduces into governmental railway operation "the same abominable profiteering which disfigures other fields of government activity." The amount required annually to pay interest charges, he said, was about \$400,000,000 a year and deducting this amount from the proposed guaranty would leave approximately \$550,000,000 of the guaranty available for the stockholders. He did not say that the railroads would distribute \$550,000,000 in dividends, because they have not done so in the past and he had no reason to believe they would do so in the future, but the entire sum inures to the benefit of the stockholders. This, he said, amounts to $8\frac{1}{2}$ per cent on all the stock of all the railroads in America without taking into consideration the other sources of income which many of the companies have. Senator Kellogg disputed this statement, saying that according to figures he had received from the Interstate Commerce Commission the amount would be 8.26 per cent on the outstanding capital stock of \$6,314,000,000.

Senator Cummins then separated the railways into two classes, one group operating 110,000 miles of line, which he thought the bill would not guarantee more than they should receive, and another consisting of 86 systems of railway operating 140,000 miles and which carry from 75 to 80 per cent of the traffic. As to these 86 roads, he presented a table showing the percentage on the capital stock which would be guaranteed under the proposed plan. The Pennsylvania Railroad, he said, would be guaranteed 8.92 per cent, the Philadelphia & Reading 25.7 per cent, the Delaware, Lackawanna & Western 32.9 per cent, the Illinois Central 11.33 per cent, the Louisville & Nashville 16.75 per cent, the Norfolk & Western 12.51 per cent, the Atchison, Topeka & Santa Fe 9.7 per cent, Chicago & North Western 10.18 per cent, Chicago, Burlington & Quincy 22.05 per cent. For the roads in his table in the eastern district the average would be 11.48 per cent, in the southern district 12.37 per cent and in the western district 9.96 per cent. The roads in this table were those which had in the three years earned more than 5 per cent upon the capital stock. Senator Cummins proposed that any excess over the amount required to pay the usual dividend and interest on the indebtedness, should be taken by the government for use in the development and betterment of the property with the

condition that the company would never be permitted to charge the public for a return upon the value so created. He said he would offer an amendment which would not interfere with the payment of interest upon all the railway securities, including whatever dividends have been paid, whether it be 5 per cent or 8 per cent, but that if the excess were deducted the guarantee would be reduced substantially \$175,000,000 a year.

Senator Kellogg's Address

Senator Kellogg declared that this bill involves "the most far-reaching and momentous economic transition that has ever taken place in so short a time." "What effect it will have upon our industrial and political structure," he said, "no one, of course, can accurately tell, but, judging from other things and from the political experiences in our own country, it cannot be anticipated that it will meet with success."

Senator Kellogg denied that the railroads had broken down and presented statistics showing the enormous increase in traffic owing to the increase of exports on account of the European War which followed a long period of depression. It is not denied, however, he said, that there has been tremendous congestion in certain sections of the country, principally in the district east of Chicago and north of the Ohio river, but principally east of Pittsburgh and very largely on the lines of the Baltimore & Ohio, Pennsylvania and other lines in their immediate territory. One of the principal causes for the congestion, he said, was government priority orders, "a most glaring example of abuse of governmental power through separate branches of the service in no way co-ordinated."

"The result was," he said, "that thousands of freight cars were rushed to a point and tied up because materials were shipped in advance of necessity. For instance, 700 cars of material for construction of government buildings at Washington stayed upon the tracks for weeks because they could not be unloaded. Anchors were shipped under priority orders for ships not yet built and a thousand cars were tied up carrying shipyard materials. I believe it was for Hog Island, which could not be unloaded and used faster than about 15 cars a day. It shows that a transportation system run by executive orders through non-co-ordinated departments is an absolute impossibility. As a matter of fact, in spite of the Sherman law and non pooling law and the laws authorizing a shipper to designate the route, and in spite of priority orders unwisely issued, the railroads did accomplish a great deal during the first six months of the war."

"This railway committee undoubtedly co-ordinated the facilities of various roads and enormously increased the amount of transportation. My own opinion is that it was unnecessary to take over the railroads for government operation, and that transportation, in order to be most effective, must proceed in its usual and natural channels, without too much arbitrary interference. That all that was necessary for Congress to do was to authorize the President to appoint a director or agent of the government, who should have authority to see that the railroads were operated as a unit, in order to facilitate, so far as possible, the transportation of those articles absolutely necessary to the life of the people and the prosecution of the war, and that if the transportation of any class of products or articles, such as luxuries, pianos, automobiles, and so forth, become inadvisable, this transportation could be stopped and preference given to necessities for the Army and the public. This could have been done without material injury to any of the railroads, but if they were injured by any such action a tribunal might have been created to assess the damage to be paid by the government. As a general proposition, private management is far more successful and efficient than management

through government agencies. The railroads were undoubtedly hampered by certain law and restrictions which should have been abolished. They should have been supported by government authority to operate as a unit, to route freight over lines least congested, and to transport the largest amount of materials necessary for the maintenance of the public and of the Army. Bearing in mind that this congestion was simply in the eastern and northeastern territory, I am constrained to believe that as great service could have been obtained through the government's co-operation as by taking over the entire railroad system of the United States and operating it as a government institution. By allowing the railroads to operate their own property we would have maintained the personal interest and preserved the enterprise that goes with great organizations of this kind. One of the most valuable features of a railroad, as in all other private enterprises, is the organization and the personal interest that each employee feels, where there is an opportunity for promotion, and the highest position is within his grasp. By doing this I believe the government would have obviated a guarantee to the railroads of an income by way of compensation for the use of the properties thus taken over. But the President and his advisers thought otherwise, and I bow to that decision, and I am going to do, as is my duty, everything I can to strengthen and facilitate the government operation and to insure justice to the people and the railroads and the vast army of security holders vitally interested in this great measure."

Discussing the question of compensation, Senator Kellogg said it is not only a legal necessity for Congress to provide the means for determining and paying a just compensation, but it is of the highest importance to the country that this should be speedily determined. A further decline in railroad securities, which ought to be the best investment in the country, would threaten a public disaster.

Senator Kellogg declared that, considering the fact that 1915 was an extremely low year in net earnings and further, that there had been an investment in the property of large sums between 1914 and 1916, he was inclined to think that it was a fair offset to the very prosperous years of 1916 and 1917. While undoubtedly some roads are excessively over-capitalized, there are many that are under-capitalized and it was his judgment that it will be found, if the railroads of the country are valued, that their value is a figure not far from the present capitalization, and that 5 or 6 per cent on the actual money invested could not be called excessive.

"But if we are to concede that the earning capacity is not a reasonable basis for the value of the use of the properties, I know of no way to arrive at an accurate rental value without years of investigation and litigation. It is said that the standard return, after paying interest on the bonds of all the railroads in the country and after deducting an estimated \$70,000,000 excess-profits tax, would pay about 7.15 per cent on the net capital stock; I mean net capital stock outstanding in the hands of the public. Before deduction of this excess-profits tax it would amount to about 8.26 per cent. But this, of course, would allow nothing for betterments and improvements, which represents one of the most important questions in railroad management. Every year the railroads in this country must spend millions of dollars in betterments and improvements in order to properly serve the public. Many of these betterments and improvements are such that they will not pay a return on the investment, such as new stations, elevation of tracks, safety appliances, elevated or depressed crossings, and very many other improvements."

Senator Kellogg also took occasion to reply to statements made by Senator Cummins in his minority report, in which he had included a table of about 10 railroads which he said would be guaranteed from 21 to 647 per cent on their stock after paying interest on the bonds. Senator Kellogg

said he had submitted this table to M. O. Lorenz, statistician for the Interstate Commerce Commission, and had received from him a reply which he put into the record, showing that the Bessemer & Lake Erie, for which Senator Cummins had calculated a return of 647 per cent, owns but 8.81 miles of road, but operates 205 miles, and that while its capital stock is nominally \$500,000, the property account of the roads operated is over \$45,000,000 and the proposed standard return earned is only a little more than 10 per cent of this amount. Senator Cummins had included in his table the Chicago & Erie with a return of 70 per cent. Mr. Lorenz' letter showed that this is a subsidiary of the Erie Railroad and with only \$100,000 capital stock reports a property investment for the 250 miles of road which it owns of nearly \$30,000,000, on which the proposed standard return is less than 1 per cent. Similar statements were made for the other roads included in Senator Cummins' table. Senator Cummins took no part in the debate on this point.

"My opinion is that if the roads had been left in the hands of their owners," said Senator Kellogg, "with authority vested in the President to appoint a director who should regulate their operation during the war, with power to divert traffic to lines least congested and to co-ordinate all their facilities and equipment, the injury any road would suffer would be small and would occur in only a few instances. We would thereby have avoided consideration of this very complicated question of guaranty. As I have said, however, the President and his advisers thought otherwise, and I bow to that decision. It is our duty to determine as best we can a fair and reasonable basis of guaranty." Senator Kellogg also opposed the proposal to give the President power to initiate rates. "It is appalling," he said, "to say that because we are at war, this entire rate structure and the absolute power to change a rate affecting the billions of dollars of railroad property and hundreds of millions of dollars of commerce shall be placed in the hands of one man, without right of appeal, be he ever so great and though he possess the wisdom of Solomon. It is not the business of an executive."

Senator Kellogg also declared that the bill ought to provide a definite time after the termination of the war when government operation shall cease and that it ought not to be left to the uncertain result of future congressional action. To keep the roads an indefinite time and pay rent therefor is obtaining property under false pretenses, so far as the American people are concerned. "I am quite aware," he said, "that it will receive the approval of those who believe in government ownership and operation because they see, without squarely meeting the issue, an opportunity to get permanent possession of the railways and carry out their ideas or to experiment with the railroads with this end in view. Though I do not believe it was wise or necessary to take over the railroads, I am prepared to go to the full limit to make government operation as successful as possible and to grant all the powers necessary to that end, but I am not yet prepared to take a step that will vest such powers in government ownership advocates and force government operation of railroads upon the people of this country. That question should be met by the American people squarely and fairly, unhampered by any other issue." Considering the result of experience in government ownership and operation in other countries, Senator Kellogg said in part:

"I believe there is no question that the result of experience has shown that government operation of railways is more expensive, less efficient, and less beneficial to the people generally than private operation. We have a splendid system of railroads, with cost of construction and capitalization the lowest, in comparison, the leading countries of the world, with the best equipment, the cheapest service, and, in most respects, the best service.

"It is true that in one respect our service is not as good as that of Great Britain, Prussia, and France, and that is in the number of accidents to employees and passengers. But this is principally due to the training of the employees. In those countries, under the law, there are severe penalties accruing in the event of errors and mistakes by employees, which are enforced. There is no reason to believe that there will be fewer accidents under government operation than under private. It is impossible for me, in the time at my command, to go through all the statistics and comparisons between government and private ownership operating side by side. But experience has undoubtedly shown in Canada, France, England, Austria-Hungary, Italy, Australia, and New Zealand that government operation is less effective, less efficient, and more expensive and subject to all kinds of political interference. This is especially true in the countries where the railroad management is responsible to parliaments and congresses.

"Over and over again has it been shown where railroads are nationalized operating expenses immediately advance, the number of employees is increased, and the efficiency is decreased. Political influence is exercised over construction, betterments, and extensions to meet the demands of the people, and, with the exception of Prussia and Japan, there is not a government system in the world that pays its operating expenses and a fair rate of interest on the cost, and in many cases there are very large deficits. It is true that even the German states, outside of Prussia, do not make their railways pay, and the result in Austria has been exceedingly disappointing and disastrous.

"One of the most serious objections to government ownership and operation is the political influence and pressure brought to bear. One of the difficulties with railroads of this country has been that in many instances they have been too valuable as a political asset. But this is nothing to what it will be if the government takes over all the railroad properties, valued at more than \$17,000,000,000, and makes government employees of over 1,700,000 men.

"One of the scandals of our government occurs in connection with its appropriations for internal improvements, such as rivers and harbors, post-office buildings, drainage projects, and so forth, where Congressmen and Senators deem it perfectly legitimate to obtain any kind of an appropriation for the benefit of the people of their districts in utter disregard of whether it is necessary for the national welfare or not. If all railroads of the country were placed in the same category, improvements, extensions and betterments to meet the demands of the people of the various communities would be obtained through political influence; the running of trains, freight and passenger, furnishing facilities, would be constantly subject to political pressure through Congressmen, Senators and public men generally. It has already commenced and the people of this country are demanding that they have a right to have their Congressmen and Senators intercede with the Director General of Railroads in behalf of their particular section of the country. Their Senators and Representatives can not do otherwise than present these matters, and will not do otherwise.

"I do not say that this is objectionable other than as to the system involved. The building of railroads to meet the great commercial conditions of a growing country ought not to be constantly the subject of political pressure.

"But there is another serious objection. In turning the railroads over to government operation the employees and officers will be divested of the incentive and enterprise essential to any great undertaking. Today the highest positions with the railroads of the country are within the reach of the humblest boy in the service. I know most of the railroad presidents today controlling the destinies of this vast property and they advanced from very humble positions, and the value of the organization of the railroad company

is derived largely from motives of self-interest and individual enterprise which opportunity offers to every man in railroad employ.

"Hope of preferment and opportunity are the guiding stars which have made this country foremost in the industrial and commercial fields of the world." Nationalizing the railways makes all of the men mere government employees. There is no hope that they can reach the position of president of the railway and enjoy the power and influence which goes with that position. They are mere clerks. They lose interest and ambition. Men with capacity, ability, and authority to employ their own men could run the departments in Washington for very much less money and very much more efficiently. It is, of course, one of the things that go with a democracy. I do not wish to see it changed, except to see it bettered. I am not in favor of turning over the vast railways of this country merely to reduce men to the dependent influences of government operation."

Senator McLean's Address

Senator McLean declared that the only possible justification for the bill is the fact that it is a war measure. Regular and sufficient transportation is the great and prime necessity which cannot be met without unity of action and perfect co-operation and this cannot be had unless the power to secure it is placed beyond interference by private interests. As a war measure, therefore, he was willing to confer upon the President all the power and latitude of action necessary to enable him to make fair and reasonable agreements with the carriers for the use of their properties during the war emergency and for a period thereafter long enough to permit the carriers to readjust themselves to peace conditions. To extend the operation of the act until Congress shall otherwise order, he declared, would be to give to the law all the permanency and length of life that it is possible for Congress to give to any law and, considering the ease with which attempts to repeal it could be delayed and ultimately defeated, he could not escape the conclusion that those who vote against fixing a time within which it shall cease to operate, vote for permanent government ownership. Certainly those who favor government ownership would have every advantage, and beginning from the date of the enactment of the law they would endeavor to convince the people of the country that government regulation had failed and that the only possible solution must be found in government ownership.

"It is my guess," he said, "that a large percentage of the carriers of the country, smarting under the injustices inflicted by the system in vogue prior to December 28, 1917, will join forces with the government ownership advocates of every name and nature, including socialists and Bolsheviks, and those of us who disagree with them and want cheap, regular and safe transportation would best begin to drill for the coming onslaught."

"Putting aside for a moment the wicked things that managers of the railroads have done in the past, or would have done but for the interposition of the government, what has the capital that has been put into the railroads done for the country, and what do the railroads themselves stand for today as a national asset? The 400,000 miles of track in the United States have been put down for less than half the average cost per mile in other countries. Transportation in the United States costs less than half the average cost in other countries. The wages paid are more than double the average wage in other countries. The average tonnage per car and the total tonnage per mile is greatly in excess of that in other countries. The regularity, safety and comfort of the service provided by the American roads is far better than that of the roads in other countries. For every dollar that the railroads have taken from the public more than a dollar has been returned. Is it not time to quit

visiting upon the railroads the sins of the nineteenth century and do to them as we would be done by?

"Railway supplies and equipment—new cars, engines, and nearly everything that is required to sustain the roads and meet the increased demands upon their carrying capacity—cost nearly three times today what they did three years ago. Congress and the Interstate Commerce Commission have stubbornly refused to authorize or permit the railroads to charge self-sustaining rates, or to unify and consolidate control in the interests of economy. No business on earth could survive such treatment. The farmer who, for want of hay, put green goggles on his horse and fed him shavings was a magician in the solution of transportation problems compared with the American Congress.

"And after all, has it been the fault of Congress or the fault of a distorted public opinion which has sustained Congress in its efforts to teach the railroads to live without eating? If the American people will demand an intelligent regulation of railway rates when peace is restored, the carriers will meet every need at constantly decreasing comparative cost.

"Why should the government assume this colossal burden, a burden that will constantly increase in weight and finally result in constantly increasing cost of transportation?

"Why should we expect results very different from those which have inevitably afflicted government ownership in other countries? In the Utopia of government-owned railroads policies will be dictated by politicians. Employment will depend upon the favor of the Director General and his subordinates. Qualifications for service will depend on ability to get votes rather than ability to avoid accident or secure regular and sufficient transportation. New lines of road will be paid for out of the annual congressional pork barrel. Rolling stock will soon compare favorably with the sorry rigs which the rural free-delivery carriers use to deliver mails. An utter lack of incentive and initiative will exist in every department. Incompetency and 'red tape' and a rapidly increasing number of employees will inevitably result. The people will not only be taxed to pay the interest on the original cost of \$20,000,000,000, but the annual deficits will constantly increase. In Italy, where the chief railways were nationalized in 1905, the number of employees increased within three years from 97,000 to 137,000, and the systems do not earn enough to pay one-quarter of the interest on the investment in them.

"It is quite probable that the managers of the great transportation lines, circumscribed and crippled as their organizations will be at the close of the war, will beg the government to buy their roads and end their sufferings. I put this question to the president of one of the leading roads of the country, and his reply was: 'As an American citizen I am very certain that a time limit should be fixed, but as a railway manager I would welcome permanent government possession and operation with a fair guaranty on the investment.' I am already receiving postal cards from railway stockholders, all printed and exactly alike in terms, urging me to oppose a time limit on the operation of the carriers by the government.

"It is claimed that, because the system in vogue prior to the 28th of December last was a failure, government ownership is the only alternative. If it is true that the system which failed was clearly unintelligent and unjust, it would seem to be clear that an intelligent regulation of the railroads of the country, under private control, should be given a trial before we adopt a system which both experience and reason tell us will result in unsafe, irregular, insufficient service, to say nothing of the opportunities for political chicanery and graft.

"I have tried to set forth some of the reasons which compel me to oppose government possession and control of the

railways 'until Congress shall otherwise order.' I hope the Senate will insist upon fixing a time limit. I hope the American people will give this subject the attention it deserves before it becomes a national issue at the polls."

Senator Pomerene's Address

Senator Pomerene declared he had no apology to make for the shortcomings of the railroads in the past, but that, in his judgment, the Congress of the United States ought not to approach this subject now as if it were going to penalize the railroads for the wrongs which they committed many, many years ago. The railroads of the country, he said, are owned by the people of the country and he quoted figures showing the number of stockholders and estimates of the number of people interested directly or indirectly in railroad securities. He also quoted figures showing the enormous shrinkage in the market quotations of railway securities amounting to 31 per cent from 1912 to 1917 and a list of stocks whose total par value is approximately 75 per cent of the total. He said that a few days ago a prominent business man had told him that he had seen the balance sheet of one of the great colleges of the country which had bought certain railroad stocks at 113, which had recently fallen to less than 60. "If we will remember this decline in market values as affecting the financial conditions of the business institutions of the country, the insurance companies, the savings banks and savings societies," he said, "we can understand what this tremendous shrinkage in values means" and he thought the time had come to give more liberal treatment to the railroads. According to the plan proposed by Senator Cummins, he said, the total of all money earned over and above dividends and interest would be passed to the government, but, in his judgment, Congress has no authority whatsoever to adopt such a course of action in fixing compensation to be paid. He also contended that there should be a definite time limit for the period of government control. If it is the judgment of the majority of the Senators and of Congress that government control should be continued or that we should have government ownership, he said, the principles of common fairness and honesty suggest that Congress shall tell the roads now what it will do, so that they may get their house in order.

Senator Robinson's Address

Senator Robinson of Arkansas also urged the Senate to give serious consideration to the bill, saying that the important questions at issue should be determined just as quickly as their importance and nature will permit. With the bill out of the way, he said, the financial plans and policies of the administration can be much more readily formulated and consummated and the enormous funds necessary to be secured through Liberty loans and otherwise for the prosecution of the war can be much more readily obtained when the questions as to the policy of the government respecting control and operation the transportation lines have been definitely fixed by law.

Senator Robinson declared that, in his opinion, federal control and operation were almost inevitable, but that the President had acted wisely in not exercising his powers until the necessity for such action had been recognized by public opinion. In explaining the reasons for his belief that government control was necessary, he pointed out that in recent years railroad extensions and construction have not kept pace with the requirements of commerce. He said it would not be profitable to enter upon a discussion of the reasons, but the railroads were unable to increase their facilities to correspond with the increased traffic and the military operations of the government were being greatly embarrassed. The railroads were restricted by the laws and while the service which the War Board rendered was in many respects admirable and highly commendable, it could not make or

repeal laws and, most important of all, it could not remove the natural obstacles to unified operation created by the desire and obligation of every railroad manager to secure for his line all the business he could obtain.

Furthermore, he said, the railroad representatives were fearful of a decline in railroad credit. They claimed to need the financial support of the government to strengthen and stabilize railroad securities, in the absence of which the railroads were threatened with ruin. Whatever may be our views concerning the wisdom and necessity of federal control, he said, it is an accomplished fact and the taking possession of the roads creates a legal liability on the part of the government to the owners to pay for the use of the property taken. He then entered upon a lengthy discussion of the proposed basis of compensation to show that the provision in the bill is fair and just and approximates the basis upon which the courts would determine it. No other plan has been suggested, he said, which, in his opinion, so nearly meets the requirement of fairness and justice to both the public and the carriers as the proposed standard return and if the roads had continued under private control it is quite probable that the amount which the public would have been required to pay for transportation would have exceeded the amount that will be paid to the railroads under federal control. He discussed at length the British plan of control of the railroads. Senator Robinson concluded as follows:

"The railroads of the country are a material and necessary factor in the successful prosecution of this war on the part of the United States. We must operate them during the war under unified control; we must speedily hasten to France the troops and supplies which are necessary to enable us successfully to maintain this combat. This measure is a part of the administration war programme. It has been found necessary in the public interest, and the administration and the public await with anxiety the final disposition of this bill."

Senator Watson's Address

Senator Watson particularly opposed the idea of an indefinite period of control.

"From the financial standpoint," he said, "this is the most colossal proposition ever presented to any legislative body in the history of the world. It involves taking this vast property from the hands of those who made it and those who own it, and committing it to the operation and control of the government. It involves transferring the authority to make rates from the legislative to the executive branch of the government. And, if the time limit set forth in the last section be stricken out, it may prove to be the first step in the government ownership of all the transportation facilities and all the methods of communication of the entire land."

"I do not believe that the railroads of this country will ever be permitted to return to the old competitive system which we have compelled them to pursue for the last 30 years. I believe that they will be nationalized; that they will be operated as one transportation system; that they will be permitted to pool their traffic and their earnings; that useless lines will be abandoned; that all the property and all the equipment which every railroad has heretofore provided for its own operation and its own use will be used in common by all the other railroads in the nationalized system. I believe that the government will control and finance this unit, and that private ownership will be continued in the future as in the past. In short, complete governmental control with private ownership of the property controlled."

"Suffice it in this place to say that the tremendous success achieved by the Railroads' War Board in the nine months of its control is a most forceful illustration of what can be done under a unified railroad system properly managed. It

may safely be predicted that the American railroads will never return to the old system of competition. I believe that it is gone forever; that the Sherman anti-trust law so far as it affects railroad combinations will be repealed; that anti-pooling laws directed at railroad operations will, in so far as they affect the transportation system of the country, be abrogated, and a plan will be adopted which will give the government practical control of American railroads, without the weakness and the inefficiency incident to government ownership."

In discussing section 1 of the bill, which provides for compensation to the railroads for their use while under government control, Senator Watson said in part:

"It is better for us under existing circumstances to deal generously with the roads than to have eighteen billions of properties plunged into litigation with all that such litigation would mean to the country at the present time."

In discussing the rate-making power, Senator Watson said in part:

"This bill is a war measure. It deals with an unusual situation and therefore confers unusual power. The President by the provisions of this act is authorized to guarantee the roads a fixed dividend to insure the maintenance of every railway system at its present efficiency and to finance improvements and additions.

"It may be necessary, therefore, successfully to carry out this vast project, for the President to raise the rates and he should be given power to assume the initiative in this undertaking. It follows that their control and operation should be placed in the hands of the executive department of the government. While in time of peace the authority to make rates may remain lodged in the legislative branch of the government, yet, in order properly to finance the operations of all the railroads, it seems to me there is no escape from the conclusion that it must be done by the executive branch of the government alone.

Government Ownership

"But, Senators, government control is not government ownership, although the two are frequently confounded in the public mind; and, although they are used interchangeably by many bodies in drafting resolutions, in reality they are as wide apart as the poles.

"Government control means the adoption of a plan that would enable the government to have charge of the operations and the financing of all the roads without being compelled to buy them. Government ownership would necessitate the purchase of all the property valued at approximately eighteen and one-half billions of dollars. It would at once deprive the states of something more than a hundred and fifty millions by way of taxation. In Indiana the railroads paid in 1917, \$5,888,000 in taxes, state and local, on a valuation for taxation of \$240,000,000, or approximately 11.6 per cent of the total assessed valuation on the property in the state for taxation. The elimination of this great sum would seriously cripple other forms of industries that would be compelled to bear this increased burden of taxation under government ownership. Proper governmental control would not involve this relinquishment.

"If the government owned the railroads they would be directly administered by the President and his Cabinet. But I believe it to be far preferable that some plan should be devised that would mean advisory control, exercised very much as England is handling its railroads today.

"Governmental control will undoubtedly enable the railroads of the country to handle all the traffic in any time of peace and practically all of it in this time of war. It is not necessary that a policy of government ownership should be adopted in order to secure this desired end.

"My objection to returning wholly to private management is that in the time of peace the railroads might not be oper-

ated as they were under the Railroads War Board; that the old competitive methods might be readopted, and that all the old systems with all of their evils might again be foisted upon the public. Therefore, I favor such public control as will preserve the good and prevent the evil of private management, and at the same time avoid the dangers and pitfalls of government ownership.

"Government ownership of railroads would undoubtedly be immediately followed by the government ownership of the telegraph and telephone systems and express companies. We have already gone to great lengths in experiments with government ownership. We have a government owned railroad in Alaska; we have a government owned nitrate plant; we have a government owned armor plate plant, we are erecting two government owned ammunition plants and in my judgment, without any authority of law; we have a government owned merchant marine, and we are so far committed to that policy that it is time for us to pause long enough to see whether we are drifting as a nation.

"I believe that the government ownership of all the methods of transportation and all the means of communication, adding four millions of people to the pay roll and converting them into federal employees, will ultimately result in the destruction of our form of government. Undoubtedly it means a letting down in efficiency, it means a lowering of all the standards of effectual workmanship, and it means a vastly increased outlay of money for a vastly inferior service. Everyone who is familiar with the operations of the government knows these things to be true.

"I am opposed to indefinite extension of government control because it opens up the way for, if indeed, it is not intended as the first step toward government ownership. Certainly it is in complete harmony with the purpose of all socialists, national and international—the force that is asserting itself so tremendously in all nations at the present time.

"This means other millions working for the government. It means the extension of civil service over this vast number of citizens; it means that the civil service system, regardless of its merits in the past and of the high purpose of those who conceived and those who have since enforced it, is quite likely to break down, because of the power it will be required to exercise. It means the inescapable temptation to use this force as a political machine to raise the wages of all employees before election, and to use all the other means of control and methods of subordination known to the American people and sometimes used by politicians in the stress of a campaign.

"I do not believe we can stand that strain. I do not believe we should place such dangerous power in the hands of any man. I do not believe that we should confer such extreme authority over such a vast number of American citizens upon any individual. It is contrary to the very purpose of our theory of government.

"If we take the first step along this socialist highway, who so wise as to prophesy what the last may be? Who so bold as to deny what the next will be? Unquestionably, we are face to face with the settlement of this stupendous problem, and we should not commit ourselves even to the first of its doctrines without preparing to accept them all or to fight them all. For, if we inaugurate this programme, in the end it will all be forced upon the country, and, in my judgment, forced upon it to the destruction of our form of government.

If we have in this country the government ownership of railroads, telegraphs, telephones, and express companies, immediately the demand will come to take over the mines. In fact, we are told that the administration is even now preparing to take charge of the mines and of the oil fields. This may now be, or may hereafter become necessary, as a war measure. But if the control of all these public utilities

shall continue in the time of peace, as it is now proposed that the authority invested by this bill shall, there is the gravest danger that any President, backed by the power his position naturally gives him over the press and over the people; that any President, backed by all the tremendous agencies he can use for the formation of public opinion and the vast influences he can bring to bear for the creation of public sentiment; might make himself the Chief Executive of this country so long as he chooses to do so, and that would ultimately mean the overthrow of the form of government created by the fathers and preserved to us by the countless sacrifices of succeeding generations.

"I am decidedly in favor of the time limit imposed in this bill. There is no occasion for further extending it. The Congress in existence at the close of this war will meet the exigencies of the occasion. The American people will demand that this question be dealt with wisely and patriotically and bravely, and the American Congress will heed that demand.

"I early offered an amendment providing for a six months' limitation on governmental control after the proclamation of peace. The committee has seen fit to extend the limit and while I very much prefer the shorter period yet I am content to see the latter imposed.

"All the other authority conferred upon the President is for the period of the war. This, too, is a war measure. There is no possible justification for it on any other theory. The President's proclamation recites that this step is taken because of the compulsion of war; he sets forth specifically that he took this action under the statute of August 29, 1916, which is nothing but a war enactment and wholly for war purposes; this very bill recites that this legislation is rendered necessary as a war proposition.

"Why, then, should not the powers it bestows, cease at a specified time after the war? On what theory can it be definitely extended? Who is willing to contend that it is necessary, in order to win this war, to permit Mr. McAdoo, or any other man, to control the railroads long after the war shall have ceased?"

Senator Johnson's Address

Permanent government ownership of railroads, rather than government control for the period of the war, was advocated by Senator Johnson of California.

"I would now take the inevitable next step in government control of our railroads," Senator Johnson declared, "and do whatever might be essential to make that government control permanent government ownership, or at least leave the way open so that immediately upon the determination of the war, we might follow to its logical conclusion what already we have partly done."

The California Senator protested vigorously against the proposed rate of compensation to be paid the railroads under the provision of the bill, and also opposed the Senate's plan to turn the roads back to private management 18 months after the conclusion of peace.

In support of his declaration for government ownership Senator Johnson said that the railroads had broken down under the stress of the last few months; that, if the country is to have efficient national transportation, the roads must be nationalized and operated by one directing head; that the American people have "paid the price of private ownership" and that "despite barriers or obstacles, the nation is marching straight to the goal of public ownership and the people at last will come into their own."

Senator Robinson of Arkansas has submitted some amendments to the bill for the purpose of clarifying certain language in it and to omit the provision for paying compensation for the new investment from June 30 to December 31, 1917. Senator Townsend has submitted in the form of an amendment a substitute for the bill, prepared outside

of the committee, but he said not particularly with the idea of securing its adoption.

A minority report was filed on February 15 by eight Republican members of the House committee, declaring their intention of supporting the bill, but that it should be amended to provide that the rate-making power of the Interstate Commerce Commission shall remain unimpaired and that a definite date for the determination of federal control should not be more than one year after the proclamation of peace. The report is signed by Representatives Esch, Hamilton, Parker, Winslow, Dillon, Sweet, Stiness and Cooper.

Various amendments to the bill have been submitted by Senators McLean, Saulsbury and Thompson, the latter providing for a continuation of government control until Congress orders otherwise.

Members of Congress are receiving numerous telegrams from chambers of commerce and other similar organizations in the interest of various short line railroads which they do not want to have left out of the list of roads taken over by the government. Many other telegrams and resolutions are being sent in by shippers' organizations protesting against any disturbance of the rate-making powers of the Interstate Commerce Commission.

The Nebraska State Railway Commission has sent the following:

"We protest proposed basis of compensation to railroads under government operation as excessive. Railway operating income plus income from other sources gives percentage returns on capitalization of three principal roads in this state as follows: North Western, 12.04; Union Pacific, 14.14; Burlington, 25.63. Suggest limitation to regular dividends of last three years. By all means, strike words 'reasonable compensation' from first section of bill. They surrender all that has been gained in rate regulation. We also protest giving the President power to initiate or make rates; should be left where it now is."

Representatives of the railroad brotherhoods and other labor organizations have addressed a petition to both houses of Congress asking them not to fix a time limit for the return of the railroads to their owners, leaving the question for further determination.

FILMS TO BOOM BRITISH TRADE.—Latest advices from London say that a scheme has been formulated by British Industries, Limited, for furthering British trade in foreign markets by means of the films. The company is arranging a tour which will begin next June, or as soon thereafter as international affairs permit, and will embrace the principal cities in western Europe, North and South America, Canada, India, South Africa, Egypt, Australia and New Zealand. In 85 of the principal cities of the world films are to be exhibited illustrating leading British industries and manufactures, and to these exhibitions representatives of the principal firms in the cities visited will be invited. A British manufacturer may have films of his industry prepared by the company, and these will be exhibited in such places included in the tour as he may select.

A commercial reference book entitled "British Industrial Expansion," is also to be prepared for distribution during the tour, and in this each exhibitor will be entitled to two pages of descriptive matter in one or more of four languages. In addition to the film of any particular industry, there will be supplementary and descriptive slides giving the names, address and business of the different firms. The tour is estimated to last 18 months.

MAIL BY AIR IN SWEDEN.—The Swedish Government is considering proposals for the establishment of an airplane postal service between Noortelje and Abo, beginning during the latter part of February or the early part of March.

A Scientific Study of Railway Track Under Load

Progress Report on Investigations and Extensive Tests Extending Over Five Years

AFTER FIVE YEARS of investigation a special joint committee of the American Society of Civil Engineers and the American Railway Engineering Association, organized to investigate the stresses in railroad tracks, has presented a report which has been published in the proceedings of the American Society of Civil Engineers for January, 1918. The report covers nearly 200 pages, and the large amount of work done by the committee is indicated by the statement that the tests involved 250,000 observations in rail strains alone. Although the committee calls attention to the fact that the investigations are to be continued, much progress has been made in ascertaining the action of track under wheel loads and the report affords a fund of knowledge on a subject concerning which very little tangible information had been available previously. An abstract of this report follows:

Fundamental Considerations

A proper conception of the fundamentals underlying the action of track under load may be had only by considering the track as an elastic structure under load: The wheel loads are applied on the top of the rails; the rails act as flexible beams which rest on flexible supports (ties); and the ballast and roadway on which the ties rest are themselves yielding or flexible. Due to the stiffness of the rail and the yielding of its supports, the load from a wheel will be distributed over a number of ties. It is evident that the amount of yielding of the supports affects the values of the moments and stresses developed in the rail. The properties of elasticity and stiffness in the rail, the tie, the ballast, and the roadway enter in a complex manner into the development of the stresses in the track structure, the relative stiffness of the various parts affecting the results in any one part. The spacing of the wheels of locomotives and cars longitudinally along the track also influences the division of the load, as pressures on the various ties, and hence influences the value of the stresses developed in rails, ties and ballast.

A number of writers have obtained expressions for the bending moment and stresses in a rail by considering the latter as a simple beam supported on the two adjacent ties, with the wheel load at a point half way between. Other writers assume the beam to be fully restrained over the adjacent ties. In these and many other ideas it is virtually assumed that the load is taken only by the two ties adjacent to the load.

If we consider a rail with an indefinitely large number of evenly spaced wheel loads, the tie spacing being, say, not more than one-third of the wheel spacing, it can be shown mathematically that, for a given wheel spacing, there is relatively little difference in the tie reactions until the wheel spacing becomes quite large. The foregoing refers only to an indefinitely large number of wheel loads. For a small number the results will be greatly modified.

Analysis of Track Action

It is concluded that the method of analysis which is based on the assumption of a continuous elastic support under the rail is by far the most convenient, most easily applied, and most comprehensive in its application to the questions involved in the work. The assumption of a continuous support in place of tie supports is not an element of serious inaccuracy for the close tie spacing and large rail sections

used on American railroads. The method has been found to be more general and to have fewer limitations than the methods based on concentrated tie loads.

The term, modulus of elasticity of rail-support, is introduced as a measure of the vertical stiffness of the rail-support. It may be defined as the pressure per unit of length of each rail required to depress the track one unit. It represents the stiffness and yieldability of tie, ballast, and roadway, but does not involve the stiffness of the rail. As applied to ordinary track, the load on one rail required to

Fig. 1. Distribution of Depression and Bending Moment for a Single Load

depress one tie one unit, divided by the tie spacing, will give the modulus of elasticity of rail-support.

The method of analysis will be developed, first for a single wheel load and then for a combination of wheel loads. Assume that the rail is supported continuously on an elastic support and that the support has a constant modulus of stiffness; that is, that the depression of the track and the resulting upward pressures on the rail are directly proportional to each other. Assume, further, that the track construction is such that negative pressures may be developed. The following nomenclature will be used (see Fig. 1):

- P = wheel load on a rail at the point which will be used as the origin of abscissas;
- E = modulus of elasticity of steel;
- I = moment of inertia of section of the rail;
- y = depression of rail at any point, x it being assumed that there is no play or hock lash in the track; downward displacement of a rail is negative, however, in the applications to track, the ordinary downward depressions of track will be taken of as positive;
- p = upward pressure against rail per unit of length of rail at any given point;
- u = an elastic constant which denotes the pressure per unit of length of each rail necessary to depress the track (rail, tie, ballast, and roadway) one unit, for the system of units ordinarily used, it will be expressed in pounds per inch of length of rail required to depress the track 1 in.; u represents the stiffness of the track, and involves conditions of tie, ballast and roadway; it is termed the modulus of elasticity of rail-support;
- M = bending moment in rail at any point.

The fundamental condition on which the analysis is based is that the track depression at any point and the upward pressure on the rail per unit of length at the same point are directly proportional to each other. In other words, $p = uy$.

It will be recalled that, in the mechanics of beams, the derivatives of the elastic curve (first, second, third, and fourth), in their order, represent or are proportional to (1) the slope of the elastic curve, (2) the bending moment in the beam, (3) the shear, and (4) the intensity of the load. In the case in hand, the fourth derivative (the intensity of the load) has the unique relation of being directly propor-

tional to the original function, given by the equation of the elastic curve or curve of depression of track.

From the fundamental condition, the differential equation of equilibrium is

$$EI \frac{d^4 y}{dx^4} = u y \dots \dots \dots (1)$$

This differential equation is satisfied by the following equation:

$$y = \frac{P}{64EI} x^4 + \frac{u}{4EI} \left(\cos \times \sqrt{\frac{u}{4EI}} + \sin \times \sqrt{\frac{u}{4EI}} \right) \dots \dots \dots (2)$$

From this, formulae may be obtained for the bending moment in the rail, the shear and the intensity of the pressure (p) against the rail, and with the aid of these characteristics of the curves for bending moment and rail depression shown in Fig. 1 may be determined for any set of values assigned. To find the effect of a combination of wheel loads on the track depressions and the pressures and the bending moment in the rail, as may occur with a given type of locomotive, the equations and diagrams for a single wheel load may be applied by the use of the principle of superposition; i. e., by considering that, at a given point along the rail, the combined effect of two or more wheel loads is the algebraic sum of the effects of the individual wheel loads.

Special Apparatus Used

Nearly all instruments used in the tests were designed especially for the work. In the tests with static loading, longitudinal strains in the rails under bending load were measured with a Berry strain gage. A level-bar was used to measure the deflection of the rail and the depression and bending of the ties. For measuring the pressure transmitted to various parts of the ballast a pressure-capsule was used in which the elastic deflection of a thin steel diaphragm is transmitted to an indicating dial micrometer.

A flat car loaded with from 25 to 50 tons of rails was used in connection with special load-indicating screw-jacks to apply loads equivalent to a one-axle or a two-axle load. The rails on the car were supported on H-beams placed crosswise of the car, and the bottoms of these H-beams rested on the upper ends of indicating screw-jacks. The lower ends of the screw-jacks bore against the rails through curved bearing blocks having a radius approximating that of an ordinary car wheel, but not coned. The construction of the load-indicating screw-jacks is shown in detail in Fig. 2. To measure the strains in rails under moving locomotive loads an instrument involving the general principle utilized in the stremmatograph developed by Dr. P. H. Dudley was devised. In moving-load tests, the deflection of various points of the rail was measured by using double-exposure photograph of small pieces of black paper with small white crosses on them that were glued to the rail at intervals along the outside.

The Test Track

The track of the Illinois Central used in the test work is on the double-track main line, about two miles north of Champaign, Ill. The stretch of track used is on an embankment, from 4 to 8 ft. high, composed of loam and clay. A single-track road was built in 1854, and the second track was added in 1900. Age has given compactness to the embankment, and it was in dry condition throughout the tests. The ballast at this place consists of crushed limestone; it usually has an average depth under the ties of about 12 in. The rails are A. S. C. E. 85-lb. section. The rails on the south-bound track are 33 ft. long, and were

laid in 1902; those on the north-bound track are 30 ft. long, and were laid in 1900.

To provide uniform known conditions of track for the tests, four stretches were specially prepared. For these test sections special oak ties replaced the original ties. Four such sections were prepared within a short distance of each other. On one section the ballast had a depth of 6 in. below the ties; on another, 24 in.; and on two others, 12 in. On one of the last-named sections the ties were 7 in. by 9 in. by 8 ft.; on all others they were 6 in. by 8 in. by 8 ft. In locating the test sections, depths of ballast closely approximating those desired were found, and the track was raised to make the proper depth. The special ties had been prepared accurately to size, and were of uniform quality. When first prepared, these special test sections were laid

Fig. 2. Details of Load-Indicating Jack

with the 85-lb. rail which had been in the track originally. Later, when it was desired to use heavier rails in the tests, these were removed and replaced by the heavier ones. The sections used were chosen because they were readily available, and give considerable range in weight.

In placing the ties used for the special test sections, the old ties were removed and the new ones put in without disturbing the ballast below the bottoms of the ties. This was done by the regular section men of the Illinois Central. For each test section, the depth of ballast was determined by excavating to sub-grade, near the ends of the ties on each side of the track at two points in each rail length. The track was raised sufficiently to give the required depth of ballast under the ties, and in no case was it necessary to raise the track more than two inches. Whenever the track had been in use long enough to need it, it was tamped and put in good surface. After such resurfacing, tests were not run until sufficient time had elapsed for traffic to compact the ballast which had been disturbed; generally 10 days or 2 weeks were allowed.

Static-Load Tests

The typical procedure of the static-load tests, when the loading apparatus for one-axle and two-axle load was used, was as follows: The car, loaded with rails, was taken to the test section and carefully spotted over the points where the load was to be applied. The brakes of the car were then set and the engine was uncoupled and run away from the test section far enough not to affect the results. After the load indicating jacks had been put in place, ready to apply the load, zero-load readings were taken with the strain-gage and the level-bars. Load was then applied with the jacks, and a set of load readings were taken. The next load increment was applied and the load readings taken. After the desired number of increments of load had been applied (usually four), the load was removed and the zero-load

readings were again taken. To take a complete set of readings, including two sets of zero readings and four load readings, required from 1½ to 2 hours.

The typical procedure in static-load tests with a locomotive was practically the same as when the loading apparatus was used. The locomotive was then run on the test section and spotted at the desired point. Load readings were taken, and then the locomotive was spotted at a new position and load readings taken. After taking load readings with the locomotive at the number of points desired, the locomotive was run off the test section and zero-load readings were again taken.

Moving-Load Tests

Tests in which the load on the test track was produced by a locomotive running over the section are designated as moving-load tests. On the tests on the Illinois Central three types of locomotives were used in moving-load tests, a Mikado, an Atlantic, and a Pacific. The same types were used on static-load as on moving-load tests, except that the

of the locomotive produced an appreciable effect on the rail stresses which was somewhat variable and it was decided to eliminate this variable at first and to study only the effect of speed, leaving the effect of traffic for investigation later. In order to have the counterweight of the locomotive drivers in the same position in all tests, the drivers were slipped to cause the counterweight to come to a definite position for a given position of the locomotive on the test section.

Tests were also made on the tracks of the Delaware, Lackawanna & Western at a point near Dover, N. J., during the fall of 1916. The section of track chosen was on the east-bound main line, about one mile east of the station at Dover. The tracks here are laid with 101 lb. D. L. & W. rails on 7-in. by 9-in. by 8 ft. 6-in. cross-tied ties, tie-plates and screw-spikes being used on every tie.

The ballast consists of trap rock having a depth of about 18 in. under the ties. Directly beneath the ballast there are 2 ft. of cinders, which were originally used as a ballast. Beneath the cinders is a light embankment of clay mixed with boulders. For purposes of the tests, the original rail at this point was replaced by new 105-lb., D., L. & W. rail section for about ¼ mile. This change was made and the track was put in good line and surface about September 1, a month before the tests were started. Tests were made with a Ten-wheel, a Mikado, and two Pacific locomotives. The method of making the tests was the same as that followed on the Illinois Central.

Depression of Track

In Fig. 3 are given track depression profiles for one-axle and two-axle loads (the axles being 66 in. apart), for tests made on the test sections of track on the Illinois Central. At the place where the tests with loading apparatus were made, the ties were 22 in. from center to center. The load was applied near the middle of the length of a rail, in order to avoid the effect of rail joints.

Little difference is to be found in the depression for the load over a tie and for the load midway between ties. The depression is generally somewhat greater for the load over a tie. This is true of both one-axle and two-axle loads. There is a marked difference in the magnitude of the track depression according to the condition of the track, freshly tamped track having a smaller depression under load than track which has been subjected to the action of traffic for a considerable time after being surfaced. In this report the term "after tamping" is applied to track on which trains had been run for, say, from one to two weeks after the track had been tamped. The term "before tamping" is applied to track which had been subjected to traffic of passenger trains for, say, from two to six months. It should be stated, however, that in all these tests the track was in excellent condition.

For freshly tamped track the magnitude of the depression of the track is directly proportional to the load applied. This property of direct proportionality in track depression corresponds to a constant modulus of elasticity of rail support. It will be found that the relation between the magnitude of the applied load and the magnitude of the track depression (corresponding to the quality of stiffness in properties of materials), is an important property of track, and has an influential bearing on the stresses developed in the rail under applied load.

In tests of track before tamping a light load produced a relatively greater depression than was given by later increments of load. It thus appears that the stiffness of the rail-support is smaller for the lighter loads. This may be thought to be in the nature of piling or looseness in the track. It is probably nearer correct to say that for the smaller loads the depression produced is not proportional to the load applied. If there is play in the test sections of track it would seem

Fig. 3. Track Depression Profiles

switching locomotive was used only on static-load tests and the Pacific locomotive only on moving-load tests. The Mikado locomotives were used at speeds up to 35 m. p. h., that being the maximum speed permitted by the regulations of the Illinois Central. The Atlantic and Pacific locomotives were used at speeds up to 60 m. p. h., a few tests being made at higher speeds.

In all moving-load tests (except at very low speeds), steam was shut off as the locomotive approached the test section of the track. It was found that the tractive effort

most likely to be between the tie and the ballast immediately under the rail and adjacent thereto, so that the tie must bend before it comes to a full and even bearing along its length, and part of the resistance for the lighter loads may be that of the flexural resistance of the tie.

Stresses in Rail; One-axle Load and Two-axle Load

Fig. 4 gives load-stress diagrams for gage lines at the point of application of load in the case of one-axle load and at the points of load in the case of two-axle loads, the average of the stresses at the two points being taken in the latter case. Little difference is to be found in the rail stress under the load for a load over a tie and for a load midway between ties. The stress is generally somewhat greater for the load between ties, though the difference is smaller than the variations found in different tests.

It is seen that the rail stresses differ markedly according to the condition of the track, freshly tamped track giving smaller stresses than track which has been subjected to the action of traffic for a considerable time after receiving a general surfacing. This is found to be true in tests for both the one-axle and the two-axle loads. In general, for freshly tamped track the stress developed in the rail is di-

Fig. 4. Load Stress Diagrams

rectly proportional to the load applied. For the track "before tamping," the stresses appear to increase proportionately to the load; but, to the stress found on this assumption must be added a constant stress in order to obtain the stress which is developed at the given load. It would appear, also, that the rate of increase of stress with increase of load is approximately the same in track "before tamping" as in freshly tamped track, the lines in the load-stress

diagrams being approximately parallel for the two cases. For a rail of 85-lb. section the stress in rail in an untamped track was found to be as much as 6,000 lb. per sq. in. more than in freshly tamped track, and this was true whether the load was 10,000 or 50,000 lb. per axle, or whether the stress for the freshly tamped track was 5,000 or 20,000 lb. per sq. in. Tests have not yet been made to determine what the effect would be on track in poor condition.

Stresses in Rail; Static-Load Tests with Mikado Locomotive

In Fig. 5 are given stress-distribution profiles for static-load tests with the Mikado locomotive on rail of 85-lb. and 100-lb. sections on the test sections of track on the Illinois Central. For the 85-lb. section, tests were made on three depths of ballast and two sizes of ties; for the 100-lb. sec-

Fig. 5. Stress Distribution Diagrams. Static-Load Tests with Mikado Locomotive

tion, tests were made on one depth of ballast. In all these tests the track was in a freshly tamped condition.

The maximum stresses in the rail are directly under the wheels, positive moment being developed at these points. Negative moments occur at points between the wheels. The stress under the inner two drivers is generally less than that under the outer drivers, and that under the front driver is generally somewhat greater than that under the rear driver. The tests on rail of 100-lb. section gave lower stresses, as might be expected, but the general distribution of stresses along the rail was much the same. The effect of the increased section of rail on the bending moment developed will be discussed later.

Modulus of Elasticity of Rail Support

The table gives the values of the modulus of elasticity of the support as calculated from the track depressions expressed in pounds per inch of rail length to depress the track one inch. The conditions of track are not stated very definitely, but even in track marked "before tamping," the track was in good surface, and only in a few instances was it in need of tamping. The values derived from the tests for the different methods of loading on the same track agree very well. There seems to be some tendency toward a higher value of the modulus in the track having the heaviest rail. It is apparent that the character and condition of the track greatly influence the magnitude of the modulus of elasticity of rail-support. The value for the

modulus on the track of the Illinois Central with 24-in. ballast may be taken as about 1,600 lb. per in. per in. For the track on 6-in. and 12-in. ballast, the values are approximately 1,000, except for the track on 7 in. by 9 in. ties, where the values are higher, say, about 1,200. Although the embankment for the two tracks was built at different times, it is not known that the two parts of the embankment have any special differences in condition. In all these test stretches, there is a tie spacing of 22 in. where the tests were made. For track used for freight service, which was ballasted with 6 in. of cinders in not very compact condition, the value of the modulus of elasticity of rail-support is about 750. For the track of the Champaign and Havana branch of the Illinois Central with about 6 in. of fine cinder ballast above a light embankment of loam, tie spacing varying from 22 to 26 in. (56-lb. rail), the modulus of elasticity of rail-support found was about 530. At the time, the track was not in good condition at the point where the test was made. Some of the ties were partly decayed.

For the track of the Delaware, Lackawanna & Western information on the depression of track and the condition of the track is not complete, and only an estimated value of the modulus of elasticity of rail-support can be given. This

from the smaller value of this stress and the greater variations of conditions to which it is subjected.

Influence of Rail Section

The heavier rail gives a much higher bending moment coefficient than the lighter. It will be most convenient to use in the discussion the bending moment coefficient K , by which the wheel load, P , may be multiplied to get the bending moment at the load or at a point between loads. If the difference in the track conditions is taken into account, the 125-lb. rail being on track with 24 in. ballast, which gave a higher modulus of elasticity of rail-support than that of the track on which the tests of 85-lb. rail here used were made, the contract becomes greater. That the bending moment coefficients should be greater for the heavier sections is evident from analytical considerations, especially in the case of the trailer, which is at some distance from other wheels, and in the case of outer drivers. The increase due to increase of section, however, is greater than may be expected from the analysis of track action herein given, or for any known rational analysis. For the drivers and trailer of the three types of locomotive used on the Illinois Central, the values of the bending moment coefficient derived by the

VALUES OF MODULUS OF ELASTICITY OF RAIL-SUPPORT

| Depth of ballast, in inches | Size of ties, in inches | Condi- tion of tamping | 85-lb. Rail | | | 100-lb. Rail | | | 115-lb. Rail | |
|-----------------------------|-------------------------|------------------------|--------------|-----------|-----------|--------------|-----------|-----------|--------------|-----------|
| | | | Loco- motive | One- Axle | Two- Axle | Loco- motive | One- Axle | Two- Axle | Loco- motive | One- Axle |
| 24 | 6 by 8 | Before | | 1,170 | 1,180 | | | 1,090 | | 1,640* |
| | | | | 1,190 | | | 1,080 | 1,100 | | 1,820* |
| | | | | 1,640 | | | 1,030 | | | 1,600 |
| | | | | | | | 880 | | | |
| | | | | | | | | | | |
| | | After | | 1,330 | 1,180 | | 1,000 | 1,090 | | 1,690 |
| | | | | 1,650 | | 1,510 | 1,710 | | 1,540 | 1,900 |
| | | | | 1,660 | | | 1,430 | | 1,420 | 1,840 |
| | | | | 1,570 | | | | | 1,800 | 1,560* |
| | | | | | | | | | 1,830 | |
| Average | | | | | | | | | | |
| | | 1,630 | | | 1,510 | 1,370 | | 1,590 | 1,830 | |

track was evidently stiffer than that of the Illinois Central. The value, 2,200 lb. per in. per in., is probably representative of this track. The track had 18 in. of trap rock ballast below the tie, and the material of the roadway below was such that it was very solid. The spacing of the 7-in. by 9-in. by 8 ft. 6-in. ties averaged about 22 in.

Effect of Increased Speed

From tables arranged to show the effect of speed as a percentage of the stress in the rail at 5 miles per hour for each mile per hour increase of speed greater than 5 miles per hour, it is found that the values for the increase for positive moment range from about 0.3 to 1.2 per cent increase for each mile per hour increase in speed. Values higher than 0.9 per cent are found in a number of cases. The increases found in the tests on the Delaware, Lackawanna & Western were of the same character, but the values were somewhat smaller than those found in the tests on the Illinois Central.

The heavier rail section appeared to give a somewhat higher proportional increase of stress with increase of speed than the lighter. The indications in the tests on track of the Illinois Central were that the Mikado locomotive gave a rate of increase somewhat greater than the Atlantic and the Pacific. The tender trucks gave a still higher rate of increase, though, of course, the amount of the stress was less than that under the drivers.

The proportional increase in the stress for negative moment was large and rather irregular, as would be expected

analysis are less than 10 per cent higher for track with the 125-lb. than for track with the 85-lb. section. For the tests at 5 miles per hour, the values of the bending moment coefficients average nearly 30 per cent higher with the 125-lb. than with the 85-lb. section, considering the drivers and the trailer of the three types of locomotive. For the tests at the higher speeds, the increase is still greater.

CALCUTTA IMPORTED RAILWAY EQUIPMENT to the value of \$1,409,211 in the year ended March 31, 1917, as compared with \$3,968,611, in the corresponding period of 1916, according to the report of Consul General James A. Smith from Calcutta, British India.

CANADIAN VESSEL STATISTICS FOR 1916.—The total number of vessels on the Dominion register at December 31, 1916, was 8,660, measuring 942,598 net tons, a decrease of 97 vessels, and an increase of 13,286 tons compared with 1915. During 1916, 432 vessels were removed from the register of which 260 were broken up, reported out of existence, condemned, dismantled or dandood, 26 were wrecked, 22 were sold to U. S. Government; 1 to French Government; 1 to Russian Government; 20 stranded; 7 lost, 7 abandoned at sea; 2 lost by collision, 14 foundered, 18 burnt, 25 transferred to Newfoundland; 17 to Barbadoes; 5 to Great Britain; 1 to Australia, 2 registry no longer required; 3 sunk by mines and 1 by torpedo. It was estimated that 42,566 persons were employed on vessels registered in the Dominion during 1916.—*Canadian Railway and Marine World*

Canadian Railways and the War*

THE CRISIS in the American coal situation made it necessary to assure the United States that coal supplied to Canada was being used for necessary purposes only and . . . the formation of the Canadian Railway Association for National Defence resulted (October, 1917). To that date the domestic traffic of the Dominion had been kept moving expeditiously, despite war conditions, with the exception of one brief period in the winter of 1916-17.

The Canadian railways had already carried 400,000 troops from recruiting points to concentration centres and from concentration centres to training grounds, and training grounds to ports of embarkation, and these men had been fed and "slept" better than were the troops of any other belligerent nation mobilizing over such an extended area.

Over 70,000 laborers [from Asia] for Europe had been carried across the continent. These also had been fed and "slept" under railway management.

There had been a colossal new burden due to the taking of coal vessels from the St. Lawrence and the lakes for ocean service; to the reduction of staffs to furnish army recruits and many sudden shiftings and reversals in the tides of traffic . . . including the flow of Canadian raw materials, some of them never before exported from Canada, into the United States. The passenger train service had been reduced to the extent of 10,000,000 passenger train miles a year, saving 500,000 tons of coal.

The Association has made marked progress. The speed of all trains has been so regulated as to give the maximum of tractive effort from a given amount of coal. Passenger train service has been reduced still further so as to effect a saving of another 2,000,000 passenger-train miles yearly.

The American railways, to equal the Canadian record, would have to cut off 110,000,000 passenger-train miles instead of 20,000,000. The Canadian reduction means a saving of 600,000 tons of coal yearly. Further reductions are under way.

The Railway War Board took charge, in a supervising way, of all traffic difficulties. Potato cars were loaned from one road to meet the shortage on another. Calls for refrigerator cars, apple cars, engines, box-cars—all kinds of equipment—were met through the direction of the Board. A special officer was sent to supervise the coal handling at the Niagara Frontier, with excellent results. A campaign for economy in the ordering of cars and in using their space has been promoted. The surplus of Canadian freight cars in the United States is being steadily reduced through pressure applied. Of these cars 1,300 have come in loaded with anthracite to relieve the coal shortage.

The Outlook

The car shortage, which has been ameliorated, will, it is hoped, be entirely relieved by persuading shippers to load cars to their maximum capacity instead of to less than half their capacity as has been the practice in the past. Steps will be taken also to impress upon shippers and consignees the seriousness of holding cars longer than necessary. The sympathetic co-operation of the Canadian people—shippers, consignees and the travelling public—is a prime necessity. . . . Although it is true that the Canadian railways are organized as nation-wide enterprises, and so have escaped the difficulties experienced by the American lines, and that, being large and few in number, they are able to work to-

gether successfully, nevertheless, congestion on lines outside of Canada, labor shortage and extreme weather conditions, coupled with abnormal traffic demands, make it necessary to load cars to full capacity; to load them promptly and quickly, and to release them at the earliest possible moment.

Embargo Rules of the Railroad Administration

W. C. KENDALL, manager of the car service section of the Railroad Administration has issued circular No. C. S. 1 giving instructions to be observed in the handling of embargoes, in addition to those conveyed in General Order No. C. S. 17 issued by the Commission on Car Service. The instructions, which are issued by authority of the Director General of Railroads and are effective immediately, are as follows:

1. Embargo promptly consignees who do not unload freight promptly on arrival, subject, however, to the approval of the regional director.

2. When a complete embargo is not an essential, the following list of exceptions must be observed so far as practicable and in the order named.

(a) Live stock, perishable.

(b) Coal, coke and charcoal. Acids, alcohol, ammonia, light oil (benzol and toluol), petroleum and its products in tank cars. Empty tank cars.

(c) Food, domestic (not export), for human consumption, including wheat, corn, oats, rye, barley, rice, cereal products, salt, canned goods, sugar, syrup, molasses, peanuts, vegetable oils. Feed, domestic (not export), for animals and poultry, not including hay or straw.

(d) Materials consigned to the United States Government or its authorized agents, including the Public Printer, the Bureau of Engraving and Printing, the Post Office Department, the Navy Department, Navy Yards, and Navy Stations, the Marine Corps, to the American Red Cross, the Imperial Munitions Board, Canada, and shipments of steel, lumber, ties and piling consigned to the United States Shipping Board Emergency Fleet Corporation. (Shipments to the War Department will be more fully dealt with in instructions subsequently to be issued.)

(e) Railroad material and supplies (other than coal or coke), when consigned to an officer destined to a point on his own line.

(f) Printing paper and printing ink. Scrap and waste paper when consigned direct to paper mills or manufacturers.

(g) Agricultural implements and farm machinery required for preparing the soil. Binder twine; canning machinery; carbide; carbon black; chrome, graphite, manganese, and pyrites ore; fertilizer, fertilizer materials, including agricultural lime and pulverized lime stone; field and garden seed, seed grain; food containers (glass, wood, tin or paper); fullers earth; laundry soap and soap powder; medicines, drugs and surgical instruments; mine props, mine wagons, powder, and other materials and supplies necessary for the operation of coal mines; oil well supplies; spraying materials, including arsenic (basis for insecticides), and spraying implements; sulphur; tanners' extract; tin plate for manufacture of tin cans.

3. It should be understood that an embargo placed against carload freight includes less carload shipments of things which are ordinarily forwarded in carload lots.

4. Cars must not be loaded in violation of embargoes. When this is done, agents are not permitted to issue bills of lading and if cars are not unloaded they will be held at point of origin, subject to current demurrage charges until unloaded or until embargo is lifted.

* Abstract of War Board Bulletin No. 1, issued by the Canadian Railway Association for National Defence. The executive committee of this association consists of J. and S. Langlois, Howard Kelly, Sir William Mackenzie and Alfred H. Smith. The administrative committee consists of T. E. Gillen, D. B. Hanson, C. A. Hewes, Sir George Bury, F. F. Backus, E. D. Bromner and J. H. Wood. The general secretary is W. M. Neal, 263 St. James St., Montreal.

A Japanese View of Railway Exports to the East

An Interview with Akio Kasama of the Railway Commission
Which Has Been Visiting This Country

"THE UNITED STATES AND JAPAN will secure the bulk of the railway supply business in China after the war," said Akio Kasama, secretary of the Imperial Government Railways of Japan to a representative of the *Railway Age*, who called on him at his New York office. Japan and the United States will develop this business, working side by side, at times independently and at times in close co-operation, but always peacefully and without resorting to the mailed fist method of commercial expansion, was the idea hinted at rather than bluntly stated by the diplomatic Japanese representative.

Mr. Kasama has been in this country several months as a member of the Japanese Commission of Inspection which ostensibly has been investigating our transportation system, our mining and our iron and steel manufacturing facilities, but in fact has also been interested in the establishment of a friendly basis of co-operation between the United States and Japan in the Far East. Consequently his viewpoint of American and Japanese co-operation in the Far East in the future may indicate that this understanding was reached on one of the frequent trips this commission made to Washington. Continuing on the subject of future railway business in China, Mr. Kasama pointed out that:

The first need of China is for railroads. Capital must be provided before these railroads can be built, as China is unable to finance them herself. The United States will have the greatest surplus of capital of any nation. Japan will also have capital to invest. Germany will be shut out of the railway supply business in the Far East by unfriendly feeling—to China Germany is virtually an enemy country—and because German capital will be employed in building up her own territory and that of her allies. The English railroad supply industry will be fully employed at home and in her colonies. India alone will be in imperative need of so much equipment that it would take the entire output of the whole English railway supply industry for one year to furnish it. Belgium is no longer a factor in export of railway supplies. France will have her hands more than full at home.

In short, according to Mr. Kasama's ideas, and they are those of the commission of which he is the secretary, the bulk of the railway supply business in China must be taken care of by Japan and the United States, as there will be no other country in a position after the war to handle this kind of business. With the field in China practically abandoned by all save American and Japanese railway supply interests arises an interesting question as to which one will get the lion's share of the business.

The Possibilities of American Export Trade

Japan, said Mr. Kasama, has a large steel plant at Wakamatsu on the island of Kyushu. This plant imports a large portion of its ore or pig iron from China. It is in a position to make all kinds of steel, but its capacity, despite its steady increase, is still insufficient even to care for the domestic demands of the empire. Some two-thirds of Japan's raw steel has to be imported and no less than four-fifths of its steel plates have to come from steel mills in other countries. Mr. Kasama expressed his belief that the United States was the country which should most logically be expected to supply such raw material.

Concerning Japan's railway supply industry, Mr. Kasama said that Japan's car and locomotive plants were well organized and should see a steady development. Unlike

the big steel plant at Wakamatsu these plants are in private hands. They now produce one third of Japan's own demands, this one third being available for export to China or other countries. Mr. Kasama did not believe that there would be a great market in Japan for American cars and locomotives or in railway supplies generally except in such things as lubricators, injectors, gages and spring steel which Japan does not supply in sufficient quantities.

On the basis of this situation Mr. Kasama thought that the United States would furnish much of the capital for development of the railways of China and would get its reward largely through the sale of steel and iron-steel plates, shapes, rails, and other semi-manufactured or bulky commodities. Japan's car and locomotive plants with their surplus capacity would fabricate the raw material into cars and locomotives and Japanese labor or Japanese "genius," as he expressed it, would build the railroads and presumably help the Chinese to operate them. Japan he further added, has adopted the firm policy of encouraging industry in China, particularly iron and steel mills. Presumably it would also encourage the railways there to build their own cars and locomotives. The South Manchurian railway in which the Japanese already have an interest has made many of its own locomotives for some time.

The *Railway Age* representative expressed his doubts as to whether American bankers would desire to invest capital on the basis outlined. Mr. Kasama did not doubt that China is so vast and its needs for new railroad lines so great that undoubtedly American and Japanese interests would find plenty of room to work independently.

The Siems-Carey Railway & Canal Company, the protégé of the American International Corporation and the National City Bank, furnishes an example of an independent American project, that company now having all plans made including those for financing, for construction of 2,600 miles of railroad built to American standards practically throughout and equipped naturally by American railway supply companies. This railroad will serve a territory with hundreds of millions of inhabitants and of untold wealth in undeveloped resources. Other and similar entirely American projects are in contemplation.

The Commission's Personnel

The commission representing the Imperial Government Railways of Japan came to this country last October. It was headed by Dr. Shima and consisted of two other members and an accompanying staff. All three of the members stand high in the affairs of the Japanese railways. Dr. Shima is the director of the machinery and rolling stock department of the Imperial Government Railways and professor of mechanical engineering of the College of Engineering of Tokyo University. Akio Kasama, the secretary of the commission, occupies a position no less important than that of secretary of the Imperial Government Railways and on the commission represents the national department. J. Nakamura, the third member, is a civil engineer, holding the position of assistant traffic manager in charge of the passenger section, a position similar to our general passenger agent or passenger traffic manager. Dr. Shima has since returned to Japan. Mr. Nakamura expects to return shortly, while Mr. Kasama will remain in this country to observe particularly the working out of the government control of railroads under Mr. McAdoo.

When speaking to the *Railway Age* representative Mr.

Kasama outlined the commission's three extensive trips over the railroads of almost the entire country, the commission's mission in the United States, the possibilities of the American railway supply industry in the Far East, and he also expressed some opinions on American railroad operation.

The Commission's Three Trips

The commission's first trip was from San Francisco to Washington and New York. On the Pacific coast some time was spent inspecting the terminals and water front facilities at San Francisco and Los Angeles and in examining the methods of train despatching, signaling and yard operation. The commission then came east to Colorado and a stop was made at Pueblo to visit the plant of the Colorado Fuel & Iron Company, with which company the commission has since placed an order for 20,000 tons of standard American 75-lb. rails. From thence the party traveled east through Denver, Ogden, Omaha, Chicago, reaching New York early in November. At New York some time was spent in looking over the extensive terminals, particularly those of the New York Central and Pennsylvania, in inspecting the waterfront, including the Bush Terminal and other facilities, and considerable interest was shown in the construction and operation of New York's subway lines. The party then went on to Washington and considerable time was spent in visiting the Department of Commerce, the Railroads' War Board, the Interstate Commerce Commission, the Bureau of Railway Economics, the Bureau of Standards and other organizations and bureaus. Mr. Kasama expressed the commission's appreciation of the courtesy shown its members in Washington and commented on the co-operation extended by all with whom the members came in contact.

The commission then returned to New York, spending some time in Baltimore to inspect the Baltimore & Ohio's terminal facilities and particularly its coal handling plants.

The extensive western trip followed soon after. The commission first went to Schenectady to visit the plants of the General Electric Company and the American Locomotive Company, whence it went to Buffalo where considerable time was spent in examining the terminal facilities. From there the commission went to Chicago, from there to Duluth, Hibbing, Minneapolis, Sault Ste. Marie, Detroit, Cleveland, Ashtabula, Youngstown, Pittsburgh, Johnstown and Philadelphia. Railways, railway terminal facilities, iron mining, ore and coal handling and steel manufacture received their due consideration. At Sault Ste. Marie the commission showed particular interest in the canal and at Detroit in the automobile manufacture.

The third trip was that taken by the party on Dr. Shima's return trip to Japan. First, the commission went to Washington. From there its members went to Norfolk, where the coal handling facilities were inspected, thence to Bluefield where the Norfolk & Western's electrical installation came in for attention. Thence the commission went west over the Chicago, Milwaukee & St. Paul's electrification and over the Great Northern to Seattle where the handling of lumber was looked into. The party arrived in San Francisco late in December and Dr. Shima sailed on December 28, the day that Mr. McAdoo received his appointment as Director-General of railroads.

The Mission

One of the commission's purposes in coming to this country was to look into American railroad practice, the other to secure plates and other railway materials for export to Japan. Japan at the present time is contemplating the conversion of its lines to standard gage. The mileage of the empire totals about 10,000 of which 5,600 is directly operated by the Imperial Railways. The gage of nearly all of Japan's mileage is 3 ft. 6 in., but there are small sections

of 4 ft. 8½ in. gage and the railways operated by the Japanese government in Chosen are all of standard gage. The project of standardization is now in contemplation. The commission, said Mr. Kasama, expected that a bill providing for its carrying out would be introduced in the Diet this year, but recent advices to the commission announce its postponement until the next Diet which convenes next December. On account of this proposed standardization of gages the commission was particularly interested in the methods employed in parts of this country which were visited for transferring freight from narrow to standard gage railroads.

The commission was particularly on the lookout for ideas in American railroad operation that might prove worthy of adoption in Japan. As one result of the investigations, the Japanese railway administration is going to equip a complete train with American standards practically throughout with a view to observing the adaptability under Japanese conditions of automatic couplers, M. C. B. journal boxes, etc.

One of the results of the mission's visit has been the placing of the order for 20,000 tons of rails mentioned above. As a matter of fact, the commission has had in mind the securing of some of the tonnage previously decided on for the rails for the Russian railways. But further than that the commission has been trying to secure licenses for car plates and other materials for cars, locomotives and other railway equipment. This is not the same thing as the ship plates, Mr. Kasama emphasized, as the ship plates matter is in the hands of another commission.

Amazed at Passengers' Patience

Mr. Kasama was asked to express an opinion on American railroad operation. The commission, he said, was impressed by the size of the American cars and locomotives and the extensive terminals. "But," he added, "Dr. Shima and the rest of us were simply amazed at the patience of the American traveler. When a train is two hours or three hours late, the American just folds his hands and says, 'I wonder what's wrong. Well, I suppose something has happened and it can't be helped,' whereas if a train is late in Japan, the papers print long articles about it and the government is held responsible." Mr. Kasama did agree, however, that the tremendous strain on the railroads and the extremely bad weather conditions may have been largely responsible for some of the delay. Mr. Kasama also commented on the great number of competing and only partly filled passenger trains, but added that the taking off of so many trains lately had undoubtedly largely eliminated the waste in passenger service. He also complained about the lack of care in indicating the destination of trains. In Japan, he said, the trains always left and always arrived on the same track and signs were displayed on the trains themselves. Here, he noted, the trains are often changed from one track to another, sometimes at the last minute, and he commented on the fact that, according to his observation, passengers always asked the conductor whither the train was bound. Of course, he agreed that the present war-time conditions may have had considerable to do with the lack of smoothness in passenger train operation.

ALL AMERICANS CAN SERVE.—Every man, woman, and child in this country, who wants to serve the country, can serve it and serve it in a very simple and effective way, Secretary McAdoo says. That service is to lend your money to the government. Every 25 cents loaned to the government is a help at this time and practically every man, woman, and child by making some trifling sacrifice, some denial of a pleasure, or giving up some indulgence, can render the government that support.

Hearings Before Railroad Wage Commission

Representatives of Employees Complete Testimony. Railroad Officers Concede Need for Higher Wages

WASHINGTON, D. C.

THE RAILROAD WAGE COMMISSION on February 14 finished taking the testimony of representatives of labor organizations and of unorganized employees who had asked to be heard regarding their requests for increased wages and adjourned subject to the call of the chairman. Meanwhile the boards of statisticians and examiners appointed by the commission will continue their work of investigating the entire wage situation from the available statistics supplemented by the testimony and exhibits that have been presented by the witnesses. Testimony of railroad officers was begun on February 18.

Among the witnesses heard on February 13 was W. G. Edey, representing train dispatchers on the Seaboard Air Line, who asked for the same scale that had been requested by other dispatchers. He denied charges made by brotherhood officers that the railroad officers were trying to prevent transportation efficiency and he cited examples of engineers on the Seaboard who were receiving high wages.

James A. Hennessey, representing dining car stewards on the Pennsylvania, asked for an increase of 20 per cent in wages, with a minimum of \$150 a month, and shorter hours, with at least four days a month off.

A. B. Jenkins, representing the International Union of Molders, asked for increases of approximately 33 1/3 per cent.

E. T. Thompson, appearing on behalf of colored helpers and laborers of the southeastern roads, asked for a 20 per cent increase.

The testimony of Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers, on February 13, was only briefly referred to in last week's issue. He told the commission that at the time the railways were taken over by the government the engineers had no concerted wage movement in progress, that he had advised against it because he did not want to do anything that would jeopardize the country in keeping the lines of communication open. He said that the brotherhood had furnished men for the engineering regiments for service in France and he expected his men to make sacrifices on account of the war and that the lower paid employees should receive first consideration, but that the engineers as a class were not highly paid and that they should have an increase to partly meet the increased cost of living, to a minimum of \$6 a day.

He read sworn statements from engineers in various classes of service showing their wages for the month of January for eight hours' work a day for 30 days and their family expense accounts. The examples he cited were all of men with families of five or six, and the earnings ranged from \$103 to \$184, while in many cases the expenses for the month amounted to more than the earnings. All were making payments on Liberty Bonds. The man who earned \$184 ran 4,500 miles in passenger service. The engineer who runs the Congressional Limited train, he said, a picked man, who has to read correctly nearly 400 signals in 100 miles, is paid \$4.25 for 100 miles while unskilled negro laborers on government buildings in Washington receive \$5 a day. He quoted the various rates paid to engineers for eight hours or 100 miles, saying that if a man earned more than the daily rate it was by working overtime or making excess miles and he cited a table in the report of the Eight-Hour Commission showing the number of men receiving various amounts. This indicated, Mr. Stone said, that 50 per cent of the engineers earn less than \$150 a month.

About 95 per cent of the men in yard service had been put on an eight-hour basis, he said, but when the wage movement was started by the conductors and trainmen the roads began to increase their hours in order to show higher average earnings.

When Chairman Lane asked if the longer hours were not due to winter conditions Mr. Stone replied that he did not think so, and that there would be no shortage of men if the railroads would pay more. Engineers were remaining in service when they could get better pay elsewhere, rather than lose their seniority rights.

Referring to charges made by Mr. Shea that railroads were increasing their violations of the 16-hour law, Mr. Stone said one of his local chairmen had seen an order signed by Regional Director A. H. Smith directing the roads to disregard the law and to run engines to their terminals. This resulted, he said, in men working 20 to 30 hours. He had wired Director General McAdoo about the order and had received a reply: "No authority has been given for violation of hours of service law. I have so instructed the Regional Director."

Commissioner McChord remarked that an investigation is being made of reports of disregard of the law and a report is to be made to Mr. McAdoo.

Referring to questions put to Mr. Shea regarding the possibility of the firemen saving coal, Mr. Stone said that hundreds of thousands of tons of coal are wasted on the railroads but that the waste is "all down the line" and it is necessary to begin "back of the firemen." "It is no use to talk to the firemen about saving coal," he said, "when his engine is in such poor condition that it is wasting coal every minute. The roads have got to get their power in shape and their terminals and roundhouses. Some roads last year made no provision for winter at all." He said that the railroads had never before entered the winter season with power in such bad condition but he denied that it was due to shortage of men so much as failure to pay enough to attract good men. He also criticised the practice of employing women for heavy work, saying that England had not done so until after it had been in the war for a long time but that in this country the plan had been adopted "before we even got started in the war."

Chairman Lane, who has tried to bring out from most of the witnesses some idea of the proper relation between wages in various classes of employment, asked Mr. Stone about the relation between the wages of engineers and other employees. Mr. Stone said there was no definite relation but that the firemen's pay had been increased in greater proportion than that of the engineers because the larger engines had increased his work. Chairman Lane remarked about the responsibility of the dispatcher. Mr. Stone said he did not want to disparage the dispatchers but he did not think their responsibility as great as that of the engineer. He told the commission that of 100 firemen only 17 become engineers and of the 17 engineers only 6 become passenger engineers.

B. F. Richardson of the American Federation of Railroad Workers, appeared on behalf of men in the mechanical and bridge and building departments.

J. A. Franklin appeared on behalf of the railroad department of the American Federation of Labor, representing men in the mechanical trades, helpers and apprentices and railway clerks. He asked for \$6 a day for skilled em-

ployees and \$4.50 for helpers and described how these men had left the railroad service for higher wages elsewhere.

A. E. Barker, for the International Brotherhood of Maintenance of Way Employees, asked for \$3.25 to \$3.50 a day for section men and \$110 to \$140 a month for section foremen.

J. B. Parsons and F. R. Weller testified on behalf of civil engineers in construction and maintenance of way work. They did not ask for specific increases but that their case should be taken into consideration. Mr. Parsons contrasted the pay received by draftsmen, transmitters and other technically educated men with the wages of trainmen and mechanics.

Chairman Lane made a rough calculation when Mr. Franklin was speaking that the increases he asked would amount to \$82,000,000 a year. He pointed out that the increased wages would probably have to be paid by shippers but said he did not think the possibility of an increase in rates should be a bar to reasonable wages.

Railroad Officers Testify

The necessity for increased wages for a large proportion of the railway employees was conceded by the representatives of the railroads who appeared before the commission on February 18. They appeared at the invitation of the commission and said their purpose was not to oppose requests made by the employees, but merely to aid the commission by giving information. No one is more keenly aware than the railroad managements that many employees are not properly compensated, said J. G. Walber, secretary of the Bureau of Information of the Eastern Railroads, but he denied that the railroads had intentionally discriminated against organized and unorganized employees and said they had attempted to do what they could with their available resources to improve the condition of labor. Railroad officials need no evidence that the cost of living has increased and that the lower paid men need assistance during the war, said J. W. Higgins, chairman of the Association of Western Railways. Mr. Higgins expressed the opinion that all men receiving less than \$150 a month needed an increase and that perhaps the figure should be placed at \$2,000 a year, this being the amount exempted from the income tax by the government. Of course, he said, men drawing less than \$100 a month are entitled to greater consideration than those paid as much as \$150 a month.

Mr. Walber outlined the history of concerted wage movements in eastern territory and explained the necessity for an organization on the part of the railroads to deal with such movements and he described in a general way some of the wage schedules and their development for the purpose of showing that their effect upon wages is measured not merely by the rates, but also by the rules which affect the earning power of the employees. After railroad traffic began to pick up in 1915, he said, there was a general movement on the part of the railroads to increase wages among their unorganized employees without concerted demands. This began even before the railroads felt to any considerable extent the competition of munitions plants and other industries and went on all through 1916 and 1917. He had been unable to compile comprehensive statistics covering these individual increases because there was such a shortage of clerks that it was difficult to secure statistical information from the railroads, but he thought that skilled labor and clerks had received increases averaging about 15 per cent and that unskilled labor had received increases from 25 to 100 per cent. Meanwhile, the train employees continued under their former scales except as modified by the Adamson law settlement. He mentioned these things to show that the railroads had endeavored to take care of their employees in the best way that they could, but said they were unable to take care of all the employees. The telegraph operators, he said, have

received more adjustments since 1910 than any other organization and he submitted a tabulation showing the wages of 24,000 men on the eastern railroads averaging \$79 a month.

Mr. Walber said it was true that when rates of wages are increased the railroads often try to readjust their operating conditions in order to reduce the cost and to avoid the penalties, but to show the effect of wage adjustments he presented figures showing that if the 1909 basis had been in effect in 1915 the pay of the engineers on the eastern railroads would have been approximately \$6,000,000, or 18.3 per cent less than it was, and 3.57 per cent of the increase was due to changes in rules rather than the changes in the rates. Firemen had received an increase of \$5,205,000, or 25.61 per cent, of which 21.68 per cent was due to changed rates of pay and 3.98 per cent due to changes in the schedule rules. The conductors had received an increase of \$5,439,000, or 23.32 per cent, of which 3.54 per cent was due to the rules. Other trainmen had received an increase of \$12,300,000, or 29.91 per cent, of which 8½ per cent was due to the rules.

As to the effect of the Adamson law settlement, he said, the report of the Eight-Hour Commission speaks for itself, but in reply to some criticisms of it made by representatives of the brotherhoods he wished to state that with the exception of one statement dealing with delays between terminals, the statements in the report were made up by compilation of the time slips prepared by the men themselves. The railroads had merely compiled the information and the brotherhoods had had representatives at every conference and had the opportunity to check all the figures. Because the commission was allowed only \$25,000 for its expenses, the railroads had had to assume the expense of printing forms and compiling information. One form had cost \$20,000 to print. He said it was unfair to criticize the information because it was furnished by the railroads, because no one else could furnish it.

H. B. Perham, president of the Order of Railway Telegraphers, had told the commission about some station agents on the Central Vermont paid from \$30 to \$45 a month. Mr. Walber had made an investigation and found that the man paid \$30 a month was merely a caretaker of a very small station and his main business was that of a farmer. The men receiving \$45 a month were either mere caretakers or received additional income from commissions on express business. Mr. Walber also replied to statements made by Timothy Shea, assistant president of the Brotherhood of Locomotive Firemen and Enginemen, that railroads have tried to avoid paying increased wages awarded by various boards to the hostlers and that on one eastern road the road foreman of the engineers had written to a hostler changing his classification to that of engine repairer and giving him an increase from \$65 to \$70 a month instead of giving him the pay awarded to hostlers. Mr. Walber said he thought the eastern railroads had settled all controversies regarding the hostler question and on looking the matter up had found that the arrangement with this hostler had been the result of a mutual agreement between the railroad and the brotherhood, of which Mr. Shea had been advised, and that the man concerned was at an outlying point where he merely had to clean the fire and take care of one engine during the night.

Mr. Walber also submitted to the commission a large amount of statistical information regarding wages on the eastern railroads and information regarding their wage contracts. All the roads, he said, have contracts with the four brotherhoods. Most of them have contracts with the Order of Railway Telegraphers, only a few have contracts with the shopmen, but many have agreements with the employees on their roads if not with an organization. He thought that probably about 25 per cent of the employees were organized.

Mr. Higgins apparently caused some surprise when he advocated increases for employees earning less than \$2,000

a year. Chairman Lane remarked that that would include a very large proportion of the employees. Mr. Higgins said it would leave out many of the engineers and conductors. To show the trend of wages of the train employees, Mr. Higgins presented a compilation taken from the Interstate Commerce Commission reports showing that the average wage of the train employees for all roads had increased from \$810 a year in 1900, to \$884 in 1905; \$993 in 1910, and \$1,249 in 1914. Since 1914, he said, the statistics have not been on a comparable basis. Combining ton miles and passenger miles and referring to them as traffic units Mr. Higgins showed that in 1900 the number of traffic units per train employee was 824,000; in 1905, 793,000; in 1910, 902,000; and 1914, 1,037,000. The wages per train mile were 17.46 cents in 1900, 22.58 cents in 1905, 25.89 cents in 1910, and 31.36 cents in 1914. For each dollar paid in wages to train employees the railroads had received 1,018 traffic units in 1900, 896 in 1905, 908 in 1910 and 830 in 1914. In other words, while wages per employee had increased 54 per cent and wages per train mile had increased 79 per cent, the number of traffic units per employee had increased only 26 per cent and the number of traffic units per dollar had decreased.

Mr. Higgins outlined the concerted wage movements in western territory and then, to show the amount of recent increases in wages, mainly to the unorganized employees, he gave figures for nine western railroads, representing about 75,000 miles of line, which he had received by telegraph since he came to Washington. He had asked for these because the representatives of the employees had apparently given the commission the impression that the railroads had done nothing for their unorganized men. In 1916 these nine roads employed 319,185 men and their increase in wages during the year 1916 amounted to \$11,073,094, or an average of \$34.69. This figure does not represent the increase in wages per man for a full year, but is simply the average of the increases actually paid that year, some of which extended through only a small part of the year. In 1917 the same roads had 340,436 employees, an increase of about 6.7 per cent, while the payroll for the year increased \$39,013,612, an average of \$114.89 per man. While this included the effect of the Adamson law, Mr. Higgins said, that was a small matter, compared with the other increases paid. The total increase in wages for 1916 and 1917 on these roads amounted to \$50,186,706, an average of \$149.58, and if the same proportion of increase had been paid by all roads in the country it would amount to approximately \$250,000,000. The bulk of the increases were made in the latter part of 1917 and have only recently been reflected in the figures.

The largest recent request for an increase in wages was that of the conductors and trainmen. He had made a compilation for 63,000 miles of road, for which he had received returns, showing that the men included in this request in the month of October, 1917, had received in wages \$4,425,000 and that in their proposed schedule, without the request for time and a half overtime which they have since submitted to the government, the increase would have amounted to \$1,362,415 for the month, or 30.8 per cent.

Mr. Higgins said that in replying to his telegrams some of the nine roads had included their entire payroll, including officers, while others had omitted the officers, but he gave the figures by individual roads to show that the average increases per man on some of the roads that had omitted the officers were higher than the averages on the roads which had included the officers. Commissioner McChord remarked about the inclusion of officers' salaries, but Mr. Higgins said he thought that would make but little difference as he did not think officers' salaries had been increased recently, although many of the lower paid officers ought to have an increase.

"Do you think any of these officers ought to have their salaries reduced?" asked Commissioner McChord.

"I am not in a position to answer that," Mr. Higgins said, "but I think that after a man has spent his lifetime acquiring the knowledge and the capacity to handle a railroad, he is entitled to fair compensation."

F. W. Brown, assistant to the vice president of the Southern Railway, testified regarding wage schedules in the southeastern district.

Chairman Lane asked that information be filed for the eastern, southern and western districts, showing all increases in wages since January 1, 1916. The Wage Commission has also addressed a circular letter to all of the roads, asking for information regarding the number, wages and hours of their employees by classes, showing the number of men receiving wages classed by \$10 a month grade, and also showing the number of men and the amount of wages that would be required to put all employees on a basis of eight hours a day and 26 days a month.

E. T. Whiter, assistant general manager of the Pennsylvania Western Lines, described the work and conditions of employment of train dispatchers and operators and the operation of trains. He said train dispatchers receive about \$150 a month, work eight hours a day, usually have one day off a week, and two weeks' vacation, and in reply to statements that there is little opportunity for promotion, he mentioned that four vice-presidents of the Pennsylvania were formerly train dispatchers and a large number of other officers. Regarding the demand of dispatchers for an extra rate of pay for overtime and on Sundays, he said it would be feasible to provide that they should have one day off a week, but that to give the men Sundays off would require an additional set of dispatchers and as the railroad runs every day the pay should be the same for Sundays as for any day. He said the Pennsylvania System had never dealt collectively with employees' organizations except with the train employees and had not made a contract with them until 1910, but to show how it had treated its employees, he said that since 1900 the Pennsylvania Lines West have made horizontal increases to all employees of: 10 per cent in November, 1900; 10 per cent in December, 1906; 6 per cent in April, 1910; the latter increase including train employees. Train dispatchers had received an increase in 1913 of 6 per cent, in 1916 of 4 per cent, 1917 of 8 per cent. Telegraph operators in addition to the horizontal increases had received 5 per cent in July, 1911; 4½ per cent in July, 1914; \$5 a month on February 1, 1916; \$5 a month on February 1, 1917, and another \$5 a month on November 1, 1917. Other employees received an increase of 6 per cent in 1913 and of 8 per cent in 1917. Station agents and their forces receiving less than \$250 a month were given two increases in 1917 amounting to about 14 per cent and now receive from \$50 to \$200 a month, the majority from \$75 to \$125. Telegraph operators receive \$70 to \$114, averaging \$85.70. Yardmasters receive from \$140 to \$185, averaging about \$160. Yard clerks receive from \$60 to \$125, averaging about \$75. Various adjustments were also made with the shop employees in the year 1917, and in many cases the piece-workers receive more than their foremen.

In 1918 the payroll of the Pennsylvania Lines West was \$12,000,000 greater than in 1916, about \$5,000,000 representing the increases on account of the Adamson law for 15,000 employees and \$8,500,000 representing an increase to 55,000 other employees. To illustrate the difficulty in securing men for railroad service, Mr. Walter said that on the lines west on September 1, 1917, there were in service 67,790 men in maintenance and transportation departments as compared with 65,162 on September 1, 1916. At 40,000 had been in the service of the company for over a year, but to secure the 27,000 new men in nine months 88,000 men had been employed. In other words, three men were employed

for every vacancy because the men stayed such a short time, being attracted by the higher pay offered by industrial concerns.

Other railroad officers testified regarding the wages and working conditions in various departments, including F. G. Nicholson, assistant to the receiver, Chicago & Eastern Illinois; P. T. Latimer of the Chicago, Burlington & Quincy; C. H. Niemeyer, assistant engineer, maintenance of way, Pennsylvania Lines West; E. L. King, superintendent of telegraph of the Southern Pacific; E. C. Wills of the Missouri Pacific; C. P. Conklin of the New York, New Haven & Hartford; W. J. Tollerton, general mechanical superintendent of the Chicago, Rock Island & Pacific; D. R. MacBain, superintendent of motive power of the New York Central; E. F. Potter, assistant to general manager of the Minneapolis, St. Paul & Sault Ste. Marie; and J. R. W. Davis, engineer maintenance of way of the Great Northern.

Railroad Officers Not Disloyal

THE FOLLOWING is an extract from Interstate Commerce Commissioner George W. Anderson's speech to the New England Traffic Club at Boston on February 12, 1918:

There is one thing more I want to say to you. Of course there are all kinds of nasty rumors afloat as to bad faith on the part of railroad officials and of railroad employees—of an alleged desire that federal control be a failure—stories that they are holding up trains, allowing congestions to take place, and doing other things to impede traffic. I want to make my position on that entirely clear. It is this: I do not believe those stories. We in Washington are going to assume good faith and loyalty until the contrary is ascertained to be the fact. We are not going to assume that railroad officials and railroad employees are playing double with the American people in time of war until it is proved that they are playing double. And let me add that in my opinion, if disloyalty and double-dealing are ever proved, they will be proved against a very small number of men. But there will be no dealing with alleged disloyalty and bad faith by any brash guesswork. We propose to know what we are doing before we charge men—whether they be highly paid officials or moderately paid wage earners—with disloyalty. But if we find there is disloyalty, God help the men against whom it is proved.

And so when you see newspaper reports indicating that the railroad service is as "honey-combed with treason and disloyalty" as this region is "honey-combed with German spies" according to the Boston Herald and the Boston Transcript, you need not assume that it is true or that we in Washington are to work on the assumption that it is true. On the other hand, if you find evidence—real evidence—which indicates to a reasonable fact-respecting mind that there is disloyalty, let us have that evidence.

For my part, I have a profound belief in the loyalty and patriotism of the American citizen. And I care little whether he or his father or his grandfather was born in this country or was not born here. If there is anything that we in America need to keep in mind at the present time, it is that we are all immigrants. The only difference is as to the date of our immigration. It is high time that we had an end of charging disloyalty and treason simply because some of our best citizens have names which are not as nasal and as Yankee as some of our names. I will go further and say that I believe that a large share of the men with German names and Austrian names are just as good American citizens as those that have Scotch names like my own. Because my ancestors came over here a couple of hundred years ago it does not follow that I am any better an American citizen than those who have come here more recently. The Germans that came over here

after the '48 revolution because they could not stand in Germany the sort of thing that has now involved the whole world in war—the sort of American citizens typified by Carl Schurz—are just as good citizens as any of us, and they are not to blame because their names are German names. I am bitterly indignant at a denunciation of American citizens grounded simply upon the fact that their names are not what their denouncers would best like. I regard that attitude of mind as a menace to our public safety—as a threat against success in the cause into which we are putting the best of our American youth. I regard the propaganda of hate and denunciation emanating from some of our newspapers and magazines as a distinct public danger. This is no time for ill-grounded, vituperative, prejudiced denunciation. Wholesome criticism helps. Wild, lurid denunciation never helps.

What I am saying as to the broader question applies to the railroad situation. There will be plenty of mistakes made. We who are in office will make our share of mistakes. We expect to be criticised for our mistakes, but we don't expect to be denounced for them. We need enlightenment. Nobody realizes it better than we who have to make decisions on questions that it is almost impossible to decide. The men operating the railroads will make mistakes. A great many officials will have difficulty in comprehending the new national status and in forgetting that they are not working for the same old corporation, bound to get traffic for it and the most lucrative return for it. They must reorganize their mental processes, their mental habits and readjust them to the new status during the war period. Some of them will not do it easily. But if they act in good faith, are loyal to the cause, are genuine American citizens, deal with the problem and with us frankly and honestly, they will get a square deal. We who have official responsibility are going to give a square deal if we know how, and we expect a square deal. In a word, the administration assumes good faith—the American people demand of us and of everybody else in the public service good faith—we believe we shall have good faith.

New York World.

In Need of Repairs

Reduce Dynamic Augment for Heavy Locomotives*

The Need for Reducing the Weight of Reciprocating Parts; How the Reduction May Be Effected

By E. W. Strong

American Vanadium Company, Pittsburgh, Pa

IN no decade in the history of the American locomotive have there been more and greater improvements in design than in the last 10 years. What is rightly called the modern American locomotive is a very different machine from that of 10 years ago. Through the development of correct boiler and cylinder proportions; by the application of fuel-saving and capacity-increasing devices, and by refinements in detail design, the modern locomotive has been brought to a high degree of efficiency in operation and maintenance.

Through these means, and the introduction of new types of wheel arrangements, tremendous progress has been made in the construction of more and more powerful units to meet the never-ceasing demand for greater hauling capacity.

But in one respect there has been, generally speaking, no progress; to the contrary, approved practice is not on a par with that of 10 years ago. This is in regard to the weights of the reciprocating and revolving parts per unit of load. H. A. F. Campbell in his series of articles on "Reciprocating and Revolving Parts," which began in the *Railway Age Gazette*, Mechanical Edition, March, 1915, presents data which discloses this fact very forcefully. And this condition exists in face of the fact that never before has there been greater opportunity for betterment by taking full advantage of the developments in locomotive materials.

The present heavy moving parts result in a large unbalanced weight in the wheel counterbalances. This, revolving at high speed, has a great centrifugal force (commonly referred to as the dynamic augment), alternately increasing and decreasing the rail pressure on a wheel point. The principle is the same whether the dynamic augment is due to the overbalance of the weight added to partly balance the reciprocating parts, or that due to the lack of balance to fully balance the revolving parts, which condition sometimes exists in the case of the main wheel with relatively small drivers and long stroke.

While it is perfectly true that with the enormous increase in wheel loads the ratio between the dynamic augment at diameter speed† and the static weight per wheel is no greater today in high speed engines than it was 25 years ago, it is equally true that present tremendous static wheel loads more nearly approach the capacity of the track. There is less margin of track capacity and less opportunity for increasing it. Furthermore, it is no longer the high speed engine which requires the most serious consideration, but the freight engine. And in the latter class it is not the dynamic augment due to the weight required to balance the reciprocating parts, but that due to lack of weight in the main counterweight to balance the revolving weight on the main crank pin.

This is particularly true of the 2-10-2 type locomotive. In most existing engines of this type the lack of balance for revolving weight in the main wheel causes a much greater dynamic augment than the excess balance in the other wheels for the reciprocating parts. The dynamic augment in the main wheel is, of course, directly opposite to that in the other wheels.

Fig. 1 gives a graphical representation of the dynamic augment in the main and other wheels of a representative 2-10-2 type locomotive at diameter speed. The curves represent the action of the unbalanced weight throughout a complete revolution of the respective driving wheels. In the example selected, the engine had the following proportions:

| | |
|--|-----------------|
| Boiler pressure | 250 lb. |
| Cylinders | 31 in by 32 in. |
| Drivers, diameter | 63 in. |
| Total weight in working order | 401,000 lb. |
| Weight on drivers | 335,000 lb. |
| Weight of reciprocating parts per side | 2,604 lb. |
| Ratio of weight of reciprocating parts to total weight of engine | 1/152 |
| Piston thrust per pound of reciprocating weight | 57.9 lb. |
| Revolving weight on main wheel | 1,912 lb. |

In this case, only 35 per cent of the reciprocating weight was balanced. The main counterweight lacks 691 lb. of balancing the revolving weights on the main pin. The average excess balance in the other wheels was 408 lb. Fig. 2 represents graphically the maximum dynamic augment in

Fig. 1. Action of Unbalanced Weights in Wheels of a Representative 2-10-2 Type Locomotive

the main and other wheels of the same engine at various speeds from 15 miles per hour up to diameter speed. At 40 miles per hour, which is probably the maximum speed which this engine would ever attain, the dynamic augment in the main and other wheels is respectively 14,200 lb. and 8,400 lb., or 42½ per cent and 25 per cent, respectively, of the static weight of the wheel on the rail. Further, when the pressure of the main wheel on the rail is at its maximum the pressure of the other wheels is at a minimum. The charts and the above figures refer to the dynamic augments in single wheels only and not to the combined augments of the counterbalances in the corresponding pairs.

The above example is not extreme. The engine selected is a very appropriate example, because it was built largely to the railroad's designs. It is the mechanical departments of the roads that must be impressed with the necessity of improvement in existing counterbalance conditions.

Fig. 3 is a chart similar to Fig. 2, representing the dynamic augment in a representative 4-6-2 type locomotive with 60 per cent of the weight of the reciprocating parts

*From a paper read before the February, 1918, meeting of the New York Railroad Club.

†Speed in miles per hour equal to the diameter of the drivers in inches.

balanced. In this case, of course, there was no difficulty in fully balancing the revolving weights on the main pin. This engine has the following proportions:

| | |
|--|------------------|
| Boiler pressure | 200 lb. |
| Cylinders | 27 in. by 28 in. |
| Drivers, diameter | 73 in. |
| Total weight in working order | 305,500 lb. |
| Weight on drivers | 197,300 lb. |
| Weight of reciprocating parts, per side | 1,880 lb. |
| Ratio of weight of reciprocating parts to total weight of engine | 1/162 |
| Piston thrust per pound of reciprocating weight | 64 lb. |

The factor which made possible the development of the Pennsylvania Class E6 engines was the use of especially light reciprocating parts. With 66,500 lb. on a single pair of drivers, these engines established a record. By so reducing the weight of the reciprocating parts as to keep the dynamic augment within 30 per cent of the static weight on a wheel point, it was possible safely to use this enormous axle load. In fact, these engines produce less strain on track and bridges than many having 10,000 lb. to 12,000 lb. less weight on drivers.

The locomotive impact tests made by the Chicago, Burlington & Quincy point very clearly to the possibilities of using heavier and more powerful units on track that is at present loaded to capacity, through simply lightening the reciprocating and revolving parts, with consequent reduction in the dynamic augment. Four locomotives were tested, two of the 2-10-2 type and two of the Pacific type. In each pair, one engine had especially light reciprocating parts made of heat-treated alloy steel and the other parts made of ordinary steel. The two 2-10-2 type engines had approximately the same weight on drivers, while the reciprocating parts in one weighed 16 per cent less than in the other. With the Pacific type locomotives, the one with light reciprocating parts was 16,600 lb. heavier on drivers and had 6,600 lb. greater tractive effort, while the weight of the reciprocating parts was 5 per cent less than in the other.

The results showed that, in the case of the 2-10-2 type engines, the maximum impact on the rail of the one with light reciprocating parts was 35 per cent less than that of the other. In both cases the speed was about 40 miles per hour. In the case of the Pacifics, the one with the light reciprocating parts, though 10 per cent heavier on drivers than the other, produced less stress on track and bridges.

By taking advantage of the greater strength of alloy and special steel forgings and castings to use increased unit stresses, by using hollow bored crank pins and piston rods, rolled steel or alloy and special cast steel pistons, and by special care in the design of all details, a large percentage of saving can be effected in the weights of reciprocating parts.

TABLE I.—WEIGHT OF RECIPROCATING PARTS OF THREE CLASSES OF PENNSYLVANIA LOCOMOTIVES

| | 4-4-2 | 4-6-2 | 2-8-2 |
|--|---------------|------------------|------------------|
| Total weight | 240,000 lb. | 305,500 lb. | 315,000 lb. |
| Weight on drivers | 133,100 lb. | 260,000 lb. | 238,000 lb. |
| Cylinders | 23½ by 26 in. | 27 in. by 28 in. | 27 in. by 30 in. |
| Diameter of drivers | 80 in. | 80 in. | 62 in. |
| Piston thrust | 89,000 lb. | 114,000 lb. | 114,000 lb. |
| Weight of reciprocating parts per side | 1,014 lb. | 1,376 lb. | 1,470 lb. |
| Piston thrust per pound reciprocating weight | 87 lb. | 83 lb. | 77 lb. |

By far the great majority of roads using alloy steel forgings have been content to utilize them to provide an increased factor of safety. The few cases in which advantage has been taken of high tensile steels to reduce weights of reciprocating parts serve to show the possibilities. The Pennsylvania Railroad was the first to use especially light reciprocating parts; and still furnishes the most conspicuous example of such practice.

The weights of the reciprocating parts and the general proportions of three of their standard classes of road engines are given in Table I. For main and side rods, piston rods, pins and valve motion parts they use carbon steel, heat-

treated to give a minimum elastic limit of 50,000 lb., and 80,000 lb. tensile strength. Rolled steel pistons are employed; while the crossheads are made of .40 carbon electric furnace cast steel, having a tensile strength of 70,000 to 80,000 lb. per sq. in. By using sections which take full advantage of the greater strength of the materials employed, combined with the greatest care and attention to detail design, exceptionally light reciprocating parts have been attained.

The Pacific and 2-10-2 type locomotives on the C. B. & Q. previously referred to, are other well known examples of the application of especially light reciprocating parts. On these engines, heat-treated Nichrome steel was used for the piston rods, connecting rods, stub straps, pins and eccentric cranks. Pistons and crossheads were made of .40 carbon cast steel. In the 2-10-2 type engines, the weight of the

Fig. 2. Dynamic Augment in Wheels of a 2-10-2 Type Locomotive at Various Speeds

reciprocating parts was reduced 16 per cent. In addition, the weight of the revolving parts on the main pin were so reduced as to make it possible to omit counterweight bobs on the main axle. In previous sister engines with ordinary carbon steel parts, it had been necessary to follow such practice. A total saving in weight of 1,023 lb. per side was effected. The increase in the various calculated maximum stresses in the main and side rods as compared with the builders' standard practice for plain carbon steel averaged 21 per cent.

One of the most recent instances of utilizing higher tensile steels to lighten reciprocating parts is furnished by the powerful Pacifics built for the El Paso & Southwestern. For this purpose, heat-treated chrome-vanadium steel was specified for the main and side rods, piston rods, crank pins, eccentric cranks and crossheads. The engines had the following general proportions:

| | |
|--|------------------|
| Boiler pressure | 200 lb. |
| Total weight in working order | 311,500 lb. |
| Weight on drivers | 190,000 lb. |
| Cylinders | 27 in. by 28 in. |
| Diameter of drivers | 73 in. |
| Piston thrust | 114,500 lb. |
| Weight of reciprocating parts | 1,628 lb. |
| Piston thrust per pound reciprocating weight | 71 lb. |

By an increase in unit stresses of only 10 per cent as compared with the builders' standard practice for ordinary carbon steel, and by the use of hollow bored crank pins and piston rods, and a double bushing solid back end on the main rod, a total saving of 369 lb. per side, or 13 per cent of the weight of the parts affected, was obtained. Of this, 128 lb. was in the reciprocating parts. This meant 1,880 lb. reduction in the dynamic augment per wheel at 73 miles per hour.

In each of the above instances of weight reductions, heat-treated forgings have been the means selected for that end. But most roads lack equipment for heat-treatment. This has been the chief obstacle to the general adoption of heat-treated forgings. It operates particularly in repair work, where for any reason the forging has to be locally heated, thereby destroying the effect of the heat-treatment. The more simple a steel and the more simple its treatment, the better adapted it is to American railroad conditions.

To meet all the special conditions entering into locomotive design, construction and maintenance, the American Vanadium Company, about five years ago, developed a type of vanadium steel that without heat-treatment other than the usual simple annealing gives all the physical requirements for heat-treated (quenched and tempered) plain carbon steel. This steel, known as carbon-vanadium, is one of the simplest types of alloy steels, being a plain carbon steel with vanadium alone added.

Tests of solid driving axles 11 in. in diameter of this type of steel, annealed, gave the following physical properties:

| | | |
|-----------------------------------|--------|--------|
| Elastic limit, lb. per sq. in. | 59,260 | 60,430 |
| Tensile strength, lb. per sq. in. | 88,270 | 92,520 |
| Elongation in 2 in., per cent. | 25.5 | 24.5 |
| Reduction of area, per cent. | 48.9 | 50.0 |

Compared with ordinary annealed carbon forgings, carbon-vanadium steel has over 25 per cent higher elastic limit, or useful strength. When higher physical properties

Fig. 3. Maximum Dynamic Augment in Wheels of a Pacific Type Locomotive

are desired than can be obtained by simple annealing, results can be obtained by heat-treatment that approximate those from the more complex alloy steels.

A study was recently made of the amount of weight that could be saved in the reciprocating and revolving parts through an increase in unit stresses over approved practice for plain carbon steel, equal in proportion to the increase in the minimum elastic limit of annealed carbon-vanadium steel as compared with plain carbon steel. Several representative heavy locomotives were selected for investigation. The builders' adopted practice for maximum allowable unit stresses for plain carbon steel was taken as the base; and new sections worked out, keeping within the limit of 25 per cent increase over these stresses.

Two of these locomotives were the ones for which the dynamic augment curves shown in Figs. 2 and 3 were plotted. In the case of the 2-10-2 type, the results show a reduction of 326 lb. in the weight of the revolving parts on the main pin. This would mean a reduction of 6,700 lb. in the present dynamic augment in the main wheel at a speed of 40 miles per hour, due to the existing lack of 691 lb. in the main counterweight. The above saving in weight, and the reduction of 296 lb. in the reciprocating parts gives a total reduction of 622 lb., or 155 lb. per wheel, in the excess balance that had to be added to the counterweights

of the other wheels. This means a reduction of 2,200 lb. in the maximum rail pressure at 40 miles per hour on any one of these wheel points, assuming that all the weight saved in the reciprocating parts would be taken out of the counterweights.

By the use of vanadium cast steel for crossheads and pistons, or rolled steel pistons, and by special care in design, considerable additional weight reduction could be effected, probably 250 lb. at a very conservative estimate.

The total estimated saving in weight in the reciprocating and revolving parts through the modified designs is 921 lb. per side.

Apart from its relation to the dynamic augment, this weight taken out of the running gear could be added to the boiler. The above amount combined with what could be saved by using hollow bored axles of carbon-vanadium steel, would make it possible to add 1½ in. to 2 in. to the diameter of the boiler, without increasing the total weight of the engine.

In the case of the Pacific type locomotive, the results show a saving of 260 lb. in the weights of the piston rod and front end of main rod. This means 86 lb. reduction in the excess balance in the wheel counterweights, which would result in 3,900 lb. decrease in maximum rail pressure on a wheel point at diameter speed.

Piston thrust was taken as full boiler pressure times the area of the piston. The stresses were calculated by the formulae in use by the builders.

Extended piston rods were applied to both the 2-10-2 and Pacific type. In the modified designs the extensions are eliminated. The use of the ordinary piston rod with a piston having an extended wearing shoe is considered good practice and is rapidly supplanting the use of the extended rod. Hollow bored extended rods of the Pennsylvania type could be used with almost as much saving in weight.

Discussion

A number of members took part in the discussion. Marked advantages of the alloy and special steels in making it possible to reduce the weight of the parts, and thus the dynamic augment, were not questioned. James Partington, estimating engineer, American Locomotive Company, stated, however, that the use of these steels was not progressing as rapidly as the advantages seemed to warrant, because of the commercial and manufacturing conditions which confront the railways and the locomotive manufacturers. A number of months is now required for the delivery of the special heat treated parts and, even under normal conditions, a much longer time is required than for carbon steel forgings. This is a bad handicap when it is necessary to replace forgings, because of defects, in the erecting shop or in making regular running repairs. Mr. Strong, in replying to this criticism, suggested that the automobile manufacturers were using the alloy steels to the greatest possible advantage and that the difficulty in question could be overcome if the railroads would carry extra parts in stock.

W. E. Symons called special attention to the advantages of the four-cylinder compound locomotives in reducing the dynamic augment to a minimum. J. J. Yates, bridge engineer, Central of New Jersey, commented on the disastrous effect of an excessive dynamic augment upon the bridges and said that heavier wheel loads would be permissible in the proportion to which the dynamic augment could be reduced. The discussion also developed the fact that the high speed locomotives could be fairly well balanced but that the slow speed heavy freight engines were unbalanced to a very considerable degree because of the small diameter wheel and the fact that an adequate amount of counterbalance could not be provided. The use of the lighter parts would, of course, prove a very distinct advantage in such cases.

Joint Conference of Capital and Labor

IN THE COURSE of the reorganization of the Department of Labor, a joint conference committee, representing capital and employers on the one side and labor unions and employees on the other side, has been appointed to work in conjunction with Secretary of Labor Wilson. The National Industrial Conference Board has chosen the following to represent the employers:

Loval A. Osborne, New York, vice-president of the Westinghouse Electric & Manufacturing Company and chairman of the executive committee of the National Industrial Conference Board.

Charles F. Brooker, Ansonia, Conn., president of the American Brass Company.

W. J. Vandervoort, East Moline, Ill., president of the Root & Vandervoort Engineering Company.

L. F. Loree, New York, president of the Delaware & Hudson, chairman of the board and executive committee of the Kansas City Southern, president of the Hudson Coal Company, Northern Iron & Coal Company and Schuylkill Coal & Iron Company.

C. Edwin Michael, Roanoke, Va., president of the Virginia Bridge & Iron Company.

The American Federation of Labor has appointed the following as representatives of labor:

Frank J. Hayes, president of the United Mine Workers of America, Indianapolis, Ind.

William L. Hutcheson, president of the United Brotherhood of Carpenters and Joiners of America, Indianapolis, Ind.

J. A. Franklin, president of the Brotherhood of Boiler-makers & Iron Shipbuilders of America, Kansas City, Kan.

Victor Olander, representative of the International Seamen's Union of America, Chicago.

T. A. Rickert, president of the United Garment Workers of America, Chicago.

These ten men are to choose two additional members as representatives of the public.

Secretary Wilson, in announcing the appointments of members of this committee, wrote them in part as follows:

"Agreements of members and policies, which would govern the relations between employers and workers during the war, will greatly facilitate the formulation of a national program and will contribute largely to a successful administration of that program."

Among the questions to be considered by the conference committee will be those dealing with the basis for wage determination, strikes and lockouts, piece work prices and

price fixing, means of eliminating improper restrictions on the output of war materials, methods of promptly adjusting disputes at their source through boards containing equal representation of employers and employees, etc.

The first meeting of the conference will be held at the office of Secretary Wilson, February 25.

Standardization of Purchases

HENRY WALTERS, chairman of the Atlantic Coast Line and the Louisville & Nashville, who is acting as special adviser to Director General McAdoo, is in charge of the studies being made for the purpose of establishing standard designs of cars and locomotives to be adopted by the railway administration. Mr. Walters has held numerous conferences with car and locomotive builders on the subject and expects to have several more before anything has been decided.

The committee on cars appointed last summer by the Council of National Defense, at the time when it was proposed to have the government buy freight cars for the railroads, has been delegated to investigate the question of freight car standards and a new committee on locomotive standards is to be appointed by Mr. McAdoo. The car committee consists of S. M. Vaulain, vice-president of the Baldwin Locomotive Works; W. H. Woodin, president of the American Car & Foundry Company; J. M. Hansen, president of the Standard Steel Car Company; N. S. Reeder, vice-president of the Pressed Steel Car Company and Clive Runnels, vice-president of the Pullman Company.

John Skelton Williams, director of the divisions of finance and of purchases, is to organize a staff of assistants which will be in the nature of a central purchasing board for the railway administration. Samuel Forcher, purchasing agent of the Pennsylvania Railroad, has been temporarily assigned as assistant to Mr. Williams to conduct a general investigation of the general subject of handling railroad purchases with a view to working out a plan, and other railroad officers will be called in to assist from time to time as occasion may require. It is understood that the administration intends to take charge of the purchase of cars, locomotives, rails, oil and other important items of railway supplies which are to be standardized, but it is not the present intention to take over all railway purchases and undoubtedly most kinds of supplies will continue to be purchased by individual railways as at present. The extent to which the administration will take charge of railway purchases will depend largely on the result of the investigation.

Labor Turn-Over Problem. Functions of the Corporation School. Vital Necessity of Such Schools

By Norman Collyer
Southern Pacific Company

THE RAILWAYS OF THE UNITED STATES engaged in interstate commerce employ about 1,800,000 persons. If we include interurban and street railways the number is increased to over two million. Now conceive, if you will, a great map of the United States on which each of these employees is represented by a tiny electric light. Some are moving along the familiar tangled lines indicating railway systems, but the greater number are stationary and grouped about the large terminals. Everywhere lights are being extinguished, sometimes by the death, more often by the resignation or discharge of an employee; and everywhere new lights are appearing as new employees are hired. Five times a minute, 300 times an hour, 7,200 times a day, employees are being lost and replaced. These figures are assumptions only, but they are conservative and probably far below the facts.

No one knows what the labor turn-over in the railroad industry amounts to, and as employment statistics are now kept—or rather, not kept—there is no way of getting at it. I base my data on the number of time vouchers issued by the Southern Pacific Company during a normal year, for although time vouchers are occasionally issued to persons not leaving the service, these rare instances are more than offset by those leaving the service who do not receive time vouchers. The avoidable cost of this labor turn-over likewise is unknown, but is certainly staggering in its magnitude. Probably \$40,000,000 a year would be too low an estimate. Magnus W. Alexander, of the General Electric Company, analyzed a group of 12 factories employing some 40,000 hands, and by certain reasonable and perfectly defensible assumptions proved that 22,031 employees were hired during the year 1912 in excess of their apparently necessary requirements at a cost of \$831,000, or an average of \$37.72 for breaking in each man hired. The Ford Motor Company by giving the subject attention reduced its labor turn-over from 400 per cent to 23 per cent; the Cleveland Foundry Company from 240 per cent to 125 per cent. These are special instances, cited merely to show that labor turn-over can be reduced and that in each case the diagnosis precedes the cure.

Let us consider what takes place when a new light appears upon our map—that is to say, when a new employee is hired. He wants the job, else he would not have taken it, but before he can make a beginning he must understand what is desired of him. He needs instruction. If he has some ingenuity and initiative, and especially if he can interpret his job in terms of previous experience, he is likely to attempt self-instruction—to experiment, “cut and try,” spoil his work, break his tools, and hurt himself or his fellow-workmen. After his task has been explained to him he will be awkward and forgetful, hence instruction needs to be repeated as training. Even when he clearly understands the requirements of his position he is apt to become lazy and careless unless checked up by constant supervision. But supervision alone is weak and ineffectual, and requires the backing of an adequate system of discipline. Whenever men are gathered together for any large undertaking, these four elements follow each other as surely as the phases of the moon—first *Instruction*, then *Training*, then *Supervision*, then *Discipline*.

Under the corporation school plan the beginner does not learn by self-instruction; nor by watching others and taking hold when he is allowed to; nor by the casual instruction of his associates, who are too indifferent, too busy, and too unskilled as teachers to make such instruction effective; nor by the competent but hurried and infrequent instruction of a foreman or supervisor whose time is more profitably occupied in directing the work of skilled employees. He learns by none of these methods, but is made ready for his work by acquainting him with its requirements and drilling him in its performance in an orderly, carefully preconceived manner, to the end that waste of time and effort may be eliminated.

The Corporation School

The purposes of corporation schools are three-fold: (1) to teach a particular task involving a short series of closely related duties, such as comptometer work, or the operation of a telephone switchboard; (2) to teach a trade, as in the case of mechanical apprenticeship systems, or schools for dining car chefs; (3) to teach subjects related to a task, a trade, or a business, thus presenting an opportunity through voluntary study to increase present efficiency or prepare for advancement.

The methods used vary with the purposes of the schools: We have the recitation method used by the Southern Pacific board of examiners on train rules, which is without doubt the oldest method used in any kind of school, dating back to the days of Greece and Rome; the lecture method, likewise a survival from the medieval period when books were scarce and their contents had to be dictated to the students; the supervised study method, popular in shop apprentice and telegraph schools; the laboratory method, which is the method of learning a thing by doing it—not necessarily in a laboratory, but wherever it is normally done; and the correspondence method, which is of special interest to railroad companies, whose employees work on such irregular hours and are scattered over such a vast territory that they can frequently be reached in no other way. It is quite possible that entirely new methods of instruction may be discovered, just as the correspondence method was invented about 25 years ago.

These different methods are applied in a great variety of ways: There are schools in which the employee spends all of his time in learning and is not expected to do any productive work whatever during the period of his training, as in the case of the educational trips given by the Southern Pacific to selected groups of ticket clerks, or a more recent and striking illustration the Reserve Officers' Training Camps of the National Army; schools in which study and practice are blended, as in the Southern Pacific agency school; schools in which the employee's time is made as productive as possible, no related instruction being given on company time; and continuation schools, which as the name implies, are designed to afford the employee an opportunity to continue his general education under the company's guidance while earning a livelihood. These last may be maintained either by the company or by public or private institutions in co-operation with one or more corporations. The manufacturing industries of Fitchburg, Mass., Akron, Ohio, and

* Abstract of an address before the Pacific Railway Club, January 10, 1912

Providence, R. I., have attained a degree of co-operation with public instruction that eclipses that of any railroad company I know of.

If we are to meet the needs of the future; if we are to maintain our roadway and equipment in a manner satisfactory to the Government; if we are to weather the present shortage of labor and survive the further loss of thousands of skilled workmen to ship-yards, factories and mills to the shops of the ordnance department, to the Governmental offices at Washington; above all, if we are to contribute our necessary and patriotic quota to the battle-fields of Europe—it must be through a better use of our man-power, a more intensive training of our employees. The corporation school offers a means through which this can be accomplished. It is past the experimental stage. Whatever your problem, be assured that some other corporation executive, somewhere, has met the same problem and tackled it. The fruits of his experience it is your duty to obtain. I am not so fatuous as to believe that the corporation school can whistle up employees where none are to be had, or that it is a panacea for all the labor troubles to which the harassed railway manager is heir; but it is a proven assistance in getting new men quickly into their stride and holding them in the service.

What Are You Doing?

"But," you exclaim with pride, "we already have a corporation school. Look at our mechanical apprentices—look at our airbrake instruction rooms—look at our office work schools."

Are you really doing these things, or are you merely going through the motions? Are you supervising your students, and are you supervising the supervisors to see that the students are not pulled off their studies and diverted to other work to meet the local convenience of a department? Are they getting the instruction and training which it was the intention they should get, or does the caption "student" or "apprentice" on the payroll satisfy you? Are you correlating your educational work with employment, safety and welfare activities? Are you developing and extending your educational work so that when once the employee has formed the habit of learning, it will follow him through his railroad career? Have you established relations with the educational institutions in your territory? Have you started such records as will enable your management to know at any time the results of your educational system, including particularly the failures and those who leave the service, so that their number may be reduced? Have you formed alumni associations where enough employees have completed formal training to justify them? Above all, have you adjusted your organization so that the graduates of your corporation schools, if competent, will have opportunity to do the work for which they were trained, at the full wage, with the support of their superiors, the respect of their fellows, and the loyalty of their subordinates? If not, you have not made even a beginning.

I claim no novelty in the ideas here advanced, for they have long been dwelt upon by gifted writers and eloquent speakers. Thirty years ago Dr. W. T. Barnard, assistant to the president of the Baltimore and Ohio, published an extensive report entitled "Technical Education in Industrial Pursuits, with Especial Reference to Railroad Service," which was widely circulated; and the plan for a railroad college proposed in 1887 by Walter G. Berg, chief engineer of the Lehigh Valley, caused considerable interest and comment in that year. Looking back from this distance, it appears that neither of these gentlemen realized the prime importance of making the training of railroad employees a function of the railroad itself, by, for, and within the railroad, rather than a detached activity perhaps to be supported by the railroad. At any rate, the Barnard plan, for which the directors of the Baltimore and Ohio had appropriated \$20,000

per annum, suddenly collapsed, and the Berg plan never got beyond the stage of discussion.

As early as 1898 the American Railway Master Mechanics' Association adopted a Recommended Code of Apprenticeship Rules, and in 1905, following the publication of Geo. M. Basford's historic paper before that association on "The Technical Education of Railroad Employees" re-awakened interest resulted in the establishment on a number of roads of mechanical apprenticeship systems designed along modern lines. Nor is this movement confined to the motive power department; the 1915 edition of the Manual of the American Railway Engineering Association, page 131, refers to methods of educating section foremen, and in fact in almost every department of the railroad industry there are examples of similar undertakings. Alas, the failures far outnumber the successes! Some were born of the enterprise of a single individual and perished when for one reason or another his support was withdrawn; some were founded upon incorrect principles and hence were predestined to failure; some were without provision for an adequate supply of new recruits, while others turned out graduates faster than positions could be found for them, causing a back-wash into the school with consequent discouragement and demoralization; many were started with good intention, but lacked definite educational program, competent instructors, well-defined policies—in short, their failure was a failure in management. All honor to the mechanical department of the Santa Fe, which instituted an apprenticeship system in 1907 and stuck to it! With 622 of its graduates in service, many in official positions, that road is reaping the benefits of its steadfast and progressive policy.

Vital Necessity of Corporation Schools

This problem, however, because of its importance transcends the boundaries of any one department; it affects all departments, and hence should command the attention of the highest executive officers. If you will allow me to revert to the subject of relations with public instruction, in which we are some twenty years behind the cash register, the rubber and the electric manufacturing industries, I shall give you an illustration. Would you, Mr. Purchasing Agent, enter into a contract to buy material from a concern the excellence of whose product you had grave reason to doubt? Would you place orders to the tune of three and one-half million dollars a year, waive inspection of material, accept whatever was offered you, and make no effort to get your money's worth? You would not—not if you expected to hold your job. And yet that is what you are all doing with respect to the public education system of California. In 1916 the railroads of this State paid in operative taxes \$7,151,583. Of this sum 51 per cent, or \$3,647,300, was used for purposes of public education. The boys and girls sent you from the public schools you take into your service, sometimes after a perfunctory mental examination, generally with none; you waive inspection, and then complain of the character of the material after it has reached you and been paid for.

How did the Southern Pacific engineers reduce rail failures per 100 miles of track from 31.10 in the first six months of 1911, to 5.16 in the same period of 1914? Not by standing idly by and deploring the product of the mills. They collected their data with respect to steel rail performance, decided which mills were the most reliable and which methods of manufacture gave the best results, then followed it up by sending their metallurgists and inspectors to the mills themselves to see that such methods were observed insofar as their own rails were concerned.

Where is the railroad that has tried to improve the product of the schools? The school-masters would resent your counsel as an intrusion, say you? From my own experience, I know they would welcome it. What are they working for, if not the usefulness, the success, and the material welfare

of their graduates? Are they not interested in what becomes of the twelfth part of their product that is normally destined for the railroad industry? Every school with which you establish helpful relations will then become a recruiting station for your lines, and you can get the cream of its output, if you will. I look forward to the time when representatives of the railroads will sit in the councils of the National Education Association, not as railroad men soliciting passenger business, but as educators charged with the training of an important fraction of the population of the United States. Such representation will require a broad vision of the needs of all departments, because public instruction is of necessity the common denominator of all forms of human industry—it is not intended to serve one industry alone, much less this or that department of a single industry.

It may perhaps be suggested that corporation schools are all very well for concerns under private management and control, but that the railroads, since they are for the time being an arm of the Government, could not with propriety undertake to usurp the functions of another arm of the Government. The argument is fallacious, because education being a governmental function, should be assumed by whatever agency can best accomplish it. For 70 years the British Admiralty has maintained a splendid system of apprenticeship, from which selections are made through competitive examination for Keyham College, whence a still smaller number reach the Royal Naval College at Greenwich. The

Great Eastern Railway, the London & Northeastern Railway and Great Western Railway of England have had educational systems nearly as long, and are not now so engrossed in the bitterness of war as to neglect them.

Certainly it costs money to train men properly—it takes equipment, furniture, tools, and plenty of instructors to develop them fast and make them productive as quickly as possible. It costs more money not to train them—it costs millions in accidents, injuries, broken tools, spoiled work, loss of their own time and of the time of foremen and others, careless habits allowed to go uncorrected, and the needless heavy labor turn-over. These vast sums may be buried in the accounts, but they are there, just the same.

Hasten the day of that American railroad whose vigorous and far-sighted management will give these questions the consideration they compel! They require time, patience, professional skill and managerial capacity of the highest order for their solution. We have in the railway men of America an army twice as large as the army which Xerxes marched down from the plains of Cappadocia, and which was, until the present war, the largest army in history. If this great army of railway men is to be counted among the resources of America, we must enlist their co-operation, train their muscles, energize their faculties, mobilize their intelligence, and unite their powers into one great organization that will be a determining factor in the patriotic enterprise of winning the war.

More Data Required on Transverse Fissures*

A Discussion of Some of the Conditions Surrounding the Development of This Form of Failure

By C. W. Gennett, Jr.

Manager, Rail Inspection Department, Robert W. Hunt & Co., Chicago.

SINCE THE LEHIGH VALLEY ACCIDENT transverse fissures have become a source of constant anxiety to railroad officials because such defects, only infrequently detected by the trackmen, may first appear under trains entirely without warning. The number of actual accidents resulting from rails containing fissures is no doubt a small part of the whole, but the large losses that have been directly attributable to fissures, coupled with the continual possibility of repetition creates an alarming situation that demands a full investigation of the cause of fissures apart from other types of rail failures. Mr. Howard's position gives him a field for action and opportunity for laboratory examination and research that is unsurpassed, and the results of his investigations must be received with the utmost attention and respect. His admirable paper, summarizing his previously published studies and analyses of the transverse fissure problem, constitutes a convincing treatment of the subject chiefly from the standpoint of stress and strain to which rails are subjected. The intricacies of the problem are so great that seemingly any theory advanced for the cause of fissures may be attacked from some angle; and although Mr. Howard's deductions are logical in the direction followed, there is the apparent necessity for considerable work along other lines before his theories can be fully accepted.

It is doubtless a generally conceded fact that fissures,

whether fundamentally due to fatigue or something else, are of a progressive character, their ultimate size being the result of growth from an originating nucleus or point of rupture. Abundant proof of this lies in the variable sizes of the fissures found, and there can be no doubt but that their development or growth is the result of the strains to which rails are subjected in the track. Obviously, therefore, the most important factor in investigating the cause for fissures lies in determining the conditions that exist at the point of original rupture, that is where the separation of the metal at the nucleus occurs. The composition of the steel chemically and structurally in this small area thus becomes of vital interest, and it is not sufficient to place too much credence in the manifestation of the good conditions that may be found elsewhere in the sample under investigation. The inferior conditions that may be present not only at the original point of rupture, but at other places, are manifold and minute, and examination of them requires careful and skilful work by trained metallurgists and microscopic observers. Absence of results of critical examinations of various specimens in many of Mr. Howard's government reports, including his present paper, is surprising and disappointing and does not carry conviction to the statement that "Critical examinations have shown transverse fissures to have their origin in metal microscopically sound and normal in structure." In fact, the results of some chemical analyses of steel containing transverse fissures that have been reported are such as to direct suspicion quickly to the quality and consequent structure of the steel and that "Neither chemical analysis nor microscopic examinations

*A discussion of a paper on Transverse Fissures by James E. Howard, engineer-physicist of the Interstate Commerce Commission, which was presented before the American Institute of Mining Engineers at New York this week. Mr. Howard's paper was published in the *Railway Age Gazette* of November 26, 1917, page 997.

have shown a definite cause for the development of transverse fissures" is due perhaps to insufficient chemical and microscopic work having been done to permit establishing such connection. The question is whether Mr. Howard's studies have been directed along certain metallurgical lines far enough to justify beyond argument those statements of his which plainly eliminate the chemical and physical condition of the steel from any responsibility regarding the origin of fissures.

Several reports have been issued by the Interstate Commerce Commission giving the results of Mr. Howard's work in connection with accidents caused by transverse fissures. The following table gives the average results of the various chemical analyses made on rails containing fissures mentioned in those reports.

| Rail | C | Mn | P | S | Si | Ni | Cr |
|---------|------|------|------|------|------|-------|------|
| A | .843 | 1.20 | .042 | .032 | | | |
| B | .66 | .67 | .050 | .033 | .016 | | |
| C | .69 | .79 | .095 | .025 | .005 | | |
| D | .83 | .79 | .062 | .041 | .165 | .066* | .05 |
| E | .84 | .79 | .059 | .040 | .152 | .28 | .02 |
| F | .801 | .91 | .015 | .041 | .125 | | |
| G | .71 | .77 | .121 | .030 | .093 | | |

*Probably incorrect.

None of the above rails, possibly excepting "F," are acceptable under the requirements governing the chemical composition laid down by recognized specifications for rail steel. The "slender deficiency" by which most of these steels fail to fulfill common rail specifications is not apparent and although "it is not always clear that the most suitable steel for the purpose is asked for in specifications" (probably meaning rail specifications) still the burden of thought is largely against the advisability of using steel of the hardness and brittleness indicated by the above. That such steels have been accepted and put into track, of course unknowingly and in spite of the specifications, is a criticism of the methods of procedure and by no means a defense for that steel when later fracture occurs.

Aside from being chemically defective in a general sense for use in rails, the above steels offer other significant features for consideration. High carbon coupled with high phosphorus makes a hard non-ductile steel to start with, but the effect that large amounts of these elements, singly or together, may have in small local areas deserves study. Further, the low amount of silicon in some of the steel above mentioned indicates the liberal use of aluminum at the time the steel was cast into ingots. Large amounts of aluminum added to steel, especially in the molds, has often been regarded as of doubtful practice, while the resulting presence of alumina in soft steel has been identified and the good qualities of the steel questioned. Recently alumina has been microscopically found in rail steel, and incidentally in rails containing transverse fissures.

Basic open hearth steel such as used for rails is easily subject to the many vicissitudes of heat treatment; in fact, rails are virtually heat treated by the action they undergo when cooling on the hot beds. The influence there of cold winds and contact with the cold skid rails may be marked. Some effects of unusual heat treatment may be and doubtless are confined to short longitudinal lengths of rail, and it is almost inconceivable that austenite or cementite does not exist locally in many cases. The presence therefore of distinctly non-ductile localities or regions is plainly predicated. All rails containing these hard spots caused by either chemical or physical conditions must be subjected, of course, to the damaging blows of the straightening presses long before they ever reach the track and apparently opportunity is thus offered for interior injury to occur.

Slag inclusions are held responsible by Mr. Howard for the chief type of rail failures, i.e., those known as split heads, the theory being that the inclusions are elongated in the process of rolling and become streaks in the metal which are unable to resist the shearing action of the traffic later.

But hard spots of a non-ductile character, originating perhaps from chemical causes or possibly minute globules of a distinctly foreign nature or the physical effects produced by the methods by which rails are cooled, are not regarded as menacing the integrity of the metal, merely because the presence of such conditions has not been even perfunctorily identified in the rails examined notwithstanding the indications, and the definite proof of their existence in certain other cases.

Thus it seems inconsistent now to attribute the cause of fissures to a type of purely fatigue fracture for which wheel loads are mostly responsible and the suggestion is advanced that as further microscopic work proceeds the effects of somins, non-ductile spots and chemically unsuited steel for the purpose used may be more fully established, while in the meantime the situation emphatically warrants a suspension of judgment until these painstaking studies can be made.

It seems regrettable that with a subject as important as that of transverse fissures no particular effort has been made to accumulate systematically the important historical data pertaining to the various cases. Obviously this is a work for the American Railway Engineering Association whose engineer of tests should have a complete index of the different cases with such information on each as would render unnecessary the need for dealing with generalities now so often the case. Such cataloging of the fissures that have occurred should show as accurately as possible among other things:

1. Name of manufacturer and railroad.
2. Dates of rolling and occurrence.
3. Heat number and chemical analyses (complete).
4. Location of rail in the ingot (and if possible the ingot in the heat).
5. Location of the fissure in the rail with respect to the branded side of the rail.
6. Location of the fissure in the rail with respect to the track gage side of the rail.
7. Was rail on high or low side of curved or straight track.

With the results of such tabulation covering a large number of cases the study of certain matters concerning fissures could be much better approached than now when comparatively few rather isolated cases must often be considered.

LOAN AUTHORIZED FOR RAILWAY CONSTRUCTION IN PERU.—Commercial Attache William F. Montavon at Lima, under date of January 15, reports that a bill passed by the Peruvian Senate authorizes the government of Peru to contract with the Banco Italiano, of Lima, for a loan amounting to 3,000,000 soles (\$1,500,000) to be employed in the construction of a narrow-gage railway connecting the present line of the Central Railway of Peru with the coal fields of Jatunhuasi. The loan is to bear an interest of 7 per cent and an amortization of 1 per cent. The term of maturity is not fixed in the bill.

TRADE OPPORTUNITIES IN SERBIA.—At a luncheon given by the Council of the British Engineers' Association to the members of the Serbian Industrial Mission in London on January 21, some interesting speeches were delivered, in the course of which mention was made of the many excellent opportunities for trade which would present themselves in Serbia at the conclusion of the war, particularly in connection with the reorganization of railway and river communications. Mr. Doushan Tomich, secretary of the Serbian Industrial Chambers, said that Serbia is very rich in raw materials, which had hitherto been developed by the Central Powers, and that in order to develop these, Serbia required machinery, tools, locomotives, electrical apparatus and other supplies. The suggestion was made by Sir Wilfred Stokes, of Ransomes & Rapiers, Ltd., that after the war Serbia would want railways and that England must be prepared to equip and finance them.

General News Department

Two passengers were killed and four seriously injured in a derailment of a Chicago, Burlington & Quincy passenger train near Curtis, Neb., on February 19.

J. Rothschild, has been made secretary of the American Association of Railroad Superintendents, succeeding E. H. Harman, who resigned in December when he was appointed superintendent of the Wiggins Ferry Company. Mr. Rothschild's office is at room 305, Union Station, St. Louis, Mo.

"Safe Practices" in the management of shafting, couplings, pulleys and gearing is the title of the National Safety Council's illustrated Pamphlet No. 8, which has just been issued. It consists of eight pages and the price is 10 cents. No. 9 deals with engine guarding and engine stops, automatic governors, etc., 16 pages; No. 10 is on oiling devices and oilers, eight pages. All of these are to be had from W. H. Cameron, general manager, National Safety Council, Chicago.

The Nevada-California-Oregon, south of Hackstaff, Cal., is now operated by the Western Pacific, the contract having gone into effect on January 30. This portion of the road includes the main line from Hackstaff, southward, to Reno, Nev., 65 miles, and the line from Plumas Junction, Cal., to Davies Mill, 40 miles. A large part of this mileage lies parallel to the main line of the Western Pacific. This arrangement leaves in the hands of the officers of the N.-C.-O., 171 miles. Hackstaff northward to Lakeview.

On the Great Western Railway of England there are torpedo-placing machines at over 1,500 signal cabins; and about one-third of these have been installed during the past year. This statement is found in the annual report of the signal department of the road. This report says that 13 additional signal cabins were put in use during the year and the total number of working levers now is 46,857, an increase of 603 during the year. These new installations have been made necessary by the establishment of government manufacturers, etc.

Jacob M. Dickinson, former receiver of the Chicago, Rock Island & Pacific and Secretary of War in President Taft's cabinet, is the head of a new law firm recently organized in Chicago. The new firm of Dickinson, Wetten & Keehn will include Jacob M. Dickinson and his son, J. M. Dickinson, Jr., Emil C. Wetten, Roy D. Keehn, William J. Matthews, Arthur J. Eddy, and C. H. Pegler. Mr. Pegler having previously been general counsel of the Aurora, Elgin & Chicago, is now the acting manager during the absence of the general manager in Washington on special war duty.

The shopman of the Grand Trunk are to have a general increase in pay, aggregating it is said, more than \$500,000 on all of the company's lines. The advance is in accordance with the decision of a board of conciliation which has recently made a unanimous report. The men affected are the machinists, the boilermakers and the blacksmiths, said to be about 1,300 men in all. The report also provides that grievance committees shall be established in the shops; the working day is to be 9 hours and the rate of pay is to be advanced 50 per cent for overtime and for work done on holidays. The agreement runs one year from the first of March.

The state of New Jersey has taken action looking to the construction of a bridge across the Delaware river between Camden and Philadelphia, and a tunnel across the Hudson between Jersey City and New York; this in the shape of three laws, approved by the Governor on February 14, looking to the appointment of a commission, the preparation of preliminary estimates, and providing for a tax to cover that part of the cost of the two projects, which, in the opinion of the legislature, should be borne by New Jersey. The commission called for by these laws will consist of eight members, to serve without compensation; and this body will be expected

to make the necessary arrangements with the officers of the states of New York and Pennsylvania.

The urgent deficiency appropriation bill, to supply deficiencies in the appropriations for the fiscal year ending June 30, 1918, as reported to the lower House of Congress on February 14, carries an item of \$125,000,000 for transportation of the army and its supplies. It also contains an appropriation of \$100,000,000, asked by Major General Goethals, acting quartermaster general, for a chain of quartermaster storehouses at the seaboard and at interior points to be used for army supplies. It is proposed to spend \$23,000,000 on storehouses at Norfolk, Va.; \$16,500,000 at Charleston, S. C.; \$12,970,000 at Philadelphia, \$10,700,000 at Boston, and other sums in the vicinity of New York. The gulf ports have not been included because of the long additional voyage to Europe.

Promptness in extinguishing fires by employees of the Pennsylvania Railroad is the salient point in an annual review by the insurance department of the company which has just been issued. By extinguishing fires before the arrival of the public fire companies they saved last year \$10,445,196 worth of company property. Altogether 334 fires were thus put out. The total loss sustained was only \$12,575. The total fire loss of the Pennsylvania Railroad System (east and west) including those cases in which the public fire companies responded, was \$306,465, showing the very low loss ratio of 8 c. for each \$100 of value at risk. The regularly organized fire brigades extinguished 66 fires, at which the loss was less than \$59 per fire. Chemical extinguishers checked 30 fires, resulting in a total loss of \$630 on property worth \$197,156. Fire pails were used 53 times to extinguish fires on property worth \$664,622, at a loss of \$1,292. Locomotive fire apparatus was used in 19 fires in which the combined loss was \$1,176, the property threatened being valued at \$332,420. Fire hose was used 18 times, and chemical engines proved their value in four fires. Sand pails, extinguishers and tug boats were utilized in putting out other fires. By following the general instructions given, the employees of the company, without the aid of apparatus, extinguished 107 fires at a total loss of \$2,064 on property worth \$355,500. Fifty-one fires were due to causes wholly beyond the control of the company or the employees.

Examination of Railroad Improvement Plans

Director General McAdoo has appointed a committee consisting of Francis Lee Stuart, chairman of the port terminals committee of the Council of National Defense; A. T. Hardin, vice president and chief engineer of the New York Central; A. C. Shand, chief engineer of the Pennsylvania; and H. A. Lane, chief engineer of the Baltimore & Ohio, to go over the budgets of desired expenditures for improvements for the eastern railroads which are being filed at Mr. McAdoo's request, and to make recommendations to him.

Charge of Sabotage Denied

At its regular quarterly meeting on February 12, the Cincinnati Railway Club passed a resolution refuting the imputation that the railroads of this country are not doing their full duty in supporting the government in the war effort. The resolution was passed after spirited addresses by John Judson Harrison and Col. Brent Arnold. Justice Harrison made an eloquent tribute to the loyal support given by the roads to the President in the stupendous work of prosecuting the war, and Col. Arnold declared that charges to the effect that the roads were attempting to hamper the administration were "gross and untrue and calculated to do injury to an industry which has been particularly conscientious in its efforts to promote the war program of the nation."

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF DECEMBER, 1917

| Name of road. | Average mileage operated during period. | Operating revenues | | | Maintenance of way and structures. | | | Operating expenses | | | Operating ratio. | Net from railway operation. | Railway tax accruals. | Operating income (or loss). | Increase (or decrease) last year. | |

Car Safety Appliances

The executive committee of the Master Car Builders' Association has issued Circular No. 26 announcing that the Interstate Commerce Commission has extended the date effective for the application of safety appliances to cars to September 1, 1919. To conform thereto, paragraph (m) of Rule 3 of the Rules of Interchange should read: "After September 1, 1919, no car will be accepted in interchange unless properly equipped with United States safety appliances or United States safety appliances, standard."

"Heroes at Home"

This is the title of a circular which has been issued by F. E. Loomis, president of the Lehigh Valley, addressed to all employees of the road and accompanied by a picture reprinted from the New York American. The picture and circular are copied below.

"Never have I seen more splendid devotion to duty than that manifested by Lehigh Valley Railroad men in the trying days we have experienced this winter.

"With the temperature for weeks below zero, blizzards and

by blasts seemed only to spur you on to greater efforts. There have been few slackers.

"I want to express to you my sincerest thanks. That you fought a winning battle is proved by the quick recovery the Lehigh Valley has made from each fearful assault of the weather—by the fact that we are now in shape to give the government the co-operation it rightfully expects.

"This would not have been possible but for the loyalty and untiring work of officers and men."

Boats for New York Barge Canal

One hundred boats of modern type, with necessary motive power, ought to be built at once for use on the New York State barge canal, which probably will be open throughout its length by May 15. This is one of the main recommendations in the report of Gen. W. W. Wotherspoon, superintendent of public works of the State of New York, which has just been sent to the legislature. Gen. Wotherspoon has had no visible success thus far in getting the authorities at Washington to take action looking to the construction of boats by government money or under federal authority. He says that

600 or more of the old style canal boats still in existence ought to be requisitioned and put into service on the canal this year. To show that under present conditions canal boats can make even better time than is made by the railroads, Gen. Wotherspoon has compiled records of a number of freight shipments from Buffalo to New York and of six cars which were traded the average time was 11 days (440 miles) and the quickest movement was in 8 days.

Regional Directors Appoint Assistants

R. H. Ashton, regional director in charge of the operation of western railroads, with headquarters at Chicago, has appointed M. J. Gormley, assistant in the president's office of the Chicago & North Western, operating assistant, and J. G. Woodworth, second vice-president in charge of the traffic of the Northern Pacific, traffic assistant.

C. H. Markham, regional director in charge of the operation of railroads in the South, with headquarters at Atlanta, Ga., has appointed L. W. Baldwin, vice-president and general manager of the Central of Georgia, his operating assistant, and Charles R. Capps, first vice-president in charge of traffic of the Seaboard Air Line, his traffic assistant.

Mail to Be Sent by Airplane

The Postmaster General proposes to establish aerial transportation for letters, on one route as soon as practicable, and has asked for bids for the construction of five airplanes for an aerial route for the delivery of first-class mail between Washington, Philadelphia, and New York, making one round trip per day. The contract will be awarded to the bidder whose airplanes have stood satisfactory service test in the war and navy departments. It is the purpose of the Post Office Department to make this a permanent service. An appropriation of \$100,000 is available. The call for bids requires airplanes capable of carrying 300 pounds of mail a distance of not less than 200 miles without stop, at a maximum speed, full load, of 100 miles an hour, a minimum speed, full load, of 45 miles, climbing speed of 6,000 feet in 10 minutes. The planes must have the Hispano-Suiza motor, 150 h. p.

The intention is, as soon as the authority of Congress is received, to establish a through aerial route to Philadelphia and New York, carrying 300 pounds of first-class mail, for the transmission of which a special postage rate will be charged, not exceeding 25 cents an ounce.

Conference on Conservation of Railway Fuel

A conference recently was held in Chicago at Maj. R. O. Schmidt, representing the Fuel Administration, and a number of representatives of the railways regarding methods which should be adopted to promote greater conservation of fuel by the railways. Major Schmidt, who was formerly professor of railway engineering in the University of Illinois, has been assigned by the War Department to the Fuel Administration, and the conference was called by him. Almost 50 men, representing the Railway Fuel Association, appeared at the conference, which included its services to the Government for the purpose of bringing about conservation regarding the use of fuel by railways. The members of this committee participated in the conference with Major Schmidt. They include Eugene McLaughlin, chairman of the general coal agent of the Frisco System, who is now in the coal business; W. L. Robinson, Baltimore & Ohio; L. W. Pratt, Chicago & North Western; L. R. Pyle, Seaboard; and D. E. Hunt, Railway Educational Bureau. Others who participated in the conference were M. K. Barron, Baltimore & Ohio; John Crawford and A. W. Wilson, Burlington; and Charles D. D. Indiana Coal Operators' Association. One subject made at the conference was as to the possibility of a unified system of fuel conservation on all the railways. It is an important question whether the matter of fuel conservation on the railways will be handled by the Fuel Administration or under the Director General of Railroads.

Following the Chicago conference, the Executive Committee of the International Railway Fuel Association telegraphed the Fuel Administration, informing the services of the association, its members and its executive committee, to the conservation division of

the Fuel Administration, "to make use of in any manner that can be advantageous to them in their tremendous and most important undertaking." The message was signed by E. W. Pratt, J. G. Crawford and W. H. Averell.

Congestion on the Pennsylvania

The daily statement issued by Commissioner McChord on February 18 of reports of the Interstate Commerce Commission inspectors on congestion of freight traffic, contains the following as to conditions on the Pennsylvania:

"The report of cars stored between terminals shows that on February 13 there were 4,285 loads and 9,799 empties, or a total of 14,084 cars, stored between terminals, while on February 4 there were 6,233 loads and 20,259 empties, a total of 26,492 cars stored between terminals. During the period from February 4 to 14 there was a decrease in the number stored between terminals of 1,948 loads and 10,460 empties, a total decrease of 12,408 cars.

"Comparing the reports of cars on hand for movement in all directions, at the principal yards of the Pennsylvania Railroad, there were on February 5 a total of 36,279 cars on hand, while on February 14 there were 40,484 cars on hand, an increase of 4,205 cars."

Be Good Soldiers!

W. J. Jackson, receiver of the Chicago & Eastern Illinois, recently issued an extended statement on patriotism which was sent to every employee of the road. The circular points out that the duty of the railroad employee in this country is no less sacred than that of the man in khaki "over there." Mr. Jackson's statement reads in part as follows:

"We all know that if our boys now in France are to accomplish anything; if the sacrifice of the lives in the sinking of the transport *Tuscania* the other day is to be avenged; if the outrages on humanity committed by the enemy are to be stopped—it will be by Americans—by us folks at home by our work, and as our efforts either give our soldiers and their allies all they need to fight with or fail to do so.

"If you were 'Over There' in a uniform, you wouldn't be an American unless you were 'on your toes' in doing things. No duty would be too difficult, disagreeable or dangerous for you to undertake cheerfully. This is the report that comes from every one of our boys now there, and it is just as true of those yet to go. The reports of the bravery and energy of the railroad recruits are particularly gratifying.

"Every railroad and every railroad man must 'do his bit' by doing his best to meet this emergency. To do our best is our plain duty; to do any less is absolute treason to those over in Europe risking their lives and sacrificing their life plans and many of them their health, for our account.

"Every extra effort in the repair of engines or cars; every additional car of freight moved; every little delay saved in keeping things going; every little misunderstanding avoided and every little cause for grumbling or dissatisfaction removed, will help just that much—for it is in doing the small things as they should be done that friction is avoided—and we must all try to avoid friction of every nature if we are to build up a proper spirit of co-operation to carry on our work."

New York Railroad Club

The next meeting of the New York Railroad Club on March 15, will be known as Annual Electrical Night. Edwin B. Katte, chairman of the committee, announces the following program for the occasion, the subject being "Recent Electric Locomotives:"

The New York, New Haven & Hartford new 180-ton passenger locomotive, which will be presented by E. R. Hill.

The Chicago, Milwaukee & St. Paul new gearless, bi-polar passenger locomotive under construction by the General Electric Company, which will be described by A. H. Armstrong, illustrated by lantern slides from photographs of the general drawings.

The Chicago, Milwaukee & St. Paul new quill gear locomotive under construction by the Westinghouse Electric & Manufacturing Company, which will be described by F. H. Shepard, of the Westinghouse Company, and illustrated by lantern slides.

The New York Central latest electric passenger locomotive, which will be briefly described by Mr. Katte, and illustrated with lantern slides.

Society for Testing Materials

The twenty-first annual meeting of the American Society for Testing Materials will be held at the Hotel Traymore, Atlantic City, N. J., on June 25 to 28, 1918. Atlantic City was selected as the place for this meeting on the basis of the information received a year ago in reply to a detailed inquiry addressed to the membership which showed a decided preference for this city over others suggested. The annual meetings of this society have been held at Atlantic City for the past 16 years, with the single exception of that in 1903, which was held at Delaware Water Gap.

Traffic News

The National Industrial Traffic League will hold its spring meeting at the Hotel LaSalle, Chicago, on March 21 and 22.

Irving T. Bush, president of the Bush Terminal, New York City, has resigned his position as chief executive officer of the War Board for the port of New York.

In Canada freight cars loaded with export freight must be filled to their full capacity. This is the substance of an order recently issued by the Canadian Railway War Board.

The Boston & Maine has discontinued the use of dining cars on three through trains leaving Boston for Montreal in the morning and on corresponding trains southward.

The Canadian Pacific announces further extensive reductions in passenger train service on its western lines. On some branches of light traffic the single train each way will run every other day instead of every day.

The state commissions of Indiana, Illinois, Michigan, Wisconsin and all but four states west of the Mississippi river have so far issued orders changing the demurrage rules applicable to intrastate traffic to conform with the latest revision of the interstate rules by the director-general of railroads.

Conrad E. Spens, vice-president in charge of traffic of the Chicago, Burlington & Quincy, has been appointed director of transportation for the United States Food Administration succeeding Edward Chambers, who had been serving since the first of the year as director of traffic in the railroad administration.

The Kansas City-Missouri River Navigation Company announces that beginning March 1 its transportation equipment, consisting of two tow boats and nine steel merchandise and lighter barges, will be ready for service on the Missouri River. The company expects to carry 2,000 tons of merchandise a week between East St. Louis, Ill., and Kansas City, Mo.

R. H. Aishton, regional director of western railroads, has asked the roads in his territory to prepare statements showing the location of traffic soliciting offices, both on the line and at outside points, indicating whether an agency is a passenger or a freight office or a joint office, and setting forth the cost of the maintenance of each agency, itemized according to the expenditures for rent, salaries and other expenses.

A large delegation of representatives of New England textile mills called on various government officials at Washington on February 18, to urge the necessity of increased coal shipments. They were assured by Director General of Railroads McAdoo and Chairman Hurley of the Shipping Board that transportation of 600,000 tons of coal by water and 400,000 tons by rail a month to New England was assured. This was more than the New Englanders had asked for.

Six million meals were served on Southern Pacific dining cars and restaurants in the twelve months ending with November, 1917. This is stated in the report of Allan Pollok, superintendent of the commissary department of the company. The Southern Pacific operates more dining cars than any other road in the country, and Mr. Pollok says that it has been complying fully with the suggestions of the Food Administration as to meatless Tuesdays and wheatless Wednesdays.

The buffet observation cars heretofore run on the Union Pacific-North Western train No. 10 from Ogden, Utah, to Omaha, Neb., and from Cedar Rapids, Iowa, to Chicago, have been temporarily discontinued. The Chicago & North Western also announces the following additional reductions in sleeping car service: Through sleepers from Kansas City, Mo., to Minneapolis, Minn., northbound, leaving Kansas City via the Missouri Pacific at 1:55 p. m. and the Chicago, Burlington & Quincy at 11:35 a. m., and southbound, leaving Minneapolis at 6:15 p. m., and entering Kansas City via the

C. B. & Q. and the Missouri Pacific respectively, have been discontinued. The through Kansas City-Sioux City sleepers, leaving Kansas City via the Missouri Pacific at 11 p. m. and leaving Sioux City, Iowa, at 8 p. m., have also been discontinued.

The Transportation Club of Louisville, Ky., held its annual meeting at the Old Inn Hotel on February 12; and the following directors and officers were elected: president, Ralph H. Morris, general freight agent, Southern Railway; vice-president, C. B. Stafford, manager traffic department, Louisville Board of Trade; secretary-treasurer, W. T. Vandenberg, commercial agent, Seaboard Air Line; directors, H. H. Hughes, Jr., superintendent, John P. Morton & Co.; Brent Arnold, Jr., division freight agent, Cleveland, Cincinnati, Chicago & St. Louis; Walter R. Hensley, vice-chairman commission on car service and embargo zone chairman; Arthur S. Key, traffic manager, Federal Chemical Company. The speakers at the banquet included Capt. Fernand Renaudeau of the French army, Capt. George F. Jeanes of the British army, Brig. General D. B. Devore of the American army and T. C. Mapother, a Louisville attorney.

An officer of the Canadian Pacific says that his road on one occasion diverted by way of the Soo Line 1,000 cars of freight so as to relieve the main line along the north shore of Lake Superior. These cars went from Winnipeg, via Minneapolis, to Sault Ste. Marie, and thence to Ontario. They consisted chiefly of grain for domestic consumption in Canada. One hundred cars of freight per day are being diverted from the Canadian Pacific at Quebec and are sent over the National Transcontinental to Halifax. This relieves the Canadian Pacific main line to St. John for classes of export freight more urgently required there. From Toronto 120 cars of freight eastbound for Montreal are turned over from the Canadian Pacific to the Canadian Northern every day. The Grand Trunk during the winter season has been diverting from 150 to 200 cars of coal per day to the Canadian Pacific and the Toronto, Hamilton & Buffalo, in order to lessen the congestion on the Grand Trunk at the Niagara frontier. The Grand Trunk has also diverted fifty cars a day to the Canadian Northern at Toronto.

Regulation of Railroad Steamers

The Marine Section of the Transportation Division is a new bureau of Director General McAdoo's organization to supervise the operation of coastwise steamship lines owned by railroads which were taken over by the Government. W. H. Pleasants, president of the Ocean Steamship Company of Savannah, Ga., has been appointed manager of the Marine Section and will give special attention to co-ordinating the relations between all shipping, including that on the Great Lakes, and the railroads.

Holiday Traffic Restricted

Director General McAdoo declined to give his approval to a plan for transporting a large body of Pennsylvania National Army troops from Camp Meade to Philadelphia for a parade on Washington's Birthday, holding it an unwarrantable use of engines, cars and tracks in the congested district. He has, however, approved a plan for the movement of two regiments from Camp Upton, over the Long Island road, to New York, the Long Island being in a position to handle the movement.

Campaign to Reduce Accumulation of

Freight at Chicago Freight Houses

The Chicago regional committee of the National Industrial Traffic League, which is co-operating with the Chicago committee of the Car Service Section of the Railroad Administration with a view to conserving transportation facilities in general, has been requested by the carriers to conduct a special campaign among receivers of freight, emphasizing the necessity for calling for shipments promptly upon receipt of notice of arrival. Under the storage rules the receiver of freight is entitled to 48 hours, free time, but some receivers make a practice of permitting their i. e. l. shipments to accumulate at the inbound stations for several days and weeks before arranging for disposition. The railroads are

furnishing the League's committee with the names of consignees who fail to remove their freight within 72 hours after notice, and the committee in turn is taking such cases up with the consignees and asking them to co-operate in the general movement to prevent congestion at the stations.

Drastic Embargo Covering 314 Square Miles

The three principal railroads in Philadelphia, the Pennsylvania, the Philadelphia & Reading and the Baltimore & Ohio, announced last week that, beginning February 18, no freight would be accepted at any point within ten miles of the Philadelphia city hall for movement to other points within that territory—an area equal to 314 square miles. There are 96 freight stations within this territory. Movement of freight from one station to another within the city of Philadelphia was discontinued, by these roads two months ago.

Freight Moving Freely

The congestion of freight in "Eastern" territory has been very materially relieved. By a report issued by A. H. Smith, regional director, it appears that between February 6, when the congestion was at its highest point, and February 19, the reduction in the number of freight cars "above normal" on all of the lines was 44 per cent. Temperatures are now favorable throughout this territory.

The detailed figures on the two dates named and for February 20 are shown below:

| Cars above normal | February 6 | February 19 | February 20 |
|-------------------|------------|-------------|-------------|
| Eastbound—loads | 59,784 | 39,457 | 38,910 |
| Eastbound—empties | 13,345 | 3,140 | 4,048 |
| Westbound—loads | 39,841 | 28,287 | 26,940 |
| Westbound—empties | 47,934 | 19,090 | 17,400 |
| Total loads | 99,625 | 67,744 | 65,850 |
| Total empties | 61,279 | 22,230 | 21,448 |
| Grand total | 160,904 | 89,774 | 87,298 |

The movement of food supplies from the West direct to ships in New York harbor by the special system of solid through trains termed "G. O. C. Specials," is now under full headway in large volume. Pig iron production has been increasing rapidly in the past few days as a result of the advent of mild weather, and at many blast furnaces the receipts of coke have been in excess of requirements. The production of steel has not undergone an increase corresponding with the increase in pig iron production, for the reason that steel production has been limited by the ability to ship the finished product. Nearly all mill warehouses and yards in the Pittsburgh region are still filled with steel awaiting shipment.

The Pennsylvania Railroad reports a marked improvement in shipments of soft coal and general freight. In the first 18 days of February 22,620 cars of bituminous coal passed Lewistown Junction. This compares with 18,141 cars in the corresponding period of January, and with 18,661 cars in December. The eastbound bituminous movement for the first time since last summer shows an increase compared with the corresponding period a year ago.

Operating conditions in the West continue to improve since mild weather set in. Special attention is still being given to the movement of grain in the Western States. Statistics of grain receipts last week indicate that the order of the director general of railroads giving priority to the movement of grain in Western States has materially increased the number of cars loaded. Grain receipts at Chicago last week were 7,280,000 bushels, an increase of 4,583,000 bu., or 169 per cent over the previous week, and 3,341,000 bu., or 83 per cent, over the same week a year ago. The increase in the receipts of corn over the previous week was 2,216,000 bu., and of oats 1,418,000 bu. Receipts of grain at all the primary markets for the week ended February 16 totaled 22,104,000 bu., or 54 per cent over the receipts of the previous week, and 51.5 per cent over those of the same week a year ago.

PRODUCTION OF GOLD AND SILVER in the United States during the calendar year 1917 was less than in 1916 as shown by the statistics of this Bureau of the Mint and the United States Geological Survey. Gold produced in 1917 was valued at \$84,456,000 as against \$92,500,390 in 1916, and silver was valued at \$61,140,300 in 1917 as against \$61,280,621 in 1916.

Commission and Court News

Personnel of Commissions

J. E. Benton, of Keene, N. H., has been appointed solicitor of the Bureau of Valuation of the Interstate Commerce Commission, succeeding **P. J. Farrell**, who has been appointed chief counsel of the commission. Mr. Benton was formerly connected with the Bureau of Valuation as valuation analyst and examiner.

P. J. Farrell, who has been appointed chief counsel to the Interstate Commerce Commission, as was announced in these columns last week, was born on May 10, 1861, and admitted to practice in all the courts of Vermont in 1887 as attorney at law and solicitor in chancery. In April, 1906, he was admitted to practice in the Supreme Court of the United States. Mr. Farrell was in the railroad service several years; beginning with the Connecticut & Passumpsic Rivers road, now a part of the Boston & Maine, in 1880. He was station agent, conductor, clerk in general freight office and train despatcher. He was subsequently a railway postal clerk, and in 1888 he was promoted to be chief clerk of railway mail service, with headquarters at Boston. In 1889 he resigned this place and became law partner of Charles A. Prouty, former Interstate Commerce Commissioner and now director of the bureau of valuation of the Interstate Commerce Commission. Mr. Farrell practiced law at Portland, Ore., and Newport, Vt., until 1901, when he entered the employ of the Interstate Commerce Commission, where he has acted as attorney in cases before the commission and in the courts, and as solicitor of the bureau of valuation.

P. J. Farrell

State Commissions

Wasteful Duplication of Facilities

In an order issued on February 4 the Railroad Commission of the State of California dismissed the complaint of the city of San Jose vs. the Southern Pacific and the Western Pacific asking for the erection of union passenger and freight terminals as well as the use of certain tracks jointly. The Commission, however, emphasized the importance of avoiding the wasteful duplication of railroad construction and operation. In anticipation of the termination of its franchise through San Jose, the Southern Pacific some time ago secured the permission of both the city and the railroad commission to build a new line through the outskirts of the city. Permission was also granted to the Western Pacific to build a line from Niles to and through San Jose. The complaint of the city was that the projected lines would surround the principal portions of San Jose, thereby rendering communication between the city and the surrounding territory difficult and dangerous, and would greatly depreciate the value of property in a residence section which the Western Pacific planned to pass through. In order to overcome these objections and also to eliminate the unnecessary duplication of grade crossings, the city asked that the two roads use the same tracks in the city and erect union passenger and freight stations. The commission found that a union passenger station was not particularly needed in San Jose and that the construction of several small freight

houses in various parts of the city would be just as convenient to shippers as a joint station. It was the opinion, however, that in the interest of economy and safety the Western Pacific should use the Southern Pacific line not only in San Jose, but also from Niles to San Jose, with the privilege of building such spurs therefrom as might be thought necessary to develop business for the road.

The testimony offered with reference to the proposed construction of the line by the Western Pacific from Niles to San Jose, about 20 miles, showed that the president of that road had attempted without success to effect an agreement with the Southern Pacific for the use of the latter's line from Niles to Milpitas, 11 miles. On this subject the Commission says: "The attitude of the Southern Pacific in refusing to negotiate on this subject with the Western Pacific does not commend itself to us. This attitude is contrary to the growing realization that our nation must put an end to further wasteful duplication of railroad construction. . . . We assume that the question whether the Western Pacific shall get into San Jose will be passed upon by the Director General of Railroads. If he decides that the proposed construction is not justified, particularly at present, there will be no need for considering further the matter now under consideration. On the other hand, if he decides that the Western Pacific may enter San Jose, we hope he will take steps to have this done in such a manner as to prevent the wasteful duplication now contemplated in connection with the Niles-San Jose situation."—*San Jose vs. Southern Pacific and Western Pacific*. Decided February 4, 1918.

Court News

Exclusive Use of Platforms for Express Business

The New Jersey Court of Chancery holds that railroad station platforms being private property the railroad, for a consideration, may contract to give an express company the exclusive right to do an express baggage and passenger business on and from the platform, and such a contract does not create a monopoly.—*Thompson's Express, Etc., Co. v. Whitmere* (N. J.). 102 Atl., 692. Decided December 31, 1917.

Injuries to Live Stock—Waiver of Notice of Claim

The Mississippi Supreme Court holds that the provision of a contract of live stock shipment that the shipper shall file notice of loss within ten days of delivery is waived where shortly after arrival the railroad's proper agent was orally notified of the injuries and damage, and accepted the notice and inspected the animals and wrote on the way bill a memorandum of the injuries and claim.—*Bernstein v. Y. & M. V. (Miss.)*, 77 So., 146. Decided January 2, 1918.

Landowner's Duty Under Right-of-Way Agreement

The Circuit Court of Appeals, Ninth Circuit, holds that under an agreement that a railroad company might build its road across certain land at such a height as to permit the landowner to build a dam on condition that the company would protect its own roadway by riprapping or building a wall, it was the landowner's implied duty in building the dam to use every reasonable precaution by the construction of a spillway or other suitable device to carry off flood waters.—*Eastern Oregon Land Co. v. Deschutes R. Co.*, 246 Fed., 400. Decided October 1, 1917.

Commission's Order as to Station Facilities

An order of the South Dakota Railroad Commissioners required the Chicago & North Western to provide a suitable station house in place of two box cars, and maintain an agent in a town of 40 inhabitants, with two stores, lumber yard, coal yard, blacksmith shop and insurance office, in a farming community, and at which, during the year previous, the company transacted \$10,000 of business, \$7,000 of which was freight in carload lots. The South Dakota Supreme Court holds that the order was reasonable as to the maintenance of an agent, but that the evidence was insufficient to show that station facilities were inadequate.—*Barnard v. Chicago & N. W.*, 166 N. W., 148. Decided January 18, 1918.

Equipment and Supplies

Locomotives

THE HUDSON COAL COMPANY has ordered one 21-ton four-wheel tank locomotive from the American Locomotive Company.

THE DELAWARE RIVER STEEL COMPANY has ordered one 47½-ton four-wheel tank locomotive from the American Locomotive Company.

THE SOUTH MANCHURIAN RAILWAY has ordered 25 super-heater Mikado locomotives weighing 230,000 lb. from the American Locomotive Company.

THE SOUTH AFRICAN RAILWAYS have ordered 20 super-heater Mountain type locomotives weighing 195,000 lb. from the American Locomotive Company.

Specifications for the following locomotives have recently been determined on orders received some months ago by the American Locomotive Company: Western Pacific, 5 Mikado locomotives weighing 330,000 lb.

Freight Cars

THE UNITED STATES GOVERNMENT has ordered for use on military railroads in France 950 box cars from the American Car & Foundry Company, 500 low side gondola cars from the Cambria Steel Company, 250 box cars from the Mt. Vernon Car & Manufacturing Company, 500 box cars from the Pullman Company, 200 box cars and 750 high side gondola cars from the Standard Steel Car Company, 250 refrigerator cars from the Haskell & Barker Car Company, 100 box cars from the St. Louis Car Company and orders will be placed shortly for 500 additional box cars and 500 additional low side gondola cars.

Signaling

THE DELAWARE, LACKAWANNA & WESTERN has purchased two A. G. A. single-arm railway grade crossing signals from the A. G. A. Railway Light & Signal Company, Elizabeth, N. J.

CEMENT PRODUCTION IN THE UNITED STATES is almost exclusively for domestic use, says a recent bulletin of the National City Bank of New York, the exports having amounted in value to but \$5,822,000 in 1913, the high record year, and \$4,112,000 in 1917.

NEW RAILROAD INTO MONGOLIA.—A. W. Perrin, acting commercial attaché at Peking, China, writes under date of December 24, 1917, as follows: It is reported that negotiations are on foot for a loan for the extension of the new Supingkai-Chengchiatun Railway from Chengchiatun, Manchuria, to Kailu, in Eastern Mongolia. The Supingkai-Chengchiatun line, which was constructed by means of a loan from the Yokohama Specie Bank, is now considered completed, as construction trains carrying passenger cars are running on a regular published schedule between Supingkai and Chengchiatun, though over a temporary wooden bridge across the Liao. The proposed extension into Eastern Mongolia is 130 miles in length, and it is said that 150,000 yen (roughly, \$750,000 U. S.) will build it. According to the agreement under which the Supingkai-Chengchiatun Railway was built, the Yokohama Specie Bank must be given first chance to advance any funds needed for extension of line. The new loan will probably be 2,000,000 yen (\$1,000,000). The extension of this railway into Eastern Mongolia was contemplated from the first, as Japan is anxious to get into railway communication with that comparatively undeveloped country. The charter of the Oriental Development Company has recently been amended in order to make it freer to advance money for industrial developments in Eastern Mongolia as well as in Manchuria.

Supply Trade News

THE ASBESTOS PROTECTED METAL COMPANY, Pittsburgh, announces the removal of its Boston office to the State Mutual building to be in charge of Wm. H. Cummings.

J. A. McNulty, roundhouse foreman of the Chicago & North Western, at Chicago, has entered the railway sales department of the Anchor Packing Company, with headquarters at Chicago.

THE PITTSBURGH WOOD PRESERVING COMPANY, the Ohio Wood Preserving Company, the Michigan Wood Preserving Company and the Acme Lumber Company have moved their general offices to the Century building, Pittsburgh, Pa.

E. L. Marshall, of the railway sales department of the National Carbon Company, Inc., Cleveland, Ohio, resigned his position February 1. A. E. Pratt, for several years signal supervisor of the Erie at Marion, Ohio, will succeed Mr. Marshall and take over his work as special railway salesman.

W. S. King, formerly general superintendent of the Illinois Central, has entered the supply field with offices in the McCormick building, 332 South Michigan avenue, Chicago. He will represent the Dancasens Brake Beam Company and the Frost Railway Supply Company, together with general railway supplies.

THE LOUISVILLE FROG & SWITCH COMPANY, Louisville, Ky., has been incorporated with a capital stock of \$200,000 to take over the business of the W. M. Mitchell Company, Inc., and to manufacture switches, frogs, crossings and other special track apparatus and fastenings. The officers include W. M. Mitchell, president, and H. O. Wieland, secretary and treasurer. Charles H. Krauss, superintendent of the Weir Frog Company, Cincinnati, Ohio, has resigned to become general superintendent of the Louisville Frog & Switch Company. Previous to his connection with the Weir Frog Company, Mr. Krauss was connected with the Lorain Steel Company, Johnstown, Pa., and with the Kilby Frog & Switch Company, Birmingham, Ala., for a number of years in the capacity of superintendent.

Griffin Wheel Company

THE NECESSITY of working off excess profit tax requirements has delayed the publication of the annual report of the Griffin Wheel Company, Chicago, for the year ended December 31, 1917. The company has, however, given out a preliminary statement covering its operations during the past year. After reserving about \$250,000 for extraordinary taxes, a net profit of approximately \$1,100,000 was earned. Net quick assets on December 31, 1917, amounted to over \$6,000,000 of which \$1,007,000 was in cash and \$1,500,000 in United States government and state securities. The company owes no money, and since 1907 has not found it necessary to enter the money market even for temporary loans.

While continuing its policy of paying annual dividends out of the previous year's earnings, the Griffin Wheel Company will, on March 1, anticipate its semi-annual dividend of 3½ per cent on the 92,820 shares of common stock outstanding, due September 1, and pay a full year's dividend calling for \$649,740 out of the last twelve months' operations. This action will be taken to clear up the surplus account in preparation for taxes.

The company advanced the price of its wheels in January, 1917, after an uninterrupted period of uniform prices since 1884, with the one exception of the year 1907 when an advance in price was maintained for a short time. Although the company could have profited to the extent of about \$400,000 by increasing the price of its product to conform with the general advance in the cost of materials during the last three years, advance purchases made possible the decrease in advance in price until the time aforementioned. In fact the company did not increase its prices until the cost of raw materials had advanced more than 100 per cent.

Financial and Construction

Railway Financial News

LAKE SUPERIOR & ISHPEMING.—At a meeting of the stockholders of this company R. C. Mann, C. D. Mason and W. P. Beldon were elected to the board of directors, succeeding J. B. Laughlin, T. F. Jones, Jr., and J. H. Hoyt.

MUNISING, MARQUETTE & SOUTHEASTERN.—At a meeting of the stockholders of this company W. P. Beldon was elected to succeed J. H. Hoyt as a member of the board of directors.

PACIFIC GREAT EASTERN.—The suits which were brought in the courts by the British Columbia government against Foley, Welch & Stewart and the railway company have been settled, and the government will take over the property and the contractors will drop out of it. It is expected that legislation will be introduced to provide for the completion of the road from the present end of the line 23 miles north of Clinton, to Prince George, and for the administration of the railroad by the Minister of Railways. The lands and property of the Pacific Great Eastern Land Company and all subsidiary companies will also be handed over. There are now on hand 8,000 tons of rails available for the completion of the road, and also some other material; and there is standing an order for 21,000 tons of rails recently financed by the government, let to the United States Steel Corporation, which, on instructions, must commence delivery.

UNION PACIFIC.—A quarterly dividend of $2\frac{1}{2}$ per cent has been declared on the common stock, together with the regular semi-annual dividend of 2 per cent on the preferred stock, both payable April 1 to stock of record March 9. This puts the common stock on a 10 per cent basis, as the last previous common dividend paid was 2 per cent regular, with $\frac{1}{2}$ of 1 per cent extra.

Railway Construction

SOUTHERN RAILWAY.—Improvements will be made to the facilities at Sheffield, Ala., for handling the increase in traffic incident to the location of the government nitrate plant at this place. The present passenger and freight stations will be enlarged, additional yard tracks will be installed, and additions to the local shop facilities are also contemplated.

GREAT EASTERN RAILWAY'S SEA WATER SUPPLY.—The Great Eastern Railway has announced that it will no longer carry sea water. What is surprising about this notice is, not that the traffic has been stopped, but that, in these times, it should have been continued so long.—*The Engineer London.*

THE COAL SITUATION IN FRANCE.—Before the war France consumed about 65,000,000 tons of coal yearly, of which, in round figures, 41,000,000 tons were of domestic production and 24,000,000 tons were imported from abroad; that is to say, from Great Britain, Germany and Belgium. The monthly consumption in peace times thus amounted to 5,400,000 tons, says a report of Commercial Attaché C. W. A. Veditz from Paris, dated January 5. In 1916 the domestic mines produced only 20,000,000 tons, and the imported coal amounted to only 19,000,000 tons, making the total quantity available for consumption 39,000,000 tons. In November, 1916, a typical month, the French mines produced 1,800,000 tons of coal and the imports amounted to 1,500,000 tons, the available monthly supply being therefore 3,300,000 tons, which represents a deficit, compared with the monthly consumption in 1913, of approximately 40 per cent. It should, of course, be noted that the invaded portions of France contain the principal French coal mines, and that therefore the war has cut off the chief source of supply and has made necessary the more intensive exploitation of the mines in the uninvaded regions.

Railway Officers

Executive, Financial, Legal and Accounting

F. A. Moses, Jr., has been appointed freight claim agent of the Tennessee Central, with office at Nashville, Tenn., vice **H. R. Smith**, resigned.

J. M. Wood, assistant to the treasurer of the Pennsylvania Railroad, and assistant treasurer of the Long Island Railroad, with headquarters at Philadelphia, Pa., has been appointed assistant treasurer of the Pennsylvania Railroad.

James M. Kurn, president of the Detroit, Toledo & Ironton, with office at Detroit, Mich., was elected vice-president in charge of operations and construction of the St. Louis-San Francisco, on February 13, succeeding **E. D. Levy**, resigned.

C. D. Mason has been elected secretary and **R. C. Mann**, assistant secretary, has been elected treasurer, of the Lake Superior & Ishpeming and the Munising, Marquette & Southeastern, with headquarters at Cleveland, Ohio, succeeding **W. D. Pollock**.

Decatur Axtell, who has resigned as vice-president of the Chesapeake & Ohio, the Hocking Valley and the Chesapeake & Ohio of Indiana, with office at Richmond, Va., as was announced in these columns last week, was

Decatur Axtell

born at Elyria, Ohio, and was educated at Illinois College. On March 16, 1864, he began railway work as a rodman with an engineering corps on the Pacific of Missouri and later served in various engineering capacities on the St. Louis & Iron Mountain, the Cairo & Fulton and the St. Louis, Iron Mountain & Southern, now forming part of the Missouri Pacific, until July, 1880. He was then appointed general manager of the Richmond & Allegheny and in April 1882, he was appointed vice-president and general manager of the same road. In June, 1883, when the R. & A. went into the hands of a receiver, he was appointed receiver and manager and in May, 1889, when the R. & A. was acquired by the Chesapeake & Ohio, Mr. Axtell was made second vice-president of the latter road. In addition to serving the Chesapeake & Ohio as vice-president, Mr. Axtell, in December, 1889, was elected president of the Toledo & Ohio Central and vice-president of the Kanawha & Michigan. Three years later he was elected chairman of the board of directors of the Toledo & Ohio Central, serving in that capacity until April, 1909; from 1903 to 1910, he was also chairman of the board of directors of the Kanawha & Michigan. In April, 1910, he was elected vice-president of the Hocking Valley and in August, 1910, vice-president of the Chesapeake & Ohio of Indiana, serving in these capacities until the date of his resignation. Mr. Axtell has been in charge of the accounting and treasury departments and has also been chairman of the Valuation Committee of the Chesapeake & Ohio Lines.

Ralph Budd, who has been elected executive vice-president of the Great Northern, as was announced in our issue of February 15, was born at Waterloo, Iowa, on August 20, 1877, and was graduated from Highland Park College of Engineering at Des Moines, Iowa, in 1899, following which he began railway work with the Chicago Great Western. Until 1902 he was consecutively draftsman, rodman, levelman, instrumentman and assistant engineer, and

from the latter date to 1905 was successively roadmaster, general superintendent of construction on the St. Louis division and division engineer of that division. He was then transferred to Chicago as division engineer. The following year he became chief engineer of the Panama Railroad at Colon, Panama, where he remained until 1909, when he went to the Oregon Trunk as chief engineer. From 1910 to May 1, 1914, he also was chief engineer of the Spokane, Portland & Seattle, and from 1911 to Jan. 1, 1913, also chief engineer of the Spokane & Inland Empire and Spokane Traction Company at Portland, Ore. Mr. Budd was appointed assistant to the president of the Great Northern on January 1, 1913, and on February 15 was appointed chief engineer. On May 1, 1914, he again became assistant to the president, which position he retained until his recent election as vice-president.

Operating

W. G. Choate has been appointed general manager of the Houston Belt & Terminal Railway, with office at Houston, Tex.

J. J. Grosche has been appointed master of trains of the Louisville & Nashville, Kentucky division, with office at Paris, Ky., vice **J. G. Metcalfe**, resigned.

C. C. Fisher has been appointed trainmaster of the Sacramento division of the Southern Pacific, with headquarters at Sacramento, Cal., succeeding **C. A. Collins**.

J. A. Gordon, general manager of the Chicago Great Western at Chicago for the past four years and an officer of that road for seven years, has resigned, effective March 1.

D. J. Morris, assistant superintendent of transportation of the Wheeling & Lake Erie, with headquarters at Brewster, Ohio, was appointed superintendent of car service with the same headquarters, effective February 1.

F. L. Horton, chief dispatcher of the Central of Georgia, with office at Macon, Ga., has been appointed trainmaster, with headquarters at Albany, vice **H. M. Sours**, resigned; and **W. L. Chandler** has been appointed chief dispatcher with headquarters at Macon, vice Mr. Horton.

F. M. Smith, superintendent of passenger transportation of the New York Central lines west of Buffalo, has been appointed assistant to the general superintendent of the Fourth district, with headquarters at Chicago, and **L. C. Anderson** has been appointed superintendent of passenger transportation, vice Mr. Smith.

W. L. Ekin, division engineer of the Pennsylvania lines, St. Louis System, with headquarters at Terre Haute, Ind., has been promoted to superintendent of the Peoria division, succeeding **Taber Hamilton**, with headquarters at Decatur, Ill., effective February 11. Mr. Ekin entered the service of the Pennsylvania Lines, on July 6, 1900, and was appointed assistant engineer on the Michigan division on September 1, 1905. He was promoted to division engineer of the same division on May 1, 1907, and was later transferred to the St. Louis division, at Terre Haute, which position he held at the time of his appointment.

Frank P. Barr, superintendent of transportation of the Wheeling & Lake Erie, with headquarters at Brewster, Ohio, was appointed assistant to the general manager of that road, with headquarters at Cleveland, Ohio, effective February 1. He was born in Canton, Ohio, in 1878, and received his early education in the public schools of that city. He entered the service of the Cleveland, Canton & Southern, on July 1, 1895, as a car record clerk in the office of the car accountant. He continued in that position until August, 1899, in which year the Wheeling & Lake Erie absorbed the Cleveland, Canton & Southern. He was clerk in the office of the superintendent of car service from that date until February, 1906, at which time he was promoted to chief clerk. He was appointed car accountant in May, 1907, and on June 10, of the following year, was promoted to superintendent of car service. He remained in that position until July 1, 1912, when he was promoted to superintendent of transportation, which office he held until February 1, 1918, when his appointment as noted above became effective. Mr. Barr has been in

railway service for practically 22 years, and as superintendent of transportation of the Wheeling & Lake Erie, was responsible for the successful operation of the lake coal pooling plan, which was made effective at the Huron, Ohio, lake port of that road during 1916, and resulted in the members of that pooling arrangement urging the adoption of the general pooling plan to include all bituminous coal shipments for the upper lake docks during 1917. The position of superintendent of transportation has been abolished.

Frank L. Fletcher, who has been appointed superintendent of the Huntington division of the Chesapeake & Ohio, with headquarters at Huntington, W. Va., as has already been announced in these columns, was born on September 21, 1885, at Mount Sterling, Ky., and was educated in the public schools of his native town. He began railway work on September 18, 1901, as a telegraph operator on the Chesapeake & Ohio. He remained in that position until September, 1906, when he was appointed train dispatcher. From March, 1912, to October, 1914, he was assistant trainmaster and then was promoted to trainmaster. Since July, 1916, he served as superintendent of terminals of the Chesapeake & Ohio, the Cleveland, Cincinnati, Chicago & St. Louis and the Louisville & Jeffersonville Bridge & Railroad Company, with office at Louisville, Ky., until his recent appointment as superintendent of the Huntington division of the Chesapeake & Ohio, as above noted.

Andrew R. Macgowan, whose appointment as superintendent of the Pennsylvania division of the Delaware & Hudson, with headquarters at Carbondale, Pa., has already been announced in these columns, was born on January 16, 1883, at Moncton, N. B., and was educated in the high schools. He began railway work on January 19, 1899, with the Canadian Government Railways, and served consecutively as clerk, rodman and trainman until April, 1904, when he became contractor's engineer on the Northern Maine Seaport branch of the Bangor & Aroostook. From January to November, 1906, he was resident engineer of the Somerset Railway, now a part of the Maine Central, and then returned to the service of the Canadian Government Railways as assistant engineer, remaining in that position until April, 1915. He was then to December, 1915, division engineer and from January to June, 1916, was principal assistant engineer. In July, 1916, he was appointed superintendent, which position he held until he left to go to the Delaware & Hudson as above noted.

F. Wear, division superintendent of the Great Northern at Great Falls, Mont., was promoted to assistant general superintendent, with the same headquarters, effective February 20, succeeding **John Sesser**, granted an indefinite leave of absence to join the American Expeditionary Forces in France. **J. Weber**, superintendent of terminals, at Seattle, Wash., was appointed superintendent of the Blaine division with headquarters at Great Falls, Mont., succeeding Mr. Wear. **T. B. Degnan**, superintendent of the Northern division, with headquarters at Crookston, Minn., was appointed superintendent of terminals, at Seattle, Wash., succeeding Mr. Weber. **L. M. Davis** was appointed superintendent of the Northern division, with headquarters at Crookston, Minn., succeeding Mr. Degnan. **R. E. Landis**, superintendent of the Marcus division, with headquarters at Marcus, Wash., was transferred to the Spokane division, with headquarters at Spokane, Wash., succeeding **J. L. Close**, transferred to Whitefish, Mont., succeeding **M. J. Flanagan**, assigned to other duties. **George Wear**, trainmaster at Everett, Wash., was promoted to superintendent of the Marcus division, with headquarters at Marcus, Wash., succeeding Mr. Landis.

Traffic

John L. Coffey has been appointed general agent of the Chicago, Milwaukee & St. Paul, at Cedar Rapids, Ia.

H. G. Powell, division freight agent of the Illinois Central, at Omaha, Nebr., has been promoted to assistant general freight agent, at St. Louis, Mo., succeeding **F. H. Law**, promoted. **C. E. Staley**, traveling freight agent, with headquarters at Oklahoma City, Okla., has been promoted to division freight agent, at Omaha, Nebr., succeeding Mr. Powell, transferred.

E. A. Farr, city passenger agent of the Gulf Coast Lines, at Houston, Tex., has been promoted to general agent of the passenger department, with the same headquarters, succeeding W. H. Pinnick, resigned.

H. C. Gettier, division freight agent, of the Atlantic Coast Line, with office at Montgomery, Ala., having resigned, to accept service elsewhere, the duties of the Montgomery office will, for the present, be performed by C. R. Jones, soliciting freight agent.

J. A. McDonald, district passenger agent of the Canadian Pacific at Brandon, Man., has been transferred to Regina, Sask., succeeding J. E. Proctor, who has been transferred to Calgary, Alta., succeeding R. Dawson, transferred to Brandon, in place of Mr. McDonald, effective February 1.

A. F. Meyer, general agent of the Cleveland, Cincinnati, Chicago & St. Louis, at Pittsburgh, Pa., was promoted to division freight agent, at Indianapolis, Ind., succeeding C. R. Lewis, resigned, effective February 15. D. H. Hutchinson, commercial agent, at Boston, Mass., was appointed general agent at Pittsburgh, to succeed Mr. Meyer.

Engineering and Rolling Stock

H. H. Tripp, resident engineer of the Canadian Pacific, at Kenora, Ont., has been transferred to the Edmonton division, with headquarters at Edmonton, Alta., succeeding R. C. Harris, who has been transferred to the Calgary division.

J. F. Gildea, division master mechanic of the Canadian Pacific, with office at Montreal, Que., has been appointed master mechanic of the Pennsylvania division of the Delaware & Hudson, with headquarters at Carbondale, Pa., vice J. J. Reid, resigned.

W. H. Erskine, master mechanic of the Chicago Great Western, at Des Moines, Ia., has been appointed master mechanic of the Virginian. Frank Aitken, master mechanic of the Pere Marquette, at Wyoming, Mich., has been appointed master mechanic of the Chicago Great Western, to succeed Mr. Erskine at Des Moines.

H. H. Carrick, assistant master mechanic of the Southern Pacific at San Francisco, Cal., has been appointed master mechanic of the Stockton division, with headquarters at Stockton, vice F. P. McDonald, transferred, and J. T. Slavin has been appointed assistant master mechanic of the Coast division, with headquarters at San Francisco, vice Mr. Carrick.

John L. Conerly, whose appointment as master car builder of the Missouri, Kansas & Texas, with headquarters at Denison, Tex., was announced in these columns on January 18, was born in Pike county, Miss., on November 22, 1869. He entered the service of the Illinois Central in December, 1890, as car repairer at McComb, Miss., and was later promoted to inspector. On December 31, 1900, he was promoted to car foreman and transferred to Jackson, Miss., where he remained until June, 1903, when he was transferred to New Orleans, La. He remained at New Orleans until June, 1910, when he was promoted to general car foreman and transferred to Memphis, Tenn. He left the Illinois Central in February, 1914, to take a similar position with the Missouri, Kansas & Texas, at Denison, Tex., and in September, 1914, he was promoted to general car inspector. He was with the Ft. Worth & Denver City and the Midland Valley from September, 1915, to February 15, 1917. He returned to the Missouri, Kansas & Texas as general car inspector on February 15, 1917, and from this position was promoted to master car builder, effective January 1, 1918, succeeding H. J. Tierney, resigned.

L. B. Allen, whose appointment as superintendent of maintenance of way of the Chesapeake & Ohio system, with headquarters at Huntington, W. Va., has already been announced in these columns, was born April 19, 1879, at Lexington, Ky., and graduated from the Kentucky State College in 1899, with the degree of civil engineer. He began railway work in the same year as a rodman on the Southern Railway, and from August, 1899, to January, 1904, was engaged on location and construction work on the Chesapeake & Ohio. He was then for one year assistant in the office of the engineer of maintenance of way, and

from January, 1905, to May 1910, was division engineer of the Kentucky division at Ashland, Ky. From May 1, 1910 to 1914 he served as engineer maintenance of way of the Kentucky general division of the same road and the Chesapeake & Ohio of Indiana, with office at Covington, Ky., and as assistant chief engineer. In February, 1914, he was appointed superintendent of the Huntington and Big Sandy divisions of the Chesapeake & Ohio. He later served as general superintendent of the western general division until his recent appointment as superintendent of maintenance of way of the entire Chesapeake & Ohio system, with headquarters at Huntington, W. Va., as above noted.

R. C. Miller, division engineer of the Pennsylvania lines west of Pittsburgh with office at Toledo has been transferred to Terre Haute, succeeding W. L. Ekin, promoted; J. K. Sherman, division engineer with office at Zanesville, Ohio, succeeds Mr. Miller, with office at Toledo, and H. W. Brown, assistant division engineer with office at Chicago, succeeds Mr. Sherman at Zanesville.

Railway Officers in Military Service

George T. Slade, vice-president of the Northern Pacific, has been commissioned as Lieutenant Colonel and has been assigned to railroad service in France on the staff of General W. W. Atterbury, director of transportation of the United States Expeditionary Forces.

Obituary

George H. Alexander, superintendent of freight transportation of the New York Central, with headquarters at New York, died on February 15, at his home in Yonkers, at the age of 49.

C. C. Wright, general solicitor of the Chicago & North Western, with office at Chicago, died at his home in Evanston, Ill., on February 14. He was born at Whitehall, N. Y., on April 19, 1859, and was educated at Tabor college, Tabor, Ia., Colorado college, Colorado Springs, Colo., and in the law department of the Iowa State university. He entered the legal department of the Chicago & North Western in 1887, working in the state of Wyoming, and resigned in 1903 to take up the general practice of law at Omaha, Neb. Later in the same year he was elected city attorney of Omaha, and served in that capacity until March 1, 1905, when he was appointed assistant attorney of the Chicago & North Western, with the same headquarters. He was promoted to general solicitor, with headquarters at Chicago, on November 21, 1910, and remained in that position until his death.

J. A. D. Vickers, vice-president and general manager of the American Express Company, with headquarters at Chicago, Ill., died in that city on February 16. He was born at Toronto, Ont., on May 22, 1858 and was educated at upper Canada College in that city. He entered the employ of the Vickers Express Company, in Canada, a company of which his father was the founder, as an office boy, in the Toronto office in 1875. During the seven succeeding years he filled practically every position in the local office, and in February, 1882, was appointed superintendent, acting also in the capacity of treasurer and auditor. On February 1, 1889, this company was absorbed by the American Express Company and he became superintendent of the Canadian division, which position he held until May 1, 1891, when the service of the National Express Company was extended over the New York, Chicago & St. Louis and the Grand Trunk to Chicago, and over the Toledo, St. Louis & Western to St. Louis. He was placed in charge of these lines as superintendent of the National Express Company, with headquarters at Chicago. On July 1, 1905, he was made general superintendent and on November 27, 1906, was promoted to general manager, Western department, which position he held until June 11, 1914, when he was appointed vice-president and general manager of the western lines of the American Express Company. His supervision extended from Buffalo and Pittsburgh to the cities of the Pacific Coast and from Winnipeg to the Gulf, with an aggregate of nearly 7,000 offices, 18,000 employees and 55,000 miles of railroad lines.

EDITORIAL

Railway Age

EDITORIAL

The account of the Pennsylvania Railroad's prolonged contest with King Winter, which is printed in another column, is a record of a campaign of unprecedented magnitude, and one involving many unique problems. The story is of absorbing interest, just as it stands; but it possesses added significance from the fact that it gives, for non-railroad readers, a vivid picture of conditions, scarcely less trying, which have prevailed during the past two months on many other railroads in the frost-bound regions. The Pennsylvania has done those other railroads a service in preparing this comprehensive yet succinct sketch of actual life, under extreme winter conditions, on a railroad where a heavy traffic is pressing for movement throughout every hour of the day and night, week in and week out. This winter has been unprecedented not only in length and severity, but also in the complicated nature of railroad work at this time. Deep snows, low temperatures and baffling winds are not new things; but they can make, at the present time, much more trouble than ever before. On a four-track or a six-track railroad the snowplow does not carry off all the honors, as it did in the old days of single-track; more likely it may find itself impotent. A winter emergency that occurs but once in a dozen years cannot be met by the use of the methods which would be applied in Alaska. The Pennsylvania could have wished for a few miles of Southern Pacific snow-sheds; but this is a situation in which wishes do not go far. In the light of the facts here set forth, the superficial talk about the incapacity of the officers of railroads which have "broken down," and especially the suggestions about how such officers might easily have kept their locomotives in better condition, which have been made so prominent in the newspapers, become puerile indeed.

A Chapter of Railroad History

The trade acceptance, a description of the uses and advantages of which appears on another page of this issue, may be new and something of a novelty to American business men of the present day, but it is in wide and extensive use in England, France and Germany, and in Canada. It was at one time an important factor in our own country, and apparently is by way of becoming such again. The American business man owes it to himself to look into the trade acceptance carefully because it relates directly to his own business transactions and is meant primarily to be of essential service to him. It not only relieves him of all the worry about the payment of bills that is a corollary of the open book account method of doing business, but it means everything to him from the standpoint of his credit and his financial standing. But there is another important factor that should greatly impress the layman, and that is the fact that behind the campaign to extend the use of the trade acceptance in this country are some of the country's greatest bankers and a no less powerful authority than the Federal Reserve Board itself. In fact the Federal Reserve Board is so much in favor of the use of the trade acceptance and regards it of such high standing that the Federal Reserve Banks discount trade acceptances at a

lower rate than promissory notes. But it is our desire to enlarge upon these points here, as they are brought out in detail in the article. One point, however, deserves attention in this place. It is that the trade acceptance is of such standing that what is needed to extend its use now is not nearly so much argument in its favor as plain simple publicity to explain it. The present time has been wisely taken as the moment to do this work. The American business man now is more willing than ever to see the disadvantages of old-time inertia; and he should be particularly willing to realize the advantages of an instrument of credit that will result in business stability and in economy in handling his business transactions.

In a letter to the editor published in another column in this issue W. C. Cushing, chief engineer maintenance of way

The Screw Spike Situation

of the Pennsylvania Lines, Southwest System, takes exception to an editorial published in the issue of February 8 commenting on the report on screw spikes prepared by a committee of the Pennsylvania System and published in a recent bulletin of the American Railway Engineering Association. Mr. Cushing criticises particularly two points made in this editorial, namely, that the report refers almost solely to the service of screw spikes as track fastenings and ignores largely their effect in decreasing the destruction of the wood and that the screw spike is more directly applicable to heavy traffic lines at present. In support of this first criticism Mr. Cushing cites the statement in the report that "no satisfactory device is known for resetting screw spikes after the thread in the wood has been destroyed." He also refers to previous writings of his in the Proceedings of the American Railway Engineering Association which were to the same effect although these writings were not mentioned in the report referred to in the editorial. These refer to the efficiency of the screw spike as a track fastening and do not cover the phase of the question developed by J. W. Kendrick and others relative to the lessened destruction of the timber as compared with the cut spike. As stated in the editorial it has been primarily for the purpose of arresting the spike killing of the ties and of increasing their service life that screw spikes have been adopted on those roads where they are in use today. With reference to the second objection that screw spikes are not suitable for heavy traffic lines the difference arises largely from the definition of heavy traffic lines. If only tracks such as those of the Pennsylvania at Birmingham, Pa., with the enormous movement of 140,000 tons per day or over 50,000,000 tons per year are considered, it is entirely possible that Mr. Cushing's statement may go unchallenged. However, it is believed that the lines of the New York, New Haven & Hartford, the Delaware, Lackawanna & Western, and the Auburn, Topsham & Santa Fe, in which screw spikes have been installed, are commonly considered as well within the limits of heavy traffic lines when compared to the traffic over the entire country and the fact that these roads use screw spikes in such large numbers deserves serious consideration in determining their merits.

The Trade Acceptance

The trade acceptance, a description of the uses and advantages of which appears on another page of this issue, may be new and something of a novelty to American business men of the present day, but it is in wide and extensive use in England, France and Germany, and in Canada. It was at one time an important factor in our own country, and apparently is by way of becoming such again. The American business man owes it to himself to look into the trade acceptance carefully because it relates directly to his own business transactions and is meant primarily to be of essential service to him. It not only relieves him of all the worry about the payment of bills that is a corollary of the open book account method of doing business, but it means everything to him from the standpoint of his credit and his financial standing. But there is another important factor that should greatly impress the layman, and that is the fact that behind the campaign to extend the use of the trade acceptance in this country are some of the country's greatest bankers and a no less powerful authority than the Federal Reserve Board itself. In fact the Federal Reserve Board is so much in favor of the use of the trade acceptance and regards it of such high standing that the Federal Reserve Banks discount trade acceptances at a

Railway Ownership and Other Industries

THE ADOPTION OF GOVERNMENT CONTROL of railways is causing much discussion of government ownership. The discussion of this subject usually moves in too narrow a circle. It commonly takes account of the direct consequences which government ownership would have but ignores its probable indirect consequences. We have heard much in the recent debates in Congress about the effect which government ownership would have on railway rates and earnings, on railway employees' wages and conditions of work, and on transportation service, but we have heard little about the indirect effects it would have on other business concerns and their employees.

Besides being the largest concentrated class of employers of labor, the railways are also the largest concentrated class of purchasers of commodities. When the man in the street hears the "railway supply business" mentioned he doubtless thinks of it as made up of a comparatively small class of industries which caters to railways exclusively. How many know that the railways are the largest consumers of coal, of iron and steel, and of lumber? How many realize that they are among the largest purchasers of electrical apparatus, and even of office appliances and stationery? How many who know these things have ever considered the effect which government ownership would have on all the great industries from which the railways purchase annually close to a billion dollars worth of coal, lumber, iron and steel, etc.?

The railway equipment and supply manufacturers of the country recently have been getting a foretaste of government ownership. Reports have gone out from Washington that the Director General of Railroads has extensive plans for standardizing railway equipment and supplies. The railway equipment and supply companies suddenly have awakened to the fact that government control has given the government almost the power of life or death over each of their concerns. Consequently, there has been an unprecedented rush of railway supply men to Washington.

The *Railway Age* has been following developments at Washington closely and feels sure that the railway equipment and supply people have been unduly concerned. Director General McAdoo is a sensible man. He has surrounded himself with able men, and has shown no disposition to play politics or run amuck. When he has finally adopted the policies which he intends to follow it probably will be found that everybody who has good devices to sell to railroads can still sell them, and that in the main they will deal with the same railway officers they have dealt with in the past.

But the developments, nevertheless, have been illuminating. Suppose we had government ownership instead of government control, and were at peace instead of at war. The government would have absolute control over railroad purchases, as it has now. In other words, it would be permanently in the position of the largest customer of several of the leading industries of the country. But it would not be subject to the moral restraints in the use of the power this would give it to which it is subject when the country is at war. Under government control in war politics will probably have little or no influence on railway purchases. Under private ownership these purchases heretofore have been made by numerous railway companies and have little or no effect on politics. Under government ownership in time of peace politics probably would have a very great influence.

Imagine the effects which would be produced by throwing into the political scales railway purchases aggregating about a billion dollars a year, which are made from concerns located in every part of the country and employing millions of men. Under government ownership of railways the affairs not only of the railways but of all the concerns they make purchases from would become largely the football of politics.

There are other phases of government ownership of vital

importance which other classes of business concerns may well consider: If the government should acquire the railways, how long would it be before it would begin to enlarge its shops, so as to enable it to make locomotives, cars and supplies of all kinds? How long would it be before the acquisition of the railways would be followed by the acquisition of telegraph and telephone lines? If the government should make armor plate for its navy, why should it not own the mines and produce the coal for its own railroads?

Government control is going to have the good effect of bringing home sharply and in concrete form to many thousands of business men the effects which government ownership would have. It is arousing those who manufacture for and sell to railways to the dangers of the situation as nothing else could and it is causing many persons seriously to consider the enormous acceleration of the tendency toward state socialism which government acquisition of the railways would cause. There are some who think that government control inevitably will lead to government ownership. On the contrary, it will help prevent government ownership, for it will cause the people thoroughly and intelligently to consider the question. Free silver might have been tried if it had not become the paramount issue of a national campaign, which resulted in the public actually considering it on its merits. Predictions are being made that government ownership of railways will be the paramount issue of the campaign of 1920. The *Railway Age* hopes it will be. If government ownership is ever thoroughly and intelligently discussed it will be beaten, just as free silver was; and then we shall be able to get a sane solution of our railroad problem, just as the defeat of free silver made it possible to get a sane solution of the currency problem.

Should Standard Locomotives be Considered as a War Measure?

IN CONSIDERING standard locomotives the most important question to be answered is—will such locomotives provide the necessary power in the shortest possible time? The railroads need all the power they can get at the earliest possible moment. Immediate relief will be best obtained by repairing and increasing the power of existing locomotives. Future requirements demand new locomotives. Can more power, and we mean power not locomotives, be obtained by introducing standard locomotives than by building locomotives of existing designs, which are particularly adapted for the service in which they are to be used for the roads that need them most?

In order to realize the full benefits of a standardization program, the number of standard types of locomotives must be a minimum. The topography of this country and the conditions under which railroads must operate are such that locomotives must be built of at least the Mikado, Mallet, Pacific, Santa Fe and switching types. Two or more designs of each of these types will have to be built to meet the varying conditions. For example, consider the Mikado type locomotives built last year. Of 835 of this type, 127 had a total weight varying from 160,000 to 280,000 lb.; 241 weighed between 281,000 and 300,000 lb.; 130 weighed between 301,000 and 320,000 lb., and 337 weighed between 321,000 and 340,000 lb. The bulk of the orders varied between 281,000 and 340,000 lb. If we neglect the 127 locomotives weighing below 281,000 lb. and attempt to standardize the remainder in, say, two classes, it would be possible to design a locomotive to weigh 281,000 lb. to meet the requirements of the present locomotives weighing up to 310,000 lb. The second design might weigh 311,000 lb. and answer the purpose for those locomotives which have been built weighing up to 340,000 lb.

The 281,000-lb. locomotive would be under the desired capacity on many roads. In some cases it would be under weight by 30,000 lb., and this would represent a deficiency of over 10 per cent in tractive effort, or an average of over 5 per cent for that particular design of locomotive. The same line of reasoning will apply to the second design. This means, therefore, that from a purely tractive effort standpoint, 5 per cent more locomotives will have to be built to meet the demands, than if existing designs were duplicated. This also means that the cost of operation of trains with these locomotives will be increased. The percentage loss in operating economies could be reduced by making three standard designs of this particular type rather than two, but here we begin to multiply the standards. The same reasoning will apply to the other types of locomotives.

In the development of the designs for all these locomotives, whether there be 10, 12 or 15 designs, new drawings will have to be made and new dies, templates and patterns will have to be constructed. This will take time and material and prolong the time in which such standard locomotives may be received from the builders and during which time locomotives of existing standards which have been found to meet successfully the peculiar operating conditions for which they are built, might be constructed. In like manner all the railroads will have to provide themselves with the necessary materials, including drawings, templates, patterns and castings with which to maintain the standard locomotives properly. This will take considerable time and require the services of men in the repair shops who might better be concentrating their efforts on the maintenance of existing locomotives. Furthermore, it will be necessary for the locomotive repair men to become accustomed to these new designs. The matter of repairs will therefore become further complicated by the increase in the number of locomotive classes to be maintained by every railroad. This is a vital point, for the railroads now have not enough labor with which to maintain the present power.

There is no argument whatever in the question of first cost for standard locomotives. As pointed out in the case of the Mikado type locomotives, the standard locomotives must be of compromise designs in order to cover a wide range of operating conditions. The losses in operating efficiency due to locomotives of improper characteristics for the service in which they are to be used, will in a short time overbalance any saving that may be made in first cost. This is well illustrated by the purchase several months ago of Mallet locomotives for a western road at a cost of \$105,000 each. These locomotives made it possible to operate solid trains through one division where previously it was the practice to make two trains into three in order to negotiate a certain grade. A careful study of the economies to be derived by operating the two solid trains showed that the railroad could well afford to pay the exorbitant price for these engines. Therefore, in the long run, the saving in first cost by the standard locomotive is offset by the increased cost of operation. Not only are operating costs increased, but where the standard locomotive is deficient in tractive effort, the number of trains will have to be increased, thus increasing the train density of the line and increasing the congestion.

The standardization of all types of locomotives used in this country cannot be considered expedient as a war measure. The costs are too great. There is, however, an opportunity of designing emergency locomotives of adequate tractive power to use indiscriminately throughout the country to relieve congestion where it may occur, and these locomotives must of necessity be of such weight and dimensions that they can be used under any clearance and weight limitations. There will not be need for a large number of

such locomotives, for which conditions become more stable it will be found easier to route traffic so that congestion may be avoided.

Our railways need power and they will need it badly next winter. If the roads are provided with power which best meets their conditions, with which they are familiar, and for which they have repair parts, then better results will be obtained than if locomotives of a strange design, not particularly adapted to the local operating conditions, are given them.

Facts versus Fiction

About Railway Salaries

THESE continues to be a great deal of loose talk about "fancy" railway salaries. The necessary requisitions for information which the Director General is making are helping to keep the talk going. He first asked each railway to furnish him a list of all its officers receiving more than \$10,000 a year. This was done at the request of Senator Cummins. He has now asked for a list of the salaries paid to all officers in the New York offices of the companies. He has also directed that "with reference to general officers and division officers receiving \$3,000 or more and less than \$10,000 per year, each carrier shall make to the regional director a monthly report showing increases in salaries, appointments to fill vacancies and the creation of new positions (showing salaries therefor), beginning with the month of January, 1918." With reference to general officers and division officers receiving \$10,000 or more per year the monthly reports are to be made in duplicate, one to be for the regional director and the other for the director general.

The public would be warranted in drawing the conclusion from what is being said in some quarters that a railway general officer who is not receiving at least \$10,000 a year is poor indeed, and that no president is receiving less than \$75,000 or \$100,000 per year. But facts often are stranger than fiction, and some facts which stand out in striking contrast to all this fiction are that the average salary paid to all railway general officers in the year ended June 30, 1916, was less than \$6,000, and that the average paid to all general and division officers was less than \$3,000. The detailed facts, as shown by statistics compiled by the Interstate Commerce Commission, are as follows:

In 1916 there were 4,247 general officers who received \$3,000 or more. The total amount they were paid was \$27,442,958, an average of \$6,461.73. The number of division officers who received \$3,000 or more was 1,115 and their total compensation was \$4,140,693, an average of \$3,713.63.

The number of both general and division officers who received \$3,000 or more was 5,362, and their total compensation was \$31,583,651, an average of \$5,890.

The number of general and division officers who received less than \$3,000 was 14,401, and their total compensation was \$23,970,143, an average of \$1,664.46.

The total number of both general and division officers was 19,763, and their total compensation was \$55,553,794, an average of \$2,811.

In view of the talk about alleged excessive salaries, the most significant of the statistics given above are those regarding salaries of general officers receiving \$3,000 or more. This classification includes all officers receiving so-called "fancy" salaries and probably includes every man receiving as much as \$10,000. The total earnings of the railways of the United States in 1916 were \$3,475,000,000, and their total operating expenses were \$2,277,000,000. The compensation paid to all of the 4,247 general officers who received \$3,000 or more was \$27,442,958. This was less than 8/10 of one per cent of the total earnings of the roads and was

1¼ per cent of the total operating expenses. In other words, the total compensation paid to all general officers receiving over \$3,000 a year took less than 8 cents out of each \$10 bill the railways earned, and took 12½ cents out of each \$10 charged to their operating expenses.

There have been cases where railway officers were scandalously overpaid. It is true, as has been alleged, that there are some parasites on the payrolls—men who are receiving large salaries for doing little or nothing. But such cases are extremely exceptional. As a rule, the salaries paid to railway officers are smaller than the salaries and incomes of men occupying comparable positions in other lines of business and professional activity. Usually when large salaries are paid they go to men who have worked their way up from the ranks to positions of the greatest eminence in the business. They are for those who receive them the rewards of many years of arduous and efficient service; and they are for the younger and more ambitious officers, prizes to work for and incentives to put forth their utmost efforts. Remove the large salaries from the railway business, and you will rapidly reduce the number of able and ambitious men who will enter it, and as rapidly increase the number of able and ambitious men who will leave it. For whatever theorists may say is done or ought to be done, the fact is that at least nine-tenths of the able and ambitious men in the professions and in industry are governed in what they do and in the way they do it by the amount of money they expect to receive for it.

The lower ranks of railway officers are paid too little. There ought to be a pretty general increase in the salaries of division superintendents and their staffs, including assistant superintendents, master mechanics, division engineers, trainmasters, road foremen of engines, train despatchers, and so on. But a general reduction in the salaries of the higher officers would be unjust to the officers themselves and extremely inexpedient from the standpoint of the public. It would cost, through reduced efficiency in railroad operation, many times as much as it would save.

The *Railway Age's* understanding is that the director general does not contemplate any sweeping changes in railway salaries. He has repeatedly made remarks indicating that he does not. It is to be hoped, however, that he will soon settle the question definitely one way or the other. There is much uneasiness and uncertainty among railway officers about what he intends to do. Now, railway officers are human, and we have known very few human beings who could work with high efficiency while living in constant fear of having their incomes reduced or losing their jobs.

There is much solicitude being shown by the government regarding the attitude of railway employees. The Railroad Wage Commission doubtless will give them a general increase in their pay, and meantime they are being adjured from high official quarters to be loyal and work hard. Meantime, railway officers are being accused by certain newspapers of "lying down"; they have been given to understand that they must not use publicity to defend themselves or their work; they are reading in almost every newspaper gossip about what is or is not going to be done to their salaries, and there still prevails among them much uncertainty as to just what the government wants and does not want to do.

Railway officers are working as hard as they ever did, but it is inconceivable that with all these handicaps they can work with the greatest possible efficiency. There are almost 20,000 railway officers. At least nine-tenths of them have risen from the ranks to their present positions. They are the brains of the business. As important as is the efficient use of hands to the success of railroad operation, there is something much more important, and that is the efficient use of brains. Now, while under conditions of uncertainty and discouragement a man may use his hands efficiently, no man under those conditions ever did or ever

will use his brain with the greatest efficiency; and when the brains of a business are not used efficiently it is a matter of but a short time until the hands in it will not be used efficiently.

Railway Supply Companies and Standardization

THE OPEN LETTER TO William G. McAdoo, director-general of railroads, from George A. Post, president of the Railway Business Association, which is published elsewhere in this issue, points out clearly the position of the railway supply companies in the matter of standardization. These companies hold a unique position in the development of cars and locomotives in the United States. Due to the extreme competition in the railway supply field, they are forced to use the most scientific methods and avail themselves of the best inventive genius to maintain their business. This has all worked to the advantage of the railway companies, and it is due largely to this competition that our locomotives and cars have been so well developed. The railways under private management have found it necessary to improve their facilities, thereby obtaining more economical operation to meet the competition with other roads. As compared to the state-owned roads of Germany, Emery R. Johnson in his book on American Railway Transportation says: "The technical development of the freight service in the United States is far in advance of that of Germany." The railway supply companies have played a very important part in this development. As Mr. Post says, "In the field of transportation, inventors and developers of special appliances embody the spirit and function of progress." Further, "What they (manufacturers of railway goods) have achieved for the public in safety, comfort, speed and economy of railway operation has been accomplished in an atmosphere of keenest competition." If standardization of either cars or locomotives is carried to the extreme, the incentive for the railway supply companies to still further improve their products and seek new methods for further increasing economies in operation will be removed.

Some persons believe that it is not necessary to use patented articles in the construction of cars and locomotives if sufficient thought and study is given to designs which will perform practically the same functions without the violation of any patent rights. In almost every case, however, those who seek to evade these patent rights, use the patents as a base from which to design similar parts, and through some technicality seek to evade the patent rights. Any wholesale attempt to follow such a practice will defeat the very purpose of all patent law, which is designed to stimulate the exercise of genius. Until we are ready to admit that an absolute state of perfection has been reached we can ill afford to throttle future development.

As a purely economic problem, particularly during time of war, those companies which are well organized to manufacture the special devices applied to cars and locomotives should be held intact. The country needs cars and locomotives. If any attempt is made to have the *entire* car or the *entire* locomotive made at any of the so-called erecting plants, either the capacity of those plants will have to be reduced to provide facilities for making these specialties, or time, money and labor will have to be expended to increase the facilities of the plants for this purpose. In the first case it would mean a decrease in the output of cars and locomotives, and in the second case it would mean a delay for many months in securing the full output of cars and locomotives. At the same time, the plants and investments of those whose business it is to manufacture these parts would be destroyed. Furthermore, the benefits from well organized

and centralized production of these plants would be lost, for if the work is to be done by the car and locomotive builders it would be distributed among the builders' plants, whereas now it is done at the highly specialized central plant of the specialty manufacturer. Some of those builders that have attempted to manufacture special devices under shop rights, have on mature and careful investigation, with a fair charge to overhead expense, found that they were doing so at a net loss.

The plants of the supply companies are essential for the rapid production of cars and locomotives. The ideas, inventive talent and the engineers of the railway supply companies are needed for the further development of our equipment. Justice demands that they be paid for what they have done. The progress of our railways in the further development of cars and locomotives demands that they be encouraged to produce and to develop new ideas which will make cars and locomotives safer to run, cheaper to maintain and more economical in construction.

Mr. Foster's letter merits the profound consideration of the governmental authorities interested in the purchase of cars and locomotives.

The Danger of Over-Standardization

SINCE THE GOVERNMENT ASSUMED CONTROL of the railways there has been a great deal of comment regarding the possibility that it would standardize many kinds of equipment and appliances, and require the use of the things standardized throughout the United States. Arguments have been advanced to demonstrate the economies which would follow the reduction in the number of standards now in use. Undoubtedly some important advantages and economies could be gained by increasing the amount of standardization on our railways. But it is easily possible to over-standardize as well as to under-standardize. The former has been an evil in the past. There is danger that the latter will be the tendency under concentrated government control of the railways' and of the two evils over-standardization would be much the worst, because it would interfere with progress.

The history of our railroads has been one of rapid, continuous development. Locomotives, cars, bridges and many other elements of the property have been retired because of obsolescence or inadequacy more frequently than because they were worn out. This development has never been more rapid than in the last few years. The introduction of the Mikado and Santa Fe types of locomotives with the stoker, the superheater and other appliances, the substitution of open-hearth for Bessemer steel rails, the development of the concrete trestle and the use of the section motor car are all so recent as to be familiar to everyone. If a locomotive or a form of road work construction had been adopted as standard for all of the railways of the United States, it is not too much to fear that the red tape which surrounds a government standard once it has been adopted would have held back most, if not all of these developments. With the tremendous demands which are now being made upon the carriers for service and with the handicaps of labor shortage, etc., under which they are laboring, the roads now need the benefit of new developments of all kinds more than at any previous period in their history.

Many of the important developments in the railway field have been the result of the co-operation of railway men and railway supply manufacturers. Practically all of the improvements of any importance have required sympathetic study and observation in service to develop and adapt them to the work they are to perform. In many instances, important devices have been rejected by several roads as impractical, only to be developed successfully on some other road.

Herein lies one of the greatest dangers of standardization for instead of the merits of such devices being passed upon by a large number of men working independently on different roads, they will very naturally be reviewed by a small group working more or less closely in unison, who will determine whether the devices shall be used or not. One need only recall the skepticism of Commodore Vanderbilt when George Westinghouse first presented the air-brake to him, to show the reality of this danger. If Commodore Vanderbilt had been on a standardization committee for all of the American railroads it is entirely possible that the air-brake would have met an untimely end. At least the chances are that its development would have been seriously delayed. A more recent instance of the differing of opinion which is certain to develop regarding any device is illustrated by the rejection of screw spikes by the Pennsylvania while the Lackawanna, operating in the same general territory and with somewhat similar traffic conditions, has made them standard for use over the entire system.

The greatest development in the railway industry comes when men throughout the country and on all kinds of roads are endeavoring to improve conditions. This state of affairs has existed very generally on the American railroads, and new improvements have been developed in the east and in the west, on main lines and on branch lines. The section motor car, probably the most important improvement of recent years in the maintenance of way department, was developed on two or three western roads, where its use was at first confined largely to branch lines of light traffic. On the other hand, the pneumatic tie tamper, which bids fair to become one of the most important labor saving devices in this field, was developed on the multiple-track main line of an important eastern road.

That the railways of the United States are far from the limit of their development will be granted by all. That there is a great demand for further development in all branches of the service if they are to meet successfully the demands of the public for increased and more efficient service, is also evident. This requires the maximum freedom for the introduction and working out of new ideas which in turn require opportunity for progress along a wide diversity of lines. The surest way in which this development can be killed is by over-standardization and railway men and government authorities alike, should realize this to its fullest extent.

Buffalo, Rochester & Pittsburgh

EXTRAORDINARY INTEREST attaches to the publication of the first annual reports for the 1917 calendar year. The report of the Buffalo, Rochester & Pittsburgh is the first one to be made public and if there was any real foundation for hope that it is typical of what others will be, it would be a matter of congratulation both to the public and the railroad security holders. The extraordinary difficulties, under which the Eastern roads especially operated in 1917, are well known. Unnecessarily delayed maintenance, congestion, inadequate facilities and abnormally high costs have been the rule. Notwithstanding this, the Buffalo, Rochester & Pittsburgh made a remarkably good showing in 1917. Except for deferred maintenance of way, the ills enumerated above were effectively offset. The road handled the largest amount of freight in its history; the total ton mileage being 2,697,000,000; an increase over 1916 of 12.74 per cent. Passenger mileage totalled 57,000,000, an increase of 4.26 per cent.

Operating expenses, of course, mounted up, the eight-hour law was in effect, there were necessary increases in rates of pay for employees in other branches of service besides the train service fuel and material cost much more; notwithstanding there was no alarming jump in expenses; the total

being \$11,879,000; an increase of \$2,489,000; whereas revenues amounted to \$14,975,000 in 1917; an increase of \$2,213,000. The decrease in net, therefore, was only \$276,000. Taxes increased nearly 100 per cent; the total being \$506,000 in 1917, comparing with \$262,000 in 1916. After paying interest and rental charges, the Buffalo, Rochester & Pittsburgh had \$1,068,000 available for dividends, or equivalent to 6.47 per cent on the total outstanding stock. In 1916 the surplus was \$1,239,000 or the equivalent of 7.51 per cent. The company is paying 6 per cent on both its preferred and its common.

In a broad way, the reason why the Buffalo, Rochester & Pittsburgh did so well under such trying conditions, was

though it is hardly fair to use the word fortunate when the explanation is foresight and liberality. Prior to 1917, the company had ordered 22 locomotives but only 8—all Mallets—have been received and those 8 were received subsequent to December 31. In addition to the 14 to come on this order, 25 additional (of which 5 were for passenger service and 20 for freight and switching) have been ordered and deliveries are expected within the next month.

During 1917, the company spent \$1,724,000 for additions and betterments. The largest items are \$508,000 for terminal facilities at East Salamanca, N. Y.; \$315,000 for terminal facilities at Elk Run Junction, Penn., and \$283,000 for yard and siding extensions.

The Buffalo, Rochester & Pittsburgh bituminous coal moves in large part north. About the only traffic which could be used as an offset to give coal cars a southbound loading is iron ore received at the lakes for shipment to the furnaces at Punxsutawney and elsewhere on the south end of the line. In 1917 the tonnage of bituminous coal carried was 10,216,000; an increase of 909,000 tons over 1916. The tonnage of iron ore was 610,000 tons; a decrease of 125,000. Notwithstanding this fact, which, of course, necessitated a larger empty car movement, the average revenue train load in 1917 was 836 tons as compared with 777 tons, the average in 1916. This is a real achievement in better operation and due largely to supervision which effectively kept after the obtaining of full rating trains for locomotives.

The following table shows the principal figures for operation in 1917 as compared with 1916:

| | 1917 | 1916 |
|---|--------------|--------------|
| Average mileage operated..... | 585 | 586 |
| Freight revenue | \$13,119,838 | \$11,036,335 |
| Passenger revenue | 1,313,594 | 1,214,352 |
| Total operating revenue..... | 14,975,000 | 12,761,755 |
| Maintenance of way and structures | 1,454,770 | 1,580,862 |
| Maintenance of equipment | 4,043,988 | 3,056,545 |
| Traffic expenses | 191,523 | 152,883 |
| Transportation expenses | 5,813,030 | 4,303,677 |
| General expenses | 354,834 | 278,631 |
| Total operating expenses..... | 11,878,566 | 9,389,793 |
| Taxes | 506,000 | 262,000 |
| Operating income | 2,590,075 | 3,108,518 |
| Gross income | 3,900,077 | 4,233,792 |
| Net income | 1,739,820 | 2,129,539 |
| Appropriations | 671,715 | 890,492 |
| Dividends | 990,000 | 885,000 |

New Books

The Caloric Value of Fuels. By Herman Poole, F.C.S. Third edition, rewritten by Robert Thurston Kent, M.E. 267 pages, illustrated, 6 in. by 9 1/4 in., bound in cloth. Published by John Wiley & Sons, Inc., 432 Fourth avenue, New York. Price, \$3 net.

This book, while based on the second edition of the late Mr. Poole's work which was published in 1900, has been practically rewritten to incorporate the latest researches not only on coal, but on fuels which to a great extent have replaced or supplemented coal. Revision has been made of some of the work of investigators which was published in the first edition and which now is generally discredited. It has been prepared particularly to cover every industry which uses fuel. It contains five chapters on the various methods of measuring the caloric value of fuel. Three chapters are given over to the discussion of all kinds of solid fuels, liquid fuels and gaseous fuels. One chapter contains a discussion on the combustion of coal, one on the caloric power of coal burned under a steam boiler, and another on the analysis and measurement of the products of combustion. An appendix is added, in which are included the A. S. M. E. boiler test code and tables of interest in the study of fuels. The book is well illustrated.

The Buffalo, Rochester & Pittsburgh

that for some years past the management has exercised, to an unusual extent, foresight in anticipating traffic needs and great liberality in providing facilities beforehand to meet these needs. Deferred maintenance of way will have as little immediately detrimental effect on this road as possibly on any road in the East. When President Noonan says in his report, "Notwithstanding the abnormal conditions prevailing in all directions, the physical condition of your property is excellent and prepared to handle a maximum business," it is not a mere glittering generality. Detailed physical inspection would show it to be strictly a statement of fact.

One of the imperative needs of the railroads in the past year has been more locomotives. In this respect the Buffalo, Rochester & Pittsburgh has been particularly fortunate—al-

Letters to the Editor

Screw Spikes Unsatisfactory for Heavy Traffic Lines

PITTSBURGH, Pa.

TO THE EDITOR:

The editorial on the screw spike situation, which appeared in *The Railway Age* of February 8, page 294, makes it desirable and even necessary to make some additional statements relative to this subject. The writer of the editorial failed to catch the full significance of item No. 2 on page 3 of the report of the screw spike and tie plate test, in Bulletin No. 200 of the American Railway Engineering Association for October, 1917, prepared for the committee by W. G. Coughlin, chairman of the Pennsylvania committee, wherein the very first sentence states that "No satisfactory device is known for resetting screw spikes after the thread in the wood has been destroyed." This vital defect has also been referred to by the writer twice previously in publications of the American Railway Engineering Association; the first time as a prediction, by reason of his studies of European practice, and the second time as a confirmation of the prediction, from the results of trials made. In Bulletin No. 109, dated March, 1909, under the title of "The Question of Screw Fastenings to Secure Rails to Ties," page 33, he made this statement:

"The proof that the screw spike is not a thoroughly efficient rail fastening lies in the devices which have been invented to assist it in its work: the screw plug, the Collet trenail, the Thollier helical lining, and the Lakhovsky screw and case."

In Bulletin No. 165, dated March, 1914, under the title of "Experiment with Treated Cross Ties, Wood Screws and Thollier Helical Linings," the writer made this statement on page 265, after the results of prolonged service tests in the tracks of the Pennsylvania Lines West of Pittsburgh:

"... Some of the same difficulties are arising in the new tests, which clearly show that a screw spike is not a successful device for securing rails to wooden ties, unless a successful method of repairs from time to time can be devised which will enable one to 'cure' the screw spike when it becomes loose, which it does inevitably in the course of time in many instances under heavy traffic and severe conditions."

In other words, it is impossible for a screw spike to be either a successful method for fastening the rail to the tie or a successful appliance for prolonging the life of the tie by preserving it from mechanical destruction until a successful method has been devised for enabling the spike to have a firm hold in the tie once more after having become loose. This covers both of the points in the editorial: the one with reference to the spike as a fastening, and the other with reference to its function for the protection of ties from the destructive action of the ordinary cut or nail spikes. The following statement is taken from the editorial:

"While their function as track fastenings is of primary importance, their economy comes about primarily because of their protection of the ties from the destructive action of the ordinary cut or nail spikes. The Pennsylvania appears not to have considered this advantage of the screw spike as it confined its report almost entirely to the service secured as a track fastening in spite of the fact that it is the other object which has led to the introduction of the screw spike in most instances."

The editorial does not tell the entire story in this par-

ticular, because if one will refer to the *above* quoted Bulletin of the American Railway Engineering Association No. 165, for March, 1914, he will find that the writer inaugurated an experiment on the Pennsylvania Lines West of Pittsburgh in 1905, in order to decide upon the value of that very function of enabling a treated cross tie to be used through its entire life, for he realized that it was a question of suitable fastenings. The following is a quotation from page 265:

"The experiments described in the following pages by those who had direct charge of the work, Messrs. Wiggins and McKeon, were undertaken by the writer to determine if it would be possible to find suitable rail fastenings which would enable us to obtain the full life of a preserved cross tie until it should perish by decay. He was fully impressed with the short life of steel products used in track work especially on railroads carrying a large amount of refrigerator traffic, and also with the idea that it might not be possible to obtain the full life of preserved cross ties, because it seemed quite doubtful whether the fastenings heretofore proposed would last sufficiently long for the purpose."

Unless a suitable fastening could be secured it would not be possible to obtain the full length of life of the treated cross tie, because in all probability it would be destroyed by the mechanical action of replacement of fastenings during the period of life of the tie. The test referred to was designed specifically for that purpose and the screw fastenings used were a failure, because they did not meet the conditions. A successful method for rehabilitating the screw hold in the wood after the screw became loose had not been found. Other experiments of a like nature were made over other portions of the Pennsylvania System, which also pointed to the same trouble with the screw fastening; then the elaborate experiments at Birmingham and Wooster under the supervision of a special committee, headed by Jos. T. Richards, and afterwards by W. G. Coughlin, his successor as engineer in maintenance of way of the Pennsylvania Railroad, were undertaken, not only for the purpose of determining the economy of the screw spike as an economical and efficient rail fastening, but also to discover by trial a plan for the continuity of the screw spike as a fastening throughout the life of the tie. No benefit to the tie itself can be given by the fastening, unless its defects in service can be repaired as they arise; otherwise, the tie is destroyed by the imperfection of the fastening devised for the protection and prolongation of its life. It was the judgment of the joint committee that, up to the present time, this difficulty with the screw spike has not been met. You will readily see, therefore, that the following statement is incorrect:

"By ignoring this condition, which led to the original introduction of the screw spike, it is not surprising that the Pennsylvania arrived at the conclusion presented in the recent report."

The writer takes exception to another statement in the editorial, as follows:

"The screw spike requires a more expensive form of track construction than the cut spike. For this reason, its use is probably limited at present to those lines of heavy traffic where the destruction of the track is the greatest and the cost of maintenance correspondingly heavy."

This is precisely the condition under which the screw spike is not suitable for use, and the reasons have really been stated in the previous part of this communication. It is the reason for the screw spike being successful on the Delaware, Lackawanna & Western, the Atchafalaya, Topeka & Santa Fe, and the New York, New Haven & Hartford. Just as soon as the traffic is sufficiently heavy, over the tracks where screw spikes are used on those railroads, the screw will become loose and the necessity for repairs arise. The track where the tests at Birmingham were made probably carries the heaviest traffic in the country, as the re-

port in Bulletin No. 200 shows in detail, and it is because the traffic is so heavy that the screw fastenings became loose. Mr. Coughlin calls attention to this in the report. The traffic at Wooster, not being nearly so heavy as at Birmingham, does not affect the screw fastenings nearly to the same extent in the same time. As long, therefore, as the fastenings are used where the traffic is not of the severest kind, a certain amount of success can be obtained with this type of fastening, but for the purposes of the Pennsylvania System on those portions of its lines where it is very important to prevent the mechanical destruction of ties, on account of the heavy service conditions, the screw spike will not be successful until the cure for its shortcomings has been discovered.

W. C. CUSHING,
Chief Engineer Maintenance of Way,
Southwest System, Pennsylvania Lines.

The Despatcher's Responsibility for the Waste of Fuel

SALT LAKE CITY, Utah.

TO THE EDITOR:

In your issue of February 8 there appeared an article entitled "Who Wastes the Fuel," written by a master mechanic. The author states that the train despatcher wastes more fuel than anyone else, basing his statement on the assumption that the despatcher is responsible for all unnecessary stops and delays on the line. A careful investigation would show that the great majority of these delays are due to causes over which the despatcher has no control.

The despatcher is not responsible for the retention of the "31" form of train order, now ten years behind the times. Neither is he responsible for the stops and broken drawbars resulting from the rule that requires conductors to sign the "31" order. Not infrequently the conductor reports the train ready and receives his orders from the despatcher 15 or 30 minutes before he actually leaves the yard. In nine cases out of ten the despatcher has no knowledge of this until the train shows up late at the next office. Other trains are then probably out of reach; this results in bad delays and more unnecessary stops for orders. Other reasons for delays are hotboxes, rebrassing cars, engine failures, and various similar causes. Quite a bit of what is called poor despatching, as well as useless consumption of fuel, could be eliminated provided the conductors were required to give information concerning such delays to the despatcher so that he could arrange the best possible meeting points and keep other trains moving.

T. G. ANDERSON.

HAILEYVILLE, Okla.

TO THE EDITOR:

"Master Mechanic," writing in the *Railway Age* of February 8, says that "No one person wastes as much coal as the train despatcher, more especially in a single-track district." This is a rank exaggeration. Train despatching in the abstract is strictly confined to single track. It requires as much skill to successfully despatch trains on a single track railroad as it does to turn engines out of a shop or roundhouse, and I dare say a little more. The telephone is now in use generally for handling trains, and it introduces new complications. Just at the time when the despatcher's mind is on his trains, trying to figure a good move, someone comes on the wire and wants to get quick action on a car somewhere; or to load a car of stock, get a wire pass, talk to the chief clerk, find out where his pay check is, what conductor will be on No. 56 next Sunday, or something of the like. How could anything but poor despatching be expected under such circumstances? When it takes from 10 to 15 minutes to raise an operator for a "19" order, should anyone be surprised if the train had to

stop to get it? It is on record where an operator was told by the superintendent, while the despatcher was calling the operator for an order and a passenger train was due in 30 minutes, the operator having a few tickets to sell for that train, not to pay any attention to the despatcher; he could put his orders out somewhere else; "take care of your passengers." As a matter of fact this was the only station open at that time for a distance of 25 miles, and the only place he could get the train he was after.

What recourse has the despatcher when an engine fails on an important train and it is necessary to get another engine from the roundhouse in quick time and the roundhouse is unable to give even an approximate figure on when the engine will be ready? Nine chances out of ten the only information the despatcher can obtain is that the engine is being made ready, "will give you a figure soon." This is repeated several times. There are opposing trains to move against this engine (or train), and, no doubt, with the despatcher in such a fix some of them will have to stop for further help, and maybe lie in the side track for hours. I would like to see Mr. Master Mechanic handle a situation of this kind to a successful conclusion, and then say who is wasting the coal.

When the shop has a break-in engine to put out on the main track in the midst of a lot of trains (when it could be broken in just as easily in the yard), and it is two or three hours coming out of the house, the despatcher all the time fighting other trains to move the break-in engine, who is wasting the coal then?

Your correspondent's assertion that unimportant messages are sent to trains at small stations, causing them to stop especially for the message, is not true on the Rock Island.

He asks how many despatchers make a study of the profile of the road and are thoroughly acquainted with the grades and curvature at important points? There are many of them. The best way for the despatcher to gain this knowledge is by frequent trips over the road, but how many railroads allow the despatcher this opportunity unless he does it on his own time? If Mr. Master Mechanic wants to attend an annual meeting of a railroad gathering at such places as Atlantic City or Chicago, his pay goes on, he is furnished a bed to sleep in both ways, and a liberal expense account. The despatcher is not so fortunate; yet such opportunities to gain knowledge would be as beneficial to the despatcher as to the master mechanic. The railroad would not lose a cent by it.

Short side tracks, grades, etc., constitute a condition over which the despatcher has no control; he must make the best of it. If he has to hold back trains to avoid sawing at certain places and trains double hills because there was no sand in the box when the engine left the house, the fuel is being wasted by someone else.

When an engine failure occurs, which is the fault of the mechanical department, the master mechanic becomes very active to see if he cannot prevail on the transportation department to keep the case off the engine failure list. If he is successful in talking them out of it, then where does the full effect of the failure fall? * * * J. L. Coss.

EGYPT AND JERUSALEM JOINED BY RAIL.—A copyright cable despatch in the New York Sun from London, dated February 21, states that Gen. Allenby has completed the railroad connection between Egypt and Jerusalem in the early part of the month, thereby enabling him to simplify his transportation arrangements and to make an attempt to clear the situation on his right flank. The position south-east of Jerusalem remains obscure, but the Turks are in possession of the northern shores of the Dead Sea and hold positions covering Jericho, from which they have communications by the Hedjaz railway.

McAdoo's Instructions to Regional Directors

Outline of Their Functions and of Policy of Director General for Operation Under Government Control

UNDER THE ORGANIZATION of the Railroad Administration the point of contact between railroad officers and the administration in most instances is through the Regional Directors appointed by Director General McAdoo on January 18, A. H. Smith, in charge of operation of the Eastern roads; C. H. Markham, in charge of the operation of the Southern roads, and R. H. Aishton, in charge of the operation of the Western roads. Orders issued by the Regional Directors are issued by authority of the Director General. On February 4, Mr. McAdoo addressed to each of the Regional Directors a letter outlining what he expected of them, which is of great interest as expressing the policy which Mr. McAdoo desires to have carried out under government control. The letter is as follows:

The following is an outline of the functions of the Regional Directors. I shall be glad if you will bring to my attention from time to time any points which are not clear to you or which you think call for modification or extension.

Broadly speaking, I wish to give you power to direct railroad operations in your territory so as to handle traffic with the least congestion, the highest efficiency and the greatest expedition. As far as is consistent with these objects you will, of course, keep down operating expenses.

I have put responsibility upon you for the entire operating situation. I mention the following simply as a few illustrations of the matters which are thus entrusted to you.

You should see that terminals are used to the best advantage and that such changes in established practices are made as will bring this about.

Where minor capital expenditures are needed to establish new connections for the better use of terminals, you will endeavor to get some or all of the interested companies, by their voluntary action, to arrange therefor, and will refer to me cases of expenditures which cannot be so arranged.

You will order such changes in routing of traffic, using any lines or parts of lines in combination, as will avoid uneconomical routes and congestion of particular terminals or railroads, giving due consideration to shippers' interest.

The Commission on Car Service has been replaced by the Car Service Section of the Division of Transportation (the personnel remaining largely the same). The Car Service Section

(a) Will have charge of all matters pertaining to car service, including the re-location of freight cars as between individual railroads and regions.

(b) Will issue instructions through the Regional Directors providing, on application of proper governmental authorities, for preference in car supply and movement.

(c) Will receive from railroads such reports, periodical or special, as it may require in order to keep fully informed with respect to car service, embargo or transportation conditions.

(d) Must be promptly informed of all embargoes placed, modified or removed, and will, from time to time, recommend such embargo policies and exemptions as the needs of the government, seasonal requirements, or other circumstances, may demand.

(e) Will deal directly with railroads with respect to matters within its jurisdiction, and will keep the Regional Directors advised of all instructions or orders in which they are concerned.

You will keep fully advised as to the situation concerning the use of locomotives, repairs to locomotives, amount of

shop capacity and amount of shop labor available for locomotive repairs.

You will have power to promote the general good of the transportation situation in your region by making transfers of locomotives from one railroad to another or of locomotives needing repairs from one shop to another and transfer of shop labor from one shop to another. Such transfers should, of course, have reference to any agreements between labor and the company affected and be made with just regard to the welfare and rights of employees. You will, of course, have like duty and power respecting car repairs.

Policy as to Labor

As to labor, you have been advised of the appointment of the Railroad Wage Commission. The general policy as to all labor is that there shall be no interruption of work because of any controversies between employers and employees. All matters relating to wages and living conditions will have the consideration of the Railroad Wage Commission.

Pending action by me upon the report of that commission there ought not to be any radical change in existing practices without submitting the matter to me for approval. But it should be understood that the usual methods of settling by agreement ordinary grievances and complaints shall continue as heretofore and that the companies are free to negotiate as heretofore with their employees and are expected to observe faithfully existing agreements with their employees. In cases of doubt about new negotiations with employees, the advice of the Director General should be sought.

You should bear in mind that labor has the very natural feeling that railroad managers, although now working for the government and on government account, necessarily continue the same conception of and attitude towards labor problems that they had when acting under private management. I am told that labor will have a natural suspicion that any unfavorable action taken by railroad managers indicates a purpose on their part to make governmental control a failure and to use it for promotion or vindication of their own theories. For these reasons, great care should be taken to avoid anything having even the appearance of arbitrary action, and it will be expedient, at least at the outset and until the matter shall take more definite shape, not to dispose, unless by mutual agreement, of any labor claims involving large questions of policy without first submitting the matter to me.

In the central organization in Washington I propose to have a labor man as a member of my staff who will give his special attention to labor problems, not only to the problems of wages and conditions but also to the problem of aiding the railroads in obtaining sufficient labor and of bringing about a better understanding between officers and employees. The morale and esprit de corps of officers and men should be brought to the highest standards.

Special Studies

There are several matters involving broad questions of public policy concerning which I wish you to make careful studies and report to me with your recommendations.

1. To what extent, if at all, should additional passenger service be discontinued in order to save coal, labor, locomotives and shop capacity for freight service. In arriving at any recommendations on this matter it is very important

to give due consideration to public convenience. It is quite probable that I shall wish to take the matter up informally with state railroad commissions as to any reductions in service which you think should be made. In dealing with such matters the local point of view must be considered and the state commissions afford a useful instrumentality for obtaining this point of view, and also, to the extent that we can act in harmony with the commission's views, for satisfying local public sentiment as to what is done. So far the state commissions have evinced a commendable spirit of co-operation.

2. I wish you also to make careful study of the extent to which (a) freight solicitation should be discontinued or diminished and freight and passenger agencies, freight offices, ticket offices, etc., discontinued or consolidated; (b) the extent to which traffic officials, soliciting or otherwise, should be transferred to other service and to what other service they should be assigned, and (c) extent to which, if at all, any portion of these forces should be released from service.

3. I wish you also to make a study of (a) the extent to which duplications of service can be avoided, both passenger and freight; (b) extent to which fast freight service can be discontinued or slowed down; (c) extent to which less-than-carload service can be consolidated or diminished; at all times having reasonable consideration for the public convenience.

4. I would like to have your views as to the extent to which the making of purchases can be unified either for the entire country, or for the separate regions, or for parts thereof, accompanying it with a statement of the advantages which you think would result from such unification.

5. The extent to which standardization may be effected in your region on the railroads in your territory (a) with respect to locomotives—the various types which will be required to effect the best standardization; (b) freight cars, open and box cars, and the various types which will be best adapted for use in your territory.

Your recommendations should be made in reference to the adoption of the same standards throughout the United States except in so far as local conditions can make specific types or designs desirable to meet the peculiarities of such local conditions.

6. In general I shall be glad to have you make a study of the extent to which various classes of operating expenses can be curtailed or eliminated on account of present conditions of government possession and control. Of course, you understand that by virtue of General Order No. 6 it will be necessary for local associations to make applications for the Director General's approval if it is desired that they continue to be supported out of operating revenues. If any such applications are made to you, I shall be glad to have your recommendations in regard thereto, being guided by the principle that no functions should be carried on by associations whose expenses are chargeable against operating revenues except such functions as are reasonably necessary under the existing condition of Government possession and control, and that only the expense appropriate to such functions should be paid out of operating revenues.

On all these matters I shall appreciate your specific recommendations at the earliest practicable date.

General Instructions

In dealing with this whole subject, it is, of course, important for you to view the matter, and to get the various railroad executives of railroads in your jurisdiction to view the matter, from the entirely new standpoint that all the railroads now constitute a single system, to be operated so as to secure the maximum of transportation with the minimum of waste; and that the fact that a readjustment will mean that a particular railroad will lose certain sorts of

traffic must be disregarded as it is not a sufficient reason why the readjustment should not be made, if in other respects it is in the public interest.

Certain general matters are having consideration here and somewhat later will probably be taken up with you. Examples of these matters are additions and betterments, what equipment not already ordered needs to be provided. I shall be greatly interested in any suggestions which you can make to me on these matters at the present time and from time to time.

You will of course have the right to continue or discontinue or create such local committees or representatives as you think proper to insure the best results at particular terminals or in particular subdivisions of your territory. Doubtless at many important terminals you will find it advantageous to select some exceptionally able, aggressive and tactful railroad representative to take charge of the terminal and to co-ordinate, with the railroad activities, the activities of merchants, coal dealers, truckmen, etc., so as to secure the best possible results in the loading and unloading of cars.

I take it that your communications to the railroads in your region should be to the respective presidents, receivers or other chief operating officers with such modifications of that practice as you may think advisable, arranging, however, in case of such modifications, that the president, receiver, or other chief operating officer fully understands the practice which you pursue.

Pending the further shaping of the work, there are various general subjects which you should refer to this office, and in all such cases I shall appreciate your suggestions or recommendations. Among such subjects are financial problems and legal problems.

You should not proceed upon the assumption that it is proper, by reason of the federal authority under which you act, to take, without regard to state railroad commissions, action which under existing laws requires the permission or approval of these commissions. The President's proclamation contemplates that unless and until I shall otherwise order, procedure under existing state statutes shall be observed.

I wish to emphasize that, at least at the outset, I do not consider it expedient for the regional directors to undertake to establish without my approval, policies of a public character, i. e., policies which substantially affect the character of service rendered the public or the rights of the public.

Substantial reduction of passenger service is an example of this character. It is impracticable to define these matters clearly, but practical definition will evolve gradually as cases arise. Meanwhile doubtful questions should be submitted to me.

The controlling principle is that the government being now in possession and control, it is important for the Director General, as the direct representative of the Government, to have a voice in deciding matters which primarily affect the public, because we cannot expect that the public will be entirely satisfied to have these matters settled by the railroad managers, who in the public estimation, will still be regarded as imbued with the attitude of private management, no matter how disinterestedly those managers may be endeavoring to represent the public interest and nothing else.

Generally speaking, you will develop your organization as you think necessary, but it seems to me that in any event you will need a competent traffic representative, who should be selected with the concurrence of Mr. Edward Chambers, who will be in charge of the Division of Traffic with headquarters at Washington. I think you had better treat your organization as tentative until you have submitted the organization plan to me, as I may, upon consideration of tentative plans, wish to make some suggestions upon the subject.

Transportation and Food Supply

A STATEMENT issued by Herbert Hoover, United States food administrator, on February 21, that the United States is facing a critical period as to its food supply and attributing the cause to railroad congestion has developed a slight controversy with the Railroad Administration. While Mr. Hoover's statement apparently refers to the accumulated results of the delays to transportation experienced in December and January, Director General McAdoo has issued a statement saying that "so far as transportation is concerned there is no danger of suffering from a serious food shortage in the eastern part of the country." Mr. Hoover said that since December 1 this country has fallen far behind the agreed food program with the Allies, and by the end of February we will be short 45,000,000 bushels of cereal products as well as in meat products that were to be delivered. "This deficiency," the statement said, "is due solely to the railway congestion. The railway directorate since coming into control on January 1 has made effort to find remedy, but during the month of January the weather was insuperable, and although progress has been made since February 5 the situation is the accumulation of three months' delays.

"We have been unable to transport to seaboard the necessary foodstuffs for the Allies. This has not been due so much to the actual inability of the railways giving priority to foodstuffs for Allied shipping as it has been to delay in bringing the products from the farms to the terminal markets, where it can be aggregated, prepared and purchased by the Allies.

"The economic ramifications of this whole delay in the movement of the national harvest are almost countless, and they present the most critical of situations, of which no solution exists but a continued expansion of the efforts of the railway administration in the movement of foodstuffs in every direction to the exclusion of much other commerce of the country.

"Comparisons of the movement from day to day during the last few days with movements of similar periods last year reflect the efforts being made by the railway directorate. We have, however, a long accumulation to be got over within the next 60 days. The situation calls for every co-operation of the public—through the quick loading of cars, loading them to capacity and discharging them quickly—and in every way reducing the tax on the railways. Co-operation can be given by reduction in consumption of home and local stores to the exclusion so far as may be of transported articles.

"If every interest co-operates we shall supply the Allies and remedy the distribution of our abundant domestic supplies, for our farms are full of foodstuffs. No effort is being spared to move Allied food as fast as it can be accumulated in the interior, and today the railway directorate is arranging special trains to carry meat and packing house products from Chicago to load the waiting ships."

At the office of the Railroad Administration it was stated that the problem is rather one of supply and development of supply rather than of transportation, and that the railroads for some time have not only exceeded the movement for the corresponding period of the preceding year but have handled promptly all grain offered for transportation. Director General McAdoo has even gone so far as to instruct agents to solicit farmers to send in their grain for shipment. On February 21 there were 30,714 loaded cars at North Atlantic ports awaiting ships, exclusive of bulk grain and coal. In a letter to Mr. Hoover, Mr. McAdoo said:

"If you will notify me from time to time of the location of the specific supplies and the port or ports in the United States to which you wish to have such supplies transported,

I will guarantee the necessary transportation subject alone to interruption from blizzards and floods.

The Railroad Administration also issued a statement saying:

"There has now been about two weeks of moderately good weather during which time an extraordinary effort has been put forth by the railroads. For the week ended, February 16, 22,104,000 bushels of grain were received at Western primary markets, which were the largest receipts for one week in two years, an increase of 54 per cent over the previous week, and 51 per cent over the same week last year.

"The average number of cars of grain being loaded is 5,000, which is approximately 6,000,000 bushels daily. This has been done notwithstanding that weather conditions are still severe in a large part of the country, and it will certainly increase in proportion as the weather moderates."

This statement was based on figures gathered by the traffic division of the Railroad Administration. In the eight days between February 11 and February 19, 38,750 cars were loaded with grain, of which 26,549 were in the Western district (or west of the Mississippi), 9,519 were in the Eastern district, and 2,882 in the South.

Forty-two special food trains, containing 1,368 cars, were sent eastward from Chicago and East St. Louis to New York, Philadelphia and Boston for transshipments to the Allies between February 12 and 19. This through movement of food trains is still continuing, and six trains of meats are going daily to Eastern ports for export.

Between February 10 and February 21, 9,863 cars of live stock, dressed beef and perishable products have been shipped eastward from Chicago.

The movement of special food trains under fast schedules can be made in any section of the country threatened suddenly with a food shortage, according to railroad administration officials, and this plan will be resorted to if the shortage which Mr. Hoover forecast actually develops.

Reports to Mr. McAdoo on February 25, from Regional Director A. H. Smith, showed that there were no steamers waiting for food supplies on that date and that accumulations of cars at eastern terminals had been greatly reduced, from about 170,000 on January 1, to 43,970 eastbound loads, 4,115 eastbound empties, 31,012 westbound loads and 17,718 empties. In response to requests from Mr. McAdoo as to information as to the location of specific supplies and the port or ports to which he wished such supplies transported, Mr. Hoover has announced a plan for securing daily reports which may be furnished to the Railroad Administrator. An organization of regional transportation agents will be created for the purpose. Reports received by the Railroad Administration show that in many cases where cars are ordered the shipper has failed to load them promptly.

"The Food Administration," Mr. Hoover said, "has now directed the allied agencies to furnish it daily with their requirements, in order that they may be transmitted to the Railroad Administration in Washington.

"The most serious problem is the car needs, due to delayed movement of last year's crops, and of livestock from the primary country points to the interior terminals, the mills, and the manufacturing centres, where they can be purchased for export and domestic supply. The presentation of these needs to the Railroad Administration is being met by the appointment of regional transportation agents for the Food Administration, already established in Chicago and proposed at New York and Atlanta. Their agencies will secure and furnish information as to car necessities for the primary movement of foodstuffs to the regional railway administration.

"Shippers of foodstuffs should apply in the first instance to the local railway officials for cars, and upon failure to secure necessary transportation, they should, for grain and grain products, apply to the Food Administration zone train-

agers; while shippers of livestock and perishables in the same difficulties should apply for the present directly to the Food Administration in Washington. These applications for cars will be put before the various Regional Directorates, and will be daily reported to the Railroad Administration in Washington."

At a conference on Monday between Mr. McAdoo and Mr. Hoover and members of their staffs arrangements were made for closer co-operation between the railroad and the food administrations, and Mr. McAdoo designated the following members of his staff to work with representatives of the food administration: C. R. Gray, director of the division of transportation; Edward Chambers, director of the division of traffic; W. C. Kendall, manager of the Car Service Section, and C. E. Spens, who has been appointed by Mr. McAdoo to serve as transportation director of the food administration.

Locomotive Standards Under Consideration

THE COMMITTEE ON LOCOMOTIVES appointed last summer by the Council of National Defense, of which S. M. Vaucrain, vice-president of the Baldwin Locomotive Works, is chairman, has made a report recommending several standard types of locomotives to Henry Walters, who is in charge of the standardization investigation for Director General McAdoo. The recommended standards were then referred to a committee of railroad motive power officers, consisting of three appointed by each regional director, for their consideration and report. The railroad committee has been holding conferences on the subject since February 22 and will report back to Mr. Walters.

H. T. Bentley, superintendent of motive power and machinery of the Chicago & North Western, now acting as assistant to C. R. Gray, director of the division of transportation in the Railroad Administration, has been appointed chairman of the committee and the other members are as follows: Eastern district, H. Bartlett, chief mechanical engineer, Boston & Maine; William Schlafge, general mechanical superintendent, Erie; and H. L. Ingersoll, assistant to the president, New York Central; Southern district, R. W. Bell, general superintendent of motive power, Illinois Central; W. H. Lewis, superintendent of motive power, Norfolk & Western, and J. Hainen, assistant to vice-president, Southern Railway; Western district, Robert Quayle, superintendent of motive power and car department, Chicago & North Western; W. H. Wilson, assistant to first vice-president, Northern Pacific; and John Purcell, assistant to vice-president, Atchison, Topock & Santa Fe. J. T. Wallis, general superintendent of motive power, Pennsylvania, Western lines, has also taken part in the conferences.

The locomotive builders' committee, besides Mr. Vaucrain, includes Andrew Fletcher, president of the American Locomotive Company, and H. P. Ayres, vice-president of the H. K. Porter Company.

A "FIRST AID CORPS" FOR UNLOADING FREIGHT is one of the typical features of German railway operation. Attached to each important freight station is a regularly organized "first aid corps" of 100 able-bodied laborers who may be sent at a moment's notice to any point where freight is being discharged, upon advice from the consignee that he has not sufficient help to accomplish the work promptly. Unloading must be carried on day and night. Women and youths of the national auxiliary service may also be called upon to aid in unloading light freight. The service is organized on a military plan, with officers, sub-officers and corporals.

Milton H. Smith Testifies Regarding Political Contributions

THE INTERSTATE COMMERCE COMMISSION has given out a copy of a deposition of Milton H. Smith, president of the Louisville & Nashville, taken at Louisville, Ky., February 4, upon written interrogatories propounded by Joseph W. Folk, chief counsel for the commission, in connection with the commission's investigation into the financial relations, rates and practices of the company. The questions are some of those which Mr. Smith declined to answer at the time of his testimony before the commission and which he was ordered to answer in a decision by the Supreme Court of the District of Columbia recently upheld by the Supreme Court of the United States.

Mr. Smith said in reply to the interrogatories that he knew of no funds of the Louisville & Nashville expended in Tennessee for political campaign purposes during the year 1915 and charged to operating expenses. He also said that there were no such expenditures in Alabama in 1912 or 1913, but that \$30,000 was so expended there in the year 1914 and was charged to operating expenses. Such expenditures were not charged to construction account and no part was charged on the books of the Nashville, Chattanooga & St. Louis.

Among the vouchers found by the examiners of the commission in the files of the Louisville & Nashville there appeared one in favor of the Columbia Trust Company dated in February, 1910, for \$20,715, for special fees paid under the direction of the president. The examiners were refused information regarding this voucher. Mr. Smith stated that it was for payments of political agents and was charged to legal expenses, one of the sub-divisions of operating expenses. In reply to a query as to why the entry in reference to this voucher was made in such a way as to give no information as to the purpose of the expenditure, he said: "To be entirely frank, this was because it was not deemed advisable to disclose to anyone, not even to the company's own subordinate officers and employees, that it was making political expenditures."

As to another voucher for \$15,000, dated May 5, 1907, in favor of the National Bank of Commerce, Mr. Smith said this voucher was for money expended in aiding a newspaper "which was advocating certain views upon public questions in which the Louisville & Nashville concurred." He also admitted that the company by his direction had expended approximately \$34,800 in Alabama through an advertising agency in a campaign against rate reductions advocated by former Governor Comer of that state.

He was asked: "Is it the policy of the Louisville & Nashville to make political campaign contributions, if you know?"

"It is not," replied Mr. Smith, "but in the past the company occasionally made campaign contributions to defeat a candidate who was running on a platform of antagonism and injury to this company. In such cases the interests of the company seemed, in the judgment of its officers at that time, to require this as a matter of protection. These practices, however, while customary and conventional with corporations generally in the past, are contrary to the public opinion of today, and have been discontinued by our company. So far as this present proceeding is concerned, I think it proper to add that we appreciate the public nature of the service intended to be rendered by the commission and recognize the duty to co-operate in every way hereafter to the end that there shall be no more cause for complaint of such contributions."

GERMAN TRAVEL RESTRICTIONS.—Germany is to prohibit all traveling to the seaside or to the "cure" resorts during the ensuing summer.—*Railway Gazette, London.*

The Pennsylvania's Fight with Jack Frost and the Snow Banks

View from the Pennsylvania Railroad tracks at a point in the state.

THE MONTHS of December, January and February have been truly characterized as the "worst winter" in the history of railroading in the Eastern United States; seven weeks of arctic weather with fifteen-foot drifts on tracks, below-zero temperatures, and blinding gales that made regular running of trains impossible and at times stopped movement altogether. The experiences of the Pennsylvania Railroad in this seven weeks' struggle with the forces of nature have been brought together in a report by Elisha Lee, acting vice president in charge of operation, an abstract of which is here presented.

Surveying all divisions of the lines east of Pittsburgh the features of the weather during the period covered by the report, were not only the record-breaking cold, the heavy snowfalls and high winds, but the unprecedented length of the frigid spells, which gave no breathing time to recover and prepare for the next emergency. In the mountain regions traversed by the Pennsylvania these conditions were practically unbroken throughout the entire time from mid-December until the beginning of February.

Even as far south as Cape Charles, Virginia, there were fifteen days on which it was impossible to operate car floats across the mouth of the Chesapeake to Norfolk on account of the ice barriers, and the passenger service was suspended on three different occasions.

At Cresson, Pa., on the main line on top of the Allegheny mountains, temperatures of 18 degrees below zero were recorded, with high gales and 40 inches of snow on the ground. From December 20 to January 28 the thermometer never registered higher than 33 degrees, and that only for an hour or so on four different days. For eight days from December 28 to January 4, the thermometer continuously registered zero or below, with high winds prevailing, and this was followed by a ten-day stretch, from January 12 to 21 inclusive, on eight of which the thermometer stayed below zero, and on the Renovo division, in north-western Pennsylvania, it was below zero on fourteen days.

On the Pittsburgh division, Altoona to Pittsburgh, 110 miles, the month of January, 1918, showed a total deficiency of 485 degrees of temperature as compared with the same month last year. There was a snowfall of 21½ inches as against 9½ inches in 1917. The snow drifts at the entrance to the Gallitzin tunnels, at the summit of the mountains, were 15 ft. high.

The Northern (Buffalo) division reported double the snowfall of last year, with several storms during which there was practically no train movement for 24 to 72 hours at a stretch.

The snowfall on the Philadelphia division, from Harrisburg to Philadelphia, in January was 34 in., or two and one-half times as great as in the same month of 1917. The Williamsport division spent five and one-half times as much money as last year in removing snow and ice.

The shopmen stood the acid test of fidelity by shoveling snow, breaking ice and clearing switches, often under weather conditions involving severe hardship. The withdrawal of these men from the shops had a serious effect on repairs and construction; but there was no alternative, as without their aid it would have been impossible to open the lines and restore traffic.

The Altoona shops reported that between December 20 and January 21, their men spent 9,225 ten-hour days in snow-shoveling and switch-clearing. This resulted in the loss to the shops of class repairs to 19 engines, the building of 39 steel freight cars, the strengthening of 23 cars, heavy repairs to 25 others, light repairs to 45 passenger cars and the manufacture of 350 car wheels. In addition the operation of the shops in general was unavoidably slowed up by the temporary disruption of the forces.

On the Bellwood division, with a shop force of only 250 men, the shopmen spent 11,000 hours in shoveling snow during the same period. This is given in the report as the principal reason for an accumulation of 540 cars awaiting repairs on January 30, the normal capacity of the Bellwood division shops being 150 cars. The Pittsburgh division, for the same reason, reported an accumulation of 3,257 cars awaiting repairs, or 100 per cent above normal.

Showing the disastrous results of a winter season, during severe weather, the Sunbury division reported that during zero weather a truck broke on a freight car east of Berks, Pa., on the single-track portion of the line. In the time this truck was cleared seven passenger and four freight trains had frozen up, the cars had to be released for fuel under the steam-car law, and the cars were stored and the engines held to the terminal.

Among miscellaneous results reported from the severe cold on all divisions, were air lines freezing, trains stalling, trains frozen into the tracks, cuttings for cars due to

journal boxes being stripped off by snow and ice, broken rails, frozen signals and signal wires, and failure of interlocking plants. Much trouble was experienced with water-scoops on engines freezing up so that they could not be used. It was frequently necessary to maintain large forces of men at each track tank to remove the accumulation of ice caused by the flying water freezing on the rails and roadway.

The report deals in detail with the effect of extreme cold in lowering the efficiency of unskilled and semi-skilled labor, and in making it impossible in many cases to hold men in the service. On the Cresson division, where conditions were unusually severe, in order to maintain an engine-house force of 149 men, it was necessary to hire 171 new men in four months, making a turnover for that period of nearly 115 per cent or at the rate of 344 per cent for the year. The turnover for the entire force of 495 men directly connected with train operations was at the rate of 218 per cent per year.

In the Pittsburgh district the turnover of engine-house forces was at the rate of 192 per cent per year; for firemen and trainmen 120 per cent and for track forces 351 per cent. Furthermore, 55 per cent of the entire force of freight brakemen and 44 per cent of the entire force of firemen

Cut Approaching the Westbound Tunnel near Gallitzin—
Drifts 15 ft. Deep.

on the Pittsburgh division have been in the service less than six months.

On the Monongahela division, which had a turnover of 540 per cent for the year among track laborers, it was necessary, in order to keep switches open in the yards, for supervisors, assistant supervisors and foremen to work with pick and shovel, as they and a few of the older laborers were the only ones who stuck to their work in times of trouble.

The effect of the weather in reducing the average tonnage carried per freight train was, on the Maryland division, 36 per cent; Philadelphia division, 25 per cent; Middle division, 17 per cent; Pittsburgh division, 38 per cent.

Frozen ash-pans in engines caused thousands of delays over all portions of the system. Reports on the Cresson and Williamsport divisions show that during zero weather from three to four hours were required to clean one ash-pan, which normally would take from 25 to 40 minutes. The Conemaugh division reported delays due to frozen ash-pans totalling 8,392 hours, which was equivalent to the loss of the services of 35 engines for a month of 30 eight-hour days.

Frozen ash-pans are caused by flying snow, and water dripping from boiler appliances, forming a solid frozen mass with the ashes. Condensed moisture and steam coats

the mechanism of the ash-pan so that much time is lost in clearing the working parts, while it is necessary to break up the solid frozen masses with steam jets and iron bars.

Coal freezing in cars and on coal wharves caused great trouble and delay at many points. The coal obtainable for railroad use during this winter was below the usual quality, much of it being pulverized. When saturated with water from rain or melting snow, followed by low temperature, it

A Powerful Tandem

solidified into a mass almost like concrete. Where there were no thawing houses, it was necessary to place pans of burning oil beneath the cars, or place steam jets in the coal, before the coal could be run through the hoppers or could be shoveled out.

Thousands of delays in the very cold weather were due to the lubrication in the journal boxes of cars freezing, especially where the cars were standing in classification yards. In such cases hot oil had to be used before it was possible to move the cars over the hump. It was often found necessary to push cars down the hump grades be-

On a Car-float—After a Trip from Norfolk to Cape Charles

cause the oil in the axle boxes was so stiffened that they would not run by gravity.

The solidly frozen roadbed, which for weeks at a time was as hard and unyielding as a cement pavement, greatly increased the wear and tear on engines and the amount of repairs required. At the Meadows shop, near Jersey City, from December 30 to January 31, 20 engines arrived at the enginehouse with broken frames, which is a greater number of this class of failures than ordinarily occur in

a whole year. Many main and side rods of engines were also broken in the efforts to move cars which had frozen to the rails. The Pittsburgh division reported 576 engine failures in January, 1918, as compared with 398 in January of last year, an increase of 45 per cent. The Conemaugh division reported engines out of service for a total of 4,400 hours in making running repairs, which is equivalent to a loss of 18 engines for a month of 30 eight-hour days.

Much trouble with boilers, especially of engines running on the mountain divisions, was reported from the unavoidable use of water of poor quality, due to the low supply streams, some of which were frozen almost solidly for weeks. This resulted in the failure of thousands of flues and many leaky boilers.

Frozen switches were an almost constant cause of trouble and delay. The Philadelphia terminal division reported that on a single day, January 28, there were 70 switch failures in six hours, due to the snow blowing into frogs and switchpoints. This occurred in spite of the fact that a large force of track laborers was on duty in all yards.

Many specific incidents are given in the report telling of actual experiences with trains stalled in blizzards and the difficulties encountered in starting traffic moving after a tie-up once occurred. A single incident of this kind is typical. On the night of January 27, when a half dozen through express trains were stalled on the top of the Allegheny mountains near Gallitzin, with the temperature at zero, the wind blowing a gale and the snow drifts in the cuts 12 to 15 feet deep, Train No. 9, the Western Express, with three engines, reached a point half a mile west of Gallitzin, when it was stopped by the snow. The seven rear cars were uncoupled and another engine sent to pull them back, but by the time the tunnel was reached the west portal had drifted shut and it was impossible to go any further. The passengers were taken out of the train and sent to a hotel. It was impossible to move these cars until five o'clock the next afternoon, and then five heavy freight engines were required to pull the seven empty coaches.

Meanwhile the other three cars, together with the three engines which were pulling the train when it stalled, remained a mile and a quarter further on in the drift. Five hundred men worked all the night of January 27 and all the next day until afternoon, before these three cars and three engines were dug out and the track cleared for them to move.

Despite the conditions which prevailed during the period covered by the report, of which those cited are merely examples, 2,773 freight trains, with a total of 110,457 cars, were moved over the Allegheny mountains, past Gallitzin station, in January. At the same time all regularly scheduled passenger trains were represented, with very few exceptions, occurring in the worst storms, when some through trains were annulled. Many extra trains were also run to accommodate the unusually heavy travel. At Lewistown Junction, 2,376 freight trains of 117,704 cars were passed during the month.

These results, in the face of unprecedented difficulties, were only accomplished by the self-sacrifice, loyalty and devotion to duty of many thousands of officers and employees who cheerfully performed unaccustomed and arduous work and repeatedly faced hardship, danger and real suffering, in the struggle to keep the lines open so that the public and the government might be served.

WAR-SAVINGS SERVICE.—The government wishes to enlist every man, woman and child of the nation in war-savings service. When an individual buys war-savings stamps he enlists in the production division of the nation, thereby supporting and backing up the fighting division which is in France and on the seas.

General Order No. 8,

Governing Labor Conditions

TO CORRECT numerous misunderstandings that have arisen as to the relations between railroad and their employees since the government took over the railroad and as an appeal both to officers and employees to observe the spirit of the new conditions, Director General McAdoo has issued in General Order No. 8 a statement outlining his desires as to labor conditions.

The order directs that:

(1) All acts of Congress to promote the safety of employees and travelers upon the railroads, including acts requiring investigation of accidents on railroads, and orders of the Interstate Commerce Commission made in accordance therewith, must be fully complied with. These acts and orders refer to hours of service, safety appliances and inspection.

Now that the railroads are in the possession and control of the government, the statement says, it would be futile to impose fines for violations of said laws and orders upon the government; therefore it will become the duty of the Director General in the enforcement of said laws and orders to impose punishments for wilful and inexcusable violations thereof upon the person or persons responsible therefor, such punishment to be determined by the facts in each case.

(2) When the exigencies of the service require it, or when a sufficient number of employees in any department are not available to render the public prompt transportation service, employees will be required to work a reasonable amount of overtime. So far as efficient and economic operation will permit, excessive hours of employment will not be required of employees.

(3) The broad question of wages and hours will be passed upon and reported to the Director General as promptly as possible by the present Railroad Wage Commission. Pending a disposition of these matters by the Director General, all requests of employees involving revisions of schedules or general changes in conditions affecting wages and hours, will be held in abeyance by both the managers and employees. Wages, when determined upon, will be made retroactive to January 1, 1918, and adjusted accordingly. Matters of controversy arising under interpretations of existing wage agreements and other matters not relating to wages and hours will take their usual course, and in the event of inability to reach a settlement will be referred to the Director General.

(4) In order No. 1, issued December 29, 1917, the following appeared:

"All officers, agents and employees of such transportation systems may continue in the performance of their present regular duties, reporting to the same officers as heretofore and on the same terms of employment."

The impression seems to exist on some railroads, the order says, that the said order was intended to prevent any change in the terms of employment during governmental operation. The purpose of the order was to confirm all terms of employment existing upon that date, but subject to subsequent modifications deemed advisable for the requirements of the service. Any contrary impression or construction is erroneous. Officers and employees will be governed by the construction here given.

(5) No discrimination will be made in the employment, retention, or conditions of employment of the employees because of membership or non-membership in labor organizations.

The order concludes with the following:

"The government is now in control of the railroads; the officers and employees of the various companies no longer serve a private interest. All now serve the government and

the public interest only. I want the officers and employees to get the spirit of this new era. Supreme devotion to country, an invincible determination to perform the imperative duties of the hour while the life of the nation is imperilled by war, must obliterate old enmities and make friends and comrades of us all. There must be co-operation, not antagonism; confidence, not suspicion; mutual helpfulness, not grudging performance; just consideration, not arbitrary disregard of each other's rights and feelings; a fine discipline based on mutual respect and sympathy; and an earnest desire to serve the great public faithfully and efficiently. This is the new spirit and purpose that must pervade every part and branch of the National Railroad Service.

"America's safety, America's ideals, America's rights are at stake. Democracy and liberty throughout the world depend upon America's valor, America's strength, America's fighting power. We can win and save the world from despotism and bondage only if we pull together. We cannot pull apart without ditching the train. Let us go forward with unshakable purpose to do our part superlatively. Then we shall save America, restore peace to a distracted world and gain for ourselves the coveted distinction and just reward of patriotic service nobly done."

Railway Shop Employees

Director General McAdoo also announced that the railroad shop employees, realizing the necessity of assisting the government in the operating of the railroads on a more efficient basis and to meet the present emergency in the repairing of locomotives, acting through A. O. Wharton, president, railway employees' department, American Federation of Labor, and the international officers representing the machinists, boilermakers, blacksmiths, carmen, sheet-metal workers, electrical workers, and apprentices and helpers, have agreed to the following changes in reference to working conditions:

(1) The hours of labor in shops and roundhouses to be governed by the necessities as indicated by the general condition of equipment. At shops and roundhouses now working one shift which totals less than 70 hours per week, an increase, preferably on a seven-day basis, may be made. Where desired, working hours may be so arranged that men will be released at 4 p. m. on one day each week. Existing working agreements to govern the rate, subject to the action of the Railroad Wage Commission.

(2) All apprentices who have served three years may be promoted to mechanics and paid the going rate of wages for that position. Such promoted apprentices to be given the right of practical experience on work of their respective trades to which they had not been advanced during the three-year period.

(3) Helpers in their respective trades who have had five or more years' experience may be promoted to classification of mechanics; they to receive mechanics' rate and be given an opportunity to learn all branches of the trade. The duly authorized committeeman of each trade in each shop covered by agreement shall be consulted, and mutual understanding arrived at in promoting helpers; and the ratio of helpers to be promoted, to the number of mechanics, in any one trade in any one shop, shall not exceed 20 per cent. The international officers and general chairmen of each trade on each road covered by agreements shall be furnished a complete record of the men promoted.

(4) Mechanics applying for employment will not be denied such employment for any cause other than inability to perform the work; this preference rule to be in effect as long as three-year apprentices or promoted helpers are employed at mechanics' rates.

(5) Where a reduction is made in the force of mechanics, promoted helpers in accordance with their seniority shall be set back first; then advanced apprentices; no mechanics

to be laid off until all such promoted helpers and apprentices have been set back.

(6) The promotions above referred to are to meet an emergency caused by the war, and shall cease at the close of the war.

Letters from Overseas*

"YOURS OF NOVEMBER 1 was delivered to me some days since, mail service being somewhat irregular out here.

"I wish I were able to follow your suggestion in regard to an occasional letter to the *Railway Age*. We are certainly having interesting experiences, but there are various necessary restrictions in the censorship that force us to keep most of them to ourselves.

"However, the many railroad men who are coming over here may be interested to know that we have found our chief wants to be tobacco, woolen socks, and soap and tooth paste. The Railway Tobacco Fund ought to solve the first problem, thanks to you people at home, and if the boys fill up any surplus space in their kits with the other articles, they won't regret it. We also find a knit cap is just the thing for taking the chill out of a shrapnel helmet, which is about as pleasant as a cake of ice in this weather.

"The soap is the least important of the list, for usually there isn't time to wash often.

"All the above may be 'old stuff,' but we had to find it all out ourselves, and it may help some one else to hear about it."

Shunters, Coops and Railheads

Letters recently received by the Santa Fe Magazine from former Santa Fe men contain interesting information concerning railroad equipment and railroad terms in use on the lines behind the front in France. Sergeant N. J. Pierce, of the Twelfth Engineers, says in part:

"The engines and cars here and in England seem like toys compared with our 40-ft. cars. It would make the boys laugh to see a guard (a brakeman) cut a car and push it on to a siding by hand. A passing track over here is a 'coop,' a terminal is a 'railhead,' a switchman is a 'shunter.' Whenever a despatcher gets a message he acknowledges it by 'righto' instead of 'O.K.'"

Corporal W. T. Roberts, of Company F of the Thirteenth Engineers (Railways), writes in a similar vein:

"We took over this part of the French railroad about September 12, cannot mention on what part, but a very busy line, and our work is mostly at night; that is, in the train movement. We are having very good success, although the conditions are far from being perfect, or at least what we used to work under.

"The French engines are all small, half cab, no air and no sand. The cars, or wagons as they are called here, are of small size with bumpers and link couplers. The grades are quite heavy and full of curves, but very good roadbed, all gravel. We are allowed one brakeman to every seven cars loaded, but don't always have them, consequently we have a hard time holding them going down grades.

"The fireman is kept very busy. He not only keeps the engine hot but must also handle the brakes on the tank. Some engines, though, have air pumps on them. I have been lucky enough to fall heir to one and proceeded at once to get my air pump in order. Had quite a time in securing the parts for the repairs, but finally succeeded and am now in fair shape."

*The *Railway Age* expects to publish regularly letters from railwaymen overseas. If you receive a good letter from a railwayman who is now in France, send it in for publication and let the *Railway Age* pass it around for all to enjoy.

The Railroad Bill Passed by the Senate

Few Changes from Form in Which Bill Was Reported;
House Expected to Pass Bill This Week

WASHINGTON, D. C.

THE ADMINISTRATION RAILROAD BILL, authorizing the President to make agreements with the railroads for their compensation during the period of government control, on the basis of their net operating income for the three years ending June 30, 1917, and giving the President and the Director General of Railroads almost unlimited power in administration of the roads, subject to a review by the Interstate Commerce Commission as to rates, was passed by the Senate on Friday, February 22.

The bill was passed without a roll-call and with but two important amendments from the form in which it was reported by the Committee on Interstate Commerce on February 7. An amendment proposed by Senator Cummins to include within the scope of federal control every railroad not controlled nor operated by another carrier company, and which has heretofore competed with railroads taken over, was adopted by a vote of 58 to 14, to prevent the Director General from carrying out his announced intention of leaving out some of the short lines, some of which at their own request had already been notified that they were excluded. An amendment offered by Senator Robinson to reduce the proposed compensation to the railroads by eliminating the provision for a return on new investment during the last six months of 1917 was adopted by a vote of 44 to 34.

In other respects the basis of compensation on which the President is authorized to make agreements with the carriers, which the Senate committee estimated would make the maximum guarantee approximately \$945,000,000 a year, was approved. Determined efforts were made by an aggressive minority to amend the bill but without much success.

Period of Federal Control

The most decisive vote on any of the amendments was that on the proposal of Senator Johnson to reinsert in the bill the provision that government control shall continue until specifically terminated by Congress, instead of for 18 months after the proclamation of peace as provided in the bill. This was lost by a vote of 61 to 10, those who voted for it being Senators Ashurst, Gronna, Johnson of California, Johnson of South Dakota, Jones of Washington, Kenyon, Kirby, Norris, Phelan and Poindexter. It was proposed by Senator Johnson frankly for the purpose of paving the way for government ownership. Senator Poindexter advocated it to prevent the railroads being returned to private ownership without some provision for their permanent unification. Senator Cummins, though an advocate of government ownership, opposed it because he was unwilling that the railways shall be dominated by one man "for a single minute after the war ends." He proposed an amendment to the amendment providing for a board of directors to control the roads after the war, which was rejected. Senator Smith of Georgia said it was all he could do to vote for the bill anyway, but that with a provision for indefinite control he could never do so. Senator Jones said he was for the amendment because he favored government ownership and he did not want the present plan continued for so long as 18 months.

Senator Lodge offered an amendment to shorten the period of government control after the war to six months. This was lost, 47 to 28. Senator King of Utah then offered an amendment to reduce the time to one year, which was also unsuccessful, the vote being 45 to 29.

Director General McAdoo had originally advocated an indefinite period on the ground that no time limit should be imposed by Congress to work out the readjustment after the

war, but in general the wishes of the administration as to the provisions of the bill prevailed without difficulty over all opposition, and practically all efforts to restrict the authority of the President or the Director General were defeated by large majorities.

Senator Cummins made a vigorous fight to reduce the compensation to be paid the roads to an amount sufficient to pay dividends and interest charges. His first amendment on this point, applying to roads that have paid over 5 per cent dividends, was defeated by a vote of 52 to 23.

Senator Kellogg pointed out that to limit railroads to the dividends they have formerly paid would be to take away from the Burlington, for example, a surplus which results largely from the fact that it is capitalized for a low figure, to be expended on some other property by the government, and he said that no railroad could live any number of years without an income above its dividend requirements. He also emphasized the fact that the railroads cannot pay increased dividends out of their guarantee without the approval of the President.

Senator Smith, chairman of the Committee on Interstate Commerce, pointed out that it was not proposed to take money out of the treasury to give to the railroads unless government operation should result in a deficit, but merely to guarantee them the amounts they had earned under rate regulation. "No one knows whether the earnings of the roads have been too great or too little, he said, because we do not know the valuation of the roads.

Effort to Reduce Compensation

The senators who voted for Senator Cummins' amendment were: Ashurst, Cummins, Gore, Gronna, Hardwick, Henderson, Hitchcock, Hollis, Johnson, Cal.; Johnson, S. Dak.; Jones, Wash.; Kendrick, Kenyon, King, Kirby, McNary, Norris, Reed, Sutherland, Thomas, Townsend, Trammell, and Vardaman.

On the following day Senator Cummins tried again with an amendment which he said might be more readily understood, providing that in no case shall the net income exceed 5 per cent on the capital stock outstanding on December 31, 1917. When this was defeated, 46 to 19. Senator Cummins offered it again, substituting 6 per cent for 5 per cent. This secured 24 votes and after 7 per cent had been substituted 27 Senators voted for it.

President May Initiate Rates

Senator Cummins' effort to restrict the rate-making power of the President to that now possessed by the carriers was defeated 45 to 24. His amendment provided that the Interstate Commerce Commission should continue to have its present jurisdiction over all rates except for the transportation of troops and government property. Senator Cummins said that under the compromise provision adopted by the committee, allowing the President to initiate rates and to put them into effect subject to review by the commission on complaint, "there is no hope of any practical exercise of power upon the part of the commission."

Senator Sterling of South Dakota also offered an amendment intended to preserve the authority of the state and interstate commissions over rates, which was lost after considerable debate but without a roll call.

Several efforts were made to provide that the President shall be controlled in the administration of the roads by all existing laws applicable to carriers. Senator Robinson and

others declared that this would nullify the purpose for which the roads had been taken over, and amendments by Senators Hitchcock and Smith of Georgia to provide that the President must have authority of law for his orders was defeated 46 to 25.

"Surely the Senator from Arkansas does not wish the President to issue orders not expressly authorized by law and in violation of law," said Senator Smith of Georgia.

"I certainly do think it may be necessary to issue orders not expressly authorized by law, because you cannot define what orders the President may find it necessary to issue," replied Senator Robinson. As finally passed the bill makes the railroads subject to the laws only in so far as the laws do not conflict with the orders of the President.

In proposing the elimination of a return on the investment after June 30, 1917, Senator Robinson said the additional sum is not necessary to enable the President to reach an agreement with the roads and that it would complicate the situation to require the commission to make the extensive investigation necessary to determine the additional investment. He estimated the amount by which the compensation would be reduced at \$6,500,000. The amendment was adopted without debate.

Senator Frelinghuysen of New Jersey proposed an amendment, which was adopted, "that nothing in this act shall be construed to amend, repeal, impair or affect the existing laws or powers of the states in relation to taxation."

Senator Kirby of Arkansas tried to withhold from the President authority to purchase railroad securities but only 11 Senators supported the amendment. Senator Smith of Michigan proposed to strike out the provisions that the President may not sell securities at less than the cost, but the amendment was rejected. Senator Cummins remarked that if his amendment had been adopted the surplus turned into the treasury would have been ample to take care of maturing obligations. To this Senator Smith of South Carolina replied:

"I am of the opinion that had the amendment of the Senator from Iowa prevailed the government would have had to buy all of these bonds. I think that the persons who held them would have thought them practically worthless."

Senator Cummins tried to amend the provision which had been inserted by the senate committee, to prevent any increase of compensation during the period of federal control as a return on surplus invested, by projecting it into the future and striking out the words "during the period of federal control." This was lost by a vote of 49 to 21.

Senator Townsend offered as an amendment a substitute for the bill which he said was designed to clarify the bill and provide what the advocates of the bill thought they were saying when they wrote the bill, but he secured only 11 votes.

A great many in both houses of Congress apparently accepted the bill without any enthusiasm. Many of them expressed the opinion that the taking over of the roads by the government was a mistake but that as the step had been taken it was necessary to pass the bill and it went through rather more quickly than had been expected in many quarters. Many thought the basis of compensation proposed too liberal to the railroads and 27 senators voted to reduce it. Many more thought it rather liberal, but that as the railroads had been taken over without any provision for their compensation it was necessary to establish a basis of settlement on which an agreement might be reached. On the other hand, there was a much more friendly attitude toward the railroads than has usually been displayed in congressional discussion, and an inclination on the part of many members to stand with the roads as against the advocates of government ownership. The overwhelming vote against leaving the period of federal con-

trol indefinite was considered as some indication of the sentiment on the subject because so many of the government ownership advocates opposed a time limit.

Senate Speeches on the Bill

Following those reported in last week's issue, extended speeches on the bill were made by several senators before the debate on the provisions of the bill began.

Senator Johnson of California, whose address was briefly reported last week, argued that government ownership is inevitable. He asserted that the railroads had broken down, which to his mind demonstrated the failure of private ownership, and he bitterly opposed the proposed basis of guarantee as excessive, contrasting the treatment accorded the railroads, by guaranteeing them approximately 8 per cent on their stock, with the 4 per cent rate paid on Liberty bonds, and with the guarantee to the English railroads, which he said paid only about 4 per cent on their stock.

Senator Norris objected to the compensation as "placing an obligation upon an already overburdened people that cannot be justified." He objected to the provision authorizing the President to initiate rates, saying it is asking a great deal of the Interstate Commerce Commission to expect them to overrule the President of the United States.

Senator Thompson made a brief speech advocating government ownership after the war, in support of an amendment to restore the original Section 13 of the bill providing that the government control shall continue until Congress orders otherwise. He submitted a petition signed by representatives of the four brotherhoods and of other labor organizations urging Congress not to fix a time for the return of the roads to private management.

Senator Townsend submitted a substitute for the bill, intended, he said, to make clear its intent, because he thought the administration bill was imperfectly drawn. He apparently resented the fact that the committee had so little to do with the authorship of the bill, saying "it came to us ready-made, and then we amended it and talked it over to some extent; and then the scrivener, the man outside who had made the bill, took our suggestions home with him and brought back the amendments prepared, and the bill as finally patched up was never before our committee in its present form."

The committee, according to Senator Townsend, was deadlocked on the period of federal control and on the question of rate-making and he thought the resulting compromise was satisfactory to no one. He thought the compensation proposed was too great but did not know whether it is greater than a court would allow under the conditions. He objected to rate-making by the President. "I do not want to be understood as saying that the railroads are not entitled to just and reasonable rates," he said, "they may be entitled to an increase in rates; but I want some tribunal of the people to determine what are just and reasonable rates."

The section restricting dividends to the amount paid in the past except as approved by the President, he thought was of doubtful validity but even if the section is valid it is ineffective, he said, for the penalty of \$5,000 is not severe enough to compel obedience. The authority to order the carrier to make additions, he said, is also of doubtful validity and his substitute contained a provision that the agreement shall contain a clause binding the carrier to conform to all the provisions of the act or orders thereunder, under penalty of suspension or forfeiture of payments under the agreement.

Senator Underwood criticised the "crudeness of draft" of the bill and warned Congress of the dangers of too much surrender to the executive, but he said he would vote for the bill unless it carried an indefinite period of government control.

"We might adopt the present bill with its lack of limita-

tions and its crudeness of draft as a war measure, but when we step one foot beyond the period of this war, when we have carried the transportation system out of its usual channels and turn it over to one man power, we are establishing the machinery of oppression. Then you are building up an organization for the destruction of business, and I say, therefore, unless it is limited to the period of the war I cannot support it."

Senator Underwood declared he had heard none of the representatives of the railways raise a point of objection to the taking over and "it is apparent that they could not have been taken over if they had not agreed to it" because the law of August 29, 1916, was unconstitutional in that it made no provision for compensation.

If the proposed legislation were to be permanent he would not vote for it, but as a temporary war measure he thought the people could afford to commit the question of compensation to the President for its temporary ascertainment, rather than drive the railroads into the courts.

Senator Sherman of Illinois declared that the bill is a temporary measure and that if he were writing it he would probably provide for a shorter period after the war but that he would support the bill. He presented statistics showing the large number of security holders and others who are interested in railroad investments.

"It is not merely a question," he said, "of the railways and of their managers, but it is a question affecting the whole fabric of credit of the country. The impairment of this vast quantity of securities by a small per cent becomes at once an impairment of the credit resources of the entire country. This bill reassures the general public and the holders of shares that there shall be no liquidation."

"The government has broken down as much as the railroads have broken down," Senator Sherman declared. "It was a great undertaking on the part of both," he said, and "some degree of liberality can be exercised in judging of each of them."

He opposed the idea of an indefinite period of control, saying that it was proposed for the purpose of bringing about government ownership, which he opposed. "If the government cannot run the railroads any better than the government has run the state and municipal affairs it has taken," he said, "then I am right in my opposition, for it has universally failed to produce as good results as private control."

Senator Poindexter objected particularly to the provision allowing the President to fix rates and to the time limitation. He said he was not arguing for government ownership, although he would not shrink from it if it should prove necessary, but he thought that there are "other intermediate measures which should first be tried before we resort to that last extreme." He did not believe the government should continue to operate the roads as they are now being operated, but that they should be turned back to private ownership, but not until legislation has been enacted to remedy the existing evils resulting from the competitive system. He ridiculed the idea of the commission exercising supervisory power over the President.

Senator Lewis declared that the bill is not only the forerunner of government ownership of railroads, but also of telegraph and telephone and coal and oil and he predicted that the question would be the great issue in the next presidential campaign.

Senator Johnson of South Dakota argued for an indefinite period of federal control, saying that the time proposed would not be fair to the public nor to the stockholders, "because it would not give a reasonable time to the country to practically demonstrate government ownership, which should be done."

Senator Hardwick of Georgia, declared that it was unnecessary and inadvisable to take over the railroads in the first place and that they have not been taken over against

their will or without their consent. The real reason for this transaction," he said, "is financial. We are taking over the railroads because, in the opinion of the President and railroad people and a great many well informed people, their financial interests require us to do it." For that reason, he argued, if the large roads are to be taken the short lines also should be included.

"Does the Senator really think," asked Senator Vardaman, "that the purpose of the taking over of the roads is in the interest of the roads? I would not charge the administration with that."

"I have not any doubt about it," replied Senator Hardwick. "I am not charging the administration with it, but I would rather lend them the money and let the owners operate the roads themselves."

Senator Vardaman of Mississippi approved the President's action in taking over the roads but supported the Cummins amendment to reduce the compensation.

Senator Thomas of Colorado said he had long ago reached the conclusion that government control or possibly government ownership may be the only solution of our various transportation problems, but he did not think an emergency war measure should be made the vehicle for such legislation and that the bill should contain nothing regarding the time to which governmental possession should extend after the end of the war. He also said that the effort to give the President rate-making power was foreign to the purpose of the bill.

Debate in the House

The debate was begun in the House on February 18 by Chairman Sims of the Committee on Interstate and Foreign Commerce, who explained at length the provisions of the bill. Representative Parker of New Jersey followed with a prepared speech in favor of the bill. Representative Stephens of Nebraska urged that the period of federal control be left indefinite, saying that to insert a time limit would undoubtedly force government ownership, which he feared, except as a last resort, on the ground that the government "might cease to be a government by the people and for the people and become instead a government by the employees for the employees." He criticized private ownership, but thought that some plan of permanent government control might succeed. Representative Dillon of South Dakota said the bill should be considered as a war measure and not for the purpose of establishing a government ownership experiment station. Representative Coady of Maryland declared the President's action was made necessary "by a condition produced by a maximum of regulation and a minimum of increases in rates." "We have not been fair to the roads," he said.

Representative Snook of Ohio said he did not believe he could bring his mind to sanction a law that in times of peace would take over all the roads and guarantee that such a return as is provided in the bill, but that he welcomed it under the circumstances. He denied that the railroads had broken down.

Representative Dewalt of Pennsylvania said the conditions which brought about government control were partly the fault of the railroads and partly the fault of the government and he advocated the basis of compensation proposed in the bill as necessary to prevent financial disaster.

Representative Esch of Wisconsin urged that there should be no interference with the rate-making authority of the Interstate Commerce Commission and opposed the proposed basis of compensation as excessive. The roads should be satisfied, he said, with enough to pay interest and dividends and with surplus right to go either to the government or be divided between the roads and the government. He urged that the period of federal control be limited to one year after the war.

Representative Barkley of Kentucky said it was impos-

sible to imagine the disastrous results to the financial condition of the country if the compensation should be made so low that the railroads should feel it necessary to go into the courts. He advocated giving the President power to make rates because he said it would probably be necessary for him to advance them to pay the large increases in wages. "Unification of physical control is wholly incomplete," he said, "unless the unification of financial control goes hand in hand with it."

Representative Cooper of Ohio supported the bill and objected to an indefinite period. "I believe that to take over the railroads indefinitely means government ownership," he said. "There are some who would have the question of government ownership sneak into this bill. Let us try and be fair with the railroads and give them a square deal and help them when they need helping instead of clubbing them when they are down."

Representative Fordney of Michigan declared that the taking over of the railroads was a mistake but that he would vote for the bill because it is necessary now that the roads have been taken over. But he was unalterably opposed to government ownership and cited examples from other countries which he said showed that it had been a failure wherever it has been tried.

Representative Winslow of Massachusetts opposed giving the President rate-making power, saying he thought Congress was going too far in the direction of granting powers to one or two men.

Representative Decker of Missouri said that no one could tell what the railroads are worth or say whether the proposed basis of compensation is too much or too little. Some members of Congress, he said, are worrying about how they shall explain their action when they get back home, but he thought he had a satisfactory answer. "I am going to say," he declared, "that for 30 years there has been in this country a great body called the Interstate Commerce Commission, whose duty it has been, so far as possible, to determine what is fair compensation for the railroads. That body has the confidence and respect of the people of the United States. In some places there is more confidence in it than in others, but it is the only body we have. We simply took what they had allowed these railroads to receive during the last three years, and divided it by three. Can you beat that system?"

Representative Lenroot of Wisconsin took occasion to assert that he did not believe that the Interstate Commerce Commission can be held responsible for the condition of the railroads nor that it was due entirely to the lack of proper management on the part of the railroads, but that Congress should have repealed the restrictive legislation as soon as

war was declared. He thought the compensation proposed in the bill was liberal but was not certain that it is any greater than the roads would be entitled to under the law. He declared that the bill as drawn was full of inaccuracies and suggested a number of amendments to clarify it.

Representative Rayburn of Texas declared that whether the bill should pass is not a debatable question, but that it is purely a war measure and should terminate as soon after the close of the war as possible. "It is not candid," he declared, "for men to say that since we have taken over the roads under the war power we should hold them after the war to try one nostrum after another." He believed the compensation proposed in the bill is as nearly just as it could be made.

Representative London of New York, who is a socialist, replied to the speech by Representative Fordney with an argument for government ownership and for an indefinite period of federal control.

Representative Hersey said he thought it was unnecessary to discuss government ownership because "when the war is over the question will have been settled forever, for I am sure that the operation of the railroads by the government will result in such a failure that we shall be only too glad to return these roads to their rightful owners."

Voting on amendments to the bill was begun in the House on February 23.

An amendment similar to that proposed by Senator Cummins in the Senate to include short lines was adopted in the House on motion of Representative Esch, after a long debate, by a vote of 73 to 27, after having been modified to apply only to lines which connect with roads under federal control. An amendment offered by Representative Montague of Virginia to include in the classes of roads with which the President is authorized to deal specially those on which recent expenditures by additions or improvements, were not fully reflected in the three years' income, was adopted.

Much of the session on Monday was devoted to amendments offered by Representative Lenroot intended to clarify the bill. Several minor changes resulted.

Several efforts to reduce the proposed basis of compensation were made in the House. Representative Dowell offered an amendment to provide that the standard return shall not exceed 7 per cent on the stock, after payment of expenses and fixed charges. This was defeated by a vote of 40 to 15.

Representative Dillon proposed to change the provision for an appropriation of \$500,000,000 by providing that \$300,000,000 of the amount may be expended only as authorized specifically by Congress.

A Light Railway "Drag"

A Union Package Freight Terminal at Jersey City

A Plan for the Handling of L. C. L. Freight at New York to Reduce Congestion and Expedite Movement

THE RECENT ACTION of President Wilson in instructing the Secretary of War and the chairman of the Shipping Board to investigate a comprehensive plan for the handling of l. c. l. freight between Jersey City and New York, which was prepared by the American International Terminals Company of New York City, has directed much attention to this project. This plan contemplates the provision of terminal facilities along the Morris Canal Basin, a short distance north of the passenger terminal of the Central Railroad of New Jersey in Jersey City at an estimated expenditure of \$75,000,000. This terminal, which will be accessible to all of the railroads along the west shore of the Hudson river, is designed for the handling of package freight to and from Jersey City or New York City, for export or for transfer between railroads. These facilities are designed

the north side of the Canal basin. The basin will be widened to a width of from 300 to 450 ft., and will have sufficient depth to accommodate any tug or lighter.

General Description of the Terminal

Along the bulkhead, 15 ft. back from the water front, a ten-story building will be constructed, 85 ft. in width on the first floor, and with the other floors set back 15 ft. further, making them 70 ft. in width. Connected with the bulkhead building, 16 ten-story buildings are projected, of an average length of 1,400 ft. and 75 ft. in width. Each of these buildings will have a 75 ft. driveway on one side and eight railroad tracks on the other side. Each of the driveways will have a separate outlet by an overhead crossing to Grand street, avoiding any grade crossings of driveways or

The Terminal Site and Approaches

to enable package freight to be collected and delivered at a material reduction in cost from that now encountered, while this will also provide a much needed increase in facilities and relieve congestion.

The plans were prepared under the direction of W. H. Lyford, president of the American International Terminals Company and an attorney of Chicago, who has given much attention to terminal problems in various parts of the country, being the promoter of the plan for the joint ownership of the Belt Railway and the development of the Clearing Yard project at Chicago. While the plans were completed somewhat over a year ago, the project was postponed temporarily because of the outbreak of the war. It has now been brought prominently before the public by the action of President Wilson referred to above and also by the consideration which the Joint Port Commission of the states of New Jersey and New York has given to the plans.

The plan provides for four steamship piers along the Hudson river, and a bulkhead about 4,550 ft. in length along

streets over tracks. It is contemplated that the first floors of these 16 buildings will be used as terminal freight stations for handling package freight, and that each railroad will occupy the first floor of two of these buildings, using one as an inbound station and the other as an out-bound station, with two tracks to serve each inbound house and six tracks to serve each out-bound house.

On the first floor there will be no partition walls between these buildings and the connecting building along the bulkhead, so that, by way of the bulkhead building, freight may be trucked from any building to cars at any other building, to any lighter along the bulkhead, or to any steamship at either of the four piers along the river. It is contemplated that substantially all of this trucking will be performed by electric tractors hauling four-wheel trailers, which will have the effect of minimizing the trucking distances.

Rail access to the terminal from the north, for the West Shore, the Lackawanna and the Erie, is proposed by way of the 1,000 ft. railroad, formed by the New Jersey Junc-

tion and the National Dock Lines, owned by the West Shore and the Lehigh Valley, respectively. From the south it is proposed to give the Lehigh Valley, the Central Railroad of New Jersey, the Pennsylvania, and possibly the Baltimore and Ohio, three separate ways of access: first, by a four-track line to be laid in the bed of the Morris Canal from its crossing with the Central Railroad of New Jersey opposite Black Tom; second, by the National Docks Line; and third, by existing surface lines from the nearby yards of the Lehigh Valley and the Central Railroad of New Jersey.

Each railroad company will have an unobstructed lead to its station tracks in the terminal area, from the belt line or other approach which it may use, and can move its trains and cars to and from the terminal with its own locomotives without interference from the locomotives of other companies.

General Scheme of Operation

It is proposed that inbound trains of merchandise destined to Manhattan Island be run into these inbound station buildings, instead of being floated to New York, and that the freight be immediately unloaded and (1) trucked to New York by a fleet of motor trucks, using existing or special ferries, and delivered at union freight stations to be located away from the water front, in each shipping district of New York; or (2) transferred by tractors and trailer trucks to outbound cars of other roads in the terminal area; or (3) placed upon lighters along the bulkhead and floated to ship-side or other destination; or (4) trucked to piers for delivery to ships; or (5) elevated to the upper floors for storage.

Outbound freight, instead of being delivered at the pier stations of Manhattan Island, will be delivered at the various union inland stations in New York, and trucked to the proposed Jersey City terminal, where, together with lighterage freight and storage freight from the upper floors, it will be loaded into outbound cars for destination.

As all the freight stations in the proposed terminal will be connected with the bulkhead, and all buildings will be of sufficient width to furnish adequate truck-ways, all of the railroads using the terminal will be able to interchange *i. e.* freight by trailer truck, in a few minutes, from any inbound car into any outbound car in the terminal area, with one handling and at minimum cost. While the volume of this interchange freight is comparatively small, it is growing constantly, and present methods of its interchange between the Jersey roads are slow and expensive.

It is contemplated that each railroad may wish to employ its own freight handlers and have full control of the operations on the first and possibly also the second floors of the buildings which it occupies, but that probably a common trucking force should move the freight along the bulkhead and to and from lighters and steamships. It is suggested that, along the bulkhead, it would be possible to consolidate the lighterage business of all of the roads and to lighter full loads to each destination, instead of moving partially loaded lighters around the harbor for each railroad. As an example of the possibility of consolidating lighterage services, each of the railroads is now sending to the pier station at 130th street a separate lighter for its own business, whereas, at the proposed union terminal in Jersey City it is planned that freight can be received on one lighter for all of the roads and distributed into the cars of each company, and one lighter will handle all of the outbound business delivered at the 130th street pier station in a day, thereby releasing five or six other lighters and as many tugs.

Export Terminal and Warehouse

It is suggested that, in addition to its use for handling freight to and from Jersey City and New York, this terminal might be used as a common export terminal for handling and warehousing export package freight for all railroads.

To that end, it is proposed that such freight be consigned to this terminal and immediately unloaded, thereby releasing the cars. Such freight consigned to ships then in the harbor could be lightered or trucked to them by the Terminal Company, and freight which must be held for incoming ships would be elevated to the upper floors and stored until delivery could be made to the ship's side. The freight from all roads for each ship would then be consolidated by the Terminal Company and delivered to the ship.

It is proposed to construct the Jersey City terminal on such a large scale that about 20,000,000 sq. ft. of floor space will be available for storage, and it is suggested that the railroads may use all of these storage facilities to advantage for the storage of export freight, even during the free time, rather than hold the freight in cars, which are needed for the movement of other freight. If the railroads do not approve the suggestion that they use all of this warehouse space for export freight, it might be leased to private parties, under long-term leases, to be used for warehouse or industrial purposes. As the occupant of each floor would have shipping facilities over all of the railroads using the terminal, without any cartage expense, it is believed that all of the warehouse space could be readily leased to responsible tenants.

An elaborate investigation has been made of the trucking features of these plans, first as to trucking on the floors of the Jersey City terminal, and second as to the use of motor trucks for moving freight to and from the terminal. As to platform trucking, the results of the use of tractors and trailers in two freight stations in Chicago, where this system of trucking has been used for more than three years, and where accurate accounts of costs have been kept, are stated to have demonstrated that one man with a motor truck hauling trailers can do the work of from 11 to 14 men with two-wheel trucks, showing a greater efficiency than by any other method of trucking. With reference to the substitution of motor trucks for car floats for moving freight across the river, it is stated that, if facilities were furnished at the Jersey City Terminal, and at inland union stations on Manhattan Island, for handling, loading and unloading removable truck bodies, motor trucks would move freight between Jersey City and New York with a material saving of time and expense, as compared with present methods of moving freight in cars on floats. As a result of the use of removable truck bodies in Baltimore and elsewhere, it is stated, that one motor truck is able to move three or more removable bodies as fast as they can be loaded and unloaded.

It is assumed in the development of this plan that inland freight stations can be located in the first floors of new warehouse and industrial buildings to be erected on vacant or poorly-improved real estate, away from the water front, to such advantage to the owners of such buildings and surrounding real estate that the cost of securing the use of such stations would be a small fraction of the present cost of leasing pier stations. Such inland stations could be located anywhere on Manhattan Island, in the Bronx, in Brooklyn, or on Staten Island, in places easily accessible from existing ferry landings, or from new landings to be secured for additional ferries. Aside from the economy in time and cost of movement, the use of inland stations could be extended indefinitely, whereas it is practically impossible to secure additional pier space on the water front, and the pier terminals are already congested to their limit.

Capacity of Proposed Terminal

It is estimated that 6,000,000 tons of merchandise is delivered on Manhattan Island from New Jersey railroad terminals per year, and that 4,000,000 tons of merchandise is delivered at New Jersey railroad terminals from Manhattan Island, or a total of 10,000,000 tons per year moved across the river. It is estimated that all of this tonnage and 5,000,000 tons additional, could be moved through the proposed

Jersey City terminal and moved by motor trucks across the river.

The frontage of the proposed Jersey terminal on the Hudson river is about 1,350 ft., which will accommodate 22 ferry slips, each of a width of 65 ft., center to center. New ferry boats should be constructed, which will carry at least 40 5-ton trucks each way. It is assumed that, while the truck bodies will have a capacity of five tons each, they will carry an average of four tons each way. A total of 9,000,000 tons of freight per year would be equivalent to 2,250,000 4-ton truck-loads per year, or 7,500 truck-loads per working day.

Nine ferry trips per working day from each of the 22 ferry slips at the Jersey terminal could carry 7,920 truck-loads each way per day, or 11,904,000 tons each way per year of 300 working days.

There are 13,000 linear feet of westbound freight platform at the Jersey terminal, which would accommodate 722 truck bodies at a time, allowing 18 ft. per body. An average of 10.4 trips per day for 722 trucks, which would equal 7,509 truck-loads per day, would carry 30,036 tons per

day at 4 tons per truck, or 9,010,891 tons per year of 300 days.

While the plans provide for eight railroad tracks, with a car standing capacity of 12 cars each, between each pair of station buildings, it will only be necessary to use four tracks at each westbound station and two tracks at each eastbound station, to handle the estimated tonnage of 9,000,000 tons eastbound and 6,000,000 tons westbound.

A total of 9,000,000 tons eastbound per year of 300 days equals 30,000 tons per day, which would be carried by 1,500 cars, at 20 tons per car. Also 188 eastbound cars could be unloaded at each of the eight eastbound stations, by using two tracks at each station, and setting each track three times per day, or the same number of cars could be handled on one track by setting the track six times per day.

A total of 6,000,000 tons westbound per year of 300 days equals 20,000 tons per day of westbound freight. This tonnage would be carried by 1,000 cars per day, at 20 tons per car. Four tracks set only once a day at each of the eight westbound stations, would carry the entire outbound tonnage of 6,000,000 tons per year.

A Plea for the Railway Supply Manufacturers

An Open Letter to the Director General of Railroads from the Railway Business Association

GEORGE A. POST, president of the Railway Business Association, under date of February 25, sent the following communication to Director General of Railroads McAdoo:

Manufacturers of railway necessities respectfully invite you to study certain considerations bearing upon mechanical design and practice in the field of rolling stock construction, purchase and maintenance.

The Railway Business Association, of which I have the honor to be president, is a national organization of manufacturers, merchants and engineers dealing with steam railroads. What we have to say from our own experience accurately portrays the problems of the whole railway appliance industry.

It appears from your official announcement that you have delegated to technical committees the work of recommending to you a detailed plan of procedure for the acquirement of new rolling stock by the railroad systems. The phases upon which we desire to address you are those which involve the peculiar interest of makers of appliances or parts as distinguished from assemblers of locomotives and cars.

In the field of transportation inventors and developers of special appliances embody the spirit and function of progress. Our interest and the national interest in this respect are identical. What the manufacturers of railway appliances cherish and what the public as a whole is interested in preserving is that flexibility which leaves the way open to mechanical advance. Always we have before us two antagonistic requirements which must be compromised—improvement through change and stability through standardization.

To a certain extent standardization is essential. As transportation became national and interchange of cars among the several roads became common, convenience and economy in repairs required a tendency toward interchangeability of parts. With the organization of the Railroads' War Board last April came for the first time to any extent use of engines on the rails of roads other than the owner. What has long applied to cars affecting repairs now applies in some degree to engines. The drift, as with cars, is toward interchangeability

of parts. The method by which inter line use of cars was made possible was, to be sure, standardization, but it was a standardization of dimensions. If the car frame were uniform a device of any patent could be used upon it. Thus we attained practical current convenience while preserving variety of design and material, of terms, delivery and dealings, and hence reasonable expedition in the demonstration and introduction of improvements.

We earnestly commend to your favorable consideration the fullest adherence to this method consistent with the most effective rehabilitation and maintenance of transportation facilities in face of the enemy. We are ready for any sacrifice essential to winning the war. We would deplore as disastrous to the nation's business any departure, not clearly necessary for national defense, from competition between patented railway appliances.

Manufacturers of railway goods have borne an honorable part in promoting the progress of transportation science. What they have achieved for the public in safety, comfort, speed and economy of railway operation has been accomplished in an atmosphere of keenest competition. We could try persuasion upon one independent railway manager after another until the test was made and a demonstration afforded. Our work has been marked by variety, elasticity, development. The inventor, the executive and the salesman have been inspired by the hope of excelling, roused to effort by the exertions of rivals. Under such conditions our industries and the country with them have progressed and thrived. The man with whom we have hitherto dealt has had a definite responsibility for affording his company the benefit of the latest scientific discoveries.

We believe that the preservation of decentralization in our dealings is not only important for the immediate present, but vital as a precedent for the ultimate adjustment after the war.

Looking especially to the present, many of those engaged in the railway supply industry are profoundly anxious concerning the policy which you will adopt as it may affect them and the scores of thousands of workers whom they employ.

Unofficial statements and rumors have hinted at the possi-

bility of far-reaching standardization, under which large numbers of plants would be swept out of existence or forced to reorganize for some other type of service. A maker produces, let us say, a device which is part of a car. He is one of several who manufacture competing appliances that perform the same function. Will some one of us, he has been asking, be declared standard and all the others thrown into the discard? If so, the conclusion of peace would find the unfortunates whose products had been discarded under the edict of standardization for the period of the war deprived of a large part of the value of their patents through disuse and their business paralyzed through discontinuance of the mechanical and commercial processes which keep any business a progressive living organism.

Established commercial processes are the result of experience and of scrutiny under government regulation, federal and state. We are confident that you will be alert to the desirability of performing your difficult and vital function as Director General of Railroads with the least possible disturbance to those processes. We believe that you will find it practicable to preserve the business and the individuality of the several makers of rolling stock appliances. Cars have now been so far standardized in dimensions that they can travel over any railroad in the United States, as anyone can see who observes upon a freight train the multiplicity of ownership insignia. So far as speed of production is concerned little or no delay is occasioned in changing from one patent to another and substituting on each lot the appliances which have been designated by the particular buyer.

We can see no obstacle to the adoption of a plan under which, whatever the design of the car as a whole, every reputable established appliance for each function would be sanctioned and the several roads directed to exercise, as in the past, their judgment in specifying devices.

What applies to construction of new rolling stock is of more importance in the field of maintaining rolling stock that exists. The largest number of locomotives ever ordered for domestic account in any one year was 6,265. The number of locomotives in use and under maintenance according to the last report was 63,862. The largest number of freight cars ever ordered in any one year was 341,315. The number of freight cars in existence and requiring upkeep as last reported was 2,326,987. Obviously the big end of the rolling stock task and the preponderant consumption of engine and car parts is not in new construction but in maintenance. Apart from repairs made by one railroad upon cars found out of order on its rails a highly important proportion of such work is the thorough overhauling of cars by the road that owns them in its own shops. For replacement of parts broken or worn out each road orders from the makers quantities of whatever appliances are standard upon that road. Stability in the industry during the war will be promoted by permitting in general each road to determine as in the past which of the competing appliances it will use in repairs.

Such a policy, affecting both construction and repair upkeep, will not only give rapidity and certainty to the exigent performance in war and preserve for the time of peace the commercial organizations which have carried on mechanical progress, but it will involve the minimum readjustment of shop operation and production quotas, thus keeping these enterprises in a strong position as payers of war taxes and subscribers to war bonds—these and the tradesmen and the people of the communities wherein their plants are located who draw sustenance primarily from the industrial pay roll.

Please permit me personally, and I believe I may say the same thing in my representative capacity, to felicitate you. Sir, upon your manifest determination to form judgments based upon knowledge and upon the opinion of those whose vocation fits them to serve the country through you at this crisis.

Uniform Rules For Marking Freight

AT THE REQUEST of the Director General of Railroads the Interstate Commerce Commission has approved for filing, by all carriers by railroad subject to his authority, schedules containing the following uniform rules and regulations and practices governing marking less than carload freight:

Section 1. Freight, when delivered to carriers to be transported at less than carload or any-quantity ratings, must be marked in accordance with the following requirements and specifications, except as provided in Section 2 (b) of this rule or otherwise provided in specific items in this classification or in the Interstate Commerce Commission's Regulations for the Transportation of Dangerous Articles other than Explosives by Freight. If these requirements and specifications are not complied with, freight will not be accepted for transportation.

Section 2. (a) Each package, bundle or loose piece of freight must be plainly, legibly and durably marked by brush, stencil, marking crayon (not chalk), rubber type, metal type, pasted label (see Note 1), tag (see Note 2), or other method which provides marks equally plain, legible and durable, showing the name of only one consignee, and of only one station, town or city and state to which destined.

When consigned to a place of which there are two or more of the same name in the same state, the name of the county must also be shown.

When consigned to a place not located on the line of a carrier, it must also be marked with the name of the station at which consignee will accept delivery.

When consigned "To Order," it must be so marked, and further marked with an identifying symbol or number which must be shown on shipping order and bill of lading.

Note 1. Labels must be securely attached with glue or equally good adhesive.

Note 2. Tags must be made of metal, leather, cloth, or rope stock or sulphite fibre tag board sufficiently strong and durable to withstand the wear and tear incident to transportation; and when such cloth or board tag is tied to any bag, bale, bundle or piece of freight, it must be securely attached through a reinforced eyelet. Tags used to mark wooden pieces or wooden containers must be fastened at all corners and center with large-headed tacks or tag fasteners. Tags may be tied to wooden pieces when the freight would be injured by the use of tacks or tag fasteners. Tags tied to bags, bales, bundles or pieces must be securely attached by strong cord or wire, except that when tied to bundles or pieces of metal they must be securely attached by strong wire or strong tarred cord.

(b) A shipment that fully occupies the visible capacity of a car, or that weighs 24,000 lb. or more, when shipped from one station, in or on one car, in one day, by one shipper for delivery to one consignee at one destination, need not be marked.

(c) The marks on bundles, packages or pieces must be compared with the shipping order or bill of lading, and corrections, if necessary, made by the shipper or his representative before receipt is signed.

(d) Old consignment marks must be removed or effaced.

(e) Freight in excess of full cars must be marked as required for less than carload freight.

The schedules are to be filed on not less than 30 days' notice.

BAVARIAN RAILWAY TRAFFIC STOPPED BY SNOW.—According to advices to the Dutch press, all train traffic from Bavaria to northern Germany was stopped late in January by snowstorms. Troops have been requisitioned to clear the snow.

Germany's Railway Situation Is Most Serious

Prussia's Railroads Had a Deficit of \$50,000,000 in 1917

Requiring Increased Rates and Fares for 1918

NOW THAT Milder weather and the approach of spring give us a chance to look up from our worries and glance back upon the railway mishaps of the most severe winter for 50 years, we can console ourselves that, however bad conditions may have been in the United States, they were considerably worse on the railways in Germany.

A deficit of 250,000,000 marks for the Prussian railways in 1917; a possible deficit of more than twice that amount in 1918, only partly to be compensated for by increased rates and fares; congestion; lack of coal; a threatened shortage of cars, and an exceedingly poor and much reduced passenger service represent only a part of the difficulties that have arisen.

The statement that there has been a deficit on the Prussian railways is made on the authority of the Prussian Minister of Finances Hergt. The Prussian railways in the past have contributed no small amount of the revenues in the Prussian budget, so the fact that there has been a deficit of 250,000,000 marks is of more than ordinary importance. Herr Hergt expects that this deficit will double in 1918 on account of the rise in price of coal. In outlining the new budget the minister said that the new incomes of Prussia would exceed those of last year by nearly 1,400 million marks, while the expenses will be higher by 1,239 million marks than those of last year. The net surplus will be 343 million marks.

Following is the text of Minister Hergt's speech before the Prussian House of Representatives as quoted in a recent issue of the New York Tribune. It is given in detail to show clearly the importance of the railway revenues in Prussian finance:

"Assuming that on April 1, 1918, the war will still be going on, all additions to the income and supplementary taxes which had been voted on July 8, 1916, will be repealed. The incomes and the expenses of the fiscal year 1918 will balance without these additional taxes. These favorable results have been obtained in spite of the rising expenses on account of the war—the total salary of officials alone has been raised by 370 million marks because of high prices—thanks to the opening of new sources of incomes. For this purpose the railroad administration, the expenses of which also have risen on account of the war, raised the rates of passenger and freight traffic; it is expected that this will increase the receipts of the railroads by 389 million marks. In addition there remains available for the needs of the State the net proceeds of the State above the margin of 2.10 per cent for the invested capital; this would give about 159 million marks.

"In preparing the budget for 1918 the same methods have been used as in preparing that of 1917. In planning the expenses great moderation was exercised. Nevertheless, it was impossible to keep down the expenses to what they had been in previous years.

Income Exceeds 6,500,000,000 Marks

"The ordinary incomes will amount to 6,538,863,278 marks (that is, 1,381,700,000 more than during the present year). The ordinary expenses for the new year will reach 6,195,091,411 marks (1,239,400,000 marks more than during the present year). The ordinary surplus for 1918 will be 343,771,867 million marks (145,400,000 more than during the present year).

"At the head of the administrations from which a surplus

may be expected stands the administration of direct taxes with a surplus of 184,700,000 marks. Then comes the forest administration with a maximum surplus of 29.1 millions. The administration of custom duties and indirect taxes promises a maximum surplus of 17.8 millions. The Prussian stamp tax can be raised by 10 millions. The maximum proceeds from maritime traffic, it is hoped, will reach 12.5 million marks. From the administration of the crown lands a surplus of 2.8 millions is expected. The surplus of the lottery administration will be higher by 880,542 marks.

"It is natural that there should be deficits during the first years of the war. But these deficits which amounted to 517 million marks have been reduced to 317 millions by means of special taxation. There is no doubt, however, that we have used up our reserves. But reserves are, anyhow, for the purpose of being used up some time. As good householders we must naturally take care that we straighten out the deficit of 317 millions. This will not be easy when we consider the expenses which are continually increasing.

"Prussia's share in the payment of indemnities to Eastern Prussia is 70 million marks. These will have to come out of the Prussian treasury. The forest administration is still a Sleeping Beauty, and it will take a year before it will yield fruit. The mining administration, on the contrary, has so far had 1916 as the most successful year. Had we not borrowed in 1916 the sum of 100 million marks in order to straighten out the old deficits, our incomes and expenses would have balanced, and this would have repeated itself in 1917 and 1918.

"The income of the railroad administration in 1915 for the first time surpassed 4,000,000,000 marks. The increase in passenger as well as freight traffic was immense. The year 1916 meant for the railroad administration the climax of the war times. Since then its incomes have been falling down very rapidly, for in 1917 the railroad administration expects to find a deficit of 250 million marks. Doubtlessly, it will be possible at least partially to straighten out this deficit by means of the surplus income of the mining administration, which has surpassed the brightest hopes.

Why Rate Increases Are Necessary

"On account of the rise in the price of coal, a new decline has taken place in the railroad administration, so that in 1918 the railroad administration will be confronted by a deficit of 500 millions; it will bring nothing to the State, will not lay aside anything, but will have to take a few dozens of millions from the State. Here a radical improvement in the condition of income is desirable.

"We cannot impose new taxes upon the population of the empire and the States as long as there are these extraordinary differences in the communities. Therefore, we must immediately proceed to the equalization of burdens. Without any general State measures this is impossible. We furthermore need tax reserves because of the coming imperial finance reform. Naturally every minister of finances of Prussia must agree that the taxes on incomes and wealth belong to the States of the federation. And no minister of finances could take upon himself the responsibility of yielding these sources unless he received something to replace them. But the empire, the States and the communities form one unit, and this must be taken into consideration. The principle must be not only 'Give to the Kaiser what belongs

to the Kaiser," but also 'Leave to the King what belongs to the King.' At the present 3½ billion marks of the Prussian taxes go to the Empire. These 3½ billions have to be substituted by other taxes.

"All this makes it necessary to raise the railroad rates—passenger rates, 10 per cent; freight rates 15 per cent; military rates 10 per cent. This rise in rates will bring a total of 389 millions. But even then the railroad administration will be unable to contribute its share to the State. One hundred and fifty-nine millions will still be missing. The new raising of the railroad rates is only temporary; we hope to abolish them after the war, but we must take the liberty of trying their effect upon traffic and State finances."

The Passenger Service

The imposition of higher fares, plus a tax, appears, comments the Railway Gazette of London, to have been undertaken hitherto not with a view to increasing revenue, which had actually risen on a level with the figures for 1913, but in order to discourage travelling as much as possible, and in pursuance of this end, the passenger service has ruthlessly been cut down. Even so, there are limits to what can be done in this direction. As the Frankfurter Zeitung points out, 70 per cent of the passengers in fast trains are soldiers, and although the military authorities curtailed the granting of leave during the autumn in order to reduce congestion, it was found impossible to frame any general rules for the restriction of travelling, such as, for instance, would have been involved in a system of granting permits. The Prussian railways alone issue a million and a half tickets a day, and if it were desired to establish which journeys were urgent or necessary and which unnecessary, the inevitable result would be injustice and the creation of a vast new staff of petty officials. In the meantime, everything is being done to render railway travel as expensive and as uncomfortable as possible. Heating is practically non-existent, food is extremely difficult to obtain even on the longest journeys, and the costliness of travel can be gaged from the following comparative table showing the old fares from Berlin to a number of important centres and those now in force:

| | Old Fares— | | New Fares— | |
|-------------------------|------------|-----------|------------|-----------|
| | 3rd Class | 2nd Class | 3rd Class | 2nd Class |
| | Marks | Marks | Marks | Marks |
| Aix-la-Chapelle | 19.20 | 29.30 | 39.20 | 59.30 |
| Breslau | 10.20 | 15.80 | 23.20 | 35.80 |
| Cologne | 17.80 | 27.20 | 37.80 | 57.20 |
| Frankfurt-on-Main | 16.60 | 25.50 | 36.60 | 55.60 |
| Munich | 20.10 | 30.70 | 40.10 | 60.70 |

The amount of baggage permitted has been severely cut down. This is mainly due to certain obvious operating reasons, such as the desire to reduce both the weight and the length of trains, in order to economize in coal, labor, and the utilization of rolling-stock. In certain eventualities, the unfortunate passenger may also have to choose between being stranded at a junction or going on without his baggage, since a new regulation provides that in order to avoid unpunctual working, facilities can be withheld for the transshipment of luggage between connecting trains.

These restrictions have, of course, not been received with great enthusiasm, and in one quarter they have, curiously enough, even led to a demand for the institution of one passenger class only. The suggestion is made by the Vossische Zeitung, which says:

"It might perhaps be difficult to find a satisfactory method to dam the flood of passengers. But the method chosen simply means that henceforth a well-lined purse is essential if we desire to make long journeys in comfort. . . . Why has the simplest method of lightening express trains not been selected—that of forbidding passengers to travel by them for short journeys? Above all, since it has been believed to be necessary to double the price of tickets, we ought to profit by the occasion and establish one class only. . . . There are eight seats in a third-class compart-

ment, six in a second, and four in a first. If the difference in classes were abolished and eight persons put in each compartment, a considerable alleviation would result in this way alone."

"We believe," says the Railway Gazette, "that some restrictions preventing short-distance passengers from travelling in expresses have been drawn up since the publication of the above comment, but the conservative and respectable Voss's Gazette can hardly be serious in its suggestion for one class only. The idea is unthinkable in contemporary Prussia, where an army officer may perhaps deign to travel in the same compartment with civilians, but will certainly not permit the rank and file of the 'field-grays' to come betwixt the wind and his nobility."

The Freight Situation

The German press does not publish such full details of the freight traffic problem as of passenger difficulties, but extremely significant facts are printed from time to time. We do know that both rail and water transportation have been handicapped by the severe winter weather. The Frankfurter Zeitung recently said of the general situation that "it is not possible to impose any additional restrictions on merchandise traffic. It is hardly possible to institute economies through a better organization of the rolling-stock. On the other hand, traffic necessities continue to increase." In the course of this article it was pointed out that while 4,200,000 tons of potatoes a year were handled as the average before the war, the traffic rose to 6½ million tons in 1916. In August last, it became necessary to "immobilize" 43,000 more cars than in the corresponding month of 1916, while for September the figure had risen to 65,000. And it is not as though the German railways could dispose of a surplussage of working stock. At the outbreak of war, the system as a whole owned about 622,000 cars, and up to the end of last year, approximately 91,000 new cars and 4,153 locomotives are said to have been constructed. These additions are entirely inadequate to meet traffic requirements, especially as the situation is complicated by the necessity for utilizing German rolling-stock and locomotives on the railways of occupied territories. It was estimated that at the beginning of September last, 155,000 cars were in use in Belgium, Poland, Courland and Serbia, and, after making every allowance for cars belonging to the railways of these countries, it is obvious that such an extension of operations, with its attendant long hauls, increases the strain on the working stock at the disposal of the German railway administrations.

Germany has also had difficulties in regard to coal and water transport. The coal problem is mainly one of transportation, and arises out of the congested state of the railways and of inland navigation. The difficulties of the latter have been accentuated by the lack of coal transport facilities, which handicaps the working of the canal and river tugs and barges. "Altogether," the Railway Gazette concludes, "Germany's transport difficulties are incomparably more serious than our own, which is something to be grateful for in a 'railway war,' to use Marshal Joffre's description of the present conflict."

11,300 More Miles to Be Operated

Further details concerning these difficulties on the railways of the Central Powers will be found in an article recently published in the London Times, which says:

"It is difficult to gage the true position, as the newspapers sometimes give prominence to reforms which may be proposed by the authorities, but which are in reality only intended to throw dust in the eyes of the public in Germany to cover up some deficiencies in the service.

"There is no doubt that up to about six months ago the railways were able to maintain a fairly efficient transport service. Gradually, however, with the waning man-power the

service deteriorated. As long as possible the railways kept up a time-table, which was very little behind the pre-war standard. The fares were unaltered except for trifling increases. Of course in the war zone the service was reduced long ago, if not suppressed entirely.

"This make believe efficiency could not last, and the Railway Minister had to show his hand rather suddenly. It is instructive to note that the occupation of so much extra territory has become a burden for the German railways. The drain on their resources has become immense, in spite of the fact that there is no coal shortage in the sense of that experienced by France and Italy. The difficulty is to get the coal to its destination.

Extra Mileage to Be Operated

"In considering the effect of the war on the internal working of the railways, the extra territory served must not be lost sight of. This is what it means in extra mileage to be operated:

| | Miles. |
|-------------------|--------|
| Belgium | 2,700 |
| France | 9,900 |
| Poland and Russia | 5,310 |
| Romania | 1,400 |
| Serbia | 750 |

In other words, there are roughly 11,000 miles in enemy hands, slightly less than one-half of the railways of Great Britain.

"It is quite certain that not too much rolling stock was left available for the enemy. This is especially the case with locomotives. It has been officially stated that over 155,000 German wagons are running in the occupied zones. Since the beginning of the war the Germans have built 120,000 new wagons and 5,000 new engines, but this supply is not nearly enough for the requirements.

"It will therefore be seen that to keep up the supplies for the armies and the civilian populations over such long distances was no light task. Gradually it became impossible. Public notices were issued asking people not to travel. Still the traffic increased, and the trains became overcrowded and behind time.

"It was in October last, when the harvests were being transported, that the breaking point was reached. The minister was no longer able to carry on the traffic without some drastic move. Suddenly, on the 18th of the month, the fares by all fast trains were doubled. On November 1 a new time-table was issued, by which many trains were struck off.

"The Austrians followed suit on December 1 with a 50 per cent increase in the fares, making 80 per cent with the previous one imposed in February. The Hungarians raised their fares from November 15 on a sliding scale from 70 to 120 per cent.

Marked Reduction in Traffic

"The immediate effect of all this was to reduce the traffic by about two-thirds. The trains that were then running were reduced in weight, and dining cars, which had disappeared from the scheme, were again put into working.

"The Under Secretary of State, Herr Stieger, speaking on December 14 on the question of the coal shortage, stated that the reduction in travel accounted for a saving of 2,000 tons a day on the Prussian railways. What he did not say was how many protests had been received as a result of the suddenness of the introduction of such a ban on travel.

"It is interesting to note that the fares are about equal to those charged in England. Thus, for a journey of 90 miles the third class fare in England is \$2.70; in Germany it is \$2.40, in Austria it is \$2.64 and in Hungary \$3.04.

"To summarize the new time-tables which came into force in November, 1917, is not so easy, as a detailed comparison would occupy too much space. Roughly the whole train service has been reduced by about 55 per cent. Taking at

random the service from Cologne to Berlin, a distance of 362 miles, the fastest trains in pre-war days did the journey in 8½ to 9 hours. There were about 15 in each direction. There are now only nine trains for civilians and four 'leave' trains for the military only. They do the journey in 11 hours.

"There are numerous 'leave' trains all over the country, which are run daily for military purposes to convey the troops between the Eastern or Western fronts and their homes. Thus there is a regular service from and to Vilna, Riga and other Russian stations right up to Berlin. On the Western front there are 15 trains a day for the troops on leave, besides four ordinary fast trains on the main line between the Belgian frontier and Cologne. From Metz during the day there are 11 'leave' trains and eight for civilians for all parts of Germany. Some of these trains are not always run when leave is stopped.

"The time-tables in Belgium and in the occupied territory of France present a sorry picture. Except for the military trains there are but few ordinary trains and these are stopping trains. The journey from Ostend to Brussels takes about five hours instead of one hour and three-quarters as in peace time. Moreover, all sorts of restrictions are in force and no journey can be made without a permit from the military authorities.

"Comparing the German train service with our own the balance is certainly in favor of ours."

Development of the Steel Car*

By Henry P. Hoffstot

Manager of Sales, Central District, Pressed Steel Car Company.

A GOOD MANY YEARS AGO some few all-steel cars were built and placed in operation by some of the steel companies and these cars are, I believe, still in service. The change from the use of wood to steel in the construction of coal cars in America was not brought about at one time but was extremely gradual in its development. In the early 90's C. T. Schoen commenced making pressed steel car shapes in his little plant in lower Allegheny and for years supplied the railroads with pressed steel center plates, side bearings, stake pockets, push pole pockets, etc., for use in connection with the construction of wooden cars. During the same time the Fox plant cut on Penn avenue was furnishing pressed steel trucks and truck specialties to railroads for use on wooden equipment.

About 1895 Mr. Schoen conceived the idea of building steel cars on a large scale. The following year the first steel cars were ordered by the Pittsburgh, Bessemer & Lake Erie, and shortly after by the Pittsburgh & Western, and the Pittsburgh & Lake Erie. It is therefore to the forefront of the officers of these three companies that a great deal of the credit for the bringing about of the change from wood, or wooden cars with steel trucks and a few steel specialties to the all-steel car must be given. Mr. Schoen conceived the plan but in order to show the public it was necessary to find a buyer on whose railroad a demonstration of the cars in actual operation could be made. The heads of these three companies took the chance, and that they made no mistake in their judgment is now well recognized. The demand for this type of car grew rapidly. Its construction virtually revolutionized railroad traffic of this country. The first helper cars were built to carry coal, and while stenciled 50-ton were hardly of 40-ton capacity so far as present M. C. B. requirements are concerned. Probably 85 to 90 per cent of these cars are still running after 20 years of service.

*Reprinted from the Railway Age, Vol. 1, No. 1, p. 161.

in and out of the Pittsburgh district, which with its bituminous coal and ore gives the car as severe service as could be received by them anywhere in this country. Since that time there has been an evolution in the construction of cars as great as that which took place in 1896 and 1897.

The railroads are continually demanding cars of heavier capacity so that the increasing volume of tonnage offered can more economically be handled on our congested railroads. Early in this century the combination of pressed steel and structural steel was used in car construction, and this is the type of construction most commonly used today. I am not here to discuss the benefits to be derived from the use of pressed steel over structural steel, or vice versa. Car companies are in the business of supplying a commodity to railroads and industrial concerns the same as a tailor is in the business to sell clothes to his customer. We sell what the customer wants.

There are steel cars and steel cars—some no better than wooden cars which will last under the treatment now given to cars hardly as long as would good wooden cars—and there are steel cars the life of which as yet cannot be computed. Often an additional ton of steel carefully applied in the designing of the steel car will make the car so much stronger and better able to withhold the shocks and wear and tear received in unfair treatment to which we must expect a car to be subjected in the ordinary course of its life that by the end of 12 to 15 years it can be renovated at a comparatively small expense, while the car of poor design has long since undergone heavy repairs and may again be ready for more. In making this comparison it must be assumed that each type of car has undergone the same general treatment and been kept up in the way of painting and minor repairs in about an equal way. I make mention of this comparison not with the idea of passing along the blame for the failure of a particular type of car to the superintendent of motive power or mechanical engineer of the railroad involved who may have originally designed it, for I realize that in all probability it was the financial limitations of the railroad which limited him in the amount to be expended and that it was to keep within such limitations that he failed to authorize the use of the ton of additional steel which if put into the car at the beginning at an additional initial cost of possibly \$40 per car might have saved \$400 in rehabilitating the car later on.

100-Ton Cars

Now the 70-ton car has come into general use, and several thousand 90-ton cars are in operation on at least one well known railroad which is also experimenting with a 100-ton car. The carrying of this huge tonnage has been made possible only through the use of steel in car construction. Heavier bridges, heavier rails, and heavier locomotives, etc., have all been required and are being put in to enable all roads to carry these heavier cars which have done so much toward reducing the cost per ton mile for handling materials and eliminating more or less of the congestion in our large terminals, for if the 30 and 40-ton cars of 20 years were still in operation, it would be necessary in order to carry the same tonnage to have trains anywhere from 20 to 30 per cent greater in length.

Many 100-ton coal cars are now in operation on short lines about the steel mills, and recently one of the railroads became interested in a 120-ton car. Its officers felt that the concentration of a 120-ton load in one car would not only shorten up the trains, thereby making a less number of units for a given train, but also a less number of operations in the dumping machines at the terminals, and would also reduce the number of wearing parts to be maintained as well as eliminate to a great extent the extra long sidings which would otherwise be required to handle the same tonnage in cars of lighter capacity. In other words, some of

the general reasons which brought about the change from the 30 to 40-ton capacity wooden cars to 40 and 50-ton steel cars are now tending to bring about the use of very much heavier capacity steel cars. The officers of this particular railroad, fearful lest a mistake might be made in the ordering at the present time of a large number of cars in which such a radical change would be made, elected to have four of the large car companies each build a sample car. The engineers of the railroad at that time supplied the car companies with the maximum height and width and approximate length which they felt would carry the required tonnage and left the details of the design of the cars to each of the car companies, their idea being to get these sample cars into actual service, and if experience showed that cars of 120-ton capacity could be more economically used than 50 or 70-ton cars, they would undoubtedly pick out the superior qualities from each of the four sample cars and design a car which in the opinion of their engineers would show as nearly as possible 100 per cent efficiency. These four cars have been delivered, and are now receiving their trial; it will be interesting to know the results. I believe that you will agree that this is a good way to get results.

The Standard Car

All of the car companies employ designing engineers who are at the top of their profession, and while I cannot speak for all of the companies, I can at least speak for the company which I represent and say that we at all times solicit an opportunity to help in the designing of steel and composite cars with a view not of exploiting any particular specialty or type of car, but solely with the view of bettering the steel car, always having in mind that the adoption of a car of standard design for the different classes will mean millions of dollars saved annually in the money expended by the railroads and indirectly by the American public in the first cost of cars and their maintenance. Certain rulings of the M. C. B. Association in the construction of all cars make it necessary to comply with certain regulations so far as clearances, strength, etc., are concerned. These rulings, however, do not go very far toward bringing about standard designs of cars. For many years this question has received more or less attention, and three or four years ago a committee of five builders was appointed by the railroad presidents representing the American Railway Association to go into the matter very carefully. Later ten or twelve railroad representatives were placed on this committee. After three years of labor they made their report and submitted specifications and blueprints covering box cars and gondola cars of several capacities. Shortly after this the committee was dissolved and the work I believe is now being continued in the hands of another committee appointed by the railroad presidents consisting entirely of railroad engineers. It will be interesting to watch the developments along this line, for it is the opinion of many that the greatest advance that can be made in steel car construction at this time will come with the adoption of cars of standard design for use all over the country.

No further progress along these lines can, however, be expected until Congress decides whether the railroads after the war are to remain the property of and be operated by their real owners under the control of an Interstate Commerce Commission, more liberal than heretofore in its views as to rates, or whether permanent Government ownership and operation is to prevail.

Car companies are now in position to take orders and commence delivering cars within three months. If the conditions of this winter are not to be repeated next winter, hundreds of locomotives and thousands of cars must be ordered by some one for use on our American railroads to take care of replacements if nothing else. Let Congress act, then watch the 70-ton steel car develop.

The Trade Acceptance in the Supply Field

The First of Two Articles, Describing the Trade Acceptance and Showing Its Important Advantages

THE OPENMINDEDNESS of the American business man as encouraged by the publicity campaigns that have been put behind the patriotic appeal for thrift, economy, Liberty Bonds and War Savings Stamps, is proving one of the greatest helps in favor of extending the use of the trade acceptance.

The trade acceptance is not new; it is not an innovation. It represents an idea in business that is in wide and successful use in England, Canada, France and Germany, in export trade the world over in general; before the Civil War, it was a commonly known credit instrument in our own country. It has attained a new importance to us within the last two or three years, however, because of its sanction and encouragement by the Federal Reserve Board. It is of first importance at the present moment because it will prove one of those things that will help American business most efficiently to do its part in winning this war, and that,

ly, on a more stable and certain basis. Most goods today are bought presumably upon a 30, 60 or 90 day term of credit. Most purchasers—at least those of good credit standing—essay to pay their bills, if they do not discount them for cash, at the expiration of the term, but they are under only such obligation to do so as their desire for a good name in business demands. Many purchasers, on the other hand, let their bills hang over until they may have available funds to pay them or until the seller's credit manager has worried them into sending a check. With the trade acceptance, this is not the case. The acceptance, like a promissory note, is made out for a definite term and, like a promissory note, it is definitely due on its expiration. When accepted by the purchaser and endorsed by the seller, it may be discounted at the bank, and the bank, in turn, may discount it with the Federal Reserve Bank, it being such good commercial paper, in fact, that the Reserve Bank will actually discount it at a lower rate than ordinary single name paper.

In other words, so good is the acceptance that after it has been accepted by the purchaser, the bill is credited as paid in the ledger. The purchaser may if he chooses, default on his payments, but the obligation to pay on a definite date is so plain that the acceptor will think twice before he will take any such chance with his obligation and with his dealings with his bank. The open book account, in other words, is settled or eliminated, the capital that was tied up in the unpaid bill is released and there is stability and satisfaction

to all concerned. It is estimated that there are on open book accounts on the average in this country in the neighborhood of \$4,000,000,000. The advantages of converting this or even a part of it into liquid capital are evident. The necessity of so doing at this time when we are working with might and main to win the war should be similarly apparent.

Definition

A trade acceptance is defined by the Federal Reserve Board in regulation A, series of 1917, as a draft or bill of exchange drawn by the seller on the purchaser of goods sold, and accepted by such purchaser; and a bill of exchange, within the meaning of this regulation, is defined as an unconditional order in writing, addressed by one person to another other than a banker, signed by the person giving it, requiring the person to whom it is addressed to pay, in the United States, at a fixed or determinable future time, a sum certain in dollars to the order of a specified person.

It is not hard to see from this definition of what high standing an acceptance must be. "It may be assumed from the attitude of the Federal Reserve Board toward the trade acceptance," says Lewis E. Pearson, chairman of the board of the Irving National Bank and chairman of the American Trade Acceptance Council, "that it is the intention that as an instrument expressing credit value it shall more nearly approximate the condition of actual currency than does any class of paper in the commercial field." It must possess the quality of eligibility. It must be fully and free-

The Approved Trade Acceptance Form

is the only thing that American business has in its mind to do.

"In times of normal easy money conditions," says Beverly D. Harris, vice-president of the National City Bank of New York, "we are prone to follow the line of least resistance. Radical innovations are unsettling and difficult of accomplishment. It is in a great war emergency like the present, when excessive burdens must be well distributed over a broad area, and limitations are placed upon credit, that we come to a full realization of the true value and efficiency of the trade acceptance, scientifically employed, as a means of opening latent avenues of credit which would otherwise be unavailable, and bringing the entire banking power of the country to the support of the general situation."

Ease of Adoption

The trade acceptance, while it is a new thing as far as we Americans of the present generation are concerned, possesses fortunately as one of its advantages, its ease of adoption. Its use will necessitate practically no change in present methods of doing business; it will necessitate no changes in the present terms of credit. It will not interfere in the least with the firm desiring to discount its bills for cash; with the firm selling on long or short terms of payment, or with deferred dating of bills. It will only interfere with the debtor who declines to pay his bills when they come due.

Its use, essentially, will put business and credit, general-

ly negotiable. These qualities are secured by the fact that it fully protects all interests concerned and provides sufficient evidence on its face to justify the confidence of a bank or other purchaser of an acceptance who is not in possession of additional information concerning the transaction out of which it grows. The Federal Reserve Banks regard an acceptance as of better standing than a promissory note. In the note the important element is faith in the ability and integrity of the maker of the note. The acceptance not only has the faith and integrity of the acceptor behind it; it is further supported "by a commercially accepted, fully protected and legally approved theory to the effect that a certain commercial instrument made in a certain form and possessing other characteristics, subject to determination by the Federal Reserve Board, which appear on its face, and known as a trade acceptance, shall be eligible for re-discount at Federal Reserve Banks."

How is this eligibility obtained in the trade acceptance. First it arises from an actual commercial transaction. It is unconditional—an unconditional bill unconditionally accepted. It is for a definite sum of money, and it possesses a definite maturity. These four requisite elements protect the interests of the purchaser of the acceptance.

Its Practical Use

The trade acceptance works out in practice as follows: A seller of goods sends with his invoice an acceptance upon which has been written in the amount of money due, and the date of maturity. To facilitate matters, there is usually attached on a perforated slip a short statement of what the acceptance is with an expression of the seller's desire that it be made use of. The purchaser has one of three choices. If he wishes he can pay his bill at once and take advantage of his discount for cash. Or at the other extreme he can let the bill go over as an open book account. Presumably, however, he will make use of the acceptance. To do so he will write across its face the word "Accepted," the date and bank where payable and his signature, thereupon returning it to the firm from whom he bought the goods. The latter can then credit the account on the ledger as settled; he holds an acknowledgment that the transaction has taken place and if he wishes can bank the acceptance and secure money upon it. He does practically no worrying about overdue accounts and if disputes arise as to the kinds of goods shipped the matter can be settled in a straightforward way without ill-feeling over the fact that the account may be held up without payment.

The natural presumption is, of course, that the acceptance will be paid at maturity. Those who have used the idea are uniform in their agreement that payment is rarely defaulted. Sometimes, but seldom, cases arise wherein an extension of time is desired. This can be arranged for by a promissory note—for an acceptance in theory is meant to cover only a live, commercial transaction.

The seller on receiving the acceptance back from the purchaser of the goods has his choice of holding the paper in his own portfolio until maturity, or if he desires, he can immediately realize upon it by discounting it at a rate lower than a promissory note. As noted above, his bank has good reason to look with favor on his use of the acceptance method of doing business, because the bank in turn is in a position to re-discount a trade acceptance with the Federal Reserve Bank also at a rate below the rate at which other paper of similar character may be discounted. But there is a very important additional advantage to the merchant who desires thus to obtain capital. The bank will lend money on a promissory note to a merchant on a basis equivalent to about 50 per cent of his open book accounts, but on the acceptance the percentage that may be borrowed is not 50; it is 100. No better terms can be obtained on the security of Liberty Bonds.

An actual illustration is here in order to show exactly how the trade acceptance works out and to outline its definite advantages. A merchant, we shall say, has a chance to buy a certain lot of goods at \$5,000 and he has secured a buyer whom he will charge \$6,000. The manufacturer will give him 90 days credit and he is certain that the buyer will also not pay in less than 90 days. In short, there will be a space between the time his bill will be due and the time he is certain of payment taken up by the handling of the goods, etc. Bear in mind that the merchant cannot be absolutely certain that his buyer will pay in 90 days; some authorities have estimated that in over 50 per cent of the cases the term of credit is exceeded. On the open book account, the merchant would find it most difficult, if not impossible, to finance this transaction. His bank in the first place cannot loan him \$5,000 on the \$6,000 sale. It will presumably loan him \$3,000 on the so-called two for one rule, but it will probably demand that 20 per cent be left on deposit, leaving \$2,400 with which to buy \$5,000 worth of goods.

Note the difference in the case of the trade acceptance. The merchant buys the goods from the manufacturer, giving him a trade acceptance with 90 day maturity for \$5,000. The manufacturer then cashes the acceptance, let us say, and has his money. The merchant, in like manner, secures a trade acceptance for \$6,000 from the ultimate purchaser; he can bank that and he also has secured his money and realized his profit. In other words, the transaction has financed itself and the merchant is ready to go ahead on another deal.

Advantages to Seller, Buyer and Banker

"It is difficult to imagine," says Mr. Pierson, "a class of interests in any way related to commercial credit operations which will not be benefited by the general development of the trade acceptance."

"The Seller"—It will be helpful to the seller. Commercial transactions will be completed promptly instead of being allowed to remain open throughout a possibly long drawn-out credit period, with the attendant evils of extensions, counterclaims, unwarranted return of goods, etc. At the time of settlement all equities between buyer and seller are definitely determined, and the buyer by accepting furnishes an implied acknowledgment of the correctness of the account. If, later, possible objection to payment should be based upon a claim of improper deliveries, the burden of proof will rest where it belongs, upon the buyer, instead of upon the seller, as at present. Business can be transacted and accommodation extended practically without impairment of the seller's capital, as each transaction virtually will automatically finance itself because of the eligible quality of the credit instrument employed. This lessens the need for working capital and increases the ratio of earnings to capital actually employed. Because of the practical certainty that money will come in more regularly and borrowing power be greater, the seller will be able to conduct his business upon a more systematic basis. Business capital will be kept in properly liquid form instead of being tied up as at present in open-book account. The present difficulties attending the collection of accounts will be eliminated, or at least greatly reduced—this, particularly, if the acceptance is made payable at the seller's bank, in which case collection becomes a detail in the machinery of banking and is accomplished, without any effort or action on the part of the seller.

"The Buyer"—The use of the acceptance should represent substantial value to the buyer, particularly if he belong to the better class. By giving to the seller a negotiable evidence of indebtedness, with the full understanding that it will be negotiated, he virtually serves notice upon the business community to the effect that he has not formed

the dangerous habit of overbuying—that he is prepared to meet his obligations promptly at maturity—and that he expects to receive the fullest measure of consideration as a preferred buyer. By assuming an obligation in this form, he establishes rather than weakens his credit. His paper when negotiated will receive the benefit of the best preferential discount rates and the obligation throughout will be carried upon his own integrity and responsibility, rather than upon a basis of special favors.

"The Banker"—The general use of the acceptance will help banking generally. Commercial paper will be more soundly based, more nearly uniform in quality; will be presented for discount with greater regularity, thereby avoiding congestion; will progress upwards through re-discount channels more freely; will be more helpful in showing the true credit standing of both seller and buyer. Banking resources will be rendered more flexible and their commercial possibilities for the benefit of the business community materially extended. Loans by banks to customers no longer will constitute a direct drain upon resources, but, in effect, will represent a guarantee by the bank of the soundness of acceptances, which, because of their eligibility, can be converted into cash quickly and economically. Otherwise expressed, the bank will be able to loan credit instead of cash.

Now Is the Time to Encourage the Use of the Trade Acceptance

"The trade acceptance," said Mr. Pierson on another occasion, "is nothing more nor less than an exceedingly simple, direct, economical method of covering credit obligations arising from the sale of merchandise. It accomplishes no miracles—makes no obligations less serious than they should be—disturbs no proper relation between the different parties to business transactions—and has no quarrel with any rational business method now in the field. The idea it expresses is sound from a business point of view—promotes all proper interests concerned—and represents substantial value to the nation in times of stress.

"So, then, the line of duty for us is clear—buyers and sellers and bankers, American business men all, should get squarely behind the trade acceptance and follow this splendid movement in its interest which has been put upon such a definite basis. Let us think in terms of war, and war necessities, and conditions after the war, and not in terms of a business past now as clearly removed as is the past of the Pharaohs.

"Let us realize that there has come into the world, and particularly into this great western world of our own, a new spirit—a new dispensation—new responsibilities—and new obligations, which we dare not disregard. The acceptance is here—is here to stay—is a part of the business and financial life of this community, whether or not the occasional banker or business man would have it so. The only question is: 'How soon will it be possible to bring this fact definitely to the attention of the business of the country?'"

(This is the first of two articles on the trade acceptance in the railway supply field. The second will appear in an early issue.)

THE U. S. OUTPUT OF PORTLAND CEMENT IN 1917 was the largest in the history of its production, amounting to 93,550,000 barrels, while that of the other principal cement producing countries in the latest available year was: Germany 30,000,000 barrels, England 17,000,000 barrels and France 8,000,000 barrels. The production in the United States has grown from 42,000 barrels valued at \$126,000 in 1880 to 93,550,000 barrels valued at \$101,000,000 in 1917.—*Bulletin of the National City Bank of New York*

Railway Officers Who Are Joining the Colors

COL. W. J. WIGGUS, formerly vice president of the New York Central, who has been serving on the military railroads in France, recently returned to this country to co-operate with Director General of Military Railways Felton in securing the enlistment of a number of railway men for service as officers of the railway regiments in France. George T. Slade, vice-president of the Northern Pacific and H. C. Nutt, general manager of the Los Angeles & Salt Lake, have received commissions as majors. Both will be deputy director generals of transportation.

C. L. Hinkle, general superintendent of the Toledo, St. Louis & Western, and R. K. Rochester, superintendent of the Northwest System, Pennsylvania Lines, will serve as general superintendents with the rank of major, and J. H. Elliott, general manager of the Texas & Pacific will serve as assistant general manager with the rank of major. J. F. Hickey, superintendent of the Missouri, Kansas & Texas, has been commissioned a major on detached service assisting the personnel. Hugh McG. Taylor of San Antonio, who has been engaged in construction work on the railways in Cuba, has been given the rank of major. H. M. Waite, formerly manager of the city of Dayton, Ohio, who previously was a railway officer, has been commissioned as lieutenant-colonel.

Paul M. La Bach, assistant engineer of the Rock Island Lines, has been made mechanical and water supply engineer with the rank of major.

The following will serve as division superintendents with the rank of captain: H. J. Micksch (Missouri, Kansas & Texas), O. E. Coyne (Missouri Pacific), R. E. Clark, A. W. Woodruff (superintendent Wyoming division, Union Pacific), C. A. Maxwell (superintendent, San Antonio & Aransas Pass), and Edward E. Carter (assistant superintendent, St. Louis-San Francisco, Neodesha, Kan.). C. E. McMillan, and J. W. Highleyman (master mechanic, Union Pacific at Cheyenne), have been commissioned captains and will serve as superintendents of motive power. H. B. Hayes, general roundhouse foreman of the Seaboard Air Line at Savannah, Ga., has been commissioned a captain and will serve as mechanical foreman.

The following have been given the rank of first lieutenant and will serve as division engineers: T. P. Kennedy, R. F. Scott, Jr., M. W. Rust (Virginian Railway), C. B. Harbison, W. B. Maurer, A. W. Worthington (formerly with the Pennsylvania Lines and now with the Goodrich Rubber Co.), C. H. Jones (Erie). A. H. Scull has been commissioned second lieutenant and will serve as assistant division engineer. The following have been commissioned majors and will serve as deputy engineers of construction: E. W. Clark, N. F. Brown, P. L. Stalker and E. J. Langford. The following have been commissioned captains and will serve as assistant engineers of construction: R. S. Harden, F. E. Craft, J. L. Vogdes, T. B. Watson, E. B. Palmer, C. S. Platt, R. T. Frazier, Jr., and D. P. Beach. A. M. Miller, who has been commissioned a captain, is in charge of mobilization of a railway transportation corps of clerks.

The following have been appointed railway transport officers, with the rank of first lieutenant: L. F. Ballard, F. R. Outerbridge, J. I. Slater, R. S. McElwee. The following have been made railway transport officers with the rank of second lieutenant: F. A. Bourdreau, J. Storey, T. D. Barker, G. N. Richard.

A railway transport officer is described as "a combination of passenger agent, freight agent, bureau of information and diplomat." He is located at practically every junction point and every large station where troop trains stop as well as at points of origin and destination of important

troop movements. He is designated by a brassard and is the means of communication between the department of the director general of transportation and the commanding officer of the troops enroute. Because of the intimate relations that must exist between an officer of this kind and commanding officers of troops and French railway and government officers, he should have adaptability to new conditions and knowledge of general railway conditions, so as to be able quickly to familiarize himself with the making out of transport orders and other French railroad practices, and a basic understanding of French upon which quickly to perfect himself in that language.

Railroad Wage Commission

THE RAILROAD WAGE COMMISSION has practically concluded its public hearings for the purpose of receiving requests for higher wages for various classes of railroad employees and the more important work of investigation of the facts presented and of the available statistical data, together with a consideration of possible bases for deciding as to what increases should be awarded is being carried on by its staff of examiners and statisticians. Over 100 blank forms have been sent to a large number of representative railroads for classified information as to wages and hours of employees and telegrams have been sent to Class I roads asking for less detailed information. In order to secure data promptly the roads to which the blanks were sent were asked to send first the information for five representative divisions.

The blank forms are intended to obtain for the commission, in succinct form:

First—A grouping by rates of pay of the employees coming within each of the defined classes of occupations as established by the Interstate Commerce Commission Classification of Employees, so as to show:

(1) The number of men having a basic working day of 8, 9, 10, 11, 12, or more hours.

(2) The number of men working a six-day week, and those working a seven-day week.

(3) The number of men at different specified rates per month, day, or hour.

(4) The number of men who, if required to work overtime, receive no additional pay.

(5) The number who receive pro rata pay for any overtime worked.

(6) The number who receive time and a half, or better, for any overtime worked.

Second—A basis for an approximate estimate of the aggregate amount involved in any increase of the present rate of wages, that may be recommended.

The commission is also conducting an elaborate investigation into the increased cost of living. To supplement the official statistics it has called on the newspapers of the country to collect up-to-date facts and has sent them blanks for their reporters to use in securing data as to the living expenses of families in their cities.

The advantages of the eight-hour day and "punitive overtime" as portrayed by labor leaders before the Railroad Wage Commission were questioned by railroad operating and mechanical officers who testified on February 20 and 21. W. J. Tollerton, general mechanical superintendent of the Chicago, Rock Island & Pacific, said that when the Rock Island shops were put on an eight-hour basis he found that many men left to work for another road which worked nine-hour shifts with pay for 9½ hours, and when the longer hours were restored the men returned. Another complication was caused when numerous foremen resigned to take subordinate positions because they could earn more money at piece work or by working long hours. Chairman Lane asked him if he be-

lieved that a man does as much work in eight hours as in ten. "That has not been our experience," replied Mr. Tollerton.

D. R. MacBain, superintendent of motive power of the New York Central, said that the eastern railroads would have had even greater difficulties in keeping motive power repaired during the winter if they had not been able to work nine and ten-hour shifts and he said that on a piece-work basis the men worked just as efficiently during the last hour as during the first. Operating officers have been working 15 to 20 hours a day during the winter, he said.

E. F. Potter, assistant general manager of the Minneapolis, St. Paul & Sault Ste. Marie, declared that the plan of paying time and a half for overtime was impracticable in railroad service, because many delays are beyond the control of either the management or the employees but that the amount of overtime depends to such a great extent upon the employees themselves that a premium should not be paid for it. All of the railroad officers who testified were men who had come up from the ranks themselves and were therefore able to reinforce their statements by illustrations from their own experience both as employees and as officers.

Additional representatives of various groups of employees, mostly unorganized, appeared before the commission on February 25. A. L. Rhodes, a Pullman conductor, appeared individually and asked consideration for Pullman employees generally. He described his working conditions, saying he received \$99 a month, this being the standard rate for conductors who have been in service from 5 to 10 years. His last increase was 10 per cent in 1916. George P. Mann appeared on behalf of the clerks employed by the Boston & Maine, and J. R. T. Auston for the telegraphers on the Pennsylvania.

L. S. Hungerford, general manager, and L. S. Taylor, comptroller, of the Pullman Company, also testified.

Other witnesses were: T. M. Maxwell, representing unorganized employees of the Indianapolis Union Railway; J. M. Lynch, president of the Brotherhood of Freight Handlers, and S. E. Padgett, general chairman of the Colored Association of Railroad Employees, who asked that the pay of colored employees be equalized with that of white employees for the same work.

HEDJAZ RAILWAY "MUCH DAMAGED."—The British War Office has made the following announcement about the campaign in Palestine and Arabia: Confirmation has been obtained of the success of the operations undertaken by the Arab forces against the Hedjaz Railway to the north of Maan (which is 60 miles south-south-east of the Dead Sea). It appears that for three days subsequent to January 3, Arab troops were in possession of an important portion of the line, wrecking and burning rolling-stock and damaging bridges. The troops who executed this raid subsequently retired, having suffered very slight losses, carrying off prisoners and booty.

BRITISH LINES IN FRANCE.—In the despatch from Sir Douglas Haig, published in the London press on January 9, the following references to British army transport appeared: "During the year the dock capacity allotted to the British armies in France was thoroughly organized. In the first nine months the number of cranes was more than doubled. The number of imported broad-gage (standard) locomotives in traffic in France in October, 1917, was nearly ten times as great as at the end of 1916. Many hundred miles of standard gage track have been laid also, both in immediate connection with our offensives and for the general service of the army. Light railways have grown with a like rapidity, and the track operated at the end of October was already eight times as great as that working at the commencement of the year."

Increase Life and Service of Locomotive Boilers*

Prevent Scale Formation and Corrosion from Bad Water by Treating the Feed Water

By George Austin

General Inspector of Boilers, Atchafalaya, Topok, & Santa Fe

FORMATION of mud or salts or both on the water side of the tube sheet of a locomotive boiler covering the copper flue ferrules, a film of slime between the firebox plates and the water, or water in the boiler heavily charged with suspended matter, or scale formation, causes overheating and leaking. It may as well be said at the start that overheating is the principal agent, and other causes are accessory. The first indications of flues and some times other parts being near the leaking point are small light colored beads of sodium salts, mixed with other solids, adhering to the edge of the flue beads. Although flues are tight in the holes, there are small crevices through which the slime works its way and the moisture quickly evaporates on the hot plate, leaving a dry hard deposit, that temporarily plugs up the hole it leaked from. In most cases

Side Sheet Corroded by Bad Water

the engine will make another trip; in some districts it will not do so, without leaking pretty badly or failing. A knowledge of local conditions should and usually does govern the kind of work, if any, to be done on flues, showing these pre-leaking indications. The remedy, of course, is to remove the scale which has formed on the water side. To wait until a leak starts is to wait until some damage is done. Leaks caused by overheating causing the parts affected, nor can repairs be made without further injury, that is, nearly every time flues are worked, their life is shortened. Therefore, on account of overheating causing the necessity for repairs, our energies should be directed to keeping the boiler clean and preventing overheating.

Feed waters heavily charged with incrusting solids will form scale among the flues and staybolts where we cannot get at it to wash it off. We couldn't wash it off if we did get at it; it must be knocked off. Scale forms mostly while the engine is working and at those parts which attain the highest temperatures, probably because they evaporate more water and a larger quantity of solids are precipitated.

In the case of waters heavily charged with alkalies, the injunction to keep the boilers clean will create a strong

sense of the futility of such a remark. Those boilers are clean when they leave the terminal, perhaps freer from mud and scale than boilers on other districts, which give much better performance. The salts from the water being evaporated, precipitate at the points at which evaporation is accomplished. This being nearest to the heating surface, a film of slime grows between the plates and the water causing overheating. That may not be just the right explanation, but, it is not far from it. This slime making water as well as the scale forming water, just spoken of, will always give trouble as long as we let it get into the boilers. Neither case is subject to mechanical improvement, except, so far as adequate facilities may be provided for washing boilers and changing water.

The fillet of scale which forms over the copper ferrule, regardless of its composition, reduces the power of the copper ferrule as a conductor to keep the end of the flue from getting hotter than the flue sheet. It has been suggested that a wider ferrule than is commonly used will require heavier incrustation to impair its efficiency as a conductor and widen the interval between leaks, which reasoning is very plausible.

Scale formation in arch tubes and firebox sheets is indicated first by a sand paper roughness of the parts which are becoming affected, and later by clinker, or as it is sometimes called honeycomb, clinging to it. It actually seems as if it was trying to defend itself from injury by establishing a non-conductor of honeycomb on one side to offset the scale formation on the other. The smooth, slightly rounded flatter or bobbing tool in a No. 3 air hammer is effective in most cases in removing this scale. By working on the fire side the jar seems to cause it to flake off. Boilers should be warm when such work is done. There is little danger of cracking the plate by using the methods mentioned to remove the scale; there is great danger of developing cracks if it is not removed. On some divisions we rattle our fireboxes nearly every month which is our term for the operation.

We must keep fireboxes clean if we are to get service from them. Clean fireboxes and boilers cut down repairs. Some roads have adopted the system of giving the flues a periodical expanding and claim good results; although we wait for the leaking indications, the same thing is accomplished. The expanding removes the scale and maintains the copper ferrule as a conductor.

Simmering Leaks

By simmering leaks, is meant small leaks in fireboxes that leak continually, but not enough to form a stream and run down the plate and give trouble. These should not be permitted, especially where the water in the boiler is heavily charged with suspended solids. These small simmering leaks are just big enough to let the water through and fine enough to keep back the mud and build up a mud fillet around the flue or stay bolt. Overheating is frequently so severe that the flues and staybolts affected become loose in the holes. Many engine failures are due to permitting simmering leaks, especially among the flues. The above class of failure most frequently occurs during seasons when the water is muddy.

The performance may be accepted as a barometer indi-

*From the Engineering Magazine, Vol. 1, No. 1, 1901.

cating firebox performance. If you have no flue troubles, you have no other boiler trouble. If you have small flue mileage, you have small firebox mileage. If you help the flues, you help the firebox.

Keeping Boilers Clean

The wash-out appliances including scrapers and search lights used on the Santa Fe were illustrated in the 1915 proceedings of the Master Mechanics Association on pages 398 and 399. (See also *Daily Railway Age Gazette*, June 12, 1915, page 1296.) We use all the good ideas we can get both as to systems and appliances, which fit our conditions, including hot water boiler washing plants. We wash out locomotive boilers as often as any large railroad in this country, and everything practicable is done to keep boilers clean. Boiler cleaning is a roundhouse job. Dirty, poorly cared for boilers coming in for general repairs, generally need considerable firebox and boiler repairs, indicating poor looking after in the roundhouse.

Treating Feed Water

So far we have dealt with mechanical means of keeping boilers clean, which in certain territories will be found efficient, that is, where the average hardness of the feed water does not exceed six grains per gallon, or road service is not too severe. Excepting perhaps Lake Michigan water I do not know of any water on the Santa Fe, so low in incrusting matter unless accompanied with foaming solids.

Any water treatment that will dissipate the fillets of scale from the flue ferrules or other parts to prevent its formation, is far and away ahead of any mechanical treatment, for the reason that chemical action anticipates and prevents possible damage and affects all parts, while mechanical treatment is deferred and local only, and follows possible damage and fuel losses. It is, therefore, evident that we may look for the greatest improvement through water purification or treatment, either by treating the water before it is delivered to the locomotive or in the tank and boiler. If the volume of business on a district is small or the water is not bad enough to justify the expense of water treating plants, during these times it may be very profitable to treat the water in the engine tank. Increases in the demands for power, and cost of labor and material and the greater value of the locomotive, have changed and are still changing values; what would have been considered extravagance yesterday may be good business today. The Santa Fe has road side water treating plants, 125 of them; they use anti-foaming boiler compound, and also, a compound to prevent incrustation and foaming as well. We also use soda ash applied to the locomotive tanks. All water treatment is under the direction of the chief chemist. On some districts the water treatment is supplemented to a limited extent by mechanical means, that is, it is found profitable to a limited extent on some districts to use both chemical and mechanical means. For example, if the staybolts show leakage and inspection shows scale forming, a light pneumatic hammer and bobbing tool are used on bolts and plates in the leaking zone and scale knocked or jarred off. When water treatment creates too much foaming, we may obtain better results by allowing a little scale forming, which may be taken care of by mechanical means. Water treatment may be brought to a point where it is better to allow a little scale than have excessive foaming.

Pitting Flues and Other Corrosion

The Santa Fe like other roads in bad water districts has to contend with pitting and corrosion. While corrosion of firebox plates has resulted in short life of many fireboxes, flue pitting causes frequent failures and is most annoying on that account. Just what causes pitting and corrosion is not altogether clear. One may advance a theory for a given case

and be forced to admit that it does not fit some other. The electrolytic theory seems to be most reasonable when applied to flue pitting, which assumes that there is a positive and negative pole, with an electrolyte or carrier. In proportion as the water increases its soluble salts the efficiency of the carrier or electrolyte increases, therefore, anything tending to diminish the power of either pole, or the carrier between them, will weaken the corrosive action.

The company which furnishes the treatment we use to overcome foaming, claims that it prevents foaming by changing the nature of the soluble salts, and that this change also overcomes the tendency to cause corrosion, by making the salts a less active electrolyte. This claim seems to be borne out by the fact that we have had more trouble from corrosion since adopting superheater engines, which require a smaller quantity of treatment to overcome foaming, or that part of foaming which formerly annoyed the engineer. This is on account of the tendency of the superheater to dry up the water that is carried over. We have had cases where by washing and changing the water frequently engineers have been able to run in bad foaming districts without the use

Effect of Corrosion Around Staybolts

of this treatment. While they considered this a saving to the company, it developed that there was damage from corrosion. We are now using this treatment in sufficient quantities to overcome the foaming tendencies of the water, whether the engineers consider it necessary or not, and find that our trouble from corrosion is diminishing.

It has been observed that passenger engines using anti-foaming compound, pitted more than freight engines on the same district; that superheater passenger engines in the same service pitted more than saturated engines, and it has been found that when a small quantity of boiler compound is applied when the boiler is washed, or has water changed, and also applied in the engine tanks wherever water is taken, thus keeping the water in the boiler slightly treated at all times, flue pitting has been reduced. We have not had this continuous treatment in operation long enough to know just how much it is helping us, but reports received from points where the system has been carried out, are all favorable.

Referring to corrosion of firebox sheets, two illustrations are shown of fireboxes that have been removed on account of

internal corrosion. These pictures were taken about five years ago and were not uncommon cases at that time. These seem to be plain cases of allowing scale to form at the junction of the stays with the firebox sheets, just a dirty boiler, that's all. If we feel that it is not practical to try to improve these conditions, the conditions have us beaten. If on the other hand, we call to our assistance the chemist and help him to help us, we will without a doubt beat the condition, which was done in these cases.

Blowing Off Helps Boiler Conditions

Any method of water treatment is benefited by the judicious use of the blow off. Short frequent openings, a short time after the locomotive comes to a stop, or just after starting, give the best results. Starting with the beginning of the trip, frequently blowing a small quantity of water out at convenient times, when it can be just as well done as not, will keep down the concentration of foaming solids and allow greater mileage between washouts. There are occasionally times when it is necessary to practically change the water in the boiler, but these occasions are usually due to failure to anticipate that condition, or in other words, the blow off was not used soon enough to prevent the water becoming heavily charged with foaming matter. When the water in a boiler becomes so bad as to practically need changing and the engineer wants to give it a good blowing out, do not fill up and then blow out; blow out all that can safely be done first, and then regain the usual supply slowly; if necessary, repeat the operation. Filling up before the blow off is opened simply dilutes the foul water and wastes the fresh water.

With muddy or roily water not accompanied by foaming, the boiler is greatly benefited by frequent short blow offs, and the possibilities of mud burning and flue and staybolt leakage are reduced. The water in the boiler is free from suspended matter, and better circulation and steaming is assured. Blowing out from both sides should be the rule. When, as is often the case, more blowing is done from the left than the right side, the effects are shown by more staybolt leakage, cracking and patching on the right than on the left sheet. While it must be admitted there is a point at which blowing out begins to be a waste of effort, water and fuel, and different districts require different treatment, a generally good rule is to use the blow off freely in all districts where bad water prevails. This brings the engine to the terminal in the best possible condition to be turned. If boiler compound is used, the water should be kept saturated with it, thus reducing pitting and foaming and the liability of running short of water on account of working it out through the cylinders and stack. Foaming will lose more water than need be blown out in a trip to prevent foaming.

Water treatment should be installed wherever practical. Stopping leaks is a poor substitute. The cost of water treatment can be determined, but who can say what its absence may cost in the way of deterioration of boilers and failures and delays of power, incident to poor water condition. If it seems too expensive to install road side treatment, try treating in the boiler or tender. Encourage the chemist to experiment, stimulate them to develop treatment suited to the conditions. Chemical experiments promise results along the lines of conserving steam boilers which can be expected from no other source.

PUTILOFF IRON WORKS CONFISCATED.—Reuter's representative at Petrograd recently telegraphed to London: The People's Commissioners have decreed the confiscation of the great Putiloff iron, steel and gun works in Petrograd, "owing to the indebtedness of the company," and of the motor-car workshops of the International Sleeping Car Company, "owing to the refusal of the management to continue to work."

Discipline in the Signal Department

By Robert B. Elsworth

Engineer of Maintenance of Signals, New York Central Railroad.

ORDINARILY A QUESTION OF DISCIPLINE CONCERNS TWO parties, the employee and the officer charged with responsibility of maintaining proper procedure. In the case of a public service corporation the public must be considered, which introduces a third party. This third party becomes a major one, if there is a possibility of safety being even remotely related.

This point is emphasized by the attitude of public officers and oftentimes the newswriters towards a failure of discipline which may be disclosed during an investigation, although the dereliction may have no direct bearing on the conditions which are being investigated. Consequently, it is necessary that the discipline record be complete. This is especially true in regard to wrong working of signal apparatus caused by inaction or wrong action on the part of a member of the maintenance force.

It should be considered imperative for a signal department to keep a definite record for each man and that all serious derelictions be listed, with a statement of the discipline administered in each case. It is also important that a general office keep a complete record of all reported wrong workings of the signal apparatus whether real or imaginary. In cases where men are at fault a statement as to discipline imposed and reason for same should be added. Perhaps there is not a clear understanding as to what the word discipline means. Many consider discipline on a railroad as suspension from service or discharge. That alone is not correct. Of the many definitions the one which appears most applicable to railroad signaling is "Authoritative Direction and Control."

Not long ago a responsible officer severely reprimanded a maintainer for permitting a condition to occur and then reported the trouble as unavoidable, all of which was done in perfectly good faith. Another officer reported a man as responsible for permitting an unsatisfactory condition, but explained that the man was new in the position and that after being cautioned he realized the fault. The officer then added that in his opinion no discipline was necessary. Now, while in both of these cases the men had been disciplined, it will be agreed that in the first case, if the man was not at fault, he should not have been reprimanded. In the second case the caution was the discipline. In many cases the record is just as important as the action taken. Why be afraid to state the facts?

The question of discipline does not come up very frequently in the signal department, but in fairness to the public, the employee and the company it is important that a consistent policy be established and followed out; and that the men understand both the policy and the necessity for it.

Probably the majority of rails follow the suggestion method of discipline, action under which an offender is divided into five degrees.—Cautions, reprimanding, suspending, demoting and discharging.

With the class of men employed in a signal department, cautioning or calling a man's attention to his inaction or wrong action should secure the best results in most cases. This is particularly true in this field because in order to get anything like satisfactory results a man's heart must be in his work, which must not be consistent with a policy which would cause him to lose faith in the fairness of his superiors. In an operating department a man is generally given the benefit of a doubt; that is, if he can cause any confusion in the mind of his officer or if the

case against him is not absolutely proved the chances are that he may get off. In the signal department the men are expected to, and do, tell the truth; and they are held responsible for physical conditions which it would seem at times required the attention of a superman. The men are also, of necessity, generally held responsible for unknown and unexplained conditions. To get the best results under these conditions a broad-minded man is required and he should be dealt with in a broad-minded manner.

A reprimand should be used in cases where a man is obviously negligent and still the fault and his record are such that a discharge or suspension is not considered necessary.

Actual suspension is a type of discipline which is rarely proper in a signal department. A record suspension where the time is not actually served is not quite as objectionable. Generally the man actually responsible for physical conditions is the man in charge of a gang or section and as soon as such a man suffers public humiliation, his men lose a certain amount of respect for him, and the gang an equivalent amount of efficiency. Neither is the signal department often satisfactorily equipped to get along without the man during the suspension.

He is also a big man who can keep up his spirit and keep his heart in his work after an actual suspension because of some defect or fault in apparatus, fixtures or appliances which it would have been difficult, although possible, for him to forestall. Such discipline should only be applied in cases where drastic action is required, and still the man is worth keeping; and then only if the man is large-minded enough to realize the necessity for the action. In fact it might almost be considered a compliment to the ability and intelligence of a signal maintainer to be suspended.

Demotion is similar to suspension and should only be applied in cases where a young man has been promoted too rapidly and is willing to undergo further seasoning; or in cases where an old and faithful man is losing his grip slightly. A man may be a first-class mechanic, but still not able to handle other men. Men should not be demoted solely as punishment.

Discharge is the cure-all of a discipline system. If a man is habitually careless or deliberately insubordinate, the sooner he is out of the department the better. If he is not amenable to cautioning or reprimanding, or if he makes radical mistakes, the organization is better without him. This also applies to the drink habit. Most of these faults should, as a rule, develop before a man reaches a responsible position; and a railroad company in promoting men cannot afford to play the part of the woman who marries a man to reform him.

Before any of the above degrees of discipline are applied, and before a man's record is altered, the man should, if he desires, be given a hearing by his employing officer and allowed to state his case. The necessity for any discipline should also be explained to him carefully and in such a manner that a reasonable man would understand. This, however, does not mean that the employee should conduct the hearing or dictate the terms.

Sometimes an officer starts out to caution a man and ends by discharging him, because the man is unable to realize that he has done wrong and will not take advice. In other words, the homeopathic dose will not "take," and something stronger is required.

There are strong arguments in favor of the entire abolition of suspensions, and a good deal of the foregoing tends to sustain such arguments. In the system which substitutes demerit marks for reprimands and suspensions, the conditions of cautioning, demoting and discharging would remain the same. Demerit marks would be entered against a man's record when necessary. When the number of these demerit

marks reached a fixed limit the man would be automatically discharged. On the other hand, the demerit marks could be worked off by a period of satisfactory service. This system is not subject to the most serious objections of suspension; that is, humiliation before subordinates and absence from needed service.

As a rule, discipline is not considered of enough importance in the signal department to warrant a separate system, and the policy of the railroad's operating department is followed. On the other hand, it is possible that a better force would be provided, and some good men saved, by the signal department taking the initiative and organizing a discipline system which would be applicable to the class of men required in this department for satisfactory and efficient work.

The fundamental requirements of such a system are that:

- (1) Satisfactory operation be obtained.
- (2) The record be complete and one which the company can stand behind, no matter who questions it.
- (3) The spirit of the men be maintained.
- (4) The officers in charge be responsible for action taken.

The necessity for the first three requirements has been explained. The fourth is based on the belief that, for an organization to be efficient the men responsible for the results must make the decisions; that is, we cannot have "authoritative control" if such decisions are made by men who do not have to obtain results.

As signal department discipline is principally concerned in cases of improper working of signal apparatus we should consider for a minute the vital necessity of recording all complaints, *well founded or ill founded*, that are made, or mentally formulated, in the minds of the enginemen or conductors; and it is for the best interest of the road that the results of investigations be made known to the train crews interested.

A case is recalled where an engineman asked about an improper proceed indication, occurring on a different division, which had been talked about in the enginehouses for a week and still had not been reported. The trouble, which was immediately remedied, was so simple that a formal report was considered unnecessary; but this silence may have had undesirable results in a great many men's minds.

On another occasion a conductor thought he observed an improper indication and spoke about it to a signal maintenance man. An investigation revealed that the conductor was surely mistaken and could not even have seen the signal from where he stood. Still, no report was made and no steps were taken even to tell the conductor that an investigation had been made. Surely, the company would be in poor position to refute this man's testimony in case the matter ever came up in court.

The ideal should be to have all apparatus work properly; but as this may not at all times be possible, the next best course should be followed; that is, report all cases of alleged trouble and settle them in a manner that is fair to the public, to the men and to the company.

Now, one more word about the train crews, particularly the enginemen. Nothing will build up their faith in the signal system so much as a frank and prompt explanation covering irregular operations. If a signal or a switch operates improperly tell the trainmen interested. If a man's failure is the cause advise them as to the discipline. If the apparatus fails, give them that information with a statement as to the likelihood of a repetition, and what, if any, steps are to be taken to improve conditions. These points are often neglected, but it is a conviction based on sound reason, as well as experience, that confidence will go hand in hand with knowledge. An engineman's responsibility entitles him to such information and the railroad service will be correspondingly improved.

Railroad Salaries and New York Offices Under Investigation

THE QUESTION of railroad salaries is under investigation by the Railroad Administration under the direction of C. A. Prouty, director of public service and accounting. Some time ago Director General McAdoo addressed a letter to the railroads asking for lists of officers and directors paid \$10,000 a year, or more, but made it clear that the information was desired to respond to a request made by Senator Cummins of the Senate Committee on Interstate Commerce. On February 23 he issued General Order No. 9, calling for information regarding salaries and providing that a report as to officers receiving \$10,000 or more a year shall be sent to the Director General. It is understood that a plan is under consideration by which salaries above a certain amount may not be charged to operating expenses but will be required to be paid, if they are to be continued, from the sums which the railroad companies will receive under their guarantee. This is on the theory that some of the larger salaries are not paid merely for the work of operating the property but that a part at least is properly chargeable to the interests of the stockholders which under the plan of government control are supposed to be taken care of in the guarantee, and that therefore a part of the compensation of the executive should be borne by the stockholders, if they consider the services necessary, rather than charged to expenses of operation.

General Order No. 9 reads as follows:

"With reference to officers whose salaries are chargeable to operating expenses, it is ordered:

"1. A carrier shall not create an additional office or fill a vacancy in an existing office, except when such step is necessary to the operation of the railroad under the existing condition of government possession and control. In cases of doubt, application, with statement of salary proposed, may be made through the Regional Director for the Director General's approval.

"2. A carrier shall not fill a vacancy in an office of or above the grade of general manager or create such an office without the approval of the Director General. Application

with statement of salary proposed may be made through the Regional Director for the Director General's approval.

"3. With reference to general officers and division officers (according to I. C. C. classification of steam railway employees), receiving \$8,000 or more and less than \$10,000 per year, each carrier shall make to the Regional Director a monthly report showing increases in salaries, appointments (showing salaries therefor) to fill vacancies, and the creation of new positions (showing salaries therefor), beginning with the month of January, 1918.

"4. With reference to such general officers and division officers receiving \$10,000 or more per year, such monthly report shall be made in duplicate, and one duplicate shall be sent to the Regional Director and the other duplicate to the Director General."

The Railroad Administration is also interesting itself in the expenses of New York financial offices. A circular letter was addressed to the railroads on February 21 asking them to furnish at the earliest possible date information as to the number and compensation of officers and employees of offices maintained in New York for financial purposes by companies which have no operating offices in New York City. The information is asked for the year 1917 and an estimate is asked for 1918. The letter also calls for a report showing the location and rentals of offices and the date of expiration of the lease; details as to payments to trust companies, banks or other agencies for services in paying principal and interest of bonds, notes, dividends, etc., making transfers of stock, acting as stock registrar, etc., or acting as agencies for registration of bonds, etc.; compensation and nature of services at New York or in connection with matters handled at New York paid to lawyers by way of fees and not by way of salaries; fees and other compensation paid to directors, and total of principal and interest (separately stated) on bonds and amount of dividends paid at New York.

Where companies have operating offices in New York it is desired that they likewise give information as to their financial offices and in case an officer or employee or an office is not employed solely in the discharge of the functions mentioned a reasonable apportionment is asked. The information is to be sent to the Interstate Commerce Commission.

British Engineers Reconstructing a Bridge on the Flanders Front

General News Department

Former President William Howard Taft has been selected by representatives of capital as their representative for the public in the joint conferences now being held at Washington between employers and employees to establish a basis of relations during the war.

The Colorado, Kansas & Oklahoma, a fifty-mile Kansas railroad which has run no trains for a long time, is to be dismantled. The contract for dismantling has been let to W. F. Bronson of Franklinville, N. Y. The line of the road is from Scott City, on the Missouri Pacific, northward to Winona, on the Union Pacific.

A large number of switchmen on the Elgin, Joliet & Eastern walked out on February 21 because the road had reinstated switchmen who refused to participate in the wage strike of the men last September. At the time of writing quite a number of the strikers had returned to work, leaving only about 175 out, and the operations of the road were being carried on with relatively little embarrassment.

Twenty-one traveling agents and other employees of the traffic department of the Southern Railway have been transferred to the industrial and agricultural development service of the road; and a list of the names of these men is printed in the Southern News Bulletin for February. The same issue of the bulletin contains the names of 38 representatives of the freight department of the road, heretofore stationed at points off the company's lines, who now have been assigned to duty in the freight traffic service at the larger cities on the company's lines; also 19 men in the passenger department who have been transferred in the same way.

Director General McAdoo has given out a statement regarding published reports intimating irregularity or impropriety in the taking over by the government of the Hudson & Manhattan Railroad, of which he was formerly president. This road was notified the same as all others, and its notices to the public were published promptly. Mr. McAdoo says: "On account of my previous connection with this company, which was terminated when I entered public life, five years ago, I submitted the question to a meeting of the Railroad Advisory Board. * * * After full discussion they were unanimous in the conclusion that the Hudson & Manhattan was an important and necessary part of the terminal facilities of the Pennsylvania, * * * and therefore was included in the President's proclamation.

Accidents at highway crossings are increasing in number every year, and it is more necessary than ever that enginemen approaching crossings should keep a careful lookout and sound the whistle or ring the bell in accordance with the rules. Even if this has been done and afterwards persons or vehicles are discovered approaching the track, and it is not certain that they have seen the train and intend to stop, the whistle should be sounded. If the pedestrian or the vehicle is not seen by the engineer, but by fireman or brakeman, such employee should immediately notify the engineer. Where motors approach a crossing on a road parallel with the track, or where travelers appear to be thinking of something else, or talking with some one, and do not notice the approach of the train, such thoughtless persons should be warned by sounding the whistle.—C. and W. W. Circular.

A Boston Proposition

Senator Weeks and a number of Massachusetts representatives have laid before President Wilson a "recommendation" that the government adopt and apply to the railroads E. Moody Boynton's mono-rail system. By this system, exploited some 25 years since, Mr. Boynton proposed to convert every single-track railroad into a double-track line. The process was quite simple: throw away the present cars and

engines, provide new ones only 4 ft. wide and build an overhead structure along the track to keep the vehicles from tipping over.

A Safety Section in the

Director-General's Organization

A "Safety Section" has been created by Director General W. G. McAdoo, to be a branch of the Division of Transportation. Hiram W. Belnap has been appointed manager of the section, and will have supervision over the safety work on all railroads, utilizing such safety organizations as are already available and suggesting such others as are desirable. Mr. Belnap takes up this work in addition to his present duties for the Interstate Commerce Commission as chief of its bureau of safety.

Western Society of Engineers

Will Consider Material Problem

The Western Society of Engineers, Chicago, is preparing a special program relating to the material situation for a meeting to be held on Tuesday evening, March 19. As this is the week of the American Railway Engineering Association convention in Chicago, special attention will be given to the problems of the railways. A special invitation will be extended to the members of that association to attend this meeting. The program will include discussions of the priority regulations, the influence of transportation facilities on the supply of construction materials, the steel situation, the lumber industry and the cement supply.

Patriotic Pennsylvania Railroad Employees

The Pennsylvania Railroad has issued a pamphlet containing brief articles by a dozen or more employees of the road, telling, from their own experiences, how railroad men may make themselves efficient in the duty of helping to win the war. These writers are Edward F. McKenzie, locomotive engineman; Wm. Parker, car repairman; T. T. Buck, engineman; S. C. Lowrey, engineman; U. S. Shearer, engineman; John Phelan, track foreman; H. S. Meyer, engineman; H. P. Peterson, engineman; H. E. Emery, station agent; Emanuel Shepp, track foreman; Hugh Mulloy, track foreman; H. F. Krear, engineman; Thomas M. Finn, engineman, and P. L. Smith, fireman. Mr. McKenzie's paper is reprinted on another page of this paper.

Mr. McAdoo Commends Patriotic

Meeting of Pacific Railway Club

The Pacific Railway Club, San Francisco, Cal., devoted its monthly meeting on February 14 to a discussion of ways of further increasing the efficiency of the railroads during the war. A feature of the meeting was the reading of a message from W. G. McAdoo, director general of railroads. Mr. McAdoo expressed deep gratification that an evening had been devoted to discussing ways and means of making the railroads of the country more efficient for the prosecution of this war, and continued: "If our gallant sons who are fighting for America's sacred rights and universal freedom are to be victorious they must be backed with all the man power and resources of the nation. This cannot be done unless the railroads of the country function in the most proficient manner. Every officer and employee of our railroads owes to our gallant soldiers and sailors the supreme duty of supporting them with the full measure of his energy, patriotism and intelligence, to the end that America's resources may be fully marshaled and used with irresistible effect upon the Kaiser and his military autocrats who seek to dominate and enslave the free peoples of the world."

The speakers of the evening were: W. S. Palmer, president

and general manager of the Northwestern Pacific, who spoke on "How Can Railroad Men Display Their Patriotism"; Edwin O. Edgerton, railroad commissioner of the state of California, who spoke on "The Railroad Commission's Part in Winning the War"; and D. M. Folsom, professor of mining, Stanford University, who spoke on "The Need for Fuel Conservation on the Railroads."

Disastrous Collision Near Columbia, S. C.

Twelve persons were killed or fatally injured, and 37 were injured, in a rear collision of passenger trains on the Southern Railway at Frost, five miles north of Columbia, S. C., on the 25th of February. The leading train, an accommodation, had been stopped because of the failure of an air hose; and, according to the report, the hose had been repaired, the flagman had been called in and the train had been started when it was run into by a following through passenger train, coming on at full speed. All of the dead and injured were on the leading train, and the persons killed were men sitting in the smoking compartment of the rear car, a steel car.

Oregon Timber to Be Sold by Government

Francis K. Lane, Secretary of the Interior, has ordered the sale of nearly 70,000,000 feet of timber standing on lands heretofore included in the grant to the Oregon & California Railroad, in western Oregon. The timber will be sold at the land office at Roseburg, Ore., to the highest bidder after advertisement has been made. These and other lands were granted to the Southern Pacific, to aid in railroad construction, upon the condition that they should be sold to actual settlers in 160-acre tracts at \$2.50 an acre. On account of failure to comply with this condition of the grant, a large amount of land was forfeited. After the timber has been cut and removed, lands are available for agriculture will be disposed of under the homestead laws and mineral lands under the mining law.

Heavier Loading in Chicago Switching District

Recent reports received by the Chicago Committee of the Commission on Car Service show that many shippers are making sincere efforts to load cars more heavily. During the period from February 1 to 13, inclusive, the Illinois Steel Company, South Chicago, shipped 492 cars averaging 100,972 lb. per car, or 105.5 per cent of marked capacity. This is an improvement of 5.6 per cent over the period from January 1 to January 27, inclusive, when 485 cars were shipped by the same company with an average load of 95,377 lb., or 99.9 per cent of marked capacity. In a recent 10-day period the Marquette Cement Manufacturing Company, Chicago, loaded 48 cars to 114.8 per cent of capacity and during a similar period the Portland Cement Association in the same city reported 62 cars loaded to 109.2 per cent of marked capacity. The Michigan Central advises that the average load per car shipped from its Kensington (Chicago) elevator in January, 1918, was 72,052 lb., as compared with 63,620 lb. for the same month of 1917, and 59,120 lb. for January, 1916.

Western Director Concentrates

Attention on Food Exports

In co-operation with the United States Food Administration and the other regional directors of railroads, R. H. Aishton, regional director of western railroads, has made arrangements for the movement of large quantities of flour, grain and meat to the seaboard for shipment to Europe. At the request of the U. S. Food Administration the initial shipment was made early last week from Minneapolis. It develops, however, that the train, which consisted of about 25 cars of flour, had to be broken up at Chicago because the flour was destined to three different seaports. To avoid a repetition of the delay experienced by this shipment, the regional director asked that in the future all cars in each train be destined to one port so that preliminary arrangements might be made for the transfer of the train from western roads to eastern lines. Accordingly, plans were made by the railroads to handle 150 cars of flour from Minneapolis to New York early this week in 50-car trainloads. Likewise, arrange-

ments were completed for the movement of 100 cars of meat from Kansas City to seaboard between February 27 and March 9. The other movements provided for are as follows: 200 cars of oats from Minneapolis to an eastern port between February 28 and March 18; 250 cars of oats from Minneapolis to another port between February 28 and March 14; 50 cars of meat from St. Paul to seaboard on February 25, and a like number from Cudahy, Wis., on the same date, and 1,700 cars a week from Chicago.

Transportation conditions in western territory continue to improve slowly, but there is still an accumulation of about 8,000 cars east of the Missouri river and a like number west which are held on account of eastern embargoes. Deliveries of empties to western lines by the eastern carriers are still small.

Additions to the Roll of Honor

Reports compiled by the Texas & Pacific up to February 1 indicate that 463 employees have joined the army or navy, of which 19 have received commissions:

Texas & Pacific

| EMPLOYEES WHO RECEIVED COMMISSIONS | | | |
|---|-------------------|-----------------|------------------------------|
| Name | Railroad Position | Military Rank | Branch of Service |
| O. B. Freeman | Atty. | Captain | Army, Co. Bowie, Tex. |
| L. A. Wright | Atty. | Captain | Army, Jackson, Bar. |
| F. B. Lammons, Jr. | Tr. Aud. | Capt. Res. Gen. | 35th Inf., Camp Travis, Tex. |
| E. A. Wood | Engineer | Captain | Army, Co. Travis, Tex. |
| A. Laird | Engineer | Captain | Army, Camp Stanley |
| W. E. Mettenry | Engineer | Captain | Army, Ft. Riley, Kan. |
| V. R. Irvine | Engineer | Captain | Army, Fort Leavenworth, Kan. |
| H. P. Wilson | Engineer | Captain | Army, Camp Grant, Ill. |
| L. C. Galbraith | Accountant | Captain | Army, new in France |
| W. E. Ioor | Engineer | Captain | Army |
| H. W. Rieck | Trav. Agt. | Captain Inf. | Camp Travis, Tex. |

| Employees who received commissions | | | 19 |
| Number of employees volunteering or drafted | | | 444 |
| Total number of employees in government service | | | 463 |

Returns have so far been received from 129 railroads representing 211,912 operated miles. These roads have furnished a total of 55,826 soldiers and sailors for the country, of whom 1,504 are commissioned officers.

Unloading Cars with Dynamite

Dynamite, used to loosen frozen cinders in coal cars on the Pennsylvania Railroad, was the means of saving a half hour's time on each car recently, when time was specially valuable and steaming and other expedients had proved unsatisfactory.

Strenuous efforts were being made to put in two additional tracks to relieve serious congestion of traffic, and cinders were being used as ballast. Hopper bottom steel cars loaded with this material were rushed in as fast as they could be unloaded. But in the very cold weather the cinders in the bottoms of the hoppers froze solid, and oil had to be burned under the cars to thaw the mass; but over an hour was consumed in thawing a car. The use of dynamite to break up the frozen material in the hopper outlets gave excellent results. One car was swung open, exposing the frozen cinders, and a sharp pointed steel bar about 1 1/2 inches in diameter was driven to the point just barely went through the frost, which in the case was about a foot thick. There were four or five cars that had been made of heavy headed with a large amount of dynamite. Dynamite placed with an electric fuse in the car was well tamped and then fired off. The dynamite went to the frozen cinders, broke them up and the cinders cleared so that the cars were quickly unloaded. A careful examination of the cars was made after blasting to ascertain if there were any spring stains or rivets, but the cars were found to be free from any injury or breakage, and ready to be shipped. There was no practical difference of cost, but there was a saving in the time of two men in more than one half hour per car in favor of the dynamite.

Second Tobacco Shipment to Railway Regiments

On February 23 the committee in charge of the Railway Regiments' Tobacco Fund forwarded its second shipment to the railroad regiments in France. The shipment consisted of 10 cases of 12 packages each. Each package contained 240 bags of Bull Durham smoking tobacco and 80 bags of Tuxedo pipe tobacco. The shipment weighed about a ton and a quarter, and will be divided equally among the ten railway regiments now on French soil.

The tobacco is bought at wholesale prices and is not subject to revenue charges because it is consigned to government forces. It is delivered in bond to the Quartermaster's Department of the Army in this country, which takes care of its transportation without expense to the givers. The members of the committee in charge of the Tobacco Fund, of which F. A. Poor, president of the P. & M. Company, is chairman, themselves pay all of the office and postage expenditures, so that every dollar contributed to the fund goes into tobacco for the soldiers.

About 150 railroad supply companies have so far subscribed to the Tobacco Fund, most of them to the extent of \$10 a month for 15 months to January, 1919. The committee now has a balance of about \$6,000 on hand, after paying for the shipment just made, and plans to make further shipments about every three weeks. The utmost care is taken to prevent any loss or delay through the improper packing of the tobacco. Before a shipment goes forward from the point of packing a member of the committee in charge of the fund inspects the cases and their contents, either in person or through a responsible representative.

A letter received by Mr. Poor from Fred A. Preston, secretary and treasurer of the P. & M. Company, and now a captain in the regular army in France, indicates to what an extent "smokes" are appreciated by the American boys in France:

"The cigarettes arrived and I am the most grateful person in the world. Today for the first time in weeks I am having a real smoke. As I have told you before, I simply can't tell you how much smoking means to every one of us. There is something about the climate or the work that makes smoking absolutely indispensable. Whereas I formerly consumed about five a day, I now smoke 25, sometimes more, and because good cigarettes are not obtainable we smoke any d— thing."

Although a large number of supply companies have responded generously to the appeal for subscriptions, there is still a need for additional funds and contributions from other companies are solicited.

The last appeal for funds which was sent to railway supply companies may be taken as applicable to every company in the field, whether it has received the letter through the mail or not:

"The railway regiments now in France have already by their valor under fire, as well as by the service they have given in their chosen occupation, brought honor to themselves and the flag under which they serve.

"The railway supply industry feels an especial interest in the members of these regiments, which include many of our acquaintances and friends. As a slight means of showing our appreciation, and of contributing to their comfort and pleasure, the Railway Regiments' Tobacco Fund was organized. About 150 railway supply companies have already joined this movement, and the first shipment and second shipments of tobacco have been made. In order to make it the success which it deserves at least 100 more subscribers are wanted.

"Will you not 'don your bit' by entering the subscription of your company for \$10 a month for 12 months from January 1, 1918, to January 1, 1919; this subscription to terminate should the war end at an earlier date? "Checks should be made payable to John R. Washburn, treasurer, and mailed to Samuel O. Dunn, secretary, the Railway Regiments' Tobacco Fund, 750 Transportation building, Chicago."

The supply companies which have so far subscribed to the fund are as follows:

Adams & Westlake Company, Chicago.
Ajax Forge Company, Chicago.
Ajax Rail Anchor Company, Chicago.
American Arch Company, Philadelphia, Pa.
American Car & Foundry Company, New York.
American Flexible Bolt Company, Pittsburgh, Pa.
American Manganese Steel Company, Chicago Heights, Ill.
American Steel Foundries, New York.
American Vulcanized Fibre Company, Boston, Mass.
Anchor Packing Company, Philadelphia, Pa.
Anti-Cremer Corporation, New York.
Barco Manufacturing Company, Chicago.
Belle City Malleable Iron Company, Racine, Wis.
Bettendorf Company, Bettendorf, Iowa.
Blackall, Robert H., Pittsburgh, Pa.
Boss Nut Company, Chicago.
Bridgford Machine Tool Company, Rochester, N. Y.
Bronze Metal Company, New York.
Brown, J. Alexander, New York.
Bryce Steel Castings Company, Columbus, Ohio.

Bucyrus Company, South Milwaukee, Wis.
Buda Company, The, Chicago.
Burden Sales Company, New York.
Butler Drawbar Attachment Company, Cleveland, Ohio.
Camel Company, Chicago.

"Engineering" Week in Chicago

The officers of the American Railway Engineering Association have been impressed by the special need of the convention this year as an opportunity for a full discussion of the problems with which the members have been confronted as a result of our participation in the War and the situation presented by Government operation of the railways. The need of an opportunity for discussing these new conditions has been generally felt and with a view to affording its membership a maximum benefit from the convention changes are being made in the program which will afford special opportunities for a presentation of the problems of to-day.

The National Railway Appliances Association has similarly seen the special field for its exhibit this year, and preparations have long been under way for a show that will best meet the needs of the railroads under the present circumstances. Owing to the number of demands made for space in this exhibit the floor plan has been rearranged extensively, reducing the space of some of the larger exhibitors and the area devoted to aisles in a manner that will have permitted of an increase in the number of booths. In all 158 firms have arranged for space and a considerable waiting list is ready to take up any space remaining or released for any reason. There is therefore every reason to believe that the exhibit this year will be one of the most profitable and successful in the history of this organization.

With a view to a presentation of its position in regard to the convention this year the American Railway Engineering Association, through its President John G. Sullivan, chief engineer of the Canadian Pacific, Western lines, has issued a letter announcing the coming meeting to be held on March 19, 20, and 21 from which the following abstract has been taken:

The present railway conditions make it incumbent upon us as an Association and as individuals to co-operate with the Government and our executive officers to devise ways and means of solving present problems and bettering conditions.

While a journey to Chicago for this purpose will involve a certain portion of your time, it is confidently believed that the time will be well spent and more than repaid by the benefit to be derived from contact with men from all sections of the North American continent, all dealing more or less with problems similar to your own.

The program to be arranged will take cognizance of the changed conditions of the present time in the railway world, more particularly with reference to war emergency yard improvements to relieve the freight congestion; ways and means for overcoming or meeting the shortage of material and labor; devising new ways of labor-saving in maintenance work, reclamation and utilization of scrap material; substitution of other materials for wood and steel; conservation of resources; and discovering, if possible, new sources of economy.

Members are therefore earnestly urged to make their plans to attend the Nineteenth Annual Convention of the American Railway Engineering Association, to the end that we may give the best that is in us towards "Winning the War."

Traffic News

The Cape Cod Canal, after being closed for nearly two months, was opened for navigation on February 26.

E. J. Henry, western traffic manager of the Lehigh Valley, has been appointed assistant to W. H. Plehants, manager of the Marine Section of the Railroad Administration and will have authority over matters pertaining to the Lake lines.

Passenger traffic to and from Washington has increased so rapidly since the war began that additional facilities have been provided in the Union station, in that city. Ticket sales for the month of January, 1918, amounted to \$850,134, as compared with \$389,341 in January, 1917.

On Washington's Birthday, some 10,000 or more soldiers paraded in New York City; and the Long Island Railroad reports that in the five-day holiday period it ran 96 special trains between Camp Upton and the city, with no serious disturbance of the regular traffic; and the total number of passengers on these 96 trains was 49,013.

Fifty-six per cent of the less than carload freight offered to railroads in San Francisco, Cal., for shipment is delivered during the two hours between two and four in the afternoon. This fact has been developed from an actual check made by all the lines in that city. The San Francisco Chamber of Commerce and other bodies are urging on shippers to send their freight to the railroad as early in the day as possible.

For the purpose of avoiding uncertainty regarding projects for road-building the railroad administration has sought information as to the approximate number of open-top cars that will be required this year for the transportation of road-building material. It is expected that it will be possible to give assurance of what car supply will be available so that plans can be made with reference to it.

To conserve the supply of coal at lake docks and to provide for the utilization of a surplus of coal from the Montana and Wyoming mines the United States Fuel Administration is to embargo lake shipments of bituminous coal to North and South Dakota except for public utility requirements. The dock territory is supplied in large part from Illinois and this action will make the dock supply available in many communities where it is badly needed.

The railroad administration has recently had occasion to deny the comfort of private passenger cars to various wealthy people who desired to use them for small parties. The Railroads' War Board had already taken steps to curtail the use of private cars, before the period of government control, and the policy has been rigidly adhered to by the railroad administration, which has declined to approve the use of private cars for less than 40 persons, except in a few instances of cases of illness or for foreign missions traveling in this country. A considerable number of private cars were taken to Florida early in the winter and these will be allowed to be returned.

F. M. Whitaker, vice-president of the Chesapeake & Ohio, has been appointed by Director General McAdams to co-operate in traffic matters with the Fuel Administration. This completes the organization of representatives of the railroad administration appointed to take charge of traffic matters for various departments of the government and to handle all requests for priorities or preferential movement for the government. The other representatives are H. M. Adams, for the War department; H. P. Anewalt, for the Navy department; J. F. Holden, for the Shipping Board; J. A. Middleton, for the oil division of the Fuel Administration, and C. E. Spens, for the Food Administration.

The Committee on Freight Transportation at New York, of which James S. Harlan, of the Interstate Commerce Commission is chairman, is holding conference at the office of the New York State Public Service Commission, 120 Broadway, New York, with a view to formulating the New York Public Service Commission, New Jersey Public Utilities Commission, committees

of railroad officers, members of the Merchants' Association, the Traffic Club, the Board of Trade and Transportation, the New York Team Owners' Association, and the Freight Transfer Association. The proposal for a general scheme of store-door delivery, which is being considered by this conference, was noticed in the *Railway Age* on February 1.

Parcel Post Weight Limit Increased

Postmaster General Burleson has announced an increase in the allowable weights of parcel post packages, effective on March 15. The 50-pound limit in the first and second zones is increased to 70 pounds, which is also extended to the third zone. In the other zones the weight limit is increased to 50 pounds.

Auto Truck Line Between Waukegan and Chicago

In line with the desire of the Government for automobile lines to take over short haul shipments from the railroads, the Chicago, Waukegan & Gary Transportation Company has been organized, with William L. O'Connell, treasurer of the O'Connell-Manly Truck Company, Waukegan, Ill., and former chairman of the Illinois State Public Utilities Commission, as its president. The corporation has been granted a certificate of convenience and necessity by the public utilities commission and expects to begin service between Waukegan, Ill., and Chicago, about 36 miles, within three weeks, starting with from three to five kerosene-burning Manly trucks and trailers. Plans of the new company include the extension of service to other cities within a similar radius of Chicago.

Sailing-Day Plan Extended

The "shipping day" or "sailing date" plan for accepting and forwarding less-than-carload freight has now been extended to cover the service on all of the twenty-five divisions of the Pennsylvania Railroad east of Pittsburgh and Erie. It is believed that further study and longer experience will point the way to additional economies, but the beneficial results already achieved are so satisfactory that the plan is declared successful. Reports from all divisions just compiled show that a total of 654 cars are being saved daily in the transportation of less-than-carload freight on the lines east of Pittsburgh. In addition 25 distributing local freight trains have been discontinued altogether by substituting tri-weekly or semi-weekly "pickup" trains on branches where traffic is light. This "sailing date" plan for handling l.-c.-l. freight was first put into effect on September 4, 1917, in Philadelphia. Five and a half months' experience has shown that the plan not only economizes car space, but gives shippers more regular service and reduces the length of time in transit. Moreover, by eliminating much rehandling at freight transfer stations it has lessened loss and damage costs and the amount of freight going astray.

Export Freight Movement

Freight is moving now with a good degree of freedom throughout "Eastern" territory, as indicated by daily reports to A. H. Smith, regional director. The congestion on the lines of the principal roads leading to the seaboard is being slowly overcome, but with fluctuating results. The number of cars above normal on February 24 and February 27 was reported as follows:

| | Sunday | Wednesday |
|-------------------|--------|-----------|
| Eastbound loads | 47,303 | 37,692 |
| Eastbound empties | 5,149 | 5,034 |
| West bound loads | 30,578 | 25,285 |
| Westbound empties | 17,093 | 9,492 |

The United States Steel Corporation reported on Tuesday that the corporation's blast furnaces were operating at 75 per cent of full capacity and the finishing mills at 80 to 85 per cent. These figures represent an important improvement during the last ten days, attributable to normal weather and better transportation conditions.

The movement of coal in New York harbor is still somewhat hampered because of the damage suffered during the severe weather of two weeks ago, 23 tugs belonging to the railroad companies being still laid up for repairs.

Commission and Court News

Interstate Commerce Commission

The Commission has postponed the effective date of its order in the reconsignment case to April 1.

The Commission has authorized an increase in the rate for passenger mileage tickets in southeastern territory from 2 cents a mile to 2½ cents.

The Commission has issued a circular to the railroads for the purpose of securing information for Director General McAdoo regarding the issuance of free transportation in intrastate traffic other than that authorized by the federal anti-pass law for interstate travel. Information is also asked regarding the issuance of transportation in exchange for advertising.

State Commissions

The State Public Utilities Commission of Illinois held a hearing at Chicago on February 27, to consider the petition of William E. Golden, Chicago, for a reduction in passenger fares to not more than one cent a mile between Chicago and Great Lakes Naval Training station; Camp Grant, Rockford; and Fort Sheridan, Ill.

Personnel of Commissions

Hiram W. Belnap, who, as announced elsewhere, has been appointed manager of the Safety Section of the Division of Transportation of the United States Railroad Administration,

H. W. Belnap

has been with the Interstate Commerce Commission for 15 years, for the past seven years as chief of the Bureau of Safety, and for the preceding eight years as inspector of safety appliances. Previous to that he had had 14 years' experience in various capacities in train operation. It is announced that, as manager of the Safety Section, "he will deal directly with each railroad, supervising such organizations for safety as are already available, bringing about such uniformity in practice as is deemed necessary, and suggesting such additional organizations and such modifications of practice as are desired."

The director general feels strongly that there should be no abatement whatever in the safety work on the railroads, but that there should be centralized supervision, not only to insure proper practices but also in order that each railroad may promptly secure the advantage of experience which other roads have had in the development of safety work." Mr. Belnap will continue to exercise his usual functions under the Interstate Commerce Commission.

Court News

Creation of Relation of Carrier and Passenger

The Supreme Court of the State of Washington holds that where, through permission of a division superintendent, a ticket was sold to the plaintiff from a station where passengers were not taken on, the relation of carrier and passenger with

all its attendant duties was created, and the carrier was liable in tort for not stopping the train at that point, although until the sale of the ticket on special permission no duty to stop existed.—*Fenlon v. C. M. & St. P. (Wash.)*, 169 Pac., 863. Decided January 7, 1918.

Freight Rate Order

The Florida Supreme Court holds that an order of the Railroad Commissioners prescribing a rate for the transportation of a certain class of freight carried in carload lots, which prescribes different charges to be made for different distances cannot be successfully attacked by a railroad resisting the enforcement of the order by segregating one item in the schedule of rates prescribed and showing that the expense incurred by moving the freight for the distance to which the item applies equals or exceeds the revenue derived by the railroad from handling the freight for that distance.—*State v. Live Oak, Perry & Gulf (Fla.)*, 77 So., 223. Decided December 17, 1917.

Through Rates for Freight

The Alabama Court of Appeals holds that where there were two rates applicable to shipments between certain points, one a joint or through rate over one route, the other made up by adding the respective rates of the several roads involved in another route, the initial carrier was at liberty to contract with reference to the former rate, though it shipped over the latter route, and when the terminal carrier accepted the shipment it was chargeable with notice of the rate agreed upon and could not charge a greater compensation than the contract provided for.—*Oden-Elliott Lumber Co. v. L. & N. (Ala.)*, 77 So., 240. Decided December 18, 1917. Rehearing denied January 15, 1918.

Notice of Claim for Damages

The Oklahoma Supreme Court holds that a provision in a contract for an interstate shipment of live stock that as a condition precedent to the bringing of an action for damages for loss or injuries the claimant shall give notice of the data thereof to some general officer, claim agent or station agent of the railroad with 90 days after the loss or injury, and failure to give such notice shall be a bar to recovery is reasonable and valid, and no action can be maintained for such damages without showing a substantial compliance with the requirement of this provision. It is held that the giving of one-day notice at the point of destination to the delivery carrier did not obviate the necessity of complying with the provision by giving notice to the company against which damages are claimed.—*Rock Island v. Mr. Elreath (Okla.)*, 169 Pac., 628. Decided November 6, 1917. Rehearing denied January 8, 1918.

Injury on Right of Way—Contributory Negligence

A right of way adjoined on each side by a street was level and unfenced and was crossed by the public at all points. Opposite the house of a resident, which faced the right of way, there was a well-marked path across the right of way passing close to a turntable and curving slightly around it. A footbridge across a ditch on the right of way and used in connection with such path existed before the turntable was installed, but was reconstructed to facilitate access to the turntable. While the said adjoining resident was crossing the right of way by the path, followed by his daughter, 3½ years old, the latter fell into the turntable pit. In an action for her injuries the Louisiana Supreme Court held that the turntable, being of the usual construction and being on the railroad's own property, where it had a perfect right to be, the company owed the public no duty of fencing the right of way or warning the public away from the turntable. If the danger from the turntable was so obvious that the railroad company should have known of it and guarded against it, then the plaintiff whose house faced it, should have known of it and not left his little child to take care of herself as she followed him. As the accident was not caused by the attrac-

tiveness of the turntable to children, the doctrine of the "turntable cases" had no application.—*Hendricks v. Kansas City Southern (La.)*, 77 So., 130. Decided November 26, 1917.

Dining Car Conductor Not a Brakeman

The Supreme Court of Pennsylvania, on February 25, reversing the decision of the Superior Court, sustained the Public Service Commission of Pennsylvania in refusing to class the dining car conductor as a member of the train crew in counting the individual in relation to compliance with the "full crew" law of that state. The suit affects the Baltimore & Ohio, the Central of New Jersey and the Philadelphia & Reading, all three of these roads having asserted the right to count the dining car conductor as one of the five men to make up a "crew" of a passenger train to comply with the law. The decision of the court says that, in the case considered, the dining car conductor performed no duties as brakeman; he simply was subject to call by the conductor. In this situation, says the court, the judgment of the conductor, as to when there ought to be an additional brakeman, was substituted for the direct requirement of the law.

Consignor's Liability for Freight and Demurrage

In an action against a consignor for freight charges the Wisconsin Supreme Court holds that where the carrier, on the agreement of the consignee to pay freight and demurrage on goods once rejected, released the goods to the consignee, it merely released its lien and did not release the consignor from liability to pay these charges. In the absence of evidence that acceptance and renewal of a note for freight and demurrage charges given by the consignee was intended as a payment thereof, such note would not release the consignor from liability to pay such charges. And in the absence of evidence that the consignor notified the original or other carriers that he acted only as agent for another in delivering brick to the carrier and that the carrier received the brick on such consideration, the consignor could not escape liability for freight and demurrage charges on such ground.—*Great Northern v. Hocking Valley Fire Clay Co. (Wis.)*, 166 N. W., 41. Decided January 5, 1918.

Trespasser on Trestle—Engineer's Duty

In an action for the death of a boy of 16 years, killed by a train while walking as a trespasser on a trestle, the Kentucky Court of Appeals holds that notwithstanding the reckless negligence of the deceased in starting across the trestle after being told that a train was coming, it was the engineer's duty, after he actually discovered the peril, to exercise ordinary care with all the means at his disposal to stop the train or reduce its speed so as to avoid striking the deceased, but this was the full measure of the duty owed to him. A railroad employee stationed at the trestle, where some new work had been done on the track to observe the condition of the track and give such notice or warning as might be necessary to passing trains, warned the deceased that a train was coming and that he had better look out for it. The deceased was neither ignorant nor drunk, feeble nor helpless, nor so young in years as to need protection. The employee had a right to assume that the boy was capable of taking care of himself and would not needlessly put himself in danger, and the watchman was not negligent in failing to observe the course that the boy pursued or to signal the engineer to stop or slacken the speed of the train. Engineers are under no more duty to anticipate the presence of trespassers on a trestle or to keep a lookout for them than at any other place on the track where travelers have no right to be. Bridge carpenters or workmen were often on the trestle about the time of day the accident happened, and the engineer, seeing the deceased on the trestle, thought he was one of the bridgemen and sounded the alarm whistle, believing that he would get out of the way, as he could easily have done by stepping on a cap or projecting member. It is held that he was not negligent in so believing or in failing to apply the emergency brakes until he discovered that the boy was not one of the workmen. Judgment on a directed verdict for the railroad was affirmed.—*Lapp v. Louisville, H & St. L. (Ky.)*, 199 S. W. 798. Decided January 15, 1918.

Equipment and Supplies

Locomotives

THE GRAND TRUNK has ordered 25 switching locomotives from the Canadian Locomotive Company.

Freight Cars

THE OIL, GAS & LEASE COMPANY is inquiring for 50 8,000-gal. tank cars.

THE OIL STATE GASOLINE COMPANY, Tulsa, Okla., is inquiring for ten 8,000-gal. tank cars.

THE WARREN OIL COMPANY, Warren, Pa., is inquiring for 100 8,000-gal. capacity tank cars.

THE MILLER PETROLEUM COMPANY, Chanute, Kan., is inquiring for 10 10,000-gal. capacity tank cars.

THE MIDCO OIL SALES COMPANY, Chicago, is inquiring for 200 8,000 to 10,000-gal. capacity tank cars.

THE INDIAN REFINING COMPANY, Lawrenceville, Ill., is inquiring for 150 8,000-gal. capacity tank cars.

THE PEOPLES TANK LINE COMPANY, Coffeyville, Kan., is inquiring for 100 8,000-gal. capacity tank cars.

THE WESTERN PAPER MAKERS CHEMICAL COMPANY, Kalamazoo, Mich., is inquiring for several 8,000-gal. capacity tank cars.

THE INDEPENDENT PACKERS & FERTILIZER COMPANY, Columbus, Ohio, is inquiring for three 50-ton steel underframe tank cars.

THE LA BELLE IRON WORKS, Steubenville, Ohio, has ordered 5 10,050-gal. 50-ton capacity tank cars from the Pennsylvania Tank Car Company.

THE PHOENIX COTTON OIL COMPANY, Memphis, Tenn., has ordered 8 8,050-gal. 50-ton tank cars from the Pennsylvania Tank Car Company.

THE PENN AMERICAN REFINING COMPANY, Oil City, Pa., has ordered 8 8,050-gal. 40-ton capacity tank cars from the Pennsylvania Tank Car Company.

THE UNITED GAS IMPROVEMENT COMPANY, Philadelphia, has ordered 3 10,050-gal. 50-ton capacity tank cars from the Pennsylvania Tank Car Company.

Passenger Cars

THE CANADIAN GOVERNMENT RAILWAYS are reported as having ordered 7 dining and 14 sleeping cars from the Pullman Company.

THE RAILWAY-STORES BRANCH OF THE RAILWAY BOARD OF INDIA (at Simla and Calcutta) makes estimates and designs for rolling stock, plant, and machinery, signaling and interlocking, railway ferries, steamers, etc.; makes allotment of funds in connection with indents for stores; and itself indents for stores for state railways and for some native state railways. It tenders and contracts for coal, ties and cars for state railways, ratifies contracts for supply of materials, keeps a record of surplus stores, and compiles and distributes every quarter the lists of stores purchased by the India office for the state railways. It is the general policy of the Indian railways to make most of their purchases in England. The address of the representative of the board in England is India Office, Whitehall, London. Local offices, however, have considerable to do with the selection of types of material, equipment, etc., so it would seem advantageous to keep the local agent, chief engineers and mechanical engineers, as well as the railway board of India, supplied with catalogues and other information as to articles of equipment or material which might be of special advantage in India, and perhaps superior, cheaper or possibly more promptly supplied than those furnished by English firms.

Supply Trade News

L. A. Larsen, assistant to the president of the Lima Locomotive Works, Inc., has also been appointed secretary-treasurer to succeed Mr. Cloos, resigned, effective February 13.

The Westinghouse Electric & Manufacturing Company announces the removal of its office from Phoenix, Arizona, to Tucson, Arizona. Its representatives, J. H. Knost and W. G. Wilson, will have headquarters in the Immigration Building at the latter point.

W. H. Thompson, for many years prominent in the heavy electric traction work of the Westinghouse Electric & Manufacturing Company, has resigned to accept the position of works manager of the Fairmont Mining Machinery Company of Fairmont, W. Va., makers of coal mining equipment.

P. K. Aldrich, formerly with Edwin S. Woods & Co., Chicago, has formed the Superior Side Bearing Company, with offices at 922 Webster building, Chicago. Mr. Aldrich is president and general manager of the new company, which will manufacture side bearings with an intermediate support, and other railroad specialties.

The L. S. Brach Supply Company, Newark, N. J., announces the following appointments: as superintendent, Henry Keohler, formerly of the Crucible Steel Company; as production engineers, Louis Rist, formerly with the Crocker-Wheeler Company, Ampere, N. J., and Herman Rose, formerly a foreman with the L. S. Brach Supply Company.

T. McCullum, formerly roundhouse foreman for the Duluth, Missabe & Northern, has been appointed railway representative for the Garratt-Callahan Company, Chicago, in charge of the northwest territory, with headquarters in Minneapolis, Minn. William Rollinson, foreman in the mechanical department of the Minneapolis, St. Paul & Sault Ste. Marie, has been appointed railroad representative in the states of Ohio, Indiana and Illinois, with headquarters at Indianapolis, Ind. George DuR. Fairleigh, formerly in the sales department of the U. S. Cast Iron Pipe Company, has been appointed railroad representative in the southwestern territory, with headquarters at Dallas, Tex. G. E. Wilson, formerly master mechanic for the Nevada Consolidated Copper Company, operating the Nevada Northern, has been appointed railway representative for the Pacific Coast territory, and will have his headquarters at San Francisco, Cal.

Baldwin Locomotive Works Have Record Year

The seventh annual report of the Baldwin Locomotive Works for the year ended December 31, 1917, shows that 2,748 new locomotives were built, amounting to \$63,455,574; other regular work was completed amounting to \$13,835,707, and contracts for shells and other special work were executed amounting to \$20,972,583, making a total production of every kind of \$98,263,865. This compares with gross sales in the preceding year of \$59,219,058. Profits were \$11,193,840. After providing reserves for taxes, depreciation, amortization, doubtful accounts, charges to capital and interest charges, there remained as net profit \$8,305,722, out of which there was distributed as dividends to the preferred stockholders \$1,400,000, leaving \$6,905,722 to be added to the surplus carried over from 1916 of \$8,949,624. The balance sheet shows that of the real estate plant equipment, patents, etc., carried at \$44,953,706, the patents and good will represent \$16,699,299. Of the accumulated earnings amounting to \$15,855,346 the sum of \$15,800,000 has been applied to the reduction of this account, leaving the book value of good will, patents, etc., \$899,299, and the amount carried forward as surplus, \$55,346.

President Alba B. Johnson says in part: "The locomotive business at the beginning of 1918 continues to be favorable. The probability that during the continuance of the war the government will become the chief purchaser, presents a new con-

dition, the effects of which cannot be fully foreseen. The consolidated balance sheet of the Baldwin Locomotive Works and Standard Steel Works Company shows a total surplus of \$3,449,816."

Following is a summary of operations of the Baldwin Locomotive Works for the years ended December 31, 1916 and 1917:

| | 1916 | 1917 |
|---|--------------|--------------|
| Gross sales | \$51,214,057 | \$98,632,865 |
| Cost | 51,837,347 | 86,484,845 |
| Manufacturing profit | \$6,367,110 | \$11,779,019 |
| Other income | 61,000 | 961,465 |
| Profit on buildings | 3,461,135 | — |
| Gross profit | 10,505,066 | \$12,740,485 |
| Deduct taxes, interest, etc. | 1,160,439 | 1,546,646 |
| Profit | \$9,444,641 | \$11,193,840 |
| Less reserve for depreciation, etc. | 6,825,175 | 2,888,118 |
| Net profit | \$2,619,465 | \$8,305,722 |
| Dividend on preferred stock | 1,000,000 | 1,400,000 |
| Surplus for year | \$1,619,465 | \$6,905,722 |
| Surplus brought forward | 4,805,937 | 8,949,624 |

Pressed Steel Car Company

The gross sales of the Pressed Steel Car Company in 1917 were \$9,000,000 greater than in 1916 and the greatest in the company's history. The profits, totaling \$2,130,308, were at least up to the average, but they were \$620,844 less than in 1916. Deducting \$875,000 preferred dividends there was available \$1,255,308 for the common stock, equal to \$10 a share, as against \$1561 in 1916. The company paid during the year 7 per cent or \$875,000 on its common stock, the largest dividends since its organization, leaving a surplus for the year of \$380,308 and a total surplus of over \$10,000,000.

President L. N. Hoffstot at the annual meeting said that of the \$4,034,843 gross sales more than \$30,000,000 came from car business. The remainder was income from forgings, shell and general repair work. He also stated that wages had increased 50 per cent but that efficiency decreased 50 per cent. The plants are now running at about 70 per cent of capacity.

Mr. Hoffstot in his remarks to stockholders, speaking about gross sales and earnings, says: "It is a disappointment to your management that the percentage of profit has not been greater, but it is largely due to the two contingencies referred to in last year's report—the inability to secure regular supplies of raw material and labor.

"In the manufacture of steel cars it is necessary that component factors reach plants in proper proportion and regular order. For example—the average car requires for its construction approximately 50 per cent plate steel and 50 per cent steel in the form of shapes and bars. Until the middle of October there was received less than one-half the plate steel requirements with the result that inventories were unduly increased to more than triple in value and double in units on account of large quantities of shapes and bars coming in regularly without plates, thus causing additional expense. In order to increase production, fill orders as nearly as possible on time, and minimize loss, there was purchased outside of existing contracts a large quantity of plate steel at a high average price. The establishing, however, of fixed prices prevented utilizing the steel due from the original source of supply at the time deliveries could be secured on basis of the delay in the receipt of complete material postponed the construction of some work over a period in which there were several increases in wages of day workers, and in this period shop supplies including fuel increased in the same ratio. This was serious because a large percentage of the business was taken prior to December 1, 1916. Fortunately, the capacity of your plants were under-scheduled or there would have been a most unsatisfactory situation with our customers.

"As soon as our country entered the war your company offered its facilities to the government for making such material as the plants are fitted to produce, and while your company has undertaken considerable work for their various requirements, your plants have freight car capacity still open, as the equipment for manufacturing freight cars is not adaptable to the more

highly finished products required for war work. We have believed for a long time that the great shortage of cars must inevitably result in placing of large orders and the building in which this equipment is located could therefore be more advantageously used by building cars than embarking in manufacture of material involving large expenditures for new machinery and difficulty of forming new organizations for this work. To win the war requires an efficiently equipped railroad system from the Atlantic to the Pacific and from Canada to Mexico, and the railroads will not only have to make up for what they have not done in the past, but must also prepare to meet extraordinary requirements due to existing conditions.

"It is our firm belief that it adequate provision has been made for equipment and terminal facilities in the past to keep pace with the country's increase in tonnage there would not have been this desperate freight congestion nor would the cost of materials and labor have advanced so rapidly. For example, the tonnage capacity for steel ingots has increased from 30,000,000 tons in 1912 to 50,000,000 in 1917, and as far as we are able to definitely ascertain, there were less cars available in 1917 than in 1916. The increase in this kind of tonnage causes serious demands in the way of cars and locomotives by reason of the fact that six or seven tons of limestone, coke, pig iron and other materials are required to be hauled in the production of one ton of steel ingots.

"A matter of the gravest importance in the present crisis which it is hoped our government may promptly correct is the migratory disposition of workmen, as to win the war it will require steady, sober application by everyone. Labor conditions have been most difficult and we can no better illustrate this than by the statement that during the year we employed four men for every job, that is, each employee averaged only three months' service with us. This changing of employment slows down production and tends to make high costs. The taking over by our government, as a war measure, of the railroads of the country, marks an interesting epoch in the history of railroads. It is to be hoped that they will not be tied down by the shortsighted policy heretofore adopted which has so limited the returns that there has been no available income for the purpose of keeping up with the growth of the country in either the equipment or terminal facilities, and that we may never again see such a demoralization of business as has resulted from the failure of transportation facilities.

"During the year \$213,102 was spent about equally in additions to equipment of McKees Rocks and Allegheny plants and in adding to miscellaneous order departments. We have also under construction at McKees Rocks a powdered coal plant, which should be completed early in 1918, which will largely replace fuel oil and gas, and which will use coal much more economically, as both fuel oil and gas very much increased in price last year and were difficult to secure in regular amounts. The increase in stocks and securities shown on the financial statement represents an investment in the Lincoln Gas Coal Company in which your company has a controlling interest, and was made to insure a continuous supply of coal, as the almost prohibitive prices of both gas and oil when used as fuel together with the difficulty in securing regular supplies, have made it necessary to replace with coal as far as possible the use of gas and oil as fuel, which will greatly increase our coal consumption. We hope to have this property in operation and be getting the benefit of the coal during the ensuing year.

"Western Steel Car & Foundry Company has several interruptions in its operations during the year. Owing to business losses being inconformable to a continuous production schedule, while overhead charges due to existing war conditions kept increasing. In addition general labor unrest in the Chicago district, particularly during the summer and abnormal weather conditions throughout the year were an added handicap. Deliveries of material supplies, generally greater, were substituted for maintenance with production secured. The policy of price fixing by Government order at this work was the same as that for our Pittsburgh plants. Your management has considered it wise to make no withdrawal of this company's earnings, as increased cost of material and necessary additions to plant to meet the changing conditions of the industry, make this inadvisable. The indications are we should secure a good volume of business for this work during the coming year and if successful in this respect favorable results should be obtained."

President Hoffstot, speaking about general conditions in the

industry, added: "The tendency of the Government is to cut off steel for non-essentials, but we are not worrying because we are doing government work and the government will see to it that we are supplied with steel. Cost sheets this quarter will in all probability be very high. For instance, pig iron is quoted around \$36, and yet it cost \$38 a ton to make. I don't think the government will buy any cars for the railroads until the railroad bill is passed. The government ought to buy about 100,000 cars and use them as a floating reserve."

Franklin Railway Supply Company of Canada, Ltd.

The Franklin Railway Supply Company of Canada, Limited, has taken over the business formerly handled by the Montreal branch of the Franklin Railway Supply Company, Inc. The new company will have exclusive rights in Canada to all the products of its parent company and will continue the same policies and business methods that have governed the Franklin Railway Supply Company, Inc., since its formation. The officers of the new company are: J. S. Coffin, chairman of the board; Joel S. Coffin, Jr., president, and Leland Brooks, vice-president. The company's headquarters will be at Montreal.

Joel S. Coffin, Jr., who has been elected president of the new company, brings to this new organization a wide experience in both the railroad supply business and locomotive building. He was born at Waukesha, Wis., and received his education at the public schools in Franklin, Pa., and Stevens Institute. After leaving Stevens he entered the service of the Venango Manufacturing Company at Franklin, Pa., and later served the American Locomotive Company in the erecting shop and as locomotive inspector. In 1912 he entered the employ of the Franklin Railway Supply Company as a service representative. He later went into the sales department and in 1915 was appointed Canadian sales manager which position he held up to the time of his recent election.

Leland Brooks, who has been elected vice-president of the Franklin Railway Supply Company of Canada, Ltd., was born at New York City and received his education in the public schools of that city and Stevens Institute. Upon leaving Stevens he entered the employ of the New York Central, serving seven years in the engineering department. Leaving the New York Central he took a position with the Franklin Railway Supply Company, Inc. For the past year he has been connected with its Canadian branch as assistant manager which position he held up to the time of his recent election.

Trade Publications

THE SPEEDSTER.—The Blaw-Knox Company, Pittsburgh, Pa., has issued a leaflet illustrating and describing the Blaw Speedster Bucket. This is a new bucket of the Blaw type designed primarily for use as a re-handling bucket.

AN INVESTIGATION OF PIPE CORROSION.—This is the title of Bulletin No. 30, issued by the A. M. Byers Company, Pittsburgh, Pa. The investigation was prompted by local agitation on the part of property owners in Pittsburgh, due to the difficulty of maintaining hot water pipe lines. It involved an investigation of the condition of hot water pipes in 125 apartment buildings in the city of Pittsburgh, and the data is arranged to show a comparison of the life of wrought iron and steel pipes.

ARGENTINA EXPORT FREIGHT.—During the first six months of 1917, 32,960 cars entered Buenos Aires loaded with 549,401 tons of export freight, and during this period the total railway traffic of the national capital was conducted in 123,656 cars, containing 1,023,568 tons of freight and live stock.

A ROAD TRANSPORT CONTROL BOARD, needed by reason of the overlapping of government motor transport demands, is being formed for England. Transport experts would like to see a small executive of practical men. "There is as great a need for a Road Transport Executive as there was for the Railway Executive," says the Commercial Motor. "There are committees devoting their attention solely to such questions as canal traffic and horse traffic. But motor transport is left in its unorganized state."

Financial and Construction

Railway Financial News

BUFFALO, ROCHESTER & PITTSBURGH.—See editorial elsewhere in this issue.

PACIFIC GREAT EASTERN.—Negotiations have been concluded for the Canadian Government to take over and finish this line. The company is to pay the Government \$1,100,000, of which \$750,000 will be in cash, and the balance due after the war. The Government will resume the operation of trains, which was recently suspended by the company, and will construct the line from Clinton to Williams Lake, a distance of 100 miles, during the present year.

ST. LOUIS-SAN FRANCISCO.—This company has filed application with the Kansas Public Utilities Commission for permission to issue bonds to the amount of \$2,800,000. Of this sum \$2,064,000 is for reimbursement of expenditures and \$105,000 is for expenditures in equipments and \$721,000 for paying equipment obligations maturing February 15, 1918.

TEXAS STATE RAILROAD.—A bid of \$180,000 from the Midwest Iron Company of Kansas City for this 38-mile line was rejected by the commission in charge of the sale. The Texas State Railroad was incorporated in 1907. It has one locomotive and 38 cars. The funded debt outstanding on June 30, 1916, was \$100,000 first mortgage 5 per cent bonds. The president of the road is E. Stubblefield, with office at Rusk, Texas.

Railway Construction

ALABAMA INTERURBAN.—Application has been made in Delaware by this company for a charter to build a line between Birmingham, Ala., and the Warrior river. The first section to be built will be from the Warrior river towards Birmingham, a distance of 17 miles, at which point connection will be made with existing lines until the 35 miles have been built into Bessemer and Birmingham. T. L. Cannon, president, Birmingham.

EMORY RIVER LUMBER COMPANY'S ROAD.—Plans have been made to build a 10-mile line from Lancing, Tenn., to timberlands in Morgan county. There will be three steel bridges aggregating 200 ft. on the line, also six trestles. The line will be built to carry lumber and coal. J. S. Walker, president; F. J. Roettger, chief engineer, Lancing, Tenn.

PENNSYLVANIA RAILROAD.—This company is making alterations and building an extension to the freight house at River street in Newark, N. J. The cost of the work will be about \$16,000.

PHILADELPHIA & READING.—A contract has been given to A. L. Carhart, for improvements to be made at Skillman, N. J., including the construction of a brick powerhouse 33 ft. wide by 74 ft. long, on concrete foundations, with concrete coal pocket to one side 16 ft. wide by 34. long. The roof and floor construction will be of steel and reinforced concrete, and the roof covering of asbestos and asphalt. The contract also calls for building a two-story brick signal tower 15 ft. wide by 20 ft. long, with concrete cellar and foundations, and floors of steel and reinforced concrete and slate roof. A contract for all electric equipment has been given to the Union Switch & Signal Company.

PIONEER RAILWAYS IN CHILE.—In the January number of Chambers' Journal, J. M. M. Cunningham points out that this land of mountains, hemmed in between the higher Andes and the sea, has problems in the way of her developments, very different from anything encountered in the wide plains of neighboring Argentina, and claims to possess the first railway ever built in South America. This claim is made for the line of about 50 miles in length, which runs from the small port of Caldera to the mining center of Copiapo, the capital of the province of Atacama. It was begun in March, 1850, and formally opened to traffic in January, 1852.

ANNUAL REPORT

Buffalo, Rochester & Pittsburgh Railway Company—Thirty-third Annual Report

The Directors of the Buffalo, Rochester and Pittsburgh Railway Company submit to the Stockholders the following report for the year ending December 31, 1917:

| ROAD OPERATED | | IN | | DECREASE | |
|-----------------------|----------|----------|----|----------|------|
| | 1917 | 1916 | | 1917 | 1916 |
| Owned | 1,007.11 | 1,007.11 | 01 | | |
| Leased | 10.65 | 10.65 | 01 | | |
| Trackage rights | 1.83 | 1.83 | | 1.83 | |
| Total miles of tracks | 1,019.59 | 1,019.59 | | | |
| Second track | 10.65 | 10.65 | 01 | | |
| Sidings | 41.57 | 41.57 | 00 | | |

Total miles of tracks, all steel rails, 1,177.31 30.5
The decrease of road operated is due to an adjustment of .02 miles in line track and leased, and a change of 1.85 miles in trackage rights, Buffalo, N. Y.

The tracks were increased by 2.8 miles of second track built between Marion Center, Pa., and Home, Pa., turned into service on August 10, 1917, and 30.7 miles of sidings, of which 18.26 miles are on line used under trackage rights.

| INCOME. | | INCREASE OR | |
|--------------------------------------|-----------------|-----------------|----------------|
| | 1917 | 1916 | DECREASE |
| Operating income | | | |
| Revenues | \$14,975,400.30 | \$12,761,784.65 | \$2,213,615.65 |
| Expenses | 11,878,565.89 | 9,389,793.33 | 2,488,772.56 |
| Net revenue | \$3,096,834.41 | \$3,371,991.32 | \$275,156.91 |
| Tax accruals | 506,000.00 | 262,000.00 | 244,000.00 |
| Collectible revenues | 350.00 | 443.93 | 93.93 |
| Total operating income | \$3,603,184.41 | \$3,634,435.25 | \$31,250.84 |
| Non-operating income | 1,316,000.13 | 1,125,274.46 | 190,725.67 |
| Total income | \$4,919,184.54 | \$4,759,709.71 | \$159,474.83 |
| Expenses for interest, rentals, etc. | 2,166,256.06 | 2,194,253.01 | 27,996.95 |
| Net income | \$2,752,928.48 | \$2,565,456.70 | \$187,471.78 |
| Provisions | | | |
| Depreciation and Fire Insurance | \$2,340.98 | \$32,100.36 | \$29,759.38 |
| Funds | 644,354.25 | 858,391.41 | \$214,037.16 |
| Total appropriations | \$2,985,285.23 | \$340,491.77 | \$2,644,793.46 |
| Surplus available for dividends | \$1,068,105.26 | \$1,239,047.37 | \$170,942.11 |

On or about 1917 7.51% 1.04%
Tax accruals include as nearly as it has been practicable to determine, provision for all taxes imposed this year. The increase of \$244,000 is chiefly due to the larger revenues and the higher rate of Federal tax.
The increase of \$190,726.77 in non-operating income came principally from the favorable balance in Hire of Equipment account, and from interest received on cash balances.

A special appropriation of \$644,354.25 was made from net income. Of this amount \$125,000.00 was paid into the Sinking Funds under Equipment Agreement Series A, B and C including \$1,236.26 accrued interest was paid to retire \$51,000 bonds of these Series, and balance applied to the purchase of new rolling stock. \$21,317.99 represents the cost of Equipment Bonds Series D, E and F paid off during the year, less one-half of the principal refunded by 4% per cent Consolidated Mortgage Bonds. \$1,000.00 covers the amount paid into the Sinking Fund to retire bonds of Equipment Agreement Series G, and \$125,000 is the principal of Series H bonds paid off during the year.

| DIVIDENDS. | | 1917 | | 1916 | |
|-----------------|--------------|------|-----------|------|-----------|
| | | | | | |
| Preferred Stock | \$6,000,000 | 6% | \$360,000 | 6% | \$360,000 |
| Common Stock | 10,500,000 | 6% | 630,000 | 5% | 525,000 |
| Total | \$16,500,000 | | \$990,000 | | \$885,000 |

At the close of the fiscal year, your Board of Directors has declared dividends of three dollars per share on the preferred stock and one dollar per share on the common stock, payable February 15, 1918.

CAPITAL STOCK.

There has been no change during the year in this account. The total authorized capital stock of the Company amounts to \$16,500,000, consisting of \$6,000,000 preferred stock and of \$10,500,000 common stock.

FUNDED DEBT.

In accordance with the provisions of the Consolidated Mortgage of 1907, \$2,000,000 of 4% bonds were received from the Trustee to apply on payments made for improvements and betterments, and the securities placed in the Treasury of the Company. The Trustee also delivered to the Company \$2,000,000 Consolidated Mortgage 4% bonds, representing 50% of the Equipment Bonds Series D, E and F retired during the year. These bonds added to those in the Treasury of the Company made a total of \$3,455,000 of which \$2,132,700 were sold during the year for corporate purposes, leaving a balance of \$1,322,300 held in reserve. Under the terms of the Sinking Funds for the redemption of Equipment Bonds \$2,500,000 were retired, as follows: \$1,000,000 Series B, \$500,000 Series C, \$115,000 Series D, \$115,000 Series E, \$89,000 Series F, and \$81,000 Series G.

Also the third annual installment of \$125,000 Series H bonds was retired, as provided for in the agreement.

To provide for additional rolling stock, an issue of \$1,600,000 five per cent Gold Bonds was authorized, to be secured by new equipment costing \$2,655,600. These bonds were issued under an agreement known as

Equipment Agreement Series I, dated June 1, 1917, and were sold and placed on the market by the Trustee. The first issue of \$1,600,000 was placed on the market on July 1, 1917, and the second issue of \$1,600,000 was placed on the market on July 1, 1917, and the third issue of \$1,600,000 was placed on the market on July 1, 1917, and the fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the tenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the eleventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the twelfth issue of \$1,600,000 was placed on the market on July 1, 1917, and the thirteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the fourteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the fifteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the sixteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the seventeenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the eighteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the nineteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the twentieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the twenty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the twenty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the twenty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the twenty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the twenty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the twenty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the twenty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the twenty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the twenty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the thirtieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the thirty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the thirty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the thirty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the thirty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the thirty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the thirty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the thirty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the thirty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the thirty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the fortieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the forty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the forty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the forty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the forty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the forty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the forty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the forty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the forty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the forty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the fiftieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the fifty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the fifty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the fifty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the fifty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the fifty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the fifty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the fifty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the fifty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the fifty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the sixtieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the sixty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the sixty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the sixty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the sixty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the sixty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the sixty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the sixty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the sixty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the sixty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the seventieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the seventy-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the seventy-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the seventy-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the seventy-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the seventy-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the seventy-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the seventy-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the seventy-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the seventy-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the eightieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the eighty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the eighty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the eighty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the eighty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the eighty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the eighty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the eighty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the eighty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the eighty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the ninetieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the ninety-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the ninety-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the ninety-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the ninety-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the ninety-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the ninety-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the ninety-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the ninety-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the ninety-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundredth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and tenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eleventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twelfth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fourteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventeenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eighteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and nineteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twentieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirtieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fortieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fiftieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixtieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventy-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventy-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventy-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventy-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventy-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventy-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventy-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventy-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventy-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eightieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eighty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eighty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eighty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eighty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eighty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eighty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eighty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eighty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eighty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and ninetieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and ninety-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and ninety-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and ninety-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and ninety-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and ninety-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and ninety-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and ninety-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and ninety-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and ninety-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundredth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and tenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eleventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twelfth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fourteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and seventeenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and eighteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and nineteenth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twentieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and twenty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirtieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and thirty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fortieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and forty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fiftieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-fourth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-fifth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-sixth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-seventh issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-eighth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and fifty-ninth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixtieth issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixty-first issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixty-second issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixty-third issue of \$1,600,000 was placed on the market on July 1, 1917, and the one hundred and sixty-fourth issue of \$1,600,00

FREIGHT REVENUES.

The average rate received per ton per mile increased .25 mill, being 4.86 mills as compared with 4.61 mills last year.

The average distance each ton was hauled increased 8.59 miles, being 170.42 miles, against 161.83 miles a year ago.

The revenue tonnage moved was the largest in the history of the Company, and is as follows:

| | 1917. | 1916. | Increase or Decrease. |
|-------------------------|------------|------------|-----------------------|
| Bituminous coal..... | 10,315,591 | 9,296,181 | 919,410 |
| Coke | 413,845 | 432,875 | —29,030 |
| Iron ore | 610,236 | 735,535 | —125,299 |
| Pig and bloom iron..... | 414,804 | 436,399 | —21,595 |
| Other freight | 4,161,086 | 3,862,166 | 298,920 |
| Total | 15,825,562 | 14,783,156 | |

An increase of 7.05 per cent., or..... 1,042,406

The increase substantially all came from bituminous coal. The small decreases in coke, iron ore and iron products were more than offset by the increase in other freight.

Tons moved one mile in 1917..... 2,696,983,166

Tons moved one mile in 1916..... 2,392,310,997

An increase of 12.74 per cent., or..... 304,672,169

The result for the year is a gain of 18.88 per cent., or \$2,083,503.40 in gross freight revenue.

The decision of the Interstate Commerce Commission granting an increase in freight rates became effective at various dates from April 16 to December 30, 1917.

A careful estimate indicates that such increase added about \$810,000.00 to our revenues this year.

EXPENSES.

There was a net increase of 26.51 per cent., or \$2,488,772.56 in Operating Expenses, as follows:

| | Increase. | Decrease. | Per Cent. |
|--------------------------------|----------------|--------------|-----------|
| Maintenance of way | | \$8.0 | |
| Maintenance of equipment | \$987,442.62 | \$126,091.85 | 32.3 |
| Traffic | 38,640.03 | | 25.3 |
| Transportation | 1,509,352.51 | | 35.1 |
| Miscellaneous operations | 3,216.56 | | 18.8 |
| General | 76,202.69 | | 27.4 |
| Total | \$2,488,772.56 | | 26.5 |

In general the increases can be attributed to the greater traffic, the marked advance in the cost of fuel, material and supplies, and the continual upward adjustment of wages.

Maintenance of way expenses, the only primary account showing a decrease, would also have increased, if the shortage of labor had not seriously interfered with the regular maintenance program.

Depreciation charges were increased \$112,139.25, due to an advance in the rates applied on rolling stock beginning July 1.

The eight-hour law, effective during the entire year, added approximately \$381,250 to the Transportation Expenses.

Notwithstanding the abnormal conditions prevailing in all directions, the physical condition of your property is excellent and prepared to handle a maximum business.

The operating ratio increased 5.72 per cent., being 79.32 per cent against 73.60 per cent.

The percentage of each group of operating expenses to operating revenue for the past five years is as follows:

| | Year ending 6 Mos. | | | | | Year ending June 30, | | | | |
|--------------------------------|--------------------|-------|-------|-------|-------|----------------------|-------|-------|-------|-------|

| Total | | | | | | | | | | |

The average cost per ton per mile is 3.82 mills, an increase of .46 mill over last year.

The average number of revenue tons carried one mile per revenue freight train mile, excluding the mileage of helping engines, increased 59.17 tons, being 835.78 tons, against 776.61 tons a year ago.

The average number of revenue tons carried one mile per revenue freight engine mile, including the mileage of helping engines, increased 48 tons, being 545 tons against 497 tons.

The average for the past ten years are as follows:

| | YEAR ENDING | TRAIN LOAD. | ENGINE LOAD. |
|-------------------|-------------|-------------|--------------|
| JUNE 30, | 1908 | 530 | 371 |
| | 1909 | 597 | 400 |
| | 1910 | 638 | 430 |
| | 1911 | 635 | 420 |
| | 1912 | 647 | 439 |
| | 1913 | 710 | 462 |
| | 1914 | 694 | 454 |
| | 1915 | 707 | 477 |
| | 1916 | 786 | 502 |
| SIX MONTHS ENDING | | | |

| YEAR ENDING | | | |
| DECEMBER 31, | 1916 | 777 | 497 |
| | 1917 | 836 | 545 |

The average number of revenue passengers carried one mile per revenue passenger train mile is 44, being 4 more this last year.

The non-revenue freight traffic, not included in any of the other figures of this report, is as follows:

| | 1917. | 1916. |
|---------------------------------------|-------------|-------------|
| Number of tons | 1,199,571 | 1,178,492 |
| Number of tons carried one mile | 107,013,042 | 104,519,196 |

FIRE INSURANCE FUND.

The assets of this fund were increased \$38,644.74 and now amount to \$361,169.54 in interest bearing securities and cash.

PENSION FUND.

The assets of this fund, created July 1, 1903, were increased \$5,850.54, and now amount to \$232,387.41 in interest bearing securities and cash.

There were 64 pensioners upon the roll on December 31, 1917, a net decrease of 4 during the year.

GENERAL REMARKS.

The Ontario Car Ferry Company, Limited, paid a dividend of 5% for the year ending June 30, 1917. The sum of \$12,500 received on the \$250,000 of this Company's stock was credited to non-operating income account.

The Interstate Commerce Commission began the valuation of your lines on July 1, 1917, and completed about 50 per cent. of the field work. The amount expended to date on this account has reached \$63,123.08.

On March 1, 1917, your Company withdrew from the New York Central passenger terminal in Buffalo, N. Y., and began using the passenger terminal of the Delaware, Lackawanna & Western R. R. Co. The new agreement entered into is dated March 1, 1917, and extends over a period of ten years with the privilege of renewal for a like period.

The officers and employees of your Company subscribed to the two Liberty Loans of the Government as follows:

| | | | |
|-----------------------|-------|-------------------|-----------|
| 1st Liberty Loan..... | 3,390 | individuals | \$275,650 |
| 2nd " | 1,738 | " | 128,250 |
| Total | 5,128 | " | \$403,900 |

of which \$111,950 has been paid in full and the bonds delivered.

Your Company has furnished its quota of men to the Nation's military and naval forces. Two of the directors and 370 employees have joined the colors, of whom five have received commissions.

At the annual meeting of the stockholders held November 19, 1917, the By-laws were amended by changing the date of the annual meeting from the third Monday in November to the third Monday in May of each year, so as to correspond with the change in the fiscal year of the Company, which as noted in last year's report none took effect on December 31st.

The President of the United States, through the Secretary of War and the Director General of Railroads assumed possession, control, operation and use of your property at 12 o'clock noon on December 28, 1917. It is confidently expected that Federal Legislation will be promptly enacted to provide for the protection of the holders of stock and other securities of your Company and for the improvement and maintenance of your property during the period of Government control.

The acknowledgments of the Board are renewed to the officers and employees for their faithful and efficient service.

By order of the Board.

WILLIAM T. NOONAN,
President.

Rochester, N. Y., February 6, 1918.

Railway Officers

Executive, Financial, Legal and Accounting

H. R. Williams, vice president of the Chicago, Milwaukee & St. Paul, with office at New York, has resigned.

E. K. Scott has been elected assistant secretary of the Kentucky & Indiana Terminal, with office at Louisville, Ky.

J. P. Nelson, in addition to his duties as valuation engineer of the Chesapeake & Ohio, has been appointed real estate agent with office at Richmond, Va.

Ralph M. Shaw, whose appointment as general counsel of the Chicago Great Western, with headquarters at Chicago, was announced in these columns on February 8, was born in

Paris, Ky., on February 18, 1869. He attended Kentucky University until 1888 and graduated from Yale University in 1890. He then entered the law department of the University of Michigan, taking post-graduate work in law until 1892. He was admitted to the Illinois state bar in July of the same year, and has since been in the active practice of law in that state. He is a member of the firm of Winston, Strawn & Shaw, Chicago, and is a member of the board of directors of the Joliet & Northern Indiana,

the Union Stock Yards & Transit Company of Chicago, the Chicago River & Indiana, the American Creosoting Company, the Federal Creosoting Company and the American Tar Products Company. He was appointed assistant general counsel of the Chicago Great Western in 1915 and, in addition to being general counsel of that road now, is also general counsel of the Chicago River & Indiana, while the firm of which he is a member is counsel for the Chicago Junction Company the Michigan Central, the Chicago, Indianapolis & Louisville, the Chicago & Alton and the Canadian Pacific.

Operating

W. L. Park, first vice-president of the Chicago Great Western with office at Chicago, Ill., will assume the duties of **J. A. Gordon**, general manager, resigned, effective March 1.

J. A. Clancy has been appointed trainmaster of the twenty-seventh and twenty-eighth districts of the Grand Trunk, with headquarters at Durand, Mich., vice **F. A. Rutherford**, promoted.

D. S. Weir, trainmaster of the Southern Pacific, with office at Bakersfield, Cal., has been appointed assistant superintendent of the Portland division, with headquarters at Portland, Ore., vice **William Wilson**, promoted.

J. W. Tucker, formerly trainmaster on the Tennessee & Coosa branch of the Nashville, Chattanooga & St. Louis, was appointed assistant superintendent of the Chattanooga (Tenn.) terminals effective February 1.

J. F. Maguire, assistant to vice-president in charge of operation of the Lehigh Valley, with headquarters at New York, has been appointed general manager. Mr. Maguire formerly served in the same position on this road.

W. L. Fox, formerly supervisor of the Western & Atlantic

division of the Nashville, Chattanooga & St. Louis, was appointed trainmaster on the Tennessee & Coosa branch, effective February 1, succeeding **J. W. Tucker**, promoted.

E. W. Fowler, inspector of transportation of the Chicago Great Western, with headquarters at Chicago, Ill., has been appointed superintendent of transportation with general supervision over transportation matters, effective March 1.

M. J. Flanagan, trainmaster on the Chicago, Milwaukee & St. Paul at Aberdeen, S. D., has been appointed superintendent of the Dubuque division, with headquarters at Dubuque, Ia., succeeding **J. W. Stapleton**, resigned, effective February 15.

R. M. Glover, assistant superintendent of the Southern Pacific lines, at Victoria, Tex., has been transferred to the El Paso division of the Galveston, Harrisburg & San Antonio, with headquarters at El Paso, Tex., succeeding **W. D. Austin**, who died in that city on February 5.

V. S. Burnham, trainmaster of the Southern Pacific, with office at Stockton, Cal., has been appointed trainmaster of the Los Angeles division, with headquarters at Indio, and **C. H. Redington** has been appointed trainmaster of the Stockton division, with headquarters at Stockton, vice Mr. Burnham.

J. W. Daniels, superintendent of the Missouri Pacific, with office at Little Rock, Ark., has been transferred to the White River division, with headquarters at Aurora, Mo., succeeding **J. F. Russ**; **T. A. Shea**, superintendent at Poplar Bluff, Mo., has been transferred to the Arkansas division, with headquarters at Little Rock, succeeding Mr. Daniels; **W. C. Morse**, superintendent at Van Buren, Ark., has been transferred to the Missouri division, with headquarters at Poplar Bluff, succeeding Mr. Shea; **W. F. Kirk**, acting superintendent at Wichita, Kan., has been appointed superintendent of the Central division, with headquarters at Van Buren, succeeding Mr. Morse, and **M. McKernan** has been appointed acting superintendent of the Wichita division, with headquarters at Wichita, succeeding Mr. Kirk.

C. E. Green, whose appointment as superintendent of the Dakota division of the Chicago, Rock Island & Pacific, with headquarters at Estherville, Ia., was announced in these columns

on February 8, entered the service of the Chicago, Milwaukee & St. Paul as a telegraph operator at Garner, Ia., on July 1, 1885. He left the St. Paul in October, 1889, to become operator for the Burlington, Cedar Rapids & Northern at Sibley, Ia. In July, 1891, he was promoted to agent at Cazenovia, Minn., where he remained until February, 1892, on which date he was transferred to Toronto, S. D. He was promoted to despatcher at Estherville, Ia., in September, 1892, and in May, 1898, was transferred to Cedar Rapids,

Ia. The Burlington, Cedar Rapids & Northern was taken over by the Chicago, Rock Island & Pacific in 1902, and in October of that year he was promoted to night chief despatcher. From March, 1902, to February, 1904, he was chief despatcher at Cedar Rapids; from February, 1904, to October, 1912, he was trainmaster at the same point; from October, 1912, to March, 1913, he was train rule examiner at the same headquarters; and from March, 1913, to July, 1917, he was trainmaster of the Iowa division. On the latter date he was transferred to the Illinois division, where he remained until January 20, 1918, on which date his promotion, as noted above, became effective. Mr. Green has been in the continuous service of the Chicago, Rock Island & Pacific for practically 29 years.

R. M. Shaw

C. E. Green

G. W. Wildin, general manager of the New York, New Haven & Hartford, with office at New Haven, Conn., has resigned and his duties have been assumed by **C. L. Bardo**, assistant to president, whose title is now assistant to president and general manager, with headquarters at New Haven. Portraits and sketches of Messrs. Bardo and Wildin were published in the *Railway Age Gazette* of September 7, 1917, pages 442 and 443.

Traffic

J. A. Benell, commercial agent of the Chicago & Alton, at Indianapolis, Ind., has resigned to become associated with the Haines Automobile Company.

F. J. Kemper, traveling freight agent of the Missouri Pacific, with headquarters at Cincinnati, Ohio, has been promoted to general agent, at Atlanta, Ga., succeeding **T. H. McKoy**, deceased.

G. A. Blair, whose resignation as assistant freight traffic manager of the Chicago, Milwaukee & St. Paul, was announced in these columns December 28, 1917, has been appointed traffic manager for Wilson & Co., with office at the Union Stock Yards, Chicago, effective February 25.

G. H. Smitton, assistant traffic manager of the Great Northern, with office at St. Paul, Minn., has been appointed general traffic manager; **H. H. Brown**, general freight agent, with office at St. Paul, has been appointed assistant traffic manager; **P. H. Burnham**, assistant general freight agent, with office at St. Paul, has been appointed general freight agent, and **W. R. Mills**, advertising agent, with office at St. Paul, has been appointed assistant general passenger agent; all with headquarters at St. Paul, effective February 20.

Engineering and Rolling Stock

P. D. Miller, assistant division engineer of the Pennsylvania, at Cambridge, Ohio, has been transferred to Toledo, succeeding **Howard O'Brien**, resigned, effective February 15.

V. B. Wagner, whose appointment as chief engineer of the Cripple Creek & Colorado Springs, with office at Colorado Springs, Colo., was announced in these columns on February 15, was born at Virginia City, Nev., on April 23, 1879. He entered the service of the Denver, Boulder & North Western in October, 1897, as a rodman and chainman on the construction of 10 miles of narrow gage track from Boulder, Colo., to Ward. He was employed by the Colorado & Southern from January, 1899, until 1901. He was instrument man on the construction of the Salmon river extension of the Oregon Short Line from March to June, 1901. From June to October, 1901, he was levelman on preliminary location from Durango, Colo., to Clifton, Ariz., on the Arizona & Colorado. In November, 1901, he was employed as an instrument man on the Colorado & Southern and in March, 1903, was promoted to chief draftsman in the office of the chief engineer. He was employed by the Nevada Northern as a draftsman from January to December, 1907, and was later promoted to resident engineer. From March to July, 1908, he was draftsman for a locating party on the Colorado & Southern; from July to October, 1908, he was draftsman in the chief engineer's office of the Denver & Rio Grande; from October, 1908 to February, 1909, he was engaged in the general practice of engineering at Ft. Collins, Colo.; and from March, 1909, to July, 1910, he

V. B. Wagner

was construction engineer for the street railway system at Greeley, Colo. He again returned to the Colorado & Southern in June, 1910 as resident engineer and was later promoted to office engineer at construction headquarters. On April 1, 1912, he was appointed chief engineer of the Colorado Midland, with headquarters at Colorado Springs, Colo., and in February, 1914, he was assigned additional duties as chairman of the valuation committee of the road. On January 15, 1918, he was again assigned additional duties as chief engineer of the Cripple Creek & Colorado Springs.

T. D. Sedwick, acting engineer of tests of the Chicago, Rock Island & Pacific, with headquarters at Chicago, Ill., was appointed engineer of tests, with the same headquarters, effective January 15.

W. C. Davis has been appointed road foreman of engines of the Shasta division of the Southern Pacific, with headquarters at Dunsmuir, Cal., vice **R. W. Cuvellier**, assigned to other duties; effective February 21.

Charles Raitt, general foreman of the car department of the Atchison, Topeka & Santa Fe, at Richmond, Cal., has been appointed master mechanic of the Arizona division, with headquarters at Needles, Cal., succeeding **L. A. Mattimore**, deceased, effective February 20.

Railway Officers in Military Service

F. M. Odena, Jr., mechanical and electrical engineer for the Chicago Union Station Company, Chicago, Ill., has been commissioned a major in the ordnance department of the army.

Col. Charles DeLano Hine, who resigned from railroad service last summer and was placed in command of the 165th Infantry, has been transferred to the transportation department of the U. S. Expeditionary Forces in France.

Horace B. Coburn, assistant superintendent of the third division of the Union Pacific System, with headquarters at Walla Walla, Wash., has been commissioned first lieutenant, engineering corps, U. S. Reserve and is now stationed at Camp Lee, Petersburg, Va.

P. M. Benedict, assistant to the president, assistant secretary and assistant treasurer of the Chicago, Burlington & Quincy, with office at Chicago, has been appointed by the War Department as assistant district manager of the equipment division of the Signal Corps, United States Army, with headquarters in the Consumers building, Chicago.

In addition to the list of employees of the Nashville, Chattanooga & St. Louis who have entered military service published in these columns several weeks ago **F. H. Jackson, Jr.**, stenographer in the office of the master mechanic at Atlanta, Ga., has received a commission as second lieutenant in the 43rd Infantry, Camp Pike, Little Rock, Ark.

Obituary

John N. Drake, of New York city, secretary and treasurer of the Short Line Railroad Association, died in Washington, D. C., on February 22, at the age of 73.

JAPAN'S RECORD YEAR IN FOREIGN TRADE.—Commercial Attache Frank R. Rutter reports from Tokyo under date of January 14 that imports into Japan in 1917 reached a total of \$516,343,000, and exports from Japan in that year amounted to \$799,098,000. These figures represent a gain over 1916 of 37 per cent in the case of imports, and 42 per cent in the case of exports and were the largest in the country's history.

BALTIMORE & OHIO MILITARY MAP.—A military map of the United States has been issued by the Baltimore & Ohio and copies may be obtained from passenger and freight representatives of the railroad. The map shows not only national army and national guard camps but all regular army increment camps, reserve officers' training camps, army posts and stations, naval stations, hospitals, marine barracks, naval training stations and aero training stations. An index easily locates each camp on the map.

Standardization or Efficiency

UPON those at Washington who are attempting to evolve standard equipment rests a tremendous responsibility. Equipment must be produced that is modern in every respect. It must be possible to operate it as efficiently as the most modern equipment that we now have. If an attempt is made to build either cars or locomotives cheaply by eliminating patented devices which are essential for economies both in operation and in maintenance, there can be only one result—disappointment and a great reflection on those who stand sponsor for the designs.

It would be a national calamity should the equipment be standardized at the expense of modernization and efficiency. The problem is an engineering one and nothing else.

Any drastic standardization of equipment is bound to be reflected in increased operating expenses. It will be a boomerang to those who father it.

There must be no mistake made in standardization!

Orders for freight cars are being held in abeyance until Congress has passed the President's railroad bill. The country needs new freight cars. It is plainly evident that some sort of a standard car will be determined upon. Everything must be done, however, to speed the placing of actual orders. The builders were never in better shape to receive orders and any order placed, even at this time, will not be ready for delivery until midsummer at the best. There will be a vital need for new cars next fall and winter. The standardization committees have had sufficient time with the assistance of what has previously been done on the standard car, to formulate definite plans for the consideration of railway men. The men who provide special equipment for the cars must hold themselves in readiness for prompt deliveries. Let everyone co-operate and urge that the matter be handled with dispatch.

Be Prepared to Order Cars Promptly

Suppose, Mr. Railroad Man, that Mr. McAdoo should say: "You can have no new locomotives this year." What would your answer be? After the first cry of "Help!" you would wire Mr. McAdoo for money to improve your shops, to add modern facilities to your engine terminals, to modernize your locomotives and to perfect your shop organization. You would set about doing what should have been done years ago, but for which money was not available. The experiences of the past winter have shown, as nothing could have shown, what the lack of up-to-date facilities has meant. It is not so

much the lack of locomotives as it is the lack of power. The real work to be done is to modernize the equipment, improve the shop and engine terminal facilities, and increase the rating of the power. If the railroad were allowed to do this we should have a far more efficient transportation system. This is where the real "record" is to be made.

How many railroads allow their train dispatchers to study their divisions by riding over the road regularly on local freight and other trains? Or, rather, how many require such inspection, and pay the man while he is doing it? This question, asked by a correspondent in our last issue, page 442, is lockeyed, but important. It has been asked regularly for 25 years past, but there is evidence of poor dispatching on good roads which indicates that many operating officers still fail to give to the question the correct answer. Dispatchers with specially vivid imaginations, and with the necessary energy and ambition, frequently succeed in doing wonderfully well with a minimum amount of knowledge concerning the grades, the engines, the men and the hundred other things which cannot be realized thoroughly without actually seeing them with the physical eye; but it is important to recognize the cold fact that a good many dispatchers are not endowed with such imagination, energy and ambition. To be assured that the dispatcher will do the best thing in every train-move it is important to make sure that he knows his territory with his eyes shut. And if there ever was a time when poor dispatching was costly and good dispatching was vitally necessary, such a time is now.

Well-Equipped Train Dispatchers

Among the problems which the regional directors and their staffs are now studying at the request of Director-General McAdoo is whether freight solicitation as it existed under private management should continue under government control, and, if not, the changes in methods and organization which should be made. In this connection all railroads have been asked to prepare lists of their traffic soliciting offices, both on and off their lines, with the cost of maintaining them. Although under present conditions of abnormal tonnage and government operation competition for traffic is a dead letter, it is the opinion of many shippers and railroad officers that traffic representatives perform other services than solicitation which are indispensable. They have done invaluable work during the present period of car shortage by encouraging the heavy loading of equipment by shippers and the prompt release of cars by both shippers and consignees. They have adjusted claims to the satisfaction of both the carriers and their patrons and have assisted in packing freight for shippers and in routing cars in a way to avoid congestion. It is pointed out that operating officers are so heavily burdened with the details of their own work that they cannot be expected to give proper attention to the individual needs of shippers and consignees. In virtue of their long experience as intermediaries between the carriers and the shipping public traffic representatives are best fitted to adjust such cases

Need for Traffic Representatives

Truth About The Power Situation

of misunderstanding and friction as arise between the railroads and their patrons. It is possible that this work can be carried on by a smaller force of men than was necessary under competitive conditions and that outside agencies representing roads in common territories may be consolidated advantageously. The extent to which these changes can be made is the problem which the railways are now studying. It is clear, however, that nothing would do more to create misunderstanding or concentrate criticism against the railroad administration than the abolition of traffic representatives. Under competitive conditions one road profited by the mistakes of another and a premium was placed on service to the public. Under government control criticism will not be confined to one line, but will be directed against the whole transportation system. Consequently, the need for men to keep in close touch with the shipping public is even greater under the present system of railroad operation than in the past.

Recent Developments in the Handling of L. C. L. Freight

MORE ATTENTION has been given to the handling of less-than-car-load freight during the last three or four years than during any decade previous to that time. This has already resulted in a number of interesting developments and will lead to even more important ones in the near future. It has brought to railway men a greater realization of the inadequacy of present methods and facilities for the handling of the large tonnages of package freight now offered to them. This in turn has provided the incentive for the investigation of mechanical means for the handling of this class of business; for the development of multiple-story freight houses to decrease ground rentals; for the construction of union transfer stations for the interchange of l. c. l. freight between roads, etc.

The most elaborate plan for the handling of traffic of this character which has yet been proposed is that developed by the American International Terminals Company for the handling of package freight between Jersey City and New York, which was described in the *Railway Age* of March 1. While adapted directly to conditions existing at that terminal the more important principles involved in the layout are capable of application at other large stations and are therefore of general interest.

The most important development in the handling of package freight within recent years has been the motor truck. While its reception has been relatively slow and there are still many freight houses in which it can still be applied to good advantage, it has shown marked economies in those places where it has been installed and where operating methods have been adapted to its use. It is not surprising, therefore, that this New York terminal contemplates the use of motor trucks throughout.

The suggestion that receiving stations be established at various points on Manhattan Island and in Brooklyn for the collection and distribution of freight for all lines has much to commend it, particularly in reducing the average distance of trucking by shippers and in relieving congestion at existing stations which is now particularly acute along the west water front of New York.

The greatest innovation in this plan is the recommendation for the use of motor trucks with removable bodies for the transfer of the freight between the terminals at Jersey City and the collection and distribution stations in New York. This development is in its infancy at the present time, having been used at only a few points, including Cincinnati and Baltimore. It is showing marked advantages at those points, and it is, therefore, not surprising that this

method of transference has been adopted in the New York plan.

These various steps have much to commend themselves to students of package freight transfer, not only in New York, but in the other large terminals throughout the country. The presentation of plans such as these indicate that important improvements are to be expected in the handling of l. c. l. freight in the near future.

Comprehensive Water Treatment Program

AT THE PRESENT TIME when railway men are giving increased attention to water treatment as a means of reducing the number of engine failures and improving locomotive performance, it is necessary that they realize the importance of treating properly all the water supplied to the locomotives under consideration, whether this includes one station, an engine district or an entire division. It has happened too frequently that, after a superficial examination of conditions, those stations on the different divisions have been selected for improvement where the water was most objectionable or the consumption greatest, to the exclusion of less objectionable but nevertheless unsatisfactory supplies at adjacent stations. While the improvement in the character of the water at these isolated stations may be all that can be expected and constitutes an important betterment, full relief cannot be secured in this manner.

A survey of water treatment on railroads made several years ago by the water service committee of the American Railway Engineering Association disclosed the fact that a much larger measure of success was experienced in cases where the water treatment covered an entire division and had taken due account of all waters used on at least one entire engine district. The reason for this is simple. Softened water cannot be used advantageously in boilers containing appreciable quantities of scale or suspended matter. This is demonstrated by the difficulties commonly attending the initial operation of new water softening systems, when progressive disintegration of the old scale in the boilers through the action of the treated water causes foaming and a reopening of scale-closed leaks at first, although these troubles are readily overcome under a properly considered water treating system as soon as the boilers become free of scale.

This fact points to the need of keeping the boilers clean, a condition which cannot be fulfilled as long as appreciable quantities of encrusting solids are being introduced into the boilers at certain water stations, no matter how perfectly the treatment may be carried out at other points on the same engine district. This does not necessarily mean that a complete system of treatment must be provided at each water station, for in some cases the water may be naturally non-encrusting, while at other points a modified form of treatment may be sufficient. Again some waters carry large amounts of material in suspension and but little in solution, so that a filter or settling basin will suffice to produce a satisfactory water. Each water must be studied as an individual case and the necessary corrective measures applied as indicated by the investigation, keeping in mind that the ultimate object is to keep all bad water out of the boilers.

The simplest problem in feed water treatment is encountered with engines in switching and transfer service which take water from a single source. Some of the best records for life of boiler flues have been obtained in the case of engines of this class, using only the treated water coming from one terminal water station. In the case of passenger locomotives also, the problem is relatively simple, for the provision of good water at terminals and at one or perhaps two intermediate stations will often be adequate for this

class of engines. The most difficult problem and the one whose solution is most important is that created by freight engines taking water at each roadside station and frequently running over two or more engine districts radiating from one terminal.

It is evident that only limited benefits can be secured from even the most successful treating plant at one station if the others from which an engine also takes water are supplying untreated water of objectionable quality. Therefore rather than selecting the worst points on several divisions for attention, the best results can be secured by concentrating attention on one district or division at a time and the greatest returns for the expenditure can only be secured in this way.

Controller Williams on the Breakdown of Railroad Credit

WE PUBLISH on another page a letter written by John Skelton Williams, controller of the currency, to the Interstate Commerce Commission on November 1. That was over four months ago, but the letter is almost as interesting reading now as it would have been if it had been made public then. Mr. Williams had already given utterance in the press to some of his views on the railway situation. The letter which we are now permitted to publish was intended only for the eye of the commission and was a much more complete discussion of the state of railroad credit, its causes, and the effects it was producing than was contained in Mr. Williams' public statements.

There has been and will continue to be much discussion as to why government control of the railways was adopted. There really were two reasons, one financial, the other operating.

The financial condition to which the railways had been brought has never been more strikingly shown than in Controller Williams' letter. He presents statistics demonstrating that there had been a shrinkage in the market value of the stock of 12 leading railways since 1906 of \$1,697,000,000, or 51 per cent. The general shrinkage of values, of which the cases of these 12 roads were merely illustrations, had impaired the investments not only of hundreds of thousands of individuals, but also of many of the most important financial and fiduciary institutions of the country. Mr. Williams called attention forcefully to the reduction in the average rate per ton per mile which had taken place since 1908, at a time when wages and the prices of materials were greatly increasing. As he made clear, the collapse of railway credit was due to a repressive policy of railroad regulation, which had prevented rates from being advanced enough to meet increased expenses.

A little over a month after Mr. Williams wrote his letter to the Interstate Commerce Commission, that body sent a special report to Congress. Mr. Williams had strongly recommended an advance of rates. The commission said that no increase of rates it could give would remedy the financial situation of the railways, and recommended government guarantees to them. Only the certainty that the policy of guaranteeing the net return of the carriers was going to be adopted has prevented serious further declines of the value of their securities. It is well to have the reasons for the financial condition to which the railways had been reduced before government control was adopted set forth authoritatively at this time by a high government official so well situated to understand and so competent to present the facts as is Mr. Williams. Perhaps it is a good omen that the man who wrote this letter has since the adoption of government control been made one of the advisors of Director General of Railroads McAdoo and placed in charge of the division of purchases and supplies.

As already stated, there was an operating as well as a

financial reason for the adoption of government control. President Wilson decided that the railways could be more efficiently operated under government than under private control because, as he said, there are some things which the government can do which private management cannot do. As the existing transportation facilities were being operated, it had become impossible for the railways, and especially the Eastern lines, to handle all of the available business. They have continued under government control to be unable to do so, and it is a safe prediction that these facilities, and especially those of the Eastern lines, are being increased, this condition will last indefinitely. It is奇怪 in some quarters that "private management had broken down." On the contrary, private management was moving more traffic in proportion to the number of men employed and amount of facilities available than it ever did before. Mr. Williams makes clear in his letter that the breakdown of the credit of the railways was due to the refusal of the regulating authorities to let them make needed advances in their rates. Their failure to provide enough facilities, in its turn, was due to the breakdown of their credit. The reasons, both financial and physical, which made necessary government control go back, then, to the kind of regulation to which they had been subjected. Of course, the traffic which they have been called upon to handle during the war is not only vastly larger than that of a few years ago, but has been made abnormally complex by the conditions of war. But fundamentally, the past and present inability of the railways to handle all the available business is due to insufficient facilities, and the insufficiency of facilities is directly traceable to the fact that for almost 12 years before the adoption of government control they were subjected to a policy of regulation which was adapted to and did finally break down their credit.

The Interstate Commerce Commission has not yet decided the case involving advances in rates which called forth this letter of the controller of the currency regarding the condition of railroad credit. It will be interesting to see when the decision is rendered whether the developments of the last few months have had any influence on the commission's views regarding the way in which rates should be regulated.

Standard Locomotive Repairs

THERE ARE MANY OBJECTIONS to the adoption of universal rigid equipment standards which have received considerable attention since the investigation of the standardization of cars and locomotives has been in progress at Washington. Little has been said, however, about the relation of the locomotive standardization plan to the maintenance department. This is a matter which should be given careful thought, especially when considering the adoption of standard types of locomotives under present conditions. There are many railroads, including most of those now of the greatest importance to the nation, which have been slowly developing their own standards of locomotive construction for many years. The purpose has been to develop interchangeable parts in order that the stock of spare parts and material may be kept at a minimum and that these parts may be made on a manufacturing basis. As the details and, to some extent, the classes of locomotives, have become standardized, special shop equipment has been provided to make possible the economical centralized production of the finished parts needed in the maintenance of the power. Patterns for a large number of castings have been made applicable to several classes of engines, turret lathes, and in some cases, automatic machines have been provided for the quantity manufacture of motion work pins; jigs, templates and flanging forms have been designed for the performance of standard opera-

tions; the sizes and tapers of bolts have been standardized in order that standard drills and reamers may be supplied to all repair points on a system and repair practices retained under effective control. To impose an entirely new design of locomotive upon the maintenance departments, differing in all respects from the local standards evolved on each road, would at any time result in considerable disorganization and loss of efficiency in the operation of shops. There are already many extraordinary difficulties to be overcome in order to keep up the output of locomotive repair shops. Under these conditions, when a national crisis demands the utmost from these organizations, the wisdom of throwing such an additional burden of disorganization upon the maintenance departments is very doubtful.

The Shepherdsville Collision

CHIEF INSPECTOR BELNAP reports the Shepherdsville collision of December 20 as due to the negligence of (1) the leading train, No. 41; (2) the following train (No. 7), and (3) the operating officers of the company. The language in which he sets forth this conclusion is quoted on another page. The failure of the flagman of No. 41 must include his failure to use fuses, though the report has nothing special to say on this point. If trains are to be spaced by time alone the use of fuses (or torpedoes) is always an essential element, for the distances between stations, and the length of time which the flagman may take, in any given case, to get back with his red flag or lantern, are so variable that they can never be fully provided for in any general rule; and a general rule is our only protection, for no flagman can be expected to know enough of the circumstances of any particular case to be able to exercise his own judgment. To get along by the exercise of individual judgment is an experiment that was tried for half a century and had to be admitted a failure. In place of that expedient, the only practicable recourse, aside from the space interval, is the use of fuses. Fuses, however, besides being costly, introduce new difficulties; so that, in the light of extended and varied experience, it is not very strange that they afforded no protection in this case.

As to flagging *per se* (excluding the question of fuses), it may be said that if the flagging rule ever fails, this was one of the occasions where failure would be liable to occur. The train had station work to do, making it easy to be careless in counting minutes; the following train, No. 7, had a clear view for more than a mile and had the warning of two good red lights on the rear car of No. 41; and it was running under a rule requiring the speed of the train to be kept under control so that it could be stopped within the very short distance of six hundred feet. However, though the conductor and the flagman of No. 41 violated plain rules, it is impossible (unless one had been acquainted with the men, their personalities and their records), to discuss their failure any farther, for they have paid the extreme penalty for their negligence, and their mental processes on that fateful evening are a sealed book. These men took a risk which, no doubt, seemed to them small, but which proved to be great. The country-wide accident records of the Interstate Commerce Commission would show, no doubt, numerous other cases, quite similar, within the same month.

Engineman Wolfenberger's negligence is characterized as a "material contribution." To many railroad officers this will look like an inversion of the true relation; his dereliction will be classed as the chief immediate cause of the collision. His testimony as to speeds, and as to when he first saw the train-order signal; when he whistled, when he applied brakes and to what extent, and the testimony

of other persons on these points, are subject to a good deal of doubt as to their accuracy; but it is difficult to believe that if both the engineman and the fireman had been keeping a good lookout they would not have seen the two red tail lights of the train ahead.

To take no special pains to reduce speed, or to see the change in the color of the train-order signal was, evidently, habitual; and the omission of the engineman and the fireman to confirm each other's reading of fixed signals was not only habitual, but was approved by their superiors. Enginemen of the highest grade employ this monitorship habitually; and they appreciate its value, whether it is required by the superintendent or not.

The company's responsibility is put third; but the public will be likely to put it first. The officers of the state or federal government would necessarily look first to the company, as they have no way of dealing directly with enginemen, conductors or flagmen except by criminal prosecutions. Probably if there were more criminal prosecutions of employees who cause people to be killed by violating the rules of safe operation, the number of bad accidents would be reduced; but our public officials and juries seem incurably reluctant to apply the law of manslaughter in such cases.

The astonishing thing about this collision is that a prominent road, which is reasonably prosperous, and which has introduced automatic block signals on hundreds of miles of its lines, should be operating a section of its most important main line with no space interval at all! The management of the Louisville & Nashville has many characteristics of enterprise and has spent millions of money for safety; yet here neglected a lesson which has been displayed on the railroad screen, in giant letters, under the brightest light, for the last thirty years. The daily papers, as a matter of course, at once turned their heaviest guns on the wooden coach, ignoring the impossible problems which face the railroad manager who would introduce steel cars throughout his lines at a single stroke—or even in five years; but the railroad manager cannot ignore the fundamental principle that, in the matter of collisions, it is his duty to prevent them, not merely to mitigate their effects.

The company's statement said that the line was operated under the standard rules of the American Railway Association; but that declaration has little meaning, for everyone acquainted with the Standard Code knows that innumerable safeguards necessary in train operation are covered by the rules only in the most vague and general way. The code is no more a guarantee of safety than is cold water in the boiler a guarantee that the engineman will ever start his train. The company might have added, with truth, that so far as concerns clear and forceful language, lucid arrangement of subjects, and careful attention to a thousand details, its own code of rules is one of the best in the country; but the rules for train operation are nothing but a skeleton at best. This was a case where the time interval system was of no value except as it was supplemented by flags, torpedoes and fuses.

That the road should report the block system as in effect when in fact it was not, and repeat the declaration year after year, is inexplicable. The existence of train-order signals at the stations of the Louisville & Nashville, with operators in attendance, made it possible to operate the block system at any time; but a rule that is suspended completely and permanently can hardly be called a live rule.

But if no block system had ever been invented, the explanation offered by the road would still be grossly inadequate. Whether or not there had been proper inspection to test the intelligence and fidelity of flagmen and conductors in protecting the rear of trains is a point on which Mr. Belnap's report has nothing to say; but whether this was done and proved ineffective, or was neglected because these men had never got into serious trouble, is perhaps only an

academic question now. In any event a discussion of this point could only go over old ground.

The question whether there had been inspection to see that enginemen properly heeded the rule requiring them to slacken speed for the purpose of seeing the operation of every train-order signal is already answered, in the negative, by the admission of the engineman, before the Kentucky commission, that motionless signals were accepted by enginemen, habitually. Indeed, the fact that fast trains could not obey the rule in times of fog without losing time, seriously, gives ground for the conclusion that the neglect of this rule must have been well known.

The railroad company will, no doubt, take the government's advice to put the block system in operation on this section of its road. The public will be interested to see whether that system is better enforced than was the old system. It undoubtedly will be, for when the management of the Louisville & Nashville does apply itself to doing a job particularly well it always succeeds in doing it well.

Railroad Rates as a Means of Taxation

THE NEW YORK TRIBUNE editorially commends to the consideration of Congress a plan for increasing freight rates to an extent (the Tribune suggests 100 per cent increase) which would yield the government a large surplus over and above its guarantee to the companies. The Tribune says: "No form of taxation yet devised could reach all of the people of the country more surely than a tax on freight." The Tribune's proposed increase of rates is to be solely as a war measure and solely for the duration of the war. The Tribune apparently forgets that there is now a tax both on freight and on passengers as a war measure. The proposal to increase freight rates as a tax is, we believe, founded on unsound principles and it is open to the greatest dangers both economically and politically.

The *Railway Age* has already advocated the establishment of rates which will furnish net operating income ample to meet the government's guarantees. Every commercial product as well as every product of mines, agriculture and forests has two primary measures of value: one, its inherent qualities; the other, its relative geographical position. The factory, the mine, the farm or the lumbering camp produce—manufacture—the inherent quality of the subject. Transportation produces—manufactures—the other element of value—relative geographical position. In modern life only a fraction of the products of factory, mine, farm or forest are consumed where produced. To all the rest must be added transportation. Transportation is therefore in the nature of a part of the process of production; it is that part of the process which produces geographical position. Geographical position is as necessary an element in consumability as are the inherent qualities of the article itself.

It is a fundamental economic mistake to put a tax on production. Such a tax is essentially different from a tax on profits from production. One tends to restrict production, the other to the adoption of economies in production. Just the minute you begin to use railroad rates as a part of the taxing power of the federal government you will get the railroads into politics in the same way that the tariff question has been in politics. The equitable freight rate is a fine blend of the value of the service with the cost of the service. It is true that if you adopt as a guiding principle the rule that the government must at least receive net operating income sufficient to meet its railway guarantees, you lay stress on the cost of service; but this is as it should be.

Now is the opportunity of more than a generation to readjust the rate fabric of this country. Competition in the first place and a shortsightedness on the part of the Interstate

Commerce Commission in the second place have left a rate structure that is quite illogical. With the government as the recipient of any surplus over its guarantee there is an opportunity to go at this rate structure in an unencumbered, broad way that ought to work great good to the industries of the country as well as to the consumers. To miss this large opportunity, however, as means of taxation would be a serious blunder.

Reforms in Passenger Service

GOVERNMENT CONTROL is beginning to effect some important reforms in railway passenger service which the *Railway Age* has been advocating for years, but which it was impracticable to secure while the unrestricted competition required by law prevailed in the railroad business.

This paper has called attention many times to the wasteful duplication of passenger train service between cities in all parts of the United States. One of the examples on which we have often commented has been the service between Chicago and St. Louis. Four railways operating between these cities have run 15 trains a day from Chicago to St. Louis and the same number from St. Louis to Chicago. The trains on the different roads have departed and arrived at destination at practically the same time. In consequence, although there were 15 trains, there were only five times in the day when a passenger could leave Chicago for St. Louis. We have repeatedly remarked that if, in such cases as this the number of trains was reduced and they were so spaced as to leave at different times, a large economy would be gained, and at the same time the service rendered to the public would be improved.

A reform in the Chicago-St. Louis service is now to be made. The number of trains is to be reduced from 15 to 9, and they are to leave at eight different times in the day. An article giving the new schedule is published elsewhere in this issue. Under the new schedule, a large economy and the improvement in the service which long have been practicable, will both be attained. There are many other cities in the country the passenger service between which is susceptible of similar reform, and it is understood that like action regarding the service between these other places is to be taken by the railroad administration. It is to be regretted that changes along this line had to be deferred until government control was adopted, but the necessities of the railways should not on this account be too severely criticized. The law has required them to compete, and duplication of passenger service has been a result of ill-considered competition.

Another reform which this paper has advocated for years has been the consolidation of the ticket offices of the railways in the various cities. The multiplicity of ticket offices, like the duplication of passenger service, has afforded an opportunity to effect reforms which would save the railways money, and at the same time provide the convenience of the public. Under the system under which each railway has had its own ticket office, if a traveler wished to go from Chicago to St. Paul, for example, he could not get sleeping car space on one road to lead to go to the ticket office of some other road which might be a considerable distance away. With a consolidated ticket office, if he could not get sleeping car space on one railway he could without leaving the office find space on a train of some other railway. The St. Louis Union Station has organized their ticket offices so as to afford consolidated services, and at the same time improve the convenience of the public. Since government control has been adopted it has been decided to consolidate the ticket offices in Washington, and it is understood that this is a forerunner of similar action in

other cities. The reason for the multiplication of ticket offices in the past has been the same as the reason for the duplication of passenger train service.

Another reform in passenger service which government control probably will soon accomplish will be the abolition of the indiscriminate and wholesale reservation of space on sleeping cars. Our railways in the past have given passengers the privilege of making as many reservations as they have pleased, at as many times as they have pleased. This privilege has been grossly abused, and its abuse has cost the railways and the Pullman Company millions of dollars a year. Whenever people, especially in the large cities, have thought that they might want to make a trip they have reserved sleeping car space. The railways have had to put enough cars in their trains to accommodate all making reservations. A large number of those who have made the reservations and who have later decided not to make the trips they contemplated, have either canceled the reservations a short time before the hours of departure of the trains or have not canceled them at all. In consequence, all over the country the railways have run cars which have not been properly loaded. The remedy for the abuse of the reservation privilege is to require passengers when they make reservations to pay cash for their railway and sleeping car tickets. Of course, if they do not make the trips they contemplate their money will have to be refunded but when people are required to pay cash for reservations the number of them made will be greatly curtailed and the number of cars run half-loaded will be correspondingly reduced.

There are various other reforms in the handling of passenger business which long have been needed and which can be made in such a way as to save money for the railways and at the same time not materially inconvenience the public. It is to be hoped that under government control many of them will be so completely accomplished that the old abuses will not be revived after government control is terminated.

Pennsylvania Railroad Company

THE INCREASE IN THE TONNAGE of freight handled was not apparently the primary cause of the unprecedented strain which was put on the Pennsylvania Railroad in 1917. It is hard to overstate the extent of this strain. Transportation expenses—the out-of-pocket cost of actually moving freight and passengers—increased by \$24,540,000 and totaled \$104,935,000 in 1917. This is an increase of 31 per cent. There was congestion and delays to ordinary freight and passenger trains, such as had never before been experienced, and yet the total tonnage of freight carried in 1917 amounted to 169,647,000 tons, an increase of only 3,402,000 or 2.05 per cent. It is true that the average haul of each ton of freight was somewhat longer so that the total ton mileage amounted to 27,791,000,000, an increase of 3.06 per cent over the ton mileage of the previous year. It is also true that there was a tremendous increase in passenger business. The number of passengers carried one mile totaled 2,524,000,000, an increase over the previous year of 16.39 per cent; but as a matter of fact, by curtailing regular passenger service, the Pennsylvania was enabled almost to offset the mileage made by special troop trains. Passenger train mileage totaled 31,759,000, an increase of only 2.61 per cent over the previous year.

To adequately understand these figures and to get some conception of the burden put on the management and employees and the heroic efforts which were put forth to carry this burden, it is necessary to describe briefly the situation at the beginning of the calendar year, 1917.

The Pennsylvania Railroad directly operates 4,541 miles. The main line runs from New York via Philadelphia through Harrisburg to Pittsburgh. Branching out from this main line, are a network of lines connecting the principal traffic centers as far south as Baltimore, Md., and north to Wilkes-Barre, Pa., Rochester and Buffalo, New York, and Erie, Pa.; thus the Pennsylvania Railroad serves the great manufacturing, industrial and commercial center of the United States.

Notwithstanding the fact that huge sums have been spent each year for many years on additions and betterments and these sums have been expended with keen foresight as to the trend of the developments of traffic, the physical plant at the end of 1916 was being operated within a very small percentage of its full capacity. This could be said of no other railroad of the size of the Pennsylvania. It is hardly necessary to cite even the most impressive of the great undertakings which the Pennsylvania has completed in recent years, in the attempt to keep its railroad up to the requirements placed on it. The New York extension, costing over \$100,000,000, and the double track low-grade line from Harrisburg to Philadelphia, costing as it did \$40,000,000 and being an addition to a four-track line already existing between these two cities, are two examples. On an average \$30,000,000 a year was expended for fifteen years for additional terminal and yard facilities. The credit of the company was used to the full extent that it was considered safe to use it. If the profits which the company had been making had provided a better credit far greater facilities would have been provided. The fact was recognized that although a very large amount was being expended for such purposes it was not as much as should be spent. The road had reached the point of saturation by the end of 1916.

There is another feature which must be borne in mind. The organization, by which is meant the officers and employees of the Pennsylvania, is unique. The aim of the development of this organization has been to take in young men, to train them carefully and fully, to treat them so well as to insure their remaining with the company and to operate the property along scientific lines which require skill and long practice to understand and effectively to carry out. The piece of machinery is so huge, its complicated parts fit one within another so intricately, that the loss of a single part is liable to cause endless confusion.

W. W. Atterbury, vice-president in charge of operation, was in September appointed director general of transportation for the United States in France and later was made brigadier-general. More than 11,000 officers and employees of the Pennsylvania entered the service of the United States. Through death, the Pennsylvania lost Simon C. Long, general manager, George W. Creighton, general superintendent of the Eastern Pennsylvania Grand division, George W. Boyd, passenger traffic manager, and Robert H. Large, coal traffic manager. It is not that younger men had not been trained to replace and do the work of Mr. Atterbury and of the executive officers who died, but was rather the combination of all the circumstances, the loss of Mr. Atterbury's services, loss of the trained services of 11,000 others who went into the war service, unprecedented passenger service demands, and what has not heretofore been mentioned, but what is of the very greatest importance, the mass of preference orders from the government, many of them at times contradictory, and a hopelessly confusing change in the ordinary channels of traffic. At one time 85 per cent of the total freight traffic was subject to preference orders. Moreover, 177,000 new men were hired in 1917. This is at least four times the number of men that had been taken on new in any previous year. Is it any wonder that there was congestion and greatly increased expense on a road 4,500 miles long that was trying to do a freight business alone exceeding over 60

per cent of the combined annual ton mileage before the war of all the railroads of Great Britain and France.

Notwithstanding all the extraordinary difficulties, the average tonmile in 1917 was 872 tons; an increase of 62 tons over the previous year. The average loading per loaded car was 32.17 tons, an increase of 2.94 tons. This is an achievement which every Pennsylvania man may well be proud of.

The total operating revenues in 1917 amounted to \$255,940,000, an increase of \$24,815,000 over the previous year. Total operating expenses amounted to \$200,588,000, an increase of \$34,424,000. After paying largely increased taxes and increased interest charges, there was \$39,282,000 available for dividends. This was less by \$12,995,000 than the amount available at the end of 1916. Regular dividends of 6 per cent called for \$29,951,000 and sinking funds called for a little over \$2,000,000 more. The remaining \$7,000,000 the Pennsylvania appropriated toward the quarterly dividend which was paid February 28, 1918.

During 1917 \$25,579,000 was spent for additions and betterments and \$8,494,000 for additional equipment. Of the twenty-five and a half million dollars spent for additions to terminal facilities, additional track, etc., less than half, probably, was spent on improvements which were actually available during any part of the year 1917. For instance, \$11,555,000 was spent for the purchase of property for terminal facilities and for right of way.

The taking over of the operation and assets and liabilities of the Pennsylvania Company, which operates the southwest system of the Pennsylvania Lines West and controls their stock ownership, and the other Pennsylvania Lines West, has been previously commented on in these columns. The figures, of course, in these comments do not include any of the Pennsylvania Lines West. The Pennsylvania has acquired almost all of the minority stock of the Long Island and now owns 99.16 per cent of all of the stock of that company.

At the end of the year the Pennsylvania had on hand \$17,744,000 cash, an increase of \$3,686,000; but no time drafts and deposits which latter, at the end of 1916, amounted to \$48,374,000. Loans and bills payable amounted to \$14,317,000, a decrease of \$21,688,000. During the year the company sold \$60,000,000 general mortgage 4½ per cent bonds, charging to profit and loss \$3,266,000 discount. It was from the proceeds of these bonds that the company paid off the loans and bills payable as noted above—the principal payment being \$20,000,000 of 4½ per cent notes—and also paid for the new equipment and additions to road, terminal facilities, etc., previously mentioned. There are available \$21,000,000 additional general mortgage bonds which have previously been authorized by the stockholders, and the stockholders are now asking to authorize an additional \$75,000,000 of these bonds so as to make a total of \$96,000,000 of bonds which the directors can sell on such terms as are possible.

The table below shows the principal figures for 1917 and 1916:

| | 1917 | 1916 |
|---|--------------|---------------|
| Ton mileage operated | 4,541 | 4,536 |
| Freight revenue | \$76,927,094 | \$164,226,792 |
| Passenger revenue | 52,628,945 | 44,707,476 |
| Total operating revenue | 129,556,039 | 208,934,268 |
| Maintenance of way and structures | 9,610,631 | 28,819,322 |
| Maintenance of equipment | 52,611,430 | 45,805,126 |
| Other expenses | 860,787 | 2,534,360 |
| Transportation expenses | 104,934,700 | 80,394,313 |
| General expenses | 6,409,937 | 5,509,430 |
| Total operating expenses | 200,588,086 | 166,164,582 |
| Taxes | 10,199,823 | 9,029,399 |
| Operating income | 44,264,408 | 55,056,007 |
| Gross income | 65,983,659 | 74,220,874 |
| Net income | 19,815,951 | 53,976,504 |
| Sinking Funds | 18,000,000 | 18,000,000 |
| Dividends | 29,511,000 | 29,511,000 |
| Amounts for additions and betterments | 25,579,000 | 21,402,515 |
| Amounts for betterments on branch lines | 8,494,000 | 3,737,846 |
| Amounts for 1918 dividends | 7,143,459 | 7,143,459 |

Letters to the Editor

The Labor Situation and Its Effect Upon Clerical Forces

DENVER, CO.

TO THE EDITOR:

While the writer, like practically all other railroad office men, holds the opinion that he is not being paid as much for his services as they are worth, he desires to have it understood that this communication is not written with a selfish motive, and that it is not to be taken in the light of a class protest. The writer is a railroad clerk and has been for ten or more years, but he has been for some time in charge of an office in which a number of clerks are employed. He has had some experience in employing and handling clerical forces, and therefore feels qualified to sound a warning regarding the present situation, and the probable future situation under existing conditions, with particular reference to the quality of labor available for clerical positions. He will endeavor to place himself in the position of an employer of clerks, which, in fact, he is, as he not only employs them but is responsible for the work which they do, or do not do.

In the first place, there seems to be a disposition on the part of officers who handle labor matters in general, such as rates of pay, hours of service, and working conditions, to consider clerical labor hardly worth the same serious consideration that is given train and enginemmen, shop forces, and the employees in the maintenance of way department. The idea seems to be that clerks do not produce anything, that their work does not, except in an indirect way, affect operation; that it is easy and no especial intelligence is required to handle it, and therefore, that the heads of the offices should be able to continue to keep an effective force at the same old rates or at very slightly increased rates.

As a matter of fact, under the present conditions, the clerical labor situation deserves very serious attention if railroad offices are to meet the demands made upon them. In the first place, some classes of clerks, such as yard clerks, bill clerks and station forces, do affect operation as vitally as telegraph operators. In the second place, the requirements of the Interstate Commerce Commission, and the increased demand for accuracy in records of all kinds, call for a very much higher degree of intelligence in accounting and in the various other classes of office work than when railroad office salaries were high in comparison with the salaries paid for similar classes of service in other industries. Under the old conditions excellent material was available from which office men could be drawn. But the quality of the material available for this class of work has been steadily deteriorating for several years, until at present, the head of the average railroad office is hard put to maintain an organization with which he can turn out work which will not keep him in hot water continually.

The standard of education is very much lower in the material now available; initiative, judgment and loyalty are so rare as to cause surprise, and it is next to impossible to build up an efficient organization and to maintain it.

Girls and women have been and are being used to fill the gaps in many offices, and it may be said of them that in some cases they fill them well. Female clerks are as good, if not better, than male clerks in some positions, but they are not always suitable for use as bill clerks in the yard offices, and for use in some of the agencies and division offices. The working conditions in these offices are not favorable for the

retention of women of the class likely to be efficient and likely to have the necessary education.

The present situation, then, is that the standard of the work required of office forces continues to be raised, and the quality of the labor available to handle the work continues to deteriorate. What is the cause of this condition? The answer—two words—salary, opportunity. The remedy, in the opinion of the writer, lies in the same two words. Another general increase? More expense? No, not a general increase, a little more expense probably, but not much, nothing like so much as it looks at first glance.

The trouble lies in the method of organization. Clerical workers cannot be handled like shopmen, operators, or trainmen; they should not receive class rates. The men we need for office work do not fit in with that kind of an organization. Office work is not, strictly speaking, a trade or a profession. With the class of men we want it is simply a means to an end. This class of men take up office work for the experience it gives which will fit them for the more or less important official positions on the railroad or in other business. They want promotion to executive positions, they want to get somewhere—the class we need and want, understand, not the class we are getting.

Clerks, or the class we need for the office work now required, are not trades-union men, they are not of the type that takes kindly to trades-union principles; they are, and if we are to get the class of service we want, they must be of the executive type. They would never be content to serve an apprenticeship at the less important desks and then be satisfied to settle down as mere clerks for the balance of their lives. A different order of intelligence is required for clerical positions; they must offer advancement and encouragement. The men must see themselves a little further along each year, or at least see prospects of promotion. If they are satisfied without this they are not of the best type for office men.

Under the present method of organization, which is more or less common to the railroads of the country, there are too many positions that pay practically the same salaries—\$60, \$65 or \$75. The writer knows of one division office in which there are five \$75 jobs in the timekeeping and personal record department. The men on these jobs are good men in their way, but not one of them has been in that office longer than one year and the timekeeping force is constantly changing. When some one steals the chief timekeeper the office head has to steal another from some other road where the rate is lower.

How much better would be an organization, the total salaries of which would represent practically the same outlay, with the clerical compensations graduated so that the new man received \$65, the next \$70, then \$75, \$80 and \$85. The work could be arranged so that the importance and the responsibility of men would increase with the rates of pay and promotions would follow as vacancies occurred. The \$85-man, having been through the whole mill, would be the logical man for his chief's job when the chief stepped up, and the quality of service given by the whole organization would be very much higher.

The graduated wage scale is the ideal for office work, and there should be a definite and comparatively inflexible path of promotion. Thus ambition would be kept alive, the mind kept active and broadened by reaching ahead for the details of the next job, and the new man would be broken in—where he could do the least damage—on the job of the least importance. True, there would be some little disorder when everybody moved ahead, but this would not be serious. As all would be more than fairly familiar with their new duties, the organization would work down to the usual or perhaps greater efficiency in a few days, and every one would feel that he was getting somewhere.

The opportunity for promotion need not end in the office

and should not end there. Men of the stamp that a good system of advancement would attract and develop would make good officials in some positions, if they were permitted to get some outside experience as they went along. Send them out regularly to look up something concerning the work on which they are engaged at the desk. Have them go with the division officials occasionally on their various trips of inspection. Let them see both sides of the work and become familiar with the actual conditions about which they write and which they record.

Each office man should make periodical trips over the division and over other divisions, under the supervision of field men who will explain matters from the field man's point of view. Under this arrangement the interest in the work would increase greatly. The men would know what they are writing about. There would be fewer foolish letters, and by the time a man reached the chief clerk's desk, he could, with a few weeks' coaching, make a valuable man in many of the minor official positions, having gained by experience a fairly good grasp of both theory and practice. Office men are quite generally promoted to official positions in the freight and passenger traffic departments, and these departments get good men. The same could be done in the operating department if the rudiments of the outside work were taught during a term of several years, as suggested above.

The same system of graduated salaries, suggested above, could be worked out even in the great billing offices in the cities, for though the work cannot be so easily divided as to importance and responsibility, it *can* be graded to some extent. With the possibility of a gradual promotion and increase in compensation before them, a much more intelligent class of men could be secured for these positions.

Unionism would be a highly undesirable thing in the offices, both from the standpoint of the railroad and from that of the men, but office men are being driven towards it. The average clerk does not want it, and if he can see fair prospects without it he won't have it. But there is imminent danger that it will come to a real union, as strong as the telegraphers, or the trainmen, under the present conditions, and with the union a much poorer quality of work will be turned out. Or if, as is possible, we avoid the union because the men with spirit enough to form one seek employment elsewhere, we shall in time be forced to do work that should be handled by men of keen intelligence, with spiritless drudges, rejects and failures, and the word "clerk" will deserve the more or less good-humored contempt which is already beginning to be attached to it.

CHIEF CLERK.

MEXICAN WAR TANKS.—A large Mexican oil company during each year assembles all of its tank cars for repairing. In search of three cars which had been side-tracked in the territory formerly dominated by Villa, a party representing the company espied what appeared to be "British armored tanks." On investigation, it was found that the Mexicans had drilled three holes in each side of the cars and had installed six machine guns in each. It was so furnished that eight men could comfortably be seated and entrance was made through an opening at the front of the car.

EUROPE'S FREE PORTS.—In the free ports of continental Europe merchants can ship goods through a free port either by arranging with a shipping company, whose vessels call at the free port, to have the goods shipped to their destination or through bill of lading; or shipped to the free port on option bill of lading which allows the merchant to defer his choice or settlement of the destination of goods until they have arrived at the free port. Merchants may also forward goods from domestic or foreign points to the free port for storage, and afterwards order them reshipped to any domestic or foreign point.

Completing the West 200-ft. Span

Elevated Terminal Connection at Kansas City

Project Involves a Long Two-Track Steel Viaduct and a Heavy Double-Deck Bridge of Unique Design

THE KANSAS CITY TERMINAL RAILWAY is expending about \$4,500,000 in constructing an approach to the Union station for the use of certain railways entering the city from the west which involves a double track elevated railway several miles in length across the bottoms of the Kansas river in Kansas City, Mo., and Kansas City, Kan.,. It also includes a double-deck railway bridge over the Kansas river, a project alone of no ordinary proportions which embodies a number of novel features of design and construc-

tion about by the congested condition of the approaches to the old station, as well as by the inadequacy of the station facilities. Because of this fact the selection of a site for the new station at a distance of more than a mile from the old one left a number of the railroads without adequate means of access. Consequently the conclusion of the agreement between the several roads was largely contingent upon the formulation of satisfactory plans for adequate approaches to the station for all of the roads concerned. These plans embodied the West Bluff connection for the Chicago, Burlington & Quincy, the Wabash and the Chicago, Rock Island & Pacific, Chicago line, extending south from the Hannibal bridge past the old Union depot. It also provided for the reduction of grades and the four-tracking of the main line of the Kansas City Belt Railway to afford ample approach from the east for the Chicago & Alton, the Missouri Pacific, the Atchison, Topeka & Santa Fe, the Rock Island's St. Louis line, the St. Louis-San Francisco and the Kansas City Southern. A third provision was for an elevated railway to afford approach over the industrial district occupying the bottoms on both sides of the Kansas river between the bluffs of Kansas City, Mo., and Kansas City, Kan., for the trains of the Union Pacific, the Chicago Great Western, the Nebraska and northern Kansas lines of the Missouri Pacific, and the western lines of the Chicago, Rock Island & Pacific which enter Kansas City over the Union Pacific tracks.

The first two improvements were carried out simultaneously with the construction of the station but the building of this elevated railway or "High Line" was delayed. Consequently when the new station was opened the four railroads were compelled to seek temporary entrance to the station until such time as the approaches agreed upon would be ready. The Union Pacific and the Rock Island have been entering the new station via the tracks of the Kansas City Terminal from the Kansas side of the Kansas river, crossing that stream near the Santa Fe's western connection. The Missouri Pacific and the Chicago Great Western, which uses the tracks of the former from Leavenworth, Kan., now enter the station from Kansas City, Kan., by a route that crosses the Kansas river near its mouth, skirts the bank of the Missouri

Location of the New Elevated Line Across the Kansas River Bottoms

tion. This is the latest important step in the Kansas City Union station project. The work has been in progress since October, 1916, and its completion in 1918 will effect a marked improvement in the facilities for both freight and passenger traffic in the district immediately west of the station.

The Union station project at Kansas City was brought

river for about a mile and joins the tracks of the Kansas City Terminal near the site of the old Union station.

Both of these routes are subject to serious interference from freight, transfer and switching movements. The route of the first two roads is most seriously congested at the Kansas river bridge on account of a heavy movement of refrigerator cars to and from the packing houses on the Kansas side. Further interference in this route is caused by 15 railroad crossings and 4 crossings of important streets at grade in Kansas City, Kan. The second route interferes with switching in the industrial district along the Missouri river and with the operation of freight yards of the Santa Fe, the Burlington, the Alton and the Frisco in the vicinity of the old station.

New Connection Eliminates Interference

The new "High Line" leaves the grade of the west station approach tracks about one-half mile west of the station, crosses the Kansas river on the site of the existing bridge and curves to the northwest to a point north of Kansas avenue where the structure divides, one branch for the Union Pacific and Rock Island turning to the west and the other continuing to the north to a connection with the Missouri Pacific tracks near Central avenue. The total length of this elevated railway is about 4 miles. Each of the branches is about 1½ miles long. It consists of 3,900 ft. of surface tracks, 8,800 ft. of embankment approaches, 8,500 ft. of steel viaducts and the bridge across the Kansas river, which in addition to providing a double track crossing for the elevated railway provides two tracks on a lower level for freight and switching movements.

The construction of this connection was delayed for a number of years in the negotiations for a franchise for the overhead street crossings in Kansas City, Kan., the primary difficulty being a difference of opinion as to the character of passenger station facilities to be provided by the railroads for that city. This feature was finally agreed upon and the plan which was approved by the people of Kansas City, Kan., in July, 1915, includes provision for two passenger stations to cost \$100,000 each, in addition to the elevated railway. One of these stations will be located on the Union Pacific branch at Seventh street and the other on the Missouri Pacific branch at Central avenue.

The Kansas River Bridge

The bridge over the Kansas river is the most important single feature of the project and is distinctive in a number of features. It is a double-deck structure. The heavy loading which this implies on two spans of 300 ft. each required the use of a number of special details of design. As in the

bridge each 24 hr. it was imperative to devise erection methods which would insure absolute continuity of traffic over the bridge and at the same time avoid the use of the track on the bridge for any of the erection operations. As a result of

Cross Section of 300-ft. Double-Deck Span

these exacting requirements the method adopted is unusual.

The old bridge was built for single track in 1907 to replace a structure destroyed by a flood. A single track was entirely adequate at that time since the bridge was used only

Profile of the Kansas River Bridge

old bridge, a preponderance of refrigerator car movements calls for the use of a water tight floor and the design of this was complicated seriously by the necessity for shallow construction on account of the unfortunate relation of high water in the river to the elevation of the tracks on the lower level. Because there are about 180 train movements over this

for transfer and switching traffic. It consists of two pin connected Petit through truss spans 300 ft. long with an 80-ft. through girder span and 50 ft. of pile trestle on the west end. A timber ballast floor on a suspended floor system carries the track. Of the substructure for the old bridge, the two piers and the south abutment are used to support the

new superstructure. These had been built to provide ultimately for double track. The two piers were carried to a cemented boulder formation by the pneumatic process and the abutment is supported on a pile foundation. The decision to make use of the old masonry was based on a careful study which took into account the heavier loading to be obtained from the double-deck structure. It was necessary

New 132-ft. Span in Foreground with Old 80-ft. Girder Span Still in Place

to provide a new west abutment which is carried on a pile foundation.

In the new structure the old 300-ft. spans are replaced by spans of the same length consisting of pin connected Baltimore trusses of sufficient height to provide a through structure for the traffic on both levels. The girder span is replaced by a 132-ft. riveted Warren truss span of such a height that it is a through structure for the lower level tracks and a deck span for the upper level.

Because of the heavy loading the truss members in the two 300-ft. spans assumed proportions ordinarily to be found in spans of much greater length. Each of the spans weighs nearly 2,300 tons. The bottom chord and one set of the main diagonals are eye-bars of nickel steel with a required ultimate strength of 95,000 to 110,000 lb. per sq. in. and an elastic limit of 55,000 lb. All other web members are of a box- or I-sections made of the ordinary structural grade of steel. The top chords and the end posts are of an H-section similar to that used in the main members of the Metropolis bridge. They have two heavy girder sections for the sides connected by a diaphragm in the plane of the chords, and double plate lacing and channel battens on the top and bottom faces. The material in top chords and end posts is a high carbon steel similar to that used in the ribs of the Hell Gate arch and has an ultimate strength of 66,000 to 76,000 lb. per sq. in. and an elastic limit of 38,000 lb. per sq. in.

Ballast floors are provided for both decks. The thickness of the lower floor from top of rail to under clearance was limited to 4 ft. 10 7/8 in., while that of the upper floor, which was not so limited, has a thickness of 7 ft. 4 in. However, the same general scheme of floor framing was used in each case. The main floor beams, spanning from truss to truss at the panel points, carry girders spanning longitudinally just inside the trusses on each side. These in turn carry intermediate floor beams 5 ft. center to center on which are supported the timbers of the ballast flooring. In the upper floor the depth is such that this system entails no departure from ordinary structural practice. The main floor beams are at-

tached to the posts of the trusses with the usual bracket connections, lateral stiffness of the spans being obtained by these connections and heavy portal and sway bracing above the upper roadway.

In the lower deck the main floor beams could be made only 2 ft. 6 1/2 in. deep, back to back of angles, making it necessary to construct them as box girders. For this reason the longitudinal girders, which are 5 ft. 3 1/2 in. deep, could not be framed into them to make the connection, so it was necessary to notch the ends of the longitudinal girders to rest on the top flanges of the main floor beam. A departure from usual practice in the connection of the lower floor beams to the trusses was devised to avoid bending in the posts as a consequence of the material deflection in floor beams of so shallow a depth. The bottoms of the posts were

New 300-ft. Span Surrounding Old Span, Showing Also Gantry Traveler and a Derrick Car on Temporary Track

extended below the main truss pins and were connected with a steel casting containing a pin hole at right angles to the floor beam, thus affording a pin connection between the post and floor beam and thereby making the truss members independent of flexure in the floor system.

Erection Under Difficulty

The greater width and height of the new spans factor in suggested their erection around the old bridge, which was to remain in service. The old superstructure had been erected on the south side of the substructure with a view to future renewal of the structure by a double track bridge. The erection plan adopted for the new structure in consequence entailed the shifting of the old superstructure into position at a central location in which its axis would coincide with the axis of the new bridge. This measure, however, would not

solve the problem of the erection of the new floor system for the lower deck, since the grade for the old track and that for the tracks on the lower level of the new bridge are identical. The piecemeal removal of the old floor system and its replacement by the new floor would be a slow and cumbersome process that would result in serious interference with the traffic. Another obstacle was the impracticability of driving piles for falsework in the space between the trusses of the old bridge since this would involve a disturbance of the ballast floor and interference with the heavy train movements.

The solution of these difficulties was attained by raising the old spans 27 in. so that the floor system for the new spans could be installed completely underneath the old floor before disturbing the old structure in any way. This plan has the further advantage that the old spans can be supported from the new and thus obviate the need of any falsework directly under the old span.

The erection method and falsework scheme are shown in several of the photographs. The space between the trusses of the new span was sufficient to permit the placing of the legs of the gantry traveler between the new and old trusses. The gantry is supported on rails carried on the top flanges of the two lines of longitudinal girders of the lower floor system.

The falsework consists of two bents of five piles each driven under each panel point of each truss of the new bridge. These bents are long enough to afford ample support for the new trusses, the girders carrying the gantry and also a temporary track outside the trusses on each side car-

Typical Sectional View of the Viaduct

ried on girders intended for use in the upper floor system. These temporary tracks are used to deliver all structural materials to the work on flat cars and to support the derrick cars in erecting the lower floor system.

The method of erection with the gantry may be seen from the photograph. The two main cross beams at the top of the gantry have a material overhang beyond the trusses on each side and are fitted with rails on which a pair of heavy longitudinal beams spanning between the cross members may be rolled transversely. The longitudinal beams are equipped with heavy tackle for lifting and are shifted transversely as found necessary for the raising of members from cars on the tracks alongside and for placing them in position in the trusses.

One of the photographs shows an end view of the partly completed viaduct and indicates the character of the construction. The bents consist of two vertical columns generally 20 ft. center to center, connected by a cross girder, a bottom tie and cross bracing. These carry four lines of longitudinal girders covered by a reinforced concrete slab for ballasted tracks. The columns are of a built up H-section and the cross girders of a box section, the two webs being approximately in the planes of the two sides of the columns to facilitate web splices. The flange angles of the girders also extend beyond the webs for riveted connections to the column.

The Viaduct

Longitudinal stiffness of the structure is provided at intervals by bracing two bents to form a tower. Where this could not be done on account of interference with surface tracks, streets, etc., masonry piers were introduced consisting

Special Tower Bracing Was Used Over a Team Yard

either of solid shafts or two pedestals connected by an arch. Another variation from the standard construction was used where the viaduct crosses a freight house and team yard at Baird street. To provide clear passage for tracks and roadways, the transverse bracing was omitted and the longitudinal bracing for the towers was arranged to form an "A" rather than an "X" to give a minimum interference.

The viaduct columns are carried on creosoted pile foundations with pedestals varying from 6 ft. square to 12 ft. square depending on the load and the allowable pile bearing as determined by pile driving records. The concrete deck is 10½ in. thick, and cantilevers out on each side for a walk with outside edges 9 ft. 3 in. from the center line of track. The slab was built in place to give monolithic construction but has a longitudinal joint on the center line between the tracks and a transverse joint at intervals of about 100 ft. It is covered with waterproofing consisting of four-ply felt and one ply of cotton drill laid down with asphalt and covered with a one-inch asphalt mastic. The slab is pitched from the walk and from a ridge at the center line between tracks to drain holes at intervals of 5 ft. on the center lines of track. One interesting feature in connection with this floor slab is the protection given to the top flanges of the girder where covered by the slab. This surface is treated with a coat of refined coal tar and then covered with a sheet of lead weighing 2 lb. per sq. ft. which is carefully pressed down over the rivet heads. The concreting of the slabs was materially cheapened by the use of an ingenious form system suspended from the steel work as shown in a drawing.

On the Missouri Pacific branch of the viaduct three truss spans, 147 ft., 117 ft. and 137 ft. in length respectively

span a yard of the Union Pacific. These are riveted Pratt truss spans of the usual construction except that a floor of special construction is used on the northernmost span on account of the reduced headroom resulting from the descending grade of the tracks.

The embankments used in the three approaches to the viaduct contain 290,000 cu. yd. of material and were given two different forms according to the local conditions. Where space was available fills were built, having a $1\frac{1}{2}$ to 1 slope on each side with toe walls where the fill would encroach on streets or private property. These retaining walls are of a gravity broken back type which has been used extensively on Kansas City Terminal work. Where but a limited amount of space could be used for the approach embankment, particularly where located between

Part Section of Viaduct Floor Slab Showing Form for Overhang

adjoining tracks, the embankment is supported between reinforced concrete walls 2 ft. thick, spaced 30 ft. apart and tied together at intervals of 14 to 16 ft. by concrete ties. These concrete ties were used to support the construction track required to place the filling material. The fill is all clay and will be planted with alfalfa on all exposed slopes.

Special mention is due the conduct of the engineering work for this structure. In the face of a rapidly advancing steel market it became imperative to award contracts for the structural steel for the entire viaduct, including the Kansas river bridge, as soon as the stage of work on the design, would reasonably allow, and was followed with the preparation of detail plans for the bridge companies at the rate of about 3,000 tons a month. This program entailed the perfection of an efficient organization and conduct of the work along systematic lines. Special measures were taken to insure accuracy of the field work. A standardized type was procured from Washington and careful checks were made between the tapes used in the field and those used in the actual fabrication of the members.

This work was under the direction of J. V. Hanna, chief engineer, and G. E. Tebbetts, bridge engineer of the Kansas City Terminal. The general contractor for the entire project is the Arkansas Bridge Company of Kansas City, Mo. The steel work was fabricated by the American Bridge Company at the Gary plant, and is being erected by the Kelly Atkinson Construction Company, Chicago.

THE AUSTRIAN LOCOMOTIVE INDUSTRY IN 1917 delivered 398 locomotives and 326 tenders for Austrian State and private railways, but exported nothing. The car works delivered about 14,000 trucks and coaches to the state and private railways and to private industry.—*Commerce Reports*

Rules for Handling Freight for the War Department

NEW INSTRUCTIONS AND REGULATIONS governing the shipment of freight for account of the War Department, which take the place of the old system of reference orders which were issued by the various government departments and which resulted in so much confusion have been issued by the Car Service Section of the Railroad Administration and by H. M. Adams, director of inland transportation of the war department.

The instructions by W. C. Kendall, manager of the Car Service section, were issued in Circular No. C. S. 1, and order that beginning March 1 the shipment of freight for account of the War Department be handled only in accordance with the regulations of the division of inland transportation.

The director of inland transportation has issued Order No. 1, general rules and regulations for the payment of contractors and bureaus in shipping freight for the use of the war department, and Order No. 2, regulations for the shipment of freight for particular destinations and provisions for a system of transportation orders.

The circular of the Car Service Section provides:

It will be noted that under the provisions of Order No. 1, all negotiations conducted by the war department with respect to embargoes, special movement, failure to furnish cars, tracing and delivery of cars, etc., will be conducted by the Division of Inland Transportation with carriers through the Car Service Section.

Carriers affected by the restrictions in Order No. 2, section 1, or reissues thereof, should cover these restrictions by embargo, or by special instructions to agents and others interested, on their respective lines.

It will not be necessary to transmit such embargoes to zone chairmen or to connecting lines.

Carriers laying embargoes against points not designated in Order No. 2, or against points included in subsequent orders from the Director of Inland Transportation, will exempt freight for account of the war department, in accordance with Circular No. C. S. 1, dated February 11, 1918, or reissues thereof.

Where such general exemption is not made, carriers must honor all Transportation orders issued by the Director of Inland Transportation, except when the freight covered by such orders is of a perishable nature, and the route to destination is impassable by reason of physical obstructions.

Agents must in all cases endorse original and all copies of bills of lading, and waybills (including card bills if issued) with a reference to the transportation order in the following form:

TRANSPORTATION ORDER

No. U. S. W. D.

Agents honoring transportation orders will receive the surrender of such orders when presented, filing thereon such copies of bills of lading.

In case of emergency, transportation orders will be issued by telegraph over the signature of the Director of Inland Transportation. These telegraphic transportation orders will be addressed to the shipper or railroad agent at point of origin and will give the number of the order with all necessary details. They will be confirmed by mail. Such telegraphic orders should be honored and the originals held by the agent until the supporting orders are received.

Failure of the shipper to make use of transportation orders after they have been presented to carriers agent or failure to comply with the instructions governing their use, should be covered by full report to the Car Service Section.

In the event that connecting carriers refuse to accept ship-

ments moving under transportation orders, immediate report should be made to the car service section, giving full information, including order number, point of origin, destination, and the nature of the shipment.

These instructions supersede all previous instructions with respect to the handling of freight for use of the war department.

Report on Shepherdsville Collision

THE INTERSTATE COMMERCE COMMISSION has issued a report, dated January 28, and signed by H. W. Belnap, chief of the Bureau of Safety, giving the cause and nature of the rear collision of passenger trains on the Louisville & Nashville at Shepherdsville, Ky., on December 20, when 45 passengers and two employees were killed and 52 passengers were injured. This collision was reported in our issues of December 28, page 1,185; January 4, page 88, January 11, page 137, and January 18, page 181.

This report gives the facts substantially as they have been reported, but with a number of additional details. It is estimated that train No. 7, at the moment of collision, was running at 25 miles an hour. The force of the collision drove the standing train (No. 41) forward a distance of 800 ft. The conductor and the flagman of this train, who were killed, were standing on the front platform of the rear car. The line approaching Shepherdsville from the north is level for a distance of 2,100 ft. and is straight for 5,400 ft. In this distance there is nothing to obstruct the view of the engineman of an approaching train. The hour was about 5:30 p. m., it was dark, but the weather was clear. Shepherdsville station is on the west side of the tracks and the passing siding, on which the local train was to be set back, extends 400 ft. south of the station and about 2,500 ft. north. This track is between the two main tracks. The train-order signal is a semaphore, operating in two positions in the lower right-hand quadrant. The station agent and others testified that the red lights on the rear of train 41 were burning brightly. Testimony as to the speed of the express train, as to whether smoke, or fog or anything obscured the lights, whether or not train No. 7 whistled and as to how long No. 41 had been at the station, is somewhat confusing and the report makes no attempt to clear up all of the discrepancies.

Engineman Wolfenberger, of No. 7, said that it did not occur to him that not getting the signal at Shepherdsville was due to train 41 being close ahead, although he knew that he left Louisville 18 minutes behind it; he had been losing time himself. The fireman was on his seat but did not say anything to Wolfenberger about the signal.

The report makes no mention of the statement, reported to have been made by Wolfenberger at the investigation which was held by the Kentucky State Railroad Commission, to the effect that operators often change the train order signal, from stop to proceed, before the engineman calls for it, and that consequently enginemen were accustomed to accept a stationary signal (contrary to the rule requiring them to see the signal change from stop to proceed).

The fireman of train 7 said that all of the train order signals encountered between Louisville and Shepherdsville were given promptly. He had no conversation with the engineman about the position of the signal at Shepherdsville as they were approaching it; the rules do not require the engineman and fireman to call signals to one another.

The conclusion of the inspector is that the direct cause of the collision was the failure of the conductor and flagman of train 41 properly to protect their train. "The action of these two experienced employees in failing to protect their train is inexcusable." (According to the officers of

the road, an important element in the negligence of these men was their failure to use fuses or torpedoes when losing time; but the present report does not say, in detail, in what the failure consisted.) Engineman Wolfenberger's neglect is called a "material contributing cause"; and to the officers of the road is attributed "a large measure of responsibility"; this for "failure to provide proper means of spacing trains in this territory." Continuing, the report says:

"Between South Louisville and Lebanon Junction, which territory embraces the scene of this accident, there are 44 scheduled trains in both directions daily. Traffic of such density can not be safely handled under the rules and practices of the time-interval system. For the prevention of similar accidents the operating officers should take immediate steps to provide an adequate block system.

"Rules 221a and 221d which assume to provide means for the proper spacing of trains in this territory, are grossly inadequate, if not positively unworkable. Rule 221a requires that when an approaching train has reached a point 600 feet from the signal, 'or nearer if the signal can not be seen that far,' the engineman will call for the signal, and if it is not changed to the proceed position at once the train must be brought to a stop before the signal is reached, as required by rule 221d [which requires conductors and enginemen when approaching train-order offices to have their trains under control and not assume that the signal will be changed.]

"Rules 221a and 221d establish a maximum braking distance of 600 ft., which is entirely inadequate for the safe movement of high-speed passenger trains. The schedule rate of speed of train No. 7 between Brooks and Shepherdsville is 50 miles per hour, and had the signal been in its normal position the engineman of train No. 7 could not have stopped short of the signal without having reduced speed very materially at a point considerably farther away than 600 ft. In short, compliance with this rule means that, irrespective of their schedules, trains must approach all open train-order offices prepared to stop within a distance of 600 ft. . . .

"The Louisville & Nashville Railroad in its annual reports to the Interstate Commerce Commission has repeatedly stated that this section of the road from Louisville to Bardstown Junction was operated under manual-block rules. It is clearly disclosed by this investigation, however, that such protection is not afforded, and furthermore it is evident that such protection was not intended to be given. Several witnesses stated that it was the practice to space trains 10 minutes apart. This is provided for in rule 91 of the general rules for movement of trains, and there is no rule among those providing for train movement under the manual block which permits this method of operating trains. It is therefore apparent that the manual block system is not in force on this portion of road, notwithstanding the Louisville & Nashville Railroad Company's reports to that effect.

"During the past five years about 700 miles of the Louisville & Nashville have been protected by automatic block signals, most of which mileage is on single-track road. According to its reports for 1916, 132 miles of road are worked under the manual block system. With 4,700 miles of road operated, this gives about 20 per cent of its passenger mileage protected by some form of space interval, and of its principal main lines about 45 per cent is so protected. While this shows commendable progress, the fact remains that there are still long sections of its main lines carrying heavy traffic without adequate protection. . . ."

Causes of the Decline in Railroad Credit

A Letter to the Interstate Commerce Commission by the
Controller of the Currency

THE FOLLOWING LETTER, outlining the history of the conditions which caused the decline in railroad credit and a serious shrinkage in the market prices of railroad securities during 1917, was addressed to the Interstate Commerce Commission on November 1, by John Skelton Williams, controller of the currency and a former railroad executive, who is now also director of the divisions of finance and of purchases of the United States railroad administration. The letter was written just before the opening of the hearings before the commission on the application of the eastern railroads for advances in freight rates and gives the reasons which, in the opinion of the writer, demonstrated the insufficiency of the existing level of rates. It also gives an interesting view of the financial condition of the railroads just before the decision was reached that they should be taken over by the government. Mr. Williams said:

The official reports made to this office by the national banks of the United States show that these banks are the holders of about \$500,000,000 of railroad bonds, largely of high character, selected with care and discrimination during a period of years. In addition to these large holdings the state banks, savings banks and trust companies hold approximately \$1,500,000,000 additional of railroad securities.

Demoralization of Credit

These investments the banks purchased in the belief that they would maintain the prices at which they were purchased, or grow more valuable from year to year, with the growth and development of the country's business and of the corporations issuing them. A crisis, however, has arisen. The net earnings of many of our most important railroad systems, as well as of the less important lines, despite the greater volume of business, show a shrinkage which not only imperils dividends, but is threatening the ability of many railroads to meet their interest charges, and their solvency. There has been a serious collapse in the market values of railway securities and such a demoralization of credit that the sale of new securities to provide fresh capital or to meet maturing bonds has been shut off, and even temporary financing is now only being obtained at rates which are costly if not ruinous.

The impairment of confidence and consequent shrinkage in securities owned by the national banks had become so pronounced that on October 15, 1917, as controller of the currency I gave to the press a statement which said, in part:

"In view of all conditions, the controller of the currency has instructed national bank examiners that they need not at this time require national banks holding high grade bonds of unquestioned intrinsic value and merit to charge such investments down to present abnormal figures; but an intelligent and conservative discretion will be exercised as to the prices at which national banks can safely and reasonably be permitted to carry such high class securities, and as to what proportion of the depreciation should be charged off in any six months' period."

In giving out that statement I did so in the confident belief that the credit and welfare of the railroads of this country would be safeguarded and protected and that they would be permitted to charge such rates for the transportation of freight and passengers as would, with honest and efficient

management, enable them to meet their expenses and yield a fair return upon the billions of dollars of capital which has been invested in them, and I am, of course, still confident that this will be done.

This office has received so many earnest requests asking the controller of the currency, in behalf of the national banks of the country, to make to your honorable commission representations as to the serious consequences which may ensue if relief is not promptly afforded the railroads in the shape of increased rates, to enable the roads to meet the unprecedented increases in the cost of materials and labor and yet maintain their credit, that I ask the liberty of submitting to you this memorandum and brief summing-up of the situation as I see it at this time, in the light of an experience of about 20 years as a railway executive (as well as banker) before retiring entirely from these activities and divesting myself of all financial interest in railroads and in banks, as I did, to accept public office more than four years ago.

As an illustration of the communications which have come to me as controller of the currency from banks which are under the supervision of this office, I beg leave to quote the following extract received under date of October 29, 1917, from the president of the First National Bank of ———, who says in part:

"Why does not the controller appear before the Interstate Commerce Commission and make an appeal for the banks of which he is supposed to be the guardian and protector? With millions of our funds invested in railroad securities, it would seem this would be his duty. . . . With the farmers granted over double prices, the coal, steel and copper double and more, the railroads are certainly entitled to a paltry 15 per cent."

With this apology I trust that I may be pardoned for respectfully submitting to your honorable commission this communication, based, as above stated, upon my own knowledge and observation of past and present conditions.

From the close of the Civil War up to the beginning of the present century the principal media for investment of the surplus earnings of the American people, in the way of public securities of any kind, were the bonds and shares of our railroad corporations. The railroad mileage of the country grew from 52,922 miles in 1870 to 192,940 miles in 1900, an increase of nearly four-fold; this new construction was paid for partly from the savings of our own people and partly from capital sent in from Europe.

Confidence in railway securities as investments was rudely shaken between 1892 and 1897, during which years 213 railways having an aggregate mileage of 56,407 miles failed and passed into the hands of receivers. The total railway mileage of the country in 1892 was 171,567 miles—in 1897, 183,284 miles, so that the companies which became bankrupt in those five years represented nearly one-third of the entire railway mileage of the country. This is exclusive of many thousands of miles which had already become insolvent before 1892 and were in receivers' hands at the beginning of that five year period.

The records show that the persistent and steady decline in railroad freight rates which had been going on through several decades culminated in 1898-9, but this shrinkage did not cease until the solvency of over one-half of the entire railroad mileage of the country, which had been built up to that time, had been destroyed.

The average rate which in 1888 was 10.01 mills per ton

per mile, declined in 1890 to 9.41 mills. By 1895 it had fallen to 9.39 mills, and the low point was reached in the fiscal year 1898-9, when the average rate per ton per mile was only 7.24 mills. But although the shippers got this reduction of 25 per cent in the freight rate and also a reduction in the same period of 18 per cent in the average passenger mile rate, along with these reductions came the bankruptcy of companies operating tens of thousands of miles of railroad lines. In those years, it is fair to point out, the Interstate Commerce Commission did not possess the control over railroad rates which has since then been conferred upon it by Congress. With the powers now exercised by the commission such disastrous rate wars as were sometimes waged in the past by rival roads to ruin one another and which brought much demoralization, we are happy to realize, are no longer possible.

The Trend of Railway Rates

It is a long lane that has no turning. Finally the turn came, and a slight upward trend in ton-mile rates began in 1899. Contemporaneously with this upward movement came the revival in the general business of the country.

In 1901 the average rate per ton mile was 7.50 mills, and these rates did not again go below 7.48 mills until 1912, when the downward dip again manifested itself and an average rate of 7.41 mills was established. In 1913 the

out in those years the successful reorganizations of many of the important trunk lines which had passed through receiverships in the five years prior to 1898. These reorganized properties included such well known systems as the Atchison, Topeka & Santa Fe, the Baltimore & Ohio, the Union Pacific, the Norfolk & Western, and many others.

Between 1898 and 1907, 42,807 miles of new railroads were added to the country's mileage—but this was 13,596 miles less than the mileage which had become bankrupt in the five years prior to 1898.

The financial panic of 1907 was followed by several years of more or less uncertainty and there were ups and downs in business without any great variations in railroad rates, until the outbreak of the European War in 1914. The swollen business of the country incident to the European war in 1916 brought large earnings to the railroads, which reached their maximum, both as to gross and net, in that year.

The Decline in Security Prices

The year 1917 has been a period of unprecedented advances in the prices of products and commodities of all kinds accompanied by heavy declines in the market values of bonds and stocks generally, but especially of railway securities. Some moderate advances in rates have been granted to railroads in some sections in the past 12 months,

TABLE SHOWING THE SHRINKAGE IN THE SHARES OF THE COMMON CAPITAL STOCK OF THE PARENT COMPANIES OF TWELVE LEADING RAILROAD SYSTEMS FROM THE HIGH PRICES IN 1906 OR LATER TO THE PRESENT LOW LEVEL.

| | Outstanding capital stock (common) | Highest price since 1906 | Value on basis of present capitalization and highest prices reached | Recent lowest sales | Value on basis of present low prices | Percentage* of shrinkage to capital stock | Shrinkage shown by multiple given decline by present capitalization |
|----------------------------|------------------------------------|--------------------------|---|---------------------|--------------------------------------|---|---|
| Chic. Mil. & St. Paul | \$117,000,000 | 199 5/8 | \$233,561,000 | 43 | \$50,310,000 | 156 5/8 | \$183,251,000 |
| Baltimore & Ohio | 152,000,000 | 122 1/4 | 185,820,000 | 50 | 76,070,000 | 72 1/4 | 109,820,000 |
| Delaware & Hudson | 42,000,000 | 227 1/2 | 95,550,000 | 95 | 39,900,000 | 132 1/2 | 55,650,000 |
| Erie | 112,000,000 | 50 7/8 | 56,980,000 | 15 1/8 | 16,940,000 | 35 3/8 | 40,040,000 |
| Illinois Central | 109,000,000 | 172 | 187,480,000 | 97 1/2 | 106,003,000 | 74 1/2 | 81,477,000 |
| N. Y. Cent. & Hudson River | 249,000,000 | 147 | 366,030,000 | 68 | 169,320,000 | 79 | 196,710,000 |
| N. Y., N. H. & Hartford | 157,600,000 | 204 3/8 | 321,653,000 | 21 1/8 | 33,755,000 | 183 3/8 | 287,898,000 |
| Norfolk & Western | 118,000,000 | 147 1/8 | 173,608,000 | 101 | 119,180,000 | 46 1/8 | 54,428,000 |
| Pennsylvania | 499,000,000 | 151 1/4 | 754,738,000 | 95 1/4 | 476,545,000 | 55 1/4 | 278,193,000 |
| Southern | 120,000,000 | 42 3/4 | 51,450,000 | 23 | 27,600,000 | 19 3/4 | 33,850,000 |
| Southern Pacific | 272,000,000 | 138 3/4 | 376,040,000 | 82 | 223,040,000 | 56 3/4 | 153,000,000 |
| Union Pacific | 222,000,000 | 219 | 466,180,000 | 114 1/4 | 253,635,000 | 104 1/4 | 232,545,000 |
| Total | \$2,169,000,000 | | \$3,289,090,000 | | \$1,592,228,000 | 78.23 | \$1,696,862,000 |

Note: Percentage of shrinkage to value on basis of present capitalization and highest prices reached 51.59 per cent.

*What is meant by this is evidently the difference between highest price and lowest price. In other words the figure in the fourth column is subtracted from the figure in the second column to get the figure in the sixth column.—[EDITOR.]

rate declined still further to 7.29, with a general business depression. In 1914 there was in the first half of the year a slight improvement in general business and the average rate moved slightly up to 7.33 mills. In 1915 the average rate was 7.32 mills. This rate of 7.32 mills was very close to the minimum rate established in 1898-9 of 7.24 mills, when over one-third of our railroad mileage had been turned over to receivers. At that time (1898-9), however, the cost of materials and labor was very much less than in recent years. Now, on top of unsatisfactory and inadequate freight rates, come enormous increases in the cost of both materials and wages, and the situation has again become perilous.

The following figures show the comparative stability of railroad rates after the minimum of 7.24 mills had been reached in 1899, and a 7.50 mill rate established in the fiscal year 1900-1:

| | |
|----------------------|----------------------|
| 1901..... 7.50 mills | 1905..... 7.66 mills |
| 1902..... 7.57 mills | 1906..... 7.48 mills |
| 1903..... 7.63 mills | 1907..... 7.59 mills |
| 1904..... 7.80 mills | 1908..... 7.54 mills |

With the rapid development of the country and prosperous and tremendously expanding business of those years, there was a pronounced revival of interest in railway securities, which rose to a very high level, and there were carried

it is true, but the advances thus far allowed do not begin to offset the enormous increases which have taken place in the prices of materials and in wages.

The apprehension and fear that the railroads of the country may not be allowed to charge rates which will adequately offset the heavy increases in wages and in all materials which they use in operation, is in a large measure responsible for the shrinkage which has taken place in the railway security market in the past year.

To the inability of the railroads during the past 10 years to charge rates commensurate with the increases which have taken place during this period in wages and other operating costs is attributable a portion, but not the whole, of the enormous shrinkages in railroad values which have taken place in this longer period.

The table shows vividly the unprecedented declines in the market value of their shares which have been sustained by 12 of the leading railroad systems of the country from the highest prices reached in 1905 and later to the low prices prevailing at this time. These 12 systems include railroads in every portion of the country, north, east, south and west, and their gross earnings amounted for the year 1916 approximately 1,400 million dollars, or about 40 per cent of the total earnings of all the railroads of the coun-

try. Their mileage represents over 80,000 miles, or more than 50 per cent of the total railroad mileage of the United States.

The table only gives the declines that are shown in the market value of the shares of common stock of the parent companies of the 12 systems, and does not express the great losses that have been experienced in the preferred shares and in the bonds of the parent companies, or in the stocks or the bonds of the many subsidiary or auxiliary companies which are embraced in the mileage of those systems. The shrinkage in these has also been enormous.

| | |
|---|-----------------|
| From this table it is shown that the capital stock of these parent companies was..... | \$2,169,950,000 |
| The market value of these stocks at the respective high prices at the period national aggregated..... | 3,280,000,000 |
| The market value at the recent low levels of prices is only..... | 1,774,125,000 |
| The amount that there has been a total shrinkage in values of..... | |
| per cent of the total shrinkage in these 12 stocks being..... | 1,606,825,000 |

This collapse in prices has wiped out, in this brief period, values, in the aggregate, nearly as great as the entire capital and surplus of all the national banks of the United States. Such a destruction or elimination of values, existing or supposed to exist, is well calculated to produce a profound and far reaching effect. This vast loss or shrinkage also represented a sum greater than the total net operating income of all the railroads of the United States for any two years combined prior to 1916.

Besides the direct losses inflicted upon individual investors and holders of railway bonds and shares, there must be taken into account the indirect losses suffered by the men and women who are stockholders in corporations of many kinds which hold railway securities among their investments, such as the insurance companies (both mutual and joint stock), savings banks, trust companies, national and state banks.

The total outstanding capitalization of the railroad corporations of this country at this time, which is now imperilled (including stocks, bonds and other obligations) is close to \$18,000,000,000.

It is noteworthy that while railroad shares are now in many instances at the lowest prices at which they have ever sold, the shares of many industrial corporations are still selling at prices above the highest quotations which prevailed for them at any time prior to the outbreak of the European war.

The Necessity for Relief

Unless the roads are now enabled to secure substantial relief through an increase in rates, we will probably have a repetition of the experiences of 1892-7, when hundreds of railroad companies, operating about a third of the entire mileage of the country, including trunk lines and independent roads, were handed over, insolvent, to the management of receivers. The ton-mile rate is now close to the minimum rate of that period, although the roads are now compelled to pay from 50 per cent to 150 per cent more for wages and salaries, and for every material and article used by them in their operations. The enormously increased carrying capacity of the roads per car and per train, and efficient and scientific methods of management do not begin, as it is easy to demonstrate, to be sufficient to offset the big increases in wages, in taxes, and in the prices of materials which the railroads are now obliged to meet.

Within the past few days the announcement has been made of a large increase (45 cents per ton) in the price of coal in a large section of the country, to enable operators to meet an increase in wages to the miners. Many roads which a year ago were paying from \$5 cents to \$1.10 per ton for their coal, are now obliged to pay from \$2 to \$2.45 or more. An advance of a dollar a ton on the 200 million tons used by the railroads means an increased annual ex-

pense of 200 million dollar. The railroads could not increase in rates to enable them to meet the great increase in wages and materials, far more than do the operators who had already gotten an increase in the time they are allowed to charge for coal of over 50 per cent.

For the fiscal year 1916 the freight rate per ton per mile was unofficially reported to have been 7.14 mills. That is, in fact, lower than ever before recorded, the previous minimum having been reached in 1898 at 7.24 mills. And at the end of the calendar year 1916 we had 44,000 miles of railroad, embracing 70 railroad corporations covering every section of the country, administered by receivers. The mileage of these insolvent roads ranged from a few miles up to the Rock Island System with 7,653 miles. Among the lines in the hands of receivers were nine systems of over 1,000 miles each, namely, the Boston & Maine, 9,000 miles; the Chicago & Eastern Illinois, 11,136 miles; the Chicago Rock Island & Pacific, 7,653 miles; the International & Great Northern, 11,160 miles; the Missouri, Kansas & Texas, 8,536 miles; the Missouri Pacific, 3,931 miles; the St. Louis, Iron Mountain & Southern, 3,555 miles; the Port Maitland, 2,249 miles, and the Texas Pacific, 1,944 miles.

Your honorable commission in the past has been itself to be the best friend of the railroads, as well as the protector of the public, and one cannot look back to the old days of cut-throat competition among the railroads or remember the gross discriminations in rates in times past when the railroads used their rate-making and rate-cutting powers to make fortunes for favored shippers and to ruin others, without appreciating the enormous power for good which your commission has so beneficently exercised; nor should we fail to remember the time when certain leading trunk lines not only gave special low rates to certain monopolies or trusts, but also granted to those monopolies a bonus for every ton of freight hauled by them for the convenience of the "trust."

Fair-minded and well-informed men have admired the firmness with which this honorable commission has resisted the pressure so often brought to bear upon it in divers ways by selfish interests, and the force and clearness with which it has presented the sound reasons for the conclusions which it has reached. Right thinking men have also deplored the unjust and malicious criticisms that your honorable body has been required to endure in the just and fearless performance of its duties.

When the railroads shall have laid before you frankly the facts and figures to show to what extent the rates now in force are insufficient to maintain the arch of the roads and to enable them to perform efficiently their public functions, under the present unusual and extraordinary conditions, we are entirely confident that the decision which you may reach will be one which your superior knowledge and painstaking study of the whole situation will amply justify; but I trust that I may be pardoned for expressing the earnest hope that this decision, whatever it may be, will come promptly.

The construction of new railroad lines has practically ceased, and existing roads have been forced to cut down largely on their improvement and betterment plans. There is a way can be found now to reduce the prices of materials and the cost of labor to a normal basis, and that for the present is hopeless, it seems clear, on the facts as they now appear, that revision and modification of the scale of rates to meet these new conditions has become imperative.

If this is not done I fear we may look forward to defaults in dividends and in interest and to another era of railroad receiverships, with all the evil destruction of credit and demoralization which that implies. If the relief required is granted, confidence in our railroad securities will be revived and a basis established for new financing and

for proceeding with new development and construction work which is now so greatly needed. The beneficent influence and effect of such action would be felt throughout our entire country.

Mr. Williams also discussed the subject in his recent annual report in part as follows:

Depression in Railway Securities Owned by Banks

For more than half a century most of the surplus earnings of the people of the United States available for the purchase of public securities have been invested in the bonds and shares of our transportation corporations, principally steam railroads and electric street railways. The rates these corporations are allowed to charge for transportation of passengers and freight are closely limited—for steam railroads by both the Interstate Commerce Commission and the state corporation commissions of the respective states; for the street railways by municipal and other local authorities. The average freight and passenger rates permitted to our railroads in the past year were about 30 per cent under the average rates of 30 years ago; while the wages paid, in many instances, have increased 100 per cent, and the cost of materials used for operation also has increased as to numerous articles 100 per cent, and in some cases much more than 100 per cent.

In the fiscal year ending June 30, 1916, the railroad corporations of the country, despite low rates, made the greatest earnings in their history, both gross and net, owing to the great increase in the volume of traffic. It became evident, however, that with the tremendous advances in wages and in the cost of materials between July, 1916, and December, 1917, the railroads would be unable hereafter to approximate the net earnings realized in the last year or two, without a material increase of the rates for transportation they are allowed to charge, and that many of them lacking such increase, or some other relief, would be unable to meet their fixed charges and maintain solvency. The uncertainty on the part of investors as to whether the Interstate Commerce Commission would grant the relief the figures seemed to show to be needed was asserted—and apparently with reason—to have caused heavy declines in the quoted prices of nearly all railroad securities. The shares of some of our most important transportation lines and "arteries of commerce" have recently fallen to the lowest level in the past quarter of a century.

There are faithful students of the situation who think it is as important rightfully to protect for honest investors the value of the securities of legitimate enterprises and to save them from ruin as to restrain the prices charged the people for what they eat and wear and use to keep their homes habitable. The investors and holders of securities representing the corporate business enterprises of the country may be few in numbers, comparatively, but the effect of disaster or ruin to them spreads widely and threatens the stability of our entire economic and financial system, impairs ability to absorb future loans needed by the government, and checks hope of development.

FUEL PRICES IN HOLLAND.—The Netherlands Government has fixed maximum prices for coal and coke, taking effect January 1, which are an advance on previous prices. They are stated in florins per hectoliter, but in American terms are equivalent to about \$22 a ton for anthracite, and \$17 for bituminous coal; coke, about \$10 a ton; coal briquets, about \$25 a ton. The distribution is carefully regulated by cards in specified quantities, varying with the size and nature of the residence or the place of business. The quantity allowed, especially to residences, is much smaller than the amount they consumed in peace times.—*Commerce Report.*

Gigantic Construction Program of American Engineers in France*

THE STUPENDOUS CHARACTER of the construction program undertaken by the American railway engineers in France is outlined in a letter received by G. D. Hood, superintendent of telegraph of the Chicago, Rock Island & Pacific, from Mel Printz, master engineer, Third Engineers' First Battalion, National Army. The letter reads in part as follows:

"With the arrival of more and more material, and more men skilled in railway and terminal construction, the 'port to front' American railway is developing on a large scale, so that thousands of troops will be handled and an endless supply of ammunition and food kept going every day. American engineering genius is having its chance to show on French soil what it has done at home and, after the war, France will have a splendid American line to help reconstruction.

"Aside from the high officers of army headquarters, the transportation experts gathered by General Pershing from the army engineers and from civil life, few Americans have the slightest idea of the size of the project. Few, in fact, realize that the problem placed before the transportation service of the A. E. F. is so important that until it is solved and the solution put into concrete form—in rails and ties, in cars and locomotives, in wharves and warehouses—until that time the army itself, as an important factor on the battlefield, must remain imperceptible.

"There is a long stretch from the available harbors of the French coast to the American troops near the front. Somehow this territory must be traversed by speeding trains, carrying men and munitions, food and clothing, building materials, and all the other goods, animate or inanimate, which must be delivered from the transport harbors to the front. This must be done without disturbing for an instant, the traffic on the many French lines in military use.

"The main route from the harbor of —? to the American front has been in existence for years. It sufficed for handling the peace-time traffic of that part of France. When a small freighter arrived, it was unloaded, chiefly by hand. Its cargo was put ashore and ultimately removed in small lots by the tiny French freight cars. From there on, distribution inland was conducted much after the fashion of the 'local freight work' in America.

"This is a matter of technical construction not merely of yard tracks, but of wharves and warehouses, giant cranes, dredges, everything which would be needed, say, for the creation of a new harbor within the Jersey meadows leading to rail connection at Newark.

"At one of the chosen harbors, ten new wharves are to be built. On them are to be installed mechanical unloading devices—as an example, the army has ordered sixty of the largest loading cranes. The old terminal system suited to the light traffic of French peace times is to be swept out almost bodily. It was possible to run small cars in on direct stub tracks, receive them on turntables, slide to another stub track and send them out. The big American cars cannot be handled that way; so instead, the engineers will put in the loop system providing for a continuous flood of empty cars passing into the wharves system and out loaded.

"As cars will not be always immediately available, and as it is vital that the ships be unloaded and returned without delay to America, there are to be giant storage sheds for holding the freight until new rolling stock arrives. Every bit of this work is pioneer work, in a strange land, with

*The *Railway Age* expects to publish regularly letters from railwaymen overseas. If you receive a good letter from a railwayman who is now in France send it in for publication and let the *Railway Age* pass it around for all to enjoy.

labor almost non-existent. Even the great route must be enlarged with sidings. The prevalent French system of despatching at half hour intervals must be replaced with a quick service allowing, in emergency, trains at five times that frequency. Here is employed the remarkable brain of the American train despatcher, brought to France by the U. S. government, for that purpose.

"And at the end of the express route are the light field railways within the area where it is not advisable to build permanent tracks. Here are the narrow-gage tracks and rolling stock and motive power built today, destroyed tomorrow, rebuilt the next day and working, as nearly as possible, all the time. And from this net-work must be built a still finer net-work of highways where motor trucks will take over the goods and distribute them to advanced points in the fighting area itself. This is no job of building park boulevards."

The 413th Telegraph Battalion

ONE OF THE MOST INTERESTING of the special military units which have been raised in this country for service abroad is the 413th Telegraph Battalion, Signal Corps, National Army. This battalion, which is composed entirely of volunteers and numbers 230 men, is an organization of railroad telegraphers. The work of drilling, training and thoroughly equipping the men has just been completed, and the battalion is now housed in its barracks in France ready for actual service in the field.

has been for seven years division operator of the Pennsylvania Railroad at New York and has been altogether 20 years in the company's service.

The duties of the battalion, which will probably take its members frequently into and near the front-line trenches, will be to construct and maintain telegraph lines of communication for the American Expeditionary forces abroad.

Major Baird's experience in the railroad service has particularly fitted him to direct and supervise work of this kind. When the New York passenger station of the Pennsylvania Railroad and the tubes under the Hudson and East rivers were opened, he was placed in charge of the construction and installation of all the telegraph and telephone lines and other similar electrical work required. He also built the overland lines and equipped ten interlocking block stations, and then organized the operating forces, consisting of train despatchers, train directors, telegraph operators, signalmen, etc., and remained in charge of them until he assumed his military command. Major Baird is a veteran of the Spanish War, in which he distinguished himself for bravery under fire.

The adjutant of the battalion is Lieutenant D. S. Bixler, who was a Junior at Princeton University when war was declared, and volunteered for service, entering the military training corps at Princeton. He was then transferred to the Officers' Reserve Training Corps at Fort Myer, Virginia, and after completing that course was transferred to the Army Transportation Section and assigned to the 41st Telegraph Battalion, Signal Corps. He is an employee of the Pennsylvania Railroad, and was learning the railroad business by working through various departments during

The Officers of the 413th Telegraph Battalion

From left to right: Captain J. D. Jones, Lieutenant J. G. Dennis, Lieutenants R. J. Hunter, D. S. Bixler, J. H. Powers, and E. K. McCloskey, and Lieutenants A. A. Lawton and R. G. Hunter.

All but one of the officers, and a majority of the enlisted men, of the 413th Telegraph Battalion are employees of the Pennsylvania Railroad, furloughed from their usual duties to devote their specialized skill and experience to the military service of the nation as long as may be required. They consist of division operators, train despatchers, block signal operators, telegraph operators, electricians, linemen and other railroad men of allied occupations.

The battalion has been recruited in the last three months by its commanding officer, Major Charles G. Baird, who

vacations. He is the son of H. C. Bixler, superintendent of stations and transfers of the Pennsylvania Railroad.

The medical officer of the battalion is Dr. A. A. Lawton, who has been commissioned first lieutenant. He was a prominent physician in New York City.

The supply officer is Lieutenant R. G. Hunter, who was Major Baird's chief assistant in the construction and installation of the telegraph and telephone systems of the Pennsylvania Railroad's New York improvement.

Company "D" of the Battalion is in command of Captain

J. D. Jones, an electrical engineer who was division operator of the Pennsylvania Railroad at Williamsport, Pa., when he volunteered. Prior to that he had been assistant division operator at Pittsburgh.

Company "E" is commanded by Captain J. B. Crossley, who was train dispatcher on the New York, Philadelphia & Norfolk at Cape Charles, Va.

Lieutenant J. G. Dennis was a train dispatcher of the Pennsylvania Railroad at Pittsburgh. Lieutenant J. H. Pinter was a telegraph operator of the railroad at New York. Lieutenant E. S. McCormick was a train dispatcher on the Allegheny division. Lieutenant E. K. McCloskey was a telegraph operator in the railroad service at New York.

As a final step of preparation all of the members of the 413th Telegraph Battalion were furnished with comfort kits and other supplies by the Women's Division for War Re-

11,000 of its employees in the military and naval service of the United States. All of these have been furloughed from the railroad service, and upon their release from military duty will be returned to their old or equally good positions with the railroad.

Consolidation Type Locomotives for French Railways

TWO ORDERS OF CONSOLIDATION TYPE LOCOMOTIVES, aggregating 140 locomotives, have recently been completed by the American Locomotive Company for France. The Chemin de Fer du Midi received 40 and the French State Railways 100 locomotives, the design being the

The French State Railways Locomotive

lief of the Pennsylvania Railroad, an organization composed of wives and daughters of Pennsylvania Railroad employees who have made it their duty to look after the comfort of railroad men who have entered military service.

The medical officer of the battalion, Dr. Lawton, has been supplied with a complete hospital equipment, which was a gift to the battalion by the Pennsylvania Railroad.

A liberal supply of tobacco for all the boys in the battalion was delivered to the barracks shortly before de-

parture. This was a gift from the Pennsylvania Railroad Employees Tobacco Fund, an organization of employees of the railroad who are endeavoring to keep their former associates, who are now in the army and navy, supplied with "smokes."

same in both cases with the exception of the diameter of the driving wheels and some other minor differences. The engines are of basic American design modified in fittings and fixtures to suit French practice. They were designed by the builder, and each drawing was approved by a representative of the railway. The dimensions are in the metric system, the International system of screw threads, and the French-Westinghouse system of pipe threads.

The locomotives all have cylinders 23 in. by 26 in., and

Consolidation Type Locomotive for the Chemin de Fer du Midi

carry 170.6 lb. boiler pressure. Owing to the slight difference in the diameter of the drivers there is a difference of 1,000 lb. in the tractive effort of the two orders, the locomotives for the French State Railway developing a tractive effort of 35,200 lb., while those for the Midi develop 36,200 lb. While the boiler capacity is low in

The Pennsylvania Railroad System now has more than

The locomotives all have cylinders 23 in. by 26 in., and

relation to the cylinder capacity, it compares very favorably with recently built locomotives of the same type for use on American railroads.

The dimensions of both boilers are identical. The design in general follows American practice, a good grate area being obtained by the use of a short, wide firebox. The firebox is fitted with a brick arch and the boiler includes a 26-element superheater. Handholes are used instead of washout plugs to give greater accessibility for washing out. A dump grate in the front of the firebox is operated from the cab by a screw, the firedoor opens inside as required by a French law, and the outside end of the blowoff cock has a special thread for connection to the fire hydrants of the city of Paris. In order to quickly free the stack of smoke, the blower is fitted with a quick-opening valve operated from both sides of the cab. Lagging on the boiler is omitted; the jacket is supported on a crinoline frame leaving an air space which acts as a non-conductor.

Among the points of general interest in the design, it will be noted that the locomotives are all controlled from the left side, contrary to American practice. The steam is distributed by 10 1/4-in. piston valves, which are controlled

Elevation of Consolidation Type Locomotive for the Chemin de Fer du Midi

by the Walschaert valve gear. The cylinders are fitted with 16-pass valves operated by air cylinders, and with muffled cylinder cocks.

While the running gear in general is designed along the lines commonly followed in this country, the cross-balancing of the driving wheels is contrary to American practice for two-cylinder locomotives. The effect of this practice on the angularity of the counterbalances is clearly indicated in the illustrations.

A pneumatic sander is combined with a screw conveyor extending through the sandbox and operated from the cab.

All the engines have a variable exhaust operated from the cab by a screw which passes through one of the handrails, and the front ends are fitted with spark arresters. Other special types of equipment include French Westinghouse air brakes, French standard buffers and couplers, Roy buffers between engine and tender and a water brake.

The general dimensions and data for the two locomotives are given in the table:

An Equation to Express Fair Return

By Wm. G. Raymond

Dean, College of Applied Science, University of Iowa,
Iowa City, Ia.

IN A LITTLE BOOK CALLED "What Is Fair" which has just been published, the author, who is also contributing this article, proposes an equation to express fair return to a public utility under continuous regulation from the beginning. In proposing the equation the author contents himself with saying that the application of the equation pays interest, which he calls the wage of money, on all capital whether represented by bonds or stock, and a profit rate for service that grows less as the business grows larger although the gross money profit grows with the growth of business; that the application of the expression is such that extension of business on a given capital is encouraged; that it indicates the profitability of doing business with borrowed capital, and that public control must be exercised to see that operating costs are not inflated.

The equation is, Fair Return = $rI + 10rC\frac{1}{4}$,

in which I is the invested capital, r the rate at which the corporation can borrow money, and C the annual operating expense, excluding fixed charges but including depreciation and all other items.

The author says that the coefficient and exponent of the second term of the second member may be subjects for discussion, but that he thinks the principle according with general commercial practice is sound.

No further discussion of the application of this equation is given and it is thought an illustration of its application under various conditions will be of interest. For this purpose Tables 1 and 2 herewith are presented. Table 1 shows the application of the formula for five different amounts of invested capital varying from \$10,000 to \$100,000,000 and for two ratios of invested capital to annual operating cost. The first, with the capital $\frac{1}{4}$ of the annual operating cost, represents in some degree the private competitive commercial enterprise in which capital is turned several times a year.

TABLE 1.—SHOWING THE APPLICATION OF THE FORMULA (FAIR RETURN = $rI + 10rC\frac{1}{4}$) FOR TWO RATIOS OF CAPITAL TO ANNUAL OPERATING COSTS. WHEN r IS 5 PER CENT. (QUANTITIES CERTAIN TO FOUR SIGNIFICANT FIGURES ONLY.)

| Capital | \$10,000 | \$100,000 | \$1,000,000 | \$10,000,000 | \$100,000,000 |
|---|----------|-----------|-------------|--------------|---------------|
| Return: | | | | | |
| Wage of money 0.05 | | | | | |
| × Capital | 500 | 5,000 | 50,000 | 500,000 | 5,000,000 |
| When Capital Is One-Fourth of Annual Operating Cost | | | | | |
| Wage of service = | | | | | |
| profit | 5,318 | 39,881 | 299,070 | 2,242,710 | 16,817,800 |
| Total return | 5,818 | 44,881 | 349,070 | 2,742,710 | 21,817,800 |
| Per cent of capital. | 58.18 | 44.88 | 34.91 | 27.43 | 21.82 |
| When Capital Is Four Times Annual Operating Cost | | | | | |
| Wage of service = | | | | | |
| profit | 470 | 3,525 | 26,434 | 198,231 | 1,486,525 |
| Total return | 970 | 8,525 | 76,434 | 698,231 | 6,486,525 |
| Per cent of capital. | 9.70 | 8.53 | 7.64 | 6.98 | 6.49 |

The second represents in some degree the case of the public utility, which generally has an invested capital much in excess of the annual operating costs. Indeed, in the case of electric lighting properties and rail properties it is probable that the capital is more often five times the annual operating cost than four times that cost which is assumed in the table. An interest rate of 5 per cent has been assumed for the table and it will be noted that in the application of the equation there is nothing to encourage the corporation to obtain its money at a low rate since the higher the rate it must pay, the higher its profit rate will be, and it may be that the two r 's of the two terms should be different; the first representing

what the company must pay, the second representing an acceptable going rate of interest. For the table the r 's are taken as the same and as 5 per cent.

The table gives the total return that would be allowed under this formula, and the rate of return on the invested capital, which in the case of the private competitive commercial enterprise varies from about 58 per cent where the capital is small (\$10,000) to about 22 per cent where the

TABLE 2.—SHOWING THE RATE PER CENT OF RETURN TO THE OWNER FOR THREE RATIOS OF BORROWED CAPITAL AND OWNER'S INVESTMENT; OTHER ASSUMPTIONS AS IN TABLE 1.

| Total capital invested | Capital = $\frac{1}{4}$ annual operating cost | | | Capital = 4 times annual operating cost | | |
|------------------------|---|------------------------|-------------------------|---|------------------------|-------------------------|
| | Nothing borrowed | $\frac{1}{2}$ borrowed | $\frac{9}{10}$ borrowed | Nothing borrowed | $\frac{1}{2}$ borrowed | $\frac{9}{10}$ borrowed |
| \$10,000..... | 58.18 | 111.56 | 536.8 | 9.70 | 14.40 | 52.00 |
| 100,000..... | 44.88 | 84.76 | 403.8 | 8.53 | 12.05 | 40.25 |
| 1,000,000..... | 34.91 | 64.81 | 304.1 | 7.64 | 10.28 | 31.43 |
| 10,000,000..... | 27.43 | 49.85 | 229.3 | 6.98 | 8.96 | 24.82 |
| 100,000,000..... | 21.82 | 38.64 | 173.2 | 6.49 | 7.97 | 19.87 |

capital is large (\$100,000,000). For the public utility the rate on the investment varies from 9.7 per cent where the capital is small (\$10,000) to 6½ per cent where the capital is large (\$100,000,000). Many thoroughly successful commercial enterprises are earning in accordance with the figures given and most public utilities would be entirely content to earn in accordance with the figures given for them if such earnings could be assured. And the earnings shown are certainly sufficiently less than those of the successful private commercial enterprises to satisfy the most conservative of those who feel that public utilities, being whole or partial monopolies, should be content with a less rate of return than is accorded private competitive business.

But a study of Table 2 is perhaps even more interesting in showing the effect of doing business with borrowed capital. Purely private business is more often done on the capital of the owner than is the public utility business which is more often done with borrowed capital, and this fact tends to equalize the earnings of the two classes of business, such equalization being considered proper by the author of the book. It will be noted that for the private business where nothing is borrowed, the rate of return on the invested capital is only slightly more than the rate of return on the owner's invested capital in the public utility business in that case where the owner borrows 9/10 of his capital.

It should be noted also that rate of return is not always as important as the gross sum earned. Many public utilities have been financed wholly on borrowed capital, the stock representing nothing but speculative value, and where this is the case the rate of return is infinite on the capital invested by the owner. If the stock could be said to have some value, that attaching to the foresight and enterprise in establishing the property, then the rate would be finite, and if this value might be said to be 1/9 of the money capital invested, so that the whole capital might be said to be 10/9 of the actual money invested, the owner's return would be as in the last column of Table 2, which compares favorably with the return shown in the second column.

It is thought that a careful study of Tables 1 and 2 will be interesting and instructive to many persons who are studying the question of fair return.

IMPORTS TO THE UNITED STATES for the seven months of the fiscal year ended with January were valued at \$1,634,000,000, as against \$1,348,000,000 for the corresponding period of the previous year, according to figures just issued by the Department of Commerce. Exports for the seven months' period totaled \$3,448,000,000, as compared with \$3,616,000,000 for a similar period the year previous.

Railway Officers Wanted for Service Abroad

S. M. Felton, Director General of Military Railways, Organizing
Additional Operating and Engineering Regiments

S. M. FELTON, director general of military railways, is organizing a number of additional railway regiments and battalions for active service in France and desires to hear from capable railway officers or ex-officers who desire to go abroad as commissioned officers. In addition to the regiments already abroad, two railway operating regiments of a total strength of 1,587 each, are now being organized, together with five railway operating battalions of a strength of 774 each, one railway maintenance of way battalion of a strength of 774 and two maintenance of equipment battalions with a strength of 774 each; and other units are to follow.

Mr. Felton desires to hear from officers and ex-officers who are or have been general managers, general superintendents, assistant superintendents, superintendents of transportation, division superintendents, superintendents of motive power, master mechanics, trainmasters, chief dispatchers, general yardmasters, yardmasters, road foremen of engines, general shop foremen, engine house foremen, engineers of maintenance of way, roadmasters and track supervisors who desire to take active service in these railway units, providing they are not over 50 years of age in the case of general superintendents, superintendents of motive power and general managers, and not over 45 years of age in the case of officers of lower rank. In communicating with Mr. Felton at his office at 734 Fifteenth street, N. W., Washington, D. C., they should give their railroad experience in detail and their references. Men now in active service should have the consent of their superior officer before applying.

Providing the qualifications are satisfactory, commissions will be given for the various ranks as follows:

General managers, as lieutenant colonels;

Assistant general managers, general superintendents, and superintendents of motive power, as majors;

Division superintendents, master mechanics, engineers of maintenance of way, as captains;

Trainmasters, chief dispatchers, road foremen of engines, general yardmasters, roadmasters, as first lieutenants;

Yardmasters, track supervisors, and engine house firemen as second lieutenants.

Enlisted Men

The office of the Chief of Engineers of the War Department has recently issued a booklet entitled "The United States Needs Skilled Engineers in France," describing the needs of the army for engineer troops, the duties of the various departments of the engineer service and the conditions of enlistment, for the purpose of giving information to men desiring to enlist as privates or non-commissioned officers and to the employers of such men. Some extracts from this booklet, including the sections particularly applicable to railway engineers, are as follows:

In this war, the duties of engineer troops are so varied that any man with technical training can be so placed that he may employ his training with advantage to his country and with pleasure and profit to himself.

Engineer troops are charged with reconnoitering and surveying for military purposes and the preparation of maps of the theater of operations; planning and superintending of defensive and offensive works of troops in the field; examination of routes of communications for supplies and for military movements; construction and repair of military roads, railroads, and bridges; military demolitions; the conduct of gas and flame warfare; the operation of "Tanks";

the location, design and construction of wharves, piers, landings, storehouses, hospitals and other structures of general interest; the construction, maintenance and repair of roads, ferries, bridges and incidental structures; and the construction, maintenance and operation of railroads under military control, including the construction and operation of armored trains.

The American army operating in Europe must be transported, fed, supplied with ammunition and all other materials and supplies required to conduct successful warfare. To render this possible the engineers must provide for the construction of wharves, warehouses, storehouses, shops, hospitals, depots and all of the other structures necessary to protect the army and its ammunition and supplies from the weather. It must build and operate railroads connecting the wharves with the storehouses and depots, and the latter with a point as close to the scene of fighting as may be practicable, with branch lines to every point where it may be necessary to supply the American forces.

Roads must be constructed and repaired, bridges built, repaired and strengthened, fortifications and other defensive works laid out and constructed. For these and other purposes, trees now standing in French forests must be felled and converted into railroad ties and timbers.

All of this work falls to the part of the engineers, whose efforts are just as important toward the final success of our arms as are those of the men in the forefront of battle. The man building a road over which motor trucks rush bombs to the front is doing work just as important as the man who finally throws the bomb into the enemy trench. The railroad builder or trainman who facilitates the movement of supplies of food and ammunition to the front is performing just as essential a duty as the man on the firing line. So, too, is the carpenter who is engaged in construction of storehouses for supplies and ammunition which are stored until needed for use of the fighting force.

The engineer department is not organizing a civilian construction and operating corps for service in France, and further addition to the overseas civilian clerical force has been stopped. It is proposed to have the engineer construction, clerical and operating work required by the American Expeditionary Forces performed by special engineer units organized as part of the United States Army. This rule will be observed save under very exceptional circumstances.

There are no civil positions in connection with the engineer units in the military service. All civil positions in the engineer department at large, except that of men laborer, are made under civil service rules as required by law. The incumbents of these positions are not in the military service and are not sent abroad. Information relating to qualifying for these positions should be obtained by corresponding with the Civil Service Commission, Washington, D. C.

Approximately one-half of the organizations are strictly combatant, the others are special units made up of skilled men who, in peace time, are engaged on work similar to that which they are expected to perform with our armies abroad. All of these organizations, whether originally organized as combatant or special troops, will be assigned such duties as competent authority may direct and will be available for all kinds of service. All organizations will be organized as military units with the various grades of officers and non-commissioned officers, and all men are uniformed and equipped as soldiers. The officers are taken

from the Corps of Engineers, the Engineer Officers Reserve Corps, from graduates of engineer training camps, and from enlisted men who have earned promotion to commissioned grades. The enlisted men are enlisted for the period of the emergency in the National Army authorized by the act of Congress approved May 18, 1917.

An enlisted man desiring to transfer to another unit must make an application therefor through military channels to the commander having authority to effect the transfer and stating the reasons for the request, also his qualifications for service in the particular regiment to which he asks transfer. Action on such requests will be governed by circumstances, and by the views expressed in the indorsements of commanding officers. The expense of a transfer made at the request of a soldier must be borne by the soldier.

Any registrant under the selective service law, who has not actually been called to service, may be immediately inducted into the service at the request of the registrant. Applications for induction should be made to the Chief of Engineers, giving a complete statement of the applicant's qualifications.

Any man who is physically qualified between the ages of 18 and 21, or 31 and 40, may voluntarily enlist for an engineer organization, provided he proves to the recruiting officer that he is experienced or skilled in any engineering trade, or is a "handy man" who is specially suited for engineering work.

Volunteers should apply to a recruiting officer, or to an engineer officer.

There are about 600 recruiting stations in the United States. An officer at any one of these stations will enlist you for an engineer organization, if you are deemed suitable.

Enlistment is in the grade of private. Subsequent promotion to the rank of non-commissioned officer is secured by merit. It is intended to fill many of the vacancies which will occur from time to time among the commissioned officers by selection from the ranks. One of the best ways to secure a commission is through enlistment.

The regulations governing physical requirements for enlistment in engineer organizations are the same as for the army at large, but minor defects in volunteers for some of the special units may be waived by proper authority.

After entering the service, men are clothed, fed, sheltered and transported at the expense of the United States.

Army pay, as shown below, is practically clear money:

MONTHLY PAY OF ENLISTED MEN

| Rank | Pay in U. S. | Pay abroad |
|------------------------------------|--------------|------------|
| Master engineer, senior grade..... | \$81.00 | \$96.00 |
| Master engineer, junior grade..... | 71.00 | 84.00 |

The act approved October 6, 1917, makes government allowances for the dependents of soldiers, in addition to the soldiers' pay.

Engineer troops are organized into sections, detachments, separate companies, separate battalions and regiments.

The organization of Sections and Detachments depends upon the character of the work for the section or the detachment.

An engineer company consists of the following enlisted men:

| | No. |
|----------------------------|-----|
| First sergeant..... | 1 |
| Sergeant, first class..... | 4 |
| Supply sergeant..... | 1 |
| Master sergeant..... | 1 |
| Stable sergeant..... | 1 |
| Sergeant..... | 10 |
| Corporal..... | 20 |
| Horseshoer..... | 1 |
| Saddler..... | 1 |
| Wagoner..... | 5 |
| Cook..... | 5 |
| Bugler..... | 3 |
| Private, first class..... | 66 |
| Private..... | 132 |
| Total enlisted..... | 250 |

A Separate Battalion consists of the following enlisted men:

| | No. |
|------------------------------------|-----|
| Master engineer, senior grade..... | 2 |
| Master engineer, junior grade..... | 4 |
| Battalion sergeant major..... | 1 |
| Battalion supply sergeant..... | 1 |
| Sergeant..... | 2 |
| Corporal..... | 2 |
| Wagoner..... | 2 |
| Cook..... | 2 |
| Private, first class..... | 1 |
| Private..... | 6 |
| and three or four companies. | 3 |

A Regiment consists of the following enlisted men:

| | No. |
|---|-----|
| Master engineer, senior grade..... | 4 |
| Master engineer, junior grade..... | 4 |
| Regimental sergeant major..... | 1 |
| Regimental supply sergeant..... | 2 |
| Sergeant bugler..... | 2 |
| Color sergeant..... | 2 |
| Sergeant..... | 2 |
| Wagoner..... | 3 |
| Cook..... | 2 |
| Private, first class..... | 2 |
| Private..... | 12 |
| and six companies, of two or more battalions. | 6 |

Railway Construction Battalions

These battalions will construct or repair the railroads which will carry food and ammunition to the front; their duties will include grading, track construction and maintenance, bridge work, etc. When an advance is made, the tracks must at once follow the troops, so that the supply of munitions will not fail.

Volunteers are especially desired who are experienced

| | |
|-----------------------|--------------------|
| Timbermen; | Blacksmiths; |
| Bridge carpenters; | Transmitters; |
| Masons; | Surveyors; |
| Pipe fitters; | Draftsmen; |
| Steam fitters; | Storekeepers; |
| Hoisting enginemen; | Machine repairmen; |
| Firemen; | Clerks; |
| Dinky runners; | Electricians; |
| Teamsters; | Oilers; |
| Track layers; | Painters; |
| Construction foremen; | Rock drillmen; |
| Pile drivers; | powdermen; |
| Concrete foremen; | Signal installers; |
| Telegraph linemen; | Bridemen; |
| Riggers; | Cooks. |
| Machinists; | |

Car Repair Shop Battalions

These organizations will be located in car repair shops and yards in France where repairs will be given to freight and passenger car equipment. Volunteers are desired who have had experience in railway and manufacturing car shops.

| | |
|-------------------------------|----------------------|
| General foremen; | Machinists; |
| Shop foremen; | Mechanics' helpers; |
| Gang leaders; | Painters; |
| Office men; | Pipe fitters; |
| Storekeepers; | Planing mill men; |
| Acetylene welders; | Roofers; |
| Airbrake repairmen; | Sheet iron workers; |
| Air tool repairmen; | Tinsmiths; |
| Automobile repairmen; | Truck repairmen; |
| Blacksmiths; | Upholsterers; |
| Blacksmiths; | |
| Car builders, wood and steel; | Buglers; |
| Derail enginemen; | Barbers; |
| Electricians; | Cooks; |
| Engine — steel shapes; | Tailors; |
| Gas enginemen; | French interpreters. |

Enginehouse Battalions

These organizations will be located at railroad terminals in France from entry ports to the fighting lines. They will maintain American and French type locomotives in service. Volunteers are desired who have had experience in railway enginehouses.

| | |
|----------------------------|----------------------------|
| Clerks; | Electricians; |
| Draftsmen; | Engine watchmen; |
| Engine designers; | Electrical welders; |
| Enginehouse foremen; | Flue repairmen; |
| Gang leaders; | Hostlers; |
| Storekeepers; | Locomotive inspectors; |
| Airbrake repairmen; | Laborers; |
| Airbrake inspectors; | Messengers; |
| Asphalt men; | Machinists; |
| Acetylene welders; | Oil room attendants; |
| Boilermakers; | Plumbers and Pipe fitters; |
| Boiler washers; | Stationary engineers; |
| Blacksmiths; | Switchmen; |
| Car repairmen; | Staybolt inspectors; |
| Carpenters; | Tinsmiths; |
| Coal and coal storage men; | Tender repairmen; |

Locomotive Repair Shop Battalions

These organizations will be located in locomotive repair shops in France where general repairs will be given to American and French type locomotives, including fire box and boiler renewals. Volunteers are desired who have had experience in railway shops as

| | |
|-----------------------|---------------------------|
| Master mechanics; | Erecting shop machinists; |
| Shop foremen; | Gas engine men; |
| Gang leaders; | Machine shop machinists; |
| Office men; | Mechanics' helpers; |
| Storekeepers; | Painters; |
| Acetylene welders; | Pipe fitters; |
| Air tool repairmen; | Stationary engineers; |
| Automobile repairmen; | Sheet iron workers; |
| Blacksmiths; | Tender repairmen; |
| Boilermakers; | Truck repairmen; |
| Carpenters; | Tinsmiths; |
| C.B. builders; | Welders; |
| Fabric makers; | Barbers; |
| Coppersmiths; | Cooks; |
| Crane operators; | Tailors; |
| Electricians; | French interpreters; |

Railway Maintenance of Way Battalions

These organizations will maintain the railroads in France. The men of the regiments will renew ties, repair worn rails and switches, in fact, everything which goes towards the maintenance of a railroad already built. Volunteers are desired who are, or have had experience as

| | |
|------------------------------|---------------------|
| Track laborers; | Carpenters—Foremen; |
| Section foremen; | Signal supervisors; |
| Extra gang foremen; | Signal maintainers; |
| Trackers—Bridge and building | Signal battymen; |
| Track supervisors; | |

Railway Miscellaneous Trades and Storekeepers Battalions

In order to supply the needs of the army at the front it is necessary to maintain and operate a high class, standard gage railroad.

The amount of traffic handled during a stated period of time is so vast that it requires a very efficient force of experienced railroad men to make the enterprise a success.

Railroad storehouses must be manned to handle this vast business and special men are needed for the work, as well as for other details of railway operation among them men of the following classes:

| | |
|-----------------------|-------------------|
| General storekeepers; | Shipping clerks; |
| Assayers; | Machinists; |
| Shoemen; | Carpenters; |
| Accountants; | Painters; |
| Storekeepers; | Electricians; |
| Statisticians; | Freight handlers; |
| Steamfitters; | Station agents; |
| Clerks; | |

Railway Operating and Transportation Battalions

These organizations will operate railroads in France from the landing places to the fighting line. The men of

the regiments will operate the trains and act as dispatchers, station agents and operators, etc. Volunteers are desired who are, or have had experience as

| | |
|-----------------------|-------------------------|
| Yard clerks; | Freight car inspectors; |
| Engineers; | Freight car repairmen; |
| Signalmen; | Freight carmen; |
| Conductors; | Freight carmen; |
| Yard foremen; | Freight carmen; |
| Asst. car inspectors; | Freight carmen; |
| Yardmasters; | Freight carmen; |
| Locomotive firemen; | Freight carmen; |

Progress Toward Standardization

RAPID PROGRESS has been made by the committees of car and locomotive builders and of railroad mechanical officers in the preliminary work of preparing specifications and designs for various types of standard freight cars and locomotives to be reported to Director General McAdoo for his decision. When the standard type are finally adopted it is understood that they are to be used not only for the cars and locomotives to be purchased by the Railroad Administration out of the revolving fund consisting of an appropriation by Congress of \$500,000,000 and any surplus earnings of the railroads above the amount required for their guarantee, but also for orders to be placed by individual roads which are able to finance additions to their rolling stock.

Greater progress has been made so far in the designs for standard freight cars than in those for the locomotives, both because of the greater degree of standardization which previously existed in the car field and also because some of the work done by the Committee on Standard Box Cars of the American Railway Association could be taken as a foundation. It is probable that the railroad officers and the builders will be able to agree on specifications for the cars to be submitted to Mr. McAdoo early next week.

As has been previously reported in the *Railway Age*, the Railroad Administration first requested suggestions for the proposed standards from the committees representing the car and locomotive builders, of which Samuel Vauclain, vice-president of the Baldwin Locomotive Works, is chairman. These were appointed by the Council of National Defense last summer at the time when the plan for having the government acquire from 100,000 to 150,000 cars for the use of the railroads was under serious consideration. These committees were called into conference by Henry Walters, chairman of the Atlantic Coast Line and the Louisville & Nashville, who is in charge of the standardization investigation for Director General McAdoo, and their recommendations for both cars and locomotives were then referred to a committee of railway mechanical officers, three appointed by each Regional Director, and H. T. Bentley, superintendent of motive power and machinery of the Chicago & North Western and mechanical assistant in the Transportation Division of the Railroad Administration, as chairman.

The designs submitted by the builders' committees have been gone over carefully by the railroad committees, which have made numerous suggestions for changes as to types, dimensions, weights, etc., and has asked the builders to make the desired changes in their designs. When the revised designs are approved by the railroad committees they will be submitted to Mr. Walters and Mr. McAdoo for final approval.

In addition to the members of the committees reported in last week's issue, a number of others have been called into the conferences including F. H. Clark, general superintendent of motive power of the Baltimore & Ohio; C. A. Shroyer, superintendent of the car department of the Chicago & North Western; H. R. Warner, general superintendent of motive power of the Chicago, Milwaukee & St. Paul; J. C. Fritts, master car builder of the Delaware, Lackawanna & Western; A. G. Trumbull, master of the

general mechanical superintendent of the Erie; J. McMullen, mechanical superintendent of the car department of the Erie; W. O. Moody, mechanical engineer of the Illinois Central; John A. Pilcher, mechanical engineer, Norfolk & Western; W. J. Keisel, Jr., assistant mechanical engineer, Pennsylvania; F. W. Mahl, director of purchases of the Southern Pacific.

While the entire matter is still in a tentative stage and nothing will be definitely decided until the various recommendations are approved by Director General McAdoo, it is understood that the following types of cars have been under consideration: 40-ton single sheath box car, 40-ton double-sheath box car, 50-ton single-sheath box car, 50-ton all-steel gondola with light drop doors, 50-ton composite steel and wood gondola with light drop doors, 55-ton all-steel hopper bottom coal car, 70-ton all-steel hopper bottom coal car, and 70-ton low side gondola. The suggestions of the railroad committee were concurred in by the Vauclain committee and the necessary changes in design are being made this week. It is to be presented for approval at a meeting next week in Washington.

It is also understood that about 10 types of locomotives have been under consideration, for the first orders to be placed, including 6-wheel and 8-wheel switching locomotives, a heavy and a light Mikado, two Pacific types, two Mountain types and possibly a Mallet and a Santa Fe type.

The proposed Mikado, Pacific and Mountain types are as follows:

| Type | Cylinders | Weight on drivers | Tractive power |
|----------|------------------|-------------------|----------------|
| Mikado | 26 in. by 30 in. | 220,000 lb. | 54,600 lb. |
| Mikado | 27 in. by 32 in. | 240,000 lb. | 60,000 lb. |
| Pacific | 25 in. by 28 in. | 165,000 lb. | 40,700 lb. |
| Pacific | 27 in. by 28 in. | 180,000 lb. | 43,800 lb. |
| Mountain | 27 in. by 30 in. | 240,000 lb. | 57,000 lb. |
| Mountain | 27 in. by 30 in. | 220,000 lb. | 53,900 lb. |

Further conferences between the railroad committee and the locomotive builders are to be held next week at Philadelphia after the car designs have been approved.

Because of the greater variety of conditions encountered on western lines additional types will probably have to be considered before the work is completed as well as variations for the different kinds of coal used.

The question of patented specialties has been one of the most complicated that have had to be considered and the question of how they are to be dealt with has not yet been finally determined.

One of the questions under consideration has been as to how far it is desirable to go in standardizing various devices—whether the specifications shall extend to detail types or whether they shall be sufficiently elastic to admit of all types that can conform to standard dimensions in such a way as to permit of interchangeability. It is understood that the

latter idea is most likely to prevail and that modern devices of proved merit will be approved, but those in the experimental stage will not be included. The locomotives are to be equipped, among other things, with superheaters, brick arches, mechanical grate shakers, mechanical fire-doors, and two water gages. It has not been decided to what railroads the locomotives will be assigned, but it is understood that where it is known that a considerable number, such as 50 to 60, are to be delivered to a road, that road may be allowed to indicate the particular specialties which it has been accustomed to use.

As to the cars, it is understood that friction draft gear conforming to standard specifications must be used and that spring draft gear will be excluded.

It is also understood that cast-steel bolsters and cast-steel side-frames will be used, if conditions in the steel market permit. Frictionless side-bearings probably will be given preference. It is understood that the M. C. B. journal boxes will be used. Brakebeams of three or four point suspension are favored. There is a report that the committee thinks roofs on which the patents have expired should be used.

The committees probably will not make public their recommendations until they have gone to Mr. McAdoo and been passed on by him, for until then nothing can be regarded as finally settled. Meantime, those who have been watching developments closely pretty well agree that the outcome will be a widespread distribution of orders among railway supply manufacturing concerns. In fact, the orders to be placed will be so large that only by a pretty widespread distribution of them will it be possible to get the specialties required made as rapidly as the conditions demand. There are some classes of concerns, such as the makers of spring draft gear, which apparently will be hard hit. The same will be true of concerns having devices that are just in the development stage.

There has been much speculation as to the number of cars and locomotives to be ordered by the government. The bill providing for an appropriation of \$500,000,000 has been passed by both Houses of Congress and is in conference this week for the adjustment of provisions on which the bill was passed in different form by the Senate and the House. An order of 100,000 cars is most frequently mentioned in the gossip, but an order for 150,000 to 200,000 has been spoken of as possible and it is understood that the locomotive order will be for 1,500.

It is understood that the Railroad Administration will arrange for standard prices, which will apply to all orders, whether placed by the railroads or by the administration, and arrangements will be made whereby the builders will have priority orders for the materials needed so that the cars and locomotives may be delivered as rapidly as possible.

They Move Them as Easily as Wrecking Cranes

The Japanese Operated Railroads of Korea

Over One Thousand Miles of Railway Constructed in Asiatic Peninsula in Less Than Twenty Years

THE RAILWAYS OF KOREA, or of Chosen, as the Japanese would have us call it, have the distinction of being among the standard gage railways of the world which pay the lowest salaries and wages to their employees. The average monthly compensation on the railways of Chosen is only \$11, about 37 cents a day, while the head of the system with its 1,000 miles of line receives only \$292 a month.

The railways of Korea have the two-fold purpose of helping to develop Chosen for the Japanese, which control it,

the Asiatic continent in the building of standard 4 ft 8½ in. gage railroad lines is soon to be carried further by the contemplated change of the 5 ft. 6 in. gage railways of Japan proper to standard gage.

The railways of Chosen are divided into four main sections: (1) that from Keijyo to Fusan, 275 miles, connecting Keijyo or Seoul, as the capital of Chosen is sometimes named, to the port of Fusan where connection is made by fast steamer lines to the main line railroads of Nippon to Kobe, Osaka, Yokohama and Tokyo; (2) the line from Ryuzan near Keijyo to Autung, 310 miles, where direct connection is made with the railways in Manchuria; (3) the line from Taiden, a point between Keijyo and Fusan, to Mokuhō; (4) the line from Ryuzan to the eastern coast at Gensan and Bunsen. There are also additional branch lines.

As a link in the transportation system between Japan and China the system benefits by an increasing flow of through traffic in addition to the intra-peninsula business which is still in its infancy and a fertile field for development. The Nipponese have shown characteristic aptitude in encouraging both passenger travel and freight movement in Chosen. Excursion rates and reduced fares for Koreans going to market at the larger cities have swelled passenger receipts and encouraged industry. Electric lights, electric fans, heat, drinking water and toilet facilities in passenger coaches, sleeping and dining car service, railway hotels and hospitals, medical attention by physicians on the payroll of the system, and other accommodations for the comfort of patrons of the lines have all tended to make travel more attractive. In a like manner the simplification of custom house transactions, the introduction of the principle of re-consignment, the reduction of rates for longer hauls, the establishment of a system of rebating and the opening of warehouses at the larger stations have encouraged freight movement.

History of Chosen Lines

The history of the railway lines in Chosen dates back to a concession to build and maintain a railroad between Keijyo, the capital, and Jinsen, its seaport, which the Korean government granted in 1896 to James R. Morse, an American. In May, 1897, while construction work was in progress, the Kei-Jin Tetsudo Hikiuke Kumiai (Syndicate) purchased the concession and continued the work. Other private companies undertook the extension of the Korean railway system. In September, 1899, a line between Jinsen and Ror-yoshin, about 20 miles in length, was opened to traffic, and the remaining section between Ror-yoshin and Seidaimon in Keijyo, 5 miles, was finished in July, 1900, thus completing the railway between Jinsen and Keijyo. The construction of a 270-mile line from Keijyo to Fusan, the port at the southeastern extremity of Korea, was undertaken in August, 1901, and completed in January, 1905. A 300-mile extension from Keijyo to Shingishu, on the Manchurian frontier, and a 25 mile branch from Sanroshin to Masan, a port near Fusan, were opened to general traffic in April, 1908. When the nationalization of the railways in Japan was decided upon in 1906, the Imperial Government of Japan purchased the Keijyo-Fusan and the Keijyo-Jinsen lines, establishing the Railway Bureau of the Residency-General of Korea at the same time. In September of the same year the Keijyo-Shingishu and the Sanroshin-Masan

Map of the Chosen Railways

and of serving as the connecting link between the railways and steamship lines of Japan and the railways to the west and north of Chosen, in Manchuria.

Twenty years ago there was not a mile of railway in Korea. Today there are 1,006 miles of line in the peninsula, practically all of which was constructed by Japanese engineers. The fact that these railways, like those controlled by the Japanese in South Manchuria, are all of standard gage merits more than ordinary attention. The Japanese are converted to the idea and advantages of standard gage railways and the work which they have begun on

lines were also acquired and placed under the jurisdiction of the Railway Bureau. These lines were taken over by the Imperial Government Railways in December, 1909, but in October of the following year they were transferred to the jurisdiction of the Government-General of Korea.

The first construction work of the railways in Chosen was carried on rather hurriedly, with a view to connecting the extreme South with the extreme North of the country as quickly as possible and joining a few of the important seaports with the trunk line by means of branches. Within a few years after their completion, however, reconstruction work was undertaken and finished in due time. With the construction of a bridge over the Yalu river and the rebuilding of the Antung-Mukden line in Manchuria, the Chosen railroads assumed world-wide importance as a link in communication between China and Japan, and hence between Europe and Japan.

Other units added to the Korean railway system include lines from Taiden to Mokuho at the southern extremity of Chosen from Keijyo to Gensan on the northeast coast, and from Keijyo to Chinnampo, a western port, totaling 348.3 miles, and the Gensan-Bunsen section of the projected Kankyo line along the northeastern seaboard, 12.5 miles. The program for 1916 was to build two more units of the Kankyo line, one from Bunsen to Yeiko, 21.4 miles, and another from Seishin to Sohyo, 32.2 miles. The total operated mileage of the Korean roads at the end of the fiscal year 1915 was 1006.5 miles, or an increase of 368.6 miles over the mileage at the end of the fiscal year 1906.

Connections with Japan and Manchuria

The railways of Chosen connect with the railways in Japan by fast and regular steamship service between Fusan in the south and Shimonoeki, the southeastern terminus of the main line railway of Nippon. Similarly a through connection is made with the South Manchurian railway in the

View at Fusan Pier

north at Antung by a bridge over the Yalu river between Antung and Shingishu.

This steamship connection with Japan and the consumption of international affiliations have proved a potent factor in increasing freight traffic on the Chosen lines. Following the completion of the bridge over the Yalu river and the reconstruction of the Manchurian line from Antung (on the Yalu river) to Mukden in 1911, through traffic arrangements were made with the Manchurian, Siberian and Russian lines whereby the Chosen trunk line (Antung to Fusan) became a portion of the great passenger and freight route from Japan to Europe. At a conference held at Moscow in June, 1913, the Korean railways were recognized as a part of three great international transportation routes, i. e., via Siberia, via Siberia and Suez, and the round-the-world route

via Siberia and Canada. Through traffic agreements with the various Chinese roads were effected in 1914 and 1915 and have further added to the importance of the Chosen system.

When the Residency-General took over the management of the lines in 1906, they could not be operated to their fullest capacity because of the inadequacy of existing transportation facilities. Since that time through passenger service has been established between Fusan and Shingishu, the termini of the main line at each extremity of the peninsula, express service has been inaugurated on the Keijyo-Jinsen and other branch lines and general increases have been made in the number of trains run. With the construction of the Yalu river bridge and the rehabilitation of the Antung-Mukden (Manchurian) line in 1911, tri-weekly service was inaugurated between Keijyo, Korea, and Changchun, Manchuria, and all trains on the Chosen trunk line were operated as far as Antung, on the boundary with Manchuria. The opening of through service between Korea and Manchuria thereupon resulted in the revision of the steamer schedules between Shimonoeki, Japan, and Fusan, Chosen, to provide for daily instead of every-other-day service. At the same time the night train between Fusan and Keijyo, which had been run every other night, was run nightly and this innovation in conjunction with a daily passenger train between Keijyo and Antung, completed daily through service in Korea. Since June, 1912, the time of the through trains has been shortened and the run of the tri-weekly Chosen-Manchuria express which operated between Changchun and Keijyo was extended to Fusan. The construction of a new pier at Fusan facilitated passenger transfers from steamers to trains, and the revision of time-tables on the imperial Government Railways of Japan made close connections with the steamers at Shimonoeki possible, thereby tying Manchuria to Japan with a dependable regular service. There has also been a through freight service over the same route since January, 1913.

The policy of adding trains and revising time-tables in both Chosen and Manchuria continued until the fall of 1914 when the European war resulted in a decrease in the number of through passengers. This necessitated a reduction in the service of the Chosen-Manchuria express from three times a week to once a week. On the other hand, the Gensan-Bunsen section of the Kankyo line was opened to traffic in August, 1915; and in September of the same year schedules on the Keijyo-Gensan line were revised to provide for closer connections with the other lines running into Keijyo.

Freight Traffic on the Chosen Lines

Freight traffic has developed gradually as industries have increased in number and size, and as trade relations and traffic connections between Korea, Japan and Manchuria have become closer. The first year after the nationalization of the lines showed an increase of four per cent, both in the volume of freight and of receipts, over the previous year. In the following year (1907) arrangements for through traffic were improved, transactions at custom houses were very much simplified, a system of rebates was established to encourage shipping and other changes were made, all of which resulted in heavier traffic. In 1912 rates were reduced, the principle of reconignment was put into practice, and rates for long hauls were further reduced with a resultant increase in shipments, especially after the reduction in rates on import freight which became effective at the end of the year.

A special reduction in rates on cotton cloth and cotton yarn consigned to Manchuria and an increase in rice exports to Japan contributed to the favorable showing in 1913. Although the inauguration of through-freight service between Japan and Manchuria in January, 1913, encouraged

the exportation of rice and other grains, an economic depression set in towards the end of the year and continued until 1915. In the latter part of that year increases in the price of rice and other grain contributed to a revival in traffic. Greater activity in mining enterprises was reflected in a great volume of ore shipments. Timber, salt and coal traffic also increased appreciably and through business between Japan and Manchuria assumed greater importance. Freight statistics of the Korean roads for the fiscal year 1915 showed an aggregate tonnage of 1,656,640, a ton mileage of 170,945,269, and receipts amounting to 5,350,200

Station at Fusan Steamer Dock

yen (\$1,678,100), as compared with a tonnage of 391,175, a ton mileage of 24,777,710 and receipts totaling 1,088,498 yen (\$344,240) in 1907.

Korean Passenger Traffic

The passenger traffic of the Chosen lines has similarly increased both relatively and absolutely since their nationalization in 1906, although adequate statistics are not available for a direct comparison of results achieved before and after they were taken over by the Railway Bureau of the Residency-General of Korea. In the second year of operation by the Bureau riots in different provinces of Chosen affected passenger business adversely. In the following fiscal year, however, the opening up of the Keiijo-Shingishu and Masan lines, and the adoption of a uniform passenger rate for all the lines resulted in increased traffic. Night train service and an increase in the number of trains run further induced travel. Subsequently, a reduction of through service and a re-arrangement of local train service were necessitated by the economic reaction following the Russo-Japanese War. Thereafter no marked increase in passenger traffic occurred until 1910, when business conditions began to improve. In 1911 there was a further improvement in business and in 1912 when a reduction in passenger fares was made the number of short-distance passengers greatly increased. Excursion trains and special trains for large parties of visitors proved very popular, with a resulting increase in passenger receipts. In the following year the initiation of the policy of selling tickets at reduced rates to Koreans going to market at the principal towns swelled the number of travelers. In the same year the opening of through traffic between Japan and Manchuria and China marked a new epoch in the railway history of Korea.

The beginning of the present world war was reflected in a heavy decrease in passenger traffic in 1914. Although this period of depression continued in 1915, the Industrial Exhibition which took place at Keiijo in September in commemoration of the establishment of the Government-General in Chosen produced a revival in passenger travel which continued even after the close of the exposition. The number of passengers carried during the fiscal year 1915 totaled

5,040,471 and the receipts 1,001,250 yen (\$1,980,790), as compared with 2,625,772 passengers and receipts of 2,118,744 yen (\$1,059,372) in 1907.

Well-directed publicity, traffic affiliations with foreign companies, improvements in service, and the economic betterment of Chosen have all contributed in producing these satisfactory results. The railways have co-operated with newspapers in holding train exhibitions and in other undertakings to stimulate passenger travel. A rise in the standard of living in Korea and greater interest in travel, as well as a better understanding of the country's attractions, has resulted in an increase in tourist parties. For the convenience of tourists from foreign countries arrangements were made with Thomas Cook & Son, the International Sleeping Car Company, the Nordisk Reisebureau and the Tourist Bureau for the sale of tickets both to points in and through Korea to Japan or Manchuria.

In 1908 dining-car service was inaugurated on the Korean lines. Dining cars are equipped with writing tables, and boards and men for Japanese chess are loaned to passengers on request. Emergency medicine cases are provided on express trains, and first and second class cars are equipped with drinking water, electric fans in summer and steam heat and stoves in winter. First and second class sleeping cars are run on the Keiijo-Fusan line, extending from the capital to the extremity of the peninsula, and all express trains on the Keiijo-Fusan, Keiijo-Shingishu and the Keiijo-Jinsen lines are electrically lighted. To meet the needs of both passengers and employees, railway hospitals have been built at Ryuzan, Taiden and Soryo on the Keiijo-Fusan line, and, in addition, physicians in the service of the railways are available at all the principal stations.

Rolling Stock, Warehouses, Hotels, Maintenance Work

At the end of the fiscal year 1915 the rolling stock of the Chosen lines consisted of 169 locomotives, 357 passenger cars and 1,604 freight cars. The latest type of locomotive in use is a ten-wheel superheater locomotive weighing 112 tons. Seven other classes of engines are in use, three of which are of the saddle-tank type. All passenger cars have four-wheel trucks and are fitted with steam heat, air-brakes, vestibules, electric lights and fans. The largest type of car has a capacity of 104 persons. The freight cars

Railway Bridge Over Yalu River

are all of the four-wheel truck type except some of 20-ton capacity, which have six wheel trucks. Most of the freight cars are provided with air-brakes and have capacities ranging from 22 to 26 tons. Some four-wheel freight cars of 10-ton capacity are still used at the different shops.

In 1912 the Chosen lines opened hotel accommodations for tourists in the upper floors of the station buildings at Fusan and Shingishu. A five-story fireproof hotel, costing 840,000 yen (\$420,000) was completed in Keiijo in October, 1914. In the following year a small hotel was built at Kongo-san (Diamond Mountain), a resort on the Keiijo-Gensan line. In the fiscal year 1915 the guests at these hostels numbered

2,505 and the gross receipts amounted to 108,218 yen (\$54,109).

The first railroad warehouses in Chosen were opened at 11 stations in July, 1913. Since that time warehouses have been constructed at nine other stations. Warehousing in Korea, however, is still far below the needs of the country, to the disadvantage of industrial development.

Maintenance work on the Korean lines in 1915 included the handling of 21,692 cu. yd. of earth work, 132,664 cu. yd. of ballast, 205,632 sq. ft. of painting, the renewal of 321,387 ties and the transfer of 8.8 miles of rails. In addition, 2,935 telegraph poles and about 630 miles of wire were renewed and a number of bridges and buildings were repaired.

Telegraph Facilities

In the fiscal year 1915 the 156 telegraph offices on the Chosen lines handled 4,279,790 railway messages and 179,730 public messages. To take care of the increase in business an additional telegraph line was added in 1915 between Ryuzan and Teishu and one of the lines between Taikyū and Soryo was extended to Fusan. Prior to 1906 facilities for telegraphic communication on the Korean system were crude and rudimentary. In 1908 with the inauguration of through passenger service between Fusan, at the extremity of the peninsula, and Shingishu, at the Manchurian frontier, a through telegraphic circuit between Ryuzan and Soryo was installed. When the railway bridge over the Yalu River was completed and through Korean-Manchurian train service was established in 1911, all telegraphic circuits along the lines were changed. Subsequently, additional circuits were opened between Ryuzan and Taiden, between Ryuzan and Shingishu, and from Ryuzan to Mokuhō.

Employees' Relief Association

The Relief Association of the Chosen railways was established in April, 1910, as a part of the Relief Association of the Imperial Government Railways of Japan, but in October of the same year when the roads were taken over by the

Railroad Hostel in the Diamond Mountains

Governor-General it became an independent organization. Benefits granted by the association fall under two heads: one for injuries and the other for death and old age. Injury benefits cover expenses arising from injuries to members while on duty and compensation to employees permanently disabled, the latter ranging from the equivalent of wages or salary for from one month to two and one-half years in the case of the Japanese and half that amount for Koreans. Benefits for death and old age are granted in the case of an employee's death before the age of 55 years or upon his

reaching that age. The amount of the benefits varies according to age, length of membership in the association and the amount of salary or wages. Refunds are made to members who retire from the organization before reaching the age of 55. The benefit funds are supported by government subsidy and contributions by the members. In the fiscal year 1915, 8,430 out of 9,234 employees and officers of the lines were members, and of this number 5,114 were Japanese and 3,316 Koreans. Total receipts, including the government subsidy, members' contributions and interest amounted to 114,051 yen (\$57,025), while expenditures totaled 47,644 yen (\$23,822).

Wage Scales on Korean Lines

The wage problem in Chosen is insignificant when considered from the point of view of American standards. In 1915, the average monthly wage of the 8,699 employees of the system was but \$10.81. Japanese constituted 5,359 of

Railway Hotel at Keijō

the total number employed and received an average compensation of \$13.06 a month, or nearly twice as much as the wage of the 3,340 Korean employees who received but \$7.23. Even the 531 officers of the lines received an average salary of but \$46.40 a month. The munificent salary of the chief executive officer, known as engineer in chief, was 583.32 yen a month, or the equivalent of \$291.66.

Operating Results

Comparisons of Korean operating data for the fiscal year 1915 with statistics of all American lines having annual operating revenues above \$1,000,000, for the year ended December 31, 1916, show marked differences in transportation conditions in the two countries. The average receipts per passenger on the Chosen lines amount to but \$.0106 a mile, or barely more than one-half the American average of \$.02042. This low rate of return is compensated for by the heavier loading of Korean passenger trains. Whereas the average number of passengers per train-mile on American railroads is but 57, Chosen roads carry 118.3 per train-mile, or over twice as many. Freight traffic statistics, on the contrary, show lower receipts and heavier train-loading for railroads in the United States. Average receipts per ton per mile in Korea are \$.0093 as compared with \$.00706 on American lines; the average trainload in Chosen is but 91.6 tons as against 560 tons in the United States. It is interesting to note that average receipts have been falling steadily in Korea, while the average tonnage per train has been increasing. In 1907 the average trainload was but 29.3 tons, or less than one-third the trainload in 1915; the average receipts per ton per mile, on the other hand, were reduced from \$.0219 in 1907 to \$.0093 in 1915.

In the first two years following the nationalization of

the Korean lines in 1906 net losses were incurred in the operation of the system. Following general improvements in facilities, increases in traffic resulting from the steady industrial development of Korea and reductions in operating expenses, the lines became self-supporting. In 1908 the subsidy received from the government amounted to only 181,000 yen (\$90,500) as compared with 433,000 yen (\$210,500), the amount estimated as necessary to cover the annual losses of the lines. In the next year despite an economic depression, an epidemic of cholera and an unusually severe winter, no subsidy was required. Since then the financial condition of the roads has been improving steadily. In 1913, the net returns were almost double those of the previous year as a result of the increase in freight and passenger business following the opening of the Keijyo-Gensan line and a part of the line from Taiden to Mokuho.

The beginning of the war in Europe caused a decline in transportation for a time, but later a revival of business and an increase in rail shipments because of the scarcity of ships resulted in a recovery in the receipts of the Chosen system. In the fiscal year 1915 operating revenues amounted to 8,934,430 yen (\$4,467,215) and operating expenses to

7,155,806 yen, leaving a balance of 1,778,624 yen (\$888,880). The opening ratio for the year was, therefore, 80.01.

Railroad Enterprise Awakening the East

A Yankee naval officer first brought the light of western civilization to Japan. With a lapse of but 65 years, the enterprise, energy and initiative of the Nipponese have won for them the name of "Yankees of the East." Having transformed their own island kingdom into a progressive and powerful commercial and industrial state, they have undertaken also to awaken continental Asia from its lethargy by tapping its immense undeveloped resources and introducing modern economic standards. Knowing that improved transportation is the necessary forerunner of material welfare, the adaptable Japanese have proved themselves worthy imitators of the Caucasian nation in opening up new avenues of trade on both land and sea. As indicated by the review of their railway undertakings in Chosen, they have successfully penetrated the exclusiveness of the "Hermit Nation," thereby acquiring a territory 80,000 square miles in area, in which to exercise their genius for development.

Car Building Plants and Railroad Repair Shops

A Census Report on This Subject Gives Some Interesting Figures on These Plants for 1914

In 1914, there were 103 establishments engaged in the manufacture of freight and passenger cars for steam railroad service. These plants hired on the average 58,988 persons and the total value of products was \$194,775,669. In the same year also there were 1,362 steam railroad car repair shops, which shops hired on the average 361,925 persons and the value of the products of which was \$514,041,225.

These figures are contained in a report of the Bureau of the Census entitled Steam and Electric Cars and Railroad

including the operations of railroad companies, while the last two classes include the reports of railroad companies covering only the operations of their machine and repair shops. The value of products of the latter group is not a selling value, but a value equal to the operating expenses, such as salaries and wages, cost of materials, and miscellaneous expenses. An abstract of the report follows, the numbers of the tables being retained as in the original report.

Table 1 summarizes the statistics of the four industries

¹ A minus sign (—) denotes decrease; percentages are omitted where base is less than 100.

Repair Shops which has just been made public. This report presents statistics for (1) establishments building cars for use on steam railroads; (2) those building cars for use on electric railroads; (3) the operations of repair shops by steam railroad companies, and (4) the operations of repair shops by electric railroad companies. The first two classes include the reports of car-manufacturing establishments not

for 1914 and gives a comparison of the total with 1909, together with the percentages of increase.

The Car Building Plants

Table 14 shows in detail the statistics of cars built for use on steam railroads by establishments engaged primarily in their manufacture, for 1914, 1909, 1904 and 1899.

There was an increase of 2.1 per cent in the number of steam-railroad cars built in 1914, as compared with 1899, while the value for the same period shows an increase of 101.6 per cent. The average value of passenger-service cars increased from \$7,526 in 1899 to \$12,800 in 1914, and freight-service cars from \$533 in 1899 to \$825 in 1914. This increased cost per car is due largely to the more extensive use of steel in the construction of cars and the building of larger cars.

In addition to the cars manufactured by establishments

¹ In addition, 14,876 cars, valued at \$14,638,932, and parts and repairs, valued at \$980,074, were reported in 1914, and 23,693 cars, valued at \$19,362,855, and parts and repairs, to the value of \$210,487, were reported in 1909, by establishments engaged primarily in other industries.

² Includes gasoline motor cars for use as passenger cars by steam railroads for 1914 and 1906.

³ Reported as coal and coke cars in 1909, 1904, and 1899.

⁴ Includes 9,737 logging, mining, industrial, and dump cars, valued at \$1,825,693.

⁵ Includes 25 cable cars, valued at \$21,232.

assigned to this industry in 1914, there were 17 steam-railroad cars, valued at \$72,034, built by establishments engaged primarily in the manufacture of electric-railroad cars: 10,745 cars, valued at \$11,999,983, by repair shops of steam-railroad companies; and 4,114 cars, valued at \$2,566,915, by establishments engaged primarily in other in-

dustries, making a total of 14,876 cars, valued at \$14,638,932, as compared with 23,693 cars, valued at \$19,362,855 in 1909.

Of the total number of steam-railroad cars reported in 1914, 9.8 per cent were all-wood; 47.8 per cent, steel underframe; 3.3 per cent, steel body with wood interior; and 39.1 per cent, all-steel. A larger percentage of the passenger-service than of the freight-service cars were steel; \$4.8 per cent of the passenger-service cars were all-steel, and 9.7 per cent were steel body with wood interior. Of the freight-service cars, 49.1 per cent were steel underframe, of which 71.5 per cent were box cars, and 37.8 per cent were all-steel, of which 50.1 per cent were gondolas.

Railroad Repair Shops

Scope of the combined industry.—This industry is divided for census purposes into two classes—cars and general shop construction and repairs by steam-railroad companies, and cars and general shop construction and repairs by electric-railroad companies.

Every steam or electric railroad company of any magni-

¹ Less than one-tenth of 1 per cent.

tude operates one or more repair shops, chiefly for the purpose of maintaining the efficiency of the rolling stock. Such shops often manufacture complete cars and some of them manufacture complete locomotives. While the bulk of the work of the repair shops is on the rolling stock, they also do shopwork in connection with the construction and repair of bridges, buildings, etc. Most of the work done is on rolling stock operated by the company, but some companies do work of this character for others. The products are not ordinarily given a selling or contract value. The amount reported as the value for 1914 usually represented the cost of materials, salaries, wages, rent, and taxes. At prior censuses a miscellaneous expense item was reported, which to that extent increased the value of products. For steam-railroad repair shops this item amounted to \$3,946,043 in 1904 and \$5,886,066 in 1909, and for electric-railroad repair shops \$285,483 in 1904 and \$702,536 in 1909. The steam-railroad repair shops are far more important than the electric-railroad repair shops. In fact, measured

by the number of persons employed, they constitute one of the important industries covered by the statistics of manufactures.

Size of establishments.—The tendency of the industry to become concentrated in large establishments is indicated by the statistics given in Tables 29 and 30.

Fuel.—Coal is the principal class of fuel used in steam-railroad repair shops. In 1914, 506,696 tons of anthracite,

and 5,486,405 tons of bituminous coal were consumed in this industry. The other fuel used was coke, 79,597 tons; oil, 2,508,703 barrels; and gas, 1,829,902,000 cubic feet.

Special Statistics of Repair Shops

Table 32 gives in detail the statistics of steam-railroad repair shops for 1914, 1909, 1904, and 1899.

The table shows fewer locomotives and cars built in steam-railroad repair shops in 1914 than during some of the earlier census years. The number of locomotives decreased by 85, or 31.2 per cent, from 1899 to 1914, and the number of cars built, by 16,188, or 60.1 per cent, but

¹ Includes \$121,011 reported for Alaska.

² Not reported.

the total value of work done in these shops shows an increase of 135.5 per cent for the 15 years.

In 1914 the motive power and machinery department reported 46.1 per cent of the total value of products; car department, 47.3 per cent; bridge and building department, six-tenths of 1 per cent; and all other, or unclassified products, 6.1 per cent.

DAYLIGHT SAVING IN FRANCE will begin on Saturday, March 9, when all clocks will be set forward an hour at midnight.

Cinderella

Or the Little Coal Slipper

By B. L.

ONCE UPON A TIME, in the reign of good king Wudro, there was a man named Samuel who, on account of his easy-going nature, was generally known as Uncle Sam. He had a little daughter named Cinderella. She had a step-mother and besides two step-sisters called Industrie and Husbandrie, who hated little Cinderella because they did not want to share with her. They treated her like a servant and she had to fetch and carry everything; all the coal and wood, and goods of every kind that came into or out of Uncle Sam's house, Cinderella had to carry. They were constantly scolding her so that life was miserable for the poor child. The sisters dressed in rich gowns and went to balls and parties, while Cinderella had to stay at home in her torn and shabby clothes. Cinderella grew very fast, so that her clothes became too small for her, but every time she went to her step-mother and complained that her skirts had become too short and that her stockings were full of holes, her step-mother would say that five per cent more would make the skirts plenty long enough, and that she did not really need the stockings, reminding Cinderella that she was eating too much and suggesting many ingenious ways how Cinderella could do more work on less food.

It happened one evening that King Wudro gave a grand ball for his officers, who were going to the war, and invited Cinderella's step-sisters, who were now prouder than ever, but no one thought of the little girl at home, who felt so sad and lonely. Just as she was thinking how unhappy she was, her fairy godmother, Trafique, appeared before her.

"What troubles you, dearie?" she asked. "Would you like very much to go to the King's ball tonight?"

"O, very much, indeed!" answered Cinderella.

"Well," said her godmother, "you shall go and be the

most beautiful lady there. Fetch me a large pumpkin root of the garden," said the fairy. Cinderella lost no time in doing as she was bid, bringing a venerable yellow pumpkin known as a "Gentlemen's Agreement." No sooner had the god-mother touched the pumpkin with her wand, then behold! it was changed into a grand carriage. She then had four mice brought in belonging to the Brotherhoods, which she turned into horses. Four lizards, who had been executives, became footmen, and a wise old rat was changed into a suave coachman.

Cinderella could hardly believe her eyes. Just as she

looked down at her ragged clothes the good fairy waved her wand over her, and there stood Cinderella in a most magnificent ball gown, looking more beautiful than ever. To complete the toilet, the fairy gave her a pair of tiny coal slippers, which fitted her dainty feet perfectly. The only drawback to Cinderella's costume was that for the sake of efficiency she had to wear also a union suit, and there was a terrible law in the kingdom, called the Sherman Act, which punished with death anyone wearing such a garment.

The fairy then warned Cinderella on no account to remain at the ball after 12 o'clock, for if she did all her finery and splendid livery would be changed back again and she would once more be the shabby Cinderella.

Prince Makadu, a most noble and active gentleman, was told that a beautiful princess had arrived and he hastened to greet her. He led her into the ball room, where everyone looked at the charming girl. The prince danced with Cinderella many times, for he had never seen so lovely a lady. Cinderella had such a delightful time that she forgot to watch the clock, and suddenly she heard twelve strokes ring out, her fairy garments began to give her the greatest anxiety and she heard a terrible voice, supposed to be that of the King's Executioner, crying out in a voice of thunder, "Are you wearing a union suit?" Without saying good-bye to the prince, she rushed from the palace, and in her haste lost one of the coal slippers, the only gift of the fairy's that had remained unchanged, for when she reached the door she found that at the sound of the terrible words she had heard, the coachmen and footmen had run away, and instead of the fine horses there were only four small mice, squeaking for over-time upon a minute basis.

The prince was very sad when he missed the beautiful princess. He ran to the gates to see if any trace of her could be found; but the only thing he saw was a little coal slipper which Cinderella had lost in her flight, and he vowed that he would marry the lady whose foot it fitted.

So the next day a herald went through the town, going from house to house to fit the dainty slipper. All the ladies tried it on, but no matter how hard they squeezed their feet, it did not fit. At last the herald arrived at Cinderella's home. Her two step-sisters quickly stepped forward but they could not possibly manage to move the coal. They were greatly disappointed, and just as they were about to give up the attempt they heard Cinderella's gentle voice asking, "Will you let me try?"

As soon as her dainty foot slipped into the fairy shoe, it fitted perfectly! Then to the surprise of all, she pulled the companion slipper out of her pocket and put it on the other foot. Cinderella was the only girl in the kingdom who could accomplish this movement of coal, or keep it on foot. Just at this moment the fairy god-mother appeared and waved her wand over Cinderella. There again stood the magnificent lady of the ball with her beautiful dress studded with anthracite. The herald was delighted to have found the charming princess for whom the prince had been searching. He took Cinderella to the palace and Prince Makadu was so happy that she could move the coal that he made no objection to her costume, but thought only of her efficiency.

He married her at once, so at last Cinderella became a real princess. In the bride's trousseau there was a beautiful garment of the finest silk, which fitted her from wrist to ankle, like a glove. You will have to guess what it was, but I can tell you this, it made Cinderella very efficient.

She and the Prince lived happily together for ever—perhaps it would be better to say—for ever since.

Gaines Wall and Firebox Efficiency

By Jno. D. Rogers

Shop Superintendent, Virginian Railway, Princeton, W. Va.

THE WRITER has had an opportunity during the past six years of observing the advantages of the Gaines type of firebox construction from a practical and operating standpoint, both on passenger and freight locomotives. In considering the design of modern power, the question of firebox proportion is of primary importance, and should be given the most careful consideration, keeping in mind the ratio of grate area to heating surface. In the past the grate area has been limited by the endurance of the firemen. Since the introduction of successful stokers, this is no longer a function of steam making capacity. We now have stokers successfully firing grates of 100 sq. ft. and over, with apparently no limit to even further increase in grate area. The most important factor in firebox design is having proper depth of throat sheet; this is limited by the wheel arrangement. Few modern locomotives can have the mud ring over the driving wheels without a sacrifice being made in the design of the ash pan, and in many cases, even with the use of trailer wheels, ash pans are designed in such a manner that they choke the grate, making them very difficult to clean, at the same time limiting the air opening to the underside of the grate.

The source of all trouble in many bad steaming locomotives is in the ash pan, yet the front end, bad coal, and improper firing get the blame. Most grate failures can be traced to fire on the flares of the ash pan, choking off the draft, and causing the grates to become overheated.

With the Gaines wall the depth of throat sheet does not have to be considered, as, regardless of the depth of the fire, flues cannot be affected, nor can the misuse of the blower combined with dirty coal, or dead fire, have the usual bad results; flues leaking on locomotives with this construction are unheard of, cold air cannot reach them, and the writer has known of locomotives in service two years or more without any work being performed on the flues; in fact, no more than inspection of firebox by the boilermaker.

With all the advantages of the superheater there is no device that is more inefficient when the superheater flues are stopped up. To get results the flues have to be cleaned. This means every two or three trips. A green fireman may choke a full set of flues before he gets his train out of the yard by improper firing. It costs money to remove arches and blow flues. A great many locomotives could be turned "on the pit" if it were not for the flues being stopped up. I have no record of a locomotive equipped with a Gaines wall and combustion chamber having a flue choked; consequently the superheater operates at maximum efficiency, at the same time saving delay and expense at terminals. Most of the sparks are caught in the combustion chamber, which is easily cleaned at any time.

Even with the best designed fireboxes it is difficult to keep the bottom flues open, which means that a great part of this heating surface is continually out of service; at the same time choking these flues causes them to leak. A great proportion of our flue trouble can be traced to this source.

The Gaines type of firebox should be especially adapted to roads operating in terminals that have rigid smoke restrictions. The fact has been demonstrated that this firebox gives more complete combustion with the result that criticism from smoke inspectors is reduced to a minimum, while at the same terminals other locomotives cause frequent complaints. The Gaines walls, under most severe conditions, last from eight to twelve months, maintenance being simply a matter of patching the wall occasionally with fire clay.

MARACAIBO, VENEZUELA, IMPORTED RAILROAD MATERIALS valued at \$68,919 from the United States in 1915, and \$94,186 in 1916. The share of the United States in the import trade of this district rose from about 43 per cent in 1913 to 72 per cent in 1916.

Railroad Bill Sent to Conference for Final Adjustment

Period of Federal Control After War and Rate-Making Authority Still Points of Difference

WASHINGTON, D. C.

BY OVERWHELMING MAJORITIES both Houses of Congress have declared that the taking over of the railroads by the government is a war measure, that the legislation for their control is emergency legislation enacted to meet conditions growing out of the war, and that the existing system of government control shall continue only during the war and for not longer than a specified period thereafter. The question as to what the period shall be was referred to conferees appointed by the House and by the Senate after the railroad control bill was passed by the House on February 28, substantially in the form in which it was written by representatives of the administration and as passed by the Senate on February 22, but with differences on two important points and in several less important particulars. As passed by the Senate, the bill provided that the period of federal control shall continue for not longer than 18 months after the proclamation of peace terminating the war and the bill as passed by the House provided that it shall continue during the period of the war "and for a reasonable time thereafter, which shall not exceed two years next following the date of the proclamation." Both bills provide, in nearly identical language, that the President may, prior to July 1, 1918, relinquish control of all or any part of any railroad or system of transportation, further control of which he shall deem not needful or desirable; and the President may at any time during the period of federal control agree with the owners thereof to relinquish all or any part of any railroad or system of transportation. He may also relinquish all railroads at any time he shall deem such action needful or desirable and in such case no right to compensation shall accrue to the owners from the date of the relinquishment.

The administration had at first opposed fixing any definite time for the return of the roads to their owners, but apparently acquiesced in the idea of a time limit, when the opposition to such a plan became pronounced, and only 10 senators and 40 representatives voted for an indefinite period. Both bills contain the express declaration that nothing in the act is to be construed as expressing or prejudicing the future policy of the federal government concerning the ownership, control, or regulation of carriers or the method or basis of the capitalization thereof.

Affirmative action by Congress will, therefore, be required to prevent the return of the roads to their owners after the war, whereas under the terms of the bill as it was originally introduced, providing that the period of government control should continue until Congress ordered otherwise, a failure of Congress to agree as to the disposition of the roads would have meant an indefinite period of government control.

The House passed the bill by a vote of 336 to 6. Only two democrats and four republicans voted against it—Representatives Thomas, Kentucky; Gordon, Ohio; Chandler, Oklahoma; Dennison, Illinois; Hangen, Iowa; and Ramseyer, Iowa. It is understood that the leaders had planned to avoid a record vote on the bill but a roll-call was demanded by Representative Dennison. The Senate had passed the bill without a roll-call.

The Senate appointed as conferees Senators Smith, of North Carolina, Pomerene and Townsend, and the House appointed Representatives Sims, Doremus and Esch. Later Senators Robinson and Cummins were added.

The principal sections of the bill governing the method of compensation of the roads, on the basis of the average

net operating income for three years as the standard return as proposed by President Wilson, with provision for special treatment in exceptional cases, were not altered either by the House or by the Senate, but the House bill contained a provision omitted in the Senate, providing that the compensation should be increased by a percentage on the additional investment, estimated at about \$240,000,000, during the last half of 1917. It is understood that the conferees have agreed to eliminate this provision. The House bill did not include the Senate amendment that "there shall be no increase of compensation for any additions, improvements or betterments constructed out of or purchased by the earnings for investment or surplus earned during the period of federal control."

Another important question submitted to the conferees was as to whether the President or the Interstate Commerce Commission should have final authority over rates. The Senate bill provided that the President may initiate rates but that they shall be subject to review by the commission. The House bill also provided for a review by the commission of rates initiated by the President but authorized the commission merely to report its recommendations to the President.

The most important contests in the House were on the issues as to whether the President or the Interstate Commerce Commission should have final authority over rates and as to the period of federal control. In committee of the whole an amendment by Representative Sweet giving the authority to the commission was adopted by a vote of 164 to 157, but when a separate vote was taken before the final passage of the bill it was defeated 210 to 165, leaving the provision as reported by the committee. This authorized the President, when in his judgment it is necessary, to initiate rates by filing them with the commission and provided that they should be "fair, reasonable and just" and that the commission should hold hearings and make a report of its findings and recommendations (which shall prima facie be taken as correct) to the President for his final action. The Sweet amendment provided that the commission should retain its full jurisdiction over rates but, during the period of federal control, should "consider all the facts and circumstances growing out of unified co-ordinated federal control occasioned thereby."

An amendment proposed by Representative Esch to reduce the period of control after the war to one year was also adopted in committee of the whole, 143 to 11, but was defeated in the House 164 to 205. An amendment by Representative Barkley to leave the period indefinite was voted down 143 to 40. Representative London proposed to make the time 99 years, and received 4 votes, while there were 102 against it.

The playing of politics in connection with the bill was manifested in the votes on various amendments, rather than in the passage of the bill itself, particularly on the period of government control and on the rate-making power, the Republicans generally expressing themselves in favor of the shortest period of the continuance of the federal control system after the war and against giving the President power to control rates. There was a strong Republican line-up behind the Esch amendment to reduce the period after the war to one year, on the theory that this might possibly terminate the present system before the next Presidential election, but there was a surprising change in the

votes as taken in committee of the whole, where they were not recorded individually, and as taken separately just before the final passage of the bill. Some 16 Republicans from the western states where the Farmers' Non-Partisan League has a strong influence, with its advocacy of government ownership, voted for the Esch amendment, under cover of the non-recorded vote, but switched and voted against it when a roll-call was taken.

The House adopted an amendment similar to that of the Senate providing for the inclusion of short line roads in the federal system, providing that "every railroad not owned, controlled, or operated by another carrier company, and which has heretofore competed for traffic with a railroad or railroads of which the President has taken the possession, use and control, or which connects with such railroads and is engaged as a common carrier in general transportation, shall be considered as within federal control, as herein defined and necessary for the prosecution of the war, and shall be entitled to the benefit of all the provisions of this act."

In general the House bill contained more qualifications and restrictions on minor points than did the Senate draft. In the provision for the purchase of railroad securities by the President the House inserted, out of an abundance of caution, the words "out of the revolving fund created by this act," because some of the members objected to an unrestricted power. It was also provided that any securities so purchased shall be held by the Secretary of the Treasury, who shall, under the direction of the President, represent the United States in all matters in connection therewith in the same manner as a private holder thereof, and that the President shall make a detailed report of receipts and expenditures from the fund each year.

An amendment adopted on the motion of Representative Lenroot provides that no person employed in connection with the operation of railroads or systems of transportation under Federal control, except those persons referred to in the preceding paragraph of the bill which authorized the President to employ government agencies such as the Interstate Commerce Commission, shall be deemed to be an officer or employee under the United States within the meaning of the excess profits tax nor a civil employee of the United States within the meaning of the federal compensation act.

A section not in the Senate bill sought to protect short lines by providing that nothing in the act shall be construed to affect the routing instructions over and the traffic arrangements of such railroads as may not be taken over unless such arrangements and instructions prejudice the transportation of war materials or of government supplies.

The House was also more cautious than the Senate in its amendments of the section numbered 10 in the Senate bill and 11 in the House bill. The former provides that "carriers while under federal control shall, in so far as is not inconsistent therewith, or with the provisions of this act, or any other act applicable to such federal control, or with any order of the President, be subject to all laws and liabilities as common carriers," and that "suits may be brought by and against such carriers and judgments rendered as now provided by law." The House omitted the words "in so far as is not inconsistent therewith, or with the provisions of this act, or any other act applicable to such federal control, or with any order of the President." It also added that "no defense shall be made thereto upon the ground that the carrier is an instrumentality or agency of the federal government," and that "any final judgment heretofore rendered or that hereafter may be rendered against any common carrier under federal control shall be paid out of the sum accruing as compensation to the carrier against which such judgment is or was obtained."

Another section declares moneys and other property derived

from the operation of the carriers during federal control to be the property of the United States but provides that unless otherwise directed by the President such moneys shall not be covered into the treasury, but shall remain in the custody of the same officers and be accounted for in the same manner as before federal control.

A provision of the House bill not in the Senate draft provides that the owners of a railroad making an agreement with the President for compensation shall accept all the terms and conditions of the act and any regulations or order made by or through the President under authority of the act or of the act of August 29, 1916, under which the President took over the roads.

The House also added by a vote of 31 to 24 an amendment proposed by Representative Parker of New Jersey providing that overlapping and deferred accounts and claims, which are usually paid as current operating expenses, shall be paid out of operating income and on the surrender of the carriers they shall be returned subject to any such overlapping accounts.

The conferees expected to reach an agreement at a night session on Wednesday. An agreement fixing the period of government control after the war was reached on Wednesday, and, after a conference with the President, Senator Smith announced that he had a compromise plan as to the rate making authority to propose which he thought would be accepted. Under this plan the Interstate Commerce Commission would continue to have jurisdiction over rates that would be required to take into consideration increased expenses.

Demurrage on Heatless Days

THE INTERSTATE COMMERCE COMMISSION, Division No. 2, has issued a set of rulings on various questions which have arisen as to the application of demurrage rules and storage charges on the fuelless days designated by the Fuel Administration order of January 17. The questions were as follows:

First.—May the fuelless days designated by the Fuel Administrator be considered legal holidays as that term is used in the demurrage code?

Second.—Should demurrage charges be collected on a shipment such as asphalt which arrived at destination on January 18 and which because of its consistency could not be unloaded without first being heated and which was not heated because of the consignee's understanding of the Fuel Administrator's order?

Third.—Should demurrage charges be collected on cars containing freight which could not be loaded or unloaded without the use of a derrick operated by power derived from fuel?

Fourth.—Should demurrage charges be collected on shipments to a large industrial concern which could not load or unload them without certain inter-plant switching which could not be performed without power derived from fuel?

Fifth.—Should storage charges be assessed on less-than-carload freight which was not removed because an industry completely ceased operation on the fuelless days as the result of its understanding of the Fuel Administrator's order and of the instructions of the local fuel administrator?

It was held, as to the first question, that the fuelless days designated by the Fuel Administrator may not be considered legal holidays as that term is used in the demurrage code.

As to the second and third questions, it was held that a particular shipper's understanding of the Fuel Administrator's order is not conclusive, as different shippers may

construct the order differently; and that in cases where power or heat derived from fuel is necessary and customary for loading or unloading property, cars arriving and set for loading or unloading on January 18 should be treated exactly as though set for loading or unloading on January 23. In other words, in the circumstances of these cases, no demurrage charge should be assessed.

As to the fourth question, it was held that demurrage charges should be collected on shipments to industrial concerns which failed to load or unload cars because it is alleged that they were prevented by the Fuel Administrator's order from using locomotives for inter-plant switching. The Commission does not consider that there was any prohibition upon the plant locomotives from using power where necessary for loading or unloading any more than there was a prohibition against the use of locomotives for general railroad business.

As to the fifth question, it was held that storage charges should be assessed on less-than-carload freight not moved because the industry ceased operation on the fuelless days as the result of its interpretation of the Fuel Administrator's order, or the instructions of the local fuel administrator.

R. S. Lovett Director of Betterments and Additions

DIRECTOR GENERAL MCADOO has announced the creation of an additional division in his organization, that of Betterments and Additions, and has appointed Judge Robert S. Lovett director of the new division. Judge Lovett has resigned as chairman of the executive committee of the Union Pacific, and has severed his connections with all other corporate interests to devote himself exclusively to his new work for the government. He has also resigned as a member of the War Industries Board of the Council of National Defense.

As director of the Division of Betterments and Additions of the Railroad Administration, Judge Lovett will receive and pass upon the reports made by the railroads as to their budgets of necessary expenditures for improvements and in general will have supervision over capital expenditures.

Judge Lovett was born June 22, 1860, at San Jacinto, Texas. He entered railway service in 1884 as local attorney of the Houston East & West Texas. Since then he has been consecutively assistant general attorney and general counsel for the Texas & Pacific; general counsel of the Southern Pacific lines in Texas, while a member of the law firm of Baker, Botts, Baker & Lovett; president of the Houston & Texas Central, and general counsel of the Union Pacific-Southern Pacific system, and from 1904 to 1909 was vice-president and general counsel for the same roads. Since September 13, 1909, he has been chairman of the executive committee of the Union Pacific System. From October 21, 1909, to October 1, 1911, he was also president of the same system. From September 13, 1909, to January, 1913, he was also chairman of the executive committee of the Southern Pacific Company. Judge Lovett

R. S. Lovett

has been in Washington since shortly after the United States entered the war, and has been chairman of the priorities committee of the War Industries Board. He was also, until the government took over the railroads, director of priority in transportation.

Chicago-St. Louis Passenger Service Rearranged

ON RECOMMENDATION OF R. H. AHSITON, regional director for the western railroads, Director General McAdoo has provided a plan for the rearrangement of passenger train service between Chicago and St. Louis on a non-competitive basis. There are at present 15 passenger trains between the two cities, many of which leave at the same hour over different railroads. The new plan, which is to become effective on March 17, contemplates a reduction to nine trains more evenly distributed throughout the day, and provides that tickets shall be made interchangeable so that the traveling public will be afforded increased train facilities. The day trains are arranged to run from 9:00 a. m. until 12:00 noon, and the night trains from 9:00 p. m. until 11:30 p. m. on the following schedule:

| Southbound | | |
|----------------------------|-----------------|------------------|
| Railroad | Leave Chicago | Arrive St. Louis |
| Illinois Central | 9:00 a. m. | 6:00 a. m. |
| Chicago & Eastern Illinois | 10:00 a. m. | 6:00 p. m. |

This provides for three morning, one noon and five night trains from Chicago to St. Louis, and two morning, two noon and five night trains from St. Louis to Chicago. This schedule curtails excessive service formerly offered to the public under competitive conditions, but has been arranged so as to leave service which will be entirely adequate, while effecting a total saving of 15,700 train miles per month, an estimated saving in coal of 9,558 tons per month. The traveling public will have a choice of a greater number of hours of departure and arrivals than heretofore by using the road which has a train at the desired time, and the reduction will have an effect in reducing considerably the interference with freight traffic by passenger trains. The total cost per month of the service to be reduced is estimated at \$76,310.

Consideration has been given by Mr. McAdoo's staff and by the regional directors to similar plans of rearrangement of service between other important cities, announcement of which is expected shortly.

NEW JAPANESE SERVICE TO SOUTH AMERICA—Announcement is made by the Nippon Yusen Kaisha that it has definitely decided to open a new service to South America. With three steamers, each of 6,000 tons gross, the service will be operated every two months, making six round trips a year. Among the principal ports of call are Yokohama, Kobe, Singapore, Durban, Cape Town, Santos, Rio de Janeiro, and Buenos Aires.

General News Department

The Wisconsin & Michigan announces that its operating headquarters have been moved from Peshtigo, Wis., to Menominee, Mich.

The paint shop of the Florida East Coast, at St. Augustine, Fla., together with five passenger cars, was destroyed by fire on February 19.

Daniel Willard, president of the Baltimore & Ohio, has been again chosen chairman of the Advisory Commission of the Council of National Defense.

Gordon Grant, formerly chief engineer of the National Transcontinental Railway, of Canada, has been appointed adviser to the Canadian Minister of Railways, a new office created by the Dominion government.

Twenty two hundred and forty men from the Pacific system of the Southern Pacific are now serving their country in the army or navy. This is 366 more than had joined the colors at the time that the statistical issue of the *Railway Age* was published (January 4).

Free transportation for soldiers is proposed in a bill which Representative Steenerson has introduced in Congress. He would authorize free transportation for both officers and men, of the Army, the Navy and the Marine Corps, when on furlough, to and from their homes.

Albert J. Stone, operating vice-president of the Erie, has been appointed Assistant to A. H. Smith, Regional director, Eastern territory, United States Railroad Administration; headquarters, Grand Central Terminal, New York City; D. C. Porteous, secretary of the Seaboard Air Line, has been appointed assistant to John Skelton Williams, director of the Divisions of Finance and of Purchases of the Railroad Administration.

Exportation of railway material to Spain has been the subject of negotiations between the War Trade Board and the Spanish government, now nearly completed, providing for the exportation of a large amount of materials and supplies from the United States to be used in the rehabilitation of the Spanish railroads; this in return for assistance from Spain in furnishing supplies to the American Army in France and in the use of Spanish ships for some of our ocean traffic.

Obsolete or obsolescent locomotives may be useful somewhere, and Director General McAdoo has addressed a circular letter to the presidents of Class I railroads asking for information regarding all locomotives which are not in service by reason of age, condition, size, weight, etc., but which, if in good condition or properly repaired, could be used to advantage on roads of less traffic density or more favorable operating conditions. Information is asked regarding the character of the engines, their power and dimensions, general condition of boilers, fire boxes and machinery, and approximate cost of repair.

The Morkrum rapid telegraph is being installed on a number of important circuits of the Pennsylvania Railroad. The Pennsylvania already has rapid printing telegraphs in operation on lines between Pittsburgh and Philadelphia, between Altoona and Philadelphia, and between Washington and Philadelphia. All of these printing systems are worked on telephone trunk circuits. Most of the operators are women or boys. In the transmission of car reports and other reports to be copied on printed forms, the printing telegraph instrument records them on regular message forms and from these the receiving operator transcribes the figures to the form on which the code letters are printed.

Railroad Employees' Income Tax Returns are the subject of a circular which has been issued by Director General McAdoo. It appears that, numerous railroad employees who are not paid fixed annual salaries have not kept accurate

records of their earnings for the calendar year 1917, and, therefore, find it difficult to make an accurate return under the law. The director general asks the railroads to give to each employee who does not receive a fixed annual salary and who is included in the railroad's report to the collector of internal revenue, a statement as to the amount of compensation shown in such report as having been received by him, in order to facilitate the making of accurate tax returns.

Requirements for steel rails during the current year, is a subject concerning which Director-General McAdoo has asked for information from the railroads. A circular has been addressed to the presidents of all Class I carriers asking them to send information to the Interstate Commerce Commission showing the number of gross tons of new rail placed in track during the calendar year 1917, the estimated amount required for 1918, separately for maintenance and construction, the minimum amount required to maintain track in safe condition during the year, the tonnage contracted for delivery, including that due on previous contracts or carried over on contracts for the previous year, and the tonnage of rail on hand on January 1.

A train of sixty automobile freight trucks, started from Buffalo, New York, by the War Department on February 12 reached New York city, about 440 miles, on February 28, having encountered serious delays because of bad roads. The trucks were two weeks in reaching Amsterdam, about 260 miles. On one day they accomplished only six miles: the longest day's run was 77 miles. Snow from 3 ft. to 5 ft. deep was encountered in many places and the roads, for considerable distances, were not wide enough for the five-ton trucks. On one occasion, the men in charge, 170 of them, had to sleep in the trucks, having found it impossible to reach a town. One man was injured while chopping ice away from truck wheels and one truck fell down a 60-ft. embankment. These trucks were loaded with automobile parts, consigned to the War Department storehouse at Baltimore, Md.

Contractors on new subway construction work in New York City are facing serious financial perplexities because of the high prices of material and of wages, and scarcity of help; and the Public Service Commission of the state has called upon the city authorities to join the commission in devising measures of relief. The number of men now at work for the contractors is about 7,000, as compared with an average of 12,000 in April, 1917; and those now at work are being constantly offered better pay elsewhere. The Public Service Commission fears a complete stoppage of the work, and consequent delay in the opening of the new routes, which would impose upon the city great losses. Remedial legislation is needed at once. The contractors are said to be willing to complete the unfinished work on the basis of cost of labor and materials, without profit. The Public Service Commission, in its annual report, issued in January, expected that some 40 or 50 miles of tracks in the new subways would probably be opened for traffic early in this year. The completion of these lines has been much delayed by the contractors' difficulties.

Railroad Contributions

The Railroad Administration, under the direction of C. A. Prouty, director of the division of public service and accounting, is conducting an investigation to determine whether and to what extent during the period of government control railroads should continue to make contributions to the support of associations of commerce, boards of trade and similar civic organizations. Railroads have not only become members of such associations, paying dues in the same way that other members do, but they have also in some cases made special contributions; and, in order to determine his policy in the matter, the Director General is collecting information as to the character of the practice and the

amount of money involved. For this purpose a circular letter has been addressed to various organizations asking them to furnish the names of railroads; whether the amount of dues is determined by rules or by-laws of the organization, or whether it is voluntarily determined by the railroad, and whether there is any limitation as to the use to which the contribution shall be put.

Railroad Wage Commission

A special session of the Railroad Wage Commission was held on February 28 at Washington to hear testimony by Miss Pauline Goldmark, representative of the Consumers' League of New York, and other organizations, regarding the employment of women in railroad work. She said that women first were employed in any considerable number by the railroads about a year ago, at the instance of the Railroads' War Board, and that while they were at first employed for clerical and other light work they have since been employed in increasing numbers for heavier work in freight yards, track repairs and shops. Some of this work, she said, involved too great a physical strain, as in cases where they are required to lift heavy weights.

Bolsheviki Destroy Bridges on Trans-Siberian

Advices received at Washington Monday indicated that German controlled Bolsheviki elements in Siberia had begun operations to prevent Japan and the Entente Allies from controlling the eastern end of the Trans-Siberian Railroad. John F. Stevens, chairman of the American Railway Commission, reported to the state department that the Russians had begun destroying bridges on the Trans-Siberian between Lake Baikal and the Manchurian frontier. It is believed that this action is aimed at preventing any advance of Japanese troops to carry out police duties.

All the bridges on the railroad have been permanently mined for some time. Russians believe that the Bolsheviki may blow up many of these structures. The Bolsheviki, they insist, will pursue the same tactics toward the Japanese as they have against the Germans, and will refuse to recognize them as friends.

Minnesota Appeals for Cars

The State Public Safety Commission of Minnesota recently sent a personal appeal to President Wilson for cars needed to move 13,000,000 bushels of potatoes from northern Minnesota. The text of the telegram, which was signed by Governor Burnquist and the chairman of the commission reads, in part, as follows:

"Minnesota, in response to requests from your administration and as a patriotic duty, produced 33,000,000 bushels of potatoes last year; 13,000,000 bushels on hand are spoiling for want of a market, but principally for the want of refrigerator cars to move them. Cannot the supply division of the quartermaster's department furnish an immediate outlet for a large part of the same and the director of railways furnish transportation to move this enormous supply of valuable foodstuffs? Failure to do so at once means destruction of the supply and a small acreage this year. All other sources of relief but your good self have been appealed to without success. Here is an opportunity to cut red tape and produce results."

Thirty-seventh Regiment Electrical

Engineers, Being Recruited

A regiment of electrical engineers is being recruited in Chicago as rapidly as possible for service in France. The selection of the staff of commissioned officers has practically been completed, though the selection of non-commissioned officers has not been made and the men who enlist will have chances for these places. Men who are skilled in the following trades will be enlisted: Cooks, machinists, blacksmiths, metal workers, foundrymen, pattern-makers, plumbers, electricians, pipe fitters, draftsmen, storemen, carpenters, welders, boiler-makers, bricklayers, masons, chauffeurs, handymen and linemen. The regiment will also need operators of oil, steam and gasoline engines and electrically driven pumps.

The regiment will be known as the 37th Engineers and will be commanded by Col. Theodore A. Dillon, an officer of the Engineering Corps of the Regular Army, who has been relieved

from duty as electrical engineer of the Panama Canal to command this regiment. A special recruiting office has been opened at 120 West Adams St., Chicago, in charge of Major Arthur B. Kratz, Engineer Officers' Reserve Corps, also formerly on the Panama Canal.

West in Need of Cars

At a conference in Washington last week with Director-General McAdoo and the other regional directors, R. H. Ashton, in charge of western lines, made an appeal for additional cars for his territory to take care of emergency movements. Cars are especially needed to move potatoes from the northwest and live stock from Iowa, Illinois and South Dakota. As a result of the meeting it was decided to deliver a thousand cars a day to western roads until further notice.

The special trainload movements of flour, grain and meat, arranged for by the western regional director in co-operation with the United States Food Administration, and outlined in the *Railway Age* of March 1, page 473, have been carried out according to schedule and are proving an excellent method of taking care of export demands. Priority is still being given to the movement of grain in 11 western states and, since February 22, priority has been extended to cover farm implements, incubators, egg cases and egg case fillers.

Railroad Commission Investigates Possible Economies

The Railroad Commission of California recently completed an investigation of possible economies of operation of transportation companies in that state during the war. In a report handed down on February 9, the commission made a number of recommendations, including the following:

1. Labor Shortage: To obtain needed unskilled labor the Federal government should remove the entrance tax and suspend the literacy test to permit the importation of Mexican labor. The importation of Oriental labor is not necessary in view of the availability of Mexican labor. To obtain skilled labor universities and technical schools should establish courses in railroad shopwork, including practical training in railroad shops.
2. Competition: No construction work on competitive lines unless so far progressed that stoppage would entail a considerable loss, instead, use existing facilities jointly.
3. Priority: All orders should be handed to the railroads through one central bureau.
4. Cross-hauls: Steps should be taken to do away with all unnecessary cross-hauls.
5. Franchise Requirements: State, county and city government authorities not to require utilities, during the present emergency to live up to franchise requirements which call for improvements that are not immediately necessary in the operation of the public utility affected.
6. Supplies: The establishment of a priority by the Federal government as between requirements of railroads of the United States and orders for foreign governments and industries in this and other countries.
7. Reconsignment: Suspension of this privilege on all commodities with the exception of perishable products and the relaxation of such privileges on perishable products to a minimum.
8. Team Tracks: All existing team tracks to be used jointly by any carrier which is able to reach them.
9. Short Haul Freight: All short haul freight, particularly less than carload shipment, to be handled by inland water transport, common carrier, trolley electric lines and motor tracks.
10. Advertising: The considerable expense incurred by railroads in advertising could be materially reduced without impairment of efficiency.

American Gear Manufacturers' Association

"Gear Standardization" will be the principal subject of discussion at the second annual convention of the American Gear Manufacturers' Association, to be held at Green Brier Hotel, White Sulphur Springs, W. Va., on April 18, 19 and 20. An address by a representative of the United States Chamber of Commerce, of which the association has just become a member, will also bring matters of timely interest before the association.

The convention will begin with meetings of committees on Thursday morning, April 18. At 1:30 the first session will open with an address by President F. W. Sinram, "The A. G. M. A. Past, Present and Future." Following the address by the Chamber of Commerce representative, C. R. Pool will talk on "Hardening and Heat Treating of Gears" and J. F. Watrous will present the report of the Standardization Committee.

Friday morning's session will include reports of officers and committees, election of new members of the Executive Committee and miscellaneous business. An informal banquet will be held in the evening.

On Saturday morning a paper on "Uniform Cost Accounting" will be presented by J. H. Dunn, and on "Hobs and Hobbing Machines" by a representative of the Barber-Coleman Company.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF DECEMBER, 1917.

REVENUES AND EXPENSES OF RAILWAYS

CALENDAR YEAR 1917 Continued

| Name of road. | Average mileage during period. | Operating revenues | | | Maintenance of way and structures. | | Operating expenses | | | Operating ratio. | Net operating income (or loss). | Railway operating accruals. | Increase in operating income (or loss) last year. |
|--|--------------------------------|--------------------|------------|--------|------------------------------------|------------|--------------------|-------------------|----------|------------------|---------------------------------|-----------------------------|---|
| | | Freight. | Passenger. | Total. | Way and structures. | Equipment. | Traffic. | Trans- portation. | General. | | | | |
| Albany, N. Y., and Saratoga & Plattsburgh, N. Y. & | | | | | | | | | | | | | |

Railway Regiments' Tobacco Fund

During the past week one new subscription to the Railway Regiments' Tobacco Fund for \$10 a month for 12 months was received from the Rome Iron Mills, Inc., New York; a donation of \$20 was made by the McConway & Torley Company of Pittsburgh, and a second contribution of \$100 was received from the Chicago Railway Equipment Company, Chicago.

American Institute of Consulting Engineers

The Council of the American Institute of Consulting Engineers, on February 19, elected the following officers for the ensuing year: President, Lewis B. Stillwell; vice-president, Alexander C. Humphreys; secretary and treasurer, F. A. Molitor (35 Nassau street, New York). The new members of the Council elected at the annual meeting are J. Vipond Davies, P. W. Henry and C. M. Ingersoll.

The Northern Pacific "Careful Club"

The Bureau of Efficiency of the Northern Pacific has adopted a new plan to secure the co-operation of employees in accident prevention. It has organized a "Careful Club." All employees and their families are eligible for membership, which they may secure by accepting a four-colored emblem bearing the Northern Pacific trade mark and the words "Careful Club, Northern Pacific." The emblem is in the form of a lapel button for men and a bar pin, with the added words "Ladies' Auxiliary," for women.

With the emblem each member is handed a card on which is printed: "Having hereby become a member of the Northern Pacific Careful Club, I wear as a token this N. P. emblem to remind me that as our lives and limbs are priceless it is my duty to myself, to my family, to my employer and to my nation to avoid all risks; and my duty to my fellowmen is to induce him to do likewise. This duty I will faithfully strive to perform."

Conference on Railroad Fuel Coal

A general conference on questions arising in connection with the supply of fuel coal to railroads, called by the United States Fuel Administration, was held at Washington on March 1. Representatives of coal mine operators, eastern railroads, the office of the Director General of Railroads, and the Fuel Administration attended. The conference was purely advisory. It selected W. K. Fields, president of the National Coal Association, as chairman, and began a general discussion of recommendations to the Director General of Railroads and the Fuel Administration designed to secure the following results:

1. To provide a definite and dependable supply of good fuel for the railroads.
2. To avoid excessive use of transportation in obtaining railroad fuel.
3. To retain for other uses some coals of special quality which are now being used as railroad fuel.
4. To so distribute railroad fuel in connection with all other distribution as to obtain as nearly as possible equal running time for all mines. A committee was named consisting of one member from each of the railroads represented in the conference and one member representing each of the coal districts present, which should consider the questions they had been called to discuss and report to the conference.

The railroads appointed the following committeemen: Delaware & Hudson, J. White Sprong; New York Central, S. B. Wight; Erie, W. R. Collins; N. Y. Ontario & Western, Chas. A. Draper; Norfolk & Western, Geo. Duglinson, Jr.; Lehigh Valley, F. L. Blendinger; Bangor & Aroostook and Boston & Maine, Frank C. Wright; Pennsylvania and Long Island, C. M. Sheaffer; Delaware, Lackawanna & Western, C. C. Hubbell; Canadian Northern, H. T. Rawlings; Central of New Jersey, J. F. Hinterleiter; Chesapeake & Ohio, D. T. Jellison; Baltimore & Ohio, W. L. Robinson; N. Y., N. H. & H., George G. Yeomans; Philadelphia & Reading, E. B. Crosley. The committee adjourned to meet again on Friday, March 8.

Traffic News

The Kansas Public Utilities Commission in a decision handed down on February 20, denied the application of the railroads of that state for an increase in freight rates of 20 per cent.

Sixty ships are now engaged in carrying coal to New England, and shipments of bituminous coal for factories in that territory are being largely increased. While New England is behind in its normal supply, there is now a gradual revival in industries which were affected by the shortage.

The Adams Express Company has announced this week an embargo on all carload shipments, and on all pieces of freight weighing more than 300 lb. each, throughout the territory east of Chicago and St. Louis, and north of the Potomac and Ohio rivers. Government shipments, food products, and a few other things are excepted.

Figures showing that nearly 50 per cent more grain has been hauled to western primary markets during the last three weeks than in the same period of last year have been made public by the Railroad Administration. In spite of this, however, the reserve of grain in elevators of western primary markets is now only one-third of that of a year ago.

According to reports made by the Milwaukee (Wis.) committee of the Commission on Car Service, the average weight per car of merchandise loaded in Milwaukee during January, 1918, was 16,428 lb., as compared with 11,597 lb. in 1917, or an increase of 4,831 lb., effecting a saving of 3,756 cars. The total number of cars loaded in January, 1918, however, was less than half the total of January, 1917, the decrease in tonnage being 27,620,863 lb.

While Chicago and the entire East have had a siege of snow and cold weather this winter, the weather along the Union Pacific in Wyoming has been mild, says the company's monthly bulletin for February. On February 4 the thermometer at Cheyenne, Wyo., registered 61, and an Omaha newspaper had an article headed "Go to Wyoming, the Land of Fruit and Flowers, the Popular Winter Resort." The Union Pacific spent a million dollars last year for steel and concrete snow sheds in Wyoming but they have proved unnecessary this winter.

General William W. Wotherspoon, superintendent of public works of the state of New York, discussing ways and means for utilizing the barge canal from Lake Erie to the Hudson river, which is to be ready for use on May 15, recommends the building of barges 150 ft. long, and 20 ft. 4.5 in. wide, with a draught of 8 ft. 6 in. or 9 ft. Such a barge could carry 600 tons. For the present the size of vessel which can be used on the canal for through traffic to New York City will be limited by the lock in the Hudson river, between Troy and Albany, which is only 44 ft. wide, 10 ft. deep and about 310 ft. long. A barge of 2,800 tons could pass through this lock, but General Wotherspoon doubts the commercial practicability of so large a vessel. With a supply of vessels of the smaller size suggested he would have them run in fleets of four. With one of the four equipped with power, the fleet could pass through the locks at one time.

The proposal for a special charge to cover the switching service performed by railroads on private and industrial sidings has been revised by the Railroad Administration and is arousing shippers throughout the country. While there has been no announcement, a tentative plan has been drawn by the traffic department of the Railway Administration, which provides for a charge of \$2 a car for placing the loaded cars on a private siding, or taking a loaded car from the siding; \$1 per car for spotting a car at a particular location on the siding, and \$2 per car for interplant switching. It has been estimated that these charges would increase the revenues by \$176,000,000, but shippers have made estimates much higher. The Railroad Administration is also making efforts to expedite the work of compiling a uniform classification of freight. Members of the three classification com-

mittees, together with a representative of the Interstate Commerce Commission, are at work in Chicago at the request of the Interstate Commerce Commission in an effort to submit a report for early consideration.

Through the Hudson Terminal of the Hudson & Manhattan Railroad, Church and Cordland streets, New York City, there pass annually about 17,000,000 passengers to or from stations on the Pennsylvania Railroad, which is an increase of more than 50 per cent over the number thus using the station in 1911, the year in which the Hudson & Manhattan and the Pennsylvania began their joint service of electric passenger trains between Church street, New York, and Park Place, Newark. These figures are given in a statement by Samuel Rea, president of the Pennsylvania Railroad, explaining the use of the tube terminal as a passenger terminal of the Pennsylvania Railroad. He calls attention to the fact that this terminal was so used for two years before the Pennsylvania station at Thirty-second street was opened. Passengers began using the "Hudson Tubes," in place of the ferry boats, as soon as the tubes were opened, transferring to and from the Pennsylvania trains at the old station of that road in Jersey City. Transfers from electric to steam trains, and steam to electric, are now made at Manhattan Transfer, eight miles west of Jersey City.

Freight Congestion at Atlantic Ports

Regional-director A. H. Smith reports that on March 1, the freight on hand at the six North Atlantic ports awaiting shipment by ocean vessels amounted to 30,719 carloads, as compared with 33,595 cars on February 1. The decrease at New York was 3,249 carloads, but there were increases at Baltimore and Philadelphia. Of the total freight on hand March 1, the amount in cars was 7,018 carloads; on piers or in warehouses, 7,000 carloads, and on the ground, 16,701 carloads. Since January 1, the decrease in the total has been about 25 per cent.

Joint City Ticket Office at Washington

City ticket offices of seven railroads in Washington are to be combined in a single union ticket office, in a central location, by order of the Railroad Administration. Committees of the various territorial passenger associations are considering plans for similar changes in other cities, but it was decided to make the first move of this kind at Washington. The offices to be combined are those of the Baltimore & Ohio, which has two offices, the Pennsylvania, the Southern, the Norfolk & Western, the Chesapeake & Ohio, the Seaboard Air Line and the Atlantic Coast Line. A considerable saving in rentals will be made besides releasing valuable space for other purposes, but the total saving will be only about half the amount of the reduction in rentals because it is expected to make some increases in salaries. The new office is to be opened about May 1.

Aerial Postal Service

The Post Office Department has announced that the proposed aerial postal service between Washington, Philadelphia and New York is to begin not later than April 15. By arrangement with the War Department, the postal route will be conducted for one year as a part of the aeronautic training service of the War Department and the War Department will provide the aeroplanes for the service. One trip each way will be made daily, except Sunday, on a regular schedule. Not to exceed 300 pounds of first class mail, occupying a space of not more than 25 cubic feet, will be carried each trip. It is proposed to issue 24-cent stamps, to be used on letters by airplane, their function being similar to that of a ten-cent special delivery stamp; thus making the cost of a one-ounce letter 27 cents. It is expected that the trip between Washington and New York, including a stop at Philadelphia, will be made inside of three hours. In New York the proposed landing places are several miles from the main post office.

EXPORTS FROM THE PORT OF NEW YORK during the month of January, 1918, according to a compilation of the National City Bank of New York, included steam locomotives valued at \$1,025,139, freight cars at \$888,244, and rails at \$670,040.

Commission and Court News

Interstate Commerce Commission

E. L. Bevington, J. E. Hannegan and E. E. MacLean have filed fifteenth section applications with the Interstate Commerce Commission for permission to file tariffs increasing the rates for the movement of special baggage cars and special passenger cars and making a change in the rules governing the combination movement of special baggage and passenger cars and special trains between Colorado common points, Ogden and Salt Lake City, Pacific Coast points and Chicago, Missouri river, and Mississippi river points, and Texas and New Mexico points. The proposed basis is 12½ fares or 30 cents a mile with a minimum of \$25 a car for special baggage cars and 25 fares with a minimum charge of \$25 for special passenger cars.

Court News

Limitation of Liability

In an action against an express company for the loss of a trunk, the New York Appellate Division holds that although the shipper's servant who delivered the trunk and took a receipt for it was illiterate, the liability of the defendant was limited by the amount stated in its receipt, where the amount paid for transportation entitled the shipper only to such amount under the filed tariffs, the shipper being charged with notice of filed tariffs, which are terms of the contract.—*Kolb v. Taylor*, 168 N. Y. Supp., 685. Decided January 17, 1918.

Grant of Perpetual Right to Use Streets

The Louisiana Supreme Court holds that by the terms of Act No. 79 of 1896, p. 113, the governing authorities of towns or cities having less than 25,000 inhabitants have no authority to grant to a railroad company a perpetual or irrevocable right to use or occupy any street in the municipality, unless the grant be approved by a majority of the property taxpayers in the municipality voting at an election called for that purpose.—*Louisiana Western v. Crowley (La.)*, 77 So., 486. Decided November 26, 1917. Rehearing denied January 3, 1918.

Heating Waiting Rooms

Section 784 of the Kentucky Statutes requires ticket offices to be open 30 minutes before time of departure of passenger trains and until the trains depart. Section 772 requires proper waiting rooms, properly lighted and heated. In a prosecution for violation of section 772, the Kentucky Court of Appeals holds that under these sections railroads are not required to keep their waiting rooms suitably heated or ventilated during the whole day, or at any other time except the time provided by section 784.—*Illinois Central v. Commonwealth (Ky.)*, 200 S. W., 17. Decided January 29, 1918.

Crossing Accidents—Contributory Negligence

The California Supreme Court holds that the driver of an automobile damaged in a collision with a train at a crossing was negligent, barring recovery, in not getting out and looking up the track, although no whistle was blown nor bell rung. He was driving on the left-hand side of the roadway, on which side a building obstructed his view of the track, and he was well acquainted with the dangerous conditions and knew that several accidents had occurred there.—*Murray v. Southern Pacific (Cal.)*, 169 Pac., 675. Decided December 18, 1917.

The California District Court at Appleton for the Second District holds that an automobile driver, familiar with a railroad crossing, where the view was somewhat obstructed, could have stopped a safe distance from the track, stilled the noise of the automobile engine and listened for an approach-

ing train; but he failed to do so and was, as matter of law, guilty of contributory negligence, barring recovery for injury to the automobile.—*Rayhill v. Southern Pacific (Cal.)*, 169 Pac., 718. Decided November 8, 1917.

State Commission's Approval of Switching Rates

The Illinois Supreme Court holds that, under section 36 of the Public Utilities Act, declaring that no public utility shall increase any rate or other charge or so alter any classification, practice, or regulation as to result in any increase in rate, except on a showing before the commission, the increase of switching charges by a rule which defines a side track as a team track is improper, where the previous charges had been imposed for many years. Although it was conceded that the fact that an unreasonably low rate had been charged for a long term of years would not prevent the railroad from making a reasonable charge, still the statute does prevent doing it without the commission's approval.—*Commission v. C. P. & St. L. (Ill.)*, 118 N. E., 427. Decided December 19, 1917. Rehearing denied February 7, 1918.

Stipulation as to Claim for Damages

The Massachusetts Supreme Judicial Court holds that the stipulation of a contract for an interstate shipment of horses requiring claim for damages to be in writing, verified by the shipper and delivered to the carrier's agent within five days of the time of the removal of an injured horse from the car, was reasonable. A station agent cannot bind the railroad by admissions in effect substituting a new agreement as to such a shipment in place of the agreement of the railroad and shipper, and depriving the railroad of the requirements of the written contract between it and the shipper. It is also held that a contract covering a shipment of horses was not defective because unfiled and incomplete in certain places, among them omitting the name of the shipper from the heading, reading: "This agreement made this * * * day of 10-2-1912 and by and between the Boston & Maine Railroad, hereinafter called the carrier, and * * * hereinafter called the shipper," etc.—*Fletcher v. N. Y. Cent. & H. R. (Mass.)*, 118 N. E., 294. Decided January 14, 1918.

Federal Employers' Liability Act—

Limitation of Time for Action

The New York Supreme Court, Special Term, Steuben County, holds that under the federal Employers' Liability Act, § 6, providing that no action shall be maintained under the act unless commenced within two years from the day the cause of action accrued, where plaintiff's intestate was killed in service in 1909, and she brought action under the state statutes, later amending to set up the federal Employers' Liability Act, which action finally resulted in dismissal of her complaint, on the ground that she had failed to show her intestate was engaged in interstate commerce at the time of the accident, she was not entitled to bring a new action in 1917, under the federal Employers' Liability Act, though within a year after the decision of the Court of Appeals affirming the judgment dismissing her complaint in the former action, despite New York Code Civ. Proc., § 405, substantially providing that when an action is commenced in due time, and plaintiff fails otherwise than upon the merits, a new action can be commenced within one year.—*Norton v. Erie*, 167 N. Y., Supp. 177. Decided November 12, 1917.

Rival Claims to Goods

The Minnesota Supreme Court holds that where on arrival at destination property is demanded from a carrier by the consignee and also by an adverse claimant, the carrier is entitled to a reasonable time for investigation, on its request therefor, before an action will lie against it. Where the adverse claimant claimed no rights under the contract of shipment and made no claim to the property until after it had arrived at its destination, the carrier owed to him only the duties of a bailee or warehouseman and might relieve itself from liability by showing that without fault or negligence on its part it was unable to produce or deliver the property. In an action of replevin by the adverse claimant the defendant

carrier interposed both the above defenses, and they were excluded at the trial. Verdict was given for the plaintiff, and from an order denying a new trial the defendant appealed. It was held that the defenses were erroneously excluded, and as the record showed conclusively that the defendant did not waive them, a new trial was ordered.—*Taylor v. Duluth, S. S. & A. (Minn.)*, 166 N. W., 128. Decided January 18, 1918.

Cases Under the Federal Employers' Liability Act

Where a railroad, whose tracks were wholly within the state, maintained a private spur track at the owner's expense, over which it moved freight cars from its station to the owner's premises, the New York Appellate Division holds that a laborer, injured while repairing the spur track, was not engaged in interstate commerce, notwithstanding that the railroad sometimes moved interstate freight over the track.—*Liberti v. Staten Island*, 167 N. T., Supp. 478.

The New York Appellate Division holds that a carpenter employed in repairing coal chutes through which coal passed to interstate locomotives was not engaged in interstate commerce.—*Gallagher v. N. Y. C.*, 167 N. Y., Supp. 480.

The Indiana Appellate Court holds, following *N. Y. C. v. Winfield* (1917), 244 U. S. 147, and *Erie v. Winfield* (1917), 244 U. S. 170, that if a railroad employee is engaged in interstate commerce when accidentally injured without negligence of the employer, he cannot recover under the state Workmen's Compensation Act, though the railroad company is not liable under the federal Employers' Liability Act. A flagman killed by an automobile while he was diagonally crossing the intersection of the defendant railroad's track to get his lantern or flag was held to be engaged in interstate commerce depriving the state industrial board of jurisdiction. *Walker v. C. I. & L. (Ind.)*, 117 N. E., 969.

The New Jersey Court of Errors and Appeals holds that under the federal Employers' Liability Act, relieving the employer from liability for injury to an employee arising out of risks assumed by the employee, a railroad employee injured by reason of an obvious risk fully appreciated by him was injured by an assumed risk and could not recover. *Capan v. D., L. & W. (N. J.)*, 102 Atl., 661.

Refusal of Mileage Book Coupons by Foreign Road

In an action for damages for misrepresentation in the sale of mileage transportation tickets it appeared that on April 3, 1914, the plaintiff telephoned to the agent of the defendant, the Alabama Great Southern, at Bessemer, that he wanted transportation from Bessemer to Shreveport, La. Before the train was due the plaintiff went to the ticket office and the agent delivered to him a book containing mileage coupons, form S. I. M., and a ticket from Bessemer to Shreveport, the agent tearing out of the book coupons to pay for such ticket; and the plaintiff signed the contract printed on the outside of the mileage book. The ticket routed the plaintiff over the defendant's road and over the Vicksburg, Shreveport & Pacific to Shreveport. There was stamped on the face of the contract signed by the plaintiff in large red letters that coupons would not be accepted on trains or for transportation over the V. S. & P. after March 1, 1914. Under tariff duly filed with the Interstate Commerce Commission by the defendant and other roads it was provided that the V. S. & P. would not honor coupon mileage tickets, form S. I. M. Desiring to return to Bessemer the plaintiff presented to the ticket agent of the V. S. & P. the mileage book and demanded a ticket in exchange for mileage coupons. This was refused; the plaintiff took passage on the V. S. & P.'s train and was ejected by the conductor for refusal to pay fare. The plaintiff brought action for damages for the defendant's agent's wrongful representation that the mileage transportation was good over the V. S. & P. on his return trip. The Alabama Court of Appeals held that as the contract was strictly in conformity with the regulations and tariff filed with the Commission, it was binding on the plaintiff, and the defendant was not liable for the agent's statement that the coupons were good for return transportation over the V. S. & P.—*Alabama Great Southern v. Vermillion (Ala.)*, 77 So., 67. Decided November 13, 1917.

Equipment and Supplies

Locomotives

THE CANADIAN GOVERNMENT RAILWAYS have ordered from the Canadian Locomotive Company 6 six-wheel switching locomotives and 4 ten-wheel narrow gauge locomotives, the latter four for the Prince Edward Island Railway. Delivery is specified for June.

Freight Cars

CIO ANFALDO & Co. are inquiring for 300 tank cars.

THE CANADIAN GOVERNMENT RAILWAYS are inquiring for 5,000 40-ton box cars.

FELS & Co., Philadelphia, are inquiring for a number of 8,000- to 10,000-gal. tank cars.

THE PURE OIL COMPANY, Minneapolis, Minn., is inquiring for 30 steel underframe tank cars.

THE UNITED STATES GOVERNMENT has ordered for use on military railroads in France in addition to the 3,500 recently reported, 500 low side gondola cars from the Haskell & Barker Car Company and 375 high side gondolas and 200 box cars from the Standard Steel Car Company.

Miscellaneous

FOREIGN TRADE OPPORTUNITIES.—Commerce Reports, published daily by the Bureau of Foreign and Domestic Commerce of the Department of Commerce, contain in recent issues the following trade opportunities:

26540.†—The professor of railway engineering of a college of engineering and mining in Peru desires to receive illustrated catalogues from American manufacturers and exporters of railway equipment, etc., these catalogues to be used in connection with his classes in railway engineering; also sanitary supplies and equipment.

26558.†—An agency is desired by a man in France for the sale of railway construction materials. Correspondence should be in French. References.

26559.*—A company in India desires to secure an exclusive agency for the sale of light railway material. Payment will be made by 60-days' rupee drafts, documents against acceptance. Correspondence may be in English. References.

Reserved addresses may be obtained from the bureau and its district and co-operative offices. Request for each opportunity should be on a separate sheet and state opportunity number. The Bureau does not furnish credit ratings or assume responsibility as to the standing of foreign inquirers; the usual precautions should be taken in all cases. Symbols: *Reported by American consular officers; †Reported by commercial attaches and commercial agents; ‡Direct inquiries received by the Bureau.

Signaling

THE LOUISVILLE & NASHVILLE is making extensive additions to its Union electric interlocking plants at Louisville, Ky., and Amqui, Tenn.

THE MISSOURI PACIFIC has ordered from the Union Switch & Signal company an interlocking machine, 20 levers, to be installed in the place of an old machine at Halsey, Ill.

THE MISSOURI, KANSAS & TEXAS has ordered from the Union Switch & Signal Company material for a twelve-lever interlocking at Clinton, Mo., at the crossing of the St. Louis-San Francisco.

THE YAZOO & MISSISSIPPI VALLEY has ordered from the Union Switch & Signal Company material for a mechanical interlocking at Baton Rouge, La., 21 working levers.

Supply Trade News

A. J. Beuter, representative of the Baldwin Locomotive Works at San Francisco, Cal., has been transferred to Portland, Ore.

The Bettendorf Company has waived its patent rights on truck sides and underframes for the duration of the government control of the railroads.

F. H. Bird, traveling engineer for the American Steel Foundries, Chicago, has been commissioned a first lieutenant in the Ordnance Department of the U. S. Army.

W. I. Seigle, a member of the board of directors of the H. W. Johns-Manville Company, New York City, was elected vice-president at a recent meeting of the board. William T. Klaus was elected a director to succeed Mr. Seigle.

Ernest Baxter, general storekeeper of the Wabash, with office at St. Louis, Mo., has resigned to become manager of railroad sales for the Kansas City Bolt & Nut Company, with office in Kansas City, Mo., effective March 1. A photograph and biographical sketch of Mr. Baxter appeared on page 1128 of the issue of the *Railway Age Gazette*, for May 23, 1917.

W. D. Horton, circulation manager of the Simmons-Boardman Publishing Company, publishers of the *Railway Age*, has resigned to accept a position as district railway sales

W. D. Horton

manager of the Patton Paint Company with headquarters at Milwaukee, Wis., effective March 1. Mr. Horton was born in Brooklyn, N. Y., December 3, 1880 and was educated in the public schools of that city. On June 1, 1908 (at the time of the consolidation of the *Railway Age* and the *Railroad Gazette*) he joined its staff and from 1908 to 1914 acted as traveling subscription representative, on April 1, 1914 being appointed circulation manager. Mr. Horton has had a wide selling experience, having spent several years, previous to 1908, selling various commodities such as stationary engines, boilers, wood-working and other machinery. In this work he travelled extensively throughout the United States, Canada, Mexico, Cuba, the West Indies, and in South and Central America. As circulation manager, he obtained a wide personal acquaintance among executive officers and department heads of nearly all the railways in the United States and Canada.

R. S. Cooper, who for several years has been in charge of the New York office of the Independent Printing and Engraving Company, Chicago, has been elected vice-president and general sales manager with headquarters at the Trust Building, Chicago. R. T. Scott, who has been in charge of the Pittsburgh office, succeeds Mr. Cooper at New York and H. F. Finney succeeds Mr. Scott at Pittsburgh.

H. J. Tierney, president of the Tierney Supply & Lumber Company, Chicago, has been appointed representative for the Grip Nut Company, Chicago, with office at 1742 Railway Exchange Building, St. Louis, Mo. Mr. Tierney began railway service with the Missouri, Kansas & Texas, on March 5, 1888, as apprentice cooper. He was appointed mechanical engineer in 1907, and was promoted to superintendent of

the car department in January, 1916, with headquarters at Denison, Tex., which position he resigned on January 1, 1918, to become president of the Tierney Supply & Lumber Company.

Interstate Iron & Steel Company

The annual report of the Interstate Iron & Steel Company, Chicago, for the year ended December 31, 1917, shows net earnings of \$989,028, after the deduction of \$61,659 for dividends on preferred stock, the payment of all operating expenses, taxes and fixed charges and after ample provision for depreciation and preferred stock sinking fund requirements. This net return is equal to 24.7 per cent on the outstanding common stock. However, no dividends were distributed on the common shares this year for reasons outlined by S. J. Llewellyn, the president, as follows:

"In normal times a substantial dividend upon the common stock would be justified. However, in view of the extremely unsettled financial conditions and the unknown factors of the business situation throughout the world your directors believe that it is to the best interests of the stockholders to conserve the cash resources of the company so as to adequately meet any unforeseen demands, rather than to pay a dividend at this time."

The company's balance sheet for the last fiscal year is as follows:

| ASSETS | | | |
|--|----------------|----------------|----------------|
| Plant and Goodwill: | | | |
| As at January 1, 1917..... | \$5,492,931.46 | | |
| Additions during year..... | 871,434.93 | | |
| | \$6,364,366.39 | | |
| Deduct: | | | |
| Depreciation reserve..... | \$323,978.18 | | |
| Proportion of abnormal cost of construction during 1917 written off..... | 44,450.00 | 568,428.18 | \$5,795,938.21 |
| Current Assets: | | | |
| Inventory..... | \$1,813,608.48 | | |
| Accounts and bills receivable less reserve..... | 1,082,403.67 | | |
| U. S. Liberty Loan Bonds—4's..... | \$475,000.00 | | |

| Surplus: | | | |
| Adjusted balance January 1, 1917..... | \$162,739.29 | | |
| Surplus net income for year ending December 31, 1917..... | 1,050,686.75 | | |
| | \$1,213,426.04 | | |
| Deduct—Dividends paid on preferred stock..... | 61,658.84 | 1,151,767.20 | |
| Total liabilities..... | | \$9,885,999.22 | |

American Steel Foundries

The American Steel Foundries found the fiscal year ended December 31, 1917, the greatest in the company's history. The gross sales for the year were \$49,369,584, as compared with \$31,361,006 for 1916. The earnings from operations, after deducting all manufacturing, selling, administrative, and head and district offices expenses, and adding miscellaneous income, were \$8,956,321, as compared with \$4,965,224 in 1916. Taking out \$917,646 for depreciation, \$219,235 for interest charges, and \$2,287,600 for Federal taxes, there were net profits before bond redemption and debenture retirement of \$5,531,839.

Dividends of 1¼ per cent each were paid in the first and second quarters of the year, and of 1¾ per cent in the third and fourth quarters, involving a total payment of \$1,031,040. Of the balance of the net earnings \$197,251 went into additions to property; \$1,787,378 to reduction of bonded indebtedness (including debentures); and \$2,604,293 to increase in working capital, which at the end of the year was \$9,895,421. The surplus increased during the year \$2,777,558, and now stands at \$6,429,228.

President R. P. Lamont in his report comments on the present situation as follows: "The year 1918 starts out badly. The operations for January were seriously curtailed by extraordinarily bad weather, railroad embargoes, and forced shutdowns on account of the coal situation, though we had plenty of coal and oil to run without interruption. February was also unsatisfactory, and it is certain that the first quarter of the year will not compare favorably with the same quarter last year. However, we have a large tonnage ahead of the Foundries which will keep us busy for six months at least. The miscellaneous business holds up particularly well, and sooner or later the railroads will have to come into the market; a great deal depends upon when they do, but with the large and constantly increasing shortage of equipment it seems certain that as soon as the necessary machinery is provided at Washington, the roads must buy large numbers of both cars and locomotives. We have a considerable volume of government work on our books; the margin of profit is small, but it will increase the volume of our business and help to carry overhead. We expect on the whole a satisfactory year."

The balance sheet follows:

| ASSETS | | | |
|--|--------------|--|--|
| Real estate, buildings, plant, machinery, tools, equipment, patents and good will..... | \$20,480,727 | | |
| Real estate not used for business purposes..... | 298,630 | | |
| | \$20,779,358 | | |
| Miscellaneous securities..... | \$1,192,098 | | |
| Inventories..... | 7,552,854 | | |
| Accounts and bills receivable (less reserves)..... | 8,608,865 | | |
| Cash..... | 825,308 | | |
| | 17,979,125 | | |
| Deferred charges to operations..... | 226,391 | | |
| | \$38,984,873 | | |
| LIABILITIES | | | |
| Capital stock..... | \$17,184,000 | | |
| Four per cent debentures..... | 1,716,800 | | |
| Notes payable to banks..... | \$3,125,000 | | |
| Accounts payable and payrolls accrued..... | 2,694,690 | | |
| Provision for war excess profits, income and other taxes..... | 2,461,791 | | |
| Accrued interest on debentures..... | 28,613 | | |
| | 8,310,094 | | |
| Reserves for: | | | |
| Furnace rebuilding and metal flask renewals..... | 273,866 | | |
| Workmen's compensation..... | 101,482 | | |
| | 375,348 | | |
| Appropriated surplus: | | | |
| Bond sinking fund reserves..... | \$3,249,403 | | |
| Debenture retirement reserve..... | 1,720,000 | | |
| | 4,969,403 | | |
| Undivided surplus..... | 6,429,228 | | |
| | \$38,984,873 | | |

Trade Publications

NEW YORK CONNECTING RAILROAD.—The Lehigh Portland Cement Company, Allentown, Pa., has issued two companion pamphlets describing this monumental work on which 600,000 bbl. of Lehigh Portland Cement was used. One of these contains a brief description of the construction of this line with special reference to the masonry work and is illustrated by maps. The second is a folder of colored illustrations showing the Hell Gate bridge section of this line in panoramic views and detailed illustrations of various portions of the masonry work.

JAPAN'S FUEL PROBLEM.—Anthracite coal in Tokio has been raised from 7 to 18 yen (\$3.50 to \$9) per ton. One of the causes attributed by coal dealers to the increased prices was the lack of space in the transportation of coal by the railways and shipowners, while at the coal mines and the provincial coal depots, stock is being accumulated to the annoyance of mine operators. The output of the collieries is increasing, but it is yet out of keeping with the demand of the market. The growing decline in the visible stock is mostly due to the overtaxed railways, resulting in the increase of prices.

Financial and Construction

Railway Financial News

CHICAGO, MILWAUKEE & ST. PAUL.—The directors met on February 28, but again took no action regarding the regular semi-annual dividends on both the common and the preferred stock. The question of declaring these dividends was indefinitely deferred at the regular meeting held January 25 last.

DENVER & RIO GRANDE.—E. L. Brown, president and a co-receiver recently appointed by the court, has resigned as co-receiver, and the court has designated Alexander R. Baldwin to act as sole receiver of the company's free assets. He will have no jurisdiction over operations. This change in the status of the receivership was made to segregate the operations of the property from the receivership. In receivership the courts would be called upon to operate the property, which eliminated the control of its operation by Director-General of Railroads William G. McAdoo. The new arrangement will continue the operations of the property under control of the Director-General and retain only the free assets under the jurisdiction of the court.

FT. SMITH, SUBIACO & EASTERN.—In a suit in equity by the St. Louis Union Trust Company to foreclose a mortgage on the Ft. Smith, Subiaco & Eastern, the United States District Court of the Western District of Arkansas issued an order appointing I. H. Nakdimen and Charles H. Sommer receivers of this road, which operates between Fort Smith, Ark., and Scranton, a distance of 14 miles.

ILLINOIS CENTRAL.—This company has notified its stockholders that it has discontinued the practice of sending them a monthly statement of its earnings. This action is taken on the ground that Federal control has so mingled the operations of all roads that a monthly earning statement would be of little or no value to the security holders.

PENNSYLVANIA RAILROAD.—See comments on annual report elsewhere in this issue.

PITTSBURGH & LAKE ERIE.—Col. J. M. Schoonmaker has been elected chairman of the board of directors, a newly created office.

Railway Construction

DELAWARE, LACKAWANNA & WESTERN.—This company is making plans to carry out improvements, including grading and relocation of tracks in the freight yards at Binghamton, N. Y. The work involves the handling of 300,000 cu. yd. of earth fill. Bids for the work will probably be asked for in the near future.

ERIE.—Plans have been made by this company to build a steel bridge with concrete floor about 70 ft. long and 61 ft. wide, over the tracks at Rochester. The new bridge will connect Clarissa street with the bridge over the Genesee river.

NARRON CENTRAL RAILROAD.—This company's plans call for building a line from Kenly, N. C., on the Atlantic Coast Line, northwest, to Zebulon, on the Norfolk Southern, about 20 miles. Track has already been laid on about seven miles. The line is being built to carry lumber, farm produce, cotton, tobacco and merchandise. N. Narron, president, and O. F. Watson, chief engineer, Kenly.

SOUTHERN RAILWAY.—Plans are being made by this company to build a new station at Cordova, Ala. The building will be of frame construction and will replace the structure destroyed by fire.

WESTERN MARYLAND.—A contract has been given to the Price Construction Company, Baltimore, Md., to put up a shop building at Hagerstown, Md. It is to be a brick structure with slag roof, and will be 34 ft. wide by 80 ft. long. The cost of the work will be \$10,000.

Railway Officers

Executive, Financial, Legal and Accounting

G. B. Wall, vice-president of the Chesapeake & Ohio, has been appointed a vice-president also of the Hocking Valley, with office at Richmond, Va., and will perform such duties as the president may assign to him.

I. G. Ogden, vice-president of the Canadian Pacific, with office at Montreal, Quebec, has been relieved of some of his duties, to enable him to give his entire time to the financial department, and **John Leslie**, controller, has been placed in entire charge of the accounting department in all its branches.

James M. Kurn, who was elected vice-president in charge of operations and construction of the St. Louis-San Francisco, as has already been announced in these columns, was born at Mt.

Clements, Mich., on October 4, 1870, and began railway work in 1885 as a telegraph operator on the Michigan Central. On November 1, 1887, he was appointed to a similar position on the Atchison, Topeka & Santa Fe, and during the succeeding five years served as operator and agent at various stations on that system, being promoted to train despatcher in 1892. He was later appointed superintendent of the Rio Grande division and on December 20, 1905, was transferred to the New Mexico division, where he remained until October 1, 1910, on which date he was appointed general superintendent of the western lines, with headquarters at La Junta, Colo. He resigned this position on January 1, 1914, to become president and general manager of the Detroit, Toledo & Ironton, with office at Detroit, Mich., which position he held for the last four years, until the date of his appointment, as noted above, effective March 1.

J. M. Kurn

Operating

Victor Parvin, trainmaster of the Virginian Railway, with office at Princeton, W. Va., has been appointed superintendent of the New River division, with office at Princeton, vice **L. R. Taylor**, resigned.

J. W. Cousins, has been appointed terminal superintendent of the Illinois Central at New Orleans, La., succeeding **J. L. Beven**, granted leave of absence to enter government service, effective February 1.

R. B. Cooper was appointed trainmaster of the New Orleans division of the Yazoo & Mississippi Valley, with headquarters at Wilson, La., succeeding **M. G. Kennedy**, transferred, effective February 1.

H. A. Connett has been appointed chief train despatcher of the eighth and ninth districts and the Park City branch, of the Union Pacific, with office at Evanston, Wyo., succeeding **V. A. Wirt**, promoted, effective February 25.

J. S. Bergman, assistant superintendent of the Winston-Salem division of the Southern Railway, with office at Winston-Salem, N. C., has been appointed superintendent of the same division, with office at Winston-Salem, vice **J. M. Bennett**.

E. L. Desjardins, assistant superintendent of the Canadian Government Railways, with office at Lévis, Que., has been appointed superintendent of the Moncton-Diamond Junction

district, with office at Edmundston, N. B., vice **A. R. Macgown** resigned to go to another company.

Charles H. Hopkins, superintendent of the Southern division of the New York, Ontario & Western, with office at Middletown, N. Y., having resigned, **W. D. McQueen**, superintendent of the Scranton division, with office at Childs, Pa., has been appointed superintendent of the Scranton and Southern divisions with office at Middletown, and **N. S. Badger**, trainmaster at Childs, has been appointed assistant superintendent of the Scranton division, with office at Mayfield yard, Pa.

Engineering and Rolling Stock

W. H. Eyer has been appointed engineer and roadmaster of the Bloomsburg & Sullivan, with office at Bloomsburg, Pa., vice **William C. Fortune**, deceased.

B. J. Peasley, whose appointment as mechanical superintendent of the St. Louis-Southwestern of Texas, with office at Tyler, Tex., was announced in these columns on January 18, was born at Decorah, Ill., on December 21, 1867. He entered railway service at the age of 16 as laborer and machinist's apprentice with the Chicago, Burlington & Quincy, at West Burlington, Ia. On completing his apprenticeship he entered Elliott's Business College, at Burlington, Ia. After completing the business course he again entered railway service as a machinist with the Atchison, Topeka & Santa Fe, at Ft. Madison, Ia. In 1894 he was employed by the Ft. Madison Gas & Gasoline Engine Company; from 1895 to 1899 he was employed by the Chicago, Ft. Madison & Des Moines, as fireman and engineer. From 1899 to 1901 he was employed by the Illinois Central, at East St. Louis, Ill., as a machinist and was later promoted to division and wrecking foreman, at Carbondale, Ill. In 1901 he entered the service of the Denver & Rio Grande, as roundhouse foreman at Helper, Utah, where he remained a short time, returning to the Illinois Central, at East St. Louis, Ill., where he served in the capacity of roundhouse foreman, shop foreman and general foreman until September, 1906. He was appointed general foreman with the Missouri Pacific, at Bixby, Ill., in September, 1906, and was later promoted to master mechanic, at Ferriday, La., where he remained for six months and was then transferred to De Soto, Mo., as master mechanic of the Missouri division. In February, 1914, he was promoted to superintendent of shops at Argenta, Ark., where he remained until promoted as noted above.

W. W. Appleton, general master mechanic of the Canadian Government Railways, with office at Moncton, N. B., has been appointed superintendent of motive power with office at Moncton, vice **G. R. Joughins**, who was superintendent of rolling stock; **W. E. Barnes**, master mechanic at Moncton, succeeds Mr. Appleton. The title of **G. E. Smart** has been changed from master car builder to superintendent of car department.

W. A. Randow has been appointed master mechanic of the first division of the Denver & Rio Grande, with headquarters at Pueblo, Colo., with jurisdiction over the entire division, with the exception of Burnham shops, vice **M. J. Powers** resigned, and the office of assistant master mechanic has been abolished. **H. C. Stevens**, master mechanic, with office at Alamosa, has been appointed superintendent of shops at Burnham. **J. L. Fagan**, master mechanic at Grand Junction, has been appointed master mechanic of the fourth division, with headquarters at Alamosa,

vice Mr. Stevens. **F. T. Owens**, assistant master mechanic at Pueblo, has been appointed master mechanic, with office at Grand Junction, vice Mr. Fagan.

Traffic

G. W. Cushing has been appointed traffic manager of the Utah Railway, with headquarters at Salt Lake City, Utah.

G. E. Hill has been appointed commercial agent of the Lehigh Valley, with office at Newark, N. J., vice **C. H. Gulick**.

G. F. Brigham, general agent of the Chicago & North Western at St. Louis, Mo., has resigned to engage in other business.

F. E. Pittman, assistant treasurer of the Reid Newfoundland Company, with office at St. Johns, N. F., has been appointed general passenger agent, vice **J. W. N. Johnstone**, resigned.

Frank D. Austin, acting manager of the Mount Jewett Route, with office at New York, has been appointed assistant coal freight agent of the Erie, with office at New York, vice **Charles H. Horrell**, resigned to go into other business.

R. C. Cotner, traveling passenger agent of the Southern Railway, with office at Spartanburg, S. C., has been appointed division passenger agent with office at Spartanburg; **R. H. Graham** has been appointed division passenger agent, with office at Greenville; **E. P. Johnson**, traveling freight agent, at Jacksonville, Fla., has been appointed commercial agent, with office at Jacksonville, vice **T. D. Mullaly** and **U. G. Soule**, has been appointed commercial agent with office at St. Louis, Mo., vice **C. F. Lauer**.

Obituary

Robert A. Kutschback, assistant general attorney of the New York Central, with headquarters at New York, died in a hospital in that city on February 28, at the age of 64. Mr. Kutschback had served in the law department of the New York Central for about 34 years.

A. W. Wright, a railway construction engineer, died at Los Angeles, Cal., on February 3. He had charge of much of the construction of the Union Pacific in the early 60's and later of the Northern Pacific. He was also connected in an engineering capacity with a number of cable railways.

W. S. Danes, retired engineer maintenance of way of the Peru division of the Wabash, died at Chicago, Ill., on February 22, at the age of 65 years. He entered the service of the Wabash in 1880, as general foreman in charge of bridges and buildings. He was promoted to superintendent of bridges and buildings, and later to engineer maintenance of way of the Peru division, with headquarters at Peru, Ind., which position he held until retired.

ELECTRIC LOCOMOTIVES FOR MANCHURIAN COAL MINE.—The 50-ton electric locomotives for use by the Fushun collieries for freight handling are the first of the kind ever built at the South Manchuria Railway workshops. They are for the standard gauge. Each locomotive is designed to haul 580-ton trains at the speed of 12.9 miles per hour on the level tangent track, exclusive of the weight of the locomotive, the trolley voltage being 1,200 volts. They are of the two-bogie type, each bogie carrying 125-horsepower motors. The total weight is 97,200 lb.; ballast weight, 15,200 lb.; weight on drivers, 112,400 lb.; weight per driving axle, 28,100 lb.; and weight of a motor, 5,000 lb.—*Commerce Reports*.

ITALY LEADS IN MOTOR CAR EXPORTS.—Italy occupies the position of the leading motor car exporting nation of Europe, according to official figures issued by the Ministry of Finance. For the first eight months of 1917 her motor exports increased 113.4 per cent, as compared with the corresponding period of 1915, and 96.4 per cent as compared with the first eight months of 1916. The largest proportion of vehicles consisted of motor lorries despatched to the various Allied Powers. They numbered 6,169, and had an average value of 14,375 lire (\$2,731) each. Touring cars totaled 506 for the eight months, their average value being 17,568 lire (\$3,338) each. They were practically all fully equipped cars for Allied staff service.

EDITORIAL

Railway Age

EDITORIAL

The Railway Business Association is to be congratulated on the vision of its leaders who are guiding it into channels for greater usefulness, the possibilities of which are simply tremendous. It is not too much to say that it has within its grasp opportunities which if rightly used will make for the future welfare and prosperity of the entire country. A "call to arms" of all the supply interests, which has been sent out by the executive committee of the association, will be found elsewhere in this issue. The meeting, which will be held in Chicago on April 8, promises to be one of the most important events in the history of the railways and railway supply interests in this country.

A Great

Opportunity

The building of standard locomotives to meet all conditions on American railways is impracticable. This we have demonstrated clearly in recent issues. The Government's standardization committee has been working a month on this problem. If it is attempting to formulate standard designs for all types of locomotives it is working to no purpose. By far the most practical thing to do is to design one or two locomotives which will be suitable for common use or as floating equipment. As far as possible power, for use on individual roads should be built to each road's standards, which are especially suited to its peculiar conditions. To attempt to go further than this is inexpedient and a waste of time—and time is the most potent factor in this war.

Extensive Standardization Impracticable

The Interstate Commerce Commission's final summary of railroad revenues and expenses for December has been published this week. In December, of course, the roads were being operated without any Government guarantee of net income and without Government control. Transportation expenses averaged \$646 per mile of road in December, 1917, as compared with \$490 in December, 1916. This was for the entire United States. In the East transportation expenses averaged \$1,207 per mile in 1917 and \$914 in December, 1916. Because of weather conditions, January and February were both worse than December in respect to cost of operating trains; but take December and try to get some conception of what this increased cost meant. Visualize any piece of track a mile long that you are in the habit of traveling over. If this piece of track is in the East, it costs about \$300 more for engine-men's and trainmen's wages, fuel and lubricants to move the trains that passed over that mile of track in December, 1917, than it did in December, 1916. The freight trains were on an average considerably shorter in December, 1917, than in December, 1916. The freight they carried yielded considerably less revenue for each train in 1917 than in 1916. As a matter of fact the total revenue from freight for all the trains moving over that mile of track was a few dollars less last year in December than in December of the year before. Multiply this increase of \$300 in trainmen's wages and fuel by the number of miles covered in the hour's trip between

Washington and Baltimore. There was an *increase* of \$124,000 in the single month of December, assuming that this piece of road was near the average for the Eastern territory. As a matter of fact, probably the increased cost on this particular forty miles was far greater than the average. Taken the operation of one mile of railroad to the business of a corner grocery store; how long would the groceryman stay in business if he had not been permitted to raise his prices in December, 1917, as compared with the same month in the previous year, and had had to pay out in wages and for his goods \$300 more than he had paid the year before? Everybody now acknowledges that railroad expenses are mounting tremendously, but it is worth while to stop and try to translate the figures for this increase into the homely things that we all deal with every day.

Is it any wonder that the railroads have difficulty in obtaining competent supervision in their shops when a man has to make a sacrifice in his earnings to become a foreman? Is it any wonder that the heads of the mechanical department complain that they can't keep competent foremen on the job when we see such conditions as that where, out of about 700 workmen in one shop, last month, five received more wages than the general foreman, eight more than the assistant general foreman, 11 more than the boiler and machine shop foreman, 16 more than the blacksmith foreman, 69 more than the erecting shop foreman and 147 more than the gang foreman? Can a man be blamed for resigning his position when those under his charge, and for whose work he is responsible, are getting more money than he? Full cognizance must be taken of existing labor and living conditions if the shops are to retain and obtain competent men to supervise the work.

Supervision Must Be Adequately Paid

There was a meeting of railway executive officers in New York on Monday, presided over by Frank Trumbull, chairman of the Railway Executives' Advisory Committee. In the statement given out after the meeting, it was pointed out that the agreements between the individual companies and the government, which will have to be arrived at, should be actuated by a spirit of co-operation and we may surmise, therefore, that the meeting on Monday was a "get together" affair rather than any attempt to determine upon a fixed general policy of action. As any close student of the present situation knows, there are a great number of questions which will have to be settled between each individual road and the government. For instance, the question of continuance or discontinuance of detailed accounting figures, and the question of the adequacy of maintenance. There are also the questions pertaining to the financing of the needs of the railroads. It is the desire of the majority of railroad executives to help the government, both in regard to the sale of Liberty Bonds and the financing of railroad extensions, etc.—necessitated by war conditions—to the full extent of their ability. It may be that with Director General McAdoo's approval, some roads at least can sell their own

What It Cost in December

Railway Executives' Advisory Committee

securities to pay for additional facilities urgently needed by shippers and the government. It may be that in other cases the government itself could better afford to lend the roads money. The Railway Executives' Advisory Committee has never been as invaluable to the railway companies and the government both as it is at present. Even if every single railway president in the country were actuated with the single desire to be as helpful to the government as possible, it would still be necessary, if this desire was to be made effective, to have concerted action. The Railway Executives' Advisory Committee can act as a clearing house for intelligent and patriotic discussion of the complex detailed questions which will arise between the government and each individual road. It can on one hand educate the railroad men and on the other co-operate with the director general.

The Test of Efficiency Under Government Control

SEVERAL LARGE RAILWAY SYSTEMS are handling less freight now than they were a year ago. We have in mind one system in particular which is moving so much less freight and earning so much less money that if government control, with its prospective guarantee of net return, had not been adopted the company would be in danger of bankruptcy. If the efficiency with which this railway is being operated could fairly be measured by the total traffic it is handling now, as compared with the total it was handling a year ago, government control might properly be condemned or the officers of the railway might justly be convicted of "lying down." And yet, measured by the standard which ought to be applied, this railway is being operated with greater efficiency than formerly. Its situation calls attention forcibly to the fact that the standard by which efficiency of operation was properly measured a year ago and the one by which it ought to be measured now, are entirely different.

The standard which properly was applied a year ago, when the country was at peace, was the amount of business of all kinds which a railway moved in proportion to the facilities it had and the expenses it incurred. The purpose for which government control was adopted was to make the railways more efficient instrumentalities, not merely for moving all kinds of traffic, but for helping win the war. Therefore, the standard which ought to be applied now, is how effectively each railway is being used to help accomplish this purpose. The railway in question is a large carrier of coal, and is located in the immediate territory where there is the greatest activity in the manufacture of munitions. The Railroad Administration believes the most effective way in which it can contribute toward winning the war is to move the largest possible volume of coal to Eastern destinations. One of the most important parts of its main line is, therefore, being used almost exclusively to carry coal; and it is moving a great deal more coal now than ever before. But this part of its line, when thus devoted almost exclusively to carrying coal, cannot, of course, handle as much traffic of other kinds originating on other parts of its lines as formerly; and as traffic of other kinds originating on its other lines cannot get through without moving over this busy line, the railway is unable to handle anywhere near as much business as formerly on its other lines. In consequence, it is handling a greatly increased business over a small part of its mileage, and, for this very reason, a greatly reduced business over most of its mileage.

The total amount of business which the railways will handle under government control will continue to be one measure of their efficiency, but it will be, while the war lasts, a secondary rather than a primary test. The primary test will be how successful they are in moving traffic whose move-

ment is essential to the winning of the war. Of course, a broad view of what traffic is essential must be taken. The people of the country must live and they must prosper while the war is going on; and it would be easy to make the mistake of concentrating excessive attention on the movement of food-stuffs, coal, munitions, etc. At the same time, in justice both to the Railroad Administration and to the managers of the individual railways, the fact that under these abnormal conditions the old standards of efficiency cannot fairly be applied should be recognized.

The Problem of Increased Track Capacity

AT THE PRESENT TIME under the unified operation of the railroads, other conditions being equal, an effort is being made to route traffic over the lines that will give the shortest haul. This may throw a large amount of business over lines which heretofore have carried only a medium amount of traffic, and one of the problems requiring solution is the handling of this increased amount of traffic in as expeditious a manner as possible. One method of meeting this situation is by the building of additional yards and main tracks, but with the present conditions existing in the labor and material markets such a program would require a considerable length of time before any noticeable results could be obtained. Such construction would also require the use of work trains during the entire time the work is under way, taking motive power, trainmen and cars from other important service. With the above conditions existing it would seem advisable to consider other possible alternative methods of accomplishing the same results.

Train operation is governed by the manual block system over a number of lines that are now handling increased traffic. This system possesses advantages for certain classes of service, but the maximum traffic capacity is not obtainable as the number of block sections necessary for the movement of the maximum number of trains would involve a very high cost for wages of block operators. Another disadvantage of the manual block system is that the length of the blocks is not fixed; in many cases they are very much shorter during the day than at night when the closing of some of the offices necessarily lengthens the distance from one block station to another, with consequent delays to trains. The safety factor of this system is also low in comparison with that of automatic block signals.

With automatic block signals the maximum capacity of the tracks can be secured, as the block section lengths can be arranged for the movement of the largest number of trains. These blocks are always of a fixed length, thus eliminating delays of trains, following one another, where it is necessary to increase the length of blocks by the closing of offices at night. The force of men required for the operation and maintenance of an automatic block system is comparatively small and the safety factor of the system is high in comparison with that of the manual block. As stated by one superintendent, "on the division of 107 miles (82 single, 25 double track), handling the usual business would require 22 additional operators to handle the traffic by manual block, an expense of approximately \$18,500 per annum." In addition to increasing the track capacity the above statement shows only one of the savings resulting from the installation of an automatic block system in place of the manual block.

This method of increasing track capacity should receive careful consideration from operating officers, as such a system can be installed in a comparatively short length of time, with a considerably smaller force and far less work train service as compared to the building of additional track facili-

ties, and with a very low first cost as compared with that for additional tracks. The saving in man power, money and material in construction, and the low cost for operation and maintenance are also important factors to be considered at the present time.

"Reasonable" Rates Under Government Control

ONE OF THE HARDEST QUESTIONS which political economists, railway officers and railroad commissions have ever tried to answer is the question, "What are reasonable rates?" The railroad control bill, as reported by the conference committee and as apparently it will become a law, impliedly gives the answer which should be made to this question at least during the period of control.

It provides that the President may initiate rates which shall be reasonable and just and shall take effect at such time and upon such notice as he may direct." The Interstate Commerce Commission, upon complaint, may investigate and determine whether the rates fixed actually are reasonable. If, however, the President shall certify that in order to defray the expenses of federal control, operating expenses, ordinary taxes and compensation to the carriers it is necessary to increase earnings, the Commission in determining the reasonableness of the rates, must take into consideration this certification of the President. The bill does not say that the Commission must make the rates high enough to cover all expenses, ordinary taxes and compensation to the carriers; but that it is the desire and expectation of Congress that it will do so is made plain.

Various views have been put forward as to what constitutes a reasonable schedule of rates. Some have contended that each rate charged should be made fairly proportionate to the service rendered for it, and that if this were done rates as a whole would be reasonable. Others have contended that a reasonable schedule of rates would consist of rates which were fairly adjusted in relation to each other and would as a whole yield a fair return on the fair value of the property devoted to public use, and no more. Still others have contended that a reasonable schedule would consist of rates which were fairly adjusted in relation to each other and which as a whole would enable the carriers to earn large enough profits to attract into the railway business enough capital adequately to develop transportation facilities.

Most of the regulating authorities have adopted and acted on the "fair return upon a fair valuation" theory. They have persistently ignored the fact that a "fair return upon a fair value," as the courts use the phrase, means merely a return which will not be absolutely confiscatory, and that such a return may be entirely inadequate to attract sufficient new capital into the railroad business. Furthermore, they have not been consistent in carrying out even this restrictive theory. Even on the principle of a "fair return" there necessarily comes a time, in a period of rapidly advancing wages and prices, when rates must be substantially increased. The last few years have been such a period, but the regulating authorities have not allowed sufficient increases in rates to offset advancing expenses.

Government control creates a new situation. The returns of the companies are to be guaranteed. So long as this is done the government must pay increased expenses, and it must secure the means for paying them either by advancing rates or by advancing taxes. Congress has tacitly recognized the fact that the regulating authorities have failed under private control and might fail under government control, in the absence of specific legislation on the subject, to advance rates enough to offset increases in expenses. There-

fore, it, in effect, specifically requires the Interstate Commerce Commission to do this. Nobody entertains the thought that when the government has to pay the bill the state regulating authorities will be allowed to fix state rates lower relatively than interstate rates. It would appear, therefore, that both state and interstate rates will be advanced, under government control, as expenses increase.

It is highly desirable from the standpoints of both the railways and the public that this shall be done. Whether the railways are to be returned after the war to the managements of their owners or are to be bought by the government, it will be expedient that there shall exist at that time a substantial parity of income and outgo. The adoption of government ownership seems to grow more improbable every day. The whole course of Congress in dealing with the railroad control bill has indicated that a large majority of its members are opposed to government ownership. A large majority of the newspapers of the country which have spoken on the subject also are opposed to it.

If private ownership is retained the precedent established by saying in the law, almost in express terms, that "reasonable" rates are rates sufficient to meet advancing expenses and also to pay a return on investment, may be important. The Railway Executives' Advisory Committee, in the hearings before the Newlands Committee, advocated legislation which, in effect, would have defined reasonable rates as rates which would cover all expenses and taxes and a return on investment sufficient to cause adequate expansion of railway facilities. These are the only kind of reasonable rates which will ever promote the prosperity and welfare of the country; and a step toward legislation requiring such rates, even when taken under the present abnormal conditions, is a hopeful sign.

Sanitation on Railroads

IT IS AN UNWELCOME fact that the ideas of sanitation are still extremely primitive in many communities in this country, particularly in small towns and rural districts. Consequently it is not to be expected that either the employees or the local patrons of a railroad passing through such regions are particularly squeamish about the pollution of drinking water, contamination by flies, protection from mosquitoes, or other conditions generally frowned upon in more enlightened communities. Because railway trains, station buildings, eating houses and shops are gathering places for people in large numbers and frequently in close quarters, any unsanitary conditions prevailing become intensified and opportunities for the spreading of disease are increased. Consequently it devolves upon the railroad to maintain high standards of sanitation which means in many cases that the standards must be far above that of the communities through which it passes. Generally speaking this work is best handled under the direction of a trained sanitarian and a good idea of the problems with which this officer is confronted and the measures he must take to correct irregularities are covered in an article appearing on another page of this issue.

Sanitation on a railway involves two classes of activities. The first includes those which it takes as a common carrier to guard the health of its patrons and employees, and the second concerns the measures taken for the improved health and therefore greater efficiency of its employees. Under the first class the province of the sanitarian is limited largely to the condition of the surroundings with which the patron and employee come in contact. This problem must also be dealt with in the treatment of the employees in the shops, office buildings, and elsewhere, but if the measures taken by certain large industrial and commercial organizations are to be taken as a model, a much wider field is open for the sani-

tarian in educating the employee in the proper care of his health, not only while at work but in his home as well.

While the conduct of this policy has in some cases verged on paternalism the exercise of common sense will indicate the proper limitations in most cases, and these measures are paying large returns for the money expended through the increased efficiency of the employees, less loss of time from work, and improved esprit de corps.

Maintenance Work Must Be Pushed

WITH THE LEGISLATION relative to the control of the railways agreed upon and the passage of the act only awaiting ratification of the conference committee's action by the Senate and the House, the director general is now in a position to proceed with comprehensive plans for the betterment of the railway properties. One of the problems demanding the most urgent attention is the formulation of a definite policy regarding the routine maintenance as well as the additions and betterment work to be undertaken this year. It is now the middle of March and the roads are still without authority to proceed with plans for the season's work.

Work of this kind is very largely seasonal in character and much of it can be done to best advantage only during the summer months. During the last few years the roads have gradually come to realize the economy of starting the season's work as early in the spring as weather conditions permit. The shortage of labor and the large amount of work left unfinished last season have already given added impetus to this tendency. Many of the roads had their budgets for 1918 practically completed when the President issued his proclamation, taking them over on December 27, 1917. Since that time the initiative has passed largely into the hands of the director general and the preparation of plans by the roads has been almost at a standstill, awaiting his action.

The railways have recently been requested to furnish the director general with information concerning their minimum requirements for the year both for maintenance and for improvement work. In some instances, they have also consulted with the regional directors regarding their needs but they are still awaiting definite authorization to proceed. As a result of this condition over two months' time has been largely lost—time in which plans are usually completed, materials assembled and organizations perfected. The roads are now practically at the opening of the working season, less prepared to undertake actively the improvements which are so needed, than at any time for a number of years. This condition exists at a time when the roads are emerging from one of the most severe winters in history, during which they have handled a traffic exceeding all previous records. It also follows several years of sub-normal maintenance.

The factor limiting the amount of work which it will be possible to complete this year, as in the years just past, will undoubtedly be the amount of labor available. This makes it highly important that the roads enter the labor market at the earliest possible date before contractors, industries and the Government itself, secure all of the men for outside work of a similar nature. It has been the experience of the roads in past years that those companies which have started work early have had their pick of the men and have secured more efficient forces than those which organize their forces later. This year the shortage may be expected to be even greater than last year because of the abnormal demand in the shipyards, and in the war industries and the further effect of the draft, etc.

Equally serious is the situation regarding materials. In normal years the roads have ordered their rails during the early winter for delivery in the spring. Following the out-

break of the war, orders were placed still further in advance. Since the government has taken over the roads almost no rails have been ordered and they are entering the spring with little prospect of securing any in the near future. The only possible result of such conditions will be a large reduction in the amount of work which can be completed and a marked increase in the cost of that which is done.

The standards to which the roads are to be maintained is also a source of some concern. In his proclamation announcing his decision to take over the railways the President stated that "The railway properties will be maintained in as good repair and as complete equipment as when taken over by the government." In contrast with this statement the director general has asked the roads for information showing the minimum number of gross tons of rails required. While the demands for steel and other materials for war purposes are such as to require that no greater inroads be made upon the output of these materials than is necessary, it should be borne in mind that this will not insure the maintenance of the properties to the standards to which they have been maintained in past years and that any reductions in rails or other materials are not savings in the end but merely deferred maintenance which must be made good. The traffic of the country demands that the roads be maintained in proper condition. This in turn requires that they be permitted to secure not less than their minimum requirements of materials and that they may be permitted to undertake their work at once; for, measured in terms of work accomplished, a day now is equivalent to a week in the winter. There is reason, fortunately, for believing the director general contemplates a more generous maintenance policy than the request for information as to minimum requirements indicates; but it will be very difficult to make up for the loss of time that is occurring in getting started on needed work.

New Books

Railroad Structures and Estimates. By J. W. Orrock, principal assistant engineer, Canadian Pacific, Montreal, Que. 580 pages. 272 illustrations. 8½ in. by 5½ in. Bound in leather. Published by John Wiley & Sons, Inc., New York Price, \$5.

Cost figures have assumed a new importance since the inauguration of the federal valuation work, for it has caused many men to recognize the dearth of information of this character today. For this reason this book is particularly timely and valuable. The objection is frequently raised that no cost data can be used safely without a full knowledge of the conditions surrounding its collection. This is true in large measure, but even without this complete detail it is of much assistance to the estimating and construction engineer if used intelligently.

The first edition of this book was published in 1909. In the second edition the contents have been rearranged to conform with the classification of accounts prescribed by the Interstate Commerce Commission in 1914. A large amount of new material has also been added.

The book is limited to railway work and gives in detail data regarding the cost of the more unusual as well as the common problems encountered in such work. It is, therefore, of particular value to railway men. Liberal use has been made of information published in the technical magazines in the preparation of this volume. The book is divided into 20 chapters, typical headings of which include Track Materials and Estimates; Structural Materials and Estimates; Bridges, Trestles and Culverts; Ties; Rail; Other Track Materials; Track Laying and Surfacing; Stations and Other Buildings and Shops and Engine Houses.

Railway Business Association Broadens Activities

Invites All the Supply Interests to a Conference. Its Leaders See Great Possibilities Ahead

ACTIVITIES APPROPRIATE TO CHANGED CONDITIONS, and primarily aimed to serve the business interests of all those who furnish necessities to railroads, are recommended for the Railway Business Association in a unanimous report by its General Executive Committee. This plan for future work is addressed alike to members and those not enrolled but believed to have a common stake with members. It accompanies an invitation to attend the annual convention at the La Salle hotel, Chicago, on April 8, and participate in the discussion of purposes and methods. These proposals have been the subject of protracted conferences. They respond to expressions from many of the business men affected. Discussion from the convention floor is earnestly urged. The report of the General Executive Committee is distributed in advance in order that those attending may come to the meeting prepared to express their views. The report follows:

Events have given to those who deal in railway necessities a duty to the country and to ourselves which calls for more vigorous and far-reaching organized activity than any which we have undertaken in the past.

Successful prosecution of the war requires that American railroads shall be promptly rehabilitated and their facilities maintained and adequately increased. When war shall have ceased a portentous problem will remain. Full enjoyment of the liberties for which we are fighting requires national prosperity. National prosperity depends upon a robust railway system. The impairment of transportation vitality now disclosed is chronic. Its causes must be eradicated. America must have a railway system adequate for her great destiny.

Public Opinion

Determination of policy now and after the war rests with the government. What that policy shall be will depend upon public opinion. Public opinion will be intelligent in proportion to the thoroughness with which exact knowledge is diffused among the citizens. While the railroad men because they are operating under government direction may not be in position to voice their views freely to the public, the manufacturers of and dealers in equipment, material and supplies are entirely free to make inquiry and publication of the results on any aspect which they view as affecting the national interest or their own.

We have never known business men in this field to manifest so great an anxiety or so thoroughgoing a desire as now for concerted action.

The work falls under two general heads:

First:—*Development of policy and practice by the Director General of Railroads affecting construction and maintenance of material, equipment, supplies and structures during the war.*

We recommend a systematic participation by us in public discussion of the problem so far as our occupation gives us special competency to speak.

Second:—*Reconstitution of the railway system after the war.*

We recommend that our industry from now on seek the co-operation and co-ordination of other organizations in the endeavor to promote national concurrence in the general principles which should govern railway legislation upon the conclusion of peace.

Standardization

Decisions by the director general or administrative application of policies by his deputies during the war may pro-

foundly affect manufacturers of railway goods. The present director general has indicated a hospitable disposition toward devices not yet in use. He has also declared that for upkeep and repair, use will be made of the appliances for which existing vehicles were designed.

The purpose to improve car and locomotive design will not only afford the country for the war the most advanced transportation instruments obtainable, but, together with use of existing established devices, will carry through the war into time of peace the occupation of promoting progress in the art of transportation through invention and manufacture.

Such business units have been built up by inventive genius, adequate management and fair dealing; they are established upon the practical demonstration of actual use. To exclude a given maker of appliances for the period of the war with the aim of standardization might signify his permanent disappearance as an industrial factor. It is impossible to foresee in what shapes standardization may be advocated or what criteria may be proposed in sanctioning interchangeable appliances as permitted to bid upon new construction. We do not know what changes in personnel, organization or policy may occur. With constant vigilance we must warn the public and officials against setting up unwise and harmful precedents.

Ultimately what the country has to fear and what manufacturers should resist is overstandardization, which discourages invention and stifles enterprise and progress.

It is our duty to observe systematically the course of official thought and action and to give those in authority the benefit of our knowledge and opinions and likewise the benefit of public opinion as gathered by us upon the questions involved.

Railways After the War

For development of national concurrence in the general principles which should govern legislation affecting railroads after the war, we recommend that the railway supply craft and other businesses allied thereto shall undertake whatever labor may be necessary. Those whose ideas differ widely from our own are not waiting for the declaration of peace. They are carrying on an insistent propaganda. Individuals and organizations in their conduct of that propaganda have increasingly had the aid of numerous and powerful publications.

The sooner our own proposals for railway legislation are developed and arguments presented in their support the more open the public mind will be for unbiased consideration of our views.

Attacks on the Managers

Recently certain railway labor leaders, public officials and others have made statements which if not refuted would deprive the railway managers of the public confidence.

In the highest quarters testimony is abundant to the splendid loyalty and efficiency of American railway officials. With an unprecedented burden of responsibility and difficulty they have wrought wondrously well. Not merely in fairness to them, but in the interest of temperate discussion and sound public thought upon the general railway problem we should place the facts before the public and maintain in the minds of the citizens that esteem for the railway managers as a whole which after many years of acrimonious controversy had at the moment of this assault upon them become happily general.

Still another reason dictates an immediate beginning. Problems will crowd upon Congress in great number and

perplexity after the war. Those will be first dealt with upon which there is the most obvious public concurrence. The period of uncertainty pending railway legislation will inevitably involve a postponement of anything like comprehensive projects for railway construction. The shorter this delay the sooner the new railway system can come into the market with purchases to take the place of munition and other war-supply manufacture. This will tend to stabilize employment in the period of transition from war to peace. Hence it is of great material importance that discussion of principles for an ultimate solution of the railway problem shall have proceeded as far as possible before the cessation of hostilities.

Your committee has endeavored to define certain general principles which it believes you will be ready to espouse.

Individual Initiative

Foremost we place the preservation of individual initiative in the investment of capital and in management.

By this we mean reliance upon the judgment of the investing public in projecting enterprises of construction or improvement. We mean responsibility of the owners or their representatives for selection of operating executives. We mean maintenance in railroading of a career outside the government in which the poor boy, as in the past, can begin with nothing and rise to the top by aid of no influence except his own ability and efforts. We mean the preservation of government regulation—regulation in which the citizen can appeal, not from one government official to another, but from an official outside the government to the government itself.

Competition as Well as Co-operation

Second stands the organization of railways into a number of independent corporate units.

Profound changes have been made possible by the war. These may effect the corporate structure and the relations of one railroad corporation to another. Whatever may come we should, in our judgment, urge that the organism be so worked out as to preserve a healthful equilibrium between co-operation and competition.

Here again it is appropriate to mention competition between manufacturers of railway appliances.

The crux of our peculiar problem is the question: With whom shall the fate of the inventor or developer of inventions rest? If the number of railroad units were reduced or if railroad units adopted group provision and maintenance this would involve partial centralization, but to concentrate altogether would entail an extreme narrowing down of the number of minds whose discretion consideration and experiment lay and from one of whom appeal could be had to another. It may be apprehended that complete centralization would in time be administered by officers who would come to have no personal and compelling motive for hospitality toward improvement. There is always a tendency to overburden the government agencies with detail. To seek relief from this they might fall into the error of a too rigid standardization.

Adequacy the Aim

A third principle is for the federal government to adopt as the primary aim of regulation adequacy of facilities through attraction of capital.

What we have to create is a public sentiment which will result in a governmental policy to promote and not to restrict construction and upkeep of railways. If we are to have a prosperous country and that is to say a progressive transportation system, we must face squarely the fact that our country can have such a system, efficient and expanding to meet the nation's necessities, only by permitting such earnings as will meet railway disbursements, both those essential to adequate operation and those imposed by government, and provide in addition a surplus as the basis of railway credit.

Broader Associated Effort

As dealers in railway necessities we should, in our associated capacity, broaden and strengthen our facilities for making reports to the public from our point of view upon current events in this field and for promoting in the several communities discussion of current proposals affecting transportation.

We should adhere sedulously to the declaration that as a group we "shall have no part in party politics." Now, as from the beginning, we should court the sunlight. We believe we need leave undone nothing that ought to be done if we seek the co-operation of those agencies only which are committed to the most open methods and the most immaculate conduct.

Trade Acceptances and Exports

Supplementary to the rehabilitation, maintenance and enlargement of the railroads during the war and the development of public purposes for legislation affecting railways after the war there are certain other activities to which we invite attention.

Trade acceptances, common abroad, but not until recently introduced here, have been suggested as a means to railway supply manufacturers of reducing their cost of doing business by getting immediate negotiability at the bank for an invoice attested by the purchaser as correct and bearing a contractual due date. Discussion of this subject as it applies to our industry has been placed on the program for the association convention.

Opportunities for trade with railways and other utilities in foreign countries, rendered more obvious by the temporary trade isolation of the Central European powers, have led many to turn their thoughts in that direction.

The investment interest of American citizens in foreign railways has substantially increased as a result of the war and otherwise. Federal sanction of co-operation between competitors in foreign export trade is assured. The association office is engaged in a study of the possibilities of service to our members in connection with exports. A report upon the subject will be presented at the convention. We recommend that delegates be accredited to the National Foreign Trade Council and that steps be taken to encourage participation in that Council by members of this craft.

Our Opportunity

No industrial group ever had a more splendid opportunity. Our special motive we lay bare without apology—that motive is our own prosperity and the prosperity of those who look to us for the steady and profitable employment of their labor and their savings in these industries. The work of the Railway Business Association in the past has brought it public esteem and confidence, while fortifying it with experience and facilities, connections and, above all, mutual acquaintance and the habit of team work. We can rejoice as we proclaim that what we urge is patriotic in time of war and patriotic in time of peace.

PERU'S RAIL PROJECT TO REACH COAL AT HIGH ALTITUDE.—The importance of the project to build a 75-kilometer (46.6 miles) railway line in Peru, from Huancayo to the coal deposits at Jatunhuasi, on the eastern side of the Andes, is discussed in articles which have been published in the West Coast Leader. The railroad to the coal mine will cost approximately \$1,500,000 which money has been guaranteed by the Italian bank at Lima. This new line will join the main line of the Ferrocarril Central del Peru, probably at kilometer 343, and will be of standard gage. The haul from the coal mines to the seacoast will be 418 kilometers (300 miles). The contract is not let, but there is every probability that the Peruvian Corporation will take it and operate the road after its construction.

Winter Temperatures and Locomotive Capacity

A Study of the Relation Between Decreasing Temperature and Increasing Motive Power Requirements

By W. L. Bean

Assistant to the General Mechanical Superintendent, New York, New Haven & Hartford

THE USUALLY SEVERE TEMPERATURES of the winter of 1917-18 added tremendously to the difficulties of railroad operation and prompted the making of a study, the object of which was to establish a measure of the relative effect of the extraordinary weather as compared with that of other years in terms of decreased effectiveness of steam locomotives of the New York, New Haven & Hartford in handling traffic.

A drop in temperature decreases the capacity of the steam locomotive boiler and also greatly increases train resistance; in fact the first factor is of much less importance than the latter. The question as considered in this article is principally that of increased demands of power to move cars whose journal friction increases as the temperature falls, because of the increase in the viscosity of the lubricant.

Operating records in electric freight service between Harlem River terminals and New Haven, a distance of approximately 70 miles, where undulating grades of 0.6 of 1 per cent rule, with considerable curvature, afforded an opportunity to consider the problem on the basis of increased power consumed by electric locomotives in winter as compared with summer. The average kilo-watt hours per 1,000 gross ton-miles in freight service were plotted for each month for nearly two years as shown in Fig. 1 and the monthly mean temperature at New Haven, Conn., as recorded by the United States Weather Bureau, was also plotted. Maximum power consumption and minimum temperatures, and vice versa, register quite accurately, as would be expected. In the year 1916 the maximum and minimum power rates were both higher than in the year 1917, and explanation was sought by plotting.

(a) *Average revenue tons per revenue car mile.*—This shows a fairly uniform increase during the two-year period and would account in part for the lower power consumption in 1917.

(b) *Average wind velocity in miles per hour, all directions.*—There was most wind in March, 1916, when the power consumption rate was highest, and least in the summer of 1917.

(c) *Precipitation.*—The precipitation, especially the snow-fall in February and March, 1916, was much heavier than in 1917.

Each of these factors account for a heavier power consumption rate in the year 1916 than in 1917, there being no change of importance in electric equipment or operating practices.

Temperature and Power Consumption Ranges

In the endeavor to secure values of use in estimating the decreased effectiveness of steam locomotives as a result of cold weather, the average of the minimum power requirements in the two years was subtracted from the average of the maximum consumptions and the "power range" was found to be 8.45 kw. hours. This amounted to 31.1 per cent of the average minimum or summer power consumption and was assumed to represent the excess power required to create 1,000 gross ton miles in mid-winter versus that necessary in mid-summer. Similarly the "temperature range" between average maximum and average minimum was found to be 47.5 deg. Fahrenheit. Dividing the "power

range" by the "temperature range" it is found that for each degree of temperature change the demand for power increases 0.65 per cent.

The above discussion and result has been possible only

Fig. 1—Relation Between Electric Power Consumed and Weather Conditions

because of power consumption records kept for electric locomotives, but it is felt that the factor 0.65 per cent may be applied to steam locomotive service because there is no great difference in the heat losses and engine friction of steam

and electric locomotives considered in percentage of maximum capacity.

Furthermore, heat losses in steam locomotives causing reduction in capacity in winter versus summer are practically offset for the purposes of this study by the consumption of current in heating cabs of electric locomotives. This use requires approximately three per cent of the total electric power used on a trip.

Concerning heat losses and friction in steam locomotives, Messrs. Schmidt and Marquis in Bulletin No. 59 of the University of Illinois, state:

"Taking all these facts into consideration, it seems likely

Fig. 2—Estimated Effect of Winter Temperatures on Train Resistance Stated in Terms of Loss of Use of Locomotives

that cold weather does not greatly reduce the tractive effort of locomotives, and that, consequently, it does not necessitate radical reductions in rating in so far as its effect upon the locomotive itself is concerned. Probably a reduction in rat-

Fig. 3—Temperature Variations at New Haven, Conn., for the Months of December and January for the Past Four Years

ing of four or five per cent, even with air temperatures as low as 0 degrees F., is sufficient to allow for the reduced tractive effort of the locomotive."

Considering all these things, it appears reasonable to apply to steam operation under the track characteristics named the factor 0.65 per cent per degree of temperature.

Steam locomotives are at their greatest disadvantage in starting trains in winter, whereas electric locomotive motors are favored in winter versus summer, because they can be overloaded for longer periods without overheating. Hence, electric engines can exert their maximum tractive effort over

longer periods in the first part of their trips during which time journals are warming up and train resistance is therefore decreasing.

Adjustments in Tonnage Ratings to Suit Temperatures

Reductions in tonnage ratings because of temperature changes are rarely made above 45 degrees F. Starting at that point and applying the factor 0.65 per cent, a table of tonnage reductions can be constructed which would appear to suit conditions obtaining on track of the characteristics of that portion of the New Haven System before referred to.

| Temperature Range | Tonnage Reduction |
|-------------------------|-------------------|
| 45 to 35 degrees..... | 6 per cent |
| 35 to 25 degrees..... | 13.0 per cent |
| 25 to 15 degrees..... | 19.5 per cent |
| 15 to 5 degrees..... | 26.0 per cent |
| 5 to -5 degrees..... | 32.5 per cent |
| -5 to -15 degrees..... | 39.0 per cent |
| -15 to -25 degrees..... | 45.5 per cent |

The above applies to medium and slow freight.

Effect of Temperatures on Available Engine Power

The foregoing data may be used in connection with current weather conditions to measure the effect of temperature at any particular time in increasing the demands on engines in handling traffic and further on in the article a representation is made of this loss in terms of entire engines.

The daily mean temperature at New Haven, Conn., for December, based on 45 years' weather bureau records, is 31.8 degrees. The normal daily mean temperature for January is 27.3 degrees. The actual mean temperatures for those months for four recent years are as follows:

| December | January |
|------------------------|------------------------|
| 1914..... 30.4 degrees | 1915..... 33.0 degrees |
| 1915..... 32.0 degrees | 1916..... 33.0 degrees |
| 1916..... 32.4 degrees | 1917..... 30.6 degrees |
| 1917..... 23.4 degrees | 1918..... 19.6 degrees |

Therefore:

December, 1914, was 1.4 degrees below normal.
 December, 1915, was .2 degrees above normal.
 December, 1916, was .6 degrees above normal.
 December, 1917, was 8.4 degrees below normal.
 January, 1915, was 5.7 degrees above normal.
 January, 1916, was 5.7 degrees above normal.
 January, 1917, was 3.3 degrees above normal.
 January, 1918, was 7.7 degrees below normal.

From the above, on the basis of 0.65 per cent greater power being required to move cars for each degree of temperature drop, excess power requirements in last December

and January as compared with those months in the three immediately preceding years were as follows:

| |
|--|
| December, 1917 |
| 4.55 per cent greater than in December, 1914 |
| 5.55 per cent greater than in December, 1915 |
| 5.95 per cent greater than in December, 1916 |
| January, 1918 |
| 8.71 per cent greater than in January, 1915 |
| 8.71 per cent greater than in January, 1916 |
| 7.15 per cent greater than in January, 1917 |

Assuming 800 locomotives normally in service, the result of such handicap as stated above measured in the number

of locomotives necessary to make up the increased demand for power on account of low temperature, was as follows:

| December, 1917 | |
|--------------------------------|--|
| 36.4 engines more than in 1914 | |
| 44.4 engines more than in 1915 | |
| 47.6 engines more than in 1916 | |
| January, 1918 | |
| 69.7 engines more than in 1915 | |
| 68.7 engines more than in 1916 | |
| 77.3 engines more than in 1917 | |

Fig. 2 indicates the number of engines which would have to be added in a normal December and in a normal January to make up the loss of engines due to winter temperatures as compared with summer. Also the losses in each of the two months in the three preceding years are shown.

It will be noted that December weather in 1914, 1915 and 1916 ran fairly close to normal but in 1917 was excessively low with the result that instead of losing a normal of 68.6 engines, the equivalent loss was 112 engines, or in other words, the December loss this year was 63 per cent greater than the normal December loss.

On the other hand, it will be noted that the losses in January of the years 1915, 1916 and 1917 were below normal because the temperatures in each of those months were above normal.

Curves showing the maximum, minimum and mean temperatures for the past four years are shown in Fig. 3.

On account of the abnormally high temperatures in January in previous years, the loss of engines in those years averaged about 66.5 as compared with a normal loss of 92.0 and an abnormal loss in January, 1918, of 132.1; therefore, the loss this season was about 43 per cent greater than in a normal January and about 98 per cent greater than the average of the three preceding Januaries.

Any consideration of the foregoing estimates should, of course, take fully into account that no effect is considered other than that of low temperatures in causing increased resistance of trains, as regards friction in bearings, and allowance for heat losses in steam locomotives. Those factors only in the slowing up of train movements are to be connected with this study. Greater breakage of locomotive and car parts, as well as rails; delays caused by frozen parts; accumulations of ice; obstruction of vision by steam; and the effect of cold on working forces are, of course, not taken into account.

INCREASED PAY FOR IRISH RAILWAYMEN.—The recent government award of 12½ per cent increase in wages to the workers and 7½ per cent increase to piece-workers engaged on the English railways has been made applicable to all men engaged in the repair, construction and maintenance of locomotives and cars and locomotive sheds and shops in Ireland.

AMERICAN-RUSSIAN TRADE IN 1917.—The total trade between the United States and Russia during the calendar year 1917 amounted to \$438,000,000, according to a statement issued by the Bureau of Foreign and Domestic Commerce, Department of Commerce. This total represents a decrease of \$39,000,000 from the record figures of 1916, but the decrease was in the trade with Asiatic Russia and was doubtless due to the congestion and the import restrictions at Vladivostok. Locomotives worth \$11,281,000 and railway-stock material valued at \$5,865,000 were sent to European and Asiatic Russia together in 1917 as against \$3,727,000 and \$4,407,000, respectively, in the preceding year. There was a marked decline, however, in exports of freight cars, which were valued in 1916 at \$4,112,000 for European Russia and \$7,994,000 for Asiatic Russia, and in 1917 at only \$763,000 for European Russia and \$1,264,000 for Asiatic Russia. This trade in railway equipment has originated since the war started.

Baltimore & Ohio Weighing Bureau*

By L. D. Davis

Supervisor of Scales and Weighing.

THE ORGANIZATION of the department in the beginning consisted of a chief scale inspector reporting to the chief engineer maintenance of way, with the scale inspectors reporting to the district engineers of maintenance of way. Jurisdiction was extended over the Baltimore & Ohio Southwestern in 1910, and in January, 1911, the chief scale inspector was appointed supervisor of scales and weighing, reporting to the general manager, at which time his supervision was extended to cover all matters pertaining to scales and weighing. Since April, 1912, the bureau has been under the transportation department. In August, 1912, jurisdiction was extended over the Cincinnati, Hamilton & Dayton. Its present organization is as follows:

A scale shop at Martinsburg, employing a foreman and

The Organization of the B. & O. Weighing Bureau

from two to three mechanics, is under the maintenance of way department, but work is handled in accordance with suggestions of the weighing bureau.

The number of different type of scales in use and period for testing is shown below:

| Number of scales | Increase since 1910 | Schedule for testing |
|--|---------------------|----------------------|
| 144 Track scales | 18* | Every sixty days |
| 255 Private track scales | 20 | Every sixty days |
| 537 Motor truck stock and depot scales | 195 | Every six months |
| 1,500 Portable and other scales | 290 | Once every year |

*Decrease. The reduction in the number of track scales is due to the removal of eleven from coal pits, because of changed operating conditions, and concentration of weighing.

The annual expenditure for new scales, the renewal and maintenance of old scales, and bureau supervision, beginning with 1909 is as follows:

| Year | Cincinnati, Hamilton & Dayton | |
|------|-------------------------------|--|
| | Baltimore & Ohio | |
| 1909 | \$8,400 | |
| 1910 | 69,471 | |
| 1911 | 139,827 | |
| 1912 | 161,967 | |
| 1913 | 67,786 | |
| 1914 | 69,746 | |
| 1915 | 41,306 | |
| 1916 | 83,355 | |
| | 508,142 | |

The greater part of this expenditure has been for new track scales of improved design and installation. Fifty-two of the improved type scales have been installed, on which 76 per cent of cars are weighed.

The proper design and installation of scales is hardly of more importance than their proper cleaning and maintenance.

It should be considered that in a track scale there are 15 levers of a fixed ratio, coupled together to record a weight, and it is absolutely essential that these levers be rigidly supported, pivots kept sharp and unobstructed by dirt or rust. Measures taken to prevent rust have resulted in a material increase in the life of scales.

The Older Type of Installation

Prior to 1909 only one track scale was set on steel, all others being on timber. In 70 of these the load was supported and distributed to the levers through 12 in. by 18 in. wood stringers. At the present time all but 20 scales are set directly on concrete, and in all of them the load is

*From the Baltimore & Ohio Engineering Magazine, January, 1918.

supported by steel "I" beams. Four of those on timber will be renewed on concrete this year and two abandoned. Every track scale in use at the beginning of 1909 has either been abandoned, renewed or replaced, some of them having been renewed more than once.

The first of the newer type scales was installed at Cumberland, Md., in January, 1910, and there have passed over it approximately 900,000 cars or 35,000,000 tons of freight, resulting in freight revenue of about fifty million dollars, before it was necessary to renew any of the scale parts, and then only the eight main levers were replaced in November, 1915. In that period of nearly six years, the scale was tested 34 times with a scale test car and it was found out of adjustment but seven times, the largest error found being 90 lb. The older type scales under similar service lasted without renewal about six months.

Latest Design in Track Scales

In order to accommodate longer and heavier cars and to allow for a possible increase in these respects, the design in use 1910 to 1917 has been superseded and in the future 60 ft. scales will be installed at motion-weighting points, and 50 ft. scales at spot-weighting points. The latest type is designed to support 50 per cent of the capacity on each section, while the type now in use was designed for a uniformly distributed load of 300,000 lb.

It is logical that this type should be adopted since half the weight of a loaded car is concentrated on each track which pass successively over each section of the scale, and when cars of equal weight are coupled, the weight of an entire car is concentrated on a comparatively short space. Parts of the 50 ft. and 60 ft. scales of the latest type will be interchangeable except as regards the four extension levers, which are necessarily of different length. Sixty-foot scales have been installed at Newark, at Connellsville and at Cleveland.

The importance of installing the best type of scale obtainable may be realized when it is considered that if the track scale at one large weighing point were weighing one pound light in each thousand, the loss in freight revenue would approximate \$50 a day.

Track scales at nearly all motion-weighting points are equipped with automatic recording attachments. Instructions require that the car shall be entirely on the scales three seconds for weighing and that the speed shall not exceed four miles an hour.

The development and extended use of motor trucks, with about 80 per cent of the load concentrated on the rear axle, has necessitated an improvement of design of scales on which to weigh them. This type has been installed at New York, Chicago, Cincinnati and Olney. The scale is 20 tons capacity with a platform 22 ft. long by 9 ft. wide, and equipped with a full capacity single beam with ball bearing poise. The installation is entirely of concrete and steel, even to the concrete deck.

Depot scales have been improved, both as to design and strength. While formerly designed with truss rods, the rods have been eliminated and levers of sufficient strength in themselves to support the load are now used. The suspension platform type is also used instead of the direct bearing type.

A number of depot scales have been installed at points where only portable scales were in use, and this has resulted in a larger amount of accurate weighing and the consequent increase in revenue.

Test Cars

Test cars are sealed after each test trip, or about five times annually. These test cars are spotted consecutively over each section of a track scale, and if any adjustments are necessary, these are made by moving nose irons on the

end of levers, thereby changing their ratio to such an extent as to put the scale in adjustment.

Test cars have also been improved in design. There is under construction a heavier car weighing 80,000 lb. Two large castings weighing 33,000 lb. each make up the greater part of the weight. Every unnecessary part has been eliminated from the design, the change of which might result in a change of weight. All parts have been designed, as far as possible, to avoid holding dirt. Journals are equipped with roller bearings to facilitate movement by the scale inspector with push bar, and to avoid the frequent necessity of sponging and packing journal boxes, which frequently results in a change of weight.

Worn and broken scales are sent to the Martinsburg shop. The old pivots are sharpened, if possible, or replaced by new ones, and the fulcrum distances gaged as accurately as possible with special gages after which pivots are hardened, tried with a gage, and ground again if necessary. The levers are then put on sealing horses. If the gaging has been done accurately, which is extremely difficult, a certain weight suspended from the load pivot will balance a predetermined weight on the sealing beam. If it does not, it is then necessary to grind again the pivots until the weights balance. As each lever is sealed in the shop with weights to transmit its proportion of the load accurately, the levers, if properly coupled together and supported will, in unison, accurately transmit the weight of the entire load and the scale give correct weights. In this way loss of revenue from use and wear is reduced to a minimum.

A Record Carload of Lumber

SINCE THE ENTRANCE of the United States in the war car conservation has come to be recognized as a patriotic duty and many shippers have made enviable loading records. The illustration shows a car of yellow pine lumber that was shipped by the Arkansas Lumber Company on February 12 from Cloquet, Ark., to Camp Pike, Ark.,

Car of Lumber Loaded to 110 Per Cent of Marked Capacity

via the Warren & Ouachita Valley and the Missouri Pacific. The car contained 60,000 ft. b. m. of lumber and weighed 150,000 lb., or 110 per cent of the marked capacity of the car, which was 140,000 lb.

IRISH RAILWAY TRAVELING RECORD.—A record for Irish railway traveling was accomplished recently on the Great Northern Railway, says the London Times. Lord Pirrie, in a special train, went from Belfast to Dublin, a distance of 115 miles, in 107 minutes, the return journey being accomplished in 109 minutes.

Selling to Railroads Under Government Control

Orders Placed Will Be Large, and Changes in Standards and Purchasing Methods Less Than Have Been Feared

THREE QUESTIONS regarding the relations between the railways and the railway equipment and supply concerns under government control have been much mooted recently. These are, first, how large are the purchases of the railways likely to be; second, who is going to determine what they shall buy; and, third, who is going to do the actual buying? Pretty definite answers may now be made to these questions, as a result of public announcements and quasi-public assurances which have come from the railroad administration in Washington.

Will Purchases Increase or Decrease?

As to the magnitude of the purchases to be made under government control, there is reason for believing that they will show a large increase over those made in recent years. If the properties are to be put and kept in condition to handle more satisfactorily both the commercial and the war business of the country, the expenditures for both maintenance and additional facilities must be substantially increased.

The expenditures for maintenance of way and maintenance of equipment combined amounted in the fiscal year 1916 to \$922,000,000 in the next twelve months to about \$1,100,000,000. As near as can be estimated, 40 per cent, or about \$400,000,000, of this was spent for equipment, materials and supplies and the rest for labor. The expenditures for maintenance probably ought to be increased at least \$150,000,000 annually, which would involve an increase of expenditures for things used in maintenance of way and equipment of, say, \$60,000,000.

New investment in road and equipment—that is, the outlay charged to capital account—was less than \$280,000,000 in 1916, the latest year for which complete figures are available. Six to eight years ago the annual new investment was about \$750,000,000 annually; and in order to secure anything approaching a normal increase of facilities, the annual new investment at present, with the wages and prices now prevalent, ought to be \$1,000,000,000. Suppose, however, it should be only \$750,000,000, which at present wages and prices would increase facilities only two times as much as they were increased annually in 1910, 1911 and 1912. About 40 per cent of this also would be outlay for equipment, materials and supplies. This would make a total annual outlay for equipment, materials and supplies used in maintaining and increasing facilities of about \$800,000,000. Expenditures for equipment, materials and supplies during the last four years, when additions to facilities have been smaller than for many years and great economy has been practiced in maintenance, probably have averaged less than \$600,000,000 a year. Therefore, if under government control the railways are to be adequately maintained, and any considerable stimulus is to be given to the expansion of their facilities, the expenditures for equipment, materials and supplies will have to be increased by about \$200,000,000 a year.

There is much reason for believing the railroad administration contemplates increases in expenditures on a large scale. An official statement was issued last week announcing the organization of the new purchasing department of the administration. In this it was stated that purchases "will amount to between \$1,000,000,000 and \$2,000,000,000 per annum." This estimate includes the outlay for fuel, which is not included in the estimates of expenditures for equipment, materials and supplies given above. The annual

outlay of the railways for fuel is now about \$400,000,000. An expenditure of \$400,000,000 for fuel and of \$800,000,000 for equipment, material and supplies would make total purchases amount in a year to only \$1,200,000,000, which is but little larger than the minimum figure mentioned by the railroad administration.

Needless to say, these estimates of both past and prospective expenditures for equipment and supplies are but rough approximations; but probably they are as near correct as any general estimates that can now be made. From all indications it may be predicted that the volume of the business which the equipment and supply companies will soon be doing will be more satisfactory than it has been for some years.

Who Will Determine What the Railways Shall Buy?

Who is going to determine what the railways shall buy? The announcement regarding the organization of the division of finance and purchases, of which John Skelton Williams is the director, states there is to be a central purchasing committee at Washington and regional purchasing committees associated with each of the regional directors. All purchases of locomotives, cars and steel rails will be made through the office of the director of purchases in Washington. But this does not mean that the exact locomotives, cars and rails which shall be bought will be determined by the permanent staff in Washington. A committee of railway mechanical officers was called for its recommendations regarding the kinds of locomotives and cars that should be ordered and as to how they should be equipped. Doubtless before rail orders are placed a committee of chief engineers of the railways will similarly be called on to consider the weight, specifications and methods of manufacture of the rail to be ordered. In other words, under government control, as under private control, the experienced technical officers of the railways in all parts of the country will determine what kind of locomotives, cars and rail shall be bought. This was not clear when the talk about general standardization was begun a few weeks ago. It seems to be definitely settled now. Furthermore, even when standards once have been used, it does not follow that when additional equipment is subsequently ordered exactly the same standards will be adhered to.

As to other kinds of materials and supplies they are to be bought by the purchasing officers of the individual railways acting under the supervision of the regional purchasing committees. The technical officers have in the past been largely relied on by the purchasing officers of the individual lines to indicate what supplies should be bought for them. They will, of course, continue to do likewise under the new system. In other words, the same trained and experienced men who have had charge of the maintenance and development of the physical properties of the railways in the past will continue to have charge of them. This means that they will be, as they have been heretofore, the men to whom the selling departments of the supply companies will have mainly to address themselves in order to market the things that they make and handle.

But who is going to do the actual buying of things other than rolling stock and rail? In the main it is to be done, as it has been in the past, by the purchasing departments of the various roads. There will, however, be introduced some new elements in the relations between the railways and the supply companies. All contracts for supplies for periods

of six months or longer must be submitted before being made to the regional purchasing committees, and "information as to the prices paid for all supplies will be furnished monthly by all roads to the regional purchasing committees, so that the prices paid by each road for all articles may be carefully checked." The purpose of this requirement is obvious. It is intended to bring about uniformity in the prices paid by the different roads for articles of similar quality handled under similar conditions.

The Co-Ordination of Purchases

The announcement regarding the plan for the division of purchases says that purchases of supplies needed in the current operations will be made for "time being" through the purchasing departments of individual roads. It adds "the regional purchasing committees will address themselves to consideration of the opportunities for standardizing and consolidating purchases of every kind that may admit of such treatment, with a view to increasing efficiency and economy." This indicates that there will be increasing standardization of supplies and increasing centralization of purchases as time goes on.

There is no reason now, however, for believing that in the long run standardization of supplies and consolidation of purchases will be carried as far as there seemed reason to fear when the talk about these policies began. It may be confidently predicted that even though an attempt to go a long way with standardization and centralization were made it would later be abandoned. Both the Ordnance Department and the Red Cross have tried highly centralized organizations, and are abandoning them in favor of decentralized organizations, because they found the centralized organizations were top-heavy, cumbersome and inefficient.

The railways of the United States spread over such an immense area, operate under such diverse conditions, and buy such enormous quantities of equipment and supplies that it would be easy to standardize and centralize purchases for them so much as to cause waste, delays and demoralization which could soon force the Railroad Administration to decentralize.

Both the official and unofficial statements of officers of the Railroad Administration indicate that the policy they are trying to work out is one which will co-ordinate rather than merely centralize purchases. While, therefore, purchasing methods are going to undergo important changes, and it will be necessary for railway equipment and supply companies to modify their selling methods accordingly, there is no reason for believing that a supply dealer who can convince the technical and purchasing officers of a road that they ought to buy his goods, and buy them at prices which will yield a reasonable profit, will have much more difficulty in selling them to that road than he has had in the past.

Supply concerns will have to carry on negotiations in many cases now not only with the officers of individual lines, but also with the regional purchasing committees and with the purchasing department in the director general's office in Washington. But in the past in the case of large railway systems they often have had to convince both the technical officers away from general headquarters and also the technical and purchasing officers at the general headquarters of the railways in Chicago, New York and other large railway centers.

Trying Out New Devices

One important question which has been raised has been as to the influence which government control will have on the selling of new and experimental devices to railroads. The *Railway Age* has raised this question in its editorial columns and pointed out that rigid standardization would

stop progress by preventing the introduction of new and improved devices. This matter was brought directly to the attention of Director General McAdoo in the able letter which was sent to him under date of February 4 by George A. Post, president of the Railway Business Association, and which was published in our issue for March 1. Officials of the railroad administration since then have sought to make clear that it is their intention even under the conditions of war to promote rather than retard the technical development of the railroads, and in accordance with this policy to keep the door open for giving full and fair trial to new and improved devices.

The development of the organization and policy of the Railroad Administration naturally is being followed with anxious interest by everybody who is directly affected by the management and operation of the railways, and this includes not only those who are directly connected with the roads but also all those who manufacture and sell equipment, materials and supplies to them, and all those who are large users of their services. No class of concerns will be more vitally affected by the policy of the railroad administration than the railway equipment and supply concerns because they have invested a vast amount of capital and employ hundreds of thousands of men for the purpose of doing business with the railways. Their plants are located in every part of the United States, and anything that was done which might seriously hurt them or any large part of them would have serious effects on the industry and commerce of many communities, large and small. Therefore, it is not only in their interest, but in the interest of the country generally, that the various organizations which represent the railway supply interests and especially the Railway Business Association, which is the most important and inclusive of these organizations, keep closely in touch with developments and take whatever steps may be necessary to guard their legitimate interests. That misuse or abuse of power by the railroad administration might do them great harm is perfectly obvious. Present indications are, however, that government control, while it may injure some concerns and even some entire classes of concerns, will not cause any revolutionary changes in the railway equipment and supply business, such as government ownership might cause. As already indicated, the purchases of the railways probably will be largely increased under government control, and unless all signs fail in the long run there will not be as great changes in the relations of the supply companies and the railways as there seemed reason to apprehend a few weeks ago.

The committee of railway mechanical officers that has been engaged for some time on the designs for standard cars completed its work on them at a meeting at Washington on Monday and submitted its report to Director General McAdoo, through C. R. Gray, director of the division of transportation, for final approval. If the standards are approved they may be announced by the latter part of this week.

Members of the committee then went to Philadelphia to continue conferences with representatives of the locomotive builders on the proposed standards for locomotives.

CANADIAN RAILWAY REGIMENTS BUSY.—A summary of the work done by all battalions of the Canadian railway troops in France during the month of January has been issued by the Militia Department at Ottawa. The statement shows that during that period 9 miles of broad gage track were laid by the Canadians and 33 miles of narrow gage. The average number of miles of broad-gage track maintained during the month was 49, while 141 miles of the narrow-gage track was maintained. The men were employed in locating, grading, ballasting and laying lines. About 6,100 Canadians were engaged on the narrow-gage lines and 1,100 on the broad-gage lines.

Financing and Purchasing Division Organized in Two Sections

A PLAN FOR THE ORGANIZATION of the Division of Finance and Purchases of the Railroad Administration, which provides for the co-ordination and supervision of railroad purchases of materials and supplies by a central advisory committee at Washington and regional purchasing committees at New York, Atlanta and Chicago, was announced by Director General McAdoo on March 7. While all purchases of cars, locomotives and rails, and of cross ties which cannot be obtained along the lines of the respective roads, will be made through the Washington office, and fuel purchases for New England will be made by a special committee, the plan does not contemplate the centralization of all purchases.

All other supplies and materials needed for current operation will be purchased, for the time being, through the purchasing departments of the respective roads under a general supervision of the regional purchasing committees and the central committee.

The plan of organization was submitted by John Skelton Williams, director of the division of finance and purchases, which is to be divided into a finance section and a purchasing section. In the organization of the purchasing section Mr. Williams has been assisted by Samuel Porcher, purchasing agent of the Pennsylvania Railroad.

Finance Section

The director of the division will be assisted in the work of investigating and providing plans to meet the financial requirements of the railroads throughout the country, whether these needs relate to the taking up and renewal of maturing obligations and the issuance of new securities, or the provision for betterments and additions, by an advisory committee of three men, experienced in finance, selected, one from the North, one from the West, and one from the South. These men, whose names will be announced later, will serve the government without compensation, and will have offices in Washington.

The requirements for new capital, outside of revenue from earnings, for new equipment, betterments and additions, have usually called for from \$250,000,000 to \$750,000,000 per annum, according to the activity of business and the condition of the money market.

Purchasing Section

In the matter of purchases for the railroads, which will amount to between \$1,000,000,000 and \$2,000,000,000 per annum, the director of the division will be assisted by an advisory committee of three, which will be composed of the general purchasing agents or vice-presidents in charge of purchases of three leading railroad systems, who will be detailed to Washington for this work, under the supervision of the director of the division.

There will also be constituted three additional committees; these committees to be composed of three or more general purchasing agents, or men experienced in this work, to be known as the regional purchasing committees, with headquarters in New York, Chicago, and Atlanta, in touch with the regional directors of these three districts.

All purchases of locomotives, passenger, freight and other cars, and steel rails will be made directly through the office of the director of purchases.

In New England territory fuel purchases will be made by a special committee appointed by the regional director, under the direction of the Washington office. In other sections, each railroad will be expected to handle its requirements, under the immediate direction of the respective regional purchasing committees, either collectively with other companies, or separately, as may be directed by that com-

mittee. The details of all contracts already made and of all other contracts as made will be scrutinized and checked by the regional purchasing committees, which will act under the general direction of the Central Committee.

Cross ties and lumber which can be obtained along the lines of the respective roads will be negotiated for and purchased through the purchasing department of each road, under the supervision of the regional purchasing committees. Cross ties needed by the various roads which cannot be obtained on their own lines will be purchased through the Washington office.

All other supplies needed for current operations will be purchased, for the time being, through the purchasing departments of the respective roads, but all contracts for periods of six months or longer must be approved by the regional committees before completion.

Information as to the prices paid for all supplies will be furnished monthly by all roads to the regional purchasing committees, so that the prices paid by each road for all articles may be carefully compared and checked, both as to prices and standards, qualities and places of delivery.

The regional purchasing committees will address themselves, as soon as possible, to consideration of the opportunities for standardizing and consolidating purchases of every kind that may admit of such treatment, with a view to increasing efficiency and economy.

The regional purchasing committees will submit to one another and to Washington, as information and for criticism, full statistics as to cost prices of materials used in railroad operations, and these prices will be carefully compared and checked.

The names of the advisory and regional committees are given below.

Personnel of Finance Section

Advisory Committee, located at Washington, will include: Franklin Q. Brown, New York; Festus J. Wade, St. Louis; Frederick W. Scott, Richmond.

Mr. Brown, formerly of Boston, but now the senior member of the banking firm of Redmond & Co., of New York, was for many years vice-president of the Plant System of railroads; also president of the Plant Investment Company, controlling, besides railroads, coast-wise steamships and other transportation companies, including the Southern Express Company. Mr. Brown has had considerable experience both in the construction and operation of railroads; and for the past 10 years has been engaged in the banking business in New York.

Mr. Wade is president of the Mercantile Trust Company of St. Louis, one of the largest banking institutions in the West, organized by him about 20 years ago, and one of the first large trust companies to become a member of the Federal Reserve System. Mr. Wade has also been active in railroad reorganizations in the West; was a leading factor, soon after the outbreak of the war, in the establishment of the "Hundred Million Dollar Cotton Fund," and has been a student of railroad as well as of financial and banking problems.

Mr. Scott, of Richmond, has been prominent in banking and railroad circles in the South for many years past, identified with one of the oldest national banks in Virginia; has for many years been a director in the Atlantic Coast Line; and was organizer of the syndicate which a few years since acquired control of the Chesapeake & Ohio, from which he later retired. He headed the shareholders' protective committee of the International Mercantile Marine Corporation, which was successfully reorganized without foreclosure, and has been a live in railroad and other enterprises in the South.

The Central Advisory Purchasing Committee, with headquarters at Washington, is composed of: Henry B. Spencer,

Washington; Samuel Porcher, Philadelphia; George G. Yeomans, New Haven.

Mr. Spencer is vice-president of the Southern Railway in charge of purchases, and was chairman of the Committee on Materials and Supplies of the American Railway Association's Special Committee on National Defense. He has been connected with the Southern Railway since his graduation from Harvard University in 1895; and for a while prior to his election as vice-president was general manager of that system.

Personnel of Purchasing Section

Mr. Porcher was born in South Carolina. He is a graduate of the University of Virginia, and since 1913 has been general purchasing agent of the Pennsylvania Railroad, with which road he has been connected since 1882.

Mr. Yeomans was born in New Jersey; is a graduate of Princeton University; served with the Chicago, Burlington & Quincy Railroad from 1884 to 1905; was subsequently assistant to the President of the Wabash, and since 1915 has been general purchasing agent of the New York, New Haven & Hartford.

The *Regional Purchasing Committees*, to be located respectively in the Eastern, Western and Southern Districts, are as follows:

NEW YORK: E. H. Bankard, general purchasing agent of the Baltimore & Ohio; S. B. Wight, general purchasing agent of the New York Central Lines; E. T. Burnett, of Roanoke, Va., purchasing agent, Norfolk & Western.

CHICAGO: Charles A. How, general purchasing agent of the Missouri Pacific; L. S. Carroll, general purchasing agent of the Chicago & North Western; Ira O. Rhoads, general purchasing agent of the Southern Pacific Company.

ATLANTA: F. H. Fechtig, general purchasing agent of the Atlantic Coast Line; Albert C. Mann, purchasing agent of the Illinois Central; H. T. Shanks, of Louisville, Ky., purchasing agent of the Louisville & Nashville.

Railway Freight Operations For November

THE NUMBER OF REVENUE TON MILES of freight transported by the railways of the United States for November, 1917, increased 2.9 per cent, or from 32,231,086,866 to 33,151,564,499, as compared with November, 1916, according to the monthly report compiled by the Bureau of Railway Economics. The revenue ton miles per freight locomotive increased 2.5 per cent but the average per freight car decreased 1.3 per cent. Freight train miles decreased 0.9 per cent, loaded freight car miles decreased 3.9 per cent, and locomotive miles decreased 1.1 per cent. Non-revenue ton miles increased 8.7 per cent.

The average number of freight cars in service increased 4.2 per cent and of locomotives increased 0.4 per cent. The tonnage per train was 655 as compared with 628 in November, 1916, and the tonnage per car increased from 25.3 to 27.2, or 7.5 per cent. The average miles per locomotive per day decreased 1.5 per cent and per car per day decreased 7.1 per cent.

In the eastern district revenue ton miles handled increased 2.1 per cent, in the western district 2.9 per cent and in the southern district 4.7 per cent.

For the combined eight months, April to November, inclusive, revenue ton miles increased 11.3 per cent, the tons per car increased 9.3 per cent, and tons per train increased 7.3 per cent. The average number of revenue ton miles per freight locomotive increased 10 per cent and per freight car 8.3 per cent. The average mileage per locomotive per day increased 2.8 per cent to 68.7 miles, while the average mileage per car per day decreased 0.4 per cent to 27.5. The percentage of empty car mileage increased 1 per cent to 30.1.

Letters From Overseas*

THE FOLLOWING LETTER has been received by a railroad man from a lieutenant in one of the railway regiments in France:

"Your welcome letter of December 11 received a few days ago and it surely was a distinct pleasure to hear from you, as letters from friends and loved ones back home bring about the only sunshine that enters our lives out here in the war zone.

"Myself and all the men in my district experienced as enjoyable a Christmas as we could hope to so far, far from home, for we all received many nice packages, the most of which reached us a few days before Christmas. Our Chicago Great Western present arrived a short time after Christmas and was surely appreciated by every member of Company C. Myself and two other officers spent the first three days of the New Year in Paris. About every sixty days I run into Paris for three days' recreation, as it does one a lot of good to get out of the war zone and back to real life and civilization occasionally.

"Our regiment is still busily engaged in successfully operating one of France's most important lines of communication, and until the past two or three days we have been handling a record business, as the troop movement has been quite heavy bringing the troops from the trenches for rest and transferring them from one part of the front to another. I was particularly impressed with a troop train we handled the other day, as it was a train of French soldiers coming from the trenches for a few days' rest, and although they were literally covered with mud from head to foot, yet they looked hale, hearty and carefree, for they were singing and seemed quite happy, because they were out of the trenches and mud for a few days' recreation and an opportunity to clean up. The French are wonderful soldiers and wonderful people, and while the dirty Huns are able to kill some of them, yet they will never be able to conquer the indomitable French spirit.

"We now have all of the U. S. A. engineers that are going to be assigned to us, and they are certainly rendering fine service. We are handling at least 40 per cent more tonnage per train per mile than with the French power, and have naturally effected a marked reduction in both train and engine mileage, which results in fuel economy that surely is a vital question over here. These engines are much easier on track than I anticipated, and are not causing any trouble at all in kicking our curves out of line. The winter in our part of France has been most mild, certainly a marked contrast to winters I have been accustomed to in Minnesota the past five years. Our weather during the last two weeks has been like spring and our section men are surfacing track every day now.

"We are all quite optimistic over here, and are of the opinion that a big successful drive by our Allies in the Spring will end it all and bring the dirty, fiendish Huns to their knees."

ON THE NEW YORK, CHICAGO & ST. LOUIS, the green or white flags carried on the front of locomotives are supported on the pilot beam; and the Chicago Great Western and the Bessener & Lake Erie also have an arrangement somewhat different from the usual practice of putting the flags at the side of the headlight. These facts are given in a circular issued by the National Safety Council, W. H. Cameron, general manager, Chicago, which has been issued in connection with an inquiry made by the Council as to injuries to men in putting up the flags. Cases have been reported of serious injuries to firemen by falling from the top of the engine.

*The *Railway Age* expects to publish regularly letters from railwaymen overseas. If you receive a good letter from a railwayman who is now in France, send it in for publication and let the *Railway Age* pass it around for all to enjoy.

Unusual Failure of a Railroad Draw Bridge

Train Pushed the Span Off the Pier at One End, Causing
It to Tip Down Into the River

THE failure to stop a freight train approaching a draw span on a middle-western road on Sunday, February 17, after the bridge had started to swing, resulted in the freak accident shown in the pictures. Running part way onto the bridge while it was swinging, the train pushed the span in a longitudinal direction a sufficient distance to clear the bridge-seat on the loaded end, with the result that the span was tipped down into the position shown, carrying with it the engine and two cars that had run onto it. No loss of life or personal injuries resulted.

The bridge was built about 1897 and consists of a 238-ft draw span flanked on the south by a 92-ft. pony span and on the north by four 157-ft. through Pratt truss spans. All of the spans are pin connected and the substructure is ashlar masonry. The draw span has a rim-bearing center and end lift equipment of a type in which the shoes are raised and lowered in a vertical direction by toggles, the bottoms of the shoes being shaped to engage depressions in the bearings on the bridge-seats. The rail locks are of the vertical-lift type with butt-jointed rails.

The accident is accounted for by the failure of the engineer to observe the signals in time to stop his train. Preparations were being made to swing the span for the passage of a boat as a freight train was approaching from the south. The bridge is not protected by interlocking, but the red flag and torpedoes set against the train were apparently ignored as the train failed to stop. The bridge tender said that he had raised the rail locks and the end bearings and had attempted to swing the bridge but found it jammed in some manner so that there was an appreciable delay in starting the swinging movement. This fact undoubtedly saved the train from going into the river for, because of this delay, the span was turned only a few inches when the train reached it, so that a portion of the train readily passed onto the span, although all of the wheels were derailed except the first two wheels on the engine.

There is a lack of definite data on the speed of the train

The locomotive and two cars passed onto the span before coming to a stop, and the resulting longitudinal thrust produced a most remarkable displacement of the superstructure. The draw span was pushed 6 ft. north and two feet east

View Showing How the Span Swung in Tipping Down

(upstream) and this span in turn pushed the adjacent 157-ft. span 20 in. to the north. The second fixed span was moved 16 in., the third one 3 in. and the fourth one 2 in. The spans were not anchored to the masonry, but it is be-

Method of Raising the Span

at the instant that it struck the span. The trainmen maintain that the velocity was about 3 miles per hour, but the physical evidences point to a speed much higher than this.

heaved that more serious results would have been brought about had the spans been firmly secured to the substructure.

Being deprived of its support at the heavy end, the draw

span tipped down like an unbalanced scale. The pictures show the engine almost entirely out of the water with the tender nearly submerged. Behind the latter was a coal car completely submerged, while a second car hung in an inclined position with its rear trucks on the pier, this car being removed before the picture was taken.

In tipping, the span made an appreciable turn in a horizontal plane so that the south end was swung about 15 ft. to the south. In the longitudinal movement that preceded the tipping the north end of the swing span became jammed tightly against the end of the adjacent fixed span, and in

View of the Span from the Northwest

consequence when the tipping motion started the end of the fixed span was lifted about 2 ft. and also swung somewhat to the east before it was released from the end of the swing span, and dropped back onto the pier. The top of the latter was seriously shattered.

The principal damage to the span was the crushing of the drum on the side which carried the weight of the span while in the inclined position, and a rather serious battering of the floor system in the two panels nearest the south end of the bridge. One hip vertical was also badly buckled.

The Position of the Drum Gives an Idea of the Longitudinal Displacement

As seen in the photographs the bracing in the tower panel is too light to take more than a nominal shear and was entirely inadequate to transmit the enormous dead-load shear obtaining in this panel while in the tipped position. In consequence resistance to collapse of the tower panel was afforded principally by the stiffness of the bottom chords and the floor system. One of the light tower diagonals broke some time after the accident occurred.

The method of restoring the structure is shown in the

large photograph. A large gallows frame was erected over the south end of the span, supporting it on two groups of piles driven in either side of the span by a marine driver. After lashing the locomotive and tender securely in place on the bridge the submerged coal car was drawn out through the south portal of the span. Then by means of heavy hoisting tackles supported from the gallows frame and attached to the hip pins, the span was slowly raised, the power being supplied by hoisting engines on the marine pile driver and a derrick car standing on the 90-ft. pony span. Auxiliary lines from the winch heads on the hoisting equipment were also made use of.

After the span had been raised to within about 4 ft. of the final elevation the south end was supported temporarily on a grillage of I-beams resting on the falsework. With the bridge in this position it was possible to remove the engine and tender after which steps were taken to shift the span to its proper position on the pivot pier. On account of the damage done to various parts of the superstructure it has been found necessary to place the draw span on falsework before restoring traffic.

Railway Revenues and Expenses in 1917

RAILWAY OPERATING INCOME in the calendar year 1917 was \$967,268,523, or \$121,000,000 less than in 1916, according to the summary of railway returns for December and for the 12 months ended December 31, 1917. The income per mile decreased 11.4 per cent. Railway operating revenues for the first time crossed the four billion mark, amounting to \$4,041,014,239, as compared with \$3,625,252,371 in 1916, an increase of \$416,000,000, or 11.2 per cent per mile. Operating expenses amounted to \$2,852,880,196, an increase of \$476,000,000, or 19.8 per cent per mile, while taxes were \$220,162,949, an increase of \$61,000,000. The operating ratio was 70.6, whereas in 1916 it was 66.55. Most of the decline in operating income was in the Eastern district, where the reduction was \$89,000,000, a decrease of 19.4 per cent per mile, and the operating ratio increased from 67.97 to 75.03. In the Southern district there was a reduction in income of nearly \$3,000,000, and in the Western district of \$29,000,000.

For the railroads as a whole all items of revenue showed large increases except that from mail traffic. While freight revenues increased approximately 10 per cent to \$2,829,246,769, and passenger revenues increased from \$707,757,469 to \$825,496,565, or 16 per cent, the mail revenues actually decreased, as a result of the Postoffice Department's new policy of paying for the mail on the space basis, from \$61,227,765 to \$58,681,549. Express revenues increased from \$90,311,885 to \$106,895,282. Every item of expense, except that of transportation for investment, also showed a large increase. Maintenance of way and structures cost \$444,458,855, compared with \$424,530,358 in 1916. Maintenance of equipment increased from \$598,714,857 to \$691,025,391. Traffic expenses increased from \$62,915,931 to \$64,966,241. Transportation expenses increased from \$1,185,833,399 to \$1,529,800,773, or 29 per cent.

For the month of December the figures reflect plainly the severe weather conditions then prevailing. While revenues increased from \$311,000,000 to \$335,000,000, expenses increased from \$209,000,000 to \$251,000,000; taxes increased from \$14,479,000 to \$24,369,000, and operating income was reduced from \$86,869,000 in 1916, to \$59,204,000. In the Eastern district while revenues increased about \$7,000,000, expenses increased \$19,000,000, and the operating ratio was increased from 72.01 to 82.22.

The detailed figures showing per mile averages, as compiled by the Bureau of Railway Economics, are as follows:

The Sanitarian's Work Is Valuable to a Railroad

An Outline of the Work Being Done to Remove Unhealthful Conditions on the Illinois Central

By A. E. Campbell

Health Officer, Illinois Central, Chicago.

GENERAL SANITATION was once considered of value mainly as an adjunct in limiting possible epidemics, but modern public health work has developed its ideas and functions far in advance of this corrective form of work, and its attention is now focused mainly upon broad measures concerned with the prevention of disease and its hazards. If we cover machinery to prevent possible accident, why should we not clean up our laborers and their environment, vaccinate them, for instance, to prevent a possible epidemic and an outbreak of small pox to disturb the harmonious operation of our large plants? Our modern industrial plants have employed experts to study their complicated machinery and obtain maximum of efficiency. Why should the human machine be neglected?

Large industrial organizations are beginning to appreciate the value of promoting the efficiency of the individual employee. The experienced employee is one of the greatest assets of any industrial organization, and the problem is how to keep him employed at his work the greatest number of days in the year and how to keep him physically fit and consequently at his highest state of efficiency.

The Illinois Central and Yazoo & Mississippi Valley have well-developed hospital departments through which the employees receive all medical and surgical care for a small monthly contribution. Careful attention is also given to sanitary measures as regards both working and living conditions of the employees.

Along the lines of the Illinois Central malaria was formerly so common that in certain sections 40 to 50 per cent of the employees would be incapacitated at times by that disease. We early began the use of quinine as a prophylaxis, and we have found that, by administering 12-grain doses of it twice a week to each employee, we can absolutely prevent the development of malaria, even though individuals may become infected.

Drinking Water Is Examined Carefully

The drinking water at all our shops was investigated. At one point, where a great deal of sickness had developed, it was found that all drinking water was taken out of a surface well with a chicken yard and an outside surface privy quite near, both draining toward the well. The city water was fully three-fourths of a mile distant. We equipped eight large barrels with hinged covers on the top and faucets at the bottom, and hired a negro with a wagon to haul four barrels of city water in the morning and four in the evening and distribute it in the shops. After that we did not have one case of bowel or stomach disturbance. At other places the water, which was taken from rivers or ponds, became quite murky and unfit for drinking after heavy rains. This water was sedimented and then sterilized with lime, by means of an apparatus such as shown in one of the drawings. Now we use lime to sterilize all the drinking water.

The drinking water all through southern Illinois comes from shallow wells, nearly all of them showing gross pollution, and although we had a sign on each of our wells—"The use of this water for drinking purposes is forbidden"—still our employees and the traveling public continued to drink the polluted water, and we felt that we should do

something to lessen this danger. In some cases we have had to resort to water-tight cisterns in which the incoming water has to pass through three feet of sand before entering the cistern. It then passes through a brick wall before being pumped for drinking purposes, so that the rain water is well purified. This style of cistern has been approved by the Public Health Service.

We have abolished the scavenger. When any of the vaults of our outside closets need cleaning, we remove the building, cover all excretions with waste, cobs, wood, or creosoted ties, sprinkle with kerosene and burn, using some tar to keep down the odor, and keeping a hot coal fire over the contents for some time. The pit is then filled in and a new one dug 8 ft. deep, and 6 in. of chloride of lime is put in the bottom. This has worked well with us and has had the unqualified endorsement of municipal and state officers.

We keep our privies dark and as it is very difficult to keep them screened, it has been thought advisable to have them painted black inside as this tends to keep out flies. The doors to all outside toilets should be separated and both the men's and women's toilets screened from view and properly designated. The bottom of the screen should be 16 in. from the ground. The waste from all construction crews is also watched and all gangs are provided with portable toilets. On one division this toilet is now made in one piece,

A Method of Filtering and Sterilizing Water for Trains During Flood Times

as when sent out knocked down, the different pieces often get lost.

At one of our shops our employees were greatly annoyed by small insects that swarmed through the place, lighting on the victims' faces and hands. We sent samples of them to the Bureau of Entomology at Washington, which informed us that they were white ants, insects very destructible to wood, water tanks, railroad ties, and all wood in the building. They advised that we remove all flooring in the shop, soak the ground with kerosene, and substitute creosoted blocks for flooring. This was done, the annoyance was re-

moved, and an insect pest destroyed that might have proved very expensive to the company.

The reports of the sanitarian are made out in triplicate, one copy going to the general manager, one to the general superintendent, and one to the local superintendent. Thus the needs or desires of the employees are brought direct to the attention of the management. Laborers complained that their living quarters were cold and scarcely fit to live in in cold weather. The sanitarian made a tour of every laborer's shack on that division, in company with the supervisor of buildings, and made a detailed report of every one. Within two months every shack on that division was papered with tar paper, lathed and re-lathed, and painted throughout, adding much to the comfort of the laborers.

The ventilation of waiting rooms and ticket and general offices has received attention. All waiting rooms in stations

Two Forms of Drinking Water Supplies

are ventilated by lowering the upper sash windows on the side opposite the prevailing winds. In this way the air is kept at an agreeable temperature. In general offices, where there are one hundred or more clerks, weights are placed on all papers and windows are thrown open at 10 A. M. and 3 P. M. each day, while the clerks stand up and walk around. In ticket offices, the draft coming through the ticket window causes frequent colds. At one terminal this draft was the cause of six employees leaving the office because of pulmonary tuberculosis, three of whom died. This draft can be overcome by installing other openings such as a transom over the door, or a lattice work over the ticket window, to subdivide the air passage and control the draft.

Large offices are surveyed for the detection of early cases of tuberculosis, and if any employees seem to be in declining health they are examined, treated, and stationed near windows. Clerks who are thin and anemic are treated and built up, probably being given a vacation or a change in their work.

Attention to the Traveling Public

Many railroads have not had any definite system of cleaning their stations and toilets. They were cleaned by the section men when the agent thought the places were dirty, or when some passenger complained. Then they were left until another complaint reached the agent or the management. We adopted a regular routine of scrubbing stations at terminals every second day, at county seats and junction points twice a week, and all other stations once a week. The floors and toilets of all stations at terminals, county seats, and

junction points should be swept twice a day, and the toilets scrubbed twice a day. At all of our stations, the raising of dust when sweeping was a problem that had to be solved. We had a preparation put up at our shops, composed of ocean sand, salt, sawdust and arctic engine oil. Besides keeping down dust, this preparation possesses cleaning properties that make it valuable. A method used by some of our agents in sweeping is to put an ordinary gunny sack over the handle of a wide pushbroom, so arranged that the handle passes through the center of the gunny sack, turn this over and under the pushbroom, and dampen the sack with kerosene oil. By this means dirt can be removed very readily without the raising of any dust.

The water and ice used on trains are watched with great care. At one large terminal where many trains were watered the city water became polluted owing to floods. We had a sand-and-charcoal filter built promptly, and all water used was passed through this, and then into a large tank, where it was boiled for 20 min. with live steam. Then the water was passed over ice manufactured from distilled water after which it was put in the coolers. All coolers were washed out with boiled water, and the hands of attendants were also washed with water that had been boiled. During all the flood period we did not have a single complaint from passengers.

At one terminal used by two large railroads the only available drinking water came from a spring which had an environment indescribably bad—out-side surface privies, chicken yards, hog pens, and kitchens all draining toward this spring. Examination of this water showed 25,000 bacteria to the cubic centimeter. Four ounces of lime was added and this spring was walled to a height of about four feet. Ten hours after adding the lime a sample of the water was examined and found absolutely sterile. Two weeks later another sample was examined with the same result. All our section crews in this part of the country carry a lime solution and are instructed how to sterilize any water they may use. At all junction points, where the water is bad, water coolers are installed in waiting rooms and the water is sterilized for drinking purposes.

We are also watching the drinking water used at all our restaurants, even if our trains are not watered at those stations. At one large terminal, where fully 500 persons ate daily at the restaurant, examination of the drinking water showed three thousand bacteria on gelatin and ten thousand on agar. The manager was at once notified. Arrangements were made to have all the drinking water sterilized in a large cooler, and all drinking water served to the public taken from this cooler. The hands of waitresses and the dishes used are washed with water that has been boiled.

The ventilating of trains is also attended to. On suburban trains during rush hours we see that the rear end sash is open. When the train is standing full we have the sash of the front and rear doors open. In this way the air is being changed constantly. The heating of trains in both northern and southern climates is often very perplexing. If 90 lb. pressure is required to maintain steam through a long train, this amount will keep the train entirely too warm in a southern climate unless the temperature is controlled by the train crews. All steel coaches running south should have ceiling paddle fans, as steel becomes very hot. Here are good rules to observe:

1. When the temperature reaches 75 deg. with the train moving turn off the steam on the sunny side or on the side of the train opposite to the prevailing winds.
2. Always keep the transom at the rear door open when there are many passengers in coach. It should always be open when the train moves but should be closed when the temperature falls to 70 deg.

Avoid drafts on cold day. Do not open the transom

on the side of the train when the wind is blowing against it. Keep the front doors on all suburban and through trains closed, unless you wish to cool the coaches quickly.

4. If passengers complain of excessive heat, move them to the outer ends of their seats or to seats near the door.

5. If a temperature of 75 deg. is maintained in a rapidly moving train, there will be no complaint, since the temperature drops as the speed of the train is increased.

The cleaning of trains in transit becomes very necessary when a train travels overnight. A porter should sweep it once or twice while on the journey. The water coolers on trains should have separate apartments for water and ice, and the pipe carrying the melting ice water should cross the lower part of the water cooler so as to cool the drinking water as it escapes.

Attention Is Given to the Food

Restaurants along the line need attention. It was found in many places that one-half of all the refrigerators were unable to maintain a temperature lower than 55 deg., and that sensitive foods, including milk and cream, were kept with vegetables and fish. No attention was paid to the proper cleaning of ice boxes, as it was no person's business to attend to that part of the work. Grease traps were full to overflowing, and when emptied were put back into the sewer.

We brought about a number of changes in these conditions. Now all food is covered at all restaurants, ice boxes are watched and kept clean, and new refrigerators have been installed at many points. The ventilation in our new diners is much improved; the upper half of the door entering the kitchen is open and screened, a canopy has been placed over the stove and an exhaust fan over the canopy. Every diner leaving Chicago is examined regularly and the dining room is closely inspected each month.

The following instructions were issued to all chefs on dining and private cars and all handlers of food at restaurants:

1. Keep all dairy products, such as milk, cream, butter, and cheese, in one compartment. Cheese should be in a box on the upper shelf, if possible, butter on the lower shelf.

2. Keep all bakery goods by themselves; pies should be kept in a locker, cookies wrapped in paraffin paper (neither of these need necessarily be in the ice box).

3. Keep all meats—beef, pork, veal, mutton—in one compartment and as far as possible in the bottom of the cooler on a clean cloth. Chickens can be carried with meat provided that the heads and feet are covered and the fowls are separated from meats by a clean cloth.

4. Fish should be wrapped in a clean towel and packed in ice. No other food should be near it.

5. Lettuce should be trimmed and sprinkled with water and carried in brown paper or paper bags. All other vegetables should be carried in sacks.

6. Conserve all food; permit no waste. All trimmings of meat should be used in entrees or for soup stock as soon as trimmed.

7. Watch for decay in meat and chicken. If meat assumes a dark color, or smells bad, trim it off and use it at once.

8. Watch your ice box; go over it daily and clean it carefully. Arrange all food as here directed, as far as possible, and you will have no trouble.

The carriage of meat and produce on diners during the hot months is a very difficult problem, owing to the close proximity of the fire to the cooler; and as the door is opened so frequently during the preparation of a meal the temperature of the cooler sometimes rises 10 to 15 deg. in one hour. For this reason railroads should control the eating houses along their line, so that all meats can be exchanged and a fresh supply carried on the diner.

Not long ago we were asked as to the effect of fish on

drinking water, as the company is building a large dam in Kentucky and expects to use the water supply thus obtained not only for engines, but also for drinking water at our shops and for watering our trains at that point. It was proposed to introduce fish into the reservoir, but the sanitarian insisted that fish pollute water, and if they abound in small lakes or water which is dammed, their pollution becomes a serious matter, calling for some form of treatment. Besides, fish bring fishermen, and fishermen in boats are also liable to pollute the water in many cases. Not only was it felt that no fish should be put in the lake, but that it should be protected from human visitation, and the grounds around it should be likewise guarded.

Advantages to the Employees

Efficiency engineers today recognize the fact that employees work to better advantage and with greater speed and accuracy if their surroundings are cheerful and well lighted. In considering a lighting installation the subject of brightness should never be overlooked. The investigations of Prof. C. E. Ferree, of Bryn Mawr Psychological Laboratory, indicate that after three hours of work under daylight, the eye loses approximately 5 per cent in efficiency, and that under the indirect system of artificial lighting the loss is about 7½ per cent during the same period. While under the semi-indirect and direct systems the loss reaches over 70 per cent. This latter loss is due to direct glare from the units and also to the specular reflection from polished surfaces, desk tops, etc. Hence we have installed the indirect system at many of our terminals and also in our new office building at 63rd St., Chicago.

The development of sanitation offers advantages for educating the laborer in sanitary measures. If he is surrounded in the workshop or office by ideal sanitary conditions, he is thereby made capable of comparing these conditions with those that obtain in his home. In this way men are unconsciously led to desire a higher environment. The personal relation of the sanitarian to the worker in the office or workshop is a means by which the principles of personal hygiene are so inculcated as to be applied, and not regarded as fads of the medical profession.

Within the past year we have taken up another educational feature which, it is believed, will prove of incalculable benefit to the management—that of giving instruction in first aid to the injured. One of the laborers is taken as an object lesson. He lies on the ground, as if he had been run over by a train. All laborers are shown how to make him comfortable, how to carry him or remove him from wreckage, how to warm him, or to arrest bleeding; step by step they are led through the methods of rendering first aid to the injured man. This training has been given at every shop on the system. It is not only educational but it is welfare work—and work which, if it is to be permanent in its operation and lasting in its results, must be founded on the bed rock of education.

With these aims in view, our employees are addressed in kindly words about their own work, and they are also made acquainted with the burden of care and responsibility borne by the management. They are told frankly that responsibilities in the railway service gravitate to the person who can shoulder them, and power flows to the men who "know how."

EQUIPMENT EXPORTS FROM ENGLAND IN 1917.—The British Board of Trade reports the exports of railway material of the following value during the twelve months ended December 31, 1917, the corresponding figures for 1916 being given in brackets: Locomotives, \$8,075 (\$6,485); rails, \$3,450 (\$2,910); passenger cars, \$895 (\$1,890); freight cars, \$2,205 (\$3,675).

Railroad Control Bill Passed by the Senate

Period Limited to 21 Months After War. Interstate
Commerce Commission Retains Rate Authority

THE BILL PROVIDING for the compensation of the railroads and prescribing the terms and conditions under which government control is to be exercised was expected to be passed early this week but it encountered unexpected delay in the Senate on Monday and its consideration was postponed until Wednesday. The delay was caused by the objection of several senators to the action of the conferees in adding section 15 restricting state taxation of the railroads. The bill was referred back to conference by the Senate on Wednesday; the objectionable features were removed and the bill was returned to the Senate late in the day and passed by a vote of 47 to 8. It is expected that the House will pass the bill before the end of the week.

The conferees appointed to reconcile the differences in the bill as passed by the House and the Senate reached an agreement on March 7, after considerable difficulty in effecting a compromise on the rate-making authority, and submitted their report to Congress March 9.

The conference report includes the provision that the period of government control shall extend not to exceed 21 months after the proclamation of peace terminating the war, and the provision for agreements between the roads and the President for compensation based on the average net operating income for the three years ending June 30, 1917. The section on rate-making, a compromise between those who feared any curtailment of the authority of the Interstate Commerce Commission and those who felt that the President should have a free hand to take action in an emergency, as well as to insure that the roads shall be made self-sustaining during the period of federal control, was written by Senator Robinson of Arkansas. Whereas the Senate bill proposed to authorize the President to initiate rates but to give the commission power to overrule his action after an investigation, and the House bill would have made the commission's report a mere recommendation to the President, the compromise adopted gives the commission final authority but requires it to take into consideration a certificate by the President that increased revenues are necessary to defray expenses and to pay the agreed compensation to the owners of the roads.

The President is placed in the position of an operating carrier that initiates a rate, but without the restriction imposed upon carriers by the requirement that they shall secure the commission's approval before filing an increased rate; and any rate he proposes will take effect without suspension. Upon complaint the commission shall conduct hearings in the usual way, giving due consideration to the fact that the roads are under a unified control and not in competition, and shall then make its findings and report.

The compromise was not reached, however, until the conferees had voted down a provision absolutely requiring the commission to make rates high enough to pay the railroads' guarantees and all expenses and also another that would have required the commission to hand down a decision in 30 days.

The language finally adopted would seem calculated to settle the controversy which has always been interjected into general rate advance cases before the Interstate Commerce Commission as to whether the commission's determination as to what are reasonable rates should take into consideration the needs of the railways for increased revenues or whether a "reasonable" rate is a reasonable rate regardless of its effect on revenues as a whole. If the President or

the Director General of Railroads, therefore, should find it necessary to increase rates as they are likely to find after the Wage Commission makes its report some time this month, their task will be much more simple than that of the railroads which have been in that position in the past.

The substitute section also provides that the act shall not be construed to amend, repeal, impair, or affect existing laws or powers of the states in relation to the lawful police regulations of the states, except wherein such laws, powers or regulations may affect the transportation of troops, war materials, government supplies or the issue of stocks and bonds. The text of the bill as reported by the conferees is as follows:

Provision for Compensation

"SEC. 1. That the President, having in time of war taken over the possession, use, control and operation (called herein Federal control) of certain railroads and systems of transportation (called herein carriers), is hereby authorized to agree with and to guarantee to any such carrier making operating returns to the Interstate Commerce Commission, that during the period of such Federal control it shall receive as just compensation an annual sum, payable from time to time in reasonable installments, for each year and pro rata for any fractional year of such Federal control, not exceeding a sum equivalent as nearly as may be to its average annual railway operating income for the three years ending June 30, 1917. That any railway operating income accruing during the period of Federal control in excess of such just compensation shall remain the property of the United States. In the computation of such income, debits and credits arising from the accounts called in the monthly reports to the Interstate Commerce Commission equipment rents and joint facility rents shall be included, but debits and credits arising from the operation of such street electric passenger railways, including railways commonly called interurbans, as are at the time of the agreement not under Federal control, shall be excluded. If any lines were acquired by, leased to, or consolidated with such railroad or system between July 1, 1914, and December 31, 1917, both inclusive, and separate operating returns to the Interstate Commerce Commission were not made for such lines after such acquisition, lease, or consolidation, there shall (before the average is computed) be added to the total railway operating income of such railroad or system for the three years ended June 30, 1917, the total railway operating income of the lines so acquired, leased, or consolidated, for the period beginning July 1, 1914, and ending on the date of such acquisition, lease, or consolidation, or on December 31, 1917, whichever is the earlier. The average annual railway operating income shall be ascertained by the Interstate Commerce Commission and certified by it to the President. Its certificate shall, for the purpose of such agreement, be taken as conclusive of the amount of such average annual railway operating income.

War Taxes Deducted

"Every such agreement shall provide that any Federal taxes under the act of October 3, 1917, or acts in addition thereto or in amendment thereof, commonly called war taxes, assessed for the period of Federal control beginning January 1, 1918, or any part of such period, shall be paid by the carrier out of its own funds, or shall be charged against or deducted from the just compensation that other

taxes assessed under Federal or any other governmental authority for the period of Federal control or any part thereof, either on the property used under such Federal control or on the right to operate as a carrier, or on the revenues or any part thereof derived from operation (not including, however, assessments for public improvements or taxes assessed on property under construction, and chargeable under the classification of the Interstate Commerce Commission to investment in road and equipment), shall be paid out of revenues derived from railway operations while under Federal control; that all taxes assessed under Federal or any other governmental authority for the period prior to January 1, 1918, whenever levied or payable, shall be paid by the carrier out of its own funds, or shall be charged against or deducted from the just compensation.

"Every such agreement shall also contain adequate and appropriate provisions for the maintenance, repair, renewals, and depreciation of the property, for the creation of any reserves or reserve funds found necessary in connection therewith, and for such accounting and adjustments of charges and payments, both during and at the end of Federal control as may be requisite in order that the property of each carrier may be returned to it in substantially as good repair and in substantially as complete equipment as it was in at the beginning of Federal control, and also that the United States may, by deductions from the just compensations or by other proper means and charges, be reimbursed for the cost of any additions, repairs, renewals, and betterments to such property not justly chargeable to the United States; in making such accounting and adjustments, due consideration shall be given to the amounts expended or reserved by each carrier for maintenance, repairs, renewals, and depreciation during the three years ended June 30, 1917, to the condition of the property at the beginning and at the end of Federal control and to any other pertinent facts and circumstances.

"The President is further authorized in such agreement to make all other reasonable provisions, not inconsistent with the provisions of this act or of the act entitled 'An act making appropriations for the support of the Army for the fiscal year ending June 30, 1917, and for other purposes,' approved August 29, 1916, that he may deem necessary or proper for such Federal control or for the determination of the mutual rights and obligations of the parties to the agreement arising from or out of such Federal control.

"If the President shall find that the condition of any carrier was during all or a substantial portion of the period of three years ended June 30, 1917, because of non-operation, receivership, or where recent expenditures for additions or improvements or equipment were not fully reflected in the operating railway income of said three years or a substantial portion thereof, or because of any undeveloped or abnormal conditions, so exceptional as to make the basis of earnings hereinabove provided for plainly inequitable as a fair measure of just compensation, then the President may make with the carrier such agreement for such amount as just compensation as under the circumstances of the particular case he shall find just.

Short Lines Included

"That every railroad not owned, controlled, or operated by another carrier company, and which has heretofore competed for traffic with a railroad or railroads of which the President has taken the possession, use, and control, or which connects with such railroads and is engaged as a common carrier in general transportation, shall be held and considered as within 'Federal control,' as herein defined, and necessary for the prosecution of the war, and shall be entitled to the benefit of all the provisions of this act: *Provided, however,* That nothing in this paragraph shall be construed as including any street or interurban electric rail-

way which has as its principal source of operating revenue urban, suburban, or interurban passenger traffic, or sale of power, heat and light, or both.

"The agreement shall also provide that the carrier shall accept all the terms and conditions of this act and any regulation or order made by or through the President under authority of this act or of that portion of the act entitled 'An act making appropriations for the support of the Army for the fiscal year ending June 30, 1917, and for other purposes,' approved August 29, 1916, which authorizes the President in time of war to take possession, assume control, and utilize systems of transportation.

"Sec. 2. That if no such agreement is made, or pending the execution of an agreement, the President may nevertheless pay to any carrier while under Federal control an annual amount, payable in reasonable installments, not exceeding 90 per cent of the estimated annual amount of just compensation, remitting such carrier, in case where no agreement is made, for its legal rights for any balance claimed, to the remedies provided in section 3 hereof. Any amount thereafter found due such carrier above the amount paid shall bear interest at the rate of 6 per cent per annum. The acceptance of any benefits under this section shall constitute an acceptance by the carrier of all the provisions of this act and shall obligate the carrier to pay to the United States, with interest at the rate of 6 per cent per annum from a date or dates fixed in proceedings under section 3, the amount by which the sums received under this section exceed the sum found due in such proceedings.

Adjustment of Claims for Compensation

"Sec. 3. That all claims for just compensation not adjusted (as provided in section 1) shall, on the application of the President or of any carrier, be submitted to boards, each consisting of three referees to be appointed by the Interstate Commerce Commission, members of which and the official force thereof being eligible for service on such boards without additional compensation. Such boards of referees are hereby authorized to summon witnesses, require the production of records, books, correspondence, documents, memoranda, and other papers, view properties, administer oaths, and may hold hearings in Washington and elsewhere, as their duties and the convenience of the parties may require. In case of disobedience to a subpoena the board may invoke the aid of any district court of the United States in requiring the attendance and testimony of witnesses and the production of documentary evidence, and such court within the jurisdiction of which such inquiry is carried on may, in case of contumacy or refusal to obey a subpoena issued to any person, corporation, partnership, or association, issue an order requiring appearance before the board, or the production of documentary evidence if so ordered, or the giving of evidence touching the matter in question; and any failure to obey such order of the court may be punished by such court as a contempt thereof. Such cases may be heard separately or together or by classes, by such boards as the Interstate Commerce Commission in the first instance, or any board of referees to which any such cases shall be referred may determine. Said boards shall give full hearings to such carriers and to the United States; shall consider all the facts and circumstances, and shall report as soon as practicable in each case to the President the just compensation, calculated on an annual basis and otherwise in such form as to be convenient and available for the making of such agreement as is authorized in section 1. The President is authorized to enter into an agreement with such carrier for just compensation upon a basis not in excess of that reported by such board, and may include therein provisions similar to those authorized under section 1. Failing such agreement, either the United States or such carrier may file a petition in the Court of Claims for the

purpose of determining the amount of such just compensation, and in the proceedings in said court the report of said referees shall be prima facie evidence of the amount of just compensation and of the facts therein stated. Proceedings in the Court of Claims under this section shall be given precedence and expedited in every practicable way.

"Sec. 4. That the just compensation that may be determined as hereinafter provided by agreement or that may be adjudicated by the Court of Claims, shall be increased by an amount reckoned at a reasonable rate per centum to be fixed by the President upon the cost of any additions and betterments, less retirements, and upon the cost of road extensions to the property of such carrier made by such carrier with the approval of or by order of the President while such property is under Federal control.

"Sec. 5. That no carrier while under Federal control shall, without the prior approval of the President, declare or pay any dividend in excess of its regular rate of dividends during the three years ended June 30, 1917. *Provided, however,* That such carriers as have paid no regular dividends or no dividends during said period may, with the prior approval of the President, pay dividends at such rate as the President may determine.

The Revolving Fund

"Sec. 6. That the sum of \$500,000,000 is hereby appropriated, out of any moneys in the Treasury not otherwise appropriated, which, together with any funds available from any operating income of said carriers, may be used by the President as a revolving fund for the purpose of paying the expenses of the Federal control, and so far as necessary the amount of just compensation, and to provide terminals, motive power, cars, and other necessary equipment, such terminals, motive power, cars, and equipment to be used and accounted for as the President may direct and to be disposed of as Congress may hereafter by law provide.

"The President may also make or order any carrier to make any additions, betterments, or road extensions, and to provide terminals, motive power, cars, and other equipment necessary or desirable for war purposes or in the public interest on or in connection with the property of any carrier. He may from said revolving fund advance to such carrier all or any part of the expense of such additions, betterments, or road extensions, and to provide terminals, motive power, cars, and other necessary equipment so ordered and constructed by such carrier or by the President, such advances to be charged against such carrier and to bear interest at such rate and be payable on such terms as may be determined by the President, to the end that the United States may be fully reimbursed for any sums so advanced.

"Any loss claimed by any carrier by reason of any such additions, betterments, or road extensions so ordered and constructed may be determined by agreement between the President and such carrier; failing such agreement the amount of such loss shall be ascertained as provided in section 3 hereof.

"From said revolving fund the President may expend such an amount as he may deem necessary or desirable for the utilization and operation of canals, or for the purchase, construction, or utilization and operation of boats, barges, tugs, and other transportation facilities on the inland, canal, and coastwise waterways, and may in the operation and use of such facilities create or employ such agencies and enter into such contracts and agreements as he shall deem in the public interest.

President May Purchase Securities

"Sec. 7. That for the purpose of providing funds requisite for maturing obligations or for other legal and

proper expenditures, or for reorganizing railroad in receivership, carriers may during the period of Federal control, issue such bonds, notes, equipment trust certificates, stock, and other forms of securities, secured or unsecured by mortgage, as the President may first approve as consistent with the public interest. The President may, out of the revolving fund created by this act, purchase for the United States all or any part of such securities at price not exceeding par, and may sell such securities whenever in his judgment it is desirable at prices not less than the cost thereof. Any securities so purchased shall be held by the Secretary of the Treasury, who shall, under the direction of the President, represent the United States in all matters in connection therewith in the same manner as a private holder thereof. The President shall each year, as soon as practicable after January 1, cause a detailed report to be submitted to the Congress of all receipts and expenditures made under this section and section 6 during the preceding calendar year.

"Sec. 8. That the President may exercise any of the powers herein and heretofore granted him with relation to Federal control through such agencies as he may determine, and may fix the reasonable compensation for the performance of services in connection therewith, and may avail himself of the advice, assistance, and co-operation of the Interstate Commerce Commission and of the members and employees thereof, and may also call upon any department, commission, or board of the government for such services as he may deem expedient. But no such official or employee of the United States shall receive any additional compensation for such services except as now permitted by law.

"Sec. 9. That the provisions of the act entitled "An act making appropriations for the support of the Army for the fiscal year ending June 30, 1917, and for other purposes," approved August 29, 1916, shall remain in force and effect except as expressly modified and restricted by this act; and the President, in addition to the powers conferred by this act, shall have and is hereby given such other and further powers necessary or appropriate to give effect to the powers herein and heretofore conferred. The provisions of this act shall also apply to any carriers to which Federal control may be hereafter extended.

"Sec. 10. That carriers while under Federal control shall be subject to all laws and liabilities as common carriers, whether arising under State or Federal law, or at common law, except in so far as may be inconsistent with the provisions of this act or any other act applicable to such Federal control or with any order of the President. Action at law or suits in equity may be brought by and against such carriers and judgments rendered as now provided by law, and in any action at law or suit in equity against the carrier no defense shall be made thereon upon the ground that the carrier is an instrumentality or agency of the Federal government. Nor shall any such carrier be entitled to have transferred to a Federal court any action heretofore or hereafter instituted by or against it, which action was not so transferable prior to the Federal control of such carrier, and any action which has heretofore been so transferred because of such Federal control or of any act of Congress or official order or proclamation relating thereto, and any action of either party be removed to the court in which it was originally instituted. But no process, mesne or final, shall be levied against any property under such Federal control.

The Rate-Making Power

"During the period of Federal control, the power in this respect the public interest requires, the President may appropriate from moneys (classification, regulations, and creation) holding the same with the Interstate Commerce

Commission, which said rates, fares, charges, classifications, regulations, and practices shall not be suspended by the commission pending final determination.

"Said rates, fares, charges, classifications, regulations, and practices shall be reasonable and just and shall take effect at such time and upon such notice as he may direct, but the Interstate Commerce Commission shall, upon complaint, enter upon a hearing concerning the justness and reasonableness of so much of any order of the President as establishes or changes any rate, fare, charge, classification, regulation, or practice of any carrier under Federal control, and may consider all the facts and circumstances existing at the time of the making of the same. In determining any question concerning any such rates, fares, charges, classifications, regulations, or practices, or changes therein, the Interstate Commerce Commission shall give due consideration to the fact that the transportation systems are being operated under a unified and co-ordinated national control and not in competition.

"After full hearing the commission may make such findings and orders as are authorized by the act to regulate commerce as amended, and said findings and orders shall be enforced as provided in said act: *Provided, however*, That when the President shall find and certify to the Interstate Commerce Commission that in order to defray the expenses of Federal control and operation fairly chargeable to railway operating expenses, and also to pay railway tax accruals other than war taxes, net rents for joint facilities and equipment, and compensation to the carriers, operating as a unit, it is necessary to increase the railway operating revenues, the Interstate Commerce Commission in determining the justness and reasonableness of any rate, fare, charge, classification, regulation, or practice shall take into consideration said finding and certificate by the President, together with such recommendations as he may make.

Penalties

"Sec. 11. That every person or corporation, whether carrier or shipper, or any receiver, trustee, lessee, agent, or person acting for or employed by a carrier or shipper, or other person, who shall knowingly violate or fail to observe any of the provisions of this act, or shall knowingly interfere with or impede the possession, use, operation, or control of any railroad property, railroad, or transportation system hitherto or hereafter taken over by the President, or shall knowingly violate any of the provisions of any order or regulation made in pursuance of this act, shall be guilty of a misdemeanor, and shall, upon conviction, be punished by a fine of not more than \$5,000, or, if a person, by imprisonment for not more than two years, or both. Each independent transaction constituting a violation of, or a failure to observe, any of the provisions of this act, or any order entered in pursuance hereof, shall constitute a separate offense. For the taking or conversion to his own use or the embezzlement of money or property derived from or used in connection with the possession, use, or operation of said railroads or transportation system, the criminal statutes of the United States, as well as the criminal statutes of the various States where applicable, shall apply to all officers, agents, and employees engaged in said railroad and transportation service, while the same is under Federal control, to the same extent as to persons employed in the regular service of the United States. Prosecutions for violations of this act or of any order entered hereunder shall be in the district courts of the United States, under the direction of the Attorney General, in accordance with the procedure for the collection and imposing of fines and penalties now existing in said courts.

"Sec. 12. That moneys and other property derived from the operation of the carriers during Federal control are hereby declared to be the property of the United States. Unless otherwise directed by the President, such moneys shall not

be covered into the Treasury, but such moneys and property shall remain in the custody of the same officers, and the accounting thereof shall be in the same manner and form as before Federal control. Disbursements therefrom shall, without further appropriation, be made in the same manner as before Federal control and for such purposes as under the Interstate Commerce Commission classification of accounts in force on December 27, 1917, are chargeable to operating expenses or to railway tax accruals and for such other purposes in connection with Federal control as the President may direct, except that taxes under Titles 1 and 2 of the act entitled 'An act to provide revenue to defray war expenses, and for other purposes,' approved October 3, 1917, or any act in addition thereto or in amendment thereof, shall be paid by the carrier out of its own funds. If Federal control begins or ends during the tax year for which any taxes so chargeable to railway tax accruals are assessed, the taxes for such year shall be apportioned to the date of the beginning or ending of such Federal control, and disbursements shall be made only for that portion of such taxes as is due for the part of such tax year which falls within the period of Federal control.

"At such periods as the President may direct, the books shall be closed and the balance of revenues over disbursements shall be covered into the Treasury of the United States to the credit of the revolving fund created by this act. If such revenues are insufficient to meet such disbursements, the deficit shall be paid out of such revolving fund in such manner as the President may direct.

"Sec. 13. That all pending cases in the courts of the United States affecting railroad or other transportation systems brought under the act to regulate commerce, approved February 4, 1887, as amended and supplemented, including the commodities clause, so called, or under the act to protect trade and commerce against unlawful restraints and monopolies, approved July 2, 1890, and amendments thereto, shall proceed to final determination as soon as may be, as if the United States had not assumed control of transportation systems; but in any such case the court having jurisdiction may, upon the application of the United States, stay execution of final judgment or decree until such time as it shall deem proper.

Period of Federal Control

"Sec. 14. That the Federal control of railroads and transportation systems herein and heretofore provided for shall continue for and during the period of the war and for a reasonable time thereafter, which shall not exceed one year and nine months next following the date of the proclamation by the President of the exchange of ratifications of the treaty of peace: *Provided, however*, That the President may, prior to July 1, 1918, relinquish control of all or any part of any railroad or system of transportation, further Federal control of which the President shall deem not needful or desirable; and the President may at any time during the period of Federal control agree with the owners thereof to relinquish all or any part of any railroad or system of transportation. The President may relinquish all railroads and systems of transportation under Federal control at any time he shall deem such action needful or desirable. No right to compensation shall accrue to such owners from and after the date of relinquishment for the property so relinquished.

"Sec. 15. That nothing in this act shall be construed to amend, repeal, impair, or affect the existing laws or powers of the States in relation to taxation or the lawful police regulations of the several States, except wherein such laws, powers, or regulations may affect the transportation of troops, war materials, government supplies, or the issue of stocks and bonds: *Provided, however*, That no State or subdivision thereof, or the District of Columbia, shall levy,

assess, or collect an amount of taxes from railroad property within the State or subdivision thereof, or the District of Columbia, while under Federal control, in excess of the ratio which the taxes derived from railroad property bore to the total taxes of such State or subdivision thereof, or the District of Columbia, for the year previous to Federal control.

"Sec. 16. That this act is expressly declared to be emergency legislation enacted to meet conditions growing out of war; and nothing herein is to be construed as expressing or prejudicing the future policy of the Federal government concerning the ownership, control, or regulation of carriers or the method or basis of the capitalization thereof."

The conferees adopted the bill as passed by the House as the basis for their work and the bill as submitted for final action was in the form of an amendment to the House bill. In several cases in order to reach a new agreement the conferees wrote language into the act which was in neither bill, as in the case of the compromise on a period of 21 months after the war and in the case of the rate-making section. As a result, the Senate on March 8 adopted a resolution directed against the practice of inserting new matter in such reports.

The Senate receded from its disagreement to section one of the House bill with an amendment striking out so much of the House bill as provided an increase of the annual sum payable as compensation to the carriers upon the cost of additions or betterments, less retirements, or road extensions made during the six months ended December 31, 1917, and with further slight amendments of the wording of the House amendment. The section in the Senate bill which proposed to reduce the compensation by providing that there should be no return on surplus invested during the period of Federal control was omitted.

The Senate receded from its disagreement to section two of the House amendment relating to the compensation of carriers which fail to reach an agreement on the basis of a standard return, with an amendment providing that the compensation that might be agreed upon as provided in that section should cover the time consumed in arriving at an agreement.

The Senate receded from its disagreement to section 3 with an amendment at the end of the section providing that proceedings in the court of claims should be given precedence and expedited in every practicable way. In section 8 it was agreed to strike out the Lenroot amendment providing that no person employed in connection with the

operation of the railroads shall be deemed to be an officer or employee of the United States within the meaning of the war tax and workmen's compensation laws.

Section 9 of the House bill, which made provision regarding the operation of short line railroads not taken over, was stricken from the bill because of the adoption by the House of the Senate provision requiring all lines referred to in the section to be taken over.

Section 11, as agreed upon by the conference, leaves the President practically unrestricted by the laws which have applied to common carriers, except to some extent as to rates. The House bill provided that carriers while under Federal control shall be subject to all laws and liabilities as common carriers, except in so far as may be inconsistent with the provisions of this act or any other act applicable to such Federal control. The substitute agreed upon adds the words of the Senate bill "or with any order of the President." This section was also amended by the new language as to the rate-making power, "the effect of which," the conference report states, "is to give paramount and final power to the Interstate Commerce Commission to determine finally as to the reasonableness and justness of any rates, fares, charges, classifications, regulations and practices that may be initiated by the President during the period of Federal control, with authority to make such findings and orders as the commission may think right and proper with regard thereto."

Representative Cary of Wisconsin has introduced a bill, H. R. 10,550, to provide for national ownership of the railroads.

An effort to obtain the passage of the bill in the Senate on Monday was defeated by Senator Frelinghuysen, who made a point of order against the conference report under the new rule adopted by the Senate on the ground that the conferees had exceeded their authority and had written new matter into the bill in the restriction of state taxing powers. Senator Knox also supported the objection to the tax provision, saying that governors of many states had been assured that the bill would not curtail state taxing powers. Senators Curtis, Johnson of California, Williams and Gallinger also opposed the report for similar reasons and it was finally put over until the next day and again deferred until Wednesday. Senators Smith of South Carolina and Robinson of Arkansas defended the conference report and declared the provision was necessary to protect the federal government against the possibility of excessive state taxation. In the bill as finally passed by the Senate Section 15 was eliminated.

The Tommies Use Them All—Light Railways, Motor Trucks and Canal Barges

New Details for Draw Span Bearings

THE DRAW SPAN of the Chicago, Burlington & Quincy bridge over the Missouri river at Kansas City, is provided with end lifts and a turning center that embody a number of novel features. The bridge is double decked with two railway tracks on the lower level and a highway above. The draw span is 450 ft. long and except for the special features mentioned above may be said to follow current practice. The structure as a whole was described in the *Railway Age Gazette* of June 8, 1917, page 1181.

One of the drawings and the photograph show the details of the end lift. The functions of the end bearing of a swing span are two-fold. It affords the means for raising the end of the bridge as required to change the span from a double cantilever over the pivot pier when open, to a span supported on three piers when closed or vice versa. It must also supply expansion bearings to facilitate changes in the length of the span under varying temperatures or passing loads. This last condition involves a further complication since the device must be equally operative under all positions of the end bearings as determined by the changing length of the span.

The idea of a rocker connected with the end of the span

Vertical Section of the Center Assembled

by means of a link so as to form a toggle, has been applied frequently in the design of end lifts, but the design here shown embodies a number of features which overcome disadvantages in some of the earlier plans. It consists of three sets of toggle links and rockers connected up on each side with bars to insure parallel motion. The links are suspended at the upper end, by means of a $4\frac{1}{2}$ -in. pin, from a steel casting bolted into the end of the bottom chord. The toggle is operated by a structural steel strut connected at one end to a crank in the operating machinery and at the other end to a pin near the lower end of the inside link. When the strut is pulled to the right (toward the center pier) the toggle links and rockers swing in that direction and the end of the bridge is lowered. When the operating strut is pushed to the left, the links and rockers return to the vertical position and the bridge is raised.

As long as the rockers are in contact with the surface of the bearing on which they rest, their motion corresponds exactly to that of the links, but as soon as the toggles have been swung far enough to clear the span entirely from the bearing, the rockers would have a tendency to hang in a

vertical position from the pins that connect them to the toggle links and as a result when the bridge is closed the rockers would come in contact with the bearing while in a vertical position. To overcome this the bell crank and counterweight shown in the drawing were added which cause the rockers to tip up to the left when clear of the bearing and they do not start to right themselves (in raising the bridge) until their roller surfaces come in contact with the bearings as the toggles straighten out. As a result, the angle

Sectional Elevations of the End Lift

between the axis of the toggle links and the surface upon which they roll is always the same at the instant that they come in contact, no matter how much the span may have been shortened or lengthened by temperature changes. The rockers have unusually large radii and are also free to rock under the bridge with changes in the length of the span while the upper links are held in a fixed vertical position by the operating strut.

In the Burlington bridge at Kansas City there are three sets of links as shown in the drawing, but the nature of the design is such that it is capable of indefinite extension and

A View of One End Bearing Complete

as many links may be used as are required for the load to be carried. The dead load under each end of each truss on the Kansas City structure is 160,000 lb., the corresponding live load being 1,600,000 lb. The design of the links and rockers is such that the pins act in direct compression along nearly the entire length. Operating tests of the end lifts, showed that their working efficiency exceeded anticipations.

The center is of the combined center and rim bearing type, one-half of the load of the bridge being on the center which consists essentially of a 48-in. wrought-steel, concave lens turning on a convex aluminum bronze lens of the same diameter, the surface of contact being that of a sphere of 10-ft. radius scraped and ground to fit. The lenses are supported on a cast-steel pedestal and are enclosed by a cast-steel ring, lined with a bronze bushing. This ring is made in halves so that it is taken off readily. With this ring removed it is only necessary to jack the bridge up about 1/4 in. and remove two keys in order to take the two lenses out when it becomes necessary to re-grind the surfaces or replace them. All bolts removed in this operation are of titanium aluminum bronze, this metal being used since it insures that the bolts will not corrode in place and make removal difficult.

Just above the upper lens is the upper center casting which is equipped with a cylindrical surface to receive the live ring, to which the radial struts are attached. This is a departure from the usual practice since the live ring is ordinarily turned on the lower center casting. To avoid difficulty in the field the segments of the tread were assembled in the shop together with the lower center casting and the 4-in. by 4-in. angles serving as radial struts to connect them. After all the parts had been assembled to give a true circle for the tread, all bolt holes for the radial struts were reamed and all connections marked so that each member could be reassembled in the identical position.

These and other details of the turning machinery of this bridge were designed by B. B. Carter, consulting engineer (Chicago, under the general direction of the late C. H. Carlidge, bridge engineer of the Chicago, Burlington & Quincy.

The Director General on Equipment Standardization

Proposed Standards for New Equipment Only. Will
Welcome Opportunity for Making Improvements

ON MARCH 6, George A. Post, president of the Railway Business Association, interviewed Director General McAdoo on the subject of standardization. The following is a letter sent to the members of the association by Mr. Post telling of this interview:

As president of the Railway Business Association, I have had an extended interview with the director general of railroads, in which was discussed the matter brought to his attention in my letter* to him of February 25—the anxiety felt by manufacturers of railway specialties as to possible consequences to them in any scheme for standardization of equipment. I was received cordially, and was accorded a generous period of time for conference. Mr. McAdoo spoke freely and frankly concerning what he has in mind in seeking establishment of standards.

I submitted two queries as a basis:

"First—Are the recently constituted committees on locomotives and cars expected to recommend to the director general standards to be adhered to, not only in the building of the new locomotives and cars, now under consideration for the immediate relief of traffic, but as well to all power and vehicles that may be required during the period that the railways shall remain under the administration of the director general? Also, are such standards, when approved by the director general, to apply and govern in the matter of repairs to equipment during such period?"

"Second—During the period that the railways are under the control of the director general, will it be considered so important to adhere rigidly to any standard that may be now approved, as to cause a cessation of trial, development and acceptance of any new mechanical inventions intended to improve and economize railway operation?"

With these two questions propounded for his consideration, Mr. McAdoo proceeded to express his ideas responsive thereto. I do not attempt to record fully his exact language, but to condense, animated by an eager desire to report faithfully and fairly the viewpoint of the director general:

Mr. McAdoo on Railway Standards

As director general of railroads, it is his duty to see that our railroads are put in condition to perform with the highest degree of efficiency possible the vital part they must play in winning the war. That their performance thus far

has not met the requirements is a fact known to everybody. They must have, as quickly as possible, among other things, large additions to their power and rolling stock. The purchase of such equipment will call for the expenditure of vast sums. The natural thought of an official responsible for such expenditure, and for the least possible delay in delivery of sadly needed locomotives and cars is: "To what extent may they be standardized?" As a matter of general knowledge, Mr. McAdoo was aware that the American Railway Association, made up of the railway executives of the country, had for several years had committees at work for the accomplishment of standardization, so that it was clear the subject was a live one with railway administrators long before the roads were taken over by the government under stress of war. The roads had not agreed when the change of control occurred.

When Mr. McAdoo assumed the directorship, the roads were taken over as going concerns, and their official personnel was not disturbed, except as he has called upon some of the gentlemen of distinction in their service to become members of his official staff. When he sought to be advised as to how far standardization of equipment might be effected, he caused to be appointed committees made up of locomotive and car builders and railway mechanical officials, representative of the regional districts which had been created.

Mr. McAdoo disclaims being a railroad man and is utilizing the forces he finds at hand to suggest what ought to and may be done in the solution of this particular railway problem. He has laid down no rules for their conferences, has no preconceived notions, and has given his advisors free rein. No reports or recommendations from them have yet been received by him (March 6).

Whether he will approve of all their recommendations when received, he does not know, of course, but this he would like the manufacturers of railway material, as represented by the Railway Business Association, to appreciate, namely—that any embarrassments, losses, or necessary expenditures for the purpose of adaptation to the new standards will be entailed not by his personal initiative or prescription, but as the consensus of opinion of those with whom they have heretofore done business and to meet the exigent requirements of war conditions. If the railroad executives had formulated standards before the war manu-

**Railway Age* March 1, page 457

facturers would have been obliged to endure and adapt themselves to the changes ordained by their customers.

Of course, he went on, there can be no such thing as a permanent standard for railway practice. America and progress are synonymous terms. The old gives place to the new in the onward march of progress. There was never a time when the inventive genius of our nation so needed to be working at highest speed as now. No matter what may be established as a standard for new equipment under the present pressure for celerity of manufacture and attainment of economy he would hope and expect that when future requirements shall confront us, the inventor and progressive manufacturer will offer improvements of great value, to be welcomed as aids to economical and efficient railway operation.

During the period that the roads shall remain under governmental control, it will be the determination of the officials in charge that our railroads shall be made better than ever before. Anybody who has plans to suggest for improvement will be hospitably received.

The proposed standards are for the immediate present, and for new equipment to be purchased. They will not apply to existing equipment, which must be kept in repair with parts already intended for such repairs. It would be folly to prescribe that cars requiring repairs must await the arrival of new standard parts, instead of being repaired with specialties already in stock, or easily obtained from the manufacturers.

Accepting the figures presented by the Railway Business Association, for the purpose of his comment, there are now in use and under maintenance 63,862 locomotives and 2,326,987 cars. No one would consider it wise to do anything save keeping them in service as long as they can be made to last by the use in their repair of such devices as were originally used in their construction. In so doing there would be a continuing demand for such stocks of supplies as the manufacturers keep on hand to meet requirements.

Mr. McAdoo can see no reason for the manufacturers of railway material and equipment to be filled with fear for their future. They should, on the contrary, take counsel of their hopes. He expects to see them doing a greater volume of business than in recent years and at a fair profit. There will be no trouble for any manufacturer who is willing to do business at a fair price.

Members of Railroad Administration Staff Resign Railroad Offices

ALL MEMBERS OF THE STAFF of the Railroad Administration at Washington have severed their connections with all railroad companies and other corporate or private interests and are devoting themselves exclusively to the service of the government, according to an announcement by Director General McAdoo.

Walker D. Hines, assistant to the director general, has tendered his resignation as chairman, general counsel, and director of the Atchison, Topeka & Santa Fe. Carl R. Gray, director of the division of transportation, has tendered his resignation as president, chairman and director of the Western Maryland, and as chairman and director of the Wheeling & Lake Erie. Edward Chambers, director of the division of traffic, has tendered his resignation as vice-president of the Atchison, Topeka & Santa Fe. As heretofore stated, R. S. Lovett, director of the Division of Capital Expenditures, has already severed his connection with various railroad companies.

The announcement applies also to the various assistants to the members of Mr. McAdoo's cabinet, who are railroad men; but not to the regional directors. Heretofore the sal-

aries of members of the staff have been paid by the railroad companies but it is understood that they will now be placed on the government payrolls and will be paid presumably from the revolving fund, which, according to the provision of the bill, may be used "for the purpose of paying the expenses of the federal control."

A Novel Arch Viaduct

THE ACCOMPANYING PHOTOGRAPH shows a combination of a structural steel viaduct following the lines of usual viaduct practice combined with a spandrel-braced steel arch, the design representing the solution of the special problem presented by the local situation. The structure is known as the Dead River arch, a few miles from Marquette, Mich., on the Lake Superior & Ishpeming, which handles ore from mines at Ishpeming and vicinity to the ore docks at Marquette.

The structure shown replaces a lighter steel trestle where it crosses a gorge of the small river at an acute angle and on a grade of 1.63 per cent. As it was necessary to replace the existing structure under traffic, it was found expedient to design the new bridge to clear the old one and as there is a considerable fall in the stream directly under the crossing

Combination of an Arch and a Viaduct

so that the stream is very turbulent, particularly during high water, the use of falsework would have been very expensive if not hazardous at the season of the year when the reconstruction was in progress. In consequence an arch was decided upon with a span of 116 ft. and a rise of 70 ft., and with the track at an additional elevation above the crown of the arch of 28 to 30 ft. In a preliminary design the arch was made only 50 ft. high, but this did not work out well on account of the high tractive forces set up in the high trestle bents on top of the arch. The bridge was fabricated and erected by the Wisconsin Bridge & Iron Company, Milwaukee, Wis., under the general direction of R. C. Young, chief engineer of the Lake Superior & Ishpeming, Marquette, Mich.

Refrigerator Cars for the Michigan Central

The Design Represents the Most Modern Practice, Special
Attention Being Given the Insulation

A SHORT TIME AGO the Michigan Central received 250 refrigerator cars which represent the latest development in the construction of this class of equipment. These cars were built by the Merchants Despatch Transportation Company at East Rochester, N. Y. They are 41 ft. long and weigh 51,500 lb., having a rated capacity of 70,000 lb.

The cars are particularly well insulated, slab cork being used in the floors and below the sub-belt rail on the sides and ends. The sides are insulated with four layers of $\frac{1}{2}$ -in. insulation and the ceiling has five layers, the layers being applied with no air space between them. The method of insulating these cars was adopted after making extensive tests with the different methods of application. It was applied so as to eliminate as much as possible all dead air spaces. It has been found difficult to maintain a tight car with the courses of insulation separated, as the constant weaving of the car causes a circulation of air in the supposed dead air space. By placing the various courses of insulation close together, the construction of the car is simplified and the insulation can be supported better. The

post and over the side sills at the door opening. This extends 16 in. up on the side framing. A layer of burlap plastic is then laid over the sills of the car and extends up 6 in. on the sides. Another layer of burlap plastic is laid over the $1\frac{3}{4}$ -in. flooring, extending up 6 in. on the car framing, and on top of this is placed the top course of flooring.

The carlines are mortised into the side plates and are held in position by $\frac{1}{2}$ -in. tie rods, extending between the side plates and set flush with the face of the carline. The XLA outside metal roof, made by the Standard Railway Equipment Company, is used on these cars. The roof boards and the ceiling are $1\frac{3}{16}$ in. thick.

Insulation

The insulation in the floor is made up of 2-in. corkboard laid on a $1\frac{3}{16}$ -in. false floor between the sills. The cork is held in place by 1-in. nailing strips. Zero compound is then placed over the cork, making a perfect seal.

The outside of the car framing is covered with a layer of $\frac{3}{8}$ -in. shiplap pine. Over this is applied a layer of three-

Refrigerator Car for the Michigan Central

ice tanks are of M. D. T. standard construction, which was adopted a few years ago. The ice is held in wire screens in the inside of the tank. An air space of 2 in. is left between this screen and the walls of the tank on all sides, which permits free circulation of air around the ice and through the tanks to the base. An insulated bulkhead is used to prevent cooling of the perishable freight near the bulkhead to a lower temperature than is obtained in other parts of the car. Floor racks are provided to allow free circulation of the air under the lading.

Underframe and Side Framing

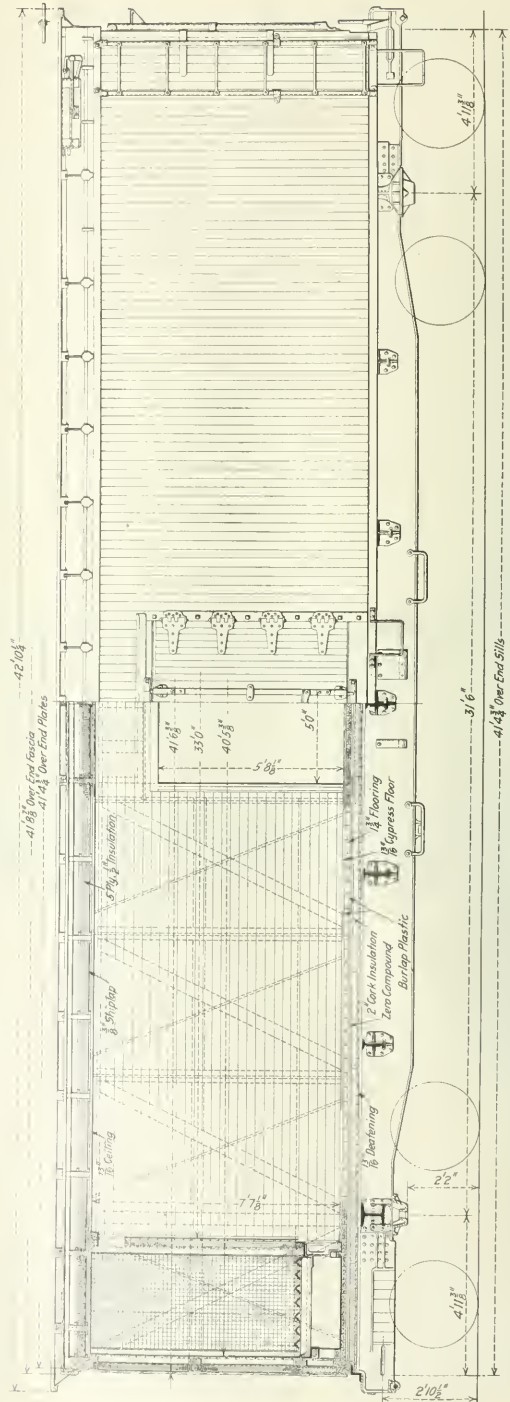

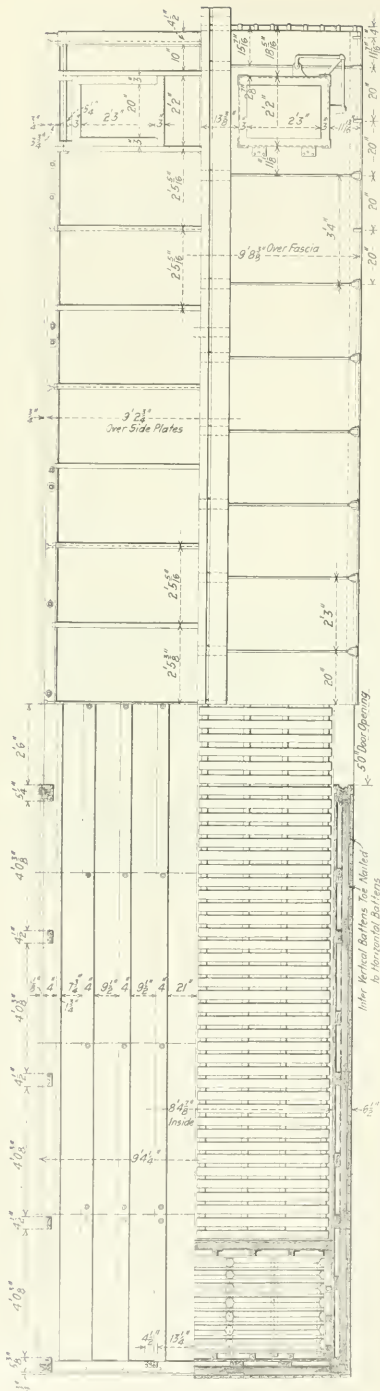

These cars are provided with the Bettendorf steel underframe, which is 41 ft. $4\frac{3}{4}$ in. over end sills. This underframe supports two side sills and six intermediate sills $5\frac{1}{2}$ in. wide by 4 in. thick. Three-quarter inch diagonal rods criss-cross the diagonal braces, as indicated in the drawings.

The siding and the inside lining are $1\frac{3}{16}$ in. thick, and the flooring is $1\frac{3}{4}$ in. thick. Before applying the floor, the side framing is lined with a special waterproofing which extends from the inside face of the corner post to the door

ply 90-lb. waterproof paper extending from side sill to side plate. Sub-belt rails $2\frac{1}{2}$ in. by $1\frac{3}{4}$ in. are then applied over the belt rails. Between the lower sub-belt rail and the side sill 2-in. corkboard is applied, the faces of the board being dipped in hot Hydrex compound before being applied.

The four-ply, $\frac{1}{2}$ -in. insulation is applied en masse between the belt rails and the side plates. The insulation is held in place by $\frac{1}{4}$ -in. round nailing strips. Battens are placed at each intermediate post, corner post, door post and belt rails and an additional batten is applied in each panel formed by the vertical battens, belt rails and side plate filler to more securely support the insulation. Two-ply wool felt is applied immediately on top of the battens, and on top of this is applied a layer of three-ply, 90-lb. waterproof paper extending from the top of the side plate to the bottom of the side sill and from door post to door post around the ends of the car. The siding is applied on top of this.

The roof of the car is insulated with five layers of $\frac{1}{2}$ -in. insulation applied to a $\frac{3}{8}$ -in. false ceiling, separated from the ceiling by 1-in. by 1-in. nailing strips. The insulation is held in place by 1-in. by 1-in. nailing strips, as indicated

Plan and Elevation of Michigan Central Refrigerator Car

in the illustrations. A layer of burlap plastic is applied between the metal roof and the roof boards.

Ice Compartments

The ice compartments are 3 ft. long by 7 ft. 11 in. wide. The sides and ends of the car are lined with No. 24 galvanized iron to a height of 30 in. The ice grate frame is

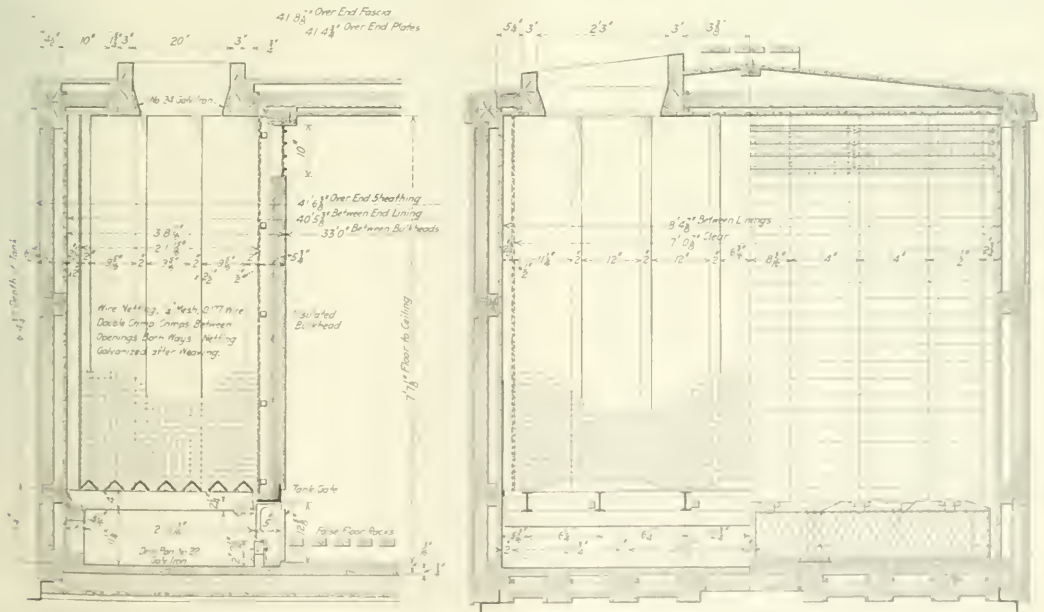

2-in. by 2 in. by $\frac{1}{4}$ in. galvanized angles, which are riveted to the bulkhead base at the bottom and bolted to a reinforcing angle through the ceiling at the top. To the intermediate bulkhead posts are bolted 2-in. by $2\frac{1}{4}$ -in. furring strips, on which is laid a $1\frac{1}{2}$ -in. bulkhead lining. Four layers of $\frac{1}{2}$ in. insulation protect the lining next the bulkhead from too low temperature.

Various Sections Showing Application of Insulation

made up of malleable iron and commercial shapes. There are six 4-in., 7.5-lb. galvanized I-beam supports for the grate bars. The ice grates are $2\frac{3}{4}$ in. by $2\frac{3}{4}$ in. by $\frac{1}{4}$

The bulkhead top rail is 2 in. by 2 in., extending the full width of the bulkhead, being nailed to the bulkhead post furring strips. The outside lining is $1\frac{1}{2}$ in., which is

Arrangement and Design of Ice Compartments, Michigan Central Refrigerator Car

in. galvanized angles set with the corner up, as indicated in the drawings. The bulkhead is supported on a galvanized 5-in. by $3\frac{1}{2}$ -in. by $\frac{3}{8}$ -in. angle, which is bolted to the malleable base casting. There are eight bulkhead posts of

2-in. by 2-in. galvanized angles, which are riveted to the bulkhead base at the bottom and bolted to a reinforcing angle through the ceiling at the top. To the intermediate bulkhead posts are bolted 2-in. by $2\frac{1}{4}$ -in. furring strips, on which is laid a $1\frac{1}{2}$ -in. bulkhead lining. Four layers of $\frac{1}{2}$ in. insulation protect the lining next the bulkhead from too low temperature.

The tank screen is made up of 0.177 wire with a $1\frac{1}{2}$ -in.

mesh. The netting on the side and rear of the tank is fastened to oak furring strips and at the front it is secured to the bulkhead post furring strips. The tank covers are insulated with four layers of $\frac{1}{2}$ -in. insulation. The openings in the roof are 20 in. by 27 in.

The opening at the bottom of the bulkhead is covered with a gate of $1\frac{1}{2}$ -in. diamond mesh made up of 0.177 wire, which is mounted on a frame of $\frac{7}{8}$ -in. by 7/16-in. channels. These gates are fastened to the angle bulkhead

Construction of the Solid Bulkhead

support by hinges. At the top a similar netting is used with four $\frac{1}{2}$ -in. rods applied as indicated in the drawings.

Among the specialties used on this car may be mentioned Miner roller side bearings, Western angle cock holder and card holder, Bettendorf trucks and Virginia dust guards.

The following are the general dimensions of this car:

AMERICAN EQUIPMENT AT CHILEAN IRON MINE.—Under the name of the Bethlehem Chile Iron Mines Company, the Bethlehem Steel Company operates the iron mines at Tofo, near Coquimbo, Chile. In order to get the ore out on a large scale it has installed a complete modern plant, the most important features of which are the loading dock and the electric railway for taking supplies up to the mine and bringing down the ore. From the trains the ore is dumped upon a storage space on the ground or into the bins of the dock, if the latter are empty. The locomotives that are to haul the trains will run on both 2,400 and 1,200 volts and will employ regenerative braking on the trip down hill, the distance being 24 kilometers (16 miles), with a uniform grade of 4 per cent all the way. Three will be required, and all will be of the type used in the recent Chicago, Milwaukee & St. Paul electrification.—*Commerce Reports.*

An Engineman Doing His Bit*

By Edward F. McKenzie

Passenger Engineman, Pittsburgh Division, Pennsylvania Railroad

WHEN OUR BELOVED COUNTRY entered the war for humanity, I resolved to do everything in my power to help win the war; and, as a beginning, I took council with my wife and son as to how we could do the most good. The first consideration was the elimination of all unnecessary expense and waste. We had planned a vacation to Atlantic City; this was given up at once. Upon looking over our wardrobes, it was decided that last winter's suits would be good enough for this winter. Next, we considered economizing on food, and have worked out the following program for the table:

Meat, two days a week; fish, two days a week, and the other days, beans, soups, macaroni, etc. We use wheat (whole wheat), corn and rye bread in turn. We frequently have mush and milk for evening dinner, and fry what remains for breakfast the following day. The stock of all meat is used in soups; the fryings of all salt meat and pork are used to fry other foods. As breakfast foods, we use oats, corn cakes and buckwheat cakes, alternately. Our rule is never to have more than one heavy meal a day—breakfast and lunch being light. Fruit and vegetables are used at all meals. This program gives a well-balanced diet, keeping us in good health.

I cultivated a war garden in my spare hours which supplied our wants all summer, in addition to a good supply for winter. The money saved by such methods was considerable, and enabled me to join the Red Cross and contribute liberally to it and to the Y. M. C. A. fund, as well as all church and hospital funds that have been presented to me. I purchased a Liberty Bond in the first and also the second issues from my earnings, authorizing the Railroad company to take 10 per cent each month from my earnings; and I am adding to my savings to purchase more when some other men may not be able to buy them. I have also advised other employees to do the same.

I read up on American citizenship and have missed no opportunity to talk to foreign-born men, and show them the advantage of being citizens and supporting the government where they make their living, and have allayed their fears as to any bodily harm that might come to them, or the confiscation of their money, and have advised them to go about their work as usual and not talk too much.

Being a passenger engineman, I next gave thought as to how I could best serve the government while at my work, as I realized that military affairs depend to a large extent on the railroads of the country, on transportation of men, munitions and supplies, as well as keeping the mills and plants which manufacture these supplies working to full capacity. Knowing these facts, I first wrote to our road foreman of engines and to our general superintendent, tendering my services in any capacity in which I could be of most service to the company and to the nation, holding myself ready at all times, although on a regular run.

I go to work one-half hour earlier than required by the company in order that I may give the engine a most thorough inspection and have it in perfect condition when starting, as a break-down on the road means delay—one of the things not desired.

And at the close of each day I ask God to bless our armies and to endow our President and his cabinet with wisdom, that they may be the instruments in God's hands to bring the war to a successful end for humanity and democracy.

*Reprinted from a pamphlet issued by the Pennsylvania Railroad. Mr. McKenzie was the author of the first prize paper on locomotive running, which was printed in the *Railway Age Gazette*, November 14, 1913; also of an article in the issue of September 22, 1916.

"A Free Route to Persia and Afghanistan"

How England Built Her Sind-Pishin Railway to Protect the Indian Frontier from Invasion

"WE HAVE ACQUIRED a direct free route via Russia to Persia and Afghanistan," said the despatch from the Wolff Bureau, the German semi-official news agency, which was featured in first page headlines in the American press on Saturday last.

Although it would be hard to believe that Germany might have any hopes at this time of conducting such a long range campaign as would be required in Persia or Afghanistan, the announcement is of more than ordinary importance because it is an implied threat at the British possessions in India.

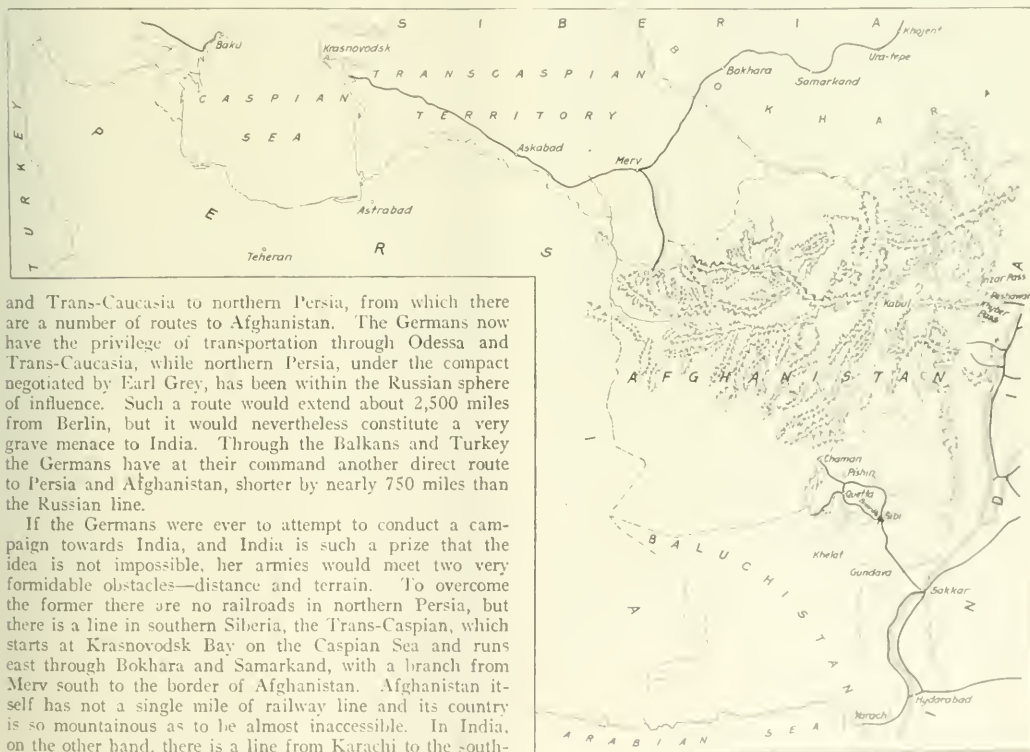

The probable route of the line is through Lemberg or Kiev, which the Germans have announced they are holding, southward and eastward, through Odessa, Postov, Caucasia

conditions or the construction of which has surmounted so many obstacles, physical or political.

The story which follows is abstracted from E. A. Pratt's "Rise of Rail Power in War and Conquest," P. S. King & Son, London, and appears in that book as an appendix entitled "Indian Frontier Railways."

India's Most Vulnerable Point

On the north-west frontier of India the plains of the Punjab are separated from the great central valley of Afghanistan, from the deserts of Baluchistan, and from the Russian Empire on the north thereof, by ranges of mountains, otherwise "a gridiron of stupendous ridges and furrows" intersected by passes which have always been re-

Afghanistan and the Railways Leading to It.

and Trans-Caucasia to northern Persia, from which there are a number of routes to Afghanistan. The Germans now have the privilege of transportation through Odessa and Trans-Caucasia, while northern Persia, under the compact negotiated by Earl Grey, has been within the Russian sphere of influence. Such a route would extend about 2,500 miles from Berlin, but it would nevertheless constitute a very grave menace to India. Through the Balkans and Turkey the Germans have at their command another direct route to Persia and Afghanistan, shorter by nearly 750 miles than the Russian line.

If the Germans were ever to attempt to conduct a campaign towards India, and India is such a prize that the idea is not impossible, her armies would meet two very formidable obstacles—distance and terrain. To overcome the former there are no railroads in northern Persia, but there is a line in southern Siberia, the Trans-Caspian, which starts at Krasnovodsk Bay on the Caspian Sea and runs east through Bokhara and Samarkand, with a branch from Merv south to the border of Afghanistan. Afghanistan itself has not a single mile of railway line and its country is so mountainous as to be almost inaccessible. In India, on the other hand, there is a line from Karachi to the southern border of Afghanistan and another to Peshawar on the eastern border. Afghanistan has served for many decades as a border state between Russia in Siberia and England in India. Will it soon have a new importance as a border state between Germany and England?

It is in the light of that question that it is of particular interest at this time to look back a few years to the struggles that have taken place over Afghanistan and to efforts that have had to be taken to protect the border of that country against invasion of India. The story is of particular interest from a railway standpoint, for there are few railways in the world that have been built under such adverse

garded as the most vulnerable points of the Indian Empire. Through these passes from the earliest days of recorded history there has come a long succession of invasions instigated by that incalculable wealth of India which may well have inspired the envy of dwellers in less favored lands.¹

These considerations would alone suffice to establish the

¹ Altogether there have been 26 invasions of India, dating back to about 3000 years B.C., and of this number no fewer than 21 have ended in complete failure.

need for an effective control of the more important of the said passes by the power which exercises supremacy in India; but the obligation thus devolving upon the British people as the present holders of that supremacy has been increased in recent times by two further factors—(1) troubles with frontier tribes; and (2) the development of that central Asian question which, though now no longer acute, was, not so many years ago, a source of great anxiety in England and India. Frontier troubles gave rise to a number of expeditions to Afghanistan from time to time, while the gravity of the general situation was increased by the once steady advance of Russia towards India—whether for purposes of actual conquest thereof, or alternatively, for the attainment of the aim cherished by Russia during three centuries for an outlet to a southern sea, such outlet being sought via the Persian Gulf on her disappointment in regard to the Dardanelles; though British interests were concerned in either case.

This combination of circumstances, with the possibility, at one time, that Afghanistan might become the theatre of war in a conflict between two great European powers, invested with special interest and importance the provision on the north-west frontier of India of railway lines which, whether constructed to the more important passes or going actually through them, would form a ready means of concentrating Anglo-Indian troops at such places on the frontier, or beyond, as occasion might require.

From this point of view the Bolan and Khyber passes—the former leading to Quetta and Kandahar and the latter to Kabul—have more especially had importance attached to them as “the two gates of India.”

The Political Troubles of 1878

The refusal of the Ameer of Afghanistan—who had already accorded an ostentatious welcome to a Russian Embassy at Kabul—to receive a British mission led, in 1878, to an order being given for the advance of three columns of British forces upon Afghan territory, the routes selected for this purpose being (1) the Khyber Pass, (2) the Kuram Pass, and (3) the Bolan Pass. At this time, however, the system of frontier railways which had been advocated so long scarcely existed except on paper. The nearest point of railway communication with Afghanistan was then at Sukkur, on the Indus. An extension across the Sind desert to the entrance to the Bolan Pass had been surveyed, and a very short section had been laid; but in their advance on Kandahar Sir Donald Stewart and his force had to march all the way from the Indus, experiencing great trials in crossing the intervening desert, where many of the men lost their lives. The work of constructing this desert railway—which presented no engineering difficulty—was now taken actively in hand, and the line was available for the troops on their return.

Success attended the expedition of 1878 so far as it led to the flight of Shere Ali, the occupation of Kandahar by Sir Donald Stewart, the control by the British of the three main highways between India and Afghanistan, and the signing of the treaty of Gandamak; but the murder of Sir Louis Cavagnari and his staff at Kabul, in September, 1879, rendered necessary the sending of a further expedition, General Sir Frederick (afterwards Lord) Roberts being directed to proceed with a British force by the Kuram route to Kabul.

Thereupon the whole question of transport facilities was revived afresh and, although the expedition itself was a conspicuous success, delays and commissariat difficulties arose which might have been avoided had better railway facilities been available. The terminus, at that time, of the Punjab State Railway was at Jhelum, 70 miles from Rawal Pindi, 180 from Peshawar and 260 from Thal, the frontier post of the Kuram Pass; and in spite of the vigorous efforts made, between 1878 and 1880, to extend the line, Jhelum remained the actual railway base throughout, no material assistance being gained from the 20 miles of exten-

sion which, owing to the great engineering difficulties presented by innumerable ravines, could alone be carried out during that period.

Rawal Pindi—one of the most important strategic points in India—was not reached by the railway until October, 1880, by which time the Afghan War of 1878-80 had been brought to a close; and the further extension of the Indian railway system to Peshawar—another position of the utmost strategic importance, situate 10 miles from the entrance to the Khyber Pass, and 190 from Kabul—was effected by May, 1883.

Railway Towards Kandahar

From a military point of view, however, still greater importance was attached, at that time, to the securing of rail communication through the Bolan Pass to Quetta and Pishin in the direction of Kandahar, this being the route by which, it was thought, the Russians would be certain to attempt their invasion of India—if they should undertake one at all.

Surveys for an extension of the Sukkur-Sibi desert line to Pishin were made while that line was under construction, and early in 1880 the government gave directions that the extension was to be proceeded with; though they decided that the route to be taken from Sibi should be through the Hurnai Pass in preference to the Bolan route, the former being regarded as preferable for the broad gage line (5 ft. 6 in.) with which the “Kandahar State Railway,” as it was to be called, would be provided.

Arrangements were at once made for collecting the necessary materials and for carrying through the work with the least possible delay; but further progress was checked in July, 1880, by the disaster at Maiwand. In the following October the Gladstone Government, which had succeeded the Beaconsfield Administration and had, apparently, resolved upon a complete reversal of the Indian policy of their predecessors, followed up an earlier announcement of its intention to withdraw from Kandahar by giving orders for the cessation of the work on the Sind-Pishin Railway, Maiwand having been avenged, and some refractory tribes subdued, Afghanistan was completely evacuated by the British at the end of April, 1881, and the construction of frontier railways in India was dropped, for the time being.

In the middle of 1883 came a reconsideration of the position. Russia was then showing increased activity in the direction of Merv, and the British Government concluded, apparently, that it had been too hasty in ordering the abandonment of the Kandahar State Railway scheme nearly three years before. So it gave orders that the work should be resumed; though, in order to render this *volte face* on its part less conspicuous, it directed that the undertaking should now be known only as the “Hurnai Road Improvement Scheme”; that it should be proceeded with quietly, in order that it might not attract too much attention, and that the suggestion of a “road improvement scheme.” instead of a railway, should be kept up by the engineers, not being allowed to have even a temporary line of rails for conveying stores, materials for bridges, etc., from the base to the passes. This last-mentioned stipulation meant that the stores and materials had to be either transported on the backs of camels or dragged on wheels up stream; and it was estimated that, in addition to the great loss of time, a sum of not less than 1,000,000 pounds was wasted in this way before the order prohibiting the use of temporary rails was rescinded.

Russian Advance Toward Merv

A start was made with the work in October, 1883, and the fact that the Russians were then actually approaching Merv, and that a sudden advance by them in force was regarded as probable, led to the laying of great emphasis on the need for construction being pushed on with the utmost vigor. When, in February, 1884, the Russians did occupy

Merv, the pressure brought to bear on the engineer-in-chief became still more acute. Then, in May, the British Government formally announced that, owing to the encroachments of Russia, the line would be built. The fiction of a "Hurnai Road Improvement Scheme" was now abandoned. Henceforth the line under construction was to be known as "The Sind-Pishin State Railway."

From the very outset, however, the difficulties which crowded upon Colonel (afterwards Sir James) Brown, R. E., an officer well experienced in railway and engineering work, who was entrusted with the carrying out of the scheme, were unfavorable to the prospects of speed in construction. The surveys, which had already been made, were found not only worthless but misleading. The first members of his staff were unacquainted with railway work and had to be succeeded by men brought from England. The plant and materials previously collected, but disposed of at scrap-iron prices when the line was abandoned in 1880, had now to be replaced at an almost fabulous cost, owing to the urgency of the need for them.

The Forbidding Physical Obstacles

All these were, nevertheless, minor troubles as compared with the physical conditions to be overcome.

Starting from an elevation at Sibi of 300 ft., the line was to rise 6,200 ft. in the 120 miles between Sibi and the summit level at Kach.

Then, for the greater part of the 224 miles to which the line was to extend, the country was a wilderness of rocks and stones—a land of barrenness and desolation, where there was no timber, no fuel, scarcely a blade of grass, and, in places, for stretches of several miles, no water. It was a land, too, almost devoid of inhabitants, while those who did dwell there were described as "a savage and blood-thirsty race of robbers," continually engaged in plunder and intertribal warfare, and not growing sufficient food even for their own consumption. Almost everything that was wanted—including supplies for from 15,000 to 30,000 workers and materials for the line—had to be imported from a distance.

Still less inviting was this inhospitable region by reason of its range of climatic conditions. The lowlands have the reputation of being one of the hottest corners of the earth's surface. A temperature of 124 deg. has been registered in the Nari Valley. The highlands, in turn, offer the alternative of Arctic cold, the temperature there falling in winter to 18 deg. below zero. Between the lowlands and the highlands there is a temperate zone; but here the constant pestilence was dreaded no less than the extremes of heat and cold elsewhere.

As the result of these conditions, the work of construction could be carried on in certain districts for part of the year only, and the workers had to be transferred from one section of the line to another according to the season. Such a movement of front involved the transport of everything—stores, tools, offices and some thousands of men. "The management of this vast exodus," says Captain Scott-Moncrieff, R. E., in his paper on "The Frontier Railways of India," "was a work of considerable anxiety and difficulty. A sudden influx of people, such as this, into a desolate and barren land naturally caused a famine. Everything was eaten up, and for some days the question of supplies was the burning question of the hour. . . . Nine hundred camel loads of food were consumed daily on the works." The customary load for a camel was 400 lb., but some of the camels carried loads of 800 lb. up the pass.

"One of the Most Weird Tracks"

The engineering difficulties fell into four principal groups: (1) the Nari Gorge, (2) the Gundakin Defile, (3) the Chuppur Rift, and (4) the Mud Gorge.

The Nari Gorge, about 14 miles in length, beginning

just beyond Sibi, has been described as "one of the most weird tracts through which a railway has ever been carried. The hills, absolutely bare, rise above the valley for many thousands of feet in fantastic pinnacles and cliffs. It is a scene of the wildest desolation." The Nari River, running through the gorge, is formed by a combination of three streams having but little water on ordinary occasions, but becoming, in time of flood, a raging torrent which fills up the whole gorge for miles, attains a depth of 10 feet, and has a velocity of five feet per second. Over this river the railway had to be carried in five different places. Not alone bridges, but heavy embankments, cuttings and tunnels were needed. At one point there was an especially dangerous tunnel in which so many accidents occurred, owing to roof or sides falling in, that at last no workmen would enter it except at a wage five-fold that of the high rate already being paid. The whole work was liable to be stopped for months together, owing to the washing away of half-completed embankments, or bridges; though until this portion of the line had been completed no materials could be sent to the sections beyond.

In the Gundakin Defile, eight miles long, two tunnels had to be made through some most treacherous material, and four bridges had to be provided.

The Chuppur Rift is a chasm three miles long in the spurs of a rocky mountain forming an apparently insuperable barrier. The running of the railway on a ledge along the side of the mountain being impracticable, owing to the nature of the rock, the engineers cut a line of continuous tunnels partly on one side of the rift and partly on the other, connecting the two series, by an iron girder bridge; but, instead of constructing the tunnels in the usual way, from each end—a procedure which would have taken much time—they adopted the expedient of driving openings (adits) into the side of the cliff at various points, and then cutting the tunnel right and left of each of these openings until the various sections met. The only way in which the openings could be made was by lowering men down by ropes several hundred feet from the top of the cliff until they reached the point where the work for an opening was to be started. They then drove crowbars into the perpendicular sides of the cliff in order to gain the necessary support for a platform from which the blasting operations could be carried on. Six of these openings were made on one side of the cliff and six on the other. As a separate gang of men could operate at each it was possible to complete the whole work in the course of a few months. Altogether there is a collective length of 6,400 ft. of tunnels in the rift, in addition to a viaduct 75 ft. high, with seven spans of 40 ft. each, and a bridge having an elevation over the river of 250 ft., and consisting of a central span of 150 ft. and eight spans of 40 ft.

On the summit level, 25 miles in length, came the five-mile long Mud Gorge—a narrow valley, between precipitous mountains, filled with a soil little better than dried mud, and of such a character that several bad slips of road-bed, carrying away the whole of the line, occurred

Fever, Scurvy, Cholera, Desertions

In August and September, 1884, the troops and native laborers employed on the work on the lower part of the line were visited by an outbreak of fever and scurvy of a virulence almost unprecedented in Indian experience. Large numbers of the men died. In one gang of 200 the average numbers of deaths was ten a day. Of those who survived the majority were so prostrated as to be scarcely capable of doing anything. Sixty per cent of the sappers were in hospital.

Fresh troops, to the extent of three battalions of Pioneers, were brought on to work; but they had scarcely arrived before—in November—there was a severe outbreak of chol-

era. The Afghans thereupon "bolted to a man"; and they were followed by many skilled artisans who had been collected from various parts of India. Additional labor had to be obtained from the Eastern Punjab, but much time was lost.

Whilst the engineers were struggling to overcome these manifold difficulties, the political situation was steadily becoming still more acute. The climax seemed to be reached by the Penj-deh incident of March 30, 1885, when a Russian force under General Komaroff seized this important strategical position, situate near the junction of the Khushk and Murghab rivers. On April 27, 1885, Mr. Gladstone proposed in the House of Commons a vote of 11,000,000 pounds (\$55,000,000) for the purposes of what then seemed to be an inevitable war with Russia. The money was voted the same night.

So the urgency for completing the line which would now, probably, have been available for use had it not been stopped in 1880, was greater than ever. Orders were sent to India that the work must be continued along all parts of the line regardless of seasons. Within a week or two, however, of the war vote at Westminster, cholera broke out afresh among the construction party in India. By the end of May it was spreading among them "like a raging fire"; while to the cholera itself there was added a heat so intense that even the most willing of workers found it almost unendurable.

Under this combination of cholera, and excessive heat, work on the lower sections of the line was stopped altogether for a time—government orders and Russians notwithstanding. All possible measures were taken to mitigate the severity of the epidemic; but the death-rate increased with frightful rapidity. Some of the best workers, European and Asiatic—men who could least be spared, on account of the responsible positions they held—were carried off. During the month of June no fewer than 2,000 died out of 10,000. Of the remainder large numbers sought safety in flight. Many of the minor government officials, such as telegraph and post office clerks, went off in a body.

Whilst sickness and disease had thus been afflicting the camps, fresh troubles had arisen in another direction. Early in 1885 the district was visited by a succession of floods exceeding in severity anything known there for sixty years. In the course of three months the rainfall amounted to 19.27 inches,—a total six times in excess of the average. Several bridges and many miles of temporary roads were washed away; numerous accidents were caused; camping grounds were destroyed; communications were interrupted; food supplies became scarcely obtainable, and great delay resulted in the prosecution of a work for which urgency was being so persistently demanded. The floods did not finally subside until the end of May.

Nature having done so much to impede the progress of the undertaking, it only remained for politicians and officials to do what they could to follow her example.

Mention has already been made of the initial prohibition of temporary lines of rails for the conveyance of stores and materials, and the loss of time and waste of money involved in the use of camels instead; but to this one fact may be added another, namely, that after the engineer-in-chief had made his arrangement to obtain sleepers from the juniper forests on the north of the line—this being the only timber available in the whole district—the government vetoed the arrangement on the ground that it might, possibly, lead to quarrels among the Afghan tribes. The timber had to be procured from India, instead. Hence more delay.

Such, however, was the energy which had been shown, in spite of all these difficulties and drawbacks, that the work was completed within the two years and half fixed by the engineer-in-chief at the start as the period in which—"with money freely granted"—it could be done. On March 27, 1887, an engine ran over the line all the way from Sibi to

Quetta, and the Hurnai Railway was formally declared open for traffic.

In the meantime the apparent certainty of war with Russia, following, especially, on her seizure of Penj-deh, had led, in April, 1885, to an order being given for the construction of a light railway from Sibi through the Bolan Pass to Quetta, as an alternative, more direct and more quickly constructed route, of which use could be made for a movement of troops to the frontier on the anticipated partial mobilization of the Indian Army.

A Notable Engineering Achievement

The laying of this light railway constituted another notable engineering achievement.

Running through the heart of what has been described as "some of the boldest mountain scenery in India," the Bolan Pass has a length of about 60 miles and a breadth ranging from one mile to a space, in places, of only about 20 yards between the rugged mountain walls which here convert the pass into a mere defile. The pass is, in fact, practically the bed of the Bolan River, and is dry for the greater part of the year, but liable to floods. The temporary narrow gage line was to be laid along the river bed without interfering with the military road constructed in 1882-84 as far as Quetta.

For the first 40 miles there was a fairly good gradient; but beyond that came a very heavy rise to the top of the pass; and here, at least, anything more than a metre gage line would have been impracticable. The possibility of constructing a line of railway through the pass at all had long been the despair of engineers, and this was the reason why the Hurnai route had been decided on in preference to the Bolan for the broad gage line to Quetta. Unfortunately, too, the climatic were even greater than the engineering difficulties. The heat in the lower parts of the pass was "beyond all description," and cholera or other diseases carried off thousands of the workers.

With these two lines at their disposal, the government was, in the spring of 1887, quite prepared for a concentration of British and Indian forces in Afghanistan, had the political conditions rendered such a course necessary; but the situation had by then greatly improved, thanks to the negotiations which had been proceeding with Russia for the demarcation of frontiers. In April, 1877, the British and Russian commissioners met at Petrograd, and, as the result of still further negotiations, the questions at issue were settled without the appeal to arms which had at one time appeared inevitable.

In 1892 some 50 miles of the Bolan light railway were abandoned in favor of another route which, avoiding the first part of the pass, allowed of a broad-gage line being laid from Sibi through Quetta to Bostan Junction, where it connects with what is now known as the Hurnai-Pishin Loop. A branch 90 miles in length, from Quetta to Mushki, on the Seistan trade route, was opened in 1905.

A Strategic Line

Today the Sind-Pishin railway, with its two sections, via the Bolan and the Hurnai respectively, has its terminus at Chaman, on the actual frontier of Afghanistan, and within 70 miles of Kandahar. A broad gage line throughout, it forms part of the railway system of India, linking up at Ruk junction with the line running thence along the north bank of the Indus to Karachi, and, by means of a bridge across the Indus, with a line on the south of the river which, in one direction provides an alternative route to Karachi, and in the other connects with Calcutta and other leading cities. The Sind-Pishin line affords, in fact, a most valuable means for concentrating on the Afghan frontier, within a short distance of Kandahar, and in the shortest possible time a considerable body of troops collected from all parts of India, together with reinforcements from Europe, landed at Karachi.

As a strategical line, therefore, the railway is of exceptional importance to India and to British interests in general, though there can be no suggestion that it would be used otherwise than for purely defensive purposes.

Then, in what, since 1901, has constituted the North-West Frontier Province of India, there has been a considerable extension of frontier railways in recent years,—all serving important strategical purposes. From Peshawar—1,520 miles from Calcutta—there is a broad gage extension, twelve miles in length, to Fort Jamrud, at the mouth of the Khyber Pass; from Naushahira, a cantonment 27 miles due east of Peshawar, there is a narrow gage line to Dargai, at the foot of the Malakand Pass; while among other lines is one to Thal, a military outpost on the extreme limit of British territory which serves also as a depot for the trade with northern Afghanistan passing through the Kurram valley; and one to Banu, a garrison town, 79 miles south of Kohat, built on a site chosen for political reasons by Sir Herbert Edwards in 1848.

A number of other railways on the north west frontiers of India have been proposed. Whatever may or may not be ultimately done in regard to these further schemes, it is obvious that those already constructed have made an enormous difference in our strategical position in regard to Afghanistan and the lands beyond as compared with the military transport conditions of 1878.

A Plant to Transfer Coal and Ore Mechanically

THE PITTSBURGH & LAKE ERIE recently placed in operation at its Haselton yard, a mechanical coal handling plant for transferring the lading of bad order cars to other cars. Haselton yard is located at Youngstown, Ohio, and is the point where the road exchanges a large amount of traffic with the New York Central and the Erie and also handles the enormous traffic of

stone, sand, gravel, iron ore and similar material (2) materials loaded in box cars; and (3) heavy material loaded in open cars requiring the use of a crane for transfer.

These three kinds of freight require different facilities for handling. The mechanical transfer plant referred to was designed to handle the materials in the first classification, and it includes platforms to facilitate transferring lading from one box car to another and a large electrically-operated gantry crane spanning two tracks for handling the heavy materials.

Previous to the construction of these facilities the transfers described in the first and second divisions were handled entirely by hand, making it necessary to keep a large force of laborers at this kind of work, while the heavy materials were handled by locomotive cranes, wrecking cranes, or in any other way that might be available. It is found by the use of the improved facilities that the delay to cars on account of defective equipment has been very much reduced, and that the cost of transfer has also been lessened.

The nature of this mechanical transfer plant is indicated

View of the Transfer Station from the Loading Side

Side and End Elevations of the Haselton Plant

the Youngstown district. As is usual at such places a great many loaded cars are found to be defective, making it necessary to transfer the lading. The kinds of material in these cars, of course, vary widely, but they can be classed under three general heads: (1) materials handled in hopper and drop bottom cars, such as coal, coke, crushed lime-

stone, sand, gravel, iron ore and similar material (2) materials loaded in box cars; and (3) heavy material loaded in open cars requiring the use of a crane for transfer. The plant was built by the Roberts & Schaefer Company, Chicago, and consists essentially of one of the typical coaling stations built by this firm with the storage facilities omitted. The material to be transferred is received from the defective cars in a 9-ft. track hopper from which it is transferred to a 2-ton elevating bucket by means of a Schroeder measuring coal feeder.

The elevating bucket operates in a structural steel tower from the top of which the coal is dumped into a spout which affords a convenient means of discharge into the substitute car standing on a track parallel to and 26 ft. from the hopper track. The elevating machinery has a capacity of 75 tons per hour and, as in the case of the equipment for the standard coaling station of the same type, the operation is entirely automatic. An electrically-operated hoist is located in the small steel-frame shed adjoining the tower, which also contains the necessary regulating apparatus, starting switch, etc. We are indebted for the above information to A. R. Raymer, assistant chief engineer, of the Pittsburgh & Lake Erie, Pittsburgh, Pa., who represents the railway in working out the details of the improvement.

General News Department

Judge Robert S. Lovett, according to the official circular announcing his appointment as a member of the staff of Director General McAdoo, will have the title of Director of the Division of Capital Expenditures, instead of the "Division of Betterment and Additions," as it was originally announced.

A charge for placing and spotting cars on industrial tracks is not contemplated. This announcement has been made by the Railroad Administration after the receipt of nearly 2,000 telegrams and letters of protest. A memorandum of a plan for such charges was prepared in the traffic division, as a suggestion only; and the report that it was being considered was widely circulated among shippers and state railway commissioners.

Senator Kellogg, of Minnesota, has introduced a bill in Congress to include members of the Russian Railway Service Corps, consisting of about 350 railroad officers and men sent from this country to Russia last year to assist in organizing the Russian railway system, within the terms of the war insurance provided for the United States army. The Russian Railway Service Corps is not a part of the regular army but was specially organized and was financed by the Russian government.

Fuel for the New York Central is the subject of a special order issued by the Fuel Administration on March 6, addressed to coal operators under contract to supply fuel coal to that road, giving priority to such contracts and providing for making regular daily and weekly shipments. Mines under contract to furnish coal to the New York Central will be required to fill these contracts before taking on other business; and the railroad company is charged with the duty of providing cars promptly.

Forest fires burned over 962,000 acres of National Forest lands in 1917 and caused a loss of \$1,358,600 to the government in timber, forage and young growth, according to figures compiled by the Forest Service of the Department of Agriculture. In addition to the actual loss in timber and forage, these fires entailed extra expenditures by the government of \$1,121,451 for watchmen, supplies, etc. Of the 7,814 fires fought on the National Forests, 2,132 were set by lightning, and 952 were incendiary. Careless campers were responsible for 1,288, and railroads for 1,003.

On the Boston & Albany, the officers and employees have formed a permanent organization to gather and record information concerning employees who are now in the military or naval service, and to take charge of the sending of gifts to the men. "Our Fellows At the Front" is the title of a pamphlet which has been issued by a committee telling what has been done up to this time, and giving names of the soldiers and sailors (so far as compiled) together with much other information. The chairman of the committee is W. E. Adams, press representative of the road, Boston.

The mining of clean coal is to be enforced by the Fuel Administration, according to an announcement which has just been made. An inspection system will be organized. During the past winter much of the output of bituminous coal has contained a large percentage of slate and other impurities, the effect of which has been not only to reduce the selling value of the coal, but to put an additional unnecessary burden upon transportation facilities. Under the new plan adopted, coal condemned by the Fuel Administration, either lacking preparation or because it contains a high percentage of impurities, will be sold at 50 cents a ton less than the fixed government price for the mine. The inspection system will be operated through the district representatives of the Fuel Administration, who are authorized to appoint a sufficient number of inspectors to carry out the terms of the order, which went into effect last Monday. Inspectors are authorized to condemn at the mines any coal which, in their judgment, is not properly prepared.

Western Railway Club Meeting

The next meeting of the Western Railway Club will be held at the Hotel Sherman, Chicago, on Monday, March 18. Professor G. A. Young of Purdue University will present a paper on railway mechanical problems, and H. R. Warnock, general superintendent of motive power of the Chicago, Milwaukee & St. Paul, will give an informal address.

Mail-Pay Decision Confirmed

The United States Court of Claims on March 11 reaffirmed its previous decision in the railway mail pay "divisor" case, dismissing the petitions of a number of railroads for claims against the government for large amounts of back pay from the post office department. The former decision was sustained by the Supreme Court but by an evenly divided ruling, so that the case was reopened in the lower court.

Thirty-First Engineers an Operating Regiment

Col. Frederick Mears, formerly a member of the Alaskan Engineering Commission, announces that the Thirty-first Engineers, which is being organized under his direction, is to be a railroad operating organization. With few exceptions every man of the new organization will be a man experienced in railway operation. Applications will be received only from men who have good records as locomotive engineers, firemen, brakemen, railway clerks, yard foremen, trainmasters, switchmen, conductors and others whose training fits them for the duties of operating trains. Col. Mears' regiment will mobilize at Fort Leavenworth, Kan., and recruiting officers are being established at various points throughout the United States.

Disloyalty Charge a Gross Calumny

"I have read with dismay that the charge has been made that the railroad heads of this country do not wish government control of the railroads in this time of war to be successful, and are trying to prevent its success. I have faith that such a traitorous charge has not found lodgment in the public mind. The charge is as damnable as it is deceitful and is a gross calumny upon the railroad men of this country. I adjure you, even as I lay the duty upon myself, to stand firm against touch or taint of disloyalty. Any country that is not loyal to its government in times of stress is not a nation. Let us help in every way we can. The war must be won. It is the privilege of each one of us to do his share to achieve that great and imperative result."—William Sproule, president of the Southern Pacific, before the San Francisco Transportation Club.

Rock Island Generous to Its Soldiers Abroad

During the month of February officers and employees of the Rock Island Lines contributed a total of \$569 to the "Smoke Pot" maintained for the benefit of Company B of the Thirteenth Engineers (Rys.), the Rock Island contingent now in France. The Missouri division was the heaviest contributor during the month, sending \$175. The Illinois division was next with \$75, and other heavy contributors were the Minnesota division with \$63; the dining car department with \$63; the Cedar Rapids (Iowa) shops with \$55, and the St. Louis division with \$49.

In February a shipment of tobacco costing \$286 was made to Company B, and in March athletic equipment costing \$242 was shipped, consisting of complete outdoor baseball outfits, sufficient to equip two full teams, 12 tennis rackets, 2 dozen tennis balls, and tennis nets, indoor baseballs and bats, 8 sets of boxing gloves, quoits, footballs and 4-lb. medicine balls. In addition \$150 was cabled to the company as a contribution to its mess fund.

Fuel Order Modified

United States Fuel Administrator Garfield has issued an order revoking Section 1, of the regulation promulgated January 17, in all states east of the Mississippi, except Pennsylvania, Maryland, West Virginia, Ohio and eastern Kentucky. The order, which went into effect March 5, suspends certain provisions relating to priority in furnishing coal to railroads, domestic consumers, Army and Navy cantonments, public utilities, hospitals and other preferred consumers.

The five states in which the regulation continues in full force embrace the anthracite and bituminous producing fields which supply the eastern section of the country, and coal operators therein will continue to give preference to shipments for consumers in the order named in the regulation. It is also provided that in those states the provisions of Section 1 shall be extended to include contracts for coal made or accepted after January 17, as well as contracts and orders on hand, on that date.

Improved transportation conditions and other factors have contributed to a material improvement in the coal situation in the territory where the coal priority list has been suspended. In the states where the regulation continues in force the coal shortage has not been entirely overcome.

Determination of Priorities

In connection with the appointment of B. M. Baruch as chairman of the War Industries Board, President Wilson has written a letter outlining the functions of the board and of the chairman, which are somewhat enlarged as compared with those of the former organization. One of the functions of the board is:

"The determination, wherever necessary, of priorities of production and of delivery and of the proportions of any given article to be made immediately accessible to the several purchasing agencies when the supply of that article is insufficient, either temporarily or permanently."

Continuing, the letter says: "In the determination of priorities of production, when it is not possible to have the full supply of any article that is needed produced at once, the chairman should be assisted, and so far as practicable guided, by the present priorities organization or its equivalent."

"In the determination of priorities of delivery, when they must be determined, he should be assisted when necessary, in addition to the present advisory priorities organization, by the advice and co-operation of a committee constituted for the purpose and consisting of official representatives of the food administration, the fuel administration, the railway administration, the shipping board and the war trade board, in order that when a priority of delivery has been determined there may be common, consistent and concerted action to carry it into effect * * *"

West Observes Embargo to Permit Reduction of Accumulation in the East

In order to enable eastern lines to clear up accumulations, R. H. Ashton, regional director of western railroads, requested the lines under his jurisdiction to discontinue from March 10, the loading of carload freight for places east of the Illinois-Indiana state line. The only exceptions to this embargo are traffic authorized by general operating committee, freight traffic committee or director-general permits; live stock and perishables, coal, coke and charcoal; acids, alcohol, ammonia, light oil and petroleum; empty tank cars; domestic food for human consumption and domestic feed for animals and poultry, not including hay or straw.

The regional director of western roads is still giving special attention to the movement of grain to primary markets and particularly to the transportation of soft corn, which demands prompt handling to prevent deterioration beyond the point of recovery. That the efforts of the Railroad Administration in this direction have borne fruit is evidenced by recent statistics of receipts at primary markets. In February the total grain received at primary markets was 71,754,000 bu. as compared with 48,397,000 bu. in the same month of 1917. In the first nine days of March the receipts at primary markets totaled 28,158,000 bu. as compared with 20,406,000 bu. in the

same period the year before. The movement of corn and oats to markets is appreciably heavier than it was a year ago, while the movement of wheat is somewhat smaller.

The plan of moving grain, flour and meat for export in solid trainloads from primary markets to seaboard is working out to the satisfaction of both the Railroad Administration and the Food Administration. On March 11, eight trainloads of corn were en route to Gulf ports and one of flour to an eastern seaport, while two trainloads of oats, one of barley and three of corn were scheduled to make their departures on that day from primary markets to eastern and southern ports.

American Railway Engineering Association Program

The following program has been issued for the nineteenth annual convention of the American Railway Engineering Association, which will be held in Chicago on Tuesday to Thursday, inclusive, of next week. Morning sessions will continue from 9:30 to 12:30, and afternoon sessions from 2 until 5. The president's address and the secretary's report will be presented on Tuesday morning, following which the committee reports are scheduled in the order shown below, but the program is subject to such change as may appear desirable during the convention. It is expected that most of Wednesday will be devoted to the consideration of the labor problem, which will necessitate some transference of the reports assigned for presentation on that day.

March 19—Signals and Interlocking.

Conservation of Natural Resources.
Buildings.
Track.
Water Service.
Records and Accounts.

March 20—Electricity.

Yards and Terminals.
Economics of Railway Labor. Illustrated use of labor-saving devices.
Ballast. Illustrated use of mechanical tampers.
Economics of Railway Operation.
Uniform General Contract Forms.
Roadway.

March 21—Iron and Steel Structures.

Wooden Bridges and Trestles.
Masonry.
Ties.
Stresses in Railroad Track.
Rail.
Signs, Fences and Crossings.
Rules and Organization.
Wood Preservation.

The annual dinner will be held on Wednesday evening and will be in the nature of a "war dinner." Among the speakers already secured are Sir Edmund Walker, president of the Canadian Bank of Commerce, Montreal, and Rev. Stephen K. Mahon, of Toledo, Ohio.

The Railway Signal Association will hold its stated meeting at the Auditorium Hotel on Monday, March 18, while the National Railway Appliances Association will present its exhibit at the Coliseum throughout Monday, Tuesday, Wednesday and Thursday.

Meeting of Railway Supply Interests

The Railway Business Association will hold a meeting at the La Salle Hotel in Chicago on April 8. Because of the special problems before the supply interests at this time the meeting will be of more than ordinary importance and a large attendance is expected.

Western Society of Engineers

The Western Society of Engineers at its meeting in Chicago on Tuesday evening, March 19, will present a program on the material situation as it affects engineers. There will be a paper on conditions in structural steel plants by Frank J. DeWolf, division contract manager of the American Bridge Company, Chicago; one on conditions in the lumber industry by Hermann von Shrenk, consulting timber engineer, St. Louis; and one on conditions in the cement industry by B. F. Affleck, president of the Portland Cement Association, Chicago. A special invitation has been tendered to members of the American Railway Engineering Association, to convention at Chicago that week, to attend this meeting.

Traffic News

President Wilson and Director General McAdoo have been urged by a large delegation of senators and representatives to use a part of the \$500,000,000 fund appropriated in the railroad control bill, to establish barge lines on rivers and canals.

The following circular has been sent by the Car Service section to all railroads: "We must at this time impress upon all the necessity of giving special attention to the handling of seeds and agricultural implements for the next 60 days that they may be ready for spring planting."

Major-General Harry Clay Hale, of the United States Army, addressed the Transportation Club of Louisville, March 12, on the subject "What Transportation Has to Do with the War." Major-General Hale addressed the club last year on the details of transporting armies and supplies, since which time he has been in France to survey the situation there.

The Railroad Commission of Louisiana will hold a session at Baton Rouge, on March 20, to consider the adoption of Western Classification No. 55 and supplement No. 1 thereof, for use on business moving between points west of the Mississippi river, and between points east and points west of the river.

The tourist season at the Yellowstone National Park this year will be slightly curtailed. The opening date will be June 25 and the closing date, the same as heretofore, September 15. The trip through the park is now made by motor car, either private automobiles or those of the Park Transportation Company, which has supplanted the horses and stage coaches of former years.

The production of coal in the Province of Alberta in 1916 was, 4,563,020 tons, more than twice the quantity mined in 1909, and enough to put Alberta next to Nova Scotia in the production of coal, Nova Scotia being the leader among Canadian provinces and British Columbia (formerly second) third. The Canadian Northern reports that the mines on that company's lines doubled their output in two years; and for the year ending June 30, 1917, the total production of the mines on the C. N. was about 2,000,000 tons.

Director General McAdoo has announced that C. H. Markham, Regional Director at Atlanta, had arranged to concentrate at South Atlantic ports approximately 100,000 additional bales of cotton, making a total of 225,000 bales now en route or at port. Special steamer service is being arranged to take care of this accumulation. Steamers have been sent to Galveston, New Orleans, Brunswick, Savannah, and Wilmington to take cotton directly to New England. It is planned to place additional ships in service at an early date. The delayed cotton in cars at St. Louis and Chicago is being moved to New England at the rate of 50 cars a day. So far about 500 cars have been moved and this rate will be maintained until the delayed cotton is disposed of.

An emigrant train of 27 cars, double-decked, which passed through New Orleans on March 8, was filled with settlers from Dryden, Tex., going to live in Isabel, La. These new residents of Louisiana are sheep and goats, which have been bought by J. W. Bassett for the purpose of utilizing large tracts of land from which timber has been cut off, and which, since the lumbermen left them, have been wholly unused. Many thousand acres of land of this character are available in Louisiana. Additional shipments of cattle, hogs and more sheep are to be made by Mr. Bassett in the immediate future. The animals are from a district free of the Texas fever tick, and their new home will be in territory likewise free of that pest, which, it is believed, soon will be eradicated from the whole of the south.

Passport restrictions, limited through-train facilities, relatives in the army, fluctuating business conditions, income tax returns, and the unfavorable government attitude toward pleasure travel, make a formidable list of influences which have proved adverse to tourist traffic. The tourist communities of the far west and south have not enjoyed the super-capacity patronage of a year ago, but they report a volume of business which compares

favorably with the average year. The development of our new foreign trade to South America and the far east continues to fill the steamers to those parts of the world with increasing numbers of business travelers. Accommodations must be reserved well in advance and the utmost care must be exercised in complying with passport regulations. Lake, river and coastwise steamship lines, which provide the favorite summer recreation for large numbers of our people, are planning to offer the usual routes and services this season.—*American Express Co.'s Travel Bulletin.*

Oklahoma Two-Cent Fare Law Enjoined

The two-cent passenger rate provision of the Oklahoma State Constitution was permanently enjoined on March 12, in an opinion handed down by Judge Youmans of the United States District Court at Oklahoma City. An order issued by the Oklahoma State Corporation Commission, in which the commission took jurisdiction over freight and passenger rates within the State, also was enjoined permanently. The case has been pending since 1909. The Atchison, Topeka & Santa Fe and several other railroads were plaintiffs in the suit. The opinion upholds the contention of the railroads that the constitutional provision for a two-cent fare is confiscatory.

Improved Freight-Car Efficiency

The Pennsylvania Railroad reports that its campaign to make freight cars do more work saved 73,562 cars on the lines east of Pittsburgh and Erie in a single month, December. The average load in December was 37.23 tons as compared with 31.70 tons in the corresponding month of the previous year, or an increase of $5\frac{1}{2}$ tons per car. Since the early part of 1916, when the department of the Superintendent of Stations and Transfers was established the improvement has been about 30 per cent. In 1915 the average load per car was less than 29 tons; now it is 37 tons. Basing the calculation on the 164,000 freight cars on the Pennsylvania lines east of Pittsburgh, this increase has been equivalent to the addition of 49,000 cars.

On the Pacific system of the Southern Pacific during January, about 11,500 cars were saved by better loading. The freight movement of the month, 1,500,000 tons, was handled in 59,257 cars; and if each car had been loaded with the same average tonnage as in January, 1917, the same quantity would have taken 70,809 cars. Nearly one-fifth of the saving was due to improvement in loading less-than-carload merchandise. The figures do not include oil in tank cars which are always loaded to capacity.

Coal and Food Situation at Atlantic Ports

Director General McAdoo gave out on March 12 the following telegram from A. H. Smith, Regional Director at New York, showing that the railroads had fully met the conditions for transportation of food supplies and coal that is needed: "The bunker coal situation at New York harbor today is in better shape than it usually has been at this season in previous years. The reserve for bunkering transports has been built up to a point that orders have been given to hold off on shipments for two weeks.

"The following cars of export food on hand at ports named today: Boston—Canned goods 25, flour 326, provisions 137, total 588. New York—Canned goods 557, flour 620, provisions 1,150, total 2,327. Philadelphia—Canned goods 41, flour 223, provisions 188, total 452. Baltimore—Canned goods 409, flour 377, provisions 471, total 1,257. Newport News—Flour 154. Norfolk—Canned goods 86, flour 201, total 287. Grand total 4,965.

"In the total at New York are 479 cars of frozen meat. Have limited loading from Chicago to 50 cars a day.

"Total export freight on hand at all North Atlantic ports 8,016 cars on wheels, 6,760 cars unloaded on piers, and 15,713 cars unloaded on ground; total 30,489."

The Director General also gave out the following statement:

"It is not the intention of the Railroad Administration to interfere with normal commercial shipments. It has been necessary to give preferential service to supplies of food, fuel and munitions. It is expected that within a short time the railroads will be in a position to handle commercial business in the usual

way. We have not at any time issued orders interfering with commercial business except when it was necessary to do so on account of special service being required for the commodities above mentioned. Embargoes have been placed on the various railroad roads due to conditions caused by the extreme weather and the accumulation at certain Atlantic ports."

Economy in Interurban Motor-Truck Service

The New Jersey State Council of Defense has sent to the mayors of New Jersey cities a request that they establish "Return Load Bureaus," so that motor trucks carrying loads from one city to another may be added in finding return loads.

Under the plan proposed the driver of a motor truck, after delivering his load, may telephone to the "Return Load Bureau" and obtain information as to where he may find a return load.

It is proposed to establish bureaus in Asbury Park, Atlantic City, Bayonne, Belleville, Bloomfield, Bridgeton, Camden, East Orange, Elizabeth, Englewood, Garfield, Gloucester, Hackensack, Harrison, Hoboken, Irvington, Jersey City, Kearny, Long Branch, Millville, Montclair, Morristown, Newark, New Brunswick, Orange, Passaic, Paterson, Perth Amboy, Phillipsburg, Plainfield, Trenton, Union Hill, West Hoboken, West New York and West Orange.

Elliott H. Goodwin, secretary of the Chamber of Commerce of the United States, Washington, has issued a circular urging local commercial organizations everywhere to establish "Return Load" bureaus. He says:

"Owners of trucks do not wish half the earning power of their vehicles to be lost. Merchants with goods piled up and awaiting shipment do not like to see empty trucks pass their doors. Such a clearing-house will not ordinarily entail any special expense. It will promote co-operation in the community. The bureau should ascertain the established lines of trucks that run regularly on fixed routes and the part of their capacity that is not being utilized. It should then obtain information from all owners of trucks used for private hauling, getting statements about the capacity of each truck, how far its capacity is used, between what points the capacity is unused, and if the unused capacity can be made available for other persons at a reasonable price. The bureau should be listed in the telephone directory. In England return-load bureaus have proved of great assistance."

Energetic Work at Hartford

[From the Motor Truck.]

Municipal initiative has been productive of a considerable reduction of the congestion in the freight yards of the New Haven railroad at Hartford, Conn. When the factories of Hartford were closed by order of Fuel Administrator Garfield to conserve coal and minimize railroad traffic, Mayor F. A. Hagarty believed that the thousands of workers temporarily unemployed might be induced to unload the thousands of freight cars that had been accumulating; and he called a meeting of merchants and manufacturers and a plan was determined. This was to utilize power trucks and to engage all men willing to handle freight. All freight cars were to be unloaded in a specified order; means were adopted to notify consignees to be ready to receive the freight. The railroad company was anxious to co-operate and the street railway changed the operating plan of several trolley lines that the trucks might not be obstructed in the work.

Despite the short notice, 60 trucks and more than 500 men, including 14 city firemen, worked the first day and unloaded and warehoused 5,900 tons of freight from 160 cars. The second day nearly 1,000 men and more than 100 trucks emptied considerably more than 250 cars, making a total reduction of something more than 400 cars. There were some protests from consignees who were using cars for storage, but without exception the objectors yielded when informed that their attitude would be given deserved publicity. When work was begun upward of 800 cars, laden with 30,000 tons of freight, were in the railroad yards.

There was not as spontaneous a response from the workers of the city as might have been expected, for seemingly many preferred to remain idle; though the severity of the weather may have been a deterrent to some. There is reason to believe that had the employers been able to make a direct appeal and have definite understanding relative to pay, the men would have been available in much larger numbers.

Commission and Court News

State Commissions

In a decision handed down on March 8, the State Public Utilities Commission of Illinois denied the application of William E. Golden, asking that soldiers and sailors in Illinois be permitted to ride on passenger trains for one cent a mile.

Court News

Interstate Transportation of Intoxicating Liquors Through Prohibition States

The Alabama Supreme Court holds that the state prohibition statutes, as extended by the Webb-Kenyon Act, are inapplicable to the transportation of intoxicating liquors through Alabama in transit from Georgia to Florida. If so construed the prohibition statutes would be unconstitutional.—*Morague v. State (Ala.)*, 77 So. 322. Decided June 7, 1917. Rehearing denied December 20, 1917.

Fires from Sparks—Burden of Proof

The Texas Court of Civil Appeals holds that to rebut the prima facie case made out by showing that fire which damaged the plaintiff's property emanated from a railroad company's locomotive, it is placing too great a burden on the company to make it establish by a preponderance of evidence that the employees in charge of the locomotive exercised ordinary care to prevent the escape of sparks therefrom, and error in the trial court's charge imposing such burden of proof on the railroad is not harmless.—*St. Louis S. W. of Texas v. Johnson (Tex.)*, 199 S. W., 1175. Decided November 22, 1917.

Extension of Spur Tracks

Affirming an order of the State Corporation Commission, the Virginia Supreme Court of Appeals holds that the fact that a side track will be used for interstate commerce, as well as intrastate, does not deprive the commission of jurisdiction to compel the construction or extension thereof. It holds that where, after the lessee of a railroad took over the road part of a side track, some 150 feet of which, built on a wooden trestle, was burned, and the entire track was necessary, the lessee must rebuild, and it is immaterial that a certain concern will be benefited, as all are a part of the public, and are entitled to equal facilities. A railroad, it is held, cannot refuse to extend a spur track because the person desiring the spur will ship products from another State, his competitors shipping from intrastate points, resulting in a decrease in revenue on account of more inequitable interstate rates.—*Washington & Old Dominion v. P. S. Royster Guano Co. (Va.)*, 94 S. E., 763. Decided January 24 1918.

Mail Claim of New Haven Road Denied by Court

A claim of the New York, New Haven & Hartford for additional compensation for carrying parcel-post packages after they were added to the mails by the parcel post act of 1912 has been denied by the Court of Claims. Such claims made by this and other New England roads aggregate over \$11,000,000. The road alleged that the mails were carried at a loss, the compensation for four years being based upon a quadrennial weighing of the mails before the advent of parcel post, and that the rate was compensatory and in violation of the Constitution.

The court held that mail contracts are subject to increase of business without additional compensation during the four-year contract period. Not being a land-grant road, the New Haven could not have been forced to carry the mails prior to the act of July 28, 1916. In continuing to carry the increased mails and accepting the contract price, including certain added compensation provided by the act of March 4, 1913, it

made the transportation a matter of voluntary contract, under which an actual loss is not a taking of property. It is pointed out that the plaintiff was not compelled to receive the mails as a common carrier.

Improper Use of Appliance

A railroad put a U-bolt on its grain cars for the purpose of assisting elevators by giving them something to hook onto in setting cars, it being intended that only one car should be pulled at a time. The Kansas City Court of Appeals holds that the railroad was not liable for injuries to a servant of an elevator caused by a bolt giving way when three cars were being pulled at once, where there was no evidence that it would not hold if one car was being hauled, or that it was a custom to move more than one car at a time.—*Caenfielt v. Bush* (Mo.), 199 S. W., 1041. Decided December 31, 1917. Rehearing denied January 28, 1918.

Defective Door Fixtures—Variance

Between Pleadings and Proof

In an action by a railroad employee against the road, which impleaded the Pullman Company, for injuries due to a defective guard rail used to hold open the door of a vestibule in a Pullman car, the defects alleged were that the rail was bent, old and worn, and that the catch was old and defective. The Texas Court of Appeals held that the plaintiff was limited in his proof to such defects, and could not prove that the guard rail was defective in that it had not been properly latched. It also held that the Pullman Company and the railroad hauling the Pullman car, if liable at all for the injury, were jointly liable. Judgment for the defendant was affirmed.—*Blackman v. San Antonio & Aransas Pass* (Tex.), 200 S. W., 412. Decided January 2, 1918. Rehearing denied January 30, 1918.

Right of Condemnation—Abandonment

A Missouri statute requires a railroad to finish its road and put it in operation in ten years from the time of filing its articles of incorporation. Another statute provides that all railroads may contract with each other or other corporations in any manner not inconsistent with the object of their creation. A predecessor of the C. B. & Q., instead of building its own track through the city of Hannibal, used, by contract, the track of a bridge company for about a mile, and had the right on determination of the contract to condemn land for a track on the west side of the bridge company's 50-foot strip. The Missouri Supreme Court holds, in condemnation proceedings by the C. B. & Q., that the company did "finish its road and put it in operation," so that its corporate powers did not cease. The agreement with the bridge company did not constitute an abandonment of its right to condemn property adjoining the track to afford further necessary facilities under a statute giving it the right to lay out its road, not exceeding 100 feet in width.—*C. B. & Q. v. McCoey* (Mo.), 200 S. W., 59. Decided December 3, 1917. Rehearing denied December 22, 1917.

Safe Approach to Train—Ownership of Station

In an action by a passenger against the Cincinnati, New Orleans & Texas Pacific for personal injuries while attempting to board a train at a station in Cincinnati, the petition alleged that between the platform and the third track, on which the train stopped, were two other tracks on which the defendant and two other companies, including the Baltimore & Ohio Southwestern, operated passenger and freight trains. While the plaintiff was crossing one of these tracks, the B. & O. S. W. negligently caused one of its trains to move thereon and strike and injure plaintiff. His injuries were alleged to be the proximate result of the defendant's negligence in failing to provide him with a safe approach to its train, and the concurrent negligence of the B. & O. S. W. (which was not sued) in moving its train over the track at that time and place. The Kentucky Court of Appeals holds that a demurrer to this petition was properly sustained. The plaintiff's injuries were not due to the fact that the physical condition of the approach was itself dangerous or defective. On the contrary, the approach was rendered dangerous solely by the negligence of the B. & O. S. W. In the absence of an allegation

to the contrary, the court assumed that the B. & O. S. W. was the sole owner of the station and tracks, and the movement of its trains, as well as the rules and regulations governing their movement, were under its exclusive control.—*Scott v. Cincinnati, N. O. & T. P.* (Ky.), 200 S. W., 6. Decided January 25, 1918.

Carriage of Perishable Fruit

In an action against a carrier for the decay of a car of peaches shipped from Texas to Indianapolis, there was an inference of full refrigeration from payment of full charge therefor, and there was no showing that the time in transit, about 96 hours, was not reasonable dispatch. The Texas Court of Civil Appeals holds that a mere showing of delivery to the initial carrier in good condition and delivery by the terminal carrier in bad condition, with testimony that the peaches should have been carried 60 to 72 hours under proper refrigeration, did not warrant a directed verdict for the plaintiff. The inferences as to the railroad's negligence or fault being conflicting and not conclusive the case was for the jury. Judgment for the plaintiff was therefore reversed.—*Texas & Pacific v. Woldert Grocery Co.* (Tex.), 199 S. W., 1139. Decided December 27, 1917. Rehearing denied January 10, 1918.

Consignee's Duty to Remove Fruit

In an action by the consignor against a carrier for the conversion of a shipment of fruit, which the carrier sold because of the consignee's failure to unload it, the Texas Court of Civil Appeals holds that evidence of the market value of the fruit on August 22 did not support a judgment for the plaintiff, where the sale was made on August 25, the goods being of a perishable nature and subject to rapid deterioration. Under the rule established by the Texas courts the consignees had no right to retain possession of the car and peddle the fruit from it at retail, as they were doing, in violation of the instructions of the railroad. It was their duty to unload the car within a reasonable time; failing to do this they were liable for demurrage and for reasonable expenses incurred by the railroad in caring for the produce, after retaking possession, up to the time of the sale. Judgment for the plaintiff was reversed and the cause remanded.—*Ft. Worth & Denver City v. Nabors Fruit Co.* (Tex.), 200 S. W., 420. Decided January 9, 1918. Rehearing denied February 6, 1918.

Production of Bill of Lading

The New York Appellate Division holds that, under a straight bill of lading in the form provided by the rules of the Interstate Commerce Commission, the carrier's obligation is complete when it delivers the goods to the named consignee, and it need not require the surrender of the bill. Notice of the words "draft against B/L" on the face of the bill would not increase the obligation; nor does section 227 of New York Personal Property Law, added in 1911, operating as notice that the consignor intended to require payment of the draft before the buyer would be entitled to receive and retain the bill, apply to an interstate shipment, so as to require the consignee's production of the bill before delivery. A consignor of an interstate shipment, intending that the goods should not be delivered to the consignee without production of the bill of lading, may protect himself by taking an order bill, or, if preferring a straight bill, may protect himself by notification to the carrier, under section 219 of the said Personal Property Law, that a third party is the transferee of the bill.—*Dusal Chemical Co. v. Southern Pacific*, 168 N. Y. Supp., 617. Decided January 17, 1918.

Injury to Passenger's Hand in Door Jamb

In an action for personal injuries to a passenger it appeared that the plaintiff boarded the train at Atlantic, and at South Boston, where the train stopped, when about to alight, her left hand was caught in the jamb of the forward door of the car. At this station the track is straight, the grade, as estimated by an engineer called by the plaintiff, was about 2½ or 3 per cent down grade. The car was crowded and people were standing in the aisle near the forward door. She followed the passengers leaving the car and stopped on the car

platform for a moment to allow some people to precede her. As she was going onto the car platform she saw the brakeman approaching through the aisle of the car ahead and heard him shout, "Look out for your hand!" but the warning came too late, for the door swung to, crushing her fingers. There was evidence that as each passenger went out they held the door. There was nothing to show that there was a catch to hold the door in place when open, and there was no evidence of any defect in the door or its appliances. Nothing appeared to show by whom or at what time the door was opened. The Massachusetts Supreme Judicial Court considered this the difficulty with the plaintiff's case. It distinguished, as inapplicable here, the cases of *Kellogg v. B. & M.*, 210 Mass., 324, 90 N. E. 525, and *Silva v. B. & M.*, 204 Mass., 63, 90 N. E. 547, where the car door was opened by employees of the railroad. It held that a grade of $2\frac{1}{2}$ or 3 per cent did not show negligence, nor did that fact require the presence of a brakeman at the door of each car where passengers were alighting, and his absence from the platform was not negligence. Exceptions to the verdict for the railroad were overruled.—*MacGill-Allen v. N. Y. N. H. & H. (Mass.)*, 118, N. E., 248. Decided January 7, 1918.

United States Supreme Court

Maintenance of Roadbed for Men's Feet

A civil engineer who had been in the employ of the Southern Railway eleven years was directed to make a survey in one of its yards. While doing so he walked on the main track between the rails where he had seen others walk. As he stepped on a cross-tie, a small V-shaped piece of it, one and a half inches by six, being rotten, splintered off under his weight. His foot slipped down between the ties where the ballast was five or six inches below the top of the tie; and stumbling, he fell and dislocated his knee. The defect in the tie could have been discovered by sounding with an iron rod, and the standard of maintenance of roadbed prescribed by the road was to ballast to the top of the ties. But neither the condition of the tie, nor the failure to ballast to the top of the tie, was a defect of a character to impair safety in operation. The engineer knew that there were always some ties on the line which were partly decayed, and also that the ballast was occasionally below the top of the ties. On these facts he sought in a state court of North Carolina to recover damages from the railroad under the Federal Employers' Liability Act. The trial court refused the railroad's motion for a non-suit; and the jury rendered a verdict for the plaintiff. Judgment thereon was reversed by the Supreme Court of the State on the ground that there was no evidence of negligence; and the case came before the Supreme Court of the United States on writ of error. That court holds it to be clear that the railroad did not fail in any duty which it owed to the plaintiff, and affirmed the judgment of the State Supreme Court.—*Nelson v. Southern*. Decided March 4, 1918.

Fined \$22,400 for Not Stopping Trains at County Seat

Suit was brought by the State of Texas to compel the Gulf, Colorado & Santa Fe to stop two interstate trains, No. 17 southbound and No. 18 northbound, at Meridian, the county seat of Bosque county, with a population of 1,500. Two other trains each way stopped there daily, but the State Railroad Commission found that these were insufficient for the needs of business, and granted the order sought. The Texas statute giving the commission power to make such order contains a proviso that "four trains each way, carrying passengers for hire, if so many are run daily, Sundays excepted, he required to stop as aforesaid at all county seat stations"—so that the commission seemed to have obeyed a statutory mandate. Art. 6676 (2) Vernon's Sayles' Statutes. Another article, 6672, imposes a penalty of not more than \$5,000 for every failure to obey such order. The trial court confirmed the finding of the commission that the existing service was insufficient, and the order, and imposed a fine of \$22,400, being \$100 for each failure to stop. The Texas Court of Civil Appeals confirmed the finding and affirmed the judgment. The Supreme Court of the State refused to allow a writ of error, declaring itself unable to say that the conclusion of the lower court was unwarranted as matter of law.

The Supreme Court of the United States has affirmed the

judgment of the State Court, the chief justice, Mr. Justice McKenna, and Mr. Justice McReynolds dissenting. The court, by Mr. Justice Holmes, said, in part: "It is the reasoning that prevailed with the Court of Civil Appeals were applied to Meridian simply in view of the number of its inhabitants, there would be a serious question whether it could be sustained. For the consideration most emphasized was that no sleeping cars were attached to the local trains and that in order to make use of such accommodation on the trains in question passengers had to get in or out at stations from seven to fifteen miles away. It was thought that when the railroad furnished such accommodations to a part of the public it was bound to furnish the same to all others—a very questionable proposition as applied. The other fact relied upon was that passengers not infrequently came on trains Nos. 17 and 18 destined for Meridian and had to get out at Morgan or Chilton, the next stations to the north and south. We repeat that whether these facts would justify an intermeddling with interstate trains in favor of a place of this size, merely as such, would be a serious question. But the State Court sustained the order as one required by statute in favor of county seats, up to the number of four trains each way, Sundays excepted. The law is not directed adversely at interstate trains, but expresses the specific judgment of the legislature as to the needs of county seats, all of which, of course, it knew. If its judgment is correct, which we have no grounds for denying, the order may be justified, so far as its interference with interstate commerce is concerned, unless some other fact shows that the burden is too great."—*Gulf, Colorado & Santa Fe v. Texas*. Decided March 4, 1918.

Engines Changed to Burn Oil

In an action for the death of an engineman, caused by a locomotive boiler explosion, the negligence charged was that the boiler on the engine was insufficient in that (1) the button-heads of the crown-bolts were excessively and unnecessarily large and consequently unduly exposed to the direct heat produced by the fuel oil used on the locomotive; (2) the boiler was not provided with fusible safety plugs; and (3) scale was negligently allowed by the company, its officers and employees to accumulate on the crown-sheet in the boiler. The company denied negligence and set up the defenses of contributory negligence and assumed risk. Judgment for the plaintiff was affirmed by the Supreme Court of the State of Washington, and the case was taken to the Supreme Court of the United States. The ground of reversal principally urged was that the testimony did not warrant a recovery by the plaintiff. There was evidence that the engine had been a coal-burning engine, but that at the time of the explosion the fuel used was oil; that the button-heads on the bolts of the crown-sheet at the top of the fire-box were large ones when the engines were fired with coal, and were not changed with the change to oil; that the button-heads, because of their size, became overheated when oil was used for fuel, resulting in deterioration and weakening, and from the consequent giving way of the button-heads the crown-sheet came down and the explosion resulted. There was also testimony tending to show that there was an accumulation of scale and that there were no fusible plugs. On the part of the company there was testimony tending to meet and refute that of the plaintiff, and a considerable amount of testimony was introduced tending to show that the water in the boiler was too low, thereby causing the explosion from the fault of the deceased engineer in allowing it to become so. There was testimony for the plaintiff to the effect that the water was not too low at the time of the explosion. The jury having returned a verdict for the plaintiff, and the State Circuit Court and Supreme Court having found that there was evidence sufficient to sustain the verdict, the Supreme Court of the United States said that it was not its province to weigh conflicting evidence, and that the record showed testimony supporting the verdict; and that was as far as that court enters on that question. The court did not sustain the railroad's contention that so long as the large type of button-head had not been disapproved by the government inspector such fact was conclusive of the sufficiency of the type in use. It found nothing in the boiler inspection act to warrant the conclusion that there is no liability for an unsafe locomotive, in view of the provisions of section 2 of the act, because some particular feature of construction, which has been found unsafe, has not been disapproved by the federal boiler inspector.—*Great Northern v. Donaldson*. Decided March 4, 1918.

Equipment and Supplies

Railway supplymen will be specially interested in the announcement of the extended activities of the Railway Business Association on page 537, and in the articles on selling supplies to the railways under government control on pages 543 and 559.

Locomotives

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, is in the market for a second-hand 3 ft. gage ten-wheel locomotive with 14 x 18 or 20 in. cylinders or heavier.

CANADIAN GOVERNMENT RAILWAYS. The Railway Department, of which Hon. J. D. Reid is Minister, is mapping out a big program to meet the railway equipment requirements of the Dominion. The department figures that there are needed at least 150 engines and 7,500 box cars. Inquiries are being made as to prices, specifications and number of engines and cars each Canadian company can manufacture this season. A recommendation to the Cabinet Council will likely be made in a few days. The Grand Trunk is now using 45 government locomotives.

Passenger Cars

THE ATLANTIC LOADING COMPANY, 65 Broadway, New York, is in the market for 6 second-hand passenger coaches for immediate delivery.

Iron and Steel

THE CANADIAN GOVERNMENT has placed an order for 100,000 tons of steel rails with the Dominion Iron & Steel Company. The government will afterwards sell the rails to different Canadian railways.

Signaling

THE ST. LOUIS-SAN FRANCISCO has ordered from the General Railway Signal Company a mechanical interlocking, 35 working levers, to be installed by the railroad forces at Durant, Okla.

THE ATCHISON, TOPEKA & SANTA FE has ordered from the Union Switch & Signal Company materials for two interlocking plants at Hutchinson, Kan.; one at the Missouri Pacific crossing, 32 levers, and one at the Rock Island crossing, 36 levers.

THE BOSTON ELEVATED has ordered from the Union Switch & Signal Company the material for block and interlocking signals on its extension from Boston northward to Everett, Mass., about three miles. There will be 14 automatic block signals—style "N" light signals—and a mechanical interlocking plant at Everett. The new line leaves the existing line at Sullivan Square, Boston, where a complete new electro-pneumatic interlocking machine, 79 levers, will be installed. Alternating current is to be used for the control of all switches and automatic stops, as well as signals, relays and indicators.

THE WASHINGTON, BALTIMORE & ANNAPOLIS ELECTRIC RAILROAD, to provide for the heavy traffic to Camp Meade, is to install automatic block signals on its line, double track, between Baltimore and Naval Academy Junction, 14 miles, so as to space trains six minutes apart under clear signals, or three minutes under caution signals; and the signals are to be so installed that later, by putting in additional signals, the space between trains can be reduced one half. The signals will be the Union Switch & Signal Company's light signals, giving indications by colors; "three-position." The lights will have six-inch lenses, with a range, in sunlight, of 1,500 ft.

Supply Trade News

Edward U. Smith, chief draftsman with the Austin Company at Philadelphia, Pa., has been promoted to district engineer of the Philadelphia branch, with jurisdiction over the states of New Jersey, Delaware, Maryland and Eastern Pennsylvania.

Robert E. Frame, for the past six years assistant to the president of the Haskell & Barker Car Company, Michigan City, Ind., resigned, effective March 1, and has been elected vice-president of the Hutchins Car Roofing Company, with office in Detroit, Mich.

R. J. Himmelright has been elected vice-president of the American Arch Company. In his new position Mr. Himmelright will have charge of the service and road development work in

R. J. Himmelright

the United States and Canada. Mr. Himmelright was born at Wadsworth, Ohio, and received his grammar and high school education at that place. Upon leaving high school he attended Wooster University for two years as a special student. Completing this work he entered Purdue University, graduating with the degree of mechanical engineer. While at Purdue University he specialized in railroad work. Immediately upon graduation he entered the service of the Lake Shore & Michigan Southern as a special apprentice. His

work with the Lake Shore, while wholly in the mechanical department, covered a wide and varied field and gave him unusual opportunity to study locomotive operation. Leaving the Lake Shore he entered the service of the Locomotive Stoker Company as mechanical expert. In 1913 he accepted a position with the American Arch Company as traveling engineer and was made successively assistant to the manager of the service department and manager of the service department, which position he held at the time of his recent election.

Walter H. Allen, for several years in the track department of the Pennsylvania Steel Company, Steelton, Pa., and for the last two years with the Maxwell Motor Company, Detroit, has become associated with the Taylor-Wharton Iron and Steel Company, with headquarters at 30 Church street, New York.

W. F. Wagner, after 52 years' service, has severed his connection with William Jessop & Sons and is now sales manager of the Seaport Steel Company, which specializes in carbon tool steel and forgings, high-speed steel, alloy and carbon sheet steel and all varieties of high-grade steel.

G. W. Bichlmier has recently become associated with the machinery department of the Walter A. Zelnicker Supply Company, St. Louis, Mo. Mr. Bichlmier was formerly associated with the supply departments of the Missouri Pacific and Kansas City Southern and was secretary-treasurer of the W. L. Sullivan Machinery Company.

Paul T. Irvin, who has been associated with the Wells Brothers Company, and the Greenfield Tap & Die Corporation for 12 years, has resigned his position as sales manager of the gage division to accept the position of general sales manager of Lincoln Twist Drill Company, of Taunton, Mass. Edward Blake, Jr. (formerly of Wells Brothers Company), is vice-president and general manager of this company, and Frank O. Wells, president and Frederick H. Payne, vice-president of the Greenfield Tap & Die Corporation are directors.

At the annual meeting of the stockholders and directors of the Driver-Harris Company, Harrison, N. J., **Leon O. Hart** was elected treasurer and a director of the company. Mr. Hart was born in Hoboken, N. J., in 1885, and was educated at the Stevens Institute of Technology, where he graduated in 1907 with the degree of mechanical engineer. After graduation, he worked as a cadet engineer with the Public Service Gas Company of New Jersey for about one year. On October 2, 1908, Mr. Hart became associated with the Driver-Harris Company as electrical engineer, in which capacity he served until March, 1917, when he was elected assistant treasurer.

R. S. Cooper, whose election as vice-president and general sales manager of the Independent Pneumatic Tool Company, was announced in these columns March 8, entered the pneumatic tool field in 1903, after specializing in pneumatic engineering at Cornell University. After one year in the shops, becoming familiar with the processes of manufacture, and one year in the sales department at Pittsburgh, he was appointed eastern sales manager, with headquarters at New York city, and retained that position until his election to the vice-presidency, which necessitated his transfer to the general offices at Chicago, and led to his recent appointment as general sales manager, in charge of the distribution of Thor pneumatic and electric tools, and Thor motorcycles.

J. L. Price, assistant to the chairman of the board of directors of the Chicago Pneumatic Tool Company, Chicago, was recently elected vice-president in charge of finances. He was also re-elected assistant to the chairman of the board of directors and in that capacity will continue to act as the representative of the chairman. He was born at Springfield, Ill., and entered the employ of a bank in that city after graduating from high school. He later became associated with Francis Beidler & Co., Chicago, and for some years was general manager of a mill in the lumber district controlled by them. He served in various executive and financial capacities with Armour & Co., and for about five years was president of the Stock Yards National Bank of Ft. Worth, Tex. Later he was associated with the Atlantic National Bank, of the city of New York.

American Car & Foundry Changes

A. E. Ostrander, mechanical engineer at the New York office of the American Car & Foundry Company, has been made general mechanical engineer of that company and will have general supervision over all mechanical matters, reporting to **J. M. Buick**, vice-president and general manager. Mr. Ostrander's promotion has made necessary a number of other changes in the engineering department, the more important of which are as follows: **H. C. Lunger** has been made assistant to the general mechanical engineer, with headquarters at New York. **Fred G. Wolf** has been made mechanical engineer with headquarters at St. Louis, Mo. **Norman Litchfield** has been made mechanical engineer, with headquarters at New York. **John G. McBride** has been made engineer of car construction, with headquarters at New York, and will report direct to the general mechanical engineer. **H. P. Field** has been made assistant engineer, with headquarters at Berwick, Pa., and will report to the engineer of car construction. **W. L. Yocum** has been appointed assistant engineer, with headquarters at Chicago. **H. D. Distelhurst** has been made assistant engineer, with headquarters at Washington.

W. H. Seiden and **J. D. Thompson** have been made assistant engineers, with headquarters at New York. **W. J. Rao**

A. E. Ostrander

has been made assistant engineer, with headquarters at St. Louis, Mo. Mr. Ostrander was born and educated in New Haven, Conn., and during his school vacations worked in various departments of the New York, New Haven & Hartford. He entered the drawing room of the New Haven in 1897 and was later employed by **Cornelius Vanderbilt** in designing cars, car trucks and other railway appliances. For a time he worked as a car designer and checker for the Standard Steel Car Company at Pittsburgh and in September, 1902, entered the service of the American Car and Foundry Company at New York and was successively employed as designer, estimator, and chief estimator. In February, 1904, he was made assistant mechanical engineer and October 1, 1915, was promoted to position of mechanical engineer of the New York office. He has been closely identified with the development of steel cars and especially steel passenger cars. Since the outbreak of the war, he has given considerable time to special work for the government and has served on the committee of engineers from car building companies that has been engaged in designing the standard freight equipment for the United States government.

Truscon Steel Company

The Trussed Concrete Steel Company, Youngstown, Ohio, announces a change in its name to the Truscon Steel Company.

Aside from this simplification of the name, there has been no change in the company, its organization, or management in any way.

The Trussed Concrete Steel Company, in its early days, devoted itself exclusively to reinforced concrete, introducing many new reinforcing products, such as the Kahn Bar, Flortystles, etc.

For many years, however, the activities of this organization have expanded far beyond the concrete field so as to include a large variety of steel products. Prominent among these might be mentioned the steel windows so widely used in building work, metal lath, pressed steel joists, all-steel buildings, inserts and other specialties.

For years the company has been generally known by the name "Truscon"—a simplified abbreviation of the longer name. For this reason "Truscon Steel Company" has been selected as the new name of the company.

Railway Steel Spring Company

The year ended December 31, 1917, was the best in the Railway Steel Spring Company's history. For the year the company's gross earnings were \$23,905,714 as compared with \$14,086,499 in 1916. The net earnings of \$4,307,800, even after the deduction of a reserve of \$3,500,000 for Federal taxes compared with \$2,710,806 in 1916. After dividends of \$945,000 were paid on the preferred stock there was available for dividends on the \$13,500,000 common stock a balance of \$3,362,860, equal to \$24.91 a share as compared with \$13.07 a share in 1916. Dividends of 5 per cent amounting to \$675,000 were paid on the common, and the surplus at the end of the year was \$8,657,801 as compared with \$5,969,941 in 1916.

The Railway Steel Spring Company is in an exceptionally strong financial position. It has kept out of war business in the past, has been conservative as to its dividends and the result is now seen in the fact that on December 31, 1917, the company's working capital amounted to \$9,313,681, as compared with \$6,735,759 in 1916 or slightly over \$4,000,000 in 1914. The declaration of 85 dividends is evidence that the policy will be continued.

F. Fitzpatrick, president of the company, in his remarks to stockholders, says in part: "Your board of directors has made a charge of \$1,000,000 for depreciation of machinery, plants and gas wells, and applied the same to operating expense. In addition, a reserve of \$1,000,000 has been made from the surplus earnings of the year for improvements, betterments and retirement of bonds. A reserve of \$3,500,000 has been made to cover Federal income and excess profit taxes. The provision for payment of these taxes is in part represented by securities purchased for that purpose and carried under stock, bonds and investments.

"The sinking fund provisions of the Latrobe plant and Inter-Ocean plant 5 per cent bonds were worked out during the year, and the trustees of the sinking fund redeemed and had cancelled \$133,000 in par value of the Latrobe and \$132,000 in par value of Inter-Ocean bonds.

"The Latrobe plant 5 per cent bonds provided for payment

of the principal on January 1, 1921, and in view of this approaching maturity and the favorable condition of your company's finances, the provision for calling of these bonds, at 105 and interest, was availed of by the company and pursuant thereto arrangements have been completed with the trustees of the mortgage for retiring them. There were outstanding on December 31, 1916, \$2,994,000 in par value of Latrobe bonds. All of these bonds have now been retired, partly by cancellation of the bonds that were purchased by the company during the year 1917 and the remainder through payment to the trustee on December 31, 1917, of the sum required for their redemption on January 1, 1918.

"Your company encountered considerable difficulty throughout the year in conducting its regular line of business, due to the restrictive market in obtaining raw materials, and to the very tense situation prevailing with the railroad transportation facilities. It has therefore been deemed advisable to carry much larger amounts of materials in the inventories than heretofore. The policy of the company to increase the capacity of the different plants has been continued. All the plants have been maintained as far as possible in the best operating condition and for this purpose much larger expenditures than usual have necessarily been made and may continue to be made during the coming year.

"The year just closed shows results to be the largest in the history of the company, and the volume of business done, especially during the last few months of the year, has been conducted under the most trying difficulties, yet it is hoped that with better market and transportation facilities the situation will improve in the near future so as to make possible a very favorable showing for the year 1918."

The balance sheet follows in brief:

| ASSETS | | |
|--|--------------|--------------|
| Plants, properties, etc. | \$29,311,122 | |
| Inventories: materials, supplies and products, finished and in process | 5,113,038 | |
| Stocks, bonds and investments | 3,553,254 | |

P. & M. Patent Claims Sustained

The United States Circuit Court of Appeals for the Seventh Circuit handed down a decision on March 9 denying the petition for rehearing filed some time ago by the Ajax Rail Anchor Company, Chicago, in the suit brought against it by the P. & M. Company, Chicago, for an infringement of the Kramer patent No. 1,014,155 by the Ajax rail anchor. The suit of the P. & M. Company versus the Ajax Rail Anchor Company has been in the courts since early in 1914. In the lower court the case went against the plaintiff but no opinion was handed down. In the Court of Appeals the decision handed down in the October, 1916, term was unanimous in favor of the P. & M. Company and Judge Mack rendered an opinion which, taken in conjunction with the opinion of the court in the suit of the Track Specialties Company versus Barnett, which was handed down at the same time, is considered to have defined the art as entirely independent from that of rail joints, tie plates or other rail fastenings. In this decision the court stated that "The fundamental features of the Kramer patent are employed in the Ajax structure in order to secure the same objects. The latter not only responds literally to the Kramer claims, but it operates on the same general principles and is essentially similar in form so far as form is material to obtain the results sought by Kramer. Transposition of parts without change of operation or function is of no importance. That the Ajax, by decreasing very considerably the amount of metal required without in any way altering the method of operation or the objects to be attained, represents a valuable improvement over Kramer, does not save it from the charge of infringement inasmuch as, despite the changes in form thereby secured, the structure is built and embodies Kramer's conception and contribution to the art."

The Bucyrus Company

According to the annual report of the Bucyrus Company, South Milwaukee, Wis., the net earnings for the year 1917 amounted to \$854,281, of which approximately 75 per cent resulted from the company's usual pre-war products, and the remainder from munitions contracts and other special contracts arising from war demands. During the year a one per cent dividend was paid quarterly on the preferred stock, or a total paid during the year in dividends of \$100,000. The earned surplus at the end of the year was approximately 30 per cent on the preferred stock issued and the cumulative unpaid dividends thereon aggregated 22 per cent after deducting the dividend payable on January 2, 1918.

A note issue of \$1,000,000 dated December 15, 1915, matured on June 15, 1917, at which time \$400,000 was paid from the cash resources of the company and the balance paid from the proceeds of a sale of a new issue of \$600,000 in one-year six per cent gold notes maturing on June 15, 1918.

Owing to the unusual cash requirements for the payment of excess profits and additional income taxes, the amount of money involved in the inventory, the approaching date of maturity of the gold note issue and the uncertainties of the coming year, the directors considered it best not to increase the dividend disbursements above the rate of four per cent per annum.

The shipments of the usual products of the company exceeded in value those of the previous year by over 60 per cent, which is accounted for in large part by the higher prices prevailing during the later period. The company's products are to a greater or less degree essential to the successful prosecution of the war, and throughout the year many machines were ordered by the United States and allied governments. The larger portion of the output of the company went into coal mining equipment, consisting of coal stripping and coal loading machines, and a smaller quantity into iron and copper mining equipment. In addition, the company has received many contracts for material used directly in the prosecution of the war.

The company entered the year 1917 with a larger volume of orders on its books than in any previous year. New orders have more than kept pace with shipments, and 1918 opens, therefore, with more orders than the beginning of last year, exclusive in each instance of special contracts for unusual products.

Foreign business in 1917 was maintained at about the same proportion to the total business of the company as in the previous year, in which the volume of foreign orders was the greatest, up to that time, in the history of the company. Shipments of excavating machinery were made to Russia, France, Colombia, Chile, Cuba, Manchuria, England, Africa, Sweden, Costa Rica, Siam, Bolivia, Australia, New Zealand, Spain and the Federated Malay States.

At the annual meeting of the company held on March 5, 1918, the retiring board of directors was reelected, and, in addition, Major F. R. Bacon, president of the Cutler Hammer Manufacturing Company, Milwaukee, Wis., and Fred Vogel, Jr., president of the Pfister & Vogel Leather Company, Milwaukee, were elected directors to fill two vacancies. The company's statement of assets and liabilities follows:

| ASSETS | | |
|--|-----------------|--|
| Cash | \$146,012.98 | |
| Payments on Liberty Bonds | 152,798.47 | |
| Accounts and Bills Receivable | 1,449,641.19 | |
| Inventories | 2,792,653.44 | |
| Land, buildings, machinery, patterns, securities, patents, etc. | 6,781,116.63 | |
| Total | \$11,322,222.71 | |
| LIABILITIES | | |
| Bills payable a/c Liberty Bonds | \$140,790.00 | |
| Other bills and accounts payable | 466,732.97 | |
| Advance payments received | 463,045.17 | |
| Preferred dividend payable January 2, 1918 | 40,000.00 | |
| Reserves | 289,999.77 | |
| Gold notes | 600,000.00 | |
| Capital stock | 8,000,000.00 | |
| Preferred (Auth. \$5,000,000.00) Issued | \$4,000,000.00 | |
| Common (Auth. \$5,000,000.00) Issued | 4,000,000.00 | |
| Surplus, as at January 1, 1917 | \$627,574.16 | |
| Net earnings for year ended December 31, 1917, after deducting costs of manufacturing, repairs, and maintenance, administration and selling; royalties, depreciation, interest, insurance and taxes (including excess profits tax) | 854,280.64 | |
| Less dividends | \$1,481,654.80 | |
| | 260,000.00 | |
| Surplus, as at December 31, 1917 | 1,321,654.80 | |
| Total | \$11,322,222.71 | |

Financial and Construction

Railway Financial News

CANADIAN PACIFIC. The annual report for the year 1917 shows gross earnings of the railway and of lake and coastal steamers amounting to \$152,389,334. Net earnings from these sources aggregated \$40,546,018; surplus, \$30,316,875. Net revenues available for dividends were \$33,848,192. After payment of all dividends, surplus from earnings was \$12,420,919. The pamphlet report itself will be published within the course of a week or two.

NEW YORK, NEW HAVEN & HARTFORD.—John Skelton Williams, director of the division of finance and purchases of the Railroad Administration, has issued the following: "Director General McAdoo authorizes me to say that newspaper reports to the effect that the Railroad Administration has stated that the New Haven's obligations of about \$45,000,000, maturing shortly, have been or would be provided for by the government, are incorrect. While it is hoped that the road may find some way to protect its obligations, no decision has as yet been reached by the government as to the extent, if any, to which it may extend aid to the system. The subject is now under consideration, and as soon as a decision is reached official announcement will be made."

OSHRK VALLEY.—Judge Dyer in the United States District Court of St. Louis has placed a valuation of \$150,000 on this road and ordered that if it has not been sold at that figure before April 22 it is to be sold at auction to the highest bidder.

PENNSYLVANIA RAILROAD.—The stockholders of this company at their seventy-first annual meeting on March 12, approved an increase of \$75,000,000 in the indebtedness of the company, in accordance with the management's proposal providing for capital requirements, including maturing obligations. Concerning this sum, which is to be raised by this issuance of bonds and other obligations of the company, Samuel Rea, who was re-elected president, said: "In a large and growing corporation like the Pennsylvania Railroad there is a constant demand for funds with which to serve the government with the utmost efficiency. These funds will be required for new equipment and enlargement of freight handling facilities."

The shareholders ratified the acquisition by the Pennsylvania of the properties and franchises of the Cornwall & Lebanon and the Susquehanna, Bloomburg & Berwick railroads. After these matters were settled the chairman was authorized to appoint a committee of seven stockholders to nominate candidates for four directors to be elected on March 26.

A resolution offered by John Gribbel was adopted authorizing the directors and officers to execute for the company an agreement with the President of the United States to secure compensation for use of the railroad properties during their control by the government.

Railway Construction

ARCADE & ATTICA.—This company will build an engine-house at Arcade, N. Y., to be of cement block construction, 60 ft. wide and 75 ft. long.

FLORIDA EAST COAST.—This company is building a paint shop at St. Augustine, Fla., to cost about \$15,000. The structure is to have wood frame with slate roof and will be one story high, 88 ft. wide and 100 ft. long. The work is being carried out by company forces.

MAGDALEN RIVER.—The Quebec legislature has granted an extension of time in which to build this projected line along the Magdalen river valley to Little Falls, and has authorized the construction of a line from that point south and west, to connect with the Atlantic, Quebec & Western and the Canadian & Gulf Terminal, at Gaspe, or at some other point on either of these roads, also to build wharves, docks and deep water terminals at Gaspe. F. Murphy, secretary, New Carlisle, Que.

Railway Officers

Executive, Financial, Legal and Accounting

L. B. Butts, auditor of miscellaneous receipts of the Illinois Central, with office at Chicago, has been appointed auditor of station accounts, succeeding **C. C. Whitney**, who succeeds Mr. Butts.

G. H. Parker, assistant to vice-president of the Delaware & Hudson, with office at New York, has been appointed assistant controller of the Philadelphia & Reading with headquarters at Philadelphia, Pa.

The New Mexico Central was bought from the receivers on February 14, and a new company organized with the following officers: **S. C. Munos**, president; **A. F. Mack**, vice-president; **F. L. Watson**, treasurer; **F. A. Wagner**, general counsel, all with offices at New York. **R. C. TenEyck**, vice-president and general manager; **C. A. Richardson**, traffic manager and assistant treasurer, and **D. C. Collier**, general agent, all with offices at Santa Fe, New Mexico.

Operating

J. B. Wilson has been appointed trainmaster of the San Joaquin division of the Southern Pacific, with headquarters at Bakersfield, Cal., vice **D. S. Weir**, promoted.

R. M. Seale was appointed superintendent of car service of the Texas & Pacific effective March 5, with headquarters at Dallas, Texas, succeeding **R. E. Clarke**, who has entered government service.

L. M. Betts, having been granted leave of absence to enter the service of the regional director, **F. A. Spink**, on February 15, assumed charge of the office of the car accountant in addition to his duties as traffic manager of the Belt Railway Company of Chicago.

C. D. Bovard, acting assistant superintendent of the Canadian Government Railways, with office at Campbellton, N. B., has been appointed acting assistant superintendent, with office at Moncton; and **J. H. Wilson**, has been appointed acting assistant superintendent, with office at Campbellton, succeeding Mr. Bovard.

J. D. Clarke, chief clerk in the operating department of the Baltimore & Ohio, has been promoted to assistant superintendent of transportation, with headquarters at Baltimore, Md. **W. G. Curren**, superintendent of transportation, has been granted a furlough to serve in the office of **A. H. Smith**, regional director of eastern railroads, New York City.

M. C. Blanchard, district engineer of the Atchison, Topeka & Santa Fe, at Topeka, Kan., has been appointed division superintendent, with headquarters at Marceline, Mo., succeeding **R. H. Allison**, who has been transferred to the Illinois division, with headquarters at Chillicothe, Ill. to succeed **G. E. Ayer**, who has resigned to engage in other business.

J. E. O'Brien, superintendent of the Wilmar division of the Great Northern, was transferred to the Dakota division with office at Grand Forks, N. D., succeeding **R. A. McCandless**, effective March 15. **C. E. McLaughlin**, superintendent of the Minot division, was transferred to the Wilmar division with headquarters at Wilmar, Minn., succeeding **J. E. O'Brien**, transferred. **R. A. McCandless**, superintendent of the Dakota division, was transferred to the Minot division with headquarters at Minot, N. D., succeeding **C. E. McLaughlin**, transferred.

F. L. Richards, assistant superintendent of the Chicago, Milwaukee & St. Paul, with headquarters at Sioux City, Iowa, was promoted to superintendent of the Sioux City and Dakota division, with same headquarters succeeding **L. B. Beardsley**, who was appointed assistant superintendent of the same division, succeeding Mr. Richards, effective March 10. **L. A. Turner**, was appointed trainmaster of the Iowa division

with headquarters at Marion, Iowa, succeeding B. F. Hoehn, promoted to superintendent of the Milwaukee terminals, succeeding W. B. Hinrichs, who was appointed stationmaster at Milwaukee, Wis., succeeding C. W. Mitchell, transferred, effective March 1. D. W. Kelly, has been appointed trainmaster of the Superior division with headquarters at Green Bay, Wis., succeeding H. M. Gillick, transferred to the Hastings and Dakota division, with headquarters at Aberdeen, S. D., succeeding M. J. Flanagan, promoted to superintendent of the Dubuque division, effective March 1. W. F. Ingraham, was appointed trainmaster of the Sioux City and Dakota division, with headquarters at Sioux City, Iowa, succeeding C. H. Buford, who was transferred to the LaCrosse division, effective March 1. J. C. Hoffer and F. A. Miller were appointed assistant trainmasters of the Chicago Terminals, the latter succeeding B. G. Dolan, transferred, effective March 10.

Henry Douglas Pollard, whose appointment as assistant general manager of the Central of Georgia, with headquarters at Savannah, Ga., has already been announced in these columns, was born in October, 1872, at Aylett, Va. He was educated in the public schools and at Aberdeen Academy; he also took short courses at the University of Virginia, and at Drexel Institute, Philadelphia, Pa. In 1891, he began railway work as a rodman on construction work with the Baltimore & Ohio, and in 1893, he was appointed assistant resident engineer of construction, at Wellsville, Ohio, on the Ohio Southern, now a part of the Detroit, Toledo & Ironton. From 1894, to 1898, he was assistant engineer maintenance of way on the Philadelphia division of the Baltimore & Ohio; the following year he served as transitman on the Central of Georgia. In 1900, he was appointed resident engineer of construction, and subsequently served consecutively as supervisor of track, trainmaster, roadmaster and from June, 1905, to 1910, as superintendent at Macon, Ga., on the same road. He was appointed assistant superintendent of the Sorocabana Railway, at San Paulo, Brazil in 1911, and later, was inspector general of the Campana Auxiliaria, at Santa Maria and Porto Alegre, Brazil. In 1913 he returned to the service of the Central of Georgia as valuation engineer and two years later was elected president of the Wrightsville & Tennille, with headquarters at Tennille, Ga., which position he held until his recent appointment as assistant general manager of the Central of Georgia as above noted.

H. D. Pollard

Traffic

J. V. Gilmour, advertising agent of the Chicago & Eastern Illinois, with headquarters at Chicago, has resigned to engage in other business.

R. W. Smock has been appointed general agent of the Los Angeles & Salt Lake with office at Pasadena, Cal., succeeding Russell Ball resigned to go into other business.

F. J. Burke, assistant general freight agent of the Texas & Pacific, with headquarters at New Orleans, La., will, in addition to his other duties, have charge of industrial development of the property.

John Fairman has been appointed, pro tem., general passenger and freight agent in America of the London & North Western Railway of England, with office at New York, succeeding A. G. Wand, who has relinquished active service.

T. P. Hinchcliff was appointed general agent of the Chicago, Burlington & Quincy, at Detroit, Mich., succeeding E. T.

Swan, resigned, effective March 1. G. A. Shields, traveling freight agent, with headquarters at Burlington, Ia., has been appointed acting division freight and passenger agent, at Quincy, Ill., succeeding Frank A. Hart, temporarily assigned to the staff of the regional director at Chicago.

Engineering and Rolling Stock

T. W. McBeath, traveling fireman of the Canadian Government Railways, with office at Moncton, N. B., has been appointed master mechanic, with headquarters at Moncton.

W. A. Guild, division engineer of the Atchison, Topeka & Santa Fe, with headquarters at Chillicothe, Ill., has been promoted to district engineer, with headquarters at Topeka, Kan., succeeding M. C. Blanchard, promoted.

A. Leckie, division engineer of the Kansas City Southern, with office at Kansas City, Mo., has been appointed division engineer of the Southern division, with headquarters at Texarkana, Texas, vice R. H. Gains resigned to accept service with another company; and W. J. Lank has been appointed division engineer of the Kansas City Terminal division, with headquarters at Kansas City, Mo., vice Mr. Leckie.

W. F. Ackerman, shop superintendent of the Chicago, Burlington & Quincy, at Havelock, Neb., was appointed acting superintendent of motive power of the lines west of the Missouri river, succeeding T. Roope, granted leave of absence, effective March 1. E. G. Johnson, general master mechanic, with headquarters at Lincoln, Neb., has been appointed assistant superintendent of motive power, with the same headquarters, and his former position has been abolished.

Purchasing

W. F. Wright has been appointed assistant to the purchasing agent of the Louisiana & Arkansas, with office at Texarkana, Ark.

Obituary

Joseph Smith Leeds, manager of the Santa Fe Refrigerator Despatch Company, died in Chicago on March 12.

H. M. Hollister, who retired as treasurer of the Fairbanks, Morse & Co., Chicago, three years ago, died March 5, in that city, at the age of 80 years.

H. D. Teed, superintendent of telegraph of the St. Louis-San Francisco, with headquarters at Springfield, Mo., died at his home at St. Louis, on March 8, age 45 years.

Jacob W. Miller, formerly second vice-president and general manager of the New England Navigation Company, died on March 8, at his home in New York City. He was born in June, 1847, at Morristown, N. Y., and graduated from the United States Naval Academy at Annapolis, Md., in 1867. From 1882 to 1886 he was vice-president and general manager of the St. Louis, Fort Scott & Wichita Railroad, now a part of the Missouri Pacific. He subsequently served as general manager of the New York, Providence & Boston Railroad and the Providence & Stonington Steamship Company. From April, 1892, to the following August he was second vice-president of the New York, New Haven & Hartford, and later served as second vice-president and general manager of the New England Navigation Company and other steamship lines controlled by the New Haven. He resigned from the steamship service to become the executive head of the Cape Cod Canal Construction Company when the construction of the canal was begun in 1909.

A DOMINICAN RAILWAY INCREASES ITS RATES.—The Samana & Santiago Railway, which runs from the port of Sanchez, on the Bay of Samana, to the towns of La Vega, Salcedo, Pimentel, Moca, and San Francisco de Macoris, in the cacao-growing region of the Dominican Republic, has announced an increase in its tariff on both freight and passengers, effective February 4. The reason given for the raise is the extraordinary cost of all materials required for the upkeep of its property.—*Commerce Reports.*

EDITORIAL

Railway Age

EDITORIAL

DAILY EDITION

The government is devoting considerable attention at the present time to the standardization of equipment for use on the railways under government control. At present efforts to standardize equipment are being directed towards new motive power and rolling stock. Within certain limits

The Associations and Standardization

standardization of equipment and materials is desirable, but it can be carried to such a point that efficiency is materially reduced. It can also be carried to such a point that modernized ideas and new devices of merit will be eliminated without a trial. When standardization approaches this point its power for harm is greater than that for good. Through such organizations as the R. S. A. and the A. R. E. A. standardization is proceeding along the proper lines. Designs of material for adoption are submitted to the associations only after careful and thorough investigation and study has been made by committees working in conjunction with the manufacturers. By this method new devices may be submitted and tried out and those having merit can be substituted for or adopted in place of existing standards. Along these lines standardization is progressive, not retrogressive. The associations are doing good work and all members should see that standardization proceeds along right lines.

On another page is an article describing the activities of the various members of the Railway Signal Association

R. S. A. Members in Military Service

who are now serving in a military capacity. An effort has been made to present as accurate a list of men now in service as it was possible to obtain from the records. It is to be hoped that all members knowing of others who are in the service or who may enter the service in the future make it a point to notify the secretary of the Association in order that the R. S. A. Roll of Honor may be kept complete and up-to-date.

The association can look with pride upon its members who have already entered military service. It goes without saying that these men will live up to the high reputation which railway men from this continent have already earned in the present war. A number of the members have been drafted into the government service, but a greater number have volunteered and been assigned to special regiments, for which duty their special technical and practical experiences especially fits them. To date about 30 members have entered government service and several of this number are already in active duty "over there."

Each member of the Railway Signal Association who is in the army should be represented by a star in a service flag, which should be displayed at future meetings. This method of evidencing patriotism has been adopted by almost all organizations as a constant reminder of absent members who are fighting for liberty. An R. S. A. service flag would also be a reminder for those who stay at home that they have an equally patriotic duty to perform in keeping the transportation facilities of our country

operating with the highest degree of efficiency. The men who have given up their civil life to do the actual fighting should have our support at all times—let us get behind them.

It is to be noted with satisfaction that there continues to be a good attendance of signal men at the regional committee meetings of the Railway Signal Association. Through the activity of these committees the work of the Association is not confined to certain parts of the country, but

Regional Committee Meetings

covers all sections, and a large number of the younger men engaged in signal work have an opportunity to attend such meetings when they are unable to attend the stated meetings. The information obtained at such meetings is always of a constructive nature and, as the younger men are encouraged to take part in the discussion of matters before these meetings, their interest in the Association is not only increased, but their work also has an added interest for them. For the meetings to be of the greatest value, the regional chairmen should arrange a program in advance that will be of general interest to the signal men in their vicinities. These meetings should of necessity be arranged far enough in advance that proper notice may be sent to the men interested. Knowing the subject to be discussed, the men attending these meetings will make a study of conditions that affect their work and be in a position to take an active part in any discussion. It is to be hoped that signal officers will recognize the good being done by the regional committee meetings by encouraging their men to attend whenever it is at all possible, for these regional committees will naturally have a very important part to play in the advancement of good signaling practice.

One year ago this month the outlook for a signal convention was decidedly bad. Just prior to the time of the

The R. S. A. and Existing Conditions

convention a strike of the train service employees of the railways was threatening which would have rendered it impracticable to hold either the R. S. A. or the A. R. E. A. conventions. The crisis was ended when the Conference Committee of the railways gave full authority to the government mediators to settle the controversy. As a consequence the attendance the first day or so was small compared to the attendance when normal conditions prevail, although considering the circumstances the attendance was much better than was expected. Many events have transpired during the last 12 months which have been of very great importance not only to the country as a whole but to the railways as well. The two outstanding events of this period are the entrance of the United States into the world war and the assumption of control of the railway systems of the country by the Government. On the assumption of government control con-

ditions from a railroad officer's standpoint, were naturally confusing. With this condition of affairs existing there was doubt as to whether the various railroad organizations should proceed with their plans for holding the conventions as scheduled before this action. The association has accomplished excellent results heretofore in connection with matters relating to the signal field and considering the important part signals play in the movement of traffic it is essential and fitting that the R. S. A. should continue its good work. If ever there was a time when all members should get behind the Association and boost the good work, that time is the present.

A Fine Display of Courage and Enterprise

THE MEMBERS OF THE AMERICAN RAILWAY ENGINEERING ASSOCIATION, the Railway Signal Association and the National Railway Appliances Association deserve the warmest commendation for having had the intelligence and the courage to hold their conventions and exhibit as usual this spring.

The *Railway Age* is not among those publications that have contended for "business as usual" during the war. "Business as usual," as that phrase has been generally employed, means conducting as usual those businesses which are not essential to carrying on the war, as well as those which are. This is impossible; and it would be undesirable if it were possible. The main business of the nation as long as the war lasts will be that of conducting the war; and during this time every other consideration and object must be subordinated to the object of triumphing over the nation's enemies. Any business the conducting of which "as usual" will not contribute toward winning the war must be put on an entirely new basis.

But the railroad business is not one of those which are not essential in time of war. On the contrary, it is of all industries the one whose efficient management is the most essential to the winning of the war. Since this is the case, it follows that nothing which has been done in the past to maintain and increase the efficiency of the railways should now be discontinued, and that everything new which can be done to maintain and increase their efficiency should now be done.

The conventions of the various railway associations have been held, and the various exhibits of railway equipment and appliances have been given in the past, upon the assumption that the full discussion by railway men, from all over their country, of problems common to them, and the inspection by them of the improved and new devices brought forward by the various railway equipment and supply companies, would tend to maintain and increase the efficiency of the railways. Has that assumption been false or true? If it has been false, then railway conventions should not have been held or exhibits given when the railways were under private control, and the railway men and railway supply men have hypocritically or foolishly wasted their time and their companies' money on them. On the other hand, if the conventions and exhibits did increase efficiency under private control, they will do so under government control, and it would be hypocritical or foolish to discontinue holding them under government control.

Indeed, if there was good reason for having them under private control, there is even more reason for having them under government control; for there is greater need for the utmost efficiency than there ever was before; and since the railways are being operated as a

single system it is more than ever the duty of railway officers freely to exchange views and information which will be of use to all of them in their work.

That the conventions and exhibits of the various associations in the past have contributed toward increasing the physical and operating efficiency of American railways the *Railway Age* has not the slightest doubt; yet since this country entered the war, and especially since government control was adopted, many conventions and exhibits have been discontinued. We believe that most of the organizations which have adopted this policy have taken counsel of timidity, rather than of courage and good judgment. The Railroad Administration has never issued an order or a statement, nor given any intimation of its views, so far as we know, tending to discourage conventions and exhibits.

Whatever others may have done, the Railway Engineering Association, the Railway Signal Association and the National Railway Appliances Association, being sure that their conventions and exhibit are legitimate and helpful activities, have gone ahead and arranged to hold them this year as usual. It required much courage to do this. The final decision had to be made some months ago, in the midst of a winter of such terrible severity, and a demoralization of transportation so unprecedented, that they might have shaken the stoutest hearts.

The *Railway Age* congratulates the officers of these associations on the sound judgment and great courage they have shown. And now that the convention and exhibit are being held, let all make the very most of them.

We venture especially to urge upon all railway officers that it is not only their opportunity, but their peculiar duty, this year to visit the exhibit as often and study it as much as they can. In the first place, the railway supply companies have shown wonderful enterprise and courage in preparing such an exhibit as they have under the conditions that have existed; and it would be positively mean for railway officers not to show their appreciation of what they have done. In the second place, because of the labor situation, there never in history was such acute need for railway engineering and maintenance of way officers to inform themselves regarding the efficiency-producing devices which the railway supply craft is offering to them.

The associations have done well in deciding to carry on business "as usual" this spring. Let those attending so do their work that when the week is ended they can look back upon it as the most useful week's work for the railways of America, and the people of America, that they have ever done!

The Influence of Passing Sidings on Track Capacity

ONE OF THE SUBJECTS ASSIGNED to Committee 10—Signaling Practice, was to report on the problem of signaling single track roads with reference to the effect of signaling and the proper location of passing sidings on the capacity of the line. Part of the work done in this connection has been to apply and test formulae and methods on sections of roads.

In this connection an analysis of the effect of passing track locations on an 88-mile section of line was presented. This particular piece of line is used exclusively for freight service and has no large yards or junction points. The running time of the trains as presented in parts of the report was obtained by computation from the tractive efforts of the locomotives in use with their full theoretical tonnage for ruling grades. As more uni-

form results are obtained than would be possible by taking actual figures from riding trains unless the average of a large number were obtained, an analysis was made, using all the present passing tracks with their present capacity and a schedule worked out graphically showing existing conditions. The minimum time between trains was found by ascertaining the maximum sum of the schedules between passing sidings. It was found that, in using all the present passing tracks, cases existed where they were so close together that the delayed time was large. Furthermore, certain of these tracks could be eliminated, and the minimum time between trains could still be maintained, with a decrease in the delayed time to southward trains waiting at meeting points. Another schedule was also worked out showing the proposed rearrangement of passing sidings in order to obtain the maximum capacity of the line. In this rearrangement it was proposed that certain existing tracks be extended to 100 cars capacity, these extensions to be in the direction which would give the best balance of time, taking into consideration curves, grades, highway crossings, etc.

In connection with this study the assumption was made that when a track is operating at full capacity each train will meet an opposing train at each passing siding. A comparison between the present and the proposed methods shows that the theoretical capacity in trains per day under present methods would be 27 on a basis of 100 per cent, and that, under proposed methods, this could be increased to 45 or 167 per cent and that the theoretical capacity measured in freight cars per day under the present arrangement was 1,863 on the basis of 100 per cent while that under the proposed method would be 4,500 or 242 per cent. The analysis made by this committee shows what a decided effect the proper location of passing sidings has upon the capacity of a main track. At the present time this subject is worthy of the most careful consideration by operating officers and where it is found that a material increase can be effected the necessary steps should be taken to increase the track capacity. The indications are that little trouble will be experienced by the railroad officers in getting the necessary money from the government to carry out betterments of this character.

The R. S. A. Registration

THE ATTENDANCE AT THE Railway Signal Association meeting far exceeded the expectations of the most optimistic members. It was thought that the conditions on the railways of the country might be of such seriousness as to prevent the officers and employees from attending the convention in as great numbers as they have in the past. The registration yesterday showed that there were 61 associate, 14 junior and 123 active members in attendance, or a total of 198 members. In addition there were 14 visitors present, making a total attendance of 212.

Of the active members attending the meeting last year, 17 came from points east of Buffalo and Pittsburgh, while the registration this year showed that 39 active members came from the same section. These figures show that the members are taking an active interest in the work of the Association at a most favorable time and are entering into discussions which are of especial interest.

Early in the year it was thought by some that the Association should cancel its meetings while present conditions continued to exist. That this would have been unwise was amply demonstrated by the work of Committee X—Signaling Practice, with especial reference to

the study made by this committee on the relocation of passing sidings to increased track capacity.

This committee has demonstrated that by the proper relocation of passing sidings on unsignaled lines, track capacity can be increased as much as 65 per cent. Another signal engineer was able to demonstrate that, with the proper relocation of passing sidings, it was unnecessary to build a cut-off that was thought necessary.

By work such as this the Signal Association is performing a very great service to the roads when increased track capacity at the present time is of such great importance.

Tickets for the Annual Dinner

Tickets for the annual dinner which will be termed a "War-Fare" dinner, will be placed on sale in the corridor outside of the Convention hall at twelve o'clock this noon. The dinner will be held as usual in the Gold Room of the Congress Hotel on Wednesday evening. The speakers will include Sir Edmund Walker, president of the Canadian Bank of Commerce, Toronto, who will speak on "Canada's Part in the War"; Edward N. Kelsey, governor of the International Association of Rotary Clubs, whose topic will be "Good Fellowship," and Rev. Stephen K. Mahon, the title of whose address will be "Unsolved Problems." It had been hoped that William G. McAdoo, director-general of railways, would be present, but he was forced to decline the invitation owing to the pressure of his duties.

The A. R. E. A. Convention Program

The American Railway Engineering Association will assemble in the Florentine Room of the Congress Hotel for its 19th annual convention at ten o'clock this morning. Following the address of the president and the presentation of the reports of the secretary-treasurer, the reports of the standing and special committees will be taken up in the following order:

Tuesday, March 19—

- Signals and Interlocking.
- Conservation of Natural Resources.
- Buildings.
- Track.
- Water Service.
- Records and Accounts.

Wednesday, March 20—

- Electricity.
- Yards and Terminals.
- Economics of Railway Labor. Illustrated use of labor-saving devices.
- Ballast. Illustrated use of mechanical tampers.
- Economics of Railway Operation.
- Uniform General Contract Forms.
- Roadway.

Thursday, March 21—

- Iron and Steel Structures.
- Wooden Bridges and Trestles.
- Masonry.
- Ties.
- Stresses in Railroad Track.
- Rail.
- Signs, Fences and Crossings.
- Rules and Organization.
- Wood Preservation.

It is planned to devote most of Wednesday to the consideration of the report of the Committee on Economics of Railway Labor and to other phases of the labor problem.

The R. S. A. Stated Meeting in Session

Railway Signal Association Stated Meeting

Complete Abstracts of Reports of the Committees Presented
at Monday's Sessions With Discussions

THE MARCH STATED MEETING of the Railway Signal Association was held in the Auditorium Hotel, Chicago, on Monday, March 18. The morning session was called to order at 9:45 by President W. N. Elliott, signal engineer, New York Central Lines East, and adjourned at 12:45 p. m. The meeting reconvened at 2:15 and continued until 4:30 p. m.

After the meeting was called to order Mr. Elliott announced the death on February 2 of Charles C. Rosenberg, secretary-treasurer, and expressed briefly the esteem in which Mr. Rosenberg was held by the association.

To enable all who desired to express their appreciation of the association's and the individual members' loss in Mr. Rosenberg's death, the President announced a memorial service would be held as near three o'clock as possible. During this service resolutions were presented by F. P. Patenall, signal engineer of the B. & O., as follows:

WHEREAS, Almighty God, in the exercise of His divine will, has removed from this world and from our midst our late secretary-treasurer, C. C. Rosenberg, and

WHEREAS, It is but just that a fitting recognition of Mr. Rosenberg's many virtues should be had; therefore we, members of the Railway Signal Association, have paused in our labors to pay our last sad tribute to his memory, and to express our deep appreciation of the many and lasting obligations that we

as members and friends owe to him, and by words and outward tokens, to express our sorrow for the irreparable loss our association has sustained by his death.

THEREFORE, BE IT RESOLVED, That in the death of C. C. Rosenberg, this association laments the loss of an efficient officer, and a man whose utmost endeavors were exerted for its welfare and prosperity; a friend and companion who was dear to us all; a citizen whose upright and noble life was a standard of emulation to those about him.

RESOLVED, That the heartfelt sympathy of the members of this Association be extended to his sorrowing family in their affliction.

RESOLVED, That these resolutions be spread upon the records of the Association, and an engrossed copy thereof be sent to the family of the departed.

On motion, duly seconded and carried, the resolutions were unanimously adopted.

In order to carry on the work of the secretary-treasurer, the Board of Direction at its meeting on February 17 last elected H. S. Balliet, assistant terminal manager, Grand Central Terminal, as assistant secretary-treasurer to serve until the next annual

meeting, with full authority to perform the duties of treasurer, as specified in the constitution. Mr. Balliet has been performing these duties since that time. The Board has now elected Mr. Balliet secretary-treasurer to serve until the next annual meeting.

W. H. Elliott,
President

At the morning session before the committees submitted their reports the president introduced Frank Rhea of the Department of Commerce, Washington, D. C., who gave a brief talk on trade opportunities in foreign countries. His address appears elsewhere in this issue.

The proceedings of the convention were interrupted during the morning session while James A. Davis of the War Savings Committee for Cook County gave a brief talk on "Stimulating an appreciation of the principles of the Association as to the advantages to accrue through thrift, as well as the patriotic motive in helping raise funds with which to win the war."

Frank Rhea Speaks on Trade Opportunities

AT THE OPENING OF YESTERDAY'S session of the Railway Signal Association Frank Rhea, of the United States Department of Commerce, spoke on Trade Opportunities in the Far East. Mr. Rhea, who is a member of the Railway Signal Association and also of the American Railway Engineering Association, was formerly connected with the Interstate Commerce Commission, resigning over a year ago to accept an assignment with the Department of Commerce to investigate the markets for railway supplies in Australia and Asia. Mr. Rhea has just returned from a year in those countries and is now engaged in the preparation of his report. In discussing his observations yesterday morning Mr. Rhea spoke in part as follows:

"I have just returned from the far East and am now engaged in making up my report. I spent one month in New Zealand, four months in Australia, and seven months in China, Japan and Manchuria. The object of the trip was to investigate the markets for those classes of railway materials, equipment and supplies, which could be furnished by our American manufacturers. In New Zealand and Australia I saw little in the way of railway signals which we could incorporate to advantage in our American practice. In New Zealand, Mr. Wynne, the signal engineer, has worked out the best arrangement of a pick-up and discharge of tyre tablets which I have ever seen. I watched it working a great many times with trains moving at speeds of about 30 miles an hour and never saw a single failure.

"In New Zealand and Australia the general arrangement of signalling in the past has followed the British Board of Trade methods. In Australia, however, they are adopting three speed three position American signaling very rapidly, this already having occurred to a considerable extent in South Australia and Victoria, and to some extent in New South Wales and Queensland, while it will undoubtedly be adopted in Western Australia.

"One very excellent arrangement which I investigated was installation of selective telephones for train running, under an arrangement which they call "central control" and continue to use all the other staff apparatus. This arrangement was giving excellent results and it is probable that this scheme goes about as far in expediting the traffic as practical, while still retaining all the features of complete safety of operation. The British railroad man looks with suspicion on the word "despatching." In fact, to him the despatching method of running trains is synon-

The secretary made the request that the regional committees send in their reports for the next meeting before June 1.

Committee XIII on Electrical Testing presented a drawing covering an adjustable resistance which gave rise to spirited discussion. While some of the members wished to have this drawing accepted for submission at the annual meeting, feeling that while the resistance would not meet all conditions it was a step in the right direction and improvements could be made later as found necessary. The majority voted not to consider it for presentation to the annual convention.

Frank Rhea

ymous with careless train running. Therefore, in referring to this method I found it better to use the word "central control" instead of telephone despatching.

The labor situation in Australia probably deserves all that has ever been said of it, but the conditions are strikingly different from those with which we are familiar in America, in that the common labor is the organization which entirely dominates the situation, rather than the skilled and more highly paid trades. The railways are manufacturing many of the requirements in their own shops, at times doing this at a higher cost than that for which they could be purchased, but doing so for the reason that labor demands employment. The organizations of the railways are more highly departmental than anything we have in the United States. In fact, this is so much so that I have termed it the branch method of organization, the cleavage between the branches being very distinct, and extending in every instance to the administrative head of the department. The method of train operation is what I have termed the "station master method." By this I mean that instead of despatching methods of running trains, the trains are controlled and directed by the station master at each station as they proceed over the line. This method is no doubt necessary in such countries as China and Japan, but is not as expeditious an arrangement as the one above described under central control, or as our despatching methods.

In China and Japan the railways are organized and operated much along the same methods as in Australia, except that the station master method is much more of a necessity on account of the class of help employed by the railroads. The Japanese railways are all government owned and are exceedingly interesting instances of the results of government ownership. The South Manchurian railway, which is actually owned by the Japanese government and administered by the colonial department, is probably one of the most successful cases of government ownership in the world today. The employees of the Japanese railways, however, are not all intent on purposes of a military organization. Every employee is ranked and graded, and every official is in uniform, even to the extent of carrying a small sword. We have heard a great deal about the aggressiveness of the Japanese, but if their position is to be understood one has to take into account the fact that they have an inadequate supply of steel and fuel and that their anxiety to secure control of

adequate supplies is one of the reasons why they are attempting to secure these supplies from China. The Chinese railways are operated under the same scheme of organization. There is no doubt that China is one of the best examples in the world today that trade follows investment. The financial control of the Chinese railways has in the past very largely determined the awarding of the business. In my report I expect to make certain suggestions regarding the refunding of certain of the Chinese railway obligations. This suggestion is made for the reason that the Chinese railways today are earning good returns on the investment, and there is no doubt that additional railways can be built and earn handsome returns in the future.

In Australia the American signalling concerns have representatives on the ground who are looking after the business in a very satisfactory manner, and it is probably

about as well taken care of as any other branch of the railway market.

I would like to call attention to two points which I consider important in the handling of foreign business. One is the necessity of sending either seasoned, experienced men, or younger men if they are of good material, but it should be understood that they should go under contract for very considerable periods, at least for five years, and preferably for ten years. The other point is the necessity of American concerns protecting their interests by taking out patents in Japan. The issuing of patents in Japan is done in accordance with the international agreement on patent laws. While American concerns may do very little business in the future in Japan, in my opinion it is necessary to protect American interests in competitive territory by devices which may be made in Japan in case the patent situation is not protected.

Report of Committee VII—Direct Current Relays

THE COMMITTEE submitted reports on the following subjects:

1. Recommended resistance of track relay.

2. Table showing minimum resistance allowable in series with track battery for track circuits.

The committee presented the following statements on which it based its conclusion relative to the use of the 2-ohm vs. the 4-ohm relay:

1. Because of its lower operating voltage, the 2-ohm relay will operate with a lower ballast resistance.

2. The 2-ohm relay is less susceptible to leakage current from adjacent battery entering track circuit through insulated joints.

3. The energy consumption for the 2-ohm relay on equal track circuits is approximately fifty per cent less when the track is occupied. When the track is not occupied the energy consumption will be less when the ballast resistance is less than five ohms per thousand feet.

4. The length of track circuit may be increased with the use of the 2-ohm relay if no foreign current is present and the resistance between the battery and track is not less than the recommended limiting resistance.

5. On track circuits of equal length the 2-ohm relay gives equally as good protection against broken rail where no foreign current is present.

6. On track circuits of equal length, the 2-ohm relay will release with a higher shunting resistance across the rails when foreign current entering the track circuit is less than .350 amperes.

7. Considering track circuits of equal length and with other conditions equal, no definite recommendations can be made in favor of either the 2-ohm or the 4-ohm relay where foreign current is present, on account of there being conditions where each has its advantages over the other.

8. With a foreign current present, the 2-ohm relay on a track circuit of its maximum operable length will receive more combined foreign and track battery current than will be received by a 4-ohm relay on a track circuit of its maximum operable length.

9. When a battery lead or a rail is broken and the

track circuit between the break and the relay is shunted, the 2-ohm relay will be more susceptible to foreign current than the 4-ohm relay. With the track circuit not shunted, the 2-ohm relay will be more readily picked up by foreign current only when the current enters the track circuit through a resistance less than 5 ohms.

In view of the above statements, the committee recommended the use of the 2-ohm relay with caustic soda battery, provided the recommended limiting resistance is used in series with the battery. The recommended limiting resistance should also be used in series with the battery wherever the 4-ohm relay is used with caustic soda battery.

It was recommended that the above statements be accepted for presentation to the Annual Convention for approval and submission to letter ballot for insertion in the Manual.

Table of Minimum Resistance Allowable in Series with Track Battery

The committee recommended that the past practice of using a battery of three gravity cells in multiple (without added external resistance) and a 4-ohm relay be adopted as a basis of a standard in determining the limiting or external resistance for use in connection with track circuit operation.

The following table is computed on the above assumption and covers batteries containing every known type of primary or storage cells.

| Battery Voltage Limits. | | Minimum Resistance between Battery and Track Ohm. |
|-------------------------|--------------|---|
| 4-ohm Relay. | 2-ohm Relay. | |
| 37-.51 | 19-.35 | .1 |
| 52-.76 | 36-.52 | .2 |
| 77-1.01 | 53-.69 | .3 |
| 102-1.26 | 70-.86 | .4 |
| 127-1.51 | 87-1.03 | .5 |
| 152-1.77 | 104-1.21 | .6 |
| 178-2.02 | 122-1.38 | .7 |
| 204-2.27 | 139-1.55 | .8 |
| 228-2.52 | 156-1.72 | .9 |
| 253-2.77 | 173-1.89 | 1.0 |
| 278-3.02 | 190-2.06 | 1.1 |
| 303-3.27 | 207-2.24 | 1.2 |
| 328-3.52 | 225-2.41 | 1.3 |

The voltage given in the table refers to the maximum operating voltage of the track circuit battery when the current from the battery is the minimum possible with a .06 ohm train shunt, with the recommended resistance between battery and track, and with assumed adverse operating conditions. This operating voltage can be determined for a battery of any type, number and arrangement of cells, by measuring at 21 degrees C. (70 Fahr.) the voltage of the whole battery when its discharge is

25 amperes, if 4 ohm relays are to be used, or 1.7 amperes, if 2-ohm relays are to be used.

It was recommended that this table be accepted for presentation to the Annual Convention for approval and submission to letter ballot for insertion in the Manual.

Committee: E. G. Stradling (C. I. & L.), chairman; James Anderson (N. Y. C.), vice-chairman; F. F. Ambach (B. & O. S. W.), B. H. Ayers (I. & N.), C. W. Burrows, D. M. Case (Southern), A. R. Fugina (L. & N.), E. W. Kolb (B. R. & P.), H. W. Lewis (L. A.), A. F. Pratt (Frie), C. A. Veale (S. P. Co.).

Discussion

E. G. Stradling (chairman): The first half of the report on relays is presented for discussion, not for motion.

E. G. Hawkins (N. Y. C.): Does section 3 of the report refer to equal track circuits?

Mr. Stradling: If we had them equal, we would have to have all track conditions equal.

Mr. Hawkins: It refers to power rather than current?

Mr. Stradling: No, more to current. To effect saving on your batteries is the idea.

T. S. Stevens (A. T. & S. F.): Referring to paragraph six, does that mean the current measured between its possible source and the track, or across the rails?

Mr. Stradling: Across the rails. I would like to make a motion that the Association approve the use of the two-ohm relay with a caustic soda battery, this motion to be submitted to a letter ballot.

Mr. Hawkins: Referring back to number three, if all things were equal, you would think with the circuit occupied, the consumption of the current would be the same.

Mr. Stradling: With your two-ohm relay you can put more resistance in the consumption of your batteries, which will choke back the flow of the current.

A. R. Fugina (L. & N.): As to the matter of determining what the ballast resistance is of your track circuit, that can be done by taking your R. S. A. formulas, that have been developed by the Committee on Testing, and finding what the balance of resistance is.

F. B. Wiegand: I would like to ask the committee if they recommend track circuits of equal length or greater length when using two-ohm relays?

Mr. Stradling: Equal with the four-ohm relay.

Mr. Wiegand: What I would like to determine is whether the committee recommends a track circuit of equal length or greater length, when using a four-ohm relay than when using a two-ohm relay.

Mr. Stradling: We recommend greater for the two-ohm relay.

B. T. Anderson (D. L. & W.): In paragraph 3 reference is made to ballast resistance less than five ohms per thousand feet. I would like to get the percentage of all track circuits that are less than five ohms.

Mr. Stradling: I don't know that I can answer you on that.

Mr. Anderson: Do you recommend the use of the two-ohm relay on all track circuits, or just on track circuits less than five ohms?

Mr. Stradling: On all track circuits.

P. M. Gault: I would like to ask if the committee has considered any other relay than the two-ohm relay? They compare the two-ohm with the four-ohm, but they have mentioned no other resistance. That would lead us to think from this report that there are but two types of track relays.

Mr. Stradling: Our answers here are from 35 railroads, which shows that there were no other resistances

used except four ohms, consequently we compared the two-ohm with the four-ohm.

H. G. Morgan (I. C.): The Illinois Central has been using relays of three ohms quite considerably. We have found that the total energy consumption for dry as well as wet conditions will be practically the same and from 8 to 10 per cent less than the two-ohm relay on the same track circuit, and our experience seems to be that the three ohm relay will operate with more efficiency on the track circuits on the voltages that are within the range. You can operate on our track circuit on two-ohm relays as well as you can on three, but with the three ohm relays you can do it at less cost. They will operate with less cost and a higher voltage resistance than the two-ohm.

G. H. Dryden (B. & O.): I understand that in the conclusion the two ohm relay is worked only where a constant battery is used.

Mr. Stradling: That is true.

Mr. Dryden: Are we not producing a dangerous condition, if the two-ohm relay is considered unsafe unless a particular battery is used for its operation? Can we force our repairmen to keep one type of battery on the circuits constantly? Again, in criticizing the same subject one year ago, I stated at that time that I did not understand why the three gravity cells in multiple with added external resistance to a four-ohm relay should be adopted as a basic standard covering the external resistance in connection with track operation. I am of the same opinion still, that this basis of conclusion was wrong, and that the safe working current to relay coils is the proper basis for the conclusion of this committee. I will ask to hear something on that subject.

Mr. Wiegand: Another point, with reference to the committee recommending the use of long track sections, when using the two-ohm relay. I would like to know why the committee recommended the longer track section when in article 8 they say, "With a foreign current present, the two ohm relay on a track circuit of its maximum operable length will receive more combined foreign and track battery current than will be received by a four-ohm relay on a track circuit of its maximum operable length." And then in article 9 they say: "When a battery lead or a rail is broken and the track circuit between the break and the relay is shunted, the two-ohm relay will be more susceptible to foreign current than the four-ohm relay." Would it not be better to confirm the two-ohm relay to the same length of track circuit as the four-ohm relays?

Mr. Stradling: We give you these arguments relating to foreign current conditions for your information. We know that there are many track circuits where you do not have foreign current, and probably will not have, and therefore why not make them as long as possible and use the two-ohm relay?

Mr. Anderson: I question whether it is clear to all the members, as to what the committee is actually recommending, as superior. Do I understand that the committee is recommending the two-ohm for 100 ft track circuits?

Mr. Stradling: We recommend it for all lengths of track circuits, but give you the information so that you will have the advantage of being able to use it for longer track circuits, in the case of the two ohm relay.

Mr. Anderson: I am considering the conditions on roads where the track circuits run anywhere from 200 to 500 ft. in length. I think most of the members will agree that on a short track circuit in interlocking limits the four ohm relay can be operated at less cost than the two-ohm relay. It seems to me unless it is generally

understood that is the case it would be foolish to recommend the two-ohm relay if it will cost more for battery material.

Mr. Fugina: It will be difficult to recommend a relay for all conditions. We do not recommend the two-ohm relay as one which can be used for every track circuit, and be the safest relay that may be used and also the most economical. We are attempting only to recommend the relay that generally is the best for the battery. For that reason we have set out in these conclusions certain conditions in which the two-ohm relay is not as advisable as the four-ohm relay. Likewise there are some conditions obtaining where the four-ohm relay is not advisable to be used, and those of us who are in charge of this work know the conditions under which we may simply use a two-ohm relay, the conditions under which we should use a four-ohm relay, and also the conditions under which we should use the larger relays.

L. R. Mann (M. P.): I notice the committee says: "In view of the above statements, your committee recommends the use of the two-ohm relay with caustic soda battery, provided the recommended limiting resistance is used in series with the battery." What is the object of that provision?

C. F. Stoltz (C. C. C. & St. L.): The idea is if you have a storage battery which carries about two volts, there is nothing to be gained by putting enough resistance into it to consume the wattage and get your voltage down to operate a two-ohm relay. If you have plenty of voltage, there is no necessity for going to the lower resistance relay.

The idea of the motion was to recommend that the association sanctioned the use of a two-ohm relay as a safe proposition.

Mr. Mann: Would it not be advisable in cases where there is plenty of voltage that they use the eight-ohm relay?

T. S. Stevens: As I understand the recommendation of the committee, they simply ask us in a conservative way to lend our sanction towards using the two-ohm relay. I think the committee's recommendations are very good and very conservative, and I hope the resolution will meet with the approval of this meeting for submission to the annual convention.

Mr. Mann: I think the motion of the committee is good and would support that if they would qualify it; that is, I don't know that the two-ohm relay has been in enough practical use to make an absolute recommendation.

Mr. Dryden: Our road is using two-ohm relays. I think we have at least 300 or 400 in use. The point that we want to bring out is whether or not it is a safe relay provided we increase our voltage. Is it a safe relay if we multiple ourselves? Is it a safe relay if we use a caustic soda battery of higher voltage? In this committee's report they should not confine themselves to the use of a certain battery, but rather to a certain voltage or working current. The relay is safe under normal operating conditions, regardless of the kind of battery used.

Mr. Stoltz: As to the safety of the two-ohm relays, there are probably 35,000 or 40,000 four-ohm relays being operated by caustic soda batteries at the present time, and the Association has never given any sanction to caustic soda batteries with four-ohm relays without external resistance. There is a greater chance of an unsafe condition with a four-ohm relay and no external resistance in a caustic soda battery, much greater than there is with a two-ohm relay and external resistance.

Ray Marshall (G. N.): The report refers to the feasibility of operating track circuits of greater length where the two-ohm relays are used than with the four-ohm. That might be misleading, for the reason that often after track circuits are installed, conditions in the territory change, and where originally no foreign current was found it appears later. Would it not be better to standardize the length of track circuits, and apply either two or four ohm relays as conditions require?

A. Dobson (N. Y. H. N. & H.): I would like to straighten out the last part of that clause which speaks of foreign current entering track circuit through resistance of less than five ohms. Foreign current enters the track circuit usually along the rails. There will be one track circuit perhaps at some place where foreign current comes onto that particular track circuit, but all the other track circuits that are affected by this particular source of foreign current receive this current through the rails, therefore that current has to flow through or upon the insulated joint. That brings us to the point at once that in the great majority of cases where foreign current is found on track circuits, it enters that track circuit through resistance considerably greater than five ohms, because it must at least flow through the insulated joint before it reaches the track circuit, as well as through the other resistance which it may encounter between the source and the rails.

In regard to the amount of current which is supposed to be flowing along the rails, not across the track, it does not matter what the resistance of the relay is usually, the amount of foreign current that will flow from rail to rail will be the same whether the relay is two ohms or four ohms, on an average, and the resistances back of them are so great that a resistance of two or four ohms but very slightly affects the current.

There is another point that has not been brought out in this meeting. It is stated that the four-ohm relay would be safer in cases where a potash battery was used if all the resistance between the battery and the track was gone. A four-ohm relay would be safer under those circumstances than a two-ohm relay. That is true as a bald statement, but the thing that operates a track relay is the shunt, and it is the resistance of the shunt upon which depends the amount of current that will flow from the relay. To give you just roughly some figures that will show the difference under those two conditions with no resistance between the rail and the battery, with a two-ohm relay and a shunt across the battery end, the resistance of the shunt necessary to lower the current enough for the relay to drop away is something like .0016. With a four-ohm relay, under the same conditions the resistance necessary to lower this current enough for drop-away purposes is .0014, a very slight difference when you speak of it in actual figures.

Mr. Stradling's motion was then seconded and carried.

Mr. Stradling: The final portion of our report relates to the "Battery voltage limits." The committee feels that the table given is vitally important to the railroads using caustic soda batteries, either with four- or two-ohm relays.

Mr. Anderson: As I understand this table, it refers to only one type of potash battery—it does not refer to the potash track battery?

Mr. Stradling: It refers to any battery that has this voltage, even to the storage battery.

E. G. Hawkins (N. Y. C.): Referring to the latter part of the paragraph, where it refers to the discharge in connection with the four-ohm relays in 2.5 amperes, if the four-ohm relays are to be used, or in 1.7 amperes,

if two-ohm relays are to be used, is it necessary to discharge the 2.5 amperes with four ohms and only 1.7 amperes with two ohms?

R. W. Erwin (Nat. Carbon Co.): The current figures there as shown in that part of the paragraph are merely to enable you to determine at what place in this table your batteries should come under, and we have

used here the minimum of a .06 ohm train shunt, and we have assumed the most adverse operating conditions. You ask why there is a difference in the two relays. The current value for the relays was the standard R. S. A. value, and these vary with the train shunt permissible and the different current values that go with the voltage life.

Report of Committee III—Power Interlocking

THE COMMITTEE reported progress on the subject, "Prepare unit specification for electric motor switch operating and locking mechanisms," and also submitted drawings of typical circuits for power interlockings. The circuits were assigned last year, but were not completed in time for submission to the annual convention.

Progress was reported on the subject, "Prepare Specification for Fiber Conduit." The report is about completed, and it is expected to be presented for discussion at the New York

meeting.

Progress was reported on the subject, "Prepare Unit Specification for Electric Interlocking Machine." The committee also submitted a report, "Requisites for First Range Voltage, Electric Interlocking." A report on this subject was submitted at the last annual convention, and referred back to the committee. The committee has considered the recommendations made at the annual convention, and again submitted the report for discussion at this meeting.

Typical Circuits for Power Interlocking

The subject matter presented under this heading consisted of three drawings for Federal Signal Company's electric interlocking. They are for:

110-volt d.c. one-arm non-automatic signal.

110-volt d.c. switch and lock movement.

20-volt d.c. switch and lock movement.

The committee submitted the circuit drawings for Federal Signal Company's Electric Interlocking, and asked their acceptance for approval at the next annual convention, as information.

Requisites for First Range Voltage

1918

1. The rated voltage for the operation of the switch mechanism shall be 20 volts.

2. The time required for the operation of the switch mechanism shall not exceed 30 seconds at rated voltage, nor shall the time exceed 40 seconds with voltage at 20 per cent below rated voltage.

3. Provision shall be made in the design of the switch mechanism to prevent an unauthorized movement.

4. The switch mechanism shall be so constructed as to permit an emergency operation. Provision to be made for automatically interrupting the operating circuit during such emergency operation.

5. Rails of track circuit shall be connected in series so far as practicable.

6. Signals governing movements from the siding shall be of the { automatic
semi-automatic stick } type.

7. Normal and restricted speed signals governing movements on the main line, shall be of the automatic
semi-automatic type.

8. Approach signals or slow boards shall be installed on the main line.

9. Approach locking shall be installed Time

10. Repeater or lock indication for switches and signals shall be provided at point of control.

11. Operation of switch mechanism shall be controlled by { section
sectional route } locking.

12. The circuits controlling the switch mechanism shall provide protection from unauthorized movements due to disarrangement of conductors.

13. The normal and restricted speed signals shall be so controlled that unless all switches, movable point frogs and derails over which they govern, are in proper position and locked, the signals will assume the stop position.

14. The opening through which the hand crank for emergency operation is to be applied on the switch mechanism shall be provided with a weatherproof cover attached to mechanism case and equipped for purchaser's standard switch padlock. Location to be conspicuously marked.

The committee submitted the Requisites for First Range Voltage Electric Interlocking, and asked their acceptance for approval at the next annual convention, as information.

Committee F. B. Wiegand (N. Y. C.), chairman, J. S. Raymer (P. & L. E.), vice-chairman, J. W. Pilegim (U. P.), vice-chairman; Daniel Gooding (Un. Ter. Co.), A. B. DuBray (I. C. C.), N. S. Lynch (Mo. Pac.), J. W. Macfarlane (K. C. Ter. Co.), O. R. Unger (Mo. Pac.), J. B. Weid (I. & N. G.), A. Zichke (U. P.), B. J. Schmidt (T. & O. C.), H. L. Kilian (N. Y. C.), H. H. Orr (C. & T. L.), L. A. P. (W. & B.), J. C. Seaman (N. Y. C.), T. C. Siefert (C. & O.), W. C. Silda (N. Y. C.), A. H. Schmitt (M. & C. R.), G. H. Bernette (Monongahela Ry.), W. D. Carroll (P. & O.), G. A. Motry (B. & O.), G. Toff (P. R. R.), L. E. Knecht (P. & A. E. C. Hitchcock (N. Y. N. H. & H. C.), G. M. Cram (W. & A. Term. Co.), G. R. Scammon (P. R. R.), C. J. S. (N. Y. C.), L. G. Whitney (N. Y. M. & E.), L. G. Scott (N. Y. C.), Thorn Birdseye (P. R. R.), Walter T. (N. Y. C.).

Discussion

Chairman Wiegand: The committee has submitted the drawings for submission to the annual convention. I move they be accepted.

(Motion seconded and carried.)

Mr. Wiegand: The committee again presents a report on requisites for first range voltage, electric interlocking.

A. R. Lugina (G. N.): The electric interlocking 3 and 4 are rather advisable, though I am not entirely sure. I would like to know just how they expect this to be done, how are you going to control the unauthorized movement?

Mr. Wiegand: The committee's report is only on what might be termed requisites covering the construction of machines. Sub-committee B is now handling the units

of specifications. In the specifications which will be submitted with our next report, I feel that that will be taken care of, and the report will show just how it can be done. Just now I could not say.

Mr. Fugina: Are the low voltage machines that are now being placed on the market manufactured according to this provision?

Mr. Wiegand: That is something I could not say. I understand, however, that requisites can be made. The committee are working with the manufacturers, and so far as I know there has been no question in regard to meeting this particular requisite.

The committee offers a suggestion. It desires to reword section 7 as follows: "Signals governing normal

and restricted speed movements on the main line shall be of the automatic, semi-automatic type."

In 8 a change in the wording is recommended by the committee: "Signals that may give approach indication or slow board shall be installed on the main line." In 13, a change in wording is suggested: "Signals that may give the normal or unrestricted speed indications shall be so controlled that unless all switches, movable point frogs and derails over which they govern are in proper position and locked, the signals will assume the stop position."

(On motion the recommendations were approved and the committee was excused, with the thanks of the Association.)

Report of Committee VI Standard Designs

THE COMMITTEE PRESENTED ten drawings; one of which is a revision of a previous issue, eight are new designs, and one is presented for discussion.

The following revised and new drawings were submitted (with the exception of 1258, which is submitted for discussion only) for discussion and presentation to the annual meeting for approval and submission to letter ballot:

1362—Ladder Parts. (New.)

1363—Ladder Hand Rails. (New.)

1364—Ladder Platform s.

(New.)

1365—Ladders for Ground Mast Signals. (New.)

1366—Ladders for Bracket Mast Signals. (New.)

1371—Ladder Clamps and Stays. (New.)

1372—Ladders for Bracket Posts. (New.)

1376—Double Tang Ends. (New.)

1065—Signal Blades. (Change in title only—revised.)

1258—Assembly of Fittings for Locking Switches Mechanically at Interlocking Plants. (New.)

Committee: F. P. Patenall (B. & O.), chairman; J. C. Mock (M. C.), vice-chairman; W. A. Hanert (N. Y. C.), C. J. Kelloway (A. C. L.), B. H. Mann (Mo. Pac.), F. W. Pfleging (U. P.), W. M. Post (P. R. R.), M. E. Smith (D. L. & W.), R. E. Trout (St. L.-S. F.).

Manufacturers' representatives: I. W. Hackett (Fed Sig. Co.), W. P. Neubert (U. S. & S. Co.), H. B. Taylor (Hall Sw. & Sig. Co.), S. N. Wight (Gen. Ry. Sig. Co.).

Discussion

Mr. Patenall: Your committee presents 10 drawings, one of which is a revision of the previous issue with some new designs, and one is presented for discussion. We would like to have you first discuss the drawing on ladder parts. The attempt of the committee at this meeting is to present a plan which we hope will hold good for some time. The object is to provide a ladder which will be applicable to all types of signals, keeping in mind the matter of providing more safety for our men working on these masts. We ask the approval of the plan for presentation to the annual meeting, and final submission to letter ballot.

Mr. Morrison: How much will this increase the cost of signals?

Mr. Patenall: This committee has not made any study of what the additional cost of the ladder will be, but in

a general way we would assume that the platform will add two or three dollars to the cost of the ladder.

C. A. Dunham (G. N.): The committee has stated that one of the main objects is to make it a little safer for the man who has occasion to climb the signal masts. I would like to ask if the increased width of the ladder shown at the head of the drawing as 1 ft. 11 in. in width will not introduce a complication wherever signal masts are located between tracks on minimum clearances?

Mr. Patenall: With a new design used in connection with the signal mast, either in the case of the mechanism or a wider platform used in connection with the mast, the ladder will prohibit the placing of the signal unless you have sufficient track centers and of course the fact that you do use a wider platform means that your clearance diagram may be encroached on by this particular arrangement.

Mr. Dunham: In the light of what has just been said, there would seem to be considerable objection to adopting a standard requiring a ladder 1 ft. 11 in. in width for general use.

Mr. Patenall: You understand that the lower arm on the standard signal was located in reference to clearances, and that being the case its platform, if provided, will also be well outside the clearance diagram, so that we do not experience any difficulty in applying these platforms, and in the case of any particular mast, in connection with which you desire to use these platforms, we would assume that the particular mast is outside of the standard clearance diagram today.

(The drawing was accepted for presentation to the annual meeting for approval and submission to letter ballot.)

Mr. Patenall then presented plans 1363, 1364, 1365, 1366, 1371 and 1372, having to do with ladder parts, all of which were approved for presentation to the annual meeting and submission to letter ballot. Similar action was taken on plans 1376 and 1065.

Mr. Patenall: I want to make a personal appeal to this meeting on the question of painting signal blades, as well as an appeal to reduce the number of different dimensions. I communicated this last year with 89 railroads on the subject of painting and sizes of signal blades, and Heinz' 57 varieties of pickles were not in it when it came to signals. We ought not to allow a condition to exist in this country where we have so many varieties and sizes. I hope next year at this time someone will be able to report that 95 per cent of the railroads are using R. S. A. standard blades.

At the meeting in New York last year there was considerable discussion on the question of a plan which

would show the mechanical locking of switches. The plan, 1258, you have before you bears out the recommendation made by Committee II, and we present this plan for argument and discussion. The members will note particularly the operating rod and the lock rod are inclined vertically, rather than in the ordinary way. As a matter of strength, the committee has to concede that there is a great deal in placing switch rods in that way, although that is not a new method. You will note the adjustable arrangement of the lock rod, which admits of fine adjustment. Another specialty is in the adjustment of the operating switch rod sockets, which is a detail I think the members might desire to study rather carefully. This plan embodies also the rectangular block. We would like to hear from the members on this particular point.

Mr. Stradling: I would like to offer a suggestion that in the connection of the switch block or lock rod to the front rod, that the same bolts be used for that connection that are used for getting the adjustment on the front rod.

Mr. Patenall: I think the point made by Mr. Stradling is quite apropos. There is apparently a means of saving two volts by doing what he says. I would also like to hear from the members who use adjustable rail braces as a general practice.

Mr. Dunham: Plan 1258 certainly embodies many important features. If this plan is adopted it means a very appreciable departure from what is now general practice in several details. The lock or plunger casting, as we usually call it, now in general use, so far as I know has generally been very satisfactory, and if that is true, then what is the necessity for adopting a new design which requires the use of several parts not now standard? There is another point. Gage plates, as shown here, are insulated by means of turning the ends up, which may be a very good insulating proposition, but is there not objection from the standpoint of such ends being turned up and raising something in the track that a man would fall over?

I would also like to ask the committee if the spacing of the first head rod and the lock rod is in accordance with the dimensions submitted for approval by Committee II at various times. Touching the question that Mr. Patenall raised concerning the use of adjustable rail braces. My own experience is that the solid rail brace is best. The occasion for the use of an adjustable rail brace comes about largely from the ties being driven down, and when the signal repair man feels that he needs an adjustment, he tries to introduce it perhaps by stretching the rail brace, when what he really needs is to have the ties tamped up to the rails. The tendency is for the track gage to spread a little, and you do not really correct the matter properly by adjusting the rail brace.

The only occasion, as I see it, for the use of an adjustable rail brace is to overcome the wear in the brace. I am assuming, of course, that the brace is sufficiently rigid to stand the strain without bending.

Mr. Morrison: In our experience we found that it was difficult to keep the switches sufficiently tight, but by the introduction of the adjustable rail brace we have overcome that difficulty. Perhaps we are shy a few section men to keep our ties tamped; perhaps we have heavy motive power, and perhaps we use our switches a great deal at big terminals, but the adjustable rail brace has overcome our difficulties satisfactorily.

F. J. Ackerman (Kansas City Terminal): The terminal proposition, of course, at Kansas City, is decidedly different, and what I may say would not apply in a good

many instances. We have used the adjustable rail brace in that terminal territory since 1911. From past experience and observation I should say that results have been very good in this, and that I consider that we have been able to keep those adjustments and save much labor which might be required otherwise in resetting risers or shrinking plates.

As to the locking device, we have experienced no difficulty in keeping the switches in proper adjustment, which we could not have done if we had the solid rail braces.

F. B. Wiegand (N. Y. C.): We have been using the non-adjustable rail brace and up to the present time we have found no necessity for any adjustable brace. It is our practice to use the blade that is cut in the center, and so far we have found no necessity for tying the blades together as shown on the drawing.

Paul M. Gault (I. C.): I have been wondering whether the triple rods, as shown here, will prevent turning of the points. The rods we have been accustomed to use are made flat, and offhand it would appear to me that the points would tend to roll in this type of rod. Also, as to the method of insulating the tie-plates. Many roads are having satisfactory results by cutting off a few inches of the tie-plates.

Mr. Patenall: The purpose of the position of the rods as shown on this drawing is specifically to prevent the point turning. Under the old methods of applying the rods flat, we know that we did not get the results which we expected. It seems to have developed on some railroads that there has been a tendency for the point to turn under obstruction. That is not a point particularly made by this committee, but was given as a reason for the application of the rod by the committee.

It is a very difficult thing, in drawing a plan of this kind, to decide whether we shall have adjustable rail braces or whether we shall not. Someone called attention to the drilling as shown on the plan. We have no authority at this time for the drilling, other than the standard drilling of the A. R. E. A., and until that is changed we must abide by that plan. Someone mentioned the gage plate. This, of course, is the gage plate. An application which leaves a space between the plates on the tie without any connection at all cannot be considered a gage plate.

The committee has attempted to make tests which will give evidence as to the possibility of the relative resistance to strain between this type of plate and the lapped plate. In our opinion, the butt plate, such as is shown on this plan, will under all conditions of service stand up materially longer than a lapped plate because the stresses which take place are on the bolt, whereas with the lapped plate that stress is on the insulated bushing.

Mr. Dunham: Plan 1258 does not indicate how much the butt plate for insulating gage plate will stand above the base of the rail. I have in mind that this will be an obstruction, and objectionable on that account.

Mr. Patenall: If you will refer to the two drawings shown below you will get a very fair idea as to the comparative height of the plate, taking the rail into consideration. I should say offhand that two inches above the top of the tie would be a maximum height for that butt. It depends on the thickness of the plate. We are considering the use of 3/4 in. plate and that may increase the height. Whatever it is, it will only be sufficient to get the bolts and nuts clear. I understand that 2 3/4 in. is the maximum dimension over all.

C. A. Christofferson (N. P.): Anything that stands above the track, between the rails, is very objectionable. We have been using lapped plates, and have had some in

use for eight or ten years. I watched the insulation of that plate very carefully, and cannot see any wear on the insulation, nor can I see any reason why there should be wear on it, if the gage plate is properly fastened to the tie with lag screws. As to the front rod, it seems to me it would be a better plan to make the fastening for the lock rod down closer to the point, in order to get both of the ends the same length. I do not think there is any need of having any rod or rod piece. That means these rods each have to have a longer lock rod fastened in the center of the track.

J. Beaumont (I. C. C.): One year ago we changed from the vertical switch rod to the flat rod, and it was done for the purpose of securing more ample clearances and a higher degree of strength against track obstructions on trains. If this rod is placed on edge it will necessitate providing approximately three inches clearance below the rails in order to keep No. 1 rod clear at the ground. While that may not seem to be a serious matter, to my mind it means more clearance to meet this standard successfully under operating conditions than to provide for the flat rods. A rod of this kind, set on edge, is more easily bent by track obstructions.

Caleb Drake (C. & N. W.): I would like to disagree with Mr. Dunham's statement as to the adjustable rail brace lasting over a period of years. It is my experience that a 3/4-in. rail brace on heavy traffic might better be figured in months. I think the committee ought to be encouraged in the investigation of adjustable rails.

Mr. Morrison: I might say for Mr. Dunham's information that we have used the tie plate as shown on this plan for a number of years, and have not experienced

any difficulty on account of men stumbling over it, or its being struck by dragging equipment.

Mr. Dunham: I am perfectly willing to agree to this: that those wrought-iron or steel braces may last only a comparatively short time, but whether that enters the problem is not the real objection to the adjustable rail brace problem. The main reason that men have felt that they require an adjustable rail brace comes about from the fact that a wrought-iron or steel brace is not sufficiently rigid to maintain the track at the original gage, and for that reason adjustments are sought. I think the committee would do very well to ascertain what the practice is on our railways before suggesting the use of an adjustable rail brace.

Reverting to the insulated gage plate, shown in plan number 1258, I am very sure there is a substantial objection to an obstruction 2 3/8 in. in height being placed between the rails as indicated. The Northern Pacific are using an insulated gage plate or lock joint riveted together. Gage plates so insulated have been in use for a period of eight or ten years with entire satisfaction. That sort of construction is not objectionable, and it is economical.

Mr. Stradling: I believe the lapped joint to the gage plate would stand probably 1 1/2 in. or more above the base of the rail. It looks to me that we could frame it so as to turn this insulation upside down and have it out of the way. With regard to the adjustable rail brace, I feel you would either have to have an adjustable rail brace or an adjustable head rod to take care of the wear, and the adjustable rail brace has the feature of introducing more parts probably than a solid rail brace.

Report of Committee XIII—Electrical Testing

THE COMMITTEE PRESENTED drawing 1422, Adjustable Resistance for Testing, and asked that it be given consideration at the March meeting with a view of having it approved at the next annual meeting for submission to letter ballot.

Due to the obvious difficulty of drawing a specification of practical value for an adjustable resistance for testing purposes, the designs of which may vary so widely, the committee decided that a drawing should be prepared for this subject; this design is for practically all general testing purposes. The drawing is in sufficient detail and specific, so that the instrument may be purchased in the open market by reference to the drawing. Drawing 1422 was prepared with this end in view. Suggestions from manufacturers of similar apparatus, with reference to a number of details were followed by the committee. Several instruments, which were made in practical accord with this drawing, have given very satisfactory service.

Committee: P. M. Gault (I. C.), chairman; C. Drake (C. & N. W.), vice-chairman; M. A. Baird (Erie), H. Combs (L. P. & W.), C. A. Cotton (A. T. & S. F.), C. E. Earhart (A. & V.), T. Holt (Penna. Lines West), E. E. Ireland (C. I. & L.), G. W. Kydd (B. & O.), F. D. Morehart (C. M. & St. P.), T. J. O'Meara (N. Y. C.), D. W. Rosenzweig (So. Pac.), C. O. Seifert (B. & O.), C. F. Smith (U. P.), W. N. Spangler (P. R. R.), C. G. Stecher (C. & N. W.), L. L. Whitcomb (N. Y. C.)

Discussion

Chairman Gault presented an outline of the report and moved that it be presented to the annual meeting for submission to letter ballot.

L. R. Mann (M. P.): I notice the dimensions of this adjustable resistance are given at 13.5 in. over all. One that we have been using you can stick in your pocket.

The idea of having a small one that can be carried in that way is good. Did the committee go into the matter of small resistances?

F. P. Patenall (B. & O.): I ask whether these resistances can be purchased in the open market?

Mr. Gault: It was not made primarily for convenience in carrying, but as a testing instrument, if it were made smaller, it would be found impossible to get the necessary tubes on the inside.

R. E. Trout (Frisco): I am wondering how the committee came to suggest making the drop-away 500 ohm slot coils of a 1000-ohms resistance. I have in mind with this type of resistance shunt it would be necessary to cut off part of the cells of the operating battery. Would it be possible to have the instrument so you could insert enough resistance to avoid doing this?

Mr. Gault: In the lower right-hand corner you will find a diagram which shows the method of wiring.

Mr. Trout: I had in mind a series resistance with the circuit in the shunt on the battery. In a great many cases the battery feeds not only the slot coil in which you are making the test, but the mine relay in the rear.

E. G. Stradling (C. I. & L.): Referring to the diagram in the corner, it would appear you first have 60 ohms on your theoretical resistance, and then you move your switch and add 50 more, giving 110, and your next step would be an additional 100, so you have those steps in between 150 and 110.

Mr. Gault: Simply by moving the slide back in the tube you can get successive steps up to 350 ohms.

T. S. Stevens (Santa Fe): I do not think we have had quite enough information from the committee as to the necessity for as large a resistance as this. I would

like to ask the committee if that is the smallest practicable resistance, or if it is the best, whether something smaller could be designed which could be used by men other than regular inspectors?

Mr. Gault: There may be smaller tubes which would be satisfactory for the particular checks, such as a main tinner having only one type of product would require, but the committee did not think it would be of any use to design an instrument that could not be used by the general inspectors on any railroad.

R. W. Irwin (Nat. Carbon Co.): According to this wiring diagram, you cannot get any resistance between 210 and 250; in other words, the first two of the resistance tubes on the inner side must not be larger than

protest against the adoption of the report. There are a number of things that I consider the Association ought not to stand for. One is the fact that resistance is not continuous. You cannot get resistance between 110 and 150.

These units, which are mounted within the tube, are carefully filled in with insulating material so as to prevent the current from going out as much as possible. Asbestos wool is about as good an insulator and as poor a heat conductor as could be obtained. Furthermore, the cylinder is wound on bakelite, and while it is true bakelite is not a definite term, and there are a number of different qualities of bakelite, they are all non-conductors of heat.

Advance wire has been specified. Advance wire is a trade name. They might have specified several other wires which are also trade names. They might have specified constantin. I have taken a number of pieces of apparatus in which constantin was specified and put in Advance, and it was substantially the same.

I think the experience of the people who are manufacturing these rheostats should be taken into consideration. During the last week I have bought 15 slide wire rheostats, and the insulating wires are wound with nichrome. It might be interesting to say just a word about these rheostats I speak of. They represent the result of considerable study both in this country and abroad, and commercial experience in this country and abroad running back over maybe 20 years, and the wire is wound on a copper tube, covered with a burnt enamel, which gives perfect insulation and good conducting power.

There may be a few other points, but I have not tabulated them, and the criticisms I have made are those that occur to me as I look at this report. I think it would be much wiser for the Association to refer this matter of a rheostat back to the committee, rather than to go on record as favoring a design which we know could be improved.

Mr. Gault: In regard to this tube, it may appear to be perfectly heat insulated, but your committee took this identical tube and tested it to its marked capacity for, I believe, three hours, and it heated very slowly.

In regard to the trade names mentioned, Advance wire and bakelite, your committee went into the specifications for that wire at quite some length, and the wire that was best suited for the manufacture, in our estimation, was a wire called Advance wire. I may be wrong, but I don't believe that is a patent wire. Bakelite, while a more or less general term as commonly applied to signals on railroads, is rather definite. It was necessary to have some kind of a support for the wire that would not warp and get out of shape in the rain, and would stand a reasonable amount of rough usage.

In regard to the continuity of the resistance, I don't believe that you will have any difficulty in making room for proper resistance on that wire. There is a small gap between 110 and 140 and another one between 210 and 240. I don't believe the men that tried the tube had any difficulty on that account.

Mr. Patenall: The resistance unit presented itself to me for the specific purpose of being furnished to an inspector whose duty it is to make sliding checks on the rails. I have to agree with Mr. Stevens that a smaller instrument might be of service for the use of repairmen, but that is another question.

Mr. Gault: I do not agree that this could not be generally used on railroads. The committee had no specific instructions to design a tube for one particular use. We therefore took it for granted you wanted something that could be used for any purpose. There could be

Details of the Resistance Unit

the resistance on the coil wire on the outside in order to get continuous resistance.

I. R. Mann (M. P.): I believe it would be possible to get any resistance or any carrying capacity in a much smaller space. The long tube, instead of being straight, can be in a circle.

R. B. Arnold (C. & N. W.): As to the covering of the wire to protect it from mechanical injury. The resistance units are put in tool boxes on motor cars and might be easily injured. I believe that a covering of some sort could be put over that tube and a sliding contact extended out through a slot so that you can move the slide back and forth and get it in the same working condition and still have protection to the wire.

C. W. Burrows (Bureau of Standards): I had not intended to take any part in this discussion, but I do not feel that I should sit here without raising my voice in

modifications made and parts of this tube omitted if you wished to make a cheaper tube. This is a practical unit and I cannot see any reason why we should not at least give it a trial.

Mr. Hawkins: There has been a lot of criticism as to not being able to get an adjustment between 110 and 150. Maybe the committee would be willing to adopt a slip, whereby they could slip over on the end and get that adjustment.

The President: The committee is willing to accept that suggestion. With this last acceptance I put the motion as to drawing 1422.

(The motion was defeated.)

The President: I will ask the committee to take the suggestion and criticisms that have been made on this subject and bring in a report at the next meeting.

The committee was excused with the thanks of the Association.

Report of Committee II Mechanical Interlocking

THE COMMITTEE PRESENTED A REPORT to the March meeting on unit specifications for painting interlocking machines, block signals and apparatus and materials used in connection therewith, with request that same be given consideration.

1. GENERAL.—All material must be of highest quality, and unadulterated. When request is made by purchaser, samples of mixed paint or its ingredients proposed for use shall be furnished for laboratory analysis.

2. MATERIAL.—Paints must conform to the purchaser's formulas and requirements when so specified, otherwise the best recognized practice shall be followed.

3. COMPOSITION.—The paint must consist solely of oil, gums, drier and pigment, in proper proportions, by weight.

4. VOLATILE MATTER.—The volatile matter must not exceed 5 per cent of the weight of the paint.

5. OIL.—The oil must be pure, raw linseed oil.

6. DRIER.—The drier must consist of a pure turpentine drier, free from benzine mineral oils and resins, and must be mixable with linseed oil without curdling.

7. PIGMENT.—The pigment must be so finely ground that when thumbnail test is applied, no feeling of grittiness shall be apparent.

8. COLOR.—The shade of the paint must conform strictly to the purchaser's specification.

9. DRYING.—Paint must dry so that next coat can be applied at expiration of 48 hours.

10. REJECTION.—Paint failing to meet the above requirements will be rejected. Where inspection is made at destination, shipment will be returned to the manufacturer, who must pay freight charges in both directions.

Shop Painting

11. CLEANING.—(a) Outside iron connections, switch and signal fittings, not machine finished, also signal mast, both inside and out, before shipment from works, shall be thoroughly cleansed and given either a priming brush or dipping coat of red oxide or graphite paint:

(b) Machine finished surfaces, before shipment or before being exposed to the open air, shall be coated with white lead and tallow or the equivalent, in the form of a thick coat of paste which will have sufficient body and firmness to resist weather and prevent rusting, and will readily wipe off with cotton waste.

Field Painting

12. CLEANING.—Surfaces shall be thoroughly cleaned so that all loose or easily detachable mill scale, rust,

grease and dirt or other foreign substances are removed before paint is applied.

13. APPLICATION.—(a) Paint shall be well mixed, uniformly applied, thoroughly worked into all joints or open spaces, and each coat must be thoroughly dry before the application of the succeeding coat.

(b) Surfaces to be painted which will be inaccessible after erection must be given two coats before being assembled.

(c) Paint shall not be applied to outside surfaces in freezing weather, nor to wet surfaces.

(d) Priming coats shall be applied as soon as is consistent with the progress of the work.

(e) Finishing coats shall be applied in sufficient time for same to be dry when the installation is completed.

14. IRON WORK.—(a) Iron work (except interlocking machine, detector bars, gauge plates, iron foundation piers), not galvanized, shall be painted one priming coat and two finishing coats. Galvanized iron pipe shall be painted at threads, pipe rivets and wherever galvanizing is damaged.

(b) The following specific finishing coats shall be used:

| | Color |
|----------------------------------|-------|
| Signal bridges and brackets..... | |
| Signal masts | |
| Dwarf signals | |
| All connections | |

15. MACHINE.—(a) Machines shall receive one priming and one finishing coat as follows:

| | Color |
|--|-------|
| Machine from top of lever shoe to foundation supports, except finished part..... | |
| Lever above shoes, except finished parts of latch handles | |
| Block and interlocking mechanical signal | |
| Block and interlocking power signal..... | |
| Distant mechanical signal | |
| Distant power signal | |
| Dwarf signal..... | |
| Switch | |
| M. P. frogs..... | |
| Switch and lock..... | |
| Facing point lock | |
| Mechanical and electrical bolt lock..... | |
| Check lock | |
| Crossing gate | |
| Hand release | |

(b) Sufficient varnish to be mixed with last coat to produce a good gloss finish.

16. WOODWORK.—(a) Woodwork, such as junction, relay, bell, cable, battery boxes and closets, also trunking

and capping, shall be given one priming coat and finishing coats as follows:

| Color | Number of Coats |
|-------|-----------------|
| | |
| | |
| | |

(b) Inside of trunking shall not be painted.

17. **BENDING**—Interlocking stations and other buildings shall be painted as follows:

| Color | Number of Coats |
|-------|-----------------|
| | |
| | |
| | |

Committee: C. J. Kelloway (A. C. I.), chairman; F. E. Whitcomb (B. & A.), vice-chairman; Samuel Miskelly (C. R. I. & P.), vice-chairman; G. W. Chappell (N. Y. N. H. & H.), C. S. Foster (P. R. R.), Oswald Frantzen (N. Y. N. H. & H.), G. W. McClelland (P. & R.), W. B. Morrison (D. L. & W.), Chas. Stephens (C. & O.), J. I. Vernon (N. Y. N. H. & H.), G. N. MacDougald (Virginian Ry.), E. K. Post (P. R. R.), R. W. Taylor (B. & O.), E. J. Relf (N. P.), Larsen Brown (A. T. & S. F.), Wm. Dawson (N. Y. C.), E. C. Carroll (C. & N. W.), F. E. Mack (C. & E. I.), W. F. Zane (C. B. & Q.), H. F. Lomas (I. C. R. R.), F. E. Jacobs (C. & W. I.).

Discussion

Vice-Chairman F. E. Whitcomb outlined the assignments of the committee and presented the report on subject 6 for submission to letter ballot.

F. B. Wiegand (N. Y. C.): I suggest the elimination of the words "proposed for use" in the third line.

Mr. Whitcomb: The committee will accept that change.

L. F. Howard (U. S. & S. Co.): In paragraph 7 that test for pigment I understand will procure a pigment which is practically of the same degree of fineness which is used in painting carriages and automobiles. I want to call attention to that so as to be sure there is no misunderstanding as to quality.

Mr. Wiegand: I would like to suggest a change in number 12, cleaning. "Surfaces must be thoroughly cleaned and all loose or easily detachable mill scale, rust, grease and dirt, oil or other foreign substances removed before paint is applied."

Mr. Whitcomb: I will accept that.

J. A. Peabody (C. & N. W.): If what has been stated is true relative to pigment, it seems to me that it is a question that should be thoroughly considered before we adopt it, because here is a place where we certainly can save money, if any place. We do not need any such pigment as that for the protection of signal poles and relay poles.

Mr. Whitcomb: The idea was this, to have a pigment test that could be readily applied. All these other test most anybody can apply.

Mr. Peabody: If that has not been looked into, I think it should be, because it means a considerable cost.

Mr. Whitcomb: This was taken up pretty thoroughly by the committee with the structural engineers, and I don't think there was any one of them that objected to it.

F. P. Patenall (B. & O.): From the explanation given by Mr. Howard, I would think the committee is exactly right. If there is any place you can waste money on a railroad, it is in buying bad paint. I believe the committee ought to adhere pretty closely to what it has stated in its specifications.

C. Drake (C. & N. W.): I think it should be left optional in section 16, as to whether cedar trunking and capping should be painted.

Mr. Whitcomb: There is no objection whether you want to paint any of this trunking or not.

Mr. Drake: I understood this trunking and capping should be given one priming coat and finishing coat.

The President: The committee will accept the suggestion and arrange it so that that paragraph will be optional. There being no objection, these specifications will be presented to the annual convention for approval and submission to letter ballot for insertion in the manual.

Report of Committee XI—Batteries and Switchboards

IN REVISING DIRECTIONS for installation of storage batteries the committee presented for preliminary discussion and criticism directions for installation of lead type stationary storage battery, which if adopted will replace obsolete material now in the Manual.

Now that this type of battery is being used to a considerable extent in place of the gravity battery, the expensive installation of a battery well or chute does not appear to be warranted. It is felt by the committee that better inspection

and maintenance can be secured by the use of a box and that in most cases a material reduction of original cost will also be effected.

In revising specifications for soda primary battery and arranging with Committee VI for preparation of plan for 1000 A. H. primary battery jars, the committee is considering the revision of drawing 1043, R. S. A. Signal Cell, so as to eliminate the porcelain jar and to provide

in its place a round jar for the new 1000 A. H. cells.

The committee desired to have a discussion and expression of opinion on the following questions:

1. In addition to the round jars, should the standard drawing provide additional 500 A. H. and 1000 A. H. jars of a different shape?

2. If so, should such jars be rectangular or square, i. e., should it design a new square jar of those two sizes which will admit the use of both the round and plate type elements or should it follow the present design of rectangular jars which are in use on a number of roads and which use the same rectangular cover for both sizes of jar?

3. Should a solution line similar to the electrolyte line in the storage battery jar be provided with primary battery jars?

4. How close to the top of the jar is it advisable to bring the solution, bearing in mind the serious results which may be caused by spilling the solution in handling the jars in and out of battery chutes or wells?

Directions for Installation of Lead

Type Stationary Storage Battery

1. **HOUSING.**—(a) Battery should be isolated in a room or box, as the acid fumes given off during charge

are of a corrosive nature. This space should be well ventilated and lighted, and as dry as practicable.

(b) Inside of housing should contain no exposed metal work other than lead. If this is not practicable, such metal parts should be protected by at least two coats of acid-proof paint.

(c) Floor of battery room should be sloped, to provide proper drainage.

(d) Floor shall be preferably of vitrified brick, joined with pitch.

2. SUPPORTS.—Batteries should be supported on wooden racks or shelves of sufficient strength to prevent sagging or placed on layer of sand on floor of battery box. They should be arranged so as to permit access for inspection and cleaning and for the removing of any cell or element.

3. ERECTION.—(a) Fill the sand trays level with top with clean, dry sand, space trays uniformly on support so as not to touch the adjacent trays.

(b) Clean the jars and press them into sand until they have solid bearing and are in proper alignment.

(c) Scrape the contact surfaces of connecting straps of elements to insure good electrical connection.

(d) Place a positive and a negative group inside each jar in such a manner that the positive and negative plates will alternate with the two end plates negative. Arrange the groups so that the positive group of one cell will connect with a negative group of the adjacent cell. Straighten the plate lugs to prevent them from touching each other.

(e) Bolt the connecting straps together with the bolt connectors, making each connection tight. Connect rows of cells with lead tape or rubber-covered copper wire. Cover all bolt connectors and exposed copper with vaseline.

(f) Connect the charging circuit wires to the battery terminals with the positive wire of the charging circuit connected to the positive or dark brown element terminal.

(g) Before proceeding inspect all connections carefully to insure that they are tight and properly made, positive to negative; be sure that the charging current at proper voltage and under control is available and that the initial charge can be started immediately and can be continued to its completion.

(h) Unpack the wooden separator parts, which include wooden sheets and dowels. Insert the sheets into the dowels, with the grain of the sheets crosswise to the grain of the dowels. Place the separators between adjacent positive and negative plates with the dowels vertical. Place the glass hold-down in position on each cell.

(i) Immediately after separators are placed in position the cells should be filled with electrolyte to a height of three-quarters ($\frac{3}{4}$) of an inch above the tops of the plates or to the electrolyte line. The electrolyte should be of 1.210 specific gravity at 70 degrees Fahr., in accordance with R. S. A. specification.

(j) The initial charge must be started immediately after the electrolyte has been added to the cells.

4. INITIAL CHARGE.—(a) The initial charge should take from 40 to 60 hours at the normal charging rate, and should not be interrupted until the charge is complete, unless the temperature of the electrolyte exceeds 110 degrees Fahr. In this event, stop charging until the battery cools.

(b) Adjust the charging current to the normal eight-hour charging rate and maintain this value throughout the charge. Readings should be taken on every cell with a low reading voltmeter immediately after starting the charge, to insure that all the connections are properly

made, positive to negative, and that no short circuits exist.

(c) At half-hour intervals during the course of the charge, read the battery voltage and also the specific gravity of one or two selected cells. The voltage and specific gravity should rise as the charge progresses, and near the end of charge, each should have reached maximum value. Continue to charge for three hours after the maximum values have been reached. At the end of the charge, all the cells should be gassing freely and the specific gravity of the electrolyte in every cell should be stationary.

(d) If, at the end of charge, the electrolyte is not at 1.210 specific gravity at 70 degrees Fahr., it should be adjusted to this value, at the proper height above the plates.

(e) To raise the specific gravity, electrolyte of a higher density, or, if this is not available, electrolyte of 1.210 specific gravity should be added before next charge. To lower specific gravity, water should be added. If necessary, remove a part of the solution from battery before adding electrolyte or water.

(f) Water used in batteries should either be distilled or from a source which has been tested and approved for storage battery use.

(g) As the cells give off hydrogen during charge, an open flame should not be permitted near battery.

Committee: R. B. Elsworth (N. Y. C.), chairman; A. B. Himes (B. & O.), vice-chairman; J. G. Bartell (L. V.), G. E. Beck (N. Y. C.), W. E. Boland (So. Pac.), E. G. Hawkins (N. Y. C.), W. H. Higgins (C. R. R. of N. J.), J. F. Jacobs (C. R. R. of N. J.), T. L. Johnson (D. L. & W.), S. J. Knowlton (P. R. R.), A. H. McKee (O. W. R. & N.), L. F. Viellard (L. I.), C. O. Warner (N. Y. N. H. & H.), A. H. Yocum (P. & R.).

Discussion

(Vice-Chairman Himes called attention by number to the outline covering the directions for the installation of lead type stationary storage battery, asking for criticisms as each item was brought up for discussion. He brought out that the battery manufacturers had complained of the word "pitch" being used for joints, in vitrified brick floors, claiming that it hardens and will crack out. He stated that the committee has agreed to accept the criticism.)

T. S. Stevens (Santa Fe): Why not R. S. A. petroleum asphaltum? That won't harden and it is being used a great deal now.

Mr. Himes: The committee will accept Mr. Stevens' suggestion and look into the petroleum asphaltum.

Mr. Wiegand: I would like to refer to paragraph G of 3, erection. It says, "before proceeding," and I was wondering if that was before proceeding with the erection or proceeding with the charge.

Mr. Patenall: Proceeding needs correction.

Mr. Himes: The committee will change the wording of paragraph 3-G, as suggested.

Mr. Wiegand: In 3-H we speak of wooden separator parts; in 3-J we speak of separators. I was wondering if the same term could not be used in both paragraphs?

Mr. Himes: It hardly seems necessary after referring in paragraph 3-H to wooden separator parts which, of course, we know consist of the veneer and the pins, and so forth, supporting it, to repeat again the word "parts" in the following paragraph.

Mr. Wiegand: I think that word "parts" could be eliminated from H and have the paragraph read, "wooden separators."

The President: The committee will accept that suggestion.

H. M. Beck (Elec. Stor. Bat. Co.): Under number

one the statement is made that "battery should be isolated in a room or box." This is correct with the open type batteries, but there is a type of cells that is being put on the market which is intended to be used without a separate battery room, and on that account it would be a little more accurate if these directions were so changed as to refer to batteries of the unsealed or open type.

Upon the question of the use of pitch, which has been brought out, we have had some very sad experiences in our battery room with the use of compounds which are too brittle, where it is put in with the tile, especially if the temperature gets at all below normal, it not only chips, but it separates from the tile and allows the acid to go through to the foundation, to the concrete, and it attacks the concrete and causes a great deal of trouble. This is something which is very difficult to remedy after it has once occurred. On that account we try to pay particular attention to getting the right kind of compound at the start.

Number 3, under erection, Section A, specifies that sand trays should be filled with dry sand. I have found in going around not infrequently, ordinary building sand used for that purpose, and it is attacked by acids. I think that we usually specify what is known as bar sand or silica sand, which is not attacked by acid.

Section G, under 3: It is stated that the charge should start immediately after electrolyte is put in there. This is a wise precaution, but it is not necessary. There is no special harm results if a considerable period is allowed to elapse, and it is more convenient to handle it in this manner.

Number 4, initial charge A, states that this should not be interrupted until the charge is complete, unless the temperature of the electrolyte exceeds 110 deg. F. In this event, stop charging until the battery cools. I have often had cases where they have taken special pains to have men on the job and carry this on when it would take over 100 hr. In such cases it saves a good deal of time and trouble to interrupt a charge at night, and there is no injury results to the cells from doing so, if the charge is finally carried to the complete maximum.

That same section says that that charge will take from 40 to 60 hr. That is about right in round numbers, but it is much safer practice to go by the maximum load than by any fixed time, and therefore I would like to specify that the charge shall be continued to the maximum average of gravity, and for 10 hr. after the maximum has been reached.

With reference to Section D, it says that at the end of the charge the specific gravity shall be adjusted to 1.210. This again means a good deal of unnecessary labor, because it was quite an operation to adjust the specific gravity of a number of cells, 50 or more, to exactly the same point, and we find it is perfectly satisfactory to allow some leeway, and the practice of our construction department is to consider anything from 1.205 to 1.215 as perfectly satisfactory.

T. S. Stevens: I want to endorse what Mr. Beck has said as representing very clearly the Santa Fe practice, particularly about 4 (f). We work to the maximum without any specific time of charging at all, and in order to insure that we get that, after certain limited time, perhaps $\frac{1}{2}$ hr. during the charge, instead of using 4 (c) we take the specific gravity of each cell until the charge is complete, and we know then that each cell has had its proper charge.

I should think it inadvisable to begin to adjust the electrolyte at the end of the charge. You do not know what subsequent charges are going to do to your electrolyte. It may be after a 10-hr. maximum you have

not done the job, until you discharge the batteries, and possibly discharge it twice, and you find that the specific gravity goes up, and you find you adjust the gravity, only to have to reduce it again. Mr. Beck is right in the fact that we have no need to work to 1.210 specific gravity.

R. B. Arnold (C. & N. W.): With reference to paragraph (h) on page 23, I believe it would be well to have some construction of that paragraph to take care of wooden separators after they have been unpacked and before they are inserted into the battery with electrolyte in and left in that condition over night, as sometimes occurs. I have found wooden separators on top of the box after they have been left over night, in some cases are dried out so that they are not good for further use.

Under paragraph (c) on page 24, I think that the best practice is to add water before the charge is begun in order to have the water thoroughly circulated with the acid, but I do not figure it good practice, if you wish to raise the specific gravity of the electrolyte to add electrolyte. I think that is an instruction of the battery companies, which is not good practice, that after you put in your density of acid, which you wish to specify, and then you find that the electrolyte has gone down in density, that you can remedy it by adding density to increase the specific gravity.

Mr. Himes: The committee will consider the point brought out by Mr. Beck, and present a report covering these items at the next meeting.

(A motion that the specifications as here revised be submitted to the annual meeting for approval and submission to letter ballot for insertion in the manual was carried.)

Mr. Himes: Subject 6 is entitled, "Revise specification for soda primary battery and arrange with Committee VI for preparation of plan for 1000-a. h. primary battery jars."

Mr. Patenall: I would think to provide a rectangular jar for the 500-a. h. battery might result in making the application of setting up of the battery a little more compact than our present receptacle. On the other hand, I want to have the committee tell me why it should be necessary to have two types of jars when I can get nearly all the service I want out of one type. Of course, the same argument would apply with the 1000-a. h. cell. I understand some railways insist that for the 1000-a. h. battery they get either a square or a rectangular top jar. I think the committee should be rather careful in making recommendations in that direction.

Mr. Himes: The committee has not made any recommendation that we adopt any other size or shape of jar, but for some time past several railroads throughout the country have been using the 500-a. h. rectangular jar cell, and, as stated by Mr. Patenall, two or three companies have demanded square or rectangular jars for the 1000-amp. cell. Does the Association desire us to draw specifications for a square or rectangular jar, and will they use all elements and specify they shall be in square or rectangular jars and thus cut down the number of standards?

Mr. Trout: It seems to me it would be inadvisable to design a square or rectangular jar. Possibly it would not take care of the different types of design.

Mr. Erwin: Referring to what Mr. Patenall said, I believe the manufacturers would be delighted if we had only one type of jar and one type of cell. We want to get what the railroads wish but it would be much easier for us if we had to give only one thing.

(The motion made by Mr. Himes, that the rounded jar only is desirable as a standard, was put to vote and carried.)

Report of Committee X—Signaling Practice

THE COMMITTEE SUBMITTED reports on the following subjects:

Report on the problem of signaling single-track roads with reference to the effect of signaling and proper location of passing sidings on the capacity of the line.

Report on the feasibility of separating into distinct types of their own, the signals for train operation, and the markers or signs which indicate the location or position, or both, of information signs and switch signs for conveying in-

formation to trainmen and design suitable day and night (if necessary) markers or signs for switches, derailling switches, stop signs, slow signs, resume speed signs, water station and trackpan markers, highway crossing signs, etc.

Follow developments of automatic train control devices and report regarding such as comply with the A. R. A. requirements.

The Problem of Signaling Single-Track Roads

Further work on this subject was done in applying and testing formulas and methods on pieces of roads and the committee presented an analysis of the effect of passing track location on eighty-eight miles of line.

The analysis of this line is simple, due to the fact that there are no large yards or junction points and that it is used exclusively for freight service. The traffic consists almost entirely of solid tonnage trains between yards at South Pekin and Benld. The running time of these trains as used on sheets 1, 2 and 3 was obtained by computation from the tractive efforts of the locomotives in use, with their full theoretical tonnage for ruling grades. By the use of this method uniform results are obtained which are not possible when taking actual figures obtained by riding trains, unless the average of a large number are obtained, and the speed and time of a train at any point can be found, which is of considerable advantage in locating new passing tracks. These figures are checked by train dispatchers, and by actual figures obtained by riding several trains.

Sheet 1 is an analysis using all the present passing tracks with their present capacity. In this and succeeding analyses the stop for water north of Womac made by all southward trains is not necessary for locomotive requirements, but is made according to rule to relieve the water station at Benld.

It must be remembered that the minimum time between trains is determined by finding the maximum sum of schedules between passing sidings as shown in column K, sheets 1, 2, 3 and 5.

In using all the present passing tracks there are cases where they are so close together that the delayed time is large. Certain of these tracks can be left out and still maintain the same minimum time between trains (it may be advantageous to do this even though the minimum is increased slightly), with a decrease in the delayed time to southward trains waiting for meeting. On sheet 2 is shown an analysis using only the passing sidings which can be used to best advantage in eliminating delayed time.

Sheet 3 shows the schedule as worked out under the

proposed rearrangement. In this rearrangement the following existing tracks are to be extended to 100-cars capacity, the direction of the extension being that to give the best balance of time, due consideration being given to grade, curve, highway crossings, bridges and other conditions affecting passing track location. Green Valley, Allen, Luther, Hubly, Sweetwater, Barr, Siding No. 2, Archer, Lick, Lemmon, Girard and Womac. Three new passing sidings of 100-cars capacity are proposed at Brando, Mile Post 7¼ and Mile Post 94¾. In addition, Benld Yard lead should be extended north into Gillespie interlocking plant, Luther passing track south into Luther interlocking plant, Lick water station moved south to the coal chute with a penstock installed between main and passing track, and a penstock similarly installed at the water station at Lemmon. This will require a total of 7.92 miles of track, but will release 2.33 miles of track at Compro, Virden and Siding No. 3, now used for passing sidings.

Sheet 5 shows a comparison of the sum of the schedules between adjacent passing sidings and the delayed time to southward trains waiting for meeting, as obtained from columns K and L of sheets 1, 2 and 3.

Sheet 6 shows a comparison of the capacity of main track under the different arrangements shown on sheets 1, 2 and 3, giving in an easy comparable form the essential features and results which may be expected from the proposed rearrangement. All figures are based on the assumption that when operating at full capacity each train will meet an opposing train at each passing siding.

The committee recommended that the matter on the capacity of single track be accepted, and printed in the Proceedings as information.

Separating into Types Signals for Train Operation

In the investigation of this subject, the committee developed the following:

Some of the so-called signs govern train operation just as much as the movable semaphore of an interlocking or block signal system and these signs are recognized in the Standard Code of the American Railway Association as signals. See note to the definition of fixed signals, page 235, Rule Book of the American Railway Association, January, 1916, reading as follows:

"The definition of a 'Fixed Signal' covers such signals as slow boards, stop boards, yard limits, switch, train order, block, interlocking, semaphore, disc, ball or other means for displaying indications that govern the movement of a train."

Under this definition stop boards, slow boards, etc., are in fact signals. Work was confined to designing the signs that fall under the above definition and those that are closely related to them, namely, those that convey instructions to an engineman, although they may not "govern the movement of a train."

As a guide to the work, inquiries were sent out to all railroads represented in the A. R. E. A. Standard plans were received from 43 roads and these were tabulated as to type, painting, etc.

Designs were submitted for the following signs:

1. Stop.
2. Speed limit or slow.
3. Resume speed.
4. Yard limit.
5. Station one mile.
6. Yard one mile.
7. Junction one mile.
8. Crossing one mile.
9. Draw one mile.
10. Highway crossing whistle post.
11. Flanger sign.

The committee was not ready to report on the switch target, derail sign and trackpan sign and there may be others, although most if not all of the other signs come under the general heading of information signs.

It was recommended that all of the information signs, such as trespass signs, section limits, right-of-way limits, city limits, end of double track, etc., be of such shape as not to conflict with the designs submitted.

Where a preliminary sign not covered by the designs submitted is needed in the rear of an information sign, it was recommended that it be made in the same form and general character as signs numbered 5 to 9.

For stop, speed-limit, and resume-speed signs (which affect all trains), the committee followed the semaphore type and generally accepted aspects. For signs 4 to 9, inclusive, it was not practicable to follow the semaphore type and, in these cases, it was considered that the object to be accomplished was the greatest visibility and distinguishability as to form. For signs 10 and 11, the signs in present use vary widely but the variations do

In the designs the committee confined themselves to outlines and did not undertake to specify materials from which the signs may be constructed.

No recommendations were made as to standard location of these signs. This appears to be an important matter and one in which uniformity is essential. On this point the committee asked for further instructions.

The committee recommended that the above matter be submitted to letter ballot.

Developments of Automatic Train Control Devices

On this subject, the committee had not learned of

Proposed Standard Signs

anything new of which they might make a report. As an aid to those taking up the subject, it is desirable the following data in regard to classification of devices and reports of official tests made by the Block Signal and Train Control Board and by the Bureau of Safety, Interstate Commerce Commission of train control devices, be given as information.

The train control devices that have been tested and those that have been developed to the extent that models have been made or patents issued may be divided into the following classes or type:

1. Mechanical trip.
2. Electric contact rail.
3. Insulated track rail.
4. Magnetic inductive.
5. Inductive.
6. Hertzian wave or wireless.

Devices Tested

ROWELL-POTTER SAFETY STOP.—This included an automatic signal system, with signals operated by power stored by a passing train, and a mechanically operated train stop.

Tested on the C. B. & Q., near Aurora, Illinois, between December, 1908, and May, 1909. Report of test published in second annual report of Block Signal and Train Control Board.

HARRINGTON TRAIN CONTROL AND ALARM.—An overhead mechanical trip, and audible cab signal.

Tested on Erie, near Englewood, N. J., between January, 1910, and May, 1910. Report of test published in third annual report of Block Signal and Train Control Board.

LA CROIX TRAIN CONTROL SYSTEM.—An automatic stop and cab signal system of the intermittent contact rail type.

Tested on Staten Island Rapid Transit, between March and May, 1911. Report of test published in fourth annual report of Block Signal and Train Control Board.

WARTHEM CAB SIGNAL AND TRAIN CONTROL SYSTEM.—A cab signal and automatic train stop of the intermittent overhead contact type.

SOUTH PEKIN TO BENLO

COMPARISON OF CAPACITY OF MAIN TRACK WITH VARIOUS ARRANGEMENTS OF PASSING TRACKS

| Delay to Southward Train in Minutes = Sum of differences between the maximum and each individual sum of schedules read from adjacent stations, it being considered that trains are so dispatched that there is no delayed train at terminal. (See Sheet 5) | | Catches in Minutes | | Catches in Minutes | | Catches in Minutes | | Catches in Minutes | | Catches in Minutes | |
|--|---|--------------------|-----|--------------------|-----|--|----|--------------------------------------|-----|--------------------------------------|-----|
| Maximum sum of schedules to and from adjacent stations, including time entering and leaving sidings (See Sheet 5) | | Southward | | Northward | | Theoretical Capacity in Trains per Day | | Practical Capacity in Trains per Day | | Practical Capacity in Trains per Day | |
| Number of trains on road at one time | | Southward | | Northward | | Main Capacity | | Main Capacity | | Main Capacity | |

Graphical Representation of Car Capacity

Data for Analysis of Track Capacity

not appear to be material. Designs were submitted conforming to signs that are in quite general use.

It was thought that the limitations of restricted clearances were so varied that it was hardly practicable to design a sign to meet all conditions and it was therefore suggested that the designs submitted could be modified to meet the requirements of each case. Sketches were drawn up to indicate how the designs submitted could be modified to fit track spacing of thirteen feet without encroaching on the clearance limits recommended by the A. R. E. A.

Tested on the B. R. & P., near Rochester, N. Y., in April, 1911. Report not published.

RAILWAY AUTOMATIC SAFETY APPLIANCE Co.—An automatic stop device, of the mechanical trip type, controlled electrically.

Tested on the Pere Marquette, near Saginaw, Mich., between March and May, 1911. Report of tests published in fifth annual report of Block Signal and Train Control Board.

JONES SIGNAL SYSTEM—An automatic train stop of the mechanical trip type, electrically controlled.

Tested on the New York Central, near La Salle, N. Y., in March, 1913. Report not published.

GRAY THURBER TRAIN CONTROL SYSTEM—An automatic train control system using a short section of insulated track and an insulated portion of the train.

Tested on the P. Ft. W. & C., near Pittsburgh, in June, July and December, 1912. Also from April to July, 1914. Report published as part of the report of the Chief of Division of Safety, Interstate Commerce Commission for 1914, as House Document 1482, 63rd Congress, 3rd Session.

AMERICAN TRAIN CONTROL Co.—An automatic train control system of the intermittent electrical contact type.

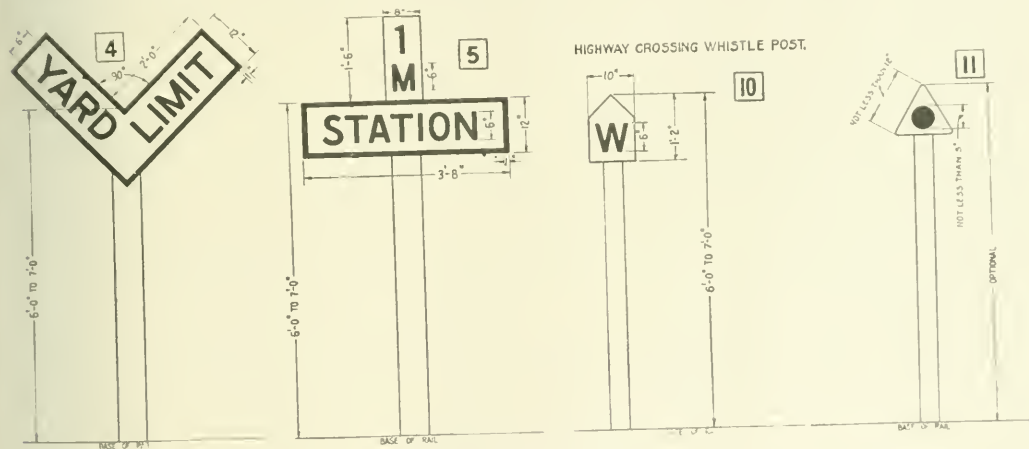

Tested on the Maryland & Pennsylvania, near Balti-

Committee: I. A. Peabody (C. & N. W.), chairman, W. J. Eck (Son. Ry.), vice chairman, C. C. Anthony, H. S. Ballet (N. Y. C.), C. A. Christofferson (N. P.), C. E. Denney (N. Y. C. & St. L.), C. A. Dunham (G. N.), W. H. Elliott (N. Y. C.), G. E. Ellis (I. C. C.), J. V. Hanna (K. C. Term. Co.), J. G. M. Leisenring (I. T. S.), H. K. Lowry (C. R. I. & P.), L. C. Mock (M. C.), F. P. Patenall (B. & O.), A. H. Rodd (P. R. R.), W. B. Scott (S. P. Ry.), T. S. Stevens (A. T. & S. F.), B. Wheelwright (G. T.)

Discussion

J. A. Peabody, Chairman, read the preliminary printed portion of the report, and said:

With regard to paragraph 2, report on the problem of signaling single-track roads with reference to the effect of signaling and proper location of passing sidings on the capacity of the line, I want to take this opportunity of calling your attention to the analysis of location of sidings on single-track lines. We did some work on our road, and in the case of the first piece of track we tried this on I guaranteed our superintendent we would increase the capacity 65 per cent. That was without the signals at all. The traffic conditions have changed on that piece of track so that we have not had to use the capacity fully, but we really obtained wonderful results. Trains are going over the line in a way they never did before, but,

Proposed Standard Signs

more, in November and December, 1914. Report of tests published as House Document 1541, 63rd Congress, 3rd Session.

GOLLOS RAILWAY SIGNAL COMPANY—An automatic train control system of the intermittent electric contact type.

Tested on the C. B. & Q., near Aurora, Ill., from August to October, 1915, and from February to April, 1916. Report of tests published as House Document 1192, 64th Congress, 1st Session.

WOODING TRAIN CONTROL SYSTEM—An automatic train control system of the intermittent electric contact type.

Tested on the D. L. & W., between Hoboken, N. J., and Newark, in May and June, 1915, and from January to April, 1917. Report of tests published as House Document 251, 65th Congress, 1st Session.

The committee recommended that the above matter on automatic train control be accepted, and presented to the association as information.

of course, we have the signals, as well as relocated passing tracks and longer passing tracks, which all go toward accomplishing this effect.

At this time, when it is going to be so necessary for all of us to increase the capacity of our lines with the least amount of labor and material, I believe it is especially necessary that we should go into this subject. I know one other signal engineer who was called on to pass on the question of the capacity of a line and what could be done with it, as against building a second track. He was supposed to be necessary in order to be continued by the officials that the traffic was very necessary, and with the passing tracks properly located, there were more than the necessary capacity for each part to come.

We hope to go on with this work also in connection with double track as well as single track, and I am convinced there is a large amount of work along that line that can be done. I do not know of any department of the railroad better qualified to go at it than the signal department.

I move that this part of our report be accepted as information.

(Motion put and carried.)

Mr. Peabody then read paragraph 6 and said:

We have presented a series of designs which we offer, and recommend that they be submitted to the annual convention for presentation to letter ballot. I so move.

Caleb Drake (C. & N. W.): Should not these designs show the thickness of the material?

Mr. Peabody: I do not think that is at all necessary. They can be designed of various materials.

Mr. Peabody then read paragraph 10.

The President: This general subject is now open for discussion.

Mr. Gault: I think there should be some distinction in the shape between signs requiring a stop and those merely for information.

J. C. Mock (M. C.): A train does not have to stop because the sign is put up and says one mile to the junction. That is information to the engineer.

The President: It has been moved and seconded that the signs or markers shown be accepted for presentation to the annual meeting for approval and submission to letter ballot for insertion in the manual.

(Motion carried.)

The report of the committee was accepted, and the committee was excused with the thanks of the Association.

Report of Committee XVI—Harmonizing of Specifications

THE FOLLOWING OUTLINE of work has been assigned this committee:

1. Harmonize and make complete in accord with accepted standards the wording and requirements of specifications and subject matter desirable or as assigned by the Editing committee.

2. Any matter affecting a committee must be approved by the chairman of said committee before presentation to the Association. The committee desires to report progress, and calls the attention of the Association members to the following:

At a joint meeting of the Editing committee, Harmonizing committee and Committee VIII, on November 9, 1917, the sections and paragraphs at variance in the re-

ports of both the Harmonizing committee and Committee VIII, as submitted at the convention in Atlantic City, were harmonized satisfactorily to the members of these committees.

Committee: F. B. Wiegand (N. Y. C.), chairman; H. S. Balliet (N. Y. C.), G. H. Dryden (B. & O.), W. H. Elliott (N. Y. C.), R. B. Elsworth (N. Y. C.), P. M. Gault (I. C.), E. G. Hawkins (N. Y. C.), R. C. Johnson (B. R. T.), C. J. Kelloway (A. C. L.), L. R. Mann (Mo. Pac.), C. H. Morrison (N. Y. N. H. & H.), F. P. Patenall (B. & O.), J. A. Peabody (C. & N. W.), E. G. Stradling (C. I. & L.).

Discussion

This report was received as information and the committee excused with the thanks of the Association.

Report of Committee VIII—A. C. Automatic Block Signaling

THE COMMITTEE SUBMITTED A NEW SET of specifications to cover a. c. motor semaphore signals. These specifications are divided into 21 different headings which cover the various phases of motor semaphore signals as follows:

(1) Requisite sheet (information for same), (2) alternative proposal, (3) mechanism housing, (4) joints in masts, (5) semaphore spectacle, (6) roundels, (7) operating, connection, mechanical, at base of mast; (8) bearings, (9) semaphore shaft, (10) mechanism, (11) circuit controller, (12) wiring, (13) motor, (14) hold clear device, (15) dielectric tests, (16) insulation, (17) inspection, (18) packing, (19) marking, (20) tests, (21) requisite sheet.

Committee: C. H. Morrison (N. Y. N. H. & H.), chairman; H. K. Lowry (C. R. I. & P.), vice-chairman; F. J. Ackerman (K. C. Term.), B. T. Anderson (D. L. & W.), J. A. Beoddy (N. & W.), J. D. Elder (M. C.), W. F. Follett (N. Y. N. H. & H.), E. C. Grant (U. P.), R. C. Johnson (B. R. T.), J. B. Lamb (Southern), H. G. Morgan (I. C.), W. W. Morrison (N. Y. C.), G. H. Packwood (St. L. M. Ry.), L. V. Parle (S. P.), E. B. Smith (N. Y. C.), F. C. Stuart (E. J. & E.), G. K. Thomas (A. T. & S. F.), L. F. Vieillard (L. I.), F. E. Wass (N. Y. C.), Edgar Winans (A. T. & S. F.), G. H. Wion (Vic. Gov't Ry.), Leroy Wyant (C. R. I. & P.), B. F. Olcr (P. R. R.).

Discussion

C. H. Morrison, Chairman: Since submitting this report the committee has held three meetings, and in reviewing the specification, as submitted, has deemed it advisable to introduce several changes and begs leave to postpone action on this specification until the next meeting, when it will be re-submitted.

The President: Unless there is some objection, the request of the committee will be acceded to.

Mr. Morrison: The specifications we have submitted, with a few exceptions, were prepared by a committee of eight last year. Unfortunately the sub-committee turned over to the committee of eight the completed specification too late to submit at the annual meeting. It includes not only the mechanism, but the entire signal. On account of the signal mechanism being so closely associated with the design of the signal mast, it was necessary to include in the specification for the mechanism the mast. For instance, there is the question of housing of the mechanism in case it is placed at the face of the pole; the method of operation between the mechanism and shaft and spectacle in case the mechanism is placed at the top of the pole. We gave the instructions given to us by the Committee on Committees very careful consideration, and owing to the fact that the specification was almost complete, we deemed it advisable, on account of the close association of other parts of the signal to the mechanism, to include in the specification the signal mast parts.

The President: This matter will be referred to the Committee on Committees.

Canadian Pacific Meeting at the Coliseum

Among the early arrivals at the Coliseum yesterday morning were E. Keough, assistant engineer maintenance of way, Canadian Pacific, with 13 roadmasters from as many different divisions on the eastern lines of that road. This is the third year Mr. Keough has brought a similar party to the exhibit. As one-third of the roadmasters on the line have attended the exhibit each year, all of those on the eastern lines have now had an opportunity to visit Chicago and study the display at the Coliseum.

Corporate and Operating Expenses Separate

(From our Washington Correspondent)

Director-General of Railroads McAdoo issued a circular yesterday ordering that after April 1 expenses of railroad offices at New York or elsewhere, devoted to financial and corporate matters as distinguished from operating matters, must cease to be charged against operating expenses, except as expressly authorized by him. This is taken to indicate that all financial and corporate, as distinguished from operating expenses, will be required in time to be paid by the railroad companies from the guarantees made to them by the Government.

Special Meeting of Committee No. 8, R. S. A.

The chairman of Committee 8, on A. C. Automatic Block Signaling, announced that a special meeting of that committee will be held in Room 401 of the Auditorium Hotel at 2:30 p. m. today.

N. R. A. A. Annual Meeting

The National Railway Appliances Association will hold its annual meeting and election of officers in the Coliseum at eleven o'clock this morning. The reports of the retiring officers will be presented and other necessary business transacted.

Union Pacific Men Go to Washington

E. E. Adams, consulting engineer of the Union Pacific, and F. W. Sercombe, assistant controller, with headquarters at New York, have been appointed assistants to R. S. Lovett, director of the Division of Capital Expenditures on the staff of the director-general at Washington.

A. N. Talbot Heads New

U. S. Construction Division

A. N. Talbot, professor of civil engineering at the University of Illinois and chairman of the special committee of the American Railway Engineering Association on Stresses in Track, has been appointed chairman of the newly created construction division in the war department to carry on the immense building program of the government, involving an expenditure of over one billion dollars and the employment of hundreds of thousands of workmen. This is a recognition of Professor Talbot's ability which will be welcomed by his many friends among the members of the Engineering Association. Professor Talbot was also elected president of the American Society of Civil Engineers at its annual meeting held in New York in January.

The Material Situation

The Western Society of Engineers has prepared a special program for a meeting to be held in its rooms in the Monadnock Block this evening. The subject for consideration will be the material problem as it affects engineers. The conditions in the structural steel plants will be described by E. J. Llewellyn, division contract manager of the American Bridge Company. The situation in the lumber industry will be described by Hermann Von Schrenk, consulting timber engineer, St. Louis, Mo., while the conditions in the Portland Cement Industry will be outlined by B. F. Affleck, president of the Portland Cement Association. A special invitation is ex-

tended to the members of the American Railway Engineering Association to attend this meeting and to participate in the discussion of this topic which is of so much concern to engineers at the present time.

A. R. E. A. Board of Direction Meets

The Board of Direction of the American Railway Engineering Association met in the English Room of the Congress Hotel yesterday forenoon to complete plans for the convention and make preparations for the coming year. Fourteen members were present.

No June Meeting of Railway Signal Association

The Board of Direction of the Railway Signal Association has announced that no stated meeting of that association will be held in New York this year, but that this meeting will be consolidated with the annual convention which will be held in September as usual.

Wood Preservers' Meeting

The Executive committee of the American Wood Preservers' Association will meet at the Sherman Hotel at 6:30 this evening to formulate plans for the year's work. In view of the unsettled conditions in the industry, a number of important problems will be presented for consideration.

Movies of the Tie Tamper

The Ingersoll-Rand Company presented a moving picture film of its pneumatic tie tamper in action in the Green room at the Congress Hotel at 5:30 yesterday afternoon. This program will be repeated at the same hour this afternoon and at 12:30 on Thursday. All railway men are invited to see this film and to observe tie tampers in action.

The Roadmasters Meet

A meeting of the Executive committee of the Roadmasters' and Maintenance of Way Association will be held at the Auditorium Hotel this evening. The taking over of the operation of the railroads by the government has created a number of problems for this Association which will be discussed at this meeting and the course of procedure outlined.

The President's Annual Dinner

J. G. Sullivan, president of the American Railway Engineering Association, gave a dinner in the English Room of the Congress Hotel last evening to the members of the Board of Direction and the Committee on Arrangements. These dinners have become an annual event through a custom which has been followed for a number of years. The number attending the dinner last night was somewhat larger than in the year previous, a hopeful indication of the attendance at the convention.

On the Union Pacific

(A Jap section train reports)

To your let or will answer Bull and calf come on high on hill, no bull no feed on one, come down on track. Calf come, to, be wagon crossing street line on crossing same time come No. 9. Don't know title but time was dark. Calf run. Bull get on. Bull broke into cannot skin. U. Tonne.

The Railway Signal Association and the War

An Outline of the Activities of the Members in Military and Naval Work. A Number of Men Already in Active Service

MARSHAL JOFFRE called the present conflict a "railway war" as long ago as 1914. When the history of this war is written the railways of the world will no doubt receive proper credit for their important part in the conflict. The railway weapon, or "The Fifth Arm," as it has been called, will be one of the essential and determining factors for the winning of the war. Had it not been for the well organized railway systems of France at the time of the battle of the Marne, history might have had an entirely different story to chronicle. Germany, with all her vaunted efficiency, would have been utterly unable to make the showing she has to date were it not for her perfectly organized railway systems.

No army in the field, no matter how large or small,

overseas duty. How nobly they have responded is common knowledge to all. The glorious part a small unit of these men took in the battle of the Cambrai is but an indication of what may be expected from them on a larger scale. These men have been selected from all classes of the service and all railroad organizations are no doubt represented by men in such service. In this connection the Railway Signal Association has had three of its standing committee members enter the service.

These members consist of Lieut. R. M. Phinney, who was formerly a member of committee No. 4—Direct Current Automatic Block Signaling; Capt. E. L. Adams, formerly vice-chairman of committee No. 9—Wires and Cables, and Capt. W. M. Vandersluis of committee No.

Capt. W. M. Vandersluis

Lieut. R. M. Phinney

Capt. E. L. Adams

can fight unless the necessary supplies and equipment reaches it when needed. In this war there may be considered to be two general divisions: the fighting forces and the production forces. It is unnecessary to dwell upon the important part to be played by the production forces, as without the proper spirit and work of these forces the fighting division would be of little or no use. The connecting link between the two forces is the transportation unit. The breakdown of either one of the three units means catastrophe. With the transportation link as the unit connecting the other two it is plain to see what an important bearing this unit has upon the whole outcome of the war. Realizing the importance of this unit, all men engaged in transportation are bearing their share of the burden towards a victorious ending to the present conflict only when they do their utmost to facilitate the smooth operation of this machine.

In order to preserve an unbroken link in this unit from our country to the fighting line over 3,000 miles away it is necessary that the fighting division have numbered among its men experienced men in the transportation field in order to operate efficiently the military railroads that it is necessary to construct from the port of debarkation in France to our fighting lines. It was necessary that the railroads of our country furnish the men for this

10—Signaling Practice. In addition to the above members, Harley E. Johnson of the nominating committee has also entered the service.

Capt. E. L. Adams was appointed senior signal engineer, Bureau of Valuation, Southern district, Interstate Commerce Commission, with headquarters at Chattanooga, Tenn., in 1914, and remained in the service of the Bureau of Valuation until September 3, 1917, when he was called into the military branch as a captain of engineers in the United States Officers Reserve Corps, and was sent to Ft. Leavenworth, Kan., for further training. On December 5, 1917, he was attached to the 112th Engineer Regiment at Camp Sheridan, Montgomery, Ala., and received orders in January, 1918, for overseas duty. He arrived in France about February 1, 1918. His company and regiment number are unknown, his address being U. S. Expeditionary Forces, France.

Capt. Adams is well known in the Railway Signal Association, in which he has been a very active member. In 1908 he was vice-chairman on the special committee of the Railway Signal Association for storage battery jars and accessories for automatic signal work, and in the same year he also served on a special committee on rubber-covered wire. In 1909 he served as vice-chairman on a special committee reporting on wires and

cables. This committee in 1910 was designated as Committee No. 9. He served continuously as vice-chairman of Committee No. 9 from 1909 to the time of his entering the army in 1917. In addition to the above assignments he also served on Committee No. 4—Automatic Block, from 1911 to 1915, inclusive.

Lieut. Robert M. Phinney was assistant engineer in the signal department of the Chicago & North Western when he accepted a commission as first lieutenant in the 415th Railway Telegraph Battalion, under Major Sherwood's command, in January, 1918. Lieut. Phinney has taken an active part in the Railway Signal Association work and served on Committee No. 4—D. C. Automatic Block Signals—continuously from 1913 until the time of his entering the army. In 1917 he was vice-chairman of this committee. In 1915 he also served on Committee No. 9—Wires and Cables.

Capt. W. M. Vandersluis was appointed signal engineer of the Illinois Central on December 16, 1912, which position he held until he was called into the service, after having accepted a captain's commission in the United States Officers' Reserve Corps. He was called to Ft. Leavenworth training camp on September 5, 1917, and was assigned to the 35th Engineers at Camp Grant, Rockford, Ill., on December, 1917. He received orders in January, 1918, for overseas duty and arrived in France about February 1, 1918. His company and regiment number are unknown, as he was unassigned at the time of leaving.

Capt. Vandersluis took an active part in the Railway Signal Association. In 1907 he was chairman of Committee No. 7 on Copper and Iron Wires for Pole Lines. From 1914 to 1916, inclusive, he was chairman of Committee No. 4—Automatic Block. In 1915 he was on a special committee on Contracts. In 1916 and 1917 he served on Committee No. 1—Signaling Practice, and in 1916 he was also on a special committee on Harmonizing of Specifications. In 1917 he also served on the committee of committees and on the finance committee of the Board of Direction.

In addition to the above members of standing committees who are now in military service, Major R. F. Morkill, signal engineer of the Grand Trunk, has been another active member in the Railway Signal Association. Major Morkill enlisted as a supernumerary second lieutenant in the Canadian Engineers early in October, 1914. He was at once sent to England for training and was sent to France about February or March of 1915. He served in France until June, 1915, when he was made a full lieutenant and transferred to the Royal Engineers. He was then sent to England on special work and remained there until the latter part of December of the same year, when he again returned to France, and has been there continuously since. He was successively promoted to Captain and Major and was presented with the Military Cross in the New Year's honors of January, 1917. In August, 1917, he was transferred to the Grand Headquarters staff and placed in charge of all of the signaling on the British railways in the occupied portions of France and Belgium. Before going to press a wire was received reading that "Major Morkill's present title is Railway Signal Engineer, and he is a staff officer to the chief railway construction engineer."

Another member who has taken an active part in the Railway Signal Association is Major Azel Ames, Jr. Major Ames has been connected with the New York Central Lines, the Block Signal and Train Control Board and with the Kerite Insulated Wire & Cable Company. In 1907 and 1908 he was chairman of Committee No. 12, Rubber-Covered Wires, and in 1908 he also served on

Committee No. 1 on Signaling Practice, and on Committee No. 7, Subjects and Definitions. He is at present a Major in the 61st Regiment, Coast Artillery, and is located at Fort Screven, Savannah, Ga.

In addition to the above men, records show that the following men have entered some branch of the service: W. G. Atwood, Assistant District Engineer, Bureau of Valuation, Interstate Commerce Commission, Chattanooga, Tenn.; A. M. Bears, signal supervisor, C. P. R.; P. E. Carter, sales engineer, General Railway Signal Company, New York; C. W. Cochran, engineer maintenance of way, C. C. & St. L., Galion, Ohio; D. K. Crawford, signal draftsman, A. T. & S. F., Topeka, Kan.; C. M. Deardorff, sales engineer, General Railway Signal Company, Chicago; C. L. Falk, signal maintainer, Wabash, St. Louis, Mo.; John H. Finney, manager, Washington office, Aluminum Company, Washington, D. C.; John S. Hall, transportation student, C. P. R., Montreal; R. B. Johnson, assistant engineer, General Railway Signal Company, of Canada, Lachine, P. Q.; C. B. Keers, signal construction foreman, A. T. & S. F., Topeka, Kan.; Roy Kimple, signal draftsman, N. Y. C., Cleveland, Ohio; F. Kingsley, associate editor, Electric Railway Journal, New York; W. Landesburg; F. R. Lindsey, signal inspector, C. & E. I., Chicago; C. A. Lyon, signal draftsman, I. C., Chicago; W. P. Martin, signal inspector, I. C., Chicago; William J. Payne, inspector, Saxby & Farmer, Ltd., Montreal; J. M. Perrin, senior signal engineer, Interstate Commerce Commission, Bureau of Valuation, San Francisco; M. Roginsky; S. E. Rollins, signal draftsman, I. C., Chicago; O. B. Ruggles, signal supervisor, B. & M., Salem, Mass.; F. J. Ryan, signal draftsman, I. C., Chicago; D. A. Scarnickia; C. D. Symes, signal inspector, D. W. & P., Virginia, Minn.; E. A. Warner, Jr., commercial department, Union Switch & Signal Company, Swissvale, Pa.; H. F. Johnson, signal inspector, C. & O., Richmond, Va.

In addition to the above members who are in military service, C. E. Denney, assistant to the president of the N. Y. C. & St. L., for some months past put in a good part of his time at Washington as general agent, American Railway Association, in the office of Col. Littell, quartermaster's office, who was in charge of cantonment camps. Mr. Denney was looking after the transportation end of the work in this department.

F. A. Bushnell Appointed on

Regional Director's Staff

F. A. Bushnell, purchasing agent of the Great Northern at St. Paul, has been appointed a member of the Regional Purchasing Committee on the staff of the regional director, R. H. Ashton, in place of Ira O. Rhoads, purchasing agent of the Southern Pacific, whose appointment was announced last week.

Reunion of Santa Fe Men

The fourth annual luncheon of the past and present members of the Santa Fe Signal Supervisors' Committee was held in the French room of the Congress Hotel on Monday noon. Those present were T. S. Stevens, signal engineer, L. Brown, assistant signal engineer, and H. Hobson, signal supervisor of the Santa Fe. G. R. Cowherd, signal engineer, F. Paso & Southwestern, B. F. Anderson, assistant signal engineer, Delaware, Lackawanna & Western; H. K. Ferguson, secretary Austin Company, and J. S. Holton and J. E. Saunders of the Union Switch and Signal Company.

First War Show of Railway Appliances Association

Importance of Transportation During World Conflict
Increases Need for Coliseum Exhibition

THE CHANGING CIRCUMSTANCES attending the prosecution of the war, the uncertainties following the assumption of control of the railways by the government, the dormant condition of the railway market, the heavy demands of munitions and other war contracts on railway supply factories and the necessity of railway men giving almost unrelenting attention to their official duties—all were factors which tended to discourage the exhibition of railway devices at the Coliseum this year. Some of the more timid members of the National Railway Appliances Association were for a time opposed to holding the show, but the courage, foresight and sound judgment of the officers and directors of the organization prevailed and one of the largest expositions of railway devices and materials ever held is now a fact. The association makes no apology for conducting its first show in war time and rightly so, for never before have there been so many new railroad officers for whom it will prove of material practical assistance and educational benefit as this year. E. H. Fritch, secretary of the American Railway Engineering Association, reports that 103 members are now with the colors, and, needless to say, the appointment of their successors and the incidental changes in railroad organization involved thereby have modified the personnel of railroad construction and maintenance of way departments, as it has never been changed before in so short a time. That the judgment of the officers of the supply association was well founded was evidenced by the unusual demand for individual passes to the show after the usual allotment of 12,000 invitations had been sent out. A large share of these special requests came from the East, a section of the country from which many thought the attendance would be light on account of unprecedented operating difficulties resulting from the war.

From the point of view of government control the exhibition is particularly well justified, for the paramount problem confronting Mr. McAdoo is to increase the capacity of the transportation system of the country and to do it quickly. It is common knowledge that he contemplates more extensive additions and betterments than have been undertaken for many years and the execution of this program demands the best brains and the most conscientious efforts of railroad officers and railway supply men alike. It is especially fitting, therefore, on the eve of this period of quickened activity, that leading engineers, both in railroad service and in the supply industry, should gather together to exchange ideas and to appraise the latest developments in the design and manufacture of railway appliances. It has been well said that transportation, next to our military and naval arms, is the most important factor in the successful conduct of the war. It is consequently vital that inventive genius

be stimulated to the utmost to the end that all means possible be utilized to make our railroads more efficient in the performance of their important function. The value of the Coliseum show is, therefore, even greater than in times of peace and of even more benefit to the railway officer, no matter how heavily burdened he may be with his regular duties. As yet no dependable prophet has appeared to forecast the date of the termination of the war and hence it is the wiser course to prepare for all exigencies which may arise in a long struggle. If the conflict does last for several years longer the holding

of a railway appliance show this year and in succeeding years will prove one of the most effective means of stimulating progress in railway methods and practices and thereby making final victory more certain.

For the very purpose of making possible the most extensive and varied exhibition of devices, the association increased the number of available spaces in the Coliseum, with the result that 267 booths are occupied this year as compared with 237 in 1917. So far as possible old exhibitors were given their old spaces, while others were assigned booths on the basis of "first come, first served."

The annual railway appliances exhibition has reached such large proportions that its successful management and economical conduct demand organizing genius and executive ability of no mean order. The experience of each succeeding year has proved profitable in pointing the way to further innovations in policy and methods, and this year's preparations for the show were carried on with particular expedition. Whereas much of the work of constructing booths and placing exhibits had to be done hurriedly in 1917, this year 102 work orders were in before March 1 and 90 per cent of the appliances for display were in Chicago before March 8, despite the unusual delays in transportation. All freight moving to the show is consigned directly to the secretary of the association, who provides special shipping tags for this purpose, and as soon as it arrives it is placed in storage, from which it is removed to the Coliseum as soon as the booths are completed. In a like manner all work connected with decorating and wiring the hall, constructing the booths, etc., is handled by the association to prevent delays and confusion resulting from the closing of individual contracts for this work by the exhibitors. This plan has the added advantage of preventing the exaction of exorbitant prices, for contractors must base their bids on the basis of dealing with the association again in succeeding years. The methods, above outlined, are an indication of the painstaking efforts of the officers and directors of the association to carry on the exhibition most economically and efficiently. The one end which they aim to achieve is to make the show pay for itself and

E. H. Bell,
President

C. W. Kelly, Secretary
P. C. Jacobs
F. J. Johnson

M. J. Trees, Vice-President
J. B. Strong
G. C. Isbester

H. M. Sperry, Honorary Director
E. E. Hudson
J. Alexander Brown

produce the maximum results from the amount expended. Needless to say the exhibition is not a profit-making undertaking and any surplus which may be made is carried over to the succeeding year.

The railway appliances exposition is new not only to many railroad officers, but to a considerable number of railway supply representatives who have taken the places of those who have gone to the colors. Practically all railway supply companies have contributed their share of men to our armed forces. Perhaps the most prominent member of the National Railway Appliances Association is Lieut.-Commander George C. Isbester, a director of the association, and now in the service of the U. S. Navy as a paymaster in the supply department at Chicago. Several firms have service flags displayed at their booths to indicate the numbers of their employees who have responded to the call of the government.

The officers and members of the board of directors of the National Railway Appliances Association are as follows: President, E. H. Bell, Railroad Supply Company, Chicago; vice-president, M. J. Trees, Chicago Bridge & Iron Works, Chicago; secretary, C. W. Kelly, Kelly-Derby Company, Chicago; honorary director, H. M. Sperry, publicity representative of the Union Switch & Signal Company, the General Railway Signal Company, the Hall Switch & Signal Company and the Federal Signal Company, New York. Directors: P. C. Jacobs, H. W. Johns-Manville Company, Chicago; J. B. Strong, Ramapo Iron Works, Hillburn, N. Y.; J. Alexander Brown, Pocket List of Railroad Officials, New York; Lieut.-Commander G. C. Isbester, United States Navy, Chicago; E. E. Hudson, Waterbury Battery Company, Waterbury, Conn.; F. J. Johnson, American Hoist & Derrick Company, St. Paul, Minn.

Edwin H. Bell, president of the association, is president of the Railroad Supply Company, Chicago. He was born in Philadelphia, Pa., and has been a resident of Chicago since 1896. After attending the public schools and graduating from the Blairstown Academy, Blairstown, N. J., he took a course in business training in the Pearce Business College at Philadelphia. In 1890 he was employed in the general manager's office of the Lehigh Valley at Buffalo and in 1897 he entered the employ of the Railroad Supply Company. In 1906 he was elected vice-president of his company and continued in that capacity until January, 1916, when he was elected president to succeed Henry S. Hawley, deceased. A large part of the success of the exhibit this year is due to the courage of Mr. Bell in advocating the importance of proceeding with plans for the display when some members of his cabinet thought for a time that it should be postponed this year.

New R. S. A. Committee Chairmen

AMONG THE CHAIRMEN of committees of the Railway Signal Association this year there appear the names of four new men. Committee No. 5—Maintenance and Operation—is headed by L. R. Mann. Committee No. 12—Contracts—was headed by C. A. Christofferson, but as he refused to accept the chairmanship, R. C. Johnson was reappointed in his place. Committee No. 13—Electric Testing—is headed by P. M. Gault, and Committee No. 16—Harmonizing of Specifications—is headed by F. B. Wiegand. Of these four new committee chairmen Mr. Johnson and Mr. Wiegand served as heads of committees last year. This leaves Mr. Mann and Mr. Gault as the only new members heading committees.

Mr. Mann was appointed on committee No. 5 in 1909

and in 1910 he was made vice-chairman, in which capacity he acted from 1910 to 1918, when he was appointed chairman. In addition to being chairman of committee No. 5, he is also chairman of the St. Louis Regional committee and as a member of the Board of Direction is on the convention arrangements committee.

It will be the duty of committee No. 5 during the present year to prepare instructions for the maintenance of mechanical interlocking plants and of stationary and portable storage batteries. It shall also be the duty of this committee to investigate and report on methods of handling trains by signal indications without train orders, a very live subject at the present time, inasmuch as the elimination of a large number of train orders will do much to keep the long trains moving, which otherwise would have to stop at various train order stations to sign for 31 orders.

Mr. Mann has had an extensive and varied experience in signal work. He began with the Chicago & Alton in 1900, being engaged on the construction and maintenance of automatic block signals from 1900 to 1902 and serving from a laborer to a signal foreman on this line.

L. R. Mann

P. M. Gault

In 1902 he went to the General Railway Signal Company as a mechanic on the construction of electric interlocking and served as mechanic and as foreman with this company in 1902 and 1903. From 1903 to 1904 he was connected with the Lake Shore & Michigan Southern on the maintenance of interlocking and block signals between Erie, Pa., and Buffalo, N. Y. In 1904 he accepted a position as general foreman on the maintenance and construction of signals on the Atlantic Coast Line and was located at Waycross, Ga. He served in this capacity until 1905, when he was appointed supervisor of signals on the Missouri Pacific, serving in this capacity until 1916, when he was appointed general signal inspector for the Missouri Pacific-Iron Mountain system, which position he holds at present.

P. M. Gault, the new chairman of committee No. 13 on Electric Testing, became a member of the Railway Signal Association in 1909 and served on committee 7, covering Definitions in 1913 and 1914, and on a special committee in 1914 on Methods of Recording Signal Performance. He has been connected with committee 13 since 1915, and acted as vice-chairman in 1916 and 1917. In addition he is the chairman of the Chicago Regional committee.

Committee No. 13 has been assigned to prepare, for this year, instructions for testing relays, indicators and

signal repeaters; to prepare tables of standard ranges and scales for electric testing instruments; standard forms for recording results of tests, and a specification for adjustable resistances to be used in testing purposes.

Mr. Gault is a 1906 graduate in electrical engineering at Ohio State University. After graduation he entered the service of the Pennsylvania Lines West of Pittsburgh as a signal apprentice and was assigned to the eastern division of the P. F. W. & C. After completing his apprenticeship course he was appointed signal inspector of the Chicago Terminal division in 1910. In

April, 1913, he resigned his position with the Pennsylvania Company and entered the service of the Illinois Central as supervisor of signals of the Illinois division, with headquarters at Champaign, Ill. In April, 1914, he was promoted to signal inspector, working out of the signal engineer's office. In January, 1915, he was promoted to the position of office engineer in the signal department. This position he held until October, 1917, when he was promoted to pilot signal engineer in the valuation department. In February, 1918, he was promoted to assistant engineer in the valuation department.

N. R. A. A. Has Attractive Exhibit at the Coliseum

Re-arrangement of Space Necessary to Accommodate Exhibitors;
Thirty-six New Companies Have Displays

THOSE WHO HAD HARBORED THE faintest doubt regarding the success of the National Railway Appliances Association exhibit this year had their fears completely allayed by the appearance at the Coliseum at nine o'clock yesterday morning when this organization opened its tenth annual show. With a few minor exceptions, all exhibits were ready and the universally expressed opinion is that the show, as a whole, presents a better appearance than in any previous year. There is just as much enthusiasm, just as much effort to interest and instruct the visitors, and just as much optimism as at any previous show, with the difference that the increased experience of the exhibitors has enabled them to display their devices to better advantage each year. Special pains have been taken through various ingenious methods to explain appliances more thoroughly and, as nearly all materials and appliances shown have seen actual service, the supply firms, as heretofore, are not overlooking opportunities to demonstrate actual results secured.

The display will continue as usual for four days, Monday to Thursday, inclusive, and, according to established precedent entrance is by means of tickets, a large number of which have been distributed among railway men. However, a pass or other evidence of railway employment will admit one.

While the improved appearance has been brought about in part by a more artistic treatment of the decorations of the hall and individual booths, a unity of treatment of the booth arrangements has been most effective in accomplishing the desired result. The idea as carried out has been particularly effective in the Annex, which has been made an integral part of the show. A material improvement was made last year in placing the main entrance to the exhibit in the Annex, and this plan has been retained this year with excellent results.

The most important change this year is the rearrangement of the aisles, which consists primarily of the elimination of the main east and west center aisle. This has been effective in increasing the available exhibit space, these changes having provided for 31 additional booths. While familiar devices and familiar faces greet the eye in the many corners of the show, a large number of new features present themselves in the displays of 36 new exhibitors who occupy 58 exhibit spaces in addition to the 119 old exhibitors. The accommodation of the newcomers presented one of the most formidable problems in arranging for this year's show. One outcome of this was the arrangement for 31 extra exhibit spaces, as noted above, while the remaining space was provided through the release of 27 spaces by old exhibitors. Thus the 119

firms who occupied 236 spaces last year make use of only 209 this year. For most part this reduction in space has been accomplished without any change in the policy of the exhibitors, although some of the signal companies are not showing as complete displays as in former years.

While somewhat broader in its scope this year, there has been no change in the firmly established policy of providing an educational display of devices interesting to men in the railway engineering and maintenance of way field. While occurring simultaneously with a convention of higher officers of these departments, special efforts have been made to reach the men in subordinate positions, a policy which has borne fruit in an ever-increasing attendance of supervisors and roadmasters with not a few foremen.

List of Exhibitors

The following is a list of the firms presenting exhibits, with the devices on display and the names of the representatives present at their booths:

A. G. A. Railway Light and Signal Company, Elizabeth, N. J.—A. G. A. railway grade crossing signal; highway danger signal; railroad signal lights—unison flash, single flash and steady light. Represented by J. K. Howard, C. S. Tiemann, A. G. Shaver and H. E. Gifford, Jr. Spaces 39 and 40.

Adams Motor & Manufacturing Company, 3914 Castello Avenue, Chicago.—Inspection motor cars. Represented by W. E. Adams, L. Gerhardt and A. P. Greiner. Spaces 218 and 218½.

Adams & Westlake Company, Chicago, Ill.—Signal lamps and lanterns; switch locks. Represented by G. L. Walters, A. S. Anderson, W. J. Pierson, C. B. Carson and H. G. Turney. Spaces 87, 88, 106 and 107.

Ajax Rail Anchor Company, Chicago.—Rail anchors. Represented by H. G. Elfborg, A. W. Holmberg and H. W. Reynolds. Space 89.

Alexander Crossing Company, Chicago, Ill.—Continuous rail crossing. Represented by Lewis Alexander, P. E. Scott, G. D. Alexander and L. C. Keenan. Spaces 228, 229 and 230.

Alger Supply Company, Chicago.—Represented by J. M. Fitzgerald and O. S. Flash. Space 167.

Alliath-Prouty Company, Danville, Ill.—Electrically operated door hardware; fire door hardware; freight and warehouse door hardware. Represented by A. Vera Martin, H. R. Maxwell, I. D. Cotterman and F. E. McCluskey. Space 181.

American Hoist & Derrick Company, St. Paul, Minn.—"American" railroad derrick. Represented by F. J. Johnson, C. C. Austin and Clark Hook. Space 88½.

American Kron Scale Company, New York, N. Y.—Railroad portable scale and railroad platform. Represented by W. W. Camp, F. Ohnell, C. F. Fisher, M. Abrahamson and F. M. Franklin. Space 214.

American Steel & Wire Company, Chicago, Ill.—Steel fence posts; woven wire railroad fence; wire netting; rail bolts. American signal wire. Represented by B. D. Ayers, I. F. Alexander, L. P. Shanahan, J. W. Collins, W. M. Miller, Jr., C. S. Knight, Jr., B. H. Rider, C. F. Wilson, William Powell, M. Flato, E. J. Conkling and P. J. Hinchey. Spaces 70½ and 71.

American Valve & Motor Company, Cincinnati, Ohio.—Poage water columns; economy switch stands; Anderson interlocking

switch stands; Anderson safety switch appliances. Represented by J. T. McGarry, F. C. Anderson, J. De Pinal and D. Higgins. Spaces 130, 131 and 132.

American Vulcanized Fibre Company, Wilmington, Del.—Vul-Cot fiber insulation for railway signals. Represented by C. V. Sutton, C. C. Bell, W. A. Jordan, Wm. Maxwell and John Barron. Space 126.

Anti-Creep Corporation and Anchor Company, New York.—Bowman efficiency rail anchor. Represented by W. E. Burke, T. B. Bowman, Bob Evans, Orlando Metcalf and Ellsworth L. Mills. Space 192½.

Armco Iron Culvert Manufacturers, Middletown, Ohio.—Corrugated culverts; roofing; metal lath and other products for railway use made from rust-resisting Armco iron. Represented by B. G. Marshall, Thomas Smith, G. F. Ahlbrandt and F. B. Milhoan. Spaces 99 and 100.

Asbestos Protected Metal Company, Pittsburgh, Pa.—Asbestos protected metal; roofing and siding; A. P. M. gypsum roof construction; A. P. M. Waugh glazing construction; A. P. M. McAllister ventilators. Represented by John H. Vance, J. T. O'Neill and A. McAllister. Space 169½.

Associated Manufacturers of Malleable Iron, Cleveland, O.—Malleable iron castings of many kinds for cars, trucks and automobiles; testing machines. Represented by S. H. Standish, W. A. Draves, A. O. Buckius, F. C. Rutz and Jas. T. Llewellyn. Spaces 221 and 222.

Austin Company, Cleveland, Ohio.—Plans, specifications and views of standard railway and industrial building units. Represented by H. K. Ferguson, W. L. Bailey, W. F. Chambers and E. M. Haas. Space 150½.

Ayer & Lord Tie Company, Chicago, Ill.—Creosoted wood blocks for floors; creosoted materials. Represented by A. H. Noyes, W. H. Blythe and L. S. Eiffel. Space 225.

John Baker, Jr., Chicago.—Asphalt for all purposes; Aspha-Way and Aspha-Bric for freight and ware house flooring, team-track paving, station platforms, etc. Represented by R. M. Elder and others. Space 201.

The Barrett Company, New York.—Barrett's specification roofing and bridge waterproofing; semaphore roofing; Everlastic Tylike shingles; Carbosota for wood preservation; Tarvia for railroad grade crossings and station platforms; Tar-Rok for sub-floor construction; Holt roof connections for interior drainage. Represented by C. F. Ames, C. T. Bilyea, W. S. Babcock, G. R. McVay and J. J. Ross. Spaces 107½ and 108.

Benjamin Electric Manufacturing Company, Chicago, Ill.—Various forms of lighting fixtures for right-of-way and maintenance of shops; industrial signals and electrical specialties; panel boards. Represented by G. B. Weber, A. E. Lubeck, M. J. Cleary, Ray Prior, J. T. B. Addington, O. L. Johnson, W. Cottrill and C. B. Harlow. Spaces 149½ and 150.

Bethlehem Steel Company, Bethlehem, Pa.—New Century adjustable model 51A switch stand; Steelton positive switch stand model 52A; U. S. A. non-adjustable switch stand. Represented by R. W. Belknap, J. F. Hennessy, E. B. C. Goyne, E. E. Goodwillie, Stanley H. Smith, Neil E. Salsich and K. C. Banks. Spaces 199 and 216.

Boss Nut Company, Chicago.—Boss lock nuts, bolts, nuts and rivets. Represented by J. A. MacLean, J. W. Fogg, C. Beaumont, W. G. Willcoxson and A. W. MacLean. Space 169.

L. S. Brach Supply Company, Newark, N. J.—Railway signal lightning arresters; crossing bells; telegraph apparatus; signal accessories. Represented by G. Gort, A. G. Brach and L. S. Brach. Space 2.

Bridges & Building Association, Chicago, Ill.—Represented by C. A. Lichty. Space 226.

Bryant Zinc Company, Chicago, Ill.—Models 1, 2 and 3 auto flags; gong type crossing bells; locomotive type crossing bells A. C. or D. C.; annunciators; relays; lightning arresters; resistance units; channel pins; bond wires; rail contacts; testing instruments; blue vitriol; battery zincs; battery coppers; primary batteries; signal accessories. Represented by A. F. Klink, Stanley C. Bryant, H. F. Worden, J. P. Costigan, W. P. Graves and A. Muller. Spaces 153 and 154.

The Buda Company, Chicago.—Motor cars; electric trucks; track drills; jacks; bumping posts; electric crossing gates; tool grinders; replacers; switch stands. Represented by F. E. Place, Wm. P. Hunt, Jr., L. M. Viles, M. A. Ross, R. B. Fisher, H. L. Miller, J. L. Artmaier, H. C. Beebe, C. H. Bull, W. C. Dyer, J. Gard, H. E. Arends, R. C. Horton, W. F. Hebard, E. Conant, R. M. Smith, M. A. Evans, A. C. Fiero, L. R. Griffin and P. G. Pendorf. Spaces 61, 62, 63, 64 and 65.

Carbic Manufacturing Company, Duluth, Minn.—Carbic portable acetylene lights; portable, low-pressure, acetylene generator for oxy-acetylene welding and cutting; Carbic combination portable light and oxy-acetylene cutting generator for wrecking outfit use. Represented by Gordon Paterson and C. H. Bolinder. Spaces 171½ and 172½.

Carnegie Steel Company, Pittsburgh, Pa.—Aeroplane crank case; submarine signal disk; aeroplane crank shaft; tractor gear; automobile fly wheel; turbine disk; rolled steel car wheel. Represented by Edwin S. Mills, N. M. Hench, C. B. Friday and Samuel Fray, Jr. Spaces 52½, 53, 71½ and 72.

Cast Iron Pipe Association, Chicago, Ill.—Cast iron pipe. Represented by F. E. Hutchins, R. C. McWane, W. E. Clow, L. J. Elliott and W. J. O'Day. Space 202.

Chicago Bridge and Iron Works, Chicago.—Model tanks and washout valve. Represented by M. J. Trees, H. C. Brown, C. M. Ladd, L. McDonald, F. L. Cook, R. M. Campbell, H. B. Horton, K. I. Small, H. B. Murphy, George T. Horton, O. A. Bailey, W. R. Manock, F. E. Lee and S. A. Poyer. Spaces 51 and 70.

The Chicago Flag & Decorating Company, Chicago.—Bunting signal flags; U. S. flags and flags of all nations; service flags. Represented by Geo. L. Glendon, Thos. Glendon, L. G. Magnusson and Walter Glendon. Space 186.

Chicago Malleable Castings Company, West Pullman, Chicago.—The Thomas rail anchor tie plate; Wightman rail joint. Represented by James S. Llewellyn and Warren M. Osborn. Space 142.

Chicago Pneumatic Tool Company, Chicago.—Oil-driven air compressor; oil engines; speed recorders; air and electric tools and rock drills. Represented by C. E. Walker, I. C. Campbell, C. A. Schumacher, C. B. Coates, E. C. Stroup, M. C. Reed and Geo. W. Favor. Spaces 115 and 116.

Chicago Railway Signal & Supply Company, Chicago.—Railway signaling apparatus and highway crossing protection devices. Represented by E. W. Vogel, C. N. Suhr, W. C. Martin, W. H. Dayton, Wm. M. McClintock, C. R. Ahrens, D. J. McCarthy and A. H. Anderson. Spaces 96, 97, 77 and 78.

Chipman Chemical Engineering Company, Inc., New York.—Photographs and other data on Atlas "A" weed killer and the progress of the Atlas "A" method. Represented by B. G. Thompson and E. N. Townsend. Space 205.

Cleveland Tractor Company, Cleveland, Ohio.—Tractors, industrial and farm. Represented by B. R. Tewksbury, K. P. Drisdale, C. Houghland and H. L. Greenfield. Space 185.

Crerar, Adams & Company, Chicago, Ill.—Track drills; Eureka bonding drills; Calumet die starters; Hercules and Standard trucks; waste; hammers; Joyer, Cridland jacks. Represented by Russell Wallace, W. I. Clock, Geo. Bassett, Arthur Martin, Charles Greory and R. Buillard. Space 28.

D. & A. Post Mold Company, Three Rivers, Mich.—"D. & A." cement fence post machines; post reinforcements; specimen concrete fence posts; rod spacers; tie wires; etc. Represented by G. H. Dougherty. Space 63.

Detroit Graphite Company, Detroit, Mich.—Paint and colors of all kinds. Represented by L. D. Mitchell, A. H. Kuersl, W. D. Vaneh, W. C. Bradford, J. J. Hogan, A. N. Bachner and T. R. Wyles. Space 108½.

Diamond State Fibre Company, Chicago.—Diamond fiber track insulation; ferrules; washers; end posts; continuous, Webber and Braddock angle plates; waste baskets; trucks; etc. Represented by Theo. Herkert. Space 13.

Paul Dickinson, Inc., Chicago.—Smoke jacks; chimneys and ventilators. Represented by A. J. Filkins, W. H. Dayton and L. G. Kelley. Space 98.

Dilworth, Porter & Co., Inc., Pittsburgh, Pa.—Represented by W. F. Schleiter. Space 27.

Dixon Crucible Company, Joseph, Iersev City, N. I.—Lubricating graphite and eraphite productions. Represented by J. E. Simson and I. A. Biel. Space 118.

The Domestic Engineering Company, Dayton, Ohio.—Delco light—a direct connected electric light and power plant. Represented by I. K. Stover. Space 14.

Duff Manufacturing Company, The, Pittsburgh, Pa.—All types of lifting jacks. Represented by C. N. Thulin, C. A. Methfessel, E. A. Johnson and T. A. McGinley. Space 91.

Edison Storage Battery Company, Orange, N. I.—Edison nickel-iron-alkaline storage batteries. Represented by H. G. Thompson, F. V. McGuiness, W. F. Bauer, E. T. Sawyer and H. J. Butler. Spaces 20 and 21.

Edison, Thos., Inc., Bloomfield, N. I.—The 400 and 500 ampere hour multiple plate battery; 500 single plate battery; 400 and 500 ampere hour heat resisting glass jars. Represented by F. I. Le Preau, I. P. Rodman, P. A. Garrity, E. W. Brown, E. W. Newcomb, B. F. Hines, R. J. Frost and L. W. Willis. Spaces 18 and 19.

Electric Railway Improvement Company, Cleveland, Ohio.—Portable rail bonding devices; Erico portable welder; Erico featherweight arc weld rheostat; Erico portable oil furnace. Represented by W. E. Huber, F. H. Neff, M. T. Stanton and L. I. Rucker. Space 1.

The Electric Storage Battery Company, Philadelphia, Pa.—Axle lighting equipment; railway signal batteries; car lighting batteries. Represented by Godfrey H. Atkin, T. Milton, T.

Pardee, Wm. Heritage, J. A. Fitts, H. M. Beck and W. E. Dunn. Space 60.

The Eymon Continuous Crossing Company, Marion, Ohio.—Continuous rail crossing. Represented by J. H. Fymon and Byron F. Wilson. Space 170.

Fairbanks, Morse & Co., Chicago.—Fifteen horsepower, type "Y," oil engine direct connected to 9 kw. generator in operation; standpipe, motor cars; centrifugal pumps; scales; electric motors. Represented by A. A. Taylor, J. H. Matthews, E. C. Golladay, F. J. Lee, G. W. Lewis, W. B. Lewis, D. K. Lee, F. M. Condit, F. P. Drinker, J. P. Flanagan, E. E. Pendray, H. E. Vergosen, E. J. Vergosen, E. J. Coverdale, J. D. Daggett, H. E. Vogel, G. E. Akers, G. Howard, H. J. Renkin, H. G. Balke, C. R. Demis, F. Lang, R. F. Koops and C. R. Story. Spaces 73-76 and 92-95.

Fairmont Gas Engine and Railway Motor Car Company, Fairmont, Minn.—Railroad mowing machine; section motor car; inspection car; handcar engine. Represented by F. E. Wade, D. G. Shephard, R. B. Ballard and W. F. Kasper. Spaces 41, 42 and 43.

Federal Signal Company, Albany, N. Y.—Reception booth. Represented by Carl Henze, W. H. Reichard, H. C. Ware and C. N. Beckner. Spaces 56 and 57.

Frictionless Rail, The, Boston, Mass.—Demonstrating the uses of the frictionless rail. Represented by F. A. Barbey, S. W. Simonds, T. F. Dwyer, Jr., and Geo. Bryant. Spaces 133 and 134.

General Electric Company, Schenectady, N. Y.—Represented by W. J. Clark, H. L. Monroe, C. Darticos, A. P. Jenks, W. H. Sigourney, John Roberts, H. W. Stewart, H. M. Jacobs and L. W. Shuge. Spaces 35, 36 and 37.

General Railway Signal Company, Rochester, N. Y.—Represented by S. G. Johnson, F. L. Hodgson, L. Thomas, F. H. Jones, W. R. Young, J. R. Wills, H. W. Lucia, W. H. Workman, E. E. Jester and J. A. Geneser. Spaces 47 and 48.

Gould Storage Battery Company, Depew, N. Y.—Storage batteries. Represented by G. R. Berger, W. S. Gould, R. Graham, R. C. Hull and W. H. Conant. Spaces 157 and 157½.

William Graver Tank Works, Chicago.—Storage tanks; water softeners; water filters. Represented by W. R. Toppin. Space 138.

Grip Nut Company, Chicago.—Grip nuts. Represented by W. E. Sharp, B. H. Forsyth, H. E. Passmore, A. Roberts, J. E. Weatherford and C. J. Wymer. Spaces 190 and 191.

W. & L. E. Gurley, Troy, N. Y.—Engineering and surveying instruments: Transits, levels, plane tables and alidades, compasses, leveling and stadia rods, hydraulic current meters, water stage registers, etc. Represented by H. M. Dibert and W. S. Hopkins. Space 69½.

Hall Switch & Signal Company, New York, N. Y.—Reception booth. Represented by H. W. Wolff, J. A. Ritter, H. L. Hollister, D. R. Day and W. J. Gillingham. Spaces 85 and 86.

Hatfield Rail Joint Manufacturing Company, Macon, Ga.—Hatfield rail joints. Represented by U. R. Hatfield. Space 166½.

Hayes Track Appliance Company, Richmond, Ind.—Hayes derails. Represented by R. W. Slauterback, E. L. Ruby, S. W. Wallace, W. Harding Davis and S. W. Hayes. Spaces 140 and 141.

Hazard Manufacturing Company, Wilkes-Barre, Pa.—Signal wires and cables; wire rope. Represented by Albert W. Gabriel, Geo. P. Cady, H. B. Pfisterer, Geo. G. Steinbrenner, L. W. Allen, W. S. Hart, Thomas Keefe, C. P. Brodthun and L. W. Bevan. Spaces 3 and 4.

Hegeman-Castle Corporation, Chicago.—Clapp fire resisting paint; tool steel gears and pinions; electric arc welders; Anglo-American Varnish Company's products; target enamels. Represented by Walter H. Evans, B. A. Hegeman, Jr., C. C. Castle, E. D. Hillman and A. C. Sullivan. Space 137.

Hoeschen Manufacturing Company, Omaha, Neb.—Hoeschen crossing signals; track instruments and annunciators. Represented by F. K. Davis, G. H. Carlson and E. Willrodt. Space 181.

Hubbard & Company, Pittsburgh, Pa.—Track tools of various kinds. Represented by W. H. Remmel, J. V. Smith, Geo. H. McCammon, J. W. Hubbard and O. W. Youngquist. Space 143.

Ingersoll-Rand Company, New York—"Imperial" pneumatic tie tampers; "Imperial" gasoline and electric motor-driven gang car with portable air compressors for operating tie tampers; pneumatic spike hammers for cut spikes; pneumatic spike drivers for screw spikes; pneumatic rail drills; pneumatic wood boring machines. Represented by W. H. Armstrong, C. W. Melcher, J. P. Gillies and Chas. Dougherty. Spaces 206 and 208.

International Filter Company, Chicago, Ill.—Showing the chemical feed of a water softener. Represented by W. N. Waterman, A. L. Hodges and Geo. H. Brown. Spaces 170½ and 171.

The International Steel Tie Company, Cleveland, Ohio.—International steel twin tie; International steel crossing foundation. Represented by Wm. P. Day, W. C. Mahon and V. E. Heglaw. Spaces 200 and 215.

Iowa Gate Company, Cedar Falls, Iowa.—Railroad fence gates. Represented by Albert Sauer and J. B. Clay. Space 193.

Johns-Manville Company, New York, N. Y.—Asbestos built-up roofing; asbestos ready roofing; asbestos shingles; smoke jacks; pipe and boiler insulation; piston packages; fibre conduit. Represented by J. E. Meek, J. C. Younglove, G. A. Nicol, P. C. Jacobs, J. M. Borrowdale, Geo. Christenson, C. S. Chinnam, F. W. Doty, H. Flanagan, C. D. Folsom, R. A. Hamaker, W. J. Hennessy, F. J. Horne, D. L. Jennings, W. H. Lawrence, C. E. Murphy, H. G. Newman, W. D. Otter, C. M. Patten, A. G. Pickett, H. B. Sewell, J. H. Trent, E. T. Wade and F. H. Willard. Spaces 171, 175, 176 and 177.

O. F. Jordan Company, East Chicago, Ind.—Spreader car model. Represented by Walter J. Riley and Robert F. Bressler. Space 220.

Kalamazoo Railway Supply Company, Kalamazoo, Mich.—Hand, push and velocipede cars; motor cars; track drills; track jacks; gauges and levels; electric valve grinders; electric rock drills; steel wheels; wood center wheels. Represented by Jno. McKinnon, D. A. Stewart, W. N. Sidnam, N. C. Study, F. E. McAllister, H. B. Miller, C. Jackson, W. Winterle and L. W. Bates. Spaces 22, 23, 24 and 25.

Kaustine Company, Inc., Buffalo, N. Y.—Sanitary waterless toilet and urinal. Represented by G. W. Hanbrook and D. A. Evans. Space 158.

Kelly-Derby Company, Chicago.—Warehouse and trailer crucks; semi-Diesel oil engines; perfect rail brace and tie plate combined. Represented by F. W. Adams, H. L. Bachman, W. H. Day, O. K. Fischer, H. H. Fry, W. B. Holcomb, Edw. E. Johnson, C. W. Kelly and F. G. Kochler. Spaces 11 and 30.

The Kerite Insulated Wire & Cable Company, Inc., New York.—Kerite insulated wires and cables. Represented by B. L. Winchell, Jr., George A. Graber, W. H. Fenley, J. A. Hamilton, P. W. Miller, J. W. Young and J. A. Renton. Spaces 49, 50, 68 and 69.

The Kettle River Company, Minneapolis, Minn.—K R-Gunite battery vaults; K-R-Gunite telephone booth. Represented by J. L. Weatherly and C. H. Marquess. Space 168½.

Keystone Grinder and Manufacturing Company, Chicago.—Keystone grinders and attachments. Represented by S. S. Newman and John Vincenz. Space 194.

Kilbourne & Jacobs Manufacturing Company, Columbus, Ohio.—Reception booth fitted with pictures of all-steel automatic air dump cars. Represented by J. Stanton Mossgrove and David Greene. Space 45.

Lackawanna Steel Company, Lackawanna, N. Y.—Abbott rail joint plates and Lackawanna hook shoulder tie plates; safety head angle bars. Represented by C. R. Robinson, A. P. Van Schaick, J. L. Hench, C. H. Hobbs, G. A. Hagar, F. E. Abbott and A. H. Weston. Spaces 33 and 34.

Layne & Bowler Company, Memphis, Tenn.—Working model Layne vertical turbine pump; turbine parts; shutter screen and Keystone wire wrapped screen for railway water supply. Represented by W. C. Curd and R. S. Charles. Space 90.

The Lehon Company, Chicago.—Mule-hide plastic car roofing; Mule-hide burlap-back car roofing; Mule-hide canvas coach and engine cab roofing; Per-hona insulating paper for refrigerator cars; Mule-hide car strips and sill covers; Mule-hide building roofing; Mule-hide asphalt shingles; Mule-hide Slate-Kote roll roofing; Mule-hide treated fabrics and membranes. Represented by Tom Lehon, D. B. Wright, Wm. I. Orr and F. A. Magern. Space 109.

Lipman Refrigerator Car & Manufacturing Company, Blois, Wis.—Refrigerator car equipment; A. B. C. system of refrigeration and heating; A. B. C. car door. Edmold car door. Represented by C. F. L. Lipman, F. Lipman, W. W. R. Lipman, A. B. Melville and L. H. Woodward. Space 6.

Long Company, Chas. R. Jr., Lexington, Ky.—Signal orders and bridge paints; line lead markers; and general line of station and bridge paints. Represented by Charles R. Long, Jr., Harry Vissinger, G. S. Turner, W. H. Hickman, M. E. Keig and S. W. Russell. Space 86.

The Lufkin Rule Company, Safford, Mich.—Measuring tapes, steel and woven; straight tie rods; mallets; sales; spring joint folding wood rules; saw and rule. Represented by S. B. McGee and Frank G. Brown. Space 121.

M. W. Savelly Company, Portland, Me.—Vaughan rail benders; Vaughan split straddlers; anchor guard rail clamps; Vaughan guard rail frames; Vaughan switch heater (new design). Represented by D. F. Vaughan and C. Z. Vaughan. Spaces 82 and 101.

Merrill & Whyte Rope Company, Kenosha, Wis.—Wire rope of every description and for every purpose; model of wire

rope and wire mills built to scale. Represented by Edw. E. Robirds, Geo. S. Whyte, Jas. A. Boope and M. M. Gross. Space 89½.

MacRae's Blue Book Company, Chicago.—MacRae's Blue Book. Represented by Albert MacRae, L. R. Rollins, Lloyd Simonson, E. B. Cooke and Thos. H. MacRae. Space 9.

The Madden Company, Chicago.—Three men rail layer; Blair tie spacer; Wagner switch point straightener; Harris-Muff ballast screen; Richter blue flag derail; Richter automatic derail and turntable lock; Chicago steel fence post; Madden rail carrier. Represented by H. C. Holloway and T. D. Crowley. Space 195.

Marsh & Truman Lumber Company, Chicago.—Bloxonend flooring. Represented by M. G. Truman. Space 213.

C. F. Massey Company, Universal Concrete Products Company, Canadian Concrete Products Company, Chicago.—Reinforced concrete products; battery well; battery box; house; culvert pipe; telegraph pole; flag pole. Represented by C. F. Massey, Jos. F. Love, J. E. Moody, P. Kircher, E. M. Hatheway, Chas. Gilman, H. E. Burns, Dan R. Brown, J. J. Gruenfeld, E. C. Alexander, A. M. Swenson and B. O. Brooker. Spaces 54 and 55.

McGraw-Hill Publishing Company, New York, N. Y.—Complete list of the papers published by this company. Represented by Wm. Buxman, J. E. Mason, E. J. Hunt and Fay Crabs. Space 8½.

Mercury Manufacturing Company, Chicago.—Mercury tractor type "L"; Mercury trailer standard warehouse. Represented by John R. Bensley, W. W. Pace, Wilton Bentley, L. R. Millar, William I. Lott, S. F. Proctor and H. B. Johnson. Spaces 10 and 29.

The Alexander Milburn Company, Baltimore, Md.—Portable carbide lights; oxy-acetylene welding and cutting outfits and apparatus. Represented by S. B. Moats. Space 5.

Miller Train Control Corporation, Danville, Ill.—Miller train control cab instrument mounted on engineer's air brake valve and stand, together with full size cut-away section of the control, shoe bar, etc. Instrument will be connected with air to show operation. An automatic stereopticon will show slides of actual photographs as well as printed matter of an educational value. Represented by W. B. Murray, H. B. Miller, J. N. Garber, E. Murray and P. E. Herren. Spaces 197 and 197½.

Monroe Calculating Machine Company, Chicago, Ill.—Monroe calculating machines. Represented by H. H. Doty. Space 9.

Mudge & Co., Chicago.—Mudge motor cars. Represented by Burton W. Mudge, Robert D. Sinclair, Karl J. Eklund, Herbert Deeming, William B. Ross, George W. Bender, Fay E. Posson, Charles M. Mudge, Jean K. Vanatta, Clyde P. Benning, Hugh U. Mudge, Clive Hastings, Ellsworth Ingalls, Charles W. Simpson, William C. Jacobs, V. Pageitt, Charles C. Smith and Frank Berz. Spaces 146, 147, 127 and 128.

National Carbon Company, Inc., Cleveland, Ohio.—Columbia R. S. A. No. 72 HV primary signal batteries; Columbia track batteries; storage batteries; Columbia dry batteries; Hot Shot batteries; carbon brushes; lighting, moving picture and photographic carbons; welding and searchlight carbons; Columbia flashlights and flashlight batteries; carbon telephone specialties—special forms in carbon. Represented by Chas. S. Pfisterer, W. H. Arkenburgh, J. M. Spangler, W. R. Pfisterer, R. J. Cox, L. W. Fischer, C. W. Wilkins, Wallace O'Connor, A. E. Pratt, R. W. Erwin, W. G. Waitt, R. C. Woods and R. S. Geraghty. Spaces 151 and 152.

National Concrete Machinery Company, Madison, Wis.—National reinforced concrete line; corner and brace fence posts for right-of-way fencing; National molds and reinforcements for concrete fence posts; Toohy timber dapper, a new device adapted for framing quickly and economically all sizes of bridge timbers and for framing car sills and other timbers used in car repairing work. Represented by I. B. Evans, M. H. Hovey, V. E. Rogers, E. A. Everett, W. Harding Davis, W. M. McClintock and Frank Sanders. Spaces 158½ and 159.

National Lead Company, New York.—Dutch Boy red-lead. Represented by A. H. Sablin and F. M. Hartley, Jr. Space 81.

The National Lock Washer Company, Newark, N. J.—Nut locks. Represented by F. B. Archibald, J. Howard Horn, R. L. Cairncross and A. T. Thompson. Space 192.

National Malleable Casting Company, The, Cleveland, Ohio.—Holdfast rail anchor; wedge lock anchor; malleable iron tie plates; malleable iron bridge washers; spools and angle washers; malleable iron rail braces. Represented by L. S. Wright, J. J. Byers and T. W. Aishton. Space 102.

National Railway Appliance Association, Chicago, Ill.—Enrollment booth. Represented by A. H. Kuerst, G. R. McVay, G. E. Geer, Thos. H. MacRea and W. G. Wilcoxson. Spaces 198 and 217.

National Surface Guard Company, Chicago.—Cattle guards (new design); rail saws; tie tongs. Represented by C. F.

Hately, C. C. Zimmerman, H. O. Conklin and H. A. Smith. Space 211.

Geo. P. Nichols & Brother, Chicago.—Electric turntable tractor; model of electric transfer table. Represented by Geo. P. Nichols, S. F. Nichols, R. M. Gaston and N. Fries. Space 173.

Northwestern Motor Company, Eau Claire, Wis.—Railway motor cars. Represented by R. R. Rosholt and R. F. German. Spaces 196 and 196½.

Ogle Construction Company, Chicago.—Hoisting machine and miniature steel automatic coating station. Represented by R. A. Ogle, L. S. Murphy, C. F. Bledsoe, Edw. Ernst and M. W. Powell. Spaces 12 and 31.

Okonite Company, The, New York, N. Y.—Reception booth. Represented by H. Durant Cheever, J. D. Underhill, W. R. Van Steenburgh, D. Woodhead, J. M. Lorenz, R. N. Baker, A. L. McNeill, E. G. Wilson, L. H. Irvine and C. S. Nolloth. Spaces 16 and 17.

O'Malley-Bear Valve Company, Chicago, Ill.—Valves and locomotive blowoff cocks; lock shield valve for oxy-acetylene service; globe; angle and "Y" valves for all service. Represented by Thomas O'Malley, Edward O'Malley, Joseph Gallagher, J. E. Brown, Jas. Pigott, G. A. MacLean, Herman Crews and Walter Morris. Space 114.

The P. & M. Company, Chicago.—Vaughan rail anti-creeper; P. & M. rail anti-creeper; Henggi rail anti-creeper; bond wire protectors. Represented by Fred N. Baylies, S. M. Clancey, J. D. Griswold, D. T. Hallberg, H. A. Hawes, R. D. Hawley, Geo. E. Johnson, J. E. Mahoney, Wm. A. Maxwell, Philip W. Moore, Fred A. Poor, John Reagan, W. H. Reeves, John Ritchie, P. V. Samuelson and L. S. Walker. Spaces 122-123.

Page Steel and Wire Company, New York.—"Copperweld" bare and weatherproof wire; bond wires; tie wires; nails; Armco (American ingot) iron wire; plain, galvanized and welding wire. Represented by W. T. Kyle, C. B. Semple, J. A. Roesch, Jr., F. W. Walters and W. S. Krenz. Spaces 182-183.

W. W. Patterson Company, Pittsburgh, Pa.—High-grade hard-made tackle blocks; wood blocks; manila rope; wire cable. Represented by W. W. Patterson, Jr. Space 145.

The Peyton Safety Rail Joint Company, Centralia, Ill.—Peyton safety rail joints. Represented by W. Perry, C. W. Witwer, J. M. Brown, C. Rettinghouse and M. C. Hughes. Space 172.

Pittsburgh-Des Moines Steel Company, Pittsburgh, Pa., Des Moines, Iowa, Chatham, Ont.—Railway water tanks; railway coaling station; railway oil tanks. Represented by W. W. Hendrix, Max Whitacre, C. L. Todd, W. P. Cogswell, H. J. Klinking, A. C. Pearsall, Herbert Miller, J. E. O'Leary, W. A. Da Lee and W. V. Bickelhaupt. Spaces 83 and 84.

The Pocket List of Railroad Officials, New York.—Pocket List of Railroad Officials. Represented by J. Alexander Brown, Harold A. Brown and Charles L. Dinsmore. Space 26.

Positive Rail Anchor Company, Marion, Ind.—Rail anchors; switches; guard rails; tie plates; rail braces; switch point protectors; heel plates. Represented by Frank M. Robbins, J. A. Shouly, L. C. Ferguson, A. H. Told, E. A. Le Beau and W. Harding Davis. Spaces 178, 179 and 180.

Geo. A. Post, New York.—Arch-necked railway spike. Represented by Geo. A. Post, James R. Steele, E. H. Walker, W. Eckels and Geo. A. Post, Jr. Space 204.

The Protective Signal Manufacturing Company, Denver, Colo.—Railway signal equipment—bells; relays; oscillators; time units; wig-wag signals; etc. Represented by Archie M. Adams, Will C. Neahr and Walter E. Wegner. Spaces 167½ and 168.

Pyrene Manufacturing Company, New York, N. Y.—Fire extinguishers; hose; reels; chemical engines. Represented by R. G. Henderson, W. D. Dorry, J. M. Johnston and H. V. Boykin. Space 160.

The Q. & C. Company, New York.—Compromise joints; Bonzano-Thomson rail joints; derrails; replacers; skid shoes; emergency knuckles. Represented by C. F. Quincy, F. F. Kister, Jay V. Wescott, Edgar M. Smith, J. L. Terry, Roger B. Quincy, E. Ray Packer, William W. Hoit and A. R. Horn. Spaces 120 and 139.

The Rail Joint Company, New York.—Continuous, Weber, Wolhaupter and 100% Standard joints; continuous, Weber and Troy insulated joints; continuous step joints. Represented by V. C. Armstrong, V. P. Thomson, Benj. Wolhaupter, E. A. Condit, Jr., E. L. Van Dresar, Jas. A. Greer, Alex. Chapman, E. F. Schermerhorn, F. C. Webb, R. W. Payne, G. H. Larson, C. B. Griffin, R. W. Smith, W. S. Boyce, H. C. Hickey and Chas. Jenkinson. Spaces 79 and 80.

The Railroad Supply Company, Chicago.—Tie plates; derrails; wig-wag crossing signals; d. c., a. c. and motor-driven bells; relays; testing instruments; lightning arresters; annunciators; electric crossing gates; signal supplies and accessories. Represented by E. H. Bell, H. M. Buck, M. J. Fox, F. M. Hill, P. W. Kohnen, F. Lull, R. S. Prentice, A. H. Smith, H. G. Van Nostrand and F. C. Webb. Spaces 104 and 105.

Railway Age—See Simmons-Boardman Publishing Company. Space 46.

Railway Electrical Engineer.—See Simmons-Boardman Publishing Company. Space 46.

Railway Maintenance Engineer.—See Simmons-Boardman Publishing Company. Space 46.

Railway Mechanical Engineer.—See Simmons-Boardman Publishing Company. Space 46.

Railway Review, Chicago.—Railway Review. Represented by Willard A. Smith, Harold A. Smith, W. M. Camp, C. L. Van Auken, A. E. Hooven; J. E. Gongeon, Chas. L. Bates and J. L. Lammedee. Space 44.

Railway Signal Engineer.—See Simmons-Boardman Publishing Company. Space 46.

Kamapo Iron Works, Hillburn, N. Y.—Manganese switch points; switch stands; switch slide plates. Represented by Thomas E. Akers, Arthur Gemunder, W. C. Kidd, Douglas E. Snow and James B. Strong. Space 109½ and 110.

Reading Specialties Company, Reading, Pa.—Guard rail clamps; car and engine replacers; rail benders; rail joints; tie spacers; rail straighteners. Represented by B. J. Buell and J. J. O'Connell. Spaces 45 and 46.

Roadmasters' and Maintenance of Way Association of America, Sterling, Ill.—Represented by P. J. McAndrews and Miss Anna McAndrews. Space 227.

Ross Foundry Company, Henry, Chicago, Ill.—Hardick lock and covered turnbuckle for switch adjustment. Represented by I. A. Ogden and William Hardick. Space 189.

Southern Pine Association, New Orleans, La.—Pine and its different treatments. Represented by Dr. H. Von Schrenk, A. L. Kammerer and H. W. Mehlitz. Space 203 and 202.

Squire Cogswell Company, Chicago.—Volkhardt water service hydrants and valves and specialties; Hawk kerosene torches. Represented by Willis C. Squire and Chas. P. Cogswell. Space 161½.

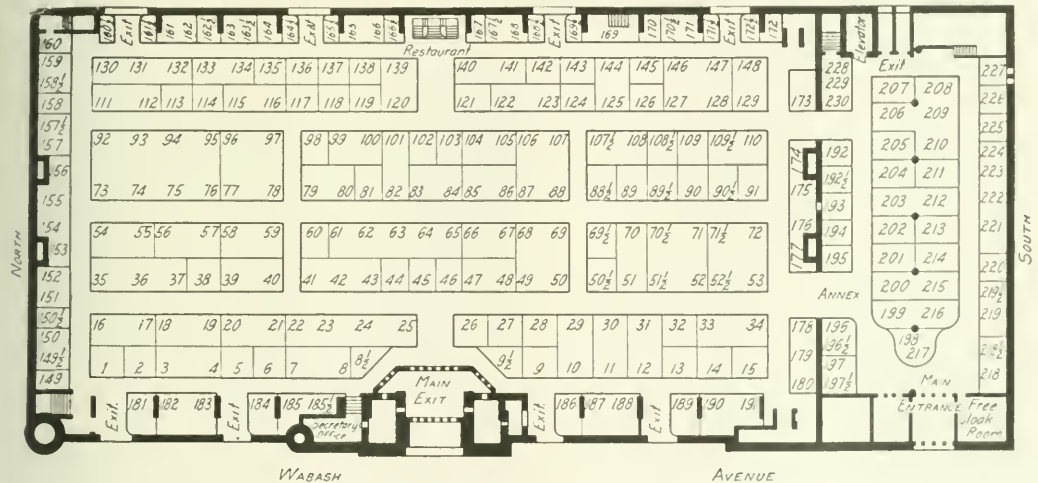

Standard Asphalt & Refining Company, Chicago.—Mineral rubber mastic floors; acid-proof floor; waterproofing; pipe coating; roofing; damp proofing; paving; insulation; liquid coatings; acid-proof tank linings. Represented by R. F. Trimball, H. C. Kichle, E. L. Hedrich, George A. Thornton, J. M. Woodruff and Charles Muller. Spaces 161 and 162.

Swain Company, Chicago.—Journal box publisher; journal box loose pulley and shattering cups; solid lubricators for all sizes of crank pin cups; metallic packing for all rods. Represented by Wm. H. Holmes and C. H. Holman. Space 187½.

Templeton, Kenly & Co., Ltd., Chicago.—Simplex car and track jacks; Simplex pole pulling jacks; Simplex emergency jacks; Simplex automobile jacks; Simplex shipbuilder's jack. Represented by A. C. Mills, W. B. Templeton, H. B. Burlow and J. H. Hummel. Space 32.

Toledo Scale Company, Toledo, Ohio.—Automatic dial scales; built-in type freight-house scale; self-contained type dormant scale; portable platform automatic dial scale. Represented by C. E. Moore, C. H. Haggood, H. O. Hem, W. B. Pantall and H. D. Ridge. Space 15.

Track Specialties Company, New York, N. Y.—Trasco guard

Floor Plan of the Coliseum and Annex, Showing Booth Numbers

Safe Lock Switch Machine Company, Lexington, Ky.—Safe lock switch machine. Represented by Curtis Dougherty, D. M. Case and C. F. Jones. Spaces 163 and 163½.

Sellers Manufacturing Company, Chicago.—Sellers' anchor bottom wrought iron tie plates. Represented by J. M. Sellers, G. M. Hogan, R. A. Van Houten and R. J. Platt. Space 124.

Signal Accessories Company, New York.—Signal material. Represented by F. C. Lavarack and C. R. Ahrens. Space 119.

The Silver Steel Company, New York.—The Silver steel tie. Represented by Jos. A. Silver. Space 164½.

Simmons-Boardman Publishing Company, New York and Chicago.—Railway Age; Railway Maintenance Engineer; Railway Signal Engineer; Railway Mechanical Engineer; Railway Electrical Engineer. Represented by L. B. Sherman, Samuel O. Dunn, Henry Lee, C. R. Mills, Frank S. Dinsmore, F. H. Thompson, H. H. Simmons, H. H. Marsh, J. H. Bryan, J. M. Rutherford, R. H. Smith, E. R. Walker, E. T. Howson, W. S. Lacher, K. E. Kellenberger, J. G. Little, A. F. Stuebing, G. L. Lacher, E. T. Owens and T. E. Crossman. Space 46.

Simple Gas Engine Company, Menasha, Wis.—Gasoline engines with clutch and chain drive for railway motor cars, three, five and six horsepower. Represented by John P. Hrubesky, F. J. Oberweiser and John G. Walter. Space 165½.

T. W. Snow Construction Company, Chicago.—Oil and water cranes. Represented by T. W. Snow and Derby Snow. Space 50½.

Union Switch & Signal Company, Swissvale, Pa.—Represented by A. L. Humphrey, G. A. Blackmore, L. E. Howard, W. P. Neubert, J. P. Coleman, J. E. Saunders, C. O. Harrison, H. A. Wallace, J. F. Talbert, W. P. Allen, Aaron Dean, H. W. Griffin, J. J. Cozzens, T. H. Patton, J. L. Brastow, J. S. Hobson, W. W. Talbert, S. E. Gillespie, V. K. Spicer, J. L. Locks, Geo. Marloff, J. D. Rott and H. R. Shone. Spaces 60 and 67.

U. S. Wind Engine & Pump Company, Batavia, Ill.—Models and samples of railway water stations, water tanks, water columns, railroad double-acting pumps, stock yard windmills and pump switch stands. Represented by L. E. Wickett, C. F. Ward, G. E. Vermilyer, J. P. Pirnie and E. B. La Salle. Spaces 111 and 112.

Verona Tool Works, Pittsburgh, Pa.—Track tools; track jacks; levels; gages; nut locks. Represented by H. Fischer, E. Woodings and H. C. Moll. Spaces 129 and 148.

Volkhardt Company, Inc., Stapleton Station, S. I., N. Y.—Non-freezing water hydrants. Represented by Wm. Volkhardt and Willis C. Squire. Space 160½.

The Walls Frogless Switch and Manufacturing Company, Kansas City, Mo.—Swing rail frog. Represented by C. E. Ennis and W. J. Stoneburner. Spaces 219 and 219½.

Waterbury Battery Company, Waterbury, Conn.—Waterbury unit cylinder primary battery; Waterbury plate type primary battery; Waterbury track battery; Schoenmehl primary battery; Gordon primary battery. Represented by C. B. Schoenmehl, G. A. Nelson, E. E. Hudson and S. J. Hough. Space 38.

Wayne Oil Tank & Pump Company, Ft. Wayne, Ind.—Oil tanks and self-measuring pumps. Represented by B. F. Geyer. Space 135.

West Coast Lumberman's Association, Seattle, Wash.—Lumber in various dimensions cut from Douglas fir. Represented by C. J. Hogue and D. H. Davis. Spaces 187 and 188.

Western Electric Company, New York, N. Y.—Railway telephone and selector dispatching circuits; flood lights; train lights; motor generator equipments for signaling. Represented by Jack C. Binning, Geo. Hull Porter, G. K. Heyer, T. J. Rider, H. K. Olmstead, F. A. Ketcham, Walter P. Hoagland, Will J. Davis and L. A. Muttart. Spaces 58 and 59.

The Wyoming Shovel Works, Wyoming, Pa.—Red Edge track shovels. Represented by G. E. Geer, H. C. Emery and H. T. Potter. Space 103.

Yale & Towne Manufacturing Company, New York, N. Y.—Locks; door closers, chain hoists. Represented by G. C. Fishleigh, L. W. Kregner, R. J. Kleinsmid and E. A. McGuire. Space 113.

Albany Regional Committee Report*

IN many parts of the country signal failures are often experienced during the winter months from frost collecting on motor commutators or contacts. This presents a problem to the signal departments to be solved with each recurring winter. Frost and moisture in signal mechanism and motor cases was discussed at length at this meeting. Some of the contributing causes of frost failures may be due to poorly fitted motor shields, motor shields cracked, poor gaskets for motor shields and mechanism doors, ventilators closed, no ventilators, high mica, causing brushes to arc and warm up commutator.

Frost failures were generally found to occur between 7 a. m. and 12 o'clock noon, depending principally upon the rays of the sun. Opening mechanism doors to clean motors when frost is forming on rails and iron poles will result in a frost failure. Failures from ice on motor commutators usually occur after a warm winter day when the temperature drops suddenly toward evening, just as the sun goes down. Motor and mechanism will have a sweating appearance and the motor commutator will have a very fine coating of ice. It has been found good practice not to open a case in severe cold weather unless absolutely necessary and at other times not before 10 a. m. and not after 3 p. m. on a sunny day. At these times the necessary work should be done in as brief a time as possible. Signals located close to a hill or mountain are less troubled with frost than those some distance away, while a signal located in a ravine near a mill pond seems to be an ideal spot for frost.

Some of the various methods employed in trying to counteract the effects of frost were the use of a wooden commutator shield, a special enlarged door, alcohol in mechanism case, alcohol on a sponge in commutator shield, the sealing up of bottom of mechanism, the installation of new gaskets for commutator shield and painting the outside of the mechanism case with aluminum. Others tried placing a packing of charcoal in mechanism cases but this did not seem to remedy the trouble. It is the opinion of most maintenance forces that proper ventilation is lacking in signal poles and mechanism cases and that providing a means for the proper circulation of air around the signal mechanism has been found to reduce frost failures materially. Another member present advised that on one section where consider-

able frost trouble was experienced this was remedied by closing up the ventilators with waste, plugging the hole in the bottom of the case with waste and setting small bottles of alcohol in the bottom of the cases, which seem to be most affected with the frost. No further trouble was experienced on these signals, but when they were cleaned in the spring the ones that had the alcohol in the cases had rusty mechanisms and bearings which was undoubtedly caused by the alcohol. Glycerine and vaseline were tried by placing them inside of the glass shield, covering the entire surface, but this did not prevent frosted motors. The same member stated that if the thermometer is higher than 10 deg. above zero it is too warm for frost to take effect, and if it is lower than 10 deg. below zero it is too cold for it to form unless it warms up very fast during the morning.

"Split Spark" Lightning Arrester

THE "SPLIT SPARK" lightning arrester, manufactured by the Chicago Railway Signal & Supply Company, Chicago, is unique in its construction and effects in protecting signal apparatus on railroads. This arrester is the invention of Fred B. Corey, for many years with the General Electric Company at Schenectady, N. Y. The over all dimensions are 5½ in. long by 3 in. high. The porcelain base, which is hollow, condamp and insect proof.

The two R. S. A. standard binding posts at the ends are for "line" and "instrument." The middle binding post is the "ground." This binding post has a carbon disc, and immediately on each side of it there are two knurled nuts, presenting many fine points toward the carbon ground disc, to which the lightning discharges to

Split Spark Lightning Arrester

ground. In the hollow base there are three sets of coils of heavy wire wound upon a fiber tube. These coils are impregnated, and the entire case is sealed, making it damp and insect proof.

One of the coils is a choke coil, while the other two are compensating coils, wound in reversed directions and connected direct to the incoming "line" binding post. These compensating coils divide the incoming static or lightning discharge, so that a positive discharge takes place between both gaps simultaneously. One particular feature of this arrester is that it has two positive discharge paths and is so designed mechanically that a fixed distance is kept between the points at all times.

*From the abstracts published in the R. S. A. Journal for March, 1918.

All coils are wound with heavy cotton-covered magnet wire, and the choke coil is the only coil offering resistance to the regular current going to the instrument, the compensating coils being connected directly to the incoming binding post.

To protect alternating current instruments the choke coil is eliminated. Extensive tests have shown that this arrangement offers no impedance and that lightning discharges are always equal between the two discharge points.

A Portable Motor Driven Conveyor

A NEW TYPE OF PORTABLE belt conveyor designed to be moved easily by one man, and which will handle loose materials such as coal, coke, ashes, crushed stone, sand or gravel and sacks, packages, boxes and manufactured products with equal facility, is being built by the Portable Machinery Company, Inc., of Passaic, N. J. The machine is operated either by an electric motor or gasoline engine and is known as a scoop

storage pile or the conveying distance. The machines are particularly adapted for filling in or extending embankments by conveying cinder or other filling materials

The Machine Showing the Belt Conveyor and Sprocket Drive

from hopper-bottom cars and discharging at the top of slope, thus obviating the necessity of an additional track along the top of the embankment.

Edison Multiple Plate Primary Cell

THOMAS A. EDISON, Inc., has made an important improvement in primary batteries in the form of a multiple plate type cell which embodies a combination of two copper oxide plates and three zinc plates as illustrated below. The method of assembly provides for two copper oxide plates suspended in copper-plated steel frames which are clamped automatically into the

Multiple Plate Primary Battery

side of the plate, thereby insuring positive contact. The zinc plates are suspended from a rigid hanger bolted on to a cross bolt, the center zinc suspension having a jam nut on each side.

The new element presents a very compact and rigid assembly, the mechanical structure of which insures a permanent fixation of the plates with the least amount of inactive material in its construction and thereby obtaining the minimum amount of displacement in the solution. As

Increased Storage Capacity Is Gained by Using the Conveyor in Flights

conveyor because of the feature whereby the conveying belt receives its load of loose material through a scoop at the lower end which can be pushed or buried completely in the material to be handled.

The conveyor is built of steel and is mounted on wheels attached to the upright supports of the conveyor. The lower end of the conveyor is attached to the lower end of these uprights by pipe section members forming a triangle. The conveyor may be moved easily from place to place by inserting two pieces of pipe in the ends of the horizontal members for use as handles.

The power is transmitted to the conveyor from the driving motor, which is mounted on the horizontal supports by means of a chain and sprocket connection to a shaft extending underneath the conveyor. From a sprocket on the other end of this shaft the power is transmitted to the driving sprocket, which is located at the upper end of the conveyor.

In handling loose material the machine has a capacity of one ton in $1\frac{1}{2}$ min., and in unloading loose materials from hopper or drop-bottom cars the lower end of the conveyor can be run under the car and the materials elevated from the track level, a distance of from 6 to 9 ft., to the storage pile. The conveyors can be used in sets of two or more to increase either the height of the

shown in the illustration, horizontal slots are counter-sunk into the bottom panels of the zinc plates, the purpose of these slots being to indicate by their perforation the exhaustion of the cell. The design of the zinc plates is such as to enable the entire surface area to be maintained intact throughout the life of the cell, thus avoiding a decreasing surface as the cell becomes exhausted. The slots also provide a more positive means, and at a more definite point, for determining when the battery is ready for renewal. The physical improvement brought about by this latest development is the exposure of additional surface area of zinc and copper oxide plates at a greater height in the solution, thereby presenting a greater surface area of the elements in a more active solution. The effect of these physical improvements in the cell is to enable it to maintain a more constant voltage at any given discharge rate between the beginning and end of its life and to reduce to a minimum the CR drop in a cell when subjected to heavy discharges, especially under cold temperatures. The multiple plate type assembly is now being furnished in 400 and 500 ampere hours capacity to fit R. S. A. jars and covers and when furnished with barrel-shaped heat-resisting glass jars is known as Edison type M-404 and M-504, respectively. It is universally adaptable to all signal circuits, line circuits, track circuits, crossing bell circuits, low voltage switch machine circuits and signal lighting circuits.

U. S. & S. Co. New and Improved Devices

DURING THE LAST few years considerable economy in the operation of electro-pneumatic interlocking plants has been effected by the introduction of minor improvements in detail parts, the sum total of which has allowed a decided decrease in the amount of compressed air necessary for the operation of this type of interlocking. The improvements made in the switch valve have been responsible for a considerable portion of the saving in air. The Union Switch & Signal Company's improved Style "C" cutoff type valve is so designed that compressed air is held normally in only one

Style "M" Low Voltage Switch and Lock Movement

chamber and against only one electrically-operated pin valve. Another improvement in this valve has been the elimination of external tubing for interconnection of air chambers. The casting is now provided with internal ports for the flow of air between its chambers. The changes made in this style valve do not detract in any way from the recognized safety features which are characteristic of electro-pneumatic interlocking.

Style "M" Low Voltage Switch and Lock Movements

The Style "M" switch and lock movement recently developed was designed primarily to operate railway

switches when provided with electrical energy. Realizing that this movement would have an extensive application in connection with the low voltage operation of outlying switches, consideration was given the fact that it might be necessary at times for the switch to be thrown over by hand, due to battery failure or disconnection. Because of the fact that the trainmen who would be required to operate the switch under these circumstances might not be acquainted with the mechanism, the open-

Special Model 12 Neutral Polar Relay

ing for the reception of the hand crank was made prominent and a switch lock is used for fastening the cover of this opening in place. This was so located to bring it where it could not be overlooked. As an additional precaution, "Crank here" in raised letters has been placed in the gear case immediately over the hand crank opening. The point at which the crank is applied in the train of gears is such that no time is lost in throwing the movement over by hand.

Relay for Handling Low Voltage Switch Movements

In order to provide for the satisfactory control of low voltage switch and lock movements now being installed quite generally, the Union Switch & Signal Company has equipped its standard model 12 neutral polar relay with a special arrangement of contact-making parts. This relay is equipped with four front and two back contacts, which are arranged so that two silver-to-graphite contacts will ordinarily be depended upon for carrying the motor current, while two graphite-to-graphite contacts will break last as the relay is de-energized, in this way taking care of breaking the current used by the motor without injuriously affecting the contact parts. This relay provides a pressure of two ounces per contact when normally energized, as do all of the standard Model 12 and 13 Union relays.

DAILY EDITION

What virtue is there in the conservation of natural resources if human rights are sacrificed? The only answer to this is that the conduct of the

Conservation and the War

War for Freedom justifies a dissipation of the natural wealth of the world at a rate not previously dreamed of, and according to meth-

ods that would be considered disgracefully wasteful in sober times of peace. However much the demands of the moment may positively require an almost ruthless waste, such as the destruction of the beautiful roadside elms of France for trench timbers, the rights of posterity demand the practice of conservation wherever it does not interfere with the adequate supply of war needs. Just as the lavish expenditure of money on the part of the government demands a corresponding frugality on the part of the people, so it devolves upon railroad men to practice conservation even more than in the past. One unfortunate effect of the present emergency has been a tendency to discontinue the practice of treating timbers for railway structures, and to use inferior grades of lumber. Cheap or makeshift measures may be necessary in some places and even desirable for temporary arrangements, but the fallacy of such practices where avoidable will be demonstrated all too quickly in a far shorter life than could be expected of standard construction.

Prior to the building of the Grand Central terminal in New York, the New York Central conducted experi-

Promoting Safety in Passenger Stations

ments extending over a period of several years before deciding on the nature of the flooring and the grade of ramps to be used in the station building. The studies included experiments with 15 or 20 different flooring materials and nearly as many different inclinations of ramps. Before and since that time individual roads have carried on similar experiments previous to the construction of passenger stations. The fact that it was considered necessary to make these experiments emphasizes the importance of the work of the Committee on Buildings and the value of its recommendations on provisions to insure safe walking in and about passenger stations. While it does not follow that these studies and recommendations will entirely relieve individual roads from carrying on their own investigations when planning new passenger facilities, it does follow that their work is simplified. The knowledge of what others have done and the character of the results obtained presented in the concise manner of this report offer a foundation on which a road may build its own conclusions. Another point to be considered in providing for the safety of the public in passenger stations is the wide difference in the characteristics of the suburbanite as contrasted with the infrequent traveler. Facilities which will insure safety and the prompt movement of experienced travelers will not in all cases answer for the inexperienced. This phase of the question has been fully considered by the Committee on Buildings. The suggestions made in the report are

of a constructive nature and should prove to be of value to railway men in working out the details of station design.

The committee on water service is to be commended for calling attention to the importance of an adequate organization to supervise water service

Importance of a Water Service Department

problems, although it could well have placed more emphasis on this subject. It is true that on most roads water service is handled as an adjunct to some other department or branch of the service without any direct concentration of responsibility. The fact that this is the common practice does not, however, demonstrate its correctness. Rather, the improvements which have been effected on the few roads which have concentrated responsibility for the construction, maintenance and operation of water stations in one distinct department indicates that this common practice is wrong. The importance of a proper quality of water is being realized now more than at any time in recent years because of the necessity of securing the maximum service from each locomotive. This is leading to a realization of the importance of studying the quality of the water delivered at each individual station, which in itself is the work of a specialist. The increased demand for water resulting from the heavy traffic is also necessitating the reconstruction of many stations to provide the requisite capacity. This increased consumption is also requiring pumping for longer intervals and increasing the costs of operation, which in turn suggests larger and more modern pumping equipment. This and the other phases of the water service problems are of sufficient importance to justify the utilization of specialists in water service matters rather than leaving them to be solved by other men whose primary responsibilities are in other directions.

The preparation of the arrangements for the present convention of the American Railway Engineering Association was facilitated materially by a

The Con- vention Attendance

common feeling among the officers and directors in favor of a meeting this year, notwithstanding the postponement of several other railway conventions. In fact, some of those in charge were especially impressed with the idea that the convention could be made of particular value this year, and that with a proper arrangement of the program many railway men would make a special effort to attend because of the opportunity to discuss the questions of the hour. The correctness of this position is borne out by the large attendance yesterday. The registration of members totaled 293 or 4 more than the number reported for the first day last year. This is in addition to 75 guests who registered. While this is a smaller number than was registered two years ago, the enormous burden placed on all railway officers under prevailing conditions makes it

difficult for many to leave their work and the attendance recorded evidences the high value which the members place on the convention now in progress.

Government Interference

With Railways

PRESIDENT SULLIVAN'S ABLE ADDRESS to the Railway Engineering Association yesterday calls attention forcibly to the danger that when governments begin to interfere with the development and management of railroads, their interference will become excessive, unwise and harmful.

In Mr. Sullivan's own country, Canada, the government began some years ago to stimulate railroad construction by a varied policy of subsidies and guarantees. If kept within reasonable limits this policy might have been beneficial. But the government, for various reasons, carried it to great excess. Mr. Sullivan did not mention the fact, but it is well-known that one of the main reasons why the policy was carried to such excess was that the political parties of Canada began to seek public favor by competing with each other in subsidizing railroad development. In consequence, the railroads became greatly over-built, and the country has on its hands a large mileage which has and will have for years only a very small business; which is unable to earn a return upon the investment on it; and which has become a heavy burden upon the Canadian taxpayers.

As Mr. Sullivan showed, the national and state governments in the United States have gone to the opposite extreme. Instead of over-stimulating railroad development, they have for years so held down the rates and restricted the net earnings of the companies, that the expansion of facilities has been almost stopped. In consequence, in the midst of a great war, the government has considered it necessary to take control of the operation of the railways in order to save them and the country financially and to promote greater development and more efficient operation of transportation facilities.

The presentation of these incontrovertible facts inevitably suggests some most important questions regarding the future of the railways of Canada and of the United States, both during the war and after its conclusion. The government of Canada has thus far left the operation of that country's railways in the hands of their usual managers. The government of the United States has taken control of operation in this country. In both countries there is an active propaganda for government ownership.

It was necessary for the government of this country to come to the rescue of the railways if they were to be saved from financial disaster. Whether it was desirable for it to assume control of their management is very doubtful. Whether it is desirable for it to make radical changes in the organizations and operating methods is still more doubtful. Certainly there is nothing in the past railway experience of either Canada or the United States to lead anybody to believe that the substitution of government methods for private initiative and enterprise will improve railway management.

Whatever the effects of government control may be during the war, when both public men and railway men are influenced by patriotic considerations of the most potent character, there can be little doubt in the mind of any well-informed man as to what would be the results of government management of the railways of Canada or the United States in time of peace. Government

subsidies have disastrously over-stimulated railroad development in Canada, and to the extent that government ownership has been tried in that country it has resulted in inefficiency and heavy losses to the taxpayers. Government regulation has stopped railroad development in the United States. These facts constitute a record of un wisdom on the part of the governments of these countries in dealing with railways which argues powerfully in favor of less government interference and greater room for the exercise of private initiative and enterprise on railways.

No step could more fatally handicap the commerce and industry of Canada and the United States after the war or do more harm to all classes of their people, than the adoption of government ownership of their railways.

The A. R. E. A. Studies Labor

IN SPITE OF THE FACT THAT over one-half of the total expenditures of the engineering and maintenance of way departments goes for labor, the American Railway Engineering Association failed to give any concerted attention to this subject until last year. While the failure to realize the importance of this subject is to be regretted, the Board of Direction is to be commended for undertaking the consideration of this subject a year ago through the formation of the committee on Economics of Railway Labor. This committee has before it a wider field for investigation and study than any other committee of the Association and the results of its investigation, if intelligently made, will be of greater value to the roads. It is not surprising, therefore, that the committee covered only a small part of the field assigned to it during the first year of its existence, for its time was necessarily spent in large measure in organizing for work in future years. Important as the hiring and the housing and feeding of men are, which the committee reported on yesterday, these are only two of a large number of problems coming within the province of this Association for study.
